LIST OF MAPS IN VOLUME III

1. CANAAN, PALESTINE AND JERUSALEM (colored) See CHRISTIANITY
2. DEVELOPMENT MAP OF CHRISTIANITY (colored) See CHRISTIANITY
 [EDITOR'S NOTE: This map represents the spread of Christianity as the dominant faith from the Apostolic times down through the great conversions in Scandinavia, Hungary and Russia about the year 1000. It can be seen that as late as the eleventh century a large area around the Baltic was still heathen, as was also the case with the northeastern parts of what is now Russia. The legend in the upper left corner of the map indicates not only the general color scheme but likewise the key to the relative importance of the early Christian centers of teaching and organization.]
3. CONSTANTINOPLE AND THE STRAITS (colored) See CONSTANTINOPLE
4. MEDITERRANEAN LANDS IN THE TIME OF THE CRUSADES (colored) . . See CRUSADES
 [EDITOR'S NOTE: The two maps showing the Mediterranean lands in 1097 and 1204 represent cartographically the portions of Europe, Asia and Africa which were involved in the Crusades at the beginning and end of that movement. The most notable change in the map between 1097 and 1204—the date of the Fourth Crusade—is the creation of new states in the Balkan Peninsula and in Syria. In the former, not only was the ephemeral Latin Empire set up in the very heart of the old Byzantine Empire, but two new kingdoms, Serbia and Bulgaria, emerged from the confused welter of the Balkan peoples. In the latter, several new and short-lived principalities resulted from the conquests of the crusaders but were not destined to outlast the thirteenth century. The inset map of the Caliphate in 750 shows the Mohammedan world just before the period of its highest wealth and culture.]

VOLUME III

CHOPIN, Frédéric François (1809-1849), greatest master of pianoforte composition. Born at Zelazowa Wola, Poland; studied first with Zwiny; later with Elsner at Warsaw Lyceum; played in public before he was nine; creator of a new style of writing for the pianoforte which enormously increased the means of emotional expression; his compositions are unsurpassed in their recognition of that instrument's powers and limitation. CHRISTADELPHIANS. — "John Thomas, M. D., an Englishman, came to this country [the United States] in 1844 and identified himself with

the Disciples of Christ. Soon after, his views changed and he became convinced by a study of the Bible that the cardinal doctrines of the existing churches correspond with those of the apostate church predicted in the Scripture. He began to publish his views and organized a number of societies in this country, Canada, and Great Britain. [The members called these societies 'ecclesias' instead of churches.] No name was adopted for these societies until the Civil War broke out. The members applied to the government to be relieved from military duty in consequence of conscientious scruples, and finding it necessary to have a distinctive name, that of Christadelphians or Brothers of Christ, was adopted."—H. K. Carroll, *Religious forces of the United States*, p. 89.—Among the most noted of the preachers and writers of the Christadelphians was Robert Roberts, of Birmingham, England, who did much to disseminate their doctrines not only in England but in the United States. He died in 1898, at San Francisco, California. There are also a few Christadelphian Churches in England. Statistics available January, 1920, report 145 churches and 2,022 members of the denomination in the United States.—*Year Book of the Churches*, 1920, p. 198.

CHRISTIAN BROTHERS, religious fraternity for education of the poor. See EDUCATION: Modern: 17th-20th centuries: Christian brothers; 19th century: Ireland.

CHRISTIAN CATHOLIC APOSTOLIC CHURCH IN ZION, religious sect founded in 1806 in Chicago by a former Congregational minister, John Alexander Dowie, who claimed to be Elijah III, John the Baptist being Elijah II. "The world first began to hear of John Alexander Dowie in Australia, where after receiving ordination to the ministry in the Congregational body, he repudiated the organized church and became an Independent. He quickly assumed place as a leader in the fight against the liquor traffic, . . . founded a Free Christian Church, taught the doctrine of 'Divine Healing,' preached constantly. . . . When he left Australia for a world tour in 1888, he had gained many adherents to his religious faith and possessed a strong personal following throughout that continent and the Islands. . . . After a few years on the Pacific coast in America he located near Chicago. . . . [In 1893 he built] a 'tabernacle' just outside the World's Fair grounds—of so poor and flimsy a character it was dubbed by the press an 'old wooden hut.' . . . His strong, pungent, denunciatory words and aggressive methods concerning the practice of medicine and surgery aroused the State Board of Health to action, in which they were defeated. . . . His following grew into the thousands, he engaged and filled to overflowing each Sunday the largest auditorium in Chicago, founded a church in 1896, sent out his paper and other almost innumerable literature from a printing plant which he owned and operated, bought a large downtown hotel as a 'Home' and headquarters, rented another, established a college with full equipment and faculty, started a bank, established in America a new industry—lace making—the machinery and lace makers being imported from England, and in 1901 founded Zion City, forty-two miles north of Chicago, which within a few years reached a population of 8,000 people, all adherents of the faith and living under the rules and regulations prescribed, leases taking the place of the ordinary deeds to property—the land, 6,500 acres, being 'dedicated to God' and practically held in perpetuity. . . . About this time he made public declaration to his church and the world that his mission was to 'restore all things spoken by the holy prophets' and that he came in 'the power and spirit of Elijah,' according to Biblical prophecy to do this. Millions flowed into his hands, and his power and activities multiplied. He spent

himself prodigally. Besides his ecclesiastical, educational and political work, he kept his hand upon and gave personal attention to no less than thirty-seven industries, all a part of the Zion undertaking. Wide reaching plans, world-wide in their character, occupied his tireless mind."—E. Shel-drake, ed., *Personal letters of John Alexander Dowie*, Introduction, pp. vii-ix.—The following extracts were written [1906] when Dowie was still alive and show the status of the Church at the height of its power.—"The statistics of Zion are not to be had from any trustworthy Zion source. . . . U. S. Statistics . . . give the estimate forty thousand as a maximum figure for Mr. Dowie's followers. About 22,000 have been baptized by trine immersion up to the present, and this includes practically all the members. However, with lapses and deaths the decrease has been large. . . . In this membership are found the rich and poor, some (officers) of University education, but mostly humble unlearned people. It is claimed that over seventy nationalities are to be found enrolled in Zion. Branches and stations are to be found in many parts of the world. All over the United States and in Canada, Zion has established preaching points and carries on an aggressive evangelistic campaign. In the United Kingdom, in many provinces of Europe, in Asia and Africa, Zion's representatives are preaching their threefold gospel of Salvation, Healing and Holy Living. The publications of Zion are now printed, or have been, in German, French, Danish, Norwegian, Dutch, with some little work done in Chinese and Japanese. . . . A number of things are entirely forbidden in Zion City. Bill boards at the cross streets caution one that swearing or smoking or bad language of any sort are not allowed. Zion City will tolerate no breweries, no saloons, no drug or tobacco stores, no physician's or surgeon's offices, no theaters, no gambling places, no dance halls, no secret lodge rooms, no keeping or selling of swine's flesh. During the history of the city these regulations have been rigidly enforced, in fact there has seldom been any attempt at infringement. Zion's attitude toward Secretism has been one of uncompromising hostility. Not only has renunciation of membership in any secret order been demanded of a prospective member of Zion, but an aggressive warfare has been waged. . . . Early in 1903 Mr. Dowie conceived the idea of a New York visitation. By visitation he meant the placing of a large body of his followers in the metropolis for the purpose of assisting him in what might be called a gigantic evangelistic campaign. He began advertising this visitation, and incidentally spoke of the probability of making one to Salt Lake City to root out Mormonism. Another to London later with ten thousand of his people was also mentioned. The New York visitation was carefully planned and about three thousand of his people were conveyed from Zion City and Chicago to the metropolis. Taking the Restoration vow and making this trip if able to do so, was practically made a test of the loyalty of a resident in Zion City. The journey was made in special trains, and the visitation was so widely advertised that New York was on the *qui vive*. Meetings were held in Madison Square Garden and in Carnegie Music Hall, during part of October and November, 1903, with great crowds in attendance. Nothing was accomplished except the stirring up of the press to rabid and sarcastic attacks upon Mr. Dowie and his Zion, and his disgracing himself and his people, by thoroughly losing his head and descending to vulgarity in speech that is almost

past belief. This attempt of the spectacular cost over \$300,000 at a time when the finances of Zion City could not stand the strain. . . . Affairs in Zion City were getting very bad financially. Depression increased. Many of the people were being allowed to remain idle, and capital invested, or supposed to be invested, was unproductive over long periods. Mr. Dowie commanded the people to sell and come into Zion City, placing their money at his disposal. November 28, 1904, he ordered every person residing in the city, to deposit funds in Zion City bank. . . . However, this command of Mr. Dowie did not relieve the situation very much. . . . From this time on it appears that there was an effort on the part of the business managers of Zion financial institutions to get Mr. Dowie to turn over the commercial affairs of Zion to others and give himself to the specifically religious work. . . . In the spring of 1905 matters became almost desperate, and Mr. Dowie's presence in Zion City during the summer of 1905 did not relieve the situation, as he was agitating his Paradise Plantation schemes in Mexico and paying little or no attention to the local financial stringencies and industrial depression. On September 24, 1905, Mr. Dowie suffered a paralytic stroke and was compelled to cease active participation in Zion affairs. . . . The 'Triumvirate' composed of Overseer John G. Speicher, Deacon V. V. Barnes, and Deacon Alexander Granger began their administration upon the departure of Mr. Dowie, December 18, 1905, with the full confidence of the Zion people. . . . Overseer Voliva was recalled from Australia and appointed by Mr. Dowie as deputy general overseer at Zion City with full power to act in all business and ecclesiastical matters. This really did away with the 'Triumvirate.' Mr. Voliva arrived in Zion City, February 12, 1906, under definite promise to Mr. Dowie to carry out in full his instructions, and to administer the church in accord with his wishes. Mr. Voliva is an Indiana man by birth and rearing, and has been preaching since his seventeenth year. He was first with the Christian Connection and then with the Disciples. He joined the C. C. C. in Zion in 1899. In 1901 he was sent to Australia and it is said he won over a thousand adherents to Zion in the less than five years of his work there. . . . Just what was the precise order of developments in the determination to renounce allegiance to Mr. Dowie, can not be fully ascertained from published documents, altho it seems clear that Mr. Voliva was planning and discussing what course to take looking to the revolt, while it appeared to the public, and Mr. Dowie believed, that he was carrying out fully his chief's orders. . . . The revolt was precipitated April 1st in the afternoon services at Shiloh Tabernacle, Zion City. . . . In this meeting of April 1st Mr. Voliva read the telegram [from Dowie], and immediately in defiance of the authority of Mr. Dowie, reinstated the deposed Overseer Speicher, and announced his determination not to carry out the instructions contained in the telegram. A large majority of those present sanctioned these acts of rebellion, and emboldened by this demonstration of general dissatisfaction with Mr. Dowie's rule, the following telegram was sent to the deposed leader:

"ZION CITY, ILL., APRIL 2, 1906.

"DOWIE:—

"Telegram read here, Chicago practically all including Cincinnati representative endorsed Voliva administration, Speicher's reinstatement, Granger's

retention, emphatically protesting against your extravagance, hypocrisy, misrepresentations, exaggerations, misuse of investment, tyranny and injustice. You are hereby suspended from office and membership for polygamous teaching and other grave charges. See letter. You must answer these satisfactorily to officers and people. Quietly retire. Further interference will precipitate complete exposure, rebellion, legal proceedings. Your statement of stupendously magnificent financial outlook is extremely foolish in view of thousands suffering through your shameful mismanagement. Zion and creditor will be protected at all costs.

"S. VOLIVA, PIPER, BRAISEFIELD, EXCELL, SPEICHER, CANTEL." "

—R. Harlan, *J. A. Dowie and the Christian Catholic Apostolic Church in Zion*, pp. 3-4, 15-16, 18-20, 22-24.—Dowie immediately returned to Chicago to fight for his leadership. "The large property known as 'Zion Estate,' with value variously estimated into the millions, was immediately thrown into litigation. . . . In the midst of complicated conditions in both church and finance, John Alexander Dowie passed away March 9, 1907."—E. Shel Drake, ed., *Personal letters of John Alexander Dowie*, Introduction, p. x.—The large church property with all its industrial plants went into the hands of a receiver. "On January 13, 1908, Judge Landis, addressing from the bench Mr. Voliva's attorney, said, 'Your client and his associates gave evidence as to values which subsequent investigation has disclosed was not founded on fact.' . . . Both Church and Estate being bankrupt, the Court declared the Church had no equity in the Estate and that the Estate belonged to the investors and creditors, and that the Receiver was no longer required to recognize the Church as a party in interest. Besides this, it was found impossible to unite the investors on a plan that would again give the Church control of the Estate. After the Receiver was appointed, Mr. Voliva tried to have . . . a refunding scheme accepted by the investors. . . . About one-third of the investors accepted Mr. Voliva's plan. The Receiver was then requested to submit a plan giving the investors control of all the assets of the Estate."—J. C. Hatley, *Receiver's report on the estate of Zion*, pp. 14-15.—According to the 1916 census reports no figures are available as to the present status of the church. Mr. Glenn Wilbur Voliva is still "overseer," and is working to build up the industries at Zion City.

CHRISTIAN CHURCH.—"This body which is commonly known as the Christian Connection, but owns only the simple designation 'The Christians' had its beginning in the early part of the present [19th] century in the union of three distinct movements: one in which Rev. James O'Kelley of Virginia, a Methodist, was prominent; another in which Abner Jones, M. D., of Vermont, a Baptist, was first; and a third in which Burton W. Stone and other Presbyterian ministers in Kentucky and Ohio cooperated. These three movements, each independent and unknown to the leaders of the others until 1806, were alike in taking the Bible as the only rule of faith, and in rejecting Calvinism. Mr. Stone and many ministers and congregations subsequently united with the Disciples of Christ, with which this denomination is often confounded. They are much alike in many respects; they have no creeds, taking the Bible simply as their rule of faith and practice; . . . they believe that immersion is the only form of baptism . . . and that believers only are its proper subjects, rejecting infant baptism. The Christians make

difference of theological views no bar to membership. . . . In church government the Connection is Congregational. It has, however, annual conferences. . . . At the General Convention held in Cincinnati in 1854 . . . representatives of the Southern churches withdrew, the result of which was the organization of the Christian Church, South. The two bodies have agreed upon a form of union [1890], by which each retains its general conference."—H. K. Carroll, *Religious forces in the United States*, pp. 91-92.—The Christians have a membership of 188,735 and 1,265 churches.—United States Census, *Religious bodies*, 1916.

CHRISTIAN COMMISSION. See **SANTARY COMMISSION AND CHRISTIAN COMMISSION.**

CHRISTIAN ENDEAVOR, United Society of.—The first society which supplied the germ of the organization for all succeeding ones, was formed in the Williston Congregational Church of Portland, Maine, on February 2, 1881, by the Rev. Francis E. Clark, the pastor of the church. The object, as indicated by the name of the society, was to organize the religious energies of the young people of the church for Christian life and work. Any society which adhered to the leading points in the constitution, accepted the name and the pledge, was admitted to the organization. The constitution provided that members must take active part in meetings and faithfully carry on various kinds of work through the parent church and under the pastor. "As the news of the new organization was spread by the press, it was gradually introduced into many churches; but there were only six societies when the first convention was held at Williston Church in June, 1882. There were fifty-three with an enrolled membership of 2,630 when the second convention was held the next year. Before ten years passed, 5,000 delegates were present in a national convention held in Chicago, representing thirty-three states and territories, societies had been started in England [1887], and Dr. Clark had been induced to retire from the pastorate to become the President of the United Society of Christian Endeavor. . . . By the time the national convention met in Philadelphia in July, 1889, 6,500 delegates were sent, a number of foreign countries were represented and the President of the United States sent a telegram of greeting. . . . These conventions have become a most important feature of this movement."—H. B. F. Macfarland, *Christian Endeavor movement (North American Review, Feb., 1906)*.—In 1915 the Fifth World's Christian Endeavor Convention was held at Chicago, and in 1921 the Sixth World's and Twenty-eighth International Christian Endeavor Convention was held in New York City, from July 6th to the 11th. The gathering, which was attended by 16,000 members, was held in the 71st Regiment Armory and presided over by the founder, Dr. Clark. On the opening day the General Secretary, E. P. Gates, announced that the organization consisted of 80,000 societies, an average increase of 2,029 societies per year for twenty-nine years. On Saturday, July 9, the delegations formed an impressive parade along Fifth Avenue to Central Park, accompanied by brass bands, banners from many states, and a series of floats depicting scenes from Bunyan's "Pilgrim's Progress." In the course of one of the meetings it was decided by ballot that the next Convention should be held in Des Moines, Iowa, in 1923. Numerous Christian Endeavor societies are working among foreign-speaking peoples in the United States. In Fresno, California, there is a strong union of Armenian societies, which issues a paper in Armenian—*The Endeavorer*. In the

Finnish churches of Massachusetts there are several societies which have formed a Finnish Christian Union employing a Finnish "field-secretary." There is also a Spanish-speaking society in New York which sent a group of delegates to the Convention. There are more of such branches on the borders of Mexico, besides others in different parts of the country speaking Bohemian and German. A dozen races are represented in the Golden Gate Union. Similar societies are spread over the American continent—in Brazil, Mexico, Bolivia, Venezuela, Colombia, the Canal Zone and Canada. Abroad, the organization has units in Great Britain and Ireland, France, Switzerland, Holland, Germany, Spain, Hungary, Poland, Esthonia, Russia, Scandinavia, Palestine, Australia and New Zealand, Africa, India, Burma, China, Siam, Japan, Korea and throughout the islands of the South Seas. In 1922 the society had a membership of 3,800,000.

CHRISTIAN REFORMED CHURCH, a religious denomination in the United States which is the outcome of three secession movements of the Dutch Reformed Church. The first secession took place in 1822 in New York and New Jersey, the seceders calling themselves in 1827 the "True Dutch Reformed Church." The second secession took place in Michigan in 1857. The Hollanders who settled in Michigan, Wisconsin, Iowa and the northwest had united with the Dutch Church in America in 1849, but since they had strong Calvinistic tendencies they soon became dissatisfied; a dozen churches in Michigan separated under Rev. K. Vanden Bosch, and formed themselves into a separate organization. The third set of seceders were those in the old Reformed Church who in 1882 were dissatisfied with the attitude of the General Synod towards the admission of masons to membership. About a half a dozen churches withdrew and united with the 1857 group. This group had changed its name in 1850 to "Holland Reformed Church," in 1861 to "True Dutch Reformed Church," in 1880 to "Holland Christian Reformed Church in America." In the meantime the first set of seceders had declined slowly and in 1890 the classis of Hackensack, a remnant of this group, joined the "Holland Christian Reformed Church in America" which now dropped the "Holland." In 1904 "In America" was dropped.

CHRISTIAN SCIENCE: Definition.—The discovery and discoverer.—The religion discovered and founded by Mary Baker Eddy, and the denomination represented by The First Church of Christ, Scientist, in Boston, Massachusetts, U. S. A. and its local branches throughout the world. "It was in Massachusetts, in February, 1866, . . . that I discovered the Science of divine meta-

physical healing which I afterwards named Christian Science. . . . I then withdrew from society about three years,—to ponder my mission, to search the Scriptures to find the science of Mind that should take the things of God and show them to the creature and reveal the great curative Principle,—Deity. The Bible was my textbook. It answered my questions as to how I was healed; but the Scriptures had to me a new meaning, a new tongue. . . . The miracles recorded in the Bible, which had before seemed to me supernatural, grew divinely natural and apprehensible. . . . He who antedated Abraham, and gave the world a new date in the Christian Era, was a Christian Scientist, who needed no discovery of the science of being in order to rebuke the evidence. To one 'born of the flesh,' however, divine Science must be a discovery."—M. B. Eddy, *Retrospection and introspection*, pp. 24-26.—"No mystery to-day surrounds the life story of Mary Baker Eddy. Her birth, her ancestry for two hundred years, her education, her social development, and her individual service to the world have been scrutinized with strong searchlights of both love and criticism. . . . [She] was born in the town of Bow, New Hampshire, . . . [her] ancestry can be traced clearly through six generations to the first Baker in America, her earliest emigrant ancestor being John Baker, who was freeman in Charlestown, Massachusetts, in 1634. . . . The day of her birth was July 16, 1821. . . . [In 1843 she married George Washington Glover, who, however, died within seven months. A son was born three months later. In 1853 she was married to Dr. Daniel Patterson, from whom she later secured a divorce.] But through all the various changes in her outward fortune her spiritual life had been developing consistently. This life, awakened in the days of her loving communion with a devout mother, was strengthened in her conscientious struggles with a dominating Calvinistic father; it was stimulated by the uplifting companionship with her clergyman teacher; it was confirmed in the subsequent personal seeking for God in the cloistered suffering in the mountain home. Going out from that cloister she met the first real obstacle to her faith in the weird doctrines of Phineas Quimby [a mesmerist or magnetist and faith healer]. How she strove to harmonize his strange theories with her faith, how she labored to evolve a philosophy from his incoherencies have been related. She had come to a crisis when her faith would no longer endure the association with ideas so incongruous. . . . The battle was terrific and it was prolonged. It had begun in 1862 and was still going on when the year 1866 dawned. . . . She was lifted suddenly by a physical shock which set her free for her great discovery and revelation. . . . [She] fell on the ice and was picked up in an insensible condition. . . . Dr. Alvin M. Cushing . . . was called. . . . The watchers believed him to imply that the case might terminate fatally. . . . After the doctor's departure on Friday, however, she refused to take the medicine he had left, and as she expressed it, lifted her heart to God. On the third day, which was Sunday [February 4, 1866], she sent those who were in the room away, and taking her Bible, opened it. Her eyes fell upon the account of the healing of the palsied man by Jesus [Matthew, 9:2]. . . . A spiritual experience so deep was granted her that in that moment all pain evanesced into bliss, all discord in her physical body melted into harmony, all sorrow was translated into rapture. She recognized this state as her rightful condition as a child of God. . . . Mrs. Patterson arose from her bed, dressed and walked

into the parlor where a clergyman and a few friends had gathered, thinking it might be for the last words on earth with the sufferer, who they believed, was dying. They arose in consternation at her appearance, almost believing they beheld an apparition. She quietly reassured them and explained the manner of her recovery, calling upon them to witness it. . . . She in that hour received a revelation for which she had been preparing her heart in every event of her life. . . . There was an interval before she could demonstrate what dawned upon her in that hour."—S. Wilbur, *Life of Mary Baker Eddy*, pp. xi, 1, 5, 12, 125-128, 130-133.

Early fruition.—"It was on . . . Dorr [Phillips], then a schoolboy, [at Lynn, Massachusetts] that Mrs. Eddy made her first demonstration of Mind science. The lad had a bone felon which kept him awake at night and out of school during the day. . . . She questioned him, 'Dorr, will you let me

MARY BAKER EDDY

heal that felon?' 'Yes, indeed . . . if you can do it,' replied the lad. . . . The boy actually forgot the felon and when his attention was called to the finger it was found to be well. . . . At the Oliver home lived a rich young man from Boston who had come to Lynn to learn the shoe business. . . . [One day] he was brought home from the factory and put to bed, where he promptly lapsed into delirium. . . . Mrs. Patterson had made him well in spite of the physician's declaration that he was in for a run of fever. [She] had in this instance once more illustrated her discovery. . . . Such were some of the first results of Mary Baker's efforts to prove that she had grasped a great truth."—*Ibid.*, pp. 146-148, 150-151.

First students.—Molding influences.—"Among the boarders [where Mrs. Patterson was living] were Hiram S. Crafts and his wife. The former was known as an expert heel-finisher in the shoe factory. He possessed an ordinary intelligence, a common school education, and a tendency towards transcendentalism. . . . Kant used this word to denote intuitions which the descendants of Puritans had already analyzed before Emerson made the word transcendentalism familiar in New Eng-

land as Carlyle did in old England. Thus it was not left for the Yankee shoe-worker to dig it out of the Critique. . . . Before the Civil War broke out, in the late forties and early fifties, the lyceum system became popular in American, especially in New England. Courses of lectures were instituted in the small towns as well as in the large cities, and the latest thoughts of science, art, literature, politics, and philosophy were given to the people. How democratic these audiences were was shown in results. Now transcendentalism in both religion and politics began to flourish. The working people were ready to believe something in religion that released them from the pain and cramp of a long-preached doctrine of inherent total depravity. The 'rise of man' was being substituted for the 'fall of man' and the cramp in the brain and the ache in the heart were letting go their clutch. Much earlier than this the intellectual world had revolted from the Calvinistic 'plan of salvation.' William Ellery Channing had done such work in Boston that Lyman Beecher left his parish in Eastern Massachusetts in 1823 to go to Boston to 'confront and stay the movement'; and he shortly wrote in a letter that 'all the literary men of Boston, the professors of Harvard College, the judges on the bench are Unitarian.' That was in 1823. The movement continued among the scholars and intellectuals until about 1836, when it reached the people and spread like contagion. Elias Hicks became the unorthodox leader of the Quakers, and Hosea Ballou was with less intellectual difficulty attacking the Calvinistic dogma with the doctrine of Universalism. This last was the really popular reaction in New England. Unitarianism was scholarly, Universalism popular. But it all amounted to a revolt against dogmatic theology. Channing denied the depravity of man to show 'how capable God had made him of righteousness.' . . . Emerson taught that the revelations God made to man were made within the soul, that the soul had infinite dignity and capacity, that transcendentalism was an experience of the immanence of God. . . . Now it must be remembered that this liberalizing work had been going on in New England for fifty years. . . . There was a danger in the work, looked at religiously, for whereas the scholars might be supposed to take care of themselves philosophically, the breach made in religious customs for the common man left him nothing. In giving up creed and catechism he could scarcely be expected to come into 'living touch' with the philosophy of Germany. So the spectacle is presented of Puritan churches becoming Unitarian and Universalist, and presently a large percentage of the members of these, unable to feed on elevated ethical ideas, dropping off into Spiritualism. Yet Spiritualism . . . did not generally satisfy the religious need of the descendants of the Puritans. They had been used to the teachings of stern duty, and it was in their nature to show themselves capable of spiritual effort. Though often of but ordinary intelligence, the artisans and craftsmen and agriculturalists of that period had a deep capacity for religion. . . . Hiram Crafts was such a man, a Yankee workman transcendentalized. He was not singular, but a type of man who was to be reached by Christian Science in the first twenty-five years of its promulgation. . . . Nor was it singular that her [Mrs. Eddy's] first convert should be made in this way. This man had no intellectual antagonisms to overcome. He was simply hungry for spiritual experience, hungry to realize that personal communion with God that the religious movement of his times had led him

to crave. The hunger of this shoe-worker was such that Mary Baker saw she must provide mental food. . . . She began to systematize her ideas and to write out a new manuscript, . . . written that Hiram Crafts might have something to study. The writings were exceedingly simplified, they were brief summaries, a primer of the simplest statements. . . . Hiram Crafts was Mrs. Eddy's first pupil. She taught him to return to his Bible, to seek in primitive Christianity the religion he had lost through liberalism, and to become a mental practitioner to the sick and the sinning. . . . For a long period he did so earn his living and made some unusual cures . . . and becoming absorbed with this topic of Mind-science, he decided to return to Stoughton to practise it. . . . In leaving Lynn with these humble people, Mary Baker took a radical step. . . . After a winter of such work as was thought necessary to prepare Hiram Crafts to practise mental healing, the family removed to the neighboring town of Taunton. . . . [He] opened an office and advertised in the local papers his readiness to deal with various mentioned diseases. . . . In three weeks he was able to print the testimonial of a woman patient who had been healed of an internal abscess. Mrs. Patterson encouraged, advised, and supported her student in all he did. . . . Every cure that he made, however simple, was a further demonstration of the science. . . . [She] saw that not only could she herself heal, but she could impart the understanding of the modus operandi to another. . . . Mary Baker was not ready to state the science of Mind-healing directly after her discovery through her own personal healing. She was not ready after she had healed others by this discovery; nor was she ready when she had fitted her first student to heal disease. How she was prepared for this work cannot be explained by the usual methods of the biographer. . . . A process of germination and unfoldment took place. . . . The work laid upon her was that of renaming, actually rechristening the verities. Returning to Amesbury in the fall of 1860, Mary Baker spent the winter completing certain manuscripts and teaching two students. . . . The Socratic method of teaching was necessarily adopted . . . as she had as yet no text-book. These early talks were later systematized, the dissertations were dignified into the form of lectures. And these lectures some of her early students declare to have been illuminating and inspirational beyond valuing in money."—*Ibid.*, pp. 155-160, 164, 189.

First publication.—Extension of teaching at Lynn.—"By the spring of 1870 she [Mrs. Patterson] had completed a manuscript which she entitled 'The Science of Man.' This manuscript was copyrighted but not published until some time later. It was first issued as a pamphlet and is advertised in the first number of the Christian Science Journal. It was later converted into the chapter Recapitulation, embraced in later editions of 'Science and Health.' It contains the fundamental principles of Christian Science and its simplest comprehensive tenet, the scientific statement of being. With this manuscript completed she knew that she could teach the science and extend her work, that the time was ripe for harvest. Through four successive years she had labored carefully, patiently, earnestly, writing and rewriting, while the truth grew in her understanding. It is no refutation of her sublime discovery in 1866 or of her divine guidance in preparing and presenting its principles that the work was a growth and did not spring full blown into her mind. . . . [Her] thoughts were definitely shaped for the work

before her. She had decided to return to the city of Lynn and take up the teaching of Divine Science. She had the manuscript, 'The Science of Man,' for a basis. . . . She formed her first class . . . shortly after they were settled. Her first pupils came from the shoe shops. Patients came in response to the modest sign which was put up outside the door. Mrs. Glover advised and instructed her associate [Richard Kennedy] in giving treatment. Meanwhile she continued her writing. . . . The treatment interested the more speculative of the patients and they sought Mrs. Glover to talk with her and learn of this new Science. Thus the first students were gathered around her, . . . workers, their hands stained with the leather and tools of the day's occupation. . . . Mary Baker laid her finger upon the central motive of life those summer evenings on Lynn Common, and the response was a realization of divine consciousness which reached throughout the world, not immediately, but gradually, persistently as the years passed. . . . It was not by overstating what Mrs. Glover had taught them, but by misstating her teaching, through misapprehension or through wilful distortion, that some of these earlier students became ineffectual and subsequently, through chagrin, were entirely estranged from the cause which they had at first so ardently espoused."—*Ibid.*, pp. 189, 190, 193, 198, 200.

Publication of "Science and Health."—Continued teaching and healing.—"Her application to her purpose from 1872 to 1875 was more rigid, more exclusive, more laborious than it had ever been. . . . These three years . . . flowered in the first edition of 'Science and Health.' . . . When Mrs. Glover moved into her new home her means were so limited she was obliged to lease the greater part of the house. . . . On the attic floor she also reserved a small bedroom, lighted only by a skylight. . . . In this garret chamber she finished her manuscript of 'Science and Health,' practically the work of nine years. . . . No one entered this room but Mary Baker until the book was finished. On the wall she had hung the framed inscription, 'Thou shalt have no other gods before me.' . . . The daily attendance of her students, their devotion to their teacher, and zeal for their faith created astonishment in Lynn and so caused some gossip. The purple-and-gold sign, 'Christian Science Home,' which arched the door was the cause of much speculation. It became a common thing for cripples and invalids to go to the house for treatment, and many remarkable cures which Mrs. Eddy performed instantaneously are recorded. . . . [Her book came out at the close of this period], the edition numbering one thousand. It was a stout volume bound in green cloth, a succinct, concise, and lucid statement of Christian Science. Though Mrs. Eddy many times revised this book, her revision was always for what she believed to be an improvement of expression. The essential statements are the same as in the original volume. . . . Internal evidence or higher criticism will not divorce this work from its author Mary Baker Eddy any more than it will divorce the fourth gospel from St. John. The first edition of 'Science and Health,' which the critics of that day fell upon with ironic glee, stands as the model of the finished structure of to-day. It was written under the severest hardships and was revised painstakingly in the midst of the multitudinous duties of a leader. It has been plagiarized and pirated from, vilified and burlesqued, but it will stand. . . . A great work of promulgation lay before the founder

of Christian Science. . . . All during the summer of 1875, in spite of laborious hours spent in her little study under the eaves, she conducted classes, and these were more numerous than were those formerly held."—*Ibid.*, pp. 208, 213, 215, 219, 221.

First step towards organization.—Founding of the Church of Christ, Scientist, Massachusetts Metaphysical College, and Christian Scientist associations.—In May, 1875, eight students arranged with Mrs. Glover to preach to them or direct their meetings on each Sunday for a year, and between them pledged ten dollars weekly for her maintenance as teacher, rental, and other incidental expenses. "This was the first step towards a Christian Science church. . . . Besides teaching, preaching, and writing, . . . [she] performed many healings. She healed George Barry of consumption. [She] had instantly healed a finger on Mrs. Godfrey's right hand from which she was suffering greatly [from broken needle and poisoning.] . . . [Mrs. Godfrey's] astonishment and gratitude was such that she sent many patients to Mrs. Glover, brought her own child through a blinding snowstorm to be cured of membranous croup, sent a workman who had fallen from the roof of a house and lost the use of his arm. All these cases were cured by Mrs. Glover. . . . [On New Year's day, 1877, Mrs. Glover married Asa Gilbert Eddy, the first of her students to announce himself a Christian Scientist and the first organizer of a Christian Science Sunday School. He passed away in 1882.] During the summer of 1878 Mrs. Eddy had ventured to carry the work into Boston. She first gave lectures in the Shawmut Avenue Baptist Church and later lectured in the Parker Fraternity Building. . . . The Boston audiences were a revelation to Mrs. Eddy. The listeners attracted to the new doctrine were distinctly of a cultivated world. . . . Organization was her word for the hour. . . . A tentative organization had been made. In 1875, it will be remembered, the little band of eight students had pledged themselves to raise money for church services, but . . . that organization was disbanded. On July 4, 1876, the Christian Scientist Association was formed to hold the students together for work and occasional meetings. This proved effectual for its purpose for a number of years. Mrs. Eddy now urged the incorporation of a church society. This was accomplished in August, 1879, and a charter, issued August 23, was received from the state. The articles of incorporation stated that the Church of Christ, Scientist, was to be established in Boston. . . . The members of the new church were twenty-six in number. . . . They elected and ordained Mrs. Eddy after the Congregational method of New England. . . . [This] organization continued in existence for about thirteen years when the church was reorganized. For a year and a half the church carried on public meetings in the parlors of the various members. Not until December, 1883, were regular services held in a public hall, . . . Hawthorne Hall on Park Street, Boston, and that hall, which has since been demolished, was the real cradle of the church. [Chickering Hall was afterwards used.] . . . The Massachusetts Metaphysical College was the name she [Mrs. Eddy] selected for [the college of instruction], . . . which she organized in January, 1881. [It was chartered by the Commonwealth of Massachusetts with the right to grant degrees.] Mrs. Eddy was named President and six students directors. . . . [The college was moved from Lynn to Boston in 1882] and students soon began to overflow the parlors.

. . . They were attracted through the public services at which Mrs. Eddy usually presided, or through the accounts of her own or her students' healings which were frequently printed in the papers of Boston. Of the work of the college she bore the entire burden. . . . During the eight years of its existence the students aggregated four thousand. [Classes at the college were discontinued in May, 1899 and on October 29 of that year the college was closed. Ten years later the work of the college was resumed by a Board of Education sitting in Boston, Mrs. Eddy acting as President. This Board grants degrees and issues certificates to teachers of Christian Science.] Mrs. Eddy spent a month [in the spring of 1884] in Chicago teaching a class. Students came from towns outside of Chicago as well as from various

Missouri, and Kentucky. Mrs. Eddy had encouraged her students all over the country to organize local churches, and this work progressed with wonderful strides. The first denominational chapel was erected at Oconto, Wisconsin, in 1886.

Reorganization of The Mother Church.—Building original church and great extension.—On September 23, 1892, the church was reorganized by twelve members under the name of The First Church of Christ, Scientist. It is also known as The Mother Church, other Christian Science churches being regarded as its branches. The original edifice of The Mother Church, the corner stone of which was laid on May 21, 1894, was dedicated on January 6, 1895. The site for this building was given under deed of trust by Mrs. Eddy. Owing to the great growth in the attend-

THE FIRST CHURCH OF CHRIST, SCIENTIST, BOSTON

The Mother Church at the right; offices of The Christian Science Publishing Society at the left

parts of the city. [On February 11, 1886, a National Christian Scientist Association was founded in New York City], with delegates present from Boston and Chicago. This national association held four subsequent meetings and was of tremendous aid in the formative period of the church. It held its second meeting in Boston [1887], its third meeting in Chicago [1888], its fourth meeting in Cleveland [1889], and its final meeting in New York [1890]."—*Ibid.*, pp. 227, 229, 261, 266-267, 272, 290, 300, 302-303.—During the period covered above Christian Science had been rapidly spreading throughout the country, and a large number of academies and institutes for the teaching of Christian Science had sprung up, and in 1888 such academies were in existence in Colorado, Kansas, California, Iowa, Nebraska, New York, District of Columbia, Pennsylvania, Illinois, Wisconsin, Ohio,

and Missouri. In 1902 it was voted at the annual meeting in Boston to raise a fund of two million dollars to provide a large extension. The new building, which was connected with the original Mother Church, was dedicated June 10, 1906, the corner stone having been laid April 16, 1904. It has a seating capacity of about 5,000, but owing to the growth of the movement it has been necessary to organize many other churches and societies in the Boston district.

Creed and polity of the church.—Conduct of services.—Board of directors.—Publications.—Lectures.—Reading rooms.—Committee on Publications.—The following "scientific statement of being," formulated by Mrs. Eddy and read as part of the Sunday services in Christian Science churches states fundamentally the basis of Chris-

tian Science teaching: "There is no life, truth, intelligence, nor substance in matter. All is infinite Mind and its infinite manifestation, for God is All-in-all. Spirit is Immortal Truth; matter is mortal error. Spirit is the real and eternal; matter is the unreal and temporal. Spirit is God, and man is His image and likeness. Therefore man is not material; he is spiritual."—M. B. Eddy, *Science and health, with key to the Scriptures*, p. 468.—"Though Christian Science repudiates all creeds or articles of faith, the [Mother Church] Manual contains a statement of *Six Tenets*, whose subscription is obligatory on all candidates for membership, and which therefore in effect as well as in form constitute a Confession. They are a revision of *Five Tenets* submitted by Mrs. Eddy to the World's Parliament of Religions in Chicago in 1893. The *Six Tenets* are as follows: (1) As adherents of Truth, we take the inspired Word of the Bible as our sufficient guide to eternal Life. (2) We acknowledge and adore one supreme and infinite God. We acknowledge His Son, one Christ; the Holy Ghost or divine Comforter; and man in God's image and likeness. (3) We acknowledge God's forgiveness of sin in the destruction of sin and the spiritual understanding that casts out evil as unreal. But the belief in sin is punished so long as the belief lasts. (4) We acknowledge Jesus' atonement as the evidence of divine, efficacious Love, unfolding man's unity with God through Christ Jesus the Way-shower; and we acknowledge that man is saved through Christ, through Truth, Life, and Love as demonstrated by the Galilean Prophet in healing the sick and overcoming sin and death. (5) We acknowledge that the crucifixion of Jesus and his resurrection served to uplift faith to understand eternal Life, even the allness of Soul, Spirit, and the nothingness of matter. (6) And we solemnly promise to watch, and pray for that Mind to be in us which was also in Christ Jesus; to do unto others as we would have them do unto us; and to be merciful, just, and pure."—W. A. Curtis, *History of creeds and confessions of faith*, pp. 393-394.—All the Christian Science "churches and societies accept the six brief tenets of the Mother Church, yet retain individual independence in the conduct of their own affairs. Centralized ecclesiastical paternalism or domination is made practically impossible by the Section entitled, 'Local Self-Government,' in Article [XXIII] of the Mother Church Manual. . . . The branch churches have their own rules and by-laws as local need calls for them, discipline their own members, maintain their own churches and organizations, and support the general Cause and church. As most branch church members are also members of the Mother Church, they come under the rules of membership of this Church as set forth in its Manual in the same way that the resident of a particular State or Territory of the American Union is subject not only to State and territorial law, but to that of the national constitution as well."—C. Norton, *Christian Science Church, its organization and polity*, pp. 6, 14-15.—"The Christian Science church began with twenty-six members, and its Founder tells us the object of its establishment; viz., 'To organize a church designed to commemorate the word and works of our Master, which should reinstate primitive Christianity and its lost element of healing.' Mrs. Eddy was appointed on the committee to draft the Tenets of the Mother Church. . . . The Christian Science church embraces a large body of practical Christian workers, including teachers, lecturers, publication committee, readers, missionaries, and practitioners of Christian healing. There

is no exclusive priesthood or separate ministry. The church Readers are elected from the ranks of the church membership for a period of three years, and are not eligible for re-election. Moral fitness, integrity in Christian Science, and proper educational qualification are to govern election to this office. . . . The ministry can thus be denominated with accuracy a lay ministry, and the church services not ritualistic, but congregational and uniform as to procedure and character. . . . A unique and interesting feature in the public services of the churches of this denomination throughout the world is this, that on Sundays the same sermon is read in all the churches. The sermons are arranged by a Bible Lesson Committee, appointed by the authorities of the Mother Church. These sermons on selected subjects consist of passages from the Bible and from the Christian Science text-book, 'Science and Health with Key to the Scriptures,' which are read in each pulpit by the two Readers, usually a man and a woman. These selections constitute the Lesson-Sermon, and they are read alternately, and without comment. . . . The mid-week public meeting of the Christian Science body all over the world is in the hands of the congregation, led by the First Reader."—*Ibid.*, pp. 11-12.—At the head of The Mother Church is The Christian Science Board of Directors, consisting of five members, who are subject to the Manual of The Mother Church consisting of by-laws and rules, formulated by the founder of Christian Science, Mary Baker Eddy. Vacancies in this Board are filled by vote of the remaining members. This Board has general supervision of all the affairs of the church including its publications. The Christian Science Publishing Society, which is in immediate charge of the publications, was founded by Mrs. Eddy and afterwards made a gift by her to the church members, and as an auxiliary to the church. The Society is under three trustees who, like all loyal Christian Scientists, are subject to the provisions of the Manual of The Mother Church. The society publishes the following periodicals: *The Christian Science Quarterly Bible Lessons* (quarter-yearly from 1890); *The Christian Science Journal* (monthly from 1883); *Der Herold der Christian Science* (monthly from 1903); *Le Héraut de Christian Science* (monthly from 1918); *The Christian Science Sentinel* (weekly from 1898); and *The Christian Science Monitor* (an international daily newspaper from 1908). In 1898 a Board of Lectureship was established with view to the correction of some of the public misconceptions of Christian Science. This Board is composed of lecturers, both men and women, whose qualifications are passed upon by The Christian Science Board of Directors, and every church and society is expected to provide at least one lecture each year, the lectures being free to the public. According to a report made at the annual meeting in 1922 of The Mother Church, the approximate attendance at lectures during the preceding year was 2,147,520. The notable difference between the "field" work of Christian Science and that of other churches is seen in its free public reading rooms, every church having to maintain one. These rooms are nearly always located in a busy section and the authorized Christian Science literature, including the writings of Mrs. Eddy and the Bible are always available for reading, borrowing or purchasing. The organization manifests its vigilance in another way, namely, through committees on publication who are charged with the detection and correction of any misstatements or misrepresentations of Christian Science in the public press.

Each state and important country or division has a committee on publication, and there are local committees or correspondents wherever a church is organized, and all of this work is under the general supervision of a manager of committees on publication, who is an official of The Mother Church in Boston.

Practice legally recognized.—Activity during World War.—Christian Science Benevolent Association.—Many attempts were made, especially in the early history of Christian Science, to forbid or regulate the practice of Christian Science healing as if it were the practice of medicine. At the instance of medical organizations, laws were proposed in many of the United States, designed to subject Christian Science practitioners to examination and licensure by medical boards. This effort, however, failed. At the present time (1923), in most of the United States, the public health laws expressly recognize the legality of Christian Science practice, and such laws in other States and countries tacitly recognize the legality thereof. The United States Government has consistently recognized the practice of Christian Science as the exercise of religion whenever occasions have arisen. Thus it has commissioned Christian Scientists as chaplains in both the army and the navy. The work of Christian Science practitioners is regarded as an individual ministry, subject to the provisions of the Church Manual and the discipline of The Mother Church. During and after the great war, an extensive camp welfare and war relief work was done in the United States and in the allied countries by committees of Christian Scientists working under the auspices of The Mother Church. The amount contributed by Christian Scientists and thus expended was nearly \$2,000,000. Another institution auxiliary to The First Church of Christ, Scientist, in Boston, is The Christian Science Benevolent Association, which was opened in 1919 pursuant to instructions previously given by Mrs. Eddy. At present the equipment of this Association includes a sanatorium surrounded by beautiful grounds in Brookline, Mass., a suburb of Boston. The present buildings were erected and furnished at a cost of about \$1,000,000. The Christian Science Benevolent Association, in addition to conducting a sanatorium for persons desiring Christian Science healing, also trains persons to act as Christian Science nurses.

Its spread.—Growth throughout the world.—Present number of accredited organizations.—Christian Science churches, and societies not yet organized into Churches, are established all over the world—in London, where there are eight churches and three societies, and in many other parts of England; in Edinburgh, Glasgow, Dublin, Belfast, and many other places in the United Kingdom and Ireland; also in Africa, Argentina, Australia, China, Chile, Cuba, Canada, Denmark, France, Germany, Holland, India, Italy, Japan, Mexico, Norway, Panama, Philippines, Sweden, Switzerland and the United States. The Christian Science movement has grown steadily since its inception, and at the annual meeting of The Mother Church in 1893, a membership of 1545 was reported. Membership statistics are not available, but it is significant that in 1910 there were 1201 Christian Science churches throughout the world—1077 of them in the United States, 58 in England, 38 in Canada, and 28 elsewhere. In 1922 the total number of churches had increased to 2,001. Much of the missionary effort of the Christian Scientists was made possible by Mrs. Eddy's provision in her will that the income from her large estate should be used for the spread of her

teachings. She passed away on December 3, 1910.

Spiritual and therapeutic influences noted by non-Scientists.—"Hundreds of thousands bear witness to having risen through Christian Science into a spiritual consciousness in which sin, poverty, and sickness cannot exist. Here is the dynamic of Love, which can regenerate the world and elevate the underworld of crime and misery to heavenly places of holiness and joy. . . . No topic of conversation is of such interest to Christian Scientists as their faith and practice. They talk of it with joy and practise it with enthusiasm. . . . Healing sickness is with them as much a religious duty as destroying sin. Both are simply a manifestation of the inner spiritual life which they are constantly striving to have more abundantly. This practice of primitive Christianity by the disciples for nearly three hundred years, which was lost to the Church when the Holy Spirit was driven out, is now undoubtedly restored in Christian Science. If the Church should adopt it there would be manifest the strongest evidence of the renaissance of Christianity. . . . Lecturers make trips around the world, teaching clearly just what Christian Science means. A monthly magazine, two weekly papers, and a daily newspaper, which is a model of Christian journalism, are sowing the seeds of Truth everywhere. The fine type of Christian character, the striving to have the mind of Christ Jesus, the art of healing as an expression of its practical theology, the business prosperity, pure living following clean thinking, the spirituality, the loyal citizenship to the Kingdom of God with its ardent missionary spirit, these are the undoubted fruits of the Spirit. Such fruitage is not common in the average church."—Rev. J. Winthrop Hege-man, *Must Protestantism adopt Christian Science?* pp. 11-14.—"Christian Science starts from God, and seeks to magnify him in the thoughts of men. By emphasizing the things of the spirit it has rendered incalculable service to spiritual religion. It has brought sense-bound souls into touch with the Infinite; has widened their horizon by bringing into view the things which are unseen and eternal; and has led to the cultivation of the upward look. Coming in as a movement of reaction and revolt, it has raised a much-needed protest against materialism in philosophy and life; and has certainly helped in the liberation of the spirit from the tyranny of the material. Coming at a time when the world was weary of religious ceremonies and doctrinal contentions, it has also supplied a needed antidote to formalism in religion."—Rev. J. M. Campbell, *What Christian Science means and what we can learn from it*, pp. 20, 160.

CHRISTIANITY

Stage of development of religious philosophy at the beginning of the Christian era.—Pagan thought.—Mysticism.—Messianic hopes of the Jews.—"The world [at the beginning of the Christian era] was one of religious unrest and inquiry. The traditional religions and the inherited forms of religious expression had in large part failed. There was a sense of weariness and dissatisfaction which showed itself in the large resort of all classes to Stoic philosophy, in the devotion among the cultured to the mystic philosophies, in conversions to Judaism, and later in the ready reception of oriental religions, including Christianity. . . . Both philosophy and mysticism recognized that men had a sense of moral guilt and were conscious of an estrangement from God through sin, from which they desired to secure purification, that is, to attain freedom from the common lot of the bondage of wickedness. Philosophy and mysticism also agreed in holding that the means at man's disposal were not sufficient to accomplish his release, that the reason and the will unaided could not free him, and that therefore external help was necessary—that an act of grace made known by a divine revelation was required. This escape from sin, this freeing of man's spirit, for which they longed, was regarded as a reunion with God, which gave the promise of security and salvation here and hereafter, and which thereby answered man's hope for an unbroken and a perfect existence. It was into a world of such a nature and with such religious thoughts as these that Christianity entered. [See EUROPE: Ancient: Roman civilization: Intellectual bankruptcy, etc.] But Christianity grew out of Judaism. It will be well therefore to recall briefly to our minds those religious ideas of the Jews to which the mission and the teaching of Jesus were immediately related. At the beginning of our era a majority of the Jews had abandoned the earlier notion of a golden age, a material kingdom of God, which was to be set up on earth, for a belief in a more spiritual kingdom, which was to be established at some future time either on a transformed earth or in a supermundane heaven. They no longer expected that the whole nation would share in the supreme happiness of this kingdom, but only those individuals who by righteousness and through God's mercy had won a place therein; the wicked were to be either utterly destroyed or punished forever in Sheol. Moreover, the Jews generally entertained Messianic expectations of various kinds; they did not, however, look forward with confidence, as their forefathers had done, to the coming of one who should be a national king on earth. There were besides hopes of revelation from God on which we must not pause. Nor is it necessary to speak of the weaknesses of Judaism, its tendency to make the

practice of religion a matter of conformity to the minute regulations of the law, its frequent disregard of moral motives, its pride and religious pretence."—C. H. Moore, *Religious thought of the Greeks*, pp. 300-301.—See also RELIGION: B. C. 600-A. D. 30: Inner logic of Hebrew religion; SEMITIC LITERATURE.

Christianity as a historical force.—"It remains for us to point out, so far as it is possible, the contributions of Christianity to our civilization, as one of the four great sources from which that civilization has been derived. What are the new elements which were brought into human life and progress by the Christian religion? In making an attempt to do this it is necessary at the outset to notice briefly, by way of caution, two or three elementary facts. . . . In the first place, we are to examine the effect of Christianity as an historical force, not as a divine religion. Whether its claim to an especial divine character be true or false makes no difference in this inquiry. Here we are to seek the influences which certainly follow from it as historical facts, whichever hypothesis may be adopted. In the second place, we are concerned here neither with the results which were accomplished by the Christian theology, nor with those which followed from the church as a government or an ecclesiastical institution. In both these directions the Christian religion furnished the foundation for great historical constructions which had extremely important results. But in neither case is Christianity as a religion the really creative power, and the results which followed from the dogmatic system, or from the church, can be credited to the religion only in so far as it furnished an occasion for the action of the forces which really called them into existence. It is with the religious that we are concerned at this point, and not with the theological or the ecclesiastical. Again, it should be noticed that influences of a religious nature, like those of pure ideas of any sort, are difficult to trace with absolute exactness. Their action is much less likely to be made a matter of record than is that of other causes which may have contributed to the common result. There can be no question, for example, but that the teachings of the gospel were decisive influences, in thousands of individual cases in the United States, in creating a public opinion against slavery before the Civil War; but it would be far more difficult to write the history of their action than to write

the history of the political influences which combined with them. We are often confined to inference in such cases in the absence of positive proof, but the inference may be so obvious as to be equivalent to proof. Taking up, then, the work of Christianity for civilization, we must first consider its influence upon the world's religious ideas in the strict sense of the word, and it will be in this direction that its most important influence will be found. Religion forms one great side of civilization, and whatever raises the world's religious conceptions to a higher level must be, it need hardly be said, among the great civilizing forces of history."—G. B. Adams, *Civilization during the Middle Ages*, pp. 50-52.—See also ETHICS: Christian; HISTORY: 18.

Life of Jesus Christ. See JESUS CHRIST.

Three stages in the development of Christianity.—Teachings of Christ.—Progress after His death.—"All thoughtful readers of the New Testament are aware that within it are represented three stages in the early development of Christianity. In the first the disciples of Jesus formed a group and then a sect within the Jewish nation. The second was that in which the gospel was carried outside Judea into the Roman Empire to Gentiles as well as to Jews. Thus the transformation of Christianity into a universal religion was begun. In that movement, as we all know, Paul was the chief figure. The third stage was that in which philosophic thought began to operate upon the doctrines of this new religion. It was the period in which Christian theology started to develop; the time in which Christian thought began to be expressed in philosophic form and squared with the philosophy of the day. The fourth Gospel is the document in our canon in which the use of a great philosophic conception for the expression of Christian ideas is first obvious. . . . Like every great spiritual teacher Jesus built on the beliefs of his time, refining, enlarging, ennobling, and transforming men's conceptions of God and of his kingdom, of man and of his salvation. His teachings were concrete; he made no attempt to present his views in philosophic form, but inculcated his lessons as occasion offered or required. His words and the history of his life are preserved to us in imperfect and fragmentary forms, having been recorded after his death at a time when his followers had considerably increased in numbers and were to be found at many places outside Judea and Syria. For our present purpose we must confine ourselves to the three synoptic gospels. Of these Mark in essentially its present form was written shortly after 70; Matthew and Luke can hardly be earlier than 80-90 A. D. These gospels are necessarily both historical and interpretative; their writers were children of their own day and shared in its beliefs and superstitions. They were naturally credulous toward the myths and legends which had rapidly grown up about Jesus. When we consider their great eschatological interest, we realized that the authors actually tell us an extraordinary amount concerning Jesus' life and teachings. The historical interpretation of the gospels must take all these matters into account. . . . After Jesus' death his followers made the central theme of their preaching the proclamation of him as the Christ, who by his sufferings and death had brought salvation to men; they taught that through him men might be delivered from their sin and enter into the blessings promised by his gospel. In general they laid more stress on eschatology than Jesus had done, for they confidently expected an early end of the world and the reappearance of Christ in glory. Quietly no doubt at first they

began to make converts in Jerusalem. Then a persecution broke out and conversions were made outside Judea among other peoples than the Jews. About the year 45 a church, largely Gentile, was formed at Antioch, the third city of importance in the Empire. The founding of this church definitely began the expansion of Christianity beyond the bounds of Judaism."—C. H. Moore, *Religious thought of the Greeks*, pp. 302, 311.

A. D. 33-70.—Early Christian Jews.—Obedience to old Hebrew law.—Attempts to harmonize Judaism and Christianity.—Revolt of Hellenists and their persecution.—First apostolic missions.—Death of James.—Work of Peter.—"We find the early [Jewish] Christians observing the national feasts and holidays (Acts ii. 1; xviii. 21; xx. 6, 10; Rom. xiv. 5). They take part in the worship of the temple and the synagogue; they pray at the customary hours (Acts ii. 46; iii. 1; v. 42; x. 9). They observe the fasts, and undergo voluntary abstinence, binding themselves by special vows like all pious Jews (xiii. 2; xvii. 18; xxi. 23). They scrupulously avoid unlawful food, and all legal defilement (x. 14). They have their children circumcised (xv. 5; xvi. 3; Gal. v. 2). . . . This scrupulous piety won for them the esteem and admiration of the people (chap. v. 13)." At first their creed was "comprised in a single dogma; 'Jesus is the Messiah.' . . . Their preaching of the Gospel strictly followed the lines of Messianic tradition (i. 7; ii. 36; iii. 20). . . . But in reality all this formed only the outside of their life and creed. Thus in the very midst of Judaism we see created and unfolded a form of religious life different from it."—A. Sabatier, *Apostle Paul*, pp. 35-36.—"The organic connection of Jewish Christians with the synagogue, which must, in accordance with the facts before us, be regarded as a rule, is certainly not to be taken as a mere incidental phenomenon, a customary habit or arbitrary accommodation, but as a moral fact resting upon an internal necessity, having its foundation in the love of Jewish Christians to their nation, and in the adhesion of their religious consciousness to the old covenant. To mistake this would be to underestimate the wide bearing of the fact. But lest we should over-estimate its importance, we must at once proceed to another consideration. Within Judaism we must distinguish not only the Rabbinical or Pharisaic tradition of the original canonical revelation, but also within the canon itself we have to distinguish the Levitical element from the prophetic, . . . taking the latter not in a close but a wide sense as the living spiritual development of the theocracy."—G. V. Lechler, *Apostolic and Post-Apostolic times*, v. 1. p. 54.—"Moreover the law had claims on a Hebrew of Palestine wholly independent of his religious obligations. To him it was a national institution, as well as a divine covenant. Under the Gospel he might consider his relations to it in this latter character altered, but as embodying the decrees and usages of his country it still demanded his allegiance. To be a good Christian he was not required to be a bad citizen. On these grounds the more enlightened members of the mother-church would justify their continued adhesion to the law. Nor is there any reason to suppose that St. Paul himself took a different view of their obligations."—J. B. Lightfoot, *Dissertations on the Apostolic Age*, p. 67.—"The term 'Jewish-Christianity' is applicable exclusively to those Christians who really retained, entirely or in the smallest part, the national and political forms of Judaism and insisted upon the observance of the Mosaic Law without modification as essential to Christianity,

at least to the Christianity of the Jewish-born converts, or who indeed rejected these forms, but acknowledged the prerogative of the Jewish people also in Christianity."—A. Harnack, *Outlines of the history of dogma*, p. 75.—"Meanwhile at Jerusalem some years passed away before the barrier of Judaism was assailed. The Apostles still observed the Mosaic ritual; they still confined their preaching to Jews by birth, or Jews by adoption, the proselytes of the covenant. At length a breach was made, and the assailants as might be expected were Hellenists. The first step towards the creation of an organized ministry was also the first step towards the emancipation of the Church. The Jews of Judæa, 'Hebrews of the Hebrews' had ever regarded their Hellenist brethren with suspicion and distrust; and this estrangement reproduced itself in the Christian Church. The interests of the Hellenist widows had been neglected in the daily distribution of alms. Hence 'arose a murmuring of the Hellenists against the Hebrews' (Acts vi. 1), which was met by the appointment of seven persons specially charged with providing for the wants of these neglected poor. If the selection was made, as St. Luke's language seems to imply, not by the Hellenists themselves but by the Church at large (vi. 2), the concession when granted was carried out in a liberal spirit. All the names of the seven are Greek, pointing to a Hellenist rather than a Hebrew extraction, and one is especially described as a proselyte, being doubtless chosen to represent a hitherto small but growing section of the community. By this appointment the Hellenist members obtained a status in the Church; and the effects of this measure soon became visible. Two out of the seven stand prominently forward as the champions of emancipation, Stephen the preacher and martyr of liberty, and Philip the practical worker."—J. B. Lightfoot, *Dissertations on the Apostolic Age*, pp. 51-52.—"The Hellenist Stephen roused deep-stirring movements chiefly in Hellenist circles. . . . The persecution of the Jerusalem community—perhaps specially of its Hellenist part—which followed the stoning of Stephen, became a means of promoting the spread of the Christian faith to . . . Cyprus, at last to so important a centre as Antioch, the imperial capital of the East. To the winning of the Jews to faith in Jesus there is already added the reception into the Christian community of the pious Gentile Cornelius, a proselyte of the gate. . . . Though this appears in tradition as an individual case sanctioned by special Divine guidance, in the meantime Hellenist Christians had already begun to preach the Gospel to born Greeks, also at Antioch in Syria, and successfully (Acts xi. 19-26), Barnabas is sent thither from Jerusalem."—W. Moeller, *History of the Christian church*, pp. 53-54.—See also RELIGION: B. C. 600-A. D. 30: Value of Greek religion.—"Philip, driven from Jerusalem by the persecution, preached Christ to the Samaritans. . . . The Apostles who had remained at Jerusalem, hearing of the success of Philip's preaching, sent two of their number into this new and fruitful field of labor. . . . Peter and John returned to Jerusalem while the Deacon Philip is called, by a new manifestation of the will of God, yet further to extend the field of Christian missions. It is not a Samaritan but a pagan, whom he next instructs in the truth. . . . He was an Ethiopian eunuch, a great dignitary of the court of Meroë, treasurer of the Queen. . . . This man, a pagan by birth, had taken a long journey to worship the true God in the temple of Jerusalem."—E. De Pressensé, *Early years of Christianity*, pp. 71-74.—"For the sake of the popular

feeling Herod Agrippa laid hands on members of the community, and caused James the brother of John (the sons of Zebedee) to be put to death by the sword, in the year 44, for soon thereafter Herod Agrippa died. Peter also was taken prisoner, but miraculously escaped and provisionally left Jerusalem. From this time on James the brother of the Lord appears ever more and more as really bearing rank as head of the Jerusalem community, while Peter more and more devotes himself to the apostolic mission abroad, and indeed, more accurately, to the mission in Israel."—W. Moeller, *History of the Christian church*, p. 55.—"The accounts which we have regarding the apostle Peter, represent him as preaching the gospel from the far east to distant parts of the west. . . . According to his own words, he founded churches in Pontus, Galatia, Cappadocia, Asia, and Bithynia, and according to the testimony of ancient historians of the Church in the east also; in Syria, Babylon, Mesopotamia, Chaldaea, Arabia, Phoenicia and Egypt, and in the west, at Rome, in Britain, Ireland, Helvetia and Spain."—J. E. T. Wiltsh, *Hand book of the geography and statistics of the church*, v. 1, pp. 19-20.—"Three and three only of the personal disciples and immediate followers of our Lord hold any prominent place in the Apostolic records—James, Peter, and John; the first the Lord's brother, the two latter the foremost members of the Twelve. Apart from an incidental reference to the death of James the son of Zebedee, which is dismissed in a single sentence, the rest of the Twelve are mentioned by name for the last time on the day of the Lord's Ascension. Thenceforward they disappear wholly from the canonical writings. And this silence also extends to the traditions of succeeding ages. We read indeed of St. Thomas in India, of St. Andrew in Scythia; but such scanty notices, even if we accept them as trustworthy, show only the more plainly how little the Church could tell of her earliest teachers. Doubtless they laboured zealously and effectively in the spread of the Gospel; but, so far as we know, they have left no impress of their individual mind and character on the Church at large. Occupying the foreground, and indeed covering the whole canvas of early ecclesiastical history, appear four figures alone, St. Paul, and the three Apostles of the Circumcision."—J. B. Lightfoot, *Dissertations on the Apostolic Age*, p. 46.—"While Peter (as it appears) is occupied with the work of preaching to the Jews outside of Palestine, the community at Jerusalem, and indeed the Palestinian communities in general, stand under the leadership of the brother of the Lord, James, as their recognised head. They remain strictly in the life of the law, and still hold securely to the hope of the conversion of the whole of God's people (which Paul had for the present given up). The mission to the Gentiles is indeed recognised, but the manner of its conduct by Paul and the powerful increase of Pauline communities excite misgivings and dissensions. For in these mixed communities, in the presence of what is often a preponderating Gentile element, it becomes ever clearer in what direction the development is pressing; that, in fact, for the sake of the higher Christian communion the legal customs even of the Jewish Christians in these communities must inevitably be broken down, and general Christian freedom, on principle, from the commands of the law, gain recognition."—W. Moeller, *History of the Christian church*, p. 73.—"The fall of Jerusalem occurred in the Autumn of the year 70 [see JEWS: A. D. 66-70]. And soon the catastrophe came which solved the difficult problem. . . . Jerusalem was razed to

the ground, and the Temple-worship ceased, never again to be revived. The Christians foreseeing the calamity had fled before the tempest. . . .

Before the crisis came, they had been deprived of the counsel and guidance of the leading apostles. Peter had fallen a martyr at Rome; John had retired to Asia Minor; James, the Lord's brother, was slain not long before the great catastrophe. . . .

He was succeeded by his cousin Symeon, the son of Clotas and nephew of Joseph. Under these circumstances the Church was reformed at Pella. Its history in the ages following is a hopeless blank."—J. B. Lightfoot, *Dissertations on the Apostolic Age*, p. 68.—"While Cæsarea succeeded Jerusalem as the political capital of Palestine, Antioch succeeded it as the centre of Christendom."—A. Plummer, *Church of the early fathers*, ch. 3.

ALSO IN: S. Mathews, *History of New Testament times in Palestine*.—A. C. McGiffert, *History of Christianity in the Apostolic Age*.—D. S. Margoliouth, ed., *Works of Flavius Josephus*.

A. D. 33-52.—Greek culture at Antioch.—Advent of Paul.—His significance in the growth of the church and its beliefs.—Church at Antioch.—Differences with the church at Jerusalem.—"Under Macedonian rule the Greek intellect had become the leading intellectual power of the world. The great Greek-speaking towns of the East were alike the strongholds of intellectual power, the battlefields of opinion and systems, and the laboratories of scientific research, where discoveries were made and literary undertakings requiring the combination of forces were carried out. Such was Antioch on the Orontes, the meeting point of Syrian and Greek intellect; such, above all, was Alexandria."

—J. J. von Döllinger, *Studies in European history*, p. 165.—"The chief line along which the new religion developed was that which led from Syrian Antioch through the Cilician Gates, across Lycaonia to Ephesus, Corinth, and Rome. One subsidiary line followed the land route by Philadelphia, Troas, Philippi, and the Egnatian Way to Brindisi and Rome; and another went north from the Gates by Tyana and Cæsarea to Cappadocia to Amisos in Pontus, the great harbour of the Black Sea, by which the trade of Central Asia was carried to Rome. The maintenance of close and constant communication between the scattered congregations must be presupposed, as necessary to explain the growth of the Church and the attitude which the State assumed towards it. Such communication was, on the view advocated in the present work, maintained along the same lines on which the general development of the Empire took place; and politics, education and religion grew side by side."—W. M. Ramsay, *The church in the Roman empire*, p. 10.—"The incitement to the wider preaching of the Gospel in the Greek world starts from the Christian community at Antioch. For this purpose Barnabas receives Paul as a companion (Acts xiii., and xiv.). Saul, by birth a Jew of the tribe of Benjamin, born at Tarsus in Cilicia [about the beginning of the Christian era], educated as a Pharisee, and although indeed as a Hellenist, he had command of Greek and had come into contact with Greek culture and Greek life, yet had not actually passed through the discipline of Greek culture, was introduced by Gamaliel to the learned study of the law, and his whole soul was seized with fiery zeal for the Statutes of the fathers. . . .

After [his conversion and] his stay in Damascus and in Arabia and the visit to Peter (and James) at Jerusalem, having gone to Syria and Cilicia, he was taken to Antioch by Barnabas."—W. Moeller, *History of the Christian church*, p. 57.—"Paul was the chief leader in extending the

gospel to the Gentiles, and so much did he overshadow the other missionaries that his work and teaching mark the second period in the history of Christianity. Although no account can here be given of his life and experiences, it is necessary to have these in mind to understand his influence. Especially important is it to remember that he was a trained Jew, familiar with the Old Testament and with the theological doctrines of his people; nor was he unacquainted with the ideas and the language of the Greek world, or untouched by the mysticism of his day. A Roman citizen by birth, a Hebrew of the Hebrews by descent and education, he was well fitted to play his great rôle as the apostle who was to carry Christianity out of Judaism to the Gentiles. He was, however, no systematic theologian to lay down a logical body of doctrine as a Greek might have done, and his writings were all occasional. Furthermore he had not been a companion of Jesus, but was one who believed that by an extraordinary experience he had come directly into knowledge of the risen Christ. . . . These, briefly, are the fundamental elements in Paul's doctrine: first, the significance of the death and resurrection of Jesus; second, faith which secures the mystic union with Christ; third, the indwelling Holy Spirit, which completes man's redemption and moral regeneration. For all Paul doubtless found warrant in the life and words of Jesus, although he seems to have neglected the ethical teachings of the Master. Paul's views have formed the basis of much of the doctrine of the Church since his time, although his idea of union with Christ through faith soon fell into the background; when it was revived it took on a form very unlike the apostle's teaching."

—C. H. Moore, *Religious thought of the Greeks*, p. 312.—"The strength and zeal of the Antioch Christian society are shown in the sending forth of Paul and Barnabas, with Mark, a cousin of Barnabas, for their companion for a part of the way, on a preaching tour in the eastern districts of Asia Minor. First they visited Cyprus, where Sergius Paulus, the proconsul, was converted. Thence they sailed to Attalia, on the southern coast of Pamphylia, and near Perga; from Perga they proceeded to Antioch in Pisidia, and from there eastward to Iconium, and as far as Lystra and Derbe in Lycaonia. Retracing their steps, they came back to Attalia, and sailed directly to Antioch. . . .

This was the first incursion of Paul into the domain of heathenism."—G. P. Fisher, *History of the Christian church*, p. 22.—"How then should Paul and Barnabas proceed? To leave Syria they must go first to Seleucia, the harbour of Antioch, where they would find ships going south to the Syrian coast and Egypt, and west either by way of Cyprus or along the coast of Asia Minor. The western route led toward the Roman world, to which all Paul's subsequent history proves that he considered himself called by the Spirit. The Apostles embarked in a ship for Cyprus, which was very closely connected by commerce and general intercourse with the Syrian coast. After traversing the island from east to west, they must go onward. Ships going westward naturally went across the coast of Pamphylia, and the Apostles, after reaching Paphos, near the west end of Cyprus, sailed in one of these ships, and landed at Attalia in Pamphylia."

—W. M. Ramsay, *The Church in the Roman empire*, p. 60.—"The work starting from Antioch, by which access to the faith is opened to the Gentiles, the formation of (preponderatingly) Gentile Christian communities, now introduces into the original Christian development an important problem, which (about the year 52, probably not

later), (Gal. ii.; Acts xv.) leads to discussions and explanations at the so-called Apostolic Council [at Jerusalem]. . . . For Paul, who has risen to perfect independence by the energy of his own peculiar stamp of gospel, there now begin the years of his powerful activity, in which he not only again visits and extends his former missionary field in Asia Minor, but gains a firm footing in Macedonia (Philippi), Athens, and Achaia (Corinth); then on the so-called third missionary journey he exercises a comprehensive influence during a stay of nearly three years at Ephesus, and finally looks from Achaia towards the metropolis of the world."—W. Moeller, *History of the Christian Church*, pp. 57-50.—"If the heathen whom he (Paul) had won to the faith and received into the Church were to be persuaded to adopt circumcision and the law before they could attain to full participation in the Christian salvation, his preaching had fallen short of his aim, it had been in vain, since it was very doubtful whether the Gentiles gained over to believe in the Messiah would submit to the condition. Paul could only look on those who made such a demand as false brethren, who having no claim to Christian brotherhood had forced themselves into the Church at Antioch in an unauthorized way (Gal. ii. 4), and was persuaded that neither the primitive Church as such, nor its rulers, shared this view. In order therefore to prevent the Gentile Christians from being disturbed on this point, he determined to go to Jerusalem and there to challenge a decision in the matter that should put an end to the strife (ii. 2). The Church at Antioch also recognized this necessity; hence followed the proceedings in Jerusalem [about A.D. 52], whither Paul and Barnabas repaired with other associates (Gal. ii. 1; Acts xv. 2 ff). . . . It is certain that when Paul laid his (free) gospel before the authorities in Jerusalem, they added nothing to it (Gal. ii. 2-6), i. e., they did not require that the gospel he preached to the Gentiles should, besides the sole condition of faith which he laid down, impose Judaism upon them as a condition of participation in salvation. . . . Paul's stipulations with the authorities in Jerusalem respecting their future work were just as important for him as the recognition of his free gospel (Gal. ii. 7-10). They had for their basis a recognition on the part of the primitive apostles that he was entrusted with the gospel of the uncircumcision, to which they could add nothing (ii. 6), just as Peter (as admittedly the most prominent among the primitive apostles) was entrusted with that of the circumcision."—B. Weiss, *A manual of introduction to the New Testament*, v. 1, pp. 172-175, 178.—"It seems clear that the first meetings of the Christians as a community apart—meetings that is of a private rather than a proselytising character—took place, as we see from Acts i. 13-15, in private apartments, the upper rooms or large guest-chambers in the houses of individual members. Such a room was doubtless provided by the liberality of Titus Justus (Acts xviii. 7), such a room again was the upper chamber in which St. Paul preached at Troas (Acts xx. 7, 8); in such assembled the converts saluted by the Apostle as the church which is in the house of Aquila and Prisca, of Nymphas and of Philemon. . . . The primitive Roman house had only one story, but as the cities grew to be more densely populated upper stories came into use, and it was the custom to place in these dining apartments, which were called cenacula. Such apartments would answer to the 'upper rooms' . . . associated with the early days of Christianity. . . . The Christian communities con-

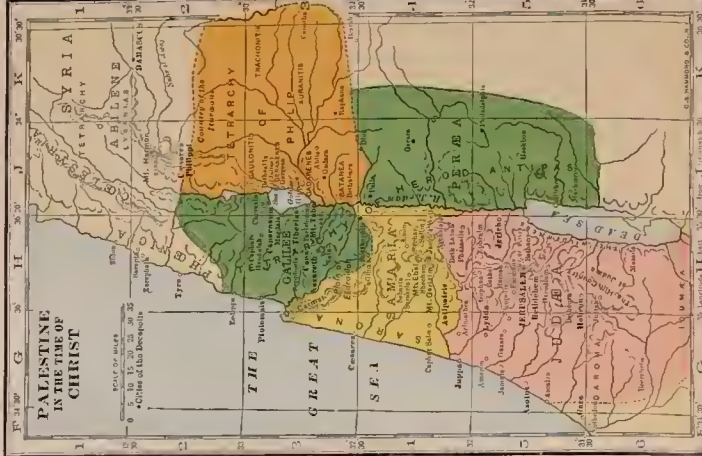

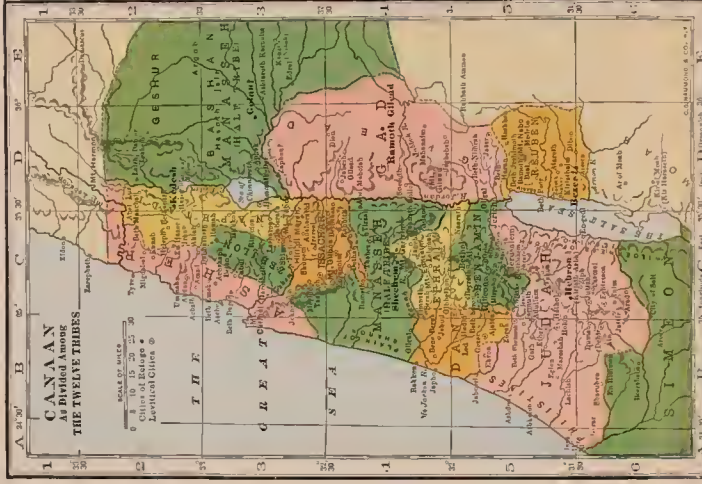

tained from an early period members of wealth and social position, who could accommodate in their houses large gatherings of the faithful; and it is interesting to reflect that while some of the mansions of an ancient city might be witnessing in suppers of a Trimachio or a Virro, scenes more revolting to modern taste than almost anything presented by the pagan world, others, perhaps in the same street, might be the seat of Christian worship or of the simple Christian meal."—G. B. Brown, *From schola to cathedral*, pp. 38-43.

A. D. 35-60.—Paul's work among the churches of Asia Minor and Greece.—Loyalty of the Macedonian churches.—Effect of Christianity upon the Near East.—"Paul's apostolic career, as known to us, lasted . . . twenty-nine or thirty years; and it falls into three distinct periods which are summarized in the following chronological table: First Period—Essentially Missionary: 35 A. D., Conversion of Paul.—Journey to Arabia; 38, First visit to Jerusalem; 38-40, Mission in Syria and Cilicia—Tarsus and Antioch; 50-51, First missionary journey—Cyprus, Pamphylia and Galatia (Acts xiii., xiv.); 52, Conference at Jerusalem (Acts xv.; Gal. ii.); 52-55, Second missionary journey—Epistles to the Thessalonians (from Corinth). Second Period—The Great Conflicts, and the Great Epistles: 54, Return to Antioch—Controversy with Peter (Gal. ii. 12-22); 55-57, Mission to Ephesus and Asia; 56, Epistle to the Galatians; 57 or 58 (Passover), First Epistle to the Corinthians (Ephesus); 57 or 58 (Autumn), Second Epistle to the Corinthians (Macedonia); 58 (Winter), Epistle to the Romans. Third Period—The Captivity: 58 or 59 (Pentecost), Paul is arrested at Jerusalem; 58-60, or 59-61, Captivity at Cæsarea—Epistles to Philemon, Colossians and Ephesians; 60 or 61 (Autumn), Departure for Rome; 61 or 62 (Spring), Arrival of Paul in Rome; 62-63, Epistle to the Philippians; 63 or 64, End of the narrative of the Acts of the Apostles."—A. Sabatier, *Apostle Paul*, pp. 21-22.—"Our knowledge of the Apostle Paul's life is far from being complete. We have only a brief sketch of journeys and toils that extended over a period of thirty years. Large spaces are passed over in silence. For example, in the catalogue of his sufferings, incidentally given, he refers to the fact that he had been shipwrecked three times, and these disasters were all prior to the shipwreck on the Island of Malta described by Luke. Shortly after the conference at Jerusalem he started on his second missionary tour. He was accompanied by Silas, and was joined by Timothy at Lystra. He revisited his converts in Eastern Asia Minor, founded churches in Galatia and Phrygia, and from Troas, obedient to a heavenly summons, crossed over to Europe. Having planted at Philippi a church that remained remarkably devoted and loyal to him, he followed the great Roman road to Thessalonica, the most important city in Macedonia. Driven from there and from Berea, he proceeded to Athens [see ATHENS: A. D. 54 (?)]. In that renowned and cultivated city he discoursed on Mars Hill to auditors eager for new ideas in philosophy and religion, and in private debated with Stoics and Epicureans. At Corinth, which had risen from its ruins and was once more rich and prosperous, he remained for a year and a half. It was there, probably, that he wrote his two Epistles to the Thessalonian Christians. After a short stay at Ephesus he returned to Antioch by way of Cæsarea and Jerusalem. It was not long before Paul—a second Alexander, but on a peaceful expedition—began his third great missionary journey. Taking the land route from Antioch, he

traversed Asia Minor to Ephesus, a flourishing commercial mart, the capital of the Roman province of Asia. There, with occasional absences, he made his abode for upwards of two years. From Ephesus, probably, he wrote the Epistle to the Galatians. . . . From Ephesus Paul also wrote the First Epistle to the Corinthians. The Second Epistle to the Corinthians he probably wrote from Philippi. . . . Coming down through Greece, he remained there three months. There he composed his Epistle to the Romans. . . . The untiring Apostle now turned his face towards Jerusalem. He desired to be present at the festival of the Pentecost. In order to save time, he sailed past Ephesus, and at Miletus bade a tender farewell to the Ephesian elders. He had fulfilled his pledge given at the conference, and he now carried contributions from the Christians of Macedonia and Achaia for the poor at Jerusalem."—G. P. Fisher, *History of the Christian church*, pp. 27-28.—"We may safely say that if Saul had been less of a Jew, Paul the Apostle would have been less bold and independent. His work would have been more superficial, and his mind less unfettered. God did not choose a heathen to be the apostle for the heathen; for he might have been ensnared by the traditions of Judaism, by its priestly hierarchy and the splendours of its worship, as indeed it happened with the church of the second century. On the contrary God chose a Pharisee. But this Pharisee had the most complete experience of the emptiness of external ceremonies and the crushing yoke of the law. There was no fear that he would ever look back, that he would be tempted to set up again what the grace of God had justly overthrown (Gal. ii. 18). Judaism was wholly vanquished in his soul, for it was wholly displaced."—A. Sabatier, *The Apostle Paul*, p. 69.—"Notwithstanding the opposition he met from his countrymen, in spite of all the liberal and the awakened sympathies which he derived from his work, despite the necessity of contending daily and hourly for the freedom of the Gospel among the Gentiles, he never ceased to be a Jew. . . . The most ardent patriot could not enlarge with greater pride on the glories of the chosen race than he does in the Epistle to the Romans. His care for the poor in Judæa is a touching proof of the strength of this national feeling. His attendance at the great annual festivals in Jerusalem is still more significant. 'I must spend the coming feast at Jerusalem.' This language becomes the more striking when we remember that he was then intending to open out a new field of missionary labour in the far West, and was bidding perhaps his last farewell to the Holy City, the joy of the whole earth."—J. B. Lightfoot, *Biblical essays*, pp. 209-210.—"The Macedonian Churches are honorably distinguished above all others by their fidelity to the Gospel and their affectionate regard for St. Paul himself. While the Church of Corinth disgraced herself by gross moral delinquencies, while the Galatians bartered the liberty of the Gospel for a narrow formalism, while the believers of Ephesus drifted into the wildest speculative errors, no such strain attaches to the brethren of Philippi and Thessalonica. It is to the Macedonian congregations that the Apostle ever turns for solace in the midst of his severest trials and sufferings. Time seems not to have chilled these feelings of mutual affection. The Epistle to the Philippians was written about ten years after the Thessalonian letters. It is the more surprising therefore that they should resemble each other so strongly in tone. In both alike St. Paul drops his official

title at the outset . . . and in both he adopts throughout the same tone of confidence and affection. In this interval of ten years we meet with one notice of the Macedonian Churches. It is conceived in terms of unmeasured praise. The Macedonians had been called upon to contribute to the wants of their poorer brethren in Judæa, who were suffering from famine. They had responded nobly to the call. Deep-sunk in poverty and sorely tried by persecution, they came forward with eager joy and poured out the riches of their liberality, straining their means to the utmost in order to relieve the sufferers. . . . We may imagine that the people still retained something of those simpler habits and that sturdier character, which triumphed over Greeks and Orientals in the days of Philip and Alexander, and thus in the early warfare of the Christian Church the Macedonian phalanx offered a successful resistance to the assaults of an enemy, before which the lax and enervated ranks of Asia and Achaia had yielded ignominiously."—J. B. Lightfoot, *Biblical essays*, pp. 240-250.—At Jerusalem, "the Apostle was rescued by a detachment of the Roman garrison from a mob of Jewish malignants, was held in custody for two years at Cesarea, and was finally enabled to accomplish a long-cherished intention to go to Rome, by being conveyed there as a prisoner, he having made an appeal to Cæsar. After being wrecked on the Mediterranean and cast ashore on the Island of Malta, under the circumstances related in Luke's graphic and accurate description of the voyage, he went on his way in safety to the capital."—G. P. Fisher, *History of the Christian church*, p. 29.—"The impression that we get from Acts is, that the evangelisation of Asia Minor originated from St. Paul; and that from his initiative the new religion gradually spread over the country through the action of many other missionaries (Acts xix. 10). Moreover, missionaries not trained by him, were at work in South Galatia and in Ephesus as early as 54-56 A.D. (Gal. v. 7-10; Acts xviii. 25). . . . The Christian Church in Asia Minor was always opposed to the primitive native character. It was Christianity, and not the Imperial government, which finally destroyed the native languages, and made Greek the universal language of Asia Minor. The new religion was strong in the towns before it had any hold of the country parts. The ruder and the less civilised any district was, the slower was Christianity in permeating it. Christianity in the early centuries was the religion of the more advanced, not of the 'barbarian' peoples; and in fact it seems to be nearly confined within the limits of the Roman world, and practically to take little thought of any people beyond, though in theory, 'Barbarian and Scythian' are included in it. . . . The First Epistle of John was in all probability 'addressed primarily to the circle of Asiatic Churches, of which Ephesus was the centre.'"—W. M. Ramsay, *The Church in the Roman empire*, pp. 284, 44, 303.

A. D. 35-64.—Early church at Rome.—Death of Paul.—"Alongside of the province of Asia Minor, Rome very early attains to an outstanding importance for young Christianity. If, as we have supposed, the community here which emancipated itself from the synagogue was mainly recruited from among the proselyte circles which had formed themselves around the Jewish synagogue, if Paul during the years of his captivity, and Peter also, influenced this preponderatingly Gentile-Christian community, we must, however, by no means undervalue for the Christian community the continuous influence of Judaism on the Roman world, an

Maps prepared specially for the NEW LARNED
under direction of the editors and publishers.

influence which was not lessened but rather increased by the destruction of Jerusalem. Many thousands of Jewish captives had arrived here and been sold as slaves—Rome was the greatest Jewish city in the Empire, . . . and in part it was an enlightened and liberal Judaism. Jewish Hellenism had already long availed itself of the weapons of Hellenic philosophy and science . . . in order to exalt the Jewish faith. . . . Under this stimulus there was . . . developed a proselytism which was indeed attracted by that monotheism and the belief in providence and prophecy and the moral ideas allied therewith, and which also had a strong tendency to Jewish customs and festivals—especially the keeping of the Sabbath—but which remained far from binding itself to a strictly legal way of life in circumcision, etc. We may suppose that Roman Christianity not only appeared in the character of such a proselytism, but also retained from it a certain Jewish colouring.”—W. Moeller, *History of the Christian Church: A.D. 1-600*, pp. 83-84.—“The last notice of the Roman Church in the Apostolic writings seems to point to two separate communities, a Judaizing Church and a Pauline Church. The arrival of the Gentile Apostle in the metropolis, it would appear, was the signal for the separation of the Judaizers, who had hitherto associated with their Gentile brethren coldly and distrustfully. The presence of St. Paul must have vastly strengthened the numbers and influence of the more liberal and Catholic party; while the Judaizers provoked by rivalry redoubled their efforts, that in making converts to the Gospel they might also gain proselytes to the law.”—J. B. Lightfoot, *Dissertations on the Apostolic Age*, p. 94.—“Historical information of any certainty on the latter period of Paul’s life is entirely wanting. While the epistles require this unknown period, and a second captivity, as a basis for their apostolic origin, on the other hand, the hypothesis of a second captivity scarcely finds any real foundations except in the three Pastoral letters.”—A. Sabatier, *Apostle Paul*, p. 269.—It only remains for us, returning to the close of the apostle’s life, to put together the slender indications that we have of its date. He embarked for Rome in the autumn of 60 (or 61) A.D.; but was compelled by shipwreck to winter in the island of Malta, and only reached the Eternal City in the spring of 61 (62). Luke adds that he remained there as a prisoner for two years, living in a private house under the guard of a soldier; then his narrative breaks off abruptly, and we are confronted with the unknown (Acts xxviii. 30). Paul is supposed to have perished in the frightful persecution caused by the fire of Rome in July, 64 A.D. (See ROME: Empire: 64-68.) All that is certain is that he died a martyr at Rome under Nero (Sabatier).

A. D. 50-100.—Apostle John and the churches of Asia Minor.—Influence of Hellenistic philosophy on Christianity.—Alexandrine school.—“Unless we are prepared to reject without a hearing all the traditions of Christianity, we cannot refuse to believe that the latest years of the Apostle St. John were spent in the Roman province of Asia and chiefly in Ephesus its capital. This tradition is singularly full, consistent and well-authenticated. Here he gathered disciples about him, organized churches appointed bishops and presbyters. A whole chorus of voices unite in bearing testimony to its truth. One who passed his earlier life in these parts and had heard his aged master, a disciple of St. John himself, recount his personal reminiscences of the great Apostle; another, who held this very see of Ephesus, and writing less than

a century after the Apostle’s death, was linked with the past by a chain of relatives all bishops in the Christian Church; a third who also flourished about the close of the century and numbered among his teachers an old man from this very district—are the principal, because the most distinct, witnesses to a fact which is implied in several other notices of earlier or contemporary writers. As to the time at which St. John left his original home and settled in this new abode no direct account is preserved; but a very probable conjecture may be hazarded. The impending fall of the Holy City was the signal for the dispersion of the followers of Christ. About this same time the three other great Apostles, St. Peter, St. Paul and St. James, died a martyr’s death; and on St. John, the last surviving of the four great pillars of the Church, devolved the work of developing the theology of the Gospel and completing the organization of the Church. It was not unnatural that at such a crisis he should fix his residence in the centre of a large and growing Christian community, which had been planted by the Apostle of the Gentiles, and watered by the Apostle of the Circumcision. The missionary labours of St. Paul and St. Peter in Asia Minor were confirmed and extended by the prolonged residence of their younger contemporary. At all events such evidence as we possess is favourable to this view of the date of St. John’s settlement at Ephesus. Assuming that the Apocalypse is the work of the beloved Apostle, and accepting the view which assigns it to the close of Nero’s reign or thereabouts, we find him now for the first time in the immediate neighbourhood of Asia Minor and in direct communication with Ephesus and the neighbouring Churches. St. John however was not alone. Whether drawn thither by the attraction of his presence or acting in pursuance of some common agreement, the few surviving personal disciples of the Lord would seem to have chosen Asia Minor as their permanent abode, or at all events as their recognised headquarters. Here at least we meet with the friend of St. John’s youth and perhaps his fellow-townsmen, Andrew of Bethsaida, who with him had first listened to John the Baptist, and with him also had been the earliest to recognise Jesus as the Christ. Here too we encounter Philip the Evangelist with his daughters, and perhaps also Philip of Bethsaida, the Apostle. Here also was settled the Apostle’s namesake, John the Presbyter, also a personal disciple of Jesus, and one Aristion, not otherwise known to us, who likewise had heard the Lord. And possibly also other Apostles whose traditions Papias recorded, Matthew and Thomas and James, may have had some connexion, temporary or permanent, with this district. Thus surrounded by the surviving disciples of the Lord, by bishops and presbyters of his own appointment, and by the pupils who gathered about him and looked to him for instruction, St. John was the focus of a large and active society of believers. In this respect he holds a unique position among the great teachers of the new faith. St. Peter and St. Paul converted disciples and organized congregations; St. John alone was the centre of a school. His life prolonged till the close of the century, when the Church was firmly rooted and widely extended, combined with his fixed abode in the centre of an established community to give a certain definiteness to his personal influence which would be wanting to the wider labours of these strictly missionary preachers. Hence the notices of St. John have a more solid basis and claim greater attention than stories relating to the other Apostles.”—J. B. Lightfoot,

Biblical essays, pp. 51-53.—“In the parable of Jesus, of which we are speaking, it is said that ‘the earth bringeth forth fruit of herself’; that is, to transfer the Greek term into English, ‘automatically.’ That epithet is chosen which denotes most precisely a self-acting, spontaneous energy, inherent in the seed which Jesus, through his discourses, his acts of mercy and power, and his patience unto death, was sowing in the world. This grand prophetic declaration, uttered in a figure so simple and beautiful, in the ears of a little company of Galileans, was to be wonderfully verified in the coming ages of Christian history.”—G. P. Fisher, *Nature and method of revelation*, p. 47.—“We have thus far seen two tendencies in Christian thought. The first appears in the synoptic gospels where Jesus is represented as the mediator and teacher, who interpreted to men the universal loving fatherhood of God and showed them their proper relations to God and to their fellow-men; the other is seen in Paul who taught that through the indwelling Christ salvation was secured. It was inevitable that reflective thought should act upon these teachings, and that in the philosophic environment of the Christian churches, at least outside Judea, attempts should be made to apprehend and to formulate in intellectual terms the nature, life, and mission of Jesus—in other words to create a Christian philosophy or theology. When in the period between 50 and 100 A. D., Christianity came into conflict with Hellenistic philosophy and theosophy this work of building up a Christian philosophy began. This stage is the third represented in the New Testament. The so-called Epistle to the Hebrews (c. 90 A. D.) is the first document of the New Testament in which the Greek intellectual habit clearly appears. Although the unknown author was writing to Gentile Christians for practical and not doctrinal ends, there is good evidence that he had been influenced by Alexandrian thought. He presents Christianity as the final and absolute religion, emphasizes Christ’s priestly office and his sacrifice, and gives a more philosophical and abstract definition of faith than any other writer of the New Testament. The great example, however, of the effect of the contact of Christianity with Greek thought is furnished by the Gospel of John and the Johannine Epistles. This fourth Gospel was apparently written at Ephesus, probably between 100 and 110 A. D. by one who was well acquainted with the philosophy and mysticism of his time; he was also strongly influenced by Paul. If the Johannine Epistles are not by the same author, they represent the same range of ideas as the Gospel, and we are therefore justified in using them together with it. The fourth Gospel is much more an interpretation than a history of Jesus’ person and life; it takes for granted that its readers are acquainted with the facts; and it assumes that the church is one universal body. Here then are two fundamental ideas; first, the eternal existence and divine nature of Christ who is the Word, the Logos of philosophic speech, and second, the revelation of God to man through the incarnate Word—‘the Word became flesh and dwelt among us.’ The concept of the Logos as the world-reason we saw first appear in the philosophy of Heraclitus; then the idea developed through the centuries until the Logos was equivalent to the reason of God, as once existing in God and being his expression. As such it was a part of Alexandrian thought, being found, for example, in Philo. The Logos of the philosopher, however, was the agent connecting a transcendental god with the divine creation, making and sustaining

the world. In so far the Johannine statement is in accord with current thought and expression, although we should probably be wrong if we affirmed that the author was drawing on Philo directly; it is far more probable that he was simply using ideas and language common in the intellectual circles of the day. But if we compare the idea of the Logos in the Johannine prologue with that in Philo we observe a profound and striking difference between the two. For Philo, as we have just said, the Logos was an abstract entity which existed for cosmological purposes; in the Johannine thought, although the Logos is the creator of the world, he is much more; he is incarnate in mortal flesh that he may reveal God to man and bring man salvation. The author wished to show that the creator and revealer were one, that the Logos had appeared as a man on earth. Now this emphasis on the human side of Jesus, the son of God, was in all probability due to the arguments of some incipient Gnostics who denied that the Christ had come in the flesh, and this polemic purpose goes far to explain the abruptness of the prologue. When once the statement has been made the philosophical language dealing with the Logos is dropped; yet the position and emphasis of the ideas in the prologue were calculated to assure the enlightened readers of the fourth Gospel that the witness of the generation which had seen Jesus was true and must be accepted. The first purpose of the author was to set forth the prime significance of the personal human Jesus, with whom men had lived on familiar terms and from whom they had learned the deepest truths. The purpose of the fourth Gospel then was first to prove that Jesus was the Christ, the Son of God, and secondly to bring men to a belief in this fact which would give them life in Christ. The idea that salvation is present spiritual experience culminates in the Johannine writings; the doctrine that those who hear and believe have already entered into eternal life is clearly stated. . . . Let us now summarize the fundamental ideas of primitive Christianity. In the first place, because of his nature and his teachings Jesus was regarded as the revealer of God to men, and at the same time, being the Christ, he was held to be their saviour and redeemer. Paul emphasized Christ’s death and resurrection, John the incarnation as the great central facts. Secondly, love and faith and their effects on man’s relation to God and to his fellow-men were made the essential elements in the Christian life. Thirdly, the doctrine of the mystic union of the believer with the divine Christ and that of the indwelling Holy Spirit were fundamental in both the Pauline and Johannine writings. Revelation, faith, mystic union with the Divine, salvation—our previous studies have shown us that these ideas were both familiar and welcome in the Greco-Roman world of the first century of our era. We have now reviewed the essential elements in each of the three stages represented in the writings of the New Testament. In the first, the teachings of Jesus show no trace of any influence exerted by Greek philosophic or religious thought. With Paul we begin to detect the signs of such influence—the germs of the doctrine of Logos, for example, are found in the later epistles (Philippians, Ephesians, and Colossians), which set forth a belief in the eternal existence of Christ, the Son of God. But it remained for the Johannine writer to give a fuller philosophic statement to this doctrine, and in general to bring Christianity well within the province of Greek thought and expression. Thenceforth Christianity belonged to the Greek intellectual world.”—C. H.

Moore, *Religious thought of the Greeks*, pp. 317-320, 324-325.—“Plutarch looked upon it as the great mission of Alexander to transplant Grecian culture into distant countries, and to conciliate Greeks and barbarians, and to fuse them into one. He says of him, not without reason, that he was sent of God for this purpose; though the historian did not divine that this end itself was only subsidiary to, and the means of, one still higher—the making, viz., the united peoples of the East and West more accessible to the new creation which was to proceed from Christianity, and by the combination of the elements of Oriental and Hellenic culture the preparing for Christianity a material in which it might develop itself. If we overlook this ulterior end, and do not fix our regards on the higher quickening spirit destined to reanimate, for some new end, that combination which already bore within itself a germ of corruption, we might well doubt whether that union was really a gain to either party; whether, at least, it was not everywhere attended with a correspondent loss. For the fresh vigour which it infused into the old national spirit must have been constantly repressed by the violence which the foreign element did to it. To introduce into that combination a new living principle of development, and, without prejudice to their original essence, to unite peculiarities the most diverse into a whole in which each part should be a complement to the other, required something higher than any element of human culture. The true living communion between the East and the West, which should combine together the two peculiar principles that were equally necessary for a complete exhibition of the type of humanity, could first come only from Christianity. But still, as preparatory thereto, the influence which, for three centuries, went forth from Alexandria, that centre of the intercourse of the world, was of great importance.”—A. Neander, *General history of the Christian religion and church*, v. 1, introduction.—“The Greek version [of the Old Testament, the Septuagint], like the Targum of the Palestinians, originated, no doubt, in the first place, in a felt national want on the part of the Hellenists, who as a body were ignorant of Hebrew. Hence we find notices of very early Greek versions of at least parts of the Pentateuch. But this, of course, could not suffice. On the other hand, there existed, as we may suppose, a natural curiosity on the part of the students, specially in Alexandria, which had so large a Jewish population, to know the sacred books on which the religion and history of Israel were founded. Even more than this, we must take into account the literary tastes of the first three Ptolemies (successors in Egypt of Alexander the Great), and the exceptional favour which the Jews for a time enjoyed.”—A. Edersheim, *Life and times of Jesus the Messiah*, v. 1, p. 24.

[The purpose of what follows in this article is to give a brief history of Christianity in some of its relations to general history, and in the light of some of the best thought of our time. The article as a combination of quotations from many authors attempts a presentation of historic facts, and also

a positive and representative view, so far as this may be obtained under the guidance of ideas common to many of the books used. Some of these books have had more influence on the development of the article than others: entire harmony and a full presentation of any author's view would manifestly be impossible. Nevertheless, the reader may discover in the article principles and elements of unity derived from the literature and representing it. Unfortunately, one of the essential parts of such a history must be omitted—biography.]

100-300.—Period of growth and struggle.—Inadequacy of the religious philosophies to satisfy men.—Opposition of Christian apologists to Greek philosophers.—Growth and spread of Christian literature.—“Christian belief, Christian morality, the Christian view of the world, of which the church as a religious society and institution is the focus, as fluid spiritual elements permeate humanity as it becomes Christian, far beyond the sphere of the church proper; while conversely the church is not assured against the possibility that spiritual elements originally alien to her may dominate and influence her in their turn. . . . In this living interaction the peculiar life of the church is unfolded, in accordance with its internal principles of formation, into an extraordinarily manifold and complicated object of historical examination. . . . For this purpose it is necessary to elucidate the general historical movement of the church by the relative separation of certain of its aspects, without loosening the bond of unity.”—W. Moeller, *History of the Christian church: A. D. 1-600*, pp. 1-3.—“Such, in fact, has been the history of the Faith: a sad and yet a glorious succession of battles, often hardly fought, and sometimes indecisive, between the new life and the old life. . . . The Christian victory of common life was wrought out in silence and patience and nameless agonies. It was the victory of the soldiers and not of the captains of Christ's army. But in due time another conflict had to be sustained, not by the masses, but by great men, the consequence and the completion of that which had gone before. . . . The discipline of action precedes the effort of reason. . . . So it came to pass that the period during which this second conflict of the Faith was waged was, roughly speaking, from the middle of the second to the middle of the third century.”—B. F. Westcott, *Essays in the history of religious thought in the West*, pp. 194-197.—“Philosophy went on its way among the higher classes, but laid absolutely no hold on men at large. The reformation which it wrought in a few elect spirits failed utterly to spread downward to the mass of mankind. The poor were not touched by it; society was not helped by it; its noblest men, and they grew fewer and fewer, generation by generation, bewailed bitterly the universal indifference. The schools dwindled into a mere university system of culture; Christianity developed into a religion for the civilised world. . . . New ideas it had in abundance, but new ideas were not the secret of its power. The essential matter in the Gospel was that it was the history of a Life. It was a tale of fact that all could understand, that all could believe; that all could love. It differed fundamentally from Philosophy, because it appealed not to culture, but to life. . . . It was the spell of substantial facts, living facts, . . . the spell of a loyalty to a personal Lord; and those who have not mastered the difference between a philosopher's speculations about life, and the actual record of a life which, in all that makes life holy and beautiful, transcended the phi-

osopher's most pure and lofty dreams, have not understood yet the rudiments of the reason why the Stoic could not, while Christianity could and did, regenerate society."—J. B. Brown, *Stoics and saints*, pp. 85-86.—The "period from the accession of Marcus Aurelius (A. D. 161) to the accession of Valerian (A. D. 253) was for the Gentile world a period of unrest and exhaustion, of ferment and of indecision. The time of great hopes and creative minds was gone. The most conspicuous men were, with few exceptions, busied with the past. . . . Local beliefs had lost their power. Even old Rome ceased to exercise an unquestioned mortal supremacy. Men strove to be cosmopolitan. They strove vaguely after a unity in which the scattered elements of ancient experience should be harmonized. The effect can be seen both in the policy of statesmen and in the speculations of philosophers, in Marcus Aurelius, or Alexander Severus, or Decius, no less than in Plotinus or Porphyry. As a necessary consequence, the teaching of the Bible accessible in Greek began to attract serious attention among the heathen. The assailants of Christianity, even if they affected contempt, shewed that they were deeply moved by its doctrines. The memorable saying of Numerius, 'What is Plato, but Moses speaking in the language of Athens?' shews at once the feeling after spiritual sympathy which began to be entertained, and the want of spiritual insight in the representatives of Gentile thought."—B. F. Westcott, *Essays in the history of religious thought in the West*, pp. 196-197.—"To our minds it appears that the preparation of philosophy for Christianity was complete. . . . The time was ripe for that movement of which Justin is the earliest [complete] representative."—G. T. Purves, *The Testimony of Justin Martyr*, p. 135.—"The writing in defense of Christianity is called the apology, and the writer an apologist. . . . There were two classes of apologists, the Greek and the Latin, according to the territory which they occupied, and the language in which they wrote. But there were further differences. The Greeks belonged mostly to the second century, and their writings exhibited a profound intimacy with the Greek philosophy. Some of them had studied in the Greek schools, and entered the church only in mature life. They endeavored to prove that Christianity was the blossom of all that was valuable in every system. They stood largely on the defensive. The Latins, on the other hand, were aggressive. They lived mostly in the third century. . . . The principal Greek apologists [were] Aristo, Quadratus, Aristides [131], Justin [160], Melito [170], Miltiades, Irenaeus, Athenagoras [178], Tatian, Clement of Alexandria [200], Hippolytus, and Origen [225]."—J. F. Hurst, *Short history of the Christian church*, p. 33.—Lightfoot assigns to about A. D. 150 (?) the author of the Epistle to Diognetus. "Times without number the defenders of Christianity appeal to the great and advantageous change wrought by the Gospel in all who embraced it. . . . 'We who hated and destroyed one another, and on account of their different manners would not receive into our houses men of a different tribe, now, since the coming of Christ, live familiarly with them. We pray for our enemies, we endeavor to persuade those who hate us unjustly to live conformably to the beautiful precepts of Christ, to the end that they may become partakers with us of the same joyful hope of a reward from God, the Ruler of all.' This distinction between Christians and heathen, this consciousness of a complete change in character and life, is nowhere more beautifully described

than in the noble epistle . . . to Diognetus."—G. Uhlhorn, *Conflict of Christianity with heathenism*, p. 166.—"For Christians are not distinguished from the rest of mankind either in locality or in speech or in customs. For they dwell not somewhere in cities of their own, neither do they use some different language, nor practise an extraordinary kind of life. . . . But while they dwell in cities of Greeks and barbarians as the lot of each is cast, and follow the native customs in dress and food and the other arrangements of life, yet the constitution of their own citizenship, which they set forth, is marvellous, and confessedly contradicts expectation. They dwell in their own countries, but only as sojourners; they bear their share in all things as citizens, and they endure all hardships as strangers. Every foreign country is a fatherland to them, and every fatherland is foreign. . . . Their existence is on earth, but their citizenship is in heaven. They obey the established laws, and they surpass the laws in their own lives. They love all men and they are persecuted by all. . . . War is urged against them as aliens by the Jews, and persecution is carried on against them by the Greeks, and yet those that hate them cannot tell the reason of their hostility."—J. B. Lightfoot, *Translation of the Epistle to Diognetus (Apostolic Fathers, pp. 505-506)*.—"These apologists rise against philosophy also, out of which they themselves had arisen, in the full consciousness of their faith open to all and not only to the cultured few, the certainty of which, based upon revelation, cannot be replaced by uncertain human wisdom, which, moreover, is self-contradictory in its most important representatives. On the other hand, they willingly recognise in the philosophy by means of which they had themselves been educated, certain elements of truth, which they partly derive from the seed-corns of truth, which the divine Logos had scattered among the heathen also, partly externally from a dependence of Greek wisdom on the much older wisdom of the East, and therefore from the use of the Scriptures of the Old Testament. To the reproach that they had deserted the religion which had been handed down from their ancestors and thereby made sacred, they oppose the right of recognised truth, the right of freedom of conscience; religion becomes the peculiar affair of personal conviction, against which methods of force do not suffice: God is to be obeyed rather than man."—W. Moeller, *History of the Christian church: A. D. 1-600*, p. 170.—"A religion so widespread had naturally begun to produce its own literature. From the synagogue it had inherited a precious group of sacred books, the fountains of ancient wisdom, and the guarantee through prophecy and psalm of the claims of Christ. But beside the authority of the Jewish Scriptures the Church of the early decades of the second century was beginning to set the 'Word of the Lord.' As Papias tells us, the tradition that might be gathered from living lips was still treasured as more valuable than any book. No Gospel yet is cited under any name, though our first three were certainly approaching if they had not definitely reached their present form in Pliny's day. The Fourth Gospel had hardly yet emerged out of the limited circle in which it first appeared. The churches founded by the Apostle Paul had doubtless preserved the letters addressed to them, and neighbouring communities would exchange their possessions. When Clement writes in the name of the Roman church to Corinth, he bids the disputants take up the letter of the blessed Paul the Apostle; what had been *his* advice at the

beginning of his preaching? When the Philippians wrote to Polycarp for copies of the letters of Ignatius, they doubtless had already a collection of those of Paul. Behind Clement stands the author of the so-called Epistle to the Hebrews, a sermon without a name transformed by some additions into a letter without an address. A similar homily is probably to be found in the Epistle of James. . . . There are other documents belonging (within wide limits) to this age, such as the Teaching of the Twelve Apostles, the Epistle of Barnabas, the letters of Ignatius. They all gather more or less definitely round the person of the Founder. The initiates into the Mystery-religions might believe themselves rooted and grounded in trust begotten of incommunicable personal experiences; the followers of Christ could produce the title-deeds of a historic faith."—J. E. Carpenter, *Phases of early Christianity*, pp. 4-5.

100-300.—Need in the Roman empire for a universal religion.—Christian opposition to paganism.—Reasons for governmental interference.—“As far as she could, Rome destroyed the individual genius of nations; she seemed to have rendered them unqualified for a national existence. When the public life of the Empire ceased, Italy, Gaul, and Spain were thus unable to become nations. Their great historical existence did not commence until after the arrival of the barbarians, and after several centuries of experiments amid violence and calamity. But how does it happen that the countries which Rome did not conquer, or did not long have under her sway, now hold such a prominent place in the world—that they exhibit so much originality and such complete confidence in their future? Is it only because, having existed a shorter time, they are entitled to a longer future? Or perchance, did Rome leave behind her certain habits of mind, intellectual and moral qualities, which impede and limit activity?”—E. Lavisse, *Political history of Europe*, p. 6.—Patriotism was a considerable part of both the ancient religion and the old morality. The empire weakened the former and deeply injured the latter by conquest of the individual states. It had little to offer in place of these except that anomaly, the worship of the emperor; and a law and justice administered by rulers who, to say the least, grew very rich. “The feeling of pride in Roman citizenship . . . became much weaker as the citizenship was widened. . . . Roman citizenship included an ever growing proportion of the population in every land round the Mediterranean, till at last it embraced the whole Roman world. . . . Christianity also created a religion for the Empire, transcending all distinctions of nationality. . . . The path of development for the Empire lay in accepting the religion offered it to complete its organisation. Down to the time of Hadrian there was a certain progress on the part of the Empire towards a recognition of this necessity.”—W. M. Ramsay, *The Church in the Roman empire*, pp. 373, 191-192.—“The economic influence of the Roman empire affected in many ways indeed the larger movements of history. The comparative free trade which the empire established, the constitution of the Roman villa or farm, the beginning of the process which transformed the slave into the serf, the forced dependence of the small landholder upon the large one, are important instances. These things constitute together, in some respects, the most primary and fundamental department of civilization, and must not be forgotten, though, with the exception of a few instances which we shall notice, they demand, like the greater part of politi-

cal history, specific treatment. [See EUROPE: Middle Ages: Roman civilization inherited.] Into this Roman empire there came the Christian religion as the first of the great influences transforming the ancient into the modern world, and adding its contribution of great ideas to those of the Greeks and Romans. It appeared just after the empire had received its organization as a monarchy; it grew very slowly by count of numbers during the next succeeding generations, while the empire was still strong and perfecting its organization; as the Roman power decayed it began to spread with greater rapidity, till, by the middle of the fourth century, on the eve of the German conquest, it was the prevailing religion—not perhaps in actual numbers, but certainly in influence and energy and in the actual control of society. During its early career, at least, the progress of this new faith was rendered slow by certain facts which were characteristic of it. Its adherents were few. They were from the lowest ranks of society, workmen and slaves—more largely also women than men—so that it attracted very little attention from persons of position and influence. Its missionaries also were Jews, a turbulent race, not to be assimilated, and as much despised and hated by the pagan Roman as by the medieval Christian. Wherever it attracted any notice, therefore, it seems to have been regarded as some rebellion of the Jews, gone mad upon some obscure point of the national superstition—an outcast sect of an outcast race. Again, it is a permanent characteristic of Christianity that many, at least, of its external features in any particular age—the points of conduct upon which it insists with the greatest emphasis—are determined, we may almost say are selected, by the character of the great evils which, for the time being, it has especially to fight. In the first age the greatest enemy to be overcome was paganism. Christianity had other truths of importance to teach, and other evils to overcome, but the one deadly foe whose complete possession of society must be first of all destroyed was the worship of many gods. This complete contrast between the new religion and the dominant heathenism led necessarily to a strictness in the teaching and practice of the monotheistic doctrine which the pagan society found it hard to understand and which placed Christianity at a disadvantage in competition with the numerous other Oriental religions which were at this time spreading over the Roman empire—Christianity would seem to the observant Roman nothing more than one of this general class. These other religions said to the Roman: Continue to worship your own gods, worship as many gods as you please, only take this one in addition; they are good, but we bring you something better on some particular point, some more perfect statement of the common truth, accept this also. Christianity said: No. All these teachings are false, all idol worship is a deadly sin. You must abandon all these beliefs and accept this alone as the only true and exclusive faith. And this teaching the Christians carried out in their daily living even, in frequent cases concerning such minutiae as food to be eaten and occupations to be pursued. This was a demand entirely new and incomprehensible to the heathen mind, trained in the idea of an unlimited pantheon. It is not strange that the determination of the Christian to die rather than to perform the simplest rite of pagan worship seemed to the Roman the most obstinate and insane stupidity. In other words, the native attitude of the ancient mind toward questions of religion must be completely revolutionized before the new faith could

be victorious—a task of immense difficulty, and not completely performed in that age, as we shall see when we come to consider the transformation of Christian ideas which resulted from the struggle.

“And yet, notwithstanding these obstacles, and the apparently slight chance of success which it had, Christianity made extremely rapid progress in relative increase. Starting from an insignificant province, from a despised race, proclaimed by a mere handful of ignorant workmen, demanding self-control and renunciation before unheard of, certain to arouse in time powerful enemies in the highly cultivated and critical society which it attacked, the odds against it were tremendous. But within a single generation it had been successfully taught in all the central provinces of the Roman empire and far beyond its boundaries. In the second century its progress among all classes was very rapid. In less than three hundred years from the crucifixion it had become the recognized religion of the imperial court, and had been placed on a footing of legal equality with paganism throughout the empire, and before that century closed it was the only legal religion. Its progress seems miraculous, and Freeman has not overstated the case in the following sentence: ‘The miracle of miracles, greater than dried-up seas and cloven rocks, greater than the dead rising again to life, was when the Augustus on his throne, Pontiff of the gods of Rome, himself a god to the subjects of Rome, bent himself to become the worshipper of a crucified provincial of his empire.’ It must have possessed certain great compensating advantages to give it so speedy a victory in the face of such difficulties. . . . Like all great movements of the kind, the spread of Christianity is not to be explained by the action of a single cause, and others, perhaps as important as these, contributed to the rapidity of its advance. However the fact may be accounted for, the number of its adherents soon became great enough to attract to itself the attention of the state. Whatever may be true of the first century, whether or not the Roman government was conscious in that age of any distinction between Christians and Jews, or whether it had any clear idea of what it was doing in the persecution under such tyrants as Nero and Domitian, it is certain that, early in the second century, it came to have an understanding of Christianity and its attitude toward the state religion—an attitude which the conscientious Roman ruler could hardly pass unnoticed. The action of the Roman government in respect to many of the new religions which were making their way toward the West was inconsistent. It was an alternation of careless indifference, or even apparent favor, with spasmodic attempts at repression which really accomplished nothing. But there was in Christianity an element of hostility toward the state which none of the other new religions contained. While they might lead to a neglect of the state religion by the greater interest excited in the new faith, Christianity insisted upon the entire abandonment of the national worship, not as an inferior religion but as an actual and particularly heinous sin. According to all the ideas of the Romans such a demand could be nothing but rebellion and treason. The safety of the state depended upon the fidelity of the citizens to the national worship. If the gods were duly honored and the sacrifices carefully performed, the state flourished; if they were neglected or carelessly worshipped, misfortunes followed. Undoubtedly this belief, on its practical, if not on its theoretical side, had greatly weakened during the prosperous times of Rome’s history.

But it had not been abandoned, and when public misfortunes became frequent and the power of the state seemed declining, it was natural that the earnest reformer should believe the neglect of the gods to be the source of the evil and seek a restoration of prosperity by means of a restoration of the national religion; or, if not himself fully confident of this, it was natural that he should believe that the ‘reflex influence’ of an earnest national worship would check the cause of decline. It follows from this that the time of systematic and deliberate persecution comes when the real statesmen of the empire have become conscious of the deadly nature of her disease. It seems evident that we must say that, during the first century, the government had no distinct consciousness of the existence of Christianity. The second century is a time of local and temporary enforcement of the laws against the Christians. With the third century we reach an age of fearfully rapid decline and of most earnest attempts, at intervals, by clear-sighted emperors, to turn back the tide. . . . Christianity was a vast, organized defiance of the law. It vehemently denounced the national religion as a deadly sin. It earnestly denied any paramount duty of loyalty to the state, and appealed to a higher loyalty to another fatherland. No restoration of earlier Roman conditions, such as the reformers hoped for, could be possible unless it was overcome. But it was too late. Christianity was now too strong.”—G. B. Adams, *Civilization during the Middle Ages*, pp. 39-42, 45-48.—See also EUCRATITES.

100-300.—Persecutions.—Change in their nature after 250.—“In September, 111 A. D., Gaius Plinius Caecilius Secundus reached Bithynia with the special title of ‘Legate Propraetor with consular power.’ He had not been long in office before he found it necessary to consult his imperial master, Trajan, on the treatment of the professors of a ‘wicked and arrogant superstition’ endangering many of both sexes, of all ages and every rank. Its infection had spread from the cities to the villages and the country districts. The temples had been almost deserted; the ceremonies of religion had been long neglected; the farmers who brought fodder to feed victims for the temple sacrifices found the markets almost without purchasers. What crimes were alleged against those who had wrought this change? They were the followers of a new faith. They met on a field day before the dawn and sang in turn a hymn to Christ as to a god; and they bound themselves by an oath—not for any deeds of darkness—but to abstain from theft and robbery and adultery, and to restore upon demand money entrusted to their care. At a second meeting they shared a common meal of harmless food; but in deference to the imperial prohibition of clubs this custom had been suspended. Of one grave offence, however, they were guilty. Confronted in court with the images of the gods, they declined to repeat a prayer at Pliny’s dictation; when wine and incense were handed to them with which to invoke Trajan’s name before his statue, they refused. The Christian movement might be checked by vigorous repression in Bithynia, but it bore within itself the impulses of constant expansion.”—J. E. Carpenter, *Phases of early Christianity*, pp. 1-2.—The relations of the laws of the empire to Christianity may be briefly stated, but there are differences of opinion which cannot be noted here: “A. D. 30 to 100, Christians treated as a sect of the Jews and sharing in the general toleration accorded to them. A. D. 100 to 250, Christians recognized, . . . and rendered liable

to persecution: (1st) For treason and impiety. (2nd) As belonging to illegal associations, but at the same time protected in their capacity of members of Friendly or Burial Societies of a kind allowed by the law. A. D. 250 to 260, Christianity recognized as a formidable power by the State. Commencement of an open struggle between Christianity and the secular authority. . . . The cemeteries of the Christians now for the first time interfered with and become places of hiding and secret assembly. [See CATACOMBS OF ROME.] A. D. 260 to 300, Persecutions cease for a time, 40 years Peace for the Church. Time of much prosperity when, as Eusebius writes, 'great multitudes flocked to the religion of Christ.' A. D. 300 to 313, Last decisive struggle under Diocletian."—G. B. Brown, *From schola to cathedral*.—"The judges decided simply in accordance with the laws, and, in the great majority of cases, did so coolly, calmly, without passion, as men who were simply discharging their duty. . . . Not the priests, but the Emperors led the attack. . . . It is true the Christians never rebelled against the State. They cannot be reproached with even the appearance of a revolutionary spirit. Despised, persecuted, abused, they still never revolted, but showed themselves everywhere obedient to the laws, and ready to pay to the Emperors the honor which was their due. Yet in one particular they could not obey, the worship of idols, the strewing of incense to the Cæsar-god. And in this one thing it was made evident that in Christianity lay the germ of a wholly new political and social order. This is the character of the conflict which we are now to review. It is a contest of the spirit of Antiquity against that of Christianity, of the ancient heathen order of the world against the new Christian order. Ten persecutions are commonly enumerated, viz., under Nero, Domitian, Trajan, Hadrian, Marcus Aurelius, Septimius Severus, Maximinus the Thracian, Decius, Valerian, and Diocletian. This traditional enumeration is, however, very superficial, and leaves entirely unrecognized the real course of the struggle. . . . Though times of relative tranquillity occurred, Christianity remained, notwithstanding, a prohibited religion. This being the case, the simple arrangement of the persecutions in a series makes the impression that they were all of the same character, while in fact the persecution under Nero was wholly different from that under Trajan and his successors, and this again varied essentially from those under Decius and Diocletian. The first persecution which was really general and systematically aimed at the suppression of the Church, was the Decian [see ROME: Empire: 192-284]. That under Trajan and his successors [see ROME: Empire: 96-138, 138-180, and 303-305] consisted merely of more or less frequent processes against individual Christians, in which the established methods of trial were employed, and the existing laws were more or less sharply used against them. Finally, the persecutions under Nero and Domitian [see ROME: Empire: 64-68, and 70-96] were mere outbreaks of personal cruelty and tyrannical caprice. . . . Christianity is the growing might; with the energy of youth it looks the future in the face, and there sees victory beckoning onward. And how changed are now its ideas of that triumph! The earlier period had no thought of any victory but that which Christ was to bring at his coming. . . . But in the time of Cyprian the hopes of the Christians are directed towards another victory: they begin to grasp the idea that Christianity will vanquish heathenism from within, and become the dominant

religion in the Roman Empire. . . . It is true that the Christians were still greatly in the minority. It is generally assumed that they formed about one-twelfth of the whole population in the East, and in the West about one-fifteenth. Even this is perhaps too high an estimate. But there were two things which gave a great importance to this minority. First, that no single religion of the much divided Heathenism had so many adherents as the Christian. Over against the scattered forces of Heathenism, the Christians formed a close phalanx; the Church was a compact and strongly framed organization. Second, the Christians were massed in the towns, while the rural population was almost exclusively devoted to Heathenism. There existed in Antioch, for instance, a Christian church of fifty thousand souls."—G. Uhlhorn, *Conflict of Christianity with heathenism*, bk. 2.—"The Encyclopedia of Missions" on the authority of R. D. Hitchcock states that there are on record "the names of churches existing at this period [at the close of the persecutions] in 525 cities: cities of Europe 188, of Asia 214, of Africa 123."

100-300. — Church organization. — Growth of the patristic church.—Rise of the episcopate.—"It is the age when the New Testament writings begin to come together to form a generally recognized canon. The opposition, too, to the sovereign spirit of Montanist [see MONTANISTS] prophecy undoubtedly increased the need for it. . . . In this same opposition to the heretics it is sought to secure the agreement of the different churches with one another, and in this relation importance is gained by the idea of a universal (Catholic) church. So-called catholic Epistles of men of repute in the church to different communities are highly regarded. As illustrations take those of Bishop Dionysius of Corinth to Lacedæmon, Athens, Crete, Paphlagonia, Pontus, Rome (Euseb. 4, 23)."—W. Moeller, *History of the Christian Church*, pp. 183-184.—"This period [100-300] may be divided into the Post-Apostolic Age which reaches down to the middle of the second century, and the Age of the Old Catholic Church which ends with the establishment of the Church under Constantine. . . . The point of transition from one Age to the other may be unhesitatingly set down at A. D. 170. The following are the most important data in regard thereto. The death about A. D. 165 of Justin Martyr, who marks the highest point reached in the Post-Apostolic Age and forms also the transition to the Old Catholic age; and Irenæus, flourishing somewhere about A. D. 170, who was the real inaugurator of this latter age. Besides these we come upon the beginnings of the Trinitarian controversies about the year 170. Finally, the rejection of Montanism from the universal Catholic Church was effected about the year 170 by means of the synodal institution called into existence for that purpose."—J. H. Kurtz, *Church history*, v. 1, p. 70.—"If every church must so live in the world as to be a part of its collective being, then it must always be construed in and through the place and time in which it lives."—A. M. Fairbairn, *Place of Christ in modern theology*.—"The Church of the first three centuries was never, except perhaps on the day of Pentecost, in an absolutely ideal condition. But yet during the ages of persecution, the Church as a whole was visibly an unworldly institution. It was a spiritual empire in recognized antagonism with the world-empire."—F. W. Puller, *Primitive saints and the See of Rome*, p. 153.—All the greater forces of the age, political and legal, and commercial, aided those working within the

church to create an organic unity. "Speaking with some qualifications, the patristic church was Greek, as the primitive church had been Jewish, and the mediæval church was to be Latin. Its unity, like that of the Greek nation, was federative; each church, like each of the Grecian states, was a little commonwealth. As the Greece which resisted the Persians was one, not by any imperial organization, but by common ideas and a common love of liberty, so the church of the fathers was one, not by any organic connection, but by common thoughts and sympathies, above all by a common loyalty to Christ. Naturally the questions which agitated such a church were those which concern the individual soul rather than society. Its members made much of personal beliefs and speculative opinions; and so long as the old free spirit lasted they allowed one another large freedom of thought, only requiring that common instinct of loyalty to Christ. Happily for the world, that free spirit did not die out from the East for at least two centuries after Paul had proclaimed the individual relationship of the soul to God. . . . The genius of the Greek expressing itself in thought, of the Latin in ruling power, the Christianity which was to the former a body of truth, became to the latter a system of government."—G. A. Jackson, *Fathers of the third century*, pp. 154-156.—The Apostolic ideal was set forth, and within a few generations forgotten. The vision was only for a time and then vanished. "The kingdom of Christ, not being a kingdom of this world, is not limited by the restrictions which fetter other societies, political or religious. It is in the fullest sense free, comprehensive, universal. . . . It is most important that we should keep this ideal definitely in view, and I have therefore stated it as broadly as possible. Yet the broad statement, if allowed to stand alone, would suggest a false impression, or at least would convey only a half truth. It must be evident that no society of men could hold together without officers, without rules, without institutions of any kind; and the Church of Christ is not exempt from this universal law. The conception in short is strictly an ideal, which we must ever hold before our eyes. . . . Every member of the human family was potentially a member of the Church, and, as such, a priest of God. . . . It will hardly be denied, I think, by those who have studied the history of modern civilization with attention, that this conception of the Christian Church has been mainly instrumental in the emancipation of the degraded and oppressed, in the removal of artificial barriers between class and class, and in the diffusion of a general philanthropy untrammelled by the fetters of party or race; in short, that to it mainly must be attributed the most important advantages which constitute the superiority of modern societies over ancient. Consciously or unconsciously, the idea of an universal priesthood, of the religious equality of all men, which, though not untaught before, was first embodied in the Church of Christ, has worked and is working untold blessings in political institutions and in social life. But the careful student will also observe that this idea has hitherto been very imperfectly apprehended; that throughout the history of the Church it has been struggling for recognition, at most times discerned in some of its aspects but at all times wholly ignored in others; and that therefore the actual results are a very inadequate measure of its efficacy, if only it could assume due prominence and were allowed free scope in action. . . . It may be a general rule, it may be under ordinary circumstances a practically universal law, that the highest acts of

congregational worship shall be performed through the principal officers of the congregation. But an emergency may arise when the spirit and not the letter must decide. The Christian ideal will then . . . interpret our duty. The higher ordinance of the universal priesthood will overrule all special limitations. The layman will assume functions which are otherwise restricted to the ordained minister."—J. B. Lightfoot, *Dissertations on the Apostolic Age*, pp. 137-140, 237.—"No Church now existing is an exact counterpart of the Apostolic Church. . . . Allusions bear out the idea that the Church at Corinth was as yet almost structureless—little more than an aggregate of individuals—with no bishop, presbyter or deacon."—J. W. Cunningham, *Growth of the church in its organization and institutions*, pp. 73, 18.—"Some time before the middle of the second century heresy began sadly to distract the Christian community; and to avoid imminent danger of schism, it was deemed expedient in a few great towns to arm the chairman of the eldership with additional power. A modified form of prelacy was thus introduced."—W. D. Killen, *Old Catholic church*, p. 51.—Respecting the rise of the Episcopate as a distinct office there is a difference of opinion among scholars,—some holding that it was expressly ordained by the Apostles, others that it arose quite independently of them; a third class think that it was developed gradually out of the eldership, but not without the sanction of one or more of the Apostles. "For the Church is a catholic society, that is, a society belonging to all nations and ages. As a catholic society it lacks the bonds of the life of a city or a nation—local contiguity, common language, common customs. We cannot then very well conceive how its corporate continuity could have been maintained otherwise than through some succession of persons such as, bearing the apostolic commission for ministry, should be in each generation the necessary centres of the Church's life."—C. Gore, *Mission of the church*, pp. 10, 11.—"Jewish presbyteries existed already in all the principal cities of the dispersion, and Christian presbyteries would early occupy a not less wide area. . . . The name of the presbyter then presents no difficulty. But what must be said of the term bishop? . . . But these notices, besides establishing the general prevalence of episcopacy, also throw considerable light on its origin. They indicate that the relation suggested by the history of the word 'bishop' and its transference from the lower to the higher office is the true solution, and that the episcopate was created out of the presbytery. . . . They seem to hint also that, so far as this development was affected at all by national temper and characteristics, it was slower where the prevailing influences were more purely Greek, as at Corinth and Philippi and Rome, and more rapid where an Oriental spirit predominated, as at Jerusalem and Antioch and Ephesus. Above all, they establish this result clearly, that its maturer forms are seen first in those regions where the latest surviving Apostles (more especially St. John) fixed their abode, and at a time when its prevalence cannot be dissociated from their influence or their sanction."—J. B. Lightfoot, *Dissertations on the Apostolic Age*, pp. 151, 100, 101.—"Since then in the constitution of the church two elements met together—the aristocratic and the monarchical—it could not fail to be the case that a conflict would ensue between them. . . . These struggles between the presbyterial and episcopal systems belong among the most important phenomena connected with the process of the development of church life in the

third century. Many presbyters made a capricious use of their power, hurtful to good discipline and order in the communities."—A. Neander, *General history of the Christian religion and church*, v. 1, sect. 2.—"As a rule Christianity would get a footing first in the metropolis of its region. The lesser cities would be evangelized by missions sent from thence; and so the suffragan sees would look on themselves as daughters of the metropolitan see. The metropolitan bishop is the natural center of unity for the bishops of the province. . . . The bishops of the metropolitan sees acquired certain rights which were delegated to them by their brother bishops. Moreover, among the most important churches a certain order of precedence grew up which corresponded with the civil dignity of the cities in which those churches existed; and finally the churches which were founded by the apostles were treated with peculiar reverence."—F. W. Puller, *Primitive saints and the See of Rome*, pp. 11 and 18.—"The triumph of the episcopal system undoubtedly promoted unity, order, and tranquillity. But, on the other hand, it was unfavorable to the free development of the life of the church; and while the latter promoted the formation of a priesthood foreign to the essence of that development of the kingdom of God which the New Testament sets forth [see PRIESTHOOD: Christian priesthood from 1st century], on the other hand a revolution of sentiment which had already been prepared—an altered view of the idea of the priesthood—had no small influence on the development of the episcopal system. Thus does this change of the original constitution of the Christian communities stand intimately connected with another and still more radical change,—the formation of a sacerdotal caste in the Christian church. . . . Out of the husk of Judaism Christianity had evolved itself to freedom and independence,—had stripped off the forms in which it first sprang up, and within which the new spirit lay at first concealed, until by its own inherent power it broke through them. This development belonged more particularly to the Pauline position, from which proceeded the form of the church in the Gentile world. In the struggle with the Jewish elements which opposed the free development of Christianity, this principle had triumphantly made its way. In the churches of pagan Christians the new creation stood forth completely unfolded; but the Jewish principle, which had been vanquished, pressed in once more from another quarter. Humanity was as yet incapable of maintaining itself at the lofty position of pure spiritual religion. The Jewish position was better adapted to the mass, which needed first to be trained before it could apprehend Christianity in its purity,—needed to be disabused from paganism. Out of Christianity, now become independent, a principle once more sprang forth akin to the principles of the Old Testament,—a new outward shaping of the kingdom of God, a new discipline of the law which one day was to serve for the training of rude nations, a new tutorship for the spirit of humanity, until it should arrive at the maturity of the perfect manhood in Christ. This investiture of the Christian spirit in a form nearly akin to the position arrived at in the Old Testament, could not fail, after the fruitful principle had once more made its appearance, to unfold itself more and more, and to bring to light one after another all the consequences which it involved; but there also began with it a reaction of the Christian consciousness as it yearned after freedom, which was continually bursting forth anew in an endless variety of appearances, until

it attained its triumph at the Reformation."—A. Neander, *General history of the Christian religion and church*, v. 1, sect. 2, B.—"Though the forms of [pagan] religion had broken away, the spirit of religion was still quick; it had even developed: the sense of sin, an almost new phenomenon, began to invade Society and Philosophy; and along with this, an almost importunate craving after a revelation. The changed tone of philosophy, the spread of mysticism, the rapid growth of mystery-worship, the revived Platonism, are all articulate expressions of this need. The old Philosophy begins not only to preach but to pray; the new strives to catch the revealed voice of God in the oracles of less unfaithful days. . . . In the teeth of an organised and concentrated despotism a new society had grown up, self-supporting, self-regulated, self-governed, a State within the State. Calm and assured amid a world that hid its fears only in blind excitement, free amid the servile, sanguine amid the despairing, Christians lived with an object. United in loyal fellowship by sacred pledges more binding than the sacramentum of the soldier, welded together by a stringent discipline, led by trained and tried commanders, the Church had succeeded in attaining unity. It had proved itself able to command self-devotion even to the death. It had not feared to assimilate the choicest fruits of the choicest intellects of East and West. . . . Yet the centripetal forces were stronger; Tertullian had died an heresiarch, and Origen but narrowly and somewhat of grace escaped a like fate. If rent with schisms and threatened with disintegration, the Church was still an undivided whole."—G. H. Rendall, *Emperor Julian, Paganism and Christianity*, pp. 21-22.—"The designation of the Universal Christian Church as Catholic dates from the time of Irenaeus. . . . At the beginning of this age, the heretical as well as the non-heretical Ebionism may be regarded as virtually suppressed, although some scanty remnants of it might yet be found. The most brilliant period of Gnosticism, too, . . . was already passed. But in Manichæism there appeared, during the second half of the third century, a new peril of a no less threatening kind inspired by Parseism and Buddhism. . . . With Marcus Aurelius, Paganism outside of Christianity as embodied in the Roman State, begins the war of extermination against the Church that was ever more and more extending her boundaries. Such manifestation of hostility, however, was not able to subdue the Church. . . . During the same time the episcopal and synodal-hierarchical organization of the church was more fully developed by the introduction of an order of Metropolitans, and then in the following period it reached its climax in the oligarchical Pentarchy of Patriarchs, and in the institution of œcumenical Synods."—J. H. Kurtz, *Church history*, v. 1, pp. 72-73.

100-300.—Missionary efforts.—"Missionary effort in this period was mainly directed to the conversion of the heathen. On the ruins of Jerusalem, Hadrian's colony of Ælia Capitolina was planted; so that even there the Church, in its character and modes of worship, was a Gentile community. Christianity was early carried to Edessa, the capital of the small state of Osrhene, in Mesopotamia. After the middle of the second century, the Church at Edessa was sufficiently flourishing to count among its members the king, Abgar Bar Manu. At about this time the gospel

was preached in Persia, Media, Parthia, and Bactria. We have notices of churches in Arabia in the early part of the third century. [See ARABIA: Sabæans.] They were visited several times by Origen, the celebrated Alexandrian Church teacher (185-254). In the middle of the fourth century a missionary, Theophilus, of Diu, found churches in India. In Egypt, Christianity made great progress, especially at Alexandria, whence it spread to Cyrene and other neighboring places. In upper Egypt, where the Coptic language and the superstition of the people were obstacles in its path, Christianity had, nevertheless, gained a foothold as early as towards the close of the second century. At this time the gospel had been planted in pro-consular Africa, being conveyed thither from Rome, and there was a flourishing church at Carthage. [See AFRICA: Ancient and medieval civilization: Roman occupation.] In Gaul, where the Druidical system, with its priesthood and sacrificial worship, was the religion of the Celtic population, several churches were founded from Asia Minor. At Lyons and Vienne there were strong churches in the last quarter of the second century. At this time Irenæus, Bishop of Lyons, speaks of the establishment of Christianity in Germany, west of the Rhine, and Tertullian, the North African presbyter, speaks of Christianity in Britain. [See BRITAIN: 2d-3d centuries.] The fathers in the second century describe in glowing terms, and not without rhetorical exaggeration, the rapid conquests of the Gospel. The number of converts in the reign of Hadrian must have been very large. Otherwise we cannot account for the enthusiastic language of Justin Martyr respecting the multitude of professing Christians. Tertullian writes in a similar strain. Irenæus refers to Barbarians who have believed without having a knowledge of letters, through oral teaching merely."—G. P. Fisher, *History of the Christian church*, pp. 45-46.

100-300. — Church in Alexandria. — Struggle against agnosticism.—Clement and Origen.—"Christianity first began its activity in the country among the Jewish and Greek population of the Delta, but gradually also among the Egyptians proper (the Copts) as may be inferred from the Coptic (Memphytic) translation of the New Testament (third century). In the second century, Gnosticism [see GNOSTICS], which had its chief seat here as well as in Syria, and, secondly, towards the close of the century, the Alexandrian Catechetical School, show the importance of this centre of religious movement and Christian education."—W. Moeller, *History of the Christian church*, p. 105.—"Never perhaps has the free statement of the Christian idea had less prejudice to encounter than at Alexandria at the close of the second century. Never has it more successfully vindicated by argument its right to be the great interpreter of the human spirit. The institutions of the great metropolis were highly favourable to this result. The Museum, built by the Ptolemies, was intended to be, and speedily became, the centre of an intense intellectual life. The Serapeum, at the other end of the town, rivalled it in beauty of architecture and wealth of rare MSS. The Sebastion, reared in honour of Augustus, was no unworthy companion to these two noble establishments. In all three, splendid endowments and a rich professoriate attracted the talent of the world. If the ambition of a secured reputation drew many eminent men away to Rome, the means of securing such eminence were mainly procured at Alexandria. . . . The Christian Church in this city rose to the height of its grand oppor-

tunity. It entered the lists without fear and without favour, and boldly proclaimed its competence to satisfy the intellectual cravings of man. Numbers of restless and inquiring spirits came from all parts of the world, hoping to find a solution of the doubts that perplexed them. And the Church, which had already brought peace to the souls of the woman and the slave, now girded herself to the harder task of convincing the trained intelligence of the man of letters and the philosopher."—C. T. Cruttwell, *Literary history of early Christianity*, v. 2, bk. 4, ch. 1.—"The question . . . came up for decision towards the close of the sub-apostolic age, as to what shape the Church was finally to take. Two types were set before her to choose from—one the Hebrew-Latin type, as we may call it, into which . . . she finally settled down; the other the Hellenist type of a Demos, or commonwealth of free citizens, all equal, all alike kings and priests unto God, and whose moral and spiritual growth was left very much to the initiative of each member of the community. In Alexandria, as the meeting-point of all nationalities, and where Judaism itself had tried to set up a new type of thought, eclectic between Hebraism and Hellenism, and comprehending what was best in both, naturally enough there grew up a Christian type of eclecticism corresponding to that of Philo. . . . Into this seething of rival sects and races the Alexandrian school of catechists threw themselves, and made a noble attempt to rescue the Church, the synagogue, and the Stoics alike from the one bane common to all—the dangerous delusion that the truth was for them, not they for the truth. Setting out on the assumption that God's purpose was the education of the whole human family, they saw in the Logos doctrine of St. John the key to harmonise all truth, whether of Christian sect, Hebrew synagogue, or Stoic philosophy. . . . To educate all men up to this standard seemed to them the true ideal of the Church. True Gnosis was their keynote; and the Gnostic, as Clement loves to describe himself, was to them the pattern philosopher and Christian in one. They regarded, moreover, a discipline of at least three years as imperative; it was the preliminary condition of entrance into the Christian Church."—J. B. Heard, *Alexandrian and Carthaginian theology contrasted*, pp. 37-38.—The two great Christian writers of Alexandria were Clement and Origen. "The universal influence of Origen made itself felt in the third century over the whole field of Greek theology. In him, as it were, everything which had hitherto been striven after in the Greek field of theology, had been gathered together, so as, being collected here in a centre, to give an impulse in the most various directions; hence also the further development of theology in subsequent times is always accustomed to link itself on to one side or the other of his rich spiritual heritage. . . . And while this involves that Christianity is placed on friendly relations with the previous philosophical development of the highest conceptions of God and the world, yet on the other hand Christian truth also appears conversely as the universal truth which gathers together in itself all the hitherto isolated rays of divine truth. . . . In the great religious ferment of the time there was further contained the tendency to seek similar religious ideas amid the different mythological religious forms and to mingle them syncretistically. This religious ferment was still further increased by the original content of Christianity, that mighty leaven, which announced a religion destined to the redemption and perfecting of the world, and by this means a like direc-

tion and tendency was imparted to various other religious views likewise. The exciting and moving effect of Gnosticism on the Church depended at the same time on the fact that its representatives practically apprehended Christianity in the manner of the antique religious mysteries, and in so doing sought to lean upon the Christian communities and make themselves at home in them, according as their religious life and usages seemed to invite them, and to establish in them a community of the initiated and perfect; an endeavour which the powerful ascetic tendency in the church exploited and augmented in its own sense, and for which the institution of prophecy, which was so highly respected and powerful in the communities, afforded a handle. In this way the initiated were able to make for themselves a basis in the community on which they could depend, while the religio-philosophical speculations, which are always intelligible only to a few, at the same time propagated themselves and branched out scholastically."—W. Moeller, *History of the Christian church*, pp. 215, 213, 130-131.—"At Alexandria, Basilides (125) and Valentine exerted in turn an extraordinary influence; the latter endeavored to establish his school at Rome about the year 140. The Gnostics of Syria professed a more open dualism than those of Egypt. The Church of Antioch had to resist Saturnin, that of Edessa to oppose Bordesanes and Tatian."—E. De Cousin, *Early years of Christianity; martyrs and apologists*, p. 135.—"There was something very imposing in those mighty systems, which embraced heaven and earth. How plain and meagre in comparison seemed simple Christianity! There was something remarkably attractive in the breadth and liberality of Gnosticism. It seemed completely to have reconciled Christianity with culture. How narrow the Christian Church appeared! Even noble souls might be captivated by the hope of winning the world over to Christianity in this way. . . . Over against the mighty systems of the Gnostics, the Church stood, in sober earnestness and child-like faith, on the simple Christian doctrine of the Apostles. This was to be sought in the churches founded by the apostles themselves, where they had defined the faith in their preaching."—G. Uhlhorn, *Conflict of Christianity with heathenism*, bk. 2, ch. 3.—"Greek philosophy had joined hands with Jewish theosophy, and the Church knew not where to look for help. So serious did the danger seem, when it was assailed at once and from opposite sides by Jewish and Greek types of Gnosticism, the one from the monotheistic point of view impugning the Godhead, the other for the Docetic side explaining away [as a spiritual illusion] the manhood of Christ, that the Church, in despair of beating error by mere apology, fell back on the method of authority. The Church was the only safe keeper of the deposit of sacred tradition; whoever impugned that tradition, let him be put out of the communion of saints."—Rev. J. B. Heard, *Alexandrian and Carthaginian theology contrasted*, p. 41.—"The interest, the meaning, of Gnosticism rest entirely upon its ethical motive. It was an attempt, a serious attempt, to fathom the dread mystery of sorrow and pain, to answer that spectral doubt, which is mostly crushed down by force—Can the world as we know it have been made by God? 'Cease,' says Basilides, 'from idle and curious variety, and let us rather discuss the opinions, which even barbarians have held, on the subject of good and evil.' 'I will say anything rather than admit that Providence is wicked.' Valentinus describes in the strain of an ancient prophet the woes that afflict mankind, 'I durst

not affirm,' he concludes, 'that God is the author of all this.' So Tertullian says of Marcion, 'like many men of our time, and especially the heretics, he is bewildered by the question of evil.' They approach the problem from a non-Christian point of view, and arrive therefore at a non-Christian solution. . . . Many of them, especially the later sectaries, accepted the whole Christian Creed, but always with reserve. The teaching of the Church thus became in their eyes a popular exoteric confession, beneath their own Gnosis, or Knowledge, which was a Mystery, jealously guarded from all but the chosen few."—C. Bigg, *Christian platonists of Alexandria*, pp. 28-29.

100-300.—Syrian churches.—Cæsarea.—Edessa.—Rural Palestine.—"The chief points of interest in the history of the Church of Cæsarea during this period are the residence of Origen there (first between A. D. 215 and 219 and again after his final departure from Alexandria in 231), the education of Eusebius, the foundation of the great library by Pamphilus, and the martyrdoms during the Diocletian persecution. Most of these will come before us again in other connexions, but they require mention here. It would be difficult to over-estimate the effect of what they imply on the Church at large. Had the work of Origen, Pamphilus, and Eusebius at Cæsarea remained unrecorded, there would be a huge blank in ecclesiastical history, rendering much that is otherwise known scarcely intelligible. Had that work never been done, the course of ecclesiastical history would have been very different. In the whole of the second and third centuries it would be difficult to name two more influential Christians than Origen and Eusebius; and Pamphilus laboured earnestly to preserve and circulate the writings of the one and to facilitate those of the other. It was from the libraries of Pamphilus at Cæsarea and of Alexander at Jerusalem that Eusebius obtained most of his material. . . . [for his 'Ecclesiastical History,' which has preserved titles and quotations from many lost books of exceeding value]."—A. Plummer, *Church of the early fathers*, ch. 3.

"Edessa (the modern Urfa) was from the beginning of the third century one of the chief centres of Syrian Christian life and theological study. For many years, amid the vicissitudes of the theological persecution, a series of flourishing theological schools were maintained there, one of which (the 'Persian school') is of great importance as the nursery of Nestorianism in the extreme East. It was as bishop of Edessa, also, that Jacob Baradaeus organized [during the sixth century] the monophysite churches into that Jacobite church of which he is the hero. From the scholars of Edessa came many of the translations which carried Greek thought to the East, and in the periods of exciting controversy Edessa was within the range of the theological movements that stirred Alexandria and Constantinople. The 'Chronicle of Edessa,' as it is called because the greater number of its notices relate to Edessene affairs, is a brief document in Syriac contained in a manuscript of six leaves in the Vatican library. It is one of the most important fundamental sources for the history of Edessa, contains a long official narrative of the flood of A. D. 201, which is perhaps the only existing monument of heathen Syriac literature, and includes an excellent and very carefully dated list of the bishops of Edessa from A. D. 313 to 543."—*Andover Review*, v. 19, p. 374.—The Syriac versions (of the Gospel) form a group of which mention should undoubtedly be made. The Syriac versions of the Bible (Old Testament) are among the most ancient remains of the language,

the Syriac and the Chaldee being the two dialects of the Aramaean spoken in the North. Of versions of the New Testament, 'the Peshito' or the 'Simple,' though not the oldest text, has been the longest known. . . . The 'Curetonian' . . . was discovered after its existence had been for a long time suspected by sagacious scholars [but is not much more than a series of fragments]. . . . Cureton, Tregelles, Alford, Ewald, Bleek, and others, believe this text to be older than the Peshito [which speaks for the Greek text of the second century, though its own date is doubtful]. . . . Other valuable Syriac versions are 'Pseudo-lexian' . . . and the 'Jerusalem Syriac Lectionary' . . . a service-book with lessons from the Gospels for Sundays and feast days throughout the year . . . written at Antioch in 1030 in a dialect similar to that in use in Jerusalem and from a Greek text of great antiquity. [A recent discovery renders these facts and statements of peculiar interest.]—G. E. Merrill, *Story of the manuscripts*, ch. 10.

"If Ebionism [see EBIONISM] was not primitive Christianity, neither was it a creation of the second century. As an organization, a distinct sect, it first made itself known, we may suppose, in the reign of Trajan: but as a sentiment, it had been harboured within the Church from the very earliest days. Moderated by the personal influence of the Apostles, soothed by the general practice of their church, not yet forced into declaring themselves by the turn of events, though scarcely tolerant of others, these Judaizers were tolerated for a time themselves. The beginning of the second century was a winnowing season in the Church of the Circumcision. . . . It is a probable conjecture, that after the destruction of Jerusalem the fugitive Christians, living in their retirement in the neighbourhood of the Essene settlements, received large accessions to their numbers from this sect, which thus inoculated the Church with its peculiar views. It is at least worthy of notice, that in a religious work emanating from this school of Ebionites the 'true Gospel' is reported to have been first propagated 'after the destruction of the holy place.'—J. B. Lightfoot, *Dissertations on the Apostolic Age*, pp. 73-80.

100-300.—Church in Carthage and Rome.—"If the world is indebted to Rome for the organisation of the Church, Rome is indebted to Carthage for the theory on which that organisation is built. The career of Carthage as a Christian centre exemplifies the strange vicissitudes of history. The city which Rome in her jealousy had crushed, which, not content with crushing, she had obliterated from the face of the earth, had at the bidding of Rome's greatest son risen from her ashes, and by her career almost verified the poet's taunt that the greatness of Carthage was reared on the ruin of Italy. For in truth the African capital was in all but political power no unworthy rival of Rome. It had steadily grown in commercial prosperity. Its site was so advantageous as to invite, almost to compel, the influx of trade, which ever spontaneously moves along the line of least resistance. And the people were well able to turn this natural advantage to account. A mixed nationality, in which the original Italian immigration lent a steadying force to the native Punic and kindred African elements that formed its basis, with its intelligence enriched by large accessions of Greek settlers from Cyrene and Alexandria—Carthage had developed in the second century of our era into a community at once wealthy, enterprising and ambitious. . . . It was no longer in the sphere of profane literature, but in

her contributions to the cause of Christianity and the spiritual armoury of the Church, that the proud Queen of Africa was to win her second crown of fame. . . . The names of Tertullian, Cyprian and Augustine, at once suggest the source from which Papal Rome drew the principles of Church controversy, Church organisation, and Church doctrine, which have consolidated her authority, and to some extent justified her pretensions to rule the conscience of Christendom."—C. T. Cruttwell, *Literary history of early Christianity*, v. 2, bk. 5, ch. 2.—"At the end of the second century the African Tertullian first began to wrestle with the difficulties of the Latin language in the endeavour to make it a vehicle for the expression of Christian ideas. In reading his dogmatic writings the struggle is so apparent that it seems as though we beheld a rider endeavouring to discipline an unbroken steed. Tertullian's doctrine is, however, still wholly Greek in substance, and this continued to be the case in the church of the Latin tongue until the end of the fourth century. Hilary, Ambrose, even Jerome, are essentially interpreters of Greek philosophy and theology to the Latin West. With Augustine learning begins to assume a Latin form, partly original and independent—partly, I say, for even later compositions are abundantly interwoven with Greek elements and materials. Very gradually from the writings of the African fathers of the church does the specific Latin element come to occupy that dominant position in Western Christendom, which soon, partly from self-sufficient indifference, partly from ignorance, so completely severed itself from Greek influences that the old unity and harmony could never be restored. Still the Biblical study of the Latins is, as a whole, a mere echo and copy of Greek predecessors."—J. J. I. von Döllinger, *Studies in European history*, pp. 170-171.—From Carthage which was afterward the residence of "the primate of all Africa . . . the Christian faith soon disseminated throughout Numidia, Mauritania and Getulia, which is proved by the great number of bishops at two councils held at Carthage in 256 and 308. At the latter there were 270 bishops, whose names are not given, but at the former were bishops from (87) . . . cities."—J. E. T. Wilsch, *Handbook of the geography and statistics of the church*.—See also AFRICA: Ancient and medieval civilization: Roman occupation.

"In the West, Rome remains and indeed becomes ever more and more the 'sedes Apostolica,' by far the most important centre where, alongside of the Roman element, there are to be found elements streaming together from all points of the Empire. Greek names, and the long lasting (still dominant in the second century) maintenance of Greek as the written language of Roman Christianity are here noteworthy. . . . Rome was the point of departure not only for Italy and the Western Provinces, but without doubt also for Proconsular Africa, where in turn Carthage becomes the centre of diffusion. . . . The diffusion in the Græco-Roman world as a whole goes first to the more important towns and from these gradually over the country. . . . The instruments however of this mission are by no means exclusively apostolic men, who pursue missions as their calling; . . . every Christian becomes a witness in his own circle, and intercourse and trade bring Christians hither and thither, and along with them their Christian faith."—W. Moeller, *History of the Christian church*, pp. 105-107.—"It has been contended, and many still believe, that in ancient Rome the doctrines of Christ found no proselytes, except among the lower and poorer classes of

citizens. . . . The gospel found its way also to the mansions of the masters, nay, even to the palace of the Cæsars. The discoveries lately made on this subject are startling, and constitute a new chapter in the history of imperial Rome. . . . A difficulty may arise in the mind of the reader: how was it possible for these magistrates, generals, consuls, officers, senators, and governors of provinces, to attend to their duties without performing acts of idolatry? . . . The Roman emperors gave plenty of liberty to the new religion from time to time; and some of them, moved by a sort of religious syncretism, even tried to ally it with the official worship of the empire, and to place Christ and Jupiter on the steps of the same 'lararium.' . . . We must not believe that the transformation of Rome from a pagan into a Christian city was a sudden and unexpected event, which took the world by surprise. [See IDOLATRY AND IMAGE WORSHIP: In Christianity: 2d and 6th centuries.] It was the natural result of the work of three centuries, brought to maturity under Constantine by an inevitable reaction against the violence of Diocletian's rule. It was not a revolution or a conversion in the true sense of these words; it was the official recognition of a state of things which had long ceased to be a secret. The moral superiority of the new doctrines over the old religions was so evident, so overpowering, that the result of the struggle had been a foregone conclusion since the age of the first apologists. The revolution was an exceedingly mild one, the transformation almost imperceptible. . . . The transformation may be followed stage by stage in both its moral and material aspect. There is not a ruin of ancient Rome that does not bear evidence of the great change. . . . Rome possesses authentic remains of the 'houses of prayer' in which the gospel was first announced in apostolic times. . . . A very old tradition, confirmed by the 'Liber Pontificalis,' describes the modern church of S. Pudentiana as having been once the private house of the same Pudens who was baptized by the apostles, and who is mentioned in the epistles of S. Paul. . . . The connection of the house with the apostolate of SS. Peter and Paul made it very popular from the beginning. . . . Remains of the house of Pudens were found in 1870. They occupy a considerable area under the neighboring houses. . . . Among the Roman churches whose origin can be traced to the hall of meeting, besides those of Pudens and Prisca already mentioned, the best preserved seems to be that built by Demetrias at the third mile-stone of the Via Latina, near the 'painted tombs.' . . . The Christians took advantage of the freedom accorded to funeral colleges, and associated themselves for the same purpose, following as closely as possible their rules concerning contributions, the erection of lodges, the meetings, and the . . . love feasts; and it was largely through the adoption of these well-understood and respected customs that they were enabled to hold their meetings and keep together as a corporate body through the stormy times of the second and third centuries. Two excellent specimens of scholæ connected with Christian cemeteries and with meetings of the faithful have come down to us, one above the Catacombs of Callixtus, the other above those of Soter." This formation of Christian communities into colleges is an important fact, and connects these Christian societies with one of the social institutions of the Empire which may have influenced the church as an organization. "The experience gained in twenty-five years of active exploration in ancient Rome, both above

and below ground, enables me to state that every pagan building which was capable of giving shelter to a congregation was transformed, at one time or another, into a church or a chapel. . . . From apostolic times to the persecution of Domitian, the faithful were buried, separately or collectively, in private tombs which did not have the character of a Church institution. These early tombs, whether above or below ground, display a sense of perfect security, and an absence of all fear or solicitude. This feeling arose from two facts: the small extent of the cemeteries, which secured to them the rights of private property, and the protection and freedom which the Jewish colony in Rome enjoyed from time immemorial. . . . From the time of the apostles to the first persecution of Domitian, Christian tombs, whether above or below ground, were built with perfect impunity and in defiance of public opinion. We have been accustomed to consider the catacombs of Rome as crypts plunged in total darkness, and penetrating the bowels of the earth at unfathomable depths. This is, in a certain measure, the case with those catacombs, or sections of catacombs, which were excavated in times of persecution; but not with those belonging to the first century. [See CATACOMBS OF ROME.] The cemetery of these members of Domitian's family who had embraced the gospel—such as Flavius Clemens, Flavia Domitilla, Plautilla, Petronilla, and others—reveals a bold example of publicity. . . . How is it possible to imagine that the primitive Church did not know the place of the death of its two leading apostles? In default of written testimony let us consult monumental evidence. There is no event of the imperial age and of imperial Rome which is attested by so many noble structures, all of which point to the same conclusion,—the presence and execution of the apostles in the capital of the empire."—R. Lanciani, *Pagan and Christian Rome*, ch. 1, 3 and 7.—The Church at Rome "gave no illustrious teachers to ancient Christianity. . . . All the greatest questions were debated elsewhere. . . . By a sort of instinct of race, [it] occupied itself far more with points of government and organization than of speculation. Its central position, in the capital of the empire, and its glorious memories, guaranteed to it a growing authority."—E. De Pressensé, *Early years of Christianity: the martyrs and apologists*, p. 41.

100-300.—Church in Gaul and Spain.—"Of the history of the Gallican Churches before the middle of the second century we have no certain information. It seems fairly probable indeed that, when we read in the Apostolic age of a mission of Crescens to 'Galatia' or 'Gaul,' the western country is meant rather than the Asiatic settlement which bore the same name; and, if so, this points to some relations with St. Paul himself. But, even though this explanation should be accepted, the notice stands quite alone. Later tradition indeed supplements it with legendary matter, but it is impossible to say what substratum of fact, if any, underlies these comparatively recent stories. The connection between the southern parts of Gaul and the western districts of Asia Minor had been intimate from very remote times. Gaul was indebted for her earliest civilization to her Greek settlements like Marseilles, which had been colonized from Asia Minor some six centuries before the Christian era; and close relations appear to have been maintained even to the latest times. During the Roman period the people of Marseilles still spoke the Greek language familiarly along with the vernacular Celtic of the native population and the official Latin of the dominant power.

When therefore Christianity had established her headquarters in Asia Minor, it was not unnatural that the Gospel should flow in the same channels which already conducted the civilization and the commerce of the Asiatic Greeks westward. At all events, whatever we may think of the antecedent probabilities, the fact itself can hardly be disputed. In the year 177, under Marcus Aurelius, a severe persecution broke out on the banks of the Rhone in the cities of Vienne and Lyons—a persecution which by its extent and character bears a noble testimony to the vitality of the Churches in these places. To this incident we owe the earliest extant historical notice of Christianity in Gaul.—J. B. Lightfoot, *Essays on the work entitled supernatural Religion*, pp. 251-252.—“The Churches of proconsular Africa, of Spain, of Italy, and of Southern Gaul constitute, at this period, the Western Church, so different in its general type from the Eastern

that country.”—J. E. T. Wiltch, *Handbook of the geography and statistics of the church*, pp. 40-41.

100-300.—British or Celtic church.—“All that we can safely assert is that there is some reason for believing that there were Christians in Britain before A.D. 200. Certainly there was a British Church with bishops of its own soon after A.D. 300, and possibly some time before that. Very little can be known about this Celtic Church; but the scanty evidence tends to establish three points, (1) It had its origin from, and remained largely dependent upon, the Gallic Church. (2) It was confined almost exclusively to Roman settlements. (3) Its numbers were small and its members were poor. . . . That Britain may have derived its Christianity from Asia Minor cannot be denied;

INTRODUCTION OF CHRISTIANITY INTO BRITAIN, A. D. 177

(After painting by J. R. Herbert)

With the exception of Irenaeus [bishop of Lyons] and Hippolytus [the first celebrated preacher of the West, of Italy and, for a period, Lyons] who represent the oriental element in Gaul and at Rome, the Western Fathers are broadly distinguished from those of the East. . . . They affirm rather than demonstrate; . . . they prefer practical to speculative questions. The system of episcopal authority is gradually developed with a larger amount of passion at Carthage, with greater prudence and patience in Italy.”—E. De Pressense, *Early years of Christianity: the martyrs and apologists*.

“Christians are generally mentioned as having existed in all parts of Spain at the close of the second century; before the middle of the third century there is a letter of the Roman bishop Anterus (in 237) to the bishops of the provinces of Betica and Toletana; . . . and after the middle of the same century a letter of Cyprian’s was addressed to . . . people . . . in the north . . . as well as . . . in the south of

but the peculiar British custom respecting Easter must not be quoted in evidence of it. It seems to have been a mere blunder, and not a continuation of the old Quarta-deciman practice. Gaul is the more probable parent of the British Church. . . . At the Council of Rimini in 350 Constantius offered to pay out of the treasury the travelling expenses of all the bishops who attended. Out of more than four hundred bishops, three from Britain were the only clergy who availed themselves of this offer. Neither at Rimini, any more than at Arles, do the British representatives make any show; they appear to be quite without influence.”—A. Plummer, *Church of the early fathers*, ch. 8.—See also BRITAIN: 2d-3d centuries; CELTIC CHURCH: 176-597.

238-400.—Conversion of the Goths.—Ulfilas and the Gothic church.—Influence of the West on the development of Christianity.—“It has been observed that the first indisputable appearance of the Goths in European history must be dated in A.D. 238, when they laid waste the

South-Danubian province of Moesia as far as the Black Sea. In the thirty years (238-269) that followed, there took place no fewer than ten such inroads. . . . From these expeditions they returned with immense booty,—corn and cattle, silks and fine linen, silver and gold, and captives of all ranks and ages. It is to these captives, many of whom were Christians, and not a few clergy, that the introduction of Christianity among the Goths is primarily due. . . . The period of the inroads, which so strangely formed a sowing-time for Christianity, was followed by a long period of tranquillity, during which the new faith took root and spread. . . . It is to the faithful work and pure lives of [Christian] men . . . who had fled from Roman civilisation for conscience' sake, to the example of patience in misfortune and high Christian character displayed by the captives, and to the instruction of the presbyters sprinkled among them, that we must look, as the source of Christianity among the Goths. . . . The fact (to which we shall have to refer later), that, of all the sea raids undertaken by the Goths between the years 238 and 260, the Visigoths took part in only two, while the Ostrogoths, who were settled in Southern Russia along the coast of the Euxine from the Crimea to the Dniester, were engaged probably in all of them, makes it very unlikely that the captives mentioned by Philostorgius were carried anywhere else than the eastern settlements. To the influence of these Asian Christians, exerted mainly, if not entirely upon the Ostrogoths, must be added the ever-increasing intercourse carried on by sea between the Crimea and both the southern shore of the Euxine and Constantinople. To these probabilities has now to be added the fact that the only traces of an organised Gothic Church existing before the year 341 are clearly to be referred to a community in this neighbourhood. Among the bishops who were present at the Council of Nicaea (A. D. 325), and who signed the symbol which was then approved, we find a certain Theophilus, before whose name stands the words, 'de Gothis,' and after it the word 'Bosphoritanus.' There can be little doubt that this was a bishop representing a Gothic Church on the Cimmerian Bosphorus; and if, following the Paris MSS., we read further down the list the name *Domnus Bosphorensis* or *Bosphoranus*, we may find here another bishop from this diocese, and regard Theophilus as chief or arch-bishop of the Crimean churches. The undoubted presence at this council of at least one bishop of the Goths, and the conclusion drawn therefrom in favour of the orthodoxy of the Gothic Church in general, led afterwards to the greatest confusion. Failing to distinguish between the Crimean and Danubian communities, the historians often found their information contradictory, and altered it in the readiest way to suit the condition of the Church which they had specially in view. . . . The conversion of that section of the nation, which became the Gothic Church, was due to the apostolic labours of one of their own race,—the great missionary bishop *Ulphilas* [see *GOths*: 341-381]. But to him too was to be traced the heresy in which they stopped short on the way from heathenism to a complete Christian faith."—C. A. A. Scott, *Ulphilas, apostle of the Goths*, pp. 19-30.—"The superstitions of the barbarians, who had found homes in the empire, had been exchanged for a more wholesome belief. But Christianity had done more than this. It had extended its influence to the distant East and South, to Abyssinia, and the tribes of the Syrian and Lybian deserts, to Armenia, Persia, and India."—G. P. Fisher, *History of the Christian*

church, p. 08.—"We have before us many significant examples of the facility with which the most intelligent of the Pagans accepted the outward rite of Christian baptism, and made a nominal profession of the Faith, while they retained and openly practiced, without rebuke, without remark, with the indulgence even of genuine believers, the rites and usages of the Paganism they pretended to have abjured. We find abundant records of the fact that personages high in office, such as consuls and other magistrates, while administering the laws by which the old idolatries were proscribed, actually performed Pagan rites and even erected public statues to Pagan divinities. Still more did men, high in the respect of their fellow-Christians, allow themselves to cherish sentiments utterly at variance with the definitions of the Church."—C. Merivale, *Four lectures on some epochs of early church history*, p. 150.—"We look back to the early acts and policy of the Church towards the new nations, their kings and their people; the ways and works of her missionaries and lawgivers, *Ulphilas* among the Goths, *Augustine* in Kent, *Remigius* in France, *Boniface* in Germany, *Anschar* in the North, the Irish *Columban* in Burgundy and Switzerland, *Benedict* at Monte Cassino; or the reforming kings, the Arian *Theodoric*, the great German *Charles*, the great English *Alfred*. Measured by the light and the standards they have helped us to attain to, their methods no doubt surprise, disappoint—it may be, revolt us; and all that we dwell upon is the childishness, or the imperfect morality, of their attempts. But if there is anything certain in history, it is that in these rough communications of the deepest truths, in these [for us] often questionable modes of ruling minds and souls, the seeds were sown of all that was to make the hope and the glory of the foremost nations. . . . I have spoken of three other groups of virtues which are held in special regard and respect among us—those connected with manliness and hard work, with reverence for law and liberty, and with pure family life. The rudiments and tendencies out of which these have grown appear to have been early marked in the German races; but they were only rudiments, existing in company with much wilder and stronger elements, and liable, amid the changes and chances of barbarian existence, to be paralysed or trampled out. No mere barbarian virtues could by themselves have stood the trial of having won by conquest the wealth, the lands, the power of Rome. But their guardian was there. What Christianity did for these natural tendencies to good was to adopt them, to watch over them, to discipline, to consolidate them. The energy which warriors were accustomed to put forth in their efforts to conquer, the missionaries and ministers of Christianity exhibited in their enterprises of conversion and teaching. The crowd of unknown saints whose names fill the calendars, and live, some of them, only in the titles of our churches, mainly represent the age of heroic spiritual ventures, of which we see glimpses in the story of *St. Boniface*, the apostle of Germany; of *St. Columban* and *St. Gall*, wandering from Ireland to reclaim the barbarians of the Burgundian deserts and of the shores of the Swiss lakes. It was among men like these—men who were then termed emphatically 'men of religion'—that the new races saw the example of life ruled by a great and serious purpose, which yet was not one of ambition or the excitement of war; a life of deliberate and steady industry, of hard and uncomplaining labour; a life as full of activity in peace, of stout and brave work, as a warrior's was wont to be in the camp,

on the march, in the battle. It was in these men and in the Christianity which they taught, and which inspired and governed them, that the fathers of our modern nations first saw exemplified the sense of human responsibility, first learned the nobleness of a ruled and disciplined life, first enlarged their thoughts of the uses of existence, first were taught the dignity and sacredness of honest toil. These great axioms of modern life passed silently from the special homes of religious employment to those of civil; from the cloisters and cells of men who, when they were not engaged in worship, were engaged in field-work or book-work,—clearing the forest, extending cultivation, multiplying manuscripts—to the guild of the craftsman, the shop of the trader, the study of the scholar. Religion generated and fed these ideas of what was manly and worthy in man."—R. W. Church, *Gifts of civilisation*, pp. 270-283.—"Turning from the stagnant East a student seeks to know what differentiates Western and Eastern Christianity. No difference is found in the formulation of trinitarian and christological doctrine. The West in fact furnished the terminology adopted in the ecumenical creeds. The West also shows a similar fusion of Christianity with elements of paganism, Roman or Teutonic. Pagan shrines, rites, and festivals were Christianized in name. Christmas, Easter, Whitsuntide had usages of pagan origin, and the saints are obviously successors to the pagan gods. It was in fact by this blending with Teutonic elements that Christianity became the religion of the masses. . . . The fact of a significant difference may be seen in the varied and powerful moral personalities of Western history, whose personal energy and rich individuality apparently center in the strength of their religious consciousness. To know the mediæval period one must gain intimacy with these remarkable types of human character: Gregory I, Hildebrand, Bernard of Clairvaux, Francis of Assisi—men who enrich our conception of human possibility. More broadly, the whole life of the West shows that religion did not suppress or conventionalize diversified human power in men of varied talents; Charlemagne, Arnold of Brescia, Frederick II, Abelard, Aquinas, Dante. Is this related to the higher valuation in the West of Christ's human personality as compared with the Greek church, where Jesus vanished into a vague, abstract humanity, attaining personality only in the Logos, and where ritualistic or monastic mysticism rested upon a pantheistic conception? It is in the West that we hear of Christ as *mediator tanquam homo* (Augustine), of the love of the human Jesus as prior to mystical ecstasy (Bernhard), of the apostolic life as the ideal (Arnold, Francis, Waldensians), of the *Imitatio Christi* (à Kempis), of the devotions of the Stations of the Cross. The play of the religious consciousness as awe and self-submission to One who is holy through righteousness, the type of religious consciousness by which the Hebrew prophets reached ethical monotheism and Jesus found the fatherhood of love in God—this seems to resume its sway more distinctly in the Western development. The East dealt with categories of substance or nature. The West talked of the will, the tragedy of the divided will, the perfection of the will in *caritas*. The Western soul vibrated more to the ethical note. There was more homesickness for the morally perfect. If the Greek church developed that aspect of Paul's thought which is now seen to be related, in expression at least, to the sacramentalism of mystery-cults, the West began with Augustine to understand that other Paulinism which wrestled with

the problems of guilt and forgiveness, of law, of merit, of justification by faith. It is Augustine who first makes us understand Christianity as 'the religion of personality,' and Harnack's chapter on Augustine as 'The Reformer of Piety' (*History of dogma*, Vol. V) is a good basis for all sympathetic understanding of the best in Western religion."—G. B. Smith, *Guide to the study of the Christian religion*, p. 342.

312-337.—The Church and the empire.—Conversion of Constantine.—Conquest of the pagans by arms.—Constantine and the organization of the church.—Patriarchal system.—Christian conquest political rather than moral.—"Shortly after the beginning of the fourth century there occurred an event which, had it been predicted in the days of Nero or even of Decius, would have been deemed a wild fancy. It was nothing less than the conversion of the Roman Emperor to the Christian faith. It was an event of momentous importance in the history of the Christian religion. The Roman empire, from being the enemy and persecutor of the Church, thenceforward became its protector and patron. The Church entered into an alliance with the State, which was to prove fruitful of consequences, both good and evil, in the subsequent history of Europe. Christianity was now to reap the advantages and incur the dangers arising from the friendship of earthly rulers and from a close connection with the civil authority. Constantine was born in 274. He was the son of Constantius Chlorus. His mother, Helena, was of obscure birth. She became a Christian—whether before or after his conversion, is doubtful. . . . After the death of Constantine's father, a revolt against Galerius augmented the number of emperors, so that, in 308, not less than six claimed to exercise rule. The contest of Constantine was at first in the West, against the tyrannical and dissolute Maxentius. It was just before his victory over this rival at the Milvian Bridge, near Rome, that he adopted the Christian faith. That there mingled in this decision, as in most of the steps of his career, political ambition, is highly probable. The strength of the Christian community made it politic for him to win its united support. But he sincerely believed in the God whom the Christians worshipped, and in the help which, through his providence, he could lend to his servants. . . . Shortly before his victory over Maxentius there occurred what he asserted to be the vision of a flaming cross in the sky, seen by him at noonday, on which was the inscription, in Greek, 'By this conquer.' It was, perhaps, an optical illusion, the effect of a parheliion beheld in a moment when the imagination . . . was strongly excited. He adopted the labarum, or the standard of the cross, which was afterwards carried in his armies. [See ROME:

Empire: 323.] In later contests with Licinius, the ruler in the East, who was a defender of paganism, Constantine became more distinctly the champion of the Christian cause. The final defeat of Licinius, in 323, left him the master of the whole Roman world. An edict signed by Galerius, Constantine, and Licinius, in 311, had proclaimed freedom and toleration in matters of religion. The edict of Milan, in 312, emanating from the two latter, established unrestricted liberty on this subject. If we consider the time when it was issued, we shall be surprised to find that it alleges as a motive for the edict the sacred rights of conscience."—G. P. Fisher, *History of the Christian church*, pp. 87-88.—"Towards the end of the year Constantine left Rome for Milan, where he met Licinius. This meeting resulted in the issue of the famous edict of Milan. Up to that hour Christianity had been an 'illicita religio,' and it was a crime to be a Christian. Even in Trajan's answer to Pliny this position is assumed, though it forms the basis of humane regulations. The edict of Milan is the charter of Christianity; it proclaims absolute freedom in the matter of religion. Both Christians and all others were to be freely permitted to follow whatsoever religion each might choose. Moreover, restitution was to be made to the Christian body of all churches and other buildings which had been alienated from them during the persecution. This was in 313 A.D. [See also ROMÉ: Empire: 313.] . . . But the causes of dissension remained behind. Once more (323) the question between paganism and Christianity was to be tried on the field of battle, and their armies confronted one another on the plains of Hadriano. Again the skill of Constantine and the trained valour of his troops proved superior to the undisciplined levies of Licinius; while at sea Crispus, the eldest and ill-fated son of Constantine, destroyed the enemy's fleet in the crowded waters of the Hellespont, sowing thereby the seeds of his father's jealousy. Byzantium fell, but not without a vigorous resistance; and, after one more crushing defeat on the site of the modern Scutari, Licinius submitted himself to the mercy of Constantine. . . . What we notice in the whole of these events is the enormous power which still belonged to paganism. The balance still wavered between paganism and Christianity. . . . Constantine had now, by a marvellous succession of victories, placed himself in a position of supreme and undisputed power. At this juncture it is of interest to observe that . . . the divided empire, which followed the reign of Constantine, served to sustain Catholicity at least in one half of the world. . . . The foundation of Constantinople was the outward symbol of the new monarchy and of the triumph of Christianity. . . . The choice of this incomparable position for the new capital of the world remains the lasting proof of Constantine's genius. . . . The magnificence of its public buildings, its treasures of art, its vast endowments, the beauty of its situation, the rapid growth of its commerce, made it worthy to be 'as it were a daughter of Rome herself.' But the most important thought for us is the relation of Constantinople to the advance of Christianity. That the city which had sprung into supremacy from its birth and had become the capital of the conquered world, should have excluded from the circuit of its walls all public recognition of polytheism, and made the Cross its most conspicuous ornament, and the token of its greatness, gave a reality to the religious revolution. . . . The imperial centre of the world had been visibly displaced."—A. Carr, *Church*

and the Roman empire, ch. 4.—With the first General Council of the Church, held at Nicæa, 325 (see NICÆA: 325), "the decisions . . . of which received the force of law from the confirmation of the Emperor, a tendency was entered upon which was decisive for the further development; decisive also by the fact that the Emperor held it to be his duty to compel subordination to the decisions of the council on penalty of banishment, and actually carried out this banishment in the case of Arius and several of his adherents. The Emperor summoned general synods, the fiscus provided the cost of travel and subsistence (also at other great synods), an imperial commissioner opened them by reading the imperial edict, and watched over the course of business. Only the bishops and their appointed representatives had votes. Dogmatic points fixed . . . were to be the outcome of unanimous agreement, the rest of the ordinances (on the constitution, discipline and worship) of a majority of votes."—W. Moeller, *History of the Christian church*, p. 337.—"The direct influence of the emperor, however, does not appear until the Emperor Marcian procured from the Council of Chalcedon the completion of the Patriarchal system. Assuming that Rome, Alexandria, and Antioch were Patriarchates by the recognition of their privileges at the Council of Nicæa (though the canon of that council does not really admit that inference), the Council of Chalcedon, by its ninth, seventeenth and twenty-eighth canons, enlarged and fixed the patriarchal jurisdiction and privileges of the Church of Constantinople, giving it authority over the Dioceses of Thrace, Asia and Pontus, with the power of ordaining and requiring canonical obedience from the metropolis of those Dioceses, and also the right to adjudicate appeals in causes ecclesiastical from the whole Eastern Church. The Bishop of Jerusalem also obtained in this council patriarchal authority over Palestine. The organization of the Church was thus conformed to that of the empire, the patriarchs corresponding to the Prætorian Prefects, the exarchs, to the governors of the Dioceses, and the metropolitans to the governors of the provinces—the Bishop of Rome being given by an edict of Valentinian III., of the year 445, supreme appellate jurisdiction in the West, and the Bishop of Constantinople, by these canons of Chalcedon, supreme appellate jurisdiction in the East. . . . Dean Milman remarks that the Episcopate of St. John Chrysostom was the last attempt of a bishop of Constantinople to be independent of the political power, and that his fate involved the freedom of the Church of that city."—J. H. Egar, *Christendom: ecclesiastical and political, from Constantine to the reformation*, pp. 25-27.—"The name of patriarch, probably borrowed from Judaism, was from this period the appellation of the highest dignitaries of the church, and by it were more immediately, but not exclusively, designated the bishops of Constantinople, Alexandria, Antioch, and Jerusalem. One patriarch accordingly presided over several provinces, and was distinguished from the metropolitan in this, that the latter was subordinate to him, and had only the superintendence of one province or a small district. However the designation applied only to the highest rulers of the church in the east, and not to those in the west, for here the title of patriarch was not unfrequently given, even in later times, to the metropolitan. The first mention of this title occurs in the second letter of the Roman bishop, Anacletus, at the beginning of the second century, and it is next spoken of by Socrates; and after the Council of Chalcedon, in 451, it came into general use.

The bishop of Constantinople bore the special title of œcumenical bishop or patriarch; there were also other titles in use among the Nestorians and Jacobites. The Primates and Metropolitans or Archbishops arose contemporaneously. The title of Eparch is also said to have been given to primates about the middle of the fifth century. The metropolitan of Ephesus subscribed himself thus in the year 680, therefore in the succeeding period. There was no particular title of long continuance for the Roman bishop until the sixth century; but from the year 536 he was usually called Papa, and from the time of Gregory the Great he styled himself *Servus Servorum Dei*."—J. E. T. Wiltch, *Handbook of the geography and statistics of the church*, pp. 70, 71 and 72.—"Christianity may now be said to have ascended the imperial throne: with the single exception of Julian, from this period the monarchs of the Roman empire professed the religion of the Gospel. This important crisis in the history of Christianity almost forcibly arrests the attention to contemplate the change wrought in Christianity by its advancement into a dominant power in the state; and the change in the condition of mankind up to this period, attributable to the direct authority or indirect influence of the new religion. By ceasing to exist as a separate community, and by advancing its pretensions to influence the general government of mankind, Christianity to a certain extent, forfeited its independence. It could not but submit to these laws, framed, as it might seem, with its own concurrent voice. It was no longer a republic, governed exclusively—as far, at least, as its religious concerns—by its own internal polity. The interference of the civil power in some of its most private affairs, the promulgation of its canons, and even, in some cases, the election of its bishops by the state, was the price which it must inevitably pay for its association with the ruling power. . . . During the reign of Constantine Christianity had made a rapid advance, no doubt, in the number of its proselytes as well as in its external position. It was not yet the established religion of the empire. It did not as yet stand forward as the new religion adapted to the new order of things, as a part of the great simultaneous change which gave to the Roman world a new capital, a new system of government, and, in some important instances, a new jurisprudence. . . . The religion of the emperor would soon become that of the court, and, by somewhat slower degrees, that of the empire. At present, however, as we have seen, little open aggression took place upon paganism. The few temples which were closed were insulated cases, and condemned as offensive to public morality. In general the temples stood in all their former majesty, for as yet the ordinary process of decay from neglect or supineness could have produced little effect. The difference was, that the Christian churches began to assume a more stately and imposing form. In the new capital they surpassed in grandeur, and probably in decoration, the pagan temples, which belonged to old Byzantium. The immunities granted to the Christian clergy only placed them on the same level with the pagan priesthood. The pontifical offices were still held by the distinguished men of the state: the emperor himself was long the chief pontiff; but the religious office had become a kind of appendage to the temporal dignity. The Christian prelates were constantly admitted, in virtue of their office, to the imperial presence."—H. H. Milman, *History of Christianity*, bk. 3, ch. 4.—"As early as Constantine's time the punishment of crucifixion was abolished; immoral practices, like

infanticide, and the exhibition of gladiatorial shows, were discouraged, the latter of these being forbidden in Constantinople; and in order to improve the relation of the sexes, severe laws were passed against adultery, and restrictions were placed on the facility of divorce. Further, the bishops were empowered, in the name of religion, to intercede with governors, and even with the emperor, in behalf of the unfortunate and oppressed. And gradually they obtained the right of exercising a sort of moral superintendence over the discharge of their official duties by the judges, and others, who belonged to their communities. The supervision of the prisons, in particular, was entrusted to them; and, whereas in the first instance their power of interference was limited to exhortations addressed to the judges who superintended them, in Justinian's reign the bishops were commissioned by law to visit the prisons on two days of each week in order to inquire into, and, if necessary, report upon, the treatment of the prisoners. In all these and many other ways, the influence of the State in controlling and improving society was advanced by its alliance with the Church."—H. F. Tozer, *The Church and the eastern empire*, pp. 56-57.—"The Christians were still a separate people. . . . It can scarcely be doubted that the stricter moral tone of Constantine's legislation more or less remotely emanated from Christianity. . . . During the reign of Constantine Christianity continued to advance beyond the borders of the Roman empire, and in some degree to indemnify herself for the losses which she sustained in the kingdom of Persia. The Ethiopians appear to have attained some degree of civilization; a considerable part of the Arabian commerce was kept up with the other side of the Red Sea through the port of Adulis; and Greek letters appear, from inscriptions recently discovered, to have made considerable progress among this barbarous people. . . . The theological opinions of Christianity naturally made more rapid progress than its moral influence. The former had only to overpower the resistance of a religion which had already lost its hold upon the mind, or a philosophy too speculative for ordinary understandings and too unsatisfactory for the more curious and inquiring; it had only to enter, as it were, into a vacant place in the mind of man. But the moral influence had to contest, not only with the natural dispositions of man, but with the barbarism and depraved manners of ages. While, then, the religion of the world underwent a total change, the Church rose on the ruins of the temple, and the pontifical establishment of paganism became gradually extinct or suffered violent suppression; the moral revolution was far more slow and far less complete. . . . Everywhere there was exaggeration of one of the constituent elements of Christianity; that exaggeration which is the inevitable consequence of a strong impulse upon the human mind. Wherever men feel strongly, they act violently. The more speculative Christians, therefore, who were more inclined, in the deep and somewhat selfish solicitude for their own salvation, to isolate themselves from the infected class of mankind, pressed into the extreme of asceticism; the more practical, who were in earnest in the desire of disseminating the blessings of religion throughout society, scrupled little to press into their service whatever might advance their cause. With both extremes the dogmatical part of the religion predominated. . . . In proportion to the admitted importance of the creed, men became more sternly and exclusively wedded to their opinions. . . . While they swept in converts indiscriminately from the palace and the

public street, while the emperor and the lowest of the populace were alike admitted on little more than the open profession of allegiance, they were satisfied if their allegiance in this respect was blind and complete. Hence a far larger admixture of human passions, and the common vulgar incentives of action, were infused into the expanding Christian body. Men became Christians, orthodox Christians, with little sacrifice of that which Christianity aimed chiefly to extirpate. Yet, after all, this imperfect view of Christianity had probably some effect in concentrating the Christian community, and holding it together by a new and more indissoluble bond. The world divided into two parties. . . . All, however, were enrolled under one or the other standard, and the party which triumphed eventually would rule the whole

Divine displeasure provoked by the debauchery of the Church. And then he proceeds to draw up an indictment and to lend proof which I prefer not to give in detail. After making every allowance for rhetorical exaggeration, enough remains to show that the morality of the Church had grievously declined, and that the declension was due to the inroads of Pagan vice. . . . Under this head, had space permitted, some account would have been given of the growth of the Christian literature of this period, of the great writers and preachers, and of the opposing schools of interpretation which divided Christendom. In the Eastern Church we should have had to notice [at greater length the work of] Eusebius of Cæsarea, the father of Church history and a friend of Constantine; Ephrem the Syrian, the poet-preacher;

THE FIVE GREEK FATHERS

St. Chrysostom, St. Basil the Great, St. Athanasius, St. Gregory of Nazianzus, St. Cyril of Alexandria
(From an ancient Greek painting in the Vatican)

Christian world."—H. H. Milman, *History of Christianity*, bk. 3, ch. 4-5.—"Of this deterioration of morals we have abundant evidence. Read the Canons of the various Councils and you will learn that the Church found it necessary to prohibit the commission of the most heinous and abominable crimes not only by the laity, but even by the clergy. Read the homilies of such preachers as Chrysostom, Basil, and Gregory, and you may infer what the moral tone of a Christian congregation must have been to which such reproofs could be addressed. Read, above all, the treatise on Providence, or *De Gubernatione Dei*, written at the close of our period by Salvian, a presbyter of Marseilles. The barbarians had over-spread the West, and Christians had suffered so many hardships that they began to doubt whether there was any Divine government of human affairs. Salvian retorted that the fact of their suffering was the best evidence of the doctrine of Providence, for the miseries they endured were the effects of the

the three Cappadocians, Basil of Cæsarea, Gregory of Nyssa, and Gregory of Nazianzus, each great in his own way, the first as a preacher and administrator, the second as a thinker, the third as a poet and panegyrist; Chrysostom, the orator and exegete; Theodore of Mopsuestia and Theodoret of Kyros, along with Chrysostom the most influential representatives of the School of Antioch. In the Western Church we should have had to speak of Ambrose, the eloquent preacher and voluminous writer; of Jerome, the biblical critic; and of Augustine, the philosopher and controversialist, whose thoughts live among us even at the present day."—W. Stewart, *Church of the 4th and 5th centuries* (*St. Giles' lectures, 4th series*).—See also *ROME: Empire: 323, to 391-395*.—"Hitherto Christian asceticism had been individualistic in its character. . . . In the third century hermits began to form a class by themselves in the East and in Africa; in the fourth they began to be organized into communities. After the institution of monastic

societies, this development of Christian asceticism spread far and wide from the deserts of the Thebaid and Lower Egypt; Basil, Jerome, Athanasius, Augustine, Ambrose, were foremost among its earliest advocates and propagators; Cassian, Columbanus, Benedict, and others, crowned the labours of their predecessors by a more elaborate organization."—I. Gregory Smith, *Christian monasticism*, pp. 23-25.

330-606.—Eastern (Greek, or Orthodox) church.—“The Eastern Church,” says a well-known writer, “was like the East, stationary and immutable; the Western, like the West, progressive and flexible. This distinction is the more remarkable, because at certain periods of their course, there can be no doubt that the civilization of the Eastern Church was far higher than that of the Western.”—G. F. Maclear, *The Slavs*, p. 25.—It is the more remarkable because this long-continuing uniformity, while peculiarly adapted to a people and a church which should retain and transmit an inheritance of faith and culture, stands in singular contrast to the reputed character of the Greek-speaking peoples of the East. The word Greek, however, has, as an adjective, many meanings, and there is danger of wrong inference through inattention to these; some of its distinctive characters are therefore indicated in brackets in various places in the following matter. “The New Rome at the time of its foundation was Roman. . . . But from the first it was destined to become Greek; for the Greeks, who now began to call themselves Romans—an appellation which they have ever since retained—held fast to their language, manners, and prejudices, while they availed themselves to the full of their rights as Roman citizens. The turning-point in this respect was the separation of the empires of the East and the West in the time of Arcadius and Honorius; and in Justinian’s time we find all the highest offices in the hands of the Greeks, and Greek was the prevailing language. But the people whom we call by this name were not the Hellenes of Greece proper, but the Macedonian Greeks. This distinction arose with the establishment of Greek colonies with municipal government throughout Asia by Alexander the Great and his successors. The type of character which was developed in them and among those who were Hellenised by their influence, differed in many respects from that of the old Greeks. The resemblance between them was indeed maintained by similarity of education and social feelings, by the possession of a common language and literature, and by their exclusiveness, which caused them to look down on less favoured races; but while the inhabitants of Greece retained more of the independent spirit and of the moral character and patriotism of their forefathers, the Macedonian Greeks were more cosmopolitan, more subservient, and more ready to take the impress of those among whom they were thrown; and the astuteness and versatility which at all times had formed one element in the Hellenic character, in them became the leading characteristic. The influence of this type is traceable in the policy of the Eastern Empire, varying in intensity in different

ages in proportion to the power exercised by the Greeks; until, during the later period of the history—in the time of the Comneni, and still more in that of the Palæologi—it is the predominant feature.”—H. F. Tozer, *The Church and the eastern empire*, pp. 9-10.—“What have been the effects of Christianity on what we call national character in Eastern Christendom? . . . The Greeks of the Lower Empire are taken as the typical example of these races, and the Greeks of the Lower Empire have become a byword for everything that is false and base. The Byzantine was profoundly theological, we are told, and profoundly vile. . . . Those who wish to be just to [it] . . . will pass . . . to the . . . equitable and conscientious, but by no means, indulgent, judgments of Mr. Finlay, Mr. Freeman, and Dean Stanley. One fact alone is sufficient to engage our deep interest in this race. It was Greeks [Hellenist Jews] and people imbued with Greek ideas who first welcomed Christianity. It was in their language that it first spoke to the world, and its first home was in Greek households and in Greek cities. It was in Greek [Hellenistic] atmosphere that the Divine Stranger from the East, in many respects so widely different from all that Greeks were accustomed to, first grew up to strength and shape; first showed its power of assimilating and reconciling; first showed what it was to be in human society. Its earliest nurslings were Greeks; Greeks [Hellenist Jews] first took in the meaning and measure of its amazing and eventful announcements; Greek sympathies first awoke and vibrated to its appeals; Greek obedience, Greek courage, Greek suffering first illustrated its new lessons. Had it not first gained over Greek mind and Greek belief, it is hard to see how it would have made its further way. . . . The Roman conquest of the world found the Greek race, and the Eastern nations which it had influenced, in a low and declining state—morally, socially, politically. The Roman Empire, when it fell, left them in the same discouraging condition, and suffering besides from the degradation and mischief wrought on all its subjects by its chronic and relentless fiscal oppression. . . . These were the men in whose childish conceit, childish frivolity, childish self-assertion, St. Paul saw such dangers to the growth of Christian manliness and to the unity of the Christian body—the idly curious and gossiping men of Athens; the vain and shamelessly ostentatious Corinthians, men in intellect, but in moral seriousness babes; the Ephesians, ‘like children carried away with every blast of vain teaching,’ the victims of every impostor, and sport of every deceit; the Cretans, proverbially, ‘ever liars, evil beasts, slow bellies;’ the passionate, volatile, Greek-speaking Celts of Asia, the ‘foolish’ Galatians. . . . The Greek of the Roman times is portrayed in the special warnings of the Apostolic Epistles. After Apostolic times he is portrayed in the same way by the heathen satirist Lucian, and by the Christian preacher Chrysostom; and such, with all his bad tendencies, aggravated by almost uninterrupted misrule and oppression, the Empire, when it broke up, left him. The prospects of such a people, amid the coming storms, were dark. Everything, their gifts and versatility, as well as their faults, threatened national decay and disintegration. . . . These races whom the Empire of the Cæsars left like scattered sheep to the mercy of the barbarians, lived through a succession of the most appalling storms, and kept themselves together, holding fast, resolute and unwavering, amid all their miseries and all their debasement, to the faith of their

national brotherhood. . . . This, it seems to me, Christianity did for a race which had apparently lived its time, and had no future before it—the Greek race in the days of the Cæsars. It created in them, in a new and characteristic degree, national endurance, national fellowship and sympathy, national hope. . . . It gave them an Empire of their own, which, undervalued as it is by those familiar with the ultimate results of Western history, yet withstood the assaults before which, for the moment, Western civilisation sank, and which had the strength to last a life—a stirring and eventful life—of ten centuries. The Greek Empire, with all its evils and weaknesses, was yet in its time the only existing image in the world of a civilised state. . . . The lives of great men profoundly and permanently influence national character; and the great men of later Greek memory are saints. They belong to the people more than emperors and warriors; for the Church is of the people. . . . The mark which such men left on Greek society and Greek character has not been effaced to this day, even by the melancholy examples of many degenerate successors. . . . Why, if Christianity affected Greek character so profoundly, did it not do more? Why, if it cured it of much of its instability and trifling, did it not also cure it of its falsehood and dissimulation? Why, if it impressed the Greek mind so deeply with the reality of the objects of faith, did it not also check the vain inquisitiveness and spirit of disputatiousness and sophistry, which filled Greek Church history with furious wranglings about the most hopeless problems? Why, if it could raise such admiration for unselfishness and heroic nobleness, has not this admiration borne more congenial fruit? Why, if heaven was felt to be so great and so near, was there in real life such coarse and mean worldliness? Why, indeed? . . . Profoundly, permanently, as Christianity affected Greek character, there was much in that character which Christianity failed to reach, much that it failed to correct, much that was obstinately refractory to influences which, elsewhere, were so fruitful of goodness and greatness. The East, as well as the West, has still much to learn from that religion, which each too exclusively claims to understand, to appreciate, and to defend.”—R. W. Church, *Gifts of civilisation*, pp. 188-216.—“The types of character that were developed in the Eastern Church, as might be expected, were not of the very highest. There was among them no St. Francis, no St. Louis. The uniformity which pervades everything Byzantine prevented the development of such salient characters as are found in the West. It is difficult, no doubt, to form a true estimate of the influence of religion on men’s lives in Eastern countries, just as it is of their domestic relations, and even of the condition of the lower classes, because such matters are steadily ignored by the contemporary historians. But all the evidence tends to show that individual rather than heroic piety was fostered by the system which prevailed there. That at certain periods a high tone of spirituality prevailed among certain classes is sufficiently proved by the beautiful hymns of the Eastern Church, many of which, thanks to Dr. Neale’s singular felicity in translation, are in use among ourselves. But the loftier development of their spirit took the form of asceticism, and the scene of this was rather the secluded monastery, or the pillar of the Stylite, than human society at large. But if the Eastern Church did not rise as high as her sister of the West, she never sank as low.”—H. F. Tozer, *The Church and the eastern empire*, pp. 45-46.—“The Greek Church,

or, as it calls itself, the Holy Orthodox, Catholic, Apostolic, Oriental Church, has a venerable if not an eventful history. Unlike the Church of the West, it has not been moulded by great political movements, the rise and fall of kingdoms, and the convulsions which have passed over the face of modern society. Its course has been out of the sight of European civilisation, it has grown up among peoples who have been but slightly affected, if they have been affected at all, by the progressive movements of mankind. It has no middle ages. It has no renaissance. It has no Reformation. It has given birth to no great universities and schools of learning. It has no Protestantism. It remains very much as the fourth and fifth centuries left it. . . . When the royal throne in the days of the first Christian Emperor was removed from Rome to Constantinople, there arose at once a cause of strife between the bishops of old and new Rome, as Byzantium or Constantinople was named. Each claimed pre-eminence, and each alternately received it from the governing powers in Church and State. One Council decreed A. D. (381) that the Bishop of the new Rome should be inferior only to that of the old; another declared (A. D. 451) the equality of both prelates. The Patriarch of Constantinople at the close of the sixth century claimed superiority over all Christian Churches,—a claim which might have developed, had circumstances favoured it, into an Eastern Papacy. The assumption was, however, but short-lived, and the Bishop of Rome, Boniface, obtained from the Emperor Phocas in 606 the much-coveted position. The Eastern Church submitted, but from this time looked with a jealous eye on her Western sister. She noted and magnified every point of divergence between them. Differences or apparent differences in doctrine and ritual were denounced as heresies. Excommunications fulminated between the Eastern and Western city, and ecclesiastical bitterness was intensified by political intrigue.”—J. C. Lees, *Greek church (Churches of Christendom)*, lect. 4.—See also **FILIOQUE CONTROVERSY**.

337-476.—Fall of imperial Rome.—Rise of ecclesiastical Rome.—The political and religious history of the empire from the death of Constantine is so fully narrated under Rome that mere mention here of a few events will suffice, viz.: the revival of paganism under the emperor Julian; the reascendency of Christianity; the formal establishment of Christianity as the religion of the Romans, by the suffrages of the senate; the final division of the empire into East and West between the sons of Theodosius; the three sieges and the sacking of Rome by Alaric; the legal separation of the Eastern and Western empires; the pillage of Rome by the Vandals and its final submission to the barbarians. (See **ROME: Empire**: 337-361, to 445-476. For an account of the early bishops of Rome, see **PAPACY**.) “A heathen historian traces the origin of the calamities which he records to the abolition of sacrifice by Theodosius, and the sack of Rome to the laws against the ancient faith passed by his son. This objection of the heathens that the overthrow of idolatry and the ascendancy of Christianity were the cause of the misfortunes of the empire was so wide spread, and had such force with those, both Pagans and Christians, who conceived history to be the out-

come of magical or demonic powers, that Augustine devoted twelve years of his life to its refutation. His treatise, 'De Civitate Dei,' was begun in 413, and was not finished till 426, within four years of his death. Rome had once been taken; society, consumed by inward corruption, was shaken to its foundations by the violent onset of the Teutonic tribes; men's hearts were failing them for fear; the voice of calumny cried aloud, and laid these woes to the charge of the Christian faith. Augustine undertook to refute the calumny, and to restore the courage of his fellow-Christians. Taking a rapid survey of history, he asks what the gods had ever done for the well-being of the state or for public morality. He maintains that the greatness of Rome in the past was due to the virtues of her sons, and not to the protection of the gods. He shows that, long before the rise of Christianity, her ruin had begun with the introduction of foreign vices after the destruction of Carthage, and declares that much in the ancient worship, instead of preventing, had hastened that ruin. He rises above the troubles of the present, and amid the vanishing glories of the city of men he proclaims the stability of the city of God. At a time when the downfall of Rome was thought to presage approaching doom, Augustine regarded the disasters around him as the birth-throes of a new world, "as a necessary moment in the onward movement of Christianity."—W. Stewart. *Church of the 4th and 5th centuries (St. Giles' lectures, 4th series)*.—"There is as little ground for discovering a miraculous, as there is for disowning a providential element in the course of events. The institutions of Roman authority and law had been planted regularly over all the territory which the conquering hordes coveted and seized; alongside of every magistrate was now placed a minister of Christ, and by every Hall of Justice stood a House of Prayer. The Representative of Cæsar lost all his power and dignity when the armies of Cæsar were scattered in flight; the minister of Christ felt that behind him was an invisible force with which the hosts of the alien could not cope, and his behaviour impressed the barbarian with the conviction that there was reality here. That beneficent mission of Leo, A. D. 452, of which Gibbon says: 'The pressing eloquence of Leo, his majestic aspect and sacerdotal robes, excited the veneration of Attila for the spiritual father of the Christians'—would be but an instance of what many nameless priests from provincial towns did, 'not counting their lives dear to them.' The organisation of the Latin state vitalised by a new spiritual force vanquished the victors. It was the method and the discipline of this organisation, not the subtlety of its doctrine, nor the fervour of its officials, that beat in detail one chief with his motley following after another. Hence too it came about that the Christianity which was adopted as the religion of Europe was not modified to suit the tastes of the various tribes that embraced it, but was delivered to each as from a common fountain-head. . . . It was a social triumph, proceeding from religious motives which we may regard with unstinted admiration and gratitude."—J. Watt. *Latin church (St. Giles' lectures, 4th series)*.—"The temporal fall of the Imperial metropolis tended to throw a brighter light upon her ecclesiastical claims. The separation of the East and the West had already enhanced the religious dignity of the ancient capital. The great Eastern patriarchates of Antioch, Alexandria, and Jerusalem had up to that time all held themselves equal, if not superior to Rome. Constantinople had even assumed certain airs of supremacy over all. The General Councils which had defined

the Faith at Nicæa and Constantinople had been composed almost wholly of Orientals. The great Doctors of the Church, the men who had defended or diffused the common Faith, had been mostly Greeks by origin and language. None had been Romans, and it was rarely, till the fourth century, that any of them had written in the Latin tongue. When Athanasius, exiled from Alexandria, came to Italy and Gaul, it was three years before he could learn enough of the language of the West to address its congregations in public. But this curious fact shows that the Western Christians were now no longer the little Greek colony of the first and second centuries. Christianity had become the national religion of the native races. The Romans might now feel that they were becoming again a people; that their glorious career was assuming, as it were, a new point of departure. . . . For at this moment the popular instinct could not fail to perceive how strongly the conscience of the barbarians had been affected by the spiritual majesty of Christian Rome. The Northern hordes had beaten down all armed resistance. They had made a deep impression upon the strength of the Eastern Empire; they had, for a moment at least, actually overcome the Western; they had overrun many of the fairest provinces, and had effected a permanent lodgment in Gaul and Spain, and still more recently in Africa. Yet in all these countries, rude as they still were, they had submitted to accept the creed of the Gospel. There was no such thing as a barbarian Paganism established within the limits of the Empire anywhere, except perhaps in furthest Britain."—C. Merivale, *Four lectures on some epochs of early church history*, pp. 130-136.—"When the surging tides of barbarian invasion swept over Europe, the Christian organization was almost the only institution of the past which survived the flood. It remained as a visible monument of what had been, and, by so remaining, was of itself an antithesis to the present. The chief town of the Roman province, whatever its status under barbarian rule, was still the bishop's see. The limits of the old 'province,' though the boundary of a new kingdom might bisect them, were still the limits of his diocese. The bishop's tribunal was the only tribunal in which the laws of the Empire could be pleaded in their integrity. The bishop's dress was the ancient robe of a Roman magistrate. The ancient Roman language which was used in the Church services was a standing protest against the growing degeneracy of the 'vulgar tongue.' . . . As the forces of the Empire became less and less, the forces of the Church became more and more. The Churches preserved that which had been from the first the secret of Imperial strength. For underneath the Empire which changed and passed, beneath the shifting pageantry of Emperors who moved across the stage and were seen no more, was the abiding empire of law and administration,—which changed only as the deep sea changes beneath the windswept waves. That inner empire was continued in the Christian Churches. In the years of transition from the ancient to the modern world, when all civilized society seemed to be disintegrated, the confederation of the Christian Churches, by the very fact of its existence upon the old imperial lines, was not only the most powerful, but the only powerful organization in the civilized world. It was so vast, and so powerful, that it seemed to be, and there were few to question its being, the visible realization of that Kingdom of God which our Lord Himself had preached."—E. Hatch, *Organization of the Christian churches*, pp. 160-178.

ALSO IN: E. Gibbon, *History of the decline and fall of the Roman empire*.—*Cambridge medieval history*, v. 1, *Christian Roman empire*.—L. Duchesne, *Early history of the Christian church*.—E. G. Hardy, *Studies in Roman history* (1st series).

347-412.—Syrian churches.—“St. Chrysostom was born there A. D. 347; and it was in his time that Antioch, with its hundred thousand Christians, became the leading Church in Asia, especially in the Arian controversy [see **ARIANISM**], for Arianism was very prevalent there. But all this lies outside our period. The so-called ‘School of Antioch’ has its origin just before . . . our period [311, Wiltsch]. Dorotheus, . . . and the martyr Lucian may be regarded as its founders. In contrast to the allegorising mysticism of the School of Alexandria, it was distinguished by a more sober and critical interpretation of Scripture. It looked to grammar and history for its principles of exegesis. But we must not suppose that there was at Antioch an educational establishment like the Catechetical School at Alexandria, which, by a succession of great teachers, kept up a traditional mode of exegesis and instruction. It was rather an intellectual tendency which, beginning with Lucian and Dorotheus, developed in a definite direction in Antioch and other Syrian Churches. . . . These notices of the Churches of Jerusalem, Cæsarea in Palestine, and Antioch must suffice as representative of the Syrian Churches. The number of these Churches was considerable even in the second century; and by the beginning of the fourth was very large indeed, as is seen by the number of bishops who attend local Councils.”—A. Plummer, *Church of the early fathers*, ch. 3.—“The letters of St. Augustine . . . are in many parts very entertaining reading, but they are nothing in point of living interest when compared with St. Jerome’s. These letters illustrate life about the year 400 as nothing else can. They show us, for instance, what education then was, what clerical life consisted in; they tell us of modes and fashions, and they teach us how vigorous and constant was the communication at that same period between the most distant parts of the Roman empire. We are apt to think of the fifth century as a time when there was very little travel, and when most certainly the East and West—Ireland, England, Gaul and Palestine—were much more widely and completely separated than now, when steam has practically annihilated time and space. And yet such an idea is very mistaken. There was a most lively intercourse existing between these regions, a constant Church correspondence kept up between them, and the most intense and vivid interest maintained by the Gallic and Syrian churches in the minutest details of their respective histories. Mark now how this happened. St. Jerome at Bethlehem was the centre of this intercourse. His position in the Christian world in the beginning of the fifth century can only be compared to, but was not at all equalled by, that of John Calvin at the time of the Reformation. Men from the most distant parts consulted him. Bishops of highest renown for sanctity and learning, like St. Augustine, and Exuperius of Toulouse in southern France, deferred to his authority. The keen interest he took in the churches of Gaul, and the intimate knowledge he possessed of the most petty local details and religious gossip therein, can only be understood by one who has studied his very abusive treatise against Vigilantius or his correspondence with Exuperius. . . . But how, it may be asked, was this correspondence carried on when there was no postal system? Here it was that the

organization of monasticism supplies a want. Jerome’s letters tell us the very name of his postman. He was a monk named Sysinnius. He was perpetually on the road between Marseilles and Bethlehem. Again and again does Jerome mention his coming and his going. His appearance must indeed have been the great excitement of life at Bethlehem. Travelling probably via Sardinia, Rome, Greece, and the islands of the Adriatic, he gathered up all kinds of clerical news on the way—a piece of conduct on his part which seems to have had its usual results. As a tale-bearer, he not only revealed secrets, but also separated chief friends, and this monk Sysinnius with his gossips seems to have been the original cause of the celebrated quarrel between Augustine and Jerome.”—G. T. Stokes, *Ireland and the Celtic church*, pp. 170-172.

ALSO IN: *Nicene and post-Nicene fathers*, series 1, vs. 9-14.—F. W. Farrar, *Lives of the fathers*, vs. 1, 2.—L. Duchesne, *Early history of the church*.—*Cambridge medieval history*, v. 1.

496-800.—Frankish church to the empire of Charlemagne.—“The baptism of Chlodovech [Clovis—see **FRANKS**: 481-511] was followed by the wholesale conversion of the Franks. No compulsion was used to bring the heathen into the Church. As a heathen, Chlodovech had treated the Church with forbearance; he was equally tolerant to heathenism when he was a Christian. But his example worked, and thousands of noble Franks crowded to the water of regeneration. Gregory of Tours reckons the Franks as Christians after the baptism of their king, which took place at Christmas, 496. His conversion made no alteration in the policy and conduct of Chlodovech; he remained the same mixture of cunning and audacity, of cruelty and sensuality, that he was before. . . . But, though his baptism was to him of no moral import, its consequences were wide spreading. When Gregory of Tours compares the conversion of Chlodovech with that of Constantine the Great, he was fully in the right. . . . And the baptism of Chlodovech declared to the world that the new blood being poured into the veins of the old and expiring civilization, had been quickened by the same elements, and would unite with the old in the new development. . . . That many of those who were baptized carried with them into their new Christianity their old heathen superstitions as well as their barbarism is certain; and the times were not those in which the growth of the great Christian graces was encouraged; the germs, however, of a new life were laid.”—S. Baring-Gould, *Church in Germany*, ch. 3.—“The details of the history of the Merovingian period of Frankish history are extraordinarily complicated; happily, it is not at all necessary for our purpose to follow them. . . . In the earlier years after the conquest, all ranks of the clergy were filled by Gallo-Romans. The Franks were the dominant race, and were Christian, but they were new converts from a rude heathenism, and it would take some generations to raise up a ‘native ministry’ among them. Not only the literature of the (Western) Church, but all its services, and, still more, the conversational intercourse of all civilized and Christian people, was in Latin. Besides, the Franks were warriors, a conquering caste, a separate nation; and to lay down the battle-axe and spear, and enter into the peaceful ranks of the Romano-Gallic Church, would have seemed to them like changing their nationality for that of the more highly cultured, perhaps, but, in their eyes, subject race. The Frank kings did not ignore the value of education. Clovis is said to

have established a Palatine school, and encouraged his young men to qualify themselves for the positions which his conquests had opened out to them. His grandsons, we have seen, prided themselves on their Latin culture. After a while, Franks aspired to the magnificent positions which the great sees of the Church offered to their ambition; and we find men with Teutonic names, and no doubt of Teutonic race, among the bishops. . . . For a still longer period, few Franks entered into the lower ranks of the Church. Not only did the priesthood offer little temptation to them, but also the policy of the kings and nobles opposed the diminution of their military strength, by refusing leave to their Franks to enter into holy orders or into the monasteries. The cultured families of the cities would afford an ample supply of men for the clergy, and promising youths of a lower class seem already not infrequently to have been educated for the service of the Church. It was only in the later period, when some approach had been

Pope, in recognition of his active and beneficent apostleship. When Gregory II. appointed him bishop of Germany (723), he went through Bavaria and established there the dioceses of Frisingen, Passau, and Ratisbon. When Pope Zacharias bestowed the rank of metropolitan upon the Church of Mainz in 748, he entrusted its direction to St. Boniface, who from that time was primate, as it were, of all Germany, under the authority of the Holy See. St. Boniface was assassinated by the Pagans of Friesland in 755."—V. Duruy, *History of the middle ages, bk. 3, ch. 8.*—"Boniface, whose original name was Winfrid, was of a noble Devonshire family (A. D. 680), educated at the monastery of Nutele, in Hampshire, and at the age of thirty-five years had obtained a high reputation for learning and ability, when (in A. D. 716), seized with the prevalent missionary enthusiasm, he abandoned his prospects at home, and set out with two companions to labour among the Frisians. . . . Winfrid was refused permission by

made to a fusion of the races, that we find Franks entering into the lower ranks of the Church, and simultaneously we find Gallo-Romans in the ranks of the armies. . . . Monks wielded a powerful spiritual influence. But the name of not a single priest appears in the history of the times as exercising any influence or authority. . . . Under the gradual secularization of the Church in the Merovingian period, the monasteries had the greatest share in keeping alive a remnant of vital religion among the people; and in the gradual decay of learning and art, the monastic institution was the ark in which the ancient civilization survived the deluge of barbarism, and emerged at length to spread itself over the modern world."—E. L. Cutts, *Charlemagne, ch. 5 and 7.* [See also MONASTICISM.]—"Two Anglo-Saxon monks, St. Wilfrid, bishop of York, and St. Willibrord undertook the conversion of the savage fishermen of Friesland and Holland at the end of the seventh and beginning of the eighth century; they were followed by another Englishman, the most renowned of all these missionaries, Wintrith, whose name was changed to Boniface, perhaps by the

the Duke to preach in his dominions, and he returned home to England. In the following spring he went to Rome, where he remained for some months, and then, with a general authorization from the pope to preach the gospel in Central Europe, he crossed the Alps, passed through Bavaria into Thuringia, where he began his work. While here the death of Radbod, A. D. 719, and the conquest of Frisia by Charles Martel, opened up new prospects for the evangelization of that country, and Boniface went thither and laboured for three years among the missionaries, under Willibrord of Utrecht. Then, following in the track of the victorious forces of Charles Martel, he plunged into the wilds of Hessa, converted two of its chiefs whose example was followed by multitudes of the Hessians and Saxons, and a monastery arose at Amöneburg as the headquarters of the mission. The Bishop of Rome being informed of this success, summoned Boniface to Rome, A. D. 723 and consecrated him a regentary bishop, with a general jurisdiction over all whom he should win from paganism into the Christian fold, requiring from him at the same time the oath which was

usually required of bishops within the patriarchate of Rome, of obedience to the see. . . . Boniface was not only a zealous missionary, an earnest preacher, a learned scholar, but he was a statesman and an able administrator. He not only spread the Gospel among the heathen, but he organized the Church among the newly converted nations of Germany; he regulated the disorder which existed in the Frankish Church, and established the relations between Church and State on a settled basis. The mediæval analysts tell us that Boniface crowned Pepin king, and modern writers have usually reproduced the statement. 'Rettingberg, and the able writer of the biography of Boniface in Herzog (Real Ecyk, s. v.), argue satis-

the Church; they reformed the ecclesiastical life, forbade the priests to hunt or to ride through the woods with dogs, falcons, or sparrow-hawks; and, finally, made all priests subordinate to their diocesan bishops, to whom they were obliged to give account each year of their faith and their ministry—all of which were necessary provisions for the organization of the ecclesiastical hierarchy and for the regulation of church government. Similar measures were taken by the Council of Soissons, convoked by Pippin in 744. In 747, Karlmann renounced the world and retired to the celebrated Italian monastery of Monte Cassino. As he left he entrusted his children to the care of their uncle, Pippin, who robbed them of their inheri-

factorily from Boniface's letters that he took no part in Pepin's coronation.' When Boniface withdrew from the active supervision of the Frankish Churches, it is probable that his place was to some extent supplied in the councils of the mayor and in the synods of the Church by Chrodegang, Bishop of Metz, a man whose character and influence in the history of the Frank Church have hardly hitherto been appreciated.—E. L. Cutts, *Charlemagne*, ch. 12.—'Both Karlmann and Pippin tried to reform certain abuses that had crept into the Church. Two councils, convoked by Karlmann, the one in Germany (742), the other in the following year at Lestines (near Charleroi, in Belgium), drew up decrees which abolished superstitious rites and certain Pagan ceremonies, still remaining in force; they also authorized grants of Church lands by the 'Prince' for military purposes on condition of a payment of an annual rent to

tance and ruled alone over the whole Frankish Empire. . . . Charlemagne enlarged and completed the work which had only been begun by Charles Martel and Pippin. . . . The Middle Ages acknowledged two Masters, the Pope and the Emperor, and these two powers came, the one from Rome, and the other from Austrasian France. . . . The mayors of Austrasia, Pippin of Heristal, and Charles Martel, rebuilt the Frankish monarchy and prepared the way for the empire of Charlemagne; . . . the Roman pontiffs . . . gathered around them all the churches of the West, and placed themselves at the head of the great Catholic society, over which one day Gregory VII, and Innocent III, should claim to have sole dominion."—V. Duruy, *History of the Middle Ages*, pp. 110-122, 108.—See MAYOR OF THE PALACE; FRANKS: 768-814; PAPACY: 755-774, and 774.—The coronation of Charlemagne at Rome by Pope

Leo III. gave the western Church the place in the state it had held under the earlier Roman emperors. The character of so great a man, the very books he read and all that fed the vigorous ideal element in so powerful a spirit are worthy of interest; for this at least he sought to accomplish—to give order to a tumultuous and barbarian world, and to establish learning, and purify the church: "While at table, he liked to hear a recital or a reading, and it was histories and the great deeds of past times which were usually read to him. He took great pleasure, also, in the works of St. Augustine, and especially in that whose title is 'De Civitate Dei.' . . . He practiced the Christian religion in all its purity and with great fervour, whose principles had been taught him from his infancy. . . . He diligently attended . . . church in the evening and morning, and even at night, to assist at the offices and at the holy sacrifice, as much as his health permitted him. He watched with care that nothing should be done but with the greatest propriety, constantly ordering the guardians of the church not to allow anything to be brought there or left there inconsistent with or unworthy of the sanctity of the place. . . . He was always ready to help the poor, and it was not only in his own country, or within his own dominions that he dispensed those gratuitous liberalities which the Greeks call 'alms,' but beyond the seas—in Syria, in Egypt, in Africa, at Jerusalem, at Alexandria, at Carthage, everywhere where he learned that Christians were living in poverty—he pitied their misery and loved to send them money. If he sought with so much care the friendship of foreign sovereigns, it was, above all, to procure for the Christians living under their rule help and relief. Of all the holy places, he had, above all, a great veneration for the Church of the Apostle St. Peter at Rome."—Einhard, *Life of Charlemagne*.—"The religious side of Charles' character is of the greatest interest in the study of his remarkable character as a whole and his religious policy led to the most important and durable results of his reign. He inherited an ecclesiastical policy from his father; the policy of regulating and strengthening the influence of the Church in his dominions as the chief agent of civilization, and a great means of binding the various elements of the empire into one; the policy of accepting the Bishop of Rome as the head of Western Christianity, with patriarchal authority over all its Churches."—E. L. Cutts, *Charlemagne*, ch. 23.—The following is a noteworthy passage from Charlemagne's Capitulary of 787: "It is our wish that you may be what it behooves the soldiers of the church to be,—religious in heart, learned in discourse, pure in act, eloquent in speech; so that all who approach your house in order to invoke the Divine Master, or to behold the excellence of the religious life, may be edified in beholding you, and instructed in hearing you discourse or chant, and may return home rendering thanks to God most High. Fail not, as thou regardest our favour, to send a copy of this letter to all thy suffragans and to all the monasteries; and let no monk go beyond his monastery to administer justice or to enter the assemblies and the voting-places. Adieu."—J. B. Mullinger, *Schools of Charles the Great*.

5th-7th centuries.—Nestorian, Monophysite and Monothelite controversies. See NESTORIAN AND MONOPHYSITE CONTROVERSY; MONOTHELITE CONTROVERSY.

5th-9th centuries.—Irish church and its mis-

sions.—The story of the conversion of Ireland by St. Patrick, and of the missionary labors of the Church which he established, is briefly told elsewhere. (See IRELAND: 5th-6th centuries.) "The early Church worked her way, in the literal sense of the word, 'underground,' under camp and palace, under senate and forum. But turn where we will in these Celtic missions, we notice how different were the features that marked them now. In Dalaradia St. Patrick obtains the site of his earliest church from the chieftain of the country, Dichu. At Tara, he obtains from King Laoghaire a reluctant toleration of his ministry. In Connaught he addresses himself first to the chieftains of Tirawley, and in Munster baptizes Angus, the king, at Cashel, the seat of the kings. What he did in Ireland reproduces itself in the Celtic missions of Wales and Scotland, and we cannot but take note of the important influence of Welsh and Pictish chiefs. . . . 'The people may not have adopted the actual profession of Christianity, which was all perhaps that in the first instance they adopted from any clear or intelligent appreciation of its superiority to their former religion. But to obtain from the people even an actual profession of Christianity was an important step to ultimate success. It secured toleration at least for Christian institutions. It enabled the missionaries to plant in every tribe their churches, schools, and monasteries, and to establish among the half pagan inhabitants of the country societies of holy men, whose devotion, usefulness, and piety soon produced an effect on the most barbarous and savage hearts.'"—G. F. Maclear, *Conversion of the West: the Celts*, ch. 11.

—"The Medieval Church of the West found in the seventh century an immense task before it to fulfil. . . . The missionaries who addressed themselves to the enormous task of the conversion of Germany may be conveniently divided into three groups—the British, the Frankish, and, entering somewhat later into an honourable rivalry with these, the Anglo-Saxon. A word or two upon each of these groups. The British—they include Irish and Scotch—could no longer find a field for the exercise of their ministry in England, now that there the Roman rule and discipline, to which they were so little disposed to submit, had everywhere won the day. Their own religious houses were full to overflowing. At home there was little for them to do, while yet that divine hunger and thirst for the winning of souls, which had so possessed the heart of St. Patrick, lived on in theirs. To these so minded, pagan Germany offered a welcome field of labour, and one in which there was ample room for all. Then there were the Frankish missionaries, who enjoyed the support of the Frankish kings, which sometimes served them in good stead; while at other times this protection was very far from a recommendation in their eyes who were easily persuaded to see in these missionaries the emissaries of a foe. Add to these the Anglo-Saxons; these last, mindful of the source from which they had received their own Christianity, making it a point to attach their converts to Rome, even as they were themselves bound to her by the closest ties. The language which these spoke—a language which as yet can have diverged very little from the Low German of Frisia, must have given to them many facilities which the Frankish missionaries possessed in a far slighter degree, the British not at all; and this may help to account for a success on their parts far greater than attended the labours of the others. To them too it was mainly due that the battle of the Creeds, which had been fought and lost by the Celtic missionaries in England, and was

Presently renewed in Germany, had finally the same issues there as in England. . . . At the same time, there were differences in the intensity and obstinacy of resistance to the message of truth, which would be offered by different tribes. There was ground, which at an early day had been won for the Gospel, but which in the storms and confusion of the two preceding centuries had been lost again; the whole line, that is, of the Danube and the Rhine, regions fair and prosperous once, but in every sense wildernesses now. In these we may note a readier acceptance of the message than found place in lands which in earlier times that message had never reached; as though obscure reminiscences and traditions of the past, not wholly extinct, had helped to set forward the present

monastery of Sekkinga on the Rhine. Trutbert was a contemporary and at the same time a countryman of Gallus. His sphere of action is said to have been Brisgovia (Breisgau) and the Black Forest. Almost half a century later Kilian proclaimed the gospel in Franconia and Wirtzburg, with two assistants, Colonatus and Totnanus. In the latter place they converted duke Gozbert, and were put to death there in 688. After the above mentioned missionaries from Ireland, in the seventh century, had built churches and monasteries in southern Germany, the missionaries from Britain repaired with a similar purpose, to the northern countries. . . . Men from other nations, as Willicricus, bishop of Brema, preached in Transalbingia at the beginning of the ninth century. Almost all

work."—R. C. Trench, *Lectures on medieval church history*, lecture 5.—"From Ireland came Gallus, Fridolin, Kilian, Trutbert and Levin. . . . The order in which these men succeeded one another cannot always be established, from the uncertainty of the accounts. We know thus much, that of all those above-mentioned, Gallus was the first, for his labours in Helvetia (Switzerland) were continued from the preceding into the period of which we are now treating. On the other hand, it is uncertain as to Fridolin whether he had not completed his work before Gallus, in the sixth century, for in the opinion of some he closed his career in the time of Clodoveus I., but, according to others, he is said to have lived under Clodoveus II., or at another period. His labours extended over the lands on the Moselle, in the Vosges Mountains, over Helvetia, Rhætia and Nigra Silva (the Black Forest). He built the

the missionaries from the kingdom of the Franks selected southern Germany as their sphere of action: Emmeran, about 649, Ratisbona, Rudbert, about 696, Bajoaria (Bavaria), Corbinian the country around Frisinga, Othbert the Breisgau and Black Forest, and Pirminius the Breisgau, Bajoaria, Franconia, Helvetia, and Alsatis."—J. E. T. Wiltsch, *Handbook of the geography and statistics of the church*, v. 1, pp. 365-367.

553.—Dispute over Three Chapters. See THREE CHAPTERS.

553-800.—Western church.—Rise of the papacy.—"Though kindly treated, the Church of Rome did not make any progress under the Ostrogoths. But when their power had been broken (553), and Rome had been placed again under the

authority of the Emperor of Constantinople [see *ROME: Medieval city: 535-553*], the very remoteness of her new master insured to the Church a more prosperous future. The invasion of the Lombards drove a great many refugees into her territory, and the Roman population showed a slight return of its old energy in its double hatred toward them, as barbarians and as Arians. . . . It was at this favorable point in the state of affairs, though critical in some respects, that Gregory the Great made his appearance (590-604). He was a descendant of the noble Anicia family, and added to his advantages of birth and position the advantages of a well-endowed body and mind. He was perfect of Rome when less than thirty years old, but after holding this office a few months he abandoned the honors and cares of worldly things for the retirement of the cloister. His reputation did not allow him to remain in the obscurity of that life. Toward 570 he was sent to Constantinople by Pope Pelagius II. as secretary or papal nuncio, and he rendered distinguished services to the Holy See in its relations with the Empire and in its struggles against the Lombards. In 590 the clergy, the senate, and the people raised him with one accord to the sovereign pontificate, to succeed Pelagius. As it was still necessary for every election to be confirmed by the Emperor at Constantinople, Gregory wrote to him to beg him not to sanction this one; but the letter was intercepted and soon orders arrived from Maurice ratifying the election. Gregory hid himself, but he was discovered and led back to Rome. When once Pope, though against his will, he used his power to strengthen the papacy, to propagate Christianity, and to improve the discipline and organization of the Church. . . . Strengthened thus by his own efforts, he undertook the propagation of Christianity and orthodoxy both within and without the limits of the old Roman Empire. Within those limits there were still some who clung to paganism, in Sicily, Sardinia, and even at the very gates of Rome, at Terracina, and doubtless also in Gaul, as there is a constitution of Childebert still extant dated 554, and entitled: 'For the abolition of the remains of idolatry.' There were Arians very near to Rome—namely, the Lombards; but through the intervention of Theudalinda, their queen, Gregory succeeded in having Adelwald, the heir to the throne, brought up in the Catholic faith; as early as 587 the Visigoths in Spain, under Reccared, were converted. . . . The Roman Empire had perished, and the barbarians had built upon its ruins many slight structures that were soon overthrown. Not even had the Franks, who were destined to be perpetuated as a nation, as yet succeeded in founding a social state of any strength; their lack of experience led them from one attempt to another, all equally vain; even the attempt of Charlemagne met with no more permanent success. In the midst of these successive failures one institution alone, developing slowly and steadily through the centuries, following out the spirit of its principles, continued to grow and gain in power, in extent and in unity. . . . The Pope had now become, in truth, the ruler of Christendom. He was, however, still a subject of the Greek Emperor; but a rupture was inevitable, as his authority, on the one hand, was growing day by day, and the emperor's on the contrary, was declining."—V. Duruy, *History of the Middle Ages*, pp. 114-115, 108-109, 117.—"The real power which advanced the credit of the Roman see during these ages was the reaction against the Byzantine despotism over the Eastern Church; and this is the explanation of the fact that although the new

map of Europe had been marked out, in outline at least, by the year 500, the Roman see clung to the eastern connection until the first half of the eighth century. . . . In the political or diplomatic struggle between the Church and the Emperors, in which the Emperors endeavored to make the Church subservient to the imperial policy, or to adjust the situation to the necessities of the empire, and the Church strove to retain its autonomy as a witness to the faith and a legislator in the affairs of religion, the Bishop of Rome became, so to speak, the constitutional head of the opposition; and the East was willing to exalt his authority, as a counterpoise to that of the Emperor, to any extent short of acknowledging that the primacy implied a supremacy."—J. H. Egar, *Christendom: Ecclesiastical and political, from Constantine to the Reformation*, p. 90.—"The election system was only used for one degree of the ecclesiastical dignitaries, for the bishopric. The lower dignitaries were chosen by the bishop. They were divided into two categories of orders—the higher and the lower orders. There were three higher orders, namely, the priests, the deacons, and the sub-deacons, and four lower orders, the acolytes, the door-keepers the exorcists, and the readers. The latter orders were not regarded as an integral part of the clergy, as their members were the servants of the others. As regards the territorial divisions, the bishop governed the diocese, which at a much later date was divided into parishes, whose spiritual welfare was in the hands of the parish priest or curate (*curio*). The parishes, taken together, constituted the diocese; the united dioceses, or suffragan bishoprics, constituted the ecclesiastical province, at whose head stood the metropolitan or archbishop. When a provincial council was held, it met in the metropolis and was presided over by the metropolitan. Above the metropolitans were the Patriarchs, in the East, and the Primate in the West, bishops who held the great capitals or the apostolic sees, Constantinople, Alexandria, Antioch, Rome, Jerusalem, Caesarea in Cappadocia, Carthage in Africa, and Heraclius in Thrace; among them Rome ranked higher by one degree, and from this supreme position exercised a supreme authority acknowledged by all the Church."—V. Duruy, *History of the Middle Ages*, pp. 109-110.—"The divergence of the two Churches, Eastern and Western, was greater in reality than it appears to be from a superficial view. It was based on essential variations in the character and disposition of the people in the East and in the West, on the nature of their civilization, and on the different, almost antagonistic, development of the Christian idea in one Church and in the other. . . . The Eastern Church rejoiced in its direct affiliation with apostolic times, in its careful preservation of traditions, and was convinced of its especial right to be considered the true heir and successor of Christ. . . . The letter of the law superseded the spirit; religion stiffened into formalism; piety consisted in strict observance of ceremonial rites; external holiness replaced sincere and heartfelt devotion. . . . Throughout the West the tendency was in a contrary direction—towards the practical application of the religious idea. The effete, worn-out civilization of the past was there renovated by contact and admixture with young and vigorous races, and gained new strength and vitality in the struggle for existence. The Church, freed from control, became independent and self-asserting; the responsibility of government, the preservation of social order, devolved upon it, and it rose proudly to the task."—A. F. Heard, *Russian church and Russian dissent*, pp. 6-

10.—“On the overthrow of the Western Empire, and the demonstration, rendered manifest to all, that with the complete triumph of the new world of secular politics, a new spiritual development, a new phase of Divine guidance, was opening, the conscience of the believers was aroused to a sense of the sinfulness of their cowardly inactivity. ‘Go ye into all nations, and baptize them,’ had been the last words of their blessed Master. . . . It is to this new or revived missionary spirit which distinguished the sixth century, of which I would place Pope Gregory the First, or the Great, as the central figure, that I desire now to introduce you. Remember that the Empire, which had represented the unity of mankind, had become disintegrated and broken into fragments. Men were no longer Romans, but Goths and Sueves, Burgundians and Vandals, and beyond them Huns, Avars, Franks, and Lombards some with a slight tincture of Christian teaching but most with none. . . . Let but the Gospel be proclaimed to all, and leave the issue in God’s hands! Such was the contrast between the age of Leo and the age of Gregory! . . . The conversion of Clovis and the Franks is, I suppose, the earliest instance of a Christian mission carried out on a national scale by the common action of the Church represented by the Pope and See of Rome. It becomes accordingly a great historical event, deserving the earnest consideration not of Churchmen only, but of all political enquirers.”—C. Merivale, *Four lectures on some epochs of early church history*, pp. 172-177. —“Christianity thus renewed its ardor for proselytism, and Gregory contributed to its success most wisely by enjoining precepts of moderation upon his missionaries, and by the skillful manner in which he made the transition to Catholicism easy to the pagans; he wrote to Augustine: ‘Be careful not to destroy the pagan temples; it is only necessary to destroy the idols, then to sprinkle the edifice with holy water, and to build altars and place relics there. If the temples are well built, it is a wise and useful thing for them to pass from the worship of demons to the worship of the true God; for while the nation sees its old places of worship still standing, it will be the more ready to go there, by force of habit, to worship the true God.’ In the interior Gregory succeeded in arranging the different degrees of power in the Church, and in forcing the recognition of the supreme power of the Holy See. We find him granting the title of Vicar of Gaul to the bishop of Arles, and corresponding with Augustine, archbishop of Canterbury, in regard to Great Britain, with the archbishop of Seville in regard to Spain, with the archbishop of Thessalonica in regard to Greece, and, finally, sending legates ‘a latere’ to Constantinople. In his Pastoral, which he wrote on the occasion of his election, and which became an established precedent in the West, he prescribed to the bishops their several duties, following the decisions of many councils. He strengthened the hierarchy by preventing the encroachments of the bishops upon one another: ‘I have given to you the spiritual direction of Britain,’ he wrote to the ambitious Augustine, ‘and not that of the Gauls.’ He rearranged the monasteries, made discipline the object of his vigilant care, reformed Church music, and substituted the chant that bears his name for the Ambrosian chant, ‘which resembled,’ according to a contemporary, ‘the far-off noise of a chariot rumbling over pebbles.’ Rome, victorious again with the help of Gregory the Great, continued to push her conquests to distant countries after his death.”—V. Duruy, *History of the Middle Ages*, p. 116.—See also above: 496-800.

597-800.—English church.—“The Catholic Church in the west became practically split up into two great sections. One of these had its centre at Rome, drew its inspiration from the culture and discipline of the imperial city, its strength from the traditions of an apostolic see, and exercised an influence none the less real, because often fitful and resented, over her barbarian conquerors throughout western Europe. The other, driven back to the islands and hills of Ireland, Scotland, and Celtic England, developed singular powers of personal saintliness and missionary self-sacrifice among her uncultured and undisciplined children. From the union of the two the Church of England derived its full and matured life. . . . On the 16th of November (597) he (Augustine) was consecrated Archbishop of the English by Vergilius, Archbishop and Metropolitan of Arles, and the infant Church of England began to be.”—H. O. Wakeman, *Introduction to the history of the church of England*, ch. 1, 2.—“About the year 580, . . . Gregory occupied the rank of a deacon. . . . He was early noted for his zeal and piety; coming into large possessions . . . he had expended his wealth in the foundation of no less than seven monasteries, and had become himself the abbot of . . . St. Andrew’s, at Rome. Devoted as he was from the first to all . . . good works, . . . his attention was more particularly turned to the cause of Christian missions by casually remarking a troop of young slaves exhibited for sale in the Roman market. Struck with the beauty or fresh complexion of these strangers, he asked whether they were Christians or Pagans. They were Pagans, it was replied. How sad, he exclaimed, that such fair countenances should lie under the power of demons. ‘Whence came they?’—‘From Anglia.’—‘Truly they are Angels. What is the name of their country?’—‘Deira.’—‘Truly they are subject to the wrath of God; ira Dei. And their king?’—‘Is named Ælla.’—‘Let them learn to sing Allelujah.’ Britain had lately fallen under the sway of the heathen Angles. Throughout the eastern section of the island, the faith of Christ, which had been established there from early times, had been, it seems, utterly extirpated. The British church of Lucius and Albanus still lingered, but was chiefly confined within the ruder districts of Cornwall, Wales, and Cumbria. The reported destruction of the people with all their churches, and all their culture, begun by the Picts and Scots, and carried on by the Angles and their kindred Saxons, had made a profound impression upon Christendom. The ‘Groans of the Britons’ had terrified all mankind, and discouraged even the brave missionaries of Italy and Gaul. . . . Gregory determined to make the sacrifice himself. He prevailed on the Pope to sanction his enterprise; but the people of Rome, with whom he was a favourite, interposed, and he was constrained reluctantly to forego the peril and the blessing. But the sight he had witnessed in the market-place still retained its impression upon him. He kept the fair-haired Angles ever in view; and when, in the year 592, he was himself elevated to the popedom, he resolved to send a mission, and fling upon the obscure shores of Britain the full beams of the sun of Christendom, as they then seemed to shine so conspicuously at Rome. Augustine was the preacher chosen from among the inmates of one of Gregory’s monasteries, for the arduous task

thus imposed upon him. He was to be accompanied by a select band of twelve monks, together with a certain number of attendants. . . . There is something very remarkable in the facility with which the fierce idolaters, whose name had struck such terror into the Christian nations far and near, yielded to the persuasions of this band of peaceful evangelists."—C. Merivale, *Four lectures on some epochs of early church history*, pp. 192-198.—See also ENGLAND: 547-633.—The Roman missionaries in England landed in Kent and appear to have had more influence with the petty courts of the little kingdoms than with the people. The conversion of the north of England must be credited to the Irish monastery on the island of Iona. "At the beginning of the sixth century these Irish Christians were seized with an unconquerable impulse to wander afar and preach Christianity to the heathen. In 563 Columba, with twelve confederates, left Ireland and founded a monastery on a small island off the coast of Scotland (Iona or Hy), through the influence of which the Scots and Picts of Britain became converted to Christianity, twenty-three missions among the Scots and eighteen in the country of the Picts having been established at the death of Columba (597). Under his third successor the heathen Saxons were converted; Aedan, summoned by Oswald of Northumbria, having labored among them from 635 to 651 as missionary, abbot, and bishop. His successors, Finnan and Colman, worthily carried on his work, and introduced Christianity into other Anglo-Saxon kingdoms near East Anglia, Mercia, and Essex."—H. Zimmer, *Irish element in mediæval culture*, pp. 19-21.—"Two bands of devoted men had hitherto been employed in the conversion of England, the Roman, assisted by their converts and some teachers from France, and the Irish, who were plainly the larger body. Between the two there were the old differences as to the time of keeping Easter and the form of the clerical tonsure. . . . Thus, while Oswy [King of Mercia] was celebrating Easter according to the custom he had learnt at Iona, his queen Earfleda observed it according to the rule which she had learnt in Kent, and was still practising the austerities of Lent. These differences were tolerated during the Episcopate of Aidan and Finan, but when Finan died and was succeeded by Colman, the controversy" was terminated by Oswy, after much debate, with the words—"I will hold to St. Peter, lest, when I present myself at the gates of Heaven, he should close them against me." . . . Colman, with all his Irish brethren, and thirty Northumbrians who had joined the monastery, quitted Lindisfarne and sailed to Iona."—G. F. Maclear, *Conversion of the West: the English*, pp. 81-85.—See also LINDISFARNE.—The impartial historian to whom we owe all the early history of the English church, thus records the memory of these devoted men as it remained in the minds of Englishmen long after their departure. It is a brief passage, one like those in the greater Ecclesiastical History of Eusebius, which must stand for much we do not know. Referring to their devoted lives—"For this reason the religious habit was at that time in great veneration; so that whosoever any clergyman or monk happened to come, he was joyfully received by all persons, as God's servant; and if they chanced to meet him upon the way, they ran to him, and bowing, were glad to be signed with his hand, or blessed with his mouth. Great attention was also paid to their exhortations; and on Sundays they flocked eagerly to the church, or the monasteries, not to feed their bodies, but to hear

the word of God; and if any priest happened to come into the village, the inhabitants flocked together to hear from him the word of life; for the priests and clergymen went into the village on no other account than to preach, baptize, visit the sick, and, in few words, to take care of souls; and they were so free from worldly avarice, that none of them received lands and possessions for building monasteries, unless they were compelled to do so by the temporal authorities; which custom was for some time after observed in all the churches of the Northumbrians. But enough has now been said on this subject."—*The Venerable Bede's ecclesiastical history of England*; ed. by J. A. Giles, bk. 3, ch. 26.—The English church passed through several stages during this period. A notable one was the rise and fall of a loose monastic system which attracted men and women of the better classes, but for lack of a strict rule brought itself into disrepute. Another was the development of classical learning and the foundation of the school at Jarrow in Northumberland resulting in making England the intellectual centre of the world. Venerable Bede, who wrote the "Ecclesiastical history of the English church," was the greatest teacher of this epoch; and Alcuin, a Northumbrian by birth, and of the school of York, of the next. Invited by Charlemagne to the Frankish court, he carried English learning to the Continent, and although he died at the time of the foundation of the empire, left his influence in many ways on the development of European culture. A single fact of interest will suffice, to show the close connection of this early history with that of Rome and the Continent—viz., to Alcuin we are largely indebted for the parent script which formed our Roman letters. (I. Taylor, *Alphabet*, v. 2, p. 180.) Northumbrian learning and the rich libraries of ancient and Anglo-Saxon literature were destroyed by the Danes, who, in their incursions, showed for a long time peculiar animosity to monks and monasteries. Although the service of this early Anglo-Saxon church was partly in the vernacular, and large portions, if not all, of the Gospels had been translated, little remains to us of its early religious literature. The translations of the Gospel into Anglo-Saxon that have come down to us are to be attributed to a late period.—See also CHURCH OF ENGLAND: 597-1066.

8th century.—Iconoclastic controversy. See ICONOCLASTIC CONTROVERSY.

9th century.—Bulgarian church.—"In the beginning of this 9th century, a sister of the reigning Bulgarian king, Bogoris, had fallen as a captive into the keeping of the Greek emperor. For thirty-eight years she lived at Constantinople, and was there instructed in the doctrines of the Christian faith. Meanwhile, the administration passed into the hands of the empress regent, Theodora. She was interested in a certain monk named Cupharas, who had been taken prisoner by the Bulgarians, and with a view to his redemption, she opened negotiations with Bogoris. An exchange of prisoners was finally effected. The sister of Bogoris was restored to him, while Cupharas was permitted to return to Constantinople. Before the release of the pious monk, however, he had striven, though quite unavailingly, to win the Bulgarian prince to the service of the Cross. These fruitless endeavors were supplemented by the entreaties of the king's sister, on her return from Constantinople. . . . At last, fear snapped the fetters

which love had failed to disengage. . . . His baptism was celebrated at midnight with profound secrecy. The rite was administered by no less a personage than the patriarch Photius. He emphasized the solemnity of the occasion by presenting the neophyte with a lengthy treatise on Christianity, theoretical and practical, considered mainly in its bearings on the duties of a monarch. The emperor Michael stood sponsor by proxy, and the Bulgarian king received, as his Christian name, that of his imperial god-father. . . . The battles of theology rang over Christendom, and the world was regaled with the spectacle of a struggle between the rival Churches for the possession of Bulgaria, a country till recently so conspicuously destitute of dogma of any kind. The Bulgarians themselves, doubtless much astonished at the uproar for their sake, and, surely, more perplexed than ever by the manners and customs of Christianity, began to waver in their adherence to the Western Church, and to exhibit symptoms of an inclination to transfer their allegiance to Constantinople. The strife went on for years. At last, A. D. 877, the Latin clergy having been dismissed from the country, Pope John VIII. solemnly expostulated, protesting against the Greek proclivities of the Bulgarians, and predicting dire results from their identity with a Church which was rarely free from heresy in one form or another. Nevertheless, the Byzantine leanings of Bulgaria did culminate in union with the Eastern Church. A Greek archbishop and bishops of the same communion, settled in the country. . . . 'The Eastern branch' of the Slavonic languages, properly so called, 'comprehends the Russian, with various local dialects, the Bulgarian, and the Illyrian. The most ancient document of this Eastern branch is the so called ecclesiastical Slavonic, i. e., the ancient Bulgarian, into which Cyrillus and Methodius translated the Bible in the middle of the 9th century. This is still the authorized version of the Bible for the whole Slavonic race, and to the student of the Slavonic languages it is what Gothic is to the student of German.'—G. F. Maclear, *Conversion of the West: the Slavs*, pp. 54-60.—See also BULGARIA: 8th-9th centuries; 1258-1872.

9th century.—Conversion of Moravia.—“In the opening years of the 9th century, Moravia stretched from the Bavarian borders to the Hungarian river Drina, and from the banks of the Danube, beyond the Carpathian mountains, to the river Stryi in Southern Poland. Into this territory Christianity had been ushered as early as A. D. 801, by Charlemagne, who, as his custom was, enforced baptism at the point of the sword, at least as far as the king was concerned. Efforts were subsequently made by the archbishops of Salzburg and Passau to fan this first feeble flicker into something like a flame. But no success attended their exertions. Paganism was overpoweringly strong, and Christianity not only weak, but rude and uncouth in type. . . . The story of this country, during the process of emancipation from paganism, is but a repetition of the incidents with which, in neighbouring states, we have already become familiar. Ramifications of the work of Cyril and Methodius extended into Servia. The Slavonic alphabet made way there, as in Bohemia and Moravia, for Christianity. The Servians 'enjoyed the advantage of a liturgy which was intelligible to them; and we find that, early in the 10th century, a considerable number of Slavonian priests from all the dioceses were or-

ained by the bishop of Nona, who was himself a Slavonian by descent.”—G. F. Maclear, *Conversion of the West: the Slavs*, ch. 4.—See also MORAVIA: 9th century.

829.—Translation of body of St. Mark to Venice. See VENICE: 829.

9th-10th centuries.—Eastern church as a missionary church.—“If the missionary spirit is the best evidence of vitality in a church, it certainly was not wanting in the Eastern Church during the ninth and tenth centuries of our era. This period witnessed the conversion to Christianity of the principal Slavonic peoples, whereby they are both linked with Constantinople, and bound together by those associations of creed, as well as race, which form so important a factor in the European politics of the present day. The Moravians, the Bulgarians, and the Russians were now brought within the fold of the Church; and the way was prepared for that vast extension of the Greek communion by which it has spread, not only throughout the Balkan peninsula and the lands to the north of it, but wherever Russian influence is found—as far as the White Sea on the one side, and Kamchatka on the other, and into the heart of Central Asia. The leaders in this great work were the two brothers, Cyril and Methodius, who in consequence of this, have since been known as the Apostles of the Slavonians. What Mezep did for the Armenians, what Ulfilas did for the Goths, was accomplished for that race by Cyril in the invention of a Slavonic alphabet, which from this cause is still known by the name of the Cyrillic. The same teacher, by his translation of the Scriptures into their tongue, provided them with a literary language, thereby producing the same result which Luther's Bible subsequently effected for Germany, and Dante's Divina Commedia for Italy. It is no matter for surprise that, throughout the whole of this great branch of the human race—even amongst the Russians, who owed their Christianity to another source—the names of these two brothers should occupy the foremost place in the calendar of Saints. It is not less significant that their names are not even mentioned by the Byzantine historians.”—H. F. Tozer, *Church and the Eastern empire*, ch. 7.—See also SLAVS: 9th-10th centuries.

9th-11th centuries.—Western church as a missionary church.—The earlier missions of the western church have been described, but it is noteworthy that again and again missions to the same regions are necessary. It requires such a map as the one accompanying this article to make plain the slowness of its diffusions and the long period needed to produce even a nominally Christian Europe. “The views of Charlemagne for the conquest and conversion of the Northern heathens [see SAXONS: 772-804], were not confined to the limits, wide as they were, of Saxony. The final pacification effected at Salz, seemed to open his eyes to more extensive enterprises in prospect. Political may have combined with religious motives in inducing him to secure the peace of his new frontiers, by enlisting the tribes of Denmark under the banner of the Cross, and he conceived the idea of planting a church in the neighbourhood of Hamburg, which should become a missionary centre. This plan, though interrupted by his death, was not neglected by his son Louis le Debonnaire, or 'the Pious.' . . . But it is easier to propose such a plan than find one willing

to carry it out. The well-known ferocity of the Northmen long deterred any one from offering himself for such a duty. At length he received intelligence from Wala, the abbot of Corbey, near Amiens, that one of his monks was not unwilling to undertake the perilous enterprise. The intrepid volunteer was Anskar."—G. F. Maclear, *Conversion of the West: The Northmen*, ch. 2.—"In 822, Harold, the king of Jutland, and claimant of the crown of Denmark, came to seek the help of Louis the Pious, the son, and one of the successors, of Charlemagne. . . . On Harold's return to Denmark he was accompanied by Anskar, who well deserves to be called the apostle of Scandinavia. . . . Thus Anskar and Autbert set out in the train of Harold, and during the journey and voyage a kindly feeling sprang up between the royal and the missionary families. Harold got no cordial greeting from his proud heathen subjects when he announced to them that he had done homage to the emperor, and that he had embraced the gospel. He seems to have been very sincere and very earnest in his endeavours to induce his nobles and subjects to abandon idolatry and embrace Christianity. To expect that he was altogether judicious in these efforts would be to suppose that he had those views regarding the relation that ought to subsist between rulers and subjects, . . . views regarding liberty of conscience and the right of private judgment. . . . The result was that after two years, in 828, he was compelled to abdicate the throne. . . . The position of Anskar, difficult as it was while Harold was on the throne, became still more difficult after his abdication. . . . But just at the time when the door was shut against him in Denmark, another was opened in Sweden, which promised to be wider and more effectual. . . . He was kindly received by the Swedish king, who gave him permission to preach, and his subjects freedom to accept and profess the gospel of Christ. As Anskar had been led to expect, so he found, many Christian captives, who had been brought from other countries,—France, Germany, Britain, Ireland,—and who, having been as sheep without a shepherd, gladly received from Anskar those consolations and exhortations which were fitted to alleviate the sorrows of their captivity. . . . After a year and a half's stay in Sweden, Anskar returned home, and gladdened the heart of the good emperor, and doubtless of many others, by the cheering prospect he was able to present of the acceptance of the gospel by the Swedes. He was now made nominally bishop of Hamburg, but with the special design of superintending and conducting missionary operations both in Denmark and Sweden. . . . Horik, king of Denmark, who had driven Harold from his throne, . . . had been hitherto an uncompromising enemy of the gospel. Anskar undertook the management of some political negotiations with him, and in the conduct of them made so favourable an impression on him that he refused to have any other negotiator or ambassador of the German king at his court. He treated him as a personal friend, and gave him full liberty to conduct missionary operations. These operations he conducted with his usual zeal, and by God's blessing, with much success. Many were baptized. The Christians of Germany and Holland traded more freely with the Danes than before, and the Danes resorted in larger numbers as traders to Holland and Germany; and in these and other ways a knowledge of the gospel, and some apprehension of the blessings which it brings with it, were diffused among the people. . . . Although the Norwegians

were continually coming into contact, in the varying relations of war and peace, with the Swedes and the Danes, the French and Germans, the English and the Irish, and although in this way some knowledge of the Christian system must have been diffused among them, yet the formal introduction of it into their country was a full century later than its introduction into Denmark and Sweden."—T. Smith, *Mediæval missions*, pp. 122-138.—"The conversions in Denmark were confined to the mainland. The islands still remained pagan, while human victims continued to be offered till the Emperor Henry I. extorted from Gorm, the first king of all Denmark, in 934, protection for the Christians throughout his realm, and the abolition of human sacrifices. In Sweden, for seventy years after Anskar's death, the nucleus of a Christian Church continued to be restricted to the neighbourhood of Birka, and the country was hardly visited by Christian missionaries."—G. F. Maclear, *Conversion of the West: The Northmen*, ch. 2.—"It is very remarkable that, in the whole history of the introduction of Christianity into Norway and Iceland, extending over a period of a century and a half, we meet not with the name of any noted bishop, or ecclesiastic, or missionary. There were, no doubt, ecclesiastics employed in the work, and these would appear to have been generally Englishmen; but they occupied a secondary place, almost their only province being to baptize those whom the kings compelled to submit to that ordinance. The kings were the real missionaries; and one cannot help feeling a kind of admiration for the ferocious zeal which one and another of them manifested in the undertaking,—even as the Lord commended the unjust steward because he had done wisely, although his wisdom was wholly misdirected. The most persistent and the most successful of these missionary kings was Olaf the Thick, who came from England in 1017, and set himself with heart and soul to the work of the demolition of heathenism, and the substitution of Christianity as the national religion."—T. Smith, *Mediæval missions*, pp. 140-141.—See also ICELAND: 981-1000.

10th-18th centuries.—Russian church.—"In the middle of the 10th century, the widowed Princess Olga, lately released from the cares of regency, travelled from Kiev to Constantinople. Whether her visit had political objects, or whether she was prompted to pay it solely, as some say, by a desire to know more of the holy faith of which only glimpses had been vouchsafed her at home, cannot be positively decided. But her sojourn in the imperial city was a turning-point in her career. Baptism was administered to her by the patriarch Polyuctes, the emperor Constantine Porphyrogenitus officiating as sponsor. Polyuctes then solemnly addressed the princess, predicting that through her instrumentality Russia should be richly blessed. 'Olga,' writes M. Mouravieff, 'now become Helena by baptism, that she might resemble both in name and deed the mother of Constantine the Great, stood meekly bowing down her head, and drinking in, as a sponge that is thirsty of moisture, the instructions of the prelate.' . . . Some latent impressions favourable to Christianity her youngest grandson, Vladimir, doubtless owed to her. Nevertheless when, at the death of his brother Yarapolk, for which indeed

he was held responsible, he mounted the throne, no signs of a gracious character revealed themselves. He was, on the contrary, a bitter and bigoted pagan. . . . It seems to have occurred to many missionaries of varying types, that a chief of such mark should not be left at the mercy of his own violent passions. The spiritual well-being of Vladimir accordingly became the object of laborious journeys, of much exertion, and of redundant eloquence. . . . Last of all came a Greek emissary. He was neither 'a priest nor a missionary, but a philosopher.' . . . Like Bogoris, the wild Russian chief was greatly moved. . . . The following year the king laid before the elders of his council the rival pleas of these variously recommended forms of faith, and solicited their advice. The nobles mused awhile, and then counselled their master to ascertain how each religion worked at home. This, they thought, would be more practical evidence than the plausible representations of professors. On this suggestion Vladimir acted. Envoys were chosen,—presumably, for their powers of observation,—and the embassy of inquiry started. 'This public agreement,' says the historian of the Russian Church, 'explains in some degree the sudden and general acceptance of Christianity which shortly after followed in Russia. It is probable that not only the chiefs, but the common people also, were expecting and ready for the change.' A report, far from encouraging, was in due time received from the ambassadors. Of the German and Roman, as well as the Jewish, religions in daily life, they spoke in very disparaging terms, while they declared the Mussulman creed, when reduced to practice, to be utterly out of the question. Disappointed in all these quarters, they now proceeded, by command, to Constantinople, or, as the Russians called it, Tzaragorod. . . . Singularly enough, the Russian envoys, accustomed, as we must suppose them to have been, only to the barest simplicity of life, had complained not only of the paucity of decoration in the Latin churches, but of a lack of beauty in their appointments. Thus the preparations of the patriarch were accurately fitted to their expectant frame of mind. They were led into the church of S. Sophia, gleaming with variegated marbles, and porphyries, and jasper, at that time 'the masterpiece of Christian architecture.' The building glittered with gold, and rich mosaics. The service was that of a high festival, either of St. John Chrysostom, or of the Death of the Virgin, and was conducted by the patriarch in person, clad in his most gorgeous vestments. . . . On their return to Vladimir, they dilated with eager delight on the wonders they had seen. The king listened gravely to their glowing account of 'the temple, like which there was none upon earth.' After sweetness, they protested, bitterness would be unbearable, so that—whatever others might do—they at all events should at once abandon heathenism. While the king hesitated, his boyars turned the scale by reminding him that if the creed of the Greeks had not indeed had much to recommend it, his pious and sagacious grandmother, Princess Olga, would not have loved and obeyed it. Her name acted like a talisman. Vladimir resolved to conform to Christianity. But still, fondly clinging to the habits of his forefathers, he cherished the idea of wooing and winning his new religion by the sword. . . . Under the auspices of the sovereign, the stately church of St. Basil soon arose, on the very spot recently occupied by the temple of Perun. Kiev became the centre of Christian influence, whence evangelizing energies radiated in all directions. Schools and

churches were built, while Michael, the first metropolitan, attended by his bishops, 'made progresses into the interior of Russia, everywhere baptizing and instructing the people.' The Greek canon law came into force, and the use of the service-book and choral music of the Greek communion became general, while, in the Slavonic Scriptures and Liturgy of Cyril and Methodius, a road was discovered which led straight to the hearts of the native population. 'Cyril and Methodius, if any one, must be considered by anticipation as the first Christian teachers of Russia; their rude alphabet first instructed the Russian nation in letters, and, by its quaint Greek characters, still testifies in every Russian book, and on every Russian house or shop, the Greek source of the religion and literature of the empire.'—G. F. Maclear, *Conversion of the West: the Slavs*, ch. 5. —See also RUSSIA: 10th-11th centuries; SLAVS: 9th-10th centuries.

'Vladimir (after he had, in his pagan way, made war upon the Greek emperor, and won Basil's sister and his religion alike with the sword) was baptised at the Cherson. His next act, after he had built a church to St. Basil, was to return to Kiev, to hurl the great idol of the thunder-god into the Dniéper, and to declare that he would hold for his enemy any who did not come to be christened. His people obeyed willingly enough, and were baptised in the river by the Greek clergy who named them in droves, while Vladimir stood in a transport of joy on the bank. It is all very characteristic of Russian history and significant both in the points where it resembles, and in those where it differs from the conversion of our own Aethelbert by St. Augustine. Gradually thereafter, as in England, order began to grow up out of chaos. The infant nation of Russia consisted of independent principalities, held slightly together by the senior member of the ruling family, the Grand Prince, who lived at Kiev. They gradually became one, as the princes and Greek bishops converted them into one Church—not a Russian Church yet, but a province of the Greek Church, with a Metropolitan, who was for more than two hundred years nearly always a Greek, living at Kiev. It was Constantinople that civilized Russia, and the religious basis of Russia is Byzantine to this day, as her deepest tradition is the championship of Christendom against the Turks, who in a later age overthrew Byzantium itself. Huge must have been the task of the monks, who in their absolute self-abnegation and the untiring courage of their zeal carried the civilization of their Greek teachers among the wild tribes.

"During our Norman period there were eighty-three civil wars and 203 different claimants to the principedom. Other centres began to supersede Kiev, notably Novgorod and Moscow. But Russia was becoming a nation, a nation in a church. Then came the terror of the Tatar invasion (just two years before St. Francis died at Assisi). By 1240 the Tatar domination had begun, and it continued for 240 years. . . . The adversity welded the Russian people together, and based their nationality more deeply in their Church: indeed, like the Balkan nations under a far more cruel Moslem oppression, when they ceased to exist as an independent nation they continued to exist as a Church. Indeed, their Church won its independence during these miserable hard years. Kiev was laid waste in 1243, and the Metropolitan perished with it: His successor was a Russian, and the Patriarch of Constantinople agreed to the appointment. The centre of gravity was shifting to middle Russia. Kiev was again laid waste.

The Metropolitan moved to Vladimir in 1299. In 1325 they settled in Moscow.

"Kiev, Moscow, Petrograd. These three towns give one the three periods of Russian history. Muscovy was rich and comparatively secure; the Grand Prince of Moscow obtained the absolute supremacy of Russia, he dealt wisely with the Tatars, and he was the 'eldest son' and the protector of the Metropolitan. In 1380 (just before the death of Wyclif) the heroic Dimitry of the Don defeated the Tatars; and though the victory was a barren one, it proved that Moscow was the champion of the Church and the nation against the 'Golden Horde,' and its prince the head of a nation, and not the mere chief of a coalition of princelets. In 1462 (when the Wars of the Roses were nearly over in England) Ivan the Great founded the Tsardom of Muscovy. By 1480 the Tatar domination was completely at an end. The Russian Church is now firmly established as a National Church and identical as always with the Russian people. . . . Meanwhile the parent Church had itself sunk under Moslem oppression; for in 1453 Constantinople had fallen. When [1588] . . . the Metropolitan of Moscow became Patriarch, there was no change except that of pomp and circumstance. He had long been the virtual patriarch of the Russian Church; and the Church itself gained nothing more than it had already in being pronounced autocephalous by his nominal superior the unhappy Patriarch of Constantinople, now a subject of the Turks. So the three periods are still Kiev, Moscow, and Petrograd, and the three chief dates 980, 1320, 1721. The establishment of the Patriarchate in the middle of the Moscow period is not the foundation of the independent Russian Church, but only a picturesque incident proclaiming the fact. Nikon, a peasant's son, was Patriarch during the years when Oliver Cromwell ruled in England. He was able, uncompromising, masterful, and modern. In the face of furious opposition he corrected some translator's mistakes in the Russian service books . . . [and made changes]. When London was being rebuilt after the Fire, a great Synod deposed Nikon, but at the same time excommunicated those who would not accept his corrections. Thus arose Russian Dissent: the Starobryádsy (old ritualists) or Starovyéry (old believers) were henceforth the Raskóliniky (the separated). It is all characteristic of the immense difference between the East and West: the Church had been too progressive for the people, and dissent arose in the interest of conservatism—of those who were too orthodox for the orthodox church; and, as happens sometimes with extreme conservatism even in the West, it was all a fuss about nothing. But fierce struggles and persecutions followed; the wildest sects sprang up from the Bezpapóvtsy, the priestless section of the Raskol, fierce ascetics, errants, self-mutilators, sects of licence, sects of suicide, silent sects (as late as 1897 twenty-four persons had themselves buried alive)—every example of the madness of collective hysteria and the *Idée fixe*. At the same time there are mystical sects like Dukhabórtsy, inspired by a kind of saintly foolishness, and sects of Western type like the Stundists and Russian Baptists; while the steady-going Old Believers include many of the most business-like, prosperous, and exemplary families of Russia. It is difficult to estimate the strength of Dissent in the Empire, but the true figure seems to lie somewhere between ten and twenty millions, as against the hundred millions of members of the Russian Orthodox Church. Far more dangerous for the

future . . . [was] the falling away of the Intelligentsia from the Church.

"In 1700 the last Patriarch of Moscow died . . . Peter the Great—for good and evil the maker of Modern Russia—moved the seat of government from Moscow to the town that he built and called by the German name of Petersburg. He wished to open a window upon the West, he also tried to Germanize the Russian Church, forbade the election of a new Patriarch, and in 1721 established the Holy Governing Synod on the model of the Lutheran consistories. So begins the modern period of Russian Church History—Kiev, Moscow, and now Petrograd. The Holy Synod consists of the Metropolitans of these three cities, Kiev, Moscow, Petrograd, the Exarch of Georgia, whose Church was a century ago incorporated with the Russian, and five of six other Bishops nominated by the Tsar, all sitting under the presidency of the Oberprokuror, a layman also nominated by the Emperor. It was an excellent plan for a man like Peter the Great, who wished to have the Church entirely under his thumb. . . . Since the establishment of the Holy Synod the deep Evangelical traditions of Russian Christianity . . . continued to flourish, because the religion of the people is too intimate and too vital to be disturbed by a change of organization. Russia has brought the gospel to large tracts of Asia in her great missionary efforts; and Russia has continued to produce thousands of Christ-like men and women: but the Church as a Church has not moved."—*Lectures on the Russian church, Bishop of London, ed., pp. 3-11.*—See also LIVONIA: 12th-13th centuries.

11th-12th centuries.—TRUCE of God. See TRUCE OF GOD.

11th-13th centuries.—Extent of Christendom.—Schism.—"In the 9th, 10th, and 11th centuries of the Christian era the reign of the Gospel and of the church was extended over Bulgaria, Hungary, Bohemia, Saxony, Denmark, Norway, Sweden, Poland, and Russia. A laudable ambition excited the monks both of Germany and Greece to visit the tents and huts of the barbarians; the first conversions were free and spontaneous; and a holy life and an eloquent tongue were the only arms of the missionaries. The leaders of nations held it lawful and pious to impose the Catholic faith on their subjects and neighbors: the coast of the Baltic, from Holstein to the gulf of Finland, was invaded under the standard of the cross; and the reign of idolatry was closed by the conversion of Lithuania in the 14th century. The conversion of the North imparted many temporal benefits both to the old and the new Christians. The admission of the barbarians into the pale of civil and ecclesiastical society delivered Europe from the depredations, by sea and land, of the Normans, the Hungarians, and the Russians, who learned to spare their brethren and cultivate their possessions. The establishment of law and order was prompted by the influence of the clergy; and the rudiments of art and science were introduced into the savage countries of the globe. The liberal piety of the Russian princes engaged in their service the most skillful of the Greeks to decorate the cities and instruct the inhabitants; the dome and the paintings of St. Sophia were rudely copied in the churches of Kiev and Novgorod; the writings of the fathers were translated into the Slavonic idiom; and 300 noble youths were invited or compelled to attend the lessons of the college of Jaroslaus."—

E. Gibbon, *History of the decline and fall of the Roman empire (abridged)*, p. 519.—“It was Photius [holder of the Eastern see in the ninth century] who laid the foundations of the schism between East and West by unduly insisting during his conflict with Rome on the differences between the two Churches. . . . This came about toward the end of the tenth century . . . after a period during which comparatively friendly relations had been maintained with Rome. Under Eustathius (1010-25) a peace was indeed patched up with Rome. . . . Michael Cerularius, who followed him after an interval, was very differently disposed to Rome. In 1053, by his doing, the Latin Churches at Constantinople were suddenly closed, the monasteries were ordered to conform to the Greek rite, and on their refusal their inmates were . . . declared excommunicate. . . . A Council which he assembled reissued with approval the manifesto of Photius to the bishops of the West and laid the whole Latin Church under an anathema. . . . The breach once made was never mended and the example of Constantinople was soon followed by other Eastern Churches. . . . Wholly taken up with their supposed Orthodoxy, the Greeks seem to have lost all desire of re-entering into communion with the Latins.”—F. X. Funk, *Manual of church history*, v. 1, pp. 270-280.—The defections of the Western prelate and his followers enumerated by Photius and his successors makes a formidable list:

“They, the followers of Rome, deemed it proper to fast on the seventh day of the week—that is, on the Jewish Sabbath; in the first week of Lent they permitted the use of milk and cheese; they disapproved wholly of the marriage of priests; they thought none but bishops could anoint with the holy oil or confirm the baptized, and that they therefore anointed a second time those who had been anointed by presbyters; and fifthly, they had adulterated the Constantinopolitan Creed by adding to it the words Filioque, thus teaching that the Holy Spirit did not proceed only from the Father, but also from the Son. This last was deemed, and has always been deemed by the Greek Church the great heresy of the Roman Church. . . . The Greek Church to-day in all its branches—in Turkey, Greece, and Russia—professes to hold firmly by the formulas and decisions of the seven Œcumenical or General Councils, regarding with special honour that of Nice. The Nicene and Athanasian Creeds are the symbols of its faith, the Filioque clause being omitted from the former, and the eighth article reading thus: ‘And in the Holy Ghost, the Lord and Giver of life, who proceedeth from the Father, and with the Father and Son together is worshipped and glorified.’ . . . The Greek Church, unlike the Latin, denounces the use of images as objects of devotion, and holds in abhorrence every form of what it terms ‘image worship.’ [See also IDOLATRY AND IMAGE WORSHIP: In Christianity.] Its position in this manner is very curious. It is true, no figures of our Lord, of the Virgin, or saints, such as one sees in churches, wayside chapels, and in the open fields in countries where the Roman Church is powerful, are to be seen in Russia, Greece, or any of those lands where the Eastern Church is supreme. On the other hand, pictures of the plainest kind everywhere take their place, and are regarded with the deepest veneration.”—J. C. Lees, *The Greek church (Churches of Christendom)*, lecture 4.—“In the Middle Ages the Latin church chiefly assumed the task of christianizing and civilizing the new races which came upon the stage. The Greek church has had no Middle Ages in the usual sense, and there-

fore no Reformation. She planted Christianity among the Slavonic races, but they were isolated from the progress of European history, and have not materially affected either the doctrine or polity or cultus of the church. Their conversion was an external expansion, not an internal development. . . . When once the two churches were alienated in spirit and engaged in an unchristian race for supremacy, all the little doctrinal and ritualistic differences which had existed long before, assumed an undue weight, and were branded as heresies and crimes. The bishop of Rome sees in the Patriarch of Constantinople an ecclesiastical upstart. . . . The Eastern patriarchs look upon the Pope as an anti-christian usurper and as the first Protestant. . . . The patriarchs of Alexandria, Antioch, and Jerusalem adhered to the See of Constantinople. Thus the schism between the Christian East and West was completed. . . . During the Crusades the schism was deepened by the brutal atrocities of French and Venetian soldiers in the pillage of Constantinople (1204), the establishment of a Latin empire and the appointment by the pope of Latin bishops in Greek sees. Although this artificial empire lasted only half a century (1204-1261), it left a legacy of burning hatred in the memories of horrible desecrations and innumerable insults and outrages which the East had to endure from the Western barbarians.”—P. Schaff, *History of the Christian church*, v. 4, pp. 310-321.

11th-13th centuries.—Period of the Crusades.—In the meantime Christendom was in the midst of an extraordinary emotional experience. “The Crusades are in many ways the most remarkable of the phenomena of the Middle Ages. Their causes were many. The historian who emphasizes economic influences may well claim the unusually trying conditions of the eleventh century as a main source. Between 970 and 1040 forty-eight famine years were counted. From 1085 to 1095 conditions were even worse. Misery and unrest prevailed widely. . . . Stimulated by these economic conditions doubtless, the whole eleventh century was a period of deepening religious feeling. Its manifestations took monastic and ascetic forms. . . . Those regions where the reform movement had shone brightest, or which had come into closest relations with the reforming papacy, France, Lorraine, and southern Italy, were the recruiting-ground of the chief crusading armies. . . . In 1291 the last of the Latin holdings in Palestine was lost. The Crusades were over, though men continued to talk of new expeditions for nearly two centuries more.”—W. Walker, *History of the Christian church*, pp. 238-244.—See also CRUSADES: Military aspect; EUROPE: Middle ages; Crusades, etc.

ALSO IN: E. Emerton, *Mediæval Europe*.—J. M. Ludlow, *Age of the crusades*.—*Cambridge modern history*, v. 1, chs. i., iv.

1048-1309.—Summit of papal power (1276).—Decline of papacy.—It was during this age that the church came to its greatest strength. Landmarks of this period of Christendom are: the rise of Hildebrand the monk reformer, who as Gregory VII gave the first impulse to the Crusades and to the struggle over the investitures, the great struggle between the Holy See and the empire and the final triumph of the church under Innocent III when scarcely a country in Christendom did not feel the power of the great pontiff. “Now it was an attempt to convert the Albigensian heretics in

the South of France, and a Crusade was started against them when preaching proved ineffectual. Now it was intervention to save the Jews from persecution and oppression. [See JEWS: 13th-14th centuries.] Now it was an excommunication for Pedro of Castile, bringing him to repentance for repudiating his wife. Now it was mediation between the King of Hungary and his brother. Now it was a similar arbitration in Norway, and again in Sweden. Now it was the coronation of a king for the Bulgarians. And amid this welter of state turmoil the Pope had an eye for the inner life of the Church, and welcomed both St. Francis and St. Dominic whose marvelous lives and new religious orders were to do so much for the Church of the Middle Ages. . . . The Trinitarians and the Humiliati also owed their approbation to him.

a group of feeble states than an effective single sovereignty. . . . The weakness of the papacy, from a worldly point of view, was that it had no adequate physical forces at its disposal. It must balance off one competition against another."—W. Walker, *History of the Christian church*, p. 289.—The removal in 1309 of the papacy to Avignon, the outcome of the growing power of France, was followed by the Great Schism when a Roman pope was acknowledged by approximately half of Christendom and a pope at Avignon by the other half. (See PAPACY: 1204-1348.) The confusion in the ranks of the church and its encroachments on temporal power were, however, offset by the various humanistic and reform movements which, springing out of the renaissance of learning, were leading up to the

St. Bernardo, St. Benedict, St. Gualberto, St. Michael

(From a drawing by Perugino)

. . . The culminating event in Innocent's pontificate was the Ecumenical Council held at the Lateran in 1252. . . . Seventy-one patriarchs and archbishops, four hundred bishops and nine hundred abbots and priors gathered round the father of Christendom."—G. Stebbing, *Story of the Catholic church*, p. 332.—After 1276 "the general temporal power of the Pope over the European princes grew less. . . . At that time the Crusades were over and along with them the enthusiasm that had called them forth. Scholasticism still filled a large place in the life of the Church, but its greatest doctors, Thomas and Bonaventure, were dead; and at the same time the long absence of the popes at Avignon was preceded by absences of considerable duration sometimes amounting to whole reigns, at Viterbo and Perugia."—G. Stebbing, *Story of the Catholic church*, p. 360.—"Long quarrels and the consequent confusion had greatly enfeebled the power of the Holy Roman Empire. Thenceforward to the Reformation it was far more

Reformation. The protesting voice of Savonarola, the theories of Erasmus, the preaching of Luther, Wycliffe, Huss and Zwingli were the inevitable medicines offered to a sick church.

11th-16th centuries.—Currents of religious and intellectual thought.—"The new stirring of intellectual life in the eleventh century manifested itself in a greatly-quicken interest in theological questions and the introduction of new methods in

the treatment of them. . . . In the universities scholastic theology, which is the greatest intellectual achievement of the twelfth and thirteenth centuries was developed. Abelard is usually taken to mark the beginning of the movement, Thomas Aquinas its culmination; in the fourteenth century its decadence began. . . . The Franciscans took a no less active part in the scholastic movement than the Dominicans, but they kept closer to the Augustinian-Platonic tradition. . . . If we should attempt in a few words to sum up the chief results of the scholastic period, we should remark first the systematisation of the whole body of Catholic theology and the effort to give it throughout a rational, and as far as possible a logically demonstrative character. . . . The twelfth century witnessed not only the rise of scholastic theology but a great revival of mysticism, whose most conspicuous representatives are Bernard of Clairvaux and Hugh of St. Victor. . . . The rise of the mendicant orders is one of the most significant phenomena of the age. They were called into existence by a deep concern for the religious condition of the multitude, and the response their labours found shows that in the masses themselves the need of a revival of the religious life was felt. . . . The popes gave to both orders general power to confess penitents, and they soon became the favorite guides of lay consciences, the Dominicans largely in the higher classes, the Franciscans among the common people. . . . The same stirring of the religious life, the same dissatisfaction with existing conditions in the Church . . . manifested itself in movements which found no room in the Church and consequently separated from it. One of these sects, the Waldensians, had an origin not dissimilar to that of the Franciscans, but a totally dissimilar fortune. . . . The opposition of the church threw them into antagonism with it, and led them to deny its authority, asserting against it, as the sects always did, the authority of Scripture. . . . Another symptom of the religious unrest was an alarming recrudescence of dualistic heresies from which the West had for centuries been free. Their adversaries stamped them with the historical label, 'Manichaeans.' . . . Their own name for themselves was 'Cathari' (the Pure). . . . The Cathari had many ramifications and variations and were called by many local names, of which Albigenses is the best known. . . . Finally, in 1200 a crusade was launched against them; the nobles in whose territories they had flourished were dispossessed and the land ravaged by war. . . . Soon a new and . . . formidable instrument was created in the papal inquisition instituted by Gregory IX (in 1232-35) and intrusted to the Dominicans, which was promptly set to work in the countries infected with heresy. . . . Till the latter part of the fourteenth century England was little affected by the new religious movements of the continent. . . . Heresy . . . had got no foothold there; the inquisition had not been introduced and the statute '*De haeretico comburendo*' was enacted only in 1401. This law was directed primarily against the Lollards. . . . The writings of Wycliffe early found their way from Oxford to Prag and the Hussite movement in Bohemia was largely inspired by his ideas. . . . The revival of the study of classical Latin literature and antiquities in the fourteenth century, in which Petrarch's is the shining name, was followed in the fifteenth by the opening to the West of the whole wealth of Greek literature. . . . Now the authority of Plato was arrayed against that of Aristotle, and the foundations of the great scholastic

system were shaken. The humanists, who formed their taste on classical models had an aesthetic antipathy to the theologians . . . and they had an equally strong aversion to the scholastic method. . . . In the revival of letters and art the popes of the second half of the fifteenth and the beginning of the sixteenth centuries had an eminent part, and both the refinement of taste and the dissoluteness of morals which are associated with the Renaissance were conspicuously exemplified in the lives of more than one of them. . . . Savonarola, like one of the old prophets, lifted up his voice in season and out of season against the corruption of the age. . . . Complaints against the extortions of the curia were never louder or more universal than at the beginning of the sixteenth century. France and England had long ago found means to protect themselves in considerable part from these exactions; but on Germany, which for want of national unity and national spirit had no such defense, they fell with double weight. The resentment this created was easily turned into sympathy with Luther in his attacks upon the hierarchy among classes to whom his theological innovations were of no concern."—G. F. Moore, *History of religions*, v. 2, pp. 268-269, 272-274, 276, 282-285, 288, 290, 292-295.—See also EUROPE: Middle ages; Renaissance and Reformation: Characteristics of the period.

12th-16th centuries.—Lack of missionary effort.—"The period of the conversion of Northern Europe covered about four centuries. Then . . . there followed an interval of approximately four hundred years when practically no effort was made to carry the gospel to regions beyond. The Russian and Balkan area took on a religious stationariness from which it has not yet emerged. Mediæval Europe, so religious and Christian in its own way, possessing a civilization so much more wonderful than we are apt to acknowledge had lost almost all remembrance of a non-European world of which the classic civilization had been so well aware. The East, which it vividly realized, was only the margin of Islam, the region in which it had conducted the wars of the Crusades. Those wars themselves had built a barrier between the West and the Near East which has begun to crumble only in modern times. The Far East, India, China, Japan, and even Africa were almost a realm of legend. . . . Little islands of Greek and Eastern Christianity still stood out above the rising tide of Mohammedanism. Constantinople remained until 1453 the last bulwark against Islam. Yet in the Fourth Crusade, Venice betrayed Constantinople as if she had been her chief foe. Neither from Constantinople nor from the ancient churches of Syria or Asia Minor went out any effort toward regaining the East which had once been Christian. The Crusades, the European effort within this area, were the very opposite of a missionary movement."—E. C. Moore, *Spread of Christianity in the modern world*, pp. 10-11.

1453.—Fall of Constantinople.—"The period between the Crusades and the Reformation

was one of gains and losses for Christendom. . . . The prevailing characteristic of this period was the loss of once Christian territories. The last of the conquests of the Crusaders in Palestine passed out of their hands in 1291. A new Mohammedan force was arising in the Ottoman Turks. Sprung from central Asia, they attained an independent position in Asia Minor in 1300. In 1354 they invaded the European portion of the Eastern empire, capturing Adrianople in 1361, and gradually spreading their rule over the Balkan lands. But a fragment of the empire remained till 1453, when Constantinople fell and the Eastern empire was at an end. . . . The Greek Church which had stood higher in culture than the Latin, certainly till the thirteenth century, was now largely robbed of significance. Its daughter in Russia was not conquered, however, and was growing rapidly in strength and importance. With it lay the future of the Eastern Church."—W. Walker, *History of the Christian church*, p. 283.

ALSO IN: *Cambridge Modern History*, v. 1.

16th century.—*Reformation period*.—"Those changes that are known collectively in history as the Reformation took on a three-fold aspect. There was the Reformation according to the princes, who wanted to stop the flow of money to Rome and to seize the moral authority, the educational power, and the material possessions of the church within their dominions. There was the Reformation according to the people, who sought to make Christianity a power against unrighteousness, and particularly against the unrighteousness of the rich and powerful. And finally there was the Reformation within the church, of which St. Francis of Assisi was the precursor, which sought to restore the goodness of the church and, through its goodness, to restore its power. . . . The Established Church of England is one of the most typical and successful [churches] of the resulting compromise. . . . All over Europe, wherever the new Protestant churches of the princes were set up, a living and very active residuum of Protestants remained who declined to have their religion made over for them in this fashion. These were the Non-conformists, a medley of sects having nothing in common but their resistance to authoritative religion, whether of the Pope or the State. . . . The change wrought by the Reformation within the Church of Rome was as great as the change wrought in the Protestant churches that detached themselves from the mother body."—H. G. Wells, *Outline of history*, v. 2, pp. 161-163, 167.—See also GERMANY: 1517-1523.—"M. Guizot has contrasted the consistency of the Church of Rome with the inconsistency of its heretical opponents. . . . 'When the multitude of different sects was charged against them, instead of acknowledging the legitimacy of their free development, they sought to anathematize dissenters, were annoyed by their own existence, and sought some apology for it. And when the dominant party amongst the Reformers were reproached with persecution, not by their enemies but by the children of the Reformation; when the sects which they anathematized exclaimed "We only do what you did; we separate ourselves from you, as you separated yourselves from Rome," they were still more embarrassed, and too frequently their only reply was an increase of severity. The reason of their inconsistency is that the religious revolution of the sixteenth century had never ascended to the first cause, it had never descended to the ultimate consequences of its own work. The rights and the claims of tradition have not been reconciled with those of liberty; and the cause of this must

undoubtedly be sought in the fact that the Reformation did not fully comprehend and accept its own principles or effects.' With this inconsistency he contrasts the harmonious completeness and the decision of the Roman Catholic theology. 'No government was ever more consistent and sympathetic than that of the Romish Church. In fact the Court of Rome was much more accommodating, yielded much more than the Reformers; but in principle it much more completely adopted its own system, and maintained a much more consistent conduct.'"—J. H. Newman, *Essay on development of Christian doctrine*, p. 198.—See also EUROPE: Middle Ages; Background of the Protestant Reformation; Renaissance and Reformation; Erasmus and the Reformation.

16th century.—*Counter-Reformation*.—*Early Roman Catholic missions*.—"In the end of the fifteenth and beginning of the sixteenth centuries the urgent need for a Reformation of the Church was recognized by all thoughtful men. . . . The complaints took many forms. . . . The country, however, where all these various conceptions of what was meant by a reformation of the Church were combined in one definite scheme of reform which was carried through successfully, was Spain. . . . It was Spain that was to furnish the Counter-Reformation with its most devoted leader, Ignatius Loyola, and with its strongest body of combatants, the Society of Jesus which he founded. . . . The Spanish policy for the renovation of the Church was not a reformation in the sense of providing room for anything new in the religious experience. Its sole aim was to quicken religious life within the limits which had been laid down during the Middle Ages. . . . Italy is the land which next to Spain is the most important for the Counter-Reformation. . . . The Catholic Church was always to these pious Italians the great historical and external institution with its hierarchy and its visible head in the Bishop of Rome. A reform of the Church meant for them the reformation of that institution. . . . So there came into existence coteries of pious Italians who met to encourage each other and to plan the restoration of religion within the Church. Humanism had left its mark on them, and their reunions were called academies. . . . The first . . . *Oratory of Divine Love* gave rise to many kindred associations. . . . Contemporary with these offshoots from the *Oratory of Divine Love* was a revival among some of the monastic orders in Italy. . . . The most important for its influence on the religious life of the people was the Order of the Capuchins. [They restored the old Franciscan preaching. Gregorio Cortese, abbot of several Benedictine convents, made them centers of learning dedicated to the Church.] . . . The improvement of the secular clergy was more important. . . . [The] idea was taken from Augustine's practice of living monastically with some of his clergy; and fulfilled itself in the order of the Theatines . . . to incite by precept and above all by example, to a truly clerical life. . . . Neither the Inquisition nor the Index account for the Counter-Reformation. Repression might stamp out Reformers in southern Europe; but faith, enthusiasm, unselfish and self-denying work were

needed to enable the Roman Church to assume the offensive. These were supplied to a large extent by the devoted followers of Ignatius Loyola."—T. M. Lindsay, *History of the reformation*, v. 2, pp. 484-485, 488-489, 492, 501, 504-505, 507, 509-510, 606.—"The calling of the so-called Ecumenical Council of Trent [1545-1563] . . . marked the reaction toward a stern and intolerant antagonism against Protestantism. . . . The organization and papal recognition of the Jesuit order and the meeting of the Council of Trent may be regarded as the two acts that went to create an unbridgeable chasm between Romanism and Protestantism and permanently divided Western Christendom into two warring camps by bringing into clear consciousness the irreconcilable antagonism in fundamental principle."—G. B. Smith, *Guide to the study of the Christian religion*, pp. 411, 413.—"This Council, so eagerly demanded, so greatly protracted, twice dissolved . . . ended in the general contentment of the Roman Catholic peoples. . . . It had done three things for the Roman Catholic Church. It had provided a compact system of doctrine stripped of many of the vagaries of Scholasticism, and yet opposed to Protestant teaching. Romanism had an intellectual basis of its own to rest on. It had rebuilt the hierarchy on what may be called almost a new foundation and made it symmetrical. It had laid down a scheme of reformation which, if only carried out by succeeding Pontiffs, would free the Church from many of the crying evils which had given such strength to the Protestant movement. It had insisted on and made provisions for an educated clergy—perhaps the greatest need of the Roman Church in the middle of the sixteenth century."—T. M. Lindsay, *History of the reformation*, v. 2, p. 594.—"The middle of the sixteenth century witnessed a great revival of enthusiasm in the Roman church for the spread of the faith among non-Christian peoples. Jesuit and Franciscan missionaries followed the discoverers and explorers, the conquerors and traders who in Portuguese, Spanish, and French ships traversed every sea and brought to Europe the knowledge of the lands of two hemispheres. . . . The priests who accompanied the adventurers had also something of the mediæval conquerors' instinct. They planned completely to displace the indigenous faiths. They were anxious to add multitudes to the numbers of the adherents of their own church. They were eager to offset the losses which at that time the Protestant Reformation was inflicting upon their church in Europe. Yet they also left the question of the relation of the faith which they ardently preached to the civilization and culture of the peoples among whom they preached it very much on one side. They entered into easy accommodations with those civilizations. It was long before they came to regard themselves as the emissaries of a spirit which was to be, abroad as well as at home, the secret of the transformation of every relation of man's life on earth. . . . They apprehended Christianity as a matter of creeds and rites rather than of spirit and conduct. This remark would be measurably true of the earliest stages of the Protestant missionary movement when at last that movement began. The Reformation had been inaugurated some decades before the departure of Francis Xavier for India. Yet the Protestant churches sent out practically no missionaries until after the end of the seventeenth century."—E. C. Moore, *Spread of Christianity in the modern world*, pp. 11-13.

in Spain.—T. Hughes, *Loyola and the educational system of the Jesuits*.

17th-20th centuries.—Development of modern Christian philosophy.—"The ecclesiastical history of the seventeenth, eighteenth and nineteenth centuries is the history of the development of principles brought into prominence in the Reformation of the sixteenth. . . . When a large portion of Northern Europe rejected the authority of the Papal See and new religious communities were formed, certain political problems of great importance presented themselves for solution. . . . To speak generally, we may say that the hostilities which were in consequence of the Reformation came to an end with the seventeenth century. While the political struggle was going on, theological controversy continued. . . . The methods of Protestant theologians in the seventeenth century differed little from those of their Catholic predecessors." Meanwhile, "when the first shock of the Reformation was dying away, philosophy received a new and vigorous impulse. . . . Many symptoms showed that however strictly the traditional formularies might be maintained, intellectual life in the church had acquired a new and more liberal—not to say sceptical—tone. Before the end of the century by far the greater number of the brilliant men of letters who adorn it, both in France and Germany, were either hostile to Christianity or regarded it merely as one—perhaps the best—of the various imperfect religions of the world. As the spiritual powers claimed by the Pope and the hierarchy came to be brought in doubt, almost all the European powers sought to prevent the intrusion of the Papacy into their domestic affairs and to increase their own authority and the independence of their clergy. This tendency showed itself before the French Revolution. After that terrible explosion in which an attempt was made to abolish Christianity altogether [see FRANCE: 1793 (November)], there was a great reaction. . . . There ensued everywhere a revival of Church feeling and Church practice in the midst of which we still live. But with this revival . . . went a great extension of a freer and bolder criticism and interpretation of Holy Scripture and it is one of the marked characteristics of the latter part of the nineteenth century that the leading principles of the critical school are accepted by many who are, beyond all doubt, true servants of Christ."—S. Cheetham, *History of the Christian church*, pp. 1-5.—See also DEISM; THEISM.—"No small part in the religious restoration was taken by the religious Orders, which in their turn profited greatly by the new awakening of Christian life. The Revolution and the subsequent secularisation made a clean sweep of the monasteries and convents, which were then appropriated for other uses, and in some cases even demolished. As soon as the storm was over juster counsels and a better appreciation of their work came to prevail. The Sisters of Charity were readmitted into France by Napoleon (1807), and thence soon spread throughout the world. The Society of Jesus was re-established by Pius VII., first in Russia (1801) and in the kingdom of the Two Sicilies (1805), and then throughout the Church. . . . (1814). Many of the Orders succeeded in again obtaining possession of the houses which they had been forced to quit. Several reforms were also introduced. . . . Several entirely new religious associations also came into being, most of them devoted to the mission or to education."—F. Z. Funk, *Manual of church history*, v. 2, pp. 254-255.—"France was the center of theological learning for the Roman Catholic

Church during the greater part of the seventeenth and eighteenth centuries; and the Jesuits, Benedictines, and Oratorians produced the greatest number of eminent theologians. . . . The Puritan movement in England was essentially a Biblical movement. The Puritans urged a more thorough study of the Scriptures, a catechetical instruction of the people, and effective preaching. In dogma they used the doctrine of the Covenant as a structural principle over against the scholastic method. . . . In the Netherlands theological scholarship revived in the newly founded universities, the Arminian movement, and the Federal School of Theology. Among the Arminians of Holland, especially the scholars of Leyden, the Humanistic spirit found expression. . . . The critical principle reasserted itself mightily in the French School of Saumur, and a freer type of Theology was there maintained. . . . In England Francis Bacon became the father of Inductive Philosophy. . . . At Helinstädt the irenical school of Calixtus struggled with the scholastic spirit. . . . The milder Calvinism and the critical spirit of the school of Saumur took refuge in Switzerland. . . . Puritanism eventually gave birth to Pietism in Reformed and Lutheran Germany. . . . The vital religion and ethical principles of Puritanism revived in Great Britain and her colonies in the form of Methodism under the leadership of Wesley and Whitefield. . . . The American colonists founded colleges modelled after those of the British Universities . . . where instruction in Theology was mingled with general education. . . . In the eighteenth century the Nonconformists of England began to establish public colleges for the training of their ministry. . . . The revival of the study of Theology took place gradually in Germany by the introduction of the new learning . . . and under the influences of the Universities of Halle and Göttingen. . . . After the disasters of the French Revolution and the wars of Napoleon the Roman Church devoted itself to the revival of theological education. For that purpose it undertook the restoration of the diocesan seminary and the improvement in the training of the priesthood. To this end the Jesuit Order was restored in 1814; their college in Rome revived, and put under their control. . . . The newer learning was only moderately employed in the seminaries. These reverted to a modified Scholasticism, building essentially on Thomas Aquinas. . . . The Council of the Vatican (1870) urged the importance of higher universities; not of the grade of the German universities, but of a higher order, to which the best scholars of the seminaries might resort for the highest possible theological education. Such institutions were established at Rome, in Belgium, and in the capital of the United States. The Catholic Church has long aimed at one in Ireland; and would undertake to establish them in other countries, if it were practicable. . . . This highest theological education . . . is in advance of all theological education in the Protestant world. . . . Theological seminaries had their chief development among Protestants in America."—C. A. Briggs, *History of the study of theology*, v. 2, pp. 146-177, 204-207.

White, *History of the warfare of science with theology*.—L. Stephens, *History of English thought in the eighteenth century*.—W. James, *Varieties of religious experience*.

18th to 20th centuries.—Development of Protestant Missionary spirit.—"Protestant nations,

the Dutch, the Danes, and the English, had succeeded the Latin races in the movement of conquest and trade both in the East and in the West. The Protestant peoples, however, undertook no world-evangelization on a great scale until the end of the eighteenth century. Something in their mode of apprehension of the gospel in the churches of the home lands made them also, at the first and for a long time, feel themselves to be the emissaries almost exclusively of a doctrine concerning the inner life and a future state. The full force of their gospel as a secret of the transformation of this world also has hardly begun to be felt until our own day. Meantime the empires of conquest and trade built up by the various European powers had waxed and waned. Those of the Latin races, except that of France, had practically vanished. Those of the Dutch and Danes had almost disappeared. That of the Russians is an episode of very modern times, at all events in its relation to Western civilization. The establishment and maintenance of these empires was marked at times by cruelties and unscrupulousness toward weaker races and by fierce rivalry among the colonizing powers. These facts brought reproach upon Christendom. . . . It is only within the last century and a quarter that any of these empires have understood it to be a part of the purpose of their existence to confer benefits upon subject peoples. The way has been opened for the gospel by secular agencies. Yet also the cause of the real gospel has been at times sorely compromised by association with these agencies. . . . The area of expansion is not now the basin of the Mediterranean. It is not the northern and western part of the little continent of Europe. In this epoch the area has been literally the whole of the habitable earth. . . . In the sense merely of proclaiming the gospel in all lands the work is entering upon its later stages. An arrest of this mere evangelizing process parallel to that . . . already twice observed in Christian history seems near. . . . How far we still are from the real Christianizing of the world is brought home to us with terrific force in these days of war [1919]. . . . Yet even that dissemination of the word of Christianity . . . and the beginning made of the transformation of men by its spirit have put practically all the nations of mankind in a position to judge between Christianity and Christendom."—E. C. Moore, *Spread of Christianity in the modern world*, pp. 13-15.

20th century.—Modern problems.—"We propose to limit ourselves to asking how the Churches conceive the relation between the old traditional religion and the requirements of modern life, and whether their ways of handling the problem give promise of a satisfactory solution. Now from the standpoint of the churches, the outstanding feature . . . is the opposition between Catholic and Protestant. . . . This opposition fails to harmonise with the stage which the religious problem has now reached in the course of its historical development. For certain as it is that the motives which hold these two faiths apart are rooted in a question of principle and that an abiding problem underlies their divergence, namely, of the relation between community and personality in religion, still this problem is not the primary problem of the present day. . . . In truth the religious problem has passed far beyond the control of any ecclesiastical or sectarian body; over and outside

the existing churches, and through them and beyond, it has become a concern of the whole human race. And as such it demands to be treated, but this is not possible unless it takes on new shapes and follows new lines of its own. . . . What the age must win for itself is an essentially new form of Christianity answering to that phase of the Spiritual Life to which the world's historical development has led us."—R. Eucken, *Christianity and the new idealism*, pp. 151-152, 159-161.—See also INTERCHURCH WORLD MOVEMENT.—"The twentieth century is face to face with the need of a new Christian apologetic. This new need has been precipitated by the development of modern science, modern philosophy, and modern society, but also partly by modern missions. Just as the new discoveries in modern science compelled a reconstruction of Christian apologetics in the light of the new scientific facts, so the discoveries of missionaries in contact with the non-Christian religions has compelled a reconstruction of Christian apologetics in the light of the new religious facts. . . . In contact with new races, new societies, new religious beliefs, and the new civilizations Christianity is undergoing new tests and it is being compelled to reshape its message and redefine its essence. There has gradually arisen the outline of a new apologetic whose fundamental postulates are a universally imminent, ethical god and an organically related and growing world."—G. B. Smith, Ed., *Guide to the study of the Christian religion*, pp. 478-479.

CHRISTMAS ISLAND.—This island is in the Indian ocean about 190 miles south of Java. It is a British possession under the government of the Straits Settlements. Before its settlement by Europeans in 1897 it had never been inhabited. It was visited by Dampier in 1688, by Captain Maclear in 1886, and by Captain Aldrich on *H. M. S. Egeria* in 1887. The island has valuable deposits of phosphate of lime.

CHRISTOPHORUS, pope or antipope, 903-904. Imprisoned Leo V, his defeated competitor,

but was himself murdered at the instigation of Sergius III.

CHRONICLES, historical records of events treated in detail, and in order of time. Chronicles are ordinarily fuller than annals (see ANNALS), and are the form used for older histories, such as the Anglo-Saxon Chronicle, begun by Alfred (see ENGLAND: 885-880), and the Chronicle of Eusebius (see HISTORY: 18).—See also HISTORY: 14; 19.

CHRONOGRAPHIA, Christian chronology of Julius Africanus. See HISTORY: 18.

CHRONOLOGY.—Primitive origin of the calendar.—"Some of the data of experience must repeat themselves in order that mankind may be able to deal with the rest. Repetition, routine, enables us to calculate, and classify in terms of the old and known, the new phenomena which are set alongside them, as the moving present eternally varies our experiences. But since the data of life do not repeat themselves, but only those of its environment, the necessary framework for history must be furnished by the physical sciences, or their prescientific forerunners. In other words, the origins of the calendar precede the origins of chronology [definable as the science of time measuring and of dates]. Strangely enough, although it lies in the prehistoric world, we know under what circumstances the calendar was first worked out. It began when men settled on the soil and began to farm it. The wandering savage may have a crude sense of time-periods; but . . . his mind does not play on into the future in such a way as to modify his present by the calculation for its needs. Once entered upon the agricultural stage, however, the conditions of life demand more thought and foresight, more planning and work for to-morrow and the day after. . . . Simple observations of nature supplied the first basis for the calendar. Naturally this varies according to land and climate. Where the monsoon blows from the southwest from May to November, and from the northeast from November to May, as in Nicobar, even low-grade savages have a loose sense of the year, or the half-year; which the changing moons can make still more definite. The floods of the Nile stimulated in Egypt its extraordinary progress in time-reckoning, as the cloudless skies of Babylonia called out its progress in astronomy. But where nature is less calculable, where the sky is largely overcast with clouds, storms are sudden, winds variable, harvests precarious—as in most of Europe—the reckoning of calendar in terms of the weather, or of the common phenomena of nature is much more difficult. There are some world-old signs of the seasons,—lore which goes back to the ancient hunters before the days of agriculture, and is still in use. For instance, the flight or flocking of birds presaging winter was already an old sign in ancient Greece."—J. T. Shotwell, *Discovery of Time (Journal of Philosophy, Psychology and Scientific Methods, Apr. 15, 1915, pp. 202-204)*.

Use of astronomical constants in calendar making.—"However much the farmer might gain from observing the migration of birds, the habits of animals or plants, he could hardly have got beyond a few signs of weather-forecasting if he had not had more stable and more frequently recurring data to fall back upon. These were furnished by sun, moon, and stars. As for the sun, while it furnished the divisions of day and night, it offered no ready multiple for their grouping. Its yearly circuit served for no more than the framework of the calendar; in a sense, it merely offered the cycle that needed calendaring. And

yet, in those parts of the world where the seasons are marked off from each other with any degree of distinctness, a rough solar year could be appreciated without any detailed divisions by stellar or lunar periods. This is especially true outside the tropics, in the northern or southern temperate zones, where the farmer can grow but one crop of grain in the year, so that from a practical standpoint, he divides his time into two main seasons, winter and summer. This has always been, and still is, the essential basis of the farmer's calendar in Europe and America. . . . From March to November is the usual part of the solar year for war as well as for farming. The campaign can begin when winter is over; and the priests of Mars shake his spears to rouse him. In the Autumn they hang them up again in his temple. So the farmer's year, calendared in large by the seasons, is suited for the politics of the city state. In Greece, a country of commerce as well as farming, a more complicated system took its place; but in Rome the simple farmers of the Latin plain took over the Hesiodic calendar which Greece had grown out of, and kept it as the basis of their year until the great reform of Julius Cæsar,—at least so it seems from the fragmentary sources which have come down to us. . . . The solar year of the seasons was more, however, than a vague and more or less uncertain calendar based upon homely observations of weather forecasting. It was universally a stellar year as well. The moon, of course, did not fit it, since its periods shift annually with reference to the sun; but the motions of the stars more nearly coincide, and from earliest times their rising and setting furnished the most definite and surest dates for all the seasonal occupations. . . . All antique literature is full of such references to the connection of the stars with the seasons—a connection which religion was still further to enhance. In fact, so important was the observation of the stars, and so closely did their phases seem to fit the changes of the weather, that they seem to have furnished the basis of the practical farming calendar to both Greece and Rome, in spite of the rivalry which came from the beliefs about the moon."—*Ibid.*, pp. 204-206.

Solar chronological scheme of the Egyptians.—"The reckoning of time reflects everywhere the outlook and habits of society, as these in turn reflect the environment and conditions of life of early peoples. In no other country is this more evident than in ancient Egypt. There it was almost inevitable that the solar year should triumph, for the land itself forced along the adjustment. Nowhere else does nature provide such a chronometer as in the valley of the Nile. The long, rock-bound river basin, like a vast but narrow-throated water-glass, holds and slowly passes along the periodic floods. There was no such instrument as this at hand for the farmers of Bœotia or Italy to measure by. For four out of twelve months the water-glass fills and empties, leaving an interval of only eight months which it requires no great ingenuity to divide into two seasons of four months each, the first being that of the growth of the crops and the second rounding out the easy symmetry of the year. For the flood returns at such regular periods that it is possible for even fairly simple people to calculate against the time of its coming,—especially since the interval is not too long. Moreover, by a strange coincidence, priestly observers, watching the heavens at the critical time when the flood was due, could see the bright dog-star, Sirius, just rising then at dawn. This 'heliacal rising' of the star, so strangely fitting in with the coming

of the flood, furnished, therefore, a genuine date for a New Year,—and the river itself swelling out before one's eyes, announced the fact to the whole country. The coming and going of moons—while still a matter of some importance—was bound to be subordinated to such a system, where the major gods of a religion, the constant stars and the demands of business all fitted into a common scheme."—*Ibid.*, pp. 309-310.—See also **ASTRONOMY: Early history; HISTORY: 11.**

Error in the Egyptian system.—Sothic cycles.—"Moons would do for reckoning time in Babylonia, where the floods of the Euphrates were less exact, and less important. But in Egypt, where the whole country was a clock, how could one miss the time? Yet that is just what the Egyptians did! They never reckoned the time correctly. Three hundred and sixty-five days do not make a solar year, but only a rough guess at one; they are over six hours short. However, the Egyptians let it go at that and held to their venerable error through all the long centuries of their history. It was not until the year 238 B. C. that the simple device of a leap-year of 366 days once every four years was decreed, in order to keep the civil year in correspondence with the stars. But even this was not obeyed nor followed up, and it was left for Augustus to end the age-long blunder by imposing upon Egypt that revised calendar of 365¼ days which Julius had himself received from an Egyptian astronomer.

Although Egyptologists are all agreed that the Egyptian year was thus inaccurate, they are by no means united upon what was done by the Egyptians to make such an inadequate calendar work. It is claimed by one group of Egyptologists that nothing was done to check the error, that the short calendar year went on for centuries, gaining days and years over the solar year without any one ever bothering over it. This is as flatly denied by other scholars, basing their argument upon both inscriptions and probabilities. . . . The foremost exponents of the former view are Eduard Meyer in Germany and J. H. Breasted in America, both illustrious names in the science of Egyptology. According to them the calendar year, running ahead a little over one day in four years, had gained a whole year in 1460 (4 × 365) years, without priests or pharaohs intervening to stop the process. The gain was very slow, almost imperceptible, only a week in a generation, or about a month in a lifetime,—too little to bother about. Any reform would disturb business and religion even more than the retention of the old misleading cycle. Hence, they claim, the Egyptian year revolved through the solar once in every 1,460-year period. The text in Censorinus, the astronomical writer of the days of the Antonines, states that the opening of the calendar year coincided with the heliacal rising of Sirius in the year 139 A. D.; *i. e.*, that in that year the star rose at sunrise on the old first day of the Egyptian year, our 10th of July. With this as a starting point our historians reckon back 'Sothic cycles' of 1,460 years to 1321, 2781 and 4241 B. C., on which years the star Sirius rose at dawn on the 10th of July. This leads to the statement that in the year 4241 B. C., the calendar year of 365 days was inaugurated, since 1,460 years before that date would be too early and 1,460 later would be too late. If this theory could be accepted, then, we have an exact date, and one of the oldest in the world, for the beginning of an astronomical measure of time. Unfortunately, there seems to be little to support it. There is no mention of the 'Sothic cycle' until late in the Roman period. The ancient

monuments are silent upon it. So the first obvious conclusion seems to be that it was a creation of the late astronomers, calculating backwards in the way just indicated, and that it never existed as a matter of history at all. In fact, when it is used for chronology its critics claim that it leads to some impossible dates and direct contradictions with some of the monuments. These facts, combined with the silence of Herodotus, seem to the critics of the Meyer hypothesis sufficient ground for consigning the 'Sothic cycle' to the realm of historical myth. And yet when the critics come to offer the alternative hypothesis, *i. e.*, that the year was lengthened from time to time to bring the festivals' stars together, the data in the texts are just as lacking. Moreover, the Decree of Canopus assures us that in 239 B. C. the calendar year was 10 months out, and as the reform of that decree was not carried out we see how the short year was apparently allowed to go on completing its cycle then."—*Ibid.*, pp. 310-311.

Assyrian.—Methods of dating documents. See ASSYRIA, EPONYM CANON OF.

Babylonian method.—"The moon-god gained ascendancy in Babylon in the days of the first Semitic kingdom. Dominating the religion, it dominated the cosmology. In the earliest semitic records, Sin, the moon-god is so lofty a deity that the sun-god, Shamash, is referred to as his 'servitor.' The 'victorious sun' won his supreme place in Mesopotamia only in later ages, and not until the Semite had yielded before the Aryan Prussians was his triumph assured. So long as the Semites ruled, the moon blocked both his path and that of a rational cosmology. . . . But, on the other hand, the materialist data need not be neglected, and a little consideration shows us that although nature was perhaps more kindly to Babylonia than to Egypt in the fertility of farms, it was, by this very fact, less propitious in the arrangement of the seasons. Pliny tells us how wheat grew there twice a year, which would disorganize any farmer's calendar that was trying to follow the sun. Under such circumstances, we can see how the invading Semites, coming from the desert where they had imbibed so deeply the nomad feeling for the moon, would not be obliged, when settling on the soil, to lay aside that deep-seated, primitive sense of its dominating luck over the nights and days, for another calendar run by the sun. Whatever the reason, the moon ruled in Babylon, and the calendar bore the marks of it.

. . . But, whatever primitive measures of time they started with—different in different cities—the priests of Babylonia had their lunar calendar in operation as long ago as 2500 B. C. The month, which began with the first appearance of the new moon in the evening sky, was reckoned with fair exactness as 29½ days, but as this was an impossible measure, two lengths of months were employed, 29 days for a 'hollow' month and 30 days for a 'full' month. In the early calendars it was, therefore, customary and necessary to indicate along with the name of a month what number of days it contained. Twelve of these months made a year of 354 days. As this was over eleven days short of the solar year, the next calendar year would be quite out of reckoning with the sun, the seasons, and such festivals as they involved. As this kept getting worse instead of better, an additional month had to be intercalated—making the year 384 days—at the command of the priests, whenever they decided that the festivals needed readjustment. The priests seem to have worked out no unchanging system of intercalation until the close of Babylonian history, when in the

Persian period regularity was definitely assured. The query comes to even the superficial student whether the 'victorious sun' of the Persian heavens was not in some way responsible for this rectification. So far, the survey of the ancient Babylonian history has been disappointing. But a new era began in the seventh and sixth centuries B. C., in which the age-long grouping of the priests, their uncertain dating and ineffective observations were changed into accurate and scientific calculations."—*Ibid.*, pp. 316-317.

Babylonian reform under Nabonassar.—**Ptolemaic canon.**—"The Ptolemaic Canon is a work by Claudius Ptolemaeus, an eminent Egyptian astronomer, who lived in the second century A. D., and who furnishes in his *Canon of Kings* a list of Babylonian, Persian, and Greek monarchs. His catalogue, beginning with Nabonassar of Babylon and extending to Alexander the Great, gives the length of reign of each King of that period. . . . Winckler has pointed out that a calendar reform took place in Babylonia under the reign of this king. The reform was called forth by the fact that about this time the sun rose in the zodiacal sign of *Aries* at the vernal equinox. This means that about 747 B. C., when Nabonassar came to the throne, a new era began, in which the New Year began on the twenty-first day of *Nisan*, the first month of the Babylonian year. . . . An '*Aries-era*' was then begun. Before that time the sun rose in the sign of *Taurus* at the vernal equinox. That time we may designate as the '*Taurus-era*,' within which the *Hammurabi* period falls. But Winckler has shown that several myths and religious customs of the old Sumerian period were based on the fact that in that period the sun rose at the vernal equinox in the sign of *Gemini*, and that therefore that period belongs to the '*Gemini-era*.' The *Omen-tablets of Sargon*, with their numerous astronomical data, indicate that a new era, the '*Taurus-era*,' began with Sargon and lasted down to Nabonassar. From Nabonassar to Nabonidus there was an even period of 200 years, and the interval between Sargon (or *Narâm-Sin*) and Nabonidus was therefore an era + 200 years. In the time of Nabonidus such an era may have been counted as an even 3,000 years, and an 'era' + 200 years would therefore be 3,000 + 200 years in the time of Nabonidus, and would account for Nabonidus' '3,200 years.' But Berossos also tells us that Nabonassar in his calendar reform had destroyed all previous records. This may mean that they reckoned its past history by 'eras,' and that each era was made to be an even 3,000 years. Such an era, indicated by the earth entering from one zodiacal sign into another at the vernal equinox, does not take 3,000 years, but only about 2,140 years. The Babylonians were acute astronomical observers, and could not fail to observe when the earth passed into a new zodiacal sign. If this happened some time before Sargon, he would be expected to readjust their calendar and astronomical calculations according to this new order, and his *Omen-tablets* were a result thereof. So far as we know, the calendar reform necessitated by this new era was not introduced until the time of Sargon, and it was therefore regarded as a '*Sargon-era*.' Nabonidus' 3,200 years would then be explained as 'the *Sargon-era*' + 200 years. Now it is possible that Nabonidus made this inscription in the year 547 B. C., and there would then be exactly 200 years from Nabonassar to his own date. The time before Nabonassar he regarded as a whole era (designated by him as '3,000 years')." —O. A. Toffteen, *Ancient chronology*, pt. 1, pp. 2, 112-113.

Jewish year.—“It is only reasonable to suppose that the Hebrews, when dwelling in the land of Egypt, employed the Egyptian method of reckoning time. . . . Just before their departure from Egypt the command of God came to Moses and Aaron that the month then current, which had not long commenced, should be to them ‘the beginning of months,’ that is to say, it was in future to be accounted as the first month of the year. This occurred in the Spring season at or about the time of the Vernal Equinox; and this month has been retained ever since by the Jews as the first of the Legal or Ecclesiastical year for the regulation of all their Fasts and Festivals. If, however, the Hebrews had been in the habit of commencing their year at the time of the Autumnal Equinox, in common with the Egyptians—of which there can be but little if any doubt—it would be long before the whole nation would become accustomed to the innovation. It was from this cause, in all probability, that for civil and political purposes the year had another commencement. The first month of this civil year was the seventh of the Legal year, and corresponded to the Thoth of the Egyptians. After the time of the Captivity in Babylon it was called Tishri. . . . It will be gathered from what has been said that the ancient Hebrew year consisted, usually, of twelve Lunar months; and, taking the average length of a Lunation at twenty-nine and a half days, there would be 354 days in an ordinary Lunar year. It must, however, be distinctly understood that the ancient Hebrew calendar was not permanently fixed. The Lunar year falls short of the Solar year by nearly eleven days, and, because the Hebrew festivals were regulated not by the Moon alone, but also by the state of the harvests which depend upon the seasons, that is, upon the influence of the Sun, it became necessary to reconcile the length of the year when measured by Lunations to its length when measured by the motion of the Sun. For this purpose an extra month was intercalated once in about every three years. In later times seven months were intercalated regularly in the course of every nineteen years. In this way the Lunar year was brought into accord with the Solar, and the calendar was made to correspond to the season. . . . It was absolutely necessary for the due observance of the religious ceremonies, the Fasts and Festivals of the Hebrews, that the year should be made Luni-Solar. . . . Whatever may have been the method of measuring time adopted by the ancient Hebrews there is a want of any evidence that, before the time of the Babylonish Captivity, they possessed an acquaintance with even the fundamental laws of astronomy, or of the true motions of the earth and of the heavenly bodies. The names of the four months, which have been given as in use before the Captivity, prove that the year was Solar as well as Lunar, for these names have reference to the seasons at which they respectively occurred. . . . One thing is clear—that the commencements of the Hebrew months were governed by the New Moons, or rather by the first visibility of the Moon—the phase which she was assumed to present when New. We know, also, that the year was rendered Luni-Solar by the intercalation of an extra month as necessity for it arose. In this way the seasons at which the Fasts and Festivals were observed would be, year by year, restored to their proper places.”—S. B. Burnaby, *Elements of the Jewish and Muham-madan calendars*, pp. 3-13.—See also AB.

Cycles in use after the dispersion of the Jews.—“The method of forming the months and years

which has been indicated continued in use among the ancient Hebrews only while they dwelt in their own land. After the dispersion they were compelled to employ astronomical calculations for the purpose of fixing the times of Fasts and Festivals, as they had no means of rapid communication with their co-religionists scattered throughout the civilised world. For this purpose Cycles were employed. The first that was used appears to have been that of eighty-four years, formed by adding the Octaeteris of Cleostratus to the seventy-six years of the Callipic Cycle. Whether this were so or not must, however, remain doubtful, because during very many years—more than six centuries after the time when the astronomical computations were first made—the method by which the New Moons and Festivals were determined was kept as a profound secret, certain astronomical rules being handed down by tradition from Patriarch to Patriarch, but not made public [until A. D. 358, by Rabbi Hillel II.].”—*Ibid.*, pp. 14-15.

Jewish Mundane Era.—“The Jews do not reckon the commencement of their Mundane Era from the day upon which they believe that the world was created, although the contrary to this is very often erroneously stated. They hold that the world was created by God at the time of the Autumnal Equinox, September 21, in the year of the Julian Period 954, B. C. 3760, and that the Sun and Moon were formed on the fourth day of the week at 15h. measured from 6h. of the preceding evening, that is, at 9h. in the morning of feria 4, Wednesday. But the Mundane Era, the Calendar, and the computation for New Moons do not start from this point. They commence from a fictitious or imaginary Moon, the first Moon of an imaginary or anticipative year next preceding the year of the creation of the world. The first day of this imaginary Moon, if it had existed, would have been in the year of the Julian Period 953, on the second day of the week. . . . This day corresponds to Monday, October 7, B. C. 3761, and the time to 11h. 20m. p.m., or 40m. before the close of that Julian day at midnight. This day and hour is the Jewish Epoch, or Commencement of the Era, from which all computations for the Calendar are made.”—*Ibid.*, p. 41.

Arabian and Mohammedan system.—“It appears to be certain that from very ancient times till shortly after the commencement of the fifth century of the Christian Era the pagan Arabians made use of a purely Lunar year. One of the practices of their religion, to which they attached the highest importance, was an annual pilgrimage to the Ka’ba, the sacred Temple at Mecca, which they believed to have been almost coeval with the world itself. . . . Inasmuch as the Lunar year of twelve months is nearly eleven days shorter than the Solar year it follows that the commencement of the ancient Arabian year, and the time of the pilgrimage, became eleven days earlier in every successive Solar year, and as time went on must have run through all the seasons. When, from this cause, the pilgrimage occurred before the harvests of the current year were gathered, and when those of the preceding year had been almost or perhaps entirely consumed, the pilgrims found great difficulty in obtaining food. To remedy this inconvenience, the Arabians endeavoured to remodel their year in such a manner that the pilgrimage should always take place in the Autumn, when both grain and fruit were abundant. With this object in view they formed a Luni-Solar year by intercalating, from time to time, a thirteenth Lunar month at the end of their twelve Lunar months. This method of keeping, or rather of attempting

to keep, the months in unison with the seasons, they had learned from the Jews who were settled at Yathrib. They adopted it in A. D. 412, two hundred years before Islâm, or the Muslim religion, was introduced by Muhammad. . . . [See also SCIENCE: Ancient: Arabian.] In whatever way it may have been done it is generally believed that from the year 412 of the Christian Era an intercalation was made, and that the custom of making it was abolished by Muhammad in the year before his death, which occurred on June 8, A. D. 632. He then established the system which is still in use among Muhammadans of all nations. . . . When the Prophet abolished the old Arabian Calendar the Muhammadan year became exclusively Lunar. It was, and it still is, governed by the Moon alone, without any regard to the length of the Solar year, or to the seasons, which consequently 'wander' through the year, coming later and later, according to Calendar dates, at every recurrence. . . . The Calendar itself is based on a Cycle of thirty years, each consisting of twelve months."—S. B. Burnaby, *Elements of the Jewish and Muhammadan calendars*, pp. 367-369.

Era of the Hejira.—"The word Hijra [or hejira] means 'Departure,' or 'Flight,' and the consequent 'Separation of friends.' The Era derives its name from the Flight of Muhammad from Mecca to Medina. It is frequently said to have commenced with the day upon which Muhammad fled from Mecca. By others it is said to commence with the day upon which he entered Medina after the Flight. Both of these statements are wrong. . . . The date of the Flight must be carefully distinguished from the date of the commencement of the Era of the Hijra, instead of the two being confused together as is so frequently the case. Although the custom of referring to events according to the year of the Flight originated with Muhammad, yet the Era of the Hijra was not officially instituted till seven years after his death, which took place in the third month of the eleventh year of the Era, June, A. D. 632, and consequently seventeen years after the Flight. Moreover, when the Era was instituted, by the Khalifa 'Umar, its commencement was not made to coincide either with the day of the Flight or with the day upon which the prophet arrived at Medina. It was intended to commemorate the Flight, but in order that the change in the method of reckoning time might not alter the first day of the Arabian year, the Era was made to commence two months antecedent to the Flight, namely, with the first day of the month Muharram, the first day of the year current at the time of the Flight, the day upon which the Festival of the New Year had from time immemorial been commemorated. This day corresponded to July 16, A. D. 622, according to Civil reckoning. [This date is 1 A. H. or 1 Anno Hegira.] The error with respect to the Era, to which reference has been made above, consists in the assertion that this day was the day of the Prophet's Flight from Mecca; or, as others say, that it was the day of his arrival at Medina. It was neither the one nor the other. . . . Muhammad did not abolish the current Arabian method of computing by Luni-Solar years with the intercalation of a thirteenth month every third year, until the end of the tenth year of the Flight, in the month corresponding to March, A. D. 632. Now these ten years, according to the Arabian Calendar, which was then in use, contained 3630 days, for three of them, at least, were Embolismic [containing an intercalated month] and had 384 days, while the remaining seven years had each 354 days. In making July 16, A. D. 622, to be

the first day of the Era of the Hijra, these ten years are computed according to Hijra reckoning, and made to contain only 3544 days, namely, six years of 354 days, and four years of 355 days; that being in accord with the method introduced by Muhammad. . . . These ten years ought certainly to be reckoned in chronology according to the Calendar which was in use during the period of time which they covered, and not according to a Calendar which was introduced after these years had expired."—*Ibid.*, pp. 372-375.

Basis of Hindu calendar.—"The first astronomical constant [we have] to know in Hindu astronomy is the moon's synodical month of $29\frac{1}{2}$ days. The exact length of this period, according to the *Sûrya Siddhânta*, . . . is 29.530587946 days. The ancient Hindu astronomers purposely calculated this period to what we should now call nine places of decimals in order that there might be no error even after thousands of years. The period fixed by modern astronomy does not differ from the above in the first six decimal places, and as .000008, the actual difference is $\frac{7}{100}$ of a second, it follows that the difference between European and Indian astronomy in 5,000 years or 61,844 synodical months may amount to 4,260 seconds or a little over 1 hour and 11 minutes. . . . In practice, the difference between the European and the Indian computation of new moons is very much less. . . . The next astronomical constant [in Hindu chronology] is the solar year, the length of which, according to the *Sûrya Siddhânta*, is 365.258756484 days. . . . Hindu astronomers reckon the present chronology from the midnight between 17th and 18th February 3102 B. C., which is commonly called the beginning of *Kaliyuga*. . . . Hindus generally reckon completed or expired years, and not current years, as the European calendar does. . . . The first year of the Hindu chronology, which began on 18th February 3102 B. C., is, according to Hindu reckoning, the year 0. By adding 3101 to an English calendar year A. D. you can always arrive at the corresponding (expired) year of *Kaliyuga*. . . . For a B. C. year, the K. Y. equivalent is obtained by subtracting it from 3102, not 3101."—D. B. S. Pillai, *Indian chronology*, pp. 1-3.

Eras in Hindu chronology.—"Originally no continuous era was used. If it was considered necessary to mark the secular date of an event, it was registered by the year of the reign of the local king in which it happened. Sometimes, however, a king on coming to the throne carried on the years of his predecessor into his own reign, thus creating a dynastic era. This often happened on the rise of a new dynasty, which might signalise its accession by dating all events by an era starting from the coronation of its founder. Such a mode of reckoning might continue for many centuries and spread to many countries, or it might speedily fall into disuse; its fate depended upon the fortunes of the dynasty, and other circumstances. Sometimes again a king might ordain the commencement of a new era to commemorate some glorious event in his reign. Lastly some eras were based on astronomical calculations, and others on events in religious history. To the astronomical class belong the *Grahaparivritti* cycle of ninety years, starting theoretically from 24 B. C., which is sometimes found in the south; the *Brihaspati* cycle of sixty years, based on a twelve-years cycle of Jupiter; the *Kali* era, supposed to begin from 3102 B. C. . . . and perhaps the *Kollam* cycle of a thousand years or era of *Parásu-râma* used in Malabar, of which

the epoch is A.D. 825, and which begins each year with the entrance of the sun into Virgo in the month of Āśvina. The Saptarshi or Laukika era, used in Kashmir, is based upon the theory of a revolution of Ursa Major every two thousand seven hundred years. In practice, however, it is reckoned in cycles of a hundred years, beginning in the twenty-fifth year of each century of the Christian era; hence to equate a Saptarshi date with ours we must add to it the number of centuries from the beginning of the Christian era plus twenty-four or twenty-five. The term 'Saptarshi' is used when the era is counted in full; when the date is abridged by being given in the 100-year cycle, it is called 'Laukika' or 'Lōka-kala.' Of the eras based upon historical events the most important are the Vikrama and the Saka or Salivahana. The Vikrama era . . . starts from 58 B.C. (the bright fortnight of the month Chaitra according to the northern calendar; but it originally began with Karttika). The Saka era, which is connected with the dynasty of the Western Kshatrapas, and may have been founded by Nahapana, begins with the bright fortnight of Chaitra, A.D. 78. The Gupta era is that which began with the accession of Chandra-gupta I in A.D. 319-320, and was continued in the Valabhi-samvat era. The Traikutaka, Kalachuri, or Chedi era has for its first current year A.D. 248-9. The Chalukya-Vikrama era is reckoned from A.D. 1075-6, in which the Western Chalukya Vikramaditya VI came to the throne. A Ganga era was current from A.D. 590 for some time. The Harsha era marks the accession of Harsha-varhdhana, its epoch being A.D. 606-7. The Virodhikrit era was established in A.D. 1191-2 by the Hoysala Ballala II to signalise his victory over the Yadavas. The Lakshmana-sena or Sena era of Bengal began on October 7, 1119. The Siva-simha era of Gujarat appears to have begun on March 10, 1113. The Anandavikrama era of Prithvi-raja II has for its initial year A.D. 33. The first current year of the Newar era is A.D. 878-9. The Bengali San begins from A.D. 593-4. Besides these there are a number of minor eras, mostly obsolete or obsolescent, which it is needless to specify. From very ancient times the Buddhists recorded events by the years from the death of Gautama Buddha; but the system now in vogue in Ceylon and Further India, which was established in the twelfth century, wrongly starts from 544 B.C. The Jains reckon from 528 B.C., in which year their founder Mahavira or Vardha-mana is said to have died."—L. D. Barnett, *Antiquities of India*, pp. 94-95.

Sexagenary cycle of the Chinese.—"If we turn to the Far East, we find that the ancestors of the people we call Tartars, had long invented or adopted from the Babylonian Soss the unerring Sexagenary cycle, which the Chinese and other Eastern peoples still use. The Chinese also reckon time by the moon, and intercalated a month at intervals. It is said that the great cycle of 600 years was used for the adjustment of lunar time with the sun. . . . Be that as it may, the 1st Emperor of the Han dynasty, B. C. 206, reformed the calendar. New Year's day was attached to the new moon of that month during which the sun entered the sign corresponding to our Pisces. The lunation during which the sun entered no new sign was fixed as the intercalary month. Whatever reforms were made in the civil calendar, the Sexagenary cycle continued its unvarying course. It is no astronomical period, but an unailing register of the lapse of time. This pre-eminent cycle of cycles is a combination of the decimal and duo-

decimal. The characters representing our numbers are combined in pairs, the 10 decimal, with the first ten of the duodecimal, in rotation, and continuing with the first of the one with the 11th of the other the 60th double sign is composed of the last of both cycles, when no more combinations are possible. The day cycle, which is already mentioned in the 'Shu King,' . . . was followed by the month and year cycle. The annals reach back to B. C. 2607 or to B.C. 2637. The accession of Tai Tsu, the 1st Emperor of the Han dynasty, is placed at the 32nd year of the 42nd cycle, or B.C. 206. This works out to B.C. 2607 for the epoch year of the 1st cycle, but B.C. 2637 is considered the commencement of the Chinese kingdom. Quite apart from the credibility of their annals, the Chinese chronological system is perfect. It has known no change, thus the confusion common to all others is quite unknown in theirs. That they have provided their old annals with cyclical dates is certain, so have the Greeks with the years of their Olympiads, the Chronologists with the years of our Era. That great tyrant, the Emperor Tshin Shi, B.C. 221-209, destroyed the classical books. It is said that copies were hidden during the persecution. On the genuineness of these copies depends the authenticity of the annals. After the tropical year was accepted as the true measure of solar time, they used another cycle for ascertaining the cyclical character of any day, 387 cycles, or 29,220 days, are exactly 80 tropical years, after which period the cyclical signs return in similar order to the days of the Julian years. The reduction to Julian dates presents no difficulty, other than due to the intricacies of other calendars, the chronological interregnum of one year, between B.C. 1 and A.D. 1, the differences between the Julian and Gregorian calendars, leap years, etc., having to be discounted at their true value."—E. Stone, *Hebrew Jubilee period (Westminster Review, June, 1911, p. 693)*.—See also CHINA: Origin of the people.

System of Maya Indians.—"The early Spanish chronicles and the books of Chilan Balam, written in the Maya language but in Spanish characters, indicate that the native calendar system of Yucatan was highly elaborate. The days were grouped in two ways: First, they were named in four series of five each up to 20, this grouping probably representing an outgrowth of the vigesimal system of numeration [counting by twenties], though the group was called u (moon or month); and 18 of these months, with five intercalary days, formed the year, which was apparently determined (as indicated by the intercalation) by more or less refined astronomic observation. Thus there were 73 five-day periods (which might be called 'weeks' were not that term preoccupied in a less desirable way) in a year, on four and only four of which the year might begin; and accordingly (1) these four days—Kan, Muluc, Ix, Cauac—were especially designated as dominical days or 'year-bearers,' and also came to hold special place in religious and domestic observance; and (2) the years were grouped in series of four, each distinguished by the day on which it began, 'Year Kan,' 'Year Muluc,' etc. Thus this grouping of the days would seem, except for the name 'month,' to represent a nearly pure solar calendar modified by arbitrary time distinctions springing originally from the vigesimal system of counting, both calendar and counting being strengthened and more firmly fixed by the interaction. In the second place the days were numbered in groups of 13, and such a group is commonly called by students of the Maya calendar a 'week,' and 28 of these 'weeks,' with one

day added, formed the year. This arrangement gave rise (1) to a series of 13 years, forming a period called by the Mayas a 'katun of days' and by the Spaniards an 'indiction;' and (2) to a longer series of 52 years elapsing before a 'year-bearer' of given name and number would again form the new year. . . . In addition to the arrangement growing out of the grouping of days, the years were grouped arbitrarily either through the vigesimal system of counting or for some obscure reason in such manner as to give a long cycle recorded in the Spanish chronicles and in the books of Chilán Balam, though there is doubt as to its duration. According to some students 20 years were grouped as a 'katun' which was divided into five series of four years each (independent of the four-year groups determined by the dominical days), called 'tzuc' by the Mayas, 'lustros' by the Spaniards; and it was the custom to record or verify the chronology by erecting carved stones, each called like the period a 'katun,' at the end of each twentieth year, in a historical monument. Now since the days of the 'week' were numbered from 1 to 13 and the years of the 'katun' from 1 to 20, a new 'katun' could not commence on the same number-day until a period of 13x20 years had elapsed; and in this way a cycle of 260 years was formed. This period, developed from the chronicles by Brinton, was called an 'ahau katun,' or chief cycle, collectively, though each 20-year period within it bore the same name; and 'each was represented in the native calendar by the picture or portrait of a particular personage who in some way was identified with the katun, and his name was given to it.'—C. Thomas, *Maya year*, pp. 11-12.—See also MEXICO: Aboriginal peoples.

Era of the Olympiads.—"The Era of the Olympiads, so called from its having originated from the Olympic games, which occurred every fifth year at Olympia, a city in Elis, is the most ancient and celebrated method of computing time. It was first instituted in the 776th year before the birth of our Saviour, and consisted of a revolution of four years. The first year of Jesus Christ is usually considered to correspond with the first year of the 195th olympiad; but as the years of the olympiads commenced at the full moon next after the summer solstice, i. e., about the first of July, . . . it must be understood that it corresponds only with the six last months of the 195th olympiad. . . . Each year of an olympiad was luni-solar, and contained 12 or 13 months, the names of which varied in the different states of Greece. The months consisted of 30 and 29 days alternately; and the short year consequently contained 354 days, while the intercalary year had 384. The computation by olympiads . . . ceased after the 304th olympiad, in the year of Christ 440."—H. Nicolas, *Chronology of history*, pp. 1-2.

Era of the foundation of Rome.—"Great doubts have been entertained, as well by ancient historians as by modern chronologists, respecting this era. Polybius fixes it to the year B. C. 751; Cato, who has been followed by Dionysius of Halicarnassus, Solinus, and Eusebius, to B. C. 752; Fabius Pictor, to B. C. 747; Archbishop Usber, to B. C. 748; and Newton, to B. C. 627; Terentius Varro, however, refers it to B. C. 753; which computation was adopted by the Roman emperors, and by Plutarch, Tacitus, Dion, Aulus Gellius, Censorinus, Onuphrius, Baroius, Bishop Beveridge, Stranchius, Dr. Playfair, and by most modern chronologists: Livy, Cicero, Pliny, and Velleius Paterculus occasionally adopted both the Varronian and Catonian

computations. Dr. Hales has, however, determined, from history and astronomy, that the Varronian computation is correct, viz. B. C. 753."—H. Nicolas, *Chronology of history*, p. 2.—This era is indicated in dates by A. U. C. (*ab urbe condita*) or U. C. (*urbe condita*), meaning "after the founding of the city," or A. U. (*anno urbis*), meaning "in the year of the city."

Spanish era.—"The Spanish era dates from 38 B.C. (A. U. 716) and is supposed to mark some important epoch in the organization of the province by the Romans. It may coincide with the campaign of Calvinus, which is only known to us from a notice in the *Fasti Triumphales*. . . . The Spanish era was preserved in Aragon till 1358, in Castile till 1383, and in Portugal till 1415."—C. Merivale, *History of the Romans*, ch. 34, note.

Julian era.—**Reformed Roman calendar.**—"The epoch of the Julian Era, which precedes the common or Christian Era by forty-five years, is the reformation of the Roman calendar by Julius Cæsar, who ordained that the Year of Rome 707 should consist of 15 months, forming altogether 445 days; that the ensuing year, 708, should be composed of 365 days; and that every fourth year should contain 366 days, the additional day being introduced after the 6th of the calends of March, i. e., the 24th of February, which year he called Bissextile, because the 6th of the calends of March were then doubled. Julius Cæsar also divided the months into the number of days which they at present contain. The Roman calendar, which was divided into calends, nones and ides, was used in most public instruments throughout Europe for many centuries. . . . The calend is the 1st day of each month. The ides were eight days in each month; in March, May, July and October the ides commenced on the 15th, and in all other months on the 13th day. The nones are the 5th day of each month, excepting in March, May, July and October, when the nones fall on the 7th day. The days of the month were reckoned backwards instead of forwards; thus, the 3d calends of February is the 30th of January; the 4th calends of February the 20th of January. . . . Excepting July and August, which were named after Julius and Augustus Cæsar, having been called Quintilis and Sextilis, the Roman months bore their present names. An error prevailed for 37 years after the death of Julius Cæsar, from reckoning every third instead of every fourth year a bissextile, or leap year, as if the year contained 365 days, 8 hours. When this mistake was detected, thirteen intercalations had occurred instead of ten, and the year consequently began three days too late: the calendar was, therefore, again corrected, and it was ordered that each of the ensuing twelve years should contain 365 days only, and that there should not be any leap year until A. U. C. 760 or A. D. 7. From that time the years have been calculated without mistakes, and the Roman year has been adopted by all Christian nations, though about the sixth century they began to date from the birth of our Saviour."—H. Nicolas, *Chronology of history*, p. 4.—"It might naturally have been expected that Julius Cæsar would have so ordered his reformed solar year, as to begin on the day of the winter solstice, which, in the 'Year of Confusion' [i. e., the year in which the error of the calendar was corrected] was supposed to fall on Dec. 25. But he chose to begin his new year on the first of January following, because on that day the moon was new, or in conjunction with the sun, at 7 hours, 6 minutes and 35 seconds after noon. By this means he began his year on a most high or holy day among the ancient Druids, with

whose usages he was well acquainted, and also made his new year the first of a lunar cycle."—W. Hales, *New analysis of chronology*, v. 1, bk. 1.—See also ANNALS: *Medieval annals*.

ALSO IN: C. Merivale, *History of the Romans*, ch. 20.

Christian era.—"Unfortunately for ancient Chronology, there was no one fixed or universally established Era. Different countries reckoned by different eras, whose number is embarrassing, and their commencements not always easily to be adjusted or reconciled to each other; and it was not until A. D. 532 that the Christian Era was invented by Dionysius Exiguus, a Scythian by birth, and a Roman Abbot, who flourished in the reign of Justinian. . . . Dionysius began his era with the year of our Lord's incarnation and nativity, in U. C. 753, of the Varronian Computation, or the 45th of the Julian Era. And at an earlier period, Panodorus, an Egyptian monk, who flourished under the Emperor Arcadius, A. D. 395, had dated the incarnation in the same year. But by some mistake, or misconception of his meaning, Bede, who lived in the next century after Dionysius, adopted his year of the Nativity, U. C. 753, yet began the Vulgar Era, which he first introduced, the year after, and made it commence Jan. 1, U. C. 754, which was an alteration for the worse, as making the Christian Era recede a year further from the true year of the Nativity. The Vulgar Era began to prevail in the West about the time of Charles Martel and Pope Gregory II. A. D. 730. . . . But it was not established till the time of Pope Eugenius IV. A. D. 1431, who ordered this era to be used in the public Registers. . . . Dionysius was led to date the year of the Nativity, U. C. 753, from the Evangelist Luke's account that John the Baptist began his ministry 'in the fifteenth year of the reign of Tiberius Cæsar'; and that Jesus, at his baptism, 'was beginning to be about 30 years of age.' Luke iii. 1-23. . . . But this date of the Nativity is at variance with Matthew's account, that Christ was born before Herod's death; which followed shortly after his massacre of the infants at Bethlehem. . . . Christ's birth, therefore, could not have been earlier than U. C. 748, nor later than U. C. 749. And if we assume the latter year, as most conformable to the whole tenor of Sacred History, with Chrysostom, Petavius, Prideaux, Playfair, &c., this would give Christ's age at his baptism, about 34 years; contrary to Luke's account."—W. Hales, *New analysis of chronology*, v. 1, bk. 1.—In a subsequent table, Mr. Hales gives the results of the computations made by different chronologists, ancient and modern, to fix the true year of the Nativity, as accommodated to what is called "the vulgar," or popularly accepted, Christian Era. The range is through no less than ten years, from 7 B. C. to 3 A. D. His own conclusion, supported by Prideaux and Playfair, is in favor of the year 5 B. C. Somewhat more commonly at the present time, it is put at 4 B. C.—See also: HISTORY: 18; JESUS CHRIST: Chronology of birth.

Medieval cycles.—"The first Cycle which was used for historical purposes is that of the Indiction, which consisted of fifteen years. This Cycle is computed from September 1, A. D. 312, though it is possible that it was, in fact, instituted for fiscal purposes in 297. But the date from which the first Indiction was reckoned is immaterial, for the number of the Cycle is hardly ever spoken of. All that is mentioned is the place which a particular year holds in an unspecified Cycle of fifteen years. We can only tell which that Cycle is by comparing other dates named in connection with

that of the Indiction—for instance, the post-consular or regnal year, or later on the year of the Incarnation. The Indiction, therefore, is mainly useful to us now as a means of checking and correcting other chronological elements which accompany it. The date was always expressed in such a form as *prima Indictione*, not in the first year of the Indiction. When we wish to translate it into terms of years of the Christian Era, it is the rule to denote it by the year in which the greater part of it falls, so that the first Indiction is called the Indiction of 313. This is worth remark because the fact has not always been clearly stated; indeed, a famous scholar, Kemble, treated at large upon the chronology of Anglo-Saxon charters, in which it is a normal feature, under the belief that the Indiction began in the September of what we should call the current year. Such a practice is unknown except at Genoa. The Indiction, however, did not always start from the same day. Besides the original, Greek or Constantinopolitan, Indiction of September 1, two varying modes of reckoning were developed. One of these, called the Cæsarean or Imperial Indiction, or the Indiction of Constantine, began on September 24; this was invented probably in order to bring it into accord with the autumnal equinox. It won favour through the authority of Bede, who adopted it; and it is conveniently distinguished as the Bedan Indiction. The other is known as the Roman or Pontifical Indiction; this began on December 25, or perhaps sometimes on January 1, and was no doubt devised in order to make the Indiction correspond with the common reckoning of the year. Of these three varieties the Greek Indiction was regularly employed by the Popes until 1087; after this the usage fluctuates until under Alexander III (1159-1181) the Bedan Indiction of September 24 became established. From Italy the Indiction passed into the Imperial chancery with the coronation of Charles the Great in 800; first the Greek Indiction, and then alternatively the other two modes of reckoning. In England the Indiction of Bede was usual, but the simpler computation from Christmas gradually came to be employed. Outside the Papal and Imperial chanceries the Indiction was mainly an ecclesiastical system. It may be found in charters for churches, and historians occasionally make mention of it; but it passed more and more out of general use. Only the notaries public who received their authority from the Pope or Emperor, and who delighted to amplify their certificates in the most precise fashion, never omitted to insert the Indiction in their official Acts. Other Cycles which were employed were invented for the technical purpose of ascertaining the date of Easter, or more exactly of finding the fourteenth day of the Moon of the Vernal Equinox. In what relation Easter stood to that day had been a subject of long dispute, but it was nearly settled by the fifth or sixth century; and the definition which became accepted was that Easter Day was the Sunday next following the Full Moon on or next after March 21."—R. L. Poole, *Medieval reckonings of time*, pp. 29-31.

Gregorian reformation of Julian Calendar.—"This was a correction and improvement of the Julian. It was discovered at length, by more accurate astronomical observations, that the true solar or tropical year was 365 days, 5 hours, 48 minutes, and 57 seconds; whence it fell short of the Julian or Egyptian computation of 365 days and 6 hours by an interval of 11 minutes, 3 seconds, . . . which, in the course of 130 years, amounted to a whole day. At the end of 130 years,

therefore, the tropical year began a day earlier than the civil, or fell back a day behind it, . . . In the time of Pope Gregory XIII, A. D. 1582, . . . the [vernal] equinox was found to be on the 11th of March, having fallen back ten days. In order, therefore, to bring it forward to its former place of the 21st, he left out ten days in October, calling the 5th the 15th day of that month. Whence in that year of confusion, the 22d day of December became the first of January, A. D. 1583, which was the first year of the Gregorian Era. In making this correction, he was principally assisted by the celebrated mathematician Clavius. But to prevent the repetition of this error in future, a further reformation of the Julian Calendar was wanting. Because the vernal equinox fell backwards three days in the course of 390 years, Gregory, chiefly by the assistance of Aloysius Lilius, decreed that three days should be omitted in every four centuries; namely, that every first, second and third centennial year, which would otherwise be bissextile, should be a common year; but that every fourth centennial year should remain bissextile. Thus, the years A. D. 1700, 1800, 1900, and 2100, 2200, 2300, were to be common years; but A. D. 1600, 2000, 2400, to remain leap years. By this ingenious reform, the Julian Calendar is rendered sufficiently accurate for all the purposes of chronology, and even of astronomy, for 6000 years to come. . . . The Gregorian or reformed Julian year was not adopted in England until A. D. 1751, when, the deficiency from the time of the Council of Nice then amounting to eleven days, this number was struck out of the month of September, by Act of Parliament; and the 3d day was counted the 14th, in that year of confusion. The next year A. D. 1752, was the first of the new style, beginning January 1, instead of March 25."—W. Hales, *New analysis of chronology*, v. 1, bk. 1.—The change from Old Style, as the Julian Calendar, and dates according with it, now came to be called, the New Style, or the reformed, Gregorian Calendar, was made in Spain, Portugal, part of Italy, part of the Netherlands, France, Denmark, and Lorraine, in 1582; in Poland in 1586; in Hungary in 1587; in Catholic Switzerland in 1583; in Catholic Germany in 1584; in most parts of Protestant Germany and Switzerland in 1700 and 1701, and, . . . in England, in 1751.—H. Nicolas, *Chronology of history*.—Japan changed from the Julian to the Gregorian calendar in 1873, China in 1912, Turkey in 1917, Russia in 1918, and Rumania in 1919; Bulgaria, Greece and Jugoslavia still retain the Julian Calendar. When the Bolshevik government of Russia issued the decree abolishing the "Old Style" or Julian calendar and adopting the Gregorian or "New Style," the new calendar was thirteen days ahead of the old. In order to bring about this change, the first day after January 31 (February 1), 1918, was reckoned as February 14.—See also RUSSIA: 1917-1920: Bolshevik laws.

French revolutionary era and calendar.—"All popular journalists, patriots, and public bodies, had begun dating 'First Year of Liberty,' or 'First Year of the Republic'; and the old calendar had come to be considered as superstitious and slavish, as an abomination in the highest degree disgraceful to free and enlightened Frenchmen. Various petitions for a change had been presented; and at length the Convention had employed the mathematicians Romme and Monge, and the astronomer Laplace, to make a new republican calendar for the new era. These three philosophers, aided by Fabre d'Eglantine, who, as a poet, furnished the names, soon finished their work,

which was sanctioned by the Convention and decreed into universal use as early as the 5th of October [1793]. It divided the year into four equal seasons, and twelve equal months of 30 days each. The five odd days which remained were to be festivals, and to bear the name of 'Sansculottides.' . . . One of these five days was to be consecrated to Genius, one to Industry, the third to Fine Actions, the fourth to Rewards, the fifth to Opinion. . . . In leap-years, when there would be six days to dispose of, the last of those days or Sansculottides was to be consecrated to the Revolution, and to be observed in all times with all possible solemnity. The months were divided into three decades, or portions of ten days each, and, instead of the Christian sabbath, once in seven days, the *décadi*, or tenth day, was to be the day of rest. . . . The decimal method of calculation . . . was to preside over all divisions: thus, instead of our twenty-four hours to the day, and sixty minutes to the hour, the day was divided into ten parts, and the tenth was to be subdivided by tens and again by tens to the minutest division of time. New dials were ordered to mark the time in this new way, but, before they were finished, it was found that the people were puzzled and perplexed by this last alteration, and therefore this part of the calendar was adjourned for a year, and the hours, minutes and seconds were left as they were. As the republic commenced on the 21st of September close on the [autumnal] equinox, the republican year was made to commence at that season. The first month in the year (Fabre d'Eglantine being godfather to them all) was called Vendémiaire, or the vintage month, the second Brumaire, or the foggy month, the third Frimaire, or the frosty month. These were the three autumn months. Nivôse, Pluviôse, and Ventôse, or the snowy, rainy and windy, were the three winter months. Germinal, Floréal, and Prairial, or the bud month, the flower month, and the meadow month, formed the spring season. Messidor, Thermidor and Fructidor, or reaping month, heat month, and fruit month, made the summer, and completed the republican year. In more ways than one all this was calculated for the meridian of Paris, and could suit no other physical or moral climate. . . . But the strangest thing about this republican calendar was its duration. It lasted till the 1st of January, 1806."—C. MacFarlane, *French Revolution*, v. 4, ch. 3.—The Republican Calendar for the Year Two of the Republic (Sept. 22, 1793—Sept. 21, 1794) is synchronized with the Gregorian Calendar as follows: 1 Vendémiaire = Sept. 22; 1 Brumaire = Oct. 22; 1 Frimaire = Nov. 21; 1 Nivôse = Dec. 21; 1 Pluviôse = Jan. 20; 1 Ventôse = Feb. 19; 1 Germinal = March 21; 1 Floréal = April 20; 1 Prairial = May 20; 1 Messidor = June 19; 1 Thermidor = July 19; 1 Fructidor = Aug. 18; 1st to 5th Sansculottides = Sept. 17-21.—H. M. Stephens, *History of the French Revolution*, v. 2, app. 12.—See also FRANCE: 1804-1805.

Plans for world-wide reform.—"Plans for improving the Gregorian calendar had aroused serious attention on all hands shortly before the war. A committee to consider this subject was appointed at the St. Petersburg meeting of the International Association of Academies in 1913. The matter was also discussed at the International Geographical Congress which met in Rome the same year. The Congress of International Associations, meeting at Brussels in 1913, and the last three International

Congresses of Chambers of Commerce (1910, 1912 and 1914), all passed resolutions in behalf of calendar reforms. Lastly, an International Congress on the Reform of the Calendar met at Liège, May 27-29, 1914. Its membership included eminent astronomers and other specialists, as well as representatives of the commercial world and of the Protestant and Catholic churches. This notable assemblage . . . studied the whole question of calendar reform in great detail, and its deliberations, . . . place the matter in convenient shape for further consideration. . . . The resolutions adopted by this congress urge that a new and universal calendar be adopted by civil and ecclesiastical authorities throughout the world; that the new calendar be 'perpetual' (i. e., that a given date of the year always fall on the same day of the week); that one day in common years and two days in leap-years be dateless; that the year consist of 364 dated days (52 weeks); that the division of the year into twelve months be retained; and, finally, that a Sunday in April be adopted as a fixed date for Easter. It was expected that the government of Switzerland would follow up this unofficial movement by inviting the countries of the world to send delegates to an official conference, in which some definite action might be taken on the subject; but the war made this impossible. . . . A bill to establish a new calendar was introduced at the last session [1918] of Congress by Representative Smith, of Michigan; but if anything is obvious and incontrovertible in connection with such a proposal it is that the calendar is an international institution and that it should not be altered except by general agreement among the countries of the world. Just at present an opportunity for concerted action in this matter is presented by the meeting of the Peace Conference in Paris. The time seems to be ripe for securing at least a *uniform* calendar throughout the world in place of the several systems that now prevail, and the suggestion has been put forth that, instead of adopting the Gregorian calendar as it now stands, an improved system, based upon the Gregorian, might be found acceptable for universal use. Two distinguished French astronomers, M. Bigourdan and Deslandres, have recently discussed this question in the French Academy of Sciences, and both have outlined plans for a modified calendar with special reference to bringing them to the attention of the peace delegates or the prospective League of Nations. It has been especially urged that the Academy of Sciences itself endeavor to reconcile the conflicting views of the scientific world on this subject, and formulate a plan for submission to the assembled representatives of the powers. Finally, in the *Revue des Deux Mondes* M. Charles Nordmann, in support of a similar proposal, brings together a large amount of interesting information concerning the history of calendar reforms and the present state of the question."—*Calendar reforms and the peace conference* (*American Review of Reviews*, Apr., 1919).

CHUMASHAN FAMILY.—"Derivation: From Chumash, the name of the Santa Rosa Islanders. The several dialects of this family have long been known under the group or family name, 'Santa Barbara,' which seems first to have been used in a comprehensive sense by Latham in 1856, who included under it three languages, viz.: Santa Barbara, Santa Inez, and San Luis Obispo. The term has no special pertinence as a family designation, except from the fact that the Santa Barbara Mission, around which one of the dialects of the family was spoken, is perhaps more widely known than any of the others."—J. W. Powell, *Seventh annual report, Bureau of Ethnology*, p. 67.

CHURCH AND STATE.—Totemism.—Patriarchal society.—“The influence of the state in matters religious presents a curious line of development. Any permanent phase of human activity will embody itself in a social institution, and the church, using the word in its generic sense, is the institution through which religious activity formally expresses itself. In the later animistic stage, religion, if that term may be applied to savage notions of the supernatural, found its best expression in totemism. The older men of the totem represented the authority of the church. They regulated totem relationship with its system of rights and obligations, instructed and initiated the youth into the mysteries of the worship, interpreted the meaning of the supernatural and sought as medicine men and conjurers to heal the physical and mental diseases of the people. Such a function contains in essence all that the church strove to become in later ages, and its early importance as a civilizing factor can hardly be overestimated. With the development of patriarchal society totemism disappeared and in its place came nature and ancestor worship. The formal part of worship now became the prerogative of heads of families, as far as ancestral deities were concerned, but side by side with these arose a system of nature worship, partly a matter of common superstition and partly a cult with a definite priesthood. Supplementing these systems were seers, soothsayers, magicians, and necromancers, who claimed a more practical and larger knowledge of supernatural beings than the more formal priesthood. The combined influence of these several priestly classes was overwhelming. The entire life of the community was dominated by them, and men became through social pressure religious in thought and action. . . . The maturity of the patriarchal system marks the height of this influence. During this period church and state were for all practical purposes one in aim and in spirit. Rulers were themselves priests and exercised priestly functions. Both institutions were conservative, loved stability, and taught submission to authority.”—J. Q. Dealey, *State and government*, pp. 89-90.

Coöperation of church and state.—“The church defied the ruler either as himself a god or God’s representative, exalted his priestly authority, educated his nobles to obedience, and kept the masses submissive by declaring rebellion to be impious. Consequently, the priesthood became a separate class, a social hierarchy, having large possessions of land, wealth, and special privileges, and exercised an authority hardly second to that of the throne itself. Its leaders were the trusted advisers and assistants of the king. It had charge of higher education and instructed aspiring youth in medicine, sanitation, the known sciences, statecraft, and divine wisdom. It regulated the morals of the people, condemning or approving social customs, and punishing infringements of its standards. It inculcated the virtues of hospitality, charity, and kindness toward the lowly. It sanctioned wholesome amusements and participated in them, developing for its own purposes the rhythm of the song and the dance, as well as the stately march of the procession and the use of musical instruments. Its

connection with family worship gave it influence there also, and through its conservative attitude and educational power it was able to solidify into a static civilization the slowly developing forces of the patriarchal period. . . . But this harmony of church and state was sometimes rudely disturbed. The prophetic or inspirational side of religion, voiced by the seer and by the religious reformer, was not infrequently in opposition to the *status quo*, and denounced both ruler and priest for their shortcomings. Then, too, as patriarchal state passed into the age of commercialism, the spirit of the newer age fought against the existing system. As intercourse with other countries developed, there came a knowledge of foreign divinities; worshipers of these resided within the borders of the state, and in many cases the worship itself was encouraged and sanctioned. New influences and broader knowledge tended to destroy unquestioning belief in the older system, and material progress demanded liberalism in state policy. Competition of religious ideas and systems and philosophizing slowly sapped beliefs in national and local gods. Even though the forms of worship survived, confidence in religious teaching and the efficacy of worship disappeared. For the ecclesiastical organization, as a rule, is slow to adapt its teachings to the changing conditions of the age, its priesthood is a class apart and sees the signs of the times by refracted light. It is inherently conservative and tends to emphasize the permanent and accepted features of life but not to understand the volcanic energy pent up and seeking expression. For such reasons it regularly fails to adapt itself readily to the newer environment, loses its power in consequence and then, after slow readjustments, tends to regain part of the influence lost. At such crises the truer interests of society may demand that the state supersede the church in many of its activities. The state, in so doing, realizing the authority and prestige of the church over the minds and hearts of men, may continue to allow it large powers and wealth, but by regulation of its organization and teachings makes it a useful ally rather than a rival for supremacy. It may, however, go farther than this; by depriving it of countenance and financial support, it may thereby thrust it into competition with other social institutions, making it dependent for support on popular favor and approval. The period of the Renaissance illustrates this. When the theological tendencies of the church became iron bands restrictive of the growing life within, the state burst these asunder and encouraged science, invention, philosophy, and secular education. It also ignored ecclesiastical teachings in respect to charity, crime, insanity, intemperance, and such social ethical questions, and sought to solve these problems by scientific investigation rather than by theological dogmatism. The result is that the church is no longer looked on as the final authority in such matters; the state, rather, making use of the teachings of science and sociology, has become the authority in fixing moral standards. On the other hand the church in adversity may turn away from the material aspect of ecclesiasticism and catch glimpses of a world mission, a world empire dominated by religious ideals. The inspiration of such an ideal might even carry the church to victory against the state and render its government theocratic. Such struggles of church and state have been common and victory has passed from one to the other. Sometimes, as in the struggles of church and state in mediæval and modern times, a truce has been declared and the respective powers of each defined, as, for example, in the *concordats* so common in the

history of the Roman Catholic Church. Broadly speaking, however, whenever a state passes into commercial-manufacturing life, it tends to emancipate itself from sacerdotal authority and to favor a more or less complete separation of church and state. A separation of church and state, however, does not imply an absolute separation. The church as a social and property-holding institution is still subordinated to the state, but it is left free to regulate its own life and religious practices."—*Ibid.*, pp. 90-93.

Separation of church and state.—"There seem to be four well-defined stages in the accomplishment of this object: (1) The state and church separate in organization, personnel, and function, but work in harmony, as in Russia under the tsars. (2) The state subordinates the church so effectively that it becomes virtually a department of governmental administration, dominated by the ruler and his ministers. This was practically the situation in several of the states of Germany under the Empire. (3) The church frees itself from governmental control in spiritual matters, but is financially chiefly supported by the state. France in the latter part of the nineteenth century illustrates this system. (4) The church becomes separate from the state and is no longer supported from public funds. This 'separation of church and state' may have a friendly aspect, as in Mexico during the last fifty or sixty years."—*Ibid.*, pp. 93-94.

Passing of religious functions to the state.—"As already indicated, the church in conflict with the state lost many of its historic functions. As long as it was in sympathy with the state and was supported by it, it mattered little which institution performed social service. But as the two drew apart and public financial support was supplied more sparingly or withdrawn altogether, it became important from the state's standpoint that it, rather than the church, should perform functions so essential to national welfare. Financial weakness also made the church less able to perform her accustomed functions. Slowly but surely, therefore, one power after another passed from the church to the other social institutions or to the state; charity, medicine, amusements, scientific investigation, philosophy, education, domestic regulation, and morals. This change has come more fully in some states than in others, but broadly speaking the power of the modern church tends to confine itself to devotional and spiritual lines only, and other functions are passing from its control. The churches may still advance theories of disease and healing, or scientific and philosophic speculations, and may seek to regulate for their members amusements, morals, domestic institutions, and education, but such religious *dicta* are suggestions, not authoritative decisions and are adopted, if at all, because of their inherent reasonableness."—*Ibid.*, p. 94.

Revolutionary idea of religious toleration.—"The Revolutionary idea of liberty logically required the acknowledgment of the principle of liberty of conscience, that is, the liberty of the individual publicly to profess his religious faith and to worship according to the dictates of his own conscience. It cannot be said that religious liberty was a doctrine to which the American people were naturally inclined. In several of the colonies it had been vigorously denied, and only Rhode Island and Pennsylvania expressly tolerated all Christian sects. The Puritan idea of liberty, as has been stated, laid less stress on legal rights than on moral attitudes, but the formation of the Union and the growth of a national spirit rendered sectarian intolerance archaic, thus enabling Puritanism at last to rid itself of its worst defect. To the Revolutionary

leaders freedom of thought was as vital as freedom of conduct, and to their lasting renown they established liberty of the conscience on the same basis as liberty of the person among the 'natural, essential, and unalienable' rights of man. The Revolutionary idea of religious toleration did not require that the public offices should be thrown open indiscriminately to all persons without regard to religious faith. In Massachusetts all state officers chosen by popular election were expressly required to declare their belief in the Christian religion, and in New Hampshire they had to be Protestants. Virginia set a better example by the abolition of religious tests for office-holding when the first state constitution was adopted in 1776, but a majority of the states which adopted constitutions during the Revolutionary period required some sort of a religious qualification from the holders of the principal public offices. The opposition to religious tests was, however, strong and growing, and in 1787 the Federal Convention provided that no religious test should ever be required as a qualification for any office or public trust under the United States. Public opinion by that time had clearly turned against it, and most of the states got rid of their religious tests for office-holding at the first revision of their constitutions. The doctrine of the complete separation of Church and State was more difficult to establish. Several of the colonies had been founded for the express purpose of providing a haven for particular sects, and in most of them the care of religion was generally felt to be a sacred duty of government. At the beginning of the Revolution the Church of England was established by law and the clergy of that church were maintained out of the public treasury in Virginia, Maryland, and the Carolinas. The same church was especially favored by the colonial governments of New York and New Jersey. In New England, outside of Rhode Island, the Independent or Congregational Churches were strongly favored, and the Massachusetts declaration of rights emphatically proclaimed the necessity of making suitable provision at public expense 'for the institution of the public worship of God.' With the lapse of time, however, the established and favored churches had become less suited to the needs of the people, and with the growth of the Revolutionary spirit the idea of a privileged church came into conflict with the principle of freedom of conscience. One of Jefferson's most cherished enterprises was the disestablishment of the Church of England in Virginia. This was accomplished immediately after the close of the Revolution. The assessment of the citizens for the support of religion by public authority was finally abandoned in Massachusetts a half century later. With the fall of the privileged churches came the rise of the doctrine of the complete separation of Church and State, a doctrine which followed logically, even if slowly, from the Revolutionary belief in the natural nobility of man."—A. N. Holcombe, *State government in the United States*, pp. 26-28.

CHURCH OF ENGLAND: Theory of origin.—Continuity of its history.—“The Church of England, the national Church of England as by law established, may be regarded as a product of the Protestant Reformation; and from this point of view its history is held to begin with the refusal of Henry VIII to own further allegiance to the pope, and the resultant declaration that the king was the head of the Church in his dominions. In theology it is in general harmony with Protestantism, but in government it claims to have retained in unbroken succession from the Apostles, and hence from Christ himself, the three major orders of bishop, priest and deacon. In ritual and worship it maintains a uniform order of church service, parts of which are derived immediately from ancient and medieval rituals. It occupies an intermediate position between the Latin communion and the churches of the Reformation. Many Anglican writers regard the Reformation as merely an incident in the history of the Church of England, which did not interrupt its historic continuity, which is held to date from Augustine, and even from the old Celtic Church. A considerable number, particularly in the High-church party, look upon the Reformation as a serious mistake, if not as a crime.”—D. S. Schaff, *Church of England* (*New Schaff-Herzog religious encyclopedia*, v. 4, p. 131).—“It [the Church] was ‘established’ not by the State, for there was no one State to establish anything, but by its own inherent force, when this land was nothing but a congeries of different and often hostile tribes. There has been no break in its continuity from that day to this; for the theory that a new Church was erected in the sixteenth century is one that has been consigned by all competent historians, some of whom are very far indeed from holding a brief for the Church, to the limbo of exploded fallacies. . . . ‘There are not many grand things left in England,’ said the late Lord Beaconsfield in his old age, ‘but the National Church is one of them.’ . . . Looking back through the long vista of ages stretching away for thirteen centuries one cannot but feel sure that the same God who has so marvellously protected His Church in the past through all its varied fortune will still protect it in the future. Over and over again the English Church has seemed to be within a hair’s-breadth of destruction; but it has never been destroyed. Hardly a century has elapsed without some crisis in its eventful history. The heathen Danes seemed likely to sweep away every vestige of it from off the land; the Normans all but reduced it to a mere appanage of Rome; King John, its official guardian basely betrayed it to the foreigner; in the civil wars of the fifteenth century it was sunk into the last stage of impotency and decrepitude; there were times, many in the sixteenth century when it appeared in imminent danger of breaking off altogether from historic Christianity; in the seventeenth it passed through a period of twenty years’ occultation; in the Georgian era it seemed to have settled down upon its lees, and to have sunk into a state of stagnation; in the first half of the nineteenth it was regarded by very many as a doomed institution; in the second half it has been frequently predicted that a society so torn by internal dissensions could not possibly survive. But God has preserved it still.”—J. H. Overton, *History of the church in England*, v. 2, pp. 420-422.

597-1066.—Anglo-Saxon period.—Council of Whitby.—Perfect union of church and state.—Resulting strength and weakness.—“The Anglo-Saxons . . . did not receive Christianity from the

Britons because in the bitter struggle which attended their conquest of Britain the Celtic inhabitants were driven, step by step, back to the western part of the island, and with them went their civilization and religion. . . . But Christianity was to come to the Anglo-Saxons first from Rome. . . . [At the end of the sixth century] Gregory sent the abbot Augustine with a numerous train of followers, as missionaries to the English. . . . [See also CHRISTIANITY: 597-800; MISSIONS, CHRISTIAN: Early Missions: 7th-11th centuries.] The simple and unselfish life of the monks won the confidence of all. . . . Augustine required of the British conformity to the Roman ritual and submission to himself as primate. . . . As soon as political affairs in the north were in a more settled condition, strife arose between the British and the Romish churchmen. . . . To adjust the differences a conference was held at Whitby in 664. . . . The king decided for Rome. . . . The decision had an important effect on the subsequent history of the English Church. The more free spirit of the British, which would have proved powerful in resisting the encroachments of Rome, was driven out. Yet the Church was perhaps saved from perilous irregularities and brought into close connection with the development of the civilization and Christianity of Europe."—G. P. Fisher, *History of the Christian Church*, pp. 146-149.—"There is a peculiar interest in the Church before the [Norman] Conquest . . . for it was *par excellence* a National Church. During the five centuries that . . . passed, . . . it not only represented the best features of national life, but it was the most important of all factors in welding together all classes, and giving a model for what had not yet become one united nation. There seems to have been absolutely no friction in the relations between Church and State. There were, of course, individual ecclesiastics who came into collision with the State authorities, and individual laymen who came into collision with the ecclesiastical authorities; but these were isolated cases, and in scarcely any instance brought the two bodies to which they belonged into conflict. The functions of each were clearly defined, and they rarely clashed. 'The Bishop and the Ealdorman sat side by side at the shire-mote to expound God's law and the world's law'; the clergy were, like other citizens, punishable by the State for offences which came under the cognizance of the State, and the laity devolved upon the clergy the duty of carrying out those laws which seemed especially to belong to their province. . . . This remarkable harmony between Church and State was, no doubt due in part to the fact that the conversion of almost every little kingdom in England began with the King and his Court, and spread downwards. . . . Instances of kings resigning their thrones and retiring into monasteries are numerous. . . . On the other hand, while the Church was thus closely connected with the highest classes, it was regarded as the best friend of the poor, and hence formed a most valuable link between the different grades of society. It was also a ladder by which members of the lowest class might rise to the highest. S. Cuthbert, the greatest Saint of the North, on whom a powerful monarch had humbly to wait to implore him to accept a bishopric, had been a mere shepherd lad. . . . The implicit confidence that was then placed in the Church was enhanced by the fact that all education was exclusively in her hands; and this was a part of her work which she did not neglect. . . . [Moreover] the Church . . . was thoroughly patriotic. . . . In short, as Dr. Freeman tersely and pointedly expresses it, 'the nation was intensely religious, and the Church

was intensely national.' The weak side of this remarkable union, which continued, with few breaks, for more than four centuries, and to which it would be hard to find a parallel, was that it partly arose *from*, and partly contributed to *form*, an insularity which, from the nature of things, could not last. . . . Another weakness, which, though not perhaps peculiar to the early English Church, is certainly very noticeable in it, was the survival of heathen ideas long after heathenism had given place to a better faith. 'The decrees of Anglo-Saxon councils,' writes Canon Bright, 'abound in prohibitions of charms, incantations, auguries, omens, necromancy, or heathenish rites, connected with wells, with stones, or with trees.' . . . But in spite of these drawbacks, there is a charm about the Church before the Conquest which we certainly miss in the subsequent period. . . . We are passing from the sweet simplicity of childhood to the hardness and too great knowl-ness of manhood."—J. H. Overton, *History of the church in England*, pp. 149-155.

1066-1534.—The medieval church.—Subjection of State to Church and Church to Pope.—Conflict between Becket and Henry II.—Edward III defies the Papacy.—Wycliffe, and the Lollards.—"The Norman period . . . is distinguished by the complete vassalage into which the Church went to the papal see, the subjection of the State to ecclesiastical domination, and the growing corruption of the clergy. But the State in turn struggled to emancipate itself from ecclesiastical fetters by legislation, and the people to rid themselves of clerical incompetency and scandal by a reform in the life and doctrine of the Church. . . . Archbishop after archbishop contended with royalty, now for the superior rights of the Church and papal investiture, now for the liberties of the people. . . . Thomas Becket . . . contended with Henry II, who sought to reform the abuses growing out of clerical exemptions from civil jurisdiction. Becket's attitude called forth the famous Constitution of Clarendon in 1164, which forbade papal briefs to be received in England without the royal consent, or prelates to go to Rome without the same consent. Though Becket was murdered victory did not rest with the king [see ENGLAND: 1162-1170]. It remained for the State as a national body to come into subjection to the ecclesiastical power of Rome. This was accomplished during the reign of John. . . . A new era seemed to have dawned with the earnest and plain preaching of the Dominican (1221) and Franciscan friars (1224); but, becoming fat with lands, they lost their hold on the popular mind. . . . The great English chronicler, Matthew Paris, in the middle of the thirteenth century, voices the protest of the people against the monetary exactions of the pope and his agents. . . . In 1366 a parliament of Edward III definitely refused to pay the annual tribute of a thousand marks promised by John to the apostolic see. In the fourteenth century loud protests began to be heard from the people and the clergy. John Wycliff . . . 'the morning star of the Reformation' translated the Scriptures and asserted the rights of the State and the individual conscience [see ENGLAND: 1360-1414]. . . . The Lollards were . . . numerous. . . . But the energetic opposition of Church and State was effective in silencing them or inducing them to recant. The statute 'for burning heretics' was enacted in 1401. . . . The Church slumbered on for more than a century longer, but the great movement finally came, out of which Christianity in England, again crystallized in a distinctly national Church of England, started forward on a career of renewed life and achievement."—D. S. Schaff, *Church of England (New Schaff-*

Herzog religious encyclopedia, v. 4, pp. 131-132).—“In the later . . . fourteenth and throughout the fifteenth century the smouldering resentment of the laity against the Church took definite shape in two movements, distinct yet tending in the same direction. One is the attack upon the moral abuses in the Church, together with its temporal and political power; the other is the growing spirit of scepticism. The former is represented by Wycliffe and the Lollards, whose story is known to everyone; the latter by the rise of the New Learning, ‘the crossing of the Alps by Greece.’ This second movement was not specifically directed against the Church; it rather produced an atmosphere in which the Church’s tapers could not burn, but flickered out of themselves. Nor did it make for moral reform. ‘When Zion was running riot, was it likely that austere virtue should take refuge on Olympus?’ . . . Right and wrong were a mere matter of taste or personal idiosyncrasy. And so we get Renaissance Italy, where Thomas Cranmer—‘an Englishman Italianised in a devil incarnate’—learnt from Macchiavelli that ruthless statecraft which struck down the English monasteries and revolutionized the English Church, not by the progress of education and piety, but by the brute force, by bloodshed reduced to a system.”—A. T. Bannister, *Church life in the latter Middle Ages* (*Edinburgh Review*, July, 1920, pp. 160-161).

1534-1563.—Establishment under Henry VIII to settlement under Elizabeth.—The Six Articles.—Doctrinal reformation under Edward VI.—Completed separation from the Catholic see under Elizabeth.—Acts of Supremacy and Uniformity.—Rise of Puritanism.—In the meantime, “the open rupture between Rome and England, which might not inconceivably have come to pass in any case as actually forced, not as the protest of religious principles against ecclesiastical abuses, but as a political expedient to which Henry VIII resorted to accomplish and to justify his divorce. . . . The king . . . demanded that he should be recognized as ‘chief protector, the only supreme lord, and head of the Church and clergy in England.’ . . . The English Church was thus severed from the papal communion and became an independent body. . . . The king, however, had little or no sympathy with the Continental Reformation. . . . The six so-called ‘Bloody Articles’ of 1539 denounced all denial of transubstantiation as heresy, and declared strongly in favor of auricular confession, the celibacy of the clergy, and the sacrifice of private masses. . . . Under Edward VI (1548-53), the doctrinal reformation was accomplished. The six articles were repealed . . . a Prayer Book was issued in 1549, the Forty-two Articles . . . drawn up in 1552. They declared that ‘the Church of Rome both erred not only in matters of faith,’ (xix); expressly denied transubstantiation; permitted the marriage of the clergy; discontinued auricular confession and approved of the communion in both kinds. With their adoption the formative period of the Church of England closes. The reign of Mary (1553-58), a firm adherent of the Roman Catholic faith, checked the Reformation for the moment, but did not crush it [see also ENGLAND: 1555-1558]. . . . The accession of Elizabeth restored the independence of the Church of England which in spite of occasional resistance from within and papal opposition from without . . . became the permanent religious home of the large majority in the land, and was firmly established by the defeat of the Spanish Armada in 1588. Two periods stand out in the history of the Church under Elizabeth. In the early part of her reign the separation of the National Church from the

Roman Catholic see was completed, and in the latter part the conflict between Anglicanism and Puritanism deepened and resulted in the victory of the Anglican school. . . . In the first year of her reign the Act of Supremacy [see ENGLAND: 1559; SUPREMACY, ACT OF] was renewed and the Act of Uniformity was passed. . . . By the latter the use of the liturgy was enforced. . . . In spite of seeming to approximate the Church of Rome in points of ritual, Elizabeth did not interfere by any public measures with the results of Reformation of Edward VI. The reduction of the Forty-two Articles to thirty-nine (1563) [see THIRTY-NINE ARTICLES], the form which they have ever since retained, did not impair their Protestant character. The independence of the National Church being thus permanently settled . . . the great question was whether Puritanism should be tolerated. This was not a question of doctrine, for the prevailing doctrinal views were Calvinistic. . . . It was a question of ecclesiastical polity, ritual, and vestments. . . . The controversy was closed in 1593 by an act of Parliament which made Puritanism an offense against the statute law.”—D. S. Schaff, *Church of England* (*New Schaff-Herzog religious encyclopedia, v. 4, pp. 133-134*).—See also ENGLAND: 1531-1503; 1547-1553; 1558-1588.

17th century.—Dissent.—Doctrine of divine appointment of episcopacy.—Laud.—Fall of Puritanism.—Act of Toleration.—“The history of the seventeenth century is marked by the consolidation of the Church of England in spite of a temporary triumph of Puritanism and by the development of the doctrine of the divine appointment of episcopacy, the first indications of which showed themselves in the Puritan controversies of the Elizabeth period, with a consequent uncompromising resistance to all dissent in ritual and doctrines, culminating in the repressive legislation of Charles II. . . . James retained relations with the Reformed Churches of the Continent. . . . But full sympathy with the Continental churches was hereafter impracticable, and recognition of their order (as was the case under Elizabeth) impossible, by the High-church views of episcopacy which were spreading, and which, under Charles I (1625-49) and Archbishop Laud . . . assumes an extreme form. . . . During the Commonwealth, the established Church was, in fact, a *religio illicita*, an act of Parliament having abolished episcopacy, and discontinued the use of the Liturgy (Sept. 10, 1642) . . . but in spite of the strong theological intellects which supported it . . . Puritanism was a failure in England. The accession of Charles II (1660) restored the Church of England to the national position which it has ever since held. . . . By the Act of uniformity of 1662, the use of the Prayer-Book was rigidly enforced; and two thousand English clergymen . . . [including Baxter and Howe], were deprived of their benefices [non-conformists who for nearly a century had sought to purify the church from within were now, in the majority of the cases, forced outside]. . . . These penalties for dissent were increased by the Five Mile Act of 1665 while the Test Act of 1673, by excluding all Puritans from office, marked the culmination of legislation against dissenters. . . . The accession of William and Mary in 1688 ushered in a new epoch. The principle that the established Church had an exclusive right to existence and protection was abrogated. . . . The first legislation in this direction was the Act of Toleration of 1689, establishing freedom of worship.”—*Ibid.*, p. 135.—See also ENGLAND: 1633-1640; 1638-1640; 1641 (March-May); 1643 (July); (July-September); 1646 (March); 1661; 1662-

1665; 1672-1673; 1687; 1687-1688; 1689 (April-August); SOLEMN LEAGUE AND COVENANT.

18th century.—Deists and evangelicals.—"The eighteenth century was characterized by a wide spread religious apathy and worldliness among the clergy and witnessed the culmination of Deism, (q.v.) which identified Christian revelation with natural religion. . . . But the influence of Deism was more than counteracted by the Evangelical spirit and activity of Whitfield and the Wesleys, graduates of Oxford, which worked with irresistible power upon the masses. . . . Against his will John Wesley founded a new church organization [Methodists]. Fresh life sprang up in the Church of England as a result of this revival of practical religion. . . . The century closed with an intense sympathy for the heathen abroad and the depraved classes at home. Sunday Schools were organized by the layman Robert Raikes of Gloucester in 1780 and in 1790 the Church Missionary Society was founded."—*Ibid.*, p. 135.—See also ENGLAND: 1711-1714.

19th century.—Oxford movement.—High, Low and Broad Church parties.—Reforms.—Organization.—"The nineteenth century was characterized by earnest philanthropic movements, by the rise of the Oxford Movement [a movement to revive church feeling and inculcate a high view of the sacraments], which profoundly influenced the Church, and by the close affiliation with the Episcopal Churches in the United States and the English colonies. [See OXFORD OR TRACTARIAN MOVEMENT.] The British and Foreign Bible Society united Churchmen and dissenters in a common enterprise, and the Evangelical Alliance in 1846 again sought to unify them in spirit and prayer. . . . However, the Church received a blow . . . when John Henry Newman, Henry Edward Manning, Frederick W. Faber, and other men of eminence among both the clergy and the laity became converts to the Roman Catholic communion. A far different school, equally devoted to the Church of England, and adhering to Reformation rather than to Anglo-Catholic tenets, included such men as the Hares, F. D. Maurice, and Archbishop Whateley. In the last half of the century Biblical scholarship was carried on to a high point by such men as Archbishop Trench, Dean Alford, Bishops Lightfoot and Westcott of Durham, Bishop Elliott, Dean Stanley, and Professors Hatch and Hart, not to mention the living. These Biblical studies culminated in the movement to revise the English translation of the Bible. The High-Church party lays emphasis upon the exclusive right of episcopacy and apostolic succession, and maintains an advanced ritual, together with insistence on the doctrines of the Real Presence and baptismal regeneration. The extreme wing has reintroduced practices abrogated under Lutheran and Calvinistic influence, such as veneration of the Blessed Sacrament, auricular confession, communion in one kind for the laity, and the establishment of monastic orders. They are distinguished for the elaborate and reverend character of their services, for the frequent celebration of the Eucharist, which is held to be sacrificial, and for their great zeal and devotion in benevolent church work. Occupying opposite ground is the Low-Church party, which holds strictly to the national interpretation of the Thirty-nine Articles, denies episcopacy to be of the essence of the Church, and denounces so-called ritualistic practices. Between these two schools, a third has grown up, since the middle of the nineteenth century. Its combination of tolerant and sometimes latitudinarian, sympathies with loyalty to the Church has secured for it the name of the Broad-Church party. Among

its more prominent representatives have been Arnold, Julius Hare, Maurice, Kingsley, and Stanley. During the nineteenth century the vigorous life of the Church was further shown by the restoration of cathedrals and the construction of churches, in the creation of new episcopal sees at home and the rapid extension of the Church and episcopate in the colonies. In addition to the Parliamentary acts bearing on the rights of Churchmen were the Compulsory Church Rate Abolition Act 1868 relieving dissenters of Church taxation, and the University Test Act (1871) throwing open the universities to all irrespective of creed. . . . The nineteenth century witnessed the repeal of the Test Act (1828) the removal of the disabilities of the Roman Catholics (1829) and Jews (1858), and the disestablishment of the Irish Church (1869). . . . England is divided into the two archbishoprics of Canterbury and York. In 1906 there were within the limits of the former twenty-five sees, and within the latter nine. In order of dignity the archdioceses and dioceses rank: Canterbury, York, London, Durham, Winchester, etc. In connection with the Church of England and Wales there are also twenty-one suffragan bishops and two assistant bishops. The Irish Church, disestablished in 1869 [see ENGLAND: 1868-1870], has two archbishops and eleven bishops, and the Scotch Episcopal Church has seven bishops. The first colonial see was that of Nova Scotia, which was created in 1787. . . . Many of the parishes have endowments in lands; others are supported, in whole or in part from public funds, such as Queen Anne's Bounty. The system of patronage has led to abuses, some of which still remain. On the other hand, the plurality system by which a clergyman might hold any number of livings at the same time . . . [and] the evils of non-residence have . . . been restrained by law. . . . The Church of England is one of the estates of the realm. Its relation to the State is one of dependence, the sovereign being its supreme governor, and Parliament its highest legislature. The archbishop of Canterbury is the first peer in the realm and crowns the king. . . . In 1888 the first Lambeth Synod was held which included the bishops of the Church of England and the Colonies and all the Protestant Episcopal Churches of America. As in America . . . the opposition of a wing of the Low-Church party to the Oxford Movement led to the formation of the Free Church of England as well as to the introduction into England of the Reformed Episcopal Church."—*Ibid.*, pp. 135-136.—See also BISHOP: Since the Reformation; and PROTESTANT EPISCOPAL CHURCH: 1607-1776.

1896.—Pope Leo XIII's decision on invalidity of Anglican orders. See PAPACY: 1896 (September).

20th century.—Problems of disestablishment and reunion.—Church Enabling Act.—During the present century the controversy over disestablishment and union, whether of "uniformity" or of "organic unity," has occupied Churchmen, High, Low and Evangelical (Broad Churchmen). The theory of episcopacy maintained by the Anglicans and rejected by non-conformists is an obstacle difficult to surmount. On the Roman side of the question, papal infallibility is of course the point at issue. "[In] June [1914] a conference was held at Kikuyu, East Africa, of all the Protestant missionary bodies in the region, for the purpose of establishing among them a working union. The opening service was held in the place of worship of the Kirk of Scotland, and the bishops of Mombasa and Uganda administered the communion to Presbyterians, Baptists, Congregationalists, Methodists,

as well as to members of their own church. At once the bishop of Zanzibar petitioned for the impeachment of his brother bishops who had arranged the meeting and admitted to the communion those who were not members of the Church of England. As a consequence, a controversy has been roused which is now going on throughout the entire English Church."—F. Palmer, *Crisis in the church of England* (*Harvard Theological Review*, 1914, pp. 235-236).—The Lambeth Conference which convenes the bishops of all Anglican communions every ten years issued a document at its session in the summer of 1920, offering a new approach to reunion, suggesting as a basis of organic unity the common acceptance of the Holy Scriptures as "the rule and ultimate standard of faith"; the Nicene Creed as "the sufficient statement of the Christian faith"; the Creeds as the baptismal confession of belief; the sacraments of Baptism and Holy Communion, and "a ministry acknowledged by every part of the Church as possessing not only the inward call of the Spirit but also the commission of Christ and the authority of the whole body." While this is only a challenge to the other churches of Christendom and details are yet to be worked out, it is generally regarded as a revolutionary step in the annals of the Anglican Church. The bill for the disestablishment of the Church in Wales which was passed in 1914 (see also ENGLAND: 1912-1914) was suspended during the period of the war and became effective in 1920. "Under the Church Enabling Act of 1919 the first National Assembly of the Church of England was elected in 1920. It consists of three Houses, the House of Bishops, the House of Clergy, and the House of Laity. The House of Laity is composed of about 330 members, elected for five years, on the basis of about one for every 100,000 population in each diocese, the Province of Canterbury returning about 210 members and that of York about 120 members. The House of Clergy totals about 260 members. The number of clergy in England and Wales is estimated to be about 23,000. At Easter, 1919, there were 2,220,194 communicants."—*New Hazell Annual Almanack*, 1921, p. 317.—See also ACADEMIC FREEDOM; CHARITIES: England: 1818-1919; ERASMIANISM.

CHURCH OF GOD IN CHRIST. See MENONITES.

CHURCH OF IRELAND.—While the Church of Ireland makes a well founded claim to continuity in the Apostolic Succession, the Reformation had as profound an influence on its history as on the history of the Church of England. In the early centuries of its existence the hierarchy of the church in Ireland may be said to have been independent, but by degrees became more or less subject to Rome. This subjection was absolute by the 12th century, remaining thus till the Reformation. Then, like the Church of England, it disavowed the Pope and gradually became Protestant. "At the time of the Reformation, during the reign of Henry VIII., an attempt was made to correct some of the abuses of the church in Ireland, but the Reformation did not meet with much popular favor, owing in a large measure to fear that only the English language could be used in church. Through the reigns of Henry VIII., Edward VI., and Elizabeth various attempts were made to introduce the English liturgy, and the government proceeded with great severity against the Roman Catholics. Under Mary there was a reaction in favor of the Roman Catholics. At the accession of James I, the Roman Catholics, thinking that he favored them, tried to expel the Protestants from the island. The king, however, suppressed the attempts, confiscating the estates of many Roman Catholics, especially in Ulster, and settling Scotch Presbyterians in their place. During the Civil War and the Commonwealth, as also during the reign of Charles I., there were many rebellions and consequent suppressions of the Roman Catholics in Ireland. At the Revolution the Roman Catholics were filled with hope, and many Protestants had to flee the country. William III., however, finally completed the conquest of Ireland, and from that epoch until recent times the Roman Catholics [as well as all other dissenters from the established church] were discriminated against in many ways. Gradually, however, the restrictions against them have been removed. Just as the Roman Catholics were discriminated against, so the Protestant Church, as the state church, was granted many favors. These have been done away with from time to time, and at last, July 26, 1860, the Irish Church Act was passed, taking effect January 1, 1871. This act disestablished the church and dissolved its union with the Church of England [see ENGLAND: 1868-1870]. Compensation was made for all vested interests, including even the annual grants for the Roman Catholic college at Maynooth and the *Regium Donum* granted to the Presbyterians by James I."—*New Schaff-Herzog religious encyclopaedia*, v. 6, p. 28.—The Church of Ireland is divided into two archbishoprics, Armagh and Dublin. In 1921 the number of clergy in the church was thirteen bishops, about 1,300 incumbents, and 370 curates. The church population was 576,000.—*New Hazell Almanack*, 1921, p. 318.—See also CELTIC CHURCH; CHRISTIANITY: 5th-6th centuries; IRELAND: 1641; 1691-1782.

CHURCH OF ROME. See PAPACY.

CHURCH OF SCOTLAND.—Christianity was introduced into Scotland as early as the third century, and the Church of Scotland like the Church of Ireland was more or less independent of Rome. It was, however, gradually brought under Roman domination where it remained until the Reformation. The history of the origin of Scottish Reformation is synonymous with the life of John Knox who founded the Presbyterian church in Scotland. After various vicissitudes, the union of 1707 guaranteed its position, and since then the Church of

Scotland has been the established church of the country.

CHURCH OF THE NAZARENE (Pentecostal Church of the Nazarene), an organization resulting from three movements, revival in nature; one in New England, one in New York City, and one in Los Angeles, Calif. The first two united in 1896 under the name of the Association of Pentecostal Churches of America and in 1907 this body met the Los Angeles organization and formed the Pentecostal Church of the Nazarene, now called simply the Church of the Nazarene. In doctrine this body is essentially in accord with the Methodist Episcopal Church.—United States Census, *Religious bodies*, 1916.—The census reported 596 churches and 32,250 members in 1916.

CHURCH OF THE UNITED BRETHREN. See BOHEMIA: 1434-1557; and MORAVIAN OR BOHEMIAN BRETHREN.

CHURCH OF THE UNIVERSAL MESSIANIC MESSAGE, a church which has supplanted the Christian Yoga Society organized in 1911 in Spokane, Wash., by A. K. Mozumdar in response to interest awakened by the introduction into the United States of various phases of oriental religions. It recognizes no creed or confession and observes no sacrament.—United States Census, *Religious bodies* 1916, pt. 2, p. 206.—Statistics available in 1920 report two churches and 266 members.—*Year Book of the Churches* 1920, p. 108.

CHURCH OF WALES.—The Church of Wales severed its connection with the Church of England when the Act of Disestablishment, passed in 1914, went into effect on March 31, 1920.

CHURCH SEPARATION LAW, France. See FRANCE: 1904-1908.

CHURCH TRIUMPHANT, "a church founded by a Mrs. Beekman (d. 1883), who claimed to be the 'spiritual mother of Christ in the second coming' and declared George Jacob Schweinfurth the 'Messiah of the New Dispensation.' Mr. Schweinfurth left the ministry of the Methodist Episcopal Church, became a follower of Mrs. Beekman, and subsequently the leader of her followers. Headquarters of the body were established at the Weldon Farm, six miles from Rockford, Ill. . . . The church is now extinct, and when most flourishing numbered only 12 congregations with 384 communicants."—*New Schaff-Herzog religious encyclopedia*, v. 3, p. 112.

CHURCHES: Structure. See CATHEDRAL.

CHURCHES OF CHRIST, originally included under the denomination called Disciples of Christ. The Conservatives of the parent body, disagreeing with the Progressives on such issues as the use of instrumental music, scriptural sanction for raising money, etc., gradually withdrew from the ranks of the Disciples and have made their denominational reports separately since 1906. Statistics report 5,570 churches and 317,937 members in the United States.—United States Census, *Religious bodies* 1916, pt. 2, p. 208.

CHURCHES OF GOD (General Assembly), founded in 1886 in Monroe County, Tenn., by several churches of various denominations, under the name of "Christian Union." The denomination was reorganized in 1902 under the name of "Holiness Church" and again in 1907 under the present name, "Churches of God." The work of the denomination is evangelistic in character. There are state assemblies for educational purposes and a General Assembly recognized as the Supreme Council. Statistics available in 1920 report 202 churches and 7,784 members in the United States.—United States Census, *Religious bodies* 1916, pt. 2, p. 211.

CHURCHES OF GOD IN CHRIST JESUS. See ADVENTISTS.

CHURCHES OF GOD IN NORTH AMERICA (General Eldership), non-sectarian churches founded in 1830 in Pennsylvania by John Winebrenner, a former pastor in the Reformed German church. "In doctrine the Churches of God are evangelical and orthodox, and Armenian rather than Calvinistic. . . . The policy of the churches is presbyterian. . . . The ministers within a certain territory and an equal number of laymen elected by the various churches (or charges) constitute annual elderships, corresponding to presbyteries, which have the exclusive right to ordain ministers. . . . The different annual elderships combine to form the General Eldership which meets once in four years."—United States Census, *Religious bodies* 1916, pt. 2, p. 213.—Statistics available in 1920 report 443 organizations and 28,376 members in the United States.

CHURCHES OF THE LIVING GOD, three bodies of negro churches in the United States similar in their general evangelistic type but differing in details. There are 193 of these churches with 11,635 members, by far the largest of the three divisions being that called "Christian Workers for Fellowship."—United States Census, *Religious bodies* 1916, pt. 2, pp. 216-220.

CHURCHES OF THE NEW JERUSALEM. See SWEDENBORG.

CHURCHILL, John, duke of Marlborough. See MARLBOROUGH, JOHN CHURCHILL, 1ST DUKE OF.

CHURCHILL, Lord Randolph Henry Spencer (1849-1895), English statesman, member of Parliament, 1874; advocate of progressive conservatism; appointed secretary of state for India in Lord

Salisbury's cabinet, 1885; chancellor of the exchequer in Lord Salisbury's second cabinet, 1886.

CHURCHILL, Winston (1871-), American novelist and politician; graduated 1894, from the United States Naval Academy; 1903-1905, member of the New Hampshire legislature; 1912, candidate for governorship of New Hampshire; best known as a writer, particularly as an historical novelist. Among his famous novels are: "Richard Carvel," "The Crisis," "Conistan," "Inside the Cup" and "A Far Country."

CHURCHILL, Winston Leonard Spencer (1874-), English statesman. Served with Spanish forces in Cuba in 1895, with Malakand field force, 1897, and with Tirah expeditionary force, 1898; war correspondent in South Africa, 1899-1900; under secretary of state for the colonies 1906-1908 (see ENGLAND: 1905-1906); president, board of trade, 1908 (see ENGLAND: 1908 [April]); Lord of the admiralty, 1911-1915 (see ADMIRALTY: Constitution of the British Admiralty; PEACE MOVEMENT: Attitude of governments; and WAR, PREPARATION FOR: 1912-1913); minister of munitions, 1917 (see ENGLAND: 1915: Ministry of munitions); appointed colonial-secretary, 1921; prominent figure at imperial conference, 1921. See BRITISH EMPIRE: Colonial and imperial conferences: 1921.

Speech on racial friction in Jerusalem. See JERUSALEM: 1920.

CHURL, in early Anglo-Saxon society, one of the two main classes into which the freemen were divided. See EORL AND CEORL.

CHURUBUSCO, Battle of. See MEXICO: 1847 (March-September).

CHUSAN ISLANDS, group of islands off the coast of China. In 1842 they were given to the control of China by England. See ASIA: 1500-1900.

CIABAN or **KIERAN, Saint** (516-549), founder of Clonmacnoise. See CLONMACNOISE.

CIBALIS, Battle of (313). See ROME: Empire: 305-323.

CIBBER, Colley (1671-1757), English restoration dramatist. See DRAMA: 1660-1680.

CIBOLA, Seven cities of. See PUEBLOS; AMERICA: 1540-1541.

CIBUNYS, aboriginal tribe. See CUBA: Aborigines.

CICALA PASHA (fl. 1600), Turkish commander during invasion of Hungary. See HUNGARY: 1595-1606.

CICERO, Marcus Tullius (B.C. 106-43), Roman orator and statesman. Filled various offices in the state and soon became the most popular leader of the day because of his unequalled oratory. His most famous orations are the "Philippics" and those against Catiline; those on philosophy are "De Senectute" and "De Amicitia." He was killed by the soldiers of Mark Antony in 43 B. C. See ROME: Republic: B. C. 69-63 to 44-42; LATIN LITERATURE: B. C. 82-43.

Philosophic interpretation of history. See HISTORY: 15.

Speeches recorded in shorthand: Tironian notes. See ABBREVIATION: Roman system.

CID, The (Rodrigo Diaz de Bivar) (1040-1099), favorite hero of Spain. See SPAIN: 1034-1090.

Romances of. See SPANISH LITERATURE: 10th-12th centuries.

CILICIA, or KILIKIA, an ancient district in the southeastern corner of Asia Minor, bordering on Syria. (See TURKEY: Map.) It was a satrapy of the Persian empire, then a part of the kingdom of the Selucidæ, and afterwards a Roman province.

The chief city of Cilicia was Tarsus, a very ancient commercial emporium, whose people (see ISAUURIANS) were noted for mental acuteness. The apostle Paul is to be counted among the distinguished natives of Tarsus, and a quite remarkable number of eminent teachers of philosophy were from the same birthplace.

969.—Recovered from Mohammedans by Byzantines. See BYZANTINE EMPIRE: 963-1025.

1915 (September).—Held by French troops during the World War. See SYRIA: 1908-1921.

1918 (October).—Yielded by Turkey in armistice with Allies. See WORLD WAR: Miscellaneous and auxiliary services: I. Armistices: d.

1919 (November).—French control. See SÈVRES, TREATY OF: 1920.

1919-1920.—Armenians desire to control. See ARMENIA: 1919-1920.

1921.—Political amnesty granted. See TURKEY: 1921 (March-April): Secret treaties.

1921 (October).—Under Angora treaty between French and Turkish Nationalists. See TURKEY: 1921-1922: Anglo-French discord.

CILICIA, Pirates of.—During the Mithradatic wars piracy was developed to alarming proportions in the eastern parts of the Mediterranean sea. Distracted by civil conflicts and occupied by foreign ones, simultaneously, the Romans, for a considerable period, gave no proper heed to the growth of this lawlessness, until they found their commerce half destroyed and Rome and Italy actually threatened with starvation by the intercepting of their supplies from abroad. The pirates flourished under the protection and encouragement of the king of Pontus, at whose instance they established their chief headquarters, their docks, arsenals and magazines, at various points on the coast of Cilicia. Hence the name of Cilician came to be applied to all the pirates of the time. This era of piracy was brought to an end, at last, by Pompey, who was sent against them, 67 B. C., with extraordinary powers conferred by the law known as the Lex Gabinia. He proceeded to his undertaking with remarkable energy and ability, and his hunting down of the freebooters which he accomplished effectually within three months from the day his operations began, was really the most brilliant exploit of his life.—H. G. Liddell, *History of Rome*, bk. 7, ch. 63.

ALSO IN: C. Merivale, *History of the Romans*, ch. 1.—G. Long, *Decline of the Roman republic*, v. 3, ch. 6-7.

CILICIAN GATES.—A pass through the Taurus range of mountains, opening from Cappadocia into Cilicia, was anciently called the Pylæ Ciliciæ or Cilician Gates. The city of Tyana was situated at the entrance to the pass. Both Xenophon and Alexander, who traversed it, seem to have regarded the pass as one which no army could force if properly defended.—E. H. Bunbury, *History of ancient geography*, ch. 10, sect. 2, and ch. 12, sect. 1.—See also ARMENIA: Physical features.

CILURNUM, a Roman city in Britain, "the extensive ruins of which, well described as a British Pompeii, are visible near the modern hamlets of Chesters."—T. Wright, *Celt, Roman and Saxon*, ch. 5.

CIMABUE, Giovanni (1240-c. 1302), Florentine painter, one of the first whose art is expressive of life. See ART: Relation of art and history.

CIMAROSA, Domenico (1749-1801), Italian composer. Studied with Manna, Sacchini, Fenaroli, and Piccinni at the Conservatory of Santa Maria di Loreto; accepted the position as composer and conductor of Italian opera at the court of Cath-

erine II, St. Petersburg, 1788; three years later went to Vienna at the call of Leopold II; Vienna received him with distinguished honors, and "Il matrimonio segreto," produced there, had remarkable success.—See also MUSIC: Modern: 1730-1816.

CIMARRONES, runaway slaves. See AMERICA: 1572-1580; JAMAICA: 1655-1796.

CIMBRI AND TEUTONES.—"For a considerable period [second century, B. C.] an 'unsettled people' had been wandering along the northern verge of the country occupied by the Celts on both sides of the Danube. They called themselves the Cimbri, that is, the Chempho, the champions, or, as their enemies translated it, the robbers; a designation, however, which to all appearance had become the name of the people even before their migration [see EUROPE: Introduction to the historic period; Migrations]. They came from the north, and the first Celtic people with whom they came in contact were, so far as is known, the Boii, probably in Bohemia. More exact details as to the cause and the direction of their migration have not been recorded by contemporaries and cannot be supplied by conjecture. . . . But the hypothesis that the Cimbri, as well as the similar horde of the Teutones which afterwards joined them, belonged in the main not to the Celtic nation, to which the Romans at first assigned them, but to the Germanic, is supported by the most definite facts: viz., by the existence of two small tribes of the same name—remnants left behind to all appearance in their primitive seats—the Cimbri in the modern Denmark, the Teutones in the north-east of Germany in the neighbourhood of the Baltic, where Pytheas, a contemporary of Alexander the Great, makes mention of them thus early in connection with the amber trade; by the insertion of the Cimbri and Teutones in the list of the Germanic peoples among the Ingævones alongside of the Chauci; by the judgment of Cæsar, who first made the Romans acquainted with the distinction between the Germans and the Celts, and who includes the Cimbri, many of whom he must himself have seen, among the Germans; and lastly, by the very names of the people and the statements as to their physical appearance and habits. . . . On the other hand it is conceivable enough that such a horde, after having wandered perhaps for many years, and having doubtless welcomed every brother-in-arms who joined it in its movements near to or within the land of the Celts, would include a certain amount of Celtic elements. . . . When men afterwards began to trace the chain, of which this emigration, the first Germanic movement which touched the orbit of ancient civilization, was a link, the direct and living knowledge of it had long passed away."—T. Mommsen, *History of Rome*, bk. 4, ch. 5.—"The name Kymri, or Cymri, still exists. It is the name that the Welsh give themselves, but I am not aware that any other people have called them by that name. These Kymri are a branch of the great Celtic people, and this resemblance of the words Kymri and Cimbri has led many modern writers to assume that the Cimbri were also a Celtic people, as many of the ancient writers name them. But these ancient writers are principally the later Greeks, who are no authority at all on such a matter. . . . The name Cimbri has perished in Germany, while that of the Teutones, by some strange accident, is now the name of the whole Germanic population."—G. Long, *Decline of the Roman republic*, v. 2, ch. 4.

ALSO IN: W. Ihne, *History of Rome*, bk. 7, ch. 9.

B. C. 113-101.—**Battles with the Romans.**—The Cimbri and the Teutones made their first appearance on the Roman horizon in the year 113 B. C. when they entered Noricum. The Noricans were an independent people, as yet, but accepted a certain protection from Rome, and the latter sent her consul, Carbo, with an army, to defend them. Carbo made an unfortunate attempt to deal treacherously with the invaders and suffered an appalling defeat. Then the migrating barbarians, instead of pressing into Italy, on the heels of the flying Romans, turned westward through Helvetia to Gaul, and occupied themselves for four years in ravaging that unhappy country. In 109 B. C., having gathered their plunder into the fortified town of Aduatua and left it well protected, they advanced into the Roman province of Narbo, Southern Gaul, and demanded land to settle upon. The Romans resisted and were again overwhelmingly beaten. But even now the victorious host did not venture to enter Italy, and nothing is known of its movements until 105 B. C., when a third Roman army was defeated in Roman Gaul and its commander taken prisoner and slain. The affrighted Romans sent strong reinforcements to the Rhone; but jealousy between the consul who commanded the new army and the proconsul who retained command of the old delivered both of them to destruction. They were virtually annihilated, October 6, 105 B. C., at Arausio (Orange), on the left bank of the Rhone. It is said that 80,000 Roman soldiers perished on that dreadful field, besides half as many more of camp followers. "This much is certain," says Mommsen, "that only a few out of the two armies succeeded in escaping, for the Romans had fought with the river in their rear. It was a calamity which materially and morally far surpassed the day of Cannæ." In the panic which this disaster caused at Rome the constitution of the Republic was broken down. Marius, conqueror of Jugurtha, was recalled from Africa and not only reëlected to the consulship, but invested with the office for five successive years. He took command in Gaul and found that the formidable invaders had moved off into Spain. This gave him time, fortunately, for the organizing and disciplining of his demoralized troops. When the barbarians reappeared on the Rhone, in the summer of 102 B. C., he faced them with an army worthy of earlier Roman times. They had now resolved, apparently, to force their way, at all hazards, into Italy, and had divided their increasing host, to move on Rome by two routes. The Cimbri, reinforced by the Tigorini, who had joined them, made a circuit to the Eastern Alps, while the Teutones, with Ambrones and Tougeni for confederates crossed the Rhone and attacked the defenders of the western passes. Failing to make any impression on the fortified camp of Marius the Teutones rashly passed it, marching straight for the coast road to Italy. Marius cautiously followed and after some days gave battle to the barbarians, in the district of Aquæ Sextiæ, a few miles north of Massilia. The Romans that day took revenge for Arausio with awful interest. The whole barbaric horde was annihilated. "So great was the number of dead bodies that the land in the neighborhood was made fertile by them, and the people of Massilia used the bones for fencing their vineyards." Meantime the Cimbri and their fellows had reached and penetrated the Brenner pass and were in the valley of the Adige (see ALPS: Roman period). The Roman army stationed there had given way before them, and Marius was needed to roll the invasion back. He did so, on

July 30, B. C. 101, when the Cimbrî were destroyed, at a battle fought on the Raudine Plain near Vercellæ, as completely as the Teutones had been destroyed at Aquæ Sextiæ.—T. Mommsen, *History of Rome*, bk. 4, ch. 5.—See also BARBARIAN INVASIONS: B. C. 113; and ROME: Republic: B. C. 118-99.

CIMBRIAN CHERSONESUS, the modern Danish promontory of Jutland; believed to have been the home of the Cimbrî before they migrated southwards and invaded Gaul.

CIMINIAN FOREST.—The mountains of Viterbo, which formed anciently the frontier of Rome towards Etruria, were then covered with a thick forest—"the *silva Ciminia*" of which Livy gives so romantic a description. It was, however, nothing but a natural division between two nations which were not connected by friendship, and wished to have little to do with each other.

. . . This forest was by no means like the *'silva Hercynia'* with which Livy compares it, but was of just such an extent that, according to his own account, the Romans only wanted a couple of hours to march through it."—B. G. Niebuhr, *Lectures on the history of Rome*, lect. 44.

CIMMERIAN BOSPORUS. See BOSPORUS, CIMMERIAN.

CIMMERIANS.—"The name Cimmerians appears in the *Odyssey*,—the fable describes them as dwelling beyond the ocean-stream, immersed in darkness and unblest by the rays of Helios. Of this people as existent we can render no account, for they had passed away, or lost their identity and become subject, previous to the commencement of trustworthy authorities: but they seem to have been the chief occupants of the Tauric Chersonese (Crimea) and of the territory between that peninsula and the river Tyras (Dneister) at the time when the Greeks first commenced their permanent settlements on these coasts in the seventh century B. C. The numerous localities which bore their name, even in the time of Herodotus, after they had ceased to exist as a nation,—as well as the tombs of the Cimmerian kings then shown near the Tyras,—sufficiently attest the fact; and there is reason to believe that they were—like their conquerors and successors the Scythians—a nomadic people, mare-milkers, moving about with their tents and herds, suitably to the nature of those unbroken steppes which their territory presented, and which offered little except herbage in profusion. Strabo tells us—on what authority we do not know—that they, as well as the Trêres and other Thracians, had desolated Asia Minor more than once before the time of Ardy's [king of Lydia, seventh century B. C.] and even earlier than Homer."—G. Grote, *History of Greece*, pt. 2, ch. 17.—See also CUMÆ.

CIMON (B. C., 507-449), Athenian commander who continued the war against Persia; won his most famous victory in 466 B. C. at the mouth of the Eurymedon in Pamphylia, where he destroyed both the Persian land forces and a fleet of about 250 vessels; built up the naval power of Athens, and strengthened her position in the Delian league; leader of the aristocratic party; because of the failure of his pro-Spartan policy, was ostracised in 461 B. C.; later recalled to Athens. See ATHENS: B. C. 462-461; 449-448; GREECE: B. C. 472-462; ACROPOLIS OF ATHENS.

CIMON OF CLEONÆ (fl. B. C. 460), early Greek painter. See PAINTING: Greek.

CINCHONA, generic name for a species of tree whose bark is used for medicinal purposes. See

MEDICAL SCIENCE: Modern: 17th century: Introduction of Peruvian bark.

CINCINNATI, Ohio, largest city of the Ohio valley, situated on the north side of the Ohio river, opposite the mouth of the Licking. It is an important commercial and industrial center and its leading industries are pork-packing, manufacture of iron and furniture. According to census statistics of 1920 its population was 401,158.

ALSO IN: C. T. Greve, *Centennial history of Cincinnati and representative citizens*, v. 1, p. 13.

1788.—Founding and naming of the city.—In 1787 "an offer was made to Congress by John Cleve Symmes [afterwards famous for his theory that the earth is hollow, with openings at the poles], to buy two millions of acres between the Little and the Great Miamis. Symmes was a Jerseyman of wealth, had visited the Shawanese country, had been greatly pleased with its fertility, and had come away declaring that every acre in the wildest part was worth a silver dollar. It was too, he thought, only a question of time, and a very short time, when this value would be doubled and tripled. Thousands of immigrants were pouring into this valley each year, hundreds of thousands of acres were being taken up, and the day would soon come when the rich land along the Miamis and the Ohio would be in great demand. There was therefore a mighty fortune in store for the lucky speculator who should buy land from Congress for five shillings an acre and sell it to immigrants for twenty. But . . . his business lagged, and though his offer to purchase was made in August, 1787, it was the 15th of May, 1788, before the contract was closed. In the meantime he put out a pamphlet and made known his terms of sale. A copy soon fell into the hands of Matthias Denman. He became interested in the scheme and purchased that section on which now stands the city of Cincinnati. One-third he kept, one-third he sold to Robert Patterson, and the remainder to John Filson. The conditions of the purchase from Symmes gave them two years in which to begin making clearings and building huts. But the three determined to lose no time, and at once made ready to lay out a city directly opposite that spot where the waters of the Licking mingled themselves with the Ohio. Denman and Patterson were no scholars. But Filson had once been a school-master, knew a little of Latin and something of history, and to him was assigned the duty of choosing a name for the town. . . . He determined to make one, and produced a word that was a most absurd mixture of Latin, Greek and French. He called the place Losantiville, which, being interpreted, means the city opposite the mouth of the Licking. [L, from Licking, *os* (mouth), *anti* (opposite), *ville* (town)]."—J. B. McMaster, *History of the people of the United States*, v. 1, p. 516.—In an attack upon the new settlement Filson was scalped by the Indians. The new name given a little later to Filson's settlement was conferred upon it by General St. Clair, governor of the territory, in honor of the Society of the Cincinnati. See NORTHWEST TERRITORY OF THE U. S.: 1788-1802.

ALSO IN: F. W. Miller, *Cincinnati's beginnings*.—W. C. Comley and W. D. Eggville, *Ohio*, pp. 92-96.

1788-1827.—Incorporation of town and city.—Early mayors.—"In the case of a city such as Cincinnati it is a very simple matter for the chronicler to state that it was first settled in 1788, received its present name in 1790, was created a township in 1791, was incorporated as a village in 1802, and became a city in 1810. . . . Such a

bare recital of chronological details would . . . be of but little value or interest. . . . The act to incorporate the town of Cincinnati was passed at the first session of the second General Assembly held at Chillicothe and approved by Governor St. Clair on January 1, 1802. . . . Section two provides that the officers are to be a 'president, recorder, seven trustees, an assessor, a collector and a town marshal, who shall be appointed and sworn, which president, recorder, and trustees shall be one body corporate and politic with perpetual succession to be known and distinguished by the name of "The President, Recorder and Trustees of the Town of Cincinnati." . . . Section five provides that the president, recorder and trustees shall be called 'The Select Council of the Town of Cincinnati,' and gives said Council the power to make and publish laws, appoint a treasurer, administer oaths, impose fines and makes it the Council's duty to adopt regulations for securing the town against injuries from fire, to keep the streets, lanes and alleys open and in repair, to regulate markets and prevent animals from running at large, etc. . . . David Ziegler [was] the first president, a position corresponding in many parts to that of mayor. . . . In the early days very few records were kept and it is now almost impossible to obtain accurate information as to the official acts of the authorities during Cincinnati's life as a town. We know that Mayor Ziegler was regarded as a very satisfactory officer. In 1803 he gave way to Joseph Prince, who had been the assessor during the first two years of the town life. . . . The act of January 1, 1802, was repealed by an act of January 10, 1815 (13 O. L. L. 60). By this act, which reincorporated the territory covered by the first act, the officers of the town were a mayor, recorder and trustees. The town was divided into four wards by straight lines crossing each other at right angles. . . . The electors were required to be white male inhabitants, freeholders or householders, who had resided therein one year. . . . These trustees were directed to select from their number a mayor, recorder, clerk and treasurer, no two of whom should be selected from the same ward. These officers were to serve for two years. The remaining two trustees of each ward were directed to decide by lot as to which should serve for one year and which for two and thereafter all trustees should serve for the term of two years. The Council was empowered to appoint a marshal, assessor, collector, town surveyor, clerks of the market and such officers as might be necessary. . . . During the time that this act remained in force, William Corry served as mayor (1815 to 1819), to be succeeded when the town became a city by act of February 5, 1819, by Isaac G. Burnet, who served until the new charter of 1827. This explains a common confusion of ideas as to the first mayor of Cincinnati. David Ziegler was the first president of the town, and Isaac G. Burnet the first mayor of the city."—C. T. Greve, *Centennial history of Cincinnati*, v. 1, pp. 50, 437-440.

1914-1921.—Municipal progress. See RECREATION: 1914-1921.

1917.—Adoption of a new charter.—"A new charter was adopted in Cincinnati at the November election. The charter makes relatively slight changes in the system under which the city has been operating under the state municipal code; the treasurer and solicitor, elective under the code, are made appointive, the terms of mayor and council are extended from two to four years, and a city planning commission with extensive powers is created. The charter otherwise incorporates the municipal code with its detailed enumeration of powers of the city government. However, by charter amendments the people of the city are now in position to avail themselves of the general powers of local government conferred by the 'home-rule' article of the constitution upon cities adopting charters for themselves."—F. W. Coker, *Municipal affairs (American Political Science Review, February, 1918, p. 125)*.

1917-1919.—Establishment of the "Social Unit."—"A laboratory experiment in practical democracy is now in progress in the United States.

. . . . The experiment is staged and promoted by the National Social Unit Organization. . . . This organization, having adopted a definite plan, naturally sought a congenial atmosphere in which to try it out. Several cities were investigated with this object in view [and Cincinnati was finally chosen]. . . . The plan was submitted; a certain definite area was to be set aside—as it proved to be, thirty-one city blocks, with about 15,000 average American citizens of mixed national antecedents and diverse occupations. The people, about 500 in each block, were to meet *en bloc* and elect a 'block worker' who lived in the block and knew the people. She—the block workers are all women—was to hunt up possible tuberculosis cases, find expectant mothers, new-born babies, sickness, dependencies, unsanitary conditions—in short, hunt around generally, find people who ought to be helped, conditions that ought to be better, and report them to headquarters. There was to be a medical organization embracing all the physicians of the district, who were thereby to come into control of the hygienic, sanitary, and medical situation among the people for whom they lived and labored and with whom they had their being. Adequate nursing service was to be installed quite on the district plan. Records of the most scientific kind were to be kept. The block workers were to meet in a Citizens' Council—and elect an executive; the physicians in a Medical Council—and elect an executive; the nurses in a Nurses' Council—and elect an executive; and persons in the various occupations in the district were to elect representatives to the Occupational Council—which also was to elect an executive. . . .

So the Social Unit was established in the district in January, 1917, but it was well on to midsummer before the working organization was perfected.

. . . . A year later, after several of the leaders in the movement had been criticized because of their supposed radical and 'Bolshevist' tendencies, the group of 600 or 700 citizens who had been responsible for starting the work in Cincinnati proceeded to investigate. They found that the experiment had really been carried on in good faith and on the precise lines that had been submitted in print and agreed to before anything had been done. Much had been accomplished. . . . On April 10 the question whether or not the experiment should be continued was submitted to a vote

of the people of the district. Out of a total of 4,154 votes there were only 120 against continuance. It was estimated that at least two-thirds of the total number of persons entitled to take part in the election actually voted, so that the declared result may be regarded as a clear indication of public sentiment in the district.—C. A. L. Reed, *"Social Unit" in Cincinnati (American Review of Reviews, May, 1910, pp. 523-524)*.

CINCINNATI, Society of the.—"Men of the present generation who in childhood rummaged in their grandmothers' cosy garrets cannot fail to have come across scores of musty and worm-eaten pamphlets, their yellow pages crowded with italics and exclamation points, inveighing in passionate language against the wicked and dangerous Society of the Cincinnati. Just before the army [of the American Revolution] was disbanded, the officers, at the suggestion of General Knox, formed themselves [April, 1783] into a secret society, for the purpose of keeping up their friendly intercourse and cherishing the heroic memories of the struggle in which they had taken part. With the fondness for classical analogies which characterized that time, they likened themselves to Cincinnatus, who was taken from the plow to lead an army, and returned to his quiet farm so soon as his warlike duties were over. They were modern Cincinnati. A constitution and by-laws were established for the order, and Washington was unanimously chosen to be its president. Its branches in the several states were to hold meetings each Fourth of July, and there was to be a general meeting of the whole society every year in the month of May. French officers who had taken part in the war were admitted to membership, and the order was to be perpetuated by descent through the eldest male representatives of the families of the members. It was further provided that a limited membership should from time to time be granted, as a distinguished honour, to able and worthy citizens, without regard to the memories of the war. A golden American eagle attached to a blue ribbon edged with white was the sacred badge of the order; and to this emblem especial favour was shown at the French court, where the insignia of foreign states were generally, it is said, regarded with jealousy. No political purpose was to be subserved by this order of the Cincinnati, save in so far as the members pledged to one another their determination to promote and cherish the union between the states. In its main intent the society was to be a kind of masonic brotherhood, charged with the duty of aiding the widows and the orphan children of its members in time of need. Innocent as all this was, however, the news of the establishment of such a society was greeted with a howl of indignation all over the country. It was thought that its founders were inspired by a deep-laid political scheme for centralizing the government and setting up a hereditary aristocracy. . . . The absurdity of the situation was quickly realized by Washington, and he prevailed upon the society, in its first annual meeting of May, 1784, to abandon the principle of hereditary membership. The agitation was thus allayed, and in the presence of graver questions the much-dreaded brotherhood gradually ceased to occupy popular attention."—J. Fiske, *Critical period of American history, ch. 3*. —J. B. McMaster, *History of the people of the United States, v. 1, ch. 2*.—"The hereditary succession was never abandoned. A recommendation to that effect was indeed made to the several State Societies, at the first General Meeting in Philadelphia. . . . But the proposition, unwillingly urged, was accepted in deprecatory terms by some,

and by others it was totally rejected. . . . At the second General Meeting, it was resolved 'that the alterations could not take effect until they had been agreed to by all the State Societies.' They never were so agreed to, and consequently the original Institution remains in full force. Those Societies that accepted the proposed alterations unconditionally, of course perished with their own generation.—A. Johnston, *Some account of the Society of the Cincinnati (Pennsylvania Historical Society Memoirs, v. 6, pp. 51-53)*.—"The claim to membership has latterly been determined not by strict primogeniture, but by a 'just elective preference, especially in the line of the first-born,' who has a moral but not an absolutely indisputable right; and membership has always been renewed by election. . . . Six only of the original thirteen states—Massachusetts, New York, New Jersey, Pennsylvania, Maryland, and South Carolina—are still [in 1873] represented at the General Meetings. The largest society, that of Massachusetts, consisting originally of 343 members, now [1873] numbers less than 80; that of New York, from 230 had in 1858 decreased to 73; the 268 of Pennsylvania to about 60; the 110 of New Jersey, in 1866, to 60; and the 131 of South Carolina was, in 1849, reduced to 71."—F. S. Drake, *Memorials of the Society of the Cincinnati of Massachusetts, p. 37*.—In 1893, the general society began a campaign to revive the state societies. Connecticut was the first to reorganize and fill her branch, and by 1902 all of the thirteen original states had filled their rolls. In 1920 the society contained about 980 members.

CINCINNATUS, Lucius Quinctius (b. c. 519 B. C.), hero of semi-legendary Roman history; patrician leader who distinguished himself in the quarrels with the plebeians, 462-454; twice appointed dictator in 458 and 439 B. C.; came to the rescue of the Roman army under Lucius Minucius by repulsing the attack of the Æquians in 458 B. C. See **ROME: Republic: B. C. 445-400**.

CINCO DE MAYO, Battle of (1862). See **MEXICO: 1861-1867**.

CINE, kinsfolk of the head of the tribe, among the ancient Irish.

CINEMATOGRAPH, apparatus for taking or showing motion pictures. See **INVENTIONS: 20th century: Moving pictures**.

CINNA, Lucius Cornelius (fl. 87 B. C.), Roman consul allied with Marius and Flaccus against Sulla. During the latter's absence in the East, his power was temporarily usurped by Cinna. See **MITHRADATIC WARS: ROME: Republic: B. C. 88-78**.

CINQ MARS, Henri Coiffier Ruzé d'Effiat, Marquis de (1620-1642), French courtier who conspired to overthrow Richelieu. The plot failed, and Cinq Mars was condemned to death. See **FRANCE: 1641-1642**.

CINQUE PORTS.—"Hastings, Sandwich, Dover, Romney, Hythe—this is the order in which the Cinque Ports were ranked in the times when they formed a flourishing and important confederation [from the thirteenth to the sixteenth centuries]. Winchelsea and Rye were added to these five . . . soon after the Norman Conquest. . . . The new comers were officially known as 'the two Ancient Towns.' When therefore we wish to speak of this famous corporation with strict accuracy we say, 'The five Cinque Ports and two Ancient Towns.' The repetition of the number 'five' in this title probably never struck people so much as we might expect, since it very soon came to be merely a technical term, the French form of the word being pronounced, and very often spelt 'Synke' or 'Sinke,' just as if it was the English 'Sink.' . . . The difference between the

Cinque Ports and the rest of the English coast towns is plainly indicated by mediæval custom, since they were generally spoken of collectively as 'The Ports.' . . . Most writers upon this subject . . . have been at pains to connect the Cinque Ports by some sort of direct descent with the five Roman stations and fortresses which, under the Comes Littoris Saxonici [see SAXON SHORE, COUNT OF], guarded the south-eastern shores of Britain."—M. Burrows, *Cinque Ports*, ch. 1-3.—"Our kings have thought them [the Cinque Ports] worthy a peculiar regard; and, in order to secure them against invasions, have granted them a particular form of government. They are under a keeper, who has the title of Lord Warden of the Cinque Ports (an officer first appointed by William the Conqueror), who has the authority of an admiral among them, and issues out writs in his own name. The privileges anciently annexed to these ports and their dependents were [among others]: An exemption from all taxes and tolls. . . . A power to punish foreigners, as well as natives, for theft. . . . A power to raise mounds or banks in any man's land against breaches of the sea. . . . To convert to their own use such goods as they found floating on the sea; those thrown out of ships in a storm; and those driven ashore when no wreck or ship was to be seen. To be a guild or fraternity, and to be allowed the franchises of court-leet and court-baron. A power to assemble and keep a portmote or parliament for the Cinque Ports. . . . Their barons to have the privilege of supporting the canopy over the king's head at his coronation. In return for these privileges the Cinque Ports were required to fit out 57 ships, each manned with 21 men and a boy, with which they were to attend the king's service for 15 days at their own expense; but if the state of affairs required their assistance any longer they were to be paid by the crown. . . . As the term baron occurs continually throughout all the charters of the Ports, it may not be improper to inform our readers that it is of the same import as burges or freeman. . . . The representatives of the Ports in parliament are to this day styled barons." The post of Warden of the Cinque Ports, "formerly considered of so much honour and consequence, is now converted into a patent sinecure place, for life, with a salary of £4,000 a year."—*History of the boroughs of Great Britain; together with the Cinque Ports*, v. 3.

CINTRA, a suburb of Lisbon, famous for its extraordinary beauty. On August 22, 1808, was concluded the convention of Cintra, by which the British and Portuguese permitted a French army to evacuate Portugal without interference (see SPAIN: 1808-1809 [August-January]). It was a favorite residence of the kings of Portugal; and it was from his palace in this city that Manuel II, the last king of Portugal, fled upon the proclamation of the Portuguese republic.

CIOMPI, Italian plebeians, figured in a riot outside the city of Florence in 1378. See FLORENCE: 1378-1427.

CIRCARS, or Sirkars, Indian term applied to parts of a province administered by a deputy governor. In English it is employed in the name of the Northern Circars. See INDIA: 1758-1761.

CIRCASSIANS, tribe in the Caucasus region. In 1864, following a general Russian oppression, they emigrated to Turkey. Their language is a branch of the Aryan root. See CAUCASUS: 1801-1877; PHILOLOGY: 23.

CIRCLES (Kreise) of Germany, territorial divisions made for the purpose of apportioning

representatives to the old imperial council. See GERMANY: 1493-1519; 1789.

CIRCUIT COURTS. See COURTS: United States: Organization of federal courts; SUPREME COURT: 1888-1913.

CIRCULATION (of blood): Its discovery. See MEDICAL SCIENCE: Modern: 17th century: Harvey and discovery, etc.

CIRCUMCELLIONES, North African fanatics whose origin was due to ecclesiastical and social conditions and who were made use of by Donatus of Bagaë, a Donatist bishop, in the controversy with the orthodox party about 340.—*New Schaff-Herzog religious encyclopedia*, v. 3, p. 117.—See also DONATISTS.

CIRCUMNAVIGATION OF THE WORLD: 1519-1522.—Magellan's voyage: first in history. See AMERICA: 1519-1524.

1577-1580.—Drake's voyage. See AMERICA: 1572-1580.

CIRCUS: Factions of the Roman—"The race, in its first institution [among the Romans], was a simple contest of two chariots, whose drivers were distinguished by white and red liveries: two additional colours, a light green and a cerulean blue, were afterwards introduced; and as the races were repeated twenty-five times, one hundred chariots contributed in the same day to the pomp of the circus. The four factions soon acquired a legal establishment and a mysterious origin, and their fanciful colours were derived from the various appearances of nature in the four seasons of the year. . . . Another interpretation preferred the elements to the seasons, and the struggle of the green and blue was supposed to represent the conflict of the earth and sea. Their respective victories announced either a plentiful harvest or a prosperous navigation, and the hostility of the husbandmen and mariners was somewhat less absurd than the blind ardour of the Roman people, who devoted their lives and fortunes to the colour which they had espoused. . . . Constantinople adopted the follies, though not the virtues, of ancient Rome; and the same factions which had agitated the circus raged with redoubled fury in the hippodrome. Under the reign of Anastasius [A. D. 491-518] this popular frenzy was inflamed by religious zeal; and the greens, who had treacherously concealed stones and daggers under baskets of fruit, massacred, at a solemn festival, 3,000 of their blue adversaries. From the capital this pestilence was diffused into the provinces and cities of the East, and the sportive distinction of two colours produced two strong and irreconcilable factions, which shook the foundations of a feeble government. . . . A sedition, which almost laid Constantinople in ashes, was excited by the mutual hatred and momentary reconciliation of the two factions." This fearful tumult, which acquired the name of the Nika sedition, from the cry, "Nika" (vanquished), adopted by the rioters, broke out in connection with the celebration of the festival of the Ides of January, A. D. 532. For five days the city was given up to the mob and large districts in it were burned, including many churches and other stately edifices. The emperor Justinian would have abandoned his palace and throne, but for the heroic opposition of his consort, Theodora. On the sixth day, the imperial authority was re-established by the great soldier, Belisarius, after 30,000 citizens had been slain in the hippodrome and in the streets.—E. Gibbon, *History of the decline and fall of the Roman empire*, ch. 40.

CIRCUS MAXIMUS AT ROME.—"The races and wild beast shows in the circi were among the most ancient and most favourite Roman amuse-

ments, and the buildings dedicated to these sports were numerous, and nearly equal in magnificence to the amphitheatres. The Circus Maximus, which was first provided with permanent seats for the spectators as early as the time of Tarquinius Priscus, was successively restored and ornamented by the republican government in 327 and 174 B. C. and by Julius Caesar, Augustus, Claudius, Domitian and Trajan. The result was a building which, in dimensions and magnificence, rivalled the Coliseum, but has, unfortunately, proved far less durable, scarcely a vestige of it now being left."—R. Burn, *Rome and the Campagna, int. and ch.* 12.—See also **ROME**: Map of ancient Italy.

CIRENCESTER, market town in Gloucestershire, England. It was originally the Roman Corinium. See **CORINIUM**.

CIRRHA, seaport of Phocis on the Corinthian gulf. See **DELPHI**.

CIRRHÆAN, or **Kirrhæan**, **WAR** (B. C. 595-585). See **DELPHI**.

CIRTA, ancient Numidian city. The modern town of Constantina in Algeria is on its site. See **NUMIDIANS** and **MAURI**.

CISALPINE GAUL (Gallia Cisalpina), in ancient geography that part of Italy north of Umbria and Liguria and south of the Alps, which was inhabited by Celtic tribes. See **ITALY**: Ancient; **ROME**: Republic: B. C. 300-347; and **ROME**: Map of Ancient Italy.

CISALPINE REPUBLIC, name given to the state in Italy, established by Napoleon in 1796; it was called the Italian republic in 1802, when Bonaparte became its president. See **FRANCE**: 1796-1797 (October-April); 1797 (May-October); 1799 (April-September); and 1801-1803; **GERMANY**: 1801-1803.

CISCAUCASIA, name given to most of the European portion of the Russian Caucasus. See **CAUCASUS**: Territory.

CIS-JURANE BURGUNDY, ancient name for the kingdom of Burgundy or Province ruled by Boso. See **BURGUNDY**: 843-933.

CISLEITHANIA, name designating the Austrian half of the Austro-Hungarian monarchy. See **AUSTRIA**: 1866-1867; and **AUSTRIA-HUNGARY**: 1866.

CISPADANE GAUL, Cisalpine Gaul south of the Padus, or Po. See **PADUS**.

CISPADANE REPUBLIC, republican state in Italy which was merged into the Cisalpine Republic in 1797. See **FRANCE**: 1796-1797 (October-April); and 1797 (May-October).

CIS-PLATINA, province in South America, previously termed Banda Oriental, which in 1821 was annexed to Brazil. See **URUGUAY**: 1821-1905.

CISSIA, or **Kissia**, district in Persia named from the principal inhabiting tribe. See also **ELAM**.

CISTERCIAN ORDER.—Monastery of Cîteaux.—"Harding was an Englishman who spent his boyhood in the monastery of Sherborne in Dorset, till he was seized with a passion for wandering and for study which led him first to Scotland, then to Gaul, and at last to Rome. It chanced that on his return thence, passing through the duchy of Burgundy, he stopped at the abbey of Molêmes. As he saw the ways and habits familiar to his childhood reproduced in those of the monks, the wanderer's heart yearned for the peaceful life which he had forsaken; he took the vows, and became a brother of the house. But when, with the zeal of a convert, he began to look more closely into his monastic obligations, he perceived that the practice of Molêmes, and indeed of most other monasteries, fell very far short of the strict rule

of S. Benedict. He remonstrated with his brethren till they had no rest in their minds. At last after long and anxious debates in the chapter, the abbot determined to go to the root of the matter, and appointed two brethren, whose learning was equalled by their piety, to examine diligently the original rule and declare what they found in it. The result of their investigations justified Harding's reproaches and caused a schism in the convent. The majority refused to alter their accustomed ways; finding they were not to be reformed, the zealous minority, consisting of Robert the abbot, Harding himself (or Stephen as he was called in religion) and sixteen others equally 'stiff-necked in their holy obstinacy,' left Molêmes, and sought a new abode in the wilderness. The site which they chose—in the diocese of Chalon-sur-Saône, not far from Dijon—was no happy valley, no 'green retreat' such as the earlier Benedictine founders had been wont to select. It was a dismal swamp overgrown with brushwood, a forlorn, dreary, unhealthy spot, from whose marshy character the new house took its name of 'the Cistern'—Cistellum, commonly called Cîteaux. There the little band set to work in 1098 to carry into practice their views of monastic duty. . . . Three-and-twenty daughter houses were brought to completion during his [Harding's] life-time. One of the earliest was Pontigny, founded in 1114, and destined in after-days to become inseparably associated with the name of another English saint. Next year there went forth another Cistercian colony, whose glory was soon to eclipse that of the mother-house itself. Its leader was a young monk called Bernard, and the place of its settlement was named Clairvaux. [See **ABBOT**; **CRUSADES**: 1147-1149.] From Burgundy and Champagne the 'White Monks,' as the Cistercians were called from the colour of their habit, soon spread over France and Normandy. In 1128 they crossed the sea and made an entrance into their founder's native land."—K. Norgate, *England under the Angevin kings, v. I, ch. 1.*—See also **CLAIRVAUX**, **MONASTERY OF**; **MONASTICISM**: 9th-13th centuries.

CITEAUX, Monastery of. See **CISTERCIAN ORDER**; **CLAIRVAUX**, **MONASTERY OF**; **MONASTICISM**: 9th-13th centuries.

CITHARA, ancient stringed instrument, used also in medieval times. See **INVENTIONS**: Ancient and medieval: Stringed instruments.

CITIES, Ancient: Abandoned or destroyed.—The following is a list of the more important ancient cities which have passed out of history. Although, in many cases, new towns have sprung up on their ruins, and often bear the same names, their respective histories have no integral relationship. The story of the fall of each of these ancient cities is found under its own name.

Abydos, Asia Minor.
Agrigentum, Sicily.
Antioch, Syria.
Argos, Greece.
Balbek, Asia Minor.
Babylon.
Byzantium (in ancient Thracia).
Carthage, Africa.
Ctesiphon, Assyria.
Ephesus Asia Minor.
Herculaneum, Italy.
Himera, Sicily.
Memphis, Egypt.
Mycenae, Greece.

Nineveh, Assyria.
 Numantia, Spain.
 Palmyra, Syria.
 Persepolis, Persia.
 Petra, Arabia.
 Pompeii, Italy.
 Saguntum, Spain.
 Samaria, Palestine.
 Sardis, Asia Minor.
 Selinus, Sicily.
 Sidon, Phoenicia.
 Sodom and Gomorrah, Palestine.
 Susa, Persia.
 Sybaris, Greece.
 Thebes, Egypt.
 Troy, Asia Minor.
 Tyre, Asia Minor.
 Veii, Italy.

CITIES, Chartered. See **BOROUGH**; **COMMUNE**; **GUILDS**; **MUNICIPAL GOVERNMENT**.

CITIES, Free, of Italy. See **ITALY**: 1056-1152, and after.

CITIES, Imperial and Free, of Germany.—“The territorial disintegration of Germany [see **GERMANY**: 12th-13th centuries; 13th century] had introduced a new and beneficial element into the national life, by allowing the rise and growth of the free cities. These were of two classes: those which stood in immediate connection with the Empire, and were practically independent republics; and those which, while owning some dependence upon spiritual or temporal princes, had yet conquered for themselves a large measure of self-government. The local distribution of the former, which is curiously unequal, depended upon the circumstances which attended the dissolution of the old tribal dukedoms. Wherever some powerful house was able to seize upon the inheritance, free cities were few; wherever the contrary was the case, they sprang up in abundance. In Swabia and on the Rhine there were more than a hundred; Franconia on the contrary counted only Nürnberg and five smaller cities: Westphalia, Dortmund and Herford; while in Bavaria, Regensburg stood alone.

The Imperial free cities . . . were self-governed, under constitutions in which the aristocratic and the democratic elements mingled in various proportions: they provided for their own defence: they were republics, in the midst of States where the personal will of the ruler counted for more and more. . . . In these cities the refined and luxurious civilization, to which the princes were indifferent, and on which the knights waged predatory war, found expression in the pursuit of letters and the cultivation of the arts of life. There, too, the Imperial feeling, which was elsewhere slowly dying out of the land, retained much of its force. The cities held, so to speak, directly of the Empire, to which they looked for protection against powerful and lawless neighbours, and they felt that their liberties and privileges were bound up with the maintenance of the general order.

In them, too, as we might naturally expect, religious life put on a freer aspect.”—C. Beard, *Martin Luther and the Reformation*, p. 16.—“Prior to the peace of Lunéville [1801], Germany possessed 133 free cities, called Reichstädte. A Reichstadt ('civitas imperii') was a town under the immediate authority of the Emperor, who was represented by an imperial official called a Vogt or Schultheis. The first mention of the term 'civitas imperii' (imperial city) occurs in an edict of the emperor Frederick II. [1214-1250], in which Lübeck was declared a 'civitas imperii' in perpe-

tuity. In a later edict, of the year 1287, we find that King Rudolf termed the following places 'civitates regni' (royal cities), viz., Frankfort, Friedberg, Wetzlar, Oppenheim, Wesel, and Boppard. All these royal cities subsequently became imperial cities in consequence of the Kings of Germany being again raised to the dignity of Emperors. During the reign of Louis the Bavarian [1314-1347] Latin ceased to be the official language, and the imperial towns were designated in the vernacular 'Richstat.' In course of time the imperial towns acquired, either by purchase or conquest, their independence. Besides the Reichstädte, there were Freistädte, or free towns, the principal being Cologne, Basle, Mayence, Ratisbon, Spire, and Worms. The free towns appear to have enjoyed the following immunities:—1. They were exempt from the oath of allegiance to the Emperor. 2. They were not bound to furnish a contingent for any expedition beyond the Alps. 3. They were free from all imperial taxes and duties. 4. They could not be pledged. 5. They were distinguished from the imperial towns by not having the imperial eagle emblazoned on the municipal escutcheon.” Subsequently “the free towns were placed on the same footing as the Reichstädte, and the term 'Freistadt,' or free town, was disused. The government of the imperial towns was in the hands of a military and civil governor. . . . On the imperial towns becoming independent, the administration of the town was entrusted to a college of from four to twenty-four persons, according to the population, and the members of this kind of town council were called either Rathsmann, Rathsfreund, or Rathsherr, which means councilman or adviser. The town councillors appear to have selected one or more of their number as presidents, with the title of Rathmeister, Burgermeister, or Stadtmeister. . . . Many of the imperial towns gained their autonomy either by purchase or force of arms. In like manner we find that others either lost their privileges or voluntarily became subjects of some burgrave or ecclesiastical prince, e.g., Cologne, Worms, and Spire placed themselves under the jurisdiction of their respective archbishops, whereas Altenburg, Chemnitz and Zwickau were seized by Frederick the Quarrelsome in his war with the Emperor; whilst others, like Hagenau, Colmar, Landau, and Strasburg, were annexed or torn from the German Empire. As the Imperial towns increased in wealth and power they extended the circle of their authority over the surrounding districts, and, in order to obtain a voice in the affairs of the empire, at length demanded that the country under their jurisdiction should be represented at the Reichstag (Imperial Diet). To accomplish this, they formed themselves into Bunds or confederations to assert their claims, and succeeded in forcing the Emperor and the princes to allow their representatives to take part in the deliberations of the Diet. The principal confederations brought into existence by the struggles going on in Germany were the Rhenish and Suabian Bunds, and the Hansa [see **HANSA TOWNS**]. . . . At the Diet held at Augsburg in 1474, it appears that almost all the imperial towns were represented, and in 1648, on the peace of Westphalia, when their presence in the Diet was formally recognized, they were formed into a separate college. . . . By the peace of Lunéville four of the imperial towns, viz., Aix-la-Chapelle, Cologne, Spire, and Worms, were ceded to France. In 1803, all the imperial towns lost their autonomy with the exception of the following six:—Augsburg, Nuremberg, Frankfort, Lübeck, Hamburg, and Bremen [see **GERMANY**: 1801-1803];

and in 1806 the first three [see AUSTRIA: 1708-1806; GERMANY: 1805-1806], and in 1810 the others, shared the same fate, but in 1815, on the fall of Napoleon, Bremen, Hamburg, Lubeck, and Frankfort, recovered their freedom, and were admitted as members of the German Bund, which they continued to be up to the year 1866."—W. J. Wyatt, *History of Prussia*, v. 2, pp. 427-432.—"According to the German historians the period of the greatest splendour of these towns was during the 14th and 15th centuries. . . . In the 16th century they still enjoyed the same prosperity, but the period of their decay was come. The Thirty-Years' War hastened their fall, and scarcely one of them escaped destruction and ruin during that period. Nevertheless, the treaty of Westphalia mentions them positively, and asserts their position as immediate states, that is to say, states which depended immediately upon the Emperor; but the neighbouring Sovereigns, on the one hand, and on the other the Emperor himself, the exercise of whose power, since the Thirty-Years' War, was limited to the lesser vassals of the empire, restricted their sovereignty within narrower and narrower limits. In the 18th century, 51 of them were still in existence, they filled two benches at the diet, and had an independent vote there; but, in fact, they no longer exercised any influence upon the direction of general affairs. At home they were all heavily burthened with debts, partly because they continued to be charged for the imperial taxes at a rate suited to their former splendour, and partly because their own administration was extremely bad. It is very remarkable that this bad administration seemed to be the result of some secret disease which was common to them all, whatever might be the form of their constitution. . . .

Their population decreased, and distress prevailed in them. They were no longer the abodes of German civilization; the arts left them, and went to shine in the new towns created by the Sovereigns, and representing modern society. Trade forsook them—their ancient energy and patriotic vigour disappeared. Hamburg almost alone still remained a great centre of wealth and intelligence, but this was owing to causes quite peculiar to herself."—A. de Tocqueville, *State of society in France before 1789*, note C.—See also HANSA TOWNS.—Of the forty-eight free cities of the empire remaining in 1803, forty-two were then robbed of their franchises, under the exigencies of the treaty of Lunéville (see GERMANY: 1801-1803). After the peace of Pressburg only three survived, namely, Hamburg, Lubeck and Bremen (see GERMANY: 1805-1806). These were annexed to France by Napoleon in 1810 (see FRANCE: 1810 [February-December]). The Congress of Vienna, in 1815, restored freedom to them, and to Frankfort, likewise, and they became members of the Germanic Confederation then formed (see VIENNA, CONGRESS OF). Lubeck gave up its privileges as a free city in 1866, joining the Prussian customs union. Hamburg and Bremen did the same in 1888, being absorbed in the empire. This extinguished the last of the "free cities." See GERMANY: 1888.

Their part in Protestant Reformation. See PAPACY: 1525-1529.

CITIES OF REFUGE, the six Jewish "cities of refuge" for the manslayer (see *Numbers* 35, 6, 13-15) were Kedesh, Shechem, Hebron, Bezer, Ramoth-Gilead, and Golan.

CITIZEN ARMY, United States. See MILITARY ORGANIZATION: 43.

CITIZEN GENËT. See GENËT, EDMOND CHARLES EDOUARD.

CITIZENSHIP.—In international law, the word "citizenship" denotes membership in a nation. It includes "the enjoyment of equal rights and privileges at home, and equal protection abroad."—P. Webster, *Treatise on the law of citizenship in the United States*, p. v. of Preface. See NATURALIZATION.

CITIZENSHIP BUREAU. See STATE DEPARTMENT OF THE UNITED STATES: 1000-1013.

CITRAMONTANI UNIVERSITY, Bologna, Italy, arose in the twelfth century as a student guild, being at first merely a spontaneous confederation of aliens on foreign soil. See UNIVERSITIES AND COLLEGES: 1231-1330.

CITY.—"The term 'city' has two meanings: the one sociological, the other legal or political. When we speak of the city in the first sense we refer to it as an aggregation of people living within a comparatively small area. When we use the term in its legal or political meaning we have reference to the fact that the city constitutes a political unity—that it has specific political duties to perform, and for that purpose is endowed by the state with more or less definite legal powers."—F. G. Goodnow, *City government in the United States*, p. 3.—Besides the sociological and political signification of the term "city" there is a distinction to be observed between its use in the United States and in Europe. In the United States a "city" is a chartered municipal corporation with a chief executive, generally termed "mayor." There are other corporate municipalities, such as towns and boroughs, differing from the "city" (see BOROUGH). In Great Britain the term "city" is generally applied to episcopal sees. The same held true in France from the fifth to the fifteenth century. In both countries, too, the term is used to designate the old nucleus of some large towns, as the *Cité* in Paris. However, in England the title of "city" has been conferred by royal grant on towns that were not episcopal sees. The first municipality to be so honored was Birmingham (1809). The term "city" was at one time used in still another sense, as equivalent to state (*civitas*). The government of those towns was independent of external authority. The only cities in this sense are the free cities of Germany and some of the cantons of Switzerland that consist of a town and its outlying districts, as Geneva. See CITY STATE; CITIES, IMPERIAL AND FREE, OF GERMANY.

Government. See MUNICIPAL GOVERNMENT; CITY MANAGER PLAN; COMMISSION GOVERNMENT IN AMERICAN CITIES.

CITY MANAGER PLAN OF MUNICIPAL GOVERNMENT: Origin of plan.—"January 13, 1908, saw the passage of a measure by a city council in a little Virginia city, of profound import to American municipal life. The town of Staunton desired commission government and inspired by the radical advantages Galveston and other cities had achieved, it was eager to adopt a similar program. . . . [But] the state constitution contained the mandatory provision that all cities of the first class must have a mayor and council. This was a blank legal wall to overcome, for Staunton . . . was . . . a city of the first class. But some genius discovered that the power to appoint new officers by the council was particularly set forth in Section 1038 of the Virginia Code. Depending on this vantage point, an ordinance was passed, providing for a general manager, equipped with power to take entire charge and control of all the executive work of the city in its various departments, and entire charge and control of the heads of departments and employees

of the city. The general manager under that plan assumed all executive duties, except those reserved to the finance, ordinance, school and auditing committees."—H. A. Toulmin, Jr., *City manager*, pp. 16, 17.—From this beginning has evolved the commission manager, more often called the city manager plan. "The commission-manager [or city manager] plan is a form of government which combines the ideas of a small representative body, elected at large on a nonpartisan ballot, possessing all ultimate legal powers of the city, and subject to certain important checks in the hands of the electorate, with concentration of administrative power into a single individual chosen by the representative body because of expert professional qualifications. Such a plan it is seen adopts the valuable features of commission government and remedies the two fundamental defects of that form. Such in bold outline is the commission-manager plan of city government. In the commission-manager plan the commission chooses and dismisses the manager, and he selects, controls, and removes the rest of the administrative force of the city. To do this effectively he must have large powers, but to give him unlimited powers would be to put in his hands without check the enormous patronage of the city. The temptation to abuse the power of patronage has been one of the most irresistible of temptations to politicians in this country and the resulting evils have been among the worst of the many that have afflicted our city governments. To guard against the perpetuation and even exaggeration of these evils in the new form of government it is absolutely necessary that civil service merit rules governing the whole matter of appointments and removals and administrative control be regulated by law, and administered by an independent authority."—H. G. James, *What is the city-manager plan?* (*University of Texas Bulletin*, no. 1702, Jan. 5, 1917, pp. 22-23).

Dayton, Ohio.—Powers of commission.—Powers of manager.—Departments.—The first large city to adopt the City Manager plan was Dayton, Ohio, which in 1914 took the necessary steps to supersede its Mayor and council by a commission and manager. "Let it be stated at the outset [however] that the favorable vote for the Commission-Manager charter was not a consequence of the flood of 1913—[as has sometimes been said] it was merely subsequent to it. . . . The breakdown of the political régime of the city was brought home forcefully at this crucial time, when the administrative head of the city proved quite incompetent to deal with the situation. . . . The adoption of a charter was made possible through the passage of a home rule amendment to the Ohio Constitution. . . . [which] was adopted September 3, 1912. . . . [This amendment] privileged such cities as desired 'to exercise all powers of local self-government, and to adopt and enforce within their limits such local police, sanitary and other similar regulations, as are not in conflict with general laws,' and provided the procedure by which such local self-government might be secured. The act does not privilege the combination of school administration with the other functions of government, and the state still retains control of the local courts and finances. . . . The organization of the Dayton government is similar to that found in modern business corporations. . . . The work is also divided into departments, upon lines natural to municipal activities, and each department is in charge of a director. The five departments are law, finance, safety, service and welfare. . . . The city commission in Dayton consists of five members elected at large by the voters [for a

four-year term].—C. E. Rightor, *City manager in Dayton*,—pp. 1, 5-6, 13, 21.—"An election takes place every second year and some of the commissioners (two or three members as the case may be) are chosen at each election. Nominations are made at a non-partisan primary and the ballots at the subsequent election bear no party designations. The candidate who receives the highest vote in the election at which three commissioners are chosen is given the title of mayor, but he has no special functions except that of presiding at meetings of the commission. He receives an annual salary of \$1800; his four colleagues receive \$1200 each. Any member of the commission, after he has served six months, is subject to recall. Petitions for a recall election must be signed by at least twenty-five per cent of the voters. Provision is also made for the initiative and referendum as in most cities under the commission form of government. The commission by majority vote enacts the municipal ordinances and has a general control over the city's finances. It also appoints the city manager, but it has no authority in regard to subordinate appointments nor may it interfere directly with the details of departmental administration. Its control over actual administrative work is confined to the appointment of the city manager, whose position is the outstanding feature of the whole plan. In addition the council appoints its own clerk, who serves also as city clerk, and it appoints the civil service board. . . . The Dayton charter provides that entire control and supervision of the administrative functions shall be vested in a city manager. This official is appointed for no definite term. He holds office at the will of the commission and may be removed by a majority vote of that body at any time. He is also subject to recall by the voters in the usual way. The charter provides that the city manager 'shall be appointed without regard to his political beliefs, and may or may not be a resident of the city of Dayton when appointed.' His salary is fixed by an ordinance of the commission."—W. B. Munro, *Government of American cities*, pp. 390-391.

Now as to the city manager's powers: "The following are apparently the general powers usually conferred upon that official:

(a) He is charged with the enforcement of laws and ordinances. (b) He administers the affairs of the departments and is responsible for the results obtained therefrom. (c) He appoints and dismisses the employees whose work will produce the results he is responsible for. (d) He advises the council and attends the meetings for that purpose, supplementing his advice with formal written reports, but he has no vote. (e) He estimates the financial needs of the corporation and acting as expert budget maker he is financial adviser of the commission. (f) He has the general powers of investigation and is the general agent of the commission. . . . In Dayton, the city manager appoints two general classes of men. The class of major executives serve as heads of departments, as the city attorney, director of public service, director of public welfare, director of public safety, and director of finance. He also appoints the minor executives or those subordinate to the heads of departments, as the health officer, chief of police, fire chief, city accountant, city treasurer and purchasing agent. He may generally select for his employees men resident anywhere. He is expected to achieve efficiency and there is no restriction as to the place in which he may seek a competent man to fill the position he has in mind. In Springfield, all others than those appointed by the commission and enumerated in a prior discussion of

that body, are appointed by the city manager. . . . In Phoenix, Arizona, the city manager appoints the city clerk, city treasurer, city assessor, city collector, city attorney, engineer, chief of police, fire chief and superintendent of streets. In this particular the prudence of the framers of the Dayton charter is exhibited. . . . What more in keeping with the innate justice and businesslike spirit which pervades the new order than to hold the city manager responsible for the complete execution of the trust which is devolved upon him as a public servant? We concentrate the power in him and we look to him to justify our confidence. Yet this very spirit of righteous justification would be a mockery of itself if we did not put it in the power of the man to whom we apply such an acid test to discharge ably the tasks he assumes. The means of discharging the trust must inevitably lie in the personnel of the departments over which he exercises so radical a control. The Dayton charter, therefore, provides that the city manager shall have a very wide and generous scope to his appointments. He has absolute control over his departments, and absolute power of appointment and removal, with or without cause, provided only that he does not act in conflict with the civil service regulations. . . . A grave difficulty has arisen as to the connection of the departments with the commissions. More or less trouble has been experienced in methods of supervising the several divisions of the municipal organization. The conventional species of commission government provided that the positions of the heads of departments were to be filled by the commissioners themselves: the commissioners were to be directors of departments or be responsible, at least, for them. . . . The problem, [therefore, for the voter] is not only the selection of a commissioner, in this form of commission government, but it is also that of selecting an executive. . . . The city manager plan has a provision of sterling wisdom to meet this situation. It obviates the theoretical and the practical difficulty of combining two radically different phases of any administration work. The commissioners have nothing to do with the execution of the legislation; the city manager has everything to do with the execution of the government business. Therefore, it is justly and very wisely provided that the city manager shall appoint the heads of the departments. . . .

"To return to the discussion of the model charter of Dayton, . . . it was provided that a director shall head each department. These departments are five in number, entitled law, welfare, service, safety and finance. . . . First and foremost, then, of these departments, we have . . . that of law. Over this department is placed . . . the city attorney. Public service is an apt title for the second department. . . . The director of public service manages the construction and maintenance of . . . the public highways generally; of the sewerage systems and disposal plants, canals, and water courses; of the public buildings; of the boulevards and squares and city grounds. . . . Upon him devolves the duty of making and preserving surveys, plans and drawings, and estimates for public work. He also sees that the streets which he maintains and repairs are cleaned, lighted and sprinkled, and that the waste is collected and disposed of. . . . Akin to the department of public service is the department of public welfare. . . . All correctional and reformatory institutions and agencies belonging to the city are to be administered by this department; parks, playgrounds and recreational centers of the city are to be controlled by this division. The director has charge of the inspection and supervi-

sion of public entertainments; of the enforcement of laws and ordinances relative to the public health in both the prevention, isolation and cure of diseases. . . . Under the director of public safety are the divisions of police and fire, . . . all matters affecting the regulation of the erection of buildings, their inspection, . . . laws and ordinances relating to the subject of traffic, weights and measures."—H. A. Toulmin, Jr., *City manager*, pp. 93-96, 98-99, 101-102, 104-108.—"The framers of city-manager charters have given a great deal of attention to the financial provisions, . . . budget-making, accounting, and municipal borrowing. The Dayton charter provides for these things in careful detail, but in some respects makes stipulations which are altogether likely to be found too rigid. The annual estimates are prepared by the city manager from figures submitted to him by the heads of the various departments. These estimates are submitted to the city council; they must also be published and public hearings held before the council takes action upon them. The charter requires an elaborate accounting system and this has been installed. It compares favorably with those used by large business corporations and is far superior to those employed by most American cities. Much of the merit of the Dayton charter comes from the attention which has been paid to financial and administrative details."—W. B. Munro, *Government of American cities*, p. 393.

Result of the experiment.—Cities which have adopted the plan.—"Now comes the question as to what the results have been. In an endeavor to get some trustworthy information on this point inquiries were sent in the autumn of 1915 to nine of the largest city-manager municipalities. Forty-five definite questions were submitted to each, the questions covering matters of actual fact. . . . [From the answers received it appears that, in the first place, the plan] has secured for each city a trained man for the head of its administrative service. In five of the nine municipalities the city manager was reported to be an engineer by profession, in one he had been a former manager of electric light and power companies, in one a successful superintendent of schools, and in one a state official, . . . [showing that] the city-manager municipalities are not only making an earnest effort to secure men of skill and experience for their chief administrative posts, but that they are meeting with at least tolerable success in that direction."—W. B. Munro, *Government of American cities*, p. 395.—"As a result of the efforts of a charter league, a bill was passed by the legislature of New Mexico [in 1917] giving Albuquerque an opportunity to draft its own charter. The commission was duly appointed and reported a city manager charter which was vigorously opposed by certain influential elements. . . . The vote cast on the charter was only about 1,000, whereas the normal city election runs in the neighborhood of 2,000 votes. The majority secured for the charter was 156. Petersburg, Virginia, was added to the list of city-manager cities on August 7, [1917] when more than 65 per cent of the qualified voters of the city went to the polls and voted to replace the . . . cumbersome and inefficient bicameral mayor-council form of government with an efficient modern government to be organized under the city-manager plan as permitted by the Virginia optional charter act of March 20, 1916. Out of a total of 1,887 votes cast in the special charter election, 1,561 or 83 per cent were for the adoption of the city-manager plan."—*National Municipal Review*, Nov., 1917, pp. 722, 723.—Many of the cities which have adopted the city manager plan

were already under the commission form of government. The majority are cities of small size, for which this plan seems to be peculiarly well adapted. On the other hand, Dayton, Ohio, which is the real pioneer in city business management, and Grand Rapids, Michigan, have populations of over 153,000 and 137,000 respectively. Wichita, Kansas, has 72,000; Springfield, Ohio, Jackson, Mich., and Portsmouth, Va., have populations of between 50,000 and 60,000; Niagara Falls, N. Y., and Norfolk, Va., have 50,000; Kalamazoo, Mich., has 48,000; San José, Cal., Newburgh, N. Y., Phoenix, Ariz., and Ashtabula, Ohio, have passed the 22,000 limit; Sherman, Texas, Bakersfield, Cal., Santa Barbara, Cal., are between 15,000 and 20,000. It may be assumed, therefore, that the plan has been tested sufficiently to prove its adaptability to these large communities. It remains to be seen how it would work if applied to cities of say 250,000 and over. "More than 3,100,000 American citizens are living to-day in towns and cities that have adopted the city-manager plan of government. Until six years ago there were but a dozen small towns in the whole country that had ventured into the limelight by authorizing their councils to appoint the chief administrative officer instead of trusting the ballot box to produce executive efficiency. To-day there are 180 municipalities in the United States operating under, or pledged to, some type of the manager plan. Of these, 114 have created the position of manager by charter, charter amendment or adoption of optional state laws by popular referendum. Nine more have secured modified manager plans by similar means, while the remaining 57 have officers called managers whose positions and duties are established by local ordinance only. Fifty of these latter are towns of less than 10,000 population. . . . Incidentally, it is worth noting that 26 other towns have tried and discontinued the ordinance-created manager plan. To date, no report is at hand of any city having reverted to its former plan of government after having adopted the manager idea by vote of its citizens. Five Canadian towns employ managers."—H. G. Otis, *City manager movement* (*National Municipal Review*, v. 0, no. 5, May, 1920, p. 305).—See also IOWA: 1914-1920; KANSAS: 1917; MUNICIPAL GOVERNMENT.

CITY OF MEMPHIS, American vessel sunk by a German submarine, Mar. 17, 1917. See U. S. A.: 1917 (February-April).

CITY OF THE VIOLET CROWN.—Ancient Athens was so called by the poets, from the color of the hills which surround it.

CITY PLANNING.—Ancient origin.—Modern necessity.—"Mr. George McAneny, former President of the Board of Aldermen of the City of New York, has comprehensively defined city planning as 'getting ready for the future.' More narrowly defined, it means arranging the public highways, buildings, parks, playgrounds, amusement and recreation centers, in a harmonious whole to make adequate provision for the material and aes-

thetic needs of the population both present and future."—H. G. Preston, *City planning* (*Outlook*, Dec. 24, 1919, p. 543).—"The origin of the rectangular plan goes back, it has been said, to the dawn of history. . . . Herodotus states that Babylon was built four-square, with straight streets that were either parallel or at right angles to one another. The adoption of its plan is said to have been due to a woman, Queen Semiramis; but even this may not have been the origin of the rectangular street system. Some Chinese towns, that are presumably two or three thousand years old, show rectangular platting; and a comparatively recent excavation, revealing traces of the village occupied by the workmen who built the pyramid of Illahun, indicate that it also was 'laid out symmetrically, on rectangular lines'. In short, without going now into the history of town planning, without noting the oft recurring interest in it which has marked the course of civilization, or special development which different nations and different times have contributed to the science of art, or civic design, it is enough to say that its dominant principle has been the straight line and the right angle. . . . More important . . . than the origin of the rectangular street plan is the persistence in its use. Long after Babylon, but five centuries before the Christian era, a group of Grecian architects, under Hippodamus, made use of the rectangular method when platting the streets of Pirene, Piraeus, Alexandria, Antioch and other cities. In the colonizing of conquered territory, we are told that parties were conducted by State officials to a selected spot in the new country where each was given a numbered square. Later still, under the Roman empire, the military origin of many towns predestined them to a regular platting. They were laid out like camps—by soldiers whose natural impulse was to arrange the people in serial rows. During the Middle Ages the few towns built were generally small, but . . . 'in the thirteenth century', (says Inigo Triggs,) 'no less than fifty towns were founded by the British in Aquitaine and Guienne, within the same number of years, all of which were laid out, wherever practicable, upon a definite system, and formed a part of the wise and far sighted policy of Edward I. . . . These towns were regular and symmetrical; the streets were wide, open, and straight, crossing each other at right angles only. . . . By this means this plat of ground was of a uniform size and shape, a parallelogram with one end facing a principal street and another a lane.' When the revival of classical architecture came, the rectangular plat made by right-angled streets was found best adapted to the classic façades, and the plan received a further impetus. But it is in America that the persistence of uniform right-angled streets has been most marked. Here the universality of the plan's adoption and the rigidity of adherence to it, has been such that Europeans, forgetting the long history of rectangular street planning, refer to it now as 'the American method'."—C. M. Robinson, *City planning*, pp. 14-16.—"The simplest form for the laying out of city streets is the gridiron or checkerboard plan, of which Philadelphia is the earliest American example. While admirable for its simplicity, ability to cross the city diagonally entails a zigzagging process involving great loss of time. Diagonal streets focusing at some point or points were first used in America in the City of Washington."—H. G. Preston, *City planning* (*Outlook*, Dec. 24, 1919, p. 543).—The tremendous growth of urban population in modern times has brought out very strongly the need of scientific planning for the construction of new cities, towns and villages, and the re-planning of old ones in such a way as to give

the greatest possible ease of movement in crowded spaces, as well as to provide room for the necessary machinery of government, breathing spaces within thickly inhabited areas, and places for open air recreation. The movement has gained such impetus that it is possible only to indicate a small portion of what is being done. Moreover, plans that are being made are so far-reaching that it will take many years to complete them, and much of the descriptions given in the following pages is of necessity in the shape of prophecy.

Brazil: The city of Rio de Janeiro.—"The roofs of the houses of Rio de Janeiro are tiled in reds and browns; the walls . . . cream . . . or rose tinted, or dazzling white. . . In the commercial district several of the ugly old sections remain; . . . but the old passenger landing . . . has been transformed into a handsome square; . . . with gardens and a . . . fountain; hills have been levelled to permit extensions . . . thousands of marshy places . . . have been reclaimed; a fine drainage canal has been constructed; an adequate sewerage system has been installed; and a system of masonry docks completed; . . . some of the streets have been broadened. . . . New government buildings have been erected, notably the Congress-

a beautiful city and, if well developed, will express in a high degree the magnificence of its site. It is, like Athens, encircled with violet hills. . . . The two cities of Ottawa and Hull face one another across the Ottawa River. The development of the capital being the work of the nation, and financial aid from the government being necessary in such an undertaking, it was determined that the establishment of a Federal District was indispensable to the successful execution of the plans. . . . Along the steep banks of the magnificent Ottawa River the city must continue to develop and, as a frontispiece to both the city and the river, the government center will find its maximum field of expression. The Rideau River and the Canal . . . play an important part in the plan, and add immensely to the interest of the city. In one sense obstacles to development, they can be overcome and woven into the general structure. . . . A new bridge . . . crossing the Ottawa River from the western end of the government group to the municipal center in Hull . . . is an important feature of the plan and, both as a traffic connection and as a feature in the composition of the government center, has magnificent possibilities. It will frame on the west the basin of the Ottawa River on which the govern-

PLAN OF THE WATER-FRONT OF TORONTO, CANADA

sional palace; also the Palace of the Supreme Court, in rose tinted stone and marble, . . . the Post Office and Mint, National Printing Office and National library . . . of great architectural beauty; . . . the City Hall and Municipal Theatre. . . . To facilitate traffic . . . a hundred and fifty foot wide avenue, the Avenida Central, has been constructed across the business section of the city, opening a vista from bay to bay. . . . Beginning at the southern end of this avenue and following the contour of the shore, they have constructed an esplanade, [the Avenida Beira Mar] . . . and further on . . . have converted [a] semicircular beach into . . . an avenue. . . . Up near the business section again, there is the Passeio Publico, with its park and lakes and broad water side terrace, overlooking the whole southern part of the harbor."—H. W. Van Dyke, *Through South America*, pp. 164-165, 167.

Canada: Ottawa and Hull.—Toronto Water Front.—Iroquois Falls.—"The Ottawa and Hull plan expresses all phases of city life, including commerce, industry and residence, the street system, parks, and transportation, and deals with their inter-relations, an essential study in a comprehensive city plan. . . . A dominant thought has been to make the city of Ottawa worthy to be a capital. The problem is not one of an intensely built-up metropolis, but one in which a finer development affecting the whole city may be expressed. . . . The site lends itself naturally to a noble and striking treatment. Ottawa today is in many respects

ment buildings front, and will connect the centers of the two cities without passing through the industrial districts further to the west. . . . The river front demands improvement, especially the Hull waterfront, which is seen from the Parliament Buildings on the Ottawa side; and a scheme has been worked out to redeem the whole river front without interfering with industry."—E. H. Bennett, *A plan for Ottawa, capital of Dominion of Canada* (*Journal of the American Institute of Architects*, v. 4, no. 6, June, 1916, pp. 263, 265.)—"A waterfront either to the sea or to a river or lake is of untold value for any city, and the pity is that so many of the finest natural sites the world over have been marred in the making. There is hardly a waterfront anywhere which has not been more or less spoiled, and the existing front at Toronto is no exception, the larger proportion being still in private ownership. There is enormous traffic on these vast inland seas, and the Toronto Harbour Commissioners have set to work to provide an immense harbour $2\frac{1}{2}$ miles wide and $2\frac{1}{2}$ miles long, with boulevard and playground facilities for many miles along the lake front, at the same time reclaiming something like a thousand acres to the east of the town for industrial and commercial purposes. The present harbour in front of the commercial part of the city has no through street from east to west, and it is proposed to construct a new thoroughfare 130 feet wide connected with modern concrete docks and streets running north for the full length of this area. The railways at present occupying the

greater part of the lake front are, with the full approval of the companies concerned, to be placed on a viaduct south of this new street, thus setting free something like 180 acres of land in the very heart of the city, which will form a very valuable asset for the scheme."—W. B. Davidge, *City planning in America: Transactions of the Toronto Conference (Journal of Royal Institute of British Architects, v. 22, 3rd series, June 26, 1915, p. 419)*. —"The plant of Abitibi Power and Paper Company at Iroquois Falls, Ontario, is beautifully situated in a bend of the Abitibi river, and here the company decided to build a model town for its employees, and employed for the purpose a civil engineer who believes 'that the providing of means, room, surroundings, beauty, and so many suggestions as possible which may tend to influence the full development and contentment and happiness of the community is just as important a problem to the town site engineer as the proper design of

Chili: Santiago.—"Santiago, 'the American city of the snow-white crown,' is unique in the charm of her unconventional beauty and the rugged splendor of her surroundings . . . with walls of the imperishable granite of the Cordilleras and towers reaching to the skies! . . . In the heart of the city itself is a hill called El Cerro de Santa Lucia, that rises to a height of three hundred feet. . . . The summit is reached by winding driveways and walks. . . . Across the city from Santa Lucia to the Central Railroad depot, an avenue called the Alameda de las Delicias extends for a distance of three miles. It is three hundred and fifty feet wide, and all down the center is a beautiful park containing statues and monuments . . . placed . . . among the trees and flowers, the fountains and lakes. . . . The old center of the city is marked by the famous Plaza de Armas, with a marble monument representing South America . . . in the war of independence. . . . On one side are the Cathedral and

CASTLE SQUARE, KARLSRUHE

Good example of garden treatment of a public square

street, sewer and water works improvements.' [In laying out the town] he followed the gridiron principle as being the most practical . . . [but found it] advisable to curve a number of the streets to get economical grades . . . resulting in a very graceful lay out. The controlling features of the first plat . . . are the railroad and the edges of the plateau. . . . A small park forming a sort of civic center and sufficient in size to contain all necessary public buildings was laid out adjacent to the railroad and business district. . . . A small park is also provided at the end of the railroad, which, with the larger park, furnishes a screen between the residence and business portions of the town. . . . The school site contains about nine acres and it is intended that the school grounds shall be the public playgrounds and athletic park for adults as well as children. . . . Part of the school grounds are set apart as children's gardens. . . . In laying out the streets a drive named Hillcrest Road was laid out around the edge of the plateau."—A. P. Melton, *Planning industrial town of Iroquois Falls, Ontario (Engineering and Contracting, v. 45, June 7, 1916, pp. 524-526)*.

Bishop's Palace, on another the Municipal and Intendencia buildings, low and massive, on another two series of shops opening out on fine arcades. . . . A few blocks away is the Congressional Palace, which occupies the whole square and is one of the largest and handsomest buildings in South America . . . and in the same district is . . . the Mint . . . and the Palace of the Fine Arts."—H. W. Van Dyke, *Through South America, pp. 290, 301-303*.

France: Plans for Paris.—"Paris was the first great city to be planned in the modern sense of the idea. Louis XIV, ambitious for his capital, intrusted its planning to the Academy of Architects, which prepared designs upon which the Madeleine, Place de la Concorde, Invalides, and the wide avenues about the Tuileries existed years before they were realized. As Paris grew into the suburbs it followed a prearranged and spacious design at little other cost than the preparation of the plans. Napoleon I had similar dreams for a capital of the world. He saw that the Paris of 700,000 people would in time have many times that population and that provision should be made for its orderly

growth. He opened up new streets, spanned the Seine with bridges, and transformed its appearance by the construction of new quays and embankments. Napoleon III continued this work on an even more ambitious scale. He employed Baron Haussman, [prefect of the Seine] who reconstructed the centre of the city by cutting new streets through the congested quarters and the opening of a series of great boulevards which encircle the older sections. . . . Now [1914] Paris is planning a fourth great development at an estimated cost of \$180,000,000. The old fortifications which still surround the city are to be developed into a great park and boulevard system like the Ringstrasse of Vienna."—F. C. Howe, *Modern city and its problems*, pp. 213-214.—"The French Parliament is authorizing the demolition of the wall of Paris and the cession of the site and the military zone just outside the wall for city improvements. It has provided the opportunity for the development of one of the most remarkable parks in the world. With an average width of 250 yards and a length of 25 miles the park will completely surround the city. . . . The demolition of the wall will release 1,150 acres of ground. Three hundred of this will be devoted to new streets, boulevards, railroads and canals."—*Paris obtains site for remarkable park* (*American City*, Feb., 1920, p. 157).—See also HOUSING: France.

Germany: Frankfort.—"As an organized art city planning has reached its highest development in Germany, from which country it has spread all over the world. . . . No large city in Germany is now without an official plan for its future growth, prepared by experts and frequently after competition. A profession of town planning has come into existence, while colleges devoted to the subjects have been opened in Berlin and Düsseldorf. Experts go from city to city to aid local officials in the planning of suburbs, the designing of centres, the grouping of public buildings, the arrangement of streets, parks, and open spaces, much as efficiency experts in this country go from factory to factory."—F. C. Howe, *Modern city and its problems*, pp. 214-217.—See also BERLIN: 1861-1903; 1910-1917.—While Frankfort is not one of the largest German cities, an account of city planning, as evolved there, is of interest. "The mediæval town of Frankfort grew out of an old Roman settlement, which was extended for the first time in the middle of the 12th century. . . . In the middle of the 14th century the town was enlarged for the second time, and the boundaries then laid down remained until the beginning of the 19th century, when the walls were broken down. Part of the fortifications were made into public gardens; the remaining ground was sold to private persons, but on condition that on each site only one building should be erected, while the remainder should for all time be preserved as garden ground. This regulation has rendered possible the belt of public and private gardens which surrounds Frankfort. . . . There are no restrictions as to the width of streets or as to their construction, so that the Town Council has full liberty to consider the requirements of different districts. One street may be 8 metres wide, another 12 or 13 metres wide, and so on, . . . [and] the width of streets may be said to range from 20 to 200 feet. The Town Council also prescribes the material to be used in the construction of roadways and footpaths, whether wood paving, asphalt or something else. The naming of streets is also entirely in the hands of the Town Council. The Council decides in what streets front gardens are to be permitted and how large they must be, what streets are to be planted with trees, and where pub-

lic squares, playgrounds, etc., are to be situated. In this way a distribution of open spaces and playgrounds all over the city is secured. The Municipal authorities also decide what classes of buildings are to be erected in the various localities. Some districts are devoted to factories, others are declared to be mixed quarters, where both dwelling houses and workshops may be erected, while the remainder is set aside as a residential district. The following is the method of town planning followed by the Municipality. First of all a plan is made, showing the general scheme of the proposed new streets. The public is invited to inspect the plan and objections are received and considered by the body which has to sanction the plans, and which is known as the *Bezirksausschuss* [district committee]. Only after the plan has been approved are buildings permitted to be erected. . . . The streets are planned with a view to the probable requirements of a long period of years. Of course the Municipality could not exercise this power of Town Planning unless they had also the power of expropriation. This power is given by law, and there is no need to go to Parliament for special powers in a case where expropriation is necessary. In the great majority of cases [however] the land-owners prefer to hand over to the Municipality by agreement the land necessary for the formation of new streets. . . . In many cases, . . . the Municipality already owns the necessary land. The city, as well as the hospitals and other benevolent institutions which are under its control, inherits from ancient times a considerable amount of land lying within the city boundaries, and increases its landed property yearly by buying fresh estates."—H. S. Lunn, *Municipal lessons from Southern Germany*, pp. 38-40.

Great Britain: London.—Garden cities.—Industrial villages.—Late legislation.—"Westminster, in common with other parts of London, has undergone vast changes since the erection of the present houses of Parliament, and the evolution is still progressing. Since the formation of a Thames Embankment, there is seen from Westminster Bridge one of the most majestic river frontages in the world, while, . . . [the] Houses of Parliament give a picturesque mass of which the nation is justly proud. The erection of Victoria Embankment commenced a new era of civic effort from Westminster which . . . has given us Parliament Street, Northumberland Avenue, the Mall, Queen Victoria Street, and . . . the New Mall, with the dignified architectural composition connecting Trafalgar Square and the Queen's Memorial and Plaza in front of Buckingham Palace, the widening of Constitution Hill and the new road, giving direct communication with Piccadilly, in line with the Queen's Monument, through Green Park. Most of these are notable both in plan, scale and design. . . . Apart from the Abbey and its surroundings, almost every erection in Westminster that strikes the eye is of recent date. . . . Notwithstanding all the tortuous purlieus in which Westminster abounds, resulting from its unrestrained growth, it is remarkable how nearly it approaches in its layout to an ideal form of plan. . . . It should be a comparatively simple task . . . to convert Westminster into one of the most beautiful and convenient . . . centers in Europe, and much of this improvement could, in large measure, be realized on a sound economic basis, eventually yielding a return on the sum expended."—T. Mawson, *Civic art*, pp. 225-226.—"In the garden cities of England, such as Letchworth and Hampstead, the site of the town was purchased by a company and the town was laid out as a whole with reservations

for public and semi-public buildings, parks, playgrounds and civic centers. The location of factories, business houses and stations was designated and the sites of the residences were carefully planned. The result has been highly gratifying from every point of view. The convenience and comfort of the citizens have been promoted, a high degree of beauty has been obtained and the health of the communities has become far famed. When these garden cities are compared with towns that have grown up without planning, the value of city planning becomes evident. In the one the needs of community life are recognized and provided for; in the other the community is ignored and each individual is left to follow his own initiative."—H. M. Pollock and W. S. Morgan, *Modern cities*, pp. 39, 40.—Toward the end of last century individual employers began to awaken to the crying need for better housing facilities for their employees, and a first attempt to adequately fill this need was made by Titus Salt, who built the village of Saltaire in Yorkshire for his employees.

munity, its physical, intellectual and religious needs being anticipated and suitably housed, and so in turn made to pay their tribute to the health and charm of the village. In addition to the beautiful church there are handsome schools and institutes gymnasias, libraries, concert halls, theatre and recreation grounds. . . . The cottages are designed in many styles by well-known architects . . . but with this variety has been infused that spirit of restraint which should never be absent."—T. Mawson, *Civic art*, pp. 270-280, 284.—The twentieth century, and the needs created by the World War, brought a new development in the building of industrial villages in Great Britain, where the government commenced an extensive housing plan. See HOUSING: Great Britain.

Greece: Athens.—"They mean to build a new Athens, a seat of government in keeping with the old, to take full advantage of the seaport's growing possibilities in commerce. . . . [In 1916 it was stated by T. H. Mawson, city planning expert, who was employed to do the work, that five years

PORT SUNLIGHT, CHESHIRE, ENGLAND

The best known example of such an industrial village is Port Sunlight, which was planned and begun in 1888 by W. H. Lever (better known as Lord Leverhulme) and which, as his ideas expanded, was almost completely replanned. "The story of the inception and founding of Port Sunlight is . . . full of interest . . . to the student of sociology and contemporary history. Years ago W. H. Lever . . . set out on foot . . . to find a site . . . for his works . . . and the model village of his dreams, and found it five miles from Birkenhead. . . . [The land] was cut up by a number of pools and tidal basins . . . which [formed] a series of . . . islands to which the plan of the village . . . was adapted. Such of the pools as could be drained were laid out as glades and park walks. Eventually . . . [full possession of water rights on the property were obtained and all depressions filled up]. The conditions originally imposed [by these depressions] being no longer operative, it was decided to give definite shape and plan to [the village] taking the imposing new church as the focal point for as many of the village vistas as possible. . . . What makes Port Sunlight so fascinating is the way in which its author has grasped and dealt with all the problems incidental to a village com-

would be required to complete the plans. The people] will first solve the problems of design on paper, in a true scientific and æsthetic manner, and then, if necessary, take fifty or one-hundred years to accomplish their object. 'Modern Athens is not more than eighty years old.' In 1834 it was only a poor village with some three hundred huts or tenements containing a mixed population of say 1,500 Greeks, and Albanians . . . in 1871 [the population] was 44,000. . . . To-day [1916] there are 200,000 inhabitants or more, and this is exclusive of the Piræus. At the close of the late Balkan wars an extensive area of new territory . . . was added to Greece, increasing . . . its parliamentary representation and demanding the erection of a more imposing government center, with numerous ministerial buildings. The municipality, anxious to express its civic pride, wished to erect a city hall, law courts and markets. The merchants contemplate a new exchange. All are wise enough to see that these buildings must be planned as a great whole, and be in themselves independently monumental in character. . . . The present railway depots must be brought together on a new and economic site. Side by side with this there must be a new and well-planned system of hotels. The

municipal and government buildings are already planned. The latter will be symmetrically grouped about a central plaza from which boulevards and parkways and other thoroughfares will radiate. The plan does for modern Athens, a city much larger than Washington, what L'Enfant's plan did for Washington when the capital was for the most part virgin soil. . . . The Athens of the future will be zoned for the best social and economic advantage. Each zone will have appropriate restrictions. Factories . . . will be situated down the prevailing wind from the business and residential districts. Labor will be given the opportunity to dwell in model cottages . . . to be erected by the municipality. There will be no compulsion, but the cottages will give the laborer more for his money than he could possibly get elsewhere. The land surrounding the Acropolis hill is to be cleared [of its slums]. The problem, says Professor Mawson, is one . . . of remodeling and extending modern Athens, and at the same time interpreting the spirit of the ancient life. In addition to the boulevard system, a . . . scheme of re-forestation is taking place on the outskirts of the city . . . also there will be numerous small plots, with abundance of trees."—*Plans for re-making Athens (American Contractor, Dec. 9, 1916, p. 82)*.

India: Delhi.—In India, where there is much congestion in the cities, the government is taking interest in city planning, in widening streets, and in providing air spaces. Attention is focussed on the new capital of Delhi, a description of the plans for which follows. "The central point of interest in the lay-out, which gives the motif of the whole, is Government House, the Council Chamber and the large blocks of Secretariats in which the Members of the Governor-General's Council administer the great departments of Government. This is the keystone of the rule over the Empire of India; . . . the place of Government in its highest expression; . . . the seat of the Governor-General in India and his Council. This Governmental centre has been given a position at Raisina hill near the centre of the new city. . . . So placed it commands views . . . on every side and is viewed by all the inhabitants. . . . There is a wide outlook over its demesne—ridge, river and plain, the Delhi of to-day and the Delhis of the past. Advantage is taken of the height of this hill and it is linked with the high ground behind so as to appear a spur of the ridge itself. Behind the hill a raised platform or forum [will] . . . be built, [which] will be flanked by the . . . secretariat buildings and terminated at its western end by the mass of Government House and the Council Chamber, with its wide flight of steps, portico and dome. . . . The forum will be approached by inclined ways with easy gradients on both its north and south sides. . . . The height and mass of the Secretariats, with the dominating influence of Government House and the Council Chamber behind them to the west, look towards Indrapat, the site of the oldest of all the Delhis. . . . Right and left the roadways go and weld into one the empire of to-day with the empires of the past and unite Government with the business and lives of its people. Behind Government House to the west [will be] its gardens and parks flanked by the general buildings belonging to the Viceregal estate. Beyond these again on the ridge itself [will be] a spacious amphitheatre to be made out of the quarry from which much of the stones for roads and buildings may be cut. Above this and behind it will lie the reservoir and its tower which will be treated so as to break the sky line of the ridge. To the east of the forum, and below it, will be a spacious forecourt defined by trees and

linked on to the great main avenue or park-way which leads to Indrapat. . . . Across this main axis, and at right angles to it, will run the avenue to the railway station. This will terminate in the railway station, the post office and business quarters at its northern end, and in the Cathedral at its southern extremity. To the south-east will lie the park area in which stand the ancient monuments of Safdar Jang's Makhbara and the Lodi tombs. . . . The axis running north-east from the secretariat buildings to the railway station and towards the Jama Masjid will form the principal business approach to the present city. At the railway station a *place* will be laid out around which will be grouped the administrative and municipal offices, the banks, the shops and the hotels. On this *place* the post office is placed in symmetrical relation to the railway station. The processional route will lead down from the railway station due south to the point where it is intersected by the main east to west axis. Here round a *place* will be gathered the buildings of the Oriental Institute, the Museum, the Library and the Imperial Record Office which will form what may be termed a centre of intellectual interest. As an alternative a longer processional route can be used as the city develops, which will lead out from the Delhi gate of the Fort past the Delhi gate of the city, through the city park, south along the area occupied by the residences of the Indian Chiefs and Nobility. Before it reaches Indrapat it will be deflected to the commemorative column in the main park-way which goes west from Indrapat to the forum. The procession past the villas of the Chiefs with the views of the Jumna and Indrapat will combine to make this route one of peculiar interest. To the south-west of the railway station will lie the houses of the local administration and the residences of the European clerks. Between Talkatora garden and Paharganj will be the area proposed for allocation to the Indian clerks, the press and other Government establishments. Due south of the forum the residence of His Excellency the Commander-in-Chief will be placed. Bound about the Viceregal estate and the forum lies the ground destined for the residences of the Members of Council, the Secretaries and other officials of the Government of India. . . . The fire station with its tower will be built to balance the lofty observatory buildings of the Jantar Mantar in the position shown on the plan. The avenues range from 300 feet to 60 feet with the exception of the main avenue east of the Secretariat buildings where a park-way width of 440 feet has been allowed. The widths of the avenues depend on the varieties of trees selected. In all main avenues it is proposed to arrange for running water with fountains at intervals as features. The principal avenues in addition to the main avenues are those running at right angles to the main east to west axis. Others form part of a system running from the amphitheatre to the railway station and Commander-in-Chief's residence, and from both the latter to the commemorative column. These . . . are the outer main sinews of the frame. The commemorative column . . . on the axis between Indrapat and Government House is the focal point of the roads and avenues on the park-way. A ridge drive . . . will be laid out. . . . Communications with the present city and Civil Lines will be by way of the avenue towards the Jama Masjid. Inside the city this bifurcates, one branch leading towards the King Edward Memorial while the other goes north towards St. James' Church and the Kashmere gate. The present civil station and the new city will also be connected by broad roads

running through the Sadr Bazar. . . . Sufficient areas have been provided for parks in the following places:—(a) the viceregal estate; (b) the park-way from Indrapat to the Secretariats; (c) the park round the Lodi tombs and Safdar Jang's Mausoleum; (d) the park area to the south of the club containing the golf and race-course; (e) the park between the new and the present city, roughly 1,000 yards in width; (f) the afforested ridge."—*Final report of the Delhi town planning committee, East India, Delhi (British Government Blue Book, Cd. 6880, pp. 5-7).*

Italy: Naples.—Rome.—"Warned, by the cholera epidemic of 1884, of the danger of over-crowding, the ancient slums in the heart of the city of Naples were torn down, by the order of the national government, the new zone known as the Rione vasta was planned for working people, and a zone was set apart for manufactories. [Moreover, Italy shows] one of the most important instances of city-planning . . . [in the modernization of] ancient city of Rome. The danger of floods from the Tiber has been removed by the construction of embankments of masonry, many streets have been widened, a public park has been laid out on the Palatine Hill, and walks and drives on the Janiculum, a tunnel has been driven through the Quirinal hill, the great via Nazionale has been constructed, many public buildings have been erected and the worst slum districts have been destroyed. Indeed, one of the most successful attempts to improve housing conditions has been made in the city of Rome. [Written in 1913.] . . . Conditions [had become] so bad that the city administration was aroused and an effort was made to secure better homes for the poor. The municipal council passed an ordinance remitting the taxes of new tenements for two years. It also provided for the formation of a corporation to undertake the building of model tenements as a philanthropic enterprise. The directors of this municipal tenement building corporation are appointed by the municipal council and serve without salary. The funds to be used in building the tenements are loaned to the corporation by the city, under an arrangement whereby the money is to be returned to the city in fifty years. . . . The genius of Rome's new tenements, however, is Engineer Edoardo Talamo, Superintendent of the Institute of Good Homes, a building corporation that has recently constructed a large number of tenements. . . . His genius bids fair to revolutionize housing conditions in his city. The houses built by Talamo's company are as a rule five-story tenements, so arranged in groups as to enclose a common yard. The tenements are built in three grades, the lowest grade for the families of the ordinary unskilled workmen, the second grade for the families of skilled workmen and the highest grade for people with good incomes. The plan followed in each case is the same. All the tenements conform to the most approved sanitary requirements."—H. M. Pollock and W. S. Morgan, *Modern cities*, pp. 48, 49.—Plans for the improvement of the city had been prepared for Pope Pius IX, who had begun to have them carried out before the revolution which created united Italy. After 1870 these plans were used as a foundation for the improvements which have been carried out and for those which are still to be carried out. Indeed the city is an excellent example of the difficulties which attend the replanning of ancient cities which are full of memories and traditions of the past. At first "buildings were torn down without sufficient thought and study, and replaced by great bizarre and poorly designed palaces, streets, and districts. It was in the air 'to

tear down'; and buildings, though often cheap and not too substantial, gave great opportunities for speculators. . . . But gradually a group of scholars and students rallied to oppose this group of careless destroyers, until at the present time they form by far the most powerful body of men that concern themselves about these things. They are great enemies of straight vistas and avenues, probably for the most part because by using the curved street they can avoid touching some fine monument or old historical spot. . . . As a matter of fact we find, in 1600 and thereabouts, great palaces like the Palazzo dell' Aquila in Rome . . . were destroyed to permit the working of some purpose of great importance. . . . A model was made from the river to the church (about 6 ft. long) connecting . . . several new elements of the plan of the city which are crying for improvement, and which readily harmonize with the rest of the scheme—in fact enhance it. One of these is the new 'Via del Parlamento'—a proposed street for which the property was condemned some years ago, and which is to be built shortly. This street, by accident, lines up with St. Peter's in such a way as to make the church visible from the Corso Umberto Primo, the main thoroughfare of the city, and at a point in the very heart of the city. This, should the houses before St. Peter's be removed, would bring St. Peter's into actual connection with the rest of the plan of the city, and would give it the fine, dominating importance that it deserves. Another element is the new Vittorio Emanuele bridge and the Corso Vittorio Emanuele, which have become . . . as important as any artery after the Corso Umberto Primo. This avenue crosses the river at 45 degrees to the axis of St. Peter's. At the point where the crossing takes place a piazza is suggested, thus forming a generous connecting point of many streets, and giving the Corso and bridge a termination worthy of their importance, as well as making the Corso Vittorio Emanuele traffic flow smoothly up to St. Peter's and to other points on that side of the river. . . . But if the problem of the old character of the streets is a hard one, that of the historical and æsthetic value of the buildings affected is a harder. Unfortunately, although there is some discussion about it, it seems as though Raphael died in one of the buildings to be torn down. Opposite to his averred house is a very small church, San Giacomo, of very little importance, but worthy of mention. . . . To-day we can better move, and reconstruct elsewhere, such buildings as are in the way of a project. In the old days they had no thought of moving them. . . . In proposing this tearing down of houses in front of St. Peter's, therefore, as can well be imagined, one encounters not only the arguments of the man who is honestly opposing you on the merits of your scheme, but also all those arguments that this 'movement' above described brings to bear on anyone who wants to change the existing state of things. . . . It is proposed that the houses and church (30 ft. front) in question be moved to the sections adjacent in the sides of the new street. . . . It is also proposed that the old Palazzo Aquila, torn down in 1600 in this neighbourhood, be rebuilt in this way, so as to retain even further the character of the street."—J. S. Pooley, *Proposed approach to St. Peter's at Rome (The Builder, v. 111, Dec., 1916, pp. 402-403.)*

United States: Lack of city planning in earlier history of the country.—Early plans of Washington (1791) and New York (1807).—"The American city has been inadequately planned. With the exception of Washington, there has been no realization of the permanence of the city, of

the importance of streets and open spaces, of building regulations, transportation, water-fronts, and the physical foundations which underlie the city's life. . . . New allotments and their intersecting streets have generally been planned by land speculators interested only in the sale of their property. They should have been laid out by the city as part of a comprehensive plan. This, in many cases, is an irreparable injury, for streets control the city as does nothing else. They make or mar its appearance. They determine its comfort and convenience. They form its circulatory system. Proper street planning is the first essential to a city plan. It is the irregular, crooked streets of Boston that lend picturesqueness to that city. Washington is dignified and commanding because of the carefully studied combination of streets and avenues, with a large number of parks and open spaces. New York is saved from the commonplace by Broadway, which cuts diagonally across Manhattan Island and expands at intervals into Union, Madison, and Longacre Squares. The historic streets of Europe—the Strand, Fleet and Regent Streets in London, the boulevards in Paris, the Ringstrassen in Vienna and Cologne, Unter den Linden in Berlin, the embankments in Budapest—are suggestive of the extent to which the city is dependent upon its streets. They are the commanding features of its life.”—F. C. Howe, *Modern city and its problems*, pp. 196-202.

“The city of Washington, D. C., is probably the most conspicuous example of a city that has consistently followed in its development a plan that was laid out at the beginning of its life as a city. After the site of the national capitol had been chosen in the spring of 1701, Pierre Charles L’Enfant, a French engineer, who had done service in the Revolutionary war, was chosen to prepare a plan of the town. With rare vision L’Enfant made a design that not only met with the approval of Washington and of the commissioners in charge, but meets the approval of the expert city planners of the present day. The ground-work of the plan is formed by a series of streets running east and west, crossed at right angles by another series running north and south. These rectangular streets are intersected by twenty-one avenues running diagonally through the city and converging at the Capitol, the White House and other centers and squares. As the streets are of generous width and the open squares large and numerous, the city has become famous throughout the world for its convenience and beauty.”—H. M. Pollock and W. S. Morgan, *Modern cities*, pp. 22-23.—“In 1901 a Park Commission composed of Messrs. Daniel H. Burnham, Charles F. McKim, Frederick Law Olmstead, Jr., and Augustus St. Gaudens, was created . . . for the purpose of obtaining a plan [to] enable . . . development of Washington to proceed on artistic as well as orderly lines. . . . The Park Commission applied themselves to a study of L’Enfant’s plan, and then, after inspecting the great cities of Europe, went to work to pick up the dropped stitches.”—L. Mechlin, *International studio*, 1907-1908, p. cix.—To this commission the city owes the removal of the railroad from the mall, the improvement of the water-front, the handsome railway station, Rock Creek Park, the sweep of parks toward the river, and the Lincoln memorial. This dignified memorial is extremely well-planned in relation to its setting and to the towering Washington monument.—See also CIVIC BEAUTY; DISTRICT OF COLUMBIA; WASHINGTON, D. C.: 1701-1800.—“In 1807 the Legislature of New York State gave the City Council the right to appoint commissioners to lay out the

city. The streets of lower Manhattan were already fixed; the most important to us was the old cow-path, later Broadway, which led out to the pasture which is now City Hall Park. The Old Boston Road too led out from where now Park Row and Chatham Square are found, on through the Bronx to Boston. The men appointed decided upon the grid-iron plan with many streets running east and west, fewer [avenues] north and south. . . . These east-and-west streets were generally to be sixty feet wide, about every tenth street one hundred feet wide. [See also NEW YORK CITY: 1807]. The great growth of the city to the northward has rendered the avenues all too few for the vast throngs of people and traffic, so long ago subways and elevated roads were built to relieve the congestion, and even many of the less used east-and-west streets have become one-way streets. . . . In 1866 the State Legislature called for a survey of the land as far north as One Hundred and Fifty-fifth Street. Much more attention at that time was given to topography. Upper and lower avenues appeared along the bluff by the Hudson River, rudimentary boulevards showed in the widening of Sixth and Seventh Avenues about One Hundred and Tenth Street, while three cross-streets—One Hundred and Tenth, One Hundred and Twenty-second, and One Hundred and Twenty-seventh—were all widened. In the meantime the street plan of Brooklyn was formed on a village basis and six district surveys were made. Seven diagonal streets were planned to aid traffic, only four of which were ever completed—Fulton, Flushing, Flatbush, and Hamilton Avenues. The district which is now the Borough of the Bronx was occupied by a group of villages and towns connected by numerous roads. It was very difficult to get unity in any way, but a plan was started in 1893 which has resulted in blasting, grading, cutting down and filling in, opening new streets and closing old. Its plan was formed before the consolidation of 1898, but after that section had become part of New York. The checker-board plan is carried out [modified] by such radial streets as Jerome Avenue, Westchester Avenue, and Boston Post Road.”—H. G. Preston, *City planning* (*Outlook*, Dec. 24, 1919, p. 543).

“In 1913 the Legislature of New York passed a law providing for commissions in cities to provide for (1) maps to include draining sewers, water system, and (2) location of public buildings, monuments, highways, parks, playgrounds. New York City immediately created such a commission and began work. Its real function has been the correlation of the different departments and the awakening of public sentiment to economic necessities and civic ideals. . . . After having formulated plans for a greater and more unified city, the committee went out of existence. The work, however, is . . . carried on by the City Engineer with helpers in the different boroughs. July 25, 1916, in accordance with permission granted by the Legislature of the State, the Board of Estimate and Apportionment passed a resolution embodying a most drastic zoning system. This resolution may be roughly divided into three parts: the first restricts the area of the ground which may be covered; the second regulates the height of buildings which may be erected; the third restricts the use of buildings in different sections. . . . By this new law there are clearly defined zones: First, for residences, including churches, hospitals, libraries, schools, museums, but rigidly excluding all forms of business and factories; second, the business section, which excludes factories and certain kinds of offensive or noxious concerns; a third, which is unrestricted.”—*Ibid.*, pp. 543-544.

United States: Progress.—Conscious planning for the future by various cities.—First official city plan commission (1907).—First city planning exhibition (1911).—Improvement plans by Chicago commission (1914).—Kansas City (1916).—"In the course of what has somewhere been called 'The American Renaissance' the determination that American cities shall be developed in a more convenient and more orderly way has been pronounced. This determination is causing the addition of two new bureaus to municipal governments—one the City Planning Commission, and the other the Art Commission. The work of the two bodies . . . is essentially different, though each is supplementary to the other, as well as to the city departments already created. The function of the City Planning Commission is to foresee and forecast. . . . When it has prepared plans . . . for the city's growth during the next decade, or during several decades, . . . and has presented them to the authorities and to the public, the plans are turned over for execution, as occasion arises, or opportunity offers, by the proper department, generally called the Department of Public Works. The latter department prepares the working plans and submits them to the Art Commission. The work of the City Planning Commission and of the Art Commission is thus separated by the interposition of the department, charged with the work of construction. The function of the art commission is, moreover, essentially critical. . . . It is essentially a jury, whose duty is to say yes or no in regard to the æsthetic qualities of designs."—A. W. Crawford, *Art commissions and the future of American cities* (*Journal American Institute of Architects*, Dec., 1915, pp. 528-529).—"Thirty or forty years ago [written in 1910] . . . it was decidedly the rule that plans appeared on paper and stayed on paper. . . . There was no official recognition that any city had a future until 1907, when the first official City Plan Commission was appointed . . . in Hartford, Conn. Until then no official body existed anywhere [in America] whose express duty it was to forecast the city's growth. . . . [In 1910 there were] upwards of two hundred and fifty City Plan Commissions. In 1803 three important plans appeared on paper. The fact that those three plans were realized marks that year as the definite beginning of the modern city planning movement in America. One of those three plans was . . . for the outer park system of Boston, a plan far surpassed in extent by the existing park system of to-day. A second was the proposed inner park system of Kansas City, which again is to-day . . . upwards of twice the extent [then] proposed. The third plan was one prepared in Chicago for a grouping of buildings around a formal center occupied by water. The group was built according to the plan and the whole world acclaimed the magnificent triumph of the Court of Honor of the World's Fair at Chicago. The scales fell off America's eyes; they asked the very obvious question: 'If we in America can do this in staff, why not in stone?' The city of Cleveland, fronting on one of the Great Lakes, as does Chicago, asked that same question some five years later. . . . In Cleveland . . . a commission was employed to prepare a complete group and . . . three of the buildings [have been] completed on the sites chosen by the commission. . . . In 1901 the well known Washington Plan was presented. Three groupings of public buildings were suggested; seven existing buildings have been retained in accordance with the recommendation of the Senate Commission. Fourteen more have been erected or authorized in accordance with that plan.

It is a common observation that American cities do not give their public buildings sufficient settings. Each building should have sufficient open space in front of it. The Civic Center secures an economic use of ground in this respect, because, instead of each building having its own setting, the one common centre does for all the buildings around it. . . . [In 1912 the construction of a civic center in San Francisco was begun, and planned to conform with the city plan as a whole.] A group plan was prepared for a central open space with four buildings on each of its sides, and four buildings occupying each of the four corners diagonally opposite the square so as to shut in the vistas."—A. W. Crawford, *Actual accomplishments in city planning* (*American Journal of the Engineers' Club of Philadelphia*, Aug., 1919).—"At the outset an area of about twelve blocks was designated as the scope of the problem to be solved by the Architectural Board. The site of the old City Hall, the nucleus of the study, was a triangle of inordinate size, blocking the through traffic circulation of four streets. . . . The final development includes about thirty-six acres, and has cut the great triangle into rectangular streets. To the west a great plaza has been created. . . . The plan in its entirety is in the form of a Roman Cross. . . . The heart of the cross is the Plaza . . . [which] is laid out in lawns with flowers and formal trees, and architecturally embellished with foundations, balustrades and sculptured groups. While . . . this undertaking . . . presents an intensive local study in city planning . . . its relation to the city plan as a whole was considered and appreciated. . . . Within it lies the embryo of a great boulevard, which shall some day stretch to the west and give access to Golden Gate Park and the ocean beyond."—J. Reid, Jr., *San Francisco civic center* (*Journal American Institute of Architects*, Aug., 1916, p. 336).—See also SAN FRANCISCO: 1906-1909.—"In . . . Springfield . . . the first complete group system is in existence—an honor gained by that small town in Massachusetts. In 1911 we held the first [American] City Planning Exhibition; . . . and it is astonishing to learn how many of the numerous paper plans shown there are now in course of execution. Take, for instance, the City of Des Moines, [Ia.]; a model showed a proposed river front improvement, which was in effect a grouping of public buildings on both sides of the river. Since then four public buildings [have been] completed in accordance with the plan . . . and a Federal Court House, an Art Museum and Municipal Court Building are in contemplation. Two . . . of the four bridges have been constructed. . . . River walls have been constructed and the river front has been 75 per cent completed. . . . [The plans made for the city of Chicago give another example of what may be done for a city which has already grown to large proportions. After the project for widening Michigan Avenue had been disposed of, the Chicago commission] took up the proposed . . . Union Terminal project. Its work on that case secured . . . important bridge, viaduct, and street improvements. The latter includes the widening of Canal Street from eighty to one-hundred feet for more than a mile in the heart of the city. The commission then gave its attention to plans for the reclamation of five miles of lake shore to the southward of the city's center. These involve the establishment of 1,550 acres, built out in the lake to form lagoons, playgrounds, and driveways, and to provide for future harbor needs. . . . Forest preserves, . . . and the construction of good roads were approved by the people in referendum. [November, 1914]."—W. D. Moody,

How to go about city planning (Journal American Institute of Architects, pp. 305-396, 398).—See also CHICAGO: 1914-1918.—“In that evolution of the modern town, as seen in the good laying out of roads and streets, and the co-ordination of open spaces, Kansas City appears to me to have reached a higher point than any city I have visited in the United States. The Town Planning movement has come to it at the right moment. Like most American cities, it has the marks of rapid . . . development—a city of 350,000 inhabitants has come into being within little more than half a century. But the Town Planning ideas have come to Kansas City just at the [right] moment. . . . The area of park and boulevard within the city—its lungs—embrace over 2,118 acres. . . . Good planning is not only found in the western portions of the city, where the residential estates of the wealthy, such as the ‘Country Club District,’ are located. . . . [On the contrary the policy in well-settled localities] has been to provide play-grounds for the children, tennis courts and baseball diamonds for older youth. . . . Every part of the city has its playgrounds. . . . Holmes Square is less than three acres in extent, but it has its free bath, its gymnastic apparatus, its sand court, its bubble fountain. . . . The development of this playground in the midst of a tenement neighborhood has changed the children from little vandals into self-appointed guardians of the place. . . . Centres of congested population, growing more aggravated yearly, were abolished to make room for parks and boulevards.”—C. R. Ashbee, *Kansas City, Missouri: the influence of a park system (Town Planning Review, Apr., 1916, pp. 233, 236)*.—In 1893 a plan was made, of which there have been modifications; but in the main the system, which embraces the whole city, was laid out in 1893. This plan includes a parkway, with two arms, which cuts across the gridiron plan and also provides diagonal traffic communications.

United States: Development in specific features.—Street systems.—Water fronts.—Park systems.—Garden suburbs.—Town forests.—“Corrections in the street systems of cities was a feature of work in European municipalities during the Nineteenth Century. It will be a marked feature in American municipalities during the Twentieth Century. In this respect Philadelphia is the leader. The greatest accomplishment of any city in America during the Twentieth Century . . . is the construction of the Fairmount Parkway. . . . But, in addition, Philadelphia has made another important improvement to its framework. Formerly there were along the Delaware water front streets only forty or fifty feet in width. To-day a magnificent traffic way, at its narrowest 150 feet wide, is in use for two or three miles, and is being carried along the whole Delaware water front. Chicago . . . [has made] two important improvements of its street systems, [in] widening Michigan Avenue to connect the north and south Lake fronts [to a maximum of 140 feet]; and in . . . widening Twelfth Street, for a distance of two miles, to a maximum width of 118 feet. Another important street improvement is the widening of Seventh Avenue in New York City, to Varick Street, and the widening of the latter to Broadway. In Minneapolis two important street links have been constructed. One from the south-west to the north-east . . . [and] another from the south-east to the north-west. We next come to the consideration of the river fronts of municipalities. . . . We are just beginning the reclamation of America’s water fronts. Harrisburg has reclaimed its water front by building a concrete river wall, in the form of steps, for a distance of 11,140 feet, . . .

and the bank above the wall is well planted. . . . The Charles River Embankment [in Boston] is of course a notable improvement. . . .

“The New York Central Railroad in New York City has been so constructed that the real estate over the tracks is used for great terminals, warehouses, office buildings, hotels and the like. The United States Post Office in New York is an example; the whole structure is built over the Pennsylvania railroad tracks. Turning to municipal park systems, we take up an element of civic design in which American cities have no competitors in foreign countries. The Boston system is the greatest outer park system in the world. Kansas City leads in so far as an interior park system is concerned. . . . The newer growth of Minneapolis is around a series of five beautiful lakes, . . . the fringes of which have been preserved as parks; four of the lakes are connected by park waterways. There are other respects in which, within recent months, we have gained the leadership over Europe. In 1914 a visit was made, by a lot of people interested in housing, to the fifty-eight garden suburbs in England. We had none in this country in 1914 that compared with them. . . . Yet to-day Atlantic Heights, at Portland, Maine, is regarded as better than the . . . English garden suburbs, . . . [while within 35 or 40 minutes of Philadelphia] are such garden suburbs as Yorkship Village, Buckman, Sun Hill, Sun Village [and others].”—A. W. Crawford, *Actual accomplishments in city planning in America (Journal of the Engineers’ Club of Philadelphia, 1910)*.—The little city of Walpole in Massachusetts has planned a town forest, for which 150 acres of land were donated. “It is estimated that forty or fifty years from now the forested area will have a timber value of about three thousand dollars per acre. Meantime roads and paths laid out through the forest provide opportunities for study and recreation for the entire town. Other towns in Massachusetts are awakening to the advantages of the community forest.”—W. D. Moody, *How to go about city planning (Journal of American Institute of Architects, Sept. 1916, p. 398)*.—“During 1920 Cook County, Ill., planned to spend \$1,250,000 for the general improvement and maintenance of its Forest Preserve. This Preserve has been extended until it now covers 15,000 acres girdling Chicago, and extending from end to end of Cook County.”—P. Reinberg, *County forest that surrounds Chicago (American City, July, 1920, p. 143)*.

United States: Industrial villages.—Government planned villages, the result of World War conditions.—“While the United States has no ‘Garden City’ like Letchworth [in England] to which it can point and no development of the ‘garden village’ as complete and significant as Port Sunlight it has had many industrial housing schemes carried out during the period of the garden city movement in England. These housing developments are of great variety in origin, extent and merit. . . . As examples, I give below a list of a score of housing enterprises selected as fairly representative of them all. They are Goodyear Heights, Akron, O.; Fairfield, Ala.; Garden Suburb, Billerica, Mass.; Overlook Colony, Claymont, Del.; Morgan Park, Duluth, Minn.; Civic Buildings Association, Flint, Mich.; Framingham, Mass.; Hopedale, Mass.; Modern Housing Corporation, Janesville, Wis.; Kingsport, Tenn.; . . . Waterbury Homes Corporation, Waterbury, Conn.; Pullman, Ill. For most of these development there was after a fashion, a general plan or lay out. In some it was the gridiron, and in many . . . it did not show great skill or merit. In only a few . . . was there more than a street

scheme. . . . Practically speaking there is no overcrowding. . . . in these industrial villages; . . . so far as mere open spaces go, there has usually been ample provision; . . . but in many cases there has been no really attractive opportunity afforded for social recreation. Notwithstanding the fact that these industrial villages appear to meet many of the essential requirements of modern town planning, one does not recall many of them with satisfaction. . . . The town planning has not, as a whole been well done. . . . The houses and other buildings have not been well placed or grouped, and there is no real recognition of street and site planning. . . . More attention should be given to village and town sites. . . . Skill should be employed in the sub-division of the area . . . and in some locations even small farms, public lands, playgrounds, open spaces, parks, etc., including the best natural features of the property should be publicly preserved and developed."—J. Nolen, *Industrial village communities in the United States (Garden Cities and Town Planning, Jan., 1921, pp. 6-9)*.—"The war has produced in the United States upwards of fifty groups of buildings, in villages, towns and suburbs. . . . No one foresaw such a result of the entry of the United States into the war, . . . [but] in remote locations, chosen for the manufacture of explosives and similar products, it was an absolute necessity to build places in which workmen could live. In locations near cities economic necessity . . . [produced the same effect] and the . . . Government was forced to appropriate \$150,000,000 for housing. The National Conference on City Planning, . . . the American Institute of Architects, . . . the National Housing Association . . . offered their services, and the offers were accepted. Generally an architect, a town planner and an engineer were compelled to produce a unified plan working together from the start. . . . At the date of the armistice fifty towns, villages or groups had advanced well toward . . . completion. . . . These offer for the United States many of the convincing characteristics of the garden village. . . . To one who likes a suburban type Buckman, near Chester, Pennsylvania or its neighbor, Sun Hill, or Atlantic Heights. . . . will appeal. . . . Yorkshipp Village has more of the character of the city than the 'suburb' . . . [and] is easily adaptable to city growth. It is a city plan, rather than a village plan. One feels constantly . . . the sense of a unity of design. . . . The city of Camden, N. J., lies to the north; and the main entrance . . . is by a bridge, crossing a stream, which leads to a plaza; . . . following the latter one reaches the Central Square . . . 300 feet each way, and from it two diagonal streets. . . . A large school yard space is provided at what will ultimately be about the centre of the village, opposite a general recreational field about 350 by 400 feet in area. . . . The houses, of colonial type, contain four, five and six rooms. Not infrequently there are small open spaces back of the houses [to] serve as playgrounds, semi-circular parks are provided, . . . [and the whole] has been endowed with an extraordinary amount of attractiveness."—A. W. Crawford, *Yorkshipp village (Garden Cities and Town Planning, Jan., 1921, pp. 9-11)*.

Aeroplane in city planning.—**Aerial photography.**—"Since the armistice [1918], aerial photography has been used in England for civil purposes, but not as yet in the preparation of town-planning schemes, though it has been used for purposes of site-planning and building surveys. In France many photographs have been taken from the air by the French Army Aerial Photographs Service, showing the extent of the devastation wrought by

invading armies. Captain Bouché of this Service says: 'Aerial photographs are most valuable to show the present use of land, the density of population and the relation of open space to built over space. In the devastated regions they have been of the greatest help in making surveys. . . . The matter of aerial photography was considered of such interest as to be the subject of discussion at the sessions of the First Inter-allied Town Planning Conference held in Paris [in] June [1919]. . . . In many places [in the United States] city planners have learned to use in their work aerial photographs that have been previously taken. . . . Planning studies at Dallas, Tex., Chicago, Ill., St. Paul, Minn., Flint, Mich., Niagara Falls, N. Y., and other places, have been considerably assisted by this means. Apart from photography, of what use can the aeroplane be to the city planner? The author's flight at Green Bay, Wis., was largely in the hope of settling this point—an effort to see the city with the eye of a city planner. . . . A view of a city from above gives to the city planner its appearance as a whole. . . . The city planner making a flight over a city can correct his maps in the air, mark the limits of the built-up area, etc., and altogether form a fairly good estimate of the correctness of the maps. From the air, the value of space, fresh air and light are realized much more than on the ground, . . . parks, open spaces and trees are seen as distinguishing landmarks. Buildings seen in bulk suggest questions at once—open space? residences? adequate roads? factory locations? and so on. One strives to reconcile all these features in the scheme of things. No amount of map study could place them in the same relationship one with the other and with the city as a whole.

"Aerial observations have very special spheres of usefulness in connection with the residential and industrial study of a city. Dealing first with a city's central area, it is possible to analyze the modification and development of existing groups of buildings and discover the influence on their surroundings. . . . In connection with residential location there is the opportunity to see the environs of a city in such rapid succession that their relative values for housing are easily appreciated. . . . Attention can be given to the question of open reservations around a city,—park, afforestation, or agricultural belt,—and these will again be determined to some extent by the nature of the land and the preservation of any distinct natural features. Industrial location, dictated largely by railroads, rivers, harbors and topographical elements, should be considered with a tentative plan for improvement roughly in mind. From the air it is possible to test the practicability of a plan for industrial or railroad revision, making such alterations as seem necessary, and perhaps recasting the entire scheme."—G. W. Hayler, *Aeroplane and city planning (American City, Dec., 1920, pp. 575-579)*.

"In order that the city planner may make his studies, many kinds of maps and drawings are necessary to show the relation of one section of the city to another. Natural as well as artificial features must be shown. . . . A photograph, however, shows much more clearly than any map both natural and artificial features, and it is here that the map made by aerial photography surpasses any map drawn by hand, because it shows the landscape with its innumerable details and enables the city planner to visualize the scene. In the zoning of a city, the 'mosaic' or aeroplane map is particularly valuable, because it shows so clearly the existing use of the land, the height of buildings, shadows cast by the very high buildings, the relation of the

streets and highways one to another, the absence of direct connecting streets, the railway lines, terminals, industrial districts, etc. . . . Dallas is particularly fortunate in possessing such a map. . . . [made] in March, 1920. Prominent streets were selected as guiding lines, and the giant bombing plane, adapted to a more peaceful occupation than bombing, flew back and forth along these parallels, accurately recording every detail of the landscape. . . . The Dallas map is about 5 feet by 8 and includes 52 square miles of territory. This covers areas that are not as yet included within the city limits, but which some day will be occupied by the city. . . . Primarily the map was made for the City Planning Commission, to be used in its work. . . . [It was designed to use at first] in connection with the zoning of the city, and

CITY STATE, Greek, term applied to the ancient cities of Greece. "Athens, Corinth, Sparta, were more than cities. They were city states; at times powerful empires. Each city was an independent commonwealth, declaring war and making peace. It knew no outside sovereign, no state or nation of which it was a part. It made its own laws and the laws for the surrounding territory. The city was sovereign. In this it differed from the cities of today, which are dependent upon the state or the nation, for with us the city is a political agency of a larger community, while the ancient city imposed its will on dependent territory which it held in subjection. Athens extended its sway over the entire Ægean Sea. It became an empire. But it still remained a city state."—F. C. Howe, *Modern city and its problems*, p. 13.—See also ATHENS; ELAM; SPARTA; and other specific cities; EUROPE: Ancient: Greek civilization: Political development; GREECE: Character of Greek colonization; B. C. 8th-6th centuries; B. C. 404-359.

CIUDAD RODRIGO, city in western Spain in the province of Salamanca. During the Peninsular War it was captured by the French under Marshal Ney in 1810, but recaptured in 1812 by the British under Wellington. See SPAIN: 1810-1812.

CIVES ROMANI AND PEREGRINI.—“Before the Social or Marsic War (B. C. 90) there were only two classes within the Roman dominions who were designated by a political name, Cives Romani, or Roman citizens, and Peregrini, a term which comprehended the Latini, the Socii and the Provinciales, such as the inhabitants of Sicily. The Cives Romani were the citizens of Rome, the citizens of Roman colonies and the inhabitants of the Municipia which had received the Roman citizenship.”—G. Long, *Decline of the Roman republic*, ch. 17.—See also ROME: Republic: B. C. 90-88.

CIVIC BEAUTY.—“To beautify a city means to make it perfect, perfect as a city, complete in serving a city’s purposes.’ In these words, John Nolen, in ‘Replanning Small Cities,’ written especially for the cities of North America, sums up and crystallizes all the reasons and ideas which, however vaguely, lie at the back of the modern city planning movement, and in the same breath gives a reminder that city planning does not necessarily connote civic beauty. It is conceivable that a city might be laid out with mathematical exactness, with wide airy streets, open spaces, strongly built houses, schools and public buildings, the most modern system of sanitation, and at the same time be without a trace of beauty, with no care for the mental health of its inhabitants. And yet, the town should offer something more than work and shelter, for the soul of man cries out for beauty, whether we admit it or whether we do not, ‘The city teaches the man.’ It is ‘one big organism, and itself a simple work of art, it is, in fact, the master work by which others should be judged—What do they do for the town? It is a university for production, a cradle of life and a school of manners.’ The demand for beauty in surroundings is inherent. It was not, for instance, by accident that ‘Greek culture built itself out in lovely cities, [and that] these cities became the objects of a passionate regard, wells and reservoirs of community spirit and strength.’”—W. R. Lethaby, *Town itself*, in *Town Theory and Practice* (C. B. Purdom, ed.), p. 49.—Kansas City probably comes nearer to this ideal than any other city in North America, but the small lake cities of Switzerland display more of the effect of conscious striving for beauty in civic surroundings than any other of our modern cities. “In a recently published volume, Frederick Harrison, the English critic and essayist, has given apt expression to the charm and achievements of some of these Swiss cities. He says, ‘I hold Zurich, Basle, and Geneva to be the model cities of our age—the fine type of what cities will one day be in a regenerated age—the true type of civic organization, having sites of rare beauty and convenience, spacious streets and avenues, noble public walks and gardens. . . . Of the mall, I hold Geneva to be the finest type of a rational city that Europe possesses. Its modest population of about 120,000 is as much as is needed for high civic life. Its wonderful site, astride the most beautiful rushing river in our continent; its calm and spacious aspect at the mouth of a grand lake large enough to look like an inland sea, and yet not so broad as to cease to be a

lake; its superb view of the snow chain of Mont Blanc; its beautiful gardens, bridges, and promenades; its history of two thousand years, its intellectual and spiritual memories of four centuries; its record as the asylum of the oppressed; its ingenious and studious people—all this makes Geneva the very model of a true city. A true city, where, as in Athens, Florence, Venice, Antwerp or Ghent, of old, men can live a wholesome civic life, . . . a beautiful, well-ordered, free, organic city.’”—J. Nolen, *Replanning small cities*, pp. 148, 149.—Nevertheless, there is much to admire in many of the cities of both the old and the new world. It may be in the town gardens so important in Europe, of which the Mirabel Gardens of the old Austrian town of Salzburg, are a good example. The gardens are entered through the groined arches and courtyard of a Cardinal’s ancient palace. Immediately behind these there is a long garden enriched by much beautiful sculpture and vases, leaving a level central glade which focusses onto the romantic old castle at one end and the town at the other; beyond this level stretch of garden the ground rises, the slopes being planted with many pleached alleys and groves which invite to shelter.”—T. Mawson, *Civic art*, p. 1151.—The beauty may be in that of old buildings, which were planned and constructed by men who deemed that they were building for posterity, buildings which have become the focus of modern planning; it may be the beauty of surroundings to which builders of our time, as well as those of old, are striving to conform. Descriptions of a number of these cities have been chosen from here and there, not at random, but in order to show that the love of beauty is not confined to one country or one clime, and that the best loved cities are those which most abound in civic beauty.

Brussels.—Brussels, the “ancient capital of the Province of Brabant . . . has come to take its place amongst the most beautiful and charming capital cities of Europe. . . . Brussels is a city of shady boulevards, open spaces, and pleasant parks as is Paris; and the beautiful Bois de la Cambre on its outskirts compares very favourably with the world-renowned Bois de Boulogne as regards rural charm and picturesqueness. . . . The last thirty—even twenty—years have seen many changes. During that period the sluggish little River Senne, which once meandered through the city . . . has been arched over, and the fine Boulevard of the same name, and those of Hainaut and Anspach have been built above its imprisoned waters. . . . [Of the fine buildings in Brussels] none excels the Hôtel de Ville [town hall], which is certainly one of the most interesting and beautiful buildings of its kind in Belgium. It is well placed on one of the finest medieval squares in Europe, and is surrounded by quaint and historic houses. . . . This most beautiful Hôtel de Ville, with its Late Gothic façade . . . and with a beautiful and elegant central tower 370 feet in height, was commenced . . . either in 1401 or 1402. . . . Scarcely a room of this beautiful and historic building but contains some treasure of art which tempts not alone the student, but even the casual visitor, to linger. . . . It may, we think after considerable experience, be safely said that no Grand Place in Northern Europe is so rich in ancient and historic houses as that of Brussels, though most of them are careful restorations, according to the old plans, of the Guild Houses damaged or destroyed by Villeroi’s cannonade. Opposite the Hôtel de Ville stands the famous *Maison du Roi*, or Broodhuis (Bread House). . . . The present building dates from 1514 onwards for a period of about ten years,

and the style of its architecture is largely transition from the Late Gothic to the Renaissance. . . . The *Musée Communal* is now housed there. Most of the other Guild Houses, which form so picturesque and interesting a feature of this fine square . . . were erected, or practically rebuilt, at the end of the seventeenth or during the early years of the eighteenth century. . . . Many of the houses are richly ornamented with gilding, and one of the quaintest is the 'Frégate,' or 'Hall of the Sea Captains,' the gable of which has been constructed to resemble the stern of a large vessel of the seventeenth century. . . . The Cathedral at Brussels . . . dedicated jointly to Ste. Gudule and St. Michael . . . stands overlooking the city with its two fine twin western towers dominating the neighbouring streets. . . . Ste. Gudule stands out the dominant note of this portion of the city—beautiful and serene. . . . Of the other fine and historic buildings which Brussels boasts, the Palais

Brussels, a place where the triumphs of art through many centuries survive, should be surrounded by such natural beauties as it is. Northward one has the beautiful Royal Park of Laeken, with its palace built in 1782 by Montoyer. . . . Southward lies the exquisite Bois de la Cambre, a portion of the old Forêt de Soignes, now a beautiful park laid out somewhat on the lines of the Bois de Boulogne, but wilder in parts."—C. Holland, *Belgians at home*, pp. 167-168, 173, 176, 178-179, 187-188, 190-191. —See also BRUSSELS.

Budapest.—"Budapest captures from the outset. Nor are first impressions of delight diminished on fuller acquaintance—for the place grows on us. . . . A magnificent site for a great city has indeed been finely utilized at this point of the Danube, where three towns have been joined to make the kingdom's capital. . . . [In the last quarter of the nineteenth century] Buda and O-Buda on the right bank and Pest on the left were formed into

PRINCES STREET, EDINBURGH

One of the most beautiful streets in the world

du Roi stands on the southern side of the beautiful park, in which there is a theatre, 'Vauxhall' garden, ponds, and tree-shadowed walks. . . . The imposing Palais de Justice stands on the Place Poelaert, named in honour of the architect of these magnificent law courts. . . . The buildings cover an area larger than that occupied by St. Peter's, Rome, and, indeed, form a magnificent monument of civic munificence. The huge block . . . is surmounted by a cupola, which is supported by colossal statues of Justice, Law, Power, and Clemency. . . . The art treasures of Brussels, enshrined in the *Musée Royal de Peinture Ancienne et de Sculpture*; in the handsome *Palais des Beaux Arts*; the *Musée Moderne de Peinture*, in the *Ancienne Cour*, once the residence of the Austrian Stadtholders of the Netherlands, adjoining the Royal Library; and the *Musée d'Antiquités et d'Armures*, erected in 1381, and used by the Duke of Alva as the Belgian Bastille, which has had its vaulted chambers skillfully adapted for its present purpose, are celebrated throughout the world. They one and all contain priceless treasures. . . . It is not unfitting, we think, that a city with such an historic past as

a civic whole; and their names combined in one. . . . The progress Budapest has made . . . is extraordinary. Wandering about its broad streets and squares, its 'Ring' streets, and promenades, we are struck again and again, not so much by the old buildings, but by the grandeur and boldness of the new. . . . Buda (Ofen) on the right bank, is the oldest part of the great city. It was near here that the only Roman legion stationed in the province of Lower Pannonia had its headquarters; the ancient place as revealed by excavation may be visited, and a small museum of relics seen at Aquincum, a short distance to the north of O-Buda (Alt-Ofen). . . . So great was the devastation [wrought in Pest by the Danube flood of 1838] that we may well marvel over the energy and determination of the people who set about rebuilding the place. Indeed, it was said when the new Pest began to rise where the old had been ruined that, but for the terrible loss of life, the disaster was a blessing in disguise, so boldly was the new town planned, so solidly were the new buildings designed. Since then it may be hoped that the improvements of the Danube for navigation have also had the effect

of greatly reducing the chance of any repetition of such a visitation. . . . It is the river that inevitably draws one; the river to which this strangely fascinating city owes no small measure of its fascination. Even when we have been up and down its broad streets, and its 'Rings'; have visited the fine museums; have inspected some of the many statues; . . . have wandered about the attractive *Városliget* or public park, it is as though we were insensibly drawn back to the Danube, to the lovely park-like Margaret's Island, . . . to the quays. . . . Here, too, as has been suggested, are to be seen some of the finest buildings of a city remarkable for such. Notably, first of all, the beautiful Parliament House, which remains in memory as a wonderful range of spired buildings with something of the delicacy of lace-work; the substantial Renaissance Academy; and such palatial offices as the great Gresham building. . . . The handsome bridges form a notable feature of the Budapest Danube."—W. Jerrold, *Danube*, pp. 204-206, 215-216.

Dublin. See DUBLIN: 1801-1908.

Paris.—The destruction of the Tuileries opened up the "wonderful vista . . . from the old Louvre right away to the Arc de Triomphe—probably the most extraordinary and beautiful civilised, or artificial, vista in the world. . . . The Arc de Triomphe du Carrousel, at the east end of the [Tuileries] gardens, is a mere child compared with the Arc de Triomphe de l'Etoile (q. v.), which stands there, so serenely and magnificently, at the end of the vista in the west, nearly two amazing miles away; it could be placed easily, with many feet to spare, under that greater monument's arch, . . . but it is more beautiful. . . . It is not until one has walked through the gardens of the Tuileries that the wealth of statuary in Paris begins to impress the mind. . . . They shine or glimmer everywhere, as in the Athenian groves—allegorical, symbolical, mythological, naked. The Luxembourg Gardens . . . are hardly less rich, but there one finds the statues of real persons. Here, [in the Tuileries] as becomes a formal garden projected by a king, realism is excluded. Formal it is in the extreme; the trees are sternly pollarded, the beds are mathematically laid out, the paths are straight and not to be deviated from. None the less on a hot summer's day there are few more delightful spots. . . . The Champs-Élysées were planned and laid out by Marie de Médicis in 1616, and the Cours la Reine, her triple avenue of trees, still exists; but Napoleon is the father of the scheme which culminates so magnificently in the Arc de Triomphe. . . . The Avenue du Bois de Boulogne has the finest road in what is, so to speak, the Marais of the present day. . . . Surely there never was, and could not be, a more beautiful city site than this anywhere in the world—with its wide cool lawns on either side, and its gay colouring, and the Bois so near. . . . The Bois de Boulogne, . . . began its life as a Paris park in the eighteen-fifties. Before that it was a forest of great trees, which indeed remained until the Franco-Prussian war, when they were cut down in order that they might not give cover to the enemy. That is why the present groves are all of a size. I cannot describe the Bois better than by saying that it is as if Hyde Park, Sandown Park, Kempton Park and Epping Forest were all thrown together between Shepherd's Bush, Acton and the river. . . . For the Avenue d'Alexandre III., as for the Pont d'Alexandre III., Paris is indebted to the 1900 Exhibition. These are her permanent gains and very valuable they are. Of the two white palaces on either side of this green and spacious Avenue, that on the right, as we face the golden dome of the Invalides, is the home of the Salon and of

various exhibitions. . . . If, however, one is walking beside the canal in the other direction, up the hill instead of down, one will soon be nearer the . . . Parc des Buttes-Chaumont. The Parc des Buttes-Chaumont is sixty acres of trees and walks and perpendicular rocks and water, the special charm of which is its diversified character, rising in the midst to an immense height made easy for carriages and perambulators by a winding road. It has a deep gorge crossed by a suspension bridge, a lake for boats, a cascade, and thousands of chairs side by side, touching, lining the roads, on which the maids and matrons of La Villette and Belleville sew and gossip, while the children play around. The Parc was made in the sixties: before then it had been a waste ground and gypsum quarry—hence its attractive irregularities."—E. V. Lucas, *Wanderer in Paris*, pp. 122, 124, 127, 141, 145-146, 149, 314-315.—"The Arc de Triomphe is a fine object-lesson. It is a work of art in a most beautiful setting. From the top of it is a magnificent view of Paris and one obtains a splendid notion of the twelve avenues that radiate from it. . . . Versailles is indeed a name to be conjured with. Once the capital of France, it is the place where treaties of peace between England and the new-born American republic and between Germany and France were signed. Here is a gorgeous palace, with magnificent works of art showing the history of France in visible form, here are the rooms of Marie Antoinette and Madame de Maintenon; here is Lebrun's famous picture of Marie and her children and Ponce's Napoleon at the tomb of Frederick the Great. Here are the *chambre des glaces* and other splendid rooms manifesting a wealth of art and taste and elaborate works from the sculptor's chisel."—H. M. Pollock and W. S. Morgan, *Modern cities*, pp. 88, 108-109.—See also CITY PLANNING: France; VERSAILLES.

Prague.—"From the Belvedere of Prague one gets the most satisfying general view of the architecture of the capital. 'The great rocky platform of the Hradcany to the west with its immense palace capped by the graceful apse and the lofty tower of the cathedral, together with the Romanesque spires of the Benedictine abbey of St. George, and the huge round tower of Daliborka with its grim associations rising sheer out of the valley in the foreground. The great river with its noble old bridge, and Gothic towers in the centre, and the countless spires, domes, and towers of the Old Town to the east, the craggy rock of the Vysehrad to the south, cannot fail to raise in the mind expectations of a rich architectural treat. . . . The cathedral, important and beautiful, is only the choir and tower of what would—if completed—have been a noble church, but at present it is but a fragment, mutilated and injured.' . . . The noble Charles bridge, which spans the Vltava by sixteen arches, is one of the choice bits of architecture in Prague. At either end are graceful towers adorned with niches and panelling, and the buttresses of the bridge are further adorned with twenty-eight statues of the saints, the bronze statue of St. John of Nepomuck being in the middle of the bridge. The Old Town Hall, with its stately tower, curious clock, and graceful chapel, although largely rebuilt during the last century, is in the Gothic style of the original building. Near-by is the Tyn church . . . with its two picturesque western spires. The vaulting internally has been modernized, but there is a fine bronze bas-relief representing the resurrection over the south door."—W. S. Monroe, *Bohemia and the Cechs*, pp. 315-318.

Stockholm.—"What strikes one most in . . . [Stockholm], next to the shining expanses of water

visible at every turn, is the large amount of verdure interspersed among the buildings. Not only is the forest within a stone's throw of the last houses on the outskirts, forming a dark background to the city, running down to the banks of the Mälär and the shores of the islets in the estuary, but, in the midst of the town, parks and planted spaces are met with everywhere. Over 2500 acres of the area covered by the town consist of parks and gardens. . . . On the central island where the Mälär joins the sea, . . . standing on a height in the very middle of the town and meeting the eye from all parts of it, rises the King's Palace, a master work of Tessin the younger, in the Italian Renaissance style. It occupies the site of the Viking fortress, round which Stockholm grew up. . . . A Monumental Bridge over the Mälär Stream unites the quay before the Palace with the large square opposite, which takes its name from the equestrian statue of Gustavus Adolphus in its midst. . . . The old church at the east angle of the square, St. James's, one of the oldest in Stockholm, has been modernised and beautified within and burnished without. But nothing can alter its massive mediæval structure, with its square tower, surmounted by a cupola rising out of the middle of the edifice and ending in a turret."—O. G. von Heidenstam, *Swedish life in town and country*, pp. 66-67, 71-73.

Vienna.—"There are two centres in Vienna, the one in the heart of the city, in front of that wonderful building with its high, tapering spire, St. Stephen's cathedral, that for seven hundred years has been a holy shrine of the Viennese. . . . The other centre of Vienna is in the beautiful garden space on the Ring, where rises up yet another tall spire over the handsome Rathaus; and not far off is the classical buildings wherein sits the Reichstag. . . . A statue of Pallas Athenæ rises before the Greek portico of the Parliament House, a statue that has given opportunity to the wits of Vienna to say that they have placed all the learning outside the building, but the *coup d'œil* from this statue of all the great and handsome buildings around, with the lovely well-kept gardens surrounding them, is one difficult to surpass for beauty. The Rathaus, the Hofburg Theatre, the University, the delicate Gothic of the Votive Church, and stretching away to the right the long line of trees, and the vast handsome buildings of the Imperial Museum, with its superb collections of industrial art, and the famous picture gallery . . . all these handsome and interesting buildings are in view. All around Vienna are beautiful spots of public resort. One of the nearest being Schönbrunn . . . this with its well-kept Versailles-like gardens, always open to the public, and its famous Gloriette, from whence is a far entrancing view, is a favourite resort of the Viennese. Here lodged Napoleon, and here lived and died his son, the young Duke of Reichstadt, 'L'Aiglon.' . . . Not far off is a newer resort, with a splendidly arranged people's restaurant and garden, the Krapfenwald, . . . and near by on another height is a more luxurious and expensive resort, the Cobenzl, with its luxuriously appointed castle hotel and restaurant; from the terrace is a splendid panorama of the country around. . . . The history of Austria can then be better understood, and one sallies forth by the gate of the glorious river, the Danube, into one of the most picturesque and historic districts the world has to show."—J. Baker, *Austria: her people and their homelands*, pp. 92-95, 97-98, 107.

Washington, D. C.—In 1913, Lord Bryce said of Washington, D. C.: "It is impossible to live in Washington and not be struck by some peculiar

features and some peculiar beauties which your city possesses. In the first place, its site has a great deal that is admirable and charming. There is rising ground inclosing on all sides a level space, and so making a beautiful amphitheater, between hills that are rich with woods. . . . Underneath these hills and running like a silver thread through the middle of the valley is your admirable river, the Potomac, . . . spread out like a lake below the city into a vast sheet of silver. . . . Nor is Washington less charming in respect of its interior. I know of no city in which the trees seem to be so much a part of the city as Washington. Nothing can be more delightful than the views up and down the wider streets and avenues, especially those that look toward the setting sun or catch some glow of the evening light. Look southwestward down New Hampshire avenue, look northwestward up Connecticut avenue, or even westward along modest little N street, . . . whose vista is closed by the graceful spire of Georgetown University, and you have the most charming sylvan views, and all this is so by reason of the taste and forethought of those who have administered the government of the city and who have planted various species of trees, so that you have different kinds of sylvan views. When you want a fine, bold effect, what could be grander than 16th street [which is sometimes called the "Avenue of the Presidents"], with its incline rising steeply to the north, and the hills of Virginia as the background, where it falls gently away to the south? There are fewer finer streets in any city."—"Concurrently with the submission of the Park Commission's plan to the Senate, Washington entered upon a period of construction by private enterprise that has amounted to nothing short of a building renaissance. A new Washington has been built by the citizens of the Capital alone, as well as by them and the citizens of the United States jointly. As though fired with inspiration by the broad vista of the city's beautification portrayed by the four famous artists composing the Commission, the people of Washington commenced to build and beautify. Not only were beautiful residences constructed, but the esthetic influence touched the construction of commercial building. If the people of the United States proposed to make Washington the most beautiful capital of the world, the people of the District of Columbia needed no urging to do their full share. Sheridan Circle, Washington's most elaborate residential section, has been entirely constructed since 1900. Residences there, and elsewhere, have been built with an eye single to beauty. Meridian Hill, with its imposing residences, has been created; Washington Heights has experienced its best building in the period. The neighborhood of Dupont Circle has been immensely improved, especially in the New Hampshire Avenue section."—G. H. Hall, *New Washington and the South*, p. 33.

CIVIC CONSTITUTION, Poland. See POLAND: 1791-1792.

CIVIC FEDERATION, National. See NATIONAL CIVIC FEDERATION.

CIVICS.—Civics is the science of citizenship. It deals with the duties of citizens to the government and to one another. As taught in the schools and colleges of the United States, it is concerned mainly with social ethics, government, and political science. "What the government of the village, the city, the country, the state or the nation is, depends upon the kind of citizens who create that government, upon the keenness of their sense of civic honor and public responsibility. What kind of citizens any commonwealth has depends largely upon the kind of training that commonwealth has given to them in its public schools as to what it means to be one of the governing body in a republic; as to what it means to hold an elective office under the people of one's town or state; as to what it means to be a citizen. This training can be given nowhere else so well as in the public schools which belong to the whole people and should be used for the good of all the people. It cannot in justice be said that the parents alone should give this training to their children, for, in most cases, the parents have not had such training themselves and are not fitted to impart it. Those who put forth this statement should be most eager for the introduction of this work into the schools in order that the present generation, the parents of the next generation, may have this training and be able to impart it to their children. What the schools do now for the rising generation in the matter of training them to high civic and ethical ideals will not need to be done over again when this generation becomes of age."—Civics Department of the General Federation of Women's Clubs, *Training in citizenship in our public schools*, p. 47.—A Department of Civic Training in Public Schools has been established in the United States in the Federal Bureau of Education.—See also AMERICANIZATION.—In France "direct instruction in patriotism has been given in the schools, which has revolved chiefly around the following points: (1) the love of France; (2) the military spirit and the obligatory service; and (3) the duty of cultivating physical courage. Furthermore, (4) the children have learned to know that taxation is necessary to support the army; (5) they have been given some definite information in regard to the state of the national defenses; and (6) certain writers have pointed out to them the perils of depopulation in a country menaced by increasingly powerful neighbors. . . . 'Do you know [asks a French text] what the Fatherland is? It is the house where your mother has carried you in her arms. It is the lawn on which you play your joyous games. It is the school where you receive your first instruction. It is the town hall where floats the flag of France. It is the cemetery where your ancestors rest. It is the clock which you see again with a new joy on each return to the village. It is the fields which bear the traces of the labor of your fathers. It is the hills, the mountains which you have so many times climbed. . . . Men of the same country are *compatriots*; they form a great family, a nation.' . . . Germany, beyond all other modern states, has embodied national aspirations in its educational system, which, though not wholly free from the influences of tradition, custom and conservatism, recognizes in a degree else-

where unparalleled the value of education as a political instrument and a factor in national evolution. . . . Only extended investigation can reveal how fully her educational system exemplifies the spirit of Germany. The present study does not profess to be exhaustive. It has made no attempt, for example, to show how industrial and technical instruction has been developed to realize the ideal of national efficiency. A careful study of official plans of instruction and of many textbooks widely used in recent years in German schools, however, warrants the following conclusions: 'Patriotism, while not designated in the school curricula as a separate subject, has been systematically taught in connection with various studies, throughout all grades of instruction, from the lowest common schools to the university. . . . Education has tended to develop national egoism through a glorification of German civilization and German achievements, and a failure to make due allowance for shortcomings. . . . The school has toyed with the vision of a greater national destiny, suggesting the hope of increased power on land and sea. This apotheosis of Teutonism which has characterized German education has naturally been accompanied by a disposition to ignore or disparage other nations.'—J. F. Scott, *Patriots in the making*, pp. 34-36, 155-157.

The question of teaching civics in the primary schools was discussed as early as 1855 in the United States where its importance has been greatly increased by the presence of large numbers of foreigners. The National Education Association, in almost all its reports from 1870 down, has laid great stress upon this point. As early as 1880 the Constitution was memorized by the children of some schools, but as the wording of its clauses was not made a subject of study, little good resulted from this feat of memory, and prior to 1892 even this was done in less than half the public schools, including the high schools. Between 1892 and 1908, study of civics lagged still more, but prior to the latter date, the matter was more vigorously taken up by the various history teachers' associations throughout the country as well as the National Municipal League, with the result that much more attention has been paid to it. The World War aroused the nation to a sense of the peril incurred by the presence of a vast mass of only partly assimilated citizens, and since 1914 more vigor and real patriotism has been put into the teaching of this important subject. "Besides and above . . . special bits of political and social knowledge, there needs to be an ideal of the value and purpose of the state. That should be taught specifically to all our voters, in all our schools; and while the schools should teach politics, government, patriotism, the nature of society far more than they now do, these subjects should be taught as living realities, not as dead forms. Much time is now given to the subject in many of our schools, but little that is of much value is generally taught. Of course one will find exceptions. Usually the skeleton of our constitutional law is given. Our young people learn the names of the offices, the length of the terms of officers, the kinds of duties performed; but often they do not learn the motive forces in our politics, how the work of politics is really done, nor what the purpose in government is and ought to be, altho one may note improvement in late years. Sometimes the effort is made to teach patriotism by singing patriotic hymns, by displaying on the schoolhouse on anniversary days our nation's flag, by reciting the victorious deeds of our fathers, by conveying to the children the thought that this country has wider stretches of

territory, more fertile fields, more millions of population, a better government than have other countries. Some of these things are good, some of them are true, but few of them will tend strongly to cure our political ills. We have enough pride in country. . . . True patriotism demands sacrifice, if need be, and its spirit is not that of a braggart. What is the true purpose of a country that should be taught in the schools, and that once breathed into the hearts of our citizens would remove the factional troubles that threaten our country, by making men of different parties none the less earnest, but more tolerant, and more unselfish? What is the citizen's ideal? How shall we measure the value of a country? No modern writer has expressed it better or with more apt illustration than James Russell Lowell in his classic essay on Democracy: "The true value of a country must be weighed in scales more delicate than the balance of trade. The garners of Sicily are empty now, but the bees from all climes still fetch honey from the tiny garden plot of Theocritus. On a map of the world you may cover Judea with your thumb and Athens with a finger-tip and neither of them figures in the prices current; but they still lord it in the thought and action of every civilized man. Did not Dante cover with his hood all that was Europe six hundred years ago, and, if we go back one hundred years, where was Germany, outside of Weimar? Material success is good, but only as the necessary preliminary to better things. The true measure of a nation's success is the amount that it has contributed to the knowledge, the moral energy, the intellectual happiness, the spiritual hope and consolation of mankind. There is no other, let our candidates flatter us as they may."—J. W. Jenks, *Citizenship and the schools*, pp. 19-21.

CIVIL CONSTITUTION OF THE CLERGY IN FRANCE.—This was the name given by the National Assembly in 1700 "to the series of regulations the object of which was in their view to incorporate the clergy with the new system, to renew antique discipline, and to reduce the whole body to obedience to the new laws. [By these regulations] . . . monastic vows were abolished, religious orders were abolished, the election of pastors was placed in the hands of their flocks."—J. H. McCarthy, *French Revolution*, v. 4, p. 135.—Prior to this move the great estates of the church had been disposed of to obtain "those immense financial resources which so long upheld the Revolution."—M. A. Thiers, *French Revolution*, v. 1, p. 118.—See also **CONCORDAT**: 1515-1861; **FRANCE**: 1789-1791.

CIVIL COURTS. See **COURTS**; **ECCLESIASTICAL LAW**: 1066-1087; 1135; **COMMON LAW**: 1066-1154.

CIVIL LAW.—Roman law, which for many centuries was administered in all civilized countries

under the jurisdiction of Rome, or the early Christian church, is known as the Civil or Roman law. (See also **CRIME AND CRIMINOLOGY**: Social regulation.) "The term civil law, though once in common use to indicate the law of the land, has been partly superseded in recent times by the improper substitute, positive law. *Jus positivum* was a title invented by medieval jurists to denote law made or established by human authority, as opposed to that *jus naturale* which was uncreated and immutable. It is from this contrast that the term derives all its point and significance. It is not permissible to confine positive law to the law of the land. All is positive which is not natural. International and canon law are kinds of *jus positivum* no less than civil law itself. The term civil law possesses several other meanings. It means the law of Rome (*corpus juris civilis*) [see **CORPUS JURIS CIVILIS**] as opposed to the canon law (*corpus juris canonici*), these being the two great systems by which in the Middle Ages, state and church were respectively governed. At other times it is used to signify not the whole law of the land, but only the residue of it after deducting some particular portion having a special title of its own. Thus civil is opposed to criminal law, to ecclesiastical law, to military law, and so on."—J. W. Solward, *Jurisprudence*, p. 3.

Origin.—"The Roman state from its formation for several centuries was a limited monarchy, at the head of which was a chief elected for life, termed Rex; beside him was a senate. The election of the king, and especially the acceptance of the laws which he, or his representatives, proposed (*legem ferre*) belonged to the *comitia* (national assemblies). In these, the voting was according to the thirty *curia* (*comitia curiata*) into which the members of the three tribes of ancient Rome (Ramsies, Tities and Luceres) were divided. The observance of the religious rules respecting state affairs was in the care of the college of pontiffs under the presidency of the *Pontif ex maximus* and important transactions of state were only permissible after the ascertainment of the auspices by the augurs. The patricians only had political rights. The other citizens were not only excluded from the offices of senators and priests, but also from the *comitia*; this was not only true of the freedmen, of their successors and of clients of single patricians, but also of others, though they were wealthy citizens, if they did not by their descent belong to one of the three tribes, and were not especially raised to the rank of patricians. The non-patrician citizens of the latter kind were termed plebeians. After the kings were expelled Rome became a republic and two consuls took the place of the king. They were always elected annually and could only be chosen from the patricians and their power of punishment was greatly diminished. Contest between the patricians and plebeians led to the establishment of the tribunes of the people and the enactment of the law of the twelve tables by the *comitia centuriata* with the purpose of reducing the discordant customs of the different citizens of the state into one national law."—F. Mackeldey, *Handbook of Roman law*, v. 1, p. 6 ff.—See also **ROME**: Republic: B. C. 451-449; 449.

B. C. 471.—Disaffection of plebeians in Rome.—**Their growing power**.—Constitutional recognition and its effect.—In the early days the higher classes "monopolized the little wealth of which Rome could boast; amassed partly in farming their holdings of public lands through the agency of their clients and slaves, and partly by their ruthless severity towards their debtors, whose mortgages were rarely redeemed, and who, as a

final resource, had too often to impledge themselves to their creditors as the condition of a fresh advance. The inevitable result of this unhappy state of matters was a bitter feeling of hostility on the part of the plebeians towards the patricians and the new order of things—a hostility that manifested itself not merely in individual instances, but in a general and all-pervading spirit of disaffection. While their real desire was for equality in political rights and participation in the more substantial privileges enjoyed by their patrician fellow-citizens, the contumelious treatment they received at the hands of the latter drove them to band themselves together for purposes of united action. They even went so far as to form quasi-corporations within the limits of their tribes, and to establish their own tutelary divinities in Liber, Libera, and Ceres, corresponding to the divine triad of the Capitoline. They were thus in a position to make common cause; and so effectually did they do so that frequently they refused to join in a campaign, and they seceded in a body from the city, with the threat of complete severance of their connection with Rome. On such occasions it was only the tardy promise of redress of some overpowering grievance, to be embodied in laws under sanction of oath (*leges sacratæ*), and appeals to their patriotism and common interests in face of an enemy, that induced them to forgo their resolution. It was not by any comprehensive and well digested reform, dictated by considerations of justice, that the plebeians at last attained a position of political equality with the higher order, but by fragmentary legislation wrung from time to time from the latter against their will, and when Rome was in peril from dissensions within or hostile demonstrations from without. It was the first secession in the year 494 B. C., in resentment of the failure of M. Volerius to obtain the approval of the patricians for his proposals for alleviation of the condition of insolvent debtors that brought about the tribunate. . . . Still greater compactness was given the plebeians as a power in the state by the constitutional recognition in 471 B. C. of the elective and legislative competency of their council (*concilium plebis*). [See ROME: Republic: B. C. 472-471.] The second secession in B. C. 449 resulted in the overthrow of the decemvirate, which had been created to give effect to the demands of the plebeians for a codification of the law; and this was followed immediately by the Valerio-Horatian laws, re-establishing the previous majesterial régime. One of their provisions was that whoever should harm a tribune of the people, an aedile (assistant to a tribune) or one of the 'ten-men judges' should forfeit his head to Jupiter, and his fortune to Ceres. The ten-men judges (*judices decemviri*) probably owed their institution to the tribunes themselves; they seem to have been judges in civil causes arising between plebeians, officiating on a remit from a tribune of aedile."—J. Muirhead, *Law of Rome, third edition*, 1916, pp. 76-78.

B. C. 450-100.—Growth of public law.—Various kinds of law which finally made up the civil law.—"In the second period—extending from the twelve tables until the time of Cicero—the Romans subjugated the whole of Italy and many foreign countries and laid the basis for a world-empire. The Italian states and their territories entered into the Roman state as dependent confederate states. They obtained their comitia, their senate, their magistracy chosen by themselves and their inhabitants continued to be peregrines. The inhabitants of the outside conquered countries became subjects of the Roman people and the soil became Roman property. The land and people

were governed by stateholders who were sent from Rome. The growing jurisprudence was divided into *leges* including express legislation and laws proposed by the magistrates and adopted by the Roman people (*populus Romanus*) in the *comitiis centuriatis*. They related more particularly to the public than to private law [see also *COMITIA CENTURIATA*]. The *Plebiscita* were resolutions passed in the *Comitiis tributis* (assembly of the tribes) on the motion of one of the plebeian tribunes. The *Senatus-consulta* were decrees of the Senate without concurrence of the people [see *CONSULTA, SENATUS*]. They chiefly referred to public law. The law of custom was formed in various ways and was of much greater importance to private law than the other above-mentioned classes. Several kinds of this law were—the *more majorum* or law founded on the manners and customs of their ancestors; the *consuetudo*, or law originating from the opinions, and usages of the people, and the *res judicatæ* formed by uniform judicial decisions; the edicts of the magistrates or prætors which sought as much as possible to enforce equitable right and meet conditions caused by gaps in existing law. The *responsa prudentium* or writings and opinions of the juriconsults, produced numerous scientific commentaries and legal maxims and a large volume of strictly civil law."—F. MacKeldey, *Handbook of Roman law*, v. 1, p. 6 ff.—See also ROME: Republic: B. C. 445-400; B. C. 376-367; B. C. 340; B. C. 300; B. C. 286; B. C. 275; B. C. 146.

B. C. 100-A. D. 550.—Development under the empire.—German and Roman law.—"In the period between Cicero and Justinian (100 B. C. to 550 A. D.) alterations in Roman law were almost exclusively effected by imperial constitutions, the writings of the jurists and imperial constitutions and customs as are modern legal changes. . . . After the fall of the Roman empire, several new German states were formed in the Occident, in which the immigrated Germans and conquered Romans lived together. The former had their own national laws and customs which they retained in their new settlements, while the subjected Romans living among them continued to use Roman law and were judged according to it. This system of personal or national laws, which prevailed in the earlier part of the middle ages, soon rendered it necessary for the immigrated Germans to commit to writing the German national laws (*leges Barbarorum*) and for the Romans subject to the Germans to commit their then prevailing law (*leges Romana*) likewise to writing. Thus, at this time, arose in the new German states of the empire two different codes of law—German and Roman."—*Ibid.*, p. 50.—See also EUROPE: Ancient: Roman civilization: Effect of imperial dominion, etc.

ALSO IN: W. W. Buckland, *Text-book of Roman law, from Augustus to Justinian*.

15th-20th centuries.—Influence.—"In some of the nations of modern Continental Europe (as, for example, in France), the actual system of law is mainly of Roman descent; and in others of the same nations (as, for example, in the States of Germany), the actual system of law, though not descended from the Roman, has been closely assimilated to the Roman by large importations from it. Accordingly, in most of the nations of modern Continental Europe, much of the substance of the actual system, and much of the technical language in which it is clothed, is derived from the Roman Law, and without some knowledge of the Roman Law, the technical language is unintelligible; whilst the order or arrangement commonly given to the system, imitates the exemplar of a scientific ar-

rangement which is presented by the institutes of Justinian. Even in our own country [Great Britain], a large portion of the Ecclesiastical and Equity, and some (though a smaller) portion of the Common Law, is derived immediately from the Roman Law, or from the Roman through the Canon. Nor has the influence of the Roman Law been limited to the positive law of the modern European nations. For the technical language of this all-reaching system has deeply tintured the language of the international law or morality which those nations affect to observe."—J. Austin, *Lectures on jurisprudence*, v. 3, p. 358.—"A glance at the history of those countries in Europe that did not adopt Roman Law will prove and illustrate the political origin of the 'reception' of this law in Germany [until 1000] and France still more forcibly. The Kingdom of Hungary never adopted the theory or practice of Roman Law. This seems all the more strange since Hungary used Latin as the official language of her legislature, laws, and law-courts down to the first quarter of the 19th century. A country so intensely imbued with the idiom of Rome would seem to be quite likely to adopt also the law of Rome. This, however, the Hungarians never did. Their law is essentially similar to the common law of England, in that it is derived mainly from precedents and usage. The unwillingness of the Hungarians to adopt Roman Law was based on a political consideration. Roman Law, they noticed, requires a professional and privileged class of jurists who administer law to the exclusion of all other classes. In German territories the privileged class of civilians were in the service of the rulers. But it so happened that ever since 1526 the ruler, or at least the nominal head of Hungary, was a foreigner: the Archduke of Austria, or Emperor of Germany. Hence to introduce Roman Law in Hungary would have been tantamount to surrendering the law of the country to the administration of foreigners, or of professors, who had a vital interest to work in the interest of their foreign employer, the Archduke of Austria. Consequently the Hungarians prudently abstained from the establishment of numerous Universities, and persistently refused to adopt Roman Law, the scientific excellence of which they otherwise fully acknowledged. . . . The same reason applies to England. England never adopted Roman Law, because it was against the interests of English liberty to confide the making and interpretation of law to the hands of a privileged class of jurists. As said before, Roman Law cannot be adopted unless you adopt a privileged class of professional jurists into the bargain. The

hatred of the English was not so much a hatred of civil law, but of the civilians. These jurists develop law on the strength of theoretical principles, and actual cases are not decided according to former judgments given in similar cases, but by principles obtained through theoretico-practical speculation. Hence there is no division of questions of law and fact in civil cases; nor is there, in a system of Roman Private Law, any room for juries, and thus law is taken completely out of the hands of the people. This, however, the English would not endure, and thus they naturally fell to confiding their law to their judges. English common law is judge-made law."—E. Reich, *Graeco-Roman institutions*, pp. 62-63.—"As Chancellor Kent correctly observed—"The institutions of every part of Europe have felt its influence, and it has contributed largely, by the richness of its materials, to their character and improvement. With most of the European nations, and in the new states in Spanish America, in the province of Lower Canada (Quebec) and in Louisiana it constitutes the principal basis of their unwritten or common law. It exerts a very considerable influence upon our own municipal law, and particularly those branches of it which are of equity and admiralty jurisdiction. It is now taught and obeyed not only in France, Spain, Germany [before 1900], Holland, Russia [prior to the revolution of 1917] and Scotland, but in the islands of the Indian Ocean.'"—F. J. Tomkins, *Modern Roman law*, pp. 1-2.—In Germany, the old system of Roman Law was superseded by a new code of laws which became effective in 1900. See GERMANY: 1900-1912.

CIVIL SERVICE REFORM

Introduction.—The public service of a country, known as the civil service, in contradistinction to military and naval service, includes the personnel of all bureaus and offices which are under the direction of the government, such as customs, internal revenue, postal service, as well as higher administrative offices. Great reforms have been made in the civil services of Canada, Great Britain, India and the United States, while in Germany the Revolution has made important changes. The Dominions of the British Empire organized their civil services after the need of reform had been recognized, and consequently have included these reforms in their regulations. Other European countries have not as yet instituted reforms, or if they have, have not published their regulations in available form.

CANADA

1908.—Introduction of competitive examinations and the merit system of appointment and promotion.—An "Act to Amend the Civil Service Act," which came into force, September 1, 1908, divides the civil service of the Dominion into the inside service and the outside service, the former embracing "that part of the public service in or under the several departments of the Executive Government of Canada and in the offices of the Auditor General, the Clerk of the Privy Council, and the Governor-General's Secretary, employed at the City of Ottawa, or at the Experimental Farm Station or the Dominion Astronomical Observatory near Ottawa." The employees of this inside service are required to be classified accord-

ing to their salaries, in three divisions, and all appointments to positions in it are (except as otherwise provided in the act) to "be by competitive examination, which shall be of such a nature as will determine the qualifications of candidates for the particular positions to which they are to be appointed, and shall be held by the Commission from time to time in accordance with the regulations made by it and approved by the Governor in Council."

For the administration of the act a civil service commission is created, consisting of two members appointed by the governor in council, who have no other office or employment, and who may employ necessary assistance for the examinations they conduct. The following are provisions of the act: "No person shall be admitted to such an examination unless he is a natural-born or naturalized British subject, and has been a resident of Canada for at least three years, and is, at the time of the examination, of the full age of eighteen years and not more than thirty-five years, and presents the required certificates as to health, character and habits.

"Before holding any such examination the Commission shall require each head of a department to furnish it with the number of additional permanent officers or clerks likely to be required in his department within the next six months.

"On this basis, and having regard also to the requirement of the several departments for temporary services, a computation shall be made by the Commission of the number of competitors to be selected at the next ensuing examination.

"If there remain from a previous examination successful competitors who have not received appointments, their number shall be deducted in making the computation, and their names, in the order of merit, shall be placed at [the top of the list] to be prepared in accordance with section 17 of this Act.

"Thereupon due notice of the examination shall be given by the Commission, stating the character and number of the positions to be competed for.

"Immediately after the examination the Commission shall make out a list of the successful competitors thereat for each position, in the order of merit, up to the number computed in accordance with Section 15.

"From the said list the Commission, on the application of the deputy head, with the approval of the head, of any department, shall supply the required clerks, whether for permanent or temporary duty. . . .

"The selections shall be, so far as practicable, in the order of the names on the list, but the Commission may select any person who in his examination shows special qualifications for any particular subject. . . .

"The cause of the rejection shall be reported by the deputy head to the Commission, who shall thereupon select another person to take the place of the one rejected, and decide whether the latter shall be struck off the list or allowed a trial in another department.

"After a person so selected has served a probationary term of six months, [he shall be deemed] to be permanently accepted for the service. . . .

"The head of the department, on the report in writing of the deputy head, may, at any time after two months from the date of assignment, and before the expiration of six months, reject any person assigned to his department. . . .

"Promotion, other than from the third to the second division, shall be made for merit by the Governor in Council upon the recommendation of the head of the department, based on the report

in writing of the deputy head and accompanied by a certificate of qualification by the Commission to be given with or without examination, as is determined by the regulations of the Commission.

"Except as herein otherwise provided, vacancies in the first division shall be filled by promotions from the second division."

Regulations prepared by the civil service commission appointed under the act require fees, ranging from \$2 to \$10 to be paid by the candidates for examination.

GERMANY

1919-1922.—New rules in the Republican constitution.—"Before the [Republican] Constitution went into effect, the status of civil servants of the Empire was regulated by the law on civil servants, March 31, 1873, as amended by the law of May 18, 1907. The new Constitution left this law intact, but it super-imposed a series of general rules, some of which were borrowed from the preceding laws applying to the civil servants of the Empire, and which are destined hereafter to hold good for all German civil servants, as well as those of the states and of public corporations. The principles that serve as a point of departure are: that civil servants are in the service not at all of the party in power, but of the community; that, therefore, civil servants who remain faithful to the community all their lives have the right to be kept in office for life and to have guaranteed them a financially adequate situation; finally that outside of his office every civil servant is neither more nor less than any other citizen. These principles the Constitution applies in the provisions relative to the free access of all citizens to public functions, to the political liberty of civil servants and finally to their financial responsibility. . . . 'All citizens without distinction are eligible for public office in accordance with the laws and according to their ability and services.' . . . In the future, citizenship in a particular state may no longer be demanded by the laws of the States as a condition for public employment; for the Constitution expressly provides that citizens must be admitted to public employment 'without distinction.' In addition, 'Every German has the same rights and duties in each state of the Commonwealth as the citizens of that State.' On the other hand, Article 16 provides that as a rule officers directly charged with the administration of services that depend directly on the Reich, and who are assigned to a State, shall be citizens of that State. From this it must be concluded that the civil servants of a State may as a rule be recruited from among the citizens of that State without violating the spirit of the Constitution. Already in preceding laws one finds no legal obstacle to the admission of women to civil service. The Constitution declares, meanwhile: 'All discriminations against women in the civil service are abolished.' By this—a logical consequence of the provision of Article 109, by which men and women have in principle the same civil rights and duties—all obstacles to the admission of women to the service of the State on the same conditions as men are abolished. . . . Civil servants are in principle appointed for life. However, exceptions are provided for, either in case future legislation on civil servants contains contrary provisions, or if, up to then, the law on civil servants of the Empire and the laws of the states have provided a different rule. . . . The rights acquired by civil servants must be inviolable. Claims in money matters must be heard by tribunals. Civil servants may not be temporarily deprived of their function, retired for a time or permanently, or be given new work of a lower

nature except under conditions and according to forms provided by law and not by simple arbitrary administrative measures. Against any disciplinary measure, civil servants may enter protests and commence procedure for damages. Furthermore, the system of secret reports on persons employed is abolished. Every civil servant has the right to consult his record, and no disparaging entry may be introduced in it without the opportunity being given to the employé to explain himself on this matter. Civil servants are in the service of the State, of the community and not at all the servants of a party or the party in power. In consequence of this they retain the liberty of political conviction and of association. A later law of the Reich was provided for organizations in which civil servants are represented and which are supposed to co-operate in the regulation of all questions concerning them. The same idea that led to the recognition of the right of workers and clerks to co-operate in the form of Factory Workers' Councils applies to civil servants and gives them the right to co-operate in all matters concerning them."—R. Brunet, *New German constitution*, pp. 219-221.

GREAT BRITAIN

1832-1855.—Demand for abolition of patronage.—Civil service in India.—Report of commission.—Order in Council providing for examination systems.—"It was not till long after 1832 that the inherent mischief of the partisan system [of appointments in the national civil service] became manifest to the great body of thinking people. When that result was attained, the final struggle with patronage in the hands of members of Parliament began on a large scale. It seems to have been, even then, foreseen by the best informed that it could not be removed by any partisan agency. They began to see the need of some method by which fitness for the public service could be tested otherwise than by the fiat of a member of Parliament or the vote of the Cabinet or the Treasury. What that method should be was one of the great problems of the future. No government had then solved it. That there must be tests of fitness independent of any political action, or mere official influence, became more and more plain to thinking men. The leaders of the great parties soon began to see that a public opinion in favor of such tests was being rapidly developed, which seriously threatened their power, unless the party system itself could be made more acceptable to the people. . . . There was an abundance of fine promises made. But no member gave up his patronage—no way was opened by which a person of merit could get into an office or a place except by the favor of the party or the condescension of a member. The partisan blockade of every port of entry to the public service, which made it tenfold easier for a decayed butler or an incompetent cousin of a member or a minister, than for the promising son of a poor widow, to pass the barrier, was, after the Reform Bill as before, rigidly maintained. Fealty to the party and work in its ranks—subservency to members and to ministers—and electioneering on their behalf—these were the virtues before which the ways of office and the doors of the Treasury were opened. Year by year, the public discontent with the whole system increased. . . . During the Melbourne administration, between 1834 and 1841, a demand for examinations, as a condition for admission to the service, came from two very different quarters. One was the higher officials, who declared that they could not do the public work with such poor

servants as the partisan system supplied. The other was the more independent, thoughtful portion of the people, who held it to be as unjust as it was demoralizing for members of Parliament and other offices to monopolize the privilege of saying who might enter the public service. Lord Melbourne then yielded so far as to allow pass examinations to be instituted in some of the larger offices; and he was inclined to favor competitive examinations, but it was thought to be too great an innovation to attempt at once. These examinations—several of them being competitive—introduced by public officers in self-defence many years previous to 1853, had before that time produced striking results. In the Poor Law Commission, for example, they had brought about a reform that arrested public attention. Under the Committee on Education, they had caused the selection of teachers so much superior 'that higher salaries were bidden for them for private service.' . . . These examinations were steadily extended from office to office down to the radical change made in 1853. . . . It had been provided, long before 1853, that those designed for the civil service of India, should not only be subjected to a pass examination, but should, before entering the service, be subjected to a course of special instruction at Haileybury College, a sort of civil West Point. This College was abolished in 1854, but equivalent instruction was elsewhere provided for. The directors had the patronage of nomination for such instruction. . . . If it seems strange that a severe course of study, for two years in such a college, was not sufficient to weed out the incompetents which patronage forced into it, we must bear in mind that the same influence which sent them there was used to keep them there. . . . Both the Derby and the Aberdeen administrations, in 1852 and 1853, took notice that the civil service was in a condition of peril to British India; and, without distinction of party, it was agreed that radical reforms must be promptly made. There was corruption, there was inefficiency, there was disgraceful ignorance, there was a humiliating failure in the government to command the respect of the more intelligent portion of the people of India, and there was a still more alarming failure to overawe the unruly classes. It was as had in the army as in the civil offices. . . . There was, in short, a hotbed of abuses prolific of those influences which caused the fearful outbreak of 1857. It was too late when reform was decided upon, to prevent the outbreak, but not too late to save British supremacy in India. A change of system was entered upon in 1853. The 36th and 37th clauses of the India act of that year provided 'that all powers, rights, and privileges of the court of directors of the said India Company to nominate or appoint persons to be admitted as students . . . shall cease; and that, subject to such regulations as might be made, any person, being a natural born subject of her Majesty, who might be desirous of presenting himself, should be admitted to be examined as a candidate.' Thus, it will be seen, Indian patronage received its death-blow, and the same blow opened the door of study for the civil service of India to every British citizen. . . . In 1853, the British Government had reached a final decision that the partisan system of appointments could not be longer tolerated. Substantial control of nominations by members of Parliament, however guarded by restrictions and improved by mere pass examinations, had continued to be demoralizing in its effect upon elections, vicious in its influence upon legislation, and fatal to economy and efficiency in the departments. . . .

The administration, with Lord Aberdeen at its head, promptly decided to undertake a radical and systematic reform. . . . It was decided that, in the outset, no application should be made to Parliament. The reform should be undertaken by the English Executive . . . for the time being. The first step decided upon was an inquiry into the exact condition of the public service. Sir Stafford Northcote and Sir Charles Trevelyan were appointed in 1853 to make such inquiry and a report. They submitted their report in November of the same year. . . . A system of competitive examinations . . . [was] recommended. . . . The report was accompanied with a scheme for carrying the examinations into effect, from which I quote the following passages. . . . 'Such a measure will exercise the happiest influence in the education of the lower classes throughout England, acting by the surest of all motives—the desire a man has of bettering himself in life. . . . They will have attained their situations in an independent manner through their own merits. The sense of this conduct cannot but induce self-respect and diffuse a wholesome respect among the lower no less than the higher classes of official men. . . . The effect of it in giving a stimulus to the education of the lower classes can hardly be overestimated.' Such was the spirit of the report. This was the theory of the merit system, then first approved by an English administration for the home government. I hardly need repeat that the examinations referred to as existing were (with small exception) mere pass examinations, and that the new examinations proposed were open, competitive examinations. . . . But the great feature of the report, which made it really a proposal for the introduction of a new system, was its advocacy of open competition. Except the experiment just put on trial in India, no nation had adopted that system. It was as theoretical as it was radical. . . . A chorus of ridicule, indignation, lamentation, and wrath arose from all the official and partisan places of politics. The government saw that a further struggle was at hand. It appeared more clear than ever that Parliament was not a very hopeful place in which to trust the tender years of such a reform. . . . The executive caused the report to be spread broadcast among the people, and also requested the written opinions of a large number of persons of worth and distinction both in and out of office. The report was sent to Parliament, but no action upon it was requested. . . . About the time that English public opinion had pronounced its first judgment upon the official report, and before any final action had been taken upon it, the Aberdeen administration went out. . . . Lord Palmerston came into power early in 1855, than whom, this most practical of nations never produced a more hard-headed, practical statesman. . . . Upon his administration fell the duty of deciding the fate of the new system advocated in the report. . . . He had faith in his party, and believed it would gain more by removing grave abuses than by any partisan use of patronage. . . . Making no direct appeal to Parliament, and trusting to the higher public opinion, Lord Palmerston's administration advised that an order should be made by the Queen in Council for carrying the reform into effect; and such an order was made on the 21st of May, 1855."—D. B. Eaton, *Civil service in Great Britain*.

1860-1912.—Appointment of civil service commission.—Competitive examinations for Indian civil service.—Open examinations for home service.—Civil service beyond reach of party.—Clerkships.—Permanent staff.—Commissions of

1874, 1886, 1912.—Under this Order-in-Council "three Civil Service Commissioners were appointed, whose office it was to test by examination the capacity of all candidates for the junior posts in the Civil Service. The next step was the introduction of a system of limited competition, according to which, when a vacancy occurred in any department, the Minister nominated three candidates who competed for the place. This was an arrangement likely to commend itself to Ministers, whose patronage was increased while their responsibility was diminished; and so, although a Select Committee in 1860, presided over by Lord Stanley, declared the system to be a fertile source of abuse, nothing further was done to change it until 1870. In that year Mr. Gladstone, who had long wished to abolish the privilege of nomination, was Prime Minister, and Mr. Lowe was his Chancellor of the Exchequer. No statesman of his time had so profound a distrust of democracy as Mr. Lowe—a distrust based on his experience and observation of political life in democratic communities. He knew that patronage was valued at least as much by a democracy as by an aristocracy, and was used with even less scruple for party purposes. The origin of the 'spoils' system in the United States—that is of a system under which civil servants are dismissed on political grounds when one party replaces another in power—has been traced by American writers to the article in the Declaration of Rights of the Constitution of Massachusetts adopted in 1760, which contains the claim that 'the people have the right at such periods and in such manner as they shall establish by their frame of government, to cause their public officers to return to private life; and to fill up vacant places by certain and regular elections and appointments.' That system had never taken root in England, though we had a taste of it in 1763, but Mr. Lowe was convinced that all the abuses he had observed in other democracies were inseparable from popular government, and he was earnest in his endeavours not only 'to educate our masters' but also to withdraw the Civil Service from their control. He it was who had been, when Secretary to the Board of Control, the chief author of the less necessary measure which opened the Civil Service of India to competition in 1853, and he was now successful in persuading his colleagues to agree to the adoption of the same system for the Home Civil Service. No legislation was needed. On the 4th of June, 1870, after the opposition of certain members of the Cabinet had been disarmed by the concession that the approval of the Minister at the head of a department should be a condition of its inclusion in the new system, an Order in Council was issued establishing the principle of open competitive examinations for filling ordinary junior posts in the Civil Service. The Order directed that from the following 31st of August all entrance appointments to all situations in the civil departments of the State, except to the Foreign Office and to posts requiring professional knowledge or peculiar qualifications, should be filed by open competition. Certain posts at the top and at the bottom of the service were also exempted from the Order, and the power of dismissal was vested in the chiefs of departments. There was also a provision that a successful candidate should pass through a six months' period of probation in order that his actual efficiency might be tested before his appointment was confirmed. It is difficult to exaggerate the importance of this reform. With the growth of democracy the functions of government increase in number and complexity, and the work of administration is thrown more and

more into the hands of the permanent servants of the Crown. Ministers change rapidly from office to office; they are too much occupied with legislative projects and general party issues to have time to master or effectively to control the administrative business of their separate departments. Their very responsibility for what is done inclines them to follow the advice and to trust to the experience of professional administrators. The Civil Service was placed beyond the reach of party. Supporters of the government were no longer obliged either to offend influential constituents by refusing to recommend their sons and nephews to the Patronage Secretary for appointments; or else to make such recommendations without any regard to the interests of the public service. The Patronage Secretary was no longer tempted to reward party loyalty by misusing his patronage with that object. And thus the impartiality and efficiency of civil servants were effectually secured just at the time when the growth of their power and the expansion of their functions rendered their possession of those qualities of essential importance to the nation."—T. E. May, *Constitutional history of England* (F. Holland, ed.), v. 3, pp. 271-273.—"One of the many notable features of the English government is the unusual combination of amateur and expert in the work of administration. The ministers are, in general, amateurs. They are drawn from widely differing walks of life; they commonly bring to their posts little experience in administration; the more important ones must give a large part of their time to activities outside their departments; they are frequently shifted from one position to another. All this would mean inefficiency and waste save for the fact that the departments and boards are manned with permanent, non-political officials, who, carefully selected in the first place, have, through long service and close application to duty, become expert in the business which the department or office is expected to carry on. More than that, the great administrative services—the post-office, the customs, the inland revenue, etc.—are completely organized under the plan which we should call in this country the 'merit system' . . . In addition to the ministers, the permanent under-secretaries and assistant under-secretaries and the chiefs of bureaus in the departments still stand outside the protected service. The chief clerks in the departments are recruited mainly by promotion. But practically all officials and employees below these are selected on the basis of competitive examinations, which are thrown open to aspirants almost as generously as are corresponding tests in [the United States]. . . . The English system provides for even greater security of tenure than does our classified service, and it is applied to positions much higher up the scale than is the competitive system in this country. From this, in part at all events, it arises that the English examinations are shaped mainly with a view to determining the candidate's capacity and general attainments, whereas ours are intended chiefly as tests of the applicant's technical proficiency and present fitness for the kind of work which he seeks. Each system has certain obvious advantages. It need hardly be added that in return for security of tenure and opportunity for promotion in the service, the English appointee must agree, as must the American, to take no part whatsoever in party politics."—F. A. Ogg and C. A. Beard, *National governments and the World War*, pp. 207-208.—"Unlike the first-class clerks, the clerks of the second division are drawn mainly from the middle and lower middle classes, and their education has been ob-

tained in the grammar schools and other schools of a similar kind. Although a distinct corps, recruited by a different examination for a lower grade of work, they are not altogether cut off from the higher positions. . . . After eight years of service they can, in exceptional cases, be promoted to first-class clerkships. . . . The highest posts in the permanent civil service to which admission is obtained by competitive examination are known as first-class clerkships. In 1805 the examinations for these positions and for the Indian Civil Service were consolidated, and in the following year those for the Eastern Cadets were added; so that a single annual competition is now the gateway to all three careers, the successful candidates being allowed, in the order of their rank at the examination, to choose the service they will enter. . . . Although these positions are called clerkships, the work is . . . of an administrative, and in the upper grades of a highly responsible, character. The aim of the commissioners is, therefore, to recruit young men of thorough general education for an important and lifelong administrative career. . . . With this object the candidates are required to be between twenty-two and twenty-four years of age, and the examination, which has no direct connection with their subsequent duties, is closely fitted to the courses of study in the universities."—A. L. Lowell, *Government of England*, pp. 158, 156, 162-163.—Three important commissions were appointed to report upon the necessity for changes in the civil service:—the Playfair commission of 1874, the Ridley commission of 1886, and the McDonald commission of 1912. The first of these suggested open competition within certain limits to be imposed by the heads of departments. This recommendation was ignored by the Disraeli ministry. The Ridley report laid special stress on the number of old men in the government service who were no longer useful and took no interest in their work. The McDonald commission dealt primarily with the question of women in government positions.

JAPAN

In 1876 "in place of the local administration by feudal lords, an elaborate bureaucracy was organized. Its members were appointed by and were responsible to the authorities in Tokyo, and to it was entrusted the entire administration of the country, local as well as national. Through it the humblest subject of the emperor was protected and supervised by the direct representatives of the monarch himself. At its inception the bureaucracy was naturally recruited largely from members of the samurai class, for these were the only ones who were trained in governmental administration. No one was allowed to hold office in the field of which he had been a member, however, and as time went on the ranks of the civil service were recruited from the successful candidates at competitive examinations. These last were open to all classes, regardless of birth, and have helped to bring into official life large numbers of men who are not of the military class."—K. S. Latourette, *Development of Japan*, pp. 123-124.—See also JAPAN: 1868-1894.

UNITED STATES

1828-1885.—*Spoils system*.—"The question as to the Civil Service [in the United States] arises from the fact that the president has the power of appointing a vast number of petty officials, chiefly postmasters and officials concerned with the collection of the federal revenue. Such officials have properly nothing to do with politics,

they are simply the agents or clerks or servants of the national government in conducting its business; and if the business of the national government is to be managed on such ordinary principles of prudence as prevail in the management of private business, such servants ought to be selected for personal merit and retained for life or during good behaviour. It did not occur to our earlier presidents to regard the management of the public business in any other light than this. But as early as the beginning of the [10th] . . . century a vicious system was growing up in New York and Pennsylvania. In those states the appointive offices came to be used as bribes or as rewards for partisan services. By securing votes for a successful candidate, a man with little in his pocket and nothing in particular to do could obtain some office with a comfortable salary. It would be given to him as a reward, and some other man, perhaps more competent than himself, would have to be turned out in order to make room for him [see ALBANY REGENCY]. A more effective method of driving good citizens 'out of politics' could hardly be devised. It called to the front a large class of men of coarse moral fibre. . . . The civil service of these states was seriously damaged in quality, politics degenerated into a wild scramble for offices, salaries were paid to men who did little or no public service in return, and the line which separates taxation from robbery was often crossed. About the same time there grew up an idea that there is something especially democratic, and therefore meritorious, about 'rotation in office.'" On the change of party which took place upon the election of Jackson to the presidency in 1828, "the methods of New York and Pennsylvania were applied on a national scale. Jackson cherished the absurd belief that the administration of his predecessor Adams had been corrupt, and he turned men out of office with a keen zest. During the forty years between Washington's first inauguration and Jackson's the total number of removals from office was 74, and out of this number 5 were defaulters. During the first year of Jackson's administration the number of changes made in the civil service was about 2,000. Such was the abrupt inauguration upon a national scale of the so-called Spoils System. The phrase originated with W. L. Marcy, of New York, who, in a speech in the senate in 1831 declared that 'to the victors belong the spoils.' . . . In the canvass of 1840 the Whigs promised to reform the civil service, and the promise brought them many Democratic votes; but after they had won the election they followed Jackson's example. The Democrats followed in the same way in 1845, and from that time down to 1885 it was customary at each change of party to make a 'clean sweep' of the offices. Soon after the Civil War the evils of the system began to attract serious attention on the part of thoughtful people."—J. Fiske, *Civil government in the United States*, pp. 261-264.—"It was not until 1867 that any important move was made [toward a reform]. . . . This was by Mr. Jencks, of Rhode Island, who introduced a bill, made an able report and several speeches in its behalf. Unfortunately, death soon put an end to his labors and deprived the cause of an able advocate. But the seed he had sown bore good fruit."—H. Lambert, *Progress of civil service reform in the United States*, p. 6.

1870-1880.—Agitation for reform.—Appointment of Curtis commission.—Advocacy by commission of competitive examination.—Roscoe Conkling.—Action of President Hayes.—Commission of enquiry into conduct of affairs in Port of New York.—Competitive examinations

in post office.—"Under President Hayes the systematic prostitution of our public offices for partisan and private purposes was, if not definitely ended, so discouraged that it has never since recovered its old shamelessness. In this, those years form an epoch in the Nation's history. In 1870-71 reform in the civil service almost became an issue. It was one of the three cardinal principles of the Liberal Republicans, was an item in the 'New Departure' made by the Democrats that year, received compliments, more or less sincere, from politicians of all stripes, and in 1872 was recognized for the first time in all the party platforms. On March 3, 1871, an act was passed authorizing the President, through a commission to be appointed by himself, to ascertain 'the fitness of candidates as to age, health, character, knowledge and ability, by examination,' and to prescribe regulations for the conduct of appointees. The President that year appointed a commission, George William Curtis its chairman. On December 10th he sent a message to Congress, transmitting the report of the commissioners, together with the rules submitted by them in relation to the appointment, promotion and conduct of persons filling the offices covered by the law. These rules provided that each applicant should furnish evidence as to his character, health and age, and should pass a satisfactory examination in speaking, reading and writing the English language. Positions were to be grouped and graded according to the nature of the work, admission to the civil service always introducing the candidate to the lowest group. . . . Public competitive examinations were to be instituted, and a list of examinees made up and kept on record, with the order of their excellence. Each appointment was to be made from the three leading eligibles. Admission to a group above the lowest could be had only by one of three candidates from the next grade who stood highest in a competitive examination. An applicant for a place of trust where another officer was responsible for his fidelity could not be appointed without the approval of such officer; and postmasterships yielding less than two hundred dollars a year were not placed under the rule. With some exceptions, notably of postmasters and consuls, appointments were to be probationary for a term of six months. Best of all the regulations presented was the following: 'No head of a department or any subordinate officer of the Government shall, as such officer, authorize or assist in levying any assessment of money for political purposes, under the form of voluntary contributions or otherwise, upon any person employed under his control, nor shall any such person pay any money so assessed.' Higher officials and some others were, however, excepted from the operation of this rule. . . .

"These paragraphs perhaps afford the reader sufficient insight into the condition of Republican politics when Mr. Hayes became President; they indicate the strength of the evil tide which he so resolutely set himself to turn. . . . Yet, while his efforts for reform were endorsed by thousands of the rank and the file Hayes found himself strenuously opposed by a large and powerful Republican faction. As the head and front of this, championing all that Grant had stood for, his sins of omission and his sins of commission alike, towered Senator Roscoe Conkling, of New York, one of the most formidable personal leaders in the grand old party. Though knowing of this gentleman's sure and potent antagonism, the President did not hesitate, but early and firmly took the bull by the horns. He touched the danger-line in removing Chester A. Arthur from the office of Collector of the Port

of New York, A. B. Cornell from that of Naval Officer, and George H. Sharpe from that of Surveyor. Over two-thirds of the nation's customs revenue was received at that port, and its administration could not but be important. Numerous complaints having been made concerning affairs and methods at the port, a Commission was appointed in April, 1877, to make an examination. . . . It recommended considerable sweeping changes. President Hayes concurred in these recommendations. He wrote Secretary Sherman: 'It is my wish that the collection of the revenues should be free from partisan control, and organized on a strictly business basis, with the same guarantees for efficiency and fidelity in the selection of the chief and subordinate officers that would be required by a prudent merchant. . . . No assessments for political purposes on officers or subordinates should be allowed. No useless officer or employé should be retained. No officer should be required or permitted to take part in the management of political organizations, caucuses, conventions, or election campaigns. Their right to vote, and to express their views on public questions, either orally or through the press, is not denied, provided it does not interfere with the discharge of their official duties.'—E. B. Andrews, *History of the last quarter-century in the United States*, pp. 230-232, 242, 243.—'In 1880, Postmaster James revived the competitive methods in some parts of his office. . . . When the President, desiring that these examinations should be more general and uniform, asked Congress for an appropriation, it was refused. But, notwithstanding this, competitive examinations continued to be held in the New York Custom House and Postoffice until the passage of the Reform Act of 1883. Feeling that more light was needed upon the methods and progress of reform in other countries, President Hayes had formally requested Mr. Dorman B. Eaton to visit England for the purpose of making such inquiries. Mr. Eaton spent several months in a careful, thorough examination; and his report was transmitted to Congress in December, 1879, by the President, in a message which described it as an elaborate and comprehensive history of the whole subject. This report was afterwards embodied in Mr. Eaton's 'Civil Service in Great Britain'. . . . For this invaluable service Mr. Eaton received no compensation from the Government, not even his personal expenses to England having been paid. And to Mr. Eaton is due, also, the credit of originating Civil Service Reform Associations.'—H. Lambert, *Progress of civil service reform in the United States*, pp. 8-10.—'The National Civil Service Reform League was organized at Newport, R. I., on the 11th of August, 1881. It was the result of a conference among members of civil service reform associations that had spontaneously arisen in various parts of the country for the purpose of awakening public interest in the question, like the clubs of the Sons of Liberty among our fathers, and the anti-slavery societies among their children. The first act of the League was a resolution of hearty approval of the bill then pending in Congress, known as the Pendleton bill.'—G. W. Curtis, *Address, National civil service reform league*, 1891.—See also U. S. A.: 1895.

1880-1883.—Attitude of President Arthur.—Pendleton bill.—Non-partisan, competitive examinations.—Civil service commissioners.—'It is one of the striking but praiseworthy anomalies of American politics that Arthur, who had been a New York City spoilsman, became as President a supporter of the merit system. In his first message to Congress, that of December, 1881, he

maintained that 'original appointments should be based upon ascertained fitness'; in the following July he made a public statement that no officeholder need feel obliged 'to make political contributions'; and, in his message of December, 1882, he said that if the [Pendleton] bill pending . . . should be passed . . . it would receive his 'unhesitating support.' . . . Pendleton, Democratic senator from Ohio, had . . . [brought] an inchoate measure before the Senate in December, 1880, and a year later . . . introduced a bill for the reform of the civil service [drawn] by Dorman B. Eaton. . . . Referred to the proper Committee, the chairman of which was Hawley, a Republican, it was reported back to the Senate, which took no action upon it at that session. Before the subject was again tackled the fall elections occurred in which the Democrats were eminently successful; this result, it was thought, gave an impetus to the reform. . . . [On December 27, the bill passed by the Senate; on January 4, 1883, by the House; on January 16, it was approved by the President. The act provided that:] no public officer should be under obligation to make any political contributions or render any political service; no senator or representative in Congress and no executive officer should solicit or receive any political assessments. Open competitive practical examinations without distinction of party and regardless of personal influence were the essence of the act; and such examinations were requisite to enter the classified service.'—J. F. Rhodes, *History of the United States*, pp. 162-164.—The Act made provision for the appointment of a civil service commission of three members, of whom not more than two should be of the same party, "to assist the President to carry the act into effect by preparing suitable rules, to provide and declare . . . for open competitive examinations for testing the fitness of applicants for the public service now classified or to be classified hereunder. Such examinations shall be practical in their character."

1889.—Theodore Roosevelt on the civil service commission.—In the spring of 1889 Theodore Roosevelt was appointed civil service commissioner by President Harrison and began the great work for this reform which he was to continue when he became president. He writes of this period in his autobiography: "I served six years as Civil Service Commissioner—four years under President Harrison and then two years under President Cleveland. . . . Civil Service Reform had two sides. There was, first, the effort to secure a more efficient administration of the public service, and second, the even more important effort to withdraw the administrative offices of the Government from the domain of spoils politics, and thereby cut out of American political life a fruitful source of corruption and degradation. . . . During my six years' service as Commissioner the field of the merit system was extended at the expense of the spoils system so as to include several times the number of offices that had originally been included. Generally this was done by the introduction of competitive entrance examinations; sometimes, as in the Navy-Yards, by a system of registration. . . . Even better work was making the law efficient and genuine where it applied. . . . In this we succeeded after a number of lively fights. . . . Our opponents relied chiefly on downright misrepresentation. . . . A favorite argument was to call the reform Chinese, because the Chinese had constructed an inefficient governmental system based in part on the theory of written competitive examinations. . . . There was, however, some honest and at least partly justifiable opposi-

tion. . . . The important point, and the point most often forgotten by zealous Civil Service Reformers, was to remember that the routine examination was merely a means to an end. It did not always produce ideal results. But it was normally better than a system of appointments for spoils purposes; it sometimes worked out very well indeed; and in most governmental offices it not only gave satisfactory results, but was the only system under which good results could be obtained."—T. Roosevelt, *Autobiography*, 1913, pp. 144-145, 149, 151, 158-159.—"On June 5 [1889], the Commission published a report in which it declared that examinations for admissions to the service, as conducted by the local [New York] board were characterized by 'great laxity, negligence and fraud'; . . . that the testimony adduced as to the misconduct of three employees was conclusive and they should be removed by the collector. . . . It was the first formal notice that the Civil Service Law was a real law and capable of enforcement by the courts like any other law. From New York City, the Commissioners visited various post offices in New York State, finding irregularities and on June 18 they started on a tour of the principal Western cities, inquiring into the manner in which the law was enforced in the Government service in each. . . . The tour was a veritable campaign of education, for full publicity was given to its proceedings and discoveries, and a convincing demonstration was made that the full power of the Commission would be exerted to have the law rigidly enforced and violators of it punished. Several postmasters were convicted of violations and were removed, and a great awakening of public interest was caused. During 1889, 1890 and 1891, Roosevelt pushed this campaign forward relentlessly, without regard to the political character of the persons affected. . . . An investigation of the Commission [by Congress] was proposed, and eagerly welcomed by Roosevelt, who met his accusers face to face and demolished ruthlessly all their assertions as to the character of his work. . . . [President Harrison] refused to remove him and stood by him firmly till the end of his term. When Cleveland succeeded him in 1893, it was declared by the partisan press of both parties that he would not think for a moment of retaining Roosevelt. The most earnest advocates of his retention were the civil service reformers. Carl Schurz, who was President of the Civil Service Reform League, was especially active. . . . Cleveland retained Roosevelt as Commissioner and he remained in the position till May 5, 1895. . . . The great value of his six years of service . . . did not lie in the increased number of places brought within the rules, but in the revolution that he had accomplished in the minds of both the politicians and the people regarding the law and its merits. . . . Not only had there been created a public sentiment in favor of the law and its enforcement, but against such features of the spoils system, as levying assessments upon office-holders . . . and the slavish employment of them for partisan political work,—against these practises a vigilant moral sense had been aroused. . . . If civil service reform had not been completely accomplished, it had been placed upon a firm foundation and its steady progress in the future in spite of all attempts to overthrow it had been assured."—J. B. Bishop, *Theodore Roosevelt and his time* (1920), v. 1, pp. 46-48, 51, 53.

1893-1896.—Extensions of the civil service rules by President Cleveland.—"Through the extensions of the Federal classification during President Cleveland's second administration, the num-

ber of positions covered by the civil-service rules was increased two-fold. On March 3, 1893, the number classified was 42,928. By a series of executive orders ranging from March 20, 1894, to June 25, 1895, 10,000 places were added to the list, bringing the total, approximately, to 53,000. Meanwhile, the Civil Service Commission had recommended to the President a general revision that would correct the imperfections of the original rules and extend their scope to the full degree contemplated by the Pendleton Act. After much correspondence and consultation with department officers, and careful work on the part of the Commission, the rules of May 6 [1896] were promulgated. They added to the classification about 29,000 more places, and by transferring to the control of the Commission the system of Navy Yard employment, established by Secretary Tracy, brought the total number in the classified service to 87,117. The positions in the Executive branch unaffected by these orders included those classes expressly excluded by the statute—persons nominated for confirmation by the Senate and those employed 'merely as laborers or workmen'—together with the fourth-class postmasters, clerks in post-offices other than free delivery offices and in Customs districts having less than five employees, persons receiving less than \$300 annual compensation, and about 1,000 miscellaneous positions of minor character, not classified for reasons having to do with the good of the service—91,600 in all. Within the classified service, the list of positions excepted from competitive examination was confined to the private secretaries and clerks of the President and Cabinet officers, cashiers in the Customs Service, the Internal Revenue Service and the principal post-offices, attorneys who prepare cases for trial, principal Customs deputies and all assistant postmasters—781 in all. The new rules provided for a general system of promotion, based on competitive examinations and efficiency records, and gave the Commission somewhat larger powers in the matter of removals by providing that no officer or employee in the classified service, of whatever station, should be removed for political or religious reasons, and that in all cases like penalties should be imposed for like offenses."—*Report of the Executive Committee of the New York Civil Service Reform Association*, 1897.—In his annual message to Congress, December, 1896, President Cleveland remarked on the subject: "The civil-service rules as amended during the last year provide for a sensible and uniform method of promotion, basing eligibility to better positions upon demonstrated efficiency and faithfulness."—*United States, Message and documents (Abridgment)*, 1896-7, p. 33.—See also U. S. A.: 1895: Status of civil service reform.

1894.—Merit system introduced in New York. See New York: 1894.

1897-1898.—Onslaught of the spoilsmen at Washington.—Failure of the congressional attack.—"During the four months following the inauguration [of President McKinley] the onslaught of place-seekers was almost unprecedented. Ninety-nine out of every hundred of them discovered that the office or position he desired was classified and subject to competitive examination. The tenure of the incumbent in each case was virtually at the pleasure of the department officers; removals might easily be made; but appointments to the places made vacant could be made only from the eligible lists, and the lists were fairly well filled. It is true that the rules permitted the reinstatement without examination of persons who had been separated from the service without personal

fault within one year, or of veterans who had been in the service at any time, and that some removals were made to make room for these. But the appointments in such cases went but a very little way toward meeting the demand. The result was that almost the whole pressure of the office-hunting forces and of their members of Congress was directed for the while toward one end—the revocation or material modification of the civil service rules. President McKinley was asked to break his personal pledges, as well as those of his party, and to take from the classified service more than one half of the 87,000 officers and positions it contained. . . . But the President yielded substantially nothing. . . . The attack of the spoils-seekers was turned at once from the President to Congress. It was declared loudly that the desired modifications would be secured through legislation, and that it might even be difficult to restrain the majority from voting an absolute repeal. The House devoted two weeks to the subject in connection with the consideration of the annual appropriation for the Civil Service Commission. . . . The effort to defeat the appropriation ended in the usual failure.”—*Report of the Executive Committee of the New York Civil Service Reform Association, 1898.*

1899.—Modification of civil service rules by President McKinley.—Criticism of the order by the National Civil Service Reform League.—On May 29, 1899, President McKinley was persuaded to issue an order greatly modifying the civil service rules, releasing many offices from their operation and permitting numerous transfers in the service on a non-competitive examination. This presidential order was criticized with severity in a statement promptly issued by the executive committee of the National Civil Service Reform League, which says: “The National Civil Service Reform League, after mature consideration, regards the order of President McKinley, of May 29, changing the Civil Service rules, as a backward step of the most pronounced character. . . . Its immediate effects, which have been understated, may be set forth as follows: (1) It withdraws from the classified service not merely 3,000 or 4,000 offices and positions, but, as nearly as can be now estimated, 10,109. It removes 3,693 from the class of positions filled hitherto either through competitive examination or through an orderly practice of promotion, and it transfers 6,416 other positions in the War Department, filled hitherto through a competitive registration system, under the control of the Civil Service Commission, to a system to be devised and placed in effect by the present Secretary of War. (2) It declares regular at least one thousand additional appointments made temporarily, without examination—in many cases in direct disregard of the law—in branches that are not affected by the exceptions, but that remain nominally competitive. (3) It permits the permanent appointment of persons employed without examination, for emergency purposes during the course of war with Spain, thus furnishing a standing list of many thousands from which positions in the War Department may be filled, without tests of fitness, for a long time to come. (4) It alters the rules to the effect that in future any person appointed with or without competitive examination, or without any examination, may be placed by transfer in any classified position without regard to the character or similarity of the employments interchanged, and after non-competitive examination only. (5) It permits the reinstatement, within the discretion of the respective department officers, of persons separated from the

service at any previous time for any stated reason.” In his next succeeding annual message to Congress the president used the following language on the subject: “The Executive order [by President Cleveland] of May 6, 1896, extending the limits of the classified service, brought within the operation of the civil-service law and rules nearly all of the executive civil service not previously classified. Some of the inclusions were found wholly illogical and unsuited to the work of the several Departments. The application of the rules to many of the places so included was found to result in friction and embarrassment. After long and very careful consideration it became evident to the heads of the Departments, responsible for their efficiency, that in order to remove these difficulties and promote an efficient and harmonious administration certain amendments were necessary. These amendments were promulgated by me in Executive order dated May 29, 1899. All of the amendments had for their main object a more efficient and satisfactory administration of the system of appointments established by the civil-service law. The results attained show that under their operation the public service has improved and that the civil-service system is relieved of many objectionable features which heretofore subjected it to just criticism and the administrative officers to the charge of unbusinesslike methods in the conduct of public affairs. It is believed that the merit system has been greatly strengthened and its permanency assured.”—*United States, Message and documents (Abridgment), 1899-1900, v. 1.*—At its next annual meeting, December 14, 1900, in New York, the National Civil Service Reform League reiterated its condemnation of the order of President McKinley, declaring: “The year has shown that the step remains as unjustified in principle as ever and that it has produced, in practical result, just the injuries to the service that were feared, as the reports of our committee of various branches of the service have proved.”

1900.—Civil service rules in the Philippine Islands.—“An Act for the establishment and maintenance of an efficient and honest civil service in the Philippine Islands” was adopted, on September 19, by the commission which now administers the civil government of those islands. The bill is founded on the principles of the American civil service in their stricter construction, and its provisions extend to all the executive branches of the government. The framing of rules and regulations for the service are left to the civil service board provided for in the act. At the annual meeting of the National Civil Service Reform League of the United States held in New York, December 13, 1900, the above measure was commended highly in the report of a special committee appointed to consider the subject of the civil service in our new dependencies, as being one by which, “if it be persevered in, the merit system will be established in the islands of that archipelago, at least as thoroughly and consistently as in any department of government, Federal, State or municipal, in the Union. This must be, in any case, regarded as a gratifying recognition of sound principles of administration on the part of the commission and justifies the hope that, within the limits of their jurisdiction at least, no repetition of the scandals of post-bellum days will be tolerated. The ruling of the several departments that the provisions of the Federal offices established in the dependencies which would be classified if within the United States is also a matter to be noted with satisfaction by the friends of good government.”

1901.—“Spoils system” of service in the House of Representatives.—The “spoils system” maintained by Congressmen among their own immediate employees, in the service of the House of Representatives, was depicted in a report, submitted February 28, 1901, by a special committee which had been appointed to investigate the pay of the House employes. The report, presented by Mr. Moody, of Massachusetts, makes the following general statements, with abundance of illustrative instances, few of which can be given here: “The four officers elected by the House, namely, the Clerk, Sergeant-at-Arms, Doorkeeper, and Postmaster, appoint the employees of the House, except the clerks and assistant clerks of members and committees, four elevator men, the stenographers, and those appointed by House resolutions. The appointments, however, are made on the recommendation of members of the House, and very largely, though not entirely, of members of the dominant party in the House. If a member upon whose recommendation an appointment is made desires the removal of his appointee and the substitution of another person, the removal and substitution are made without regard to the capacity of either person. In case a member upon whose recommendation an appointment has been made ceases to be a member of the House, an employee recommended by him ordinarily loses his place. Thus the officers of the House, though responsible for the character of the service rendered by the employes, have in reality little or no voice in their selection, and, as might reasonably be expected, the results obtained from the system which we have described are in some cases extremely unsatisfactory. This method of appointing House employes has existed for many years, during which the House has been under the control of each party alternately. We believe that candor compels us to state at the outset that some of the faults in administration which we have observed are attributable to the system and to the persistence of members of the House in urging upon the officers the appointment of their constituents and friends to subordinate places, and that such faults are deeply rooted, of long standing, and likely to continue under the administration of any political party as long as such a system is maintained.” The committee found nothing to criticize in the administration of the offices of the house postmaster or sergeant-at-arms. With reference to the offices of the clerk and the doorkeeper they say: “We have found in both departments certain abuses, which may be grouped under three heads, namely: Transfers of employes from the duties of the positions to which they were appointed to other duties, unjustifiable payments of compensation to employes while absent from their posts of duty, and divisions of salary.”—*Congressional record*, Feb. 28, 1901, p. 3597.

1901-1909.—Progress of reform under President Roosevelt.—At the close of the administration of President Roosevelt, the journal published by the National Civil Service Reform League, entitled “Good Government,” bore the following testimony to the fidelity with which the principles of the reform had been upheld and promoted by the retiring executive: “One of the first acts of President Roosevelt was the reorganization of the civil service commission, which, under the administration of President McKinley, had become lax and ineffective. Since then the enforcement of the law and rules by the commission has been sincere, vigorous and impartial. Particularly strict has been the enforcement of the prohibition against political assessments. Twice in the midst of political campaigns has the President ordered the removal of

prominent officials for levying assessments on their subordinates. During his administration President Roosevelt has extended the scope of competition to many new and important offices. Notable among these extensions have been the restoration of the field service of the War Department (withdrawn by President McKinley) and the classification of the rural free delivery service (now numbering some 40,000), the forestry service, deputy collectors of internal revenue, deputy collectors of customs, deputy naval officers, and cashiers and finance clerks in post offices. Prevented by the civil service law from ‘classifying’ unskilled laborers, President Roosevelt, under general executive authority, has prescribed a system of examination for laborers in Washington and the principal cities. By executive order of June 27, 1906, he provided a system of examination and promotion for the consular service which has done away with the more flagrant evils of that service. His latest and most striking extension has been the classification of over 15,000 fourth-class postmasters, thereby taking them out of politics. He has prohibited the participation of competitive officials in politics further than to vote as they pleased and to express privately their opinions, and has made this prohibition effective by incorporating it in the civil service rules, thus giving to the commission the power to investigate. He has by vetoing the Crumpacker census bill defeated the attempt by Congress to obtain as spoils some 4,000 clerkships for the next census. This is a brief record of President Roosevelt’s service to civil service reform during his administration. In considering the criticisms of his course which have been made from time to time by the League and the press, this service should be kept in mind and carefully weighed. For instance, against this record of constant advancement, the suspension of the rules in individual cases—in all about 370—although in our opinion arbitrary and dangerous as precedents, are of comparatively minor importance. A few have been made for political reasons; the far greater number, however, were acts of charity or personal impulse, and President Roosevelt himself realized the danger in this practice and took steps to curtail it.

“In passing on the justice of the other criticisms of President Roosevelt’s course regarding the civil service one should keep in mind the distinction which he has so sharply drawn between the classified and the unclassified service. This is clearly set forth in a reply to a letter from the civil service commission calling his attention to the omission from the postal regulations of President Cleveland’s ‘pernicious activity’ order, and quoting a passage from the 11th report of the commission. President Roosevelt said: ‘I personally drew the paragraph which you quote. The paragraph was drawn with a view to making a sharp line between the activity allowed to public servants within the classified service and those without the classified service—the latter under our system are as a rule chosen largely with reference to political considerations, and as a rule are, and expect to be, changed with the change of parties. . . . It seemed to me at the time, and I still think, that the line thus drawn was wise and proper.’ In considering such appointments to positions in the unclassified service as that of James C. Clarkson as surveyor of the Port of New York for instance, a just analysis must take into account these frankly expressed views. President Roosevelt drew a line between the classified and unclassified service, and as to the latter recognized and availed himself to some extent of existing conditions. He believed that so long as positions remained in the unclassified service it

was impractical to eliminate political considerations and that any attempt to do so led to hypocrisy. His remedy was to place the positions in the classified service, wherever practicable. And he has extended the line of the classified service higher than ever before. The League does not believe this theory is ideal, but in carrying it out the President has certainly not set the reform back. Criticism based only on the fact that one who has rendered great service to a cause has not accomplished all that its ardent supporters wish to accomplish can be properly set down as captious. In performing its duty to the public, the League has at various times during his administration frankly criticised certain acts of President Roosevelt, which in its opinion were not in line with the best interests of the service. But this does not prevent us from recognizing that during his entire administration President Roosevelt has been loyal to the reform with which he has been so prominently identified. We do not believe that any act of his was intended to injure the reform. Wherever he has thought it practicable to extend the reform he has done so. A President less devoted to the reform would not have been criticised for what President Roosevelt has failed to do."—*Good Government, Mar., 1909.*

1902-1903.—Extension of classification to the rural free delivery service.—Order concerning unclassified laborers.—"During the year ended June 30 [1903], 25,566 persons were appointed through competitive examinations under the civil-service rules. This was 12,672 more than during the preceding year, and 40 per cent of those who passed the examinations. This abnormal growth was largely occasioned by the extension of classification to the rural free-delivery service and the appointment last year of over 9,000 rural carriers. A revision of the civil-service rules took effect on April 15 last, which has greatly improved their operation. . . . Executive orders of July 3, 1902, March 26, 1903, and July 8, 1903, require that appointments of all unclassified laborers, both in the Departments at Washington and in the field service, shall be made with the assistance of the United States Civil Service Commission, under a system of registration to test the relative fitness of applicants for appointment or employment. This system is competitive, and is open to all citizens of the United States qualified in respect to age, physical ability, moral character, industry, and adaptability for manual labor: except that in case of veterans of the civil war the element of age is omitted. This system of appointment is distinct from the classified service and does not classify positions of mere laborer under the civil-service act and rules. Regulations in aid thereof have been put in operation in several of the Departments and are being gradually extended in other parts of the service. The results have been very satisfactory, as extravagance has been checked by decreasing the number of unnecessary positions and by increasing the efficiency of the employees remaining."—*President's message, Dec. 7, 1903.*

1906-1909.—Reform of the consular service.—A great and greatly needed reformation of the consular service of the United States was begun in 1906, by the passage of an act of Congress, approved April 5, which provided for the reorganization of the service, primarily by the classifying and grading of the consuls-general and the consuls, and the fixing of salaries in each class. Consuls-general were placed by the act in seven classes. . . . All fees allowed to be collected for services rendered in connection with the duties of the consular office (which the president may prescribe) are directed

by the act to be accounted for thereafter and paid into the treasury of the United States. All consular officers whose salaries exceed \$1000 are forbidden to be interested in or to transact any business as a merchant, factor, broker, or other trader, or a clerk or other agent of one, or to practice as a lawyer for compensation, or to be interested in the fees or compensation of any lawyer. The whole service is placed under inspection by five inspectors, to be appointed from the members of the consular service; and each consular office must be inspected at least once in every two years. In June following this important enactment, the secretary of state, Mr. Root, submitted to President Roosevelt the draft of a recommended executive order, which prescribed new rules to be followed in filling the consular offices, as classified by the recent act. In doing so, the secretary made this explanation: "The main features of the order were embodied in the early forms of the Consular Reorganization Bill passed at this session of Congress, but they were dropped out, largely for the reason that their enactment by Congress would appear to be an infringement upon the President's constitutional power to appoint consuls. Your adoption of these rules by executive order will be free from that objection, and judging from the very positive commendation which many members of both Houses have expressed for the proposed change in the method of appointing consuls, I do not doubt that the new system will receive the hearty approval of the Senate and of Congress whenever occasion may arise for an expression upon the subject."

The recommended order was approved and issued by the president. "Subject to the advice and consent of the Senate," it declared in substance as follows: (1) Vacancies in the office of consul-general and in the office of consul above class 8 (salary, \$2500) shall be filled by promotion from the lower grades of the service, based upon "ability and efficiency, as shown in the service"; (2) vacancies in the office of consul of these two remaining classes, 8 and 9, are to be filled (a) by promotion, "on the basis of ability and efficiency, as shown in the service," of consular clerks, vice-consuls, and consular agents, and (b) by new appointments from candidates who have passed an examination; (3) officials in the service of the department of State, with salaries of \$2000 or upward, shall be eligible for promotion, always on the basis of ability and efficiency, as shown in the service, to any grade of the consular service above the eighth class; (4) the board of examiners for admission to the service shall consist of the secretary of state (or such other officer of the department as the president shall designate), the chief of the consular bureau, and the chief examiner of the civil service commission (or such other officer as this commission shall designate); (5) this board of examiners shall formulate the rules for examinations; (6) among the compulsory subjects shall be at least one modern language other than English, the natural industrial and commercial resources and commerce of the United States, political economy, and the elements of international, commercial, and maritime law; (7) 80 per cent. shall be necessary for eligibility; (8) candidates must be over twenty-one and under fifty years of age, citizens of the United States, and of good character and physique. They must also have been specially designated by the president for examination.

Other significant provisions of the order are to the effect that no promotion shall be made except for efficiency and conduct, that "neither in

the designation for examination or certification or appointment will the political affiliations of the candidate be considered"; and that "due regard should be had to the rule that, as between candidates of equal merit, appointments should be made so as to secure in the service proportional representation of all the States and Territories." The first examination of candidates for appointment under this order was held on March 14-15, 1907, since which time no one has entered the consular service of the United States without satisfying that test. In June, 1908, Secretary Root announced the promotion or transfer of nearly sixty consular offices, setting in motion the desirable advancement of these officials from post to post, to make the best use of their proved capacity and acquired experience. About a year later, Mr. Root's successor, Secretary Knox, made public the promotion of twenty-seven incumbents of consular office, and the appointment of twenty-three new recruits to the service from his eligible list. So the long striven-for reform of the American consular service may safely be said to have arrived. A bill introduced in the senate, providing for a permanent consular service, based on competitive examinations, was decided by the Committee on Foreign Relations to be unconstitutional, for the reason that the constitution itself confers the power of appointment of consular officers upon the president, and that Congress has no right to limit this power in any way. President Taft, by an executive order, practically put the scope of the proposed bill into effect, thereby, in part, limiting the power conferred upon the president. This, in the opinion of the senators, was all that could be done legally.—See also DIPLOMATIC AND CONSULAR SERVICE: Consular service.

1908.—Extension of the merit system to nearly one-third of the fourth class postmasters of the country.—In the annual report of the council of the National Civil Service Reform League, presented at the annual meeting of the league in December, 1908, it was said: "The great event of the year, which so aptly commemorates the 25th anniversary of the passage of the Pendleton bill, is the extension of the competitive system to all fourth class postmasters in the part of the country north of the Ohio and east of the Mississippi, that is, in the New England States, New York, New Jersey, Pennsylvania, Ohio, Indiana, Illinois, Wisconsin, and Michigan. This is an extension covering more positions than suggested by the civil service commission. It is an extension large enough to be of present advantage, is made in the more thickly settled portions of the country, where it is easiest to carry it out, and yet it is not on so large a scale as to invite mistakes or perhaps partial failure. This extension covers about 15,000 positions. The order of President Cleveland of May 26, 1896, covered about 31,000 places; and yet, from the point of political significance, this present extension is the most important, we believe, in the history of civil service reform since January 16, 1883, and when its purpose is fully carried out it will include some 53,000 places." The report then reviewed the efforts that had been in progress since 1880, with the support of Presidents Cleveland and Roosevelt, to bring about the inclusion of this class of postmasters, at the least, under the rule of appointment subject to competitive examination. President Roosevelt, in his annual message of 1907, had said: "The fourth-class postmasters' convention has passed a very strong resolution in favor of placing the fourth-class postmasters under the civil-service law. The Administration has already

put into effect the policy of refusing to remove any fourth-class postmasters save for reasons connected with the good of the service; and it is endeavoring so far as possible to remove them from the domain of partisan politics. It would be a most desirable thing to put the fourth-class postmasters in the classified service. It is possible that this might be done without Congressional action, but, as the matter is debatable, I earnestly recommend that the Congress enact a law providing that they be included under the civil-service law and put in the classified service." Congress refused the desired legislation. The law committee of the league was unanimous in the opinion that the president held authority already to make the change by executive order, and Mr. Roosevelt gave a hearing on the subject to Messrs. McIlhenny and Greene, of the National Civil Service Commission, and the Hon. Richard Henry Dana, chairman of the council of the league. Evidently he became persuaded that his authority was sufficient, and was prepared to act accordingly. About the middle of November, 1908, the National League of Postmasters of the United States, which had been organized in 1905, sent a committee, with its president, A. K. Hoag, of Orchard Park, N. Y., to present to the authorities at Washington their claim to a footing of non-political appointment under civil service rules. By good fortune they met at Washington Mr. Dana and Mr. Goodrich, of the National Civil Service Reform League, who were visiting the capital on the same errand, and the doubled appeal had quick success. In an interview with President Roosevelt, the committee of the postmasters' league received assurances that he would issue an order on the subject, provided that the President-elect, Mr. Taft, would approve his taking that step. The committee went at once to the Hot Springs in Virginia, where the president-elect was then sojourning, received his ready endorsement of the plan, and conveyed it to the president in power. A fortnight later, on December 1, the memorable order was proclaimed. On the 1st of the following February a plan of filling vacancies was put into effect. It was wise, no doubt, to apply the extension of the reform in post-office appointments to one large and important section of the country, and obtain a showing of practical results, before attempting to overturn the old system as a whole. That more will follow in due time is reasonably sure. Mr. Hoag, the president of the National League of Postmasters, in a private note, remarks: "It is already evident that the change is to redound to a better service. Scores of new buildings, new quarters and new equipments are being installed by the emancipated postmasters; which shows that postmasters of this class dare, for the first time, to invest their money in better equipment, feeling that they are likely to remain postmasters long enough to make the investment a paying one, now that their tenure of office does not depend upon their relations to a political faction or boss."

1909.—Census bill.—Inveteracy of spoils-seeking in Congress.—Veto of bill in its first form by the president.—Amended bill which became law.—That Congress, in both houses, would wreck with eagerness, today, if it dared, the bettered public service of the nation, to recover for its members and their party henchmen the old "spoils" of office and place, was shown unmistakably, within the last year of this record, by its action on the bill to provide for the taking of the census of 1910. The president, and every responsible official connected with the census bureau, had borne testimony to the inefficiency and wasteful costliness of previous

census-taking under the 'old system of appointment, and had besought Congress to provide in the bill for an effective test of qualification for the employment by competitive examination. Considerable majorities in both House and Senate turned an equally deaf ear to all considerations of public interest in the matter, and passed a bill which enabled Senators and Representatives to parcel out among themselves the large number of appointments to be made. President Roosevelt did not hesitate to veto the bill, and gave it a thorough dissection in the message which explained his disapproval. In part, his comments on the Act offered to him were as follows: "Section 7 of the act provides in effect that appointments to the census shall be under the spoils system, for this is the real meaning of the provision that they shall be subject only to non-competitive examination. The proviso is added that they shall be selected without regard to political party affiliations. But there is only one way to guarantee that they shall be selected without regard to politics and on merit, and that is by choosing them after competitive examination from the lists of eligibles provided by the Civil Service Commission. The . . . Director of the Census in his . . . report states the exact fact about these non-competitive examinations when he says: 'A non-competitive examination means that every one of the many thousands who will pass the examinations will have an equal right to appointment, and that personal and political pressure must in the end, as always before, become the determining factor with regard to the great body of these temporary employments. I cannot too earnestly urge that the Director of the Census be relieved from this unfortunate situation.' To provide that the clerks and other employes shall be appointed after non-competitive examination, and yet to provide that they shall be selected without regard to political party affiliations, means merely that the appointments shall be treated as the perquisites of the politicians of both parties, instead of as the perquisites of the politicians of one party. I do not believe in the doctrine that to the victor belongs the spoils; but I think even less of the doctrine that the spoils shall be divided without a fight by the professional politicians on both sides; and this would be the result of permitting the bill in its present shape to become a law. Both of the last censuses, the eleventh and the twelfth, were taken under a provision of law excluding competition; that is, necessitating the appointments being made under the spoils system. Every man competent to speak with authority because of this knowledge of and familiarity with the work of those censuses has stated that the result was to produce extravagance and demoralization." The veto went to Congress on February 5, 1909, one month before the expiration of President Roosevelt's term of office. His successor-to-be was well known to be in sympathy with his views of the public service, and no attempt was made either to pass the bill over the veto, or to proffer its spoils-seeking provisions to the new occupant of the presidency when he came in. Congress was compelled, in this case, as in many before, to surrender its cherished spoils of salaried public employment to civil service reform, simply because public interests and public sentiment are better represented, as a rule, in the White House than in the Capitol, which is not a pleasing fact. During the extra session that was called by President Taft, in March, an amended bill was passed which came near to satisfying the demands of reform. It kept a little opening for political favoritism, in a proviso, that the director of the

census may, "when the exigencies of the service require," make his selections from the list of eligibles, not by the candidates' rating, but on the ground of "immediate availability" of previous experience in census work; but this was so small a loophole that the president's signing of the bill was generally approved. "The act empowers the director of the census to appoint special agents to whom will be assigned principally the work of obtaining statistics from manufacturing establishments, mines and quarries. While no qualifying test is required by law for the appointment of these agents, Director Durand has nevertheless provided for their selection subject to a carefully worked out scheme of *competitive* examinations, to be conducted by the United States civil service commission. In rating the candidates the experience declaration and practical test are to be given equal credit. All candidates who receive a combined rating of 70 will be placed on an eligible list, from which selection will be made as the needs of the service require. Eligibility, according to the instructions, 'is not of itself a guarantee of appointment, but selection will be made solely with reference to equipment and availability for appointment.'"—*Good Government*, Oct., 1909.

1910-1913.—Growth of civil service under President Taft.—By the summer of 1912 there were approximately 395,000 positions in the executive civil service. Over 58 per cent of these positions were filled by competitive examinations. Although this represented an increase in actual numbers, the proportion to the total had fallen as it had been 63 per cent in 1908. In June, 1913, the total number of employees in the federal civil service was 469,000.

1913-1920.—Extension of civil service under President Wilson.—"On June 30, 1915, there were 476,363 officers and employees in the executive civil service. Of these, 292,296 held positions subject to competitive examination under the civil-service rules, a decrease of 164 during the year. Of the 184,067 persons whose positions are not subject to competitive examination under the civil-service rules, 10,690 are presidential appointees, 8,030 being postmasters of the first, second, and third classes; 5,292 are clerks in charge of contract postal stations; 72,000 are clerks in third and fourth class post offices; 8,098 are mail messengers; 12,129 are star-route, steamboat, and screen-wagon contractors; 4,556 are pension-examining surgeons; 20,674 are engaged on the Panama Canal work, chiefly as laborers and minor employees; 204 are temporary employees of the Census Bureau; and 27,464 are unclassified laborers not elsewhere herein enumerated, of whom 6,500 are subject to tests of physical fitness under labor regulations. The remaining 22,960 are excepted from examination under Schedule A or are subject to noncompetitive examination under Schedule B of the civil-service rules, of whom 1,200 are employed in Washington and the others in branches of the field service. Few important positions are excepted from competitive examination under Schedules A and B. Their great variety will be seen by reference to those schedules. An increase of 751 in the number of competitive positions in Washington was more than balanced during the year by a decrease of 915 elsewhere. The most notable changes at Washington were increases of 423 and 351 in the Department of Agriculture and the Treasury Department, respectively, and a decrease of 98 in the Post Office Department. The number of classified employees in field branches of the Treasury Department decreased by 2,743, mainly because the Life-Saving Service became a part of the military

service under the law creating the Coast Guard. Fourth-class postmasters decreased in number 886, and railway mail clerks 970."—United States Civil Service Commission, *Report*, Nov. 13, 1915, pp. 5, 6.—"In a century and a quarter the service grew from a few hundred persons to . . . (June 30, 1916) 480,327. . . . The 'classified' service was extended . . . so as to include . . . in 1916, 296,926, or more than sixty-one per cent. of the total. . . . In an act approved August 23, 1912, many executive rules bearing on removals were made statutory. No person in the classified service might be removed 'except for such causes as will promote the efficiency of said service and for reasons given in writing'; and a person whose removal was sought must be furnished with a copy of the charges against him, and must be allowed 'a reasonable time for personally answering the same in writing.' All papers relating to the transaction must be 'made a part of the records of the proper department or office.' Furthermore, the Civil Service Commission was required to install a system of efficiency ratings for the classified service in Washington. . . . March 25, 1913, the Commission set up a Division of Efficiency . . . and on February 28, 1916, Congress gave this division an independent status as the United States Bureau of Efficiency."—F. A. Ogg, *National progress*, pp. 135-137.—"The Postmaster General has repeatedly urged the enactment by the Congress of legislation which would extend the classified civil service to postmasterships of all classes. These recommendations have failed of recognition by the Congress, but on March 31, 1917, the President issued an Executive order dealing with these offices. . . . This order was a most progressive step, for it increased the efficiency of the Postal Service and affords a more businesslike administration of postal affairs. The provisions of the order have been strictly adhered to. However, the President and the Postmaster General having now gone as far as possible in placing these appointments on the merit basis, it yet remains for the Congress to enact legislation extending the civil service law to include the position of postmaster at offices of the presidential classes. Fourth-class offices are included in the classified civil service and new appointments to these offices are made either from eligible registers furnished by the Civil Service Commission after examination; or, in the smaller offices, upon the recommendation of post-office inspectors. The highest eligible is always selected for appointment unless it should appear from the records that the appointment of such eligible would not be in the interest of the service.

"With respect to the extensions of the civil service to postmasterships it should be stressed that it now includes all postmasterships of every class, aggregating 53,084. Moreover, early in the present [Wilson] administration the Postmaster General inaugurated a system of efficiency ratings covering the appointments and promotions of employees in the Post Office Department proper at Washington, which requires that every appointment and promotion be based strictly on merit and efficiency. This has resulted in a more equitable distribution of the salaries appropriated by Congress and a material increase per capita in the compensation actually paid the employees. Under this system standard rates of pay are fixed for every class of duties and salaries are adjusted to these standards as vacancies occur from time to time and additional positions needed, appropriated for on the statutory roll in the various grades, are made available by Congress. . . . The magnitude and multiplicity of the business operations of the postal establishment

and efficient service which the people expect and to which they are entitled requires not only that great care be exercised in the selection of postmasters but that their tenure of office depend entirely upon efficient and meritorious service. Such service can best be rendered by men of executive ability, training, and experience. . . . In harmony with this policy the President on March 31, 1917, issued an Executive order requiring that when a vacancy occurs in the position of postmaster of any office of the first, second, or third class as the result of the death, resignation, removal, or when on the recommendation of the Postmaster General that the efficiency or needs of the service require that a change shall be made, the Civil Service Commission shall hold an open competitive examination to test the fitness of applicants to fill such vacancy, and when such examination has been held and the papers in connection therewith rated the commission shall certify the result to the Postmaster General, who shall submit to the President the name of the highest qualified eligible for appointment to fill such vacancy, unless it is established that the character of residence of such applicant disqualifies him for such appointment. The procedure under this order was modified by an Executive order of April 13, 1920, providing that the veteran preference statutes shall apply in the selection of persons for appointment as postmaster at offices of the first, second, and third classes. When the highest eligible certified to the Postmaster General by the Civil Service Commission is not a veteran but a veteran is among those certified as eligible, the Postmaster General may submit to the President for nomination the name of either the highest eligible or the veteran obtaining the highest eligible rating, as the best interests of the service may require. Since the issuance of this order of April 13, 1920, there have been submitted 243 nominations, in which were the names of 216 veterans. On October 8, 1920, the President further modified the order of March 31, 1917, by providing ' . . . if such vacancy is not filled by nomination of some person within the competitive classified civil service who has the required qualifications, then' an open competitive examination shall be held; also that no person ' . . . who has not actually resided within the delivery of such office for two years next preceding such vacancy' shall be given the examination. These orders are progressive steps in increased efficiency and business administration of the Postal Service, but while marking a decided improvement over previous practices in the appointment of presidential postmasters, they do not meet the situation fully. Though the person selected for appointment is chosen either by promotion of a classified employee or by an open competitive examination, yet the tenure of his office is not affected in any way and the reappointment of postmasters at the expiration of their terms is still necessary.

"The position of postmaster should be removed entirely from the realm of politics. . . . All fourth-class postmasters now in office have been appointed under a procedure in strict accordance with the spirit and letter of the civil-service law. In accordance with the usual practice of the Civil Service Commission the department has been furnished for these appointments with the names of the three eligibles standing highest on the list. The appointing officer has the right, without question, to select any one of the three eligibles certified. In accordance with the purpose of the President when he issued the Executive order of May 7, 1913, placing all post offices of the fourth class in the civil

service, the Postmaster General decided, in the interest of efficiency and the promotion of true civil-service principles, to give preference to the eligibles in the order of their civil-service ratings. In selecting persons from the eligible registers furnished by the Civil Service Commission, the persons with the highest rating are chosen, unless good and valid reasons are submitted to the department showing that this action would not be in the best interest of the service. If reasons are submitted sufficient to make the selection of the first eligible inadvisable, then the person with the next highest rating is chosen, unless good and valid reasons are submitted to show the inadvisability of the appointment of that person. In such cases the third eligible is selected. In no case is the second or third eligible chosen, unless the appointment of one of the highest standing eligibles has been shown to be inadvisable from the standpoint of efficiency in the Postal Service. In reaching conclusions as to the most desirable appointments an endeavor is made to select persons whose business and temperamental equipment is likely to reflect credit on the Postal Service. Consistently with the practice of appointing fourth-class postmaster with an eye solely to the efficiency of the service, as well as with the recommendation that postmasters at the larger post offices be appointed under civil-service procedure, classified postmasters at post offices advanced from the fourth class to the presidential grade have been retained in office, provided their services have been satisfactory."—*Annual Report of the Postmaster General, 1920, pp. 18-19, 32-35.*—See also U. S. A.: 1919-1920.

1920.—Extension among the states.—"The legislature of Maryland adopted the merit system during its 1920 session. The law exempts many officers from the classified service, but gives the governor of the state the power to classify them. Enforcement is in the hands of a single commissioner appointed by the governor for a six-year term. Maryland provided for the pensioning of members of the fire and police departments of Baltimore county; Massachusetts for the pensioning of members of the police department of Boston; New Jersey for the pensioning of firemen and policemen of municipalities; and New York passed a bill to bring about greater uniformity in the New York City pension system. This measure is expected to take care of all civilian employes other than those of the uniformed forces. Maryland has included among those to be given preference in the civil service, army and navy nurses. Three states, Massachusetts, New Jersey and Ohio, passed veteran preference measures. The New Jersey law provides for credit marks in civil service examinations to be given to United States soldiers, sailors or marines who served in any war, and requires appointment if among the first three certified. The Ohio law provides that any Red Cross nurse or soldier, sailor or marine may file with the civil service commission a certificate of service and honorable discharge, whereupon his name shall be placed on the eligible list by the commission, from which list he may be appointed to any position in the civil service of the state for which he is qualified."—E. M. Eppich, *Record of legislative accomplishment, 1920 (National Municipal Review, Feb. 21, 1921).*

1922.—Treasury dismissals by President Harding.—"By an executive order, on March 31, President Harding summarily dismissed James L. Wilmeth, Director of the Bureau of Engraving and Printing, and twenty-five chiefs, superintendents and foremen, including every important executive in the big Government plant which turns out cur-

rency, notes and postage stamps. In addition, seventeen other employes lost their places by abolition of their positions. The same executive order appointed Louis A. Hill to be Assistant Chief of the Engraving Division, succeeding Mr. Wilmeth, and other appointments were made to fill some of the vacant places. The only reason given for the wholesale removals was contained in a White House statement that the action was taken 'for the good of the service.'"—*New York Times Current History, May, 1922, p. 335.*—This action (and its relation to the civil service law) aroused considerable discussion throughout the United States.

CLAIRVAUX, Monastery of.—This is situated in the village of Clairvaux in northeastern France. St. Bernard, "the greatest reformer of the abuses of the monastic life, if not the greatest monk in history [1001-1153] . . . revived the practice in the monastery of Cîteaux, which he first entered, and in that of Clairvaux, which he afterwards founded, of the sternest discipline which had been enjoined by St. Benedict. He became the ideal type of the perfect monk. . . . He was not a Pope, but he was greater than any Pope of his day, and for nearly half a century the history of the Christian Church is the history of the influence of one monk, the Abbot of Clairvaux."—C. J. Stillé, *Studies in mediæval history*, ch. 12.—"The convent of Cîteaux was found too small for the number of persons who desired to join the society which could boast of so eminent a saint. Finding his influence beneficial, Bernard proceeded to found a new monastery. The spot which he chose for his purpose was in a wild and gloomy vale, formerly known as the Valley of Wormwood. . . . The district pertained to the bishopric of Langres; and here Bernard raised his far famed abbey of Clairvaux."—H. Stebbing, *History of Christ's universal church*, ch. 26.—See also CISTERCIAN ORDER; MONASTICISM: 9th-13th centuries.

CLANS.—"Biologically every community must rest on the family,—the group comprising a married couple and their children. But biological and sociological necessity need not coincide. It does not follow that the biological family must exist as a unit differentiated from the rest of the social aggregate of which it forms a part." This statement by Dr. R. H. Lowie in his book *Primitive Society* paves the way for a definition of the clan, or the gens. These divisions of society consist of groups of real or supposed kindred, and descent in such a group is unilateral. By unilateral descent the sociologist means a condition where the children are affiliated with only one side of the family, that of the father or the mother, for such social purposes as bearing a family name or inheritance of property or marriage regulations. The clan is a group of kin where descent is maternal and the gens reckons descent in the paternal line. The chief differences between the clan and gens and the family are: (1) In the family descent is bilateral (both father's and mother's side count)—in the clan, the father, for purposes of descent does

not function any more than the mother's family name in our modern society. (2) The family is a loose group, marriage, divorce, migration may break into the composition of the family—the clan is a fixed unit and although a man or woman through marriage may leave their home village they never lose their clan affiliations. (3) The clan recognizes a wider range of kin than the family; although to all intents and purposes one branch of the family is disregarded, third and fourth cousins who seem to us very remote kin are held closely together in the clan bond of kinship. There is a feeling of belonging together established through the terminology used by clan members in addressing each other. In a clan organization it is common for members of the same generation to call each other brothers and sisters. This entire concept of the clan applies only to the phenomenon as we find it among the ruder societies. In primitive life where the clan exists at all its functions are very important and may invade many phases of the culture of the people. The term clan has been used in various ways by ethnologists. The British anthropologists use the term clan for a kinship division in primitive society regardless of the method of reckoning descent so long as it is unilateral. The American anthropologists have reserved clan for groups with maternal descent and use gens for a similar group with paternal descent. In the book *Primitive Society* mentioned at the beginning of this article Dr. Lowie has suggested a new and simpler terminology to end the hopeless confusion of terms existing in the anthropological literature of to-day. His suggestion is:

"Following Professor Philbrick, I will call this unit (clan or gens) by the good old Anglo-Saxon term *Sib*, for the hopeless confusion of nomenclature in this department of our subject imperatively calls for a new word and the one chosen is recommended alike by its alluring brevity and phonetic suggestions.

"The *Sib* ('clan' of British Anthropologists) is most briefly defined as a unilateral kinship group. The family is bilateral: to say that an individual belongs to a certain family implies that he recognizes relationship with a certain man as his father and a certain woman as his mother. The *sib* traces kinship through *either* parent to the total neglect of the other. If a tribe is organized into mother-sibs ('clans' of most American Anthropologists), every child regardless of sex is considered a member of its mother's *sib* and takes the maternal *sib* name if there is one. If the tribe is organized into father-sibs ('gentes' of most American Anthropologists) every child follows the father's *sib* and takes the father's *sib* name. The other parent, for *sib* purposes, counts for nought, just as in European countries outside of Spain the mother is neglected as regards the transmission of the family name. If all men and women inheriting the name Smith were united by their common patronymic with a definite social group set apart from all Browns and Joneses, we should be justified in saying that they formed a *sib*. If we deny to them that designation it is because in our society there is no bond whatsoever connecting even all those Smiths who are related by blood; in inheritance a closely related Brown takes precedence of a more remote Smith. But for purposes of illustration we may assume a Smith *sib* founded on actual blood relationship. Such a *sib* would include the ancestral Smith with all his sons and unmarried daughters, his son's sons and unmarried daughters and so on *ad infinitum*. In order to convert this unit into a typical primitive *Sib* only one change is required, viz., making affiliation

(except for cases of adoption) wholly dependant on birth and unaffected by marriage. The father-sib thus embraces a male ancestor, his children male and female and the children of his male descendants through males. Correspondingly, the mother-sib includes a female ancestor with her children and the children of her female descendants through females."—R. H. Lowie, *Primitive society*, pp. 111-112.

After establishing the character of the sib (the new terminology will be used through the remainder of this article) in primitive society it is important to consider the effect it has on the life of the people. It is naturally closely bound up with social organization. Both kinship terminology, the names which relatives use in speaking of one another and the social customs of a community are influenced by the presence of sib organization, but not influenced in the same way. In spite of the vast distribution of the sib, the uniformity of the system is found only in the most fundamental things, and the details have been developed differently with each people. It is generally found that in the sib system the children of brothers or sisters call each other, not cousins, but brothers and sisters and, according to Dr. Lowie's new nomenclature, siblings. All sib mates of the same generation are called siblings. Then each sib is generally exogamous; that is, siblings may not intermarry. The step involved here is fairly simple—the incest rules of the family are extended with the more inclusive nomenclature—as the brothers and sisters were not allowed to intermarry, so siblings who call themselves brothers and sisters must go beyond the limits of their group to marry. The rigidity of this rule varies. In Australia a man or a woman marrying in his or her own sib may be put to death. Sibs generally have names and if, in Australia, a man finds a sib hundreds of miles away from his own, but bearing the same name as his own sib, the rule of exogamy still holds. In some areas the punishment for incest in the sib is not so drastic; offenders are mocked and ridiculed, or may become social outcasts. That this feeling of consanguinity is often only fiction can be shown by investigating the sib through genealogical methods. Most sibs claim descent from a common ancestor; but this can seldom be proven. Likewise strangers are often adopted into sibs and the same rules are applied to them although in such cases there is no possible blood relationship. Before discussing the other phases of culture which may be associated with the sib, it may be well to point out the distribution of the sib among primitive peoples. In North America the sib exists on the North Pacific Coast among the Tlingit, Haida, Tsimshian and Bella Coola; most of the Pueblo people of the Southwest, the Crow, Omaha, Ponca, Oto, Kansas, Iowa, Missouri and Dakota, of the Plains; the Iroquois Wyandot and Menomini of the Eastern Woodlands; and probably all the Southeastern tribes. In Australia the sib exists almost everywhere and the same is true of Melanesia. In Polynesia the sib is conspicuously absent. The Bantu tribes of Africa which live between the Kalahari Desert and the Sudan generally have sibs, while the phenomenon occurs irregularly among the Sudanese tribes. In Asia we find the primitive people of the south like the Khasi and the Todas having sibs. Further it is believed that on analysis the caste system of India is based on sibs with paternal descent. In the northern part of the continent the Turkish tribes have sib systems. Each of these areas can show some way in which the sib has influenced other phases of culture. This can be shown very clearly in the

case of Australia. The struggle for existence among the aborigines of this continent is rather severe and interest in the food supply has colored every phase of their life. The Australian tribes are divided into a large number of sibs having plant and animal names. Each sib is prohibited from eating the eponymous plant or animal, but every sib performs an intichiuma ceremony for the increase of this plant or animal. So even if the abundance of this particular animal does not help them directly they profit by a similar ceremony which was performed by another tribe for food they are permitted to eat. In Africa the sib is connected with the arts and crafts. The Masai have especial sibs of blacksmiths which are particularly separated from others by tabus and social customs. If we accept the sib explanation for the Caste system of India, there is another example of the economic functioning of the sib in the specialization of trade in the castes. The economic and political affiliations of the sib system merge in the case of the Omaha tribe in the Plains of America. Here members from certain sibs were chosen for definite posts in the communal buffalo hunt which was of great economic importance. These positions involved both leadership and police duty. In assigning the posts a man's hunting skill was taken into consideration for generally there were several members of a sib eligible for such a position. Again among the Hopi of the Southwestern Pueblos, there is a rabbit sib; the communal rabbit hunt must always be announced by a member of the rabbit sib. Turning to the features of non-material culture we find the sib functioning in religion and ceremonial. The southwest of the United States gives us good examples of this: "It is important to note that the ceremonies of the Hopi are generally associated with certain clans or groups of clans who lead in their celebration. In the case of certain clans, the snake clan, for example, the name does represent a mythical ancestor from which the clan is believed to be descended. . . . When the clans came to Oraibi, in mythical times each was asked if it had some ceremony that would cause rain to fall, the crops to grow, or in some other way promote public welfare."—P. E. Goddard, *Indians of the Southwest*, p. 100.—To illustrate the last affiliation of the sib with other phases of culture we can look to the development of art on the North Pacific coast of America. The art consists of wood carving of highly conventionalized figures of animals. These animals are the totem animals of the various sibs and used on the totem poles and on the boxes and dishes used by the families. These carvings of the animals are used very much as crests are used by European nobility.

For a theoretical discussion of the sib, its functions and organization, consult R. H. Lowie, *Primitive society*. The results of detailed study of the sib in one particular American tribe where it still functions in the old way will be found in A. L. Kroeber, *Zuni kin and clan* (*Anthropological Papers, American Museum of Natural History*, v. 18).

Grecian clans. See GREECE: B. C. 8th century.

Highland clans.—"In considering the genealogies of the Highland clans we must bear in mind that in the early state of the tribal organization the pedigree of the sept or clan, and of each member of the tribe, had a very important meaning. Their rights were derived through the common ancestor, and their relation to him, and through him to each other, indicated their position in the succession, as well as their place in the allocation of the tribe land. In such a state of society the

pedigree occupied the same position as the title-deed of the feudal system, and the Sennachies were as much the custodiers of the rights of families as the mere panegyrist of the clan. . . . During the 16th century the clans were brought into direct contact with the Crown, and in the latter part of it serious efforts were made by the Legislature to establish an efficient control over them. These gave rise to the Acts of 1587 and 1594 . . . ; but they were followed in a few years by an important Statute, which had a powerful effect upon the position of the clans, and led to another great change in the theory of their descent. . . . The chiefs of the clans thus found themselves compelled to defend their rights upon grounds which could compete with the claims of their eager opponents, and to maintain an equality of rank and prestige with them in the Heralds' Office, which must drive them to every device necessary to effect their purpose; and they would not hesitate to manufacture titles to the land when they did not exist, and to put forward spurious pedigrees better calculated to maintain their position when a native descent had lost its value and was too weak to serve their purpose. From this period MS. histories of the leading Highland families began to be compiled, in which these pretensions were advanced and spurious charters inserted. . . . The form which these pretentious genealogies took was that of making the eponymus or male ancestor of the clan a Norwegian, Dane, or Norman, or a cadet of some distinguished family, who succeeded to the chiefship and to the territory of the clan by marriage with the daughter and heiress of the last of the old Celtic line, thus combining the advantage of a descent which could compete with that of the great Norman families with a feudal succession to their lands; and the new form of the clan genealogy would have the greater tendency to assume this form where the clan name was derived not from a personal name or patronymic but from a personal epithet of its founder. . . . The conclusion, then, to which [an] analysis of the clan pedigrees which have been popularly accepted at different times has brought us, is that, so far as they profess to show the origin of the different clans, they are entirely artificial and untrustworthy, but that the older genealogies may be accepted as showing the descent of the clan from its eponymus or founder, and within reasonable limits for some generations beyond him, while the later spurious pedigrees must be rejected altogether. It may seem surprising that such spurious pedigrees and fabulous origins should be so readily credited by the Clan families as genuine traditions, and receive such prompt acceptance as the true fount from which they sprung; but we must recollect that the fabulous history of Hector Boece was as rapidly and universally adopted as the genuine annals of the national history, and became rooted in those parts of the country to which its fictitious events related as local traditions. When Hector Boece invested the obscure usurper Grig with the name and attributes of a fictitious king, Gregory the Great, and connected him with the royal line of kings, the Clan Gregor at once recognised him as their eponymous ancestor, and their descent from him is now implicitly believed in by all the Mac-Gregors. It is possible, however, from these genealogies, and from other indications, to distribute the clans in certain groups, as having apparently a closer connection with each other, and these groups we hold in the main to represent the great tribes into which the Gaelic population was divided before they became broken up into clans. The two great tribes which possessed the

greater part of the Highlands were the Gallgaidheal or Gael in the west, who had been under the power of the Norwegians, and the great tribe of the Moravians, or Men of Moray, in the Central and Eastern Highlands. To the former belong all the clans descended of the Lords of the Isles, the Campbells and Macleods probably representing the older inhabitants of their respective districts; to the latter belong in the main the clans brought in the old Irish genealogies from the kings of Dalriada of the tribe of Lorn, among whom the old Mormaers of Moray appear. The group containing the Clan Andres or old Rosses, the Mackenzies and Mathesons, belong to the tribe of Ross, the Clan Donnachy to Athole, the Clan Lawren to Stratherne, and the Clan Pharlane to Lennox, while the group containing the MacNabs, Clan Gregor, and Mackinnons, appear to have emerged from Glendochart, at least to be connected with the old Columban monasteries. The Clans, properly so called, were thus of native origin; the surnames partly of native and partly of foreign descent."—W. F. Skene, *Celtic Scotland*, bk. 3.—See also GENS.

"The progress of the Celtic renaissance and the formation of clan societies have given a stimulus to the study of all matters pertaining to the Celt, his language, dress and manners. To meet these demands a number of valuable works have been published bearing on clans and kindred subjects. It must never be forgotten that prior to 1746, when the clan system came to an end, a clan was something very different from a modern clan society. Prior to the '45 a clan was a set of men all bearing the same surname, and believing themselves to be related the one to the other, and to be descended from the same stock. The members of every clan were tied to another not only by the feudal but the patriarchal bond; for while the individuals who composed it were vassals, or tenants of their own hereditary chief, they were also descended from his family and could count exactly the degree of their descent; and the right of primo-geniture, together with the weakness of the law to reach inaccessible countries, had in the revolution of centuries converted these natural principles of connection between the chief and his people into the most sacred ties of human life. The castle of the chief was a kind of palace to which every man of his clan was welcome, and where he was entertained according to his station in time of peace, and to which all flocked at the sound of war. Thus the meanest of the clan, believing himself to be as well born as the head of it, revered his chief and respected himself. The clansmen did not look merely upon their chiefs as their landlords, but as the representatives of the old patriarchs or fathers of the clan, for they held the same authority after having lost their estates, and the members of the clan felt themselves as much bound for the chief's support as when he was in full possession of his rights. There are several instances on record where, on the estates being confiscated by government, and the chief in exile, the clansmen subjected themselves to a voluntary assessment for his support. For such loyalty and devotion the chief was bound to protect his followers, even against the laws, and he was held accountable to the law for depredations or violence committed by any member of the clan, and he was also bound to provide for every member of the clan. Thus the connection was sustained by mutual benefits and kind offices, the most condescending manners being employed on both sides. After the '45 the clan system came to an end, the chiefs accepting Crown

charters for what was known as clan lands. This and the repressive act which deprived Highlanders of their arms and their picturesque dress, so disgusted them, that many of them left their native land and sought homes beyond the Atlantic. It is estimated that between 1763 and 1775 upwards of 20,000 highlanders left the land of their birth rather than suffer the tyranny of the Government. The obnoxious Disarming Act of 1747 remained in force till 1782, when it was repealed through the influence of the gallant Duke of Montrose. The tyrannical administration of the Act continued long enough to stamp out the use of the Highland dress at least among the lower classes, and to put all but an end to the manufacture of tartan. Tartan is not a Gaelic word; the striped or spotted cloth under this name is called 'breacan,' derived from *breac*, chequered. In the old Gaelic tale of Curio, assigned by competent authorities to the fourteenth century, the word 'breacan' occurs. Various colored cloths have, from a very early period, been worn by the several Highland clans; originally tartan was worn only by natives inhabiting the Highlands which not only excluded the Lowlands or border countries on the south, but also the north-east of the country. In modern times many tartans have been invented and manufactured, namely after the Border tribes of the Lowlands, such as Douglas, Johnston, Dundas, etc. While there can be no doubt that district tartans are older than clan tartans, it is interesting to note that there is historic evidence that clan tartans existed as early as 1587. In a charter of that year, granting Hector MacLean, heir of the Duart, certain lands in Islay, the feu-duty is made payable in the form of sixty ells cloth of white, black, and green colors, which correspond with the hunting tartan of the house of Duart. It should be borne in mind that many clans have from one to four various tartans such as the common clan tartan, the chief's tartan, worn only by himself and heir, the dress tartan and the hunting tartan. The ignorance of this fact leads to many disputes as to the correctness of a particular tartan, it being generally supposed that a clan had only one tartan associated therewith. The clans were also distinguished by badges, usually an evergreen plant easily procurable in the clan country, worn in the bonnet. The whole question of clan badges is at present in a state of considerable confusion. Where 'authorities' give the badge to a clan, one of them indigenous and the other exotic, the presumption is strong in favor of the native plant being the correct one. An effort to allocate to each clan the martial music long associated therewith in history and tradition, and the recent work on the martial music of the clans, by 'Fionn,' has rendered it possible to largely augment previous efforts in this direction.—Johnston, *Scottish clans and their tartans*.—"The clan sentiment is far from disappearing, for the Highlander looks up to the chief of his name, albeit that Parliament-made laws have usurped the latter's powers over his following. Even the geographical disposition of the clans is recognizable today in the Highland districts. Thus, Campbell is the name most frequently occurring in central Argyllshire; Camerons swarm in Lochaber, around Fort William; Macleods abound in Skye and on the outer isles; and Ross-shire holds more of Clan Mackenzie."—R. G. Blake, *Scotland of the Scots*.

CLASSICS: Place in education from ancient times to the Middle Ages.—Homer's contribution.—Virgil's message.—"The ancient classics, the literature of Greece and Rome, were regarded as a vital constituent of education from the moment when they were produced. Studied with devotion as the immortal memorials of a great past, they have led, when rightly followed, to new and high achievement in the present. . . . I know not what Homer studied; but everybody knows that Homer was part and parcel of the education of a great age that came after him, the age of Periclean Greece. In that age, moreover, we see that two-fold impulse of the human spirit which the study of classical literature normally inspires—reverence for the past, and the passionate desire to act worthily in the present. Aeschylus, who described his dramas as mere slices from the Homeric feast, prepared for his own times, as Herder remarked, another kind of banquet. . . . Rome's innovations in human history are conspicuous enough; they followed naturally from a loyal consecration to the past, beginning deliberately with the glories of Greek literature and history, when once that potent influence had made its presence felt. . . . Virgil's great message to his generation, and to ours, came in a poem which reveals an intense study of his country's past and an intense study of Homer and Greek tragedy. . . . If the classics have moulded later history, it is not merely because of their great qualities as literature, but because they are involved in the history of their own times, and because they enshrine the ideals of a liberal and four-square education, such as their authors possessed. This is a matter that will become obvious, in a moment, when we consider the educational program of Italian humanism. But first we must quickly traverse the intervening ages—Middle Ages, but not wholly dark—which a new system of education controlled. It is a mistake to suppose that the Christian Church was hostile to pagan culture; on the contrary, after a brief season of combat and readjustment, the old learning was appropriated for a new purpose. But the purpose was new. Whereas to Cicero and Quintilian the goal of education was *eloquentia*, the art of expression and its application to the business of state, the Christian monastery removed from the world and prescribed hours of silence. . . . The Christian Church maintained both systems of education for some time, but monasticism gained the day, and was the main strength of education till later, in the Middle Ages, when the university came. Now the classics did not perish under the new régime; in fact, we can thank the monastery for preserving them for us. They constituted the first step in education, the 'Human Readings,' as Cassiodorus called them, to be succeeded by 'Divine Readings' later. More than that, in the revival of learning under Charlemagne, and later at the school of Chartres, the ancient idea came again to the front. . . . Church, State, and learning were more intimately associated than before. The university, too, though its tendencies were philosophical rather than humanistic, created a new interest in Greek by finding the real Aristotle again, and thus led the way for the humanists' quest of all Greek literature. Men of the Middle Ages did not differ radically from those of succeeding centuries in their attitude toward

the classics. Humanism and philosophy had their battles in that period as in every period, but the importance of classical culture for education was in general unquestioned. The great and striking difference lay in the amount of classical culture available. The division of the empire into an East and a West effected curious results in civilization. Byzantium, after dark ages of its own, settled down to an eminently respectable scholarship which created little in literature or thought. It treasured the Greek authors, but forgot the Roman. . . . In the West, similarly, the stream of Greek was trickling feebly; the knowledge of the language had not completely disappeared, and technical writers like Aristotle and the author of the *Celestial Hierarchy* were directly introduced, but the writers typical to us of the Hellenic genius were none of them known. Now a world without Homer, the Attic drama, Thucydides, Herodotus, Demosthenes, Theocritus, a world without the real Plato, is bound to be a very different world from our own. Not that this loss which befell the Occident was ultimately a calamity. The very isolation of the Roman spirit permitted its most triumphant expression in Dante, for whose poetry we should willingly forego whatever a combined East and West might have achieved."—E. K. Rand, *Classics in European education, in Greek genius and its influence* (L. Cooper, ed.), pp. 183-186.

Renaissance.—Return to the Ancients.—Humanistic school.—"When Dante had finished his work it was time for a new epoch. Scholasticism had run its course . . . and a new age came, in which education returned to the methods of antiquity. We need not pause to examine the cause of this event; but its most significant concomitant is the return of Greek literature to the Western World. There is a humorous aspect to the triumphs of the humanists, who 'discovered' Latin authors long treasured on monastic shelves. Quintilian, welcomed back with such a furor, had been the patron saint of the school of Chartres. The humanists could rediscover because in the thirteenth century the classical interests of the twelfth had yielded to philosophy, and in the fourteenth, monastic discipline and the monastic library had lapsed into decay. But I would not belittle the importance of what to the contemporaries of Poggio were certainly discoveries. For the thirst for discoveries led also to the more careful study of the authors existing. Petrarch initiated the movement; though curiously mediaeval in some respects, he deserves his title of the first modern man, and this because of his passion for antiquity. His great service is not so much the discovery of Cicero's letters as the exaltation of Ciceronian ideas, which were from that time on the guiding principle of humanistic education. Petrarch's craving for Homer, too, ill satisfied by the wretched translation which his teacher made, gave impetus to the general demand for the Greek authors. Work after work was won back; practically all the authors that we have to-day were recovered before the fall of Constantinople in 1453, which date surely does not mark the beginning of the Renaissance. What wonder if the age, intoxicated by the new draught, indulged itself in various excesses? . . . For a glimpse into the school of the humanists after Greek had its sure place there, we can do no better than open a little book by Battista Guarino, *De Ordine Docendi et Studendi*, published in 1459. . . . Under Guarino's cultivation, these ancient roots branch out as widely as the flower in the crannied wall. These studies of antiquity educate the whole man—moral, aesthetic, intellectual; they train him to independent thinking, for the authors are but the

starting-point; they inculcate reverence for the past; they teach its application to the present. Now two historical facts are plain with reference to this program. First, it is simply the ancient method of Cicero and Quintilian all over again. Both authors are constantly cited for principles as well as facts; '*virtutis laus omnis in actione consistit*,' said Cicero, and Vittorino echoes the words. Second, it is the basis of every truly humanistic program established from that day to this. Its principles appear in some dozen treatises of the day, and from Italy spread to the North. . . .

"Science and mathematics received more consideration than one might suppose. Religious training was not neglected, as it is with us; polite demeanor, dress, physical exercise, all were matters for attention. And let me emphasize again the point I would specially make; the twofold character of their education, its reverence for the past and its interest in the present, derives clearly from the ancient prototype. It is not necessary to quote *in extenso* the leading humanists of the North for proof that the new educational ideals are eagerly appropriated and applied. Rudolphus Agricola in Germany, Vives in Holland, but originally from Spain, Dorat and the learned Budé in France, diverge in no essential particular from Vittorino. Let Erasmus, the most cosmopolitan man of his day, speak for them all. 'The first object of education,' he declares, 'is to teach the young mind to foster the seeds of piety, the next to love and learn the liberal arts, the third to prepare itself for the duties of life, the fourth, from its earliest years to cultivate civil manners.' Erasmus truly represents England, as well as his own land, but a native voice was also heard from our mother-country at that time. I mean, not Roger Ascham, who comes later in the sixteenth century, and whose system is a bit ladylike in its painful propriety, but Thomas Elyot, who, in his *Book of the Governour* (1531), interpreted Erasmus and Budé to England. [An echo of Elyot's views on education may be heard in the *Advancement of Learning*. Bacon's thinking was permeated with the classics.] He was no pedantic advocate, surely no advocate of the Ciceronianist, whom he berates as soundly as he does the scholastic. Bacon brings us naturally to Milton, a Puritan and a rebel, who also, thanks to the ancients, could temper his virtue with Epicureanism, and show in his poetry that liturgic reverence for the past which is ingrained in classic literature."—*Ibid.*, pp. 187, 188-191.—See also EDUCATION: Modern; 16th century: Luther, etc.; 15th-16th centuries: Humanist aims; EUROPE: Renaissance and Reformation: Earlier and later Renaissance.

16th-17th centuries.—Criticisms of the classical program.—Effect of the Protestant Reformation.—Quarrel of the ancients and the moderns.—"Thus far our examination of the history of classical education in Europe has been pleasant enough, at last for those who are favorably disposed toward the classics. We have seen the ancient ideal reintroduced in the Italian Renaissance, disseminated in the northern countries, and established once for all, we should imagine, by mighty thinkers like Bacon and Milton. But no human institution is permanent, and, even in the times with which we have been dealing, forces were at work which tended to discredit an educational program based on the classics. One such force was the decay of the method itself. All movements tend eventually to a period of formalism and petrification. Petrification seized the classical program when the limits of good Latin style were restricted

to Cicero, and taste in general became puristic. . . . That was the age, too, when handbooks of imaginative etiquette were compiled to save the poets from mistakes. Lists were furnished of proper epithets for frequent nouns. . . . Clearly a system which engendered such absurdities was not destined to long life. Two events came to the rescue of humanism. One was its transfer to the other countries, where its vital elements were bound to take hold, and where the absence of patriotic interest left the judgment more free and critical; though France was somewhat bitten with Ciceronianism, though the delicate Ascham approved it, the sturdy sense of the greatest men of the period, like Erasmus and Bacon, dealt it crushing blows. The other event was the Protestant Reformation. The relation of the Reformation to humanism is somewhat complex. In its wilder and iconoclastic manifestations it was the foe of all culture, but the national element in protest against Rome should not be forgotten. Nationality is allied to secularism, and both are allied to humanism. Further, the method of the schoolmen had a stronger hold in the North, especially in France, the land of its birth, than it had in Italy. There the normal antagonist of humanism was the Sorbonne, and the Sorbonne stood for Catholic theology and the Roman Church. . . . In Italy this *via media* did not exist. It was humanism and the Church, or, for the humanist who did not care for the Church, it was humanism and neopaganism. Now, while we must appreciate the great service performed by the Reformation for the humanistic ideal, and admire characters like Melancthon and Zwingli, and not form hasty generalizations on the barrenness of Puritanism when it includes a Milton, we must also recognize the other half of the truth which I have just suggested, namely, that the exaggerations of the spirit of the Reformation were a blow to culture, and that they must be reckoned as a second force operative against the classics. From France there proceeded another disturbing influence toward the close of the seventeenth century, the famous *querelle des anciens et des modernes*. The moderns, whose sentiments first found effective expression in Charles Perrault and his poem on *Le Siècle de Louis le Grand* (published 1687), represented a wholesome national and Christian feeling, but committed absurdities both in the defense of their own position and in their attacks on the ancients. The chronological argument loomed large. With centuries of high achievement behind them, why should not the present, profiting by experience, do still greater things? This reasoning seemed convincing, so long as the modern illustrations of superiority were not mentioned; when Chapelain and Desmarets were adduced as such, the proof fell rather flat; for the literary works of the moderns, so far from representing anything of the spirit of romantic revolt, were pseudo-classic in character, and their literary criticism was distinctly pseudo-classic. Virgil came off fairly well at their hands; it was because he stood several centuries nearer modernity than Homer did, and because he was comparatively free from glaring inelegancies. On Homer fell the brunt of their attack; the vulgar characters admitted into his poems, and the indecorous behavior of his nobilities, made him an obvious target for the well-mannered critic of the seventeenth century. The reply of the beleaguered classicists is not particularly significant. Most of them were ready to acknowledge the superiority of Virgil over Homer; in fact, it had been accepted ever since Vida and the Renaissance, and most vituperatively pro-

claimed by the elder Scaliger. Fénelon, it is true, refused to decide between the poets, and Madame Dacier even gave the palm to Homer. But her declaration that nature had exhausted its resources in Homer, and had not the power to produce another like him, is of the excessive, pseudo-classic sort of criticism that makes appreciation stagnant. At all events, the close of the seventeenth century was not an auspicious epoch for the classics, especially for Greek. Indeed, it would seem that nobody had really entered into the spirit of Greek literature, save possibly the members of the *Pléiade* in the sixteenth century, since its recovery in the Renaissance."—E. K. Rand, *Classics in European education, in Greek genius and its influence* (L. Cooper, ed.), pp. 192-193.—See also LATIN LITERATURE.

18th-19th centuries.—Fresh appreciation.—Classical training for political life.—Effect of French Revolution.—Arnold of Rugby.—"To pass on now to the eighteenth century, we may note pseudo-classic influences in all the countries as a preservative of the humanistic scheme—they preserved by embalming it, but contributed nothing to its growth. In France, especially, Roman Catholic education was closely identified with the Jesuits; from the end of the sixteenth century they had shown, by basing their own instruction upon the classics, particularly the Latin classics, that humanism was not the exclusive property of the Reformers. The famous Delphin editions, published toward the close of the seventeenth century for a very indifferent young Dauphin, proved acceptable in many other schools besides those of the Jesuits. The order maintained its prominence in education in the eighteenth century, and has not ceased its activities to-day. Whatever else may be said of this illustrious company, it is interesting to note that its tremendous missionary undertakings have been the product, or the concomitant, of an educational system that is classical, if not pseudo-classical, in character. England was not influenced vitally by the Jesuits in the eighteenth century, but in its own way maintained the supremacy of the classics. . . . A classical training was firmly believed to be an admirable preparation for political life. Statesmen like Chatham and Fox and Pitt and Burke did not fail to recognize its bearing upon modern problems, or to point an argument with a classical quotation. They were simply continuing the tradition that we have seen before in Bacon, and before him in Vittorino, and before him in Dante. To England, too, is due a fresh appreciation of ancient literature for the reason that the meaning of Homer was at last beginning to grow clear. Pope, whatever his offenses, deserves, with Bentley, whom he abused, no small share of the credit, and Blackwell and Wood made further advance. This is a quiet little movement, the approach to romanticism in eighteenth-century England, and a gain for classical education. But the doctrines of Rousseau and the impetus of the French Revolution broke in a romantic storm which in principle carried with it little reverence for antiquity. At the same time it benefited the classics by clearing away false notions of their immaculateness, and by revealing Greek afresh. For the latter event we must be grateful, not only to England, but to the German school of criticism, inaugurated before the days of Romanticism by Winckelmann, and completed by Lessing, Herder, Schiller, and Goethe. . . . England took the movement more soberly. Wordsworth, the high priest of nature, could look back to Horace and sigh for 'The humblest note of those sad strains.' No change in the humanistic

ideal was made in the nineteenth century, wherever that ideal was truly interpreted. Arnold of Rugby, who typifies English education at its best, founded his system on the classics. 'The study of language,' he said, 'seems to me as if given for the very purpose of forming the human mind in youth; and the Greek and Latin languages . . . seem the very instruments by which this is to be effected.' Arnold was also deeply impressed with the moral inspiration that comes from association with the past—not only with the literature of the past, but with the very buildings in which education has made its home. . . . 'What an individual ought and often does derive from the feeling that he is born of an old and illustrious race, from being familiar from his childhood with the walls and trees which speak of the past no less than the present, and make both full of images of greatness, this, in an inferior degree, belongs to every member of an ancient and celebrated place of education.' . . . The classics, he thought, then, so far from abstracting the learner from the present, prepare him more speedily than any other system does for its service.

"As we go farther in the nineteenth century, . . . we are forced to acknowledge that to many thinkers the classics are no longer an indispensable part of education. The causes of this attitude are not far to seek—romanticism, naturalism, and the breaking-down of authority of all kinds. . . . Germany has led the way to the scientific study of the classics, and garnered more results than any other nation. It contributed the philosophy of relativity which, joining forces with the doctrine of evolution, the product of English science, led to new methods and manifold results in the study of history. But an excessive scrutiny of origins has impaired the efficacy of the classics. The tendency of the historical spirit is to compel illustrious characters of the past to know their place, whereas the Middle Ages and the Renaissance summoned the ancients to transgress their periods—yes, to walk down the centuries and shake hands. . . . A further tendency of historical analysis is to resolve great personalities and traditions into causes and effects. An author is not regarded as an entity unless he is influencing somebody else; when the critics look at him, he disappears in a mist of sources. Let me not be misunderstood. I regard the critical method of the historian as indispensable; but this very method is imperfect if it does not reckon with ethical and imaginative values as well."—E. K. Rand, *Classics in European education, in Greek genius and its influence* (L. Cooper, ed.), pp. 195-197.

19th-20th centuries.—Modern attacks.—Status of classical studies.—Toward the end of the nineteenth century, a spirit of opposition to the study of the classics again raised its head. Scientists asked if Latin and Greek were necessary to a chemist, or if a more or less profound knowledge of the humanists would take the place of skill in mathematics in the mental equipment of an engineer? While the utilitarian asked which would be of more assistance to the every day task of the every day citizen—the dead languages of a dead civilization, or the living languages of a living civilization, both of which had sprung out of the old? "The most important criticism that can be made on one aspect of present-day educational tendencies is that they are mainly in the direction of reducing the intellectual element in education and exalting the mechanical. By all means let us have manual training, for instance. . . . But we must not neglect the things of the mind, and it is simply not true to say that there

is 'just as much intellectual discipline derived from sawing straight, or making a dove-tailed joint as translating a passage of Cicero or solving a problem in geometry.' . . . One excellent result, however, of the long-continued discussion is that there is a better understanding now than formerly between the contending parties. This is as it should be. Victory should rest neither with the uncompromising advocate of the classics, nor with the Philistine who sees nothing in the humanities. . . . But let no one imagine that the so-called classical controversy is a new issue. In one form or another it is almost as old as the classics themselves. Mr. Sandys has recorded for us, in his *History of Classical Scholarship*, how at the outset the prejudices of the unduly orthodox had to be overcome. 'Tertullian asked what had Athens to do with Jerusalem, or the Academy with the Church; and St. Jerome what concern had Horace with the Psalter, Virgil with the Gospel, and Cicero with the Apostles?' In a later age Honorius of Autun (c. 1120) wanted to know how the soul was profited by the strife of Hector, the arguments of Plato, the poems of Virgil, or the elegies of Ovid—who, with others like them, are now gnashing their teeth in Hades! And we are told also that Jerome, who in his more unregenerate days had read Plautus and Cicero, falling ill of a fever, dreamed that he was dead and was hauled before the dread tribunal of the Judge of all men. Hiding his face before the brightness of the Presence, he heard the question, 'Who art thou?' and made bold to answer 'A Christian.' Whereupon a Voice was heard, 'It is false: thou art no Christian: *Thou art a Ciceronian*: where the treasure is, there is the heart also.' Let editors of Cicero beware! From that day Jerome renounced his classics, and went into the desert, where he lived as a hermit for the space of five years. More modern attacks upon classical teaching have had a somewhat different motive, whether they have proceeded from those who altogether dislike and despise classical studies, or from those who partly believe in their virtue and efficacy. The former include the large and perhaps growing number of persons who consider that the main object of education is to produce results 'capable of being transmuted into the maximum of coin in the minimum of time,' who confuse it with money-making, and think that its chief function is to show how a living may be earned. The latter are those of our own household, who go perhaps too far in conceding that classics have 'had their day,' and that the stress of international competition forbids us to consider the question any longer on its merits. You know the main ground of the attack. It is urged that the student of the classics is a 'dweller among the tombs,' studying 'the meanings of words and expressions in ancient books, representative of a once-living civilization,' 'dealing only with books, and having no touch with nature.' The exclusive study of the past is said not to lead into life, but out of it, and the charge is pressed home that those educated on none but classical lines 'often end their education very ignorant of their own country and language, and of the world of nature and men in which they have to live.' And again, on the formal side, to study a language for an unspecified number of years, and at the end to be unable to read a passage not seen before, of only average difficulty—this is described as waste, especially when there are other subjects giving an equivalent discipline, such as it is, and in closer touch with the bread and butter needs of mankind. . . . One compensation for the strong attacks that have been delivered on the classics

during recent years is the high class of literature called forth in reply. . . . Take, for instance, Professor Mackail's charming paper, read before the English Classical Association in 1904, on the 'Place of Greek and Latin in Human Life.' 'The classics appear before the world,' says Mr. Mackail, 'not, as once, candidate and crowned, but in a garb, an attitude of humility, almost of supplication.' Four centuries of classical training have produced an anti-classical reaction, but that reaction, he thinks, is being followed by another in favour of the classics. To quote a few of Mr. Mackail's sentences, he speaks of Latin and Greek as 'mediums of the most exquisite delicacy, precision, and finish'; of the literature which they embody as 'the original record of the history upon which our own history is founded, and the expression of the fundamental thought, the permanent aspiration, and the central emotion of mankind'; while the surviving products of Greece and Rome in art, politics, religion, and the whole conduct of life are at once 'the roots and the soil out of which the modern world has grown, and from which it draws life through a thousand fibres. He who truly knows both holds in his hands the keys of the past, which unlock doors in the house of the present.' To the classics, therefore, he concludes we shall always have to come back, no matter how far afield we may range in trying to provide a substitute for them."—W. Peterson, *Canadian essays and addresses*, pp. 288-291, 294-295.—"One special question cannot be overlooked—the question of the status of classical studies. But little is heard here in these days of the old-time controversy over Latin and Greek in the schools. Perhaps it is because the battle has been won by the opponents of absolute requirements in these subjects. There are many true friends of Latin and Greek who are not friendly to required Latin and Greek; and the number of schools is now small indeed in which the student may not omit one or both of the classic languages. It is significant that, at the same time, Latin is greatly on the gain in the schools. The case of Greek is different, and some good friends of classical learning are ready to predict that the study of Greek will at no very distant day be handed over to the colleges. The opening of courses in beginning Greek in some of the higher institutions is thought to point in this direction. The fact should not be disregarded, however, that while Greek has not quite held its own relatively, in secondary schools, the actual number of those studying Greek in the schools has greatly increased in the past decade. On the whole, the enlargement of freedom is not working badly in its bearing on classical studies. If fewer students are pursuing such studies because required to do so or under the pressure of tradition, more are pursuing them from deliberate choice, either their own or their advisers.' And this may be hoped for in the future. It is not simply to be desired that all should study the ancient languages or that an increasing number should study them; but rather that those whose surest approach to vital knowledge is along the historical line that our civilization has followed since the north of Europe began to be civilized, shall follow that line freely and whole-heartedly. There will always be in this number a goodly proportion of the choicest spirits among us. It is highly desirable that they should have all stimulus and encouragement to do their best in their own best way; and it is equally desirable that those whose best approach to vital knowledge is along some other line should be equally encouraged and receive equal stimulus."—E. CLAYTON, John Middleton (1796-1856), American political figure and jurist. Became secretary of state in 1849, and during his term of office negotiated the well-known Clayton-Bulwer treaty with England. See **U. S. A.**: 1850-1851; **NICARAGUA**: 1850.

CLAYTON ANTI-TRUST ACT.—The Clayton act was a law intended to clarify and perfect previous anti-trust laws. It was introduced in the House of Representative Clayton of Alabama and its passage was urged by President Wilson. The bill passed both houses of Congress six months after its introduction and was signed by President Wilson on October 15, 1914. "No measure of Congress ever met the demands of labor more completely. It sustained a time-honored contention of the labor leaders by declaring that the labor of a human being is not a commodity or article of commerce; it prohibited injunctions in labor disputes growing out of the terms and conditions of employment, unless necessary to prevent irreparable injury to property rights for which there was no remedy at law; it proclaimed that strikes, picketing, and boycotting were not violations of any federal law; it exempted from the operation of the anti-trust laws all labor, agricultural, and other associations not conducted for profit."—F. A. Ogg, *National progress*, p. 235.—See also **TRUSTS**: United States: 1914.

CLERUCHS.—"Another consequence of some moment arose out of this victory [of the Athenians over the citizens of Chalkis, or Chalcis, in the island of Eubœa, 506 B. C.]. The Athenians planted a body of 4,000 of their citizens as Kle-ruchs (lot-holders) or settlers upon the lands of the wealthy Chalkidian oligarchy called the Hip-pobotæ—proprietors probably in the fertile plain of Lelantum between Chalkis and Eretria. This is a system which we shall find hereafter extensively followed out by the Athenians in the days of their power; partly with the view of providing for their poorer citizens—partly to serve as garrison among a population either hostile or of doubtful fidelity. These Attic Kleruchs (I can find no other name by which to speak of them) did not lose their birthright as Athenian citizens. They were not colonists in the Grecian sense, and they are known by a totally different name—but they corresponded very nearly to the colonies formerly planted out on the conquered lands by Rome."—G. Grote, *History of Greece*, v. 4, pt. 2, ch. 31.

CLEVELAND, Ohio, the largest city and most important manufacturing center in the state, situated on Lake Erie, at the mouth of the Cuyahoga river; an important railway center and lake port; population (1920), 796,836. Educationally, the city is well equipped. It has wide, tree-shaded streets, fine bridges and viaducts; it is noted for its Civic Center (see also CITY PLANNING: United States: Progress, etc.) and for its ore market, while it has the largest fresh fish market in the United States. Manufacturing is the principal industry; the city has large iron and steel foundries, and is engaged in the manufacture of machines, wire and wire nails, hardware, automobiles, clothing, bridges, electrical apparatus and supplies. There are also many printing and publishing establishments.

1796.—Founding and naming of the city. See OHIO: 1786-1796.

1800-1840.—Growth of town.—Opening of Ohio canal.—In 1800 Cleveland was nothing more than a trading post, but in view of the permanence of the settlement it was given a township government. In 1810 it became the seat of government of the county of Cuyahoga, and in 1814 was made an incorporated village. Its progress was, however, not marked until the opening up of the Ohio canal and the improvement of the harbor in the early 'thirties of the nineteenth century, after which it became the distributing center of the rich mineral and agricultural products of Ohio that were destined for transportation on the lakes.

1836.—City charter.—In 1836 the city was granted a charter.

1850-1860.—Commercial importance.—When iron was discovered in the Lake Superior region, Cleveland rose to great commercial importance, and its growth was further stimulated during the railway building era of 1850-1860.

1862-1872.—Results of Civil War.—The Civil War called for the construction of factories for war materials, and thenceforward Cleveland became a great manufacturing city.

1872-1913.—Annexation of territory.—Between the years 1872 and 1913 Cleveland annexed East Cleveland, Newburg, West Cleveland, Brooklyn, Glenville, South Brooklyn, Collinwood, Nottingham, Newburg City and part of Euclid village.

1896.—Centennial.—The centennial anniversary of the founding of the city was celebrated with appropriate ceremonies on July 22, when John D.

Rockefeller presented 276 acres of land to the city for a public park.

1901-1908.—Farm colony experiment. See PRISON REFORM: United States; Correctional institutions.

1913.—New form of government.—On July 1, 1913, "the voters of Cleveland at a special election adopted a new form of government, which had been prepared by a Charter Commission under the Home Rule Powers conferred by the constitutional amendment of 1912. That plan contained many new features and was rightly regarded as a radical departure from the previous organization which had been of the prevailing type for American municipalities. Indeed, the 1913 charter was said to mark the utilization of the efficiency ideas of German cities. That the plan fell short of the goal of maximum efficiency, however, may be inferred from the fact that a new Charter Commission has been at work this year on plans looking toward the city-manager idea [adopted 1921]. But this must not be understood to mean that the 1913 charter did not represent a large gain in municipal efficiency and popular control. . . . This charter is, of course, supplementary to the state laws governing Municipal Courts and the Board of Education. The county of Cuyahoga includes the city of Cleveland and in certain respects the county government still overlaps that of the city. Under the Home Rule amendment the city government is supposed to be supreme over local affairs. Still conflicts of authority often occur. For example some of the main streets were set aside years ago as State highways. This necessitates some method of dividing the cost of repairs between the city and county."—*Equity*, Jan., 1918.

1917-1921.—Community Fund.—Origin of War Chest.—Amalgamation of Cleveland charitable institutions.—The "Welfare Federation of Cleveland," or Community Fund, owes its origin to a Chamber of Commerce survey of the various philanthropic activities of the city in 1900. The result of the survey led to the creation by the Chamber of a "Committee on Benevolent Institutions," which subsequently became the foundation of the "Federation for Charity and Philanthropy." The Jewish charities had meanwhile founded an organization to prevent duplication in their field of operations, while the city government established a Department of Public Welfare, to which an advisory body was attached, composed of a voluntary group of citizens under the title of the "Welfare Council." In 1917 this group was merged with the Federation for Charities and Philanthropy to form the present Welfare Federation, to which the Jewish Federation also adhered as a cooperating body, with representation on the board. With the entrance of the United States into the World War the original suggestion of the "War Chest" as a method of wartime financing came from Cleveland. Capitalizing the experience of wartime fundraising, the city applied its organization methods to peace-time needs. The old "Victory Chest" forces of 1918 united with the Welfare Federation, the Jewish Federation and the Catholic charitable associations, from which the Community Fund Council resulted. As the governing body of the Fund, this council is composed of forty members, sixteen of whom are elected by the federated Cleveland agencies participating in the Fund, two by the Chamber of Commerce, with the mayor and director of Public Welfare as *ex officio* members. The other twenty were originally elected from the Cleveland War Council, under whose direction the War Chest was raised and applied. Their successors are elected by the entire membership of the Com-

munity Fund Council, each member serving for two years, half coming up for reelection each year. Thus the Fund is now established as a permanent plan. A campaign is conducted during November of each year to raise the necessary funds, the amount asked for being based upon carefully-estimated "budgets" to meet requirements. The books of the agencies are audited and the budgetary statements certified by public accountants. These are published in the daily papers. The quota for the 1921 campaign was fixed at \$3,763,545, amounting to a *per capita* average of \$4.20: This was oversubscribed.

1918.—Cloakmakers' strike. See ARBITRATION AND CONCILIATION, INDUSTRIAL: United States: 1918-1919.

1918.—Trial of Debs. See SOCIALISM: 1918-1919: Debs's trial.

1921.—City manager plan adopted.—In the election of 1921 Cleveland adopted the city-manager plan, to go into effect January, 1924.

CLEVELAND COLLEGE FOR WOMEN, now part of Western Reserve University.

CLICHY CLUB, French political association, the members of which were called Clichyans. See FRANCE: 1797 (September).

CLIENTES, Roman.—"To [the Roman] family or household united under the control of a living master, and the clan which originated out of the breaking up of such households, there further belonged the dependents or 'listeners' (clientes, from 'cluere'). This term denoted not the guests, that is, the members of similar circles who were temporarily sojourning in another household than their own, and still less the slaves who were looked upon in law as the property of the household and not as members of it, but those individuals who, while they were not free burgesses of any commonwealth, yet lived within one in a condition of protected freedom. The class included refugees who had found a reception with a foreign protector, and those slaves in respect to whom their master had for the time being waived the exercise of his rights, and so conferred on them practical freedom. This relation had not properly the character of a relation 'de jure,' like the relation of a man to his guest or to his slave: the client remained non-free, although good faith and use and wont alleviated in his case the condition of non-freedom. Hence the 'listeners' of the household (clientes) together with the slaves strictly so-called formed the 'body of servants' ('familia')."—T. Mommsen, *History of Rome*, bk. 1, ch. 5.—"The client of the early Empire was a totally different person from the client of Republican times. In the days of freedom, the tie of patron and client was rather that of clansman and chief; it was justified by political and social necessity, and ennobled by feelings of loyalty and mutual obligation. Under the Empire, the relation was tainted by the selfish materialism of the age; it had seldom any trace of sentiment. The rich man was expected to have a humble train of dependents to maintain his rank and consequence. There was a host of needy people ready to do him such service. The hungry client rushed to his patron's morning reception, submitted to all his coldness and caprice, or to the insolence of his menials, followed his chair through the streets, and ran on his errands, for the sake of a miserable alms in money or in kind. The payment was sometimes supplemented by a cast-off cloak, or an invitation at the last moment to fill a place at dinner, when perhaps it could not be accepted. In the train which the great man gathered about him, to swell

his importance, were to be seen, not only the starving man of letters, the loafer and mere mendicant, but the sons of ruined houses 'sprung from Troy,' and even senators and men of consular rank who had a clientèle of their own."—S. Dill, *Roman society from Nero to Marcus Aurelius*, p. 94.

CLIFF-DWELLERS, a prehistoric people who lived in the southwestern part of North America. See AMERICA: PREHISTORIC; Cave-dwellers.

CLINTON, DeWitt (1769-1828), American political leader and governor of New York State. Admitted to the bar, 1788; elected to the state assembly, 1797; state senator, 1798-1802; originator of the "Spoils System"; member of the United States Senate, 1802; mayor of New York, 1803-1815; became leader of the Republican party in New York, and its candidate for president, 1812; promoted the free school system; elected governor of New York, 1817; reelected, 1820; opened the Erie Canal, October, 1825. See NEW YORK: 1817-1825.

CLINTON, George (1739-1812), first governor of New York, son of James Clinton. Sat in the New York colonial assembly, 1768-1775; chosen a member of the Second Continental Congress, 1775, brigadier-general in the Revolutionary army, 1775; elected first governor of New York, 1777; reelected and served for eighteen successive terms; elected vice president, 1804; sought and lost the nomination for the presidency, 1808. See NEW YORK: 1777; U. S. A.: 1804; 1808: Sixth presidential election.

CLINTON, Sir Henry (1738-1795), British general in the American Revolution. Was lieutenant-general at the battle of Bunker Hill, 1775; took possession of New York after the defeat of Washington's forces in the battle of Long Island, 1776, and succeeded Sir William Howe as commander-in-chief in North America, 1778. See NORTH CAROLINA: 1775-1776; U. S. A.: 1775 (April-May); 1775 (June); 1776 (August); 1777 (July-October); 1778-1799: Washington guarding the Hudson; 1780 (February-August); 1778 (June); 1780 (July); 1781 (May-October).

CLINTON, James (1736-1812), American general, in command of expedition against Indians. See U. S. A.: 1779 (August-September).

CLIPPER, a fast sailing ship introduced by Griffiths. See COMMERCE: Commercial age: 1820-1920.

CLISSAU, or Clissow, Battle of (1702). See SWEDEN: 1701-1707.

CLIVE, Robert Clive, Baron (1725-1774), English general and founder of British empire in India; governor of Bengal, 1758-1760, and 1765-1767. After his return to England, he was made the subject of a parliamentary inquiry in regard to his treatment of natives in India. Though fully acquitted by Parliament, he never recovered from the disgrace which ultimately led to his suicide. See INDIA: 1743-1752; 1755-1757; 1757; 1757-1772.

CLOACA MAXIMA OF ROME.—"Even at the present day there stands unchanged the great sewer, the 'cloaca maxima,' the object of which, it may be observed, was not merely to carry away the refuse of the city, but chiefly to drain the large lake which was formed by the Tiber between the Capitoline, Aventine and Palatine, then extended between the Palatine and Capitoline, and reached as a swamp as far as the district between

the Quirinal and Viminal. This work, consisting of three semicircles of immense square blocks, which, though without mortar, have not to this day moved a knife's breadth from one another . . . equalling the pyramids in extent and massiveness, far surpasses them in the difficulty of its execution. It is so gigantic, that the more one examines it the more inconceivable it becomes how even a large and powerful state could have executed it. . . . Whether the cloaca maxima was actually executed by Tarquinius Priscus or by his son Superbus is a question about which the ancients themselves are not agreed, and respecting which true historical criticism cannot presume to decide. But thus much may be said, that the structure must have been completed before the city encompassed the space of the seven hills and formed a compact whole. . . . But such a work cannot possibly have been executed by the powers of a state such as Rome is said to have been in those times."—B. G. Niebuhr, *Lectures on the history of Rome, lectures 5 and 8*.—See also FORUMS OF ROME: Forum Romanum; ROME: Ancient kingdom: B. C. 753-510.

CLOISTER. See MONASTERY.

CLONARD, Monastery of.—A great monastery founded in Meath, Ireland, by St. Finnian, in the sixth century, "which is said to have contained no fewer than 3,000 monks and which became a great training-school in the monastic life." The twelve principal disciples of Finnian were called the "Twelve Apostles of Ireland," St. Columba being the chief.—W. F. Skene, *Celtic Scotland, bk. 2, ch. 2*.

CLONMACNOISE, or the Seven Churches.—"A large and interesting group of early buildings, lies in the King's County, the barony of Garrycastle, and parish of Clonmacnoise, on the south-east bank of the Shannon, some eight miles to the south-east of Athlone. Founded about 548 at a place called Ardtribra, it owed its origin to the devout Kieran, called 'mac an tsaor,' son of the wright, from the trade of Boenan, his father. . . . The monastic city grew ever in sanctity and importance. Lying at the actual centre of the island, its fame spread to the four coasts. It became a great college, but in the Norse wars its fame and accessibility exposed it to unusual suffering—not always at the hands of the heathen. [It was many times despoiled and burned and finally] . . . its career closed with its sack by the garrison of Athlone in 1552, from which it never recovered."—T. J. Westropp, *Description of the ancient buildings and crosses at Clonmacnoise (Journal of the Royal Society of Antiquaries of Ireland, 1907-1908, p. 277)*.

CLUBS, Ancient Greek. See LESCHE; HERÆIES; ERANI; THIASI.

CLUBS, Modern: 17th-18th centuries.—The clubs of the eighteenth century which played so important a part in the history of the time—social, literary and political—were an outcome of the coffee houses of the seventeenth century, and were in fact proprietary institutions, which gradually developed into the great corporate institutions for which London and New York are especially famous. Below is given a slight mention of a few of the most historic clubs of the eighteenth, nineteenth and twentieth centuries, as well as those best known to international fame. These clubs, as the gathering places of men and women of affairs, have a distinct influence on the progress of events.

Beef Steak.—"In 1735 there was formed in the capital [London] the celebrated Beef Steak Club, or 'Sublime Society of Beef Steaks,' as its members always desired to be designated. The origin of this club is singular, and was in this wise. Rich, a celebrated harlequin, and patentee of Covent Garden Theatre in the time of George II, while engaged during the daytime in directing and controlling the arrangements of the stage scenery was often visited by his friends, of whom he had a very numerous circle. One day, while the Earl of Peterborough was present, Rich felt the pangs of hunger so keenly that he cooked a beef-steak and invited the earl to partake of it, which he did, relishing it so greatly that he came again, bringing some friends with him on purpose to taste the same fare. In process of time the beef-steak dinner became an institution. Some of the chief wits and greatest men of the nation, to the number of 24, formed themselves into a society, and took as their motto 'Steaks and Liberty.' Among its early celebrities were Bubb Doddington, Aaron Hill, Dr. Hoadley, Richard Glover, the two Colmans, Garrick and John Beard. The number of the 'steaks' remained at its original limit until 1785, when it was augmented by one, in order to secure the ad-

mission of the Heir-Apparent."—W. C. Sydney, *England and the English in the 18th century*, v. 1, ch. 6.

The Brothers'.—In 1711, a political club which took this name was founded in London by Henry St. John, afterwards Lord Bolingbroke, to counteract the "extravagance of the Kit Cat" and "the drunkenness of the Beefsteak." "This society . . . continued for some time to restrain the outburst of those elements of disunion with which the Harley ministry was so rife. To be a member of this club was esteemed a distinguished honour. They addressed each other as 'brother'; and we find their ladies in their correspondence claiming to be enrolled as sisters. The members of this club were the Dukes of Ormond, Shrewsbury, Beaufort; the Earls of Oxford, Arran, Jersey, Orrery, Bathurst; Lords Harley, Duplin, Masham; Sir Robert Raymond, Sir William Windham, Col. Hill, Col. Desney, St. John, Granville, Arbuthnot, Prior, Swift, and Friend."—G. W. Cooke, *Memoirs of Bolingbroke*, v. 1, ch. 10.

Jacobin. See FRANCE: 1790.

Dr. Johnson's.—"During his literary career Dr. Johnson assisted in the foundation of no fewer than three clubs, each of which was fully deserving of the name. In 1749 he established a club at a house in Ivy Lane, Paternoster Row, and only the year before he died he drafted a code of rules for a club, of which the members should hold their meetings, thrice in each week, at the Essex Head in the Strand; an establishment which was then kept by a former servant of his old friends the Thrales. Those members who failed to put in an appearance at the club were required to forfeit the sum of two pence. There is an interesting account of one of the meetings of the Ivy Lane Club, at which Johnson presided, in Sir John Hawkins's biography of him. . . . The next club with which Johnson became acquainted was the most influential of them all, and was the one which is now chiefly remembered in connection with his name. It was, however, a plant of slow and gradual growth. The first meeting of its members, who exulted in the designation of 'The Club,' was held in 1763 at a hostelry called the Turk's Head, situated in Gerard Street, Soho. 'The Club' retained that title until after the funeral of Garrick, when it was always known as 'The Literary Club.' As its numbers were small and limited, the admission to it was an honour greatly coveted in political, legal, and literary circles. 'The Club' originated with Sir Joshua Reynolds, then President of the Royal Academy, who at first restricted its members to nine, these being Reynolds himself, Samuel Johnson, Edmund Burke, Dr. Christopher Nugent (an accomplished Roman Catholic physician), Bennet Langton, Topham Beauclerk, Sir John Hawkins, Oliver Goldsmith, and M. Chamier, Secretary in the War Office. The members assembled every Monday evening punctually at seven o'clock, and, having partaken of an inexpensive supper, conversed on literary, scientific and artistic topics till the clock indicated the hour of retiring. The numbers of the Literary Club were subsequently augmented by the enrolment of Garrick, Edward Gibbon, Lord Charlemont, Sir William Jones, the eminent Oriental linguist, and James Boswell, of graphi-

cal fame. Others were admitted from time to time, until in 1791 it numbered 35. In December, 1772, the day of meeting was altered to Friday, and the weekly suppers were commuted to fortnightly dinners during the sitting of parliament. Owing to the conversion of the original tavern into a private house, the club moved, in 1783, first to Prince's, in Sackville Street; next to Le Telier's in Dover Street; then, in 1792, to Parsloe's in St. James's Street; and lastly, in February, 1799, to the Thatched House Tavern in St. James's Street, where it remained until long after 1848."—W. C. Sydney, *England and the English in the 18th century*, v. 1, ch. 6.

Kit Cat.—"The Kit Cat Club was instituted in 1699. Its most illustrious members were Congreve, Prior, Sir John Vanbrugh, the Earl of Orrery, and Lord Somers; but the members becoming more numerous, the most violent party obtained the majority, and the Earl and his friends were less regular in their attendance. . . . The Kit Cat took its name from a pastry-cook [Christopher Katt], whose pies formed a regular dish at the suppers of the club."—G. W. Cooke, *Memoirs of Bolingbroke*, v. 1, ch. 10, foot-note.

Mohocks. See MOHOCKS.

The October and the March.—"The October Club came first into importance in the latest years of Anne, although it had existed since the last decade of the 17th century. The stout Tory squires met together in the 'Bell' Tavern, in narrow, dirty King Street, Westminster, to drink October ale, under Dahl's portrait of Queen Anne, and to trouble with their fierce uncompromising Jacobitism the fluctuating purposes of Harley and the crafty counsels of St. John. The genius of Swift tempered their hot zeal with the cool air of his 'advice.' Then the wilder spirits seceded, and formed the March Club, which retained all the angry Jacobitism of the parent body, but lost all its importance."—J. McCarthy, *History of the four Georges*, v. 1, ch. 5.

ALSO IN: W. C. Sydney, *England and the English in the 18th century*, ch. 6.

19th-20th centuries.—London, Edinburgh, Dublin.—Many of the important clubs of the nineteenth and twentieth centuries had their origins in the seventeenth and eighteenth centuries. "Boodle's" [1762, which] in old days played a great part in fashionable West End life . . . has always been closely connected with Shropshire, from which county its membership then, as now, was largely recruited. . . . Gibbon was a member of Boodle's, which, however, in the past, as to-day, principally consisted of county gentlemen. Up to comparatively recent years, before Boodle's was reorganized, it was managed, not by a committee, but by a species of secret tribunal, the members of which were supposed to be unknown, though their duties corresponded with those of an ordinary club committee. . . . Many distinguished men have belonged to White's, and many more have tried to do so. Louis Napoleon, during his exile in London, is said much to have desired to be a member of White's, but his wish was never gratified. . . . *White's Club* [1608] is just a year older than the Bank of England. It was established before the last of the Stuarts had left the throne, and a number of its members have fought England's battles on land and sea. . . . Besides having had a great number of gallant soldiers and sailors on its list, this club can also boast that for many years the destinies of Great Britain were practically in the

hands of certain of its members. Sir Robert Walpole and his able rival, William Pulteney, afterwards Earl of Bath, were members of the old club at White's in 1756. . . . The originator of *Brooks's* [1764] seems to have been the Scotsman Almack, whose real name was Macall. . . . The tranquillity for which this club is noted has rarely been disturbed in recent times, but in 1886, when Mr. Gladstone introduced his Home Rule Bill, Brooks's became much perturbed and troubled by discord quite out of keeping with the traditions of its sacred precincts. . . . Happily, at this juncture Lord Granville came to the rescue, and at the next election made a speech which caused a general reconciliation. . . . [and] all the candidates, irrespective of political opinion, were elected. Lord Granville afterwards declared that he had never felt so nervous in his life. . . . When modern improvements were first suggested in clubs, most of the old-fashioned members fought strenuously against them. The introduction of the electric light . . . was bitterly opposed; whilst the telephone seemed . . . an attempt to introduce mercantile outposts into the very heart of clubland. The old club-men at first hated, and afterwards feared, the encroachments of business methods into their kingdom. . . . Two clubs which are much frequented by the best class of sporting men are the comparatively old-established *Raleigh* (founded in 1858), in Regent Street, and the newer *Badminton* founded in 1876, in Piccadilly, both of them well-managed institutions. . . . All this, however, has long been a thing of the past. . . . Whilst club-life, on the whole, has become less formal and ceremonious, a certain number of old-established clubs still maintain a grave solemnity of tone, and such institutions generally contain a considerable number of 'permanent officials'—the class which, whatever party may nominally be in control, really runs the country. . . . A few [of the West End clubs] still manage to retain that social prestige which was the pride of quite a number in the past. A conspicuous instance is the *Travellers'*, a club which from the days of its foundation has always been somewhat capricious in electing members. The list of public men who have been blackballed here is considerable. The late Mr. Cecil Rhodes was rejected in 1805, and at different times the late Lord Sherbrooke, the late Lord Lytton, Lord Randolph Churchill, and other public men have met with the same ill fate. The *Travellers' Club* was founded in the second decade of the nineteenth century by Lord Castlereagh, the present clubhouse being built by Barry in 1832. . . . Amongst London's political clubs, the *Carlton* unquestionably takes the first place. Originally founded by the great Duke of Wellington and a few of his most intimate political friends, it was first established in Charles Street, St. James's, in the year 1831. . . . This club contains members of every kind of conservatism, many of them men of high position in fortune and politics. . . . Perhaps the most prosperous club in London is the *Junior Carlton* [1864], which owns its own freehold. . . . The *Conservative Club* [1840], which occupies a portion of the site of the old Thatched House Tavern (pulled down in 1843), . . . was designed by Sydney Smirke and George Basevi, 1845. A feature of this club is the excellent library. [The *Constitutional* (1883) is another important political club with a large membership.] The *United University Club* [1830] in Suffolk Street, Pall Mall . . . was Mr. Gladstone's favourite club. . . . Members of this club must have taken a degree at one of the two great Universities [Oxford and Cambridge], and many distinguished men have belonged to it—the Church

and the Bar being generally well represented. . . . Amongst the most important clubs of London are those used by the military. . . . Excellent management distinguishes these institutions, of which the first to be established was the *United Service* [1831]. This was founded . . . as the *General Military Club* for naval and military officers. . . . At first it was only open to officers of field rank, beginning with a Major in the army, and the corresponding rank of Commander in the navy. The *Senior* and *Junior United Service*, with the *Army and Navy*, or 'Rag,' once received the three nicknames of 'Cripplegate,' 'Billingsgate,' and 'Hellgate'—the first from the prevailing advanced years and infirmity of its members; the second on account of the supposed tendencies of certain officers who followed the traditions of the army which 'swore in Flanders'; and the last from its love of high play. . . . The foremost modern literary club in England is of course the *Athenæum*, [whose founders were Sir Walter Scott and Thomas Moore]. . . . There have been many 'characters' amongst *Garrick* members in former days, of whom, perhaps the most original was Tom Hill, who was an authority upon most things—grave or gay. . . . Another club of which much has been written is the *Savage*, started in 1855. This Bohemian institution has always had a number of celebrities on its list. In its early days the membership included George Cruikshank, J. L. Toole, Paul Bedford, Shirley Brooks, Dion Boucicault, and George Augustus Sala. . . . Another very exclusive institution is the *Royal Yacht Squadron* at Cowes, which was originally founded by a number of noblemen and gentlemen (as the old-world phrasing ran) desirous to promote the science of marine architecture and the naval power of the kingdom. . . . Another original member was Lord FitzHarris, and his official yacht, the *Medina*, of eighty tons, was always to be seen at the earlier functions of the club. 'She was the connecting link,' wrote his son, 'between the ships painted by Van de Velde and those which preceded ironclads. She was built in William the Third's reign, and her sides were elaborately gilded.'—R. Nevill, *London clubs*, pp. 64-65, 82, 88-89, 100, 107-108, 138, 192, 195, 209-210, 222-223, 226-227, 240, 275, 292, 294-295, 300, 302.—There are many other notable clubs in London such as the *Marlborough* (1860), which is non-political, and the *East India United Service*. The *New Club* in Edinburgh (1787) is a noted club, while in the *Kildare Street* (1790) Dublin boasts a rival to any of the London clubs. Women's clubs are a very modern development in social club life, and of these the *Alexandra* (1884), the *Empress* (1897), and the *Ladies' Army and Navy* (1904) are notable examples in London.

19th-20th centuries.—New York.—"In every club book that I ever inspected, after a dignified preamble setting forth the reason for its being, there is invariably inserted a little clause, 'and for social purposes.' . . . Under this head one almost instinctively thinks of the Union, the Knickerbocker, the Union League, the Metropolitan, the Calumet, the St. Nicholas, the Manhattan, and the New York. . . . The venerable *Union* [1836], both from its traditions and from its social status, is the dean of clubdom. . . . No visitors are allowed in the clubhouse, except that members' friends who live not less than fifty miles from town may be 'put up,' or allowed to enjoy membership privileges, for a limited number of days. . . . The *Union* is popularly supposed to be the most exclusive club in New York—though in this respect the *Knickerbocker* [1871] holds the palm. . . . Mere membership [in the Knickerbocker] is a passport to so-

ciety, and there are men who would give a hundred thousand dollars to be able to engrave its aristocratic name in the left hand corner of their visiting cards. The *Calumet* is the cosy home of the younger social element; the *Metropolitan's* [1891] nickname of the 'Millionaires' is sufficiently adequate to render description useless. The *Union League* [1863], the eminently dignified representation of all that is best in Republicanism, commerce, and finance, was organized, as everybody knows, to assist the Union cause during the Civil War, and it has always been true to its honorable heritage. It . . . is unquestionably one of the finest institutions of its kind in the world. The *St. Nicholas* is limited to men who are of Dutch descent, and unless you can prove a pre-revolutionary ancestor you will knock in vain at that little oaken door behind which is so much pleasant cheer and good fellowship. The *Manhattan* [1865] is simply a 'good all round club' of Democratic political proclivities, and the *New York* is supposed to be representative of Wall Street. Both of these are excellent establishments, which, like the green bay tree, have renewed their youth for many years; and any well placed business man may aspire to membership in either of them. . . . Politically, the Republicans have the *Union League* and the *Republican*; the Democrats the *Manhattan* and the *Democratic*; the mugwumps the *Reform*; and those peculiarly interested in the city government the *City Club*. Professionally, there are the *Bar Association*, the *Engineers*, and the *Army and Navy*. Literature and the arts are represented by the *Century*, the *Players*, the *Grolier*, the *Authors'*, the *Lotos*, and the *Lambs*; the colleges by the *University*, the *Harvard*, the *Yale*, and the several college society clubs; sports by the *New York Yacht Club*, the *Racquet Club*, the *New York Athletic*, and the *Manhattan Athletic Clubs*; religion by the *Catholic Club* and the *Church Club*, besides the *Hebrew Harmonic* and *Progress Clubs*. . . . The *Century* [1847], which I think is the most attractive club in America . . . contains a salon in the back where receptions are held, and where members who are painters may hang their pictures on certain Saturday nights to get the benefit of light, comparison, criticism, and so forth. The Saturday night dinners of the *Century* are famous the world over, and that long table, where sits everybody who wishes to sit there, and where introduction is not necessary, has dined more distinguished men of letters, artists, and statesmen, and has occasioned more brilliant conversation, than any other long table I know. . . . Although each of our great colleges has its own club home, the *University* [1865], . . . in Fifth Avenue, is the largest and best known. Any man who has been entitled to write 'B.A.' after his name for three years is eligible for membership, and the army and navy are considered as college men. . . . The *Army and Navy Club* is a capital place to see warlike trophies and fine old soldiers, and if anybody is fond of old bindings . . . I would refer to his most respectful consideration the next invitation he gets to the *Grolier*."—R. Stewart, *Clubs and club life in New York* (*Munssey's Magazine*, v. 22, No. 1, Oct., 1899, pp. 106, 108-109, 112, 115, 120-121).—Almost every city in the United States, as well as in Canada, boasts its clubs, prominent among them being the *Gridiron* in Washington, the *Century* in Boston, and the *Bohemian*, a literary and artistic club, in San Francisco. Of women's clubs, the *Colony* in New York is the most famous. Older than any of those mentioned is the famous *Hoboken Turtle Club* [1797], which is still in existence.

19th-20th centuries.—Paris.—"The *Union Club* of the great cosmopolitan capital is chief among all organizations of its kind in France, although it is by no means the most ancient. The oldest club, or *cercle*, in Paris is said to be that of the *Régence*, which dates only from the last [the 18th] century. The famous chess-player, La Bourdonnais, was the secretary of this club. Only one thing was known at the *Régence*—chess in all its forms and combinations. . . . To-day it has a new and splendid home, and its sessions have an irresistible attraction for all amateurs of chess. . . . Club life and most of the statutes in France are of English importation. . . . The *Union Club* was founded in 1828 by the Duke de Guiche, an old follower of the Dauphin, who had lived for some time in England. . . . When he came back to France he was thoroughly imbued with club notions; he was especially pleased with the comfort that he had found in English clubs. . . . Fortune did not give access to this club; talent, even genius, counted for nothing. Men like Thiers, Berryer, Guizot, could only claim entrance as diplomats or statesmen. A count, however insignificant . . . or the heir to a great historic name, if he were of Legitimist opinions, was received without question. Orleanists, however good their lineage, might be and were sometimes blackballed. The descendants of marshals, generals, or other great dignitaries of the fallen First Empire sometimes encountered opposition, but generally got in. However great the distinction of a provincial nobleman might be, he was rarely admitted; the Faubourg St. Germain jealously guarded its gates. . . . It is not a long walk from the Boulevard de la Madeleine, where the *Union Club* maintains its chastened splendor, to the Boulevard des Capucines, upon which the *Jockey Club* has a palatial front. But the two spheres represented by the two clubs are as wide asunder as the poles. . . . The *Jockey Club* [1833] is really a 'society for encouraging the amelioration of the equine race in France.' It borrowed its title from the famous Newmarket Club in England. . . . Next in order, in the estimation of the Parisians, comes the *Cercle Agricole*, familiarly known as the *Pommes de Terre*. Each club has a collective *sobriquet* by which it is characterized, particularly by its enemies or opponents. Thus the celebrated club in the Place Vendôme, the *Union Artistique*, the chief of all the literary and artistic clubs of the capital, is called the '*Mirlitons*.'"—E. King, *Clubs and club life in Paris* (*Cosmopolitan*, v. 4, No. 5, Jan., 1888, pp. 368-369, 371, 374).

CLUNIAC MONKS. See CLUNY; MONASTICISM: 6th-13th centuries.

CLUNY, or Clugny, Monastery of.—The famous monastery of Cluny was founded in 910, at Cluny, near Macon, in Burgundy, by the abbot Count Berno, who had previously established and ruled the monastery of Gigni, near Lyons. It was founded under the auspices and at the expense of William, count of Auvergne, commonly called William the Pious. "In the disastrous times which followed the death of Charles the Great and the failure of his scheme to reorganize the Western world under a single head, the discipline of the religious houses fell with everything else; fell, not perhaps quite so soon, yet by the end of the ninth century had fallen almost as low as it was possible to fall. But here symptoms of a moral reaction showed themselves earlier than elsewhere. The revival dates from 910, the year of the foundation of the Monastery of Clugny in Burgundy, which was destined to exercise an enormous influence on the future of the Church. . . . Already, so one said at the time, the whole house of the Church was

filled with the sweet savour of the ointment there poured out. It followed that wherever in any religious house there were any aspirations after a higher life, any longings for reformation, that house affiliated itself to Clugny; thus beginning to constitute a Congregation, that is a cluster of religious houses, scattered it might be over all Christendom, but owning one rule, acknowledging the superiority of one mother house, and receiving its abbots and priors from thence. In the Clugnian Congregation, for example, there were about two thousand houses in the middle of the twelfth century—these mostly in France; the Abbot, or Arch-Abbot, as he was called, of Clugny, being a kind of Pope of Monasticism, and for a long time, the Pope excepted, quite the most influential Church-ruler in Christendom.”—R. C. Trench, *Lectures on Medieval church history*, ch. 8.—“In a way the eleventh may be considered one of the most marvellous centuries in all history: everything happened and all at once. The Monks of Cluny, Benedictines-militant, were the driving impulse, the Normans their efficient sword. From the moment Gerbert became Pope Sylvester II, the degradation of the Papacy, that had followed the righteous flame of S. Gregory the Great, came to an end. One German Pope after another laboured for the rebuilding of the shattered and degraded citadel, and with Leo IX, and Hildebrand (Pope Gregory VII), the redemption was accomplished. The civilization of the eleventh century was monastic, Norman, and feudal, and its vitality was preternatural. At every point the heathen assaults had been beaten back, the peril of the ‘false prophet’ was at an end, and the northern tribes, whether Teutonic, Norse, Saxon, or Frank, had been Christianized and assimilated. Feudalism had saved Europe, now the Benedictines of Cluny were to redeem it.”—R. A. Cram, *Great thousand years*, p. 14.—See also MONASTICISM: 9th-13th centuries.

CNIDUS, Cnydus, or Cnidos, ancient Greek city on coast of Caria, Asia Minor, famous for its library. See **LIBRARIES**: Ancient: Greece.

Battle of (B. C. 394). See **GREECE**: B. C. 399-387.

CNOSSUS, Cnosus, Knossos or Gnososs, an ancient city on northern coast of Crete. See **ÆGEAN CIVILIZATION**: Excavations and antiquities: Cretan area; Minoan age: B. C. 2200-1600; 1600-1200; **ARCHÆOLOGY**: Method and scope; **CRETE**: Government.

CNUT, or Knut. See **CANUTE**.

COAHUILA, state of northern Mexico bordering on the Rio Grande river (see **MEXICO**: Map). In 1824 it became part of the new republic of Mexico, and included Texas and Nuevo León (see **TEXAS**: 1824-1830). Soon after, however, Nuevo

León was separated from it, and in 1835 Texas broke away.

1910.—Revolt. See **MEXICO**: 1910-1913.

COAHUILTECAN FAMILY.—“From the name of the Mexican State Coahuila. This family appears to have included numerous tribes in southwestern Texas and in Mexico. . . . A few Indians still survive who speak one of the dialects of this family, and in 1886 Mr. Gatschet collected vocabularies of two tribes, the Comecrudo and Cotoname, who live on the Rio Grande, at Las Prietas, State of Tamaulipas.”—J. W. Powell, *Seventh annual report, Bureau of ethnology*, p. 68.

COAJIRO, or Guajira.—“An exceptional position is taken, in many respects, by the Coajiro, or Guajira, who live on the peninsula of the same name on the northwestern boundary of Venezuela. Bounded on all sides by so-called civilized peoples, this Indian tribe is known to have maintained its independence, and acquired the well-deserved reputation for cruelty, a tribe which, in many respects, can be classed with the Apaches and Comanches of New Mexico, the Araucanians of Chili, and the Guaycara and Guarani on the Parana. The Coajiro are mostly large, with chestnut-brown complexion and black, sleek hair. While all the other coast tribes have adopted the Spanish language, the Coajiro have preserved their own speech. They are the especial foes of the other peoples. No one is given entrance into their land, and they live with their neighbors, the Venezuelans, in constant hostilities. They have fine horses, which they know how to ride excellently. . . . They have numerous herds of cattle. . . . They follow agriculture a little.”—*Standard natural history* (J. S. Kingsley, ed.), v. 6, p. 243.

COALITION, an alliance or union of political states for the purpose of joint action. Although these unions have existed in a general sense since the beginning of history, there have been few alliances specifically called “coalitions”. “A number of coalitions were formed by the different European powers [during the French Revolution and] for the purpose of checking the conquests of Napoleon. The First and Second Coalitions were contrived during the last of the eighteenth cen-

tury, while the Third, Fourth, Fifth and Sixth were planned the first of the . . . [19th] century, and succeeded at last in arresting his astonishing career."—S. M. Burnham, *Struggles of the nations*, p. 759.

First coalition against France, 1792-1797. See FRANCE: 1793 (March-September); (July-December); 1794 (March-July); 1794-1795 (October-May).

Second coalition against France, 1799-1801. See FRANCE: 1798-1799 (August-April).

Third coalition against France, 1805. See FRANCE: 1805 (January-April).

Newfoundland. See NEWFOUNDLAND.

COAL-TAR DYES. See CHEMISTRY: Practical application: Dyes.

COAMO, a town in Porto Rico, scene of fighting in the Spanish-American War. See U. S. A.: 1898 (July-August: Porto Rico).

COANDA, Constantin, Rumanian representative at Peace Conference. See VERSAILLES, TREATY OF: Conditions of peace.

COAST DEFENSE, United States. See U. S. A.: 1895-1896 (December-December).

COATES, Reynell, vice-presidential nominee. See U. S. A.: 1852: Appearance of the Know Nothing or American party.

COATS LIBRARIES. See LIBRARIES: Modern: England.

COBALT, a mining town in northern Ontario, Canada, named for its cobalt deposits. It is the center of the silver mining industry in Ontario. See CANADA: 1903; 1906-1907.

COBB, Howell (1815-1868), American statesman, secretary of treasury in Buchanan's cabinet. See GEORGIA: 1860.

COBBETT, William (1762-1835), English political writer and reformer. See ENGLAND: 1830:

Reform movement: Rise of popular opinion: Influence of Cobbett.

COBBLER'S LEAGUE, or *Bundschuh*, a league of peasants prominent in the Peasants' War, Germany, 1492-1514. See GERMANY: 1492-1514; 1524-1525.

COBDEN, Richard (1804-1865), English manufacturer, free-trade parliamentarian, peace advocate, chiefly noted for the part he played in the introduction of free trade (so-called Cobdenism) into English politics and economic system; 1835, began his agitation for free trade in a series of letters signed "Libra" written to the *Manchester Times*; 1838, became the leading figure in the Anti-Corn Law League; 1841, elected to the House of Commons, mainly responsible for the passage of the free trade laws; 1849, proposed international arbitration; 1851, advocated the mutual reduction of armaments; 1853, strongly opposed the Crimean War; 1859-1860, engaged in negotiating a commercial treaty between England and France; traveled extensively and twice visited the United States.—See also TARIFF: 1836-1841; 1842: Peel's modification of corn laws; 1845-1846; 1860.

COBDEN-CHEVALIER COMMERCIAL TREATY. See TARIFF: 1860.

COBHAM, John Oldcastle, Lord. See OLD-CASTLE, SIR JOHN.

COBLENZ (Latin, *Confluentes*), a German city and fortress at the confluence of the Rhine and Mosel, long the territory of the archbishop electors of Trèves, who built the walls (1249-1254) and the great fortress of Ehrenbreitstein. See GERMANY: Map.

B. C. 9.—Foundation.—The town was founded in 9 B. C. by the Romans. It was one of the military posts established by Drusus.

A. D. 860.—Synod of Coblenz.—A Synod held in 860 was the occasion of the reconciliation of Louis the German and Charles the Bald.

1632-1636.—Captured by French.—During the Thirty Years' War, the fortress having fallen to the French, the town was garrisoned by imperial troops. These were driven out by the Swedes, by whom the French were placed in possession. The French were, however, forced by the emperor's forces to give up the city in 1636.

1688.—Siege by the French.—The city did not recover its strength and prosperity after the Thirty Years' War. Nevertheless it resisted the French siege in 1688 during the war of Louis XIV against the Palatinate.

1794-1814.—In possession of the French.—In 1794 the city was taken by the French, and remained in their possession until 1814. See AUSTRIA: 1790-1797.

1814.—Made Prussian Territory.—In 1814 the Congress of Vienna ceded the city to the king of Prussia, by whom it was made the capital of the Rhine provinces.

1918 (March).—Bombed by Allies. See WORLD WAR: 1918: VIII. Aviation.

1918 (November).—Occupied by American troops.—After the armistice of 1918, which terminated the World War, the city and its forts, including the famous fortress of Ehrenbreitstein, across the Rhine, were occupied by American troops. See WORLD WAR: Miscellaneous auxiliary services: I. Armistices: f, 1.

COBLESKILL, Battle of. See U. S. A.: 1778 (June-November).

COBURG, or *Saxe-Coburg*, Friedrich Josias, Prince of (1737-1815), Austrian soldier, served in the war of the First Coalition, in the battle of Wattignies. See FRANCE: 1793 (October): Battle of Wattignies.

COBURG, a town in Bavaria, formerly (with Gotha) the capital of the duchy of Saxe-Coburg-Gotha. (See **SAXE-COBURG**.) The town, which grew up around the castle—dating from the 11th century—of the counts of Coburg, was mentioned in the records in the first decade of the thirteenth century. Its principal industries are brewing, manufacture of porcelain-ware, dyes, and machinery. See **SAXONY**: 1180-1553.

COCCIUM, an important Roman town in Britain, the remains of which are supposed to be found at Ribchester.—T. Wright, *Celt, Roman and Saxon*, ch. 5.

CODES.—"Unified and coordinated bodies of law superseding all previous laws within the scope of the codification, or the reenactment of existing laws in a systematic and improved form. See **COMMON LAW**: 1911-1921.

B. C. 2250.—Code of Hammurabi.—"By far the most important code [of early times] yet discovered comes from about 2250 B. C. It bears the name of the real founder of the Babylonian empire, already well known to scholars through his letters and historical inscriptions, the great Hammurabi. . . . In the remarkable epilogue which he appended, Hammurabi plainly states the motives that guided him as a ruler, and led him to prepare and set up this body of laws. He describes himself as the shepherd chosen by the gods to care for his people, to lead them into safe pastures, and to make them dwell in peace and security. *That the great should not oppress the weak, to counsel the widow and orphan, to render judgment and to decide the decisions of the land, and to succor the injured*, he wrote these noble words on his stele and placed them before his likeness. . . . The code consists entirely of civil laws dealing with specific legal questions that were constantly arising in the empire over which Hammurabi ruled. Briefly and

clearly the given offence or case of dispute is stated; then the penalty or course of legal action is definitely outlined; as, for example, *If a man has borne false witness in a trial, or has not established the statement that he has made, if that case be a capital trial, the man shall be put to death*. The code was evidently prepared for the guidance of judges no less than for those seeking justice. The aim, apparently, was not to present every possible case, but, leaving the more unusual to be decided by the judge, to register the common and typical. Unlike most oriental literary products, the laws have been systematically classified. They are included under three great heads with subdivisions: I. Introduction on evidence and decisions; II. Property, (1) personal, (2) real, (3) in trade; III. Persons, (1) the family, (2) injuries, (3) laborers and labor. Within the smaller groups of laws, those defining the rights and obligations of the patrician classes precede those relating to the plebeians and slaves. This entire collection of laws is properly called the *Code of Hammurabi*. Under his personal direction it undoubtedly assumed its present form, and by him it was publicly promulgated and made the law of the empire. . . . Some of the laws, doubtless, were first formulated by Hammurabi; to this class may well belong those which attempt to fix a uniform price for hire and labor, but it is certain that the code as a whole rests on far older foundations. Many of its laws are assumed to be already in existence, and not a few of its legal phrases are found in contracts dating long before the time of Hammurabi. Like the Indian *Laws of Manu*, or the Greek *Gortyan Code*, or the Roman *Twelve Tables*, the code is evidently a compilation incorporating many very early laws and customs. So comprehensive and so well adapted to the needs of Babylonia was the wonderful Code of Hammurabi that for more than fifteen hundred years it continued to be the fundamental law of the Babylonian and Assyrian empires."—C. F. Kent, *Israel's laws and legal precedents*, pp. 4-5.—Much difficulty has been experienced in fixing the chronology of the Assyrian and Babylonian kings. Different systems have been adopted by different scholars, with the result that the dates adopted by students and writers vary greatly. Consequently the date given at the head of this article can only be taken as approximate.—See also **BABYLONIA**: Hammurabi: His character and achievements.

B. C. (c.) 13th-6th centuries.—Law of Moses.—**Book of the Covenant**.—No fixed date can be set for the origin or development of this great code of laws, found in the books of Exodus and Deuteronomy, and which have had the most profound influence on the history of the world. "How far did . . . [the] highly developed Semitic code [of Hammurabi] influence the laws of the Hebrews? The fact that it was in force through a large part of southwestern Asia for over a thousand years before the advent of the Hebrews, and that it bears striking analogy in theme, content, and form to many Old Testament laws, naturally prompts this query. The question is one that concerns not the reality but the method of divine revelation; for that revelation is as broad as human life and history. The vital consideration is whether the Infinite Judge made known the eternal principles of justice through the minds and life of the Babylonians as well as of the Hebrews? If so, the history of the origin and growth of Israelitish law begins in ancient Babylonia long before the days of Hammurabi; and the code of that truly noble ruler marks, like the Book of the Covenant (Ex. 21-23) and Deuteronomy, one of the great recep-

tive epochs of divine revelation through human laws and institutions. . . . The intricate manner in which the history of these two peoples is constantly interwoven is one of the most remarkable and significant facts of antiquity. That the younger and weaker was deeply influenced by the older and stronger is patent; in the case of the specific laws, however, that influence, though marked, appears to have been indirect rather than direct. Gradually, probably unconsciously, assimilating that which they inherited from the Semitic past, the early Israelites, wrought upon by the Divine, developed their own peculiar institutions and laws; for, striking as are the external analogies with the laws of other ancient people, especially in ceremonial regulation, the majority of the Old Testament laws are informed by a spirit and purpose which have no ancient parallel. . . . The oldest records of Moses' work, and the history of the *torah*, suggest the great leader's real relation to Israelitish legislation as a whole and justify the title, *The Law of Moses*, so often applied to that legal lore. As a prophet and leader he called the Israelitish race into being; and he it was who inspired it with ideals, moral and religious, of which its later history and institutions were but the realization. . . . Exodus 18¹³⁻²⁷ tells us that he gave the Israelites of his day what they needed; and the need was definite, detailed directions and decisions on questions of doubt or dispute as these questions arose. . . . That this was the *Book of the Covenant*, found, according to II Kings 22, by Hilkiah the priest while conducting repairs in the temple, has been recognized by scholars since the days of Jerome. The reforms, instituted by the king after the newly discovered law-book had been verified by the prophetic order, and publicly read and promulgated by him, are in perfect accord with the demands of Deuteronomy. All the symbols of the heathen cults were first cast out of the temple and destroyed (cf. Dt. 12³, 17³). All the high places, their altars, and the sacred pillars, were broken down; the asherahs were hewn in pieces (Dt. 12). Necromancy and witchcraft were suppressed (Dt. 18¹¹). Practically every recorded act in that great reformation is in accord with a specific command of Deuteronomy. Henceforth until the days of Nehemiah and Ezra the life of the Jews of Palestine was regulated by this wonderful law-book. Aside from the later introductions in 1-4, and the farewell speeches, exhortations, and blessings . . . the book of Deuteronomy consists of seven rather loosely defined groups of laws. These are found in the distinctively legal sections, 5-26. The first includes the prophetic decalogue, 5⁶⁻²¹, and is followed by a series of exhortations based on the first command. The second group, 12¹⁻¹⁷, consists of ceremonial and religious laws. The third, 17⁸⁻¹⁸, describes the appointment and duties of the officials—the judges, the king, the priests and the prophets—in the theocracy. In the fourth, 19, is found a collection of criminal laws. With this group is associated, by community of subject, the law in 21¹⁻⁹ regarding the expiation of an untraced murder. The fifth group, 20, 21¹⁰⁻¹⁴, consists of military laws to be observed in case of war. The sixth, 21¹⁵⁻²³, 22¹⁹, includes a miscellaneous collection of civil, criminal, humane, and religious laws. . . . It is obvious, also, that the book of Deuteronomy does not consist of one code coming from the same hand; for it bears all the marks of a collection of minor codes which have been gradually brought together into their present relations. The same subjects are treated in widely separated sections; and conversely, entirely disconnected themes are brought into close connection.

In addition to the primitive enactments of Exodus 20-23, many other earlier laws have evidently been utilized as the basis of these revised codes. These, as a rule, can readily be recognized by their more primitive form and content. Yet so homogeneous are the phraseology, spirit, and purpose which characterize all the different codes that they establish the underlying unity of the book as a whole. This is more marked and significant than the evidence for different groups of laws from widely different dates. That the different collections or codes are the work of the same school of writers, who from time to time expanded and supplemented the original nucleus of laws, seems to be the true explanation of the repetitions and minor variations in language and point of view.—C. F. Kent, *Israel's laws and legal precedents*, pp. 4-7, 10, 33-34.—See also JEWS: Religion and the prophets.

Also in: J. D. Peters, *The religion of Moses*.—H. C. Brown, *The historical bases of religions primitive, Babylonian and Jewish*.

B. C. 7th century.—Code of Draco.—Code of Solon.—“We know that two codes were prepared at Athens, with an interval of thirty years between them; the first by Draco, the second by Solon. The code of Draco was written when the struggle of the two classes was at its height, and before the Eupatrids were vanquished. Solon prepared his at the moment when the inferior class gained the upper hand. The difference between these codes, therefore, is great. Draco was a Eupatrid; he had all the sentiments of his caste, and was ‘learned in the religious law.’ He appears to have done no more than to reduce the old customs to writing without in any way changing them. His first law is this: ‘Men should honor the gods and heroes of the country, and offer them annual sacrifices, without deviating from the rites followed by our ancestors.’ Memorials of his laws concerning murder have been preserved. They prescribe that the guilty one shall be kept out of the temple, and forbid him to touch the lustral water, or the vessels used in the ceremonies. His laws appeared cruel to succeeding generations. They were, indeed, dictated by an implacable religion, which saw in every fault an offence against the divinity, and in every offence against the divinity an unpardonable crime. Theft was punished with death, because theft was an attempt against the religion of property. . . . In all that has come down to us of this legislation we see that it does no more than reproduce the ancient law. It had the severity and inflexible character of the old unwritten law. We can easily believe that it established a very broad distinction between the classes; for the inferior class always detested it, and at the end of thirty years demanded a new code.

“The code of Solon is entirely different; we can see that it corresponded to a great social revolution. The first peculiarity that we remark in it is, that the laws are the same for all. They establish no distinction between the Eupatrids, the simple free men, and the Thetes. These names are not even found in any of the articles that have been preserved. Solon boasts in his verses of having written the same laws for the great and the small. Like the Twelve Tables, the code of Solon departed in many points from the ancient law; on other points he remained faithful to it. The very early laws had prescribed that the eldest son alone should inherit. The code of Solon changed this, and prescribed in formal terms that the brothers should share the patrimony. But the legislator did not depart from primitive law enough to give the sister a part in the inheritance. ‘The division,’ he says, ‘shall be among the sons.’ Further, if a

father left only a daughter, this daughter could not inherit; the property fell to the nearest agnate. In this Solon conformed to the old law, but he succeeded in giving the daughter the enjoyment of the patrimony by compelling the heir to marry her. Relationship through women was unknown in the primitive law. Solon admitted it in the new code, but placed it below the relationship through males. Here is his law: 'If a father leaves only a daughter, the nearest agnate inherits by marrying the daughter. If he leaves no children, his brother inherits and not his sister. . . . In default of brothers and the sons of brothers, the succession falls to the sister. If there are neither brothers, nor sisters, nor nephews, the cousins and the children of cousins inherit. If no cousins are found in the paternal branch (that is to say, among the agnates), the succession is conferred on the collaterals of the maternal branch (the cognates).' Thus women began to enjoy rights of inheritance, but rights inferior to those of men. The law formally declared this principle: 'Males and the descendants through males exclude women and the descendants of women.' . . . Solon also introduced into Athenian legislation something entirely new—the will. Before him property passed necessarily to the nearest agnate, or, in default of agnates, to the *gennetes* (*gentiles*); this was because goods were considered as belonging, not to the individual, but to the family. But in Solon's time men began to take another view of the right of property. The dissolution of the old *yévos* had made every domain the property of an individual. The legislator therefore permitted them to dispose of their fortunes, and to choose their legatees. Still, while suppressing the rights which the *yévos* had over each of its members, he did not suppress the rights of the natural family,—the son remained the necessary heir. If the deceased left only a daughter, he could choose his heir only on condition that this heir should marry the daughter. A man without children was free to will his property according to his fancy. This last rule was absolutely new in Athenian legislation, and we can see by this how many new ideas concerning the family sprang up at that time. The primitive religion had given the father sovereign authority in his own house. The ancient law of Athens went so far as to permit a father to sell his son, or to put him to death. Solon, conforming to new manners, limited this power. It is certainly known that he forbade a father to sell his daughter, and it is probable that the same injunction protected the son. . . . As for females, the law of Solon still conformed to the earlier law, when it forbade her to make a will because a woman was never a real proprietor, and could have only the usufruct. But it deviated from the ancient code when it permitted women to claim their dower."—N. D. Fustel de Coulanges, *Ancient city*, pp. 418-423.

B. C. 509.—Roman Codes.—The Twelve Tables.—In 509 B. C. "the people adopted a number of laws. One law deprived the consul of the right to sentence citizens to death without trial and gave the accused the right to appeal to the people; the consul might still impose a fine however. Another law limited fines to thirty oxen and two sheep. Another forbade interrupting a tribune while he was speaking in the assembly. Hitherto Roman judges had dealt with cases according to custom, there being no written laws. Now the judges were patricians; they alone knew the customs and could apply them as they wished. The tribunes proposed formulation of the laws, that every citizen might be acquainted with them. The

patricians resisted at first . . . [but the] senate finally accepted the proposition, and sent three men into foreign countries to study the laws best suited to Rome. It then appointed ten patricians who were called *decemvirs* (ten men). They were charged with a double duty: to prepare the new laws and to govern the city; all other powers, consuls, and tribunes were suppressed. . . . At the end of a year, the work being still incomplete, new *decemvirs* were elected. The laws prepared by the *decemvirs* were written on twelve tables of stone; they were set up in the public square that all might become acquainted with them, and then placed in the Capitol. These laws were applied for centuries and were, says Cicero, 'the source of all Roman law.' They were written in short, crisp, imperious sentences. The old Roman customs in all their crudity were set down in law. The father of the family, during his lifetime, had the power of life and death over his children. . . . His wife was completely in his power; he might cast her off or put her to death. A woman was never free; as a girl she belonged to her father and must take the husband he chose for her; as a wife she belonged to her husband; should she become a widow, she must obey her husband's heir. . . . The insolvent debtor was to be thus treated: 'He shall be bound with thongs and chains weighing not more than fifteen pounds. . . . At the end of sixteen days he shall be sold beyond the Tiber. If he has many creditors, he shall be cut in pieces.' The new feature of these laws was that they were known to all and that they were the same for all citizens, patrician or plebeian."—C. Seignobos, *History of the Roman people*, pp. 48-51.—See also CIVIL LAW: Origin.

ALSO IN: W. Smith, *Student's Gibbon*, p. 343.

B. C. c. 500.—Code of Holiness. See JEWS: Religion and the prophets.

A. D. 117-533.—Codification of Roman law from Hadrian to Justinian.—With the rise of Roman imperialism the power of legislation gradually fell from the senate into the hands first of the praetors, and later of the emperor. The bulk of edicts had become unwieldy by the second century, and accordingly were codified by Salvius Julianus, under the direction of the emperor Hadrian. This code is frequently called the Code of Julian. In the third century (c. 205) Gregorius, who may have been professor at the Beirut law school, made a collection of constitutions promulgated by the emperors from Hadrian to Diocletian, but only fragments of this code have come down to us. The code of Hermogenianus, compiled probably at the end of the third century, is also known only by fragments. This was followed in the fifth century by the Theodosian Code, which was collected by direction of the emperor Theodosius and went into force in Constantinople in 438, and in Rome in 439.—See also CIVIL LAW.

529-534.—Code of Justinian: Corpus juris civilis.—The code of Theodosius stood until the time of Justinian, who in the first year of his reign ordered a revision of the ordinances of his predecessors. A distinction must be made between this code of Justinian's, which is known as the *corpus juris civilis*, and those that preceded it. The older codes were primarily summations of customs and traditions which had hardened into law. Justinian's code on the contrary is composed of legal enactments, the object being to harmonize them.—See also CORPUS JURIS CIVILIS.

1532.—Charles V's Code.—Charles V, Holy Roman emperor, had a code of criminal law compiled. **1685.—Code Noir in Latin America.** See LATIN AMERICA: 1504-1685.

1751.—Prussian Code of Frederick the Great.—"It may be said that a code, in the modern sense of the word, was for the first time adopted in Prussia. The measure was initiated in 1751 by Frederick the Great. . . . Concerning this code it may be said that it had its origin in one of those political emergencies which . . . justify and require a resort to statutory law. A number of originally independent states had become consolidated into a political unity and subjected to the dominion of the House of Brandenburg. Each state had its own customs . . . and laws, and the great increase of intercourse between the citizens of the different states was attended with mischievous confusion. . . . The merits of this work are to be estimated by its actual results. . . . It became loaded with declaratory laws passed to explain its obscurities, correct its errors and supply its deficiencies."—J. C. Carter, *Law, its origin, growth and function*, pp. 301-302.

1804-1807.—Code Napoléon.—This was a code of French law promulgated in 1804, and was known as the *Code civil des Français*. In 1807 (March 31), however, it was re-named the *Code Napoléon*, more in honor of the emperor than for any share he might have had in its preparation or improvement. It was a creation of the French revolution, and has served as a basis for codification of laws by several European countries, by Chili, Mexico, Louisiana (U. S. A.), and Quebec in Canada. See FRANCE: 1801-1804; 1801-1800.

1811.—Austrian Code.—Maria Theresa of Austria ordered a code to be drawn up, but this was not legalized until 1811.

1825-1833.—Russian Code.—"Peter the Great infused Roman law into Russian common law. The law in force [until the Bolshevik régime] contains a strong element derived from Roman sources. The code published by Alexander II, in 1825, and subsequently authorized codes published by Nicholas I in 1832 and again revised in 1833, and authoritatively published in fifteen volumes, under the title of *Corpus Juris Rossia*, contain the results of the labors of the civilians of the Russian law schools, who devoted their energies to the amendment of the laws of that vast empire."—J. C. Carter, *Law, its origin, growth and function*, p. 11.

1848-1883.—New York Code.—The New York constitution provided for a code and in pursuance of this a commission was appointed in 1847, and reported in 1848 a code of civil procedure, which was adopted in 1848. In 1857 a new commission was appointed and in 1865 submitted five codes—civil procedure, criminal procedure, civil code, penal code and political code. Of these the penal code was enacted in 1877, while a new civil engineer code was enacted between 1876 and 1880. The criminal code recommended by the New York Commission has been adopted by a large number of the states. All five codes have been enacted by California, the Dakotas, Montana and Idaho. "The New York Civil Code may be described rather as a codification of Text Books on the English Common Law, than as a codification of English Common Law itself. Apart from occasional scraps of terminology and arrangement borrowed from Justinian's Institutes, and the Code Napoléon, the whole work reproduces . . . the notions and the phraseology in which the English law is clothed in the most hastily compiled Text Books."—J. C. Carter, *Law, its origin, growth and function*, p. 301.—"The first New York Code, the Code of Civil Procedure, . . . was adopted in Missouri in 1849; in California in 1851; in Kentucky in 1851; in Ohio in 1853; in the four provinces of India be-

tween 1853 and 1856; in Iowa in 1855; in Wisconsin in 1856; in Kansas in 1859; in Nevada in 1861; in Dakota in 1862; in Oregon in 1862; in Idaho in 1864; in Montana in 1864; in Minnesota in 1866; in Nebraska in 1866; in Arizona in 1866; in Arkansas in 1868; in North Carolina in 1868; in Wyoming in 1869; in Washington Territory in 1869; in South Carolina in 1870; in Utah in 1870; in Connecticut in 1870; in Indiana in 1881. In England and Ireland by the Judicature Act of 1873; this Judicature Act has been followed in many of the British Colonies; in the Consular Courts of Japan, in Shanghai, in Hong Kong and Singapore, between 1870 and 1874. The Code of Criminal Procedure, though not enacted in New York till 1881, was adopted in California in 1850; in India at the same time with the Code of Civil Procedure; in Kentucky in 1854; in Iowa in 1858; in Kansas in 1859; in Nevada in 1861; in Dakota in 1862; in Oregon in 1864; in Idaho in 1864; in Montana in 1864; in Washington Territory in 1869; in Wyoming in 1869; in Arkansas in 1874; in Utah in 1876; in Arizona in 1877; in Wisconsin in 1878; in Nebraska in 1881; in Indiana in 1881; in Minnesota in 1883. The Penal Code, though not enacted in New York until 1882, was adopted in Dakota in 1865 and in California in 1872. The Civil Code, not . . . [then] enacted in New York, though twice passed by the Legislature, was adopted in Dakota in 1866 and in California in 1872, and has been much used in the framing of substantive laws for India. The Political Code, reported for New York but not [at that time] considered, was adopted in California in 1872. Thus it will be seen that the State of New York has given laws to the world to an extent and degree unknown since the Roman Codes followed Roman conquests."—*Albany Law Journal*, v. 39, p. 261.—The American propensity to codification began, not with the "Field Code" of 1848, but with the "Rites, Rules and Liberties concerning Judicial Proceedings," incorporated in "The Body of Liberties" established by the Massachusetts General Court in December, 1641. This ancient American code of procedure is reprinted in *Howard classics*, v. 43, pp. 72-78.

1865-1866.—Code Noir of United States. See BLACK CODES.

1876-1911.—Codification in Germany.—The organization of the German empire rendered necessary a codification of laws, accordingly a criminal code was enacted in 1876 and went into force immediately; the Law of Judicial organization, the Code of Civil Procedure and the Bankruptcy Law, passed in 1877, went into effect in 1879, and a Civil Code and Code of Commercial Law, passed in 1896 and 1897 respectively went into effect in 1900. All these codes are in force throughout all Germany. In 1911 the insurance ordinance of Germany codified all prior legislation on national or social insurance.—See also GERMANY: 1900-1912.

1880.—Japanese Code.—In 1879 "a commission was . . . appointed [by the Japanese government] to investigate European systems of criminal law, and M. Boissonade, a distinguished French jurist, was engaged as expert assistant. The results of their labours, extended over several years, were the Criminal Code and the Code of Criminal Procedure, published in 1880, though both only came into operation in 1882. Both are mainly based on the criminal law and procedure of France, but are in some degree adapted to the principles of the old Criminal Law of Japan. The Code of Criminal Procedure was revised in 1890, and the Criminal Code in 1908. . . . The Codes classify criminal offences under twelve headings according as they

are committed against: (1) the Emperor or Empress; (2) the Public Peace; (3) the Public Credit; (4) Public Health; (5) Cemeteries; (6) Freedom of Trade or Work; (7) Public Officers while engaged in the execution of their duty; (8) Persons; (9) Property; or (10) By military persons, and further divide them into major (felonies) and minor (misdemeanors) offences."—J. H. Longford, *Japan of the Japanese*, pp. 193-194.

1882.—Codification in England (Bill of Exchange Act). See COMMON LAW: 1882.

1920.—New York Practice Act. See COMMON LAW: 1919-1920.

1922.—Canada.—In the Dominion of Canada, where the administration of the criminal law lies within the province of the federal government, the criminal law has been coded. This code is founded on the English criminal law as coded in the Judicature Act, 1873, and strongly resembles the criminal law codes existing in the United States.

CODEX, an ancient manuscript or book. The word is usually applied to very ancient manuscript copies of the Scriptures or early books of sacred writings. The most famous codices are given below:

Codex Alexandrianus. See BIBLE, ENGLISH: Modern Biblical research.

Codex Amiatinus. See BIBLE, ENGLISH: Bible used in Roman Catholic churches.

Codex Ephraemi. See BIBLE, ENGLISH: Modern Biblical research.

Codex Juris Canonici. See PAPACY: 1917 (May).

Codex Sinaiticus. See BIBLE, ENGLISH: Modern Biblical research.

Codex Vaticanus. See BIBLE, ENGLISH: Sources.

CODICES, ancient Nahua books. See INDIANS, AMERICAN: Cultural areas in Mexico and Central America: Maya area.

CODRINGTON, Sir Edward (1770-1851), British admiral who destroyed the Turkish and Egyptian forces in the battle of Navarino, with the combined British, French and Russian fleets. See GREECE: 1821-1829.

CODS, a Dutch political faction. See NETHERLANDS: 1345-1354.

CO-EDUCATION. See EDUCATION: Modern: 19th century: United States: Secondary education.

CŒLE-SYRIA.—"Hollow Syria"—the long, broad, fertile and beautiful valley which lies between the Libanus and Antilibanus ranges of mountains, and is watered by the Orontes and the Leontes or Littany rivers. "Few places in the world are more remarkable, or have a more stirring history, than this wonderful vale."—G. Rawlinson, *Five great monarchies: Babylonia*, ch. 1.

CŒNOBIUM, **CŒNOBITES.**—"The word 'Cœnobium' is equivalent to 'monasterium' in the later sense of that word. Cassian distinguishes the word thus. 'Monasterium,' he says, 'may be the dwelling of a single monk, Cœnobium must be of several; the former word,' he adds, 'expressed only the place, the latter the manner of living.'"—I. G. Smith, *Christian monasticism*, p. 40.

COERCION BILLS, passed by British parliament in 1846 and 1881 for aid in controlling affairs in Ireland. See ENGLAND: 1846; IRELAND: 1881-1882.

COFAN, tribe in South America. See ANDESIANS.

COFFEE CASE, Brazilian. See BRAZILIAN COFFEE CASE.

COFFEY LAW. See SOUTH DAKOTA: 1918.

COFFIN, Howard Earle (1873-), American politician, member of Council of national defense. See NATIONAL DEFENSE, COUNCIL OF.

COGNOMEN. See GENS.

COHENS vs. VIRGINIA.—A law of the state of Virginia prohibited the sale of lottery tickets. In 1820 the quarter sessions court at Norfolk fined P. J. and M. J. Cohen for violation of this statute. The Cohens appealed to the United States Supreme Court. The jurisdiction of this court was denied by the attorney for Virginia on the ground that, under the eleventh amendment to the federal constitution, the court's jurisdiction is not appellate, but only original. The court decided in 1821 that in constitutional cases it had always appellate jurisdiction.

COHORS PRÆTORIA, bodyguard of the commander-in-chief of the Roman army. See MILITARY ORGANIZATION: 10; PRÆTORIAN GUARDS.

COHORT, division of infantry in a Roman legion. See LEGION, ROMAN; MILITARY ORGANIZATION: 10.

COIMBRA, the capital of a district in northern Portugal. Its chief importance is derived from the presence of the University of Coimbra, which was founded in Lisbon in 1291, and transferred to Coimbra in 1306. Until the establishment of the University of Lisbon in 1910, it was the only university in Portugal.—See also UNIVERSITIES AND COLLEGES: 1240-1510.

COINAGE. See MONEY AND BANKING.

COINS, pieces of metal designed to circulate as money. When worth more as bullion than as money, they disappear from circulation. See AS; GRESHAM'S LAW; SPANISH COINS, etc.

COKE, Sir Edward (1552-1634), distinguished English judge, parliamentarian, and famous law writer; 1592, solicitor-general; 1592-1593, speaker of the House of Commons; 1593-1594, attorney-general; 1606, chief justice of Common Pleas; 1613, chief justice of the King's Bench; foremost in the prosecution of the Earls of Essex and Southampton (1600), of Sir Walter Raleigh, whom he treated with great brutality, in 1604, and of the conspirators in the gunpowder plot in 1605; made a firm stand against King James' attempts to enforce unconstitutional authority; 1615, was removed from office by order of the king, but afterwards was again returned to parliament; 1628, brought in the Bill of Liberties, out of which grew the Bill of Rights; chiefly famous for his Reports of Cases, and for his "Institutes" in four parts: the first commonly known as Coke on Littleton; the second the text of various statutes from Magna Charta to the time of James I; the third on criminal law, and the fourth a treatise on the jurisdiction of the different courts of law.

COL DEL ROSSO, mountain in Italy, south-east of Asiago, held alternately by the central powers and the allies during the World War. See WORLD WAR: 1917: IV. Austro-Italian front: b; d, 5; 1918: IV. Austro-Italian theater: b, 4.

COL DI LANA, a mountain peak formerly in Austria and now in northern Italy, west of the Falzarego Pass. It was taken by the Italians and held against the Austrians in the World War. See WORLD WAR: 1915: IV. Italy: d; 1916: IV. Austro-Italian front: a.

COLBERT, Jean Baptiste (1619-1683), French statesman; 1661-1683, minister of finance under Louis XIV. He was the author of great economic and fiscal reforms that promoted French industries and trade, largely by means of tariff revision, and more than doubled the state income. See ACADEMY OF SCIENCES; FRANCE: 1661-1680; 1661-1683; GUILDS: Modern; TARIFF: 1664-1667.

COLBY, Bainbridge (1869-), American lawyer and diplomat; 1917, sent as commissioner to London to consult with allies; 1919, appointed secretary of state; 1920, sent note to Great Britain concerning mandates in former Turkish territory; 1921, sent on diplomatic and social mission to South America. See U. S. A.: 1917 (November); 1919-1920; 1920 (November): Note to Great Britain; 1921.

COLCHESTER, a town in the county of Essex, England. When Cæsar entered Britain, the site of modern Colchester was occupied by an "oppidum," or fastness of the Trinobantes, which the Romans called Camulodunum [see TRINOBANTES]. A little later, Camulodunum acquired some renown as the royal town of the Trinobantine king, or prince, Cunobelin,—the Cymbeline of Shakespeare. It was after the death of Cunobelin, and when his son Caractacus was king, during the reign of the emperor Claudius, that the Romans began their actual conquest of Britain. Claudius was present, in person, when Camulodunum was taken, and he founded there the first Roman colony in the island, calling it Claudiana Victricensis. That name was too cumbersome to be preserved; but the colonial character of the town caused it to be called Colonia-ceaster, the Colonia fortress,—abbreviated, in time, to Colne-ceaster, and, finally, to Colchester. The colony was destroyed by the Iceni, at the time of their rising, under Boadicea, but was reconstituted and grew into an important Roman town.—C. L. Cutts, *Colchester*, ch. 1-6.

1648.—**Roundhead siege and capture.**—On the collapse of the Royalist rising of 1648, which produced what is called the Second Civil War of the Puritan revolutionary period, Colchester received the "wreck of the insurrection," so far as London and the surrounding country had lately been threatened by it. Troops of cavaliers, under Sir Charles Lucas and Lord Capel, having collected in the town, were surrounded and beleaguered there by Fairfax, and held out against their besiegers from June until late in August. "After two months of the most desperate resistance, Colchester, conquered by famine and sedition, at last surrendered (Aug. 27); and the next day a court-martial condemned to death three of its bravest defenders, Sir Charles Lucas, Sir George Lisle, and Sir Bernard Gascoign, as an example, it was said, to future rebels who might be tempted to imitate them. In vain did the other prisoners, Lord Capel at their head, entreat Fairfax to suspend the execution of the sentence, or at least that they should all undergo it, since all were alike guilty of the offence of these three. Fairfax, excited by the long struggle, or rather intimidated by Ireton, made no answer, and the condemned officers were ordered to be shot on the spot." Gascoign, however, was relieved at the last moment.—F. P. Guizot, *History of the English Revolution*, bk. 8.

Also in: C. R. Markham, *Life of the great Lord Fairfax*, ch. 26-27.

COLCHIANS.—"The Colchians appear to have been in part independent, in part subject to Persia. Their true home was evidently that tract of country [on the Euxine] about the river Phasis. . . . Here they first became known to the commercial Greeks, whose early dealings in this quarter seem to have given rise to the poetic legend of the Argonauts. The limits of Colchis varied at different times, but the natural bounds were never greatly departed from. They were the Euxine on the west, the Caucasus on the north, the mountain range which forms the watershed between the Phasis (Rion) and the Cyrus (Kur) on the east, and the high ground between Batoum and Kars

(the Moschian mountains) on the south. . . . The most interesting question connected with the Colchians is that connected with their nationality. They were a black race dwelling in the midst of whites, and in a country which does not tend to make its inhabitants dark complexioned. That they were comparatively recent immigrants from a hotter climate seems therefore to be certain. The notion entertained by Herodotus of their Egyptian extraction appears to have been a conjecture of his own. . . . Perhaps the modern theory that the Colchians were immigrants from India is entitled to some share of our attention. . . . If the true Colchi were a colony of blacks, they must have become gradually absorbed in the white population proper to the country."—G. Rawlinson, *History of Herodotus*, bk. 7, app. 1.—See also ALARODIANS; LAZICA; MITHRADATIC WARS.

COLD HARBOR, town in Virginia ten miles north of Richmond.

First and second battles of (1862; 1864). See U. S. A.: 1862 (June-July: Virginia); and 1864 (May-June: Virginia).

COLDEN, Cadwallader (1688-1776), Scottish-American naturalist, physician, and politician. First surveyor-general of the colony of New York; member of provincial assembly; and appointed lieutenant-governor, 1761. See NEW YORK: 1773-1774; 1775 (April); 1775 (April-September).

COLDSTREAM GUARDS, division of the British army. See MILITARY ORGANIZATION: 31.

COLEBROOKE, Henry Thomas (1765-1837), English Sanskrit philologist. See PHILOLOGY: 5.

COLENSO, Battle of. See SOUTH AFRICA, UNION OF: 1899 (October-December).

COLERIDGE, Samuel Taylor (1772-1834), English poet, philosopher and critic. With Wordsworth he produced the "Lyrical Ballads," which freed poetry from the bonds imposed upon it in the eighteenth century. Coleridge's contributions to it included "The Rime of the Ancient Mariner." He did much to introduce German philosophy and literature into England; his influence was felt, also, in the formation of the Pre-Raphaelite movement, later in the century.—See also ENGLISH LITERATURE: 1780-1830.

COLERIDGE-TAYLOR, Samuel (1875-1912), English composer of African descent. Studied at the Royal Academy of Music, and with Sir Charles Stanford; influenced by the genius of Dvořák, the best of his work shows a warmth of coloring and a rhythmic insistence; wrote "Hiawatha's Wedding Feast," "Death of Minnehaha," and "The African Suite."

COLES, Elizabeth Urquhart, American philanthropist. Presented famous Barberini tapestries to New York cathedral. See GIFTS AND BEQUESTS.

COLESBERG, railroad town in northern Cape Colony, South Africa, in the Orange river valley. In 1899 it was occupied by the Boers. See SOUTH AFRICA, UNION OF: 1899 (October-November).

COLET, John (c.1467-1519), English theologian and scholar. See EDUCATION: Modern: 16th century: Colet and St. Paul's school.

COLFAX, Schuyler (1823-1885), American politician. Member of Congress, 1855-1860; speaker of the House, 1863-1869; vice-president of the United States under Grant, 1869-1873. See CONGRESS OF THE UNITED STATES: House: Speaker, etc.; U. S. A.: 1868 (November).

COLIGNY, Gaspard de (1517-1572), French admiral and Huguenot leader. Rose to the rank of admiral in the army of François de Guise; turning Calvinist, he retired from the army and worked to establish Protestant colonies in America; was one of the Huguenot leaders in the civil war; as

adviser to Charles IX, he won the enmity of Catherine de Medici and his assassination marked the beginning of the massacre of St. Bartholomew's day.—See also FLORIDA: 1562-1563; 1564-1565; FRANCE: 1560-1563; 1570-1572; 1572 (August).

COLLAS, tribe in Peru. See PERU: Paternal despotism of the Incas.

COLLATERAL SECURITY, something of intrinsic value pledged and delivered to a creditor, in case of debt, or it may be an additional obligation, given for debt. See COMMON LAW: 1842.

COLLECTIVISM, the economic theory opposed to individualism; roughly, non-revolutionary socialism. (See SOCIALISM: Definition of terms.) "Sharply opposed to [the] school of extreme individualists is the school to which, for want of a better name, we have given the designation of collectivistic. This is the school which may be said to be in the ascendancy at the present time. Just at the time when, in the middle of the nineteenth century, the individualists had seemed to have won a victory all along the line, evidence began to accumulate in overwhelming volume that the results following from the attempt to put its principles into practice were far from satisfactory. The placing of reliance upon self-interest as the mainspring of human conduct, the removal of restraints upon industrial activities, and the leaving of economic and social conditions to be determined by the free play of competition, the laws of supply and demand, and other so-called natural economic laws, utterly failed to bring about a condition increasing individual welfare. The strong used their power to advance their own interests and to oppress the weak in a ruthless manner. Wealth and power tended to concentrate in a few hands and the mass of people to be reduced to a condition of economic servitude, if not to actual peonage. Furthermore, it became evident that, with the increasing concentration of population in large cities, the rise of production upon a large scale, the growing interdependence of industries, resulting from the specialization in industry, etc., there were many things which concerned the people as a whole, and which, if they were not done by the people as a whole, would not be done at all, or would be done very imperfectly. Regardless of what might be deemed to be wrong in theory, governments found themselves compelled to enter field after field lying wholly outside of the province of the so-called essential functions of government. It had to take steps for the protection of the public health. It had to regulate the supply of such public utilities as water, gas, electric light, transportation facilities. Public conscience demanded that restrictions be placed upon the right of employers to work women and children in mines and factories. From an attitude of mind that looked upon government as an evil, public opinion more and more shifted to the position where the government was looked to as an agency having as one of its essential functions the use of its powers in an affirmative way for the promotion of human welfare. Coincident with, and partly as the result of, this change came the almost complete decay of the old school of natural law, and individual rights. Emphasis began to be placed more and more upon social rights and obligations. Government from being an agent for the protection of individual rights now began to be looked upon as an organ representing all the people as such and having as its prime function the promotion of the general, as opposed to the individual, interests of the community. It is impossible to exaggerate the importance of the revolution in thought that thus took place in respect to the true functions

of government. The old school of natural law, personal rights and individualism disappeared almost completely, and in its place arose the modern school of collectivism now firmly in its saddle. This school recognizes no *a priori* limitations upon the functions of the government other than possibly the general belief that the government should not intervene until it is clear that individual initiative will not be able to meet the requirements of the situation. It differs radically from the individualistic school in the emphasis that it places upon social obligations, as opposed to individual self-interest, and in the fact that it assigns a positive rôle to government to promote social welfare instead of the negative rôle of doing only that which it is compelled to do in order that individual initiative may have full play."—W. F. Willoughby, *Governments of modern states*, pp. 174-176.—See also ECONOMICS: 20th century; GUILD SOCIALISM; KULTUR: Defined as German collectivism; SOCIALISM: Definition of terms.

COLLEGE, ELECTORAL, United States. See ELECTIONS, PRESIDENTIAL: United States: Electoral college.

COLLEGE OF CARDINALS.—"The title of Cardinal (from the Latin, *cardo*, a hinge) has existed in the Roman Catholic Church from very early times, and was used at first to designate certain ecclesiastics who were the Pope's vicars and coadjutors in the diocese of Rome, for the management of affairs both spiritual and temporal. According to Baronius, mention is made of seven Cardinals at a Council held in the year 324; but it is not until A. D. 492, under Gelasius I., that they are clearly designated. Gradually these Cardinals acquired higher dignity and importance, until the twelfth century, when the title and rank began to be formally bestowed only on selected individuals, these distinguished persons being foreigners as well as Romans."—G. A. Bouvier, *Notes on the cardinals and their insignia (The Catholic Mind, June 8, 1906, p. 189)*.—"The Presbyterium of the Roman bishop must primitively have consisted of all the priests of the Roman diocese. In the course of time the priestly college came to comprise only those in charge of the principal churches of the city (*tituli*), or the so-called cardinal priests; besides these, the Pope's senate consisted also of the Roman deacons (*cardinal deacons*), and the neighboring bishops, *i.e.*, occupants of the suburbican sees, who, according to an arrangement of Stephen III. (769) had to perform in turn for a week at a time the services at the Lateran. Even in former ages the cardinals occupied a somewhat higher position than the rest of the clergy, but the importance of their dignity was greatly increased by the power of electing the Pope, which was conferred on them by Nicholas II., and which subsequently to Alexander III. was exercised exclusively by them. In their new quality of papal electors they shared in the increase of papal power and prestige. Important questions which formerly would have been laid before Councils were now discussed at the Consistory, or cardinals' meeting. Whereas in earlier times cardinals took rank according to their order, they gradually, since the thirteenth century, came to take precedence of all other dignitaries, even of archbishops and patriarchs. As a sign of their dignity, Innocent IV. empowered all secular cardinals to wear the red hat, a privilege which was by Gregory XIII. extended to cardinals belonging to religious orders. At a later period they also received the purple mantle (introduced by Paul II.) and the title of Eminence (from Urban VIII., 1630). Their incomes grew in propor-

tion. In the thirteenth century it was quite regular for cardinals to hold a plurality of benefices. . . . Nicholas IV., who settled the cardinals' rights in this respect, also bestowed on them a share in the government, and allowed them a voice in the nomination or deprivation of the rectors in the provinces of the Papal States, and of the collectors whose duty it was to raise those of the taxes in which the cardinals shared. . . . Sixtus V. (1586) finally fixed their number at seventy (six bishops, fifty priests, fourteen deacons). The cardinal bishoprics were those of Ostia, Albano, Porto, Silva Candida, or S. Rufina, Sabina, Praeneste, (Palestrina), and Tusculum, or Frascati. S. Rufina, as far back as the time of Calixtus II., was merged in the bishopric of Porto.—F. X. Funk, *Manual of church history*, v. 1, pp. 362-363.—See also CURIA, PAPAL.

Manner of papal elections. See PAPACY: 1059; VATICAN: Present-day papal administration.

COLLEGE OF ELECTORS, Germany. See ELECTORS, GERMAN.

COLLEGE OF THE PROPAGANDA, institution of training for Catholic missionaries, founded in 1622. See PAPACY: 1622.

COLLEGES. See UNIVERSITIES AND COLLEGES.

COLLEGIA.—Numerous associations called "collegia" existed in ancient Rome. Some were religious; some were guilds of workmen. The political clubs were more commonly called "sodalitates."—G. Long, *Decline of the Roman republic*, v. 3, ch. 11.

COLLEGIANTS, "a Dutch sect of an eclectic character founded in A. D. 1619 by four brothers named John, James, Hadrian, and Gisbert Van der Kodde, as a refuge from the bitterness of the Calvinist and Arminian controversies of the day. The name is derived from the custom which they had of calling their communities, 'Colleges,' in which they were followed by Spener and the Pietists of Germany."—J. H. Blunt, *Dictionary of sects*, p. 110.

COLLINE GATE, Battle of (B. C. 83). See ROME: Republic: B. C. 88-78.

COLLINS, Michael (1890-1922), Irish patriot, one of the delegates of the Dail Eireann, who negotiated and on Dec. 6, 1921, met with the British Cabinet and signed the treaty creating the Irish Free State, within the British empire, on a Dominion basis. After the ratification of the treaty in the Dail Eireann on Jan. 7, 1922, and the election of Arthur Griffith as president on Jan. 10th, he became minister of finance for Ireland. With Griffith, he was chief of the Irish Free State and led its army in the suppression of the republican rebellion of 1922. He was ambushed and assassinated by a republican band in August, 1922, soon after the death of Griffith.—See also IRELAND: 1922.

COLLINS, Anthony (1676-1729), English author and noted deist. See DEISM: English.

COLLINS, William (1721-1759), English poet. See ENGLISH LITERATURE: 1660-1780.

COLLINS, William Willkie (1824-1889), English novelist. In 1836-1838, travelled with his father in Italy. Studied law at Lincoln's Inn and was called to the bar in 1851. He had already engaged in literary work, when in 1851 he met Charles Dickens and contributed short stories to *Household Words*, of which Dickens was editor.

To his acquaintance with Dickens is due the new type of novel—the mystery story—of which "The Woman in White" and "The Moonstone" still rank as masterpieces. In 1873-1874 Collins visited the United States.

COLLINSON, Peter (1694-1768), English naturalist who introduced American species of plants into England. He aided Benjamin Franklin in purchasing for the new Philadelphia library. See LIBRARIES: Modern; United States: Franklin, etc.

COLLINSON, Sir Richard (1811-1883), English admiral and Arctic explorer who led an expedition in search of Sir John Franklin and discovered the northwest passage. See ARCTIC EXPLORATION: 1850-1883.

COLLISIONS AT SEA: Laws concerning. See ADMIRALTY LAW: 1873.

COLLOIDS. See CHEMISTRY: Physical: Laws of gases, etc.

COLLOT D'HERBOIS, Jean Marie (1750-1796), French revolutionist; elected third deputy to the National Convention, 1792; president of the National Convention, 1793; sent to Lyons, where he introduced the "Terror" in its worst form, 1793; took part in the conspiracy against Robespierre, 1794; sentenced to deportation, 1795. See FRANCE: 1792 (September-November); 1793 (June-October); (September-December); 1793-1794; 1793-1794 (November-June); 1794 (June-July); French victory at Fleurus.

COLLYRIDIANs (from Greek, *Kollyris*, cake), a sect of women who came from Thrace to Arabia, and espoused a peculiar form of devotion to the Virgin Mary, offering on certain days a cake or loaf.

ALSO IN: *New Schaff-Herzog religious encyclopedia*, v. 3, p. 162.

COLMAN, Saint (d. 676), bishop of Lindisfarne, who had travelled thither from the monastery of Iona. See CHRISTIANITY: 597-800; LINDISFARNE: 635-664.

COLMAR, or Kolmar, a town in the province of Alsace-Lorraine; ceded to France by the Peace of Westphalia, 1648; restored to Germany, 1871; but again became a part of France, 1918. See GERMANY: 1648: Peace of Westphalia.

COLMAR, Battle of (1674). See NETHERLANDS: 1674-1678.

COLOGNE, Köln, or Cöln, situated on the Rhine (see GERMANY: Map), one of the most important cities in Prussia and Germany, is a great railway center, and for centuries has been an important river port. In medieval times it was a free city of the Holy Roman Empire (see CITIES, IMPERIAL AND FREE, OF GERMANY), and was until 1801 the seat of a prince bishop, one of the German electors. Its chief industries are the manufacture of perfume (*eau de Cologne*), chocolate, sugar, tobacco and cigars. It has a new harbor, and the old bridge of boats, for which it was so long famous, has been replaced by a modern bridge, which was completed during the World War, to facilitate the passage of troops. The demolition of the ancient city walls provided space for the Ringstrasse, a famous boulevard. The great Gothic cathedral (begun in 1248 and completed in 1880) is one of the finest and highest in Europe.

A. D. 50.—Origin. See COLONIA AGRIPPINA.

313-785.—Foundation of see.—Cologne is the see city of a bishopric, which was founded in the year 313, and enlarged in the eighth century by Charlemagne by the addition of the bishoprics of Westphalia and the Lower Rhine, the Bishop of Cologne (Hildebold) being raised to the rank of the archbishop (785).

953.—Beginning of temporal power.—Archbishop Bruno, brother of the emperor Otto I (the Great), was created by him duke of Lorraine. From this beginning of temporal power the bishops obtained and for centuries wielded great influence in the empire.

1180.—Bishops made dukes of Westphalia. See GERMANY: 12th-13th centuries; SAXONY: 1178-1183.

1201.—City entered Hanseatic League. See HANSA TOWNS.

1288.—Self-governed.—City obtained full self-government after the battle of Worringen.

14th century.—Early school of German art. See EDUCATION, ART: Medieval and renaissance.

1356.—Bishops definitely made electors of Germany by the Golden Bull. See GERMANY: 1125-1272; 1347-1493.

1543.—Archbishop excommunicated by Pope for Protestant sympathies. See GERMANY: 1533-1546.

1801.—Cession to France.—By the Treaty of Lunéville, Cologne was ceded to France and secularized, after which the temporal power of the bishops ceased.

1815.—Assigned to Prussia.—By the Treaty of Vienna it was assigned to Prussia. See VIENNA, CONGRESS OF.

1918.—Bombed by Allies.—Occupied by them after armistice. See WORLD WAR: 1918: VIII. Aviation; also Miscellaneous auxiliary services: I. Armistices: f, 1.

Cathedral.—The cathedral of Cologne, probably one of the finest examples of Gothic architecture, was begun in 1248. The building, however, progressed very slowly, and by the end of the 15th century all enthusiasm for its completion seemed to have waned. During the succeeding years the structure became more and more dilapidated and in 1796 it was turned into a hay-magazine by the French. The building was at length rescued by Frederick William III and IV of Prussia and completed in 1880.—See also CATHEDRALS: Historical importance.

COLOGNE UNIVERSITY. See UNIVERSITIES AND COLLEGES: 1348-1826.

COLOMAN (1070-1116), king of Hungary. See HUNGARY: 972-1116.

COLOMBEY-NOUILLY, or Borny, Battle of. See FRANCE: 1870 (July-August).

COLOMBIA: Description.—Boundaries.—Resources.—The Republic of Colombia, formerly known as New Granada, occupies the north-west of the continent of South America. It lies between Lat. 12° 24' N., and 4° 17' S., and between Long. 66° 7' and 79° W. It is bounded on the north by the Caribbean Sea; on the east by Venezuela and Brazil; on the South by Peru and Ecuador; and on the west by the Pacific Ocean and Panama [see LATIN AMERICA: Map of South America]. According to the census . . . [of 1918 the total area is 440,846 square miles and the population 5,855,077]. The mountain ranges run, roughly speaking, north and south, in a line parallel with the Pacific coast; and the flow of the more important rivers is from south to north, emptying into the Caribbean Sea. Close to the coast, along the whole length of the *intendencia* of Choco, runs a river range, known as the Baudo range, belonging to the Antilles system of Panama. To the east of this range flow the rivers Atrato, which runs north to the gulf of Uraba, and San Juan (140 miles), which runs south, and enters the Pacific by several mouths at the south of the department. The Andes of Ecuador enter Colombia at Los Pastos in Nariño. The Western

branch continues north as the Western Cordillera of Colombia, or Cordillera de Choco. It is cut by the tremendous precipitous gorge of the river Patia (1,676 ft. deep), and then runs north to the department of Bolivar. As it dies down into the plain, one branch, the San Jeronimo range, divides the river Sinis from the San Jorge, and another, the Ayapel, divides the San Jorge from the Cauca. Along nearly the whole eastern side of the range runs the great river Cauca (406 miles), with numerous small tributaries, entering the Magdalena in Bolivar. The summits of the Cordillera rise to heights ranging from 9,000 to 18,000 ft., and include Cayambe (13,710 ft.), Chiles (16,912 ft.), and Cumbal (17,076 ft.). At the paramo of Las Papas the eastern Andes subdivide into the Central and the Eastern Cordilleras. The Central Cordillera . . . forms the watershed between the Cauca and the still greater Magdalena, and terminates near Morales on the latter river. This is the highest range, and includes Tolima (18,400 ft.). . . The Eastern Cordillera, or Cordillera de Bogotá . . . runs north-east from Las Papas to the northern part of the department of Boyacá. Here there is another subdivision. One branch runs north to the peninsula of Goajira, and as the Sierra de Perijá forms the boundary between the department of Magdalena and Venezuela; as it approaches the coast it is joined on the west by the Sierra Nevada de Santa Marta, which runs parallel with the coast. The other branch passes north-east into Venezuela, where it is known as the Cordillera de Merida. The two ranges enclose the great basin of Maracaibo. . . The mountains, as they die down in the north in the departments of Magdalena and Bolivar, are succeeded by an extensive plain, watered by the lower Magdalena and its tributaries, and by smaller rivers flowing into the Caribbean Sea. This plain, described as the Atlantic plain, was called by the early Spanish conquerors, New Andalusia. . . The 'Llano' country extends . . . from the foot of the Cordillera in Boyacá as far as the Orinoco. . . In San Martin, to the south-west, and in the south, the ground is slightly higher, and the rivers drain to the Rio Negro and the Amazon. The chief of these, from the west to the east, are the Napo (the boundary with Ecuador), the Putumayo or Iza, the Caqueta or Yapura, the Apaporis, and the Vaupes. This country is covered with forest and inhabited only by uncivilised Indians. It is practically unknown and unexplored. . . The southern portion lies on the equator.—V. Levine, *Colombia (South American Handbooks, pp. 1-4)*.—The boundaries of Colombia have been, and, to some degree, still are a subject of dispute. The secession of Panama in 1903 left the frontiers unsettled on almost every side, and the disagreements between Colombia, and Venezuela, Brazil, Ecuador, and Peru on the subject of their respective boundaries have furnished a fertile source of controversy and international arbitration. (See below: 1903-1921.) Agriculture, cattle, sheep and swine raising are the chief wealth-producing resources of Colombia. Maize, wheat and other cereals are produced on the upper plateaus; coffee in the lower valleys. Cacao (cocoa) sugar, rice, tobacco, bananas grow on the lower plains, while cattle, some sheep and goats are raised in the plains of the north, and swine keeping is a common industry of the country.

Inhabitants.—Aborigines.—Present races.—"The magnificent region of snowy mountains, noble rivers, and rich tropical vegetation is well peopled by numerous tribes, both on the coast and in the river valleys. The central river, Cauca, was in-

habited by several tribes, often at war with each other, who had made some advances in the arts and crafts. The Armas and Quimbayas appear to have been the principal Cauca tribes. The former, settled on the right bank of the river, over an extent of thirty or forty miles, were supposed to have numbered 20,000 souls, living in villages consisting of large round dwellings fortified with stakes. . . . There were only slight differences between the Armas and the other tribes of the Cauca and Magdalena. . . . These tribes . . . had not advanced beyond a certain stage which was alone adapted for their surroundings. For they dwelt in deep valleys with tropical vegetation, and on steep mountain sides suitable rather for hunting than for cultivation. Very different was the progress of the same race when endowed with a more favourable environment. On the lofty plateau, where the Magdalena rises, there are ruins and carved stones which appear to be the remains of a prehistoric race in the valley of San Agustín, which had established a civilisation, though not very advanced, over South Colombia. These people may have been connected with the megalithic empire of Peru. . . . In the Eastern Cordillera, between 4° and 7° N. Lat., there is an elevated region in a temperate climate, with extensive plains and fertile valleys separated by uplands with alpine lakes. Here a more advanced stage of civilization might be expected, attained by the same race; and here it was found. The country of the Chibchas is about 150 miles long from north to south and about 40 miles wide, covering 600 square miles, with a population, before the Spanish cataclysm, of 1,200,000, or 2000 to the square league. It is 240 miles from the sea of Santa Martha. To the north is the River Sogamoso; to the south rise the lofty mountains of Suma Paz; to the west is the great Magdalena River; and to the east the Cordillera sinks down into the primeval forests of the Amazonian basin. The northern half of this favoured region is drained by streams flowing northwards as tributaries of the Sogamoso, which falls into the Magdalena. . . . The inhabitants of this favoured region were called Chibchas. The Spaniards thought the name was 'Muysca,' but this was merely the word for a man in the Chibcha language. These Chibchas must needs have led very sober and laborious lives. Without any domestic animals either for food or for draught, they depended solely on their skill and hard work to raise crops of maize, potatoes, some other edible roots, and beans for their sustenance, and on their prowess as hunters. They also had constantly to defend their homes against two fierce tribes on their western frontier, the Panchas and Colimas. . . . Colonel Acosta wrote in the highest terms of the valour, constancy, coolness, and discipline of the descendants of the Chibchas as soldiers. Their lives of hard work, passed between agricultural pursuits and defensive warfare, had probably continued for ages. Their country was healthy and productive, but its height above the sea debarred its inhabitants from the use of many things needful for progress. Commerce was essential for any great advance in civilisation; and by slow degrees the practice of the exchange of products rose to a well-established system, an increase in knowledge and in needs coming with it."—C. Markham, *Conquest of New Granada*, pp. 12-17.—See also CHIBCHAS.—"Excluding the few foreigners resident in the country, there are three main stocks from which the Colombians are descended. First in order of antiquity of residence come the copper-coloured races, which the Spanish conquerors of the sixteenth

century found established everywhere. If these are not divisible on racial grounds, they are so at least on those of civilization. As in Peru and Mexico, a great portion of the ancient population had already, at the time of the conquest, attained a degree of civilization which separated them clearly from the dwellers in the forests groping in the outer darkness of primitive barbarism, a state from which, even now, they have not emerged to any appreciable extent. It is not a quarter of a century since the brothers Reyes were offered, as a token of friendship, dishes of human flesh in the forests of the Putumayo, and one of them eventually fell a victim to some of these cannibals. The savages of the open territory, almost within sight of the great waterway leading from the coast to the capital, still roam naked in the dense forests, living on the birds and animals killed with arrows tipped with 'carare,' a vegetable poison. . . . Altogether, an official publication issued by the Colombian Government estimates the wild Indians at 130,000, but it is needless to say that very little reliance can be placed on this. Many of the Indians (25,000 according to the estimate) are found in the Goajira Peninsula, on the Caribbean coast, north-east of the Sierra Nevada de Santa Marta. Amongst these are not included the more or less civilized Indians, descendants of such races as the Chibchas of the Bogotá plateau, who still in many parts form the bulk of the agricultural population. . . . Certainly below the Indian in the social scale is the negro, the descendant of the imported African slaves. Idle, vain, superstitious, cruel, cunning, and brutal, it seems no libel to describe the negro of Colombia as one of the lowest types of humanity. Yet it is impossible to forget the sad and cruel history of his transportation from his native land, of the miserable bondage in which he was kept, until finally liberated in 1851. It is small wonder that, with such a history behind him, he is what he is. . . . He, unlike the savage and the cannibals of the eastern forests, shows no signs of dying down before the advance of civilization. He perpetuates his evil qualities in his children of the full blood, and transmits them to those of the mixed blood. At the opposite end of the racial scale are the pure-bred Spaniards, descendants of the 'conquistadores,' or of subsequent immigrants from Spain. They are but a minority of the population, and those of them who can claim a descent untainted by darker blood pride themselves on the fact. Between these three original stocks there lie almost innumerable gradations of the mixed blood. There is the 'mulatto,' half-negro, half-white; the 'zambo,' half-negro, half-Indian; the 'mestizo,' half-white and half-Indian. But the mixture does not stop there, and there is every conceivable cross-breed between the mixed descendants of the various races. It is impossible to draw any clear line of division between the various grades of the mixed blood, shading off one into another by imperceptible gradations. The pure-blooded negroes live generally in the hotter and more unhealthy regions. They form a large proportion of the population on the northern and western coasts, and extend far up the valleys of the Magdalena, the lower Cauca, the San Jorge, and the Sinu. They are to be found in considerable numbers in the open valley of the upper Cauca, in the low-lying territories of Barbaecos and Chocó, and along the Pacific coast. Where they are, the traces of them, too, are to be seen in the mixed races; but in the valley of the Upper Magdalena, and throughout the mountainous regions, they are rarely seen. Here the pure-bred Indian, the 'mes-

tizo' of every degree, and the white man predominant. The latter is found everywhere in Colombia; but the sweltering plains and stifling valleys are essentially not a white man's country, and in them he may be looked upon rather as a temporary than a permanent resident. It is in the high-lying towns, and on the salubrious plateaux of the interior, that he flourishes best and is found most frequently. . . . There are many pure Spaniards on the whole range of the Eastern Cordilleras, in Santander, in Boyaca, and in Cundinamarca, and the 'mestizo' lives alongside them, chiefly in the towns of the interior, where he occupies all ranks of life, and follows almost every profession. He is a shopkeeper or a large trader, a lawyer, a physician, or a priest. The profession of politician is unfortunately common to all races, except the uncivilized Indian. Even the negro follows the trade of politics, and some of them have played a leading part, as soldiers on one side or the other, in the internal disturbances by which the country has been torn during the better part of a century."—F. L. Petre, *Republic of Colombia*, pp. 86-91.—See also RACE PROBLEMS: Previous to 1900.

1499-1536.—Discovery by the Spaniards.—"Although Colombia derives its name from Columbus, the great admiral was not the first to visit its shores. This honour belongs to Alonso de Ojeda, who had accompanied Columbus on the latter's second voyage. Ambitious and high-spirited, he himself aspired to leadership, and, thanks to powerful connections at Court and among the Seville merchants, he succeeded in fitting out an expedition in 1499: Juan de la Cosa, who had also been with Columbus on the second voyage, accompanied Ojeda as chief pilot. . . . After a rapid voyage across the Atlantic, Ojeda arrived at the coast of what is now Guiana, and continued sailing to parts then still unvisited by Columbus [and] he entered the Gulf of Maracaibo. . . . Proceeding still further along the coast, he rounded Cape de la Vela, thus being the first to touch what is now Colombian soil. The condition of his ships prevented further advances. This discovery of the Colombian coast on the Caribbean was completed in the following year by Juan de la Cosa and Rodrigo de Bastidas, in whose employ the former now was. Ojeda later made several unsuccessful voyages, reducing his fortunes to a low ebb. Finally, however, King Ferdinand decided to found colonies on the coast of Tierra Firme, and Ojeda's friends put forward his claims: he was awarded a grant of the country from the Gulf of Urabá to the Cape de la Vela, under the name of Nueva Andalucia, while the region west and then north from the Gulf known as 'Castilla de Oro' (Golden Castile) and comprising Panama and Central America was awarded to Diego de Nicuesa, an accomplished courtier of excellent connections. Ojeda arrived at the harbour of Cartagena towards the end of 1509, intending to found a colony [but] he met a stout resistance from the Indians. . . . Among those who fell under the poisoned arrows of the Indians was the loyal veteran Juan de la Cosa, and Ojeda himself escaped in a manner little less than miraculous. The timely arrival of Nicuesa . . . enabled a due vengeance to be wreaked on the Indians; but, realizing the difficulties of a colony at this place, Ojeda now resolved to follow the course advised by Juan de la Cosa, and settle at the Gulf of Urabá. There at a place which he called San Sebastian he founded his little colony; the hostility of the Indians kept the Spaniards entrenched within their fortress: hunger and disease supervened, their

ranks were thinned, factions arose, expected aid from Santo Domingo failed to arrive, so Ojeda, with a small band, set sail for reinforcements, leaving the colony in command of Francisco Pizarro. Ojeda's misfortunes redoubled: shipwrecked on the desolate coast of Cuba, the little band, through marshes, swamps, and morasses, pursued its painful way along the coast until finally succoured by charitable Indians, with whose aid he arrived at Jamaica and then passed on to Santo Domingo, 'a needy man, shipwrecked in hope and fortune,' and 'sank into the obscurity which gathers round a ruined man, died poor and broken in spirit.' The aid that Ojeda had expected from Santo Domingo was from his friend and business associate in the enterprise, the bachelor Martin Fernandez de Enciso, who set sail, only to encounter at Cartagena the remnants of the colony which had been compelled to abandon San Sebastian. Nothing daunted, Enciso proceeded to that place, gaining a fruitless victory over Indians in the region of the Sinu River *en route*. A similar series of misfortunes to those which had befallen Ojeda induced him to remove to the River Darien or Atrato, where he conquered a prosperous Indian village and established his seat of government under the name of Santa Maria la Antigua de Darien; hut mutiny was rife; a poor scapegrace of an adventurer, who had boarded Enciso's ship as a stowaway, gained the ascendancy. This was Vasco Nunez de Balboa, the discoverer of the Pacific Ocean (1513). . . . This discovery opened up a new era of conquest, leading the way to the rich kingdom of Incas. Upon the arrival of the news in Spain, hundreds of enthusiastic cavaliers flocked to join the expedition under command of Pedro Arias Davila, who had been appointed Governor of Darien, and to whom was entrusted the promising enterprise of conquering the countries of whose vast wealth Balboa had heard; but Pedrarias, to give him the name by which he is best known, did little worthy of note except perpetrate atrocities which made his name a synonym for cruelty. He soon evinced jealousy of Balboa—jealousy which grew to violent animosity and finally to the cruel execution of that brave spirit, on an unfounded charge of treason. Other adventurers gained more honourable renown than Pedrarias. Andagoya sailed along the Pacific coast in 1522 as far south as Buenaventura, the port of good fortune; but the great prize, the rich country of the South Seas, [*i.e.*, Peru] whose fame had tempted Balboa, fell to one of the sturdy band that had accompanied him—Francisco Pizarro. So far the Spaniards had not succeeded in establishing any permanent settlements or making any noteworthy conquests in the interior of Colombia. With the founding of Santa Maria under Bastidas in 1525, an abiding foothold was gained by the Spaniards; Cartagena, still on the coast, soon followed (1533). In a few years these towns gained much importance, so much so that by 1536 the Spaniards, fired by the reports of a rich kingdom in the interior, the home of 'El Dorado,' [the gilded one] and encouraged by the ease with which Pizarro had overcome the Peruvians, made their way up the Magdalena River."—P. J. Eder, *Colombia*, pp. 13-16.

1536-1731.—Spanish conquest of New Granada.—Creation of the new vice-royalty.—The Spanish conquest of New Granada was achieved in the main by Ximenes de Quesada, who invaded the country from the north, although the governor of Quito, Benalcazar, entered it likewise from the south. "Ximenes de Quesada came to America about the year 1535, in the suite of

the Governor of Santa Marta, by whom he was selected to lead an expedition against the Chibchas, who dwelt on the plain of Bogotá and around the headwaters of the Magdalena. Setting out in April, 1536, with 800 men, he succeeded in pushing his way through the forest and across innumerable streams. He contrived to subsist for eight months, during which he traversed 450 miles, enduring meanwhile the very utmost exertions and privations that human nature could support. . . . When he had surmounted the natural difficulties in his path, his remaining force consisted of but 166 men, with 60 horses. On March 2d, 1537, he resumed his advance; and, as usually happened, the mere sight of his horsemen terrified the Indians into submission. At Tunja, according to the Spanish historians, he was treacherously attacked whilst resting in the palace of one of the chiefs. . . . In any case, the chief was taken, and, after much slaughter, Ximenes found himself the absolute possessor of immense riches, one golden lantern alone being valued at 6,000 ducats. From Tunja Ximenes marched upon the sacred city of Iraga, where two Spanish soldiers accidentally set fire to the great Temple of the Sun. The result was that, after a conflagration which lasted several days, both the city and the temple were utterly destroyed. . . . On the 9th of August, 1538, was founded the city of Bogotá. Ximenes was soon here joined by Frederman, a subject of the Emperor Charles V., with 160 soldiers, with whom he had been engaged in conquering Venezuela; and likewise by Benalcazar, the conqueror of Quito. This latter warrior had crossed the continent in triumph at the head of 150 Spaniards, together with a multitude of native followers." In the intrigues and jealous rivalries between the three which followed, Ximenes de Quesada was pushed aside, at first, and even fined and banished by the Emperor; but in the end he triumphed and was appointed marshal of the kingdom of New Granada. "On his return to Bogotá in 1551, he, to his credit, exhibited an energy in protecting the people of the country against their invaders, equal to that which he had displayed in effecting their conquest. Ten years later he commanded a force organized to repel an attack from the ruler of Venezuela; shortly after which he was appointed Adelantado of the Kingdom of New Granada. He devoted three years, and an enormous amount of toil and money, to an absurd expedition in quest of the fabled El Dorado [see EL DORADO]." Quesada died of leprosy in 1572. Until 1718 the kingdom of New Granada remained subject to the Viceroy of Peru. In that year the Viceroyalty of Peru "was divided into two portions, the northern region, from the frontiers of Mexico as far as to the Orinoco, and on the Southern Sea from Veragua to Tumbez, forming the Viceroyalty of New Granada, of which the capital was Bogotá [see BOGOTÁ; 1740]. To this region, likewise, was assigned the inland province of Quito. The Viceroyalty of New Granada, in fact, comprised what now [1884] forms the Republic of Venezuela, the United States of Colombia, and the Republic of Ecuador." In 1731 "it was deemed expedient to detach from the Viceroyalty of New Granada the provinces of Venezuela, Maracaibo, Varinas, Cumaná, and Spanish Guyana, and to form them into a separate Captain-Generalship, the residence of the ruler being fixed at Caracas in Venezuela."—R. G. Watson, *Spanish and Portuguese South America*, v. 2, ch. 9.

1810-1819.—Struggle for independence and its achievement.—Early success and final reverses

of revolutionary army under Miranda.—Rise of Bolívar as revolutionary leader.—His achievement of complete independence.—"It was not until 1810, when the final victory of Napoleon in Spain appeared certain, that they made a decisive movement in favour of independence. Spain, for the time at least, was now blotted out of the list of nations. Acting, therefore, in the name of Ferdinand VII., they deposed the Spanish colonial officers, and elected a supreme junta or council. Similar juntas were soon established in New Granada, at Santa Fé, Quito, Carthage, and the other chief towns of the Viceroyalty . . . and the fortune of the patriot party in new Granada, from their close neighbourhood, was closely linked with that of the Venezuelans. The Regency of Cadiz, grasping for itself all the rights and powers of the Spanish nation, determined to reduce the colonists to subjection. They therefore declared the port of Caracas in a state of blockade, as the British government had done in the previous generation with that of Boston; and, as in the case of Boston, this resolution of the Regency amounted to a declaration of war. . . . A congress of all the provinces of Venezuela now met at Caracas, and published a declaration of independence on the 5th of July, 1811, and those of Mexico and New Granada soon followed. . . . On the 26th of March, 1812, Venezuela was visited by a fearful earthquake, which destroyed the capital [Caracas] and several other towns, together with 20,000 people, and many others perished of hunger and in other ways. This day was Holy Thursday; and the superstitious people, prompted by their priests, believed this awful visitation to be a judgment from God for their revolt. The Spanish troops, under Monteverde, now began a fresh attack on the disquieted Venezuelans. Miranda, who on his return had been placed at the head of the army, had in the meantime overrun New Granada, and laid the foundation of the future United States of Colombia. But the face of affairs was changed by the news of the earthquake. Smitten with despair, his soldiers now deserted to the royalists; he lost ground everywhere; the fortress of Puerto Cavello, commanded by the great Bolívar, then a colonel in the service of the Republic, was surrendered through treachery. On the 25th of June Miranda himself capitulated, with all his forces; and Venezuela fell once more into the hands of the royalists. Miranda himself was arrested, in defiance of the terms of the surrender, and perished in a European dungeon, as Toussaint had perished a few years before. . . . Monteverde emptied the prisons of their occupants, and filled them with the families of the principal citizens of the republic; and Caracas became the scene of a Reign of Terror. After Miranda's capitulation, Bolívar had gone to New Granada, which still maintained its independence, and entered into the service of that republic. Bolívar now reappeared in a new character, and earned for himself a reputation in the history of the new world which up to a certain point ranks with that of Washington. Simon Bolívar, like Miranda, was a native of Caracas. . . . Like Miranda, he had to some extent learned modern ideas by visiting the old world and the United States. When the cruelties of Monteverde had made Venezuela ripe for a new revolt, Bolívar reappeared on his native soil at the head of a small body of troops from the adjacent republic. The successes which he gained so incensed the royalists that they refused quarter to their prisoners, and war to the death ('guerra a muerte') was proclaimed. All obstacles disappeared before Bolívar's generalship, and on the

4th of August, 1813, he publicly entered Caracas, the fortress of Puerto Cavello being now the only one in the possession of the royalists. Bolívar was hailed with the title of the liberator of Venezuela. He was willing to see the republic restored; but the inhabitants very properly feared to trust at this time to anything but a military government, and vested the supreme power in him as dictator (1814). The event indeed proved the necessity of a military government. The defeated royalists raised fresh troops, many thousands of whom were negro slaves, and overran the whole country; Bolívar was beaten at La Puerta, and forced to take refuge a second time in New Granada; and the capital fell again into the hands of the royalists. . . . The War of Independence had been undertaken against the Regency; and had Ferdinand, on his restoration to the throne in 1814, shown any signs of conciliation, he might yet have recovered his American provinces. But the government persisted in its course of absolute repression. . . . New Granada, where Bolívar was general in chief of the forces, was the only part where the insurrection survived; and in 1815 a fleet containing 10,000 men under General Morillo arrived off Carthagena, its principal port. . . . Carthagena was only provisioned for a short time; and Bolívar, overpowered by numbers, quitted the soil of the continent and went to the West Indies to seek help to relieve Carthagena, and maintain the contest for liberty." Obtaining assistance in Hayti, he fitted out an expedition "which sailed in April from the port of Aux Cayes. Bolívar landed near Cumana, in the eastern extremity of Venezuela, and from this point he gradually advanced westwards, gaining strength by slow degrees. In the meantime, after a siege of 116 days, Carthagena surrendered; 5,000 of its inhabitants had perished of hunger. Both provinces were now in Morillo's hands. Fancying himself completely master of the country, he proceeded to wreak a terrible vengeance on the Granadines. But at the news of Bolívar's reappearance, though yet at a distance, the face of affairs changed. . . . His successes in the year 1817 were sure, though slow: in 1818, after he had been joined by European volunteers, they were brilliant. Bolívar beat the royalists in one pitched battle after another [Sagamoso, July 1, 1810, and Pantano deargas, July 25]; and at length a decisive victory was won by his lieutenant, Santander, at Boyaca, in New Granada, August 1, 1819. This battle, in which some hundreds of British and French auxiliaries fought on the side of liberty, completely freed the two countries from the yoke of Spain."—E. J. Payne, *History of European colonies*, ch. 16.

1819-1830.—Attempt to found a federal republic of Colombia, under dictatorship of Bolívar.—Bolívar's lack of statesmanship.—Dissolution of the confederation and fall of Bolívar.—Monarchical schemes.—Three days after the battle of Boyaca, Bolívar entered Bogota in triumph. "A congress met in December and decided that Venezuela and Nueva Granada should form one republic, to be called Colombia [see also BÓGOTÁ: 1816-1819]. Morillo departed for Europe in 1820, and the victory gained by Bolívar at Carabobo on June 24, 1821, decided the fate of Colombia. In

the following January General Bolívar assembled an army at Popayan to drive the Spaniards out of the province of Quito. His second in command, General Sucre, led an advanced guard, which was reinforced by a contingent of volunteers from Peru, under Santa Cruz. The Spanish General Ramirez was entirely defeated in the battle of Pichincha, and Quito was incorporated with the new republic of Colombia."—C. R. Markham, *Colonial history of South America* (*Narrative and Critical History of America*, v. 8, ch. 5).—"The provinces of New Granada and Venezuela, together with the Presidency of Quito, now sent delegates to the convention of Cucuta, in 1821, and there decreed the union of the three countries as a single state by the name of the Republic of Colombia. The first Colombian federal constitution was concocted by the united wisdom of the delegates; and the result might easily have been foreseen. It was a farrago of crude and heterogeneous ideas. Some of its features were imitated from the American political system, some from the English, some from the French. . . . Bolívar of course became President: and the Republic had need of him. The task of liberation was not yet completed. Carthagena, and many other strong places, remained in Spanish hands. Bolívar reduced these one by one, and the second decisive victory of Carabobo, in 1822, finally secured Colombian freedom. The English claim the chief share in the battle of Carabobo: for the British legion alone carried the main Spanish position, losing in the feat two-thirds of its numbers. The war now fast drew to its close. The republic was able to contest with the invaders the dominion of the sea: General Padilla, on the 23rd of July, 1823, totally destroyed the Spanish fleet; and the Spanish commander finally capitulated at Puerto Cavello in December. All these hard-won successes were mainly owing to the bravery and resolution of Bolívar. Bolívar deserves to the full the reputation of an able and patriotic soldier. He was now set free . . . to render important services to the rest of South America: and among the heroes of independence perhaps his name will always stand first. But Bolívar the statesman was a man very different from Bolívar the general. He was alternately timid and arbitrary. He was indeed afraid to touch the problems of statesmanship which awaited him: but instead of leading the Colombian people through independence to liberty, he stubbornly set his face against all measures of political or social reform. His fall may be said to have begun with the moment when his military triumphs were complete. The disaffection to the constitution of the leading people in Venezuela and Ecuador [the new name given to the old province of Quito, indicating its position at the equator] in 1826 and 1827, was favoured by the Provincial governors, Paez and Mosquera; and Bolívar, instead of resisting the disintegration of the state, openly favoured the military dictatorships which Paez and Mosquera established. This policy foreshadowed the reign of absolutism in New Granada itself. Bolívar . . . had now become not only the constitutional head of the Colombian federation, but also the military head of the Peruvian republics [see ECUADOR: 1822-1888; PERU: 1820-1826, 1825-1826, and 1826-1876]: and there can be no doubt that he intended the Colombian constitution to be reduced to the Peruvian model. As a first step towards reuniting all the South American nations under a military government, Paez, beyond reasonable doubt, with Bolívar's connivance, proclaimed the independence of Venezuela, April 30th, 1826. This practically broke up the

Colombian federation; and the destruction of the constitution, so far as it regarded New Granada itself, soon followed. Bolivar had already resorted to the usual devices of military tyranny. The terrorism of Sbirri, arbitrary arrests, the assumption of additional executive powers, and, finally, the suppression of the vice-presidency, all pointed one way. . . . At length, after the practical secession of Venezuela and Ecuador under their military rulers, Congress decreed a summons for a Convention, which met at Ocana in March, 1828. . . . The liberals, who were bent on electoral reform and decentralization, were paralyzed by the violent bearing of the Bolivian leaders: and Bolivar quartered himself in the neighbourhood, and threatened the Convention at the head of an army of 3,000 veterans. He did not, however, resort to open force. Instead of this, he ordered his party to recede from the Convention: and this left the Convention without the means of making a quorum. From this moment the designs of Bolivar were unmistakable. The dissolution of the Convention, and the appointment of Bolivar as Dictator, by a junta [council] of notables, followed as a matter of course; and by the 'Organic decree' of August, 1828, Bolivar assumed the absolute sovereignty of Colombia. A reign of brute force now followed: but the triumph of Bolivar was only ephemeral. . . . The Federation was gone: and it became a question of securing military rule in the separate provinces. A portentous change now occurred in Ecuador. The democratic party under Flores triumphed over the Bolivians under Mosquera: and Paez assured his chief that no help was to be expected from Venezuela. At the Convention of Bogota, in 1830, though it was packed with Bolivar's nominees, it became clear that the liberator's star had set at last. . . . This convention refused to vote him President. Bolivar now withdrew from public life: and a few months later, December 17, 1830, he died broken-hearted at San Pedro, near Santa Martha. Bolivar, though a patriot as regarded the struggle with Spain, was in the end a traitor to his fellow citizens. Recent discoveries leave little doubt that he intended to found a monarchy on the ruins of the Spanish dominion. England and France, both at this time strongly conservative powers, were in favour of such a scheme; and a Prince of the House of Bourbon had already been nominated to be Bolivar's successor."—E. J. Payne, *History of European colonies*, ch. 16.—"About one month before his death, General Bolivar, the so-called 'Liberator' of South America, wrote a letter to the late General Flores of Ecuador, in which the following remarkable passages occur, which have never before been published in the English language: 'I have been in power for nearly 20 years, from which I have gathered only a few definite results: 1. America, for us, is ungovernable. 2. He who dedicates his services to a revolution, plows the sea. 3. The only thing that can be done in America, is to emigrate. 4. This country will inevitably fall into the hands of the unbridled rabble, and little by little become a prey to petty tyrants of all colors and races.'"—F. Hassaurek, *Four years among Spanish-Americans*, ch. 12.—See also LATIN AMERICA: 1778-1824.

1826.—First Pan-American Congress called together by Bolivar.—Interest of the United States in pan-American Federation.—Failure of plans.—During the early years of the republic of Colombia the most interesting event was the at-

tempt to assemble a pan-American congress at Panama, and to work out a pan-American policy. "The proposition for assembling this body emanated from Bolivar, who, in 1823, as president of Colombia, invited the governments of Mexico, Peru, Chile, and Buenos Ayres, to form a confederacy of the Spanish-American states, by means of plenipotentiaries to be convened, in the spirit of classic analogy, in the isthmus of Panama. To this invitation the governments of Peru and Mexico promptly acceded, Chile and Buenos Ayres neglected or declined to be represented in the assembly, for the reasons which we shall presently state. This magnificent idea of a second Achaean League seized on the imaginations of many speculative and of some practical men in America and Europe, as destined to create a new era in the political history of the world by originating a purer system of public law, and almost realizing Bernardin de Saint Pierre's league of the modern nations. In its original shape, it was professedly a plan of a belligerent nature, having for its main object to combine the revolutionized states against the common enemy. But time was required for carrying it into effect. Meanwhile the projects, magnified by the course of events, began to change its complexion. The United States were invited to participate in the Congress, so as to form an American policy, and a rallying point for American interests, in opposition to those of Europe; and, after the discussions which are so familiar to all, the government of the United States accepted the invitation, and despatched its representatives to Panama. . . . In the interval, between the proposal of the plan and its execution, Central America was added to the family of American nations, and agreed to take part in the Congress. At length, after many delays, this modern Amphictyonic Council, consisting of plenipotentiaries from Colombia, Central America, Peru and Mexico, assembled in the city of Panama, June 22, 1826, and in a session of three weeks concluded various treaties; one of perpetual union, league, and confederation; others relating to the contingents which the confederates should contribute for the common defence; and another for the annual meeting of the Congress in time of war [see also LATIN AMERICA 1822-1830]. Having thus promptly despatched their private affairs, the assembly adjourned to Tacubaya in Mexico, on account of the insalubrious climate of Panama, before the delegation of the United States had arrived; since when it has justly acquired the epithet of 'in trouvable,' [undiscoverable] and probably never will reassemble in its original form. Is there not a secret history of all this? Why did Chile and Buenos Ayres refuse to participate in the Congress? Why has it now vanished from the face of the earth? The answer given in South America is, that Bolivar proposed the assembly as part of a grand scheme of ambition,—ascribed to him by the republican party, and not without some countenance from his own conduct,—for establishing a military empire to embrace the whole of Spanish-America, or at least an empire uniting Colombia and the two Perus. To give the color of plausibility to the projected assembly, the United States were invited to be represented; and it is said Bolivar did not expect, nor very graciously receive, their acceptance of the invitation."—C. Cushing, *Bolivar and the Bolivian constitution* (*North American Review*, Jan., 1830).—In the United States no question "excited more heat and intemperate discussion, or more feeling between a President and Senate, than this proposed mission to the Congress of American nations at Panama; and no

heated question ever cooled off and died out so suddenly and completely. . . . Though long since sunk into oblivion, and its name almost forgotten, it was a master subject on the political theater during its day; and gave rise to questions of national and of constitutional law, and of national policy, the importance of which survive the occasion from which they sprung; and the solution of which (as then solved), may be some guide to future action, if similar questions again occur. Besides the grave questions to which the subject gave rise, the subject itself became one of unusual and painful excitement. It agitated the people, made a violent debate in the two Houses of Congress, inflamed the passions of parties and individuals, raised a tempest before which Congress bent, made bad feeling between the President [John Quincy Adams] and the Senate; and led to the duel between Mr. Randolph and Mr. Clay. It was an administration measure, and pressed by all the means known to an administration. It was evidently relied upon as a means of acting upon the people—as a popular movement which might have the effect of turning the tide which was then running high against Mr. Adams and Mr. Clay. . . . Now, the chief benefit to be derived from its retrospect—and that indeed is a real one—is a view of the firmness with which was then maintained, by a minority, the old policy of the United States, to avoid entangling alliances and interference with the affairs of other nations;—and the exposition of the Monroe doctrine, from one so competent to give it as Mr. Adams.”—T. H. Benton, *Thirty years' view*, ch. 25, v. 1.

1830-1886.—Revolutions and civil wars.—New Confederation (1863) of the United States of Colombia.—Republic of Colombia.—“New Granada was obliged in 1830 to recognize the disruption of Colombia, which had long been an accomplished fact. From this date the three states have a separate history, which is very much of a piece, though Venezuela was for some years preserved from the intestine commotions which have from the beginning distracted New Granada and Ecuador. [See also VENEZUELA: 1829-1886]. . . . Mosquera, who had won the election which decided the fate of Bolivar did not long occupy the presidency. . . . Mosquera was soon driven out by General Urdanete, who was now at the head of the conservative or Bolivian party. But after the death of their leader, this party suffered a natural relapse, and Urdanete was overthrown early in 1831. The history of New Granada may be said really to commence with the presidency of Bolivar's old rival and companion in arms, Santander, who was elected under the constitution of 1832. . . . His presidency . . . was a comparatively bright episode: and with its termination in 1836 begins the dark and troubled period which the Granadines emphatically designate by the name of the ‘Twelve Years.’ The scanty measure of liberalism which Santander had dealt out to the people was now withdrawn. Marquez, his successor, was a sceptic in politics and a man of infirm will. . . . Now began the ascendancy of clericalism, of absolutist oligarchy, and of government by the gallows. This same system continued under President Herran, who was elected in 1841; and then appeared on the scene, as his chief minister, the famous Dr. Ospina,” who brought back the Jesuits and curtailed the constitution. Liberalism again gained ground, electing

General Lopez to the presidency in 1849 and once more expelling the Jesuits. In April, 1854, a radical revolution overturned the constitution and President Obando was declared dictator. The conservatives rallied, however, and regained possession of the government before the close of the year. In 1857 Ospina entered on the presidency and civil war soon raged throughout the country. “After a hundred fights the revolution triumphed in July, 1861. . . . Mosquera, who was now in possession of the field, was a true pupil of Bolivar's, and he thought the time had come for reviving Bolivar's plans. . . . In 1863 Mosquera's new Federal Constitution was proclaimed. Henceforth each State [of the eight federal states into which the 44 provinces of New Granada were divided] became practically independent under its own President; and to mark the change the title of the nation was altered. At first it was called the Granadine Confederation: but it afterwards took the name of Colombia [the United States of Colombia], which had formerly been the title of the larger Confederation under Bolivar. Among the most important facts in recent Colombian history is the independence of the State of Panama, which has become of great importance through the construction of the railway connecting the port of Colon, or Aspinwall, as it was called by the Americans, on the Atlantic, with that of Panama on the Pacific. This railway was opened in 1855; and in the same year Panama declared itself a sovereign state. . . . [But complete independence was not achieved till 1903.] In 1867 Mosquera was obliged to have recourse to a *coup d'état*, and declared himself dictator, but he was soon afterwards arrested; a conservative revolution took place; Mosquera was banished; and Gutierrez became President. The liberals, however, came back the next year, under Ponce. Since 1874 [the date of writing being 1879] General Perez has been president of Colombia.”—E. J. Payne, *History of European colonies*, ch. 16.—“The federal Constitution of 1863 was clearly formed on the model of the Constitution of the United States of America. It remained in force until 1886, when it was superseded by a law which gave the State a centralized organization and named it the ‘Republic of Colombia.’”—*Constitution of the republic of Colombia, with historical introduction by B. Moses (Sup. to Annals of American Academy of Political and Social Science, Jan., 1893).*

1846.—Treaty with United States over Panama canal rights.—First operations. See NICARAGUA: 1850; PANAMA CANAL: 1800-1850.

1885-1891.—Revolution of 1885.—Constitution of 1886.—Presidency of Dr. Nuñez.—“Cartagena is virtually the centre of political power in Colombia, for it is the residence of President Nuñez, a dictator without the name. Before the revolution of 1885, during which Colon was burned and the Panama Railway protected by American marines, the States enjoyed a large measure of home rule. The insurgents who were defeated in that struggle were Radicals and advanced Liberals. They were making a stand against centralized government, and they were overthrown. When the followers of Dr. Nuñez were victorious, they transformed the constitutional system of the country. . . . Dr. Nuñez, who had entered public life as a Radical agitator, swung completely around the circle. As the leader of the National party he became the ally of Clericalism, and the defender of ecclesiastical privilege. Being a man of un-

rivalled capacity for directing public affairs and enforcing party discipline, he has established a highly centralized military government without incurring unpopularity by remaining constantly in sight and openly exercising authority. . . . Strong government has not been without its advantages; but the system can hardly be considered either republican or democratic. . . . Of all the travesties of popular government which have been witnessed in Spanish America, the political play enacted in Bogotá and Cartagena is the most grotesque. Dr. Nuñez is known as the titular President of the Republic. His practice is to go to the capital at the beginning of the presidential term, and when he has taken the oath of office to remain there a few weeks until all matters of policy and discipline are arranged among his followers. He then retires to his country-seat in Cartagena, leaving the vice-President to bear the burdens of state."—I. N. Ford, *Tropical America*, ch. 12.

1890.—First International American congress at Washington. See AMERICAN REPUBLICS, INTERNATIONAL UNION OF: 1890.

1892.—Re-election of President Nuñez.—In 1892, Dr. Rafael Nuñez was elected president for a fourth term, the term of office being six years.

1893-1900.—Resumption of work on the Panama canal.—Revolutionary movements in Colombia as an impediment to the progress of the canal.—Boundary dispute with Costa Rica.—During the latter part of the nineteenth century the local and, for the most part, petty political quarrels of Colombia became a matter of concern to the rest of the world, and especially to the United States, because of their relation to the progress of the Panama canal. The concessions for the canal had been obtained from the government of Colombia.

In 1893 the receiver or liquidator of the affairs of the bankrupt Panama Canal Company of De Lesseps obtained from the government of Colombia an extension of the terms of the concession under which that company had worked, provided that work on the canal should be resumed before November 1, 1894. He succeeded in forming in France a new company which actually made a beginning of work on the canal before the limit of time expired [see also PANAMA CANAL: 1869-1894]. But this attempted revival of the undertaking was quickly harassed, like everything else in Colombia, by an outbreak of revolt against the clerical control of government under President Caro. The revolutionary movement was begun late in 1894, receiving aid from exiles and sympathizers in Venezuela, Ecuador and Central America. It had no substantial success, the revolutionists being generally defeated in the pitched battles that were fought; but after a few months they were broken into guerilla bands and continued warfare in that method throughout most of the year 1895. They were still threatening in 1896, but the activity and energy of President Caro prevented any serious outbreak. A boundary dispute between Colombia and Costa Rica, which became considerably embittered in 1896, was finally referred to the president of the French republic, whose decision was announced in September, 1900.—See also COSTA RICA: 1900.

1898-1902.—Revolution.—Relations to Cuba.—Panama canal concessions.—Castro, of Venezuela, and the liberals (Yellows) of Colombia.—"At the time when Spain was losing Cuba, the last Congress of Colombia sat in Bogotá. The Liberal party had but one spokesman in the Congress—to wit, Rafael Uribe-Urbe. The government majority championed the cause of Spain.

Many of the more ardent Liberals were fighting in the field for 'Cuba Libre.' Uribe-Urbe was the only man in the Congress who spoke for America as against Spain. He was hissed down. Next, the Panama Canal question came up. The French concession was to be extended for ten years. Again Uribe-Urbe spoke for America as against France. The project was voted down. The Congress was dissolved. President San Clemente, on his own motion, extended the French concession. For this he is said to have received one million dollars cash. Then the revolution broke out, and Uribe-Urbe took the field, in Santander, the richest coffee-growing state of Colombia. He fell upon the town of Cúcuta and took it, only to be driven out again after a disastrous rout at Palo Negro. To make things worse for the rebels, the Bishop of Santander ordered the excommunication of those who would not renounce liberalism or all connection with Liberals. It was a crushing blow, aimed at the wives and daughters of the fighting insurgents.

"While affairs were thus disturbed in Santander, Cipriano Castro, a Venezuelan exile living in Cúcuta, profited by the occasion to lead a small band of Colombian Liberals into Venezuela. They dashed across the border by night, and fell into Castro's native town, Capachio Viejo. Castro's father and five brothers, with other townsfolk, joined his standard and helped him win his first battle over a small detachment of Venezuelan government troops. Now the number of his adherents grew, especially as he won battle after battle or bought over his rival leaders. After a crushing defeat at Valencia, President Andrade fled the country, and Castro entered Carácas in triumph. His early Colombian adherents got Venezuelan government jobs.

"All went well for a while, especially after the prompt suppression of a counter-revolution, until Castro's sympathies with the Colombian Liberals in the field began to tell on his foreign policy. Uribe-Urbe had been badly beaten in Colombia. He was made welcome by Castro in Venezuela, and was intrusted with the command of a division on the Colombian frontier. The command was recruited from Colombians across the border. At the same time, Castro arbitrarily stopped all navigation on the Zulia and Catacumbo rivers, running from Colombian Cordillera to the Lake of Maracaibo, in Venezuela. This was a death-blow to the coffee industry of the Colombian state of Santander, which has no other outlet to the sea. Cúcuta was ruined. A German house failed for half a million dollars, an American hacienda lost \$200,000, and other foreign merchants suffered in proportion. All commerce in Cúcuta and Maracaibo coffee almost came to a standstill. Then it was that the government forces in Santander, to bring relief to the stricken district, tried to open the closed rivers by a sudden armed invasion into that region. For the sake of appearances, they were led by Ranjel Garbiras, a Venezuelan revolutionist. They made for the prosperous town of San Cristóbal, but Uribe-Urbe had managed to gather his corps of insurgents, and beat off the attack in a three days' battle. Some two thousand men fell on both sides. Uribe-Urbe promptly prepared a counter-invasion. He was aided in this by Castro, who practically put all Venezuelan forces in the Cordillera at his disposal. President Castro, who was furious at so overt an act of war on the part of his old enemies, the Colombian Clericals, furthermore sent another expedition across the Goajira desert to aid his Colombian insurgent friends in that peninsula to take the

Colombian port of Rio Hacha. Venezuelan gunboats appeared before Rio Hacha to do their part in the capture. Unfortunately for the Liberal cause, the Venezuelan army in Goajira was taken unawares while on the march, and was all but annihilated. The gunboats chose to retire without firing a shot. Castro never recovered from this reverse. The expenses of his various armed expeditions ate up all his ready finances. When he could no longer maintain Uribe-Uribe's troops, Uribe cut loose and recrossed the border, to join forces with other insurgent leaders in the interior of Colombia. Uribe's cousin proceeded to Panama, and the civil war there broke out with fresh vigor. By . . . [a] brilliant stroke in the harbor of Panama, the Colombian Liberals . . . won the command of the sea on the Pacific side. To assist them in doing the same on the Atlantic side, Castro . . . supplied them with a torpedo-boat and a small gunboat."—E. Emerson, *South American war issues (American Review of Reviews, March, 1902, pp. 298-303.)*—These last mentioned successes of Uribe-Uribe had no permanent effectiveness, for his surrender, with 1300 men and 10 pieces of artillery, was announced presently as having occurred on the 25th of October, 1902. It seemed unfortunate that he did not succeed in overthrowing the conservatives, or "Blues," who held the government, since most accounts of their rule represented it as hopelessly bad; but a change for the better came without revolution after no long time. The state of civil war was closed by a treaty of peace, signed on board the U. S. battleship *Wisconsin*, November 21.

1902-1903.—Negotiation of the Hay-Herran treaty concerning the Panama canal.—Failure of the Colombian senate to ratify the treaty.—Revolt of Panama, and declaration of independence.—"The next step in the building of the Canal, after the agreement of the French Company to sell out its rights, was the negotiation of a treaty between the United States and Colombia. In December, 1902, the government of Colombia sent as its representative to Washington, Dr. Thomas Herran who himself was favourable to the American project; and in January of the following year a convention known as the Hay-Herran treaty was signed. Under this, Colombia agreed that the French Company should sell its rights and privileges, including the Panama Railroad, to the Government of the United States; that a strip of and across the isthmus for the Canal Zone should be given into the perpetual administrative control of the United States with a combined system of jurisdiction as regarded the administration of justice. The United States, for their part, agreed in return for these privileges to pay Colombia the sum of 10,000,000 dollars in cash, and 100,000 dollars a year rental, to begin nine years after the ratification of the treaty. This treaty, in March of the same year, 1903, was ratified by the United States Senate, but was thrown out by the Colombian Senate, who refused to ratify it. . . . The Americans were greatly disturbed by the Colombian action; which was regarded as a 'hold-up game,' or attempt to extort greater benefits when it was seen how anxious the United States were to use the Panama route. The Colombians, for their part, maintained that the provisions were not sufficiently advantageous for them, and

that the abandonment of 'sovereignty' incompatible with national dignity was involved. . . . The Americans further were convinced that Colombia purposed delay, so that the term of the concession to the French Company might expire, in order that Colombia might enjoy the payments arising from the Treaty. . . . The French Canal Company naturally suffered great anxiety during these disputes fearing that the Nicaragua route would, after all, be that finally adopted. Further, the people of Panama, who had greatly benefited by the expenditure of money on the isthmus, feared that a continuance of these favourable business conditions would be lost to them. The prospect of the United States being driven to the Nicaragua route weighed heavily upon them. . . . On the 31st of October the Colombian Congress adjourned and the Hay-Herran treaty was shelved."—C. R. Enock, *Panama canal*, pp. 82-85.—On November 3, 1903, following these negotiations, Panama revolted and declared itself an independent state. The part of the United States in this revolt was bitterly resented by the Colombian government. This ill-feeling made it difficult to complete the negotiations in connection with the canal. "It was claimed by the Colombians that the revolution was 'engineered' by United States interests. The Washington Government sent a strong naval force to protect United States citizens by virtue of the treaty of 1846, by which the United States is pledged to keep the peace of the isthmus. The Colombian troops were entirely unsuccessful and had to abandon Colon, and the United States Government, whose forces held the railways, formally recognized the new Republic. Mr. Hay issued, on November 6, a memorandum stating elaborately the reasons for this step. A treaty was thereupon made with the Republic of Panama by which full rights of either a railway or a canal were granted in perpetuity to the United States within the canal zone, the United States in turn guaranteeing the independence of the Republic. Colombia protested and threatened, but was powerless to modify the situation."—*Annual Register*, 1903, pp. 448-449.—See also PANAMA: 1903; PANAMA CANAL: 1889-1903.

ALSO IN: C. L. Jones, *Caribbean interests of the United States*, pp. 193-205.

1904-1905.—Boundary disputes and arbitration treaties with Ecuador and Peru.—Boundary disputes are an essential element in Colombian history in recent times, since the frontiers of the country have never been entirely determined upon. On November 4, 1904, a treaty for arbitration of such questions whenever they should concern Ecuador was arranged between Ecuador and Colombia.—See also PERU: 1905.

1904-1909.—The administrations of President Reyes.—Modification of constitution.—Changes in army and navy.—Improvement in finances.—Railways and telegraphs.—"On August 7, 1904, the government passed into the hands of General Raphael Reyes, conservative candidate . . . who arrived with a programme of natural reconstruction and a policy of conciliation, and opened the parliamentary representation to the minorities."—J. Humbert, *Histoire de la Colombie et du Vénézuéla*, pp. 191-192.—The paragraph of the constitution which prescribes the mode of amendment seemed to obviate all possibility of modifying the constitution in practice; "but General Reyes was equal to the occasion. The Congress which was sitting when he took office in 1904 was, on the whole, hostile to him, and could be got to do nothing. The President in vain preached the necessity for less politics and more real work, and,

in the end of 1904, he cut the knot by dissolving the Congress, which had already . . . [sat for] four months of ordinary, and one of extraordinary session. He declared, under Section 121 of the Constitution, a state of siege in the departments of Cundinamarca and Santander, thus making himself dictator for the time being. During the next three or four months he was busy legislating in every direction, and by the 15th of March, 1905, he was ready to meet the National Constituent and Legislative Assembly, which he summoned for that date. This new Assembly . . . proved itself a much more amenable body than the late Congress . . . [and] the National Assembly proceeded to modify the Constitution. . . . In the army and navy radical changes were foreshadowed. The strength of the former was to be reduced to 5000 men; even these were to be organized as bodies of labourers, to be employed in peace time on the construction of roads and railways. . . . The navy, as a fighting force, was recognised to be useless, and it was proposed to reduce it to one revenue steamer on each coast, for the prevention of smuggling. . . . With the exception of the two ships to be thus retained, the 'fleet' was to be sold at auction."—F. L. Petre, *Republic of Colombia*, pp. 204-205, 315.—"In a few years the budget almost balanced; the emission of paper money had ceased, and the foreign credit of Colombia was re-established by the resumption of payment of the debt; the administration was reorganized, commerce and industries revived; mineral resources were exploited; the telegraphic system was re-established; and lines of railway were constructed, especially that of Cauca and Girardot, destined to bring the capital into communication with the upper Magdalena. The reform of the army was confided to a Chilean mission. Unhappily Reyes . . . abused his authority . . . and his administration quickly transformed itself into a dictatorship."—J. Humbert, *Histoire de la Colombie et du Vénézuéla*, p. 197.

1905-1909.—Troubles with Venezuela over the navigation of rivers flowing through both countries.—Appeal to the United States for diplomatic assistance.—The arbitrary action begun by the ill-tempered and arrogant Castro, of Venezuela, in 1902, when he stopped navigation on the rivers which flow from Colombia to Lake Maracaibo, in Venezuela, and thus opened communication to the sea (see above), was continued or resumed in subsequent years, and was a distressing trouble to his Colombian neighbors. In July, 1905, the Colombian Government appealed to that of the United States for its good offices in maintaining the principle of free navigation on rivers that are common to neighboring countries. "From the time of the award which decided the boundary dispute between the two countries," said the Colombian Minister to the United States, in a communication to the American Secretary of State, "the policy of Venezuela in matters relating to the transit trade of Colombia and the navigation of the common rivers, has been marked by a conspicuous spirit of hostility. . . . Neither logical arguments nor historic precedents, such as those submitted by the Colombian chancellery to the Government of Venezuela for the recognition by the latter of the principle of free trade over the natural waterways placed by God at the disposal of all nations, have availed."

The writer then reviewed at considerable length the arguments with which the Government of the United States had contended in the past with Spain and Great Britain for the free navigation of the Mississippi and the St. Lawrence, and said in conclusion: "It would be desirable, and I would

ask that it be done if this note were favorably received by the Government of the United States, that the American minister at Caracas be appropriately instructed in the sense of declaring on behalf of the commercial interests of the citizens of the United States his desire that the Government of Venezuela make the navigation of the Zulia and Orinoco rivers free, and urging, by persuasion, that the principle be solemnly consecrated in its public treaties. My Government will join in such an action, which comes within its traditional policy in the matter, and will interpose no obstacle or delay to the meeting of an international mixed commission for the framing of regulations concerning the use of the above-named rivers without detriment to the legitimate interests of the countries through which they flow."

To this request the then Acting Secretary of State, A. A. Adee, made a favorable reply, August 5, saying: "The principle of the free navigation of rivers has been advocated by the United States and maintained in its relations with its neighbors for many years. This government is ready, therefore, to use its good offices in the sense requested, and Mr. Russell has been instructed upon arriving at his new post in Venezuela to take advantage of fitting occasion to express to the minister for foreign affairs the great satisfaction with which the United States would view the adoption and proclamation by Venezuela of the general principle of the free navigation of rivers and fluvial arteries of communication common to neighboring countries. It is of course to be understood that in touching upon this matter this government does not seek to intervene or mediate in any way in the relations between Colombia and Venezuela, but is merely interested in the universal recognition of a policy beneficial to the commerce of the world." In the following December, the endeavor seemed promising; for the American minister to Colombia was able to report the signing, at Bogotá, of a protocol, preparatory to a new treaty of amity, commerce, and navigation, to be concluded at Caracas. Four months later, on April 27th, 1906, Minister W. W. Russell, at Caracas, announced the arrival there of the Colombian plenipotentiary, General Benjamin Herrera, appointed for the negotiation of the treaty agreed upon, but reported further that the Venezuelan Government had refused to receive him, demanding that somebody else be sent. No settlement of the matter could be obtained while Castro controlled Venezuela. However, President Gomez, his successor, annulled the decrees of hostility to Colombian commerce.

1906.—Third International American congress at Rio de Janeiro. See AMERICAN REPUBLICS, INTERNATIONAL UNION OF: 1006.

1909.—Proposed tripartite treaty between Colombia, Panama and the United States.—Resignation of President Reyes.—New elections.—Early in January, 1909, a tripartite treaty was negotiated, with Panama and the United States, for the settlement of questions connected with the secession of Panama in 1903. Panama, in this treaty, agreed to pay Colombia the sum of \$2,500,000, as her share of the Colombian public debt, receiving recognition of her independence in return. The treaty was submitted to the Colombian Congress by President Reyes on February 24th with a special message of recommendation; but public feeling was bitterly against it, for the reasons that no wrongfulness in the transaction was recognized and the indemnity was insufficient. Disturbances which broke out at Bogotá and in the provinces about the middle of March were attributed mostly to this cause of discontent. For

some reason, the president was reported to have resigned his office on the 13th, but was persuaded to resume it next day. It was now decided to suspend consideration of the tripartite treaty, until it could be submitted to an elected national congress (the existing Congress was a provisional legislature made up by appointment), the election for which would be held on the coming July 20. In June, a few weeks before the appointed election, President Reyes made a sudden departure for Europe. Rumors that he had gone because tired of political strife and would not return were contradicted by the Colombian consul at New York, in a published note which said: "His departure, the causes of which are well known throughout Colombia, was due to the fact that after five years' strenuous labor he desired a rest, and last March to the National Assembly expressed his desire to retire temporarily from the Presidency, but, owing to the opposition of public sentiment and the strong desire of the people to have him remain, he determined not to leave the Presidency until elections to the coming Congress had been made. To this Congress, about to be convened, and in which all parties are represented, President Reyes confides many of the cares of government, left by law under his jurisdiction until Congress should assemble, and withdraws, temporarily only, from the discharge of his Presidential duties, leaving in his stead Gen. Jorge Holguin, his most intimate, friend and former minister of war, who will continue to pursue in all matters the same policy as that adopted by his predecessor. Gen. Reyes during his stay in Europe, whence he has gone, will perfect plans for developing railroad and other industries in Colombia. There is absolute peace and tranquillity in all parts of the country." But the "absolute peace and tranquillity" of the country was shaken in the first week of July by a revolutionary outbreak at Barranquilla, soon suppressed, and the resignation of President Reyes was received soon thereafter, from abroad. The election of his successor now devolved on the new national congress, elected by the people on July 20. It gave the office, for the remainder of the unfinished term (which expired August 7, 1910) to Señor Gonzales Valencia, who had been proclaimed by the Barranquilla revolutionists the month before, though he disavowed their movement.

1909-1917.—Failure of a treaty between the United States and Colombia concerning the Panama canal.—Attempts to negotiate a second treaty.—Failure of the United States senate to ratify it.—"Throughout the second Roosevelt and Taft administrations the government of Colombia clung resolutely to its charge that the revolt of Panama in 1903 was fomented from Washington, and not only refused to recognize the independence of the new state, but demanded that the United States apologize and make reparation. Several attempts to smooth over the difficulty failed. In 1909 a treaty was signed which fell short of ratification, and in 1913 overtures by the United States for a tripartite convention among the nations concerned met with no response. Colombia held out for reference of the entire dispute to the International Tribunal at the Hague."—F. A. Ogg, *National progress*, 1907-1917 (*American Nation*, v. 27, p. 275).—In 1914, William J. Bryan, Secretary of State, negotiated a treaty, which was signed at Bogotá on April 7, by T. A. Thompson, Minister to Colombia, under which the Panama boundary line was to be readjusted in Colombia's favor, Colombia was to receive certain advantages, and the United States was to pay an indemnity of

\$25,000,000. This was ratified by the Colombian Senate, but the United States Senate indefinitely postponed action upon it, largely because the first article contained an expression of regret by the United States for anything that might have disturbed the friendship between the two nations, which was tantamount to a confession that this country had acted improperly in the matter of the Panama Revolution."—W. F. Johnston, *America's foreign relations*, v. 2, pp. 323-324.—"Most persons, however, refused to concede that the United States owed Colombia either an apology or money, and felt that it was the part of weakness from which no desirable result could come, to yield to a demand that was unjust merely because the nation making it was small, and one whose friendship was specially desired. The phrase 'sincere regret' seemed a censure of Roosevelt, although, strictly, the treaty 'regretted' not any action of the United States, but simply the interruption of the friendly relations of the two countries. It was objected that the United States should grant to no foreign state such exceptional privileges in the use of the Canal as were proposed for Colombia. The promise to pay \$25,000,000 carried no explanation of why that particular sum—or, indeed, any sum—should be paid. It was pointed out, too, that Colombia conceded nothing save acceptance of Panaman independence, which had already been for more than a decade a *fait accompli*; and that even the long-discussed right to a canal route by way of the Atrato River (valueless except as a safeguard against future international complications) was not conferred. The desire of the Administration to heal the Colombian rupture and to promote Latin American confidence in the justice and good-will of the United States met with sympathy. But there was strong doubt whether such a settlement would lead to that desirable result."—F. A. Ogg, *National progress*, 1907-1917 (*American Nation*, v. 27, pp. 275-277).—See also LATIN AMERICA: 1911-1914; U. S. A.: 1914-1921.

1910.—Fourth International American congress. See AMERICAN REPUBLICS, INTERNATIONAL UNION OF: 1910.

1914-1918.—Administrations of Presidents Valencia, Restrepo and Concha.—Effects of the World War.—"The Congress elected General Ramon Gonzales Valencia in 1909 for the year which was lacking of the presidential sextennat. . . . [President Valencia was followed in 1910 by Señor Carlos E. Restrepo.] one of whose first measures was the re-establishment of the departmental assemblies, which had been suppressed under President Reyes. . . . After the administrative reform, the most pressing need was the organization of public instruction. . . . [and a] decree of October, 1910, put all instruction under the control of the state and created the post of inspector-general of public instruction. . . . Furthermore, by the suppression of a number of useless posts, and the great increase of revenue from the emerald mines, and from Customs duties, the revenue of 1911 was made to exceed the disbursements by two millions of pesos. In 1914 President Restrepo's term of office expired and Señor José Vicente Concha was quietly elected in his place. Unfortunately under Concha's government Colombia. . . . felt the repercussion of the great world war. The products of the country, coffee especially, glutted the market without chance of export; no importations arrived and the customs duties, the principal source of revenue, fell away. Consequently the fiscal situation became very bad and President Concha in August, 1918, left to his successor, Marco

Fidel Suarez, a deficit which by the end of the year had grown to seven millions of pesos."—J. Humbert, *Histoire de la Colombie et du Vénézuéla*, pp. 197-198.

1916.—Boundary dispute settled with Ecuador.—"By treaty of July 15, 1916, Colombia and Ecuador came to agreement over their common frontier. The frontier thus defined terminates on the Pacific Coast along the Mataje River, south of the Mira, thus giving all the Mira delta to Colombia. East of the Andes Colombia is awarded the greater part of the basin of the Putumayo, the boundary running for the greater distance along the watershed between the rivers Putumayo and Napo. The eastern half of this region is, however, still in dispute with Peru. On the inset map accompanying Hermessen's article on the Rio Zamora (*Geogr. Rev.*, Vol. 4, 1917, p. 436) the new frontier is shown as far as its meeting with the line of the Peruvian-Ecuadorian frontier as shown on Pl. 212-213 of Andree's 'Handatlas,' 6th edition, Leipzig, 1914. Thence it runs along the Ambiyacú River to the Amazon. The text of the treaty is given in the *Revista de Geografía Colonial y Mercantil* (published by the Royal Geographical Society of Madrid), Vol. 14, 1917, No. 5-6, pp. 179-180."—*Geographical Record*, p. 327.

1919 (November).—Passage of law regulating strikes.—"The appreciable increase in wages granted in settlement of the recent strikes in Colombia have been followed by an increase in prices nearly double that of the wage increases. It is feared that this condition may lead to new wage demands on the plea that cost of living will become more burdensome. In view of this situation, Parliament enacted on November 19, 1919, a measure intending to prevent cessation of work or employment during arbitration proceedings. The principal features of this law are as follows: Recognition of the right to cease labor, provided such cessation is pacific and the object desired is an increase of wages. Disturbances resulting from union meetings due to a strike are subject to a common law; any person attempting in a strike to introduce measures of violence shall be restrained until he shall have furnished a bond to abstain from putting such measures into execution. Strikers shall have the right to designate representatives to present their demands and with power to enter into agreements. Competent authorities shall protect laborers refusing to join in a strike, and also those filling strikers' places. The law shall be invoked in all cases of aggression, violence, and sabotage. Violators shall not be liberated until the settlement of the strike is affected. The constitution of arbitration boards is provided for, and decisions are obligatory on all interested parties. Strikes are prohibited in transportation service while employees are en route. No strike shall be ordered in public lighting, water supply, or private telegraph and telephone service until after three days' notice, under a penalty of one to two months' imprisonment. Those charged with supervision who, under pretext of a strike, abandon their work, are subject to the penal code. Strikers judging themselves to be subjected to an unjust decision by public authorities have a right of appeal to competent administrative tribunals (*section du Conseil d'Etat*). . . . The right of an employer engaged in industry or agriculture (exclusive of building trades, harvest work, and other temporary work) to resort to a lockout is subject to a notice of one month prior to the proposed date of the lockout. In case of violation of this provision the wages of the employees must be paid for one month.

Outside of other penalties, any foreigners who, under pretext of a strike, shall take part in any riot or disturbance or shall have provoked a disturbance may be expelled from the country."—*Monthly Labor Review*, Sept., 1920, pp. 197-198.

1920-1921.—Economic conditions.—"In 1919 there was an exceptionally good crop of coffee,—the economic barometer of Colombia—which produced nearly three times the largest amount ever received from coffee exports in a single year. The unprecedented income from this source greatly increased for the time being the buying power of the people." On the other hand income from this source decreased in 1920 and the people found that their previous prosperity had brought them only an increased standard of living which proved a poor asset in facing the new adverse situation. Nevertheless the foreign credit of the country was not disturbed although the public debt, which had been reduced from \$25,259,000 in 1911, to \$22,708,486 in 1919, was in 1920 increased to \$32,646,075. The government scrupulously maintains its credit abroad by prompt remittance for the service of this debt.—*Commercial Reports*, U. S. Department of Commerce, Dec., 1921, pp. 987, 988.

1921.—Ratification of treaty by United States. See U. S. A.: 1914.

1922.—Boundary dispute with Venezuela settled.—Retrospect.—"Hardly had Bolivar retired from service when a congress, assembling at Valencia in 1830, re-demanded the sovereignty of Venezuela and the banishment of the Liberator [Bolivar]. During these violent internal struggles, the governments interested in the matter decided to abide by the fixing of the boundaries of the two states as formerly settled by the Spanish administration. But on inspection, it was found that the official records were not very clear on the point. Large tracts were involved, these, too, often unexplored. This gave rise to numerous discussions, which covered a period of several years. Finally in 1891, Colombia and Venezuela agreed to refer the matter to the King of Spain for arbitration. His decision, however, failed to smooth away the difficulties. The mixed boundary commissions appointed for the purpose also failed in defining territorial limits, which both countries wished to see included within their respective frontiers. Meanwhile, public opinion had become aroused. Diplomatic negotiations were resumed, which resulted in a compromise by arbitration signed at Bogota, Nov. 3, 1916, in pursuance of which the Swiss Government was called upon to settle the dispute on the lines laid down by the King of Spain. The case by arbitration opened Jan. 19, 1918. The Federal Council appointed as reporter Mr. Charles Lahardy, one-time minister of the Swiss Confederation at Paris, and an authority on matters of international law. A preliminary decree was enacted, setting forth the rules to be observed. The Federal Council passed judgment on March 24, 1922, and the result was communicated to the states interested March 27. The document embodying its deliberations covered 148 pages and presented a historic account of the question. The decree adjudged Colombia to be in the right with regard to the main point at issue, in so far as it authorized her to take immediate possession of the territories awarded to the parties by the King of Spain's decision, without waiting for the final demarcation of the portions of the frontier, which had still to be fixed. Furthermore, the decree of the Federal Council provides for the nomination of a commission of experts of Swiss nationality, who will be appointed to proceed without delay into this question of fixing the boundaries under

the responsibility of the umpire."—*Christian Science Monitor*, May 19, 1922.—See also LATIN AMERICA.

1922.—Ancient city excavated.—"Ruins of an ancient city of great size, hitherto unknown, have been uncovered in Colombia, by the South American archaeological expedition of the Field Museum of Natural History, Chicago, working under the leadership of Dr. J. A. Mason. The ruins of the city, or collection of villages, are in the Province of Magdalena, 40 miles from the Caribbean Coast and 20 miles south of Santa Marta, a portion of Colombia now uninhabited and almost unknown to the world. It is evident that this was once a great center of population, but today even its name is unknown. Mr. Mason sent this message regarding the discoveries: 'There must have been a tremendous population here at one time, as the country is covered with house sites. The region is very mountainous, and the houses, which were of wood, were built on terraces made with retaining walls. In the center of each terrace are entering steps of beautifully cut stone and if the main path is far below, other steps are built to connect the terrace with it.' The ancient inhabitants of this country decorated themselves with gold ornaments. Specimens already received at the museum include gold bells, small beautifully made gold figures and ornaments of shell, Carnelian and agate. The most valuable acquisition is a set of ornaments worn by a native priest."—*Christian Science Monitor*, Aug. 15, 1922.

COLOMBIA, Constitution of.—The text of the Colombian constitution is as follows:

Title I

Of the Nation and its Territory

ARTICLE 1. The Colombian nation is reorganized as a centralized republic.

ART. 2. The sovereignty resides essentially and exclusively in the nation. . . .

ART. 3 [sets out the boundaries of the republic.]

ART. 4. The territory, together with the public property therein contained, belongs exclusively to the nation. . . . All doubtful boundary lines shall be determined by commissions of surveyors appointed by the Senate. The ancient national territories are hereby incorporated with the sections to which they originally belonged.

ART. 5. The law may decree the formation of new departments, by dividing those already existing, when this may have been asked for by four-fifths of the municipal councils of the territory to be embraced in the new department. . . . [Amended, Mar. 30, 1905. See Amendment II. Subsections I and II provide that the new department shall have at least 200,000 inhabitants and that the territory from which it has been created shall retain at least 250,000 inhabitants.] III. The law creating the new department shall be enacted by two successive regular Legislatures. . . .

ART. 6 [provided for legislative change of department boundaries under Article 5. This article was amended. See Amendment II.]

ART. 7. Besides the general divisions of the territory, there shall be other divisions within the limits of each department for the regulation of the public service. The divisions relating to finance, military affairs and public instruction shall not coincide with the general divisions.

Title II

Of the Inhabitants—Native and Foreign

ART. 8. Colombian citizens are:

I. By birth: Those who are citizens of Colombia under one of the two following conditions: That

the father or the mother may also have been a citizen of Colombia, or that, being children of foreigners, they are domiciled in the Republic. The legitimate children of a Colombian father and mother who may have been born in a foreign country and soon after become domiciled in the Republic, shall be considered Colombians by birth for the purposes of the laws which require this qualification.

II. Origin or residence: Those who are born in a foreign country of a Colombian father or mother, and are domiciled in the Republic, and all Spanish-Americans who, before the municipal authorities of the place where they reside, may request to be inscribed as Colombians.

III. By adoption: Foreigners who apply for and obtain letters of naturalization.

ART. 9. The status of Colombian citizen is forfeited by obtaining letters of naturalization in a foreign country and fixing a residence in it; and it may be recovered under laws enacted for that purpose.

ART. 10. It is the duty of all citizens and foreigners in Colombia to live in submission to the Constitution and the laws, and to respect and obey the authorities.

ART. 11. Foreigners shall enjoy in Colombia the same rights that are conceded to Colombians by the laws of the nation to which the foreigner belongs, except those which are stipulated in public treaties.

ART. 12. The law shall define the condition of resident foreigners, and . . . [their] special rights and obligations. . . .

ART. 13. [Under this article a Colombian, even though not a citizen, who is taken in war against Colombia, is treated as a traitor; while naturalized foreigners and foreign residents are not obliged to bear arms against their native country.]

ART. 14 [declares that corporations (artificial persons) have no rights beyond those of natural persons.]

ART. 15. All male Colombians more than twenty-one years of age, who exercise a profession, art or trade, or have a lawful occupation or other legitimate and known means of support, are citizens.

ART. 16. Citizenship is lost when nationality is lost. He also loses the quality of citizenship who . . . [has] . . . (I) [taken service with] a nation at war with Colombia; (II) . . . belonged to a faction in rebellion against the government of a friendly nation; (III) . . . been condemned to suffer corporal punishment; (IV) . . . been removed from public office by . . . criminal judgment, or by an act affecting his civil responsibility; (V) . . . committed acts of violence, falsehood or corruption in elections. All persons who may have lost their citizenship may petition the Senate for restoration.

ART. 17. The exercise of the rights of citizenship is suspended: for notorious mental aberration; for judicial interdiction; for habitual drunkenness; for charges pending criminal proceedings, and after the issue of a warrant of arrest.

ART. 18. The quality of active citizenship is an indispensable condition precedent to the exercise of the right of voting, and of holding any public office of authority or power.

Title III

Of Civil Rights and Society Guarantees

ART. 19. The authorities of the Republic are established to protect all persons residing in Colombia in their lives, honor and property, and to secure the mutual respect of national rights, preventing and punishing crimes,

ART. 20. Private persons are not answerable to the authorities except for violations of the Constitution or the laws. Public officers are answerable in the same manner, as well as for exceeding their powers and for failing to execute them. . . .

ART. 21 [provides that, except in the case of soldiers in actual service, the order of a superior does not exempt from responsibility for violation of a constitutional provision].

ART. 22. There shall be no slaves in Colombia. Any person being a slave, who shall enter the territory of the Republic, shall be free.

ART. 23. No one shall be molested in his person or family, nor imprisoned, nor arrested, nor shall his domicile be searched, except upon a written warrant from competent authority, issued with all legal formalities, and for an offense previously defined by law. In no case shall there be detention, imprisonment, or arrest for debts and obligations purely civil, except by judicial order.

ART. 24. He who is taken in the actual commission of an offense may be arrested and carried before the judge by any person. . . . The police [may] pursue him . . . [into] his own dwelling . . . for the purpose of arresting him; and if he seek asylum in the dwelling of another person, requisition for him should be previously made to the owner or tenant thereof.

ART. 25. No person shall be obliged in criminal or police proceedings to testify against himself or . . . his relatives within the fourth civil degree of consanguinity or the second degree of affinity.

ART. 26. No person shall be tried except in conformity with laws enacted prior to the commission of the offense with which he is charged, before a competent tribunal, and under all the forms of the law in each case provided. In criminal matters, the lenient or favorable law, even when enacted after the commission of the offense charged, shall be applied in preference to the restrictive or unfavorable law.

ART. 27. The preceding provision does not prevent punishment being administered without previous trial in the cases and within the precise limits which the law shall indicate: I. By those officers exercising authority or jurisdiction, who may punish with fines or imprisonment any person who injures them, or who is wanting in respect toward them in the discharge of their official duties. II. By military superiors, who may inflict instant punishment in order to subdue insubordination or a military mutiny, or to maintain discipline in the presence of the enemy. III. By captains of vessels, who, not being in port, have the same power to repress the commission of crimes on board.

ART. 28. Even in time of war, no person shall be punished ex post facto, but only according to the law, order, or decree in which the act shall have been previously prohibited and the punishment prescribed for its commission. . . . [But, even in time of peace, persons may be arrested by order of the government on suspicion of plotting, and retained.]

ART. 29. The Legislature shall only prescribe death as a punishment for: . . . Treason to one's country in a foreign war, parricide, assassination, arson, assault in a gang of malefactors, piracy, and certain military crimes defined by the military laws, [judiciously proven]. At no time shall the death penalty be inflicted except in the cases provided in this article.

ART. 30. There shall be no penalty of death for political offenses. These shall be defined by law.

ART. 31. Rights acquired by natural and artificial persons, under a just title and according to

the civil laws, shall not be disavowed by laws enacted subsequently. . . .

ART. 32. In time of peace no person shall be deprived of his property wholly or in part, except as a punishment, or judicial compulsion, or indemnity, or general contribution, in accordance with law. (See Amendment VI.) . . .

ART. 33. In case of war, and solely for the purpose of effecting the restoration of public order, the necessity for expropriation may be decreed by authorities not invested with judicial power, and without previous indemnification. [This provision covers immovable property only.] . . . The nation shall always be responsible for the expropriations made by the government or by its agents. . . .

ART. 34 [forbids confiscation].

ART. 35 [protects inventions and literary work during the lifetime of the author and for eighty years thereafter, and provides for reciprocal arrangements for such protection with other Spanish speaking countries]. . . .

ART. 36. The purpose of donations inter vivos, or by testament made in conformity with the law, for objects of charity and public instruction, shall not be diverted or modified by the Legislature.

ART. 37. In Colombia there shall be no real estate that may not be transferred freely, nor shall there be any irredeemable obligations.

ART. 38. The Roman Catholic Apostolic religion shall be the religion of the nation; the public authorities shall protect it, and cause it to be respected as an essential element of the social order. It is understood that the Catholic church is not and shall not be an established church, and it shall preserve its independence.

ART. 39. No person shall be molested on account of his religious opinions, nor compelled by the authorities to profess tenets, nor to observe practices, contrary to his convictions.

ART. 40. The exercise of all forms of worship, not opposed to Christian morals or the law, is permitted.

All acts opposed to Christian morals, or subversive of the public order, which may be performed on the occasion of, or as a pretext for the exercise of religious worship, shall be subject to punishment by law.

ART. 41. Public education shall be organized and directed in accordance with the Catholic religion. Primary instruction paid for out of the public funds shall be gratuitous, and not compulsory. . . .

ART. 42 [guarantees freedom of the press, and forbids foreign subsidies to any periodical publication].

ART. 43 [declares the inviolability of posts and telegraphs, except by the government, and provides for taxation and non-prohibition of printed matter.]

ART. 44. Any person may pursue any honorable trade or occupation without the necessity of belonging to any guild or other association. The authorities shall inspect all industries or professions in their relation to morals, society and public health. The law may exact proofs of competency for the practice of the medical profession and its branches. . . .

ART. 45 [gives right of petition to the authorities.]

ART. 46 [gives right of assembly; but provides for dispersal of disorderly gatherings.]

ART. 47. The formation of companies or associations, either public or private, which are not opposed to morality or the legal order, shall be permitted. All popular political organizations of a permanent character shall be prohibited. All religious associations, in order that they may remain under the protection of the laws, shall present to

the civil authority authorization issued by their respective ecclesiastical superiors.

ART. 48. The government alone shall import, manufacture and own arms and munitions of war. [The carriage of arms in towns without permission, or in any case at] . . . political meetings, or elections, or sessions of assemblies, or public corporations, [is forbidden].

ART. 49. Legitimate and public corporations shall have the right to be recognized as artificial persons, and to execute in virtue thereof civil acts, and to enjoy the guarantees assured by this title, under such general limitations as the laws may establish for the sake of the common good.

ART. 50. The laws shall determine the civil status of all persons, and their consequent rights and duties.

ART. 51. The laws shall determine the responsibility to be incurred by public officers of all classes who infringe the rights guaranteed by this title.

ART. 52. The provisions contained in the present title shall be incorporated in the Civil Code as a preliminary title, and shall not be altered except by an act amending the Constitution.

Title IV

Of the Relations between Church and State

ART. 53. The Catholic Church shall have power, in Colombia, to administer freely its internal affairs and to perform acts of spiritual authority and of ecclesiastical jurisdiction without the necessity of authorization from the civil power; and, as an artificial person, represented in each diocese by its respective legitimate prelate, shall also have power to perform civil acts in virtue of rights recognized by the present Constitution. . . .

ARTS. 54, 55 and 56 [govern the relations between church and state. Ecclesiastics may not hold public office; but may be employed in public instruction and charity. Property of the Roman Catholic Church is not taxable, and may not be turned to other uses. Power is given to negotiate with the Apostolic See and to define the relations between the civil and ecclesiastical powers.]

Title V

Of the National Powers and the Public Service

ART. 57. All public authorities shall be limited, and shall perform their respective functions independently.

ART. 58. The law-making power shall be vested in a Congress. The Congress shall be composed of a Senate and a House of Representatives.

ART. 59. The President of the Republic is the chief of the executive power, and he shall exercise it with the indispensable co-operation of the ministers. The President and the ministers, and in each particular transaction the president, with the ministers of the respective department, shall constitute the Government.

ART. 60. The judicial power shall be exercised by a Supreme Court, by superior district tribunals, and by such other tribunals and inferior courts as may be established by law. . . .

ART. 61. No person or corporation shall, in time of peace, exercise, at the same time, patriotic or civil and judicial or military authority.

ART. 62. The law shall determine the special cases of incompatibility of functions; the cases of the incompatibility of public offices and the manner of making it effective; the qualifications and antecedents necessary for the exercise of certain employments. . . .

ART. 63. There shall be no officer in Colombia

whose duties are not defined by law or regulation.

ART. 64. No person shall receive two salaries from the public treasury, except in special cases determined by law.

ART. 65. No public officer shall enter upon the discharge of his office until he shall have sworn to maintain and defend the Constitution, and to perform the duties which are incumbent upon him.

ART. 66. No Colombian who is in the service of Colombia, shall, without the permission of his government, accept from any foreign government any office or gift, under penalty of forfeiting his employment.

ART. 67. No Colombian shall accept from a foreign government any employment or commission near the government of Colombia, without having previously obtained from the latter the necessary authorization.

Title VI

Of the Assembling and Functions of Congress

ART. 68. The two houses of the Legislature shall meet in ordinary session by virtue of law every two years, on the twentieth of July, in the capital of the Republic. The ordinary sessions shall continue one hundred and twenty days, after which the Government may declare the houses adjourned. [This provision was amended in 1905; and the sessions now last for ninety days only.]

ART. 69. The two houses shall be opened and closed publicly, and at the same time.

ART. 70. The houses shall not open their sessions nor deliberate with less than one-third of their members. . . .

ART. 71 [provides for the imposition of fines for non-appearance].

ART. 72. Congress shall meet in extra session when summoned by the Government. In extra sessions only such business shall be considered as the Government may submit for consideration.

ART. 73. By mutual agreement of the two houses, Congress may assemble in a place different from the capital, and, in case of disturbance of the public order, it may assemble in a place designated by the president of the Senate.

ART. 74. The two houses of Congress shall meet as one body only for the purpose of installing the President of the Republic, and to perform the act prescribed in Article 77. . . .

ART. 75. All meetings of members of Congress, which, for the purpose of exercising the legislative power, are held without observing the conditions prescribed by the Constitution, shall be illegal; their acts shall be null; and the members who participate in the deliberation shall be punished according to law.

ART. 76. Congress shall make the laws.

By means of these laws it exercises the following functions: I. To interpret, amend, and repeal pre-existing laws. II. To modify the general divisions of the territory in accordance with Articles 5 and 6, and to establish and reform, whenever proper, the other territorial divisions defined in Article 7. [See Amendment II.] III. To confer special powers upon the department assemblies. IV. To regulate the administration of Panama. V. To change, under extraordinary circumstances and for grave reasons of public convenience, the actual residence of the high national officers. VI. To organize and provide for the standing army every two years in ordinary session. VII. To create all the offices required by the public service, and to fix their respective salaries. VIII. To regulate the public service, determining all matters referred to in Article 62. IX. To authorize the Government to make contracts, negotiate loans,

alienate national property, and exercise other functions within constitutional limits. X. To invest the President of the Republic temporarily with such extraordinary powers as necessity may require or the public convenience demand. XI. To provide for the national revenues, and to determine the expenses of the administration.

Each Legislature shall vote a general budget. In the budget shall not be included any item not previously decreed by law nor credit not judicially recognized. XII. To recognize the national debt and provide for its payment. XIII. To decree extraordinary expenses whenever necessity requires it. XIV. To approve or reject contracts or agreements entered into by the President of the Republic with private persons, companies or political corporations, in which the national treasury is interested, if they have not been previously authorized, or if the formalities prescribed by Congress have not been complied with, or if any conditions contained in the law authorizing them have been disregarded. XV. To determine the alloy, the weight, impress and denomination of coins, and to regulate the system of weights and measures. XVI. To organize the public credit. XVII. To decree the execution or continuance of public works. XVIII. To favor useful or beneficial enterprises which may be deemed worthy of encouragement or support. XIX. To decree public honors to such citizens as may have rendered distinguished services to the country. XX. To approve or reject treaties entered into by the Government with foreign powers. XXI. To grant, by a vote of two-thirds of the members of each house, and for grave considerations of the public good, amnesties and general pardons for political offenses. In case the recipient of such amnesty or pardon is thereby relieved from civil responsibility to any person, the Government shall assume the burden of indemnifying such person. XXII. To limit or regulate the appropriation or conveying of public lands. . . .

ART. 77 [refers to the election of the Vice-president. This article was abrogated in 1905.]

ART. 78. Neither the Congress nor either house thereof is permitted: I. To direct appeals to public officers. II. To enact laws or adopt resolutions concerning matters which are exclusively intrusted to other departments of the Government. III. To vote approval or censure of any official act. IV. To require the Government to communicate to it the instructions given to diplomatic agents, or to give information relative to negotiations of a private character. V. To decree to any person any reward, indemnification, pension, or other pecuniary consideration which is not intended to satisfy credits or rights recognized by existing laws, except in the case provided in Article 76, Section XVIII. VI. To enact laws of proscription or prosecution against persons or corporations.

Title VII

Of the enactment of Laws

ART. 79. Laws may originate in either house on the initiative of its respective members or of the ministers of the Government.

ART. 80. Laws of the following classes shall be excepted from the provision of the preceding article: I. Such laws as must originate only in the House of Representatives (Article 102, Section II). II. Such laws as relate to civil matters and to judicial proceedings, which can only be amended by bills presented by special permanent committees of either house and by ministers of the Government. . . .

ART. 81 [provides that before it becomes law, a bill must pass in each house three successive readings, on three different days, by a majority of the members, and obtain approval of the government].

ART. 82 [provides that a majority must be present, in each house, before closure of the second reading, and before the vote is taken on the third reading.]

ART. 83. The Government, by means of its ministers, may take part in legislative debates.

ART. 84. The judges of the Supreme Court shall be entitled to be heard in the discussion of bills relating to civil matters and judicial procedure.

ART. 85. After a bill shall have passed both houses, it shall be sent to the Government, and if approved by the Government, it shall be promulgated as a law. . . .

[By ARTICLES 86 to 90 the president may return a bill to the legislature within six days to fifteen days, in accordance with its length. Otherwise he is required to approve and promulgate it within six days. If the house adjourns within that time, whether approved or rejected, the bill must be published. A rejected bill may be passed over the veto of the president by a two-thirds majority of each house, and may in case of continued refusal by the government be promulgated by the president of the Congress. A bill objected to as unconstitutional may be submitted to the Supreme Court for decision. By ART. 91 unfinished legislation is reintroduced in the next legislature as new.]

ART. 92. The enacting clause of all laws shall be: 'The Congress of Colombia decrees:'

Title VIII

Of the Senate

ART. 93. The Senate shall be composed of three Senators from each department . . . [with two substitutes for each Senator].

ART. 94. Senators shall be native Colombians and in the full enjoyment of their citizenship; they shall be more than thirty years of age, and in the enjoyment of an annual income of at least two thousand and two hundred dollars, derived from property or the pursuit of an honorable occupation.

ART. 95. Senators shall be elected for the term of six years, and are re-eligible indefinitely. . . . [This term was in 1905 shortened to four years. See Amendment VIII.]

ART. 96. The Senate shall try all impeachments of public officers. . . .

ART. 97 [creates rules for the trial of impeached officers by the Senate.]

ART. 98. The Senate shall also be invested with the following powers: I. To reinstate those who have forfeited their citizenship. . . . II. To appoint two members of the Council of State [now abolished]. III. To accept or decline the resignations of the president or vice-president or the designato. IV. To confirm or reject nominations made by the President of the Republic of judges of the Supreme Court. [See Amendment I.] V. To confirm or reject the military appointments made by the Government, . . . [above] the rank of lieutenant-colonel. . . . VI. To grant leave to the President of the Republic to be temporarily absent from the capital for other cause than sickness, or to exercise his functions outside of the capital. VII. To permit the passage of foreign troops through the territory of the Republic. VIII. To appoint the commissioners referred to in Article 4. IX. To authorize the Government to declare war against another nation.

Title IX

Of the House of Representatives

ART. 99. The House of Representatives shall consist of one member for every fifty thousand inhabitants of the Republic. Two substitutes shall be elected for each Representative.

ART. 100. To be eligible to the position of Representative, it is required that a person be a citizen in the full exercise of the rights of citizenship, that he be more than twenty-five years of age, and that he may not have been condemned for an offense punishable with corporal punishment.

ART. 101. Representatives shall be elected for the term of four years, and they shall be re-eligible indefinitely.

ART. 102. The House of Representatives shall have the following powers: I. To examine and pronounce finally upon the general accounts of the treasury. II. To organize all laws for the levying of taxes and for the organization of the public ministry. III. To appoint two councilors of State. [See Amendment X.] IV. To impeach before the Senate, whenever there may be just cause, the President and Vice-President of the Republic, the ministers of the cabinet, the councilors of State, the Attorney-General of the nation, and the judges of the Supreme Court. V. To examine charges and complaints presented to it by the Attorney-General, or by private persons, against any of the above-named public officers, except the President and the Vice-President, and, if found proper, to base on them impeachment before the Senate. [See Amendment V.]

Title X

Provisions common to both Houses and to the members thereof

ART. 103 [provides for the adoption of rules and the creation of house officials by both houses].

ART. 104. [The sessions of the House shall be public, within the limitations prescribed by law.]

ART. 105. The members of both houses represent the whole nation, and should vote in the sole interest of justice and the public good.

ART. 106. The Senators and Representatives shall not be held responsible for their opinions and votes given in the discharge of their duties. For any expression in debate they shall be alone responsible to the house to which they belong. . . .

ART. 107 [defines special rights of non-arrest and non-trial of members of Congress.]

ART. 108 and ART. 109 [provide that the president, the Cabinet, judges of the Supreme Court, Attorney-General and governors may not be elected to Congress within six months of the expiry of their terms of office; no person may represent a department or district in which he has held office within three months prior to the date of election; and except as ministers, diplomatic agents or military chief no member of Congress may hold office during his term, or within one year thereafter.]

ART. 110. Senators and Representatives shall not, either directly or through a third person, make any contracts with the administration, nor shall they accept from any person the power of attorney for the negotiation of any business with the government of Colombia. . . .

ART. 111 [provides for the travelling expenses of a member and his substitute, in case of substitution.]

ART. 112 [decrees that increase in the pay of members shall not take effect in the legislature in which it is voted.]

ART. 113. In case of the temporary or permanent absence of a member of Congress, the vacancy shall be filled by his substitute.

Title XI

Of the President and Vice-President of the Republic

ART. 114. The President of the Republic shall be elected for a term of six years [shortened to four years in 1905] by the electoral assemblies, voting on the same day, and in the manner determined by law. [See AMENDMENTS V. and VIII.—See also ELECTIONS, PRESIDENTIAL: South American republics.]

ART. 115. The President of the Republic shall possess the same qualifications as a Senator.

ART. 116. The President-elect of the Republic shall take possession of his office in the presence of the president of the Congress, [or of the president of the Supreme Court, or failing this of two witnesses: ART. 117] and shall take the following oath: 'I swear before God to comply faithfully with the Constitution and laws of Colombia'. . .

ART. 118. The President of the Republic shall exercise the following powers in relation to the legislative department: I. To open and close the ordinary sessions of Congress. II. To convene Congress in extraordinary sessions for serious reasons of public convenience and after previous consultation with the council of State. III. To present to Congress at the beginning of each Legislature a message on the acts of the administration. IV. To send at the same time to the House of Representatives the budget of the revenues and expenses, and a general account of the budget and the treasury. V. To give to the houses of the Legislature such information as they may call for on affairs not requiring secrecy. VI. To furnish efficient aid to the houses when they demand it, placing at their disposal, if necessary, the public force. VII. To co-operate in the enactment of laws, by presenting bills through the medium of the ministers, exercising the right to veto legislative acts, and complying with the duty to approve them, in accordance with this Constitution. VIII. To issue decrees that shall have the force of legislative enactments, in such cases and with such formalities as are prescribed in Article 121.

ART. 119. The President of the Republic shall exercise the following powers in relation to the judiciary department: I. To appoint the judges of the Supreme Court [see AMENDMENT I]. II. To appoint the judges of the superior tribunals, each one from a list of three nominations made by the Supreme Court. III. To appoint and remove the public ministers. IV. To see that prompt and full justice is administered throughout the Republic, furnishing the judicial officers, under the provisions of the law, with such aid as may be necessary for the enforcement of their decrees. Subsection V [provides for accusation by order of the president, before a competent tribunal, of any governor or public officer] for any violation of the Constitution or the laws, or for other offenses committed in the exercise of their functions. [Subsection VI gives to the president the usual executive power of pardon and commutations, providing that] in no case shall these pardons or commutations include the responsibility under which the beneficiaries are with respect to private persons, according to the laws. He shall not exercise this last prerogative with respect to the ministers of the cabinet, except on a petition from one of the houses of Congress.

ART. 120. The President of the Republic, as the chief executive officer of the nation, shall exercise the following powers. I. To appoint and remove, at his pleasure, the ministers of the cabinet. II. To promulgate the laws, to obey them, and to see that they are faithfully executed. III. To exercise his general executive power by issuing orders, decrees and resolutions necessary to the complete execution of the laws. . . . [This Article (paragraphs IV to VI) also covers his powers of appointment and removal of governors and other officials.] VII. To control the public force and to confer military appointments, under the restrictions imposed in Section V of Article 98, and with the formalities established by law for regulating the exercise of this power. VIII. To preserve public order throughout the territory, and to re-establish it if it should be disturbed. IX. To direct, whenever he may think proper, the military operations as chief of the armies of the Republic. . . . X. To direct diplomatic and commercial relations with other powers and sovereigns, to appoint at his pleasure and receive the respective agents, and to negotiate treaties and conventions with foreign powers. All treaties shall be submitted for the approval of Congress, and the conventions shall be approved by the President, in the recess of the House. . . . XI. To provide for the external safety of the Republic, defending the independence and honor of the nation and the inviolability of the territory; to declare war, with the consent of the Senate, or to make it without such consent, whenever it shall be necessary to repel a foreign invasion; and to conclude and ratify treaties of peace, reporting his proceeding afterward with documents to the next Legislature. XII. To permit, in the recess of the Senate . . . the passage of foreign troops across the territory of the Republic. XIII. To permit . . . the harboring of foreign vessels of war within the waters of the nation. XIV. To supervise the strict collection and administration of the revenues and public funds, and to decree their disbursement according to law. XV. To regulate, direct and inspect the national public instruction. XVI. To enter into administrative contracts for the engagement of services and for the execution of public works in accordance with the fiscal laws and the obligation to render an account to Congress in its ordinary sessions. XVII. To organize the national bank, and to exercise the necessary inspection over the banks of emission and other establishments of credit, in conformity with the laws. XVIII. To permit the acceptance, by the national employes who may request it, of offices or gifts from foreign governments. XIX. To issue letters of naturalization, in conformity with the laws. XX. To grant patents, for prescribed periods, to the authors of useful inventions and improvements, in accordance with the laws. XXI. To exercise the right of inspection and supervision over institutions of common utility, in order that their revenues may be preserved and properly applied, and that in all its essentials the will of the founders may be carried out.

ART. 121. In case of foreign war or of civil commotion the President may, after consultation with the Council of State, and with the written consent of all the ministers, declare the public order to be disturbed, and the whole or a part of the Republic in a state of siege. After such declaration the President shall be invested with the powers which the laws confer upon him to defend the rights of the nation or to repress disturbance, and, in case the laws are defective, he shall use the powers conferred by the law of the nations. The extraordinary means or legislative

decrees of a provisional character which, within the said limits, the President may ordain, shall be obligatory, provided they bear the signatures of all the ministers. The government shall declare the public order re-established as soon as the commotion or foreign danger shall have ceased; and the President shall send to Congress a statement of the reasons that induced his measures. All officers shall be responsible for the abuses which may have been committed in the exercise of extraordinary powers.

ART. 122. The President of the Republic, or whoever shall exercise the executive power in his stead, shall be responsible only in the following cases which the law shall define: I. For acts of violence or coercion at elections. II. For acts which may prevent the constitutional assembling of the legislative houses, or may obstruct them or other public corporations or authorities established by this Constitution, in the exercise of their functions. III. For acts of high treason. In the first two cases the penalty shall be only removal from office, and if the President shall have ceased to exercise the functions of this office he shall not be re-eligible to the presidency. No act of the President, except the appointment or removal of ministers, shall be valid and binding until it shall have been signed and promulgated by the minister to whose department it refers, who by this act becomes responsible.

ART. 123. The Senate may grant to the President a temporary leave of absence from the executive office. The President may, on account of ill health, retire, for the time necessary to its restoration, from the exercise of the executive power, by giving previous notice to the Senate, or, in recess of the Senate, to the Supreme Court. . . .

[ARTICLES 124 to 131 inclusive declared the duties and powers of the vice-president. This office was abolished in 1905. See AMENDMENT V.]

Title XII

Of the Ministers of the Cabinet

ART. 132. The number, designation and precedence of the several Ministers or administrative departments, shall be determined by law. The President shall assign to the several Ministers the business that appertains to their departments respectively.

ART. 133. A Minister shall possess the same qualifications as a Representative.

ART. 134. The Ministers are the government's organs of communication with Congress; they present bills to the houses, take part in the debates, and counsel the President in his consideration of legislative acts. Each Minister shall present to Congress, within the first fifteen days of each Legislature, a report on the condition of affairs appertaining to his department, and of the reforms which experience advises should be introduced. The House may require the assistance of the Ministers.

ART. 135. The Ministers, as the superior chiefs of the administration, may exercise, in certain cases, presidential authority, as the President may direct. Under their own responsibility they may annul, reform or suspend the acts of their subordinate officers.

Title XIII

Of the Council of State

ART. 136. The Council of State shall consist of seven members, to wit: The Vice-President of the Republic, who shall preside, and six voting members appointed in accordance with this Constitution. The Ministers of the cabinet shall have a

voice but no vote in the Council. [This Council was abolished in 1904.]

[ARTICLES 137 to 141 inclusive set out the duties of the Council, and provided for the exercise of its powers. While it existed the members held office for four years, one-half of its members going out every two years. It was the supreme consulting body of the government in matters of administration, prepared bills and codes for the legislature, and had the right to propose reforms. See AMENDMENT X.]

Title XIV

Of the Public Ministry

ART. 142. The functions of the public ministry shall be exercised, under the supreme direction of the government, by an Attorney-General of the nation [appointed for three years: ART. 14], by ministerial officers of the superior district tribunals, and by the other functionaries to be designated by law. The House of Representatives shall exercise specific ministerial functions.

ART. 143. The officers of the public ministry shall defend the interests of the nation, promote the execution of the laws, judicial sentences, and administrative orders; they shall supervise the official conduct of the public employes, and prosecute those guilty of crimes and misdemeanors that disturb the social order. . . .

ART. 145. The special functions of the Attorney-General of the nation are the following: I. To see that all the public officers in the service of the nation shall properly discharge their duties. II. To arraign before the Supreme Court all officers who are to be tried by it. III. To see that all the other officers of the public ministry shall faithfully discharge their duties, and to hold them to a legal responsibility for illegal acts. IV. To appoint and remove at his pleasure his immediate subordinate officers. And all such other functions as the law may assign to him.

Title XV

Of the Administration of Justice

ART. 146. The Supreme Court shall be composed of seven judges.

ART. 147. The judges of the Supreme Court shall hold their office for life, or during good behavior. The law shall determine the causes for which they are removable, and the procedure and formalities to be observed in rendering judicial sentence in such cases. Any judge who may accept any other office from the government shall be held to have vacated his judgeship. [See AMENDMENT I.]

ART. 148. The President of the Supreme Court shall be elected every four years by the court itself.

ART. 149. There shall be seven substitutes appointed to supply the temporary vacancies that may occur on the Supreme Bench. Whenever a permanent vacancy shall occur, either by death, resignation, or under a constitutional provision, or by judicial decree, a new appointment shall be made to supply the vacancy.

ART. 150. The judges of the Supreme Court shall be Colombians by birth and in the exercise of the full rights of citizenship; they shall be at least thirty-five years of age, and have presided as judges in one of the superior district tribunals, or in one of the tribunals of the former States, or have pursued, with credit, for five years at least, the profession of law, or have been professors of jurisprudence in some public institution.

ART. 151. The Supreme Court shall exercise the following functions: I. To take cognizance of

causes on appeal, conformably with the law. II. To adjust all disagreements that may arise between two or more district tribunals. III. To take cognizance of all causes in which the nation is a party, or which may involve a controversy between two or more departments. IV. To decide, finally, upon the constitutionality of legislative acts, which may have been objected to by the government as unconstitutional. V. To decide, in conformity with the law, upon the validity or nullity of such ordinances enacted by the departments as may have been suspended by the government, or denounced before the tribunals, by those interested, as subversive of civil rights. VI. To try the high national officers who may have been accused, before the Senate, for any offense that is made triable thereby under Article 97. VII. To take cognizance of all causes for violation of the Constitution, or laws, or for malfeasance in office, that may be instituted against diplomatic or consular agents of the Republic, Governors, judges, commanders or generals of the national forces, and the superior chiefs of the treasury office of the nation. VIII. To take cognizance of all causes affecting diplomatic agents accredited to the government of the nation, in the cases provided for by international law. IX. To take cognizance of all causes relating to the navigation of the sea, or of navigable rivers which touch the territory of the nation. And all other functions which the law may assign to it.

ART. 152. The court shall appoint and remove at pleasure its subordinate officers.

ART. 153. In order to facilitate the prompt administration of justice, the national territory shall be divided into judicial districts, and in each district there shall be a superior tribunal, whose formation and functions shall be determined by law.

ART. 154. In order to be a judge in the superior tribunals one must be a citizen in the exercise of his rights, at least thirty years of age, and have, for at least three years, performed judicial functions or practiced the profession of law with credit, or given instruction in law in a public institution.

ART. 155. The provisions contained in Article 147 shall apply to the judges of the superior tribunals. Said judges shall be responsible to the Supreme Court, in the manner to be determined by law, for malfeasance in office and for the commission of all acts in derogation of official dignity.

ART. 156. The law shall organize the interior courts, and determine their functions and terms of the judges.

ART. 157. In order to be a judge one must be a citizen in the exercise of his rights, be versed in the science of the law, and enjoy a good reputation. . . .

ART. 158. Inferior judges shall be responsible to their respective superiors.

ART. 159. Judicial officers shall not be cumulative, and they are incompatible with the exercise of any other office of emolument, or with any participation in the practice of the law.

ART. 160. Judges shall not be suspended from the exercise of their functions except in the cases and with the formalities prescribed by law, nor otherwise than by a judicial decree. Their transference to other employments shall leave their judgeship vacant. . . .

ART. 161. Every sentence shall be accompanied by the reasons therefor.

ART. 162. The law may institute juries for the trial of criminal causes.

ART. 163. Courts of commerce may be established. . . .

ART. 164. [provides for the establishment of courts of administrative law.]

Title XVI

Of the Public Force

ART. 165. All Colombians shall be required to bear arms when public necessity demands it, in order to defend the national independence and the institutions of the country. The conditions which exempt from military service shall be determined by law. . . .

[ARTICLES 166 to 171 provide for a standing army, its numbers and maintenance, courts martial, and for a national militia, and forbid military assemblies for the purpose of deliberation.]

Title XVII

Of Elections

ART. 172. All the citizens shall elect directly municipal councilors and deputies to the departmental assemblies.

ART. 173. The citizens who may know how to read and write, or have an annual revenue of five hundred dollars, or immovable property to the value of one thousand and five hundred dollars, may vote for electors, and elect directly representatives. [See AMENDMENT VIII, Art. 5.]

ART. 174. The electors shall vote for President and Vice-President of the Republic. [See AMENDMENT VIII, Art. 3.]

ART. 175. The Senators shall be elected by the departmental assemblies; but in no case shall members of the said assemblies be elected who may have belonged thereto within the year in which the election may be made. [See AMENDMENT VIII, Art. 2.]

ART. 176. There shall be one elector for each one thousand inhabitants. [See AMENDMENT VIII, Art. 4.] There shall also be one elector for each district that may contain less than one thousand inhabitants.

ART. 177. The electoral assemblies shall be renewed for each presidential election, and the persons who shall have been declared legitimate members of such assemblies shall not be deprived of the right of exercising their functions, except by a judicial decree, which shall cause the loss or suspension of the rights of citizenship. [See AMENDMENT VIII.]

ART. 178. For the election of Representatives each department shall be divided into as many electoral districts as it may be entitled to Representatives, and each district shall elect one Representative. [See AMENDMENT VIII, Art. 4.] The division to which the preceding paragraph refers shall be made by law, or in default of this, by the Government. Municipal districts containing more than fifty thousand inhabitants shall be considered electoral districts, and shall elect one or more Representatives according to their population. In case the fractions of population over and above the number necessary for a Representative shall, when added together, amount to more than twenty-five thousand inhabitants, the department shall elect one additional Representative. The law shall fix the rules of this additional election. . . .

[ARTICLES 179-181 declare that the suffrage is a constitutional function which confers no other rights or obligations, and provides means to ensure the validity and independence of elections.]

Title XVIII

Of the Departmental and Municipal Administration

ART. 182. The departments, for the administrative service, shall be divided into provinces, and the latter into municipal districts.

ART. 183. There shall be in each department an administrative body denominated a departmental assembly, composed of Deputies, one for each twelve thousand inhabitants.

The law may change the preceding numerical basis for Deputies.

ART. 184. The assemblies shall meet ordinarily every two years in the capital of the department. . . .

[ARTICLES 185 to 201 provide for local government of the departments, and the powers of the governors, who are appointed by the president.]

Title XIX

Of Finance

ART. 202. The following property shall belong to the Republic of Colombia: I. The estates, revenues, lands, valuables, rights, and shares which belonged to the Colombian Union on the fifteenth day of April, 1886. II. The uncultivated lands, mines and salt works which belong to the States, the property in which is now vested in the nation, without prejudice to the rights acquired by third parties from said States, or held by the latter from the nation under the title of indemnification. III. All mines of gold, silver, platinum and precious stones that lie within the national territory, without prejudice to the rights which the discoverers or explorers may have acquired over some of them under previous laws.

ART. 203. The Republic shall be responsible for the foreign and domestic debts that have already been recognized or that may be hereafter recognized, and for the expenses of the national public service. The law shall determine the order and manner of satisfying these obligations.

ART. 204. No indirect tax, nor any increase in such tax already existing, shall take effect until six months after the promulgation of the law establishing such tax or increase. [Repealed March 3d, 1905. See AMENDMENT IV.]

ART. 205. No alteration in the customs tariff shall take effect until ninety days after the approval of the law enacting it; and all increase or diminution of the import dues shall take effect by tenth parts during the ten following months. . . .

ART. 206. Each ministry shall prepare, every two years, an estimate of its expenditures and deliver the same to the treasury department, from which shall be prepared the general estimate for the nation and submitted to the approval of Congress, together with an estimate of the revenues from which shall be appropriated the means necessary to meet the national obligations. If Congress shall fail to vote the budget for the fiscal period of two years, the budget voted for the previous two years shall continue in force.

ART. 207. No expenditure of public money shall be made without a previous authorization thereof by Congress, by the assemblies of departments, or by the municipalities; nor shall any appropriation be diverted from the object for which it was made.

ART. 208. Whenever, in the judgment of the Government, the necessity arises for an indispensable expenditure, and the houses should not be in session, and the appropriation should not have been made or should be inadequate, a supplemental or extraordinary credit may be assigned to the

respective ministry. These credits shall be opened by the council of ministers upon proof of their necessity, and after consulting with the council of State. Congress shall legalize these credits. The Government may petition Congress for credits additional to the budget of expenses.

Title XX

Of the Amendment of this Constitution and the Abrogation of the Former

ART. 209. This Constitution may be amended by a legislative act, discussed first and adopted after three several readings in the usual manner by Congress, submitted by the Government to the next following Legislature for its definite action, and by it newly discussed and finally adopted by two-thirds of the members of both houses.

ART. 210. The Constitution of the 8th of May, 1863, which is inoperative by reason of accomplished facts, is hereby abolished; and, in the same manner, all legislative provisions in conflict with this Constitution are hereby repealed. . . .

This Constitution shall go into effect with respect to the high national powers, from and after the day on which it shall be approved; and for the nation, thirty days after its publication in the *Diario Oficial*.

Given in Bogota, August 4, 1886.

From Constitution of republic of Colombia (*Convention Manual of the 6th N. Y. State Constitutional convention, 1894, foreign constitutions, pt. 2, v. 3, pp. 151-188*).

Amendments by National Constitutional and Legislative Assembly, March and April, 1905

I. Act of March 27, 1905.—The National Constitutional and Legislative Assembly decrees: ART. 1. The term of offices of the justices of the Supreme court shall be five years, and that of the justices of the Superior tribunals of judicial districts four years.

ART. 2. The first period for the justices of the Supreme court shall begin on May first of the present year 1905, and for the justices of the Superior tribunals of judicial districts on June first of the same year. These justices may be reelected indefinitely. . . .

II. Act of March 28, 1905.—The National Constitutional and Legislative Assembly decrees: ART. 1. In the future the legislative chambers shall meet in ordinary session, without a call therefor being necessary, on the first day of February, every two years in the capital of the Republic.

ART. 2. The ordinary session shall last ninety days, at the end of which the Government may declare the chamber in recess.

ART. 3. The first constitutional Congress to be held after the passage of this act, shall meet on February first, 1908, and this date shall be adopted for the first meeting of all subsequent Congresses. . . .

ARTS. 4 and 5 [provide for the continued existence and legislative powers of the National Assembly until February 1, 1908].

III. Act of March 30, 1905.—The National Constitutional and Legislative Assembly decrees: ART. 1. The law may change the territorial division of the whole Republic and make as many departments as may be deemed advisable for the public administration.

ART. 2. It may also take away from the departments now in existence or to be created hereafter

the municipal districts which may be deemed most suitable and organize and administer them according to special laws.

ART. 3. The law shall determine the population corresponding to each department in the new territorial division and distribute among said departments the public property and burdens. It shall establish also the number of Senators and Representatives and the manner of electing them.

ART. 4. Articles 5, 6 and 76 of the present Constitution of the Republic are hereby amended.

IV. Act of March 30, 1905.—The National Constitutional and Legislative Assembly decrees: SOLE ARTICLE.—Article 204 of the Constitution is hereby repealed.

V. Act of March 30, 1905.—The National Constitutional and Legislative Assembly decrees: ART. 1. The positions of Vice-President of the Republic and of *Designado* to exercise the executive power shall be, on and after the date of the present act abolished.

ART. 2. In case of temporary vacancy of the Presidency of the Republic, the duties of the Chief Executive shall be discharged by the member of the Cabinet whom the President may designate, and if no minister is designated, by the Governor of the Department nearest to the capital of the Republic.

ART. 3. In case of absolute vacancy of the Presidency the duties of the President shall be discharged by a member of the Cabinet designated by absolute majority in the council of ministers, and if there are no ministers, by the governor of the Department nearest to the capital of the Republic. (1) The functionary in charge of the executive power shall at once call . . . the Congress, to convene in extra session, and elect, within sixty days, the citizen who should replace the President until the end of the constitutional period. (2) If the unexpired portion of the Presidential term consists only of one year or less, the functionary in charge of the executive power shall continue to discharge the duties of President, until the end of the term; but he shall order an ordinary Presidential election to be held according to the Constitution. (3) If for any reason whatsoever the minister in charge of the executive power ceases to perform the Presidential duties, the council of ministers shall make a new designation. (4) The citizen who temporarily discharges the duties of President in the case specified in Article 3 of the present act shall not be elected by the National Assembly or by Congress, as the case may be, for the rest of the period.

The citizen who has discharged the duties of President during the six months immediately preceding the day of the election of the new President, shall not be eligible for the Presidency.

ART. 4. Absolute vacancy of the Presidency of the Republic shall only be caused by the death or accepted resignation of the President.

ART. 5. The present presidential term shall last ten years, beginning from January 1st, 1905, and ending December 31st, 1914; but this provision shall be in force only as long as Gen. Rafael Reyes remains at the head of the Government. In case that the executive power ceases to be exercised by Gen. Rafael Reyes, the Presidential period shall last only four years for whoever may take his place. This period of four years shall be the regular term in the future.

ART. 6. Articles 74, 102, 108, 114, 120 (clause 9), 127, 136, and 174 of the Constitution are hereby amended, and Articles 77, 124, 125, 128, 129, 130, and 131, and all others contrary to the provisions of the present act are hereby abrogated.

VI. Act of April 5, 1905.—The National Constitutional and Legislative Assembly decrees: **SOLE ARTICLE.**—In time of peace no one shall be deprived, either wholly or in part, of his property, except in the following cases and in accordance with an express provision of law: Through general taxation. Through reasons of public utility, defined by law, upon previous indemnification, except in case of condemnation for the purpose of opening or constructing ways of communication, in which case the benefits derived by the owners of the condemned land are supposed to be equivalent to the price of the strip of land which was needed to build the road. But if it is proved that said strip of land is worth more the difference shall be paid.

VII. Act of April 8, 1905.—The National Constitutional and Legislative Assembly decrees: **ART. 1.** It shall be the duty of the departmental assemblies to direct and promote by means of ordinances, and with resources of the departments, the primary instruction and the establishment of charitable institutions, the industries already established or hereafter to be established, the colonization of the vacant lands of the departments, the opening of roads and navigable canals within the departments, and the exploitation of their forests; the regulation of the local police and of the circuit jails; the supervision of the revenue and of the municipal and departmental expenses, and everything else relating to the local progress.

ART. 2. The present act shall take the place of Article 185 of the Constitution.

VIII. Act of April 13, 1905.—The National Constitutional and Legislative Assembly decrees: **ART. 1.** The Senate shall be renewed at the same time as the Chamber of Representatives, and the term of office shall be the same for Senators and Representatives.

ART. 2. Senators shall be elected by the departmental councils as may be determined by law.

ART. 3. The President of the Republic and the Representatives shall be elected in the manner determined by law.

ART. 4. In all popular elections having for their object the constitution of public official bodies, or the appointment of Senators, the right of representation of the minority shall be recognized, and the law shall fix the manner and form in which this recognition shall be carried into effect.

ART. 5. Articles 95, 114, 173, 174, 175, 176, 177, and 178 of the Constitution are hereby abrogated.

IX. Act of April 17, 1905.—The National Constitutional and Legislative Assembly decrees: **ART. 1.** The Constitution of the Republic may be amended by a National Assembly called expressly to convene for this purpose either by Congress or by the Executive, upon application to that effect by a majority of the municipal councils. In the law or decree calling the National Assembly to convene, as provided in this article, the provisions to be amended shall be designated and the labors of the Assembly shall be confined to the discussion thereof.

ART. 2. The Assembly shall consist of as many delegates as correspond to the population, at the rate of one delegate for every one hundred thousand inhabitants. Each delegate shall have two substitutes.

ART. 3. The delegates and their substitutes shall be elected by the municipal councils of the respective electoral circumscriptions.

ART. 4. Constitutional amendments shall be discussed and passed in the same manner as is established for the enactment of laws.

ART. 5. The sessions of the Assembly shall last

thirty days, but this period may be extended at the discretion of the Government. . . .

ART. 6 [provides that a National Assembly convened to amend the Constitution shall take the place of the Congress then in being, for the remainder of its term.]

ART. 7. In the election of delegates to the National Assembly the general provisions relating to the representation of minorities shall be respected. . . .

ART. 8 [provided for a continuance until 1908 of the National Assembly then in being.]

X. Act of April 27, 1905.—The National Constitutional and Legislative Assembly decrees: **ART. 1.** The council of state is hereby abolished. The law shall determine the functionaries upon whom the duties of the said body shall devolve.

ART. 2. Title XIII of the National Constitution is hereby abrogated.

ART. 3. This law shall be in force from the date of its publication in the *Diario Oficial*.

COLOMBINO, John (d. 1367), founder of religious order. See **JESUITES**.

COLÓN, seaport of the republic of Panama, on the Atlantic coast, northwest of the city of Panama, on Manzanillo island. (See **LATIN AMERICA**: Map of South America.) Originally called Aspinwall, the town was founded in 1850, when it was selected as the eastern terminus of the Panama railway. Chosen by de Lesseps as the entrance to the Panama canal, it came under the jurisdiction of the United States by a treaty in 1903, when that country undertook the work of building the canal; this jurisdiction concerns all matters of quarantine and sanitation, and the resulting benefits have greatly increased the population (in 1917, 26,076) of the town. It is the capital of the province of Colón, and through it passes much of the commerce between Atlantic and Pacific, and between Central and South America.

COLONI, class of laborers, half slave, half free. See **SERFDOM**: 3rd-5th centuries; **GAUL**: 5th-10th centuries.

COLONIA, Uruguay, first settlement of the Banda Oriental, which was later called Uruguay. See **ARGENTINA**: 1580-1777.

COLONIA AGRIPPINA.—Claudius, at the request of Agrippina, his wife, who was the daughter of Germanicus and the mother of Nero, founded on the Rhine the Colonia Agrippina or Agrippinensis (modern Cologne) in 50 A.D.—probably the only colony of Roman veterans ever established under female auspices. The site had been previously occupied by a village of the Ubii. "It is curious that this abnormal colony has, alone, of all its kindred foundations, retained to the present day the name of Colonia."—C. Merivale, *History of the Romans*, ch. 50.

COLONIAL AGENT.—"The [American] colonists came to appreciate the necessity of having their interests guarded by agents in the mother-country. Until the latter part of the seventeenth century such agents, though occasionally appointed, were intended to meet special emergencies of some kind. After the revolution [of 1688] it gradually became the general custom to maintain standing agencies in London, in charge of the interests of the particular province. At first these agents were usually appointed by act of assembly, requiring the consent of the governor, council and representatives; but sometimes, as in Massachusetts, the choice was practically that of the house; they

were also instructed from time to time by the assembly. Through these agencies . . . the colonists came to have considerable influence in London."—E. B. Greene, *Provincial America*, pp. 78-79.

COLONIZATION: Defined.—Important factors.—"The term 'colony' is derived from the Latin *colonia*, which signifies a place of planting, or a group of persons who plant; hence in its original and simple meaning, 'colony' refers to a body of people who leave their native country and settle in a new region for the purpose of tilling the soil. The Greek generic term applied to colonies, *apoikia*, on the other hand, signifies merely a settlement away from home, or a home at a distance. Colonization should, however, be distinguished from migration, which occurs when an entire tribe or nation leaves its original home and settles in another country, as did the Anglo-Saxons and Lombards. Nor should the term 'colony' be applied to a body of people, who after emigration have lost all connection with the mother country. The concept of a colony, therefore, contains the idea of some kind of bond between the new settlement and the mother country, whether in the matter of language, of religion, of economic life, or of political allegiance. In an ethnological sense, any settlement, whether retaining its political connection or not, is a colony so long as the original language and social characteristics are preserved. In this sense we may still speak of the United States as a colony of Great Britain, of Quebec as a French colony, and of the German colonies in South America. The latter may also be regarded as colonies in respect to their economic relations, since nearly all their foreign business dealings are with the [former] German Empire.

"In its broader aspects, when we look beyond the mere fact of present settlement, colonization implies the exertion of influence by a higher civilization upon one of a lower order, or the creation of civilized life where none existed before. This influence must, however, be brought to bear through personal contact, through a certain amount of settlement by the members of the higher state among the less advanced population. To constitute colonization it would not be sufficient to exert influence through legislation, writing, or any form of propaganda, without the creation of some amount of permanent settlement. Yet permanent settlement could not truly be called colonization, if it were undertaken by people of a lower civilization in territory occupied by a state of a higher degree in development. Thus, for instance, a movement of Chinese or Africans to the United States might be a migration, but would not be colonization, as it would lack the element of an influence brought to bear by a higher upon a lower civilization. Moreover, as long as this influence is exerted, colonization is present though

the actual settlement of persons in the region affected be small. Colonization must, therefore, be viewed as a part in the process of evolution by which the more perfect forms of civilization draw into their orbit those which are less highly organized."—P. S. Reinsch, *Colonial government*, pp. 13-15.—"If population multiplies too rapidly and national boundaries cannot be enlarged peaceably or through war, then migration is and has always been the historic remedy. The spread of population from primitive centers has often been traced. The colonizing systems of Phoenicia, Greece, and Rome are known to all students of classical history, and the movements of Teutonic population in the time of Caesar and in the early Christian centuries are part of our common knowledge. The invention of the compass, the circumnavigation of Africa, and the discovery of America gave a new impetus to colonization. Portugal and Spain led the way, then Holland, France and England. The policy at first followed was that of exploitation and trade; agricultural settlements came at last and were for a time considered least in importance. An era of exploitation as such cannot permanently endure. A firm hold on newly discovered land depends finally on mining, trading, and agricultural centers. The mother country protects and aids in developing such centers in return for trade privileges, good will, and an acknowledgment of supremacy. Political capacity on the part of the colony in time brings autonomy, either peaceably or by revolution. The utility of productive colonies is so manifest that every great state eagerly adds to its colonial possessions, searching the world for places in uncivilized or partly civilized lands suited for trading or colonizing purposes. There it establishes a sphere of influence or a protectorate, sends its traders and missionaries and seeks to build up its interests on a permanent basis. The population of the colony multiplies and the civilization of the ancestral home is reproduced in miniature, with such modifications as are compelled by differences in environment. This great-colonizing era, which is still vigorous though it has already lasted over four hundred years, is effecting profound changes in political development. The possession of immense areas of fertile land suitable for colonization makes an outlet for a surplus but enterprising population, fosters commerce and manufactures, and strengthens national prestige and power. Tropical areas not suited to white settlement are, as trading centers, made to furnish valuable material for foods and manufactures, sometimes through the labor of 'coolies,' as in the Guianas of South America or in the Fiji Islands. In consequence, practically all the available parts of the earth have come under the influence of Western civilization, and the great nations are seeking to utilize the respective parts under their sway. The twentieth century is destined to see a mighty expansion of Western population into available centers at present thinly populated, such as Siberia, Australasia, Canada, and the southern part of South America, and scientific knowledge applied to the development of these regions will accomplish in a few years what under ordinary processes would require centuries of time and energy. On the other hand, the great Oriental nations of China, India, and Japan are straitened in their possessions and are seeking other lands for purposes of colonization. These races are increasingly barred out by the states of the west, thus creating international complications. Africa, the Americas, and Australia are the large areas as yet only partly developed, omitting Siberia and the western third of Asia,

but these all are controlled by European-American states eager to preserve their lands for their own racial stock. No one knows the outcome of this situation though he may surmise the possibilities involved in the struggle of races for survival."—J. Q. Dealey, *State and government*, pp. 104-106.

Ancient Greek, Roman and Phoenician.—"In spite of the important part played by Greek influence in directing modern thought, in the field of colonization such influence was not felt. Want of elbow-room, moral more than material, accounted mainly for Greek colonization. Started in this way, colonies were not likely to continue political allegiance to the mother city. The Greeks never attained to the conception of representative government. Hence colonies must either have been subject states, as became the Athenian allies, or else remain completely independent. . . . Nevertheless the ties which bound a colony to its mother city were strong. . . . The sending forth of a colony was a solemn religious proceeding. The colonists carried with them the sacred fire taken from the inmost shrine of the city gods, to be renewed from the same source should the need arise. Every year ambassadors were sent from the colony to do service to the ancient gods, and it would seem that the colonial priests were taken from the mother city. Should the colony itself found another colony, a leader was chosen from the old home. Thus, when Corcyra founded Epidamnus, the leader of the expedition belonged to the Corinthian Heracleidae. The apologetic character of the speech put by Thucydides into the mouth of the Corcyreans, when asking for the aid of Athens against Corinth, suggests the shock given to the Greek conscience by war between a mother city and its colony. Such political unity as independent Hellas ever attained was due to religion; and possibly leagues, founded on blood relationship, might have played a great part in solving problems, which unhappily proved insoluble. Be this as it may, the Greek [settlements] were hardly colonies in our use of the word. . . .

"The subject of the Roman *coloniae* is too complicated to be dealt with in detail. It may be noted that Roman colonization was always the work of the state. The Roman colonies were allotments of land in conquered territory made by the government, with a view either to holding subject peoples in check, or to providing land for the poorer citizens of Rome. The earliest colonies, the *coloniae civium Romanorum*, were garrisons, provided with land at the expense of the conquered inhabitants. At a later date, the pressure of social need, caused by the ruin of the peasant proprietors, gave birth to a form of colonization intended to meet such pressure. For this purpose colonies were founded at a distance, the first over-sea colony, planted by Caius Gracchus, being on the site where Carthage had stood. The latest phase of Roman colonization, like the earliest, took the form of military settlements. Under the empire the provinces were studded with *coloniae*, composed of retired soldiers, who were paid by grants of land for doing garrison duty; and names such as Cologne and Lincoln still recall such kind of colony. Important, however, as was the work achieved by Rome in the development of civilization, that work was carried on along other lines than those followed by modern colonization; and

no more than to Greece can we look here for precedents. A closer analogy to the modern colony is supplied by the facts of Carthaginian history. A modern French author, N. Bonnassieux, has called attention to the small extent to which commerce was developed in the ancient world. Nevertheless, it remains true that the Phoenicians were the first to anticipate the modern organization of commerce. The Phoenician colonies were merely trade factories, and it was only under the pressure of circumstances that Carthage became an empire. It was the necessity of withstanding the Hellenic invasion of the Mediterranean which altered the political character of Carthage, and caused the Tyrian factory to convert itself into the capital of a great North African empire. That empire consisted partly of conquered provinces and partly of outlying colonies. So far as these colonies consisted of settlers in conquered districts, after the Roman model, they need not detain us. It is the oversea colonies with which we are here concerned. These colonies were necessitated by the needs of Carthaginian trade. It is the connexion of maritime discovery with colonization which gives the peculiarly modern note to Carthaginian effort. Thus Hanno's famous voyage round the Libyan coasts had two objects, the founding of new colonies and discovery. Settlements were made, reaching as far south as Cerne (probably near Santa Cruz). . . . The Carthaginians, in their commercial regulations, anticipated the colonial policy of modern Europe. The colonies were kept in strict dependence upon the mother city, and colonial harbours were, so far as possible, closed to foreign ships."—H. E. Egerton, *Origin and growth of English colonies*, pp. 16-19.—See also ASIA MINOR: Greek colonies; COMMERCE: Ancient; B.C. 1000-600; B.C. 1000-200; GREECE: Character of Greek colonization; Indo-European migration; Migration of Hellenic tribes in the Peninsula; Migrations to Asia Minor and islands in the Ægean; PHOENICIANS: Origin; SICILY: Phoenician and Greek colonies.

Medieval Venetian.—"Venetian colonization furnishes a bridge between the ancient and modern worlds. 'Being unable,' we are told, 'to undertake at one and the same time the actual conquest and settlement of so many scattered territories, Venice adopted a method borrowed from the feudal system of her Frankish allies, and granted investiture of the various islands as fiefs to those of her richer families who would undertake to render effective the Venetian title and to hold the territories of the Republic at a nominal tribute.' The important island of Crete, however, Venice kept in her own hands, and Venetian citizens were induced to settle there by the grant of villages with their districts. 'Minor offices were open to Cretans, absolute equality was granted to both Roman and orthodox rites. In fact, the Republic displayed at once the governing idea of her colonial policy, namely to interfere as little as possible with local institutions; to develop the resources of the country; to encourage trade with the metropolis; and to retain only the very highest civil and military appointments in her own hands as a symbol and guarantee of her supremacy.' Nevertheless, it is probably by a true instinct that modern thought has laid little stress on the Venetian precedent."—H. E. Egerton, *Origin and growth of English colonies*, pp. 10-20.

Dutch.—"A commercial people like the Dutch naturally regarded colonies from a strictly busi-

ness standpoint, and all interests had to yield to the necessity of obtaining profits for the trading company."—H. E. Egerton, *Origin and growth of English colonies*, p. 22.—Even at the present day, "devoted as is the State of Holland to the principle of individual liberty and of statehood for all communities destined by nature for a distinct existence, it has adopted, in the management of tropical dependencies, the principle that its power is a power of assubjectization. The States-General fix by an organic law the Constitutions of the dependencies and establish by statute the most important rules and regulations. Details of the administration are provided for by the decrees of the Queen or by resolutions (*arrêtés*) of the local Governor-General, who acts after advising with an Executive Council of experts. The inhabitants of the dependencies are not consulted, and no question of allowing them representatives in the States-General has ever been raised."—A. H. Snow, *Administration of dependencies*, p. 484.—See also CURACAO; DELAWARE: 1629-1631; 1640-1656; DUTCH EAST INDIES; GULANA; JAVA; NETHERLANDS: 1594-1620; NEW YORK: 1610-1614; 1673; STRAITS SETTLEMENTS: Conquest and settlement; VIRGIN ISLANDS: Discovery and settlement.

French.—Under French rule, the governor of the North American colonies was absolute viceroy only in name. The *intendant*, who was appointed by the king and was sent out to preside over the administration of justice, was expected to check the power of the governor and to report minutely upon his doings. In Canada the bishop also, as head of the parish priests and director of education, had great authority. These three officials, each of whom desired to have chief power, and encroached upon the prerogatives of the others, were often at odds and wrote home long letters full of bitter complaints. The governor of a colony was commander-in-chief and head of the council which was composed of the bishop, the intendant and a body of councillors. In Canada this body was fixed in 1703 at twelve in number. The council was partly a law court, partly an advisory body, and, like the Parliament of Paris, registered edicts to make them legal. Frontenac proposed to call the three estates of Canada together, but was sternly rebuked by Louis XIV, and no step was again taken toward representative government. "In the Constitution of September, 1701, it was provided that: The Colonies and French possessions of Asia, Africa, and America, although they form a part of the French Empire, are not comprised in the present Constitution. . . . To put an end to all the hopes of the planters that a separation of the Colonies from France might be brought about, the political organism composed of France and its dependencies was declared to be a Unitary State by the Conven-

tion, in the Constitution of 1795, in the following language: The French Colonies are integral parts of the Republic and are subject to the same constitutional law. . . . They shall be divided into *Départements*. All laws enacted under this Constitution were to be *ipso facto* applicable, without distinction, to the Colonies then belonging to France. Some Colonies, theretofore separate, were united so as to form a single *Département*; . . . In 1798, by statute, this principle of uniformity was extended so as to assimilate the colonial *Départements* to the domestic *Départements* in all matters of finance and taxation, and the system of elective judges and jury trial in force in France was extended to the Colonies. During this period of uniformity and assimilation, the Colonies were proportionally represented in the Assemblies of France. . . . In the year 1883, while the administration of the French Colonies was in the hands of the Minister for the Marine, there was established, by decree of the President, an Imperial Council, attached to the Under-Secretary for the Colonies, called *Le Conseil Supérieur des Colonies*, composed of persons expert in colonial administration, whose duties were to advise the Under-Secretary. This Council was remodelled in 1890, as the result of the action of the French National Colonial Congress, held at Paris in December, 1889, and February, 1890, which arose out of the International Colonial Congress held in August, 1889, in connection with the Universal Exposition. . . . 'Express the opinion that an organic law should be enacted, instituting, in connection with the administration of the Colonies, a Superior Council of the Colonies.' In accordance with this resolution, the Superior Council for the Colonies as remodelled by decree of the President, was composed of the Senators and Deputies of the Colonies represented in the French Parliament, delegates from the other Colonies, seventeen barristers having special knowledge of administrative law, persons nominated by the French Government because of their expert knowledge of colonial affairs and administration, delegates from the Chambers of Commerce of the principal French cities, and delegates from societies formed for the study of colonial and geographical questions. When the office of Minister for the Colonies was established in 1894, this Council was continued and was attached to this Ministry. . . . Though Algeria is a dependency so near to France that its ultimate incorporation into France might under some circumstances be practicable, yet the great difference between the native population and the French renders it extremely improbable that such incorporation can ever occur. Since 1870, it has been represented in the French Parliament on the basis of the French population of Algeria,—that is, on unequal terms as compared with the *Départements* of France. Since 1866, the Colonies of Réunion, Martinique, and Guadeloupe have each been represented in the Chamber of Deputies of France by two Deputies and in the Senate by a Senator. French India has one Deputy and one Senator, and Senegal, Guiana, and Cochinchina have each a Deputy. In spite of this representation, however, all legislation of the French Parliament is not *ipso facto* in force in the dependencies. If Parliament by express words extends a law to some or all the dependencies, it is in force accordingly. As respects native-born Frenchmen residing in the dependencies, all laws of France protecting the person and property are regarded as being in force *ipso facto*. While France allows to some of its dependencies a very considerable autonomy—even permitting some of them, under its

supervision, to regulate their own tariffs, and while it respects the privilege of Colonial Assemblies to grant taxes, yet every act of the dependencies is under the supervision and control of the French Government. In theory, the dependencies are yet only 'prolongations of the soil' of France, to use the expression of M. Girault. Napoleon's epigram, '*Là où est le drapeau, là est la France*,' is taken as an axiom, while at the same time the march of events is contradicting it. The administration of Tunis, since 1881, as a protectorate of France under such conditions that it may perhaps be called a 'constitutional protectorate,' though having the form of an 'international protectorate,' is an illustration of the advantage to be derived from treating dependencies as entitled to inherit rights of statehood, and preserving, to the utmost degree consistent with the general interests, the local habits and customs."—A. H. SNOW, *Administration of dependencies*, pp. 476-477, 480-481, 488, 506.—See also AFRICA: Modern European occupation: Later 19th century; 1884-1899; 1914; ALGERIA; AMERICA: 1534-1535; 1541-1603; CANADA: 1603-1605 to 1711-1713; FRANCE: Colonial empire; 1661-1683; 1789: Survey of France on the eve of revolution: Colonial policy; GUIANA; INDIA: 1665-1743; 1743-1752; INDO-CHINA; LOUISIANA: 1698-1712 to 1728; MADAGASCAR; MOROCCO: 1896-1906, and after; SOMALILAND; TUNIS; VIRGIN ISLANDS: Discovery and settlement; WEST INDIES; FLORIDA: 1562-1563; 1564-1565.

Russian.—"It is well to note that, besides oversea colonization, there have been going on in modern times two methods of colonization of a special and most interesting type. The great continental Powers, the United States and Russia, have peopled their *hinterlands* by a constant flow of colonists. Russia, in many ways the most backward of European countries, [seemed prior to the Revolution] to be accomplishing in a very successful fashion the task of giving unity to her vast empire. Under an autocratic government the colonization of Siberia has been promoted by means impossible elsewhere. Land grants were conferred upon nobles, who transferred their serfs, bag and baggage, so that new villages sprang up almost in a night. The departure of immigrants from their new quarters was forbidden by strict laws. The indigenous population has either submitted to Russian influence, or, for the most part, disappeared. In 1894 it was reckoned that out of a population, from the Ural Mountains to the Pacific, of about 5,100,000, 4,500,000 were Russians. The Caucasus districts had been Russified in a still more systematic fashion. In some cases the inhabitants were removed *en masse* to Little Russia, and their places were taken by Russian immigrants, a method of procedure which recalls the doings of the Eastern empires of antiquity."—H. E. EGERTON, *Origin and growth of English colonies*, pp. 21-22.—However, the method of colonization in Alaska was different from that which Russia pursued in her other acquisitions. Its incorporation as Russian territory was due to private enterprise

rather than to government encouragement.—See also ALASKA: 1741-1787; 1787-1867.

Spanish.—"The Spanish colonies from a very early time were managed on a somewhat feudal plan of dividing up the land to settlers together with the Indians in the way of the old feudal commendation. The *encomiendas*, considered as grants from the king of Spain, of soil and of the native inhabitants, and called also *repartimientos* or repartitions, were at first instituted without law; then in 1503 the laws of Spain made labor compulsory on the Indians and their caciques, and yet regarded them as free persons. A distinction may be made between simple commendation and the repartitions, but they came, . . . much to the same result, and the natives regarded the condition to which they were reduced as a deprivation of freedom. This relation to the soil and the natives, beginning in Hispaniola, spread through the colonies. The natives perished under the system; and its cruelties, denounced by enlightened priests and monks, were thought necessary by the colonists. To save the remnant of the natives from extinction Africans were imported, the beginning of the woes from this source to the new continent. All the colonies of North and South America, without exception, we believe, received this system of *encomiendas*. But a number of laws were made for its mitigation or final extinction. In 1542, a law, prepared by a junta of important men in Spain, and accepted by Charles V., provided among other things that 'after the death of the conquerors of the Indies the *repartimientos* of Indians which had been given to them in *encomienda* in the name of his majesty, should not pass in succession to their wives and children, but should be placed immediately under the king, the said wives and children receiving a certain portion of the usufruct for their maintenance.' Further, the men serving in a public capacity who held such properties should be obliged to renounce them. The *encomiendas* were now held in Peru for the lives of the original owner and his son; and it would seem that the colonists had the impression that the grandson also was to be included. When the new law was proclaimed it created very serious disturbances in that province. After the extinction of the rebellion the president, De la Gasca, framed an act of repartition of property, the rents of which are said to have been equal to the rental of a large part of Spain. All the lands given out returned to the crown after two lives. In Mexico, Cortez made a provisional repartition, which was set aside by that of an *audiencia*, and their doings again were rectified by another. The law of succession (before 1542), at length provided for the management of the *encomiendas* for two lives and on a strictly feudal plan [see also ENCOMIENDA]. But the complaints of the colonists against parting with their properties led to the prolongation by successive steps of the tenure of these estates to three and five lives in Mexico. In Peru the tenure ended and the properties reverted after the third generation. This system remained in force until after the middle of the eighteenth century. The compulsory services of the Indians were abolished, after great efforts in Spain to do away with them, more than a hundred years after the occupation. The Indians employed in the mines were called *Mitayos*; these also could not be used in the service of individual colonists save for a time, and in limited numbers. On the whole the laws of Spain breathe great humanity towards this part of the population. The Spanish colonies, with great differences in regard to negro slavery, and to the treatment of the

native races, were all governed by presidents receiving appointment from the king. It does not appear that the people themselves had any concern in their own affairs, unless in the details of municipal and village management."—T. D. Woolsey, *Political science or the state, v. 2, pp. 161-163*.—See also AFRICA: Modern European occupation: Later 19th century; 1914; AMERICA: 1492 to 1541; CANARY ISLANDS; COLOMBIA: 1499-1536 to 1810-1819; CUBA; MEXICO: 1519 (February-April) to 1822-1828; PERU: 1528-1531 to 1820-1826; PHILIPPINE ISLANDS: 1521 to 1896-1898; PORTO RICO: Government under Spanish rule; FLORIDA: 1540-1559; 1565; VENEZUELA: 1499-1550 to 1820-1886.

United States.—"The United States, . . . though it has never deliberately or consciously pursued an imperialistic policy, yet to-day finds itself in fact possessed of a territory truly imperial—in its extent, in the variety of the people or races occupying it, and in the wide difference of the conditions that have to be met in its government and administration. . . . As dependent territory to this, [the States] but none the less under the sovereignty of the United States, are the vast territories of Alaska and its adjacent islands to the north, Porto Rico in the West Indies, the Hawaiian, Guam and Samoan islands in the middle Pacific, the Philippine Archipelago in the Far East, the Midway, Wake, Howland and Baker islands lying almost as stepping-stones in the ocean, and the ten-mile broad canal strip across the Isthmus of Panama. In the history of the acquisition of this vast territory it is possible to distinguish three fairly well-defined periods: the first beginning with the confirmation by the Treaty of 1783 with Great Britain of the claims of the original thirteen States to the territory stretching to the west as far as the Mississippi River, and ending, in 1853, with the addition of territory growing out of the admission of the Republic of Texas and the war with Mexico; the second covering the period of forty-five years, from the latter date to 1898; and the third beginning with the annexation of the Sandwich or Hawaiian Islands in 1898 and terminating with the practical acquisition, in 1904, of the strip of land across the Isthmus of Panama. . . . The first period, covering the years from 1783 to 1853, may be said to represent the period of logical and inevitable growth during which a nation was finding itself and rounding out its boundaries. During this period the territory acquired was contiguous to that already possessed, conformed to the latter in general character, and was but sparsely settled and almost wholly undeveloped. It thus afforded every opportunity for settlement by emigrants from the old territory and the consequent extension to it of American institutions, political or otherwise. . . . The years from 1853 to 1898 were years of comparative inactivity, the only events of importance occurring during them being the annexation of the Howland and Baker islands in 1857, and the acquisition of Alaska and of Brooks islands in 1867. Howland and Baker islands are so small and unimportant that their annexation is without significance. The same, in so far as the matter of the government of dependent territory is concerned, may almost be said of Alaska, notwithstanding the great area and the present promising future of that territory. . . . This period may, therefore, be said to be one during which the progress of expansion was largely suspended and the energies of the nation were being devoted to the development of the territory already possessed. The third period, extending from 1898 to the present time, short as it is, is filled with events of

great importance—events marking the development of an entirely new phase in the expansion of the United States and to a certain extent representing a direct breaking with precedent. By the acquisitions made during this period the United States has definitely entered the class of nations holding and governing oversea colonial possessions. In all prior acquisitions, except those of the small islands, which were so unimportant that no form of government for them was required, the essential principle upon which the acquisitions were based was that of the incorporation of the new territory into the Union upon full equality with the other States as soon as their population and development should render such action feasible. . . . By the acquisition of Samoa, Hawaii, Porto Rico, Guam and the Philippine Islands, the United States was for the first time confronted with the possibility, if not the certainty, that for an indefinite time to come the territory under its sovereignty would have to be divided into two classes having a different political status; the one constituting the United States proper and enjoying full political rights and privileges, and the other dependent territory in subordination to the former and having its form of government and the rights of its inhabitants determined for it. . . . Not only has the United States, in the numerous cases in which it has been called upon to make provision for the administration of dependent territory, organized forms of government which, as regards their fundamental features, have been based upon the same general principles, but it has at the same time, in doing so, acted in accordance with certain clearly defined theories which were adopted at the outset and which, so far as circumstances have permitted, have been consistently followed out. Together these theories constitute the policy of the United States in respect to dependent territory, or what in other countries would be known as its colonial policy. . . . The policy that the United States has held in respect to dependent territory may be said to be based upon, or embrace, the following essential principles: first, the administration of each dependent territory primarily with a view to its own benefit or advancement, and in no way as constituting a field for exploitation in the interest of the mother country; secondly, the conferring upon each territory the largest measure of self-government that the condition and character of its inhabitants renders feasible; and, finally, the ultimate incorporation of the territory into the United States as a State or States of the Union, coördinate in all respects with those already included, as soon as the conditions prevailing in it sufficiently approximate those in the United States; or, in the case of non-contiguous territory, if after due experience it is demonstrated that a sufficient measure of success has not been achieved in developing among its inhabitants an attachment to those beliefs and principles which underlie the political philosophy of the American people and alone render their institutions workable, or that the inhabitants of such non-contiguous territory do not desire definite incorporation in the Union—then the grant to them of that measure of autonomy or independence which they are fitted to enjoy, and which conditions render safe. . . . While Congress thus possesses supreme power in respect to dependent territory, it should be noted that where territory has been acquired as the result of military operations and occupations, full powers of government, civil as well as military, may be exercised by the military authorities until such time as Congress sees fit to exercise its own prerogative. This power on the part of the mili-

tary authorities exists in virtue of the general powers vested in the President of the United States as commander-in-chief of the United States military forces. The action taken by the commander in the field is, thus, legally that of the President acting through the war department. This power that thus exists of organizing and carrying on a purely military government for a considerable period of time, even after all hostilities has ceased, has given rise to one of the most interesting phases of the history of the government of de-

city: 1550-1650; 1600-1656; PAPACY: 1204-1348.

face is much diversified. The eastern part of the state is covered by rich plains, the west by the chains of the Rockies. Pike's Peak and numerous other high peaks of the Rockies, and great mountain passes are in Colorado, which is conspicuous for the beauty and grandeur of its scenery. The Colorado, North Platte, Arkansas, South Platte, and Rio Grande rise in California, and in the course of ages have formed the great canyons for which the state is famous, notably the Toltec Gorge, Red Gorge, Grand Canyon, Royal Gorge, the Black Canyon, most of which are remarkable for their coloring. Mining is the chief industry of the state. Gold leads among the

minerals, which include also coal, zinc, iron, silver, lead, copper and radium. Stock raising is still carried on on a large scale, especially in semi-arid regions which are not suitable for cultivation. A large proportion of the state comes under this head, but agriculture is increasing in importance although it is dependent in large measure upon irrigation. Tunneling has been resorted to in some instances to carry water from the rivers. For example the Gunnison tunnel supplies water from the Gunnison river, through a tunnel driven through the range, to the Uncompahgre valley.

"In 1920 Colorado ranked twenty-ninth among agricultural states, the value of its crops being \$149,687,000. Wheat, corn, barley, rye, hay, alfalfa, sorghums, potatoes and sugar beets are the principal crops. Since 1909 the wheat acreage has increased over 400 per cent. Colorado may now be called a part of the Wheat Belt. Colorado is the leading sugar-beet state in the Union."—E. Parsons, *History of Colorado*, p. 79.—See U. S. A.: Economic Map.

1776-1858.—Exploration and settlement.—"It might seem a very simple matter to trace the history of a commonwealth that has seen but six decades pass since the period of its earliest settlement. But Colorado presents exceptional difficulties because of the loss of valuable records. The great fire of 1863 wiped out the whole business section of Denver, and the flooding of Cherry Creek during the spring of the same year, destroyed not only buildings, but valuable maps, papers, and court records. Thus the materials for the early history of the Commonwealth became very scant. The name Colorado is Spanish for 'highly colored' and refers to the red earth and rocks. It was only a little more than one hundred years before Colorado became a state, that interest was first manifested in that section of the country. In July, 1776, two friars, Padre Silvestre, Velez Escalante and Padre Atanacio Dominguez, undertook to explore a route from Sante Fé to California. To their efforts we owe much of our reliable information concerning the country at that time. In their descriptions they gave a glowing account of the grandeur of the forests and the beauty of the mountains and valleys, passing lightly over the roughness and impossibility of the country. Recent scholars deny the validity of all claims of exploration in Colorado previous to those of the latter half of the eighteenth century. They have also dispelled the once prevalent belief in the antiquity of the cliff dwellers, the ruins of whose civilization are still to be seen. To no distinct primitive race, but to the ancestors of the modern Pueblo Indians, are assigned the curiously inaccessible stone dwellings in canons and mesas [See also KIOWAN FAMILY; SHOSHONEAN FAMILY]. The earliest authentic exploration in the Colorado territory took place in the period of the Spanish control. France had lost in 1762 the sovereignty over the tract west of the Mississippi known as Louisiana. In 1800 France regained this country and three years later sold it to the United States. The Louisiana purchase stimulated interest in the West. As a result the expedition of Lieutenant Zebulon M. Pike was organized. Zealous explorers had other difficulties to overcome than those resulting from natural causes. A striking example of the discouraging effect of the single unfavorable report was the following. Major Stephen H. Long represented the region extending for a distance of five

hundred miles east of the Rocky Mountains as unfit for cultivation and habitation. To this report Bancroft attributes the delay in securing it for the United States. Although such circumstances had a retarding effect on colonization, private expeditions of traders, forerunners of the great fur companies, advanced from time to time into Colorado. The first important forts within the present limits of the State were erected by the Bent brothers in 1832. During the years immediately following, numerous trading posts were established, among them were Vasquez's, Sarpy's, Fort Lancaster, Fort St. Vrain and El Pueblo. Authorities assert that nothing of importance took place in Colorado between the year of Long's expedition (1819) and 1858. In the year 1842 government expeditions were sent out under John C. Fremont, but no important discoveries were made there by him."—M. S. MacArthur, *German element in the state of Colorado*, p. 6.—"The only persons encountered in the Rocky mountains by Frémont at this time were the few remaining traders and their former employes, now their colonists, who lived with their Mexican and Indian wives and half-breed children in a primitive manner of life, usually under the protection of some defensive structure called a fort. The first American families in Colorado were a part of the Mormon battalion of 1846, who, with their wives and children, resided at Pueblo, from September to the spring and summer of the following year, when they joined the Mormon emigration to Salt Lake. . . . Measures were taken early in March, 1847, to select locations for two United States forts between the Missouri and the Rocky mountains, the sites selected being those now occupied by Kearney City and Fort Laramie. . . . Up to 1853 Colorado's scant population still lived in or near some defensive establishment, and had been decreasing rather than increasing for the past decade, owing to the hostility of the Indians." In 1858 the first organized searching or prospecting for gold in the region was begun by a party of Cherokee Indians and whites. Other parties soon followed; the search succeeded; and the Pike's Peak mining region was speedily swarming with eager adventurers. In the fall of 1858 two rival towns were laid out on the opposite sides of Cherry Creek. They were named respectively Auraria and Denver. The struggle for existence between them was bitter, but brief. Auraria succumbed and Denver survived to become the metropolis of the Mountains."—H. H. Bancroft, *History of the Pacific states*, v. 20, ch. 2-6.

1803-1848.—Acquisition of the eastern part in the Louisiana Purchase and the western part from Mexico. See LOUISIANA: 1798-1803; and MEXICO: 1848.

1857-1875.—Organization of territory.—Admission as a state.—"Hard times following the panic of 1857, and discoveries of gold in California aroused interest in the far west. Tales of successful prospecting along the Platte river reached the ears of westward bound adventurers, not a few of whom paused for personal investigation. Some, on returning to the east, organized expeditions for prospecting in Colorado. Green Russell, a Georgian, was a member of one of these pioneer expeditions. Of the original company of 42 persons that set out in the spring of 1858, Russell with a half dozen men were the only ones with sufficient persistence to remain until a moderate degree of success met their efforts. The political development of Colorado began at the time of these earliest settlements. In the autumn of 1858 a mass meeting was held in the settlement called

Auraria, on which occasion Colorado was organized as Arapahoe County. A representative was sent from this meeting to the Governor of Kansas to secure the sanction of the Kansas Legislature to this action. In the same year the first of a long line of petitions to effect the erection of a separate government under the name of the Territory of Jefferson was sent to Washington. It was not, however, until February 28, 1861, that Congress passed a law giving to the land between the 37th and 41st parallels of north latitude, and the 25th and 32nd meridian of west longitude the name of the Territory of Colorado. With this single creative act the Territory had for some time to be content. At this time, with the Civil War impending, national affairs were too engrossing. Washington itself was threatened; Congress was occupied with business less remote than that of the distant Territory. The [recently appointed] Governor, William Gilpin, received verbal instructions to exercise his own judgment and to do his best, for there was no time to attend to his affairs. Constitution makers in Colorado had vast experience before they at last gained their purpose. A State Constitution was framed in 1860 but failed to receive the approval of the people. At the third session of the 37th Congress, 1862-1863, a bill urging the passing of an enabling act, allowing Colorado to form a constitution, met with defeat. Congress granted this permission the following year but the constitution met the same fate as its predecessor. Finally a convention called in 1865 submitted a constitution that was adopted. This act was confirmed by Congress but was vetoed by President Johnson. Similar bills were revived and defeated periodically during the next decade. On March 3, 1875, an enabling act was passed, authorizing the electors to vote on the question of a constitution. The Constitutional Convention was held, and in the following July the new state was admitted to the Union. These, in brief, were the events attending Colorado's political struggle for being."—M. S. MacArthur, *German element in the state of Colorado*, pp. 6-8. —See also U. S. A.: 1876-1877.

1893.—Woman suffrage granted. See SUFFRAGE, WOMAN; United States: 1851-1920.

1896.—Growth of silver mining.—"An exciting episode in Colorado's political history was the fight for free silver in the presidential campaign of 1896. Both parties in this State were then as one on the silver question. Those dull years saw the beginning of the development of some of Cripple Creek's most productive mines."—E. Parsons, *History of Colorado*, p. 67.

1897.—Abolition of the death penalty.—By an act of the legislature of Colorado which became law in March, 1897, the death penalty was abolished in that state.

1899.—School law passed, for care of disorderly and criminal children. See CHILD WELFARE LEGISLATION: 1889-1921.

1903-1904.—Cripple Creek mining strike. See LABOR STRIKES AND BOYCOTTS: 1877-1911.

1909.—Political party expenses.—An act was passed by the legislature of the state providing for the control of expenditures for elections. Contributions by parties not candidates was prohibited either for persons or corporations. Candidates could spend a certain percentage of the first year's salary of the office for which they were running. The state itself contributed to the campaign according to the strength of the party. All moneys had to be paid to the state treasurer and by him paid to the party chairman who served under bond.

1910-1914.—Coal miners' strike. See LABOR STRIKES AND BOYCOTTS: 1910-1914.

1912.—Recall for direct legislation. See RECALL.

1913-1915.—Legislation.—Acts of importance passed by the legislature of the state included provision for municipal home rule, ratification of the seventeenth federal amendment providing for direct election of senators, "blue sky laws," anti-trust act, employers' liability act, the creation of a commission to regulate minimum wage for women and minors, act for recall of elective officers and judges, parents' pensions, civil service act and eight hour labor law, applied to women and underground workers. In 1915 a board of corrections was created, to have control over penitentiaries, reformatories, and insane asylums; prohibition was adopted; and the workmen's compensation law was passed. There was an attempt to repeal the act creating a juvenile court.

1915.—Industrial representation, or Rockefeller plan.—"When John D. Rockefeller, Jr., visited Colorado in 1915 [subsequent to the 1913-14 strike of miners employed by the Colorado Fuel & Iron Company] he outlined a scheme generally and understood to have been revised by W. L. Mackenzie King, for the adjustment of grievances and for the coöperation of the employees with the company in the improvement of working and living conditions. Officially this is known as the Industrial representation, but unofficially as the Rockefeller Plan."—J. A. Fitch, *Two Years of the Rockefeller Plan* (*Survey*, Oct. 6, 1917, p. 16).—This plan "is embodied in two written documents, which have been printed and placed in the hands of each employe. One of these documents is a trade agreement signed by the representatives of the men and the officers of the company, setting forth the conditions and terms under which the men agree to work until January 1, 1918, and thereafter, subject to revision upon ninety days' notice by either side. This agreement guarantees to the men that for more than two years, no matter what reductions in wages others may make, there shall be no reduction of wages by this company; furthermore, that in the event of an increase in wages in any competitive field, this company will make a proportional increase. The agreement provides for an eight-hour day for all employes working underground and in coke ovens; it insures the semi-monthly payment of wages; it fixes charges for such dwellings, light, and water, as are provided by the company; it stipulates that the rates to be charged for powder and coal used by the men shall be substantially their cost to the company. To encourage employes to cultivate flower and vegetable gardens, the company agrees to fence free of cost each house-lot owned by it. The company also engages to provide suitable bath houses and club houses for the use of employes at the several mining camps. The other document is an 'Industrial Constitution,' setting forth the relations of the company and its men. The constitution stipulates, among other things, that 'there shall be a strict observance by management and men of the federal and state laws respecting mining and labor' and that 'the scale of wages and the rules in regard to working conditions shall be posted in a conspicuous place at or near every mine.' Every employe is protected against discharge without notice, except for such offenses as are posted at each mine. For all other misconduct the delinquent is entitled to receive warning in writing that a second offense will cause discharge, and a copy of this written notice must be forwarded to the office of the president of the company at the same time it is sent to the em-

ploye. The constitution specifically states that 'there shall be no discrimination by the company or any of its employes on account of membership or non-membership in any society, fraternity, or union.' The employes are guaranteed the right to hold meetings on company property, to purchase where they choose, and to employ check-weighmen, who, on behalf of the men, shall see to it that each gets proper credit for his work. Besides setting forth these fundamental rights of the men, the industrial constitution seeks to establish a recognized means for bringing the management and the men into closer contact for two general purposes: first, to promote increased efficiency and production, to improve working conditions, and to further the friendly and cordial relations between the company's officers and employes; and, second, to facilitate the adjustment of disputes and the redress of grievances. In carrying out this plan, the wage-earners at each camp are to be represented by two or more of their own number chosen by secret ballot, at meetings especially called for the purpose, which none but wage-earners in the employ of the company shall be allowed to attend. The men thus chosen are to be recognized by the company as authorized to represent the employes for one year, or until their successors are elected, with respect to terms of employment, working and living conditions, adjustment of differences, and such other matters as may come up. A meeting of all the men's representatives and the general officers of the company will be held once a year to consider questions of general importance. The Industrial Constitution provides that the territory in which the company operates shall be divided into a number of districts based on the geographical distribution of the mines. To facilitate full and frequent consultation between representatives of the men and the management in regard to all matters of mutual interest and concern, the representatives from each district are to meet at least three times a year—oftener if need be—with the president of the company, or his representative, and such other officers as the president may designate. The district conferences will each appoint from their number certain joint committees on industrial relations, and it is expected that these committees will give prompt and continuous attention to the many questions which affect the daily life and happiness of the men as well as the prosperity of the company. Each of these committees will be composed of six members, three designated by the employes' representatives and three by the president of the company. A joint committee on industrial cooperation and conciliation will consider matters pertaining to the prevention and settlement of industrial disputes, terms and conditions of employment, maintenance of order and discipline in the several camps, policy of the company stores, and so forth. Joint committees on safety and accidents, on sanitation, health and housing, on recreation and education, will likewise deal with the great variety of topics included within these general designations. Prevention of friction is an underlying purpose of the plan. The aim is to anticipate and remove in advance all sources of possible irritation. With this in view a special officer, known as the President's Industrial Representative, is added to the personnel of the staff as a further link between the president of the corporation and every workman in his employ. This officer's duty is to respond promptly to requests from employes' representatives for his presence at any of the camps, to visit all of them as often as possible, to familiarize himself with conditions, and generally to look after the well-being of the workers. It is

a fundamental feature of the plan, as stated in the document itself, that 'every employe shall have the right of ultimate appeal to the president of the company concerning any condition or treatment to which he may be subjected and which he may deem unfair.' For the adjustment of all disputes, therefore, the plan provides carefully balanced machinery. If any miner has a grievance, he may himself, or preferably through one of the elected representatives in his camp, seek satisfaction from the foreman or mine superintendent. If those officials do not adjust the matter, appeal may be had to the president's industrial representative. Failing there, the employe may appeal to the division superintendent, assistant manager, manager, or general manager, or the president of the company, in consecutive order. Yet another alternative is that, after having made the initial complaint to the foreman or mine superintendent, the workman may appeal directly to the joint committee on industrial cooperation and conciliation in his district, which, itself failing to agree, may select one or three umpires whose decision shall be binding upon both parties to the dispute. If all these methods of mediation fail the employe may appeal to the Colorado State Industrial Commission, which is empowered by law to investigate industrial disputes and publish its findings. So as adequately to protect the independence and freedom of the men's representatives, the Constitution provides that in case any one of them should be discharged or disciplined, or should allege discrimination, he may resort to the various methods of appeal open to the other employes, or he may appeal directly to the Colorado State Industrial Commission, with whose findings in any such case the company agrees to comply. The company is to pay all expenses incident to the administration of the plan, and to reimburse the miners' representatives for loss of time from their work in the mines."—J. D. Rockefeller, Jr., *Colorado industrial plan*, pp. 20-25.

1917.—State constabulary created.—School Fund Farm Loan Act passed.—The state constabulary, created by act of the Legislature follows the plans of Pennsylvania and New York, and takes the place of a National Guard. The School Fund Farm Loan Act was passed, making possible the use of school funds to meet the needs of agriculture.

1917-1919.—Part played in World War.—Immigration.—The state furnished 34,393 men in the World War or .92 per cent of the whole. "The year 1918 was marked by a large influx of immigrants, mostly Americans from other States, who settled in eastern Colorado and in the cities and towns. There were many new settlers in 1919. The Mexican population in the State was considerably increased. The cities had a great building boom. . . . Colorado is one of the few States in which the rural population has increased during the last decade, tens of thousands of immigrants having settled on 'dry' ranches in eastern Colorado. . . . The present may be called the agricultural age of the Centennial State. Intensive farming is more profitable than mining. . . . The conquest of Nature goes on with the destruction of prairie dogs, coyotes and other wild animals. In 1919 a tract of ten acres in the Montezuma Valley, including Pueblo ruins of unusual importance, was set aside as the Yucca House National Monument."—E. Parsons, *History of Colorado*, pp. 75, 78, 79.

COLOSSEUM, or Coliseum.—“Begun by Vespasian, and opened and dedicated by Titus in 80 A D., this wonderful structure was called the amphitheatrum Flavium, but since the middle ages it has been commonly known as the Colosseum. The low ground between the Velia, the Esquiline, and the Caelian had been included within the domus Aurea, and here Nero had constructed an artificial pond, or stagnum. When Vespasian destroyed so much of the domus Aurea, he built the amphitheatre on the site of the stagnum,—one of the most accessible in the city. Although the amphitheatre was opened by Titus, it is uncertain whether it was entirely finished during his reign or during that of Domitian, and it was afterward restored by Trajan and Antoninus Pius. In 217 A D. it was struck by lightning, and so seriously damaged that no more gladiatorial combats could be held in the building until 222-223, when the repairs begun by Elagabalus were completed by Alexander Severus (or perhaps by Gordianus III). Again, in 250, the building was restored by Decius, after a fire caused by another stroke of lightning. It was injured by the earthquake of 422, and probably again a few years later, for restorations are recorded which were carried on by Theodosius II and Valentinian III in 442, and by Anthemius between 467 and 472. Still later repairs were made by Basilius in 508, and by Eutharich in 519. The last gladiatorial combats took place in the amphitheatre in 404 A. D., and the last recorded venationes in 523. In the sixth century began the gradual destruction of the great structure, which suffered from all the causes which combined to wreck the imperial city. The greatest destruction, however, was wrought by those who regarded the building as a travertine quarry. Out of it were built many medieval palaces, among them the Cancelleria, the Farnese, and the Venezia. No other Roman building has had so interesting and varied a history. During the last century various attempts were made to preserve the remaining portions from further ruin, especially by the popes between 1805 and 1852, when great buttresses were built to support the ends of the walls. Under the direction of Canina (1850-1852), thirteen of the arches on the third story and seven of those on the fourth were restored, the outer wall strengthened, new stairways erected, and the marble columns and pediment of the main entrance, which had been taken away, were replaced by travertine. These restorations, however, were carried too far, and have rendered much of the original construction somewhat obscure. In spite of these injuries, enough of the Colosseum is left to make it one of the most imposing buildings in the world. The north side of the outer wall still stands, comprising the arches numbered XXIII to LIV, with that part of the building which is between it and the inner wall supporting the colonnade. Of that part of the building between this inner wall and the arena, practically the whole skeleton remains,—that is, the encircling and radiating walls on which the cavea with its marble seats rested. These marble seats, and everything in the nature of decoration, have long since disappeared.”—S. B. Platner, *Topography and monuments of ancient Rome*, pp. 305-309.

COMES PALATII, counts of the Palace. See PALATINE, COUNTS.

COMETS. See ASTRONOMY: Problem of locating constellations; 1781-1846.

COMITADJIS, armed bands operating in Macedonia in the decade before the Balkan Wars. They were encouraged and financed, in part, by the neighboring Balkan States (especially by Bulgaria) for the advancement of whose nationalistic interests their activities were directed. Their operations frequently were indistinguishable from organized brigandage, though the political objectives were steadily kept in view.—See also WORLD WAR: Causes: Indirect: d, 2.

COMITATUS, **COMITES**, **GESITHS**, **THEGNS.**—Comitatus is the name given by Tacitus to a body of warlike companions among the ancient Germans "who attached themselves in the closest manner to the chieftain of their choice. They were in many cases the sons of the nobles who were ambitious of renown or of a perfect education in arms. The princes provided for them horses, arms, and such rough equipment as

they wanted. These and plentiful entertainment were accepted instead of wages. In time of war the comites fought for their chief, at once his defenders and the rivals of his prowess. . . . In the times of forced and unwelcome rest they were thoroughly idle; they cared neither for farming nor for hunting, but spent the time in feasting and in sleep. . . . Like the Frank king, the Anglo-Saxon king seems to have entered on the full possession of what had been the right of the elective principes [to nominate and maintain a comitatus, to which he could give territory and political power]: but the very principle of the comitatus had undergone a change from what it was in the time of Tacitus, when it reappears in our historians, and it seems to have had in England a peculiar development and a bearing of special importance on the constitution. In Tacitus the comites are the personal following of the princes; they live in his house, are maintained by his gifts, fight for him in the field. If there is little difference between companions and servants, it is because civilization has not yet introduced voluntary helplessness. . . . Now the king, the perpetual princeps and representative of the race, conveys to his personal following public dignity and importance. His gesiths and thegns are among the great and wise men of the land. The right of having such dependents is not restricted to him, but the gesith of the ealdorman or bishop is simply a retainer, a pupil or a ward; the free household servants of the ceorl are in a certain sense his gesiths also. But the gesiths of the king are his guard and private council; they may be endowed by him from the folkland and admitted by him to the witenagemot. . . . The Danish huscarls of Canute are a late reproduction of what the familia of the Northumbrian kings must have been in the eighth century. . . . The development of the comitatus into a territorial nobility seems to be a feature peculiar to English history. . . . The Lombard gasind, and the Bavarian sindman were originally the same thing as the Anglo-Saxon gesith. But they sank into the general mass of vassalage as it grew up in the ninth and tenth centuries. . . . Closely connected with the gesith is the thegn; so closely that it is scarcely possible to see the difference except in the nature of the employment. The thegn seems to be primarily the warrior gesith; in this idea Alfred uses the word as translating the 'miles' of Bede. He is probably the gesith who has a particular military duty in his master's service. But he also appears as a landowner. The ceorl who has acquired five hides of land, and a special appointment in the king's hall, with other judicial rights, becomes thegn-worthy. . . . And from this point, the time of Athelstan, the gesith is lost sight of, except very occasionally; the more important members of the class having become thegns, and the lesser sort sinking into the ranks of mere servants to the king. The class of thegns now widens; on the one hand the name is given to all who possess the proper quantity of land, whether or no they stand in the old relation to the king; on the other the remains of the old nobility place themselves in the king's service. The name of thegn covers the whole class which after the Conquest appears under the name of knights, with the same qualification in land and nearly the same obligations. It also carried so much of nobility as is implied in hereditary privilege. The thegn-born are contrasted with the ceorl-born; and are perhaps much the same as the gesithcund. . . . Under the name of thegn are included however various grades of dignity. The class of king's thegns is distinguished from that of

the medial thegns, and from a residuum that falls in rank below the latter. . . . The very name, like that of the gesith, has different senses in different ages and kingdoms; but the original idea of military service runs through all the meanings of thegn, as that of personal association is traceable in all the applications of gesith."—W. Stubbs, *Constructive history of England*, ch. 2, sect. 14 and ch. 6, sect. 63-65.—See also COUNT AND DUKE, ROMAN; FEUDALISM: Definition, etc.; MILITARY ORGANIZATION: 10.

COMITIA CENTURIATA.—"Under the original constitution of Rome, the patricians alone . . . enjoyed political rights in the state, but at the same time they were forced to bear the whole burden of political duties. In these last were included, for example, the tilling of the king's fields, the construction of public works and buildings . . . ; citizens alone, also, were liable to service in the army. . . . The political burdens, especially those connected with the army, grew heavier, naturally, as the power of Rome increased, and it was seen to be an injustice that one part of the people, and that, too, the smaller part, should alone feel their weight. This led to the first important modification of the Roman constitution, which was made even before the close of the regal period. According to tradition, its author was the king Servius Tullius, and its general object was to make all men who held land in the state liable to military service. It thus conferred no political rights on the plebeians, but assigned to them their share of political duties. . . . According to tradition, all the freeholders in the city between the ages of 17 and 60, with some exceptions, were divided, without distinction as to birth, into five classes ('classis,' 'a summoning,' 'calo') for service in the infantry according to the size of their estates. Those who were excepted served as horsemen. These were selected from among the very richest men in the state. . . . Of the five classes of infantry, the first contained the richest men. . . . The members of the first class were required to come to the battle array in complete armor, while less was demanded of the other four. Each class was subdivided into centuries or bodies of a hundred men each, for convenience in arranging the army. There were in all 193 centuries. . . . This absolute number and this apportionment were continued, as the population increased and the distribution of wealth altered, until the name century came to have a purely conventional meaning, even if it had any other in the beginning. Henceforth a careful census was taken every fourth year, and all freeholders were made subject to the 'tributum.' [q. v.] The arrangement of the people thus described was primarily made simply for military purposes. . . . Gradually, however, this organization came to have political significance, until finally these men, got together for what is the chief political duty in a primitive state, enjoyed what political privileges there were. . . . In the end, this 'exercitus' of Servius Tullius formed another popular assembly, the Comitia Centuriata, which supplanted the comitia curiata entirely, except in matters connected with the religion of the family and very soon of purely formal significance. This organization, therefore, became of the highest civil importance, and was continued for civil purposes long after the army was marshalled on quite another plan."—A. Tighe, *Development of the Roman constitution*, ch. 4.—See also SUFFRAGE, MANHOOD: B. C. 3rd century.

ALSO IN: W. Ihne, *History of Rome*, bk. 6, ch. 1.—W. Ramsay, *Manual of Roman antiquities*, ch. 4.

COMITIA CURIATA.—"In the beginning, any member of any one of the clans which were included in the three original Roman tribes, was a Roman citizen. So, too, were his children born in lawful wedlock, and those who were adopted by him according to the forms of law. Illegitimate children, on the other hand, were excluded from the number of citizens. These earliest Romans called themselves patricians (patricii, 'children of their fathers'), for some reason about which we cannot be sure. Perhaps it was in order to distinguish themselves from their illegitimate kinsmen and from such other people as lived about, having no pretense of blood connection with them, and who were, therefore, incapable of contracting lawful marriages, according to the patrician's view of this religious ceremony. The patricians . . . were grouped together in families, clans and tribes, partly on the basis of blood relationship, but chiefly on the basis of common religious worship. Besides these groups, there was still another in the state, the curia, or 'ward,' which stood between the clan and the tribe. In the earliest times, tradition said, ten families formed a clan, ten clans a curia and ten curia a tribe. These numbers, if they ever had any historical existence, could not have sustained themselves for any length of time in the case of the clans and families, for such organisms of necessity would increase and decrease quite irregularly. About the nature of the curia we have practically no direct information. The organization had become a mere name at an early period in the city's history. Whether the members of a curia thought of themselves as having closer kinship with one another than with members of other curiæ is not clear. We know, however, that the curiæ were definite political subdivisions of the city, perhaps like modern wards, and that each curia had a common religious worship for its members' participation. Thus much, at any rate, is significant, because it has to do with the form of Rome's primitive popular assembly. When the king wanted to harangue the people ('populus,' cf. 'populor,' 'to devastate') he called them to a 'contio' (compounded of 'co' and 'venio'). But if he wanted to propose to them action which implied a change in the organic law of the state, he summoned them to a comitia (compounded of 'con' and 'eo'). To this the name comitia curiata was given, because its members voted by curiæ. Each curia had one vote, the character of which was determined by a majority of its members, and a majority of the curiæ decided the matter for the comitia."—A. Tighe, *Development of the Roman constitution*, ch. 3.—See also COMITIA CENTURIATA; CONTIONES; ROME: Ancient kingdom: Early character, etc.; Genesis of the people; SUFFRAGE, MANHOOD: B. C. 3rd century.

COMMANDER-IN-CHIEF, supreme head of the army of a nation. See MILITARY ORGANIZATION: 22.

COMMANDO, in South Africa, a military body of command; also sometimes an expedition or raid. See SOUTH AFRICA, UNION OF: 1894.

COMMENDATION.—Commendation was the

act by which a freeman placed himself under the protection of one more powerful than himself, became his vassal, and in return for shelter and support pledged himself to serve his lord in all ways that comported with his standing as a free man. The following Frankish formula of the seventh century gives in itself a good idea of the institution, which closely corresponded to the *patrocinium* of the Romans. "To that magnificent Lord —, I, —. Since it is known familiarly to all how little I have whence to feed and clothe myself, I have therefore petitioned your Piety, and your good will has permitted me to hand myself over or commend myself to your guardianship, which I have thereupon done; that is to say, in this way, that you should aid and succor me as well with food as with clothing, according as I shall be able to serve you and deserve it. And so long as I shall live I ought to provide service and honor to you, suitably to my free condition;

and I shall not during my lifetime have the ability to withdraw from your power or guardianship, but must remain during the days of my life under your power or defense. Wherefore it is proper that if either of us shall wish to withdraw himself from these agreements, he shall pay — shillings to his companion, and this agreement shall remain unbroken. Wherefore it is fitting that they should make or confirm between themselves two letters drawn up in the same form on this matter; which they have thus done."—J. H. Robinson, *Readings in European history*, v. 1, pp. 175, 176.—In reply to this document the new lord in turn signed another, formally accepting his new client, and ordering that he be "reckoned among the number of the antrustions (i.e., followers). And if any one shall presume to kill him, let him know that he will be judged guilty of his wiregild of six hundred shillings."—See also *BENEFICIUM*; *SCOTLAND*: 10th-11th centuries.

COMMERCE

PRIMITIVE

Exchange.—Decidedly unclear conceptions are widely prevalent as to the system of *exchange* of primitive peoples. We know that throughout Central Africa, from the Portuguese possessions in the west to the German in the east, there is a *market-place* every few miles at which the neighbouring tribes meet every fourth to sixth day to make mutual exchanges. Of the Malays in Borneo we are told that each larger village possesses its weekly market. The first discoverers of the South Sea Islands give us reports of distant 'trading trips' which the natives undertake from island to island in order to make mutual exchanges of their wares. In America certain products, the raw material for which is to be found only in a single locality—for example, arrowpoints and stone hatchets made of certain kinds of stone—have been met with scattered throughout a great part of the continent. Even among the aborigines of Australia there are certain products, such as the pitcher-plant leaves and ochre colour, which are found in but one place, and yet circulate through a great part of the country. In such phenomena we have a new and interesting proof of the civilizing power of trade; and in the primeval history of Europe itself this power has everywhere been assumed as operative when industrial products have been brought to light through excavations or otherwise far from their original place of production. . . . *Trade* in the sense in which it is regarded by national economy—that is, in the sense of the systematic purchase of wares with the object of a profitable re-sale as an organized vocation—can nowhere be discovered among primitive peoples. Where we meet native traders in Africa, it is a question either of intermediary activity prompted by European and Arabian merchants, or of occurrences peculiar to the semi-civilization of the Soudan. Otherwise the only exchange known to the natives everywhere is exchange from tribe to tribe. This is due to the unequal distribution of the gifts of nature and to the varying development of industrial technique among the different tribes. As between the members of the same tribe, however, no regular exchange from one household establishment to another takes place. Nor can it arise, since that vocational division of the population is lacking which alone could give rise to an enduring interdependence of households.

One fancies the genesis of exchange to have been very easy because civilized man is accustomed to find all that he needs ready made at the market or store and to be able to obtain it for money."—C. Bucher, *Industrial evolution*, pp. 59-60.—Since it is very unlikely that any primitive group would settle on a location that failed to yield the requisites for subsistence, it is very probable that the primary impulse leading to commerce among peoples was the aesthetic impulse—golden trinkets and gold decorated weapons found in the valley of the Nile seem to bear out this point. After satisfying his primary needs at home, primitive man sought far and wide for beautiful things that filled his soul with joy. "With primitive man, however, before he became acquainted with more highly developed peoples, value and price were by no means current conceptions. The first discoverers of Australia found invariably, both on the continent and on the neighbouring islands that the aborigines had no conception of exchange. . . . Yet there was from tribe to tribe a brisk trade in pots, stone hatchets, hammocks, cotton threads, necklaces of mussel-shells, and many other products. . . . The transfer ensues by way of presents, and also, according to circumstances, by way of robbery, spoils of war, tribute, fine, compensation, and winnings in gaming."—C. Bucher, *Industrial evolution*, pp. 61, 71.

Result of use of money as a medium.—"From the standpoint of the total cultural progress of mankind the most important result of this survey, however, remains, that money as the favourite exchange commodity furnished a medium that bound together men from tribe to tribe in regular peaceful trade, and prepared the way for a differentiation of tribes in the matter of production. In the circumstance that all members of the same tribe or village preferably carried on, along with the earning of their sustenance, other work of a definite type, lay the possibility of an advance in technical knowledge and dexterity. It was an international, or interlocal, division of labour in miniature, which only much later was succeeded by division of labour from individual to individual within the nation, or the locality. Moreover the direct importance of the market for personal intercourse at this stage must not be undervalued, especially in lands where travellers wishing to buy something direct are regularly refused with the words 'come to market.' In this one is involuntarily

reminded of the prominent position that the market occupied in the social and political life of the peoples of classical antiquity. . . . Commerce is essentially a public matter; there are no private commercial arrangements whatever among these peoples. Indeed one can claim frankly that at this stage trade scarcely displays an economic character at all."—*Ibid.*, p. 76.

Transportation and communication.—"In the first place as concerns commercial routes, there are overland trade routes only when they have been tramped by the foot of man; the only artificial structures to facilitate land trade are primitive bridges, often consisting merely of a single tree-trunk, or ferries at river fords, for the use of which the traveller has to pay a tax to the village chief. These dues as a rule open the door to heavy extortions. On the other hand the natural waterways are everywhere diligently used, and there is hardly a primitive people that has not been led through its situation by the sea or on a river to the use of some peculiar kind of craft. The enumeration and description of these means of transportation would fill a volume; from the dugout and skin canoe of the Indians to the artistically carved rowboats and sailboats of the South Sea Islanders, all types are represented. On the whole, however, the technique of boat-building and navigation has remained undeveloped among these peoples; none of their vessels deserve the name of ship in the proper sense. Thus their importance is everywhere restricted to personal transportation and fishing, while nowhere has the development reached a freight transportation of any extent. Curiously among primitive peoples that branch of commercial communication has enjoyed the fullest development which we would naturally associate only with the highest culture, namely, the communication of news. It forms indeed the sole kind of trade for which primitive peoples have created permanent organizations. We refer to the courier service and the contrivances for sending verbal messages. The despatching of couriers and embassies to neighbouring tribes in war and peace leads, even at a very low stage of culture, to the development of a complete system of symbolic signs and means of conveying intelligence."—*Ibid.*, pp. 76-77.

Cultural value.—"Probably no other single force in human history has been more important in bringing about the complete transition from tribal to civil society than the growth of commerce. If there was opportunity for commerce the creation of a surplus was favored, since the trading of an excess in the home produce for some new want stimulated the further production of surplus to more fully satisfy that want. In time, new industries originated, and these in turn, were worked for the surplus product which could be exchanged for still newer wants. The resulting diversification of wants was educational for the people and tended to lay the basis for a rich and self-sustaining economy which becomes the foundation of a great civilization. Corresponding to the exchange in wares and articles of commerce, there was a communication of new ideas and transmission of intelligence that could not fail to react profoundly upon the developing culture of the people. The commercial people become tolerant of customs other than their own and learn familiarity with strange and remote localities. All this variety of experience broadens their point of view and gives a ripeness and maturity to their culture which no other influence can bring."—F. S. Chapin, *Introduction to the study of social evolution*, p. 295.

ALSO IN: G. F. S. Elliot, *Prehistoric man*, ch. 24.

ANCIENT

B. C. 2500.—Earliest records of trade.—Probably the oldest commercial record that exists was found sculptured on the rocks in the valley of Hammamat, east from Koptos on the Nile. It relates to an expedition sent out by the Pharaoh Sankh-ka-ra (Sankhkeré Menthotp IV) to trade in the "land of Punt." Dr. Brugsch fixes the reign of Sankh-ka-ra at about 2500 B. C. The "land of Punt" he considers to have been the Somali coast of Africa, south of the extremity of the Red sea, on the gulf of Aden. Other writers maintain that it was southern Arabia. It was the "Holy Land" of the Egyptians, from which their gods were supposed to have anciently come. The trading expedition of Sankh-ka-ra was commanded by one Hannu (a name which has a Phœnician sound). Some seven or eight centuries after Hannu's voyage to Punt was made, we obtain in the Bible a most interesting glimpse of the trade then going on between Egypt and surrounding countries. It is found in the story of Joseph. When Joseph's brethren threw him into a pit, intending that he should be left there to die, their plans were changed by seeing a "company of Ishmaelites from Gilead with their camels bearing spicery and balm and myrrh, going to carry it down to Egypt." Then Judah said, "let us sell him to the Ishmaelites." Now this story is found to agree well with other facts which go to show that some, at least, among the ancient tribes in northern Arabia—the Ishmaelites of the Bible—were great traders between the richer countries that surrounded them. By the poverty of their country, by their wandering disposition, by their possession of the camel, and by their geographical situation, these Arabs of the olden time must have naturally been made a trading people. With their caravans of camels they traveled back and forth, very busily, no doubt, through the desert, which needed no building of bridges or making of roads. In one direction they carried the barley, wheat, millet, flax and woven goods of Egypt; in another, the honey, wine, wax, wool, skins, gums, resins and asphalt of Canaan and Syria; in still another the more costly freight of gold ornaments, precious stones, pearls, ivory, ebony, spices and fragrant gums from the south. In all directions, it is probable, they dragged poor unfortunates like Joseph, whom they bought or kidnapped to sell as slaves.

B. C. 2000.—Importance of commerce in ancient India.—"It is said in the Rig-Veda that 'merchants desirous of gain crowd the great waters with their ships.' And the activity in trade, thus early noted, has continued ever since to be characteristic of the country. Professor Lassen considers it remarkable that Hindus themselves discovered the rich, luxurious character of India's products. Many of the same beasts, birds, and fragrant oils are produced in other countries, but remain unnoticed until sought for by foreigners; whereas the most ancient of the Hindus had a keen enjoyment in articles of taste or luxury. Rajas and other rich people delighted in sagacious elephants, swift horses, splendid peacocks, golden decorations, exquisite perfumes, pungent peppers, ivory, pearls, gems, &c.; and, consequently, caravans were in constant requisition to carry these, and innumerable other matters, between the north and the south, and the east and the west, of their vast and varied country. These caravans, it is conjectured, were met at border stations, and at out-ports, by western caravans or ships bound to or

from Tyre and Egypt, or to or from the Persian Gulf and the Red Sea. To the appearance of India goods in Greece, Professor Lassen attributes the Greek invasion of India. . . . The indirect evidence afforded by the presence of India's products in other ancient countries, coincides with the direct testimony of Sanskrit literature, to establish the fact that ancient Hindus were a commercial people. The code of Manu requires the king to determine the prices of commodities, and also the trustworthiness of the weights and measures used. And that the transactions contemplated were not restricted to local products is evident from reference to the charges for freight for articles in river boats, and the undetermined and larger charges to which sea-borne goods were liable. The account of King Yudhishtira's coronation in the Mahābhārata affords an instance of precious articles from distant lands brought into India. So also in the Rāmāyana, we read that when Rāma and his brothers were married, the brides were clad in silk from China. . . . Merchants are constantly being introduced into Sanskrit fiction, and equally often into Buddhist legend. They seem to have been always at hand to give variety

A NILE BARGE

and movement to the monotony of daily life."—Mrs. Manning, *Ancient and mediæval India*, ch. 40, v. 2.

B. C. 1500-1000.—Industry and commerce in Babylonia.—"The industry of the Babylonians quickly attained great skill and wide development. They were famous for their weaving in wool and linen. . . . Their pottery was excellent and the manufacture active; the preparation of glass was not unknown; the ointments prepared in Babylon were famous and much sought after, and the stones cut there were highly valued. The products of Babylonian skill and industry were first brought to their kinsmen in Syria, who could offer oil and wine in exchange. In the Hebrew scriptures we find Babylonian cloaks in use in Syria before the immigration of the Hebrews into Canaan. . . . The rough material required by Babylonian industry was supplied in the first place by the Arabs, who exchanged their animals, skins, and wool for corn and weapons. Wine, and more especially wood, of which there was none in Babylonia, were brought by the Armenians from their valleys in the north down the Euphrates to Babylon. Before 1500 B.C. the commerce of the Arabs brought the products of South Arabia, the spices of Yemen, and even the products and manufactures of India, especially their silks, which reached the coasts of Southern Arabia, to Babylon. The Babylonians required the perfumes of Arabia and India to prepare their ointments. . . . When the cities of Phenicia became great centres of trade which carried the wares of Babylonia by sea to the West in order to obtain copper in exchange,

the trade between Babylonia and Syria must have become more lively still. It was the ships of the Phenicians which brought the cubic measure, and the weights, and the cubit of Babylonia to the shores of Greece, and caused them to be adopted there."—M. Duncker, *History of antiquity*, v. 1, bk. 2, ch. 3.—See also MONEY AND BANKING: Ancient Egypt and Babylonia.

B. C. 1400.—Egypt: Importance of agriculture.—Comparative lack of trade.—"In ancient Egypt agriculture counted for more than manufactures, and manufactures were of more importance than commerce. The trade which existed was brisk enough as far as it went, but it aimed at little more than the satisfaction of local wants by the more or less direct exchange of commodities between producers. The limited development of internal traffic was due to two principal causes: the natural products of different parts of the country were too much alike for much intercourse to be necessary for purposes of exchange, and the conformation of the country, in itself scarcely larger than Belgium, was such as to give the longest possible distance from north to south. . . . The Nile was the only known highway, so much so that the language scarcely possessed a general word for travelling; going southward was called 'going up stream,' and a journey to the north, even by land into the desert, was described by a term meaning to sail with the current. . . . While internal traffic was thus brought to a minimum by natural causes, foreign commerce can scarcely be said to have existed, before the establishment of peaceable intercourse with Syria under the new empire. The importation of merchandize from foreign countries was a political rather than a commercial affair. Such foreign wares as entered the country came as tribute, as the spoil of war, or as memorials of peaceful embassies. . . . The list of the spoil taken by Thothmes III. gives a tolerably exhaustive account of the treasures of the time. It includes, of course, bulls, cows, kids, white goats, mares, foals, oxen, geese, and corn; then follow strange birds, negroes, men and maid-servants, noble prisoners and the children of defeated kings, chariots of copper, plated with gold and silver, iron armour, bows, swords and other accoutrements, leather collars ornamented with brass, gold and silver rings, cups, dishes and other utensils, vessels of iron and copper, statues with heads of gold, ell-measures with heads of ivory, ebony, and cedar inlaid with gold, chairs, tables and footstools of cedar wood and ivory, a plough inlaid with gold, blocks of bluestone, greenstone and lead, 'a golden storm-cap inlaid with bluestone,' jars of balsam, oil, wine and honey, various kinds of precious woods, incense, alabaster, precious stones and colours, iron columns for a tent with precious stones in them, bricks of pure brass, elephants' tusks, natron, and, finally, by way of curiosity, from the land of the kings of Ruthen, three battle-axes of flint."—E. J. Simcox, *Primitive civilizations*, v. 1, bk. 1, ch. 3, sect. 1.—See also EGYPT: B. C. 323-330; MONEY AND BANKING: Ancient Egypt and Babylonia.

B. C. 1000.—Commerce among the Jews.—Increase trade with other nations during the reign of Solomon.—Beginning early in his reign, Solomon made great and enlightened efforts to promote the commerce and industries of the people of Israel. "To increase the land traffic, he had small cities built in advantageous localities, in which goods of all sorts in large quantities were kept in suitable storehouses; a practice similar to that which had from ancient times prevailed in Egypt. . . . They were established chiefly in the most

northern districts of Israel, towards the Phœnician boundaries, as well as in the territories of the kingdom of Hamath, which was first conquered by Solomon himself.—The main road for the land traffic between Egypt and the interior of Asia must have been the great highway leading past Gaza and further west of Jerusalem to the Northern Jordan and Damascus. Here it was joined by the road from the Phœnician cities, and continued as far as Thapsacus, on the Euphrates. This was entirely in the dominions of the king; and here, under the peaceful banner of a great and powerful monarchy, commerce could flourish as it had never flourished before. It was clearly for the improvement of this route, which had to traverse the Syrian desert on the north, that Solomon built, in a happily chosen oasis of this wilderness, the city of Thammor, or Tadmor, of which the Greek version is Palmyra. There is not a single indication that this city was of importance before Solomon's time, but from that era it flourished for more than a thousand years. . . . For any distant navigation, however, Solomon was obliged to rely on the aid of the Phœnicians, inasmuch as they were in that age the only nation which possessed the necessary ability and inclination for it. It is true that the idea of competing with the Phœnicians upon the Mediterranean could hardly have occurred to him, since they had long before that time attracted all the commerce upon it to themselves, and would scarcely have desired or even tolerated such a rival. . . . But the Red Sea, which had been thrown open to the kings of Israel by the conquest of the Idumeans, offered the finest opportunity for the most distant and lucrative undertakings, the profit of which might perfectly satisfy a nation in the position of Israel in the dawn of maritime activity; and on their part, the Phœnicians could not fail to be most willing helpers in the promotion of undertakings which it lay in the hands of the powerful king of Israel entirely to cut off from them, or at any rate to encumber with great difficulties. In this way the mutual desires and needs of two nations coincided without any injury to the one or the other. . . . Phœnician sailors were at first, it is true, the teachers of the Israelite. It was they who aided them in constructing and manning the tall ships, which, destined to distant voyages upon certain seas, needed to be strongly built; but yet how many new ideas and what varied knowledge the nation would in this way acquire! The ships were built in Ezion-geber, the harbour of the town of Elath (or Eloth), probably on the very spot where Akaba now stands. The cargo, brought back each time from the three years' voyage consisted of 420 talents of gold, besides silver, ivory, red sandalwood, apes, and peacocks, probably also nard and aloë."—H. Ewald, *History of Israel*, v. 3, pp. 261-264.

B. C. 1000-600.—Phœnicia and Carthage.— Greatest trading cities of the time.—**Colonies.**—"The Phœnicians for some centuries confined their navigation within the limits of the Mediterranean, the Propontis, and the Euxine, land-locked seas, which are tideless and far less rough than the open ocean. But before the time of Solomon they had passed the pillars of Hercules, and affronted the dangers of the Atlantic. Their frail and small vessels, scarcely bigger than modern fishing-smacks, proceeded southwards along the West African coast, as far as the tract watered by the Gambia and Senegal, while northwards they coasted along Spain, braved the heavy seas of the Bay of Biscay, and passing Cape Finisterre, ventured across the mouth of the English Channel

to the Cassiterides. Similarly, from the West African shore, they boldly steered for the Fortunate Islands (the Canaries), visible from certain elevated points of the coast, though at 170 miles' distance. Whether they proceeded further, in the south to the Azores, Madeira, and the Cape de Verde Islands, in the north to the coast of Holland, and across the German ocean to the Baltic, we regard as uncertain. It is possible that from time to time some of the more adventurous of their traders may have reached thus far; but their regular, settled and established navigation did not, we believe, extend beyond the Scilly Islands and coast of Cornwall to the north-west, and to the south-west Cape Non and the Canaries. The commerce of the Phœnicians was carried on, to a large extent, by land, though principally by sea. It appears from the famous chapter [27] of Ezekiel which describes the riches and greatness of Tyre in the 6th century B. C., that almost the whole of Western Asia was penetrated by the Phœnician caravans, and laid under contribution to increase the wealth of the Phœnician traders. . . . Translating this glorious burst of poetry into prose, we find the following countries mentioned as carrying on an active trade with the Phœnician metropolis:—Northern Syria, Syria of Damascus, Judah and the land of Israel, Egypt, Arabia, Babylonia, Assyria, Upper Mesopotamia, Armenia, Central Asia Minor, Ionia, Cyprus, Hellas or Greece, and Spain."—G. Rawlinson, *History of Phœnicia*, ch. 9.—"Though the invincible industry and enterprise of the Phœnicians maintained them as a people of importance down to the period of the Roman empire, yet the period of their widest range and greatest efficiency is to be sought much earlier— anterior to 700 B. C. In these remote times they and their colonists [the Carthaginians especially] were the exclusive navigators of the Mediterranean; the rise of the Greek maritime settlements banished their commerce to a great degree from the Ægean Sea, and embarrassed it even in the more westerly waters. Their colonial establishments were formed in Africa, Sicily, Sardinia, the Balearic Isles, and Spain. The greatness as well as the antiquity of Carthage, Utica, and Gades, attest the long-sighted plans of Phœnician traders, even in days anterior to the first Olympiad. We trace the wealth and industry of Tyre, and the distant navigation of her vessels through the Red Sea and along the coast of Arabia, back to the days of David and Solomon. And as neither Egyptians, Assyrians, Persians, or Indians, addressed themselves to a sea-faring life, so it seems that both the importation and the distribution of the products of India and Arabia into Western Asia and Europe were performed by the Idumæan Arabs between Petra and the Red Sea—by the Arabs of Gerrha on the Persian Gulf, joined as they were in later times by a body of Chaldæan exiles from Babylonia—and by the more enterprising Phœnicians of Tyre and Sidon in these two seas as well as in the Mediterranean."—G. Grote, *History of Greece*, pt. 2, ch. 18.

"The Phœnicians are noteworthy not only as the greatest merchants and the first navigators of the ancient world; they were the leaders also in the founding of colonies. At points important for commercial or naval reasons they established stations which enabled them to trade in security with the natives and to control the sea. Gades, for instance (the modern Cadiz), near the straits of Gibraltar, was a rallying-point from which the Carthaginians extended their voyages to the tin islands in the North, and far down the Atlantic coast of Africa on the South. Similar stations

were established on many of the Mediterranean islands (Malta, Sicily, Sardinia, Balearics) and one founded on the north coast of Africa, Carthage (near the site of modern Tunis), grew to especial importance. The power of the Phœnicians declined, a few centuries after 1000 B. C., partly by reason of internal dissensions and the attacks of land-powers like Assyria, partly by reason of the commercial rivalry of the Greeks, who had risen to an independent position and cut the lines of communication between East and West. In this period Carthage fell heir to the Phœnician establishments in the western Mediterranean, and maintained its power and policy on substantially similar lines until it received its great defeats at the hands of Rome."—C. Day, *History of commerce*, p. 14.—See also PHŒNICIANS: Origin; Later commerce.

B. C. 1000-200.—Greek commerce.—Geographical advantages.—Rise to commercial power.—Competition with the Phœnicians.—Establishment of colonies.—Colonial commerce.—Rise of Athens.—Changes brought by the conquests of Alexander.—Decline.—"The Greeks . . . were, for a time, the leading merchants of the Mediterranean. The modern country of Greece has an area less than that of the State of Maine, little more than half that of the State of New York. It is, however, most richly diversified geographically, and no country in the world of an equal area, it is said, presents so many islands, bays, peninsulas, and harbors. The coast line of this little country is longer than that of Spain. No point is more than a few miles from which an observer does not see an island. In the Greek sea, moreover, every island is in plain sight either of the mainland or of another island, and in the good season the winds are very regular. Favoring conditions such as these are of vast importance in the early days of navigation, when sailors faced real perils due to their inexperience, and perils of the imagination which were even greater. At home the Greeks inhabited a country which was not rich enough to support them without exertion, but was, on the other hand, not so poor as to force them to use all their ingenuity in finding the means of subsistence. They could easily produce a surplus of oil and wine, but found a deficiency of other products, especially grain and, in the early period, manufactured wares. . . . Though it would be hard to conceive a better nursery for the growth of commerce than existed under the conditions here described, the Greeks, when we first get knowledge of them, about 1000 B. C., were not yet ready to take advantage of their opportunities. There was some commerce, it is true, but it lay entirely in the hands of the Phœnicians, who brought utensils and cloth and took away timber and metals. Little by little the Greeks rose to commercial prominence, and gained the place formerly held by the Phœnicians. A striking feature of this revolution was the Greek colonial movement, which covered some five hundred years, and ended about 600 B. C. Greek emigrants settled throughout the Ægean Sea and established themselves as a fringe on the coast of Asia Minor and about the Black Sea; in the West they chose by preference the shores of southern Italy and Sicily, but founded colonies as far as Malaga in modern Spain, and created a great commercial center on the site of modern Marseilles. The colonies kept up an active intercourse with the mother country, and Greek sailors and merchants ousted the Phœnicians from their commanding position. The Greeks at home began to produce wares for export, seeking customers not only among the colonists but in other markets also; they emancipated themselves from their

former dependence on Oriental manufactures, and developed the clay, bronze, and woolen industries to a point not dreamed of before."—C. Day, *History of commerce*, pp. 17-18.—"Between 700 B. C. and 530 B. C. we observe . . . an immense extension of Grecian maritime activity and commerce—but we at the same time notice the decline of Tyre and Sidon, both in power and traffic. The arms of Nebuchadnezzar reduced the Phœnician cities to the same state of dependence as that which the Ionian cities underwent half a century later from Cræsus and Cyrus; while the ships of Miletus, Phokæa and Samos gradually spread over all those waters of the Levant which had once been exclusively Phœnician. In the year 704 B. C., the Samians did not yet possess a single trireme: down to the year 630 B. C. not a single Greek vessel had yet visited Libya. But when we reach 550 B. C. we find the Ionic ships predominant in the Ægean, and those of Corinth and Korkyra in force to the west of Peloponnesus—we see the flourishing cities of Kyrene and Barka already rooted in Libya, and the port of Naukratis a busy emporium of Grecian commerce with Egypt. The trade by land—which is all that Egypt had enjoyed prior to Psammetichus, and which was exclusively conducted by Phœnicians—is exchanged for a trade by sea, of which the Phœnicians have only a share, and seemingly a smaller share than the Greeks. Moreover the conquest by Amasis of the island of Cyprus, half-filled with Phœnician settlements and once the tributary dependency of Tyre—affords an additional mark of the comparative decline of that great city. In her commerce with the Red Sea and the Persian Gulf she still remained without a competitor, the schemes of the Egyptian king Nekos having proved abortive. Even in the time of Herodotus, the spices and frankincense of Arabia were still brought and distributed only by the Phœnician merchant. But on the whole, both political and industrial development of Tyre are now cramped by impediments, and kept down by rivals, not before in operation. . . . The 6th century B. C., though a period of decline for Tyre and Sidon, was a period of growth for their African colony Carthage, which appears during this century in considerable traffic with the Tyrrhenian towns on the southern coast of Italy, and as thrusting out the Phokæan settlers from Alalia in Corsica."—G. Grote, *History of Greece*, pt. 2, ch. 21.—"It is a remarkable fact in the history of Greek colonies that the exploration of the extreme west of the Mediterranean was not undertaken either by the adventurers who settled at Cyme, or by the powerful cities of Sicily. A century or more elapsed from the foundation of Syracuse before any Greek vessel was seen on the coast of Spain or Liguria, and when the new beginning was made, it was not made by any of the colonies, Chalcidian, Dorian, or Rhodian, which had taken part in the discovery of the West. It was the Phocæans of Ionia, Herodotus tells us, who first made the Greeks acquainted with the Adriatic, with Tyrrhenia, Iberia (Spain), and Tartessus (the region round Cadiz). The first impulse to these distant voyages arose from a mere accident. At the time of the foundation of Cyrene, about the year 630 B. C., a Greek of Samos, by name Colæus, when on his way to Egypt, was carried by contrary winds beyond the pillars of Heracles to Tartessus. There he found a virgin market, from which he returned to realise a profit of 60 talents (£12,000), an amount only surpassed by the gains of Sostratus of Aegina, who was the premier of Greek merchants. But this was the beginning and the end of Samian trade to the West; why they

left it to the Phocaeans to enter into the riches which they had discovered, we cannot say, but within thirty years of this date, the enterprising Ionian town sent out a colony to Massilia near the mouth of the Rhone, in the district known as Liguria. . . . The mouth of the Rhone was the point where all the routes met which traversed France from the English Channel to the Gulf of Genoa. Of these Strabo specifies three. Merchandise was carried by boats up the Rhone and Saône, from which it was transferred to the Seine, and so passed down the river; or it was taken by land from Marseilles (or Narbo) to the Loire; or again carried up the Aude and transported thence to the Garonne. By one or other of these routes, the wares collected by the Gaulish merchants—more especially the tin, which they imported from Britain—was brought into the Greek market, if indeed it was not carried on pack-horses straight across the narrowest part of the country. The importance of these lines of transit at a time when the western Mediterranean was held by the Carthaginians, and the northern Adriatic by the Tyrrhenians, can hardly be over-estimated. The colonists extended their borders by degrees, though not without severe contests with the Ligurians and Tyrrhenians by sea and land. New cities were founded to serve as outposts against the enemy: Agatha in the direction of the barbarians of the Rhone; Olbia, Antipolis, and Nicaea in the direction of the Salyans and Ligurians of the Alps. They also spread themselves down the coast of Spain.”—E. Abbott, *History of Greece*, pt. 2, ch. 13.

“The city of Athens, which had developed rapidly in the century preceding the Persian wars, rose to the first place among the Greek cities in the century in which they occurred (500-400 B. C.). The Athenians broke the power of Ægina in armed conflict, and appropriated its commerce; the Athenian sea-port, the Piræus, became the leading commercial port of the Greek world, and remained so until the Macedonian period (about 300). . . . Even in times of defeat, when its war-navy was scattered and its leagues and alliances broken up, [Athens] was still able to control a large part of the trade of the Ægean and Black seas, and maintained an important commerce with the South and West. The favorable situation of the city, and the ability and energy of its navigators and business men, enabled it to conduct a large carrying trade for other peoples, and many of the exports were foreign wares which were merely transshipped in the Piræus. Of native wares it exported silver and coin, from the mines near the city, some natural products (oil, figs, honey, wool, marble) of comparatively slight importance, and especially manufactured wares, of which pottery was the chief. . . . The chief import was wheat, on which Athens was then as dependent as England is now; the city had grown so great by trade that the surrounding country was unable to support it. The great granary of Athens was the level country north of the Black Sea, and the Athenians made extraordinary efforts to control the narrow entrance to the Black Sea, that they might assure their food supply. They were not entirely dependent on this source, however, and imported wheat also from Sicily, Egypt, Syria, and the mainland to the North. Among the other imports were ship-building materials, salt fish, slaves, raw materials for the Athenian manufacturers, and articles of luxury. . . . The commercial policy of the Athenians was framed with an eye especially to the interests of the consumer. What duties were levied were low, and had no leaning to ‘protection’ in the modern sense. The export of articles

especially desired (wheat, ship-building materials) was restricted in the hope of keeping up the home-supply, and commercial advantages were granted or withheld with the idea of exercising political pressure on other states; but nothing like modern protectionism can be found in the commercial policy of this period. [See also ATHENS: B. C. 470-476]. . . . We are now approaching a point when a great change came over the ancient world. The isolation of the earlier states of antiquity is their most striking feature. Each one lives only unto itself. It rises in civilization and then declines, without sharing its gains and losses with other states. It may conquer and hold them for a time, it is true, but it rules them as foreign territory, with alien interests; and the great empires crumble as readily as they are made. This characteristic of ancient history is one of its main difficulties to the student, for it deprives him of any bond of connection between the peoples, and forces him to pass from one to another of them, until he feels lost in the complexity of the narrative. . . . The unity of the Christian faith was needed to confirm the union of peoples in a common civilization. The process of union begins, however, at the point which we have reached; the great conquests of Alexander of Macedon, and those of Rome, did much to break down the barriers between peoples, and to prepare them for the acceptance of a common civilization and a common religion. . . . Alexander united the eastern world into an empire extending from Greece to India, a little before 300 B. C., and . . . the Romans began about 200 B. C. to extend their authority outside the Italian peninsula, and before the birth of Christ had subjected to it practically all the peoples whose history we have been studying. . . . In appearance the empire of Alexander outlived its founder but a few years, and then dissolved. Alexander, however, was a civilizer as well as a conqueror; he endowed the East with a common fund of Greek culture; and however distinct or hostile the states might seem thereafter the peoples were united as they had never been before. Commerce took on a new aspect. Greece, which before had been at the center of the great commercial movements, was now left on the western edge. Greek merchants could for a time use their former commanding position to share in the great commercial development, but in the long run their struggle was hopeless. The most energetic Greeks left their home to settle in eastern countries which were richer, more populous, and closer to the great currents of trade. Corinth was the only city which managed to maintain and extend its trade. Athens declined rapidly in commercial importance; and grass grew and cows were pastured in the streets of other towns which had once been important markets.”—C. Day, *History of commerce*, pp. 10-21.—See also BOSPORUS: Ancient and medieval periods; EUROPE: Ancient: Greek civilization: Freedom of culture, etc.; SYBARIS.

B. C. 200—A. D. 800.—Commerce under the Roman empire.—“In entering on the period of Roman domination we need spend no time over the earlier history of the city which came to rule the world. The Romans were not a commercial people. Even in the last two centuries B. C., when Rome extended her sway over the eastern countries . . . and subjected a large part of the West as well, Rome did not become a commercial center. The city grew to unparalleled size, it is true, and required immense imports of food to support the population. These imports came, however, as taxes and tribute to the conquerors. Rome

supplied no exports of considerable amount, and built up no great carrying and forwarding trade such as would have made the city the center for the exchanges of other people. The service which the Romans gave to the world of their time, and for which they received such rich reward, was not economic but political in character; they were the greatest organizers and administrators of antiquity, and by their skill in the arts of war and government succeeded in living on the labor of subject peoples. They were not mere parasites. They earned all that they received by one great contribution, 'pax Romana.' Roman peace, which continued almost unbroken for centuries, and which furnished an opportunity for commercial development before unknown. . . . The study of commerce in the Roman period resolves itself, as suggested above, into a study of commerce in the different regions of which the great Roman state was composed. In the East commerce developed on the lines which have already been described; Alexandria and Antioch continued to be great markets for Oriental wares, coming now even from

and no considerable trade. The five hundred years (roughly) of Roman rule made some striking changes in the Roman provinces of the West (modern Spain, France, England; not Germany or countries farther east). It kept the people in order, and gave them an opportunity to acquire the elements of a higher civilization. The fact that modern Spanish and French are based on Latin remains always a striking testimony to the Roman influence on the provincials. . . . It is easy, however, to overestimate the results of this influence, especially so far as regards economic progress. Rome gave her subject peoples of the West a chance at commercial development, but none had sought it and few were ready to profit by it. The Roman government constructed a system of military roads, models of their kind, which enabled troops and messengers to reach speedily the different provinces. Romans settled in the provinces as officials or private gentlemen, and Roman culture was acquired by the wealthy provincials; cities and large landed estates formed centers of industry and exchanged manufactured products

TRANSPORTATION OF MERCHANDISE IN EARLY HISTORY

India and China; and Carthage remained an important outlet for the African trade. Asia Minor, northern Africa, and southeastern Europe reached the very pinnacle of their historical development in the Roman period; these countries have never since attained to anything like the prosperity they then enjoyed. We shall not have the time hereafter to notice the commerce of these regions in detail; the reader may take it for granted that merchants struggled strenuously to keep the place they had reached, and that decline came slowly, when it did come later. Our attention must be directed hereafter mainly to the West. It was there that the most important states of modern Europe arose, and there that commerce grew up in its modern form. Our chief interest must be to know what progress the peoples of the West made under Roman rule, and how far commerce had developed among them. . . . The peoples of the West were far behind those of the East in civilization. They have sometimes been compared to the American Indians, and though the comparison is inexact in detail and may easily mislead, it gives still a rough indication of their backwardness. They lived more from the products of their flocks and herds than from agriculture, when the Romans came in contact with them; they had practically no towns,

for the raw materials of the surrounding districts. The roads, however, seem to have served mainly Roman purposes, and the cities and culture depended mainly on Roman influence for their support. The mass of the people remained passive, and advanced slowly. Most of them lived by agriculture in the country districts, producing the things necessary for their own subsistence and a small surplus for the Roman tax-gatherer; they received for their surplus no wares which would have formed the basis of commerce. However much Rome did to efface the difference of race, language, and national tradition, such differences remained to hinder commerce; and peoples were still separated by great distances and by serious physical barriers. The commercial development of the West, though it may seem great in comparison with conditions in the following period of disorder, was very limited even at the height of Roman power. . . . The time came soon when the provincials could no longer look to Rome for protection and stimulus. In the third century, A. D., the Roman government began to go to pieces. It lacked the force to repress internal revolts in the provinces, and to repel the inroads of barbarians on the frontiers. The process of decline had already proceeded far before the

'Fall of Rome' (476), when even the shadow of authority passed from the Roman Emperor of the West. The remnants of Roman rule centered henceforth about the eastern capital, Constantinople. In the West barbarian chieftains established government of a kind on the fragments of the Roman state, but endeavored in vain to follow the models which the Romans had set them. The motives to commerce grew weaker as Roman culture disappeared, and the obstacles to commerce increased rapidly with the decline in public order. Brigandage and piracy became more profitable than honest industry; roads and bridges deteriorated; the course of rivers was obstructed. Even a great ruler like Charlemagne, who had himself crowned Emperor in 800, could do little to stay the process of decline, and weaker successors could do still less. The last remnants of the Roman organization seemed to have passed away, and the European world passed into the 'Dark Ages.'—C. Day, *History of commerce*, pp. 26-29.—See also AQUILEIA.

A. D. 200-600.—Gaul under the Romans and after the fall of the empire.—Export and import.—Agriculture and manufacture.—Roman roads.—Water transport.—Effects of barbarian invasions.—Fairs and pilgrimages.—“In the second century of our era, in the time of Trajan and the Antonines, Gaul with its fertile fields, its beautiful meadows, its magnificent forests, was one of the best cultivated countries of the Roman world. It exported into Italy grain from Aquitaine, Celtic and from the country of the Allobroges (Dauphiné), flax from Cadurques (Quercy) and Bituriges (Berry), hemp from Auvergne and the valley of the Rhône, spikenard from Provence (*valeriana celtica* according to M. Littré) renowned in the Roman pharmacopeia, oak and pine from the immense forests which still covered the Pyrenees, the Cévennes, the Alps, the Jura, the Vosges and nearly all the north of Gaul (forest of Ardennes), horses from Belgium, wool from the Narbonnaise, cheese from the Alps and from Nîmes, hams and salt provisions from Séquanais (Franche-Comté), and the Pyrenees. The wines of the Narbonnaise and the valley of the Rhône, often adulterated and little relished by the Italians, were notwithstanding one of the principal objects of commerce in the interior of Gaul, in Great Britain and Germany. The oysters of the Mediterranean and even those of the Atlantic and the Channel which the ancients had perhaps found means of keeping in fresh water, figured upon the tables of the gourmets of Rome. We know that long before the conquest, the Gauls took gold from the sands of their rivers and that in certain regions (Upper Pyrenees), territory of the Tarbelles, and Val d'Aoste, territory of the Salasses, they extracted gold from the auriferous rocks by processes quite analogous to those which are now employed by the great Californian companies. These mines which were yet in existence under Augustus were not long in being exhausted, but the iron of Berry, Sénonais, Périgord, Rouergue, the valley of the Rhône and of the Saône, the copper of the Pyrenees (Saint-Etienne-de-Baïgorry), of the Alps (country of the Centrons, now Upper Savoy), of the Cévennes (Cabrières in Hérault and Chessy in Rhône), the tin of Limousin, the argentiferous lead of the territory of the Rutènes (Rouergue), of the Gabales (Gévaudan), of the Centrons, etc., were mined and wrought with a skill which placed the metallurgy of Gaul in the first rank of the industries of the empire. These mining operations, superintended by the State, although they belonged to the proprietors of the soil, were often directed

by companies which combined the working of the metal with its extraction from the ore. One which had its seat at Lyons is known to us by many inscriptions. Textile industries were not less flourishing than metallurgy, the manufacture of sail-cloth was carried on all over Gaul; the bleached linens of Cahors, the carpets of the Narbonnaise, the sagums of mingled bright colors were renowned even in Italy.

“The progress of commerce had followed that of agriculture and manufacture. The network of Roman roads planned by Agrippa was completed and four roads accessible to carriages or beasts of burden, crossed the Alps by the passes of the Little (Graius Mons) and of the Great Saint-Bernard (Summus Penninus), of Mount Genève (Mons Matroua) and of the Argentière: the Corniche road stretched along the Mediterranean from Genoa to Marseilles; those of the pass of Pertus (Summo Pyrenoeco), of the valley of Aran, of the Somport, of Roncevaux, and from Lapurdum (Bayonne) to Pampeluna connected Gaul to Spain. . . . Notwithstanding the competition of new roads, river navigation had retained all its activity. . . . We know from inscriptions of a certain number of associations for water transportation which appear to have played a great rôle in the interior commerce of Gaul from the first century of our era. The boatmen of the Rhône, the Saône, the Durance, the Seine, the Loire, the Aar, an affluent of the Rhine, formed corporations recognized by the State, organized on the model of cities, having their regulations, property, elective chiefs, and patronized by great personages who charged themselves with defending their interests against the Roman authorities. The most celebrated, if not the most important of these associations, is that of the *Nautæ Parisiaci*, the memory of which has been preserved to us by the remains of an altar raised, under Tiberius, at the point of the Isle of the City (the ancient Lutetia) and found in 1711 under the choir of Notre-Dame. . . . The two great commercial ports of the Mediterranean were Narbonne and Arles, after Marseilles had lost her maritime preponderance and was only a city of science, luxury and pleasure. . . . Immense labor upon embankments and canalization which had thrown within Narbonne the mass of the river and deepened the maritime channel made of the metropolis of the Narbonnaise one of the safest ports upon the coast of Gaul. It communicated with the Rhône by the navigation of the lakes (*étangs*) which at that time extended without interruption to the western mouth of the river, with the ocean by the course of the Garonne, navigable from Toulouse (Tolosa). The port of the Garonne was then as now Bordeaux (Burdigala) which already had intercourse with Great Britain and Spain. Arles, connected with the sea by the canal of Marius and perhaps also by the small arm of the Rhône and the navigation of the lakes (*étangs*), was a maritime port and at the same time the outlet for the navigation of the Rhône which was prolonged by the Saône as far as Chalon (Cabillonum). Upon the banks of the river rose the wealthy cities of Tarascon, Avignon (Avenio), Orange (Arausio), Vienne. Lyons is the commercial and also the political metropolis of Gaul, the seat of the most powerful manufacturing and commercial companies; the boatmen of the Saône and the Rhône, the wine merchants, the mining and smelting company of the valley of the Rhône. Above Chalon, four great commercial routes start from the valley of the Saône. The first ascends the Doubs as far as Besançon (Vesuntio) and terminates at the Rhine near

Augst (Augusta Rauracorum), where the river is already navigable. The second follows the valley of the Saône and descends by the Moselle, navigable above Trèves (Augusta Trevirorum), and by the Meuse, toward the middle and lower valley of the Rhine. . . . The third route, that from the Saône to the Loire, set out from Chalons, crossed Autun (Augustodunum), and reached the Loire above Orléans (Genabum, later Aurelianum). Goods embarked upon the river arrived, after a voyage of 370 kilometers (2,000 stades), at Nantes (Portus Namnetum) which appears to have been substituted, about the beginning of the first century, for the ancient port of Corbilo and which was also in intercourse with Great Britain. The fourth route, that from the Saône to the Seine, crossed Autun, was there divided into two branches which went by way of Avallon and Alise to meet at Sens (Agedincum) on the Yonne, and descended the Seine to its mouth by Melun (Melodunum), Paris (Lutetia) and Rouen (Rotomagus). This was the shortest route between the new province of Britani and the Mediterranean; but the ancients notwithstanding the progress of navigation, always distrusted long passages by sea; so the principal emporium of commerce with Britani was not Caracotinum (Harfleur), the port of the Seine, but Gesoriacum, later Bononia (Boulogne), which is distant only 50 kilometers from the English coast. It was there that Caligula erected that gigantic pharos known to the middle-ages under the name of the tower of Odré and which existed until 1645. . . .

"When one thinks of Gaul in the second half of the 5th century, after those great streams of invasion which swept it for fifty years, one easily fancies that the flood has carried everything away, that the Roman institutions have disappeared, that private fortunes are swallowed up in a frightful catastrophe, that the barbarians have enslaved the Gallo-Romans, that social life is suspended, manufactures ruined, commerce interrupted. This picture which responds to the idea we form of a barbarian conquest, is necessarily exaggerated, because the Germanic invasion was not a conquest. The Germans who established themselves upon the Roman territory, those even who had employed force to make a place for themselves within it, did not consider themselves conquerors, but subjects and soldiers of the Empire; they dreamed so little of destroying it that they aspired to serve it whether it would or no. . . . Notwithstanding the decadence of manufactures and the inevitable disorders which weakness of the central power brings in its train, commerce appears to have preserved a certain amount of activity. In the 6th century, post stages still existed. Upon the Roman roads, maintained and repaired by the Mérovingians, heavy wagons which served for the transportation of goods and travelers circulated with their teams of oxen or horses. Royal decrees commanded the preservation of towing-paths along navigable rivers; the rivers had remained the high-ways of interior commerce, and the boatmen's companies of Roman Gaul had perhaps survived the fall of the imperial domination. The ports of the Atlantic, Bordeaux and Nantes, those of the Channel, Alet (between Saint-Malo and Saint-Servan), Rouen, Quantovic (Étapes or Saint-Josse-sur-Mer?) on the bay of the Canche, Boulogne, were in relations with the Visigoths and the Suevi of Spain, the Irish, the Frisians, and received in exchange for the wines, honey, madder, grains and linens of Gaul, oils and lead from Spain, metals and slaves from Great Britain, coarse cloths from Ireland and finer fabrics which they were beginning to make in

Frisia. Marseilles, Arles, Narbonne, the great ports of the Mediterranean, were always the depots for the trade of the Orient, where their vessels went for spices, silks, papyrus from Alexandria, cloths and carpets from Antioch and Laodicea, which their merchants exchanged in part for money, in part for metals, honey, saffron, almonds and linens from southern Gaul, coral brought from Italy, and amber brought overland from the borders of the Ealtic. The conquests of the Franks, masters of central and southern Germany, had opened to commerce two new roads: one, by the Danube, stretched away to the frontiers of the Eastern Empire and to Constantinople through the countries occupied by the fierce tribes of the Avars and the Bulgarians; the other arrived by Thuringia in the regions where the Slav tribes, Sorbs (Mecklenburg, Brandenburg, Pomerania) and Wends (Bohemia, Moravia, Austria, Carinthia) dominated. In these uncultivated countries, covered with forests and marshes, in the midst of these warlike peoples, the merchants could risk themselves only in large caravans, sword at the side and lance in hand. These distant and perilous expeditions were attractive to the adventurous spirit of the Frank race. . . . Faith, as well as ambition, found its account in these journeys to the countries of the pagan. On the way, they distributed religious images to the heathen, they tried to convert them while profiting by them. . . . This mingling of commerce and religion is one of the characteristic traits of the middle ages, as it is of antiquity. The most ancient fairs of Gaul, that of Troyes which was in existence as early as the 5th century, that of Saint-Germain-des-Prés, that of Saint-Denis, which goes back to the time of Dagobert (620), were at the same time pilgrimages. This latter the most celebrated of all, under the Mérovingians, was held outside the walls of Paris, between the churches of Saint-Martin and Saint-Laurent, upon the lands watered by the brook Ménéilmontant; it was opened on the festival of Saint-Denis and continued four weeks, in order to permit, says its charter, merchants from Spain, Provence and Lombardy and even those from beyond the sea, to take part in it. . . . The fair of Saint-Denis was the rendezvous of merchants from all parts of Gaul and Europe. Beside the wines and oils of the South might be seen the honey and wax of Armorica, the linens and madder of Neustria, the metals of Spain and England, the furs of the North, the products of the royal manufactories; but the choicest goods were the spices, pepper, tissues of silk and of cotton, jewels, enamels, goldsmiths' work, which came from the Orient by the Mediterranean ports, more rarely by way of the Danube, and whose guardians were the Syrians or Jews destined to hold so great a place in the commerce of the middle ages. The Syrians,—and under this name the Franks comprehended, without doubt, all merchants native to Egypt or Roman Asia,—formed powerful communities at Marseilles, Narbonne, Bordeaux; at Paris they had sufficient influence to enable one of them, Eusebius, to succeed in purchasing the episcopate, in 591. . . . As to the Jews, a great number were already established in Gaul before the fall of the Roman Empire, but their prosperity dates only from the epoch of disorganization which followed the barbarian invasion."—H. Pigeonneau, *Histoire du commerce de la France (trans. from the French), tome 1, livre 1.*

MEDIEVAL

5th-8th centuries.—Arabian commerce.—Trade with China.—Spread of Mohammedan civilization.—Growth of cities.—Traffic in Asia and

Africa.—Conquest of southern Spain.—Trade of the Spanish Moors.—The earliest date to which any positive statement of intercourse between the Arabs and the Chinese “appears to refer is the first half of the 5th century of our era. At this time, according to Hamza of Ispahan and Masudi, the Euphrates was navigable as high as Hira, a city lying south-west of ancient Babylon, near Kufa (now at a long distance from the actual channel of the river), and the ships of India and China were constantly to be seen moored before the houses of the town. Hira was then abounding in wealth, and the country round, now a howling wilderness, was full of that life and prosperity which water bestows in such a climate. A gradual recession took place in the position of the headquarters of Indian and Chinese trade. From Hira it descended to Obolla, the ancient Apologos, from Obolla it was transferred to the neighbouring city of Basra, built by the Khalif Omar on the first conquest of Irak (636), from Basra to Siraf on the northern shore of the gulf, and from Siraf successively to Kish and Hormuz. Chinese Annals of the Thang dynasty of the 7th and 8th centuries, describe the course followed by their junks in voyaging to the Euphrates from Kwangcheu (Canton). . . . The ships of China, according to some authorities, used to visit Aden as well as the mouths of Indus and Euphrates. I do not think that either Polo or any traveller of his age speaks of them as going further than Malabar, the ports of which appear to have become the entrepôts for commercial exchange between China and the west, nor does it appear what led to this change. Some time in the 15th century again they seem to have ceased to come to Malabar. . . . The Arabs at an early date of Islam, if not before, had established a factory at Canton, and their numbers at that port were so great by the middle of the 8th century that in 758 they were strong enough to attack and pillage the city, to which they set fire and then fled to their ships. Nor were they confined to this port. . . . In the 8th century also the Arabs began to know the Chinese not only as Sinæ, but as Seres, i. e., by the northern land route. . . . Besides . . . communication by land and sea with Arabia, and with the various states of India, . . . there existed from an old date other and obscurer streams of intercourse between China and Western Asia, of which we have but fragmentary notices, but which seem to indicate a somewhat fuller mutual knowledge and freer communication than most persons probably have been prepared to recognise. Thus, China appears to have been well known from an early period to the Armenians.”—H. Yule, *Cathay and the way thither, preliminary essay v. 1, p. lxxvii-lxxxii*.—After the Arabs began their career as a conquering people, under Mohammed and his successors, and took possession of the great ancient fields of Asiatic and African commerce, with its highways and its capital seats, from Ispahan to Palmyra, Damascus, Baalbec, Tyre, Alexandria, and the old Carthaginian ports, they quickly caught the large ideas of trade that were then opened up to them. They improved the early caravan routes and established new ones in many directions. They dug wells, made cisterns and built caravansaries, or public places of shelter for travelers and traders, along the important desert roads. The pilgrimages which their religion encouraged had a lively traffic connected with them, and by spreading one language and one set of customs and laws over the wide region which they ruled, they helped commerce as the Romans had done. From Bagdad, the new capital city which they built on the

Tigris, nearly opposite the deserted ruins of Babylon, on the other side of the Chaldean plain, they carried on direct trade with India, through Afghanistan; with China by three routes through Bokhara, or Tartary; with Siberia and with Russia, to the very center of it, through the agency of the Turkish and Tartar races. This city of Bagdad became a marvel of magnificence under the early Arabian caliphs. Other cities of Asia that acquired importance in manufactures or trade, or both, during the period of Arabian power, were Ispahan, in Persia, the woolens and linens from which were equally noted for their fineness; Damascus, in Syria, which produced cutlery of steel, and especially sword blades, that have never been surpassed, and which gave the name of “damasks” to certain raised patterns in linen that are well known by that term to this day; Herat, in Afghanistan, which was famous for its carpet looms and for its cultivation of saffron and assafœtida; Balkh and Khotan, in Bokhara, the former of which, on the banks of the Oxus, was a populous seat of trade between China, India and the West. From its great antiquity, Balkh was called “the mother of cities.” In their native country, the Arabs, during this brilliant period of their history, increased the ancient trade which they had carried on by sea, with India, on one hand, and with the eastern coasts of Africa, on the other. They extended the latter far south of the limits of ancient Ethiopia, and even to the island of Madagascar. There are few settlements now existing on the east African coast, below the straits of Babel-Mandeb, which were not of Arabian origin. The pilgrimages to Mecca, their holy city, where the remains of Mohammed were interred, made that a great market and both industry and commerce were enlivened throughout the Arabian peninsula. As masters of Egypt, the Arabians reorganized with fresh vigor the ancient caravan traffic with central Africa and with the countries on the Upper Nile. Alexandria, it is true, lost much of its former importance. This was owing, in part, to the bitter hostility that existed between the Mohammedans and the European Christians, which broke up, for a long period, nearly all open commerce between the two. But Alexandria was also hurt by the rise of new Arabian cities, in Egypt and on the Barbary coast, which drew away some of the trade that had centered almost wholly at Alexandria before. Cairo, the modern capital of Egypt, stood first among these and became a wealthy seat of many manufactures and of much commercial exchange. The interior caravan traffic of Egypt centered principally at Syene, while Temnis and Damietta were busy productive towns. Within the old Carthaginian dominions, west of Egypt, on the Mediterranean, the Arab conquerors revived a traffic quite as extensive, perhaps, as the greatest that ancient Carthage had controlled. Not far from the site of that ancient emporium, and twelve miles from the modern city of Tunis, they built the now forgotten city of Kirwan, which was one of the largest and most magnificent of its time. It was a point from which numerous caravan routes led southward into the heart of the African continent, even beyond the great desert, as well as eastward to Egypt and westward to the Atlantic coasts and Spain. Many flourishing towns surrounded this African metropolis and were the centers of many different activities, such as the cultivation of grain, the making of salt, the rearing of silk-worms and the production of silk. In Mauretania, which embraced the modern empire of Morocco and part of Algiers, the Arabs introduced the same spirit of enterprise. In their hands,

the barren country—which has since become almost a desert again—was made fertile, through wide regions, by extensive irrigation, and produced wheat, olives, grapes, dates and other fruits in great abundance, besides feeding flocks and herds of sheep, goats, horses, asses and camels in rich pastures. The people became skilful in several manufactures, including weaving and dyeing, the making of silk and gold thread, the mining and smelting of copper and iron, the preparation of soap and the tanning of leather. From the Atlantic coast of the Mauretanian dominion, the Arabs pushed their traffic far down the western shores of the continent, while they opened caravan routes to the interior quite as widely, perhaps, as they did from Kirwan and from Egypt. The chief city that they founded in Mauretania was Fez, which still bears witness to its former glory in a lingering university, or collection of Mohammedan schools; in the remains of many mosques, and in a vast number of caravansaries. The native inhabitants whom the Arabs found in Mauretania derived from their country the name of Moors. They embraced the Mohammedan religion and joined their Saracen conquerors in invading Spain, 712. This led, in Europe, to the applying of the name "Moors" to the whole of the mixed races which took possession of southern Spain, and finally gave that name to all the Mohammedans on the western Mediterranean coasts. But the Moors and the Arabs were distinct races of people. The conquest of southern Spain gave the Arabs the finest field in which their energy and genius were shown. They made the most of its mineral treasures, its delightful climate and its fertile soil. On the remains of Roman Civilization, which Vandals and Visigoths had not wholly destroyed, they built up, with wonderful quickness, a new culture—of industry, of manners and of taste, of art, of literature, of government and of social life—that was splendidly in contrast with the rude state of Europe at large. The trade of the Spanish Moors was considerably extended among the Christians of Europe, notwithstanding the religious enmities that opposed it. The products of their skilful workmanship were so eagerly desired, and they controlled so many of the coveted luxuries found in Africa and the East that their Christian neighbors could not be restrained, by war nor by the commands of the church nor by the hatred which both stirred up, from dealings with them. With other parts of the Mohammedan dominion, and with the countries in commercial connection with it, the trade of Moorish Spain was active and large. In exchange for the varied products which they received, they gave the fine fabrics of their looms; exquisite work of their goldsmiths and silversmiths; famous leather; iron, quicksilver and silver from the old Spanish mines, which they worked with new knowledge and skill; sugar, the production of which they had learned and introduced from India; olive oil, raw silk, dye-stuffs, sulphur and many commodities of less worth. The career of the Arabs, in the large region of the world which they conquered, was brilliant but not lasting. The energy which carried them for a time far ahead of their slower neighbors in Europe showed signs of decay before two centuries of their career had been run.

7th-9th centuries.—Early western trade with China.—During the Tang Dynasty the intercourse between China and other considerable powers was not only closer but conducted on more nearly equal terms than at any other time. . . . The neighboring kingdom of Tibet is first mentioned in the annals for 634 A. D., as sending am-

assadors with tribute and being able to raise a large and formidable army. . . . Appeals from Persia and India for help against the Saracens were addressed to China more than once in the 7th and 8th centuries; and the heir apparent to the Persian throne resided for a time as hostage at the court of China. . . . But for the physical structure of the continent, which isolates India and China, while freezing Tibet and nomadizing Tartary, the spread of Arab conquest round or across the desert would have reached a point near enough to bring about a collision with China. As it was, a general impetus was given to foreign travel and foreign commerce; and . . . colonies of traders established themselves in the southern ports, as well as along the continental trade routes. . . . About the year 700 A. D. a market for strangers was opened at Canton, and an imperial commission appointed to levy duties. In 714 A. D. we hear of a petition of foreign merchants, arriving by way of the southern sea, which is forwarded from the coast in quite modern fashion for the emperor's consideration. It set forth all the precious things which the merchants could bring from the countries of the West, and represented them as only desirous of collecting medicinal drugs and simples. Unfortunately for the traders, they arrived at the beginning of a new reign, when a vigorous attempt had been made to put down the luxury of the court. . . . It was concluded to take no further notice of the petition. Foreign trade continued to exist on sufferance, but so far as the Chinese were concerned, it was limited by the attitude of the Government to a moderate exportation of staple commodities, paid for in foreign coin or precious metals. What China had to sell was much more important to the Western nations than anything she or her rulers could be prevailed upon to buy; and so long as the trade dealt with surplus manufactures, like silk, or natural products, like musk or rhubarb, and did not endanger the local food supply, it was not interfered with. In 794 A. D. complaints were made that trade was leaving Canton for Cochinchina, but the traders' schemes for recovering or pursuing it were discouraged by the Government, which opined that there must have been intolerable extortions used to drive it away, or a want of natural inducements to bring it, and quoted the Shoo: 'Do not prize strange commodities too much, and persons will come from remote parts.' Arab geographers and travellers of the 9th century show what a development had been reached by foreign commerce under this modified freedom. The Jewish merchants described by Ibn Khordadbeh as speaking Persian, Latin, Greek, Arab, Spanish, Slavonic, and *Lingua franca*, and trading by sea and land to the remotest regions, had their representatives at Canton; and the four trade routes, enumerated by Sir Henry Yule, enabled all the great commercial communities to try their hand at the China trade. The first of these routes led from the Mediterranean over the Isthmus of Suez, and onwards by sea; another reached the Indian sea via Antioch, Bagdad and Bussora and the Persian Gulf; a third followed the coast of Africa by land from Tangiers to Egypt and thence by Damascus to Bagdad, while the fourth led south of the Caspian Sea and north of the central Asian desert to the gates of the Great Wall. The Chinese traders either met the Western merchants at Ceylon, or themselves came as far as the mouth of the Euphrates."—E. J. Simcox, *Primitive civilizations*, v. 2, bk. 4, ch. 12, sect. 2.

7th-13th centuries.—Medieval fairs.—Importance in the commercial system.—"A word should

be said about the place of fairs in commerce [in the later Middle Ages]. The merchants travelled over these routes to the great annual fairs which were held for days at a time in various places. These fairs were necessary in an age of small towns and of a very limited shop-keeping class. The population mostly lived in small towns. In England, for example, only ten towns contained more than 5,000 inhabitants. In these villages a trader could hardly find permanent custom for his wares. Besides, a wider market for the villages was needed. These demands the fairs met. The annual pilgrimage to Mecca was the occasion of such a fair in the East. Winchester in England had a fair lasting sixteen days. The great common was covered with booths and tents, and divided into streets, called after the names of the wares sold therein, such as the 'Drapery,' the 'Pottery,' the 'Spicery.' Smithfield and Stourbridge near Cambridge were other great centers. In Europe, Beaucaire on the Rhone in France, and Leipsic in Germany were great fair centers. The greatest European fair, existing up to the present was that of Nijni-Novgorod in Russia. Railroads, easier communication and larger cities have done away with the necessity of the fair and the class of travelling traders. Their place is taken by the great international exhibitions and by commercial travellers."—W. H. Benham, *Trade and trade centers of history*, pp. 36-37.—"The fairs always attracted people for social as well as business purposes; life in the Middle Ages would be regarded as insufferably dull at the present time, and both townspeople and country people enjoyed the excitement which the fair brought with it. There were 'side-shows' in plenty, then; wild animals, trained dogs, and monstrosities, poets and musicians, actors and clowns, dancing and gambling halls; and there was a good opportunity to turn a penny dishonestly as well as honestly. . . . The fair ordinarily grew up under the protection of some feudal lord, secular or ecclesiastical, who endeavored in every way to further its growth that he might increase his revenue from the taxes he imposed on it. The lord of a fair endeavored to attract merchants by guaranteeing them protection on their way, and there were many cases in which the lord took up the cause of merchants of his fair who had been robbed or maltreated by others, and forced restitution. Furthermore, he endeavored to secure exemption from tolls for wares on the way to his fair, and sometimes merchants on their way to a fair were freed from the attachment of the person for debt. Inside the fair a freedom of trade was allowed which was unusual at the time, and various special privileges were granted the merchants. The most important of these was a special court in which cases of breach of contract and the like could be tried. It was called the Court of Pie Powder (Pie, French *pie*, foot, *curia pedis pulverizati*, court of dusty foot) from the dusty feet of the merchants, or, as some said, because justice was done as speedily as dust would fall from the foot. At any rate this court did give a rough and ready means of settling commercial disputes by referring them to a committee of traders, which was highly prized because commercial law was still in its infancy, and no justice could be looked for in a manorial or a feudal court. . . . It would be possible to give a long list of fairs, for every country of Europe had them in varying number at different times. The oldest was probably that of St. Denis at Paris, which may have been founded (as its patrons alleged) in the seventh century, and which was certainly in active operation long before the time of

Charlemagne. In a later period another Paris fair, that of St. Germain, became more important, and later still the fairs in the French province of Champagne became the most flourishing in Europe. The prosperity of these fairs was due in part to their geographical position, which made them a natural trade center and distributing point when commerce on land was more important than that on sea, but still more, apparently, to the good government and wise policy of the Counts of Champagne. The Counts gave sufficient protection both at home and abroad, maintained regular and reasonable dues, and did everything to stimulate the confidence of the merchant class. They got an enviable reputation by their strictness in forcing the proper execution of contracts made at the fairs, and took such precautions to assure the payment of debts contracted there that some merchants (or bankers) went to the fairs simply to loan money. . . . In the thirteenth century, the period of their greatest prosperity, six fairs were held at different places in Champagne, of which Troyes and Provins, south-east of Paris, were the most important. Each lasted over six weeks, and, following in rotation, they supplied an almost continuous market. Here one might find all the wares which formed the objects of commerce in Europe; textiles of silk, wool, and linen; minor manufactures and jewelry; drugs and spices; raw materials like salt and metals; leather, skins, and furs; foods and drinks, live stock and slaves. The bulk of the trading was done by merchants from various parts of France and Flanders (modern Belgium) and by Italians who came up over the Alpine passes; there were also Germans and Spanish, and, in less number, English, Dutch, and Swiss. Wares came from more distant countries, Scandinavia and the eastern Mediterranean, but changed hands on the way. The fairs declined as heavier dues were imposed, and especially when Champagne was brought directly under the French king, about 1300; wars diverted the merchants from Champagne to Flanders, and the growth of tea-trade favored this same movement. The Champagne fairs dwindled to insignificance, and their place was taken by the fairs of Bruges and Cologne, of Frankfurt on the Main, Geneva, and Lyons. . . . England was near the circumference of trade in this period, instead of being at the center as it now is, and its commerce was not so highly developed as that of some of the Continental countries. The English fairs, therefore, were of less importance, and in most cases did not attract merchants from distant countries. The largest English fair was Stourbridge Fair held about a mile from Cambridge, in an excellent position for trade with the low countries across the Channel, and for the distribution of goods through the thickly populated districts of England. Another great English fair was that of Winchester, held each year for sixteen days."—C. Day, *History of commerce*, pp. 64-65, 67.

8th-10th centuries.—Constantinople the center of European trade.—Imports from Asia.—Rise of Venice and Genoa.—Trade routes between Europe and the East.—"The commerce of Europe centered at Constantinople in the 8th and 9th centuries more completely than it has ever since done in any one city. The principles of the government, which reprobated monopoly, and the moderation of its duties, which repudiated privileges, were favorable to the extension of trade. While Charlemagne ruined the internal trade of his dominions by fixing a maximum of prices, and destroyed foreign commerce under the persuasion that, by discouraging luxury, he could enable his

subjects to accumulate treasures which he might afterwards extort or filch into his own treasury. Theophilus prohibited the persons about his court from engaging in mercantile speculations, lest by so doing they should injure the regular channels of commercial intercourse, by diminishing the profits of the individual dealer. . . . During this period the western nations of Europe drew their supplies of Indian commodities from Constantinople, and the Byzantine empire supplied them with all the gold coin in circulation for several centuries. The Greek navy, both mercantile and warlike, was the most numerous then in existence. Against the merchants-ships of the Greeks, the piratical enterprises of the Egyptian, African, and Spanish Arabs were principally directed. Unfortunately we possess no authentic details of the commercial state of the Byzantine empire, nor of the Greek population during the Iconoclast period, yet we may safely transfer to this time the records that exist proving the extent of Greek commerce under the Basilian dynasty. Indeed, we must remember that, as the ignorance and poverty of western Europe was much greater in the 11th and 12th centuries than in the 8th and 9th, we may conclude that Byzantine commerce was also greater during the earlier period. The influence of the trade of the Arabians with the East Indies on the supply of the markets of western Europe has been overrated, and that of the Greeks generally lost sight of. . . . The Byzantine markets drew their supplies of Indian and Chinese productions from Central Asia, the trade passing north of the caliph's dominions through the territory of the Khazars to the Black Sea. This route was long frequented by the Christians, to avoid the countries in the possession of the Mohammedans, and was the highway of European commerce for several centuries. Though it appears at present a far more difficult and expensive route than that by the Red Sea and the Indian Ocean, it was really safer, more rapid, and more economical, in the 8th, 9th, and 10th centuries. This requires no proof to those who are acquainted with caravan life in the East, and who reflect on the imperfections of ancient navigation, and the dangers and delays to which sailing vessels of any burden are exposed in the Red Sea. When the Venetians and Genoese began to surpass the Greeks in commercial enterprise, they endeavored to occupy this route and we have some account of the line it followed, and the manner in which it was carried on, after the East had been thrown into confusion by the conquests of the Crusaders and Tartars, in the travels of Marco Polo. For several centuries the numerous cities of the Byzantine empire supplied the majority of the European consumers with Indian wares, and it was in them alone that the necessary security of property existed to preserve large stores of merchandise. Constantinople was as much superior to every city in the civilized world, in wealth and commerce, as London now is to the other European capitals. And it must also be borne in mind, that the countries of central Asia were not then in the rude and barbarous condition into which they have now sunk, since nomad nations have subdued them. On many parts of the road traversed by the caravans, the merchants found a numerous and wealthy population ready to traffic in many articles sought after both in the East and West; and the single commodity of furs supplied the traders with the means of adding greatly to their products. Several circumstances contributed to turn the great highway of trade from the dominions of the caliphs to Constantinople. The Mohammedan law, which prohibited all loans at

interest, and the arbitrary nature of the administration of justice, rendered all property, and particularly commercial property, insecure. Again, the commercial route of the Eastern trade, by the way of Egypt and the Red Sea, was suddenly rendered both difficult and expensive, about the year 767, by the Caliph Al Mansur, who closed the canal connecting the Nile with the Red Sea. The harvests of Egypt, which had previously filled the coast of Arabia with plenty, could no longer be transported in quantity to the ports of the Red Sea; living became expensive; the population of Arabia declined; and the carrying trade was ruined by the additional expenditure required. [See also ARABIA: Ancient succession and fusion of races.] The caliph certainly by this measure impoverished and depopulated the rebellious cities of Medina and Mecca to such a degree as to render their military and political power less dangerous to the central authority at Bagdad, but at the same time he ruined the commerce of Egypt with India and the eastern coast of Southern Africa. Since that period, this most important line of communication has never been restored, and the coarser articles of food, of which Egypt can produce inexhaustible stores, are deprived of their natural market in the arid regions of Arabia. The hostile relations between the caliphs of Bagdad and Spain likewise induced a considerable portion of the Mohammedan population on the shores of the Mediterranean to maintain close commercial relations with Constantinople. A remarkable proof of the great wealth of society at this period is to be found in the immense amount of specie in circulation. . . . The poverty of Europe at a later period, when the isolation caused by the feudal system had annihilated commerce and prevented the circulation of the precious metals, cannot be used as an argument against the probability of this wealth having existed at the earlier period of which we are treating."—G. Finlay, *History of the Byzantine empire, 716-1057, bk. 1, ch. 4, sect. 1.*

8th-16th centuries.—Industry and commerce in the Netherlands.—Frisians and Flemings.—Industrial arts.—Demand for products.—Fishes.—Agriculture.—Growth of seaport towns.—The two peoples who inhabit the region called the Netherlands—a purely Germanic stock in the north (modern Holland) and a mixed but largely Celtic population in the south (modern Belgium)—have had a history so much in common that it cannot well be divided, though they have differed in experiences as widely as in character. The struggle with nature for a foothold in the lowland itself was harder in the north than in the south, and no doubt that is why the Teutonic Frisians led the way in industrial training. It was among them that the arts of weaving and dyeing were cultivated first to a notable excellence. As early as the age of Charlemagne (eighth and ninth centuries), Frisian robes, of white and purple woolen stuffs, are mentioned among the choice gifts which the emperor sometimes sent to foreign princes, and even to the great caliph, Haroun al Raschid. In the ninth century, Frisian weavers are said to have been persuaded by an enterprising count of Flanders to settle in his dominions at Ghent and introduce there a better knowledge of their art. But if the Flemish people borrowed from the Frisians in this matter, they soon outran their teachers and made the loom their own peculiar property. The shuttle, ere long, was in the hands of a very large part of the whole south Netherland or Belgian population, and they became almost a nation of weavers. The same Count Baldwin of Flanders who brought the Frisian weavers into Ghent estab-

TYPICAL HARBOR TOWN AT THE TIME OF THE HANSEATIC LEAGUE

lished annual markets, or fairs, in various towns, which drew merchants from abroad, promoted trade and stimulated manufacturing industries throughout the country. Woolen, linen, and finally silk looms multiplied to a prodigious extent, and the weavers in all these branches acquired remarkable skill. The working of metals was also learned with great aptness, and Flemish cutlery, weapons and armor became very nearly as renowned as those of Milan and Damascus. Tanning was another valuable art which the Flemings and their Netherland neighbors cultivated, and the tilling of the soil was so industriously pursued that flax, hemp, grain and other farm products were raised quite abundantly for sale abroad. In the north Netherlands—the Hollow-land of the sturdy "Free Frisians" and Batavians, who were afterwards called the Dutch—the hard working energy of the people had been pushed in some different directions. The old trade of weaving was still vigorously carried on, in nearly every important town, and Dutch woolens, Damask linens, carpets, velvets, etc., were largely produced and widely sought after; but this industry was never so prominent as it became in the Belgian provinces. The fortunes of the Hollanders were founded to a large extent upon their fisheries, and especially the herring fishery, which assumed great importance in their hands after the middle of the twelfth century. Before that time, they appear to have been obliged to seek the herring in other waters than their own—along the shores of England, Scotland and Norway. But some change in the movements of those curiously swarming fish, about the time above mentioned, brought great shoals of them to the Dutch coast, and the herring harvest thereafter was a rich source of gain to the Hollanders. They discovered some secrets of salting or curing the fish which were very much valued, and the Dutch herring were eagerly bought for all parts of Europe. The making of pottery was another industry to which the Dutch applied themselves with success, and particularly at the town of Delft, which gave its name for many centuries to the common earthenware used in western Europe. In dairy farming and skilful horticulture, or gardening, the Hollanders were superior to all other people at an early time. Wherever sea-fisheries are extensive, sailors and ship builders are trained and ocean navigation and commerce are sure, in time, to be prosperously pursued. It was so with the Dutch. Their Frisian ancestors had suffered so much on their coasts from the harassing raids of the Norse pirates, or Vikings, that they did not figure very early in seafaring enterprise. But they fought the free-booters in their stubborn and stout-hearted way and were able at last to make the harbors of their coast tolerably safe. From that time the seaport towns of Holland grew rapidly, and Dutch merchants and merchant ships, trading with the cities of the Baltic, with England and with Flanders and France increased in number. (See FLANDERS: 13th century.) The Hollanders had an advantage in this matter over their Flemish neighbors of the South Netherlands. They were provided with better harbors and they held the outlets of the great rivers in their hands. This latter was the cause of incessant quarrels between the two peoples. The fifteenth century found the whole Netherlands, both north and south, in a thriving state, so far as industry and trade were concerned, notwithstanding bad government and disorderly times. The people were counted among the richest in Europe. Many great and wealthy cities had grown up, containing large populations and very busy ones. In the north, there were

Dordrecht or Dort, Hoorn, Zierikzee, Haarlem, Delft, Leyden, Deventer, Enkhuizen, Middelburg, Nimeguen, Utrecht, Rotterdam, and Amsterdam, which last named city eclipsed them all in the end, though it was one of the latest to rise. In the south there was Ghent, with forty thousand weavers inside its strong walls, who were always as ready to string the bow as to throw the shuttle, and whose hot-tempered revolts against tyranny and wrong are among the most exciting incidents of history. There was Bruges, which became for a time the great emporium of the commerce of northern and southern Europe, but which lost its importance before the fifteenth century closed. There was Antwerp, which succeeded to the trade of Bruges and rose to unrivalled rank; and there were Lille, Mechlin (or Malines), Courtrai, Ypres, Louvain, and other towns, all centers of flourishing manufactures, chiefly those of the loom.—See also ANTWERP: Naming of the city; NORMANS: Influence of Vikings upon the British Isles.

VIKING SHIP

the slow revival of commerce which took place in Christian Europe, during the later part of the Middle Ages, no one city or people can be said to have taken a lead from the beginning. At various points, north and south, on the Mediterranean and the Adriatic, on the Baltic, on the Rhine and other rivers which flow into the North sea, and on the Danube, (see DANUBE: B. C. 5th-A. D. 15th centuries) the Dnieper and the Don, centers of trade were growing up in a gradual way, out of which it would be hard to name one that ranked much above the rest for many generations. But the eleventh century brought a great commercial leader to the front. This was Venice. The circumstances of the founding of Venice in the fifth century, and the history of the rise of the singular republic, are given elsewhere. (See VENICE: 452.) The condition of the unfortunate refugees, who sought shelter from invading savages on a few small mud banks, barely separated from the shore of their Adriatic coast, did not seem to be a promising one. Nor was it so. While the neighboring parts of Italy were being overrun by Huns, Goths and Lombards in succession, and while the settlement of the barbarous new races was going on over all southern Europe, in the midst of great disorder and constant war, these islanders and their descendants, for generations, were protected as much by their poverty as by the shallow waters that surrounded them. They had nothing to tempt either plunder or conquest.

They lived by salt-making, fishing and fish-salting. They began trade in a small way by exchanging their salt and salted fish for other articles. It grew in their hands from year to year, for they were enterprising, industrious and courageous. Procuring timber on the opposite Dalmatian coast of the Adriatic, they became expert ship builders and sailors. The safety of their situation caused increasing numbers of their Italian fellow countrymen to join them. The islands of the Venetian lagoon were, in time, all occupied, and bridges between several of them were built. From the

GENOESE OCEAN BOAT OF THE 15TH
CENTURY

(From a contemporary woodcut)

selling of salt and fish to their neighbors, the Venetians went on to more extensive commercial business. By slow degrees, they took the occupation of general merchants, buying goods here and there to sell again. They became friendly with the Greeks on the eastern side of the Adriatic, in Dalmatia and Albania, and this led them into important relations, both commercial and political, with the Byzantine empire and its capital city, Constantinople. By the time they had gained wealth and consequence enough to attract the notice of their rough neighbors and invite attack, they had also gained strength enough to defend themselves. They took part then in the wars of the Byzantines, rendering valuable services in Italy and elsewhere, and they joined the Greeks in destroying the pirates who infested the Adriatic sea. The early important trade of the Venetians was with Constantinople, where they enjoyed, for a long period, the peculiar favor of the Byzantine rulers. After the Saracens had mastered Syria and Persia, and taken possession of Alexandria (640), Constantinople became the emporium of Eastern trade, adding it to a great traffic which the Byzantine capital had always carried on with the Tatar and Russian territories in Asia and Europe. When the Venetians gained a footing there, as political friends and favored merchants, their fortunes were made. While the Greeks were busy in desperate wars with their Mohammedan neighbors, these enterprising Italians took into their own hands more and more of the profitable trade which the Greeks had opened to them. They soon had the handling of Byzantine commerce in western Europe almost wholly. From partners they became rivals, and

especially in the Russian traffic, which they drew away from Constantinople, to a large extent, by opening direct dealings with the Russian traders, at a market place established on the Dnieper. From the beginning of the Crusades, in the eleventh century, the rise of Venetian commerce and Venetian power was very rapid (see VENICE: 1127-1128). The Venetians were prepared, as no other people were, at the time, to furnish fleets, both for transportation and for naval war. They enlisted in the crusading enterprises with a zeal which was not, perhaps, purely pious. Their carrying ships were busy conveying men and supplies; their war galleys were in the front of some sea fighting with the Moslems, and more with Christian rivals; their shrewd politicians were alert, at all points and among all parties, looking after the interests of the republic; their merchants were everywhere ready to improve the new opportunities of trade which these times of excitement opened up. In all directions, and throughout the whole of Europe, new activities were awakened, and especially such as led to a busier trade. The crusaders who lived to return, into France, Flanders, Italy, Germany, and England, brought home with them many ideas which they had picked up in the East, and much new knowledge of oriental products and arts, all of which became widely diffused and produced great effects. The result was to stimulate and improve the industries and to increase the commerce which the Europeans carried on among themselves, as well as to greatly enlarge their demand for the products of the Asiatic world. A new era in European commerce was opened, therefore, by the Crusades, and the Venetians, by their enterprise, their energy and their early experience, took the lead in its activities. (See CRUSADES: Effects and consequences of the Crusades in Europe.) They organized the traffic between the East and the West, the North and the South, upon a great scale, and centered the larger part of it in their island city. By sea and by land they managed it with equal vigor. Their merchant fleets were under the protection of the state and made voyages, at regular and appointed times, under the convoy of vessels of war. On the landward side, they arranged an extensive trade with the interior of Germany, Hungary and Bohemia, through the Tyrol and Carinthia. As the first bitterness of hatred between Christians and Mohammedans wore away, they grew willing to trade with one another, though the popes still forbade it. The Venetians were among the first in such willingness. Having many quarrels with the Byzantine Greeks, they were eager to reopen the old eastern market at Alexander, and did so at the earliest opportunity. From that beginning they spread their trade with Arabs, Moors and Turks, along the whole Mohammedan line, in Asia and Africa. (See VENICE: 810-961.) But, though Venice took the lead in the reviving commerce of the Middle Ages and held it substantially to the end of that period of history, she had powerful rivals to contend with, and the strongest were among her near neighbors in Italy. The same commercial spirit was alive in several other Italian cities, which had grown up in the midst of those disorderly times and had contrived to acquire more or less of independence and more or less of power to defend themselves. Amalfi, Genoa and Pisa were the earliest of these in growing to importance, and Florence at a somewhat later day rose to high rank. Florence, which did not become a free city until near the end of the twelfth century, gained its subsequent wealth more by manufactures and by banking than by trade. Its chief

products were woollens, silk and jewelry, and its money-lenders were everywhere in Europe. (See FLORENCE: 12th; and 14th-15th centuries.) The commercial career of Amalfi was cut short in the twelfth century by events connected with the Norman conquest of southern Italy. Pisa, an ancient city, whose history goes back to Etruscan times, was a considerable seat of trade while Venice was little known; but she fell behind both Venice and Genoa, soon after those vigorous republics were fairly entered in the race. The Pisans prospered highly for some time, by going into partnership or alliance with the Venetians, first, and afterwards with the Genoese; but they quarreled with the latter and were ruined in the wars that ensued. After the thirteenth century Pisa had no commercial importance. The most formidable rival of Venice was Genoa, a city which claims to be, like Pisa, of more than Roman antiquity. In the trade of the Levant—that is, the eastern ports of the Mediterranean sea—the Genoese pushed themselves into competition with the Venetians at an early day, and they seemed for some time to hold an equal chance of controlling the prize. During the later part of the twelfth century, such unfriendly feelings had grown up between the Venetians and the Byzantine court that the latter transferred its commercial favors to the merchants of Genoa, Pisa and Amalfi, and gave them many privileges at Constantinople. The Venetians were thus placed at a disadvantage in the Bosphorus and the Black sea; but they did not long submit. In 1204 they persuaded one of the crusading expeditions to join them in attacking Constantinople, which was taken, and the dominions of the ancient empire of the East were divided among the captors, Venice receiving a goodly share. (See BYZANTINE EMPIRE: Civilizing influence; 1203-1204; 1204-1205.) This was a golden era for Venice and she improved it to the utmost. For almost sixty years she triumphed over her rivals completely. But in 1261 her merchants were again expelled from Constantinople and the Black Sea. The Greeks had continued to hold a large part of the ancient domain of the Byzantine empire in Asia Minor, and now, with the help of the Genoese, they succeeded in retaking their old capital city. The Frank empire, or Latin empire as it was differently called, which the Crusaders and the Venetians had set up, was extinguished and the Genoese again took the place of the Venetians as masters of the Byzantine trade, including that of the Black sea and the Asiatic traffic which was carried on from its ports. But by this time the better disposition to deal commercially with one another had grown up between the Christians and the Mohammedans. So the Venetians, when they lost their footing at Constantinople, very promptly went over to Alexandria and made excellent arrangements with the Saracens there, for supplying Europe once more with the commodities of the East, by those easier and shorter ancient routes which Christian commerce had not used for several hundred years. This opening of trade with the Mohammedan races, at Alexandria, and elsewhere soon afterwards, may easily have repaid the Venetians for what they lost in the Byzantine direction; but they did not give up the latter. A long series of desperate wars between the competitors ensued, with such shiftings of victory that Venice seemed sometimes to be almost in a hopeless strait; but, in the end, she broke the power of her rival completely. The final peace, which was concluded in 1381, left her quite undisputedly, for a time, the mistress of the Mediterranean and its trade. (See GENOA: 1261-1299; VENICE: 1378-

1379, and 1379-1381; also CONSTANTINOPLE.) Both the northward and the southward lines of traffic between Asia and Europe, through Alexandria and through Constantinople, were now chiefly in the hands of the Venetians. Between those great courses were important minor currents of commerce, along caravan routes through Asia Minor and Syria, which they mainly controlled. The trade of the rich islands of the Levant and of Moorish Africa was under their management for the most part, and they found on the northern shores of the Black sea a commerce with the Russian region which the Genoese had increased while they ruled in those waters. For three quarters of a century the Venetians enjoyed this large extent of commerce with the East. Then the Turks came, besieged and captured Constantinople (1453) and spread over the country which they now occupy. For the next two centuries the Venetians were at war with the Turks—defending Christendom in the Mediterranean with little help. At the same time they had to encounter an almost fatal attack from Christian princes who had become jealous of their formidable wealth and power and who united against the republic in the shameful league of Cambrai (see VENICE: 1508-1509). They

A GENOESE CARRACK, 1542

might have recovered from this attack, for they still held the Mediterranean trade; but a great event had occurred, just ten years before the league of Cambrai, which was more fatal than war, not to Venice alone, but to most of her rivals in trade as well. This was the discovery, by Vasco da Gama, of the ocean passage to the Eastern world around the Cape of Good Hope. The toiling traffic of desert caravans, to Alexandria, to Constantinople, to Tyre, Antioch, Ephesus and Erzeroum, was soon reduced to insignificance. The rich trade of the Indies and of all the farther East—the trade of the silk countries and the cotton countries, of the spice islands, of the pearl fisheries, of the lands of ivory, of ebony, of gold, of precious stones, of fragrant gums, of curious things and curious arts—was quickly swept into a different course—into broader seas than the Mediterranean and into new lands.—See also VENICE: 14th century; 15th-17th centuries.

12th-13th centuries.—Commerce in northern Europe.—Baltic cities.—Development of the Hanseatic League.—The earliest commercial sea-ports of north-western Europe had their rise, not on the North sea, but on the Baltic and the straits which enter it. The Northmen of that region were not alone in the traffic which grew up there,

for the Wends (a Slavonic people), who occupied most of the southern shores of the Baltic, east of the Elbe, appear to have stoutly rivalled them from the first. Björko, on an island in lake Maelar, Sweden (the inlet upon which Stockholm is situated), was one of the first of the seats of commerce at the north. It is supposed to have been destroyed about 1008. But the most famous was the city of Vinet, or Vineta, on the island of Usedom, at the mouth of the river Oder. It may not have been quite as rich and magnificent a town as some would infer from accounts given in early chronicles; but no doubt it was remarkable for the age, in that part of the world, and carried on a large trade. The Swedes and Danes were the destroyers of Vineta, before the middle of the ninth century, and the former people are said to have carried away from it great quantities of marble, brass and iron work, with which they gave splendor to their own newer city of Wisby, then just rising on the island of Gothland. The career of Wisby lasted several centuries and it was prominent in commerce throughout the Middle Ages. All that can be said of that most ancient commerce in northern Europe is gathered from sources which are uncertain and obscure. It is not until the twelfth century that much of the real history of trade in the Baltic region opens. In 1140 the modern city of Lübeck was founded, on the site of a more ancient town, known as Old Lübeck, which is supposed to have been a thriving port of trade in its day but which had been utterly destroyed by its rivals or enemies. The new Lübeck established close relations with the Genoese and soon took the lead in the commerce of the north, among a large number of enterprising towns which, about that time, came into prominence on the northern coast and on the rivers which run to it. The city of Hamburg, on the Elbe, lying inland and not very distant from Lübeck, was one of the earliest of these. Like Lübeck, it had suffered destruction, in the constant warfare of the earlier time, and had made a new beginning of existence about 1013. Hamburg had access to the North sea by the Elbe and Lübeck to the Baltic by the Trave. Trading in different directions, therefore, by sea, they carried on an active traffic with one another, across the narrow stretch of land which divides them,—as they still do to this day. But this inland commerce was greatly disturbed by robbers who infested the country, until the two cities, Lübeck and Hamburg, in 1241, agreed to establish and support in common a body of soldiers for the protection of their merchants. That agreement is believed to have been the beginning of a wide-spread union which afterwards took shape among the commercial cities of northern Europe, and which became powerful and famous in the later history of the Middle Ages, under the name of the Hanseatic League.—See also HANSA TOWNS; BRUGES; 1300-1400; FEDERAL GOVERNMENT: Medieval league in Germany; INTERNATIONAL LAW: Maritime codes.

12th-16th centuries.—Oriental and Occidental trade routes.—European settlements in Asia.—Distribution of Eastern goods in Europe.—“In the fifteenth century Eastern goods regularly reached the West by one of three general routes through Asia. . . . The southernmost of these three routes was distinguished by being a sea-route in all except its very latest stages. Chinese and Japanese junks and Malaysian proas gathered goods from the coasts of China and Japan and the islands of the great Malay Archipelago, and bought and sold along the shores of the China sea till their westward voyages brought them into

the straits of Malacca and they reached the ancient city of that name. This was one of the great trading points of the East. Few Chinese traders passed beyond it, though the more enterprising Malays made that the centre rather than the western limit of their commerce. Many Arabian traders also came there from India to sell their goods and to buy the products of the islands of the archipelago, and the goods which the Chinese traders had brought from still farther East. The Indian and Arabian merchants who came to Malacca as buyers were mostly from Calicut and other ports on the Malabar coast, and to these home ports they brought back their purchases. To these markets of south-western India were also brought the products of Ceylon, of the eastern coast, and of the shore of farther India. From port to port along the Malabar coast passed many coasting vessels, whose northern and western limit was usually the port of Ormuz at the entrance to the Persian Gulf. A great highway of commerce stretched from this trading and producing region, and from the Malabar ports directly across the Arabian Sea to the entrance of the Red Sea. When these waters were reached, many ports of debarkation from Mecca northward might be used. But the prevailing north winds made navigation in the Red Sea difficult, and most of the goods which eventually reached Europe by this route were landed on the western coast, to be carried by caravan to Kus, in Egypt, and then either by caravans or in boats down the line of the Nile to Cairo. Cairo was a very great city, its population being occupied largely in the transmission of goods. A fifteenth-century traveller counted 15,000 boats in the Nile at one time; and another learned that there were in all some 30,000 boats belonging in Cairo engaged in traffic up and down the river. From Cairo a great part of these goods were taken for sale to Alexandria, which was in many ways as much a European as an African city. Thus a regular route stretched along the southern coasts of Asia, allowing goods produced in all lands of the Orient to be gathered up in the course of trade and transferred as regular articles of commerce to the south-eastern shores of the Mediterranean sea. A second route lay in latitudes to the north of that just described. From the ports on the west coast of India a considerable proportion of the goods destined ultimately for Europe made their way northward to the Persian Gulf. A line of trading cities extending along its shores from Ormuz near the mouth of the gulf to Bassorah at its head served as ports of call for the vessels which carried this merchandise. Several of these coast cities were also termini of caravan routes entering them from the eastward, forming a net-work which united the various provinces of Persia and reached through the passes of Afghanistan into northern India. From the head of the Persian Gulf one branch of this route went up the line of the Tigris to Bagdad. From this point goods were taken by caravan through Kurdistan to Tabriz, the great northern capital of Persia, and thence westward either to the Black Sea or to Layas on the Mediterranean. Another branch was followed by the trains of camels which made their way from Bassorah along the tracks through the desert which spread like a fan to the westward, till they reached the Syrian cities of Aleppo, Antioch, and Damascus. They finally reached the Mediterranean coast at Laodicea, Tripoli, Beirut, or Jaffa, while some goods were carried even as far south as Alexandria. Far to the north of this complex of lines of trade lay a third route between the far East and the West,

extending from the inland provinces of China westward across the great desert of Obi, south of the Celestial mountains to Lake Lop; then passing through a series of ancient cities, Khotan, Yarkand, Kashgar, Samarcand, and Bokhara, till it finally reached the region of the Caspian sea. This main northern route was joined by others which crossed the passes of the Himalayas and the Hindoo-Kush, and brought into a united stream the products of India and China. A journey of eighty to a hundred days over desert, mountain, and steppes lay by this route between the Chinese wall and the Caspian. From still farther north in China a parallel road to this passed to the north of the desert and the mountains, and by way of Lake Balkash, to the same ancient and populous land lying to the east of the Caspian Sea. Here the caravan routes again divided. Some led to the south-westward, where they united with the more central routes described above and eventually reached the Black Sea and the Mediterranean through Asia Minor and Syria. Others passed by land around the northern coast of the Caspian, or crossed it, reaching a further stage at Astrakhan. From Astrakhan the way led on by the Volga and Don rivers, till its terminus was at last reached on the Black Sea at Tana near the mouth of the Don, or at Kaffa in the Crimea. Along these devious and dangerous routes, by junks, by strange Oriental craft, by river-boats, by caravans of camels, trains of mules, in wagons, on horses, or on human shoulders, the products of the East were brought within reach of the merchants of the West. These routes were insecure, the transportation over them difficult and expensive. They led over mountains and deserts, through alternate snow and heat. Mongol conquerors destroyed, from time to time, the cities which lay along the lines of trade, and ungoverned wild tribes plundered the merchants who passed through the regions through which they wandered. More regularly constituted powers laid heavy contributions on merchandise, increasing many-fold the price at which it must ultimately be sold. The routes by sea had many of the same dangers, along with others peculiar to themselves. The storms of the Indian Ocean and its adjacent waters were destructive to vast numbers of the frail vessels of the East; piracy vied with storms in its destructiveness; and port dues were still higher than those of inland marts. With all these impediments, Eastern products, nevertheless, arrived at the Mediterranean in considerable quantities. The demands of the wealthy classes of Europe and the enterprise of European and Asiatic merchants were vigorous enough to bring about a large and even an increasing trade; and the three routes along which the products of the East were brought to those who were able to pay for them were never, during the Middle Ages, entirely closed. They found their western termini in a long line of Levantine cities extending along the shores of the Black sea and of the eastern Mediterranean from Tana in the north to Alexandria in the south. In these cities the spices, drugs, dyes, perfumes, precious stones, silks, rugs, metal goods, and other fabrics and materials produced in far Eastern lands were always obtainable by European merchants. The merchants who bought these goods in the market places of the Levant for the purpose of distributing them throughout Europe were for the most part Italians from Pisa, Venice, or Genoa; Spaniards from Barcelona and Valencia; or Provençals from Narbonne, Marseilles, and Montpellier. They were not merely travelling buyers and sellers, but in many cases were permanent resi-

dents of the eastern Mediterranean lands. . . .

"We have seen how the merchandise of the Far East flowed to the Eastern cities of the Mediterranean, and how it was gathered there into the hands of European merchants. It remains to follow the routes by which it was redistributed throughout Europe. Both Genoa and Venice had possessions in the Greek Archipelago which formed stepping-stones between the home cities and their . . . [settlements] in the cities of the Levant. Trading from port to port along these lines of connection, or sometimes carrying cargoes unbroken from their most distant points of trade, the galleys of the Italian, French, or Spanish traders brought Eastern goods along with the products of the Mediterranean as well as of their own home products. Venice may fairly be taken as a type of the cities which subsisted on this trade. Her merchants were the most numerous, widely spread, and enterprising; her trade the most firmly organized, her hold on the East the strongest. To her market-places and warehouses a vast quantity of goods was constantly brought for home consumption and re-port. From Venice, yearly fleets of galleys went out destined to various points and carrying various cargoes. One of these fleets, after calling at successive ports in Illyria, Italy, Sicily, Spain, and Portugal, and after detaching some galleys for Southampton, Sandwich, or London, in England, reached, as its ultimate destination, Bruges, in Flanders. Other goods were taken by Venetian merchants through Italy and across the mountains by land. Most of the re-export from Venice by land was done by foreigners. Over the Alps came German merchants from Nuremberg, Augsberg, Ulm, Regensburg, Constance, and other cities of the valleys of the Danube and the Rhine. They had a large building in Venice set apart for their use by the senate, the 'Fondaco dei Tedeschi,' much like those settlements which the Venetians themselves possessed in the cities of the Levant. The goods which they purchased in Venice they carried in turn all through Germany, to the fairs of France, and to the cities of the Netherlands. Merchants of the Hanseatic League bought these goods at Bruges or Antwerp or in the south German cities and carried them, along with their own northern products, to England, to the countries on the Baltic, and even into Poland and Russia, meeting at Kiev a more direct branch of the Eastern trade which proceeded from Astrakhan and Tana northward up the Volga and the Don. Thus the luxuries of the East were distributed through Europe. With occasional interruptions, frequent changes in detail, and constant difficulties, the same general routes and methods of transfer and exchange had been followed for centuries. It was the oldest, the most extensive, and the most lucrative trade known to Europe. It stretched over the whole known world, its lines converging from the eastward and southward to the cities of Syria, Asia Minor, and the Black Sea coast, and diverging thence to the westward and northward throughout Europe. With the close of the Middle Ages this ancient and well-established trade showed evident signs of disorganization and decline. The Levant was suffering from changes which interrupted its commerce and which made the old trade-routes that passed through it almost impracticable. The principal cause for this process of decay and failure was the rise of the Ottoman Turks as a conquering power."—E. P. Cheyney, *European background of American history*, pp. 22-27, 30-32.—See also BARCELONA: 12th-16th centuries; CAPITALISM: 14th century; INDIA: 1498-1580; MEDITERRANEAN SEA; POLAND: 14th century.

14th-16th centuries.—Development of English commerce.—“Whilst the Italians were vigorously pursuing their trade in India and Europe, and Spain was renowned for her manufactures; whilst the Hanse merchants were extending their factories, and Portuguese navigators were bent upon maritime discoveries; whilst the Dutch were struggling for independence, and France was planting the seeds of her industries; England was only known as possessing a few articles of commerce of great value. Her wools and her metals were eagerly sought by foreign traders, but she had no ships of her own to carry them abroad. She had many raw materials, but she produced no manufactures for exportation. Nor was her policy respecting foreign trade the most wise. The chief concern of the legislature in those days seemed to be to prevent foreign nations doing with English produce what, after all, the English could not do themselves. Again and again the export of wool was prohibited, or was hindered by prohibitory duties. . . . The people regarded the introduction of foreigners with the utmost jealousy. They resented their competition, they grudged their profits and their advantages. The guilds would not admit them as members, and it was hard for the poor strangers to establish a footing in England, even although Magna Charta had long before declared that all merchants shall have safety in coming to or going out of England, and in remaining and travelling through it, by land or water, for buying or selling, free from any grievous imposition. Anyhow, whatever the opposition of cities and corporations, the nation was benefited by the foreign merchants. Thankful, indeed, might England have been for the Lombards, who brought hither money and merchandise, banking and insurance; for the Flemings, who, driven by intestine dissension, found refuge on British soil, and became the founders of the woolen manufacture; and for the Huguenots, who brought with them the silk manufacture. . . . But a new era advanced. The discovery of the American continent by Columbus, and of a maritime route to India by Vasco da Gama, altered the course and character of commerce. Till then trade was essentially inland, thenceforth its most conspicuous triumphs were to be on the ocean. Till then, the Mediterranean was the centre of international trading. From thenceforth the tendency of trade was towards the countries bordering on the Atlantic. . . . It was not long . . . before England followed the lead of Spain and Portugal. John Cabot and his sons went in quest of land to North America; Drake went to circumnavigate the globe; Chancellor sailed up the White Sea to Russia; Wiloughby went on his ill-fated voyage in search of a north-eastern passage to India; Sir Walter Raleigh explored Virginia; the Merchant Adventurers pushed their adventures to Spain and Portugal; and English ships began to be seen in the Levant. Meanwhile, English trade enlarged its sphere, English bravery at sea became most conspicuous, and English industry advanced apace.”

—L. Levi, *History of British commerce, 2d ed., introduction*.—“In the 14th century the whole of the external, and much of the internal, trade of the country had been in the hands of foreigners; in the 15th our merchants began to push their way from point to point in the Mediterranean and the Baltic; in the 16th they followed slowly in the wake of other adventurers, or tried to establish themselves in unkindly regions which had attracted no one else. When Elizabeth ascended the throne England appears to have been behind other nations of Western Europe in the very in-

dustrial arts and commercial enterprise on which her present reputation is chiefly based.”—W. Cunningham, *Growth of English industry and commerce, v. 2, p. 2*.—See also AMERICA: 1572-1580; CAPITALISM: 13th-16th centuries; TARIFF: 15th-17th centuries.

15th century.—Trade and piracy.—“It would be wrong to infer from the prevalence of piracy at this period [the 15th century] that commerce must have declined. On the contrary, it was probably the increase of commerce, unaccompanied by the growth of adequate means for its defence, which made the pirate’s calling so profitable. Nor was the evil confined to the professional pirate class, if we may use the expression. Even recognised associations of merchants frequently indulged in practices which can only be characterised as piracy. Commerce, in fact, was deeply imbued with the spirit of lawlessness, and in these circumstances it is probable that the depredations of pirates did not excite the same alarm nor discourage trade in the same degree as would be the case in more law-abiding times. In the 15th century the profession of Christianity and extreme respectability were not incompatible with a life of violence and outrage, and it is to be feared that in some cases the Governments which should have repressed pirates by the severest measures, encouraged their depredations. Certainly they have never enjoyed such immunity from the strong arm of the law as in the 15th century. Outrage and robbery went on unchecked along the coasts and in the track of merchant vessels. No trader was safe even in the rivers and ports of his own country. The pirates burnt and sacked towns as important as Sandwich and Southampton; they carried off not only the goods they could lay their hands on, but men and women, and even children, whom they held to ransom. Unable to look to the Government for protection of life and property while they were engaged in trade, the merchants were thrown upon their own resources to provide security. The best method of grappling with the pirates, and that which was most frequently adopted, was for merchant vessels to sail together in such numbers that they could repel attack; and these voluntary efforts were sometimes aided by the Government. In 1406 Henry IV. granted the merchants 3s. on every cask of wine imported, and certain payments on Staple exports for purposes of defence. Two Admirals were appointed, one for the north and the other for the south, with full jurisdiction in maritime affairs and power to organise naval forces. But this scheme was unsuccessful. A similar expedient was tried in 1453, but abandoned two years afterwards. The only satisfactory remedy would have been a strong navy, but the conditions necessary for this had not yet been realised. The country could not have supported the charge of maintaining a strong naval force. . . . That merchants were beginning to realise the importance of the subject, and were becoming wealthy enough to build vessels of a considerable size, is evident from the operations of John Taverner, of Kingston-upon-Hull, and the famous William Cannynges of Bristol, the latter of whom is said to have possessed 2,470 tons of shipping and some vessels of 600 tons burthen.”—W. A. S. Hewins, *Industry and commerce (Social England, H. D. Traill, ed., ch. 7, v. 2)*.

ERA OF GEOGRAPHICAL EXPANSION

15th-16th centuries.—New routes and new markets.—Discoveries.—Effect of the closing of

the Levant trade by the Turks.—No sooner had the route by sea to southern and eastern Asia and the islands of the Indian ocean been found, than almost the whole traffic of Europe with that rich eastern world abandoned its ancient channels and ran into the new one. There were several strong reasons for this. In the first place, it cost less to bring goods by ship from India, Ceylon or China direct to European ports, than to carry them over long distances by land to the eastern shores of the Mediterranean and there ship them to the West. In the second place, by taking its new route, this commerce escaped the Moorish pirates in the Mediterranean, who had long been very troublesome. And, lastly, but not least in importance, the European merchants gained a great advantage in being able to deal direct with the East Indians and the Chinese, instead of trading at second hand with them, through Arabs and Mohammedan Turks, who controlled the Asiatic and African routes. So the commerce of the Indies, as it was generally called, fled suddenly away from the Mediterranean to the Atlantic; fled away from the Venetians, the Genoese, the Marseillaise, and the Barcelonians; from Constantinople, lately conquered by the Turks; from Antioch and Alexandria; and from many cities of the Hansa league in the north, which had learned the old ways of traffic and were slow to learn anything new. Soon many of the great marts which had been busiest, grew silent and deserted and fell into slow decay. The most enriching commerce of the world was passing to different hands and bringing younger races into the front of history. Historians have been generally found to "express a firm belief that the closing or the serious obstruction by the Ottoman Turks of the routes of oriental trade was the principal cause of the great maritime discoveries at the beginning of the modern age. . . . But the Turks had nothing to do with the two most important trade routes until they took Syria and Egypt in the winter of 1516 and 1517, while the greatest of the discoveries were made in 1487, 1492, and 1498, from 18 to 30 years before. The doubts raised by this serious anachronism have been justified by investigation. The Turks must be dethroned from their place beside Columbus. . . . Now, it is very easy to show that the routes of oriental trade were neither closed nor permanently obstructed before or during the period of the great discoveries. Certain wares were produced only in the east. To reach the west they must pass along the trade routes of the Levant. If these routes had been closed the wares could not have come. But pepper, ginger, cloves, cinnamon, mace, nutmeg, rhubarb, and the like, never ceased to be obtainable in western Europe from the Roman times to the present. The trade routes, then, were never permanently closed. But perhaps they were closed at times, or permanently obstructed, so that spices and other products of the east became very difficult to get in western Europe. What would be the evidence of such a permanent obstruction? Obviously, a permanent elevation of prices. If in the fourteenth and fifteenth centuries the advance of the Ottoman Turks or any other cause progressively obstructed oriental trade, the west would learn of it quite promptly by a progressive rise in the prices of oriental goods. . . . There was, [however] . . . an actual decline in the price of pepper in England during the incubation of the great discoveries. . . . Prices of other spices and of home-grown commodities fluctuated in the two countries quite similarly to those of pepper. It is therefore clear that there was no permanent elevation in the prices

of oriental products, and therefore there could have been no serious obstruction of the trade routes before the year 1500. More direct evidence can be found than that of the price of pepper in England and France. The Venetian diarists, Marino Sanuto the Younger and Priuli, who recorded the noteworthy events which came to their knowledge between 1406 and 1533, show that although successive disturbances of the Mameluke throne and the plague caused fluctuations of quantity, the old flow of oriental wares through Syria and Egypt was maintained unbroken down to 1502. In that year a new thing happened. The galleys from Beirut and Alexandria brought very few spices to Venice. In 1504 they brought none at all. The southern trade routes of the Levant had been emptied by the purchases of the Portuguese in India. Beginning with 1508, the Portuguese sent fleets to blockade the mouths of the Red Sea and the Persian Gulf. This seems to have been the first deliberate attempt on the part of anyone to stop permanently the passage of wares along any of the routes of oriental trade. . . . This was the situation when Selim I overthrew the Mameluke Sultans in 1516 and 1517. Instead of blocking the southern routes further, he took up the situation exactly where the Mamelukes had left it. He renewed the old treaties with Venice and the west, and took over the intention to crush the Portuguese naval power in the Indian Ocean by a fleet sent down the Red Sea. Except for the beginning of French participation in the Mediterranean trade, there was no marked change from this policy down to the time of Sanuto's death. It has been shown that the main or southern routes of oriental trade through the Levant were never closed before the great discoveries, and that the Turks, after conquering Egypt and Syria, made no effort to close them. The main contention is established, then. The Turks did not cause the great discoveries by blocking the routes of oriental trade. It is desirable to examine some lesser possibilities. Perhaps the acquisition by the Turks of the northern routes stimulated the great explorations, through causing fear that the Turks would some day control and close all the routes, and through diverting the energies of trading powers from the Mediterranean to the Atlantic. As for the first supposition, it lacks both probability and evidence. The Turks did not fight the Mamelukes before the war of 1485 to 1491, and then they were soundly beaten. Even in 1516 the outcome of the impending second war was believed to be uncertain. How, then, could westerners have expected that the Turks would one day close all the trade routes? Nor can I find the least evidence of such an expectation. The second supposition, that the Turks diverted the energies of Mediterranean trading powers so that they set out to seek new routes to India, is easily seen to be untenable. The governments of none of these, Venice, Genoa, Aragon, or Florence, had any part in the great discoveries. That was the work of the Atlantic powers, Portugal and Castile. Nor were the well-to-do citizens of the Mediterranean States more active. . . . One further line of possible influence of the Turks upon the great discoveries may be discussed. Christopher Columbus and John Cabot were Genoese by place of birth. Had not the northern regions of the Levant trade been reduced by the Turks, these men might have spent their lives in that trade, and never have become discoverers. But this is mere speculation. I believe that neither their own words nor those of their contemporary and later biographers express any consciousness of connection between their enterprises and the

rise of the Turks. Columbus seems to have found his inspiration in Portugal and Cabot in Arabia. The same documents, I may say, fail also to reveal any thought in the minds of these men that the old trade routes were or were likely to become closed or seriously hindered. Similar things may be said, by the way, of the documents that deal with Prince Henry the Navigator, of the histories of Turkey, and of Venetian writings and history, so far as I have been able to examine them. It does not belong to this discussion to determine the true causes of the great discoveries, after the influence of the Turks has been eliminated. The intellect and enterprise of Renaissance Europe were adequate to the project and its execution. There is a negative bearing upon the argument, however, in the fact that Mr. Payne seeks to eliminate all effort to find a new route to the East Indies from the motives of Henry of Portugal, while M. Vignaud tries to do the same for Christopher Columbus. M. Vignaud would in fact postpone the date when even the Portuguese thought of the eastern spice trade until the report of Covilham's journey to the east reached King John II, about the year 1400. In any case, two or three other motives, related to religion, crusading, conquest, and adventure, probably outweighed the seeking of spices in the minds of the great explorers and their royal supporters. How did the legend of the great influence of the Turks upon the maritime discoveries originate? I have not been able to trace it back to Thorold Rogers, but does it not bear the marks of being a survival of the catastrophic theory in that particular phase which makes the fall of Constantinople the determining event of modern history? Deprived some time ago of the distinction of causing the Italian Renaissance and the German Reformation, this theory has maintained a while longer its hold upon the great discoveries and the desolation of the Levant. It must certainly give up the great discoveries. I think it must also surrender the desolation of the Levant, for the decay of the regions through which the old trade routes passed was probably caused less by the presence of the Turks than by the absence of trade, inevitably attracted away by the superior advantages of the cape route. The possibility of climatic change also deserves consideration."—A. H. Lybyer, *Influence of the rise of the Ottoman Turks upon the routes of Oriental trade* (*Annual Report of the American Historical Association*, 1914, pp. 127-131).—See also AMERICA: 15th century.

15th-17th centuries.—Leadership of the Portuguese.—Discovery of the ocean route to the Indies.—Explorers and navigators.—It was not by accident that the Portuguese rose all at once, in the closing years of the fifteenth century and the early years of the sixteenth, to a position in which they controlled and directed the main current of trade between Europe and the Eastern world. The discovery by Vasco da Gama of an ocean route to the Indies, and all the results (hereafter described), which it yielded to his countrymen for the time, were a reward of enterprise which the Portuguese had fully earned. They had worked for it, patiently and resolutely, through almost a hundred years. The undertaking was begun, at about the commencement of the fifteenth century, by a Portuguese prince who ought to enjoy greater fame than if he had conquered an empire; because his ambition was nobler and the fruits were of higher worth to the world. He was known as "Prince Henry the Navigator," and he was the third son of the Portuguese king John I who was called the Great, on account of his success in wars

with the Castilians and the Moors. But this young son, Prince Henry, was much the greater man of the two. He could not endure the ignorance of his time with regard to the mysterious ocean that stretched westward and southward from the shores of the little country which his father ruled. He was bent on knowing more about it; and he was specially bent on having the Portuguese sailors make their way down the shores of the African continent, to learn where it ended and what track to the farther side might be found. Beyond cape Nun, at the southern extremity of the modern empire of Morocco, nothing was known of the western coast of Africa when Prince Henry began his work. The Phœnicians and Carthaginians, two thousand years earlier, had probably known more about it; but their knowledge was lost. Prince Henry studied everything that could give him light and became well convinced that round the continent of Africa there was a way to the Indies for bold sailors to find. Then he applied himself, with a zeal which never flagged, to the working out of that achievement. He was a young man when he began, and during more than forty years of his life he devoted his time and his means almost wholly to the fitting out and directing of exploring ships and he fixed his residence upon the most southerly promontory of Portugal, to watch their going and coming. But the art of navigation was so little understood and the navigators were so timid, that slow progress was made. Each explorer only ventured a little farther than the one before him; and so they went feeling their way, league by league, down the African coast. The forty-three years of Prince Henry's endeavors were consumed in reaching what is now the settlement of Sierra Leone, near the head of the gulf of Guinea. But even this added more than a thousand miles of the western coast of Africa to the maps of the fifteenth century and was a greater advance in geographical knowledge than had been made since Carthage fell. Before he died (1460), Prince Henry secured from the pope (who was supposed to have the giving of all heathen countries) a grant to Portugal of all these discoveries, both islands and mainland, and of all which the Portuguese explorers might make in the future, between Europe and India. So he died well content, let us hope, with the work which he had done for his country and for mankind. The enthusiasm for exploration which Prince Henry had awakened in Portugal did not die with him, though his efforts had met with unending opposition and excited much discontent. Repeated expeditions were still sent down the African coast, and they crept farther and farther toward the goal of desire. At last, in 1486, Bartholomew Diaz, with three ships, actually rounded the Cape of Good Hope without knowing it, and only learned the fact when he turned backward from his voyage, discouraged by storms. Eleven years later, Vasco da Gama set out, fired with fresh determination, by the great discovery of a new world which Columbus had so lately made for Spain, and this time there was no failure. He passed the Cape, sailed up the eastern shores of the African continent to Melinda, in Zanguebar, and thence across the Indian ocean to Calicut in Hindostan. The ocean route to India was now fully proved; the new era was opened and its grand prize plucked by the Portuguese—thanks to Prince Henry the Navigator.—See also PORTUGAL: 1415-1460; 1463-1498; INDIA: 1408-1580.

Having found the way to India by sea, the Portuguese were prompt in taking measures to make themselves strong in that part of the world and to control the trade with it. They were helped

in this effort by the grant of imagined rights which Prince Henry had obtained from the pope, long before. But they strengthened the rights which the pope gave them, by the older fashioned methods of conquest and possession. They began at once to plant themselves firmly at important points in the eastern seas and on the Indian coast. They sent out one of their ablest military men, Francesco d'Almeida, with a strong force of ships and volunteers, and appointed him viceroy of India. He took possession of several parts of the Malabar coast (the western coast of the southern extremity of Hindostan) and built forts in which garrisons were placed. He similarly established the Portuguese power in Ceylon, took possession of the Maldivé islands and founded trading settlements in Sumatra. The Venetians, who saw that their ancient trade with the East was doomed unless this new rivalry could be crushed, now joined their Mohammedan allies of Egypt in a great effort to drive the Portuguese back. A formidable fleet was fitted out on the Red sea and sent against Almeida. He was unfortunate in his first encounter with these allied enemies and lost the squadron that opposed them. But the resolute viceroy was undaunted. Recalled from his command, he refused to give it up until he had equipped and led another fleet against the navy of the Egyptians and completely destroyed it. The successor of Almeida, as viceroy of India, was a remarkable personage who is known in the annals of his time as "the great Afonso D'Albuquerque." The chronicle of his exploits in Africa and India, compiled by his son from his own letters and records, and entitled "The commentaries of the great Afonso D'Albuquerque," has been translated into English and published by the Hakluyt Society. He was a remarkably energetic commander, and very honest in his way, according to the notions of his time; but he did the work of subjugation and conquest which he was sent to do in a cruel and rapacious style. He was not rapacious on his own account; but he saw no wrong in anything done for the profit of his country. In the course of seven years he spread the Portuguese power so widely and fixed it so firmly on the East Indian coasts and in the neighboring seas that there was hardly an attempt for many years to disturb it. None but Portuguese ships dared enter the Indian ocean without special permits, and the few which received admission were forbidden to trade in spices—the most precious merchandise of the region. From the Indies the Portuguese made their way to the coasts of China and put themselves on friendly terms with its people. They were permitted to occupy the port of Macao and have possessed it ever since. Some years later they discovered the islands of Japan and opened the earliest European commerce with that singular country. (See JAPAN: 1593-1625.) So they held for a time the complete mastery of eastern trade and enlarged it to greater bounds than it had ever reached before. But they were satisfied with keeping the sources of the supply of eastern goods to Europe in their own hands. The first handling of the commodities was all that they tried to control. They brought to Lisbon the spices, silks, cotton, pearls, ivory, sugar, aromatic drugs and the like, which their ships and merchants gathered up, and there sold them to other traders, Dutch, English and German for the most part, who found the final markets for them and who enjoyed a good half of the profits of the trade. These latter derived great advantages from the arrangements—much more than they had gained in their trading with Genoa and Venice—and the commerce of

Holland and England grew rapidly as the result. But the glory and prosperity of the Portuguese, as masters of the rich traffic of the eastern world, were not of long duration. Before the sixteenth century closed, they had lost the footholds of their power and were slipping into the background very fast. By misfortunes and by folly combined, all the fruits of the patient wisdom of Prince Henry, the persevering courage of Vasco da Gama, the bold energy of Almeida, and the restless enterprise of Albuquerque, were torn out of their hands. Almost from the first, a greedy and jealous court had done all that could be done to destroy the grand opportunities in trade which the country had gained. Private enterprise was discouraged; the crown claimed exclusive rights over large parts of the commerce opened up, and these rights were sold, given to favorites and dealt with in many ways that are ruinous to successful trade. Royal jealousy sent three viceroys to divide among them the government of the Portuguese possessions in the East, when there should have been but one, and the same jealousy kept these vice-royalties ever changing. Of course, there was nowhere good government nor thrifty management of trade. In the midst of this bad state of things, the royal family of Portugal died out, in 1580, and Philip II of Spain set up claims to the crown which he was strong enough to make good. Portugal thus became joined to Spain, for the next sixty years, and was dragged into Philip's war with the Netherlands. Her Spanish masters did what they could to draw her trade away from Lisbon to Cadiz and Seville. The Dutch and English, her former customers and friends, made enemies now by Philip of Spain, pushed their way into the eastern seas, defying the mandates of the pope, and broke down her supremacy there. When the Portuguese, in 1640, threw off the Spanish yoke and asserted their independence again, calling a prince of the house of Braganza to the throne, there was not much left of their former power or their former trade. They still held Goa, on the western coast of Hindostan, and the Chinese port of Macao—as they do to the present day; and they retained, as they still do, considerable possessions in Africa. But their brief importance in navigation, in colonization and trade, was quite gone and they dropped back to a humble position in the history of the world. Even the management of their home trade with other countries fell mostly, after a time, into the hands of the English, who became their special allies and friends.

15th-17th centuries.—Spanish enterprise.—Discovery of America.—Colonies.—Exploitation of the new world.—"While the Portuguese were pursuing glory and gain in the track of Vasco da Gama, which led them south and east, the Spaniards were doing the same in the wake of the three little ships which Columbus, with a bolder hand, had steered westward, to strange shores which he never dreamed of finding. These newly opened regions of the globe, in the Atlantic and on both sides of it, were divided between the two nations by the pope, and it was a bold matter in those days to dispute his right. He gave to the Spaniards all islands and countries found west of a meridian line drawn $27\frac{1}{2}^{\circ}$ west of the island of Ferro, in the Canary group. This nearly corresponds with the meridian $45\frac{1}{2}^{\circ}$ west of Greenwich. To the Portuguese he assigned all discoveries east of it. So they both went on their appointed ways, with pious hearts and untroubled consciences, busily hunting for heathen lands to seize and despoil. But the eastern field, in which the Portuguese did most of their work, was one where com-

merce was old and where something of Europe and its people was already known. They were forced to look upon trade as the chief object of their pursuit. With the Spaniards the case was different. They found their way to a quarter of the world which Europe had never heard of and came upon people who never saw the faces of white men until then. These strange races of the new world were some of them quite as civilized, in certain respects, as the Spaniards who invaded them, and even more so, it would seem, in their notions of truth and in the refinement of their manners and modes of life. But they were simple and unsuspecting; they were not warlike in disposition and they were rudely and poorly armed. So the mail-clad cavaliers of Spain crushed them into helpless slavery with perfect ease. From the islands of the West Indies, which they discovered and occupied first, the Spaniards had soon made their way to the shores of the two continents of America, North and South. They found cities and nations which astonished them by their splendor and wealth and set them wild with greed. Europe looked poor in comparison with the shining wealth of Mexico and Peru. The Spaniards went mad with the lust of gold. They lost human feeling and common sense in their greediness to grasp the metal treasures of the new world. They were indifferent to the more precious and abounding products that it offered, and neglected to build up the great commerce which might have filled their hands with lasting riches. They made the old fable of the goose which laid golden eggs a piece of real history. They killed the goose; they destroyed their source of wealth in Peru and Mexico by their eager extortions. Of true commerce between the old world and the new there was little while the Spaniards controlled it. They did, in the course of time, ship considerable quantities of sugar, tobacco, hides, logwood, indigo, cochineal, cocoa, cinchona, or Peruvian bark (from which quinine is extracted) and other American products from their various colonies; but to no such extent as a wise and enterprising people would have done, having the same opportunities. Once a year, or once in two years, a fleet of ships was sent from Seville, at first, and afterwards from Cadiz, to Vera Cruz, for freights from Mexico, and another to Porto Bello, on the isthmus of Panama, for the South American freights. The ships which made the latter voyage were distinguished from the Mexican fleet by being called the galleons. For a long time, twelve galleons in the one squadron and fifteen ships in the other, making their voyage once a year, and sometimes only every other year, conveyed all the trade that passed between Spain and America; which shows how little the Spaniards drew from their great possessions, except the enormous treasure of silver and gold which a few ships could transport. This glittering treasure formed, in fact, the main cargo of the Peruvian galleons and the Mexican fleet. Before the close of the reign of Philip II the number of galleons was increased to about forty and that of the fleet to fifty or sixty. It is quite certain that no country had ever before received such a quantity of gold and silver as came into Spain during the sixteenth century. Instead of enriching, it ruined the nation. Neither rulers nor people had sense enough to see what a treacherous and delusive kind of wealth it formed, if trusted to alone. They vainly fancied that, with such a store of precious metals to draw upon, they could afford to despise the homely labors by which other people lived. With such mad notions as these, the honest industries of Spain were treated with

neglect or worse. Her trade with neighboring countries was looked upon as a business too insignificant for Spaniards to care for or trouble themselves about. It was mostly given over to the Dutch and Flemings, while they remained under Spanish rule, and it was afterwards kept up in great part by smugglers, Dutch and English. Agriculture decayed, and its destruction was helped by the formation of a great aristocratic company of sheep-farmers, called the Mesta, to which such tyrannical rights and privileges were given by the crown that the most fertile parts of Spain were finally turned into sheep-pasture, under its control. The best artisans and the most enterprising merchants of the kingdom were driven out, because they were Moors and Jews, or they were burned for Christian beliefs which the church did not approve. The Inquisition was so busy, with its racks and its fires, that no other business could thrive. Every kind of production dwindled, and for the supplying of all descriptions of wants the Spaniards were soon driven to look to other countries. The few who laid hands upon the riches coming in from the plunder of America spent it recklessly, in extravagant ways, while costly foreign wars which had no success, and plots in France and England which came to nothing, drained the coffers of the king. And thus the great stream of gold and silver which flowed into Spain from the new world ran out of it quite as fast, until nearly every other country in Europe held more of it than Spain herself. The strong hand with which the Spaniards were able at first, and for some time, to hold the vast domain of sea and land which the pope had given them and which their own sailors and soldiers had explored and seized, grew weak before the end of a hundred years after the memorable voyage of Columbus was made. The hardy Dutch, driven to revolt and enmity by tyrannical government and by cruel religious persecutions, attacked them everywhere, in the eastern and western world. The English, just beginning to grow ambitious and bold on the ocean, and constantly threatened by the armadas of Spain, did the same. But these were not the only enemies who harassed the Spanish colonies and fleets. In a general way, the whole world went to war with the insolent nation which claimed the lordship of the earth. There came into existence, in the seventeenth century, a powerful organization of pirates or freebooters, made up of daring men of all nations, who carried on for many years a villainous warfare of their own against the Spaniards at sea and against their American settlements. These buccaneers, as they were called, gained strongholds in several islands of the West Indies, from which the Spaniards were not able to dislodge them. Under the attacks of all these enemies, combined with her own misgovernment and her contempt and abuse of thrifty industries and fair trade—which no people can neglect without ruin—Spain steadily and rapidly sank.—See also PHILIPPINE ISLANDS: 1521.

16th-17th centuries.—Netherlands.—Business center of Europe.—Conquests by Spain.—Dutch ventures.—Mercantile companies.—American colonies.—In the first half of the sixteenth century, the people of the Netherlands were the tolerably contented subjects of that famous monarch, the emperor Charles V, who ruled in Spain, in Naples, in Germany (the old empire), and in Burgundy, as well as in the Lowland principalities, Flanders, Holland, and the rest. They were already very prosperous, working hard at many callings, trading shrewdly and busily with the rest of the world, and diligently picking up all kinds of

knowledge everywhere. In the southern provinces (which we may call the Belgian, because they are mostly now embraced in the modern kingdom of Belgium) the chief industries were those of the loom, in all branches of weaving; and in skilful workmanship of every kind the people were tasteful and apt. These provinces were the seat of a much greater and more general activity in manufactures than appeared in the states to the north of them (which we will call the Dutch states, without distinction, because they are now included in the kingdom of Holland). The latter were more extensively employed in fisheries, in navigation and in shipbuilding, although most kinds of industry, manufacturing and agricultural, were thrifty and successfully carried on. At the time when Charles V ruled the Netherlands, the city of Antwerp, in the Belgian circle of provinces, was the great metropolis of Netherland trade. It was much more than that. It was the foremost commercial capital of the world. The traffic which slipped away from Venice and Genoa, had fixed its central seat in this younger town on the Scheldt. It was sure to plant its new emporium somewhere in the Netherlands, because there was nowhere else in Europe so much energy, so much enterprise, so much industry, so much commercial wisdom, so much activity of domestic trade. Spain and Portugal held the wealth of the Indies and the Americas in their hands, but we have seen how incapable they were of using the commercial advantage it gave them. Lisbon, Cadiz and Seville were only depots for the transfer of merchandise; it was impossible to make them real capitals of trade, because they could not and would not furnish either the spirit, or the genius, or the organized agencies that it demands. The Netherlands, with their long schooling in commerce upon a smaller scale, were ready to meet every requirement when the new era opened and gave them their greater chance. There was no other mercantile organization so well prepared. The league of the Hansa towns was breaking and failing; the English were just beginning to show their aptitude for manufactures and trade. Some one of the Netherland cities was sure to win the sovereignty in commercial affairs which Venice gave up, and Antwerp proved the winner, for a time. During most of the sixteenth century, it was the business center of Europe. It was the gathering-place of the merchants and the seat of the money-changers and bankers. Two and three thousand ships were often crowded in its harbor, at one time. It distributed the merchandise of the East and West Indies, which it took from Portugal and Spain, and the manifold wares of the many manufacturing towns of Flanders, Brabant, southern Germany, to a great extent, and northern France. At the same time, its own looms, anvils, tanneries, glass-works, dyeing-vats and mechanic shops of various kinds were numerous and busy. Its thriving population was rapidly increased, for it welcomed all who came with skill or knowledge or money or strong hands to take part in its work. Such was Antwerp during the reign of Charles V, and at the time (1555-1556) when that weary monarch gave up his many crowns to his evil son, Philip II of Spain, and went away to a Spanish monastery to seek for rest. The government of Charles in the Netherlands had been hard and heavy, but the people were left free enough to prosper and to grow intelligent and strong. Under Philip the prospect changed. The story of his malignant persecutions and oppressions, of the revolt to which they drove the Netherland provinces, of the long, merciless war in which he strove to ruin or subdue them, of the inde-

pendence which the Dutch provinces achieved and the prosperous career on which they entered, is told in another place. Antwerp, the great capital of trade, stood foremost in the struggle, as became its greatness, and it suffered correspondingly. The death-blow to its fortunes was given in 1585, when, after a siege that is almost unexampled, it was taken by the Spaniards under Alexander Farnese, duke of Parma, and given up to pillage and slaughter. Its surviving inhabitants fled in large numbers, the greater part of them to Holland, some to England, and some to other countries. Commerce abandoned the port. The chief merchants who had made it the center of their undertakings chose Amsterdam for their future seat of business, and that city rose at once to the commercial rank of which Antwerp had been stripped by the stupid malice of its Spanish sovereign. While the Belgian Netherlands fell hopelessly under the fatal despotism of Spain, the Dutch Netherlands fought their way slowly to independence, which Spain was forced to acknowledge in 1648. But long before that time the Dutch republic had become a power in Europe—much greater in every way than Spain. Its foundations had been laid by the union of the seven provinces of Holland, Zealand, Friesland, Utrecht, Groningen, Overijssel and Gelderland. It had grown firmer and stronger year by year, and the people, after a time, had not only found themselves able to thrive generally in the midst of their desperate war with Spain, but the war itself opened their way to wealth and power. They learned, early, as we have seen, that they could attack their enemy to the best advantage at sea. In pursuing this ocean warfare they were led on to the East and West Indies, and soon broke, in both regions, the exclusive power which the Spanish and Portuguese had held. When Portugal was dragged into a fatal union with Spain, under Philip II, it had to suffer the consequences of Philip's wars, and it bore more than its share of the suffering. The Dutch and the English forced their way pretty nearly together into the eastern seas, and, between them, the Portuguese were mostly driven out. They divided the rich commerce of that great Asiatic and oceanic region, and, for a time, the most lucrative part of it was gained by the Dutch. While the English got their footing on the coasts of Hindostan and were laying the foundations of their future empire in India, the Dutch gained control of the spice-growing islands, which, in that day, were the richer commercial prize. The first Dutch fleet that rounded the Cape of Good Hope and made its way into East Indian waters, sailed under the command of one Cornelius Houtmann, who had been in the service of the Portuguese and learned the route. He started in 1595 with four ships and returned, after a voyage of eighteen months, with only two. He had lost more than half his men, and he brought back very little cargo to pay for the adventurous undertaking. But the Dutch were well satisfied with the experiment; they knew that more experience would lead to better success. Another fleet of eight ships was sent out in 1598 and when four of them returned the next year with a precious cargo of spices and other merchandise from Java, which they had procured very cheaply in exchange for the cloths, the metal wares and the trinkets that they took out, the delight of the nation can hardly be described. Part of the fleet had remained in the East to hold and strengthen the position they had gained, and other ships were sent speedily to join them. Very soon the armed merchantmen of the Dutch were thickly swarming in that part of the world, ready for fight or for trade, as the case

might be. So many companies of merchants became engaged in the business that too lively competition between them occurred and they threatened to ruin one another. But that danger was overcome in 1602 by joining the rival interests together in one strong association, to which the government gave exclusive rights of trade in the East. Thus the Dutch East India Company was formed. (See below, 16th-17th centuries: Merchant trading companies).—See also NETHERLANDS: 1504-1620; AMERICA: 1528-1648; ANTWERP: Name.

16th-17th centuries.—Industry and trade in England.—Foreign commerce.—“The Mistress of the Seas.”—The guilds almost always became, in time, oppressive monopolies, each acquiring, in its own department of business, such exclusive rights and privileges as practically shut out from that business all persons not admitted to its membership. This occurred among the merchants, as it did elsewhere, and English commerce grew up under the control of various societies of “Merchant Adventurers,” as they were called. The disputes and contests of these companies, at home and abroad, and their suppression of individual enterprise, appear to have hindered the growth of English commerce for a long period. But it did grow steadily, notwithstanding, and through the reigns of Henry VIII and Elizabeth, the number of English ships set afloat and of English merchants trading abroad, was rapidly multiplied. Meantime the English people gained skill in weaving, dyeing and other arts, and were fast extending the manufacture at home of their own famous wool. This, in turn, made the sheep farming more profitable, and so much land was taken for that purpose that other products were diminished and most articles of food rose in price. That occurrence caused grave anxiety, and the meddling statesmen of the time, who thought that nothing could go well if their wisdom did not regulate it by law began to frame acts of Parliament which directed how farming lands should be managed and how many sheep a single farmer should be permitted to own. The same kind of statesmanship took alarm at the spread of weaving, in a small way, among industrious villagers and country people, who set up looms and made and sold cloth, outside of the guilds of the town weavers. So the complaints of the latter were listened to, and Parliament forbade weaving to be done outside of certain towns, except for home use in the family of the weaver. There was much of that sort of legislation during Tudor times, and the industry and enterprise of the country had to struggle long and hard for freedom to fairly exercise themselves. But in spite of meddling statesmen and tyrannical monopolies, the people went on from year to year, learning more, doing more, producing more, wanting more, buying and selling more, and living in a better way. After about 1511, there appears to have been a considerable direct trade growing up between England and the countries of the eastern Mediterranean (the Levant), and consuls, to look after the rights and interests of English merchants, began to be appointed, at Candia, and elsewhere, as early as 1530. The voyage from London to the Levant and return then occupied from eleven months to a year. About 1535 the English made their appearance as traders on the Guinea coast of West Africa, disputing the exclusive rights which the Portuguese claimed there, and in 1537 they opened trade with the Moors of the Barbary coast, in northern Africa. In 1553 a chartered company of London merchants was formed with the object of exploring for a

northeastern passage to China, around Europe, through the Arctic seas, as a means of dividing the trade of the east with the Portuguese, who controlled the southern route, around Africa. This is believed to have been the first joint stock corporation of shareholders that was organized in England. Sebastian Cabot, then “Grand Pilot of England,” was at the head of it. The northwestern passage was not found, but the company opened a trade with Russia which proved to be exceedingly valuable. Excepting this, in lieu of the China trade which it could not reach, it became, as the Russia Company, a rich and powerful corporation. The success of the Russia Company stimulated the adventurous disposition of the English people and set other enterprises in motion. But still more energy was roused by the hostility of national feeling toward Spain. The destruction of the Armada broke the Spanish naval power and made the English bold. They began to navigate the sea from that time with intent to become its masters, though the Dutch were still superior to them in maritime strength and experience. During the reign of Elizabeth there rose a new race of vikings, very much like the old Norse heroes of the sea, and pursuing a very similar career. The most daring and most famous among them, such as Grenville, Drake and Hawkins, were more than half pirates, and their voyages were chiefly expeditions for plunder, directed against the Spaniards and Portuguese. The trade which they first gave attention to was the trade in negro slaves. But those piratical adventurers of the sixteenth century made England the “mistress of the seas.” They trained for her a body of sailors who were able in time to more than cope with the Dutch, and they opened the newly known regions of the world for her merchants and colonists to spread over them. Before the end of the seventeenth century, the English had become the foremost power in the western world and were making the most of its opportunities for production and trade. Meantime they were pushing their way with equal energy in the East.—See also AFRICA: Modern European occupation: Beginnings of European explorations; AMERICA: 1572-1580; COMMON LAW: 1710; 1711; EAST INDIA COMPANY, BRITISH; INDIA: 1600-1720; 1660-1702.

16th-17th centuries.—Merchant trading companies.—Commercial cities.—Change in European commercial system.—Decline of power of cities and leagues.—Government regulations and restrictions.—Development of joint stock companies.—Merchants adventurers.—“The priority of Portugal and Spain in distant adventure did not secure them from the competition of the other nations of Europe, whose awakening activity, ambition, and enterprise perceived clearly the advantages of the New World and of the new routes to the south and east. Almost within the first decade of the sixteenth century an Englishman cries out: ‘The Indies are discovered and vast treasures brought from thence every day. Let us, therefore, bend our endeavors thitherwards, and if the Spaniards or Portuguese suffer us not to join with them, there will be yet region enough for all to enjoy.’ Soon England, France, and the Netherlands were sending exploring and trading expeditions abroad, and somewhat later they all aimed at colonial empires comparable with that of Spain. These colonial settlements were chiefly made for commercial profit and depended closely on a new and peculiar type of commercial organization, the well-known chartered companies. It was these companies which established the greater number of American colonies, and the ideals, regu-

lations, and administrative methods of corporate trading were interwoven into their political fabric. Revolutions in commerce have been as frequent, as complete, and, in the long run, as influential as have been revolutions in political government. Europe in the fifteenth century had a clearly marked and well-established method of international commerce; yet before the sixteenth century was over a fundamentally different system grew up, which was destined not only to characterize trade during the next two hundred years, but, as has been said, to exercise a deep influence on the settlement and government of colonies in general and on the policy of their home governments. A complete contrast exists between international trade in 1400 and 1600. The type of commerce characteristic of the earlier period was carried on by individual merchants; that belonging to the later period by joint-stock companies. Under the former, merchants depended on municipal support and encouragement; under the latter they acted under charters received from national governments. The individual merchants of the earlier period had only trading privileges; the organized companies of the later time had political powers also. In the fifteenth century the merchants from any one city or group of cities occupied a building, a quarter, or *fondaco*, in each of the foreign cities with which they traded; in the seventeenth they more usually possessed independent colonies or fortified establishments of their own on the coasts of foreign countries. In the earlier period trading operations were restricted to Europe; in the later they extended over the whole world. The essential elements of the organization of trade at the period chosen for this description are its individual character, its restriction to well-marked European limits, and its foundation upon concessions obtained by town governments. At the beginning of the fifteenth century there were five principal groups of trading cities, whose merchants carried on probably nine tenths of the commerce of Europe. These groups were situated: (1) in northern Italy; (2) in southern France and Catalonia; (3) in southern Germany; (4) in northern France and Flanders; (5) in northern Germany. . . . There were . . . vast differences of organization among the trading towns. Venice and Cologne, Barcelona and Augsburg, Bruges and Lübeck were too far separated in distance, nationality, the nature of their trade, and the degree of their development to have the same institutions. And yet there were many similarities. . . . The union among the merchants of any one city or league was one for joint trading privileges only, not for corporate investment or syndicated business. Each merchant or firm traded separately and independently, simply using the warehouse and office facilities secured by the efforts of the home government, and enjoying the permission to trade, exemption from duties, and whatever other privileges might have been obtained for its merchants by the same power. The necessity for obtaining such concessions arose from the habit of looking at all international intercourse as to a certain degree abnormal, and of disliking and ill-treating foreigners. Hence the Germans in London, the Venetians in Alexandria, the Genoese in Constantinople, for instance, needed to have permission respectively from the English, the Mameluke, and the Greek governments to carry on their trade. Although they found it highly desirable for many reasons to hold a local settlement of their own in those cities, such a possession was not a necessary accompaniment of the individual and municipally regulated commerce of the thirteenth, fourteenth, and fifteenth centuries.

. . . As the fifteenth century progressed many influences combined to bring about a change in this system. The most important one of these influences was the growth of centralized states in the north, centre, and west of Europe. . . . National interests and municipal interests were often opposed to one another. Internal difficulties in many cities and internal dissensions in the leagues of cities helped to weaken the towns as guarantors of the trade of their citizens. As a result of these political influences, before the fifteenth century was over the distribution of commerce was much changed and municipal control was distinctly weakened. . . . Individual cities and even leagues of cities ceased to be able to negotiate with other municipalities or with potentates to obtain trading privileges for their citizens, since such matters were now provided for by commercial treaties formed by national governments.

"One of the main characteristics of earlier commerce, its dependence on city governments, thus passed away. Then came the opening up of direct commerce by sea with the East Indies, the discovery of America, and the awakening of ambition, enterprise, and effort on the part of new nations to make still further explorations and to develop new lines of commerce. The old organization of commerce was profoundly altered when its centre of gravity was shifted westward to the Atlantic seaboard, and Europe got its Oriental products for the most part by an ocean route. Cities which had for ages had the advantage of a good situation were now unfavorably placed. Venice, Augsburg, Cologne, and a hundred other towns which had been on the main highways of trade were now on its byways. Many of these towns made strenuous, and in some cases and for a time successful, efforts to conform to the new conditions. Vigorous industry, trade, and commerce continued to exist in many of the old centres, and some of the most famous 'merchant princes' of history, such as the Fuggers and the Medici, built up their fortunes in the old commercial cities in the fifteenth and sixteenth centuries. Nevertheless, these were the exception rather than the rule; and such successes were due to financial rather than commercial operations. In the general sense the old commerce of Europe, so far as it followed its accustomed lines, suffered a grievous decline.

"More important than the decay of the old method was the growth of the new. A vast mass of new trade came into existence; spices and other Oriental products, now that they were imported by the Portuguese and afterwards by Spanish, Dutch, French, and English, by direct routes and by water carriage, were greatly cheapened in price, and thus made attainable by many more people and much more extensively consumed. The early explorers of America failed to find either the route to the East or the Eastern goods which they sought, but they found other articles for which a demand in Europe either already existed or was ultimately created. Sea-fish abounded on the northeastern coasts of America to a degree that partially made up their loss to the disappointed seekers for a northwest passage. Whale oil and whalebone were obtained in the same waters. Dye-woods, timber, and ship stores were found on the coasts farther south. Furs became one of the most valued and most permanent imports from America. Gradually, as habits in Europe changed, other products came to be of enormous production and value. Sugar stands in the first rank of these later products; tobacco, cocoa, and many others followed close upon it. As colonists from Europe became established in the New World they must

be provided with European and Asiatic goods, and this gave additional material for commerce. [See also AMERICA: 1541-1603.] Besides creating an increased commerce with the East and a new commerce with the West, the awakened spirit of enterprise and the new discoveries widened the radius of trade of each nation. Men learned to be bold, and the merchants of each European country carried their national commerce over all parts of Europe and far beyond its limits to the newly discovered lands. English, Dutch, French, and Danish merchants met in the ports of the White Sea and in those of the Mediterranean, and competed with one another for the commerce of the East and the New World. Trading to a distance was the chief commercial phenomenon of the sixteenth century, and was more influential than any other one factor in the transformation of commerce then in progress. Distant trading proved to have different requirements from anything that had gone before: it needed the political backing of some

Portuguese annual fleet sent to the Indies counted sometimes as many as twenty vessels. In the one hundred and fifteen years between 1497 and 1612 eight hundred and six ships were sent from Portugal to India, all equipped for the voyage and fitted out by the government with cannon and provided with armed forces. The management of the fleet was in the hands of the government office known as the Casa da India. The merchants who shipped goods in these vessels and brought cargoes home in them were, it is true, independent traders, carrying on their business as a matter of private enterprise; but they were subject to government regulations at every turn and supported by government at every step. At first foreign merchants were admitted to the Eastern trade under these conditions, but subsequently it was restricted to Portuguese, and ultimately became a government monopoly. Under this system Lisbon became one of the greatest commercial cities of the world. Venetian, Florentine, German, Spanish, French,

SHIP OF THE BRITISH EAST INDIA COMPANY

strong national government; it needed, or was considered to need, a monopoly of trade; and it needed the capital of many men. These requirements were not felt in Portugal and Spain as they were in the other countries of Europe, because each of those countries had control of an extensive and lucrative field of commerce, and because in them government itself took the direction of all distant trading. The Portuguese monopoly of the trade with the coast of India and with the Spice Islands was practically complete. Through most of the sixteenth century her ships alone rounded the Cape of Good Hope; her only rivals in trade in the East were the Arabs, who had been there long before her, and their traffic was restricted to a continually diminishing field. Until Portugal was united with Spain in 1580, and after that until Holland broke in on the Portuguese-Spanish monopoly of the East Indies in 1595, her control of Eastern commerce was as nearly perfect as could be wished. Government regulation of this commerce extended almost to the entire exclusion of individual enterprise. The fleets which sailed to the East Indies were determined upon, fitted out, and officered by the government, just as those of Venice were. The

Dutch, and Hanse merchants took up their residence in Lisbon, purchased East Indian goods from the merchants who imported them, and dealt in other imports and exports resulting from this activity of trade. In Spain the government regulation of commerce was scarcely less close. All goods which were sent from Spain to America must be shipped from the one port of Seville, and they must be landed at either one or other of two American ports—Vera Cruz, in Mexico, or Portobello, on the Isthmus of Panama. Two fleets were sent from Seville each year, one for each of these destinations. All arrangements for these fleets, all licenses for those who shipped goods in them, and all jurisdiction over offences committed upon them were in the hands of the government establishment of the Casa de Contractacion at Seville. No intruders were allowed in the Spanish colonies; the only persons who could take part in the trade were merchants of Seville, native or foreign, who were specially licensed by the government. Monopoly as well as government support was thus secured to the distant traders between Spain and her colonies in the West and in the East Indies. For two hundred

years this system of government fleets in Portugal and Spain was kept almost intact. Since the government provided merchants with military defence and economic regulation, since it minimized competition among them and guaranteed to them a monopoly of commerce in the regions with which they traded, there was small need of organization or of a union of forces among them. Consequently commercial companies are almost unknown in Portuguese and Spanish history. In Spain and Portugal government control of trade was at a maximum. [See also ARGENTINA: 1580-1777.] In the other countries of Europe, notwithstanding occasional plans for such control, as in the Netherlands in 1608, the part which government took in commercial matters was much less, the part taken by private merchants was far greater. In fact, many of the earliest trading ventures were of an almost purely individual character. The patent given by Henry VII. to the Cabots in 1497, similar letters granted in 1502 to certain merchants of Bristol, a grant to Robert Thorne in 1527, the long series of authorized expeditions from 1575 to 1632 in search of the north-west passage, the charters given to Humphrey Gilbert in 1578 and to Sir Walter Raleigh in 1584, and many other patents made out in the sixteenth century to prospective colony builders, all were granted to individuals or to groups of loosely organized adventurers. In contrast both with government-controlled commerce and with purely private trading and enterprise, the chartered companies of England, Holland, France, Sweden, and Denmark arose. There were by no means self-controlled and independent companies; they were dependent on their governments for many rights and privileges and for constant support, protection, and subsidy. On the other hand, the governments expected them not only to develop a profitable trade but to furnish certain advantages to the nation, such as the creation of colonies, the increase of shipping, the provision of materials for use in the navy, the humiliation of political rivals, the preservation of a favorable balance of trade, and ultimately the payment of imposts and the loan of funds. They stood, therefore, midway between unregulated individual trading, in which the government took no special interest, and that complete government organization and control of trade which has been described as characterizing the policy of Portugal and Spain. Some fifty or sixty such companies, nearly contemporaneous, and on the same broad lines of organization, are recorded as having been chartered by the five governments mentioned above, a few in the second half of the sixteenth century, the great proportion within the seventeenth century. Of course, some of these companies were still-born, never having gone beyond the charter received from the government; some existed only for a few years; and some were simply reorganizations.

"The formation of these companies marks a distinct stage of commercial development, and furnishes a valuable clew to the foundation and early government of European colonies in America, England, Holland [see also PACIFIC OCEAN: 1513-1764], France [see also INDIA: 1665-1743], Sweden, and Denmark, as well as Scotland and Prussia, each had an 'East India Company'; Holland [see also NEW YORK: 1621-1646, 1638-1647], France, Sweden, and Denmark each had a 'West India Company'; England, Holland, and France each had a 'Levant' or 'Turkey Company'; England and France each had an 'African Company'; and a date might readily be found in the seventeenth century when all these were in existence at the same time.

... When English commercial companies were to be chartered, it was not necessary to invent an entirely new type of organization. A model already existed ready to hand in the Society of Merchants Adventurers, of which the origin goes back certainly to the fifteenth century, perhaps still earlier. The sphere of trade of this body of exporting merchants extended along the coasts of France, the Netherlands, and Germany, opposite England, and some distance into the interior. It is true that the Merchants Adventurers had many mediæval features which assimilated them more to the old merchant and craft guilds than to the more modern type of chartered commercial companies which were about to come into existence. They had, like the craft guilds, a system of apprenticeship and different degrees of advancement in their membership. . . . In many respects, on the other hand, the Merchants Adventurers were quite similar to the later chartered companies, whose period of existence their own overlapped. In fact, considering the early date of their origin, the tardy development of English economic life, and the obstacles to trading in a foreign country even so near as the continental seaboard, the conditions which confronted them were much the same as those which the later companies had to meet, and they met them in much the same way. They obtained a charter of incorporation from the king; they possessed a monopoly of trade in a certain territory, as against other men of their own nation; they had a common treasury for joint expenses; and they acted as, and were even called, 'the English nation,' in the foreign country which was their abiding-place. The Merchants Adventurers, therefore, might be looked upon as a late surviving mediæval merchant guild, modified in form by the necessity of adapting itself to trading in a foreign country; or it might be considered as the earliest of the modern chartered commercial companies, still retaining in the seventeenth century some of its mediæval features. Viewed in either aspect, the Merchants Adventurers were a living model for the organization of the new type of companies, and the powers and form of government of the latter show a similarity to the older company which is certainly not accidental. The five or six English companies whose dates of foundation lie within the sixteenth century all yield in importance, interest, and later influence to the East India Company, which was destined to an almost imperial existence of two centuries and a half, and which may well serve as the representative of the English chartered companies. Its origin was closely connected with the international relations of the last decades of the sixteenth century. The availability of the port of Lishon as the western distributing centre for Eastern goods ceased in 1580, when Portugal became a part of the dominions of the king of Spain. As war already existed between Spain and the Netherlands, and was soon to break out between Spain and England, commerce was much disturbed; and after a few years of troubled intercourse that port was closed to the merchants of Holland and England. The union of the crowns of Spain and Portugal at this time had much the same effect on the supply of Eastern goods to these two Protestant seaboard states that the conquests of the Turks in the eastern Mediterranean had had for the Italian cities a century before. It was not likely that the two most vigorous, free, and commercially enterprising states of Europe would allow themselves long to be excluded from the most attractive and lucrative trade in the world. After England, in her resistance to the Armada in 1588, applied the touchstone to the naval prestige of

Spain and showed its hollowness, her merchants and mariners took heart and pressed directly to the East. In 1501 an English squadron of three ships, under Captains Raymond and Lancaster, with the queen's leave, sailed down the western coast of Africa, rounded the Cape of Good Hope, followed the east coast to Zanzibar, and then passed across to Cape Comorin, Ceylon, and the Malay peninsula. They had mixed fortune, but one vessel returned home laden with pepper, obtained for the most part from the hold of a Portuguese prize. In 1595 the first direct Dutch voyage was made along much the same route. Other English and Dutch voyages followed; and in 1600 and 1602, respectively, the English and Dutch East India companies were chartered. . . .

"The East India Company remained for some years a somewhat variable body, as each voyage was made on the basis of a separate investment, by different stockholders, and in varying amounts. But in 1609 the charter was renewed, and in 1612 a longer joint-stock investment fixed the membership more definitely. By this time the company had become, in fact, as permitted by its charter, a closely organized corporation, with well-understood and clearly defined rights and powers, and it was soon started on its career of trade, settlement, conquest, and domination. A new type of commercial organization had become clearly dominant."—E. P. Cheyney, *European background of American history*, pp. 123-127, 129-137, 140-142, 146.—See also EAST INDIA COMPANY, BRITISH; INDIA: 1679-1823; MERCHANT ADVENTURERS.

17th-18th centuries.—Mercantile system.—Importance of colonization.—The competition for a sale market.—Colonial system.—England's Navigation Acts.—Economic thought in France.—School of *laissez-faire*.—"Among other characteristics of the period under consideration was the growth of what has been called the financial or mercantile system. The production of wealth, the fostering of trade and commerce became principal objects with most of the European governments. But these subjects were still imperfectly understood. The chief aim was to obtain a favourable balance of trade, as it was called [a preponderance of exports over imports, yielding a gold return to cover the difference]. With this view tariffs were framed and commercial treaties concluded. Recourse was had to restrictive, monopolising, and prohibitory systems, which tended to produce isolation and even war. It was not before the latter half of the eighteenth century that philosophers began to promulgate more rational theories, and it was reserved for our own age to see them carried into practice. Commerce was now chiefly founded on colonisation, which had reached a high pitch of development, and exercised a material influence on the prosperity and power of some of the leading States of Europe, enriching them both by the products of various climates and by the manufactures and other articles of native industry exported in return."—T. H. Dyer, *History of modern Europe*, v. 3, p. 272.—See also COLONIZATION.—"The doctrine that the commercial prosperity of a country depends on the creation, maintenance, and extension of a sole market for its products and for its supplies, was prevalent from the discovery of the New World and the Cape Passage down to the war of American Independence. This was the principal object of Borgia's Bulls. This was what animated the Dutch, in their successful, in the end too successful, struggle, after a monopoly of the Spice islands. This was the motive which led to the charters of the Russian Company, the Levant Company, the East India Company, the

Turkey Company, the Hudson's Bay Company, in England. The theory was organized in the colonial system, which Adam Smith examined, attacked, and as far as argument could go, demolished in his great work ["Wealth of Nations"]. [See also ECONOMICS: 18th century: Adam Smith and the "Wealth of Nations"; 18th-19th centuries] . . . The early wars of Europe were wars of conquest. . . . After them came the wars of religion, from the outbreak of the Insurrection in the Low Countries, and the civil wars in France, down to the Peace of Westphalia in the middle of the 17th century. From that day to our own, European wars have been waged on behalf of the balance of power. . . . The English, the French, and the Dutch were the competitors in the wars for a sole market. But Holland was practically ruined at the peace of Aix-la-Chapelle, and France was stripped . . . of her colonies at the peace of Paris, and England became not only the principal maritime, but the principal manufacturing and mercantile country in the world. As regards English trade, however, though India was an outlet to some extent for English goods, its trade was in the hands of a chartered company, whom the Seven Years' War had left in serious straits. The most important sole market which Great Britain had acquired by her wars was the sea-board of North America. To support the finances of the chartered company, the British Parliament determined on taxing the inhabitants of her sole market, and the result as you know was the war of American Independence. . . . The colonial or sole-market system was based on a strict reciprocity. The English Government admitted colonial produce into the English markets at differential duties, or prohibited the produce of foreign nations and foreign colonies altogether. The Colonies were not only the customers of English manufacturers only, to the absolute exclusion of foreign manufactures, but were prohibited from undertaking those manufactures themselves. The English Government adopted with their colonies the policy which they adopted with Irish manufactures, which they also prohibited, but with this difference, that they disabled the Irish from having any trade whatever with England, with the Colonies, and with foreign countries. They wished to extinguish, with one exception, every Irish product, and to constitute themselves the sole manufacturers and shopkeepers for the Irish. They allowed only the linen manufacture of Ulster. The Irish were to be, with this exception, agriculturists only, but they were to be disabled from selling their agricultural produce in England, or elsewhere. They were practically denied the right of trade. . . . It was the doctrine of the sole market in its most exaggerated form. . . . The colonial system, under which advantages were secured to the colonial producer by giving him a preferred market in Great Britain, while the colonist was debarred from engaging in manufactures, was a selfish one on the part of the English merchants and manufacturers. It gave the colonist a sole market, it is true. But it does not follow that a sole market is a high market. On the contrary, it is probable that the offer of a sole market is intended to secure a low market. The Virginian planter sent the whole of his tobacco to England. The English trader re-exported it to other countries, say Holland or Germany. It may be presumed that he made a profit on the original consignment, and on the re-exportation, or he would not have undertaken the business. . . . The colonial system did not preclude the plantations from sending, under the strict condi-

tions of the Navigation Act [see ENGLAND: 1652-1654], certain kinds of produce to other countries than England. These were called non-enumerated commodities, the principal being corn, timber, salted provisions, fish, sugar, and rum. There was a reason for this, which was to be found in the fiscal system of England. We did not want colonial corn, for there were duties on corn, levied in the interest of the landlords, nor colonial timber, salted meat and salted fish, for the home produce of these articles were similarly assisted. Sugar and rum were allowed to be exported, for the owners of the plantations in the Leeward isles were chiefly absentee English proprietors, who had already a monopoly of English supply, and were powerful enough in Parliament to get an extended market elsewhere. But in 1769, just before the troubles broke out with the American plantations, an Act was passed, disabling the colonists from sending even the non-enumerated commodities to any country north of Cape Finisterre, in Northern Spain. . . . The enumerated goods, and there was a long list of them, could be exported to Great Britain only. They consisted, as Adam Smith says, of what could not be produced in this country, and what could be produced in great quantity in the Colonies."—J. E. T. Rogers, *Economic interpretation of history*, lecture 15.—"At the time of Louis XIV, the economic system of what was called the mercantile school of economists had been adopted. 'This system meant heavy duties on all imported goods in order to give a better home market to the native producer; it meant encouraging native industries by such artificial means as bounties and monopolies, and it involved a system of continual state interference with trade. At first, this system was successful, but afterward bad results flowed from it. Trade was prevented from following its natural course and much distress was occasioned. A new school of economists soon rose whose tenets were quite opposed to those of the school represented by Colbert. The chief exponents of this new school were such men as Turgot and Necker in France and Adam Smith in England. These writers advocated a system of *laissez-faire*, which means that the king should not interfere with the natural course of trade and business. The motto of these men was *free trade*, and unlike the mercantilists they regarded agriculture as the producer of wealth."—J. A. Dewe, *Medieval and modern history*, p. 415.—See also CAPITALISM: 17th-18th centuries; Evolutionary survey; ECONOMICS: Physiocrats; TARIFF: 17th-18th centuries; 18th century.

17th-18th centuries.—French foreign trade.—Anglo-French treaty. See CAPITALISM: 17th-18th centuries; Foreign trade of France; FRANCE: 1661-1683; TARIFF: 1689-1721; 18th century.

17th-18th centuries.—North American colonies.—Early trade.—Means of communication.—Industry and commerce in the British colonies.—Exports and imports.—Trade with England and the West Indies.—New Netherlands and New Sweden.—"We are a nation of land-trafficers, but our ancestors in the colonies traded and traveled almost entirely by water. There were but twelve miles of land-carriage in all the province of New York; beyond Albany the Indian trade was carried on by 'three-' or 'four-handed batteaus,' sharp at both ends, like the Adirondack boat of to-day. Yachts, with bottoms of black oak and sides of red cedar, brought wheat in bulk and peltries down the Hudson; other craft carried on the domestic trade of New York town

with the shores of Long Island, Staten Island, and the little ports beyond the Kill von Kull. . . . The first regular wagon-carriage from the Connecticut River to Boston did not begin until 1697; Massachusetts had then been settled seventy years. The 'flat-bottomed boat, which has since played so important a part in the trade of the Ohio and the Mississippi, and whose form was probably suggested by that of the 'west country barges' of England, appears to have been used for floating produce down the Delaware before 1685. In the Chesapeake colonies, until late in the provincial period, there were almost no roads but the numerous bays and water courses, and almost no vehicles but canoes, rowboats, pinnaces and barks. Places of resort for worship or business were usually near the waterside. . . . But of all means of travel or trade the Indian canoe was the chief. . . . Roads in the colonies were hardly ever laid out, but were left where Indian trail or chance cart-track in the woods had marked them. . . . From England, along with bad roads, the colonists brought the pack-horse which, in Devon and Cornwall, at the close of the last century, still did the carrying, even of building-stones and cord-wood. Most of the inland traffic of the colonial period was done by packing. . . . The Germans, whose ancestors had four-wheeled vehicles in the days of Julius Cæsar, made good roads wherever they planted themselves. While their English neighbors were content to travel on horseback and to ford and swim streams, the Salzburgers in Georgia began by opening a wagon-road twelve miles long, with seven bridges, 'which surprised the English mightily.' Pennsylvania, the home of the Germans, alone of the colonies built good straight roads; and the facility which these afforded to ten thousand freight-wagons was the main advantage that gave Philadelphia the final preëminence among the colonial sea-ports, and made Lancaster the only considerable inland mart in North America. . . . Proximity to the wampum-making savages at one end of Hudson River navigation and to the beaver-catchers at the other made New York the chief seat of the fur trade. Wagon-roads, soil, climate, and an industrious people made Philadelphia the principal center of the traffic in bread and meat. The never-ending line of convenient shore that bordered the peninsulas of Maryland and Virginia, and gave a good landing-place at every man's door, with a tobacco currency, rendered it difficult to build towns or develop trade among the easy-going planters of the Chesapeake and Albemarle regions. A different coast-line, and rivers less convenient, made Charleston the rich and urbane commercial and social center of southern Carolina. Until about 1750 Boston was the leading sea-port, and its long wharf, 2,000 feet in length with warehouses on one side of it, was the New World wonder of travelers. Five or six hundred vessels annually cleared out of Boston in the middle of the 18th century for the foreign trade alone, and the city contained between twenty and thirty thousand people at the outbreak of the Revolution. But Newport, with its thirty distilleries to make rum of the molasses brought from the islands, and its seventeen sperm-oil and candle factories to work up the results of the whaling industry, had nearly half as many ships in foreign trade as Boston, and three or four hundred craft of all sorts in the coast-wise carrying trade. He was thought a bold prophet who said then that 'New York might one day equal Newport'; for about 1750 New York sent forth fewer ships than Newport, and not half so many as Boston. . . . But Philadelphia—planted late in the 17th century—

outstripped all rivals, and for the last twenty years of the colonial period was the chief port of North America. . . . The imports and exports of the two tobacco colonies together were far larger than those of Philadelphia, but their profits were far less."—E. Eggleston, *Commerce in the colonies* (Century, June, 1884).

"The early Virginia settlers produced little besides food and tobacco. Clothing, shoes, hats, firearms, household furnishings for all parts of the home, tools and equipment were purchased from England and paid for with tobacco. At first all trading was done by the London Company. After the Company was dissolved it became customary for the planters to employ agents or factors in England who sold the tobacco and purchased the goods which the planters ordered. A few merchants came to Virginia and established stores where the planters could exchange their tobacco for imported supplies, but during the early period of Virginia's history such merchants were few in number and their business small. The early plantations were situated along navigable streams and trade was carried on directly between plantation wharf and English seaport. Some of the planters had their own ships, but for the most part the vessels which carried traffic to and from Virginia belonged to English ship owners. A few attempts were made to start shipbuilding in Virginia, but like other undertakings it made no progress after tobacco planting became general. Moreover there was no need for the Virginia colonists to construct ships. The demand for tobacco in England and the demand for English goods in Virginia made possible a large direct trade with full cargoes in both directions. English ship owners gladly took advantage of the opportunity to engage in the profitable carrying trade between the colony and the mother country. Dutch vessels too, before 1660, came occasionally to Virginia to secure tobacco and dispose of European wares. [For effects of English restrictive laws see VIRGINIA: 1660-1677.] . . .

"Like the other colonies in America the New England colonies were compelled to secure many necessities, such as tools, clothing, household furnishing, sugar and wine from outside sources. Nearly all the salt for the fisheries and much of the equipment for fishing vessels and other ships were also imported. To secure these articles New England sold fish, furs, ships, lumber, staves, grain and meat. However, the commerce of New England could not be carried on by a system of direct exchange. Virginia secured most of her needed imports from England, and England was virtually the only market for Virginia's great export. While the people of New England bought a large part of their imported supplies from England, they could sell only a relatively small part of their exports to the mother country. Fish, the leading export of New England, could, before 1660, be sold in England, but only in small quantities, because English fishermen were able to supply their home market. After 1660 New England fish were entirely excluded from the English markets by prohibitory tariff duties. The New England fishermen, from the beginning of the fishing industry, found their markets in many places. The 'merchantable' cod, the fish of large size and first class quality, were sold in Spain and Portugal, the 'middling,' or second grade fish, were shipped to the Azores and Canary Islands, and the fish of poorest quality were sent to the West Indies where they were used to feed the negro slaves of the sugar planters. Staves, heading, sawed lumber, horses, salt pork, flour and grain were

also shipped to the West Indies. In fact these islands offered the best market for New England products throughout the colonial period. Lumber, ships and furs were sold in England, but the exports of these articles paid for only a small part of the goods which the New Englanders bought from the mother country. Their debts to English merchants were settled by the proceeds of sales in the West Indies and Southern Europe. The commerce of New England differed in another important particular from the commerce of the Virginians, in that while the Virginians let English ship owners and merchants carry and market their tobacco, the New Englanders did most of their carrying and trading themselves. . . . The early economic development of Maryland was similar to that of Virginia. Agriculture was the only industry of importance and tobacco the chief product for export. [For South Carolina's colonial trade see SOUTH CAROLINA: 1670-1783.]

"The first settlements of New Netherlands were planted as trading posts. At the beginning of the seventeenth century the Dutch nation was the leading commercial nation of Europe. Dutch traders went over the world gathering up the products of all lands to sell among Europeans. What drew them to America was the valuable furs and skins, which they obtained from the Indians for cloth, ornaments, firearms and liquor. Though the fur trade remained the leading economic activity of New Netherlands during the entire period of Dutch occupancy, agriculture was soon developed by settlers who came to the Hudson Valley from the Netherlands, France, England and other parts of Western Europe. The colony did not prosper because of the burdensome regulations imposed upon the people by the governing authorities and because of frequent trouble with the Indians. [See also NEW YORK: 1614-1621.] In New Sweden the fur trade was likewise the chief commercial activity. The land of the Delaware Valley was excellent for agriculture and the river banks about the small villages which the Swedes established were soon dotted with farms whose abundant crops of cereals, vegetables and fruits assured plenty and contentment to the thrifty and industrious settlers."—T. COMMERCIAL AGE

1766-1921.—Contributing factors: Mechanical inventions.—Banking and credit.—Currency.—"The growth of commerce in amount and complexity, and in the extent to which it was carried on by a special merchant class, was steady but very slow up to about a hundred years ago. Since then the growth has been very rapid. The easiest way to trace it is through the great mechanical inventions. The steam engine . . . is the greatest of them, and the one on which the importance of all the others depends. Three distinct steps or phases in the growth may be noted: (1) About the same time as the invention of the steam engine, several machines were invented for spinning and

weaving. The use of water power or steam to drive them made it necessary that the manufacture of cloth should be concentrated into factories; this was the beginning of our modern factory system. (2) In the early and middle part of the nineteenth century came the use of steam for transportation on land and water, making it possible to carry the factory-made goods long distances and bring back other goods in return for them. It would pay to carry even to a great distance cheap and bulky articles like fuel and building materials. (3) The middle and latter part of the nineteenth century saw the introduction of cheap mail service, in connection with transportation by steam, and the invention of the telegraph and the telephone. These have made long-distance communication easy, greatly facilitating production on a large scale and its attendant commerce. To-day the condition in England, the United States, and about half of Continental Europe is the reverse of what it was a hundred years ago. Division of labor is extreme; each worker usually confines himself to one kind of work; the great necessities of life as well as the luxuries are secured by exchange, partly with neighbors, but more with distant communities through the medium of various kinds of middlemen. [See EUROPE: Modern period: Rise of the middle class.] This great change is called the Industrial Revolution. It has more profoundly affected the conditions of human existence than anything else that ever happened since man trod the earth."—F. R. Clow, *Introduction to the study of commerce*, pp. 17-18.—"The increase in output due to the introduction of machinery was so great that it is impossible to estimate it in definite figures. Large-scale production for the world market became the order of the day, and a great commercial expansion followed in the wake of the Industrial Revolution. As the railway and steamship made possible rapid transportation to every part of the world, every effort was made to stimulate old and to open new markets. Newer means of communication, like the cable, telegraph, telephone, and 'wireless,' have tended to unify the world market. Prices are quoted instantly the world over; hence buyer and seller are quickly brought together. Safety devices, a widespread system of insurance, and good policing have abated most of the dangers from accidents and robbery that formerly attended commerce."—J. S. Schapiro, *Modern and contemporary European history*, pp. 36-37.—"Industry and commerce could never have grown as they have done during the last two hundred years without a correspondingly extensive development of Banking and Credit. It matters little whether one is regarded as the cause or the effect of the other, for although Banking was practised before the textile inventions and the steam-engine came into being, the evolution of the Banking business was necessary to, and facilitated the expansion of, industrial operations. . . . In early days payment for services was rendered in kind, and goods were exchanged directly for goods. . . . It was only after many centuries that gold came to be the standard of value, by reason of convenience and its general acceptability; and at all times it has had to struggle with silver for pride of place. The single-metal standard was finally adopted because of the tendency under a bimetallic system to hoard the more favoured metal, and the difficulty of maintaining a uniform relative value. But even to-day there are distinguished advocates of 'bimetalism,' which was a subject of keen controversy in the 'eighties. . . . The main results of the changes during the last sixty years are three in number.

Firstly, the majority of commercial transactions are now effected not by cash as represented by the sovereign and the banknote, but by credit as represented by the cheque and the bill. Secondly, credit implies confidence in the ability to pay, and in times of trade depression diminished confidence increases the demand for cash and enhances the difficulty of obtaining it. Thirdly, credit has become international, so that an unfavourable influence in one part of the world is felt at every point of the system. Labour troubles, a shortage of rain in the cotton or wheat-growing areas, or a rumour of war, send a tremor through every banking centre in the world, and the bankers tighten their hold on cash by raising the rate for loans to a greater or less extent as the disturbance affects them. The money market is at once the most gigantic and sensitive of all human organisations, and it owes its magnitude and its delicacy to the electric telegraph, by which time has been annihilated and the wide spaces of the earth have been bridged over."—E. Cressy, *Outline of industrial history*, pp. 232-233, 235-239.—"Finance and financiers have contributed enormously to the growth of the commerce of the century. The gold discoveries in California and Australia, and later in other parts of the world, have greatly increased the volume of the circulating medium and encouraged the creation of a single and well defined standard of value, so that the merchant may make his sales and purchases with an assurance that payments will be made in a measure of value acceptable to the whole world, and losses and uncertainty of traffic thus avoided. The supply of this precious metal has increased enormously during the century. Chevalier estimated that the amount of gold in Europe in 1402 was but \$60,000,000. From that time to the beginning of the century, the average gold production was about eight millions a year; from 1800 to 1850, about 15 millions a year; and, since that date, it has ranged steadily upward, until it has reached over 300 millions a year, thus multiplying many times the stock of the standard metal of the world. The result of this is that 95 per cent. of the commerce of the world is now carried on between nations having a fixed and well regulated currency, with gold as the standard. Add to this fact the developments of the financial and credit systems, by which sums due in one part of the world are balanced against those due in another part, and by the use of simple pieces of paper the transportation of any considerable sums of money from place to place and country to country avoided, and it will be seen that Finance has had much to do with the century's commercial growth."—O. P. Austin, *Century of international commerce* (*North American Review*, Nov., 1900).—For full historical treatment of banking, currency, etc., see MONEY AND BANKING. For government regulation, see BOXER RISING AND THE "OPEN DOOR"; FREEDOM OF THE SEAS; RECIPROCITY; TARIFF.—See also CAPITALISM; INDUSTRIAL REVOLUTION.

1770-1921.—Transportation: Ocean commerce.—Sea routes.—Steamships.—Canals.—Railways.—"Even more significant in its relation to sea power than the revolution in armaments during the 19th century was the extraordinary growth of ocean commerce. The total value of the world's import and export trade in 1800 amounted in round numbers to 1½ billion dollars, in 1850 to 4 billion, and in 1900 to nearly 24 billion. In other words, during a period in which the population of the world was not more than tripled, its international exchange of commodities was

increased 16-fold. This growth was of course made possible largely by progress in manufacturing, increased use of steam navigation, and vastly greater output of coal and iron. (Note 1, Coal production increased during the century from 11.6 million tons to 610 million, and pig iron from half a million tons to 37 million. Figures from C. Day, *History of commerce*, ch. 28.) At the end of the Napoleonic wars England was the only great commercial and industrial state. At the close of the century, though with her colonies she still controlled one-fourth of the world's foreign trade, she faced aggressive rivals in the field. The United States after her Civil War, and Germany after her unification and the Franco-Prussian War, had achieved an immense industrial development, opening up resources in coal and iron that made them formidable competitors. Germany in particular, a late comer in the colonial field, felt that her future lay upon the seas, as a means of securing access on favorable terms to world markets and raw materials. Other nations also realized that their continued growth and prosperity would depend upon commercial expansion. This might be accomplished in a measure by cheaper production and superior business organization, but could be greatly aided by political means—by colonial activity, by securing control or special privileges in unexploited areas and backward states, by building up a merchant fleet under the national flag. Obviously, since the seas join the continents and form the great highways of trade, this commercial and political expansion would give increased importance to naval power. . . . In fact the international developments of recent times, whether in the form of colonial enterprises, armament competition, or actual warfare, find a common origin in economic and commercial interests. Commerce and quick communications have drawn the world into closer unity, yet by a kind of paradox have increased the possibilities of conflict.”—W. O. Stevens and A. Westcott, *History of sea power*, pp. 312-313.—“To understand the main routes along which at present the great ocean services run, it is necessary to take a bird's-eye view of international commerce. There are definite centres where the great mass of exported manufactured goods is produced. These centres are densely populated, and the countries where they are situated are, with the exception of the United States of America, unable to produce their own food supply. Moreover, in addition to demanding ever-increasing supplies of food, they require a vast amount of raw materials of various descriptions. There are other and more widely scattered areas where the food supply for the densely populated countries, and the raw materials required to keep loom and spindle, converter and rolling-mill employed, are produced. There is also the commodity which to so great an extent dominates shipping business at the present day, namely fuel. As long ago as the year 1808 a well-known Liverpool ship owner estimated that the coal exported from the United Kingdom amounted to no less than 86 per cent. of the total tonnage of exports. Of recent years our [English] export of coal has continually increased, whilst other countries have also developed their fuel resources, and are building up an export trade in various parts of the world. The great manufacturing centres of the world at present are North Western Europe and the Eastern States of North America. The food-producing countries are America, Australasia, the Far East and Eastern Europe. The main sources for the supply of raw materials are North Western Europe, [North America], Australia, New Zealand, the countries of the Far East, and parts

of Africa. The great coal exporting country has been the United Kingdom; the countries now supplying other parts of the world, as well as themselves with coal are Australia, South Africa, Japan, India and the United States. Bearing in mind the above points, and especially the great amount of coal leaving the shores of the United Kingdom, it is easy to see why there are two great points at which a great mass of shipping is continually passing and repassing, and that there are numerous points where shipping routes divide as vessels separate in order to reach their several destinations. The two main focussing points are, first, the entrance to the Atlantic from North-West Europe, lying between Ushant and the South of Ireland. Here is focussed the principal part of the import and export trade of Western Europe—that of the United Kingdom, France, the Netherlands, Germany and Scandinavia. These countries, taken together, own the great mass of ocean-going tonnage. And this stretch of sea leads directly to the principal European seaports, where the commercial and manufacturing industries of the Old World are concentrated. The second of the two great points stretches from Cape Race to Long Island, for along this stretch of sea passes the greater part of the shipping which trades between the great ports of North America and Central and South America, and Europe. The lesser points at which shipping congregates, but to separate, are for the Far Eastern and Australasian routes *via* the Suez Canal, the Straits of Gibraltar, Aden, Colombo, Singapore and Yokohama; for the South American trades, Madeira, the Canary Islands and Cape Horn; for West and South Africa, and for Australasia *via* the Cape of Good Hope, Madeira, the Canary Islands. . . . With the opening of the Panama Canal, there may come into existence another great point of concentration at Panama.”—A. W. Kirkaldy and A. D. Evans, *History and economics of transport*, pp. 290-292.—See also LATIN AMERICA: Map of communications; MEDITERRANEAN SEA.

“No sooner had James Watt produced a steam-engine, than attempts were made to apply steam power to ship propulsion. At first the experiments were almost grotesquely unsuccessful. But the men at work on this development were men of grit, nor could any failure daunt them in their efforts. The chief spheres of action were the West of Scotland and the North-east coast of America; with the result that both Britain and America claim the honour of having been the first to propel a water-borne craft by steam power. . . . From the beginning of last [19th] century there were two great possible developments in the business of ocean transport; the substitution of iron for wood as the material for ship construction, and the improvement of the steam-engine to a point at which steamers could compete on commercial lines with sailing ships for the carriage of freight. Nor were these separate problems, for really the success of either depended on a common development. The modern marine engine could not work to advantage in a wooden hull, nor is it possible to imagine an *Aquitania*, measuring nearly 50,000 tons, propelled otherwise than by turbine engines driving quadruple screws. . . . There was another great problem that awaited the solution of those interested in ocean steaming. With engines consuming such comparatively large quantities of coal, frequent facilities for replenishing bunkers must be provided. For it must be remembered that when the steamship entered the lists there were no conveniently situated coaling stations on any of the great ocean routes as we have them to-day. The

equipment and organization of these stations has been the direct or indirect work of the steamship owner."—A. W. Kirkaldy and A. D. Evans, *History and economics of transport*, pp. 255-265.—“During the second half of the nineteenth century the wooden ship gradually disappeared from the seas, giving place to vessels constructed first of iron and then of steel. The country which suffered most from the change, . . . was the United States; the country best prepared to profit by it was England. The English now rapidly enlarged the dimensions of their ships, and improved their rig and model. . . . A study of winds prevailing on the ocean, to which an American officer, Maury, made important contributions, enabled sailing vessels to choose a course which, on many routes, shortened the duration of the voyage a third or more. Steam has been applied for handling the cargo, and for managing the rudder and sails. In spite of all improvements the sailing vessel has not been able to keep its share of seaborne commerce. American inventors made a practical success of steam navigation soon after

has steam superseded sails as the propelling force—a change that necessitated a new intellectual equipment in the men responsible for managing ocean-going vessels—but the submarine cable worked a revolution equally drastic. Nor do these two great events sum up the whole matter, for each trading country has been developing on different lines, routes have been changed, new and unthought-of possibilities have opened out. In a word, the kaleidoscopic nature of the changes has been so complete and far-reaching that there has been a constant demand for the new man, mentally equipped to face constantly changing conditions. The old shipping firms in many cases have been either renewed with outside blood, or have gone under; there has been in the forefront of the industry a continuous change in the personnel responsible for the main interest.”—A. W. Kirkaldy and A. D. Adams, *History and economics of transport*, p. 207.—See also EUROPE: Modern period: Mechanical revolution.

“The real era of the canal, . . . was in the period which may be limited roughly by the dates

SAILING VESSEL OF THE EARLY NINETEENTH CENTURY

1800. . . . The steamer was used at first however, chiefly for internal navigation and for short coasting voyages. It was of immense importance in furthering the development of the Mississippi Valley in America; and it soon made a place for itself on the European rivers. About 1840 there was a rapid development of steam transportation on the German rivers, and this has not ceased to grow in volume and efficiency. Chains have been laid along some of the river beds; on the Elbe, for instance, a chain extends all the way across Germany and even into Bohemia; and by this means steamboats are enabled to haul their barges upstream against a strong current. The application of steam to ocean navigation did not become of great importance until about the middle of the century. At that time only one-fifth of the steam tonnage entering British ports came from foreign ports; the rest was employed still in the coasting trade.”—C. Day, *History of commerce*, pp. 303-305.—“With shipping the changes during the past [10th] century have been almost continuous; there has been one long stage of transition. Many of the changes have been epoch-making, and nearly all have required a radical alteration of method which has tested the business ability of shipping managers in a most exhaustive manner. Not only

1750 and 1850. Immense amounts of capital were invested in canals in this period of their great importance; and the European and American systems of barge canals were constructed substantially on the lines which they have since retained. A traveler could then, as now, voyage through most parts of central and eastern Europe without leaving a canal-boat. Of a country like England, endowed by nature with advantages for water communication, it could be said in 1838 that no spot south of the county of Durham was more than 15 miles from the means of water conveyance. . . . Of canals as of roads it may be said that their days of usefulness are far from past. One class, indeed, that of the great ship canals, has grown rapidly in importance in recent years. Many economists believe that even the barge canals should be maintained and improved. There is still an active canal traffic in Europe, especially in Germany. . . . The future of canals seems to depend largely on the introduction of improved forms of motor (electricity, gasoline). The canal has yielded the place of first importance in internal transportation to the railroad. Its great merit, cheapness, has declined in importance with the reduction of railroad rates, while its drawbacks are felt more and more under the conditions of mod-

ern business. The canal is not only much slower and more uncertain than the railroad; its vital weakness is the fact that in temperate climates its usefulness is destroyed during at least a part of the winter. Since 1850 canal systems have grown slowly, if at all, and in some countries they have declined greatly. Nearly half of the English canals are now controlled by the railroads; some are closed and out of repair, and traffic is diverted from others by heavy tolls."—C. Day, *History of commerce*, 1919, pp. 293-295.—See also CANALS.—"As the opening of the Suez Canal in November, 1869, created a great ocean route, so the opening of the Panama Canal in August, 1914, provided another that is destined to play an important rôle in the world's commerce. . . . It not only obtained the traffic which was formerly transhipped by rail, but also a portion of the traffic which was shipped *via* the South American, South African and Suez Canal routes. It is, moreover, expected that it will in the future stimulate the international commerce of the world and the intercoastal trade of the United States, and in that way create much distinctively new ocean traffic. The commercial use of the Panama Canal began August 15, 1914, and from then until July 1, 1917, it was navigated by 3,751 vessels having a net tonnage of 12,332,155 and carrying 15,339,093 tons of cargo. When normal trade is resumed throughout the world the traffic of the canal may be expected to rise to a higher level. The ocean trade between the Atlantic and Gulf ports of the United States on the one side and the Pacific ports of North and South America, Honolulu, Manila, Australia, New Zealand, Japan and of China as far south as Hongkong on the other, will move *via* Panama. The canal will similarly provide the standard ocean route for merchant vessels sailing from Great Britain and western continental Europe to the Pacific ports of North and South America. It will also be a factor—although a much smaller one—in the trade of Great Britain and western continental Europe with New Zealand, Australasia and Japan."—E. R. Johnson and G. G. Huebner, *Principles of ocean transportation*, pp. 64-65.—See also PANAMA CANAL: 1912-1914; 1919-1920.—"In most of the leading countries of the world, a time arrived when the canal system and the railway system came into strong competition, and when it seemed doubtful on which side the victory would lie. This contest was necessarily more marked in England than in any other country. England had not, indeed, been the first in the field with canals, as she had been with railways. . . . But England having once started on a career of canal development, followed it up with greater energy and on a more comprehensive scale than any other country. For more than half a century canals had had it all their own way. . . . But the railway system, first put forward as a tentative experiment, and without the slightest knowledge on the part of its promoters of the results that were before long to be realised, was making encroachments, and proving its capabilities. This was a slow process, as the way had to be felt. The first railway Acts did not contemplate the use of locomotives, nor the transport of passenger traffic. The Stockton and Darlington Railway, constructed in 1825, was the first on which locomotives were employed. Even at this date, there were many who doubted the expediency of having a railroad instead of a canal, and in the county of Durham . . . there was a fierce fight, carried on for more than twenty years. In the United States, the supremacy of waterways was maintained until a much later date. . . . A keen

and embittered struggle was kept up between the canal and the railroad companies until 1857. . . . In the annals of transportation, there is no more interesting chapter than that which deals with the contest that has been carried on for nearly half a century between the railways and the lakes and canals for the grain traffic between Chicago and New York."—J. S. Jeans, *Waterways and water transport*, ch., 26-27.—See also RHODE ISLAND: 1877-1887.—"The coming of steam to the ship at sea brought a great revolution to navigation and to international relationship. The coming of the locomotive brought a still greater one to the internal commerce and industry of peoples, as well as to their political and social thought. The steam railway came to take the place of the highway and the canal for most of the traffic, for practically all of the passenger traffic and a large bulk of the freight. The scope and magnitude of its tasks, and the vital importance of its work, have caused modern business life to crystallise itself into the railway organisation, and have made the railway corporation, in turn, perhaps the most dominant factor in the field of politico-governmental thought and activity. The railway has now for more than a half century been the most vitally important means of the transportation of goods and persons and of the transmission of ideas. The technic of railway transportation has become one of the greatest of the applied sciences; the making of the road-beds, locomotives, and rolling-stock, has called into being and maintained upon a large scale one of the greatest of all phases of engineering and industry; the traffic of the railway, in its solicitation, movement, storage, and delivery, has become one of the world's most important achievements; the finance of railway transportation has come to possess tremendous proportions—to involve as much as one-eighth of the entire wealth of a highly efficient and productive people, as is the case in the United States. . . . This new form of transportation and communication, this thing which has meant revolution of life and thought wherever it has come, is considerably less than a century old. The first railway in the world came . . . in 1801, when the first chartered horse-car line was opened for service, in the suburbs of London. . . . The locomotive was slow in coming after the discovery of the power of steam as a motive force. It required compact space in which to generate the large volume of steam needed; and it was not until the tubular boiler, with its artificial draft made by the escaping steam, had been invented, that the locomotive became an effective thing. It was no mere chance that the first locomotive was constructed in England. Her industrial revolution in the field of the making of textiles, especially cottons, had given her the inventive spirit, and had created the surplus capital necessary for such a work. The spirit and the economic conditions were ready, but it was an immensely difficult task to secure from Parliament the legal right to construct the first steam railway. The canal and turnpike interests had for more than a quarter of a century been the dominant factor in English politics, and the charter to the Liverpool and Manchester Railway Company was obtained only after a most determined fight. The beginnings of the steam railway came during the latter part of the decade 1820-30. This form of transportation did not, however, prove itself a well defined and permanently useful one until near the middle of the century. . . . By this time it was clear that the railway was a radically new form of transportation; that it was not, as had for twenty years been

thought, merely an improved highway, upon which every citizen could at pleasure operate his cars and pay his tolls. . . . Railway extensions, even though at the time not profitable, and with slight prospect of becoming so in the near future, were made, to meet the demands of the growing spirit of nationality, as well as of commerce and industry. The railway had become a political necessity, more especially in Germany, Belgium, Italy, and Austria. Solferino and Magenta, battles which fundamentally changed the life of the Italian nation, turned largely upon the fact of the non-existence of certain stretches of railway. Prussia witnessed, in the Franco-Prussian war, the efficacy of an efficient system of railway transportation; her armies were, by means of it, at the strategic spot at which to strike an effective blow. Under the powerful spirit of growing nationality and commerce, the railway mileage of the world rapidly increased, from approximately 24,000 in 1850, to about 231,000 in 1880, to practically 600,000 in 1910 [and to 732,880 miles in 1920]."—C. L. Raper, *Railway transportation*, pp. 5-11.—See also RAILROADS.

1782-1815.—Foundations of British sea supremacy.—"If we look at the state of European powers after the conclusion of the Seven Years' War in 1763, we shall see how favorable our [Great Britain's] position then was. In the first place, England had seriously crippled her commercial rival, France, both in her Indian and American possessions, and thereby had gained extensive colonial territories which afforded a ready market for British goods. Spain, which had been allied with France, had lost at the same time her position as the commercial rival of England in trade with the New World. Germany had for some time ceased to be a formidable competitor, and was now being ravaged by internal conflicts between the reigning houses of Austria and Prussia. Holland, which had once been England's most serious rival—especially in foreign commerce—was at this time in a similar condition, and had greatly declined from the prosperity of the 16th and 17th centuries. Hence England alone had the chance of 'the universal empire of the sole market.' The supply of this market was in the hands of English manufacturers and English workmen, so that the great inventions which came into operation after 1763 were thus at once called into active employment, and our mills and mines were able to produce wealth as fast as they could work, without fear of foreign competition. It is not surprising, therefore, to find that in the ten years, from 1782 to 1792, our entire foreign trade was nearly doubled, the exact figures being:—1782, imports £10,341,628, exports £13,009,458; 1792, imports £19,659,358, exports £24,905,200. And this remarkable progress was still kept up even during the great continental wars which were caused by the French Revolution, and which lasted for almost a quarter of a century. . . . In spite of the almost entire loss of our trade in some directions, English commerce improved in others; and, in fact, any loss was more than counterbalanced by an increase in regard to the (now independent) United States, Russia, Venice, Germany, and Northern Europe, as well as with the West and East Indian colonies, both British and foreign. In fact, many of the countries whom France had compelled to become our enemies found themselves unable to do without British manufactures, especially as their own industries were suffering from the warfare that was going on on the Continent, and therefore had to find means to procure our goods."—H. de B. Gibbins, *British commerce and colonies*, pp. 91-102.

—"When the wars of the French Revolution began, the foundations of a great empire had already been broadly laid; and when it ended, England stood out as a power which had grown greater in the struggle. . . . Dutchman, Dane, and Spaniard, Frenchman and Venetian, all ancient competitors of England, fell before her; and, when the sword was sheathed in 1815, it was no exaggerated boast to call her mistress of the seas."—A. J. Wilson, *British trade (Fraser's Magazine, Sept., 1876)*.—See also AFRICA: Modern European occupation: Later 19th century; ARGENTINA: 1806-1820; CHINA: 1839-1842; U. S. A.: 1900 (December).

1783-1913.—United States.—Interstate commerce.—Big business. See U. S. A.: 1783-1789; 1790: Economic situation of the country; 1865-1872; 1865-1885; 1873-1874; 1887; 1898 (June), 1913 (June).

1789-1920.—United States merchant marine.—"When the student of the American merchant marine begins his investigation of the subject he finds the following situation existing: In 1780 the total amount of United States shipping registered for foreign trade was 123,893 tons and the proportion of American exports and imports carried in American vessels was 23.6 per cent. (These figures are quoted from the report of the Bureau of Navigation and Bureau of Foreign and Domestic Commerce of the Department of Commerce.) If he continues to study figures quoted in this report he also finds that the total of American tonnage increased, with occasional lapses, to 804,851 tons in 1817, dropped back to 537,563 tons in 1830, and reached its highest point of 2,496,894 tons in 1861. Then tonnage began to drop off gradually, reaching its lowest point in 1898, when it registered 726,213 tons, increasing gradually again to 1,066,288 tons in 1914. According to Lloyd's Register, Great Britain's tonnage for 1915 was 21,045,049 tons, Germany's was 5,459,296, while the tonnage of the United States was estimated at a total of 5,368,194, of which only 2,970,284 tons in all were estimated to be in the foreign trade. Referring to the former table again the student finds that the proportion of our foreign trade carried in American vessels was 23.6 per cent. in 1789, reached 92 per cent. in 1796, dropped back to 54.5 per cent. in 1814, reached the level of 92.5 per cent. in 1826, and then dropped almost steadily up to the present time to the low figure of 8.6 per cent. Thus the student is confronted at the outset not only by the fact that the total amount of American foreign shipping is low as compared with that of other large nations, but that it has not increased at a rate commensurate with the general increase in growth and prosperity of the country. He is also brought to realize that the proportion of our foreign shipping carried by American ships is decreasing rather than increasing, and that the United States is gradually being forced to one side in its own foreign carrying trade. . . .

"At the close of the Revolution, England had the balance of the foreign carrying trade in her favor. The abundance of timber in the United States and the native genius of the American enabled us to compete by building better ships at a lower cost. The first act of Congress passed under the new Constitution, on July 4, 1789, allowed a discount of 10 per cent. of the tariff duties on all goods imported in ships built and owned by American citizens. A further rebate was allowed on tea imported from the East Indies in American vessels. Another act of Congress gave American vessels further advantages in tonnage duties and practically barred foreign vessels from

the coast-wise trade. In 1794 the discount of 10 per cent. in tariff duties on goods imported in American vessels was changed to an addition of 10 per cent. to the duties on goods imported in foreign vessels. With this encouragement American tonnage increased from 123,893 in 1789 to 411,438 in 1792. The proportion of our exports and imports carried in American ships rose from 23.6 per cent. in 1789 to 92 per cent. in 1807. Then came the War of 1812, and at its close the United States largely abandoned its policy of preferential duties by offering to make treaties with other nations by the terms of which the preferential duties on goods imported in American ships would be given up provided other nations would reciprocate. The general effect of abandoning this protective policy appears to have had unfavorable results. While American shipping continued to increase slowly up to 1840, the advance was very much less than it had been during the period of protection.

"Beginning with 1840 the British government began a new form of encouragement to her shipping by granting subsidies to certain steamship lines. This was the means of establishing control of steamship navigation in English lead, and the United States stood alone in refusing to grant a subsidy. This prevented steamship lines from being undertaken by American capital, and our sail-packets could no longer compete. Finally, in 1845, Congress authorized the Postmaster-General to make mail-contracts with American lines, and under this act certain amounts were paid in mail subsidies. This Mail Subsidy Act was repealed in 1855, due to sectional feeling. The ships were mostly northern and the South was in power. Other conditions also operated to reduce our American merchant marine at this period. Vessels began to be built of iron instead of wood, and American shipbuilders could not compete with England in the building of iron vessels. The Civil War operated to destroy or otherwise reduce the number of ships then available for the foreign trade. Shipping dropped gradually and steadily until 1898, when it was only 726,213 tons. Since then there has been a material gain. After the repeal of the Ocean-Subsidy Act in 1855 no other legislation was enacted for the relief of American shipping until 1891. Then the Ocean Mail Act was passed providing subsidies for postal lines. Although the amounts granted were comparatively small, this Act has been of much assistance. In 1904 a Merchant Marine Commission was appointed by Congress to make a thorough investigation of the ocean carrying trade. This Commission held hearings in various parts of the country and finally published a report in 1905 recommending national encouragement in the establishment of regular lines to the West Indies, South America, South Africa, and the Orient. A bill carrying these provisions was introduced in Congress but failed to pass. In 1912 an attempt was made to bring American-owned vessels in the foreign trade under American registry by including in the Panama Canal Act of August 24, 1912, a provision offering free registry for ocean trade to American-owned foreign-built vessels not more than five years old. So few vessels took advantage of the Act that on August 18, 1914, an emergency measure was passed providing that American-owned, foreign-built vessels could be admitted to American registry, regardless of age. The President was also authorized to suspend certain requirements of law regarding the nationality of the officers of such vessels—and to exempt them from compliance with our measurement and inspection

laws. This has been effective in enrolling a number of such ships under the American flag."—*American merchant marine*, in *Debaters' handbook* (E. M. Phelps, ed.).—"After 1910 the American merchant marine engaged in the foreign trade slowly increased from a gross tonnage of 782,517 in 1910 to 1,066,288 in 1914. Then came the war in Europe, which not only created a shortage of deep-sea tonnage and exorbitant ocean freights, but made it desirable to transfer much tonnage to the neutral flag of the United States. . . . The foreign trade had risen to 1,862,714 tons gross, and by the close of the fiscal year 1916 to 2,185,008. This increase of 1,118,720 tons, or 105 per cent. in two-years represents a sudden advance unprecedented in the past history of the United States."—E. R. Johnson and G. G. Huebner, *Principles of ocean transportation*, p. 459.—In 1920 the distribution of shipping in the United States was as follows: on the Atlantic and gulf coasts there were 16,972 vessels totalling 11,852,935 tons; on the Pacific coast 6,409 vessels of 3,467,872 tons; on the northern lakes, 2,942 vessels of 2,839,514 tons; and on the western rivers, 1,689 vessels of 122,315 tons.

1800-1900.—Growth and development of German commerce.—Obstructions.—Lack of foreign trade.—Commercial policy.—Changes under the imperial government.—Rise to commercial power.—"Standing next to England in the extent of its commerce about 1900 is a country which at the beginning of the century, if not among the last, was certainly far below the leaders. This country is Germany. . . . The Germans of 1800 occupied a territory not greatly different from that which composes the Germany of to-day, and to which nature has given but a moderate endowment of resources. There was no Germany at the earlier date, however; the people were divided up among a great number of petty states, and their economic forces were cramped thereby so as to hinder their development. The commercial progress of the century has depended largely on the reform of these political conditions. . . . The Napoleonic wars wiped out the smallest and most backward of the German states, reducing the number from over three hundred to about forty. Then, until near the middle of the century, progress depended on negotiations between these states by which the worst effects of their separation were removed. In 1848 a liberal movement reformed the government of some of the important states on modern lines, and strengthened the demand for a unified Germany, leaving still undecided, however, the question whether Prussia or Austria was to be the leading state. The war of 1866 between the two states gave the leadership to Prussia; and the war of 1870 with France led finally to the foundation of the modern German Empire, under which at last the people found room for commercial expansion and advanced with astonishing rapidity. . . . In spite of the service which Napoleon did Germany by abolishing the smallest states, the country was still splintered into pieces in 1815. A network of tariff frontiers covered the land, cutting the great rivers and the natural high-roads of commerce, and preventing the movement of wares. Not only did each state have its own tariff; some had internal tariffs in addition. The single state of Prussia had altogether some sixty tariffs. Some of the states were made of scattered pieces, interspersed among the territories of their neighbors; even a small state might consist of eight or ten fragments. A merchant, to reach the center of the country from the national frontier, crossed about sixteen tariff boundaries. Not only the customs tariffs consumed

time and money. The separatism which they represented spread into all parts of the organization; there were seventeen different postal systems in the country; nearly threescore different laws on bills of exchange; hundreds of different coins. . . . The difficulties of internal commerce were so great that the life of the people was arranged in large part to enable them to exist without trade. Most of the people were engaged in agriculture and supplied themselves with nearly all the necessities of life. Manufactures were still carried on almost exclusively by scattered artisans. The German governments still clung to the old ideas of the guild system and public regulation. Little by little these ideas fell into the background in the first half of the nineteenth century, but it is important to note that they were still a living force in Germany when England had discarded them and was in the full rush of the developing factory system. . . . Hindered in development by the persistence of old institutions, and by the lack of any considerable market for the product, German manufactures remained on the same stage on which

including states from central Germany to the coast. No state liked to remain isolated when consolidation had once begun. Out of this transition stage there had developed by 1834 one great union, embracing about two-thirds of the area and population out of which the German Empire was later to be formed. From this time the union grew more slowly, but the people within it could now afford to wait, utilizing its new commercial opportunities, and confident that the other Germans could not long resist its attractions. [See GERMANY: 1817-1840; 1866-1870; TARIFF: 1833; 1853-1870] . . . Leaving now the topic of commercial policy . . . we must attend to the material development of Germany. Down to the foundation of the Empire in 1871, progress, if steady, still was slow. The best energies of the people were absorbed in the great political conflicts out of which united Germany was to emerge; delicate questions of the relations between the German states had to be settled, and much needed still to be accomplished in the reform of industrial legislation inside the states. As late as 1862

WAGON OUTFIT OF A MERCHANT IN 1830, CENTRAL EUROPE

they had been for centuries previously. . . . No statistics exist which would give an accurate picture of the development of German commerce in the early part of the nineteenth century, but we can gain some idea of its backwardness from an estimate made for so late a date as 1842. At this time German foreign trade was little over *one-tenth* of what it was in 1900, and it must have been considerably less in earlier years. . . . The fact that the country was predominantly agricultural is shown in the fact that the most important items in export were raw materials and foodstuffs, especially grain. . . . Such conditions called forth, naturally, remonstrances from the mercantile classes. Business men and manufacturers in all parts of Germany began soon after 1815 to agitate for a reform. We must content ourselves with noting only the main steps. Tariffs inside the separate states were reformed, and the navigation of the great rivers was made easier. Finally, and most important, the separate states began to draw together in groups, forming a customs-union (*Zollverein*), with a common tariff on the frontier and with free trade inside. The movement, slow at first, culminated rapidly in 1828, when three such groups were formed, one in the North (Prussia and others), one in the South (Bavaria and Wurtemberg), and a third

it was estimated that five-eighths of the people were still engaged in agriculture or in other extractive industries. In comparison with this period of preparation the progress which Germany has made since 1871 is startling. . . . While the population of Germany has increased by less than a half, rising from 41 to 56 millions, in the period since the founding of the Empire [to 1900] the foreign trade of the country has about doubled. . . . Of the total imports of Germany now [1900] only about one-fifth are manufactures. The important items are raw materials and foodstuffs. If we arrange the wares imported in the order of their value we do not find a manufactured ware appearing among the imports until we reach the item of woolen yarn, which occupies the nineteenth place on the list. On the other hand, the export of raw materials and food products has declined so that it makes now but one-third of the total exports; of the 29 leading articles exported in 1901 coal was the only raw material occupying an important place on the list, and the other items which might be ranked as raw materials (hides, furs and skins, leather, coke) were insignificant in comparison with the great manufactures."—C. Day, *History of commerce*, pp. 391-395, 399, 401.—See also GERMANY: 1890-1914: Expanding industrialism.

1820-1920.—United States whalers and clippers.—Pan-Pacific trade.—“The three decades following 1820 were the golden age of American whalemanship. They drew their tribute from all the great oceans of the world. Voyages grew steadily longer, more adventurous, and more profitable. . . . In 1818, the Pacific whaler *Globe* of Nantucket, Captain George W. Gardner, steering to the westward of the old track, found in Latitude 5° to 10° south and Longitude 105° to 125° west a new field where whales ‘seemed to exist in almost countless numbers.’ Within two years, so keen were our whaling skippers, fifty ships were cruising in this neighborhood, and the famous ‘Off Shore Ground’ of the South Pacific became the scene of some of the richest catches and most exciting adventures recorded in the annals of this mighty fishery. . . . The Arctic fishery appealed most powerfully of all to the imagination of the Yankee whalemanship. Within three years after Captain Royce had passed within Bering’s icy gates, two hundred and fifty ships had drawn cargoes of oil from Arctic waters. Our supremacy in this boldest of callings in which men anywhere engaged was then unchallenged. . . . ‘The United States, whose flag was to be found on every sea, had 596 whale-ships of 190,000 tons and manned by 18,000 seamen, while the number of English ships engaged in the whale trade was only fourteen.’ In 1842 out of the world’s total whaling fleet of 882 sail, 652 were American vessels. . . . But in 1858 there had set in the inevitable shrinkage of the American whaling industry. Between 1858 and 1860, the American shipping registered for the whale fishery fell off from 198,594 to 166,841 tons. This was before the [Civil] war had begun to turn our whalers over to destruction. The tonnage of the whaling fleet fell from 145,734 in 1861 to 117,714 in 1862, 99,228 in 1863, 95,145 in 1864, and 84,233 in 1865. The peace year of 1866 brought a sharp rebound to 105,170 tons, but this gain was brief and delusive. The next year, 1867, the whale fleet had fallen to 52,384 tons, and while it stood in 1868 at 78,486, the decline since then has been constant to the forlorn 9,534 tons of June 30, 1901. The deep-sea whalers of both the Atlantic and Pacific suffered severely from the direct attacks of Southern cruisers during the Civil War, and also from the extortionate rates of war insurance. . . . The decline of the American whale fishery is commonly attributed to the discovery of petroleum and the extraordinary abundance and cheapness of kerosene oil. But very much more important than this factor of competition was the scarcity of whales and the heavily increased cost of conducting the industry.”—W. L. Marvin, *American merchant marine*, pp. 145, 146, 164, 167.—See also FISHERIES: 1015.

“The appearance of steamers on the North Atlantic and on the Isthmian route to California gave new wings to the ambition of the builders and owners of the wonderful American sailing ships. They began at once to improve the size and speed of their vessels. The celebrated Yankee clippers were the result of this intensified rivalry of steam and canvas.”—Marvin, *American merchant marine*, p. 253.—“John W. Griffiths, of New York, was responsible for the introduction of this remarkable type of ships. Griffiths was of the opinion that a ship having ‘hollow’ or concave water-lines, especially at the bow—‘hollow entrance lines’—would sail more swiftly than one with ordinary convex lines, no matter how fine the convex lines might be. In 1841 Griffiths exhibited a model of a ship shaped according to his ideas, at the American Institute, and he also delivered a

number of lectures on the subject. The nautical world became greatly interested, and in 1843 William H. Aspinwall ordered a ship of 750 tons built to designs by Griffiths. She was named the *Rainbow*, and when sent, under Captain John Land, to Canton on her maiden voyage, she arrived back at the end of 6 months and 14 days. In another voyage she sailed to Canton in 92 days and made the passage home in 88, breaking the record each way.”—J. R. Spears, *Story of the American merchant marine*, p. 227.—“The *Helena*, the *Howquah*, the *Sea Witch*, and others followed. Some of these clippers were employed in the New York packet lines. One of them, the ‘New World,’ launched for Grinnell, Minturn & Co., by Donald McKay in 1846, was a one-thousand-four-hundred-ton vessel, the largest sailing merchantman then afloat in our service. But more of the clipper ships were engaged in the long-voyage trade to China and India, and especially in the booming trade to California. . . . In anything like a fair, strong breeze these long, finely modelled clipper ships could overtake a lumbering steamship, pass her, and run her hull down in a few hours. The famous *Sovereign of the Seas*, in a two-weeks’ voyage from New York to Liverpool in June, 1852, made in one day 340 miles, while the Cunarder *Canada* was making 200. . . . These clipper ships were wonderfully beautiful. Not one of them now remains afloat in ocean service. A few may be tumbling up and down the Pacific coast under stump top-gallantmasts, freighting coal and lumber, and unrecognizable as the splendid racers of half a century ago. But the real clipper ship of those years of glory has utterly departed.”—W. L. Marvin, *American merchant marine*, pp. 253, 256-257.

“It is difficult to calculate precisely the amount of trade with all countries bordering the Pacific, because the returns from some countries, such as Canada, Mexico and Central America, include shipments via both Atlantic and Pacific and overland also. But leaving Canada out of the calculation and including those Latin-American countries bordering the Pacific only and the aggregate of trade both ways between the United States and Pacific countries last year amounted to \$2,761,783,300. Of this the exports from the United States was \$1,203,488,561 and imports to the United States were \$1,558,294,750. Asiatic countries figured largest in this vast total, with exports thereto of \$703,667,100, and imports therefrom of \$1,041,444,120. These comprised new records, but the possibilities were scarcely touched! With only a handful of ships to handle the trade, and no concerted plan toward winning that trade, the business last year between the United States and Far Eastern countries exceeded by some \$400,000,000 all the trade with all Spanish-American countries combined, notwithstanding the fact that there are no less than forty-seven routes covered by ships between New York and South America, irrespective of other lines from Gulf and Pacific ports. That is just a slight indication of what may be accomplished when the Oriental and Far Eastern and Australasian fields are as well served with ships as the South American field.”—J. H. Gerrie, ed., *Is Pan Pacific trade worth while?* (*Pan Pacific*, May, 1920, p. 27).

1896-1917.—Development of shipping in Japan.—Commercial relations with the United States.—“From 1806 up to the outbreak of the present [World] War, Shipbuilding was developed by the Mitsubishi Dockyard and Engine Works at Nagasaki and Kohe, the Kawasaki Dockyard at Kobe, the Osaka Iron Works at Osaka, and a few smaller

yards. Japanese yards can now turn out merchant vessels of over 15,000 tons gross. Vessels of all classes and descriptions are launched annually from ordinary cargo steamers to fast mail and passenger liners, fitted with triple-expansion engines, super-heaters, turbines, geared turbines, turbine and reciprocating engines combined. No engineering problem appears to be too difficult for the Japanese brain to master. The only type not yet attempted is a motor-ship. Since the war began, nearly every dockyard in Japan increased its capital, resulting in laying down additional building berths, and many shipbuilding companies have been inaugurated and still more in contemplation. The established yards are equipped with all the latest and most up-to-date machine tools and appliances for shipbuilding, engineering, and dry-docking. The best machinery obtainable in Europe and America is in evidence, supplemented by other improvements of Japanese invention. Before the war, Japan possessed about a dozen berths for building vessels over 1,000 tons gross, now nearly 100 berths are available or will be

ports to China exceeded those to the United States. In all other years since 1897 the exports to the United States have been considerably greater than those to any other country, the exports to China generally being next in importance. In 1913 the figures were as follows: Exports to all countries, 632,460,000 yen; United States, 184,000,000 yen; China, 154,000,000 yen; France, 60,000,000 yen; Great Britain, 32,800,000 yen; British India, 20,800,000 yen; Italy, 29,400,000 yen. In that year the United States took 29.2 per cent. of the total Japanese exports, as compared with 24.3 per cent. to China, and 19.3 per cent. to France, Great Britain and Italy combined. A review of the export trade of Japan during the last 20 years shows that at no time has the United States taken less than 25 per cent. of the Japanese exports, while from 1907 to 1916 the exports to the United States averaged 31.1 per cent. of the total exports. The highest percentage ever taken by China was 27.7 in 1906, during the Russo-Japanese War; in other years the percentage of the total exports shipped to China was considerably

WHITE STAR LINE S.S. MAJESTIC
(Aerial marine cruiser above)

available shortly, the full output of which is estimated at 600,000 tons gross per annum.—J. Blair, *Japanese mercantile marine (Japan Society Transactions and Proceedings, 1917-1918, p. 41)*.—“Twenty years have brought about striking changes in the distribution of Japan's exports and imports among the individual countries which have shared in the total trade. In early years Great Britain was the most important source of Japan's imports, but she took only a small share of Japan's exports; the United States took as large a proportion of Japan's exports as Great Britain contributed to the imports, but sent to Japan in return only about two-thirds the amount of imports supplied by Great Britain. By 1913 Great Britain and the United States were contributing almost equally to Japan's imports, but the United States was taking of Japan's exports almost six times as much as the share taken by Great Britain. The United States has been for a long period the most important market for Japanese exports. In one year only since 1897 have the Japanese exports to the United States been exceeded by those to any other country; in 1905, as a result of exceptional conditions arising from the Russo-Japanese War then in progress, the ex-

ports to China exceeded those to the United States. In 1917; the greatest proportion ever sent to British India was 6.3 per cent. in 1916. In most years the exports to the United States exceeded those to any other three countries combined. Of Japan's greatly increased exports in 1916 and 1917, 30.2 and 29.8 per cent., respectively, were sent to the United States. The United States has for a long time been and remains the best market for Japan's exports.”—C. M. Pepper, *American foreign trade, pp. 274, 275*.

1914-1921.—World war and its effects.—Shipping.—Balfour of Burleigh report outlining British policy.—European and Japanese trade conditions after the war.—Shipping depression.—“The gross reduction in the non-teutonic world's tonnage for the four years [of the World War] has been over 35 per cent., the equivalent of over one ship in every three. In the amount of tonnage sunk Great Britain has been far and away the greatest sufferer; but in the proportion sunk her 46.9 per cent. ranks second to Norway's more than 50 per cent. Denmark has had over a third of her shipping destroyed, Spain about a quarter and Holland and Sweden have also lost heavily.”—H. C. Wiltbank, *What the war cost*

shipping (Rudder, p. 104).—"At the outbreak of the war the merchant tonnage of the United Kingdom was composed of 8,587 steam vessels of over 100 tons gross, with a tonnage of 18,892,000, and 653 sailing vessels of 100 tons gross and over, aggregating 365,000 tons. During the war British losses amounted to 9,032,000 tons gross, of which 7,754,000 were lost through enemy action; the remainder, 1,278,000, were lost through marine risk, abandonment, etc. The United Kingdom built 4,342,000 tons of merchant vessels during the war. She purchased 530,000 tons from other countries and captured 717,000 tons from enemy countries, which were later brought into action, making a total gain of 5,589,000 tons from all sources. Thus the net loss of the British during the war was 3,443,000 tons. Her tonnage at the close of the war was, therefore, 15,814,000. This figure probably over-states the tonnage available for use, due to the fact that many vessels were pressed into service and kept in service during the war which would normally have been written off as losses. . . . France is planning her first effort in modern times to secure a merchant marine commensurate with her foreign trade. France lost 528 vessels of 907,000 gross tons through enemy action during the war. Her loss constituted about 39 per cent. of her entire merchant fleet at the outbreak of the war. . . . Italy lost more than half her merchant fleet during the war. Her losses through enemy action were 565 vessels with a tonnage of 852,000 or 51 per cent. of her entire fleet in 1914. . . . The war losses suffered by Holland were much less than that of most other European countries. She lost approximately 200,000 tons of shipping, or 14 per cent. of her merchant fleet in 1914. Belgium's war losses amounted to 99,000 tons, or 25 per cent. of her total fleet. Brazil lost through war risk about 8 per cent. of her merchant fleet (25,000 tons). Austria lost 393,000 tons of vessels during the war. These losses were due chiefly to seizures and capture by enemy countries, and constituted 37 per cent. of Austria's pre-war merchant marine. The total steam merchant fleet of 100 gross tons and over under the German flag on June 30, 1914, amounted to 2,159 vessels of 5,291,000 tons. It was the second largest merchant navy in the world. Less than one-half of the German fleet of 1914 remained in German hands at the close of the war. According to the best information available 1,507,000 tons were in trade or in ports of Germany, Austria, and Turkey. The location of 334,000 tons was unknown. No doubt the major part of this was in German hands. Vessels aggregating 738,000 tons were laid up in neutral ports, and so far as can be ascertained, were still the property of German citizens at the close of hostilities. The outside estimate of 1914 tonnage in possession of Germany at the close of the war would not exceed 2,580,000. Germany's losses during the war were exceedingly heavy. About 2,111,000 tons (steamers of 100 gross tons and over) were captured or seized by countries at war with Germany. Seventy-nine steamers of 187,000 tons are reported lost through enemy action. Germany's losses through marine risk during the war cannot have been very heavy inasmuch as few German ships ventured upon the high seas during this period. Germany's losses from this source and other sources not mentioned above were probably about 400,000 tons, making Germany's total losses during the war of tonnage which was in existence in 1914 about 2,712,000. Germany's fleet at the close of hostilities consisted, therefore, of 2,580,000 tons of 1914 tonnage which she still owned, plus about 740,000 tons

which were built during the war making a total of about 3,320,000 tons."—E. N. Hurley, *World shipping data*, pp. 5-20.—"The United States forged ahead as rapidly as Germany fell behind. In August, 1914, at the beginning of the world war, the United States seagoing merchant marine, 500 gross tons and over, included 624 steamers of 1,758,465 gross tons, and 870 sailing vessels and schooner barges of 947,852 gross tons, making a grand total of 1,494 seagoing merchant vessels of 2,706,317 gross tons. On November 11, 1918, at the end of the war, the steam merchant marine had increased to 1,366 vessels of 4,685,263 gross tons, and the sailing vessels and schooner barges had decreased to 747 vessels of 820,917 gross tons, making a grand total of 2,113 seagoing vessels of 5,515,180 gross tons. This does not include the seized enemy vessels, which at the end of the war aggregated 88 vessels of 562,005 gross tons, of which number 81 of 546,210 gross tons were steamers, and 7 of 15,795 gross tons were sailing vessels. The total construction in the United States added to the merchant marine, during the war 875 vessels of 2,941,845 gross tons. The purchase from aliens of 233 vessels of 833,854 gross tons, the movement to the ocean from the Great Lakes of 66 steamers of 139,469 gross tons, and miscellaneous acquisitions amounting to 31 vessels of 39,210 gross tons are other sources of acquisition. The loss of 114 vessels of 322,214 gross tons by enemy action, of 278 of 405,400 gross tons by marine risk, of 130 vessels of 268,149 gross tons by sale to aliens, and of 64 vessels of 149,761 gross tons through sale to the U. S. Government, abandonment and other causes accounts for the decreases. Losses of 15 seized German and requisitioned Dutch steam vessels, amounting to 112,248 gross tons, are not included in the losses given above."—E. N. Hurley, *World shipping data*, pp. 2-5.—See also U. S. A.: 1804-1809; 1808; 1900 (December); WORLD WAR: 1918: IX. Naval operations: e; EUROPE: Modern period: Conflicting currents before World War.

"What were the effects of the war? Some are temporary. We [in the United States] lost the trade of the Teutonic powers and countries cut off by them. We exported munitions of war and products which the other belligerents were temporarily unable to manufacture, because of the devastation of their land or the shortage in man power. As a result of the general shortage of shipping, intensified by submarine activity, trade was diverted out of its pre-war routes and stocks of goods accumulated at points of production that became less accessible during the war, like sugar in Java, and coffee in Brazil. Prices rose and the volume of trade rose accordingly, although the tonnage of goods in the trade of the world fell. With cessation of hostilities these factors became inoperative in part. . . . But there have been some permanent changes as well. Chiefly, these are such as would ultimately have come about after the lapse of a long time. As a result of the shortage of commodities imported from Germany before the war, new industries were established, notably the manufacture of dyes, nitrates, and heavy chemicals, optical glass, scientific instruments, toys, and related goods. Not only in the United States, but also in Brazil, Japan, India, Australia, the establishment of local industries was stimulated by the shortage of imported goods. The process of the decentralization of the industry of the world was accelerated. Like a bomb, the war split German foreign trade into fragments. The centralization of a great group of so-called essential or key industries in Germany has forever

been destroyed. Tariffs, and in some countries anti-alien laws, will effectually consolidate the industrial gains of the war. Then, again, the shortage of shipping compelled the rerouting of the trade of the world. Courses which became temporarily expedient during the war were found to be permanently more efficient. Most of the trans-shipment trade between the United States and the Far East or South America was routed via London, Hamburg, and Rotterdam. Direct lines have since been established. . . . Finally, our trade balance has changed probably permanently. Before the war our excess of exports was about \$500,000,000, which was balanced off by means of various items we owed our customers or sent abroad, as interest on loans, shipping charges, insurance and banking fees, expenditure of Americans abroad, and remittances by European residents in the United States. During the period from July 1, 1914, to December 30, 1918, or roughly, the period of the war, our excess of exports amounted to about \$12,000,000,000. In pay-

at subnormal output and raise the cost of production for domestic needs, until our own requirements catch up with our production. The war thrust responsibilities upon us which we met. The peace finds us at a stage of economic development that might have taken us a generation, perhaps a half century, to attain."—E. M. Friedman, *International commerce and reconstruction*, pp. 8-11.—See also EUROPE: Modern period: Far-reaching effects of the World War; U. S. A.: 1915 (March): Blockade of German commerce; WORLD WAR: 1917: VIII. United States and the war: a, 1.

While President Wilson was proclaiming the removal of economic barriers as one of the aims of the World War, a committee under Lord Balfour of Burleigh was busy preparing a report defining the future industrial and commercial policy of the British empire with particular reference to the Paris Economic Resolutions. "The report may be fairly described as, in its reasoning,

COMMERCE CARRIER ON THE AIR ROUTE BETWEEN LONDON AND BRUSSELS

ment for this excess of exports from the United States during the war the European belligerents returned to the United States about \$2,000,000,000 worth of our securities, shipped \$1,000,000,000 in gold, borrowed in the open market \$1,000,000,000, and to the end of 1918 received United States Government advances of about \$8,000,000,000. There can be no return to pre-war conditions. Instead of owing Europe about \$125,000,000 annually in interest, she will owe us about \$500,000,000. Our debt for shipping charges will likewise be reduced. . . . Again, our banking fees were paid to European bankers, with whose bills we financed our exports. These will now be paid largely to our own bankers. Thanks to the efforts of the Federal Reserve Board, American acceptances grew from nothing in February, 1915, to over \$300,000,000 in February, 1919, of which about \$200,000,000 represented foreign transactions. Finally, we expanded our industrial facilities. Our iron production rose from 30,000,000 tons in 1913 to 42,000,000 tons in 1918. Our refinery copper output rose from 1,600,000,000 pounds in 1913 to 2,400,000,000 pounds in 1918. Our mining and manufacturing capacity increased far beyond our domestic requirements. We must either export our surplus or operate our industries

essentially a 'Protectionist' document, shrinking, so far as a majority of the members are concerned, from a candidly Protectionist conclusion. . . . The whole committee, with a few individual dissents, supports (a) the prohibition of importation of goods, of enemy origin for at least twelve months after peace, and for as much longer as the Government chooses; (b) monopolization of Allied products for the Allies; (c) a permanent Government policy of making the British Empire self-supporting; (d) the exclusion of foreign capital from our country, but the removal of all restriction on the use of our capital abroad; (e) a Government subsidy or tariff protection for 'essential industries'; (f) 'every encouragement . . . by the Government to the formation of combinations of manufacturers and others,' coupled with the most determined resistance to any Government control over such combinations for the protection either of the wage-earners or the consumers; (g) stringent tariff protection against dumping; and (h) placing all such tariff policy outside Ministerial and therefore Parliamentary control." This policy of economic exclusiveness is reasserted in the following resolutions passed by Lord Balfour's committee, February 2, 1917 (Cd. 8482): "In the light of experience gained during the war, we consider

that special steps must be taken to stimulate the production of food-stuffs, raw materials, and manufactured articles within the Empire wherever the expansion of production is possible and economically desirable for the safety and welfare of the Empire as a whole. We therefore recommend that H. M. Government should now declare their adherence to the principle that preference should be accorded to the products and manufactures of the British Overseas Dominion in respect of any customs duties now or hereafter to be imposed on imports into the United Kingdom. Further, it will in our opinion be necessary to take into early consideration, as one of the methods of achieving the above objects, the desirability of establishing a wider range of customs duties which would be remitted or reduced on the products and manufactures of the Empire, and which would form the basis of commercial treaties with Allied and neutral powers."—L. Rogers, *International*

and appreciation of the problems ahead, and a gradual getting into working shape of Europe's industrial machine; an improving exchange condition probable in the majority of countries which will make long-term and permanent capital investments very attractive to American investors."—W. S. Kies, *Fundamental factors in the present economic situation in Europe (Proceedings of the Academy of Political Science, Feb., 1921, pp. 1-2, 9-10, 12).*

"Apart from Germany, the United Kingdom and Greece are the only ones which show a considerable reduction in the tonnage now [1920] owned as compared with 1914. Notwithstanding the increased construction and the large amount of ex-enemy tonnage provisionally allocated to British management, and of course included in the figures, there are at the present time some 781,000 tons less of steamers owned in the United Kingdom than in 1914. Most of the other countries

(The greatest docks in the world)

economic relations after the war (International Conciliation, Feb., 1919, pp. 240-241).—"By way of summary, these, then, are the fundamental factors in the European situation which we must have clearly in mind in planning our industrial and economic future: Political instability, national and racial jealousies and hatreds largely due to an unworkable peace treaty; a dearth of working capital and a loss of purchasing power; enormous debts; budgetary deficits; wasteful and extravagantly costly governmental administration; depreciation in the actual value of currencies due to enormous inflation; a great need of foodstuffs and raw materials for years to come, and for the moment a diminishing market for manufactured products; low wages made relatively lower by exchange conditions and a huge surplus of labor which must find work, migrate or starve; inability to pay present debts, and little likelihood of paying future debts for some time to come in either gold or commodities which we can afford to accept. On the other hand, slow but sure progress, industrially and socially; a great improvement in the spirit and willingness to work, an understanding

show an increase, very considerable in some cases. The seagoing tonnage of the United States has increased by nearly 10,000,000 tons, an increase of over 500 per cent. on the 1914 figures. The other countries in which the largest increases are recorded are: Japan, 1,288,000 tons; France, 1,041,000 tons; and Italy, 638,000 tons. As in the case of the United Kingdom, the figures for France and Italy include a considerable amount of ex-enemy tonnage provisionally allocated to those countries. The figures for Germany conclusively show the change in the maritime position of that country. While in 1914 Germany occupied after the United Kingdom, the first position with over 5,000,000 tons of merchant steamers, only 419,000 tons are now recorded in the book as German, everything else having been either captured, requisitioned, or allocated to the Allies in accordance with the peace treaty. The relative position of some other countries has also altered to a large extent. In 1914 the United Kingdom owned 41.6 per cent. of the world's steam tonnage, the present percentage is 33.6. Norway, which occupied the fourth place, is now seventh, while Japan, which was sixth, is

now third. Excluding vessels trading on the Great Lakes of North America (about 2,300,000 tons), the United Kingdom percentage of the world's seagoing steam tonnage has decreased from 43.9 in 1914 to 35.1 in 1920, while the proportion of the United States, which was 4.7 per cent. six years ago, now reaches 24 per cent. It should be stated that, with the exception of the United States, most of the increase recorded by the various countries, as compared with 1914, has taken place during the last 12 months, during which period over 6 million tons of shipping have been added to the world's merchant navies. Taken together, the Scandinavian countries—Norway, Sweden, and Denmark—still show a decrease, as compared with 1914, of 47,000 tons. As the outstanding rival of the British mercantile marine, the United States has taken the place of Germany. . . . *The United States possesses to-day two and a half times as much sea-going tonnage as was under the German flag six years ago.*—A. Hurd, *World's shipping: Balance of power* (*Fortnightly Review*, Oct. 1, 1920, pp. 585-586).—“Japan, emergent from the Great War, is newly rich, aggressive, and progressive. Her sacrifices, from the nature of her geographical situation, remote from the scene of hostilities, were few. Her legitimate gains were many. Industrially, financially, and commercially she is immeasurably strengthened. Her national debts in 1919 were less than they were in 1914. She was a creditor for loans advanced to her allies. Her bank deposits had increased in the five-year period fifty per cent. Her foreign trade, measured both in exports and in imports, had gained more than one hundred per cent. It was approximately \$680,000,000 in 1914. It exceeded \$1,600,000,000 in 1919.”—C. M. Pepper, *American foreign trade*, p. 265.—“The facts of the present [1921] shipping situation are plain. Nearly every day an item in some paper states that numbers of additional ships have been tied up, or that somebody estimates the total idle tonnage to be such a figure. The steamers afloat at the first of 1921 were 56.8 million gross tons, 13.7 million more than in 1913, and in addition 7.1 million were under construction. At the same time the volume of cargo moving was only four-fifths as much as in 1913. Charter rates today (June, 1921) are in many instances at pre-war levels and operating expenses are still around three times those of 1913. The present depression has all the characteristics of those preceding, many times intensified: a large excess of tonnage over immediate requirements, decreased movement of overseas shipments, millions of tons of steamers under construction, high ship construction and operating costs, and low rates. . . . Over-building of tonnage has continually recurred, sometimes coincident with a falling off of the amount of cargo shipped. In the forty-five years before the war only fifteen years were so-called good ones, two poor years for one of prosperity. While it is impossible to get an approximation of the excess of tonnage over the current trade requirements during the previous depressions, there is convincing evidence that in no instance has the surplus of tonnage (or the amount tied up, if one wishes) been so large a percentage of the whole as at present. And today new construction, a year after the depression has set in, is going forward at over twice the highest pre-war annual rate! The conclusion seems inescapable that shipping in general is confronted with a depression of unprecedented intensity and duration. The present depression may be the most trying one that the old established lines have experienced, it will certainly test severely the new companies, and it is likely to prove almost disastrous

to our government-owned fleet.”—E. S. Gregg, *Vicissitudes in the shipping trade, 1870-1920* (*Quarterly Journal of Economics*, Aug., 1921, pp. 616-617).—See also ARGENTINA: 1918-1920; AUSTRALIA: CONSTITUTION; BLACKLIST, COMMERCIAL; CANADA: 1920; TRADE; CUBA: 1914-1918; 1920-1921 (October-March); DIPLOMATIC AND CONSULAR SERVICE: Consular service; FOOD REGULATION: 1914-1915; LATIN AMERICA: 1918-1921: Trade effects; PHILIPPINE ISLANDS: 1837-1896; 1913-1917; 1917-1918; RUSSIA: 1914 (August): Relations with Germany; 1920-1921: Difficulties of establishing peace with Allies; TARIFF: 1918-1919; U. COMMERCE, Department of, United States.—“The two most recent executive departments of the Federal Government are the Department of Commerce and the Department of Labor. The Department of Commerce and Labor was created by Act of Congress in 1903, and the Department of Labor was carved from it in 1913. The Department of Commerce and Labor, before the Department of Labor was created, had in it the following bureaus: Corporations, Manufactures, Labor, Lighthouses, Census, Statistics, Fisheries, Navigation, Immigration and Naturalization, and Standards. It also had charge of the Coast and Geodetic Survey and Steamboat Inspection Service. Of the above-named bureaus, those of the Census, Lighthouses, Fisheries, Navigation, and Standards are all in the present Department of Commerce, as are also the Coast and Geodetic Survey and the Steamboat Inspection Service. There is no longer a Bureau of Manufactures, but in the Department of Commerce is a Bureau of Foreign and Domestic Commerce, which performs the duties which were formerly in the province of the Bureau of Manufactures with certain other duties which have been since added. . . . The Secretary of Commerce at the close of the year 1914 supervised the Bureau of the Census, with its highly technical organization, and the Bureau of Corporations which was almost an independent division of the Administration. This latter bureau, by the Act of Congress of September 26, 1914, providing for a Federal Trade Commission, was merged into this commission immediately upon its organization, the above act providing that the Bureau of Corporations should then cease to exist and that all of its functions should be exercised by the Federal Trade Commission. . . . The remaining divisions of the department primarily concern commerce.

The Coast and Geodetic Survey and the Steamboat Inspection Service are both important divisions. The Bureaus of Foreign and Domestic Commerce, of Navigation, and of Lighthouses relate specifically to commerce, while the Bureaus of Standards and of Fisheries relate less directly to he same subject."—J. P. Hill, *Federal executive*, pp. 171-172.—See also U. S. A.: 1903 (February).

COMMERCE, International Chamber of.—"The International Chamber of Commerce is a direct result of the International Trade Conference, which was held in the United States at Atlantic City in the Fall of 1919. At that time there came to . . . [the United States] missions from Great Britain, France, Belgium and Italy, for conference with the business and financial interests of the United States, concerning the problems that then confronted the world. . . . The Atlantic City Conference agreed unanimously on the principles of a new type of international organization, appointed a committee on organization to try to carry it through, and agreed to meet in Paris in the summer of 1920 to perfect organization. . . . [In 1921] the Chamber had really its first meeting in London. . . . The fundamentals of the International Chamber lie in three fields. The first is education, the opportunity which is offered by these meetings of leaders of business from the several countries to exchange ideas; . . . [the second, agreement] on principles, which should guide the several nations so far as legislation is concerned affecting business and finance, reform of things which have long challenged attention, but concerning which very little has been done; and . . . [the third], action on the part of the business men themselves, without waiting for governments or waiting for legislation, wherever there is opportunity for them to secure common action. . . . The question now arises as to the organization of the International Chamber of Commerce and how it purposes to accomplish what it has set out to do. . . . As a part of the International Chamber, there is set up and maintained and now in operation a permanent international headquarters, with an adequate staff, for the present located in Paris, for the purpose of following up every action agreed upon. Each nation is represented in that International headquarters by a commissioner of its own who is there permanently."—J. H. Fahley, *International Chamber of Commerce explained* (*Export Trade and Exporters' Review*, Oct. 15, 1921, pp. 9-10).

COMMISSION GOVERNMENT IN AMERICAN CITIES.—The type of municipal reform known as the commission plan of government places all administrative and legislative powers in the hands of a small commission. (See below: Summary of advantages and objections.)

1901-1903.—Galveston plan.—The plan originated in Galveston, Texas, which in 1900 "had the usual type of city government in the United States . . . both as to general form of government and . . . quality of administration. The private business of its citizens was prosperous, but the city itself was without financial strength, its sanitary condition was poor, its streets were in bad condition, and the police did not enforce the laws. A great hurricane swept the city and left it prostrate. The city is situated on low ground and its defences from the Gulf were destroyed. The private business of its people was no longer prosperous; its bonds fell to sixty and the bankruptcy of the city and its citizens was impending. The emergency was beyond the ability of the city government, and with ruin staring them in the face its citizens had no choice but either to abandon their homes and start in business in some other place or to remain where they were and rescue Galveston. They quickly discovered that responsibility under the existing charter was divided and dissipated and that their first need was the simplification of their form of government in order to concentrate responsibility. They asked the state legislature to change the charter and vest in a small board all the legislative and executive authority of the city. The legislature made the necessary changes and the experiment began in the autumn of 1901. The governing body of the city was made a small board of five members, a mayor-president and four associates, the mayor and two of his associates appointed by the governor, the two others elected at large."—H. E. Deming, *Government of American cities*, pp. 98-99.—"Before long, however, the constitutionality of the charter was called into question, and the Supreme Court of Texas decided that certain functions . . . [of] the commissioners . . . could not be exercised except by elective officers. In March, 1903, therefore, the Legislature was appealed to for an amendment to the charter making all the commissioners elective, and the five original commissioners were forthwith indorsed by the voters at the polls. The Galveston charter, as amended in 1903, provides for the popular election, every two years, of five commissioners, one of whom is given the title of mayor-president. All are elected at large. The mayor-president is presiding officer of the commission, but otherwise has no special powers. By a majority vote of the five commissioners all municipal ordinances are passed, and all appropriations are voted, the mayor-president having no right to veto either absolute or qualified. The commissioners likewise, by majority vote, apportion among themselves the headships of the four main departments of civic administration, namely, finance and revenue, waterworks and sewerage, police and fire protection, and streets and public property; the mayor-president having no special department, but exercising a general coordinating influence over all. A single com-

missioner is, therefore, immediately responsible for the administration of each department. The commission as a whole draws up and passes the annual budget, awards all contracts, and makes all important appointments. Minor appointments are made by the individual commissioners, each in his own special department. There is throughout a complete centralization of all powers, legislative and administrative, and a very definite location of all responsibility."—W. B. Munro, *Galveston plan, in City government by commission* (C. B. Woodruff, ed.), pp. 47-48.—"It should be remembered that the Galveston plan was not at first intended to be a permanent system of government for the city. Its prime object was to enable Galveston to tide over a difficult emergency. . . . Prepared somewhat hastily, with very little experience to serve as a guide, it vested in the hands of a small body of men more extensive final powers than most cities would care to give away; but the lapse of a few years proved that the new system was a godsend to the stricken community. The people's civic spirit was aroused, the business of the city recovered rapidly, and in a remarkably short time the place was again on its feet, financially and otherwise. Then developed the conviction that commission government was a good form to maintain permanently. The other cities of Texas, noting conditions under the new régime in Galveston, came forward and asked the legislature for similar charters; and in the course of a few years commission charters had been given to all the important cities of the state, including Houston, Dallas, El Paso, Austin and Fort Worth."—W. B. Munro, *Government of American cities*, p. 298.

1907.—Des Moines plan.—Later adoptions.—"This development in Texas naturally attracted attention in other states, and the reform organizations of various Northern cities began to discuss the possibility of applying the scheme to the solution of their own municipal problems. The first municipality outside of Texas to accept the plan was Des Moines, Iowa. In 1907 the Iowa legislature passed an act [sponsored by the citizens of Des Moines] permitting any city of the state having a population of more than 25,000 to adopt a commission type of government; and forthwith . . . Des Moines . . . took advantage of the new provision. The Des Moines plan . . . is simply a new edition of the Galveston plan. . . . It provides for a commission consisting of a mayor and four councillors, all elected at large for a two-year term by the voters of the city. To this body is intrusted all the powers hitherto vested in the mayor, city council . . . [and all] administrative boards or officers. . . . The business of the city is grouped into five departments, namely, public affairs, accounts and finances, public safety, streets and public improvements, and parks and public property. By the terms of the charter the commissioner who is elected mayor of the city becomes head of the department of public affairs; each of the other commissioners is put at the head of one of the other departments by majority vote of the commission, or council, as the body is called in Iowa. All officers and employees of the various departments are appointed by the council, which also has authority to choose a board of three civil-service commissioners to administer, under its direction, the state laws relating to civil service. Most of the city officers come within the scope of these laws. Thus far the system diverges but very slightly from the Galveston plan. The chief difference lies in the fact that the Des Moines scheme incorporates . . . the initiative, referendum, protest, and recall, and makes pro-

vision for nominations by a general non-partisan primary. . . . The protest affords a means of delaying the operation of ordinances enacted by the council until the voters can have an opportunity to express themselves. By this expedient no ordinance passed by the council (except an emergent measure) can go into effect until ten days after its passage. Meanwhile, if a petition protesting against such ordinance, signed by twenty-five per cent of the voters of the city, is presented to the council, it is incumbent on that body to reconsider the matter. If the ordinance is not entirely repealed, it must then be . . . [referred] to the voters for their acceptance or rejection. The vote takes place at a regular election, if there is one within ninety days; otherwise at a special election held for the purpose. If indorsed at the polls, the ordinance becomes effective at once; if rejected by the voters, it remains inoperative. It is further provided . . . that no public-utility franchise . . . shall be valid until confirmed by the electorate. The recall provision permits the voters to remove from office any member of the council at any time after three months' tenure in office. Petitions for recall or removal must be signed by at least twenty per cent of the voters, and the question . . . is put before them at a special election. All nominations in Des Moines are made at a non-partisan primary, and the ballots . . . bear no party designations. The new régime in Des Moines seemed to begin inauspiciously. Those citizens who had been behind the new charter movement put forward their slate of candidates, consisting of business and professional men of standing who had not been prominent in the partisan politics of the city under the old dispensation. A vigorous campaign for the election of this group was undertaken, but when the ballots were counted it was found that the opponents had proved stronger at the polls. The first council under the new charter was, accordingly, made up of men who had been more or less closely affiliated with the old order of things, . . . [but experience] has proved that the caliber and qualifications of the men in office are not more important than the system under which they are expected to carry on their work. There is little question that the administration of affairs in Des Moines has been very much more efficient since the commission took charge in April, 1908, than it was during the years preceding that date.

"Since its adoption in Des Moines the spread of the revised commission system has been rapid. During the next few years a great many cities, scattered about in more than twenty different states, abolished the old system and established the new one. Some of these are cities with populations exceeding 50,000, but in general the commission plan seems . . . to have served chiefly as a scheme of town government. But also everywhere the voters have taken kindly to it, and wherever the question of adopting the system has been put before the people at the polls they have, with very few exceptions, accepted it. As yet there have been few backsliders: only one or two cities have gone back to the old plan after trying the new."—*Ibid.*, pp. 299-302.—A number of municipalities, however, have changed over to the city-manager type of government. See CITY MANAGER PLAN OF MUNICIPAL GOVERNMENT.

1911.—Adoption in Birmingham.—"Commission government . . . became effective April 10, 1911. Prior to that time the city government was vested in the mayor and thirty-two aldermen. These aldermen were chosen from different wards in the city and served without legal compensa-

tion. . . . The leaders in city politics, and the bosses, in and out of office, feeling sure of their position, daily became bolder, more brazen and more contemptuous of decent public opinion. . . . In a city primary, shortly preceding the convening of the legislature, the democratic voters of Birmingham declared in favor of commission government by a vote of about ten to one. Popular sentiment in Birmingham had crystallized so strongly and had been manifested so plainly for commission government, and the interest in this new form of city government had so developed over the state, that there was no open, organized opposition to the passage of legislation on this subject, and the commission bill applying to cities of the size of Birmingham was approved by the governor on the thirty-first of March, 1911. . . . Birmingham has three commissioners, . . . receiving seven thousand dollars each. . . . The Birmingham plan provides that the terms of the three original commissioners expire, respectively, on the first Mondays in November, 1913, 1914, and 1915. Only one commissionership will come up before the people at a time, and the successful candidate must receive a majority of all the votes cast. If in an election no candidate receives a majority, another election must be held on the same day of the following week between the two high candidates. . . . All city employees are prohibited by law from endeavoring to influence any voter in favor of or against any candidate for commissioner. The Birmingham bill does not permit voters to initiate legislation. . . . Our law authorizes a referendum to the voters on nothing but the granting of franchises to public utility corporations. Activities in procuring such franchises have been one of the frequent causes of municipal corruption. No referendum is provided on the refusal of such franchises, because the possibilities of corruption and evil on this account are manifestly insignificant. The law contains a provision for election for the recall of commissioners on petitions signed by three thousand voters. . . . Commission government in Birmingham has been an unqualified business success. . . . When the commissioners entered upon their duties, Birmingham's floating debt under aldermanic government had been piling up with alarming rapidity. A favored bank had selfishly dominated the city's finances, and the other banking institutions of the city had felt that it was useless for them to consider, or endeavor to aid in the city's financial problems. Practically all of the Birmingham bankers were enthusiastic believers in commission government, and have rallied in loyal support of the new administration. Immediately after the commissioners entered office, a note for three hundred thousand dollars, which had been bearing interest at six per cent per annum, fell due. The old administration bank, which had controlled the loan, offered to renew it at the same rate, but the commissioners placed the loan with other Birmingham banks for three months at five per cent. . . . The Birmingham commissioners issue monthly a compact summary of their proceedings for the previous month, showing in the simplest and plainest terms all receipts and disbursements of the city and all transactions of the least importance. The first aim of the commissioners was to reduce the current expenses of the city to fit its income. All sinecures were abolished. Operating expenses were cut to the bone, and the regular operating expenses of the city, in the first twenty days the commission was in existence, were reduced in the annual sum of ninety-four thousand five hundred and thirty-four dollars, without decreasing the efficiency of the city

government. While the Birmingham commission has resorted to every intelligent economy, it has not hesitated to spend money so as to secure better results and increased efficiency. . . . With its large industrial population, one of the most pressing needs of Birmingham is adequate parks and playgrounds; and at the request of the commissioners, some of the most capable and public-spirited men in the community have agreed to serve without compensation as park commissioners for the purpose of devising plans for a park system for the city. There is no 'red tape' in the conduct of Birmingham's city affairs. The commissioners devote all of their time to the public business, and a crippled negro mendicant can secure an audience with the commission as easily as a street car magnate. The work of city government is divided by the commissioners into departments headed by the respective commissioners. Under the law the division into departments can be made and rearranged by the commissioners to suit themselves. But all important questions are passed upon by the entire commission and the recommendations of a commissioner as to his department are in no sense binding upon the board."—W. Percy, *Birmingham, Alabama, under the commission plan* (*Annals of the American Academy of Political and Social Science*, Nov., 1911).

1913-1921.—Adoption in Buffalo.—First election.—Work accomplished.—Failure of attempt to obtain repeal of charter.—Under the act passed by the legislature in 1913 Buffalo adopted the commission form of government at a referendum in 1914 by a majority of 15,741 out of a total vote of 57,253. "Buffalo worked for nearly ten years to get this charter. It was repeatedly defeated in the Legislature, but public opinion became stronger after each defeat. The people would not be denied. . . . As the largest city in the East and one of the largest in the United States to attempt this system of government, the results of the Buffalo experiment will be watched with much interest. The election on November 2 and the primary which preceded it were unusual enough to deserve wide attention. They were the first tests of any part of the commission charter in actual operation. . . . This plan attempts to eliminate all party politics in the selection of city officials. Any citizen could become a candidate at the primary by filing a petition containing 100 signatures. There are only five elective officers in the entire city government. This year there were only four places to be filled, as the present mayor is allowed by the charter to serve out his term. The result was startling. Not one of the old members of the Common Council won a place on the ticket. Only one man of the professional-politician type was successful. . . . About 66,000 votes were cast at this primary, out of a total registration of approximately 80,000. . . . At the election, the eight names were placed on the voting machines in a column by themselves and in alphabetical order. There were no symbols or other party designations. The big surprise was the defeat of the Commissioner of Public Works,—the one representative of the old style of politics who had survived the primary. Despite the fact that his 'machine' following alone was good for 20,000 votes, he received only about 30,000 at the election. Somewhat to the chagrin of the reformer, the leader who was called 'father of the charter' also failed by a narrow margin. The four elected were two business men, a lawyer, and one of the former State Senators. Two of these are Republicans and two are Democrats. Except the former Senator, none of them has ever before held public office

or been at all active in politics. . . . So far the charter was intended to eliminate the old politician crowd and considerations of partisanship from the city government, it was a great success. . . . These four men combine in themselves both the executive and the legislative powers. They are the Common Council, passing on all appropriations, tax levies, and local ordinances. They are also the heads of the executive departments. . . . For administrative purposes the city is divided into five departments,—public safety (fire, police, and health), public works, finance, public affairs (schools and charities), parks and public buildings. The department of public safety is vested by law in the Mayor. Lesser appointments are to be made by the Council on nominations made by the head of the department in which the appointee is to serve. Wide latitude is given the Council in the creation and elimination of offices, but the civil service must be under the rules prescribed by the State law. The charter provides for a referendum on all franchises, and in certain conditions on other matters, but it does not include the initiative or the recall. All sessions must be public, all votes individually recorded, and reports both of Council proceedings and of the city's financial condition must be published regularly. The terms of office are four years. . . . A mayor and one councilman will be [chosen at one election], three councilmen at the next, and thereafter this alternation will continue. There never will be more than three city offices to be filled by election at the same time. There are no ward offices.”—*American Review of Reviews*, Dec., 1915.

“The franchise and referendum clauses of the charter were used with good effect at the . . . general election [in 1916] without friction or extra expense. The questions on the ballot received a reasonable attention on the part of the voter and the vote apparently was satisfactory to the majority. This use of the popular feature has begun to educate our people to a more careful consideration of public questions and to an appreciation of their duties as citizens. Very definite improvement is seen in the police force. . . . Much less criticism is heard of the chief, who is an appointee of the present government, than of his predecessor. The health department has undertaken and is carrying out a progressive development in the shape of the establishment of four health centers located . . . where the attention of the health department is most needed, [which] . . . extend the functions of the health department directly to the spots requiring attention and as each health center is in charge of a health physician giving his entire time to the work, it correlates other health activities such as babies' milk dispensaries, tuberculosis clinics, and all the regular activities of the health department. The result has been most beneficial to the poorer element of the population. Education has received a new impetus by the appointment of an excellent board of education by the mayor. The work of this board is hampered by a division of responsibility between itself and the commissioner of public affairs. . . . This weakness in the charter [was corrected] by an amendment . . . which . . . [gives] the entire administrative control to the board but . . . [leaves] the appointment of the board itself and the control of its budget in the hands of the commission. The administration of the parks has been much improved in the direction of developing their use for the public by the addition of . . . [recreation grounds]. In the department of finance and accounts the commissioner has, by his careful and scientific survey of the situation, raised the assessed valuation over two hundred

million dollars. A large part of this increase has been obtained by the inclusion of the machinery in factories as real property, under a recent decision of the court, by an increase in the valuation of public service corporation property and of the larger industrial establishments. The attempt has been made to distribute fairly the burden of taxes, and that it has been reasonably successful is shown by the fact that there have been very few protests. This will reduce the rate of taxation considerably and in this way relieve the small taxpayer of a burden which has been growing too heavy for him to carry. As a whole the tendency of this commission is to spend money rather than to save it but at the same time their efforts have been in the direction of a more democratic distribution of the benefits of the city government than heretofore.”—K. Mixer, *National Municipal Review*, Mar., 1917, pp. 278-279.—“Being the largest city in the United States to adopt this system, Buffalo is an interesting subject for study by those who are trying to solve American municipal problems. A remarkable demonstration that the people still approve the experiment after five years of trial was furnished in the session of the State Legislature which adjourned on April 16 [1921] during which a determined effort . . . [to repeal the commission charter] was defeated by the protests of the citizens. . . . Soon after the election . . . [in 1920] a Buffalo member of the State Legislature announced his purpose to present a bill revising the charter. The proposition received little attention at first, [and] the citizens gained their first knowledge of what was intended when the bill was introduced at Albany. It was then found that the measure provided for the creation of a larger council elected by districts, equivalent to a board of aldermen; separation of executive and legislative functions, giving the Mayor a veto power but no seat in the council; abolition of the non-partisan system of primaries and elections and restoration of the party system by a provision that nominations should be made and elections held under the regular State laws. . . . The principal arguments offered in support of the change were that stronger candidates for Mayor could be obtained if the power of the office were increased by restoring the veto; that different sections of the city required local representatives to promote their local interests; that taxation had been considerably increased under commission government; that much undignified squabbling . . . had occurred at sessions of the council; that the non-partisan system had facilitated the election of a Socialist. . . . The counter-arguments, which illustrate the favorable results of commission government, were many and varied. It was pointed out that the Mayor, by reason of his seat in the council and voice in the passing of appropriations and ordinances, . . . has more real power than he could exercise as a simple executive with a veto and that he had proved this by preventing riotous demonstrations and a threatened policemen's strike at a time when serious disturbances were occurring in Cleveland, Boston and other cities. It was recalled that former boards of aldermen had usually been made up of men of small caliber who were controlled by political committees and whose rule was wasteful and inefficient. No scandal or corruption could be charged against commission government. A heavy increase in taxation was undeniable, but it was shown to be less than has occurred in most cities during the period of war inflation. Moreover, it [had] been accomplished chiefly by a revision and equalization of assessments, which was just and businesslike.

When the commission government took hold, the city was bonded to the constitutional debt limit. It [had] not increased its net debt during these five years. Payment of expiring bonds . . . balanced the issue of new securities, and the city's debt . . . [stood] \$40,000,000 below the limit fixed by the State Constitution. While this improvement in the finances had been effected, important public improvements, some of which had been needed for many years, [had] been carried out. Furthermore, the tide had begun to turn. A reduction of \$5 per \$1000 in the tax rate [has already] been made. As for the election of a Socialist to the Council, that is likely to happen in any industrial city and might be more easily accomplished if the non-Socialist vote were divided between Republicans and Democrats. . . . Under the commission government . . . the election of a Socialist did not turn the city over to the Socialist party. The Socialist councilman was merely placed at the head of the department of public affairs and the government under the non-partisan council went on as before. It would be necessary under commission government for the Socialists to carry two, if not three, successive elections before they could assume administration of the city, as they would do whenever they win a single election in other cities. . . . The bill received but seven opposition votes in the Assembly and four in the Senate. It was then sent to the Mayor of Buffalo, as required by the State Constitution. By this time the people were thoroughly aroused. All the newspapers except one opposed the reversion to the old aldermanic and party-government system. Clubs of both men and women voters denounced the change. Public meetings were held at which very strong protests were voiced. Men who had held office under the old government and had been leaders in resisting the adoption of the commission charter originally declared that it had been successful and should stand. At the hearing before the Mayor the hall was crowded with earnest citizens, representing all manner of organizations, who spoke emphatically against the bill, while but seven persons, including two members of the legislature, appeared in its favor. The Mayor, after holding the bill for the fifteen days that the law permitted, returned it to Albany with a stirring veto. The session was then within three days of the time set for adjournment . . . but the evidence of public disfavor was too strong for the politicians. . . . No motion to repass the bill over the Mayor's veto was made in either house, and the legislature adjourned leaving the commission charter untouched."—M. M. Wilner, *Commission government under test* (*American Review of Reviews*, June, 1921, pp. 624-625.)

1916.—**Fight to retain commission government in Columbia, S. C.**—"For the last three years [ending 1916] quite a little dissatisfaction has been expressed by the citizens of Columbia, S. C., about the failure of the commission form of government to carry forward constructive work. An effort was made to recall the mayor but the petitioners were unable to get the requisite number of signatures. Another group of dissatisfied citizens then undertook to recall two members of the council, but they also failed to get the recall election ordered, on the ground that they did not have enough signatures. Thereupon all dissatisfied elements combined and under a section of the commission act which provided that after six years upon proper petition the question of recalling the form of government could be voted on, an effort was made to recall the government. They secured the election. A vigorous short campaign

was put on by both sides, and the commission form won out four to one. This ratio was obtained in every ward in the city except one, where a large cotton mill vote was against the [commission] form of government. 'The retention of the commission government is a strong testimonial to the belief that our people think,' a correspondent writes, 'the commission form is vastly superior to the old aldermanic form. There is a great deal of dissatisfaction here about the actual working of the commission form, but the voters properly took the view that they should look to the members of council and recall them if necessary rather than give up the entire form of government. The *Columbia State* in a strong editorial two days after the election warned the members of council that the retaining of the commission form was an expression of confidence in the form of government and not in the members of council and that the feeling was very strong in the city that unless council got together on constructive matters, some if not all of the council, including the mayor, should be recalled.'"—*National Municipal Review*, Jan., 1917, p. 116.

1917.—**Newark, N. J.**—"Newark, New Jersey, by an overwhelming vote (19,069 to 6,953) . . . decided [in 1917] to adopt the commission form of government provided by the Walsh act. This was the result of an active campaign which . . . extended over a number of months and had the support of leading organizations like the Newark board of trade. . . . Newark is . . . one of the largest cities in the country to be operated under a commission form of government."—*National Municipal Review*, Nov., 1917, p. 723.

1919.—**Cities under commission plan.**—"A list of cities that have the system at the present day [1919] . . . would contain the names of more than three hundred municipalities. Six are cities with populations exceeding 200,000."—W. B. Munro, *Government of the United States*, p. 623.

Advantages.—"In its actual working the new system has shown itself possessed of many advantages. Of these the most striking . . . [is] that the plan puts an end to that intolerable scattering of powers, duties, and responsibilities which the old type of city government promoted to the point of absurdity. By enabling public attention to focus itself upon a narrow and well-defined area, it allows the scrutiny which voters apply to the conduct of their representatives to be real, and not, as heretofore, merely perfunctory. . . . Sponsors of commission government assured us, even before the plan had had a fair trial, that they proposed a scheme of organization which would give cities a business administration. They pointed out that the management of a city's affairs is not government, but business. . . . The commission system . . . it is contended, enables a city to conduct its business promptly and without undue friction. There may be wisdom in a multitude of counsellors, but the history of those municipalities which maintain large deliberative bodies seems to warrant the impression that this collective wisdom is not of very high grade. . . . A council of some half-dozen men offers at least the possibility of despatch in the handling of city affairs; for its small size removes an incentive to fruitless debate, and affords little opportunity for resort to those subterfuges in procedure which serve mainly to create needless friction and delay. But the chief merit urged in behalf of the commission plan is not that it concentrates responsibility and permits the application of business methods to the conduct of a city's affairs, important as these things are. In the last analysis, municipal administration is as much a

question of men as of measures. . . . Much depends, accordingly, upon the answer to the query whether the commission form of government does or does not offer any assurance, or even a reasonable prospect, that it will tend to install better men in the city's posts of power and responsibility. This is, after all, the crucial question; and the advocates of the system answer it unequivocally. The plan will, they feel certain, serve to secure better men. Indeed, it can hardly help doing so, they assure us; for it is almost a commonplace of political experience that the caliber of men in public office is closely related to the amount of power and authority which they exercise."—W. B. Munro, *Government of American cities*, pp. 304-309.

Coöperation in commission cities.—"In commission cities generally business men's organizations appreciate the value of promoting efficiency in government from the standpoint of progressive business enterprise. The commission plan is regarded as a business asset. It is very common for commercial organizations in commission cities to advertise commission government first among the city's claims to recognition as a superior place for industrial settlement. The Fort Worth chamber of commerce ranks commission government among such commercial assets as transportation facilities, etc. . . . Results of coöperation in Houston include city planning, the construction and use of a city-owned auditorium, adoption of an assessment plan for street paving, the construction of a ship canal, and the maintenance of a traffic bureau for which the city appropriates \$1,000 annually. The Commercial Club of Topeka reports that 'many of the most important propositions that are presented to our city commission are first presented to the club for indorsement.' Civic organizations have found the way for coöperation widened with the adoption of the commission plan. Oklahoma City's chamber of commerce bears testimony for many others when it writes: 'The wire-pulling and politics which were persistent as obstacles a few years ago have been entirely eliminated, and at the present time a progressive movement or a new enterprise which proves upon investigation of keen business men to be another step forward is forthwith materialized with all the dispatch possible with the observance of good business principles. . . . As long as a proposition is based upon good business principles and in no way compromises the interests of the public, there has been no question of difference between the commercial organizations and the city officials.' In contrast with this optimistic note the chamber of commerce of an important Pennsylvania city regretfully reports failure to obtain serious consideration of its proposals on the part of officials 'due to the fact that the city government is in complete control of a political boss, who is likewise in control of our urban and suburban trolley lines, our gas company and our electric light company.' To overcome this condition the chamber is resorting to a zealous campaign to obtain the commission plan for its city. In justification of the Pennsylvania city's hope the board of trade in a Massachusetts commission city finds 'under the new government there is a tendency toward coöperation,' whereas, under the old form, 'there was practically no chance for such work.' In a Texan town where the adoption of the commission plan has been steadfastly opposed the chamber of commerce is 'sorry to say that practically no general civic improvement has been accomplished by our organization in coöperation with city officials.' In El Paso, on the contrary, whose chamber of commerce declares it one of

the best governed cities in the country and among the first to adopt the commission form, there is the most amicable coöperation between the city government and commercial organizations, 'which,' the chamber's secretary writes, 'is of absolute necessity to obtain the greatest amount of good to a community as a whole.' . . . It is not remarkable, of course, that commercial organizations should find commission government active in coöperation because the commission plan is peculiarly a product of business men's interests in city government. Boards of commissioners are elected to and expected to meet the demands of their communities, and between elections these demands are as yet most articulately expressed by business organizations. The country over, business men appreciate the importance of good streets, lighting, water, fire protection, parks, healthfulness and schools as inducements to new commercial and industrial enterprises. In advertising circulars sent out to present the superior advantages of their particular city for commercial or industrial settlement, commercial bodies give conspicuous place to statistics showing miles of pavement, number of schools, general healthfulness, adequacy of water supply for fire protection, etc."—H. Bruère, *New city government*, pp. 370-382.

Objections to the plan.—"The chief characteristic of the commission form of city government . . . is its concentration of both legislative and executive powers in the hands of the same small body. That in itself . . . is not a serious objection to the plan. A more substantial objection arises from the fact that the executive functions are intrusted to five men and that the location of responsibility is therefore not sufficiently defined. In other words, the objection is not to the fusion of the two classes of powers, but to the inadequate concentration of one of these classes, namely, the executive powers. Executive work, if it is to be done efficiently, must be apportioned to officials who will be individually responsible for it. That principle was recognized in the commission plan, which groups all the administrative work of the city into five departments and places one of the commissioners directly in charge of each. But the practical difficulties in that arrangement are two: (1) the whole commission may by majority vote overrule any action which an individual commissioner may take in regard to the affairs of his own department; and (2) the voters are prone to expect that the candidate who offers himself for election as a member of the commission will have some special qualification by training or experience for the administrative work which he will have to do. Now both of these things are at variance with the fundamental principles upon which the commission plan rests. Commission government claims to concentrate responsibility. In practice it does not sufficiently do so. The commissioner who is immediately in charge of the public works department, for example, and who ought to know most about its needs and problems, may be overruled by his four fellow-members who know nothing about such things. That has taken place time and again in commission-governed cities during the past half-dozen years; it has meant a divided responsibility. In the second place, it is not in consonance with the principles of the commission plan that only men who have technical knowledge should be chosen members of the commission. The commission is rightly a board of laymen, each of whom takes general charge of a department but is not expected to manage it directly. Immediate management should be left in the hands of the permanent officials, the com-

missioner-in-charge having general oversight only. But that is not what always happens. Too often the candidates in commission cities have been setting before the voters their own special administrative qualifications; they have promised, if elected, to run a department thus and so; and when elected they have proceeded to redeem these promises. Matters which ought to be left to qualified administrative discretion, to be determined on considerations of economy and efficiency alone, such as the sort of street paving to be used, have often become footballs of partisan politics at the election of commissioners. Let it be repeated that the commission plan was not, in its inception at any rate, based upon the idea that efficient working heads of administrative departments could ever be secured by electing them. That would have shown an utter disregard of our municipal experience. It was not intended that the members of the commission should be the working heads of departments. Yet that is just the direction in which the plan actually developed. In most commission-governed cities liberal salaries were provided for each of the five commissioners. This meant that the commissioners were expected to give a great deal of their time to the city's work and encouraged them to take a hand in the actual details of department business. In the great majority of commission cities (that is to say, cities with less than 50,000 population) there is no room for both a salaried commissioner and a well-paid professional expert in the management of the same department. To provide for both is costly and makes for friction. Accordingly, the individual commissioners in most of these cities have tried to manage the departments with their own skill and knowledge, and on the whole they have not made a striking success of it."—W. B. Munro, *Government of American cities*, pp. 386-387.—"Considerable variation in details will be found among commission charters, but most of the points of difference are of slight importance. The term for which commissioners are elected varies from a single year to six years, but two-year and four-year terms are the most common. . . . In nearly all commission cities the distribution of administrative work among the members is made after the commission has met and organized for business, but in a few cities the commissioners are elected directly to stated departments; that is to say, one commissioner is elected director of public safety, another director of finance, and so on. Something may be said in favor of each method; but on the whole the plan of electing five commissioners without any reference to the special administrative work which each will have to do is almost sure to be the better one. This is because the commission is not intended to be a set of administrative experts; no body directly elected ever can be such. The commission is rather a small board of amateurs who will secure expert officials and take advice from them."—*Ibid.*, pp. 302-303.—See also MUNICIPAL GOVERNMENT.

COMMITTEE OF UNION AND PROGRESS. See TURKEY: 1908.

COMMITTEE OF THE WHOLE. See CONGRESS OF THE UNITED STATES: House Committee of the Whole.

COMMITTEE ON PUBLIC INFORMATION: United States.—"The committee was established by executive order of the president April 14, 1917, and consisted of the Secretaries of State, War, and Navy, with Mr. George Creel as civilian chairman. It furnished an official channel for information concerning the purposes and conduct of the World War and cooperated with the newspapers both in publishing information about army and naval matters that should be known by our own people and in suppressing those facts which would aid the enemy. The committee conducted (1) a division of news which supervised and distributed news 'releases' from the civil and military departments; (2) a daily *Official Bulletin*; (3) a division of civic and educational cooperation which prepared and circulated the *Red, White, and Blue* and the *War Information* pamphlets; (4) Four Minute Men who spoke in moving-picture theaters; (5) public speaking in which the more extensive speaking campaigns were coordinated; (6) syndicate features; (7) a division of films; (8) a division of pictures; (9) a division of foreign language papers; (10) a division of distribution; (11) woman's war work; (12) division of reference; (13) art; (14) advertising; (15) foreign educational work; and (16) business management. The committee aided and encouraged all agencies engaged in the patriotic support of the national cause."—*War cyclopedia*, p. 60.

COMMITTEE SYSTEM: United States. See CONGRESS OF THE UNITED STATES: Senate: Procedure; and House Speaker and the committee system.

COMMODITY CLAUSE OF THE HEPBURN ACT.—In 1914 "the Supreme Court of the United States . . . handed down a decision in the so-called Commodity Clause case affecting the Delaware, Lackawanna & Western Railroad Co. and its affiliated coal concerns. This apparently brought . . . one main phase of the litigation in question to a conclusion. (No. 517, October term, 1914; U. S. *Appellant v. D. L. & W. Ry. Co.*, and *D. L. & W. Coal Co.*) The case was . . . of special interest because of the conflicting decisions that had . . . heretofore been rendered with reference to the working of the so-called Commodity Clause [known also as the Elkins Clause] of the

Interstate Commerce act under which it was made unlawful for a railroad company to carry on any business not connected with transportation. The act of 1906 made it unlawful for carriers to haul their own coal beyond the limits of the state in which they were located; and, desiring to continue the business of mining and transporting coal, the Delaware, Lackawanna & Western Railroad Co. adopted a plan under which it was to make sale and divest itself of title to the coal, at the mouth of the mines, before transportation began. Accordingly it caused to be incorporated under the laws of New Jersey, the Delaware, Lackawanna & Western Coal Co., with a capital stock of \$6,800,000, divided into shares of \$50 each. The railroad company then invited its own stockholders to subscribe to the capital stock of the coal company at the rate of one share of the latter for each four shares of the former. Ninety-nine percent of these stockholders did, as was expected, subscribe for the stock of the coal company—their subscriptions being paid for in full out of a cash dividend of \$13,600,000 previously declared by the railroad company. The new corporation was then organized by electing the vice-president of the railroad company as president . . . of the coal company. Other officers and directors of the coal company were also officers and directors of the railroad company. As soon as the organization was completed the railroad company prepared and submitted to the coal company a contract by which the railroad company, reserving what it needed for its railway locomotives, 'agreed to sell and the coal company agreed to buy, f. o. b. the mines, all coal which, during the term of the contract, the railroad company should produce from its own mines or purchase from anyone else.' The price for prepared sizes—the more important commercial coal—was fixed at 65 percent of the price in New York on the day of delivery at the mines. The railroad company also leased to the coal company all its trestles, docks, and shipping facilities. The contract—thus prepared by the railroad company—was then signed by both corporations and, on August 2, 1909, the coal company took possession of the leased property; those who had been agents of the railroad in its sales department became agents of the coal company in its sales department, and the two corporations, with managing officers in common, also had offices in common in the city of New York. Thereafter the railroad company continued its mining business, annually producing about 7,000,000 tons and purchasing about 1,500,000 tons, from operators whose mines were located on its railway. After retaining what was needed for use on its railway engines, it sold the balance, aggregating about 7,000,000 tons, to the coal company at the contract prices, f. o. b. the mines. The coal thus sold by the railroad company was then transported by the railroad company to destination, where it was delivered to the coal company, which paid the regular tariff freight rate and the contract prices on the 20th of each month. This course of dealing continued until February, 1913, when the government filed a petition against both corporations, alleging that the two were practically one, and attacking the validity of the contract. . . . The contract, therefore, violated not only the Commodity Clause of the Interstate Commerce Act, but also the Sherman Anti-trust law in the consequent conclusions. Particularly in its application to the railroad business, the decision makes clear that such a company, if it continues in the business of mining, must absolutely dissociate itself from the coal before the transportation begins. It cannot retain the title nor can it sell through

an agent. It cannot call that agent a buyer while so hampering and restricting such alleged buyer as to make him a puppet subject to the control of the railroad company. If the railroad sells coal at the mouth of the mines to one buyer or to many, it must not only part with all interest direct or indirect in the property, but also with all control over it or over those to whom the coal is sold at the mines. It must leave the buyer as free as any other buyer who pays for what he has bought. It should not sell to a corporation with officers and offices in common—for the policy of the statute requires that, instead of being managed by the same officers, they should studiously and in good faith avoid anything, either in contract or in conduct, that remotely savors of joint action, joint interest, or the dominance of one company by the other. If the seller wished—by a lawful and bona fide contract, whose provisions as to delivery and otherwise are not in restraint of trade—to sell all of its coal to one buying company, then that one buyer can be bound by reasonable terms and required to pay according to the contract."—*Journal of Political Economy*, Oct., 1915, pp. 838-839.—See also RAILROADS: 1908-1909.

COMMODUS, Lucius Aelius Aurelius (161-192), also called **Marcus Antoninus**, Roman emperor, 180-192. See **ROME:** Empire: 180-192.

COMMON LAW is the great body of law which has been established by custom, or which has grown up about the procedure of the courts in England and, following them, in the United States. In other words, common law is the law which, though firmly fixed in the life of the nation, cannot be found on the statutes.

Sources.—Unwritten or non-statutory law.—"Whatever else the Norman conquest may or may not have done, it made the old haphazard state of legal affairs forever impossible. The natural desire of the conquerors to make the most of their new acquisition, the exceptional administrative and clerical skill of the Normans, the introduction of Continental politics, the rapid growth of the country in wealth and civilization, soon proved the old customs to be inadequate. For some time, no one could tell what was going to take their place. In the end, there emerged a new national law; some of it based on immemorial nature usage, some of it unconsciously imported from foreign literature, not a little imposed by the sheer command of a new and immensely stronger central government. The precise share attributable to each of these sources will, probably, never be ascertained. It was part of the policy of the Conqueror to persuade his new subjects that he was heir to the kingdom of Edward the Confessor by lawful succession. The fiction must have been almost too gross for belief, even in an unlettered age; but the motive which prompted it led William to promise respect for the 'law of the land'—or the ancient customs of the people. The trouble was, that these customs differed from place to place and from class to class. No authoritative statement of them existed. The so-called 'Anto-Saxon Laws' were fragmentary and unsystematic. The old moots had kept no records. There was no class of English legal experts, such as those juriconsults of the Roman Empire who had reduced the usages of Republican Rome to order and method. Not unnaturally, efforts were made to supply the gap. Various private compilations, one of them at least claiming (untruthfully) an official origin, appeared; and a few of them have survived. They throw comparatively little

light on the subject; for their authors were utterly uncritical, by no means free from local and political bias, and totally devoid of literary skill. One of these compilations is known as the *Quadripartitus*, because it starts with the announcement that it will comprise four books—the first containing a Latin translation of the old English laws, the second certain contemporary documents, the third a treatise on status and pleading, the fourth, a treatise on theft and its varieties. Only two books have survived. The so-called 'English laws' are a crudely modernized version of the dooms of Cnut, Alfred, Athelstan, Edward the Elder, Edmund, and Ethelred, in the order named. Some of these are mere titles or rubrics; others are translations more or less full. Slightly later (probably about the year 1118) comes the compilation known as the *Laws of Henry I*, because it commences with a charter of that monarch. But it is principally occupied with a rather serious attempt by a writer not well fitted for his task, to compile from a multitude of local customs, of the existence of which he had somehow become aware, a general statement of the principles of English law. The *Leges Willelmi* was an unofficial compilation by some one who had access to a collection of old dooms and who was also more or less in touch with Norman and official usage. Finally, and perhaps the least trustworthy of all this group of sources, we have the so-called *Laws of Edward the Confessor*, which prefers to be an official collection, drawn up in 1070, from the mouths of local juries by wise and skillful officials.—E. Jenks, *Short history of English law*, pp. 17-19.—"The municipal law of England, or the rule of civil conduct prescribed to the inhabitants of this kingdom, may with sufficient propriety be divided into two kinds; the 'lex non scripta,' the unwritten or common law; and the 'lex scripta,' the written or statute law. The 'lex non scripta,' or unwritten law, includes not only general customs, or the common law properly so called, but also the particular customs of certain parts of the kingdom; and likewise those particular laws that are by custom observed only in certain courts and jurisdictions. When I call these parts of our law 'leges non scriptæ,' I would not be understood as if all those laws were at present merely oral, or communicated from the former ages to the present solely by word of mouth. . . . But, with us at present, the monuments and evidences of our legal customs are contained in the records of the several courts of justice, in books of reports and judicial decisions, and in the treatises of learned sages of the profession, preserved and handed down to us from the times of highest antiquity. However, I therefore style these parts of our law 'leges non scriptæ,' because their original institution and authority are not set down in writing, as Acts of Parliament are, but they receive their binding power, and the force of laws, by long and immemorial usage, and by their universal reception throughout the kingdom."—W. Blackstone, *Commentaries, introd., sect. 3*.—See also *CODES*.

449-1066.—Trial by jury unknown to Anglo-Saxons.—"It may be confidently asserted that trial by jury was unknown to our Anglo-Saxon ancestors; and the idea of its existence in their legal system had arisen from a want of attention to the radical distinction between the members or judges composing a court, and a body of men apart from that court, but summoned to attend in order to determine conclusively the facts of the case in

dispute. This is the principle on which is founded the intervention of a jury; and no trace whatever can be found of such an institution in Anglo-Saxon times."—W. Forsyth, *Trial by jury, p. 45*.

630.—First written body of English law.—"The first written body of English Law is said to have been promulgated in the Heptarchy by Ethelbert, about the year 630, and enacted with the consent of the states of his kingdom."—Joseph Parke, *History of chancery, p. 14*.

871-1066.—King's peace.—"The technical use of 'the king's peace' is, I suspect, connected with the very ancient rule that a breach of the peace in a house must be atoned for in proportion to the householder's rank. If it was in the king's dwelling, the offender's life was in the king's hand. This peculiar sanctity of the king's house was gradually extended to all persons who were about his business, or specially under his protection; but when the crown undertook to keep the peace everywhere, the king's peace became coincident with the general peace of the kingdom, and his especial protection was deemed to be extended to all peaceable subjects. In substance, the term marks the establishment of the conception of public justice, exercised on behalf of the whole commonwealth, as something apart from and above the right of private vengeance,—a right which the party offended might pursue or not, or accept composition for, as he thought fit. The private blood-feud, it is true, formally and finally disappeared from English jurisprudence only in the present century; but in its legalized historical shape of the wager of battle it was not a native English institution."—F. Pollock, *Essays in jurisprudence and ethics, p. 205*.—See also *KING'S PEACE*.

1066.—Inquisition, parent of modern jury.—"When the Normans came into England they brought with them, not only a far more vigorous and searching kingly power than had been known there, but also a certain product of the exercise of this power by the Frankish kings and the Norman dukes; namely, the use of the inquisition in public administration, i. e., the practice of ascertaining facts by summoning together by public authority a number of people most likely, as being neighbors, to know and tell the truth, and calling for their answers under oath. This was the parent of the modern jury. . . . With the Normans came also another novelty, the judicial duel—one of the chief methods for determining controversies in the royal courts; and it was largely the cost, danger, and unpopularity of the last of these institutions which fed the wonderful growth of the other."—J. B. Thayer, *Older modes of trial (Harvard Law Review, v. 5, p. 45)*.

1066-1154.—Trial by jury unknown to Anglo-Normans.—"The same remark which has already been made, with reference to the absence of all mention of the form of jury trial in the Anglo-Saxon Laws, applies equally to the first hundred years after the Conquest. It is incredible that so important a feature of our jurisprudence, if it had been known, would not have been alluded to in the various compilations of law which were made in the reigns of the early Norman kings. . . . Although the form of the jury did not then exist, the rudiments of that mode of trial may be distinctly traced, in the selection from the neighborhood where the dispute arose, of a certain number of persons, who after being duly sworn testified to the truth of the facts within their own knowledge. This is what distinguishes the proceeding from what took place among the Anglo-Saxons—namely, the choosing a limited number of *pro homines* to represent the community, and give

testimony for them."—W. Forsyth, *Trial by jury*, pp. 82-90.—See also JURY, TRIAL BY.

1066-1154.—**Curia Regis.**—"As a legal tribunal the jurisdiction of the Curia was both civil and criminal, original and appellate. As a primary court it heard all causes in which the king's interests were concerned, as well as all causes between the tenants-in-chief of the crown, who were too great to submit to the local tribunals of the shire and the hundred. As an appellate court it was resorted to in those cases in which the powers of the local courts had been exhausted or had failed to do justice. By virtue of special writs and as a special favor, the king could at his pleasure call up causes from the local courts to be heard in his own court according to such new methods as his advisers might invent. Through the issuance of these special writs the king became practically the fountain of justice, and through their agency the new system of royal law, which finds its source in the person of the king, was brought in to remedy the defects of the old, unelastic system of customary law which prevailed in the provincial courts of the people. The curia followed the person of the king, or the justiciar in the king's absence."—H. Taylor, *Origin and growth of the English constitution*, pt. 1, pp. 245-246.—See also ADMINISTRATIVE LAW: England; CURIA REGIS.

1066-1215.—**Purchasing writs.**—"The course of application to the curia regis was of this nature. The party suing paid, or undertook to pay, to the king a fine to have justitiam et rectam in his court: and thereupon he obtained a writ or precept, by means of which he commenced his suit; and the justices were authorized to hear and determine his claim."—Reeves' (Finlason's) *History of English law*, v. 1, p. 267.

1077.—**Trial by battle.**—"The earliest reference to the battle, I believe, in any account of a trial in England, is at the end of the case of Bishop Wulfstan v. Abbot Walter, in 1077. The controversy was settled, and we read: 'Thereof there are lawful witnesses . . . who said and heard this, ready to prove it by oath and battle.' This is an allusion to a common practice in the Middle Ages, that of challenging an adversary's witness, or perhaps to one method of disposing of cases where witnesses were allowed on opposite sides and contradicted each other. . . . Thus, as among nations still, so then in the popular courts and between contending private parties, the battle was often the ultima ratio, in cases where their rude and unratinal methods of trial yielded no results. It was mainly in order to displace this dangerous . . . mode of proof that the recognitions—that is to say, the first organized form of the jury—were introduced. These were regarded as a special boon to the poor man, who was oppressed in many ways by the duel. It was by enactment of Henry II. that this reform was brought about, first in his Norman dominions (in 1150-52), before reaching the English throne, and afterwards in England, some time after he became king, in 1154."—J. B. Thayer, *Older modes of trial* (*Harvard Law Review*, v. 5, pp. 66-67).—See also WAGER OF BATTLE.

1100 (circa).—**Origin of statutes of limitation.**—"Our ancestors, instead of fixing a given number of years as the period within which legal proceedings to recover real property must be resorted to, had recourse to the singular expedient of making the period of limitation run from particular events or dates. From the time of Henry I. to that of Henry III., on a writ of right, the time within which a descent must be shown was the time of King Henry I. (Co. Litt. 114b). In the twentieth

year of Henry III., by the Statute of Merton (c. 8) the date was altered to the time of Henry II. Writs of 'mort d'ancestor' were limited to the time of the last return of King John into England; writs of novel disseisin to the time of the king's first crossing the sea into Gascony. In the previous reign, according to Glanville (lib. 13, c. 33), the disseisin must have been since the last voyage of King Henry II. into Normandy. So that the time necessary to bar a claim varied materially at different epochs. Thus matters remained until the 3 Edw. I. (Stat. West. 1, c. 39), when, as all lawyers are aware, the time within which a writ of right might be brought was limited to cases in which the seisin of the ancestor was since the time of King Richard I., which was construed to mean the beginning of that king's reign (2 Inst. 238), a period of not less than eighty-six years. The legislature having thus adopted the reign of Richard I. as the date from which the limitation in a real action was to run, the courts of law adopted it as the period to which, in all matters of prescription or custom, legal memory, which till then had been confined to the time to which living memory could go back, should thenceforth be required to extend. Thus the law remained for two centuries and a half, by which time the limitation imposed in respect of actions to recover real property having long become inoperative to bar claims which had their origin posterior to the time of Richard I., and having therefore ceased practically to afford any protection against antiquated claims, the legislature, in 32d of Henry VIII. (c. 2), again interfered, and on this occasion, instead of dating the period of limitation from some particular event or date, took the wiser course of prescribing a fixed number of years as the limit within which a suit should be entertained. . . . It was of course impossible that as time went on the adoption of a fixed epoch, as the time from which legal memory was to run, should not be attended by grievous inconvenience and hardship. Possession, however long, enjoyment, however interrupted, afforded no protection against stale and obsolete claims, or the assertion of long abandoned rights. And as parliament failed to intervene to amend the law, the judges set their ingenuity to work, by fictions and presumptions, to atone for the supineness of the legislature. . . . They first laid down the somewhat startling rule that from the usage of a lifetime the presumption arose that a similar usage had existed from a remote antiquity. Next, as it could not but happen that, in the case of many private rights, especially in that of easements, which had a more recent origin, such a presumption was impossible, judicial astuteness to support possession and enjoyment, which the law ought to have invested with the character of rights, had recourse to the questionable theory of lost grants. Juries were first told that from user, during living memory, or even during twenty years, they might presume a lost grant or deed; next they were recommended to make such presumption; and lastly, as the final consummation of judicial legislation, it was held that a jury should be told, not only that they might, but also that they were bound to presume the existence of such a lost grant, although neither judge nor jury, nor any one else, had the shadow of a belief that any such instrument had ever really existed. . . . When the doctrine of presumptions had proceeded far towards its development, the legislature at length interfered, and in respect of real property and of certain specified easements, fixed certain periods of possession or enjoyment as establishing presumptive rights."—C. J. Cockburn,

in *Bryant v. Foot*, L. R. 2 Q. B., 161; s. c. (*Thayer's Cases on evidence*, 94).

1110 (circa).—King's peace superior to the peace of the subject.—“We find in the so-called laws of Henry I, that wherever men meet for drinking, selling, or like occasions, the peace of God and of the lord of the house is to be declared between them. The amount payable to the host is only one shilling, the king taking twelve, and the injured party, in case of insult, six. Thus the king is already concerned, and more concerned than any one else; but the private right of the householder is distinctly though not largely acknowledged. We have the same feeling well marked in our modern law by the adage that every man's house is his castle, and the rule that forcible entry may not be made for the execution of ordinary civil process against the occupier: though for contempt of Court arising in a civil cause, it may, as not long ago the Sheriff of Kent had to learn in a sufficiently curious form. The theoretical stringency of our law of trespass goes back, probably, to the same origin. And in a quite recent American textbook we read, on the authority of several modern cases in various States of the Union, that ‘a man assaulted in his dwelling is not obliged to retreat, but may defend his possession to the last extremity.’”—F. Pollock, *King's peace* (*Law Quarterly Review*, v. 1, pp. 40-41).

1135.—Abeysance of the king's peace.—“The King's Peace is proclaimed in general terms at his accession. But, though generalized in its application, it still was subject to a strange and inconvenient limit in time. The fiction that the king is everywhere present, though not formulated was tacitly adopted; the protection once confined to his household was extended to the whole kingdom. The fiction that the king never dies was yet to come. It was not the peace of the Crown, an authority having continuous and perpetual succession, that was proclaimed, but the peace of William or Henry. When William or Henry died, all authorities derived from him were determined or suspended; and among other consequences, his peace died with him. What this abeyance of the King's Peace practically meant is best told in the words of the Chronicle, which says upon the death of Henry I. (anno 1135): ‘Then there was tribulation soon in the land, for every man that could forthwith robbed another.’ Order was taken in this matter (as our English fashion is) only when the inconvenience became flagrant in a particular case. At the time of Henry III.'s death his son Edward was in Palestine. It was intolerable that there should be no way of enforcing the King's peace till the king had come back to be crowned; and the great men of the realm, by a wise audacity, took upon them to issue a proclamation of the peace in the new king's name forthwith. This good precedent being once made, the doctrine of the King's Peace being in suspense was never afterwards heard of.”—F. Pollock, *King's peace* (*Law Quarterly Review*, v. 1, pp. 48-49).

1154-1189.—Origin of unanimity of jury.—“The origin of the rule as to unanimity may, I think, be explained as follows: In the assize as instituted in the reign of Henry II. it was necessary that twelve jurors should agree in order to determine the question of disseisin; but this unanimity was not then secured by any process which tended to make the agreement compulsory. The mode adopted was called, indeed, an enforcement of the jury; but this term did not imply that any violence was done to the conscientious opinions of the minority. It merely meant that a

sufficient number were to be added to the panel until twelve were at last found to agree in the same conclusion; and this became the verdict of the assize. . . . The civil law required two witnesses at least, and in some cases a greater number, to establish a fact in dispute; as, for instance, where a debt was secured by a written instrument, five witnesses were necessary to prove payment. These would have been called by our ancestors a jurata of five. At the present day, with us no will is valid which is not attested by at least two witnesses. In all countries the policy of the law determines what it will accept as the minimum of proof. Bearing then in mind that the jury system was in its inception nothing but the testimony of witnesses informing the court of facts supposed to lie within their own knowledge, we see at once that to require that twelve men should be unanimous was simply to fix the amount of evidence which the law deemed to be conclusive of a matter in dispute.”—W. Forsyth, *History of trial by jury*, ch. 11, sect. 1.

1154-1189.—Reign of law initiated.—“The reign of Henry II. initiates the rule of law. The administrative machinery, which had been regulated by routine under Henry I., is now made a part of the constitution, enunciated in laws, and perfected by a steady series of reforms. The mind of Henry II. was that of a lawyer and man of business. He set to work from the very beginning of the reign to place order on a permanent basis, and, recurring to the men and measures of his grandfather, to complete an organization which should make a return to feudalism impossible.”—W. Stubbs, *Select charters of English constitutional history*, p. 21.

1164-1176.—Trial by assize.—“The first mention of the trial by assize in our existing statutes occurs in the Constitutions of Clarendon, A. D. 1164 [see ENGLAND: A. D. 1162-1170], where it was provided that if any dispute arose between a layman and a clerk as to whether a particular tenement was the property of the Church or belonged to a lay fief, this was to be determined before the chief justiciary of the kingdom, by the verdict of twelve lawful men. . . . This was followed by the Statute of Northampton, A. D. 1176, which directs the justices, in case a lord should refuse to give to the heir the seisin of his deceased ancestor, ‘to cause a recognition to be made by means of twelve lawful men as to what seisin the deceased had on the day of his death’; and also orders them to inquire in the same manner in cases of novel disseisin.”—W. Forsyth, *Trial by jury*, ch. 6, sect. 3.

1165 (circa).—Justice bought and sold.—“The king's justice was one great source of his revenue, and he sold it very dear. Observe that this buying and selling was not in itself corruption, though it is hard to believe that corruption did not get mixed up with it. Suitors paid heavily not to have causes decided in their favor in the king's court, but to have them heard there at all. The king's justice was not a matter of right, but of exceptional favor; and this was especially the case when he undertook, as he sometimes did, to review and overrule the actual decisions of local courts, or even reverse, on better information, his own previous commands. And not only was the king's writ sold, but it was sold at arbitrary and varying prices, the only explanation of which appears to be that in every case the king's officers took as much as they could get. Now we are in a position to understand that famous clause of the Great Charter: ‘To no man will we sell, nor to none deny or delay, right or justice.’ The Great Charter comes about half a century after the time of which we

have been speaking; so in that time, you see, the great advance had been made of regarding the king's justice as a matter not of favor but of right. And besides this clause there is another which provides for the regular sending of the king's judges into the counties. Thus we may date from Magna Carta the regular administration of a uniform system of law throughout England. What is more, we may almost say that Magna Carta gave England a capital. For the king's court had till then no fixed seat; it would be now at Oxford, now at Westminster, now at Winchester, sometimes at places which by this time are quite obscure. But the Charter provided that causes between subject and subject which had to be tried by the king's judges should be tried not where the king's court happened to be, but in some certain place; and so the principal seat of the courts of justice, and ultimately the political capital of the realm, became established at Westminster."—F. Pollock, *Essays in jurisprudence and ethics*, p. 200.

1166.—Assize of Clarendon. See ENGLAND: 1162-1170.

1176.—Justices in eyre.—"It has been generally supposed that justices in Eyre (iustitiarum itinerantes) were first established in 1176, by Henry II., for we find it recorded that in that year, in a great counsel held at Northampton, the king divided the realm into six parts, and appointed three traveling justices to go each circuit, so that the number was eighteen in all. . . . But although the formal division of the kingdom into separate circuits may have been first made by Henry II., yet there is no doubt that single justices were appointed by William I., a few years after the Conquest, who visited the different shires to administer justice in the king's name, and thus represented the curia regis as distinct from the hundred and county courts."—W. Forsyth, *Trial by jury*, pp. 81-82.

1189.—Legal memory.—Its effect.—"No doubt usage for the last fifty or sixty years would be some evidence of usage 700 years ago, but if the question is to be considered as an ordinary question of fact, I certainly for one would very seldom find a verdict in support of the right as in fact so ancient. I can hardly believe, for instance, that the same fees in courts of justice which were till recently received by the officers as ancient fees attached to their ancient offices were in fact received 700 years ago; or that the city of London took before the time of Richard I. the same payments for measuring corn and coals and oysters that they do now. I have no doubt the city of Bristol did levy dues in the Avon before the time of legal memory, and that the mayor, as head of that corporation, got some fees at that time; but I can hardly bring myself to believe that the mayor of Bristol at that time received 5s. a year from every ship above sixty tons burthen which entered the Avon; yet the claim of the city of Bristol to their ancient mayor's dues, of which this is one, was established before Lord Tenterden, in 1828. I think the only way in which verdicts in support of such claims, and there are many such, could have properly been found, is by supposing that the jury were advised that, in favor of the long continued user, a presumption arose that it was legal, on which they ought to find that the user was immemorial, if that was necessary to legalize it, unless the contrary was proved; that presumption not being one purely of fact, and to be acted on only when the jury really entertained the opinion that in fact the legal origin existed. This was stated by Parke B., on the first trial of Jenkins v. Harvey, 1 C. M. & R. 804, as being his

practice, and what he considered the correct mode of leaving the question to the jury; and that was the view of the majority of the judges in the Court of Exchequer Chamber in Shephard v. Payne, 16 C. B. (N. S.) 132; 33 L. J. (C. P.) 158. This is by no means a modern doctrine; it is as ancient as the time of Littleton, who, in his Tenures, § 170, says that all are agreed that usage since the time of Richard I. is a title; some, he says, have thought it the only title of prescription, but that others have said 'that there is also another title of prescription that was at the common law before any statute of limitation of writs, &c., and that it was where a custom or usage or other thing hath been used for time whereof mind of man runneth not to the contrary. And they have said that this is proved by the pleading where a man will plead a title of prescription of custom. He shall say that such a custom hath been used from time whereof the memory of men runneth not to the contrary, that is as much as to say, when such a matter is pleaded, that no man then alive hath heard any proof of the contrary, nor hath no knowledge to the contrary; and insomuch that such title of prescription was at the common law, and not put out by any statute, ergo, it abideth as it was at the common law; and the rather that the said limitation of a writ of right is of so long time past. 'Ideo quaere de hoc.' It is practically the same thing whether we say that usage as far back as proof extends is a title, though it does not go so far back as the year 1189; or that such usage is to be taken in the absence of proof to the contrary to establish that the usage began before that year; and certainly the lapse of 400 years since Littleton wrote has added force to the remark, 'the rather that the limitation of a writ of right is of so long time past.' But either way, proof that the origin of the usage was since that date, puts an end to the title by prescription; and the question comes round to be whether the amount of the fee, viz. 13s. is by itself sufficient proof that it must have originated since."—J. Blackburn, in *Bryant v. Foot*, L. R. 2 Q. B., 161; s. c. (*Thayer's Cases on evidence*, p. 88).

1194.—English law repositories.—"The extant English judicial records do not begin until 1104 (Mich. 6 Rich. I.). He have a series of such records from 1384 (6 Rich. II.). The first law treatise by Glanvil was not written before 1187. The law reports begin in 1292. The knowledge of the laws of England prior to the twelfth century is in many points obscure and uncertain. From that time, however, the growth and development of these laws can be traced in the parliamentary and official records, treatises, and law reports."—J. F. Dillon, *Laws and jurisprudence of England and America*, pp. 28-29.

1199.—Earliest instance of action for trespass.—"A case of the year 1199 (2 Rot. Cur. Reg. 34) seems to be the earliest reported instance of an action of trespass in the royal courts. Only a few cases are recorded during the next fifty years. But about 1250 the action came suddenly into great popularity. In the 'Abbreviatio Placitorum,' twenty-five cases are given of the single year 1252-1253. We may infer that the writ, which had before been granted as a special favor, became at that time a writ of course. In Britton (f. 49), pleaders are advised to sue in trespass rather than by appeal, in order to avoid 'la perilouse aventure de batayles.' Trespass in the popular courts of the hundred and county was doubtless of far greater antiquity than the same action in the Curia Regis. Several cases of the reign of Henry I., are collected in Bigelow, *Placita Anglo-Nor-*

mannica, 80, 98, 102, 127."—J. B. Ames, *Disseisin of chattels* (*Harvard Law Review*, v. 3, p. 29 note).

1208.—Evidence: Attesting witnesses.—"From the beginning of our records, we find cases, in a dispute over the genuineness of a deed, where the jury are combined with the witnesses to the deed. This goes back to the Franks; and their custom of requiring the witness to a document to defend it by battle also crossed the channel, and is found in Glanvil (lib. X., c. 12). . . . In these cases the jury and the witnesses named in the deed were summoned together, and all went out and conferred privately as if composing one body; the witnesses did not regularly testify in open court. Cases of this kind are found very early, e.g., in 1208-1209 (Pl. Ab. 63, col. 1, Berk.). . . . In the earlier cases these witnesses appear, sometimes, to have been conceived of as a constituent part of the jury; it was a combination of business-witnesses and community-witnesses who tried the case—the former supplying to the others their more exact information, just as the hundreders, or those from another county, did in the cases before noticed. But in time the jury and the witnesses came to be sharply discriminated. Two or three cases in the reign of Edward III. show this. In 1337, 1338 and 1340, we are told that they are charged differently; the charge to the jury is to tell the truth (a *lour ascient*) to the best of their knowledge, while that to the witnesses is to tell the truth and loyally inform the inquest, without saying anything about their knowledge (*sans lour scient*); 'for the witnesses,' says Thorpe, C. J., in 1349, 'should say nothing but what they know as certain, i. e., what they see and hear.' . . . By the Statute of York (12 Edw. II. c. 2), in 1318, it was provided that while process should still issue to the witnesses as before, yet the taking of the inquest should not be delayed by their absence. In this shape the matter ran on for a century or two. By 1472 (Y. B. 12 Edw. IV. 4, o), we find a change. It is said, with the assent of all the judges, that process for the witnesses will not issue unless asked for. As late, certainly, as 1489 (Y. B. 5 H. VII. 8), we find witnesses to deeds still summoned with the jury. I know of no later case. In 1540-1550 Brooke, afterwards Chief Justice of the Common Bench, argues as if this practice was still known: 'When the witnesses . . . are joined to the inquest,' etc.; and I do not observe anything in his Abridgment, published in 1568, ten years after his death, to indicate that it was not a recognized part of the law during all his time. It may, however, well have been long obsolescent. Coke (Inst. 6 b.) says of it, early in the seventeenth century, 'and such process against witnesses is vanished'; but when or how he does not say. We may reasonably surmise, if it did not become infrequent as the practice grew, in the fifteenth century, of calling witnesses to testify to the jury in open court, that, at any rate, it must have soon disappeared when that practice came to be attended with the right, recognized, if not first granted, in the statute of 1562-1563 (5 Eliz. c. 9, s. 6), to have legal process against all sorts of witnesses."—J. B. Thayer, in *Harvard Law Review*, v. 5, pp. 302-5.—"After the period reached in the passage above quoted, the old strictness as to the summoning of attesting witnesses still continued under the new system. As the history of the matter was forgotten, new reasons were invented, and the rule was extended to all sorts of writings."—J. B. Thayer, *Select cases on evidence*, p. 773.

1215 (ante).—Courts following the king.—"Another point which ought not to be forgotten in

relation to the King's Court is its migratory character. The early kings of England were the greatest landowners in the country, and besides their landed estates they had rights over nearly every important town in England, which could be exercised only on the spot. They were continually travelling about from place to place, either to consume in kind part of their revenues, or to hunt or to fight. Wherever they went the great officers of their court, and in particular the chancellor with his clerks, and the various justices had to follow them. The pleas, so the phrase went, 'followed the person of the king,' and the machinery of justice went with them."—J. F. Stephen, *History of the criminal law of England*, v. 1, p. 87.

1215.—Magna Carta.—"With regard to the administration of justice, besides prohibiting all denials or delays of it, it fixed the court of Common Pleas at Westminster, that the suitors might no longer be harassed with following the King's person in all his progresses; and at the same time brought the trial of issues home to the very doors of the freeholders by directing assizes to be taken in the proper counties, and establishing annual circuits. It also corrected some abuses then incident to the trials by wager of law and of battle; directing the regular awarding of inquest for life or member; prohibited the King's inferior ministers from holding pleas of the crown, or trying any criminal charge, whereby many forfeitures might otherwise have unjustly accrued to the exchequer; and regulated the time and place of holding the inferior tribunals of justice, the county court, sheriff's tourn, and court leet. . . . And, lastly which alone would have merited the title that it bears, of the great charter, it protected every individual of the nation in the free enjoyment of his life, his liberty and his property, unless declared to be forfeited by the judgment of his peers, or the law of the land."—O. Flintoff, *Laws of England*, p. 184.—See also MAGNA CARTA; and ENGLAND: 1215.

1216.—Distinction between common and statute law now begins.—"The Chancellors, during this reign [John 1199-1216], did nothing to be entitled to the gratitude of posterity, and were not unworthy of the master whom they served. The guardians of law were the feudal barons, assisted by some enlightened churchmen, and by their efforts the doctrine of resistance to lawless tyranny was fully established in England, and the rights of all classes of the people were defined and consolidated. We here reach a remarkable era in our constitutional history. National councils had met from the most remote times; but to the end of this reign their acts not being preserved are supposed to form a part of the *lex non scripta*, or common law. Now begins the distinction between common and statute law, and henceforth we can distinctly trace the changes which our juridical system has undergone. These changes were generally introduced by the Chancellor for the time being."—Lord Campbell, *Lives of the chancellors*, v. 1, p. 115.

1216-1272.—Henry de Bracton.—"It is curious that, in the most disturbed period of this turbulent reign, when ignorance seemed to be thickening and the human intellect to decline, there was written and given to the world the best treatise upon law of which England could boast, till the publication of Blackstone's Commentaries, in the middle of the eighteenth century. It would have been very gratifying to me if this work could have been ascribed with certainty to any of the Chancellors whose lives have been noticed. The author, usually styled Henry de Bracton, has gone

by the name of Brycton, Britton, Briton, Breton, and Brets; and some have doubted whether all these names are not imaginary. From the elegance of his style, and the familiar knowledge he displays of the Roman law, I cannot doubt that he was an ecclesiastic who had addicted himself to the study of jurisprudence; and as he was likely to gain advancement from his extraordinary proficiency, he may have been one of those whom I have commemorated, although I must confess that he rather speaks the language likely to come from a disappointed practitioner rather than of a Chancellor who had been himself in the habit of making Judges. For comprehensiveness, for lucid arrangement, for logical precision, this author was unrivalled during many ages. Littleton's work on Tenures, which illustrated the reign of Edward IV., approaches Bracton; but how barbarous are, in comparison, the commentaries of Lord Coke, and the law treatises of Hale and of Hawkins!"—Lord Campbell, *Lives of the chancellors*, v. 1. p. 139.—For opposite view see 9 *American Bar Association Report*, p. 193.

1217.—Dower.—“The additional provision made in the edition of 1217 to the provisions of the earlier issues of the Charter in respect of widow's rights fixed the law of dower on the basis on which it still rests. The general rule of law still is that the widow is entitled for her life to a third part of the lands of which her husband was seized for an estate of inheritance at any time during the marriage. At the present day there are means provided which are almost universally adopted, of barring or defeating the widow's claim. The general rule of law, however, remains the same. The history of the law of dower deserves a short notice, which may conveniently find a place here. It seems to be in outline as follows. Tacitus noticed the contrast of Teutonic custom and Roman law, in that it was not the wife who conferred a dowry on the husband, but the husband on the wife. By early Teutonic custom, besides the bride-price, or price paid by the intending husband to the family of the bride, it seems to have been usual for the husband to make gifts of lands or chattels to the bride herself. These appear to have taken two forms. In some cases the husband or his father executed before marriage an instrument called ‘libellum dotis,’ specifying the nature and extent of the property to be given to the wife. . . . Another and apparently among the Anglo-Saxons a commoner form of dower is the ‘morning gift.’ This was the gift which on the morning following the wedding the husband gave to the wife, and might consist either of land or chattels. . . . By the law as stated by Glanvil the man was bound to endow the woman ‘tempore desponsationis ad ostium ecclesiae.’ The dower might be specified or not. If not specified it was the third part of the freehold which the husband possessed at the time of betrothal. If more than a third part was named, the dower was after the husband's death cut down to a third. A gift of less would however be a satisfaction of dower. It was sometimes permitted to increase the dower when the freehold available at the time of betrothal was small, by giving the wife a third part or less of subsequent acquisitions. This however must have been expressly granted at the time of betrothal. A woman could never claim more than had been granted ‘ad ostium ecclesiae.’ Dower too might be granted to a woman out of chattels personal, and in this case she would be entitled to a third part. In process of time however, this species of dower ceased to be regarded as legal, and was expressly denied to be law in the time of Henry IV. A trace of it still

remains in the expression in the marriage service, ‘with all my worldly goods I thee endow.’”—K. E. Digby, *History of the law of real property*, pp. 126-128 (4th ed.).

1258.—Provisions of Oxford; no writs except de cursu.—“The writ had originally no connection whatever with the relief sought, it had been a general direction to do right to the plaintiff, or as the case might be, but, long before the time now referred to, this had been changed. . . . It appears that even after the writ obtained by the plaintiff had come to be connected with the remedy sought for, . . . a writ to suit each case was framed and issued, but the Provisions of Oxford (1258) expressly forbade the Chancellor to frame new writs without the consent of the King and his Council. It followed that there were certain writs, each applicable to a particular state of circumstances and leading to a particular judgment, which could be purchased by an intending plaintiff. These writs were described as writs ‘de cursu,’ and additions to their number were made from time to time by direction of the King, of his Council or of Parliament.”—D. M. Kerly, *History of equity*, p. 9.—See also OXFORD, PROVISIONS OF.

1258.—Sale of judicial offices.—“The Norman Kings, who were ingenious adepts in realizing profit in every opportunity, commenced the sale of Judicial Offices. The Plantagenets followed their example. In Madox, chap. II, and in the Cottoni Posthuma, may be found innumerable instances of the purchase of the Chancellorship, and accurate details of the amount of the consideration monies. . . . What was bought must, of course, be sold, and justice became henceforth a marketable commodity. . . . The Courts of Law became a huckster's shop; every sort of produce, in the absence of money, was bartered for ‘justice.’”—J. Parke, *History of English chancery*, p. 23.

1265.—Disappearance of the office of chief justiciary.—“Towards the end of this reign [Henry III.] the office of Chief Justiciary, which had often been found so dangerous to the Crown, fell into disuse. Hugh le Despenser, in the 40th of Henry III., was the last who bore the title. The hearing of common actions being fixed at Westminster by Magna Carta, the Aula Regia was gradually subdivided and certain Judges were assigned to hear criminal cases before the King himself, wheresoever he might be in England. These formed the Court of King's Bench. They were called ‘Justitiani ad placita coram Rege,’ and the one who was to preside ‘Capitalis Justiciarius.’ He was inferior in rank to the Chancellor, and had a salary of only one hundred marks a year, while the Chancellor had generally 500. Henceforth the Chancellor, in rank, power, and emolument, was the first magistrate under the Crown, and looked up to as the great head of the profession of the law.”—Lord Campbell, *Lives of the chancellors*, v. 1, pp. 139-140.

1275.—Statute of Westminster the First; Improvement of the law.—“He [Robert Burnel] presided at the Parliament which met in May, 1275, and passed the ‘statute of Westminster the First,’ deserving the name of a Code rather than an Act of Parliament. From this chiefly, Edward I. has obtained the name of ‘the English Justinian’—absurdly enough, as the Roman Emperor merely caused a compilation to be made of existing laws—whereas the object now was to correct abuses, to supply defects, and to remodel the administration of justice. Edward deserves infinite praise for the sanction he gave to the undertaking; and from the observations he had made in France, Sicily, and the East, he may, like Napoleon, have been

personally useful in the consultations for the formation of the new Code—but the execution of the plan must have been left to others professionally skilled in jurisprudence, and the chief merit of it may safely be ascribed to Lord Chancellor Burnel, who brought it forward in Parliament. The statute is methodically divided into fifty-one chapters. . . . It provides for freedom of popular elections, then a matter of much moment, as sheriffs, coroners, and conservators of the peace were still chosen by the free holders in the county court, and attempts had been made unduly to influence the elections of knights of the shire, almost from the time when the order was instituted. . . . It amends the criminal law, putting the crime of rape on the footing to which it has been lately restored, as a most grievous but not a capital offence. It embraces the subject of 'Procedure' both in civil and criminal matters, introducing many regulations with a view to render it cheaper, more simple, and more expeditious. . . . As long as Burnel continued in office the improvement of the law rapidly advanced—there having been passed in the sixth year of the King's reign the 'Statute of Gloucester'; in the seventh year of the King's reign the 'Statute of Mortmain'; in the thirteenth year of the King's reign the 'Statute of Westminster the Second,' the 'Statute of Winchester,' and the 'Statute of Circumspecte agatis'; and in the eighteenth year of the King's reign the 'Statute of Quo Warranto,' and the 'Statute of Quia Emptores.' With the exception of the establishment of estates tail, which proved such an obstacle to the alienation of land till defeated by the fiction of Fines and Common Recoveries—these laws were in a spirit of enlightened legislation, and admirably accommodated the law to the changed circumstances of the social system,—which ought to be the object of every wise legislation."—Lord Campbell, *Lives of the chancellors*, v. 1, pp. 143-146.—See also ENGLAND: 1275-1295; 1279.

1278.—**Foundation of costs at common law.**—"The Statute of Gloucester, 6 Edw. I. c. i., is the foundation of the common law jurisdiction as to costs, and by that statute it was enacted that in any action where the plaintiff recovered damages, he should also recover costs. . . . By the Judicature Act, 1875, O. L. V., the Legislature gave a direct authority to all the judges of the Courts constituted under the Judicature Act, and vested in them a discretion which was to guide and determine them, according to the circumstances of each case, in the disposition of costs."—S. Hastings, *Treatise on torts*, p. 370.

1285.—**Statute of Westminster the Second; writs in consimili casu.**—"The inadequacy of the common form writs to meet every case was, to some extent, remedied by the 24th Chapter of the Statute of Westminster II., which, after providing for one or two particular cases to meet which no writ existed, provides further that 'whosoever from henceforth it shall fortune in Chancery that in one case a writ is found, and, in like case falling under like law is found none, the clerks of the Chancery shall agree in making a writ or shall adjourn the Plaintiffs until the next Parliament, and the cases shall be written in which they cannot agree, and be referred until the next Parliament; and, by consent of the men learned in the Law a writ shall be made, that it may not happen, that the King's Court should fail in ministering justice unto Complainants.' . . . The words of the statute give no power to make a completely new departure; writs are to be framed to fit cases similar to, but not identical with, cases falling within existing writs, and the exam-

ples given in the statute itself are cases of extension of remedies against a successor in title of the raiser of a nuisance, and for the successor in title of a person who had been disseised of his common. Moreover the form of the writ was debated upon before, and its sufficiency determined by the judges, not by its framers, and they were, as English judges have always been, devoted adherents to precedent. In the course of centuries, by taking certain writs as starting points, and accumulating successive variations upon them, the judges added great areas to our common law, and many of its most famous branches, assumpsit, and trover and conversion for instance, were developed in this way, but the expansion of the Common Law was the work of the 15th and subsequent centuries, when, under the stress of eager rivalry with the growing equitable jurisdiction of the Chancery, the judges strove, not only by admitting and developing actions upon the case, but also by the use of fictitious actions, following the example of the Roman Praetor, to supply the deficiencies of their system."—D. M. Kerly, *History of equity*, pp. 10-11.

1285.—**Writ of elegit.**—The Writ of Elegit "is a judicial writ given by the statute Westm. 2, 13 Edw. I., c. 18, either upon a judgment for a debt, or damages; or upon the forfeiture of a recognizance taken in the king's court. By the common law a man could only have satisfaction of goods, chattels, and the present profits of lands, by the . . . writs of 'fieri facias,' or 'levari facias'; but not the possession of the lands themselves; which was a natural consequence of the feudal principles, which prohibit the alienation, and of course the encumbering of the fief with the debts of the owner. . . . The statute therefore granted this writ (called an 'elegit,' because it is in the choice or the election of the plaintiff whether he will sue out this writ or one of the former), by which the defendant's goods and chattels are not sold, but only appraised; and all of them (except oxen and beasts of the plough) are delivered to the plaintiff, at such reasonable appraisement and price, in part of satisfaction of his debt. If the goods are not sufficient, then the moiety or one-half of his freehold lands, which he had at the time of the judgment given, whether held in his own name, or by any other in trust for him, are also to be delivered to the plaintiff; to hold, till out of the rents and profits thereof the debt be levied, or till the defendant's interest be expired; as till the death of the defendant, if he be tenant for life or in tail."—W. Blackstone, *Commentaries*, bk. 3, ch. 27.

1290.—**Progress of the common law right of alienation.**—"The statute of Quia Emptores, 18 Edw. I., finally and permanently established the free right of alienation by the sub-vassal, without the lord's consent; . . . and it declared, that the grantee should not hold the land of his immediate feoffor, but of the chief lord of the fee, of whom the grantor himself held it. . . . The power of involuntary alienation, by rendering the land answerable by attachment for debt, was created by the statute of Westm. 2, 13 Edw. I., c. 18, which granted the elegit; and by the statutes merchant or staple, of 13 Edw. I., and 27 Edw. III., which gave the extent. These provisions were called for by the growing commercial spirit of the nation. To these we may add the statute of 1 Edw. III., taking away the forfeiture or alienation by the king's tenants in capite, and substituting a reasonable fine in its place; . . . and this gives us a condensed view of the progress of the common law right of alienation from a state of servitude

to freedom."—J. Kent, *Commentaries*, pt. 6, lect. 67.

1292.—Fleta.—"Fleta, so called from its composition in the Fleet prison by one of the justices imprisoned by Edward I., is believed to have been written about the year 1292, and is nothing but an abbreviation of Bracton, and the work called 'Britton,' which was composed between the years 1290 and 1300, is of the same character, except that it is written in the vernacular language, French, while Granvil, Bracton and Fleta are written in Latin."—Thomas J. Semmes, 9 *American Bar Association Report*, p. 193.

1300 (circa).—King's peace a common right.—"By the end of the thirteenth century, a time when so much else of our institutions was newly and strongly fashioned for larger uses, the King's Peace had fully grown from an occasional privilege into a common right. Much, however, remained to be done before the king's subjects had the full benefit of this. . . . A beginning of this was made as early as 1195 by the assignment of knights to take an oath of all men in the kingdom that they would keep the King's Peace to the best of their power. Like functions were assigned first to the old conservators of the peace, then to the justices who superseded them, and to whose office a huge array of powers and duties of the most miscellaneous kind have been added by later statutes. . . . Then the writ 'de securitate pacis' made it clear beyond cavil that the king's peace was now, by the common law, the right of every lawful man."—F. Pollock, *King's peace (Law Quarterly Review, v. 1, p. 49)*.

1307-1509.—Year books.—"The oldest reports extant on the English law, are the Year Books . . . , written in law French, and extend from the beginning of the reign of Edward II, to the latter end of the reign of Henry VIII, a period of about two hundred years. . . . The Year Books were very much occupied with discussions touching the forms of writs, and the pleadings and practice in real actions, which have gone entirely out of use."—J. Kent, *Commentaries*, pt. 3, lect. 21.

1316.—Election of sheriffs abolished.—"Until the time of Edward II, the sheriff was elected by the inhabitants of the several counties; but a statute of the 9th year of that reign abolished election, and ever since, with few exceptions, the sheriff has been appointed, upon nomination by the king's councillors and the judges of certain ranks, by the approval of the crown. . . . The office of sheriff is still in England one of eminent honor, and is conferred on the wealthiest and most notable commoners in the counties."—*New American cyclopædia*, v. 14, p. 585.

1326-1377.—Jurors cease to be witnesses.—"The verdict of . . . the assize was founded on the personal knowledge of the jurors themselves respecting the matter in dispute, without hearing the evidence of witnesses in court. But there was an exception in the case of deeds which came into controversy, and in which persons had been named as witnessing the grant or other matter testified by the deed. . . . This seems to have paved the way for the important change whereby the jury ceasing to be witnesses themselves, gave their verdict upon the evidence brought before them at the trials. . . . Since the jurors themselves were originally mere witnesses, there was no distinction in principle between them and the attesting witnesses; so that it is by no means improbable that the latter were at first associated with them in the discharge of the same function, namely, the delivery of a verdict, and that gradually, in the course of years, a separation took place. This separation,

at all events, existed in the reign of Edward III.; for although we find in the Year Books of that period the expression, 'the witnesses were joined to the assize,' a clear distinction is, notwithstanding, drawn between them."—W. Forsyth, *Trial by jury*, pp. 124, 128.

1362.—Pleading in the English tongue.—Enrollment in Latin.—"The Statute 36 Edward III., c. 15, A. D. 1362, enacted that in future all pleas should be 'pleaded, shewed, defended, answered, debated, and judged in the English tongue;' the lawyers, on the alert, appended a proviso that they should be 'entered and enrolled' in Latin, and the old customary terms and forms retained."—J. Parke, *History of chancery*, p. 43.

1368.—Jury system in civil trials.—"As it was an essential principle of the jury trial from the earliest times, that the jurors should be summoned from the hundred where the cause of action arose, the court, in order to procure their attendance, issued in the first instance a writ called a venire facias, commanding the sheriff or other officer to whom it was directed, to have twelve good and lawful men for the neighborhood in court upon a day therein specified, to try the issue joined between the parties. And this was accordingly done, and the sheriff had his jury ready at the place which the court had appointed for its sitting. But when the Court of Common Pleas was severed from the Curia Regis, and became stationary at Westminster (a change which took place in the reign of King John, and was the subject of one of the provisions of Magna Carta), it was found to be very inconvenient to be obliged to take juries there from all parts of the country. And as justices were already in the habit of making periodical circuits for the purpose of holding the assize in pleas of land, it was thought advisable to substitute them for the full court in banc at Westminster, in other cases also. The statute 13 Edw. I. c. 30, was therefore passed, which enacted that these justices should try other issues: 'wherein small examination was required,' or where both parties desired it, and return the inquests into the court above. This led to an alteration in the form of the venire: and instead of the sheriff being simply ordered to bring the jurors to the courts at Westminster on a day named, he was now required to bring them there on a certain day, 'nisi prius,' that is, unless before that day the justices of assize came into his county, in which case the statute directed him to return the jury, not to the court, but before the justices of assize."—W. Forsyth, *History of trial by jury*, pp. 130-140.

1382.—Peaceable entry.—"This remedy by entry must be pursued according to statute 5 Rich. II., st. I., c. 8, in a peaceable and easy manner; and not with force or strong hand. For, if one turns or keeps another out of possession forcibly, this is an injury of both a civil and a criminal nature. The civil is remedied by an immediate restitution; which puts the ancient possessor in statu quo: the criminal injury, or public wrong, by breach of the king's peace, is punished by fine to the King."—W. Blackstone, *Commentaries*, bk. 3, p. 179.

1383-1403.—Venue to be laid in proper counties.—"The statutes 6 Rich. II., c. 2, and 4 Hen. IV., c. 18, having ordered all writs to be laid in their proper counties, this, as the judges conceived, empowered them to change the venue, if required, and not to insist rigidly on abating the writ: which practice began in the reign of James the First. And this power is discretionally exercised, so as to prevent, and not to cause, a defect of justice. . . . And it will sometimes remove the venue from the proper jurisdiction, . . . upon a suggestion, duly

supported, that a fair and impartial trial cannot be had therein."—*Ibid.*, p. 294.

1388.—Prohibition against citation of Roman law in common-law tribunals.—"In the reign of Edward III. the exactions of the court of Rome had become odious to the king and the people. Edward, supported by his Parliament, resisted the payment of the tribute which his predecessors from the Conquest downwards, but more particularly from the time of John, had been accustomed to pay to the court of Rome; . . . the name of the Roman Law, which in the reigns of Henry II. and III., and of Edward I., had been in considerable favor at court, and even . . . with the judges, became the object of aversion. In the reign of Richard II. the barons protested that they would never suffer the kingdom to be governed by the Roman law, and the judges prohibited it from being any longer cited in the common law tribunals."—G. Spence, *Equity jurisdiction of the court of chancery*, v. 1, p. 346.

1436.—Act to prevent interference with common law process.—"In 1436, an act was passed with the concurrence of the Chancellor, to check the wanton filing of bills in Chancery in disturbance of common law process. The Commons, after reciting the prevailing grievance, prayed 'that every person from this time forward vexed in Chancery for matter determinable by the common law, have action against him that so vexed him, and recover his damages.' The King answered, 'that no writ of subpoena be granted hereafter till security be found to satisfy the party so vexed and grieved for his damages and expenses, if it so be that the matter may not be made good which is contained in the bill.'"—Lord Campbell, *Lives of the chancellors*, v. 1, p. 272.

1450 (circa).—Evidence.—Number of witnesses.—"It is then abundantly plain that by this time [the middle of the 15th century] witnesses could testify in open court to the jury. That this was by no means freely done seems also plain. Furthermore, it is pretty certain that this feature of a jury trial, in our day so conspicuous and indispensable, was then but little considered and of small importance."—J. B. Thayer, *Select cases on evidence*, p. 1071.

ALSO IN: J. B. Thayer, *Jury and its development* (*Harvard Law Review*, v. 5, p. 360).

1456.—Demurrers to evidence.—"Very soon, as it seems, after the general practice began of allowing witnesses to testify to the jury, an interesting contrivance for eliminating the jury came into existence, the demurrer upon evidence. Such demurrers, like others, were demurrers in law; but they had the effect to withdraw from the jury all consideration of the facts, and, in their pure form, to submit to the court two questions, of which only the second was, in strictness, a question of law: (1) Whether a verdict for the party who gave the evidence could be given, as a matter of legitimate inference and interpretation from the evidence; (2) As a matter of law. Of this expedient, I do not observe any mention earlier than the year 1456, and it is interesting to notice that we do not trace the full use of witnesses to the jury much earlier than this."—J. B. Thayer, *Law and fact in jury trials* (*Harvard Law Review*, v. 4, p. 162).

ALSO IN: J. B. Thayer, *Select cases on evidence*, p. 149.

1470.—Evidence.—Competency of witnesses.—"Fortescue (De Laud. c. 26), who has the earliest account (about 1470) of witnesses testifying regularly to the jury, gives no information as to any ground for challenging them. But Coke, a century and a third later, makes certain qualifications

of the assertion of the older judges, that 'they had not seen witnesses challenged.' He mentions as grounds of exclusion, legal infamy, being an 'infidel,' of non-sane memory, 'not of discretion,' a party interested, 'or the like.' And he says that 'it hath been resolved by the justices [in 1621] that a wife cannot be produced either against or for her husband, quia sunt duae animae in carne una.' He also points out that 'he that challengeth a right in the thing in demand cannot be a witness.' Here are the outlines of the subsequent tests for the competency of witnesses. They were much refined upon, particularly the excluding ground of interest; and great inconveniences resulted. At last in the fourth and fifth decades of the present century, in England, nearly all objections to competency were abolished, or turned into matters of privilege."—J. B. Thayer, *Select cases on evidence*, p. 1070.

1473.—Barring entails.—Taltarum's case.—"The common-law judges at this time were very bold men, having of their own authority repealed the statute De Donis, passed in the reign of Edward I., which authorized the perpetual entail of land—by deciding in Taltarum's Case, that the entail might be barred through a fictitious proceeding in the Court of Common Pleas, called a 'Common Recovery';—the estate being adjudged to a sham claimant—a sham equivalent being given to those who ought to succeed to it—and the tenant in tail being enabled to dispose of it as he pleases, in spite of the will of the donor."—Lord Campbell, *Lives of the chancellors*, v. 1, pp. 309-310.

1481-1505.—Development of actions of assumpsit.—"It is probable that the willingness of equity to give pecuniary relief upon parol promises hastened the development of the action of assumpsit. Fairfax, J., in 1481, advised pleaders to pay more attention to actions on the case, and, thereby diminish the resort to chancery; and Fineux, C. J., remarked, in 1505, after that advice had been followed and sanctioned by the courts, that it was no longer necessary to sue a subpoena in such cases. Brooke, in his 'Abridgment,' adds to this remark of Fineux, C. J.: 'But note that he shall have only damages by this [action on the case], but by subpoena the chancellor may compel him to execute the estate or imprison him ut dicitur.'"—J. B. Ames, *Specific performance of contracts* (*Green Bag*, v. 1, p. 26).

1484.—Statutes to be in English.—"In opening the volumes of our laws, as printed by authority 'from original records and authentic manuscripts,' we are struck with a change upon the face of these Statutes of Richard III., which indicates as true a regard for the liberty of the subjects as the laws themselves. For the first time the laws to be obeyed by the English people are enacted in the English tongue."—C. Knight, *History of England*, v. 2, p. 200.

1499 (circa).—Copyright.—"From about the period of the introduction of printing into this country, that is to say, towards the end of the fifteenth century, English authors had, in accordance with the opinion of the best legal authorities, a right to the Copyright in their works, according to the Common Law of the Realm, or a right to their 'copy' as it was anciently called, but there is no direct evidence of the right until 1558. The Charter of the Stationers' Company, which to this day is charged with the Registration of Copyright, was granted by Philip and Mary in 1556. The avowed object of this corporation was to prevent the spread of the Reformation. Then there followed the despotic jurisdiction of the Star Chamber over the publication of books, and the

Ordinances and the Licensing Act of Charles II. At the commencement of the 18th century there was no statutory protection of Copyright. Unrestricted piracy was rife. The existing remedies of a bill in equity and an action at law were too cumbrous and expensive to protect the authors' Common Law rights, and authors petitioned Parliament for speedier and more effectual remedies. In consequence, the 8 Anne, c. 10, the first English Statute providing for the protection of Copyright, was passed in 1710. This Act gave to the author the sole liberty of publication for 14 years, with a further term of fourteen years, provided the author was living at the expiration of the first term, and enacted provisions for the forfeiture of piratical copies and for the imposition of penalties in cases of piracy. But in obtaining this Act, the authors placed themselves very much in the position of the dog in the fable, who dropped the substance in snatching at the shadow, for, while on the one hand they obtained the remedial measures they desired, on the other, the Perpetual Copyright to which they were entitled at the Common Law was reduced to the fixed maximum term already mentioned, through the combined operation of the statute and the judicial decisions to be presently referred to. But notwithstanding the statute, the Courts continued for some time to recognise the rights of authors at Common Law, and numerous injunctions were granted to protect the Copyright in books, in which the term of protection granted by the statute of Anne had expired, and which injunctions therefore could only have been granted on the basis of the Common Law right. In 1769 judgment was pronounced in the great Copyright case of *Millar v. Taylor*. The book in controversy was Thomson's 'Seasons,' in which work the period of Copyright granted by the statute of Anne had expired, and the question was directly raised, whether a Perpetual Copyright according to Common Law, and independent of that statute, remained in the author after publication. Lord Mansfield, one of the greatest lawyers of all times, maintained in his judgment that Copyright was founded on the Common Law, and that it had not been taken away by the statute of Anne, which was intended merely to give for a term of years a more complete protection. But, in 1774 this decision was overruled by the House of Lords in the equally celebrated case of *Donaldson v. Beckett*, in which the Judges consulted were equally divided on the same point, Lord Mansfield and Sir William Blackstone being amongst those who were of opinion that the Common Law right had not been taken away by the statute of Anne. But owing to a point of etiquette, namely that of being peer as well as one of the Judges, Lord Mansfield did not express his opinion, and in consequence, the House of Lords, influenced by a specious oration from Lord Camden, held (contrary to the opinion of the above-mentioned illustrious Jurist), that the statute had taken away all Common Law rights after publication, and hence that in a published book there was no Copyright except that given by the statute. This judgment caused great alarm amongst those who supposed that their Copyright was perpetual. Acts of Parliament were applied for, and in 1775 the Universities obtained one protecting their literary property."—T. A. Romer, *Copyright law reform* (*Law Magazine and Review*, 4th ser., v. 12, p. 231).

1499.—Action of ejectment.—"The writ of 'ejectione firmæ' . . . out of which the modern action of ejectment has gradually grown into its

present form, is not of any great antiquity. . . . The Court of Common Pleas had exclusive jurisdiction of real actions while ejectment could be brought in all three of the great common law courts. . . . The practitioners in the King's Bench also encouraged ejectment, for it enabled them to share in the lucrative practice of the Common Pleas. . . . In the action of 'ejectione firmæ,' the plaintiff first only recovered damages, as in any other action of trespass. . . . The courts, consequently following, it is said, in the footsteps of the courts of equity, . . . introduced into this action a species of relief not warranted by the original writ, . . . viz., a judgment to recover the term, and a writ of possession thereupon. Possibly the change was inspired by jealousy of the chancery courts. It cannot be stated precisely when this change took place. In 1383 it was conceded by the full court that in 'ejectione firmæ' the plaintiff could no more recover his term than in trespass he could recover damages for a trespass to be done. . . . But in 1468 it was agreed by opposing counsel that the term could be recovered, as well as damages. The earliest reported decision to this effect was in 1490, and is referred to by Mr. Reeves as the most important adjudication rendered during the reign of Henry VII., for it changed the whole system of remedies for the trial of controverted titles to land, and the recovery of real property."—Sedgwick and Wait, *Trial of title to land* (2nd ed.), sect. 12-25.—"Ejectment is the form of action now retained in use in England under the Statute of 3 and 4 Wm. IV., c. 7, § 36, which abolished all other forms of real actions except dower. It is in general use in some form in this country, and by it the plaintiff recovers, if at all, upon the strength of his own title, and not upon the weakness of that of the tenant, since possession is deemed conclusive evidence of title as to all persons except such as can show a better one."—Washburn, *Real property* (5th ed.), v. 1, p. 465.

1504-1542.—Consideration in contracts.—"To the present writer it seems impossible to refer consideration to a single source. At the present day it is doubtless just and expedient to resolve every consideration into a detriment to the promisee incurred at the request of the promisor. But this definition of consideration would not have covered the cases of the 16th century. There were then two distinct forms of consideration: (1) detriment; (2) a precedent debt. Of these detriments was the more ancient, having become established in substance, as early as 1504. On the other hand no case has been found recognizing the validity of a promise to pay a precedent debt before 1542. These two species of consideration, so different in their nature, are, as would be surmised, of distinct origin. The history of detriment is bound up with the history of special assumpsit, whereas the consideration based upon a precedent debt must be studied in the development of 'indebitatus assumpsit.'"—J. B. Ames, *History of assumpsit* (*Harvard Law Review*, v. 2, pp. 1-2).

1520.—Law of parol guaranty.—"It was decided in 1520, that one who sold goods to a third person on the faith of the defendant's promise that the price should be paid, might have an action on the case upon the promise. This decision introduced the whole law of parol guaranty. Cases in which the plaintiff gave his time or labor were as much within the principle of the new action as those in which he parted with property. And this fact was speedily recognized. In Saint-Germain's book, published in 1531, the student of law thus defines the liability of a promisor: 'If he to whom the promise is made have a charge by reason of

the promise, . . . he shall have an action for that thing that was promised, though he that made the promise have no worldly profit by it.' From that day to this a detriment has always been deemed a valid consideration for a promise if incurred at the promisor's request."—J. B. Ames, *History of assumpsit* (*Harvard Law Review*, v. 2, p. 14).

1535.—Statute of uses.—"Before the passing of the Statute of Uses in the twenty-seventh year of Henry VIII, attempts had been made to protect by legislation the interests of creditors, of the king, and of the lords, which were affected injuriously by feoffments to uses. . . . The object of that Statute was by joining the possession or seisen to the use and interest (or, in other words, by providing that all the estate which would by the common law have passed to the grantee to uses should instantly be taken out of him and vested in 'cestui que use'), to annihilate altogether the distinction between the legal and beneficial ownership, to make the ostensible tenant, in every case also the legal tenant, liable to his lord for feudal dues and services—wardship, marriage, and the rest. . . . By converting the use into the legal interest the Statute did away with the power of disposing of interests in lands by will, which had been one of the most important results of the introduction of uses. Probably these were the chief results aimed at by the Statute of Uses. A strange combination of circumstances—the force of usage by which practices had arisen too strong even for legislation to do away with, coupled with an almost superstitious adherence on the part of the courts to the letter of the statute—produced the curious result, that the effect of the Statute of Uses was directly the reverse of its purpose, that by means of it secret conveyances of the legal estate were introduced, while by a strained interpretation of its terms the old distinction between beneficial or equitable and legal ownership was revived. What may be called the modern law of Real Property and the highly technical and intricate system of conveyancing which still prevails, dates from the legislation of Henry VIII."—K. E. Digby, *History of the law of real property* (4th ed.), pp. 343-345.

1540-1542.—Testamentary power.—"The power of disposing by will of land and goods has been of slow growth in England. The peculiar theories of the English land system prevented the existence of a testamentary power over land until it was created by the Statute of Wills (32 & 34 Hen. VIII) extended by later statutes, and although a testamentary power over personal property is very ancient in this country, it was limited at common law by the claims of the testator's widow and children to their 'reasonable parts' of his goods. The widow was entitled to one third, or if there were no children to one-half of her husband's personal estate; and the children to one-third, or if there was no widow to one-half of their father's personal estate, and the testator could only dispose by his will of what remained. Whether the superior claims of the widow and children existed all over England or only in some counties by custom is doubted; but . . . by Statutes of William and Mary, Will. III. and George I, followed by the Wills Act (1 Vict. c. 26), the customs have been abolished, and a testator's testamentary power now extends to all his real and personal property."—S. C. Macaskie, *Law of executors and administrators*, p. 1.

1542.—Liability in *indebitatus assumpsit* on an express promise.—"The origin of *indebitatus assumpsit* may be explained in a few words: Slade's case [4 Rep., 92a], decided in 1603, is com-

monly thought to be the source of this action. But this is a misapprehension. '*Indebitatus assumpsit*' upon an express promise is at least sixty years older than Slade's case. The evidence of its existence throughout the last half of the sixteenth century is conclusive. There is a note by Brooke, who died in 1558, as follows: 'where one is indebted to me, and he promises to pay before Michaelmas, I may have an action of debt on the contract, or an action on the case on the promise.'"—J. B. Ames, *History of assumpsit* (*Harvard Law Review*, v. 2, p. 16).

1557.—Statute of uses rendered nugatory.—"Twenty-two years after the passing of this statute (Mich. Term 4 & 5 Ph. & M.) the judges by a decision practically rendered the Statute nugatory by holding that the Statute will not execute more than one use, and that if there be a second use declared the Statute will not operate upon it. The effect of this was to bring again into full operation the equitable doctrine as to uses in lands."—A. H. Marsh, *History of the court of chancery*, pp. 122-123.

1580.—Equal distribution of property.—"In Holland, all property, both real and personal, of persons dying intestate, except land held by feudal tenure, was equally divided among the children, under the provisions of an act passed by the State in 1580. This act also contained a further enlightened provision, copied from Rome, and since adopted in other Continental Countries, which prohibited parents from disinheriting their children except for certain specified offences. Under this legal system, it became customary for parents to divide their property by will equally among their children, just as the custom of leaving all the property to the eldest son grew up under the laws of England. The Puritans who settled New England adopted the idea of the equal distribution of property, in case there was no will—giving to the eldest son, however, in some of the colonies a double portion, according to the Old Testament injunction.—and thence it has spread over the whole United States."—D. Campbell, *Puritan in Holland, England and America*, v. 2, p. 452.

1589.—Earliest notice of contract of insurance.—"The first notice of the contract of insurance that appears in the English reports, is a case cited in Coke's Reports [6 Coke's Rep., 47b], and decided in the 31st of Elizabeth; and the commercial spirit of that age gave birth to the statute of 43d Elizabeth, passed to give facility to the contract, and which created the court of policies of assurance, and shows by its preamble that the business of marine insurance had been in immemorial use, and activity followed. But the law of insurance received very little study and cultivation for ages afterwards; and Mr. Park informs us that there were not forty cases upon matters of insurance prior to the year 1756, and even those cases were generally loose nisi prius notes, containing very little information or claim to authority."—J. Kent, *Commentaries*, pt. 5, lect. 48.

1592.—Highwayman as a chief justice.—"In 1592, Elizabeth appointed to the office of Chief-Justice of England a lawyer, John Popham, who is said to have occasionally been a highwayman until the age of thirty. At first blush this seems incredible, but only because such false notions generally prevail regarding the character of the time. The fact is that neither piracy nor robbery was considered particularly discreditable at the court of Elizabeth. The queen knighted Francis Drake for his exploits as a pirate, and a law on the statute-books, passed in the middle of the century, gave benefit of

clergy to peers of the realm when convicted of highway robbery. Men may doubt, if they choose, the stories about Popham, but the testimony of this statute cannot be disputed."—D. Campbell, *Puritan in Holland, England and America*, v. 1, p. 366.

1600.—Mortgagee's right to possession.—"When this country [the United States] was colonized, about A. D. 1600, the law of mortgage was perfectly well settled in England. It was established there that a mortgage, whether by deed upon condition, by trust deed, or by deed and defeasance, vested the fee, at law, in the mortgagee, and that the mortgagee, unless the deed reserved possession to the mortgagor, was entitled to immediate possession. Theoretically our ancestors brought this law to America with them. Things ran on until the Revolution. Mortgages were given in the English form, by deed on condition, by deed and defeasance, or by trust deed. It was not customary in Plymouth, or Massachusetts Bay, and it is probable that it was not customary elsewhere, to insert a provision that the mortgagor, until default in payment, should retain possession. Theoretically, during the one hundred and fifty years from the first settlement to the Revolution, the English rules of law governed all these transactions, and, as matter of book law, every mortgagee of a house or a farm was the owner of it, and had the absolute right to take possession upon the delivery of the deed. But the curious thing about this is, that the people generally never dreamed that such was the law."—W. H. Chaplin, *Story of mortgage law* (*Harvard Law Review*, v. 4, p. 12).

1601-1602.—Malicious prosecution.—"The modern action for malicious prosecution, represented formerly by the action for conspiracy, has brought down to our own time a doctrine which is probably traceable to the practice of spreading the case fully upon the record, namely, that what is a reasonable and probable cause for a prosecution is a question for the court. That it is a question of fact is confessed, and also that other like questions in similar cases are given to the jury. Reasons of policy led the old judges to permit the defendant to state his case fully upon the record, so as to secure to the court a greater control over the jury in handling the facts, and to keep what were accounted questions of law, i. e., questions which it was thought should be decided by the judges out of the jury's hands. Gawdy, J., in such a case, in 1601-2, 'doubted whether it were a plea, because it amounts to a non culpabilis. . . . But the other justices held that it was a good plea, per doubt del lay gents.' Now that the mode of pleading has changed, the old rule still holds; being maintained, perhaps, chiefly by the old reasons of policy."—J. B. Thayer, *Law and fact in jury trials* (*Harvard Law Review*, v. 4, p. 147).

ALSO IN: J. B. Thayer, *Select cases on evidence*, p. 150.

1603.—Earliest reported case of bills of exchange.—"The origin and history of bills of exchange and other negotiable instruments are traced by Lord Chief Justice Cockburn in his judgment in *Goodwin v. Roberts* [L. R. 10 Ex., pp. 346-358]. It seems that bills were first brought into use by the Florentines in the twelfth century. From Italy the use of them spread to France, and eventually they were introduced into England. The first English reported case in which they are mentioned is *Martin v. Boure* (Cro. Jac. 3), decided in 1603. At first the use of Bills of Exchange seems to have been confined to foreign bills between English and foreign merchants. It was afterwards extended to domestic bills between

traders, and finally to bills of all persons whether traders or not. The law throughout has been based on the custom of merchants respecting them; the old form of declaration on bill used always to state that it was drawn 'secundum usum et consuetudinem mercatorum.'—M. D. Chalmers, *Bills of exchange*, p. xlii., *introd.*—See also MONEY AND BANKING; Medieval: 12th-14th centuries.

1604.—Death inferred from long absence.—"It is not at all modern to infer death from a long absence; the recent thing is the fixing of a time of seven years, and putting this into a rule. The faint beginning of it, as a common-law rule, and one of general application in all questions of life and death, is found, so far as our recorded cases show, in *Doe d. George v. Jesson* (January, 1805). Long before this time, in 1604, the 'Bigamy Act' of James I. had exempted from the scope of its provisions, and so from the situation and punishment of a felon (1) those persons who had married a second time when the first spouse had been beyond the seas for seven years, and (2) those whose spouse had been absent for seven years, although not beyond the seas,—'the one of them not knowing the other to be living within that time.' This statute did not treat matters altogether as if the absent party were dead; it did not validate the second marriage in either case. It simply exempted a party from the statutory penalty."—J. B. Thayer, *Presumptions and the law of evidence* (*Harvard Law Review*, v. 3, p. 151).

1609.—First recognition of right to sue for quantum meruit.—"There seems to have been no recognition of the right to sue upon an implied 'quantum meruit' before 1609. The innkeeper was the first to profit by the innovation. Reciprocity demanded that, if the law imposed a duty upon the innkeeper to receive and keep safely, it should also imply a promise on the part of the guest to pay what was reasonable. The tailor was in the same case with the innkeeper, and his right to recover upon a quantum meruit was recognized in 1610." [Six Carpenters' Case, 8 Rep., 147a.]—J. B. Ames, *History of assumpsit* (*Harvard Law Review*, v. 2, p. 58).

1616.—Contest with equity courts. See EQUITY LAW: 1616: Contest between Equity and Common law courts.

1623.—Liability of gratuitous bailee to be charged in assumpsit, established.—"The earliest attempt to charge bailees in assumpsit were made when the bailment was gratuitous. These attempts, just before and after 1600, were unsuccessful, because the plaintiffs could not make out any consideration. The gratuitous bailment was, of course, not a benefit, but a burden to the defendant; and, on the other hand, it was not regarded as a detriment; but an advantage to the plaintiff. But in 1623 it was finally decided, not without a great straining, it must be conceded, of the doctrine of consideration, that a bailee might be charged in assumpsit on a gratuitous bailment."—J. B. Ames, *History of assumpsit* (*Harvard Law Review*, v. 2, p. 6, citing *Wheatley v. Low*, Palm., 281; *Cro. Jac.* 668).

1625 (circa).—Experiment in legislation.—Limitation in time.—"The distinction between temporary and permanent Legislation is a very old one." It was a distinction expressed at Athens; but "we have no such variety of name. All are alike Acts of Parliament. Acts in the nature of new departures in the Law of an important kind are frequently limited in time, very often with a view of gaining experience as to the practical working of a new system before the Legislature commits itself to final legislation on the subject, some-

times, no doubt, by way of compromise with the Opposition, objecting to the passing of such a measure at all. Limitation in time often occurs in old Acts. Instances are the first Act of the first Parliament of Charles I. (1 Car. I., c. 1), forbidding certain sports and pastimes on Sunday, and permitting others. The Book of Sports of James I. had prepared the mind of the people for that more liberal observance of Sunday which had been so offensive to the Puritans of Elizabeth's reign, but it had not been down to that time acknowledged by the Legislature. This was now done in 1625, the Act was passed for the then Parliament, continued from time to time, and finally (the experiment having apparently succeeded) made perpetual in 1641. Another instance is the Music Hall Act of 1752 passed it is said on the advice of Henry Fielding, in consequence of the disorderly state of the music halls of the period, and perhaps still more on account of the Jacobite songs sometimes sung at such places. It was passed for three years, and, having apparently put an end to local disaffection, was made perpetual in 1755. Modern instances are the Ballot Act, 1872, passed originally for eight years, and now annually continued, the Regulation of Railways Act, 1873, creating a new tribunal, the Railway Commission, passed originally for five years, and annually continued until made perpetual by the Railway and Canal Traffic Act, 1888; the Employers' Liability Act, 1880, a new departure in Social Legislation, expiring on the 31st December, 1887, and since annually continued; and the Shop Hours Regulation Act, 1886, a similar departure, expiring in 1888, and continued for the present Session. . . .

(2) Place.—It is in this respect that the Experimental method of Parliament is most conspicuous. A law is enacted binding only locally, and is sometimes extended to the whole or a part of the realm, sometimes not. The old Statute of Circumspecte Agatis (13 Edw. I., stat. 4) passed in 1285 is one of the earliest examples. The point of importance in it is that it was addressed only to the Bishop of Norwich, but afterwards seems to have been tacitly admitted as law in the case of all dioceses, having probably been found to have worked well at Norwich. It was not unlike the Rescripts of the Roman emperors, which, primarily addressed to an individual, afterwards became precedents of general law.—J. William (*Law Magazine and Review*, London, 1888-9, 4th series, v. 14, p. 306).

1630-1641.—Public registry.—“When now we look to the United States, we find no difficulty in tracing the history of the institution on this side of the Atlantic. The first settlers of New York coming from Holland, brought it with them. In 1636, the Pilgrims of Plymouth, coming also from Holland, passed a law requiring that for the prevention of frauds, all conveyances, including mortgages and leases, should be recorded. Connecticut followed in 1639, the Puritans of Massachusetts in 1641; Penn, of course, introduced it into Pennsylvania. Subsequently every State of the Union established substantially the same system.”—D. Campbell, *Puritan in Holland, England and America*, v. 2, p. 463.

1650 (circa).—Law regarded as a luxury.—“Of all the reforms needed in England, that of the law was perhaps the most urgent. In the general features of its administration the system had been little changed since the days of the first Edward. As to its details, a mass of abuses had grown up which made the name of justice nothing but a mockery. Twenty thousand cases, it was said, stood for judgment in the Court of Chancery, some

of them ten, twenty, thirty years old. In all the courts the judges held their positions at the pleasure of the crown. They and their clerks, the marshals, and the sheriffs exacted exorbitant fees for every service, and on their cause-list gave the preference to the suitor with the longest purse. Legal documents were written in a barbarous jargon which none but the initiated could understand. The lawyers, for centuries, had exercised their ingenuity in perfecting a system of pleading, the main object of which seems to have been to augment their charges, while burying the merits of a cause under a tangle of technicalities which would secure them from disentanglement. The result was that law had become a luxury for the rich alone.”—*Ibid.*, pp. 383-384.

1650-1700.—Evidence.—“Best evidence rule.”—“This phrase is an old one. During the latter part of the seventeenth century and the whole of the eighteenth, while rules of evidence were forming, the judges and text writers were in the habit of laying down two principles; namely, (1) that one must bring the best evidence that he can, and (2) that if he does this, it is enough. These principles were the beginning, in the endeavor to give consistency to the system of evidence before juries. They were never literally enforced,—they were principles and not exact rules; but for a long time they afforded a valuable test. As rules of evidence and exceptions to the rules became more definite, the field for the application of the general principle of the ‘Best Evidence’ was narrower. But it was often resorted to as a definite rule and test in a manner which was very misleading. This is still occasionally done, as when we are told in *McKinnon v. Bliss*, 21 N. Y., p. 218, that ‘it is a universal rule founded on necessity, that the best evidence of which the nature of the case admits is always receivable.’ Greenleaf’s treatment of this topic (followed by Taylor) is perplexing and antiquated. A juster conception of it is found in *Best Evid.* s. 88. Always the chief example of the ‘Best Evidence’ principle was the rule about proving the contents of a writing. But the origin of this rule about writings was older than the ‘Best Evidence’ principle; and that principle may well have been a generalization from this rule, which appears to be traceable to the doctrine of *profert*. That doctrine required the actual production of the instrument which was set up in pleading. In like manner, it was said, in dealing with the jury, that a jury could not specifically find the contents of a deed unless it had been exhibited to them in evidence. And afterwards when the jury came to hear testimony from witnesses, it was said that witnesses could not undertake to speak to the contents of a deed without the production of the deed itself. . . . Our earliest records show the practice of exhibiting charters and other writings to the jury.”—J. B. Thayer, *Select cases on evidence*, p. 726.

1657.—Early instance of *indebitatus assumpsit* for money paid to defendant by mistake.—“One who received money from another to be applied in a particular way was bound to give an account of his stewardship. If he fulfilled his commission, a plea to that effect would be a valid discharge. If he failed for any reason to apply the money in the mode directed, the auditors would find that the amount received was due to the plaintiff, who would have a judgment for its recovery. If, for example, the money was to be applied in payment of a debt erroneously supposed to be due from the plaintiff to the defendant, . . . the intended application of the money being impossible, the plaintiff would recover the money in Account.

Debt would also lie in such cases. . . . By means of a fiction of a promise implied in law 'Indebitatus Assumpsit' because concurrent with Debt, and thus was established the familiar action of Assumpsit for money had and received to recover money paid to the defendant by mistake. *Bonnel v. Fowke* (1657) is, perhaps, the first action of the kind."—J. B. Ames, *History of assumpsit* (*Harvard Law Review*, v. 2, p. 66).

1670.—Personal knowledge of jurors.—"The jury were still required to come from the neighborhood where the fact they had to try was supposed to have happened; and this explains the origin of the venue (vicintum), which appears in all indictments and declarations at the present day. It points out the place from which the jury must be summoned. . . . And it was said by the Court of Common Pleas in *Bushell's case* (A. D. 1670), that the jury being returned from the vicinage whence the cause of action arises, the law supposes them to have sufficient knowledge to try the matters in issue, 'and so they must, though no evidence were given on either side in court';—and the case is put of an action upon a bond to which the defendant pleads solvit ad diem, but offers no proof:—where, the court said 'the jury is directed to find for the plaintiff, unless they know payment was made of their own knowledge, according to the plea.' This is the meaning of the old legal doctrine, which is at first sight somewhat startling, that the evidence in court is not binding evidence to a jury. Therefore acting upon their own knowledge, they were at liberty to give a verdict in direct opposition to the evidence, if they so thought fit."—W. Forsyth, *Trial by jury*, pp. 134-136.

1678.—The Statute of Frauds.—"During Lord Nottingham's period of office, and partly in consequence of his advice, the Statute of Frauds was passed. Its main provisions are directed against the enforcement of verbal contracts, the validity of verbal conveyances of interests in land, the creation of trusts of lands without writing, and the allowance of nuncupative wills. It also made equitable interests in lands subject to the owner's debts to the same extent as legal interests were. The statute carried into legislative effect principles which had, so far back as the time of Bacon's orders, been approved by the Court of Chancery, and by its operation in the common law courts it must often have obviated the necessity for equitable interference. In modern times it has not infrequently been decried, especially so far as it restricts the verbal proof of contracts, but in estimating its value and operation at the time it became a law it must be remembered that the evidence of the parties to an action at law could not then be received, and the Defendant might have been charged upon the uncorroborated statement of a single witness which he was not allowed to contradict, as Lord Eldon argued many years afterwards, when the action upon the case for fraud was introduced at law. It was therefore a most reasonable precaution, while this unreasonable rule continued, to lay down that the Defendant should be charged only upon writing signed by him."—D. M. Kerly, *History of equity*, p. 170.

1680.—Habeas corpus and personal liberty.—"The language of the great charter is, that no freeman shall be taken or imprisoned but by the lawful judgment of his equals, or by the law of the land. And many subsequent old statutes expressly direct, that no man shall be taken or imprisoned by suggestion or petition to the king or his council, unless it be by legal indictment, or

the process of the common law. By the petition of right, 3 Car. I., it is enacted, that no freeman shall be imprisoned or detained without cause shown. . . . By 16 Car. I. c. 10, if any person be restrained of his liberty . . . he shall, upon demand of his counsel, have a writ of habeas corpus, to bring his body before the court of king's bench or common pleas, who shall determine whether the cause of his commitment be just. . . . And by 31 Car. II., c. 2, commonly called the habeas corpus act, the methods of obtaining this writ are so plainly pointed out and enforced, that, . . . no subject of England can be long detained in prison, except in those cases in which the law requires and justifies such detainer. And, . . . it is declared by 1 W. and M. St. 2, c. 2, that excessive bail ought not be required."—W. Blackstone, *Commentaries*, I., 135.—J. Kent, *Commentaries*, pt. 4, lect. 24.—See also HABEAS CORPUS; ENGLAND: 1670 (Ma.).

1683-1771.—Subsequent birth of a child revokes a will.—"The first case that recognized the rule that the subsequent birth of a child was a revocation of a will of personal property, was decided by the court of delegates, upon appeal, in the reign of Charles II.; and it was grounded upon the law of the civilians [*Overbury v. Overbury*, 2 Show Rep., 253]. . . . The rule was applied in chancery to a devise of real estate, in *Brown v. Thompson* [1 Ld. Raym. 441]; but it was received with doubt by Lord Hardwicke and Lord Northington. The distinction between a will of real and personal estate could not well be supported; and Lord Mansfield declared, that he saw no ground for a distinction. The great point was finally and solemnly settled, in 1771, by the court of exchequer, in *Christopher v. Christopher* [Dicken's Rep. 445], that marriage and a child, were a revocation of a will of land."—J. Kent, *Commentaries*, pt. 6, lect. 68.

1688.—Dividing line between old and new law.—"The dividing line between the ancient and the modern English reports may, for the sake of convenient arrangement, be placed at the revolution in the year 1688. "The distinction between the old and new law seems then to be more distinctly marked. The cumbersome and oppressive appendages of the feudal tenures were abolished in the reign of Charles II., and the spirit of modern improvement, . . . began then to be more sensibly felt, and more actively diffused. The appointment of that great and honest lawyer, Lord Holt, to the station of chief justice of the King's Bench, gave a new tone and impulse to the vigour of the common law."—J. Kent, *Commentaries*, pt. 3, lect. 21.

1689.—First instance of an action sustained for damages for a breach of promise to account.—"It is worthy of observation that while the obligation to account is created by law, yet the privity without which such an obligation cannot exist is, as a rule, created by the parties to the obligation. . . . Such then being the facts from which the law will raise an obligation to account, the next question is, How can such an obligation be enforced, or, what is the remedy upon such an obligation? It is obvious that the only adequate remedy is specific performance, or at least specific reparation. An action on the case to recover damages for a breach of the obligation, even if such an action would lie, would be clearly inadequate, as it would involve the necessity of investigating all the items of the account for the purpose of ascertaining the amount of the damages, and that a jury is not competent to do. In truth, however, such an action will not lie. If, indeed,

there be an actual promise to account, either an express or implied fact, an action will lie for the breach of that promise; but as such a promise is entirely collateral to the obligation to account, and as therefore a recovery on the promise would be no bar to an action on the obligation, it would seem that nominal damages only could be recovered in an action on the promise, or at the most only such special damages as the plaintiff had suffered by the breach of the promise. Besides the first instance in which an action on such a promise was sustained was as late as the time of Lord Holt [Wilkins v. Wilkins, Carth. 89], while the obligation to account has existed and been recognized from early times."—C. C. Langdell, *Brief survey of equity jurisdiction* (*Harvard Law Review*, v. 2, pp. 250-251).

1689-1710.—Lord Holt and the Law of Bailments.—"The most celebrated case which he decided in this department was that of Coggs v. Bernard, in which the question arose, 'whether, if a person promises without reward to take care of goods, he is answerable if they are lost or damaged by his negligence?' In a short compass he expounded with admirable clearness and accuracy the whole law of bailment, or the liability of the person to whom goods are delivered for different purposes on behalf of the owner; availing himself of his knowledge of the Roman civil law, of which most English lawyers were as ignorant as of the Institutes of Manu. . . . He then elaborately goes over the six sorts of bailment, showing the exact degree of care required on the part of the bailee in each, with the corresponding degree of negligence which will give a right of action to the bailor. In the last he shows that, in consideration of the trust, there is an implied promise to take ordinary care; so that, although there be no reward, for a loss arising from gross negligence the bailee is liable to the bailor for the value of the goods. Sir William Jones is contented that his own masterly 'Essay on the Law of Bailment' shall be considered merely as a commentary upon this judgment; and Professor Story, in his 'Commentaries on the Law of Bailments,' represents it as 'a prodigious effort to arrange the principles by which the subject is regulated in a scientific order.'"—Lord Campbell, *Lives of the chief justices*, v. 2, pp. 113-114.

1695.—Jurisprudence over blasphemy. See BLASPHEMY LAWS.

1703.—Aylesbury election case.—Lord Somers's decision. See ENGLAND: 1703.

1703.—Implied promises recognized.—"The value of the discovery of the implied promise in fact was exemplified . . . in the case of a parol submission to an award. If the arbitrators awarded the payment of a sum of money, the money was recoverable in debt, since an award, after the analogy of a judgment, created a debt. But if the award was for the performance of a collateral act, . . . there was, originally, no mode of compelling compliance with the award, unless the parties expressly promised to abide by the decision of the arbitrators. *Tilford v. French* (1663) is a case in point. So, also, seven years later, 'it was said by Twisden, J., [Anon., 1 Vent. 60], that if two submit to an award, this contains not a reciprocal promise to perform; but there must be an express promise to ground an action upon it.' This doctrine was abandoned by the time of Lord Holt, who, . . . said: 'But the contrary has been held since; for if two men submit to the award of a third person, they do also thereby promise expressly to abide by his determination, for agreeing to refer

is a promise in itself.'"—J. B. Ames, *History of assumpsit* (*Harvard Law Review*, v. 2, p. 62).

1706.—Dilatory pleas.—"Pleas to the jurisdiction, to the disability, or in abatement, were formerly very often used as mere dilatory pleas, without any foundation of truth, and calculated only for delay; but now by statute 4 and 5 Ann., c. 16, no dilatory plea is to be admitted, without affidavit made of the truth thereof, or some probable matter shown to the court to induce them to believe it true."—W. Blackstone, *Commentaries*, bk. 3, p. 302.

1710.—Joint stock companies: Bubble Act.—"The most complicated, as well as the most modern, branch of the law of artificial persons relates to those which are formed for purposes of trade. They are a natural accompaniment of the extension of commerce. An ordinary partnership lacks the coherence which is required for great undertakings. Its partners may withdraw from it, taking their capital with them, and the 'firm' having as such no legal recognition, a contract made with it could be sued upon, according to the common law of England, only in an action in which the whole list of partners were made plaintiffs or defendants. In order to remedy the first of these inconveniences, partnerships were formed upon the principle of a joint-stock, the capital invested in which must remain at a fixed amount, although the shares into which it is divided may pass from hand to hand. This device did not however obviate the difficulty in suing, nor did it relieve the partners, past and present, from liability for debts in excess of their, past or present, shares in the concern. In the interest not only of the share-partners, but also of the public with which they had dealings, it was desirable to discourage the formation of such associations; and the formation of joint-stock partnerships, except such as were incorporated by royal charter, was accordingly, for a time, prohibited in England by the 'Bubble Act,' 6 Geo. I, c. 18. An incorporated trading company, in accordance with the ordinary principles regulating artificial persons, consists of a definite amount of capital to which alone creditors of the company can look for the satisfaction of their demands, divided into shares held by a number of individuals who, though they participate in the profits of the concern, in proportion to the number of shares held by each, incur no personal liability in respect of its losses. An artificial person of this sort is now recognized under most systems of law. It can be formed, as a rule, only with the consent of the sovereign power, and is described as a 'societe,' or 'compagnie,' 'anonyme,' an 'Actiengesellschaft,' or 'joint-stock company limited.' A less pure form of such a corporation is a company the shareholders in which incur an unlimited personal liability. There is also a form resembling a partnership 'en commandite,' in which the liability of some of the shareholders is limited by their shares, while that of others is unlimited. Subject to some exceptions, any seven partners in a trading concern may, and partners whose number exceeds twenty must, according to English law, become incorporated by registration under the Companies Acts, with either limited or unlimited liability as they may determine at the time of incorporation."—T. E. Holland, *Elements of jurisprudence*, 5th ed., p. 208.

1711.—Voluntary restraint of trade.—"The judicial construction of Magna Charta is illustrated in the great case of *Mitchell v. Reynolds* (1 P. W., 181), still the leading authority upon the doctrine of voluntary restraint of trade, though decided in 1711, when modern mercantile law was in its

infancy. The Court (Chief Justice Parker), distinguishing between voluntary and involuntary restraints of trade, says as to involuntary restraints: 'The first reason why such of these, as are created by grant and charter from the crown and by-laws generally are void, is drawn from the encouragement which the law gives to trade and honest industry, and that they are contrary to the liberty of the subject. Second, another reason is drawn from Magna Charta, which is infringed by these acts of power. That statute says: Nullus liber homo, etc., disseizetur de libero tenemento, vel libertatibus vel liberis consuetudinibus suis, etc.; and these words have been always taken to extend to freedom of trade.'—F. N. Judson, 14 *American Bar Association Report*, p. 236.

1730.—Special juries.—'The first statutory recognition of their existence occurs so late as in the Act 3 Geo. II., ch. 25. But the principle seems to have been admitted in early times. We find in the year 1450 (20 Hen. VI.) a petition for a special jury. . . . The statute of George II. speaks of special juries as already well known, and it declares and enacts that the courts at Westminster shall, upon motion made by any plaintiff, prosecutor, or defendant, order and appoint a jury to be struck before the proper officer of the court where the cause is depending, 'in such manner as special juries have been and are usually struck in such courts respectively upon trials at bar had in the said courts.'—W. Forsyth, *Trial by jury*, pp. 143-144.

1730.—Written pleadings to be in English.—'There was one great improvement in law proceedings which while he [Lord King] held the Great Seal, he at last accomplished. From very ancient times the written pleadings, both in criminal and civil suits, were, or rather professed to be, in the Latin tongue, and while the jargon employed would have been very perplexing to a Roman of the Augustan Age, it was wholly unintelligible to the persons whose life, property, and fame were at stake. This absurdity had been corrected in the time of the Commonwealth, but along with many others so corrected, had been reintroduced at the Restoration, and had prevailed during five succeeding reigns. The attention of the public was now attracted to it by a petition from the magistracy of the North Riding of the county of York, representing the evils of the old law language being retained in legal process and proceedings, and praying for the substitution of the native tongue. The bill, by the Chancellor's direction, was introduced in the House of Commons, and it passed there without much difficulty. In the Lords it was fully explained and ably supported by the Lord Chancellor, but it experienced considerable opposition. . . . Amidst heavy forebodings of future mischief the bill passed, and mankind are now astonished that so obvious a reform should have been so long deferred.'—Lord Campbell, *Lives of the chancellors*, v. 4, p. 504.

1739-1744.—Oath according to one's religion.—'Lord Hardwicke established the rule that persons, though not Christians, if they believe in a divinity, may be sworn according to the ceremonies of their religion, and that the evidence given by them so sworn is admissible in courts of justice, as if, being Christians, they had been sworn upon the Evangelists. This subject first came before him in *Ramkissenseat v. Barker*, where, in a suit for an account against the representatives of an East India Governor, the plea being overruled that the plaintiff was an alien infidel, a cross bill was filed, and an objection being made that he could only

be sworn in the usual form, a motion was made that the words in the commission, 'on the holy Evangelists,' should be omitted, and that the commissioners should be directed to administer an oath to him in the manner most binding on his conscience. . . . The point was afterwards finally settled in the great case of *Omychund v. Barker*, where a similar commission to examine witnesses having issued, the Commissioners certified 'That they had sworn the witnesses examined under it in the presence of Brahmin or priest of the Gentoo religion, and that each witness touched the hand of the Brahmin,—this being the most solemn form in which oaths are administered to witnesses professing the Gentoo religion.' Objection was made that the deposition so taken could not be read in evidence; and on account of the magnitude of the question, the Lord Chancellor called in the assistance of the three chiefs of the common law Courts.—After a very long, learned, and ingenious argument, which may be perused with pleasure, they concurred in the opinion that the depositions were admissible.'—Lord Campbell, *Lives of the chancellors*, v. 5, pp. 69-70.

1750.—*Dale v. Hall*, 1 Wils., 281, understood to be the first reported case of an action of special assumpsit sustained against a common carrier, on his implied contract.—'Assumpsit, . . . was allowed, in the time of Charles I., in competition with *Detinue* and *Case* against a bailee for custody. At a later period Lord Holt suggested that one might 'turn an action against a common carrier into a special assumpsit (which the law implies) in respect of his hire.' *Dale v. Hall* (1750) is understood to have been the first reported case in which that suggestion was followed.'—J. B. Ames, *History of assumpsit* (*Harvard Law Review*, v. 2, p. 63).

1750-1800.—Demurrer to evidence.—'Near the end of the last century demurrers upon evidence were rendered useless in England, by the decision in the case of *Gibson v. Hunter* (carrying down with it another great case, that of *Lickbarrow v. Mason*, which, like the former, had come up to the Lords upon this sort of demurrer), that the party demurring must specify upon the record the facts which he admits. That the rule was a new one is fairly plain from the case of *Cocksedge v. Fanshawe*, ten years earlier. It was not always followed in this country, but the fact that it was really a novelty was sometimes not understood.'—J. B. Thayer, *Law and fact in jury trials* (*Harvard Law Review*, v. 4, p. 147).

Also in: J. B. Thayer, *Select cases on evidence*, p. 149.

1756-1788.—Lord Mansfield and commercial law.—'In the reign of Geo. II., England had grown into the greatest manufacturing and commercial country in the world, while her jurisprudence had by no means been expanded or developed in the same proportion. . . . Hence, when questions necessarily arose respecting the buying and selling of goods,—respecting the affreightment of ships,—respecting marine insurances,—and respecting bills of exchange and promissory notes, no one knew how they were to be determined. . . . Mercantile questions were so ignorantly treated when they came into Westminster Hall, that they were usually settled by private arbitration among the merchants themselves. If an action turning upon a mercantile question was brought in a court of law, the judge submitted it to the jury, who determined it according to their own notions of what was fair, and no general rule was laid down which could afterwards be referred to for the purpose of settling similar disputes. . . . When he [Lord

Mansfield] had ceased to preside in the Court of King's Bench, and had retired to enjoy the retrospect of his labors, he read the following just eulogy bestowed upon them by Mr. Justice Buller, in giving judgment in the important case of *Lickbarrow v. Mason*, respecting the effect of the indorsement of the bill of lading:—"Within these thirty years the commercial law of this country has taken a very different turn from what it did before. Lord Hardwicke himself was proceeding with great caution, not establishing any general principle, but decreeing on all the circumstances put together. Before that period we find that, in courts of law, all the evidence in mercantile cases was thrown together; they were left generally to a jury; and they produced no general principle. From that time, we all know, the great study has been to find some certain general principle, which shall be known to all mankind, not only to rule the particular case then under consideration, but to serve as a guide for the future. Most of us have heard these principles stated, reasoned upon, enlarged, and explained, till we have been lost in admiration at the strength and stretch of the understanding. And I should be very sorry to find myself under a necessity of differing from any case upon this subject which has been decided by Lord Mansfield, who may be truly said to be the founder of the commercial law of this country." . . . With regard to bills of exchange and promissory notes, Lord Mansfield first promulgated many rules that now appear to us to be as certain as those which guide the planets in their orbits. For example, it was till then uncertain whether the second indorser of a bill of exchange could sue his immediate indorser without having previously demanded payment from the drawer. . . . He goes on to explain [in *Heylyn v. Adamson*, 2 Burr., 669], . . . that the maker of a promissory note is in the same situation as the acceptor of a bill of exchange, and that in suing the indorser of the note it is necessary to allege and to prove a demand on the maker. . . . Lord Mansfield had likewise to determine that the indorser of a bill of exchange is discharged if he receives no notice of there having been a refusal to accept by the drawee (*Blesard v. Herst*, 6 Burr., 2670); and that reasonable time for giving notice of the dishonor of a bill or note is to be determined by the Court as matter of law, and is not to be left to the jury as matter of fact, they being governed by the circumstances of each particular case. (*Tindal v. Brown*, 1 Term. Rep., 167.) It seems strange to us how the world could go on when such questions of hourly occurrence, were unsettled. . . . There is another contract of infinite importance to a maritime people. . . . I mean that between shipowners and merchants for the hiring of ships and carriage of goods. . . . Till his time, the rights and liabilities of these parties had remained undecided upon the contingency, not unlikely to arise, of the ship being wrecked during the voyage, and the goods being saved and delivered to the consignee at an intermediate port. Lord Mansfield settled that freight is due *pro rata itineris*—in proportion to the part of the voyage performed. . . . Lord Mansfield's familiarity with the general principles of ethics, . . . availed him on all occasions when he had to determine on the proper construction and just fulfilment of contracts. The question having arisen, for the first time, whether the seller of goods by auction, with the declared condition that they shall be sold to 'the highest bidder,' may employ a 'puffer,'—an agent to raise the price by bidding,—he thus expressed himself: [*Bexwell v. Christie*,

Cowp. 395] ' . . . The basis of all dealings ought to be good faith; so more especially in these transactions, where the public are brought together upon a confidence that the articles set up to sale will be disposed of to the highest real bidder. That can never be the case if the owner may secretly enhance the price by a person employed for that purpose. . . . I cannot listen to the argument that it is a common practice . . . ; the owner violates his contract with the public if, by himself or his agent, he bids upon his goods, and no subsequent bidder is bound to take the goods at the price at which they are knocked down to him.'—Lord Campbell, *Lives of the chief justices*, v. 2, pp. 308-314.

1760.—Judicial independence.—"A glance into the pages of the Judges of England, by Foss, will show with what ruthless vigour the Stuarts exercised their prerogative of dismissing Judges whose decisions were displeasing to the court. Even after the Revolution, the prerogative of dismissal, which was supposed to keep the Judges dependent on the Crown, was jealously defended. When in 1692 a Bill passed both Houses of Parliament, establishing the independence of Judges by law, and confirming their salaries, William III withheld his Royal assent. Bishop Burnet says, with reference to this exercise of the Veto that it was represented to the King by some of the Judges themselves, that it was not fit that they should be out of all dependence on the Court. When the Act of Settlement secured that no Judge should be dismissed from office, except in consequence of a conviction for some offence, or the address of both Houses of Parliament, the Royal jealousy of the measure is seen by the promise under which that arrangement was not to take effect till the deaths of William III and of Anne, and the failure of their issue respectively, in other words, till the accession of the House of Hanover. It was not till the reign of George III that the Commissions of the Judges ceased to be void on the demise of the Crown."—J. G. S. MacNeill, *Law Magazine and Review*, 4th series, v. 10 (1890-91), p. 202.

1760.—Stolen bank notes the property of a bona fide purchaser.—"The law of bills of exchange owes much of its scientific and liberal character to the wisdom of the great jurist, Lord Mansfield. Sixteen years before the American Revolution, he held that bank notes, though stolen, become the property of the person to whom they are bona fide delivered for value without knowledge of the larceny. This principle is later affirmed again and again as necessary to the preservation of the circulation of all the paper in the country, and with it all its commerce. Later there was a departure from this principle in the noted English case of *Gill v. Cubitt*, in which it was held that if the holder for value took it under circumstances which ought to have excited the suspicion of a prudent and careful man, he could not recover. This case annoyed courts and innocent holders for years, until it was sat upon, kicked, cuffed, and overruled, and the old doctrine of 1760 re-established, which is now the undisputed and settled law of England and this country."—W. A. McClean, *Negotiable paper (Green Bag)*, v. 5, p. 86).

1768.—First chartered business corporation in the United States.—"Pennsylvania is entitled to the honor of having chartered the first business corporation in this country, 'The Philadelphia Contributionship for Insuring Houses from Loss by Fire.' It was a mutual insurance company, first organized in 1752, but not chartered until 1768. It was the only business corporation whose charter

antedated the Declaration of Independence. The next in order of time were: 'The Bank of North America,' chartered by Congress in 1781 and, the original charter having been repealed in 1785, by Pennsylvania in 1787; 'The Massachusetts Bank,' chartered in 1784; 'The Proprietors of Charles River Bridge,' in 1785; 'The Mutual Assurance Company' (Philadelphia), in 1786; 'The Associated Manufacturing Iron Co.' (N. Y.), in 1786. These were the only joint-stock business corporations chartered in America before 1787. After that time the number rapidly increased, especially in Massachusetts. Before the close of the century there were created in that State about fifty such bodies, at least half of them turn-pike and bridge companies. In the remaining States combined, there were perhaps as many more. There was no great variety in the purposes for which these early companies were formed. Insurance, banking, turn-pike roads, toll-bridges, canals, and, to a limited extent, manufacturing were the enterprises which they carried on."—S. Williston, *History of the law of business corporations before 1800* (*Harvard Law Review*, v. 2, pp. 165-166).

1776.—Ultimate property in land.—"When, by the Revolution, the Colony of New York became separated from the Crown of Great Britain, and a republican government was formed, The People succeeded the King in the ownership of all lands within the State which had not already been granted away, and they became from thenceforth the source of all private titles."—Judge Comstock, *People v. Rector, etc., of Trinity church*, 22 N. Y., 44-46.—"It is held that only such parts of the common law as, with the acts of the colony in force on April 10, 1775, formed part of the law of the Colony on that day, were adopted by the State; and only such parts of the common and statute law of England were brought by the colonists with them as suited their condition, or were applicable to their situation. Such general laws thereupon became the laws of the Colony until altered by common consent, or by legislative enactment. The principles and rules of the common law as applicable to this country are held subject to modification and change, according to the circumstances and condition of the people and government here. . . . By the English common law, the King was the paramount proprietor and source of all title to all land within his dominion, and it was considered to be held mediately or immediately of him. After the independence of the United States, the title to land, formerly possessed by the English Crown in this country passed to the People of the different States where the land lay, by virtue of the change of nationality and of the treaties made. The allegiance formerly due, also, from the people of this country to Great Britain was transferred, by the Revolution, to the governments of the States."—James Gerard, *Titles to real estate* (3rd ed.) pp. 26 and 5.—"Hence the rule naturally follows, that no person can, by any possible arrangement, become invested with the absolute ownership of land. But as that ownership must be vested somewhere, or great confusion, if not disturbance might result, it has, therefore, become an accepted rule of public law that the absolute and ultimate right of property shall be regarded as vested in the sovereign or corporate power of the State where the land lies. This corporate power has been naturally and appropriately selected for that purpose, because it is the only one which is certain to survive the generations of men as they pass away. Wherever that sovereign power is represented by an individual, as in England, there the absolute right of property to all land in the

kingdom is vested in that individual. Whoever succeeds to the sovereignty, succeeds to that right of property and holds it in trust for the nation. In this country, where the only sovereignty recognized in regard to real property, is represented by the State in its corporate capacity, that absolute right of property is vested in the State."—A. Bingham, *Law of real property*, p. 3.

1778.—First instance of assumpsit upon a vendor's warranty.—"A vendor who gives a false warranty may be charged to-day, of course, in contract; but the conception of such a warranty, as a contract is quite modern. *Stuart v. Wilkens* [3 Doug., 18], decided in 1778 is said to have been the first instance of an action of assumpsit upon a vendor's warranty."—J. B. Ames, *History of assumpsit* (*Harvard Law Review*, v. 2, p. 8).

1783.—Lord Mansfield laid foundation of law of trade-marks.—"The symbolism of commerce, conventionally called 'trade-marks,' is, according to Mr. Brown, in his excellent work on trade-marks, as old as commerce itself. The Egyptians, the Chinese, the Babylonians, the Greeks, the Romans, all used various marks or signs to distinguish their goods and handiwork. The right to protection in such marks has come to be recognized throughout the civilized world. It is, however, during the last seventy or eighty years that the present system of jurisprudence has been built up. In 1742 Lord Hardwicke refused an injunction to restrain the use of the Great Mogul stamp on cards. In 1783 Lord Mansfield laid the foundation of the law of trade-marks as at present developed, and in 1816, in the case of *Day v. Day*, the defendant was enjoined from infringing the plaintiff's blacking label. From that time to the present day there have arisen a multitude of cases, and the theory of the law of trade-marks proper may be considered as pretty clearly expounded. In 1875 the Trade-marks Registration Act provided for the registration of trade-marks, and defined what could in future properly be a trade-mark. In this country the Act of 1870, corrected by the Act of 1881, provided for the registration of trade-marks. The underlying principle of the law of trade-marks is that of preventing one man from acquiring the reputation of another by fraudulent means, and of preventing fraud upon the public; in other words, the application of the broad principles of equity."—G. D. Cushing, *Cases analogous to trade-marks* (*Harvard Law Review*, v. 4, p. 321).

1790.—Stoppage in transitu, and rights of third person under a bill of lading.—"Lord Loughborough's most elaborate common law judgment was in the case of *Lichbarrow v. Mason*, when he presided in the court of Exchequer Chamber, on a writ of error from the Court of King's Bench. The question was one of infinite importance to commerce.—'Whether the right of the unpaid seller of goods to stop them while they are on their way to a purchaser who has become insolvent, is divested by an intermediate sale to a third person, through the indorsement of the bill of lading, for a valuable consideration?' He concluded by saying:—'From a review of all the cases it does not appear that there has ever been a decision against the legal right of the consignor to stop the goods in transitu before the case which we have here to consider. The rule which we are now to lay down will not disturb but settle the notions of the commercial port of this country on a point of very great importance, as it regards the security and good faith of their transactions. For these reasons we think the judgment of the Court of King's Bench ought to be reversed.' But a writ

of error being brought in the House of Lords, this reversal was reversed, and the right of the intermediate purchaser as against the original seller, has ever since been established."—Lord Campbell, *Lives of the chancellors*, v. 6, pp. 138-139.

1792.—**Best-evidence rule.**—"In *Grant v. Gould*, 2 H. Bl. p. 104 (1792), Lord Loughborough said: 'That all common law courts ought to proceed upon the general rule, namely, the best evidence that the nature of the case will admit, I perfectly agree.' But by this time it was becoming obvious that this 'general rule' was misapplied and over-emphasized. Blackstone, indeed, repeating Gilbert, had said in 1770, in the first editions of his Commentaries (III. 368) as it was said in all the later ones: 'The one general rule that runs through all the doctrine of trials is this, that the best evidence the nature of the case will admit of shall always be required, if possible to be had; but, if not possible, then the best evidence that can be had shall be allowed. For if it be found that there is any better evidence existing than is produced, the very not producing it is a presumption that it would have detected some falsehood that at present is concealed.' But in 1794, the acute and learned Christian, in editing the twelfth edition, pointed out the difficulties of the situation: 'No rule of law,' he said, 'is more frequently cited, and more generally misconceived, than this. It is certainly true when rightly understood; but it is very limited in its extent and application. It signifies nothing more than that, if the best legal evidence cannot possibly be produced, the next best legal evidence shall be admitted.'"—J. B. Thayer, *Select cases on evidence*, p. 732.

1794.—**First trial by jury in U. S. Supreme Court.**—"In the first trial by jury at the bar of the Supreme Court of the United States, in 1794, Chief-Justice Jay, after remarking to the jury that act was for the jury and law for the court, went on to say: 'You have, nevertheless, a right to take upon yourselves to judge of both, and to determine the law as well as the fact in controversy.' But I am disposed to think that the common-law power of the jury in criminal cases does not indicate any right on their part; it is rather one of those manifold illogical and yet rational results, which the good sense of the English people brought about, in all parts of their public affairs, by way of easing up the rigor of a strict application of rules."—J. B. Thayer, *Law and fact in jury trials (Harvard Law Review, v. 4, p. 171)*.

ALSO IN: J. B. Thayer, *Select cases on evidence*, p. 153.

1813-1843.—**Insolvents placed under jurisdiction of a court, and able to claim protection by a surrender of goods.**—"It was not until 1813 that insolvents were placed under the jurisdiction of a court, and entitled to seek their discharge on rendering a true account of all their debts and property. A distinction was at length recognized between poverty and crime. This great remedial law restored liberty to crowds of wretched debtors. In the next thirteen years upwards of 50,000 were set free. Thirty years later, its beneficent principles were further extended, when debtors were not only released from confinement, but able to claim protection to their liberty, on giving up all their goods."—T. E. May, *Constitutional history of England (Widdleton's ed.) v. 2, p. 271*.—See also DEBT, LAWS CONCERNING: In England.

1819.—**Dartmouth College case.**—"The framers of the Constitution of the United States, moved chiefly by the mischiefs created by the preceding legislation of the States, which had made serious encroachments on the rights of property, inserted a

clause in that instrument which declared that 'no State shall pass any ex post-facto law, or law impairing the obligation of contracts.' The first branch of this clause had always been understood to relate to criminal legislation, the second to legislation affecting civil rights. But, before the case of *Dartmouth College v. Woodward* occurred, there had been no judicial decisions respecting the meaning and scope of the restraint in regard to contracts. . . . The State court of New Hampshire, in deciding this case, had assumed that the college was a public corporation, and on that basis had rested their judgment; which was, that between the State and its public corporations there is no contract which the State cannot regulate, alter, or annul at pleasure. Mr. Webster had to overthrow this fundamental position. If he could show that this college was a private eleemosynary corporation, and that the grant of the right to be a corporation of this nature is a contract between the sovereign power and those who devote their funds to the charity, and take the incorporation for its better management, he could bring the legislative interference within the prohibition of the Federal Constitution. . . . Its important positions, . . . were these: 1. That Dr. Wheelock was the founder of this college, and as such entitled by law to be visitor, and that he had assigned all the visitatorial powers to the trustees. 2. That the charter created a private and not a public corporation, to administer a charity, in the administration of which the trustees had a property, which the law recognizes as such. 3. That the grant of such a charter is a contract between the sovereign power and its successors and those to whom it is granted and their successors. 4. That the legislation which took away from the trustees the right to exercise the powers of superintendence, visitation, and government, and transferred them to another set of trustees, impaired the obligation of that contract. . . . On the conclusion of the argument, the Chief Justice intimated that a decision was not to be expected until the next term. It was made in February, 1819, fully confirming the grounds on which Mr. Webster had placed the cause. From this decision, the principle in our constitutional jurisprudence, which regards a charter of a private corporation as a contract, and places it under the protection of the Constitution of the United States, takes its date. To Mr. Webster belongs the honor of having produced its judicial establishment."—G. T. Curtis, *Life of Daniel Webster, v. 1, p. 165-169 (5th ed.)*.—See also UNIVERSITIES AND COLLEGES: 1754-1769.

1823.—**Indian right of occupancy.**—"The first case of importance that came before the court of last resort with regard to the Indian question had to do with their title to land. This was the case of *Johnson v. McIntosh*, 8 Wheaton, 543. In this case, Chief Justice Marshall delivered the opinion of the court and held that discovery gave title to the country by whose subjects or by whose authority it was made, as against all persons but the Indians as occupants; that this title gave a power to grant the soil and to convey a title to the grantees, subject only to the Indian right of occupancy; and that the Indians could grant no title to the lands occupied by them, their right being simply that of occupancy and not of ownership. The Chief Justice says: 'It has never been doubted that either the United States or the several States had a clear title to all the lands within the boundary lines described in the treaty (of peace between England and United States) subject only to the Indian's right of occupancy, and that the exclusive power to extinguish that right was vested in

that government which might constitutionally exercise it. . . . The United States, then, have unequivocally acceded to that great and broad rule by which its civilized inhabitants now hold this country. They hold and assert in themselves the title by which it was acquired. They maintain, as all others have maintained, that discovery gave an exclusive right to extinguish the Indian title of occupancy, either by purchase or by conquest; and gave also a right to such a degree of sovereignty as the circumstances of the people would allow them to exercise. The power now possessed by the government of the United States to grant lands resided, while we were colonies, in the crown or its grantees. The validity of the title given by either has never been questioned in our courts. It has been exercised uniformly over territory in possession of the Indians. The existence of this power must negative the existence of any right which may conflict with and control it. An absolute title to lands cannot exist, at the same time, in different persons, or in different governments. An absolute must be an exclusive title, or at least a title which excludes all others not compatible with it. All our institutions recognize the absolute title of the crown, subject only to the Indian right of occupancy, and recognize the absolute title of the crown to extinguish that right. This is incompatible with an absolute and complete title in the Indians."—W. B. Hornblower, 14 *American Bar Association Report*, 264-265.

1826.—Jurors from the body of the county.—"In the time of Fortescue, who was lord chancellor in the reign of Henry VI. [1422-61], with the exception of the requirement of personal knowledge in the jurors derived from near neighborhood of residence, the jury system had become in all its essential functions similar to what now exists. . . . The jury were still required to come from the neighborhood where the fact they had to try was supposed to have happened; and this explains the origin of the venire (vicinetum), which appears in all indictments and declarations at the present day. It points out the place from which the jury must be summoned. . . . Now, by 6 George IV., ch. 50, the jurors need only be good and lawful men of the body of the county."—W. Forsyth, *Trial by jury*, ch. 7, sect. 3.

1828.—Lord Tenterden's Act.—"Be it therefore enacted . . . That in Actions of Debt or upon the Case grounded upon any Simple Contract or Acknowledgement or Promise by Words only shall be deemed sufficient Evidence of a new or continuing Contract, . . . unless such Acknowledgement or Promise shall be made or contained by or in some Writing to be signed by the Party chargeable thereby."—*Statutes at large*, v. 68, 9 *George IV.*, c. 14.

1833.—Wager of law abolished, and effect upon detinue.—"This form of action (detinue) was also formerly subject (as were some other of our legal remedies), to the incident of 'wager of law' (vadiatio legis),—a proceeding which consisted in the defendant's discharging himself from the claim on his own oath, bringing with him at the same time into court eleven of his neighbors, to swear that they believed his denial to be true. This relic of a very ancient and general institution, which we find established not only among the Saxons and Normans, but among almost all the northern nations that broke in upon the Roman empire, continued to subsist among us even till the last reign, when it was at length abolished by 3 and 4 Will. IV. c. 42, s. 13: and as the wager of law used to expose plaintiffs in detinue to great

disadvantage, it had the effect of throwing that action almost entirely out of use, and introducing in its stead the action of trover and conversion."—Stephens, *Commentaries*, v. 3, pp. 442-443 (8th ed.).

1834.—Real actions abolished.—"The statutes of 32 H. VIII., c. 2, and 21 Jac. I., c. 16 (so far as the latter applied to actions for the recovery of land) were superseded by 3 & 4 Wm. IV., c. 27. The latter statute abolished the ancient real actions, made ejectment (with few exceptions) the sole remedy for the recovery of land, and, for the first time, limited directly the period within which an ejectment might be brought. It also changed the meaning of 'right of entry,' making it signify simply the right of an owner to the possession of land of which another person has the actual possession, whether the owner's estate is divested or not. In a word, it made a right of entry and a right to maintain ejectment synonymous terms, and provided that whenever the one ceased the other should cease also; i. e., it provided that whenever the statute began to run against the one right, it should begin to run against the other also, and that, when it had run twenty years without interruption, both rights should cease; and it also provided that the statute should begin to run against each right the moment that the right began to exist, i. e., the moment that the actual possession and the right of possession became separated. The statute, therefore, not only ignored the fact that ejectment (notwithstanding its origin) is in substance purely in rem (the damages recovered being only nominal), and assumed that it was, on the contrary, in substance purely in personam, i. e., founded upon tort, but it also assumed that every actual possession of land, without a right of possession, is a tort."—C. C. Langdell, *Summary of equity pleading*, pp. 144-145.

1836.—Exemption laws.—"Our State legislatures commenced years ago to pass laws exempting from execution necessary household goods and personal apparel, the horses and implements of the farmer, the tools and instruments of the artisan, etc. Gradually the beneficent policy of such laws has been extended. In 1828, Mr. Benton warmly advocated in the Senate of the United States the policy of a national homestead law. The Republic of Texas passed the first Homestead Act, in 1836. It was the great gift of the infant Republic of Texas to the world. In 1849, Vermont followed; and this policy has since been adopted in all but eight States of the Union. By these laws a homestead (under various restrictions as to value) for the shelter and protection of the family is now exempt from execution or judicial sale for debt, unless both the husband and the wife shall expressly join in mortgaging it or otherwise expressly subjecting it to the claims of creditors."—J. F. Dillon, *Laws and jurisprudence of England and America*, p. 360.

1837.—Employer's liability.—"No legal principle, with a growth of less than half a century, has become more firmly fixed in the common law of to-day, than the rule that an employer, if himself without fault, is not liable to an employee injured through the negligence of a fellow-employee engaged in the same general employment. This exception to the well known doctrine of 'respondeat superior,' although sometimes considered an old one, was before the courts for the first time in 1837, in the celebrated case of *Priestly v. Fowler*, 3 M. & W. 1, which it is said, has changed the current of decisions more radically than any other reported case. . . . The American law, though in harmony with the English, seems to have had an origin of its own. In 1841 *Murray v. The South Carolina*

Railroad Company, 1 Mc. & M. 385, decided that a railroad company was not liable to one servant injured through the negligence of another servant in the same employ. Although this decision came a few years after *Priestly v. Fowler*, the latter case was cited by neither counsel nor court. It is probable, therefore, that the American Court arrived at its conclusion entirely independent of the earlier English case,—a fact often lost sight of by those who in criticising the rule, assert that it all sprang from an ill-considered opinion by Lord Abinger in *Priestly v. Fowler*. The leading American case, however, is *Farwell v. Boston and Worcester Railroad Company*, 4 Met. 49, which, following the South Carolina case, settled the rule in the United States. It has been followed in nearly every jurisdiction, both State and Federal.”—M. C. Hobbs, *Statutory changes in employer's liability* (*Harvard Law Review*, v. 2, pp. 212-213).

1838.—Arrests on mesne process for debt abolished, and debtor's lands, for first time, taken in satisfaction of debt.—“The law of debtor and creditor, until a comparatively recent period, was a scandal to a civilized country. For the smallest claim, any man was liable to be arrested on mesne process, before legal proof of the debt. . . . Many of these arrests were wanton and vexatious; and writs were issued with a facility and looseness which placed the liberty of every man—suddenly and without notice—at the mercy of any one who claimed payment of a debt. A debtor, however honest and solvent, was liable to arrest. The demand might even be false and fraudulent; but the pretended creditor, on making oath of the debt, was armed with this terrible process of the law. The wretched defendant might lie in prison for several months before his cause was heard; when, even if the action was discontinued or the debt disproved, he could not obtain his discharge without further proceedings, often too costly for a poor debtor, already deprived of his livelihood by imprisonment. No longer even a debtor,—he could not shake off his bonds. . . . The total abolition of arrests on mesne process was frequently advocated, but it was not until 1838 that it was at length accomplished. Provision was made for securing absconding debtors; but the old process for the recovery of a debt in ordinary cases, which had wrought so many acts of oppression, was abolished. While this vindictive remedy was denied, the debtor's lands were, for the first time, allowed to be taken in satisfaction of a debt; and extended facilities were afterwards afforded for the recovery of small claims, by the establishment of county courts.”—T. E. May, *Constitutional history of England* (*Widdleton's ed.*), v. 2, pp. 267-268.—See also DEBT, LAWS CONCERNING: In England.

1839-1848.—Emancipation of women.—“According to the old English theory, a woman was a chattel, all of whose property belonged to her husband. He could beat her as he might a beast of burden, and, provided he was not guilty of what would be cruelty to animals, the law gave no redress. In the emancipation of women Mississippi led off, in 1830, New York following with its Married Women's Act of 1848, and which has been since so enlarged and extended, and so generally adopted by the other states, that, for all purposes of business, ownership of property, and claim to her individual earnings, a married woman is to-day, in America, as independent as a man.”—D. Campbell, *Puritan in Holland, England and America*, v. 1, p. 71.

1842.—One who takes commercial paper as collateral is a holder for value.—“Take the subject of the transfer of such paper as collateral se-

curity for, or even in the payment of, a pre-existing indebtedness. We find some of the courts holding that one who takes such paper as collateral security for such a debt is a holder for value; others, that he is not, unless he extends the time for the payment of the secured debt or surrenders something of value, gives some new consideration; while still others hold that one so receiving such paper cannot be a holder for value; and some few hold that even receiving the note in payment and extinguishment of a pre-existing debt does not constitute one a holder for value. The question, as is known to all lawyers, was first presented to the Supreme Court of the United States in *Swift vs. Tyson* (16 Peters, 1). There, however, the note had been taken in payment of the debt. It was argued in that case that the highest court in New York had decided that one so taking a note was not a holder for value, and it was insisted in argument that the contract, being made in New York, was to be governed by its law; but the court, through Justice Story—Justice Catron alone dissenting—distinctly and emphatically repudiated the doctrine that the Federal court was to be governed on such questions by the decisions of the courts of the State where the contract was made, and held the holder a holder for value.”—H. C. Tompkins, 13 *American Bar Association Report*, p. 255.

1842.—Copyright act. See COPYRIGHT: 1766-1890.

1845.—Interest of disseisee transferable.—“It was not until 1845 that by statute the interest of the disseisee of land became transferable. Similar statutes have been enacted in many of our States. In a few jurisdictions the same results have been obtained by judicial legislation. But in Alabama, Connecticut, Dakota, Florida, Kentucky, Massachusetts, New York, North Carolina, Rhode Island and Tennessee, and presumably in Maryland and New Jersey, it is still the law that the grantee of a disseisee cannot maintain an action in his own name for the recovery of the land.”—J. B. Ames, *Disseisin of chattels* (*Harvard Law Review*, v. 3, p. 25).

1846.—Ultra vires.—“When railway companies were first created with Parliamentary powers of a kind never before entrusted to similar bodies, it soon became necessary to determine whether, when once called into existence, they were to be held capable of exercising, as nearly as possible, all the powers of a natural person, unless expressly prohibited from doing so, or whether their acts must be strictly limited to the furtherance of the purpose for which they had been incorporated. The question was first raised in 1846, with reference to the right of a railway company to subsidise a harbour company, and Lord Langdale, in deciding against such a right, laid down the law in the following terms:—“Companies of this kind, possessing most extensive powers, have so recently been introduced into this country that neither the legislature nor the courts of law have yet been able to understand all the different lights in which their transactions ought properly to be viewed. . . . To look upon a railway company in the light of a common partnership, and as subject to no greater vigilance than common partnerships are, would, I think, be greatly to mistake the functions which they perform and the powers which they exercise of interference not only with the public but with the private rights of all individuals in this realm. . . . I am clearly of opinion that the powers which are given by an Act of Parliament, like that now in question, extend no further than is expressly stated in the Act, or is necessarily and

properly required for carrying into effect the undertaking and works which the Act has expressly sanctioned.' [Citing *Coleman v. Eastern Counties R. Co.*, 10 Beav., 13.] This view, though it has sometimes been criticised, seems now to be settled law. In a recent case in the House of Lords, the permission which the Legislature gives to the promoters of a company was paraphrased as follows:—'You may meet together and form yourselves into a company, but in doing that you must tell all who may be disposed to deal with you the objects for which you have been associated. Those who are dealing with you will trust to that memorandum of association, and they will see that you have the power of carrying on business in such a manner as it specifies. You must state the objects for which you are associated, so that the persons dealing with you will know that they are dealing with persons who can only devote their means to a given class of objects.' [Citing *Riche v. Ashbury Carriage Co.*, L R., 7 E. & L., App. 684.] An act of a corporation in excess of its powers with reference to third persons is technically said to be *ultra vires* [perhaps first in *South Yorkshire R. Co. v. Great Northern R. Co.*, 9 exch. 84 (1853)]; and is void even if unanimously agreed to by all the corporators. The same term is also, but less properly, applied to a resolution of a majority of the members of a corporation which being beyond the powers of the corporation will not bind a dissentient minority of its members."—T. E. Holland, *Elements of jurisprudence*, 5th ed., p. 301.—(Compare article by *Seymour D. Thompson* in *American Law Review*, May-June, 1894.)

1848.—Simplification of procedure.—"In civil matters, the greatest reform of modern times has been the simplification of procedure in the courts, and the virtual amalgamation of law and equity. Here again America took the lead, through the adoption by New York, in 1848, of a Code of Practice, which has been followed by most of the other states of the Union, and in its main features has lately been taken up by England."—D. Campbell, *Puritan in Holland, England and America*, v. 1, p. 70.—See also CODES.

1848.—Reform in the law of evidence.—"The earliest act of this kind in this country was passed by the Legislature of Connecticut in 1848. It is very broad and sweeping in its provisions. It is in these words: 'No person shall be disqualified as a witness in any suit or proceeding at law, or in equity, by reason of his interest in the event of the same, as a party or otherwise, or by reason of his conviction of a crime; but such interest or conviction may be shown for the purpose of affecting his credit.' (Revised Statutes of Connecticut, 1849, p. 86. § 141. In the margin of the page the time of the passage of the law is given as 1848). This act was drafted and its enactment secured by the Hon. Charles J. McCurdy, a distinguished lawyer and the Lieutenant-Governor of that State. A member of Judge McCurdy's family, having been present at the delivery of this lecture at New Haven in 1892, called my attention to the above fact, claiming, and justly, for this act the credit of leading in this country the way to such legislation. But he was mistaken in his claim that it preceded similar legislation in England, although its provisions are an improvement on the contemporary enactments of the like kind in that country."—J. F. Dillon, *Laws and jurisprudence of England and America*, p. 374, notes.

1851.—Bentham's reforms in the law of evidence.—"In some respects his [Bentham's] 'Judicial Evidence,' . . . is the most important of all

his censorial writings on English Law. In this work he exposed the absurdity and perniciousness of many of the established technical rules of evidence. . . . Among the rules combatted were those relating to the competency of witnesses and the exclusion of evidence on various grounds, including that of pecuniary interest. He insisted that these rules frequently caused the miscarriage of justice, and that in the interest of justice they ought to be swept away. His reasoning fairly embraces the doctrine that parties ought to be allowed and even required to testify. . . . But Bentham had set a few men thinking. He had scattered the seeds of truth. Though they fell on stony ground they did not all perish. But verily reform is a plant of slow growth in the sterile gardens of the practising and practical lawyer. Bentham lived till 1832, and these exclusionary rules still held sway. But in 1843, by Lord Denman's Act, interest in actions at common law ceased, as a rule, to disqualify; and in 1846 and 1851, by Lord Brougham's Acts, parties in civil actions were as a rule made competent and compellable to testify. I believe I speak the universal judgment of the profession when I say changes more beneficial in the administration of justice have rarely taken place in our law, and that it is a matter of profound amazement, as we look back upon it, that these exclusionary rules ever had a place therein, and especially that they were able to retain it until within the last fifty years."—*Ibid.*, pp. 339-341.

1852-1854.—Reform in procedure.—"A great procedure reform was effected by the Common Law Procedure Acts of 1852 and 1854 as the result of their labours. The main object of the Acts was to secure that the actual merits of every case should be brought before the judges unobscured by accidental and artificial questions arising upon the pleadings, but they also did something to secure that complete adaptability of the common law courts for finally determining every action brought within them, which the Chancery Commissioners of 1850 had indicated as one of the aims of the reformers. Power was given to the common law courts to allow parties to be interrogated by their opponents, to order discovery of documents, to direct specific delivery of goods, to grant injunctions, and to hear interpleader actions, and equitable pleas were allowed to be urged in defence to common law actions."—D. M. Kerly, *History of equity*, p. 288.

1854.—"Another mode" (besides common law lien).—"Another mode of creating a security is possible, by which not merely the ownership of the thing but its possession also remains with the debtor. This is called by the Roman lawyers and their modern followers 'hypotheca.' Hypothecs may arise by the direct application of a rule of law, by judicial decision, or by agreement. Those implied by law, generally described as 'tacit' hypothecs, are probably the earliest. They are first heard of in Roman law in connection with that right of a landlord over the goods of his tenant, which is still well known on the Continent and in Scotland under its old name, and which in England takes the form of a right of Distress. Similar rights were subsequently granted to wives, pupils, minors, and legatees; over the property of husbands, tutors, curators, and heirs, respectively. The action by which the praetor Servius first enabled a landlord to claim the goods of his defaulting tenant in order to realize his rent, even if they had passed into the hands of third parties, was soon extended so as to give similar rights to any creditor over property which its owner had

agreed should be held liable for a debt. A real right was thus created by the mere consent of the parties, without any transfer of possession, which although opposed to the theory of Roman law, became firmly established as applicable both to immoveable and moveable property. Of the modern States which have adopted the law of hypothec, Spain perhaps stands alone in adopting it to the fullest extent. The rest have, as a rule, recognized it only in relation to immoveables. Thus the Dutch law holds to the maxim 'mobilia non habent sequelam,' and the French Code, following the 'coutumes' of Paris and Normandy, lays down that 'les meubles n'ont pas de suite par hypothèque,' but by the 'Code de Commerce,' ships, though moveables, are capable of hypothecation; and in England what is called a mortgage, but is essentially a hypothec, of ships is recognized, and regulated by the 'Merchant Shipping Acts,' under which the mortgage must be recorded by the registrar of the port at which the ship itself is registered [17 and 18 Vic. c. 104]. So also in the old contract of 'bottomry,' the ship is made security for money lent to enable it to proceed upon its voyage."—T. E. Holland, *Elements of jurisprudence*, 5th ed., p. 203.

1854-1882.—Simplification of titles and transfers of land in England.—"For the past fifty years the project of simplifying the titles and transfer of land has received great attention in England. In the year 1854 a royal commission was created to consider the subject. The report of this commission, made in 1857, was able and full so far as it discussed the principles of land transfer which had been developed to that date. It recommended a limited plan of registration of title. This report, and the report of the special commission of the House of Commons of 1870, have been the foundation of most of the subsequent British legislation upon the subject. Among the more prominent acts passed may be named Lord Westbury's Act of 1862, which attempted to establish indefeasible titles; Lord Cairn's Land Transfer Act of 1875, which provided for guaranteed titles upon preliminary examinations; the Conveyancing and Law of Property Act of 1881, which established the use of short forms of conveyances; and Lord Cairn's Settled Land Act of 1882."—D. H. Olmstead, 13 *American Bar Association Report*, p. 267.

1855.—Suits against a state or nation.—"In England the old common law methods of getting redress from the Crown were by 'petition de droit' and 'monstrans le droit,' in the Court of Chancery or the Court of Exchequer, and in some cases by proceedings in Chancery against the Attorney-General. It has recently been provided by statute [23 & 24 Vic. c. 24] that a petition of right may be entitled in any one of the superior Courts in which the subject-matter of the petition would have been cognisable, if the same had been a matter in dispute between subject and subject, and that it shall be left with the Secretary of State for the Home Department, for her Majesty's consideration, who, if she shall think fit, may grant her fiat that right be done, whereupon an answer, plea, or demurrer shall be made on behalf of the Crown, and the subsequent proceedings be assimilated as far as practicable to the course of an ordinary action. It is also provided that costs shall be payable both to and by the Crown, subject to the same rules, so far as practicable, as obtain in proceedings between subject and subject."—T. E. Holland, *Elements of jurisprudence*, 5th ed., 337.—The United States Court of Claims was established in 1855. For state courts of claims see Note in 16

Abbott's New Cases 436 and authorities there referred to.

1858.—Contractual theory of marriage as affecting divorce.—"The doctrine may be resolved into two propositions—(a) that a marriage celebrated abroad cannot be dissolved but by a Court of the foreign country; (b) that a marriage in England is indissoluble by a foreign Court. The first proposition has never been recognized in any decision in England. Even before the Act of 1858 it is extremely doubtful if the English Courts would have scrupled to decree a divorce *à mensâ* where the marriage was had in a foreign country, and certainly after the Statutes they did not hesitate to grant a divorce, though the marriage took place abroad (Ratcliff v. Ratcliff, 1859, 1 Sw. & Tr. 217). It is true that in cases where the foreign Courts have dissolved a marriage celebrated in their own country between persons domiciled in that country, these sentences were regarded as valid here, and some credit was given to the fact of the marriage having been celebrated there (Ryan v. Ryan, 1816, 2 Phill. 332; Argent v. Argent, 1865, 4 Sw. & Tr. 52); but how far it influenced the learned Judges does not appear; the main consideration being the circumstance of domicile. The second proposition has been generally supposed by writers both in England and America (Story, Wharton) to have been introduced by Lolley's Case, 1812, Ruse. & Ry. 237, and followed in Tovey v. Lindsay, 1813, 1 Dow. 117, and McCarthy v. De Caix, 1831, 2 Cl. & F. 568, and only to have been abandoned in 1858 (Dicey), or in 1868 in Shaw v. Gould. But the case of Harvey v. Farnie, 1880-1882, 5 P. D. 153; 6 P. D. 35, 8 App. C. 48, has now shown that the Contractual theory had no permanent hold whatever in this country, that it did not originate with Lolley's Case and was not adopted by Lord Eldon but that it arose from a mistaken conception of Lord Brougham as to the point decided in the famous Resolution, and was never seriously entertained by any other Judge in England, and we submit this is correct."—E. H. Monnier, in *Law Magazine and Review*, 12 ser., v. 17 (London, 1891-2), p. 82.—See also SUFFRAGE, WOMAN: England: 1810-1860.

1873.—Judicature acts.—"The first Judicature Act was passed in 1873 under the auspices of Lord Selborne and Lord Cairns. It provided for the consolidation of all the existing superior Courts into one Supreme Court, consisting of two primary divisions, a High Court of Justice and a Court of Appeal. . . . Law and Equity, it was provided, were to be administered concurrently by every division of the Court, in all civil matters, the same relief being granted upon equitable claims or defences, . . . as would have previously been granted in the Court of Chancery; no proceeding in the Court was to be stayed by injunction analogous to the old common injunction but the power for any branch of the Court to stay proceedings before itself was of course to be retained; and the Court was to determine the entire controversy in every matter that came before it. By the 25th section of the Act rules upon certain of the points where differences between Law and Equity had existed, deciding in favour of the latter, were laid down, and it was enacted generally that in the case of conflict, the rules of Equity should prevail."—D. M. Kerly, *History of equity*, p. 293.

1882.—Experiments in codification in England.—"The Bills of Exchange act 1882 is, I believe, the first code or codifying enactment which has found its way into the English Statute Book. By a code, I mean a statement under the authority

of the legislature, and on a systematic plan, of the whole of the general principles applicable to any given branch of the law. A code differs from a digest inasmuch as its language is the language of the legislature, and therefore authoritative; while the propositions of a digest merely express what is, in the opinion of an individual author, the law on any given subject. In other words the propositions of a code are law, while the propositions of a digest may or may not be law."—M. D. Chalmers, *An experiment in codification* (*Law Quarterly Review*, v. 2, p. 125).

1889.—**Passage of Block-Indexing Act.**—"The history of Land Transfer Reform in the United States is confined, almost exclusively, to matters which have occurred in the State of New York during the past ten years, and which culminated in the passage of the Block-Indexing Act for the city of New York of 1889. In January, 1882, a report was made by a special committee of the Association of the Bar of the city of New York, which had been appointed to consider and report what changes, if any, should be made in the manner of transferring title to land in the city and State. The committee reported that by reason of the accumulated records in the offices of the county clerk and register of deeds of the city, 'searches practically could not be made in those offices,' and recommended the appointment of a State commission, which should consider and report a mode of transferring land free from the difficulties of the present system. The report was adopted by the association, and during the same year like recommendations were made by the Chamber of Commerce and by real estate and other associations of the city."—D. H. Olmstead, *13 American Bar Association Report*, pp. 269-270.

1911-1921.—**Arbitration, a development of common law.**—"Arbitration, as a method of settling disputes, is more generally and better known than conciliation. It stands midway between conciliation and court litigation. Like the former, it is a method that can be used only by consent, and so differs from judicial procedure which rests on compulsion. . . . Arbitration is an ancient practice at common law, but it has had a checkered development. In earlier times the courts, having few cases and being jealous of their prerogatives, viewed it askance and accorded it little support; later, having crowded dockets and being overworked, the courts set the seal of their emphatic approval upon it. Again, arbitration has at times been in vogue and has then relapsed into disuse. It was frequently employed in an organized way by New York merchants as early as 1768, and in Boston in 1819 a plea was made for its more extended development. . . . Arbitration as provided for by statute in effect permits disputants to create a tribunal of their own either by agreeing on the persons to arbitrate or by agreeing to use the arbitration machinery of some private organization, as a chamber of commerce. This agreement is generally called a 'submission,' and if it contains a provision to that effect, the law permits the award to be entered as court judgment and enforced in like manner. The great defect in the American statutes is that either party may, after the submission and any time before the final award, revoke his agreement and thereby annul all the proceedings. . . . Arbitration has been coming more and more generally into use through the insistence of merchants acting through their trade groups or chambers of commerce. Under the energetic guidance of Charles L. Bernheimer a splendid organization has, since 1911, been built up under authority of the Chamber of Commerce of the State of New York,

which has been followed elsewhere, notably by the Chicago Association of Credit Men. This revival has been forced by three considerations,—first, a desire for a decision by an expert having personal knowledge of trade conditions and customs, a thing which the courts have never been able to afford; second, a hope of supplanting the enmity provoking litigious method with an amicable procedure which would not interrupt business relationships; and thirdly and chiefly, a determination to escape from the intolerable delays of the regular administration of justice."—R. H. Smith, *Justice and the poor*, pp. 68-69.—See also ARBITRATION AND CONCILIATION, INDUSTRIAL.

1919-1920.—**New York Practice Act.**—"For some years past, a movement has been in progress looking to a reform in the civil procedure in the courts of the State of New York. The simple Code of Procedure drawn by David Dudley Field, and adopted in 1848, which furnished a model for almost all the other states of the Union, had grown to such dimensions as to constitute a voluminous, intricate and inelastic system of civil practice in our courts, which involved great expense to litigants and too frequently led to the merits of the controversies being entirely obscured by questions of mere procedure. Some twenty years ago, the Committee on Law Reform of the New York State Bar Association recommended the repeal of the Code of Civil Procedure, and in its place the adoption of a simple practice act containing the more important provisions of the existing code, rearranged and revised and supplemented by rules of Court."—G. W. Wickersham, *New York Practice Act* (*Yale Law Journal*, March-June, 1920, pp. 904-906).—"In 1919, the Legislature, proposed to continue the Code of Civil Procedure, simplified and made more elastic in many of its provisions, to separate entirely from it the provisions relating to special courts, such as Surrogate's Municipal and other courts of special jurisdiction and by incorporating in the code of civil procedure, which is called the Civil Practice Act, provisions designed to make the practice less technical than it had been. The Bill was approved May 24, 1920. It is still open to the fundamental objection which attached to the Code of Civil Procedure, in that its provisions will be subject to constant legislative tinkering. The Field Code of 1848 was a model of simplicity, so far as its provisions were concerned. From the moment of its enactment, it encountered the persistent hostility of a bench and bar, which had been educated under the common law system, and the decisions made under it were constantly overruled by legislative enactment, until the amendment and revision of the Code became an annual legislative exercise, and a vast structure of statutory enactment was built up, year by year, like a coral reef; partially submerged in a sea of ignorance of the history which constantly called for construction in the courts and provoked amendment by the legislature. . . . Many provisions are to be found through the act tending to prevent mere technicalities from defeating the course of justice, and requiring adequate notice to be given of applications for relief to protect the interests of clients from destruction or injury by mere slips of practice, and greatly simplifying the method of bringing controversies into court for appropriate adjudication upon the merits. Any objection to a pleading is required to be distinctly specified in the answering pleading, or in a notice of motion based on the pleading, specifically pointing out the particular defect relied upon. Demurrers are abolished and objections to pleadings in point of law for grounds appearing on

the face of the pleading and the Court rules may define what objections may be taken by motion only. The right is given to every party to an action to take the deposition of himself or his adversary before trial, as well as the testimony of the assignor of a claim which constitutes the cause of action in suit. A new provision inserted empowering the Supreme Court in any action or proceeding: 'To declare rights and other legal relations on request for such declaration, whether or not further relief is or could be claimed, and such declaration shall have the force of a final judgment.' The rules of court are to make such provisions as shall be necessary and proper to carry the provisions of this section into effect. Judgment may be rendered by the court in favor of any party or parties and against any party or parties at any stage of the action or appeal, if warranted by the pleadings, or the admissions of a party or parties and a judgment may be rendered by the court as to a part of a cause of action and the action proceed as to the remaining issues, as justice may require. A non-suit or dismissal of a complaint or counterclaim at the close of the plaintiff's or defendant's evidence, as the case may be, or a dismissal of a complaint or counterclaim at the close of the whole evidence, is declared to be a final determination of the merits of the action, and to bar a new action between the same parties, or their privies for the same cause of action, unless the court shall dismiss without prejudice. All of these provisions are in line with the most enlightened and advanced views of simplification of practice in courts. Some of the provisions are taken from the English practice acts; others are inspired by the provisions of the revised United States Equity Rules, and all of them tend to require rules of practice, whether promulgated by the legislature or the courts, to be treated as mere procedural regulations and not statutory provisions conferring substantive rights."—*Ibid.*, pp. 904-906.

COMMONWEALTH FUND.—One of the newest foundations. The Commonwealth Fund, which was incorporated in 1918, was endowed by Mrs. Stephen V. Harkness by "a considerable gift," the amount of which was not officially divulged. The uses to which the endowment should be put was left entirely to the judgment of the directors by the donor, who in her formal offer wrote "My gift is absolute. . . . I hope, therefore, that you will feel free to use any of the gift for such benevolent, religious, educational and like purposes of an eleemosynary character as shall be within the charitable purposes of your corporate power; and to that end you are free, in the exercise of your sound discretion, to use the principal as well as the income." The following year (1919) Mrs. Harkness made another "large gift" to the fund on the same terms, with the expressed wish that it would enable the directors, "either directly or indirectly to do something for the welfare of mankind." With freedom thus assured, the trustees were able to proceed at once to use the funds of the foundation, at their discretion, in aiding to relieve some of the most crying needs of the hour. Accordingly, in the first year of its existence sums aggregating \$144,000 were disbursed. This amount included \$50,000 for the United War Work Campaign, and \$50,000 for Armenian and Syrian relief. The following year (1919-1920) the need for relief in the Near East proved to be greater and the sum of \$750,000 from the funds of the foundation, aided by further gifts from the donor and her son, was placed in the hands of the Near East Administration. It was used to enlarge the child feeding program by which when the need was greatest 75,000 children were fed daily, and enabled the work to be carried on until August, 1920. In 1920 \$500,000 were used for "food drafts for intellectuals" to assist about 140,000 people of the professional classes in Central Europe. (See also INTERNATIONAL RELIEF.) In addition large sums were appropriated for research, social and economic work at home, and the total expenditures, according to the published report, reached \$1,530,600.

In 1921 the fund made a definite entry into the "field of educational (including legal) research. Also, a careful preliminary survey of the field of child welfare was instituted in January, 1920, and completed in June, with a view to the preparation of a definite program. . . . While it continued, therefore, to be the policy during the year to make certain limited grants to miscellaneous and comparatively unrelated projects, and while the Fund . . . continued to a considerable degree its interest in foreign relief, in the main its efforts . . . [were] directed increasingly toward accomplishing results in these three fields in which its interests have chiefly lain—namely, Education, Child Welfare, and Health. Appropriations made during the year for educational work (including educational and legal research) have totaled \$364,500; for Child Welfare, \$141,270; for Health, \$269,000; while for foreign relief appropriations have amounted to \$600,000; and for miscellaneous purposes to \$50,500. . . . An appropriation of \$100,000 [was made] for 1920-21 for the encouragement of educational research. The appropriation was renewed for 1921-22; and the educational activities of The Commonwealth Fund . . . centered about the recommendations of that Committee. . . . Two distinct lines of policy . . . [were] followed by the Educational Research Committee. The first of these was to encourage some of the best investigators in the field to undertake special researches in which they were particularly interested, and for which they were well qualified, but which they were

not able to carry out effectively through lack of funds. . . . The other line of policy followed . . . [was] to select subjects in which the need existed for further information or for the development of a method of approach. The reorganization of the school curriculum, especially with reference to the social studies—under which would be included history, government, economics, geography, and sociology—was regarded by the Committee as of great importance.”—*Commonwealth fund, 1920-1921, pp. 7-8, 10-11.*—The interest of the Fund in health work in 1921 was chiefly expressed by assistance to medical and hospital work, and research, and to organizations dealing with health conditions and educational work along health lines. Appropriations were made to the Yale University Medical School, to the Presbyterian Board of Home Missions for the Point Barrow Alaska hospital, to the Grenfell Association, and to the Changsha Medical School in China.

COMMUNE: French administrative unit.—“The commune of which there are over 36,000 is the basis of local government in France. Its size varies from the smallest village to the largest city. With the exception of Paris, Lyons and Marseilles, every commune possesses the same form of government [a mayor and elected council]. The communal council, the representative body of this unit, varies in size, according to the population, from ten to thirty-six members.”—R. L. Buell, *Contemporary French politics, p. 378.*—See also ADMINISTRATIVE LAW; In France; DEPARTMENT.

COMMUNE, Medieval, the paragon; the commons. In feudal usage, the term signified, as defined by Littré, the body of the bourgeois or burghers of a town who had received a charter which gave their rights of self-government. (See also BOURGEOIS.) “In France the communal constitution was during this period (12th century) encouraged, although not very heartily, by Lewis VI., who saw in it one means of fettering the action of the barons and bishops and securing to himself the support of a strong portion of his people. In some cases the commune of France is like the guild, a voluntary association, but its objects are from the first more distinctly political. In some parts of the kingdom the towns had risen against their lords in the latter half of the eleventh century, and had retained the fruits of their hard-won victories. In others, they possessed, in the remaining fragments of the Karolingian constitution, some organisation that formed a basis for new liberties. The great number of charters granted in the twelfth century shows that the policy of encouraging the third estate was in full sway in the royal councils, and the king by ready recognition of the popular rights gained the affections of the people to an extent which has few parallels in French history. The French charters are in both style and substance very different from the English. The liberties which are bestowed are for the most part the same, exemption from arbitrary taxation, the right to local jurisdiction, the privilege of enfranchising the villein who has been for a year and a day received within the walls, and the power of electing the officers. But whilst all the English charters contain a confirmation of free and good customs, the French are filled with an enumeration of bad ones. . . . The English have an ancient local constitution the members of which are the recipients of the new grant, and guilds of at least sufficient antiquity to

render their confirmation typical of the freedom now guaranteed; French communia is a new body which, by the action of a sworn confederacy, has wrung from its oppressors a deliverance from hereditary bondage. . . . The commune lacks too the ancient element of festive, religious or mercantile association which is so conspicuous in the history of the guild. The idea of the latter is English, that of the former is French or Gallic. Yet notwithstanding these differences, the substantial identity of the privileges secured by these charters seems to prove the existence of much international sympathy. The ancient liberties of the English were not unintelligible to the townsmen of Normandy; the rising freedom of the German cities roused a corresponding ambition in the towns of Flanders; and the struggles of the Italian municipalities awoke the energies of the cities of Provence. All took different ways to win the same liberties. . . . The German hansa may have been derived from England; the communa of London was certainly derived from France. . . . The communa of London, and of those other English towns which in the twelfth century aimed at such a constitution, was the old English guild in a new French garb; it was the ancient association, but directed to the attainment of municipal rather than mercantile privileges.”—W. Stubbs, *Constitutional history of England, ch. 11.*—“Oppression and insurrection were not the sole origin of the communes. . . . Two causes, quite distinct from feudal oppression, viz., Roman traditions and Christian sentiments, had their share in the formation of the communes and in the beneficial results thereof. The Roman municipal regimen, which is described in M. Guizot’s ‘Essais sur l’Histoire de France’ (1st Essay, pp. 1-44), [also in ‘History of Civilization,’ v. 2, lect. 2] did not everywhere perish with the Empire; it kept its footing in a great number of towns, especially in those of Southern Gaul.”—F. P. Guizot, *Popular history of France, ch. 19.*—See also AGRICULTURE: Medieval: Manorial system; BELGIUM: Ancient and medieval period; CURIA, MUNICIPAL; FRANCE: 12th-13th centuries; GUILDS OF FLANDERS; SUFFRAGE, MANHOOD: 1000-1300; 1200-1600; also BREST: 1593.

COMMUNIST MANIFESTO.—“The ‘First International’ did not come into existence until 1864. Nearly a generation prior thereto, however, in the year 1836, a group of workers from various countries formed a secret organization in Paris known as the League of the Just, and adopted as its motto the shibboleth, ‘All men are brothers.’ Eleven years thereafter, the remnants of this league, exiled to London, reorganized under the name of the Communist League, and commissioned Marx and Engels to formulate its principles. The result was the Communist Manifesto.”—H. W. Laidler, *Socialism in thought and action, p. 482.*—“The new Marxian program was complete in January, 1848, and published in February. Its publi-

cation is usually considered as marking the beginning of the modern movement. The *Manifesto* was the first clear and definite statement of scientific Socialism. Its twenty-five pages of vigorous and incisive German sets forth the history and character of modern social classes, and the position of capitalism in industrial evolution. All this is interpreted as pointing out that the next stage in evolution will be characterized by the abolition of private capital and the socialization of production and exchange. The *Manifesto* was a rallying call to the proletariat, the worker's Declaration of Independence. Its inspiring keynote "Workingmen of all countries, Unite!" has been the watchword of Socialism from that day to this."—J. Spargo and G. L. Arner, *Elements of socialism*, pp. 258-259.—"The pervading thought of the manifesto: that the economic production with the social organisation of each historical epoch necessarily resulting there from forms the basis for the political and intellectual history of this epoch; that accordingly (since the dissolution of the primitive common property in land) the entire history is a history of class struggles—struggles between exploited and exploiting, ruled and ruling, classes at different stages of social development; but that this struggle has now reached a stage when the exploited and oppressed class (the proletariat) can no more free itself from the exploiting and oppressing class (the *bourgeoisie*) without at the same time delivering the whole of society forever from exploitation, oppression, and class struggles—this pervading thought belongs exclusively and alone to Marx. 'The history of all society hitherto has been the history of class struggles'; such is the keynote of the manifesto. 'But it is a distinguishing feature of the present time that it has simplified class antagonisms; the entire human society more and more divides itself into two great hostile camps, into two great conflicting classes, *bourgeoisie* [q. v.] and proletariat [q. v.].' The manifesto is for the most part an exposition and discussion of these two classes, the historical conditions under which they have grown up, their mutual relations, past, present, and future. . . . The manifesto is a treatise instinct with the fiery energy and enthusiasm of a young revolutionary party, and its doctrines are the doctrines of Marx in a crude, exaggerated, and violent form. In such a pamphlet, written for propaganda, we must not expect the self-restraining moderation of statement, the clear perspective, or the high judicial charity which should characterize a sober historical exposition. The Iron Law of Wages is stated in its hardest and most exaggerated form. To the charge that they desire to abolish private property, its authors reply that individual property the produce of a man's own labour, is already abolished. What they desire to abolish is the appropriation of other men's labour by the capitalist. To the charge that they wish to abolish the family, they reply to the *bourgeoisie* with a *tu quoque*: ye have abolished it by the exploitation of women and children in the factories, which has broken up the family ties, through the prevalence of prostitution and the common practice of adultery. The charge of abolishing patriotism they repudiate in the same manner: the workman has no country."—T. Kirkup, *History of socialism*, pp. 173-175.—See also EUROPE: Modern: Russia in the 10th century; INTERNATIONAL: Its forerunners; 1862-1872; SOCIALISM: 1843-1883.

COMPAGNONNAGES: France. — "During the years that followed the Revolution of July (1830) the workingmen of France were at times in a state of agitation throughout the entire country, formulating everywhere particular demands, such as the regulation of industrial matters, collective contracts and the like. In many cases, the strikes were spontaneous outbursts of discontent among unorganized workingmen. Frequently, however, the strikes were either consciously called out or directed by organizations which existed by avoiding the law in various ways. These organizations were of three different types: the *compagnonnages*, the friendly societies (*mutualités*) and the 'societies of resistance.' The *compagnonnages* originated under the guild-system and can be traced back as far as the fifteenth century. Their development was probably connected with the custom of traveling which became prevalent among the journeymen of France about that time. A journeyman (called *compagnon* in French) would usually spend some time in visiting the principal cities of France (make his *tour de France*) to perfect himself in his trade. A traveling *compagnon* would be in need of assistance in many cases and the *compagnonnages* owed their development to the necessity of meeting this want. The *compagnonnages* consisted of bachelor journeymen only. If a member married or established himself as master, he left the *compagnonnage*. Besides, admission to the *compagnonnage* was dependent on tests of moral character and of technical skill. Thus, the *compagnonnages* always embrace but a small part of the workingmen—the élite from the technical point of view. To attain the required technical standard, members had to pass some time as aspirants before they could become *compagnons*. The organization of the *compagnonnages* was very simple. All the *compagnons* of the same trade lived together in one house, usually in an inn, kept by the so-called *mère* (mother) or *père* (father) of the trade. The *compagnons* were generally the only boarders in the house. If not numerous enough to occupy the entire house, they had one hall for their exclusive occupation. Here they held their meetings, initiated new mem-

bers, and kept their records and treasury. Here, also, *compagnons* arriving from other towns made themselves 'recognized' by special signs and symbols. All the *compagnons* of France were divided among three 'orders' called *devoirs*. The *devoirs* had strange names indicating the legends with which the origins of these organizations were connected. Each *devoir* consisted of a number of trades, and sometimes one and the same trade was divided between two *devoirs*. Ceremonies and rites constituted an inseparable part of the *compagnonnages*. The initiation of a new member, the 'recognition' of a newly arrived *compagnon*, the meeting of two traveling *compagnons* on the road, etc., were occasions for strange and complicated ceremonies which had to be accurately performed. These ceremonies were due in a large measure to the secrecy in which the *compagnonnages* developed under the ancient régime, persecuted as they were by the royal authorities, by the church, and by the master-craftsmen. Within the *compagnonnages*, the feeling of corporate exclusiveness and the idea of hierarchical distinctions were strong. The *compagnonnages* did not strive to embrace all members of the same trade or all trades. On the contrary, they were averse to initiating a new trade and it sometimes took decades before a new trade was fully admitted into the organization. While these features harked back to the past, the economic functions of the *compagnonnages* anticipated and really were a primitive form of the latter syndicat. With their simple organization, the *compagnons* were able to exert a strong economic influence. They served as bureaus of employment. One *compagnon*, elected *rouleur*, was charged with the duty of finding employment for *compagnons* and 'aspirants.' He kept a list of those in need of work and placed them in the order of their inscription. Usually the masters themselves addressed the *rouleurs* for workingmen, when in need of any. This fact gave the *compagnonnages* a control over the supply of labor. They could withhold labor from a master who did not comply with their demands. They could direct their members into other towns of the *Tour* if necessary, as everywhere the *compagnons* would find friends and protection. They could, therefore, organize strikes and boycott a master or workshop for long periods of time. In fact, by these methods the *compagnonnages* struggled for higher wages and better conditions of employment as far back as the sixteenth century. During the Great Revolution the *compagnonnages* existed in twenty-seven trades and directed the strike-movement described above. They attained the height of their development during the first quarter of the nineteenth century when they were the only effective workingmen's organizations exerting an influence in the economic struggles of the time. The *compagnonnages* persisted in several trades during the larger part of the nineteenth century. After 1830, however, their influence declined. The new industrial conditions reduced the significance of the personal skill of the workingmen, shifted the boundaries of the ancient trades, and entirely transformed most of them. The rapid development of the modern means of communication made the *tour de France* in its old form an anachronism. The spread of democratic and secular ideas brought the medieval usages and ideas of the *compagnonnages* into disrepute and ridicule. Several attempts to reform the *compagnonnages* and to bring them into harmony with the new conditions of life were made by members of the organization, but with no results."—L. Levine, *Syndicalism in France*, pp. 25-30.

CONCERT OF EUROPE: Meaning of term.—"The Concert of Europe is a name which in modern practice conveniently designates a wholly local and anomalous episode in international politics, and disguises formal irregularities which only necessity has justified. Lord Salisbury thought the name 'somewhat absurd.' In the earlier part of the nineteenth century the current word appears to have been 'system.' Ever since the War of Greek Independence the Great Powers of Europe have endeavoured more or less constantly, and with more or less good results, to restrain the chronic elements of disorder in the Balkan peninsula and the eastern Mediterranean, due to the superposition of a dynasty bound by the law and the traditions of Islam on a mixed population of Christians agreeing in nothing but that name, and at feud with one another no less than with their nominal rulers. The Concert, such as it was, was far from harmonious in the days of Mehemet Ali's revolt, failed to prevent the Crimean War in 1853-4, and the Russo-Turkish War, in 1877, and was impotent to deal with Egypt. That country has come practically under British protection by a series of accidents, makeshifts, and fictions whose outcome, now legitimate by the consent of the Powers, is the despair of legal and political definition. On the other hand the European Concert, in 1807, though unable to prevent war between Greece and Turkey, reduced it to comparatively trifling dimensions [See also TURKEY: 1807-1809]; and, better still, it pacified Crete, with much trouble, indeed, and in a clumsy fashion."—F. Pollock, *Modern law of nations and prevention of war* (Cambridge Modern History, v. 12, p. 728).—The joint action of the leading European powers in dealing with Turkish affairs, between 1806 and 1809, which took the name of "the concert of Europe," was imitated in 1900, when the more troublesome "Far Eastern question" was suddenly sprung upon the world by the "Boxer" rising in China (see BOXER RISING AND THE "OPEN DOOR"; CHINA: 1900. The United States and Japan were then associated in action with the European nations, and the "concert of Europe" was succeeded by a larger "concert of the powers."—See also AIX-LA-CHAPELLE: Conference of (1818); PEACE MOVEMENT: 1815; FRANCE: 1815 (July-November).

Efficacy.—It has become almost a commonplace to sneer at the inefficacy of the Concert (in the form in which it has hitherto existed) as an engine for the maintenance of peace. But there is one very simple test. The Concert is a system peculiar to the nineteenth century. Has this century been more free from war than its predecessors? Undoubtedly it has. . . . The two long intervals of

peace, from 1815 to 1848 and from 1878 to 1914, have been undeniably due in a large degree to the operation of the Concert; and this in spite of the fact that during both periods that Concert has had to struggle against very grave obstacles. During the first period, or at all events from 1822, when the 'august union' broke down, the Concert was handicapped by the division of Europe into two informal but fairly clearly marked groups of Powers, the three reactionary states of the East, Russia, Austria, and Prussia, and the two liberal states of the West, Britain and France. In spite of this division, the Concert was curiously successful in avoiding war, on questions which would almost inevitably have led to war in any earlier period, as on the Belgian question in 1830, or on the Egyptian question in 1840-1. . . . Even in the period of Nationalist wars, the Concert was very active, and not wholly unsuccessful. It found a solution to the Schleswig-Holstein question in 1852, which only broke down because Prussia desired war twelve years later. It strove to avoid the Crimean War, in long conferences and interchanges of notes. It very nearly succeeded (to the despair of the Italian patriot Cavour) in averting the breach between Sardinia and Austria in 1859, which led to the establishment of Italian unity. In 1863 Napoleon III urged in vain that a general European Congress should be summoned, to revise the treaty settlement of 1815, in the hope of avoiding the wars which he saw looming ahead; his project failed partly because the definite Will to War had already become the guiding principle of Prussian policy, partly because other governments considered Napoleon's own policy to be the greatest danger to peace. In 1866, again, Britain, France, and Russia strove to obtain the summons of a Congress in the hope of averting the Austro-Prussian War. The proposal broke down in face of the demand of Austria that the sacredness of the arrangements of 1815 should be assumed at the outset as a fundamental principle. During the third period, from 1878 to 1914, the Concert has worked under exceptional difficulties. For in this period the European Powers were all simultaneously struck by colony-fever, and were all rushing in competition to seize the unoccupied regions of the earth. It is one of the most remarkable achievements of the Concert that the partition of Africa was carried out quite peacefully by mutual agreement at the Conference of Berlin in 1885. Again, in this period the decadence of the Turkish power after its defeat of 1878, and the rise of the small Balkan nationalities, introduced disturbing factors of the most serious kind, especially as the Balkans were the scene of the acute rivalry of two of the great Powers, Austria and Russia. Yet no serious explosion was permitted in this dangerous powder-magazine except the small and brief outbursts of the Bulgar-Serb war of 1884 and the Greco-Turkish war of 1897, and in each case the Concert succeeded in checking the conflagration promptly, and preventing it from spreading, though only by maintaining in existence a very precarious and uncertain state of things. But the gravest difficulty which has faced the Concert during the last quarter of a century has been the formal division of Europe into two hostile armed camps: a division more irreconcilable, more permanently organised, and more alarming than Europe has ever known before. . . . It seemed to destroy all possibility of Concert between the rival groups. Yet this was not so. The members of one of the groups—France and Russia—were quite sincerely desirous of maintaining peace. The members of the other group were quite willing to

maintain peace so long as they were able to get their own way without war, and were even willing to make sacrifices to avoid the outbreak of war at a moment not convenient to themselves. Moreover, one of the six great Powers, Britain, long stood aloof from both combinations (1891-1904), and even when she felt herself driven into a special association with the Franco-Russian group, never committed herself to a formal alliance with them. She was therefore able to exercise a mediating influence, even in the last anxious years which immediately preceded the great adventure of the Central Powers. The Concert has still worked; and has on many occasions averted war when without its action war would assuredly have broken out. In 1905, in 1908, in 1911, in 1912, in 1913, the Concert preserved the peace of Europe amid circumstances of the utmost danger. It would have preserved it again in 1914 but that, on that occasion, one Power had made up its mind for war, and devoted all its ingenuity not to discovering a peaceful solution, but to staving it off, to nullifying the earnest endeavours of the rest, and above all to preventing any meeting of representatives."—R. Muir, *Nationalism and internationalism*, p. 176-181.—"The experiment in the international organization of peace with which we have been concerned failed, it is true, as in the long run it was bound to fail. But it was by no means wasted effort. It preserved peace during the critical years following the fall of Napoleon, and so gave to Western Europe the opportunity for that marvellous industrial and economic development which was to change the face of the world. It did more than this. It set the tradition of that feeling of common interests among nations the growth of which is the strongest factor making for peace. It gave a new sanction to international law, the outgrowth of this feeling, thus making possible the developments that culminated in the Conferences of The Hague which, whatever the disappointments they may have prepared for the world, went a long way towards providing means by which war should be made the exception and not the rule. Last, but not least, it set the precedent for that Concert of Europe to which the world owes more than sometimes, in its more impatient moments, it has been willing to allow. The life of Alexander I of Russia was, to all appearance, a tragic failure. But the wonder is, not that the shadowy world of his ideals collapsed in utter ruin, but that so much of what was noble in it survived and survives."—W. A. Phillips, *Confederation of Europe*, pp. 298-299.—See also BALANCE OF POWER; EUROPE: Modern: Revolutionary movement for self-government; WORLD WAR: Causes: Indirect: c.

CONCORDAT, an agreement, compact or covenant, particularly an agreement entered into between the pope (or a bishop, in former times) on the one part, and a civil government on the other, for the regulation of ecclesiastical affairs concerning both parties. It may also take the form of a "peace treaty" to end a dissension between the Roman Catholic Church and the civil powers of any country. The earliest instrument of this type was that concluded with England in the reign of Henry I. The following are among the principal concordats negotiated by or through the Vatican: Worms, with Germany (1122), later rescinded; with Portugal (1288 and 1516); Vienna (1448), with the emperor; Bologna, with France (1516) [see **FRANCE**: 1515-1518]; with Bohemia (1630), in which the Church, renouncing property that had been alienated in the time of heresy, was compensated for from the revenues derived from the tax on salt. During the 18th century concordats were concluded with Sardinia (1727, 1741, 1742, 1750 and 1770); the duchies of Milan and of Mantua (1757, 1784); Portugal (1778); Poland (1736); Spain (1737, 1753); and the Sicilies (1741).

1515-1801.—Importance of the French concordats.—Francis I to Napoleon.—Concordat of 1801.—"The relations of France with the Holy See, from the time of Francis I., in the sixteenth century down to the period of the French Revolution, when religion was ostensibly wiped out, had been regulated by what is termed a *concordat*. This was an agreement entered into between the Holy See and Francis I., King of France in 1515, by which the religious affairs of that kingdom were regulated in accordance with the wishes of the reigning Pope Leo X. and his successors. It is known in history as the *concordat* of Francis I. Its acceptance by the respective parliaments of France in 1516-1517, which may be said to have been forced by the persistent efforts of the young monarch, was the virtual abolition of the Pragmatic Sanction. It was not accomplished without scenes of great excitement and against the protests of the most eminent ecclesiastics, as well as of the most renowned of the legists and of the statesmen of France. . . . This *concordat* of 1515, virtually established the union of Church and State in France. The King nominated the Bishops; the Holy See, unless there was impediment, sent the bulls within the six months allowed for investigation, and the prelate was consecrated. An era of comparative tranquillity in the religious affairs of France ensued; while the relations of the Church in France with the See of Rome remained cordial, until during the later years of the reign of Louis

XIV., when serious trouble arose between this great monarch and the Holy See; this trouble was such that Rome, insisting upon her prerogatives, refused the bulls for the nominations of Bishops to French sees during eleven years. During this long period thirty-five Cathedrals in France were deprived of Bishops, causing great confusion in the religious affairs of France, which was ended by the submission of the monarch. It was claimed by the advocates of the Pragmatic Sanction that during its supremacy no such disorders in the Church in France occurred. Prelates-elect were consecrated and installed by the Metropolitan and his suffragans without regard to the relations existing with the temporal ruler. The French Revolution succeeded during the last decades of the eighteenth century. In its vortex perished King Louis XVI., the royal family, the members of the nobility, of heredity and of the robe. . . . It was a reign of carnage. The religious fabric of France with its temples, its colleges, its seminaries, convents and monasteries, were wiped out of existence; while four billions of francs, comprising the religious, the educational and the charitable foundations . . . were sequestered . . . and converted into the national wealth. France was widowed of her hierarchy, while 40,000 priests, mostly pastors, were separated from their flocks. Then ensued the initial period of the Republic of France, whose obliteration was sought by the existing monarchical powers of Europe by their combined armies. France organized her defensive legions. . . . Among the young republican officers was Napoleon Bonaparte . . . [who, when] the consular system had, in 1799, become a feature in the government of France. . . . [was made] First Consul, [and] gradually obtained almost absolute control and became the ruler of the French Republic. . . . The young ruler soon saw the necessity for the restoration of religion to the people of France, who had been deprived of an organized church for more than two decades. He was not a man of strong religious proclivities, but he saw the personal advantages which would result, by this restoration, and by the creation of a French hierarchy and priesthood, sanctioned by the Holy See, which he hoped to control to advantage. He accomplished these objects by negotiating the formation of a commission, whose sessions were held under his auspices in Paris, and from whose deliberations resulted the *concordat* of 1801, between the Holy See and the Republic of France."—R. R. Elliott, (*American Catholic Quarterly Review*, July, 1903, pp. 544, 545-547).—"It has already been stated that Bonaparte desired to stand well with the Catholic Church, and had recognised the advantages of a state religion. One of his most important measures during the Consulate was to put an end to the schism which had lasted since the promulgation of the Civil Constitution of the Clergy (q.v.) in 1790, with the assistance of the Pope, Pius VII. All the bishops elected under the Civil Constitution of the Clergy, and most of those who had emigrated, sooner than take the oath of allegiance to it, resigned, and the leaders of both sections were nominated and instituted to different dioceses. A new circumscription of sees was agreed to, and France was divided into fifty bishoprics and ten archbishoprics. It was agreed by the Concordat, which was signed between the Pope and the First Consul on the 15th of July 1801, and solemnly proclaimed [in the Cathedral of Notre Dame at Paris] on the 18th of April 1802, after being sanctioned by the Legislative Body, that the First Consul should nominate all bishops, and the Pope should institute. The government of the Consulate

recognised the Catholic, Apostolic and Roman religion as that of the majority of the French people, and ordained that its public worship should be carried on freely so long as the police regulations were observed. All ecclesiastics were to swear fidelity to the government, which promised to pay a suitable salary to all bishops and curés. In return, the Pope promised that neither he nor his successors would lay any claim to the ecclesiastical estates which had been alienated, and that all such property should be held the indisputable possession of its purchaser."—H. M. Stephens, *Revolutionary Europe*, pp. 229-230.—See also FRANCE: 1801-1804; 1900-1904.

1801-1871.—*Influence in France.*—"By the Concordat, and by the Organic Articles which the First Consul regarded as merely the application of his convention with the Pope, the Central Administration held the French clergy in leash. They were functionaries of the State. The high officials (the Bishops) could virtually be chosen by the State, the Pope merely conferring canonical authority on the elect of the Civil Power; and although the Bishops chose the parish priests, the choice had to be confirmed by the State. The Bishops were obliged to swear obedience and fidelity to the Government, and to promise 'to have no intelligence, to assist at no council, to have nothing to do with any league, either in France or abroad, contrary to the public peace.' Furthermore, they were pledged to inform the central authority if they learned of any scheme concocted to its prejudice. This oath, imposed upon the minor clergy, absorbed them also into the magnificent system of officialdom with which the First Consul thought effectually to police French society. In return for the extraordinary services thus conceded by the Vatican, France agreed to ensure her ecclesiastical agents 'a proper stipend.' The Organic Articles tightened the Church's bond, interdicting all publication of Papal brief or encyclical in France without Government authority; forbidding the Bishops to meet in general assembly; forcing them to obtain Government permission if they desired to leave their dioceses. On the slightest pretext of rebellion the State could bring the Bishops to book and punish them. In a word, it was a state of servility that was in reality an humiliation for the Church, though not honestly regretted by it, since it was a step on the way leading to complete absorption of the civil authority."—M. Fullerton, *Problems of power*, pp. 88, 89.

1801-1887.—*Other European concordats.*—Besides the concordat of 1801 with France, there were the following concordats in the same century: with Sardinia, Bavaria and France (1817), the last not carried out; Sicily (1818, 1834); Prussia, and the Upper Rhine Provinces (1821); Hanover (1824); Belgium (1827); Switzerland (1828, 1845); Russia (1844); Tuscany (1851); Spain (1851, 1859); Austria (1855, 1881); Württemberg (1857), and Baden (1850). In America, Costa Rica and Guatemala (1853); Haiti (1860); Venezuela, Ecuador, Honduras, Nicaragua and San Salvador (1862-1863); and Colombia (1887).

1813.—*Agreement between Napoleon and pope.* See PAPACY: 1808-1814.

1871-1906.—*In French politics.*—"The Concordat, at the outset, put the French Administration on a solid basis. In fact, when the Third Republic was founded the Concordat was the chief trump it held, if not an absolutely necessary condition of success. Republican statesmen knew this, and one after another the Opportunist leaders, from Ferry and Gambetta to Freycinet and Rouvier, rejected

the impolitic proposals of the radicals for abrogation of the Concordat, and the suppression of the Embassy at the Vatican. They were well aware that such a policy would deprive the Government of all police authority over an army of Churchmen to a large extent hostile to Republicanism by definition, and taking their cue from a foreign Power which was always claiming the right to govern. These Republican statesmen felt that to break all ties between the State and the Catholic forces would leave the latter free to follow their natural anti-Republican allegiances, and to continue in the open certain manœuvres they had all along been secretly conducting behind the scenes. Political prudence seemed to the Opportunists, from Ferry to Waldeck-Rousseau, and even to M. Combes, to require the maintenance of the Concordat. In proportion, however, as the work of laying the foundations of the Republic approached completion, the utility of the Concordat for the State became less and less evident. There came a time when the advantages of the pact were largely on the side of the Catholics. It should not be forgotten that, owing to the changed conditions of modern life, most of the guarantees demanded by Napoleon were rapidly ceasing to have any real applicability under the Republic. They were counter-balanced by the new laws of liberty enacted by the Republic, laws benefiting the clergy and the Church as much as the other citizens—the liberty to teach, liberty of the Press, liberty of association—so that, as a matter of fact, in spite of the Concordat, the Church had recovered her territorial power and her political power, and the State was actually in a position of inferiority with regard to her. The State assured the Church a privilege and paid its ministers a living stipend which made it possible for them to use their other resources for political ends. Nothing is more characteristic of the way the Concordat was finally ceasing to be of any positive political utility to the State, than the argument used in a letter written by Mgr. Fuzet, the Archbishop of Rouen, to the senatorial reporter of the Separation Bill, with the purpose of proving that Separation would be a blunder. ‘Do not Republican politicians understand,’ said the Archbishop, ‘that it is to their advantage to keep the religious question always under discussion? For the advanced parties clericalism is not only the enemy, it is their daily bread. It is the big drum used to unite the victorious majorities when division seems impending. Are you going to burst that magic drum? . . . Every good Republican is bound to be in favour of the Concordat. To be in favour of the Concordat is not to be clerical, it is to be far-sighted.’ To the disinterested critic this naïve appeal to the sentiment of middle-class Republican *camaraderie* is of an incomparable humour. Yet it was not wanting in perspicacity. The important thing is that the Concordat had come to this: it had the value of a tom-tom! And yet . . . reflecting Republican statesmen, while fully aware of the fact, still hesitated; and who can wonder? Even M. Combes did not wish to hear of Separation.”—W. M. Fullerton, *Problems of power*, pp. 80-91.

CONCURRENT POWERS.—“What . . . do the rights of a State [in the United States] now include? Every right or power of a Government except:—the right of secession; powers which the Constitution withholds from the States; powers which the Constitution expressly confers on the Federal Government. As respects some powers of

the last class, however, the States may act concurrently with, or in default of action by, the Federal Government.”—J. Bryce, *American Commonwealth* (1914), v. 1, p. 424 (*Revised Edition of 1914*).—“The jurisdiction [of the Supreme Court] is in some matters exclusive, in others concurrent with that of the State courts. Upon these subjects there have arisen many difficult and intricate questions. . . . The State courts cannot be invested by Congress with any jurisdiction, for Congress has no authority over them, and is not permitted by the Constitution to delegate any judicial powers to them. Hence the jurisdiction of a State court, wherever it is concurrent with that of Federal judges, is a jurisdiction which the court possesses of its own right, independent of the Constitution. And in some instances where congressional statutes have purported to impose duties on State courts, the latter have refused to accept and discharge them.”—*Ibid.*, p. 237.

CONDORCET, Marie Jean Antoine Nicholas Caritat, Marquis de (1743-1794), French political economist, mathematician, philosopher and revolutionist. In 1791, secretary of legislative assembly; 1792, president of the assembly; 1792, member of

the Girondist group of the national convention; in 1793, through his criticism of the constitution and of the violence of the Terror, was forced into bidding, was arrested the following year and took his own life. See FRANCE: 1791 (October); 1792 (September-November); HISTORY: 33.

CONDORE, or Kondur, Battle of (1758). See INDIA: 1758-1761.

CONDOTTIERE, in the general meaning of the word, a conductor or leader; applied specially, in Italian history, to the professional military leaders of the thirteenth and fourteenth centuries, who made a business of war very much as a modern contractor makes a business of railroad construction, and who were open to engagement, with the troops at their command, by any prince, or any free city whose offers were satisfactory. "The demand for these bands was so great, and the pay offered so high that during the first half of the fifteenth century there were generally three or four in existence, each of which was numbered by thousands. At first the companies were composed exclusively of foreigners, but before the close of the fourteenth century these had been superseded by Italian bands, led by native *condottieri*. . . . The most famous of the foreign condottieri were the Duke of Guarnieri (the German leader Werner), Fra Moriale, Count Lando and Sir John Hawkwood [leader of the White Company, who was at one time commander-in-chief of the Pisan forces, and later fought for Florence, where he died in 1394]. Among the Italians, the most celebrated were Alberico da Barbiano, Andrea Braccio da Montone, Sforza Attendolo, . . . Francesco Sforza, . . . Federigo d'Urbino, Roberto da Sanseverino, the Duke of Valentino, Giovanni de Medici, and Francesca Maria, duke of Urbino."—F. A. Hyett, *Florence: her history and her art*, p. 152.—Among the fighters for Venice were Carmagnola, Gattamelata, and Bartolomeo Colleoni, whose fame had been commemorated by Verrocchio's statue, which still stands in Venice.—See also ITALY: 1250-1520; MILITARY ORGANIZATION: 15.

CONFERENCE OF GOVERNORS, Washington. See GOVERNORS' CONFERENCE.

CONFESSION.—"Confession is the avowal of one's own sins made to a duly authorized priest for the purpose of obtaining their forgiveness through the power of the keys. Virtual confession is simply the will to confess even where, owing to circumstances, declaration of sin is impossible; actual confession is any action by which the penitent manifests his sin. It may be made in general terms, e. g., by reciting the 'Confiteor,' or it may consist in a more or less detailed statement of one's sins; when the statement is complete, the confession is distinct. Public confession, as made in the hearing of a number of people (e. g., a congregation) differs from private, or secret, confession which is made to the priest alone and is often called auricular, i. e., spoken into the ear of the confessor. . . . How firmly rooted in the Catholic mind is the belief in the efficacy and necessity of confession, appears clearly from the fact that the Sacrament of Penance endures in the Church after the countless attacks to which it has been subjected during the last four centuries. . . . It will not of course be denied that at the beginning of the sixteenth century confession was generally practised throughout the Christian world. The Reformers themselves, notably Calvin, admitted that it had been in existence for three centuries when they attributed its origin to the Fourth Lateran Council (1215). At that time, according to Lea, the necessity of confession 'became a new article of faith' and the canon, *omnis utriusque sexus*, 'is perhaps the most important legislative act in the history of the Church. But as the Council of Trent affirms, 'the Church did not through the Lateran Council prescribe that the faithful of Christ should confess—a thing which it knew to be by Divine right necessary and established—but that the precept of confessing at least once a year should be complied with by all and every one when they reached the age of discretion.' (Sess., XIV, c. 5.) The Lateran edict presupposed the necessity of confession as an article of Catholic belief and laid down a law as to the minimum frequency of confession—at least once a year. . . . Not only was the obligation recognized in the Catholic Church throughout the Middle Ages, but the . . . Greeks held the same belief and still hold it."—E. J. Hanna, *Penance*, (*Catholic encyclopedia*, v. 11, pp. 625-633).—The confession is also used in the high Episcopal churches.

CONFUCIANISM: Origin and principles.—“A reform of this [ancient Chinese] religion was carried out in the sixth century B. C. by *Kong-fu-tse* (Master Kong, Confucius), though he himself did not wish to be regarded as doing anything more than transmit and preserve the doctrine of the Ancients. . . . Kong-tse had a high sense of his calling, and attached great value to purity of morals, though he detested the life of the hermit. Accused without cause of insincerity, he hated all false show, but he was inordinately punctilious about all forms, and perhaps not wholly free from superstition. If he thus appears somewhat narrow-minded, whoever judges him by the age in which he lived and the nation to which he belonged, notes the powerful impression which he made upon friends and foes, and observes, above all, his intercourse with his disciples, will recognise in him a man of rare qualities, endowed with a noble heart and a penetrating spirit. The religious doctrine of Kong-tse is ethical naturalism, founded on the state religion of the Tshow. He engaged in supernatural questions with as much reluctance as in practical affairs, and expressed himself very cautiously and doubtfully on religious points. Even of the heaven he preferred not to speak as a personal being, but he quoted its example as the preserver of order, and he would allude to its commands, ordinances, and purposes. But the actions of men also help to determine their destiny. The doctrine that good and evil are rewarded on earth by prosperity and adversity was firmly maintained by him. To prayer he ascribed no great value. He did not believe in direct revelations, and he regarded forebodings and presentiments simply as warnings. Rather than express an opinion on the nature of spirits and souls, he insisted that they should be worshipped faithfully and the old usages maintained; but he laid the greatest stress on reverence, and urged that the spirits should not be served in barbarous fashion, and that, in times of scarcity, for instance, honour should not be paid to the dead at the expense of the living. . . . Kong-tse devoted much attention to religious literature. He studied zealously the *Yi-king*, an obscure book of magic. The *Shu-king*, an historical work, was perhaps recast by himself, it is certainly written in his spirit. The *Shi-king* is a collection of songs chosen by him out of a large number, from which all mythological expressions have probably been eliminated. The *Li-ki*, a ritual work, was enlarged by him. These books, with the addition of a chronicle written entirely by him, entitled *Tshün tsiew*, and not of a religious nature, constitute the five *Kings*, regarded by the followers of Kong-fu-tse as the canonical books. In the *Lün-Yü* ('Arranged Conversations'); Legge, 'Analects') the remarkable utterances of the Master addressed to his followers were collected by his disciples' disciples. Others attempted in the *Ta-hio* ('the Great Instruction'; Legge, 'the Great Learning') and the *Tshung-yung*

('The Doctrine of the Mean') to supply a philosophical basis for his doctrine. These works form three of the four *Shu*, or classical books. The fourth, comprising the works of the sage Meng-tse, was added to the collection at a much later period. . . . Immediately after Kong-tse's death, a temple was erected to him by the Prince of Lu, and his worship, though not yet recognised on the part of the Government, at first increased. Towards the commencement of the fourth century B. C., during the serious disturbances which led to the fall of the Tshow dynasty, new doctrines of all kinds arose. These threatened to undermine the authority of the Master. This tendency was resisted with great emphasis by the learned Meng-tse (Mencius, 371-288 B. C.). In his teaching, which was principally political and moral, or, more accurately, perhaps, anthropological, the religious element retires still further into the background than in that of Kong-tse. Less modest and disinterested, he

CONFUCIUS

was more independent in character, and a more powerful reasoner. By his instruction and writings he acquired great influence, triumphing over all the opponents of Kong-tse, who was in his eyes the most eminent of men. It is probably owing to his labours that even the great persecution under the Ts'in dynasty (212 B. C.), and the favour displayed by some emperors of the Han dynasty (after 201 B. C.) towards the followers of Lao-tse, did not succeed in eradicating Confucianism. From the year 57 of our era the worship of Kong-tse by the side of Tshow was practised by the emperors themselves as well as in all the schools; and since the seventh century Kong-tse has been worshipped alone. For the great majority of the Chinese he is the ideal of humanity, which even the adherents of other systems may not despise.—C. P. Tiele, *Outlines of the history of religion to the spread of the universal religions*, pp. 30-33.—See also CHINA: Religions of the people.

Ethics.—“In the ethics of Confucius filial piety is, as it has been in China in all ages, the cardinal virtue. The son who loves, respects, and obeys his father, anticipating his wishes while he lives and regarding them when he is dead, will make a kind brother, a sincere friend, and a loyal subject; men

who are filial and fraternal seldom offend against their superiors. Beyond the 'five relations' [ruler and subject, husband and wife, father and son, elder brothers and younger, and friends] of the family and the state are the relations of men to their fellows in society, and these are to be ruled by the same principle. Filial piety and fraternal love are the root of benevolence, which Confucius defined as love to all men. The one word 'reciprocity' may serve as a rule of practice for a man's whole life: 'What you do not want done to yourself do not do to others.' Benevolence must not, however, transgress the limits of equity. When asked what he would say about the principle denounced by his older contemporary, Lao-tse, that injury should be requited with kindness, Confucius's characteristic answer was: 'With what, then, will you requite kindness? Requite injury with justice, and kindness with kindness.' Men should deal with one another as Heaven deals with men, according

achieve this it is necessary to have not only the steadfast will but the true ideal. It is the end of education to set forth this ideal and inspire men to strive after it. Accordingly, the burden of Confucius's teaching is the character of the 'superior man'—the man who in every situation knows the right thing and does it, a man not only of faultless virtues, but of faultless propriety."—G. F. Moore, *History of religions*, v. 1, pp. 35-37.

Later developments.—"From the tenth to the thirteenth century, mainly under the dynasty of the Sung emperors, China passed through the phase of the Confucian Renaissance. To those times the return to the teachings of the Sages was not only a renewal of moral enthusiasm—it was a cleansing and cooling draught much needed to clear away the intoxicating vapours of alchemy and mystical superstition, of mummery and imposture. It was altogether a manlier thing. China had passed out of her childhood; and in politics, in social organiza-

TEMPLE ERECTED TO THE MEMORY OF CONFUCIUS AT TAI SHAN IN SHANTUNG

to their deserts. If the duty of blood vengeance for the murder of a father or mother devolve upon a son, he should sleep on straw, with his shield for a pillow and his weapon at hand, 'he must be determined not to live with the slayer under the same heaven.' A fundamental doctrine of the Confucian ethics is that the nature of man is good. In the *Shu-king*, T'ang says: 'The Most High Lord has conferred even on the inferior people a moral sense, by obeying which they obtain a nature constantly right.' 'Heaven, in giving birth to the multitudes of the people, annexed to every faculty and relationship its law. The people possess this normal nature, and they consequently love its normal virtue.' In this respect all men are similarly endowed. Hence if men do wrong, they cannot lay the responsibility on the nature which Heaven has given them. But though all are good at the beginning, few prove themselves to be so at the end. Through parental neglect to inculcate filial piety, through faulty education and bad example, the most deteriorate, and by habit unrighteousness becomes second nature. The good nature bestowed by Heaven must be developed into a stable good character by man's own effort. To

tion, in literature, in art, and in religion seemed determined to put away childish things. The old literature, so pure and stately, so confidently manly, so free from all juggling with supernatural and unknowable things, was studied and commented upon anew, erected into a system by which all life was henceforth to be guided, at least among the educated, ruling section of Chinese society. Yet the new, mature Confucianism that emerged—that, for instance, which we find in the writings of Chu Hsi (1140-1200), the greatest of the Sung schoolmen, whose commentaries later ages have learnt by heart as almost of equal authority with the classic texts themselves—is not altogether the old. Just as Confucius himself had dreamed that he was merely a transmitter, so they, to whom Confucius and Mencius were patriarchs of a remote and hoary antiquity, no doubt regarded themselves only as restorers and explainers of an older and purer teaching. But in fact they altered it. Not consciously or intentionally, but inevitably. They insisted on seeing system where there had been no system. . . . The Confucian Renaissance was a great and memorable stage in the moral and intellectual development of mankind. It rep-

resented a gigantic stride towards reason, towards the substitution of peaceful suasion for the rule of brute force in the world, towards freedom of thought, towards the awakening and enlightenment of men's minds. It democratized all Chinese society almost from top to bottom. It made men—scores of millions of men—familiar with the conception that government must be lawful and attentive to intelligent public opinion; that power is the rightful inheritance not of force, or of birth, or rank, or of wealth, but of talent and merit openly proved by public competition, of moral worth and of individual capacity in whatever rank of society they might be found.”—W. J. Clennell, *Historical development of religion in China*, pp. 131, 147.

tory States. This excited the jealousy of the other feudal Princes, and induced the Duke of the State of Ch'i to use a stratagem to bring about the downfall of this exemplary Prime Minister. He sent as a present to the Duke of Lu eighty beautiful concubines and one hundred and twenty-five horses. Upon the receipt of this gift, the Duke of Lu gave himself up to a life of pleasure and sensual indulgence, and began to neglect his affairs of State. Confucius, after waiting a time, at last realized that his influence for good was at an end, and accordingly determined to leave the State and to seek for some other ruler who would put his teaching into practice. For a space of twelve years he wandered from State to State. He was treated by most of the feudal Princes with great discourtesy, and at times even his life was in danger. At last he returned to the State of Lu, and there spent the remainder of his days engaged in literary work. He refused to take office again and devoted his time to the editing

Confucianism and Taoism.—J. Legge, *Life and teachings of Confucius*.

CONFUCIUS.—Confucius was born B. C. 550 or 551 “in the feudal State of Lu, situated in the Southern part of the modern Province of Shantung. As a youth he was of a serious disposition and his mind was bent on learning. He set himself the task of collecting all the information possible in regard to the Ancient Worthies, and taught that what was necessary to restore peace and order was for the rulers to imitate the examples of the Emperors Yao and Shun. At the age of twenty-two he gathered about him a band of disciples, and spent his time in instructing them in the principles of morality and good government. At the age of fifty he was employed by the Duke of Lu as keeper of the public granaries, and shortly afterward was put in charge of all the public lands. He acquitted himself so well in the performance of these duties that he was promoted to be Minister of Justice, and finally was made Prime Minister. While he occupied this last office, the State of Lu was exceedingly prosperous and became one of the most powerful of the feuda-

of the ancient classics. He died in B. C. 480. It was only after his death that people turned to him as to a great teacher of mankind, and nearly three centuries elapsed before he was raised to the supreme position of honor and reverence he now occupies in the minds of his countrymen.”—F. L. H. Pott, *Sketch of Chinese history*, pp. 28-29. —See also CONFUCIANISM; CHINA: Origin of the people; CHINESE LITERATURE: Confucius the founder; MENCIUS.

CONGO RIVER, Central Africa, in respect to its basin, the second largest river in the world (after the Amazon), has an estimated length of 3,000 miles and drains an area of roughly 1,600,000 square miles. The native name of the river is Dzairé (dza-ee'reh); it has its reservoir in Lake Bangweulu, into which flow numerous streams; the largest of these feeders is the Chambezi. From Bangweulu the great river issues under the name of the Luapula. Running in a northerly direction, it expands into Lake Moero; thence to Nyangwe it is called the Lualaba. From Nyangwe to Stanley Falls, Sir H. M. Stanley named it the Livingstone; and from Stanley Falls to the mouth on the Atlantic Ocean it is known as the Congo. The river was discovered by the Portuguese naval officer Diego Cano (or Cão), in 1482, who gave it the name of "the Poderoso," or "the Mighty." An English expedition explored the entrance in 1816; this was followed by Livingstone's exploration in 1867-1871.—See also AFRICA: Geographic description; BELGIAN CONGO: 1876-1890.

CONGREGATIONAL CHURCH: Definition.

—"Congregationalism is that system of church government in which the Scriptures are recognized as the only infallible guide respecting church order and discipline;—and which maintains, that according to the Scriptures, a Church is a company or congregation of professed Christians, who, having voluntarily covenanted and associated together to worship God and to celebrate religious ordinances, are authorized to elect necessary officers, to discipline offending members, and to act authoritatively and conclusively on all appropriate business, independently of the control of any person or persons whatsoever."—G. Punchard, *View of Congregationalism, its principles and doctrines*, pt. 1, p. 17.

Origin and early growth.—"The Reformation in England developed along three lines: Anglicanism, Puritanism and Separatism. The Anglicans held to the old English Church, minus the papacy and the distinctively papal features. The Puritans, including the Presbyterians and some Anglicans, held to a National Church, but called for a thoroughgoing reformation. . . . They believed, however, that they should remain within the church, and thus secure its reformation. The Separatists held that the whole system of the Establishment was an anti-Christian imitation of the true Church and could not be reformed and that the only proper thing for a Christian to do was to withdraw himself from it. Such sentiments could scarcely be tolerated in that age especially after the Act of Uniformity passed in 1559, the year after the accession of Queen Elizabeth to the throne, and church after church which professed them was broken up. One pastor, Robert Browne, with his congregation emigrated to Holland in 1581. . . . The movement however could not be suppressed and in 1604 (the first year in the reign of James I), the man [John Robinson] to whose influence is chiefly due the development of Separatism into Congregationalism, came to a little congregation already organized at Scrooby. . . . With a number of friends and followers he went first to Amsterdam and then to Leyden. Here they met with a friendly reception, . . . but after a few years, decided to remove to America where

they could practice their religion unmolested and at the same time live and rear their children as Englishmen. After many delays and discouragements, the first band of Pilgrim Separatists, 102 persons, under the leadership of Brewster, Bradford and Winslow, landed at Plymouth, Mass., in 1620 and founded there the first Congregational church upon American soil, Robinson remaining in Leyden. They were followed after a few years by the Puritans of Massachusetts Bay. So long as they were in England the differences between the two bodies were accentuated, but after they arrived in America, the many points on which they agreed became more apparent and the essential elements of both Separatism and Puritanism were combined in Congregationalism."—United States Census, *Religious bodies*, 1916, pt. II, pp. 233-234.—"Out of the heart of Puritanism Congregationalism came. In times of reform men go to different lengths. How far a man will go depends on his temper, education, insight, and the combination of faculties. Some men by the momentum of hereditary forces must be radicals, others must be conservatives. The men of the sixteenth century who started out to reform the Church stopped at different points, . . . each one more radical than the one which preceded it. First came what we may call the Episcopal revolt. There were Englishmen who were devoted to the English Church and who loved its polity and forms of administration, but who wished to purge it of its corruptions and to cut it loose from some of the usages and traditions with which the Church of Rome had bound it. These men clung to the sacraments, the creeds, the episcopacy, and the general structure of an established national church. . . . But other Englishmen went farther. . . . There were men who were not content with simply cutting off the pope; they insisted that the bishops must go too. . . . The bishops should be driven out and the ecclesiastical authority be placed in the hands of a body of presbyters, part of them clergymen. . . . [And these] Christians who preferred to be ruled by presbyters became known as Presbyterians. . . . But there were Englishmen not so conservative as Thomas Cartwright. They were afraid of ruling elders no less than of bishops, and claimed that . . . supreme authority in the Church should lie in the hands of the people. . . . These radicals were known as Separatists and were hated of all men. . . . John Robinson was one of the bravest and brainiest of these Separatists. He was the pastor of the church a portion of whose members landed at last on Plymouth Rock. But to certain Englishmen John Robinson was a conservative. There were men who insisted on going farther. . . . These radicals became known as Quakers, and George Fox stands in history as their father. . . . But it is the Separatists with whom we are just now concerned. They did not agree among themselves and divided into two bands, the first calling themselves Baptists, the second becoming known as Independents."—C. E. Jefferson, *Congregationalism*, pp. 17-21.

1604-1688.—Early history in Great Britain and Ireland.—"For a time after the emigration to America, "theories of religious freedom were still vague and contradictory. Many Congregationalists then advocated a liberty including only Christians, and Congregationalism was not regarded as inconsistent with a State Church. . . . After the restoration of Charles II (1660) the State Church regained supremacy and resumed its attitude of severity toward dissenters. On August 24, 1662, all clergymen refusing the new Act of Uniformity . . . were ejected. They numbered over two thousand. Most

were Presbyterians but many were Congregationalists. Congregationalism then was severed from the State Church finally and remained under the ban for a quarter-century. But after the revolution of 1688 the Act of Toleration allowed the revival of both Congregationalism and Presbyterianism."—*New Schaff-Herzog religious encyclopedia*, v. 3 (1905), p. 232.

1620-1650.—Growth of numbers in New England and on Long Island.—The first band of religious settlers was soon followed by others. By 1630, the Plymouth colony numbered 300, and "before the close of the first half of [the seventeenth] century there were in New England 51 Congregational churches, besides two or three on Long Island and one in Virginia."—H. K. Carroll, *Religious forces of the United States*, p. 119.

1631-1833.—Established church in the colonies. —Support of congregations.—"In New England for many years Congregationalism was the established religion. In the colonies of New Haven and Massachusetts membership in a Congregational church was [until 1664 and 1665 respectively] a condition of the exercise of the political franchise, and the churches in most of New England were supported by monies raised in the tax levies. In course of time this system was modified so as to allow persons to contribute to whatever church they preferred. It was formally abolished in Connecticut in 1816, and in Massachusetts in 1833."—H. K. Carroll, *Religious forces of the United States*, p. 123.

1646-1883.—Doctrinal development in United States.—Westminster confession.—Savoy confession.—Congregational confession of 1883.—"The early Congregational churches were not averse to Presbyterianism on doctrinal grounds. Congregationalists and Presbyterians were in substantial agreement, the Westminster Confession serving acceptably as the doctrinal symbol of both for many years. It was adopted by the Congregationalists at a general synod at Cambridge, Mass., in 1646-48. The Savoy Confession of Faith, which is similar to that of Westminster, was adopted by local synods in 1680 and in 1708, and a national council held in 1865, in Boston, Mass., expressed its adherence to the faith 'substantially embodied' in these two confessions, and adopted a declaration, known as the 'Burial Hill Declaration,' affirming the general unity of the church of Christ in all the world, and setting forth the 'fundamental truths in which all Christians should agree,' as a basis of general co-operation and fellowship. In 1871 a National Triennial Council was held in Oberlin, O. . . . In 1883 a commission appointed by the national council formulated a confession, consisting of twelve articles. It is of a general evangelical character."—H. R. Carroll, *Religious forces of the United States*, pp. 120, 121.

1734-1800.—"Great awakening."—Influence of congregationalism in the American Revolution.—"The Congregationalists took the initiative in the remarkable revival known as 'the Great Awakening,' which was started in 1734 by the preaching of Jonathan Edwards. They had a prominent share in the political discussions preceding the Revolution, in its inception and conduct, and in the subsequent national development."—*Ibid.*, p. 119.

1795-1831.—Growth in Great Britain and Ireland.—In British colonies and dominions.—"During the nineteenth century English Congregational churches increased rapidly in number and their importance became conspicuous. . . . In 1831 they formed the Congregational Union of England and Wales. . . . The Congregational

Union of Scotland dates from 1812 and that of Ireland from 1829. . . . The London Missionary Society was organized 1795. . . . Congregational churches in the various British colonies are numerous. . . . The Canadian churches maintain cordial relations with those of the United States, but are counted as British rather than American."—*New Schaff-Herzog religious encyclopedia*, v. 3 (1905), p. 233.

1800-1916.—Missionary union with Presbyterian Church.—Abrogation of union.—Subsequent growth of churches.—In the first year of the nineteenth century "the Congregationalists of Connecticut were entering into a compact with the Presbyterian Church which resulted in crippling and almost destroying the growth of Congregationalism in the Middle and Western States for half a century. . . . In 1800 . . . when [Jonathan Edwards the younger] was attending the Connecticut General Association as a delegate of the Presbyterian General Assembly, the question was raised, probably by him, of the union of the two denominations in their missionary work. Edwards was appointed on a committee to prepare a report on the subject. As a result, the Connecticut General Association appointed a committee to consider measures 'to establish, as far as possible, an uniform system of church government' for Presbyterians and Congregationalists in the new settlements. The next year in May the General Assembly appointed a committee for the same purpose, with President Edwards as chairman, and its report was by the same assembly adopted. The next month it was also adopted by the Connecticut General Association. This report was the Plan of Union. . . . There can be no question as to the honesty of either party in entering into this agreement. Its apparent fairness also to both must be conceded. It provided that a Congregational church with a Presbyterian pastor and a Presbyterian church with a Congregational pastor should each retain its own polity, while the pastor, if he came into discipline, should be tried by the body to which he belonged; or if both parties could not agree to this, by a mutual council composed of an equal number from both denominations. . . . It seems to have been demonstrated also that important advantages resulted from this plan in the early years of its working. The Christian families in Western New York and Ohio included both Congregationalists from New England and Presbyterians from Pennsylvania. Each preferred its own polity. But they were too few to sustain each a separate church in the same settlement. . . . [The result was, however, that] Presbyterianism came to be the dominant order both in New York and in the Western Reserve. . . . In 1861 the separation between the two denominations in home missionary work was consummated. . . . In response to an invitation from the General Association of New York the first general meeting of the Congregationalists of the United States since the Cambridge synod of 1648 was held at Albany, beginning October 5, 1852. By that convention the Plan of Union was declared at an end."—A. E. Dunning, *Congregationalists in America*, pp. 318, 320-323, 325, 332-333.—"Since the abrogation of the plan of union the growth of Congregational churches in the West [has been quite rapid], particularly in Illinois and the yet newer States of the Northwest, [where for a time a plan of union similar to that of 1801 was in force]. . . . Their antislavery record entirely shut them out of the States of the South until after the Civil War. Their numbers in that section are still limited and include a good proportion of colored members, to

whose education they have been much devoted."—H. K. Carroll, *Religious forces of the United States*, p. 120.

1810-1913.—Missionary activities in United States.—"The missionary movement . . . with which the Congregational churches, as a whole, were first [and are now] identified was that which culminated in the organization of the American Board of Commissioners for Foreign Missions in 1810. . . . The home missionary work is carried on chiefly by four societies. . . . [Of the National Councils], that held at Kansas City, Mo., in 1913 was particularly important as marking the definite recognition of the Congregational Churches as an organized religious body with specific purposes . . . set forth in what has been known as a Congregational platform. . . . This platform did not in any respect modify the essential autonomy of the individual church in its expression of faith or its method of action. It did, however, associate more fully than had been done at any previous time these individual churches in what may be termed an organic unity based upon a fundamental union in faith, common purpose in action and mutual fellowship. . . . Congregationalists have been prominent in the organization and development of the Federal Council of Churches of Christ in America."—United States Census, *Religious bodies*, 1916, pt. II, pp. 234-238.

1891-1920.—Councils.—Tercentenary program.—**Statistics.**—Recent events of Congregational history include the holding of International Congregational Councils, the earliest in London in 1891, and the latest in Boston in 1920; the formulation of the Tercentenary Program in the United States in 1916; the launching of the Pilgrim Memorial Fund of \$5,000,000 to provide old age ministerial pensions in 1917; and co-operation with the Interchurch World Movement of America in 1919-1920. Statistics available in 1920 report 5,867 church organizations and 791,274 members in the United States. (United States Census, *Religious bodies*, 1916, pt. 2, p. 240.) "In France the McAll Missions are practically Congregational, and, apart from missions, a few churches exist in Germany, Hungary, Poland, Norway, Switzerland and Portugal. In Holland the Band van Vrije Christelijke Gemeenten numbers sixteen churches and in Sweden there are more than a thousand free churches with more than 100,000 members."—*New Schaff-Herzog religious encyclopaedia*, v. 3, (1905), p. 233.—"There are 4,089 churches and mission stations and 489 members in the British Isles; and 1,563,834 members in the world."—*New Hazell annual and almanack*, 1920, p. 318.—See also **INDEPENDENTS**.

CONGREGATIONS, Roman Catholic, committees of cardinals responsible for the administration of the various departments of the church. (See **CURIA, PAPAL**.) The word congregation originally denoted the whole body of religious living in a monastery, but later, monasteries rather than individuals, made a unit, and a family of monasteries formed a congregation. It denotes a branch or subdivision of an order grouped under a special government and discipline, such as the

Trappists or the monks of Cluny and St. Maur. There are two kinds of congregations divided according to their quality, i. e., religious or pious. The religious, principally priests and clerics and dependent on the Holy See, receive a decree from Rome in which commendation is bestowed upon the congregation itself, rather than on the intention of the founder. The pious, or lay congregation, whose members are not in Holy Orders, and free to leave at will, are dependent on the bishop. With the consent of Rome, the bishop may authorize the institute, respecting all things decreed by the Holy See. Of these latter are the congregations of Lazarists, Oblates, Oratory, and others. **Lazarists**, or "Priests of the Mission." See **LAZARISTS**.

Oblates, or Missionary Oblates. See **OBLATES**.
Oratory. See **ORATORY, CONGREGATION OF THE SACRED**. See **VATICAN**: Present-day papal administration.

CONGRESS, assembly of rulers or of their delegates, met together to discuss and consider questions of common interest. The following is a list of some of the most important international congresses:

- Aix-la-Chapelle (1748).** See **AIX-LA-CHAPELLE**: Congresses: 2.
- Airas (1435).** See **FRANCE**: 1431-1453.
- Berlin (1878).** See **TURKEY**: 1878.
- Berlin (1884-1885).** See **BERLIN ACT**.
- Constantinople (1876-1877).** See **TURKEY**: 1861-1877.
- Erfurt (1808).** See **FRANCE**: 1808 (September-October).
- Hague (1899; 1907).** See **HAGUE CONFERENCES**.
- Karlsbad, or Carlsbad (1819).** See **GERMANY**: 1814-1820.
- Laibach, or Laybach (1821).** See **VERONA, CONGRESS OF**.

CONGRESS OF THE UNITED STATES

Function.—"Congress is the law-making department of the government, and this function, in a government which is theoretically one of law, entitles it to preëminence under our system. It is the established organ by which the people are supposed to declare the policies that are to govern them. Congress, however, is itself subject to the higher law set forth in the Constitution. When it attempts to go outside of that instrument and pass legislation which is unauthorized or prohibited by its terms, it attempts to make our government not one of law, but in defiance of law, and such unauthorized or prohibited action is legally entitled to no greater authority than would be the same action taken by any mob in the streets. In such a case it is the function of the judiciary to protect the individual from the harmful effect of the usurpation of power and to declare it null and void. The supreme and sole legislative authority of the nation is vested in the Congress. The people, directly through their representatives and indirectly through senators, chosen through the instrumentality of state legislatures, make the laws; the judiciary interprets them, and the President executes them. This in brief is the mechanism of our government. The chief cause of the Revolution, which in due time resulted in our Constitution, was the passage of laws, and especially of taxation laws, by a legislature in which the people of the colonies were unrepresented. Our fathers had perhaps an exaggerated notion of the importance of representation in a parliamentary body. It may be due to this circumstance that the first government established by them contained but a single department and was wholly the government of a Congress. The prime faults of that government did not grow out of its method of expression, but were due to the fact that it was a fundamentally weak government, possessing few really important powers. The Articles of Confederation did not confer sufficient authority upon the central government and left it at the mercy of the discordant policies of the States. The Constitution remedied this defect by endowing the central government with definite and important powers, and made it supreme within its sphere over the state agencies. But unless we are to suppose that the architects of the Constitution wasted their efforts upon side issues, they clearly designed a government of which the great central department was the Congress. That is the first department set forth in the Constitution. Three-

fourths of that instrument is taken up with defining the composition of Congress, enumerating its powers, and establishing restraints upon its action. Aside from the greater certainty and the greater extent of the grant of powers to the central government and the creation of a constitutional court, the important difference between the Articles of the Confederation and the Constitution is found in the circumstance that the latter established an executive separate and apart from the law-making authority, except with a limited power of veto. As the legislative power was by the first article vested in Congress subject to the veto, so by the second article the executive power was vested in the President. But even the executive functions are to an extent divided. Congress may by law vest the appointment of such inferior officers, as it may deem proper, in some other agency than the President. This provision of the Constitution could be made to cover the vastly greater number of executive offices. Very important functions are exercised by the President only by and with the advice and consent of the Senate. Congress wields the legislative sovereignty of the nation, and from the very nature of that function, and with the important powers also exercised separately by the two Houses, it becomes, as the courts have termed it, the political department of the government."—S. W. McCall, *Business of Congress*, pp. 3-5.

Qualifications of Representatives and Senators.—**Method of election.**—"The qualifications of a member of the House are that he shall have been seven years a citizen of the United States, shall be twenty-five years of age, and an inhabitant of the State in which he is chosen. A Senator must have been for nine years a citizen of the United States, be thirty years of age, and an inhabitant of the State for which he is chosen. Section 3 of the Fourteenth Amendment to the Constitution provides that no person shall be a Senator or Representative in Congress who, having, as a member of Congress, or as a legislative, executive, or judicial officer of a State, taken an oath to support the Constitution of the United States, afterward engaged in insurrection or rebellion against the same or gave aid or comfort to the enemies thereof. 'But Congress may, by a two-thirds vote of each House, remove such disability.' The Constitution provides for apportioning the members of the House to the States, but it does not prescribe the qualifications of the persons who may vote in the States for such members—further than to say

that they 'shall have the qualifications requisite for electors of the most numerous branch of the State Legislature,' and by the Fifteenth Amendment, that the right to vote shall not be denied nor abridged on account of race, color, or previous condition of servitude [nor on account of sex]. The States, of course, determine who shall be permitted to vote for members of the popular branches of the State Legislatures, and by the same act they determine who shall be permitted to vote for members of the National House of Representatives. . . . The Constitution also gives to the States the power to prescribe 'the times, places, and manner of holding elections for Senators and Representatives,' but reserves to Congress the right to 'make or alter such regulations. . . . The Congress may leave all these matters to the respective State Legislatures, or it may take them all into its own hands. . . . Congress has full power to regulate all other matters connected with the election of Senators and Representatives. It may declare that members of the House shall be elected 'at large' in the States—that is, that the whole number assigned to a State shall be voted for by all the voters of the State; or it may divide the States into districts and provide for the election of one member for each district. It may provide separate ballot-boxes and National election officers and canvassing boards. But all of these powers have not been exercised by Congress and for the most part the States have been allowed to regulate the manner of choosing Representatives. The United States has, however, taken some supervision of the election of the members of the National Congress. . . . As to the election of members of the House of Representatives Congress has fixed the time—the Tuesday after the first Monday in November in each second year; has enacted that the members shall be elected from single districts—that is, one member from a district; that these districts shall be composed of contiguous territory and contain as nearly as practicable an equal number of inhabitants; that when an additional member is given to a State he shall be elected from the State at large until the Legislature redistricts the State; and that all votes shall be by written or printed ballots. Article 26 of the Revised Statutes, made up of Acts passed by Congress from 1865 to 1872, contains elaborate provisions for regulating the election of Representatives in Congress. Provision was made for supervising such elections by supervisors to be appointed by the United States Courts, and for securing a free ballot and the peace at the polls by the presence of special deputy marshals. A number of crimes against the ballot were defined and penalties allotted. These provisions were repealed in 1894. It would not be appropriate here to discuss the wisdom of such laws. Generally they were clearly within the Constitutional powers of Congress, and the question is, therefore, one of expediency. If the States provide equal and fair election laws, and these are fairly and firmly enforced, so that each legal voter can deposit his ballot freely and have it counted honestly, there is no call for the enactment of Federal election laws. But it should not be forgotten that members of the House of Representatives and Senators are National, not State, officers, and that the States have no inherent or exclusive right to regulate the election of such officers. Election offences committed at an election for members of the National House are National offences—they injure the people of all the States. It is greatly to be hoped, and much to be preferred, that the States will so vigorously and so righteously regulate these elections that there

may be no need for the United States to resume its Constitutional powers. But, as Mr. Story says, 'Nothing can be more evident than that an exclusive power in the State Legislatures to regulate elections for the National Government would leave the existence of the Union entirely at their mercy.'—B. Harrison, *This country of ours*, pp. 26-31.—"In the convention of 1787 there was great diversity of opinion concerning the apportionment and method of choice of representatives, but only slight opposition to the method prescribed for the choice of senators. Four plans were offered: (1) election by state legislatures, (2) election by the lower House of Congress, (3) appointment by the president, (4) election by the people. These last two proposals received scant support, Gouverneur Morris being the only supporter of the appointment plan, and James Wilson voting alone for election by the people. In fact, Wilson's scheme was entirely out of harmony with the temper of the convention. The demand was not how to get more popular control, democracy,—or, as it appeared to most of the convention, mob rule,—but how to prevent this. As Roger Sherman said, the endeavor was 'that the people immediately should have as little to do as may be about the government.' The plan for an election of the upper chamber by the lower was defeated by a vote of seven states to three, and it was provided that the legislatures of the states should be charged with the function of electing the senators. The advantages hoped for were four: (1) it was asserted that such election would produce a higher grade of senators; (2) it would give more effective representation, and the senator elected by the whole legislature would feel himself less the representative of a class or factional interest than of the entire state; (3) such indirect election, it was hoped, would serve to check any evils which might arise from a House of Representatives elected directly by the people; (4) finally, the election of senators to the national government would bring that government and the state government into contact, and each would have an interest in supporting the other. Although Congress was given power to make regulations concerning the time and manner of the elections of senators,—but not concerning the place, for that would involve determining the meeting-place of the state legislature.—no law was passed under this permission until 1866. By this act each House of the state legislature voted separately, and if the same candidate should receive the majority in both Houses, he should be declared elected; but if not, the Houses should meet in joint session at twelve o'clock each day and continue to ballot until some candidate should receive a majority of the votes. The operation of this law can hardly be said to have been satisfactory. Deadlocks, bribery, and corruption of the legislature, vacancies in the representation of the states, confusion of national and state business, and an interference with the legitimate business of the state legislatures have been some of the unfortunate results. Although there have been some flagrant cases of misrepresentation and a few cases of notoriously bad senators, the system has produced a dignified, able, and efficient body, which has often been wiser and more farseeing than the House of Representatives. In 1826, forty years before the passage of the law regulating the election of senators, the agitation for the direct election of senators was begun. Not until the close of the Civil War did the agitation become marked, nor did it seriously affect Congress until 1893, but in the next nine years five resolutions passed the House in every Congress, except one, asking for a constitutional amendment

providing for the direct election of senators. Outside of Congress the national parties were taking up the question, and in 1892 and 1896 it was favored by the People's party and in 1900 by the Democratic party; while in 1908, although not in the Republican platform, it received the indorsement of Mr. Taft. Various states, however, refused to wait for such action and, by means of the direct primary, nominated candidates for the Senate whom it was expected the legislature would elect. This was only indicative of popular opinion within the party, and at best could only be morally binding upon the legislature. Oregon and Nebraska, however, went further and, after the primaries for the senatorial candidates, voted on these at the regular state elections, the successful candidate being known as the 'People's Choice.' Candidates for state legislatures were given an opportunity on the official ballot to indicate whether they would support the People's Choice, irrespective of party. As a result, in 1908 the People's Choice, Mr. Chamberlain, a Democrat, was elected by a Republican legislature. The presence of senators, elected in a semi-popular manner, together with the increased popular demand, finally forced the Senate to action, and in 1912 it adopted an amendment to the Constitution, which was submitted to the states and declared in force May 31, 1913. By this amendment senators are to be elected by the people of the states having the qualifications for electors of the most numerous branch of the state legislatures."—E. Kimball, *National government of the United States*, pp. 304-307.—See also CIVIL SERVICE REFORM: United States: 1901.

SENATE

Procedure.—"The individual freedom is retained to a great degree by the rules of the Senate, and in practice it has an admirable procedure, not unlike that of a board of directors, where things are done in an orderly manner, but not according to technicalities. The small size of the body is a most important factor in bringing about this condition of affairs. As legislative bodies increase in size, it becomes necessary, as in the case of increasing populations, to impose greater restraints upon individual action; and the ordinary course of business which might be followed in a body of limited numbers would become impossible of application in a larger assembly. The greater length of the senatorial term, which is six years, as compared with that of two years in the case of a member of the House, probably also contributes in a measure to make the procedure of the Senate what it is. In some cases the necessity of making a record on a very short term might lead to an insistence on the part of the member which would not be shown if he had a much longer period in which to produce results. . . . The traditional dignity of the Senate, which is usually respected by its members, but sometimes notably infringed upon, also has an influence in determining its practice. It is rare that there is a parliamentary tangle in the Senate, and the off-hand decision of the presiding officer is usually placidly accepted as the rule of procedure. It affords little field, therefore, for discourse that cannot easily be solved simply by reading its rules."—S. M. McCall, *Business of congress*, pp. 30-31.

Committees.—"The Committees of the Senate are appointed by the Senate itself upon the nomination of a committee of Senators made up from both parties. They generally exercise an authority corresponding to that of the House Committees. The Committee on Finance of the Senate, which

corresponds to the Ways and Means Committee of the House, has the jurisdiction of the latter committee and also generally a jurisdiction over financial matters. The Committee on Foreign Relations has a much more important work than the corresponding committee of the House. This follows from the fact that the Senate has jurisdiction over treaties with foreign powers, and they are referred in the first instance to the Senate committee. The jurisdiction of the various committees in the Senate is further extended on account of the work of confirmation to office of those nominated by the President. The judicial appointments, for instance, are first considered by the Committee on Judiciary, post-office appointments by the Post-office Committee, army appointments by the Committee on Military Affairs, and so on through the different grades of service."—*Ibid.*, pp. 54-55.—See also below: Powers of the senate.—

"From the first session in 1789 to the session of 1816-17 only four standing committees had been authorized, viz., on Engrossed Bills, on Enrolled Bills, on the Library, and on the Contingent Expenses of the Senate. All other subjects requiring reference having been, on motion, referred to select committees, composed, according to circumstances, of three or five members. The first general rule adopted for the appointment, at each session, of standing committees for the consideration of the several great interests of the country, as indicated by the names of those committees, was adopted on the 10th of December, 1816. The necessity for this change from select to standing committees had become apparent in the practice of the Senate. The numerous select committees appointed upon separate and distinct objects were unsuited to the establishment of a uniform and consistent course of legislation upon subjects of a similar nature justly requiring action upon fixed principles; hence a due regard to economy of time and labor in the performance of the public business and of the public interests would not admit of a longer postponement of this change. So numerous had become the appointments of select committees upon bills, resolutions, memorials, petitions, and other matters that at the session preceding this change (1815-16) they numbered between 50 and 100. . . . The modes of appointing the committees of the Senate, as will appear from the preceding statement, have been variable. The first general rule on the subject was adopted on the 16th of April, 1789, which required that all committees shall be appointed by ballot, and a plurality of votes shall make a choice. . . . The standing committees had been appointed by ballot from their formation, in December, 1816, to the 9th of December, 1823. The appointment by ballot being restored on the 15th of April, 1826, it continued until the 24th of December, 1828, when the rule was again changed so as to require the President pro tempore to appoint the committees; and if there was no President pro tempore they were to be appointed by ballot. This mode was continued until the 9th of December, 1833, when the ballot rule was restored, which rule has continued down to the present time. The rule adopted for the appointment of the standing committees on the 14th of February, 1828, remains the rule for the appointment of those committees at the present time; so that the ballot rule has existed, with the exception of about 7 years, from the beginning of the Government, or about 74 years. The practice of the Senate, however, in the appointment of its committees, has, for the most part, differed from that rule. From the beginning the journals record the formation of committees by naming the mem-

bers under the form of an order of the Senate, sometimes on motion of a member, and at other times not so stated. This continued up to December, 1816, when the regular standing committees were authorized. Since that time the preceding statement, taken from the journals, shows particularly the manner in which all committees have been appointed. The appointment of committees by ballot, therefore, is now and has been the rule, and the practice is required to conform to this rule until changed by the Senate, unless, by unanimous consent, the rule may be suspended in particular cases. It has been found in practice that, without a previous consultation and arrangement, the balloting for committees is not only tedious but may result, by the plurality principle, contrary to the will of the majority, in giving all the members of a committee to a united minority of the Senate, except the chairman, who is required by the rule to be elected by a majority of ballots; and, on the other hand, with such an arrangement on the part of the majority, the minority members may be entirely excluded from the committees. In the beginning, and before the standing committees were authorized, the practice in the Senate in the appointment of committees was assimilated to that of the Parliament of Great Britain. . . . Although in the beginning, . . . the Senate adopted the practice of the British Parliament in appointing select committees on all subjects requiring reference and examination, it was found by experience that impartiality, economy of time, and a just and proportionate regard to the political sentiments of the majority and minority of the House, for the time being, rendered it necessary and proper that standing committees should be appointed on each of the great or general interests of the country, in advance of any reference whatever, or at the commencement of each session of Congress, or of the Senate, to which, as a matter of course, any particular subject coming under any such general head should be referred; and that, on each of those standing committees, both sides of the House, in a just and equitable proportion, should be represented. This fair and generous principle, so congenial to the general spirit and genius of our republican institutions, and the high character of the Senate of the United States, is now the settled practice of this honorable body, and has not in any instance been intentionally departed from."—W. Hickey, *Rules and practices of the Senate*.—See also below: House of Representatives: the speaker and the committee system; and: Recent history of Congress.

Freedom of debate.—Quorum.—Vice-President.—Morning hour.—Progress of bills.—"Filibustering has played little part in the development of the rules of the Senate. That has not been for the lack of filibustering of the most vicious character, but because it has not been permitted to have the legitimate effect which it should have upon the procedure of any great legislative chamber in a representative government. The constitution of the Senate is so undemocratic, there is such a grotesque disparity between the constituencies which exercise an equal voice in the selection of its members, and again the choice of these constituencies, such as they are, is so vaguely expressed in its filtration through the action of agents selected chiefly for other purposes, that it is only in a very remote sense a representative national assembly at all. It is not, therefore, to be wondered at that, after argument had been exhausted over and over again, the right of debate should often be insisted upon by a minority, and sometimes an extremely small minority, for the purely physical purpose of delay

and to prevent a majority of the Senate itself from recording a verdict. . . . The quorum of the Senate, as of the House, is fixed by the Constitution as a majority of the membership. In the First Congress great difficulty was met with in securing a quorum. Eight Senators came together on the 4th of March, and, after waiting for a week, they joined in a letter to the absent Senators, requiring them to attend. In the Fifth Congress, instead of directly writing to the absent members, those who were present ordered the secretary to write requesting them to attend. The rule as it now exists is much less gentle, but it is not so summary as the corresponding rule in the House. It provides that, when it shall be ascertained that a quorum is not present, a majority of the Senators present may direct the sergeant-at-arms to request and, when necessary, to compel absent members to attend. The rule makes it in order also for a Senator at any time to raise the question of the presence of a quorum, and a Senator is often interrupted when speaking in order that this point may be made. This right is sometimes used for purposes of delay, but sometimes also for the purpose of forcibly securing an audience. The Vice-President of the United States is the presiding officer of the Senate. He is not a member of the body, and exercises as little authority under the rules as the presiding officer of any legislative chamber in the world. The source and extent of his powers have long been a subject of controversy. In 1826 Mr. Calhoun, who was then Vice-President, expressed the opinion that he had no authority to call a Senator to order for words spoken in debate. . . . The rules were amended in 1828, recognizing that a Senator might be called to order by the President of the Senate, or by a Senator, and providing that every question of order should be decided by the President without debate, subject to an appeal to the Senate, and also that the President might call for an expression of the opinion of the Senate upon every question of order. But even with the authority at least impliedly conferred upon the President to call a Senator to order, it does not seem to have been generally accepted, and in 1850 we find the President expressing of his own motion a formal opinion that the President had the right to call a Senator to order for a violation of the rules. The view that the Vice-President had any authority over the Senate which he did not directly derive from the rules of that body has never been received favorably by the Senate. The House is presided over by one of its own members, selected by itself, and the Senate by one who is not a member, selected by an outside authority; and it is probably due to this circumstance that we have at one end of the Capitol the most powerful, and at the other end the least powerful, presiding officer in the world. The Vice-President scarcely exercises the powers of a moderator, and in no sense is he a political leader, at least so far as the action of the body over which he presides is concerned. He might, of course, be one of the leaders of his party in the country. . . . But as the Senate is not consulted in the choice of its presiding officer, he may, or he may not, have qualifications of leadership. While some great men have held the office of Vice-President, some also have held it who would not be capable of exercising political leadership in any legislative body. Ordinary business, so far as parliamentary questions are concerned, runs very smoothly in the Senate, and the chief qualifications of its presiding officer are the ability to occupy the chair with dignity, and a readiness in the transaction of the routine work of the body.

If points of order are raised upon important or doubtful questions, they are quite apt to be submitted to the Senators for their decision. . . . An important difference between the Senate procedure and that of the House consists in the fact that the former body retains its morning hour, and, when the hour was found to be too short in 1888, it adopted a resolution, formally declaring that until otherwise ordered the 'morning hour shall terminate at the expiration of two hours after the meeting of the Senate.' This hour of one hundred and twenty minutes is sufficiently long for the transaction of a great deal of business. During that time the presiding officer lays before the body messages from the President, communications addressed to the Senate, bills and resolutions, and messages from the House of Representatives. Petitions and memorials are presented in open Senate during this elongated morning hour, reports of committees are made, and bills and resolutions are introduced. But a recent amendment of the rule permits petitions and memorials and bills of a private character to be introduced, as measures are generally introduced in the House, by delivering them to the Secretary of the Senate, and much time is saved by this simple procedure. Business is also transacted during the morning hour by unanimous consent. At the conclusion of the morning business the Senate takes up its calendar of bills and considers until two o'clock such bills and resolutions as are not objected to, in the order in which they appear upon the calendar, and any Senator is entitled to speak once and for five minutes upon any question. A motion for consideration made during the morning hour is determined without debate. The Senate meets at noon, and at two o'clock or earlier, if the one hundred and twenty minute hour expires earlier through failure of business, the calendar of 'general orders,' so-called, is taken up, and matters of business are considered in their order, with the exception that various motions may be made, two of which, if passed by the Senate, would confer a privilege—first, a motion to take up an appropriation bill; second, a motion to consider any other bill on the calendar. There is no general privilege conferred upon certain kinds of bills, as is the case in the House, except that a motion is first in order to take up an appropriation bill. As in the House the rules of the Senate require that every bill and joint resolution shall receive three readings before its passage, but two of these readings are merely nominal, and are had before the bill or resolution is referred to a committee. The third reading is a real one and is for the purpose of amendment. Upon the passage no amendment can be offered except by unanimous consent. The chief specific restrictions imposed upon amendments relate to appropriation bills and prohibit general legislation by amendment to a general appropriation bill or anything that is not germane or relevant to the subject; and also any amendment is prohibited which provides for the payment of a private claim, except to carry out the provisions of existing law or treaty. The Senate considers not merely revenue bills and bills involving a charge upon the treasury, but all bills, in Committee of the Whole; but, although the journal may show that the Senate formally goes into Committee of the Whole and again rises, the practice is entirely automatic. The bill reaches the stage of amendment, and the presiding officer declares the Senate in Committee of the Whole and still retains the chair, and he is addressed, while nominally in Committee of the Whole, as 'Mr. President' and not as 'Mr. Chairman.' After

the bill is read, he declares that the bill is reported to the Senate from the Committee of the Whole with amendments, and the Senate formally acts upon what it has done while nominally in Committee of the Whole. In the regular consideration of bills and resolutions, there is no limitation upon debate except that no Senator may speak more than twice upon a single question upon the same day without leave of the Senate,—a limitation that would seem of very little practical importance in a body the membership of which has been adorned with many men, who have not found it necessary to speak twice in order to occupy a single day. The freedom of amendment and debate in the Senate are, as a rule, of much value when indulged in in good faith. Doubtless very much unnecessary speaking is permitted, but an opportunity is also given for necessary speeches to be made. It is inevitable, however, that such a free system should be abused and that debate should sometimes be employed, not with the object of throwing light upon the subject, but for purposes of delay. In 1900 a conference report on the Rivers and Harbors bill, which had passed each House in a somewhat different form, was called up in the Senate upon the day before the session of Congress was to come to an end. A Senator, whose State had not received some appropriation that was asked for, took the floor and held it for twelve hours, and to a time so near the end of the session, that it became evident that other necessary business could not be transacted, unless the Senate surrendered. The bill was thereupon withdrawn, and as a result failed of passage. In 1903 a Senator, very near the close of a session, declared that he would keep the floor until the Congress expired, so that important appropriation bills would fail of passage, unless there should be included an item to pay his State a claim which had been pending nearly three-fourths of a century. The appropriations carried in the bills were absolutely necessary for running the machinery of the government, and, if they had failed, an extraordinary session of Congress would have been necessary. The conferees of both Houses, although reluctant to make the appropriation for the claim, were practically compelled to do so, or submit the government to great inconvenience and loss."—S. W. McCall, *Business of Congress*, pp. 147-155.—"March 1, 1917, the House passed an Armed Ships bill, . . . giving the President authority to supply merchant ships . . . with defensive arms. . . . A bill of similar purport . . . was held up in the Senate by eleven members styled by the President 'a group of willful men'; and the session closed, March 4, without action. March 8, the new Senate, in special session, adopted by a vote of 76 to 3 a *clôture* amendment bringing to an end the chamber's time-honored rule of unlimited debate."—F. A. Ogg, *National progress*, p. 394.—This amendment provided that debate should be brought to an end on petition of sixteen senators, supported by a two-thirds vote of the whole Senate two days later.

Character.—"The Senate of the United States has been both extravagantly praised and unreasonably disparaged, according to the predisposition and temper of its various critics. In the eyes of some it has a statelyness of character, an eminency of prerogative, and, for the most part, a wisdom of practice such as no other deliberative body possesses; whilst in the estimation of others it is now, whatever it may have been formerly, but a somewhat select company of leisurely, 'bosses,' in whose companionship the few men of character and high purpose who gain admission to its mem-

bership find little that is encouraging and nothing that is congenial. Now of course neither of these extreme opinions so much as resembles the uncolored truth, nor can that truth be obtained by a judicious mixture of their milder ingredients. The truth is, in this case as in so many others, something quite commonplace and practical. The Senate is just what the mode of its election and the conditions of public life in this country make it. Its members are chosen from the ranks of active politicians, in accordance with a law of natural selection to which the state legislatures are commonly obedient; and it is probable that it contains, consequently, the best men that our system calls into politics. If these best men are not good, it is because our system of government fails to attract better men by its prizes, not because the country affords or could afford no finer material. It has been usual to suppose that the Senate was just what the Constitution intended it to be; that because its place in the federal system was exalted the aims and character of its members would naturally be found to be exalted as well; that because its term was long its foresight would be long also; or that because its election was not directly of the people demagoguery would find no life possible in its halls. But the Senate is in fact, of course, nothing more than a part, though a considerable part, of the public service, and if the general conditions of that service be such as to starve statesmen and foster demagogues, the Senate itself will be full of the latter kind, simply because there are no others available. There cannot be a separate breed of public men reared specially for the Senate. It must be recruited from the lower branches of the representative system, of which it is only the topmost part. No stream can be purer than its sources. The Senate can have in it no better men than the best men of the House of Representatives; and if the House of Representatives attract to itself only inferior talent, the Senate must put up with the same sort. I think it safe to say, therefore, that, though it may not be as good as could be wished, the Senate is as good as it can be under the circumstances. It contains the most perfect product of our politics, whatever that product may be. . . . While questions affecting the proper construction of the Constitution were the chief and most imperative questions pressing for settlement, great lawyers were in demand, and great lawyers were, accordingly, forthcoming in satisfaction of the demand. In a land like ours, where litigation is facilitated by the establishment of many open and impartial courts, great lawyers are a much more plentiful product than great administrators, unless there be also some extraordinary means for the encouragement of administrative talents. We have, accordingly, always had plenty of excellent lawyers, though we have often had to do without even tolerable administrators, and seem destined to endure the inconvenience of hereafter doing without any constructive statesmen at all. The constitutional issues of former times were so big and so urgent that they brought great advocates into the field, despite all the tendencies there were in our system towards depriving leadership of all place of authority."—W. Wilson, *Congressional government*, pp. 193-205.—"The force of public opinion has not only repelled the extension of the powers of the Senate, but it has to some extent curtailed them. The Senate would not now as a body dare to interfere with the President's selection of the members of his Cabinet, although originally the appointment of Cabinet officers was just as contingent upon its consent as the appointments of

any other class of public officers. Neither would it dare openly to dispute the right of the President to select members of his own party to fill the public offices under his administration, although quick to find pretexts for embarrassing him in the exercise of that right. With these exceptions, however, the Senate does not seem to have been sensibly abridged in its powers, and in all functions which it possesses in common with the House it still enjoys better opportunity with superior ability for accomplishing its purposes. Comparing its present with its original state, the authority of the Senate has on the whole greatly increased, while that of the House has diminished. The peculiar influences which created and sustained the prestige of the Senate have, however, passed away. The principle of state sovereignty is extinct, as a political force, and no longer interposes any check upon congressional action. Ability in the public championship of party principles has declined in importance, as compared with assiduity in service to party organization. Claims of distinction resting upon capacity in party service, either by craft of management or by ability to finance party organization, receive increasing recognition. Senators quite different from the provincial notables of the first period, and still more different from the parliamentary leaders and constitutional statesmen of the second period, have made their way into the Senate in such number as to determine its character as a body. The Senate, by its constitution, is protected against sudden change. Renewal of its membership is a slow and gradual process, so that the Senate at all times contains representatives of different periods of our politics. Then again, the variety of political conditions and party circumstances in the various states is always reflected in the Senate by marked diversities of temperament and mental capacity among its members. A general tendency towards a deep change in the character of the Senate is, however, quite discernible. This tendency has been towards the conversion of the Senate into a Diet of party lords, wielding their powers without scruple or restraint in behalf of the particular interests which they represent. The privileges of unrestricted debate, which were once regarded as opportunities of distinction, have become the intrenchments of particular interests, the shelter of party treachery, and the ready instrument of extortion. . . . Notwithstanding the great change that has taken place in the character of the Senate, the general tone of its proceedings is superior to that of the House in decorum. It is composed of older, graver, more experienced men, but there have been occasions when it has been shown that all these moderating qualities are unable to stand the strain. It is a small body, so that excitement finds less fuel than in the House, and the dignified traditions of the Senate have not quite lost their hold. The fundamental distinction, however, lies in the circumstances which set senators apart as a distinct class. The greater permanency of their tenure causes them to become residents of the national capital, while members of the House are, as a rule, transient sojourners. Connections of social interest have time to form, and these establish a community of feeling and a reciprocity of consideration which affect the tone of debate and modify party spirit. One of the difficulties which every administration has to encounter is the disposition of senators to stand together on issues affecting senatorial control over patronage. A senatorial faction in revolt against the administration is certain to receive as much comfort and assistance from their fellows, irrespective of party attachment, as can be extended

without endangering party position. . . . With the deterioration of its character that has taken place, the composition of the Senate makes it inferior to the House in balance and moderation. In the House the weight of particular interests is proportioned to their popular strength, but in the Senate there may be a very great disproportion. . . . Vagaries of popular sentiment and transient delusions of opinion may be magnified in the Senate far beyond their real strength. Already the consequences are such that the reputation of the Senate for conservatism has become a faded tradition, and instead of regarding the Senate as a check upon the House, the people have gotten into the habit of looking to the House for restraint upon the extravagance and impetuosity of the Senate. The change of public sentiment in this respect has been so great as to force itself upon the recognition of the Senate itself. A Senate committee in a formal report has regretfully admitted that 'the tendency of public opinion is to disparage the Senate and depreciate its usefulness, its integrity, its powers.'—H. J. Ford, *Rise and growth of American politics*, pp. 268-274.

Powers.—Confirmation of appointments.—Treaties.—"When we turn to consider the Senate in its relations with the executive, we see it no longer as a legislative chamber, but as a consultative executive council. And just here there is to be noted an interesting difference between the relations of the Senate with the President and its relations with the departments, which are in constitutional theory one with the President. It deals directly with the President in acting upon nominations and upon treaties. It goes into 'executive session' to handle without gloves the acts of the chief magistrate. Its dealings with the departments, on the other hand, are, like those of the House, only indirect. . . . The greatest consultative privilege of the Senate,—the greatest dignity, at least, if not in effect upon the interests of the country,—is its right to a ruling voice in the ratification of treaties with foreign powers. . . . The President really has no voice at all in the conclusions of the Senate with reference to his diplomatic transactions, or with reference to any of the matters upon which he consults it; and yet without a voice in the conclusion there is no consultation. Argument and an unobstructed interchange of views upon a ground of absolute equality are essential parts of the substance of genuine consultation. The Senate, when it closes its doors, upon going into 'executive session,' closes them upon the President as much as upon the rest of the world. He cannot meet their objections to his courses except through the clogged and inadequate channels of a written message or through the friendly but unauthoritative offices of some Senator who may volunteer his active support. Nay, in many cases the President may not even know what the Senate's objections were. He is made to approach that body as a servant conferring with his master, and of course deferring to that master. His only power of compelling compliance on the part of the Senate lies in his initiative in negotiation, which affords him a chance to get the country into such scrapes, so pledged in the view of the world to certain courses of action, that the Senate hesitates to bring about the appearance of dishonor which would follow its refusal to ratify the rash promises or to support the indiscreet threats of the Department of State. [See also PRESIDENT: United States: Limitation of power.] The machinery of consultation between the Senate and the President is of course the committee machinery. The Senate sends

treaties to its Standing Committee on Foreign Relations, which ponders the President's messages accompanying the treaties and sets itself to understand the situation in the light of all the information available. If the President wishes some more satisfactory mode of communication with the Senate than formal message-writing, his only door of approach is this Committee on Foreign Relations. The Secretary of State may confer with its chairman or with its more influential members. But such a mode of conference is manifestly much less than a voice in the deliberations of the Senate itself,—much less than meeting that body face to face in free consultation and equal debate. It is almost as distinctly dealing with a foreign power as were the negotiations preceding the proposed treaty. It must predispose the Senate to the temper of an overseer. [See also PRESIDENT: United States: Foreign affairs.] Still, treaties are not every-day affairs with us, and exceptional business may create in Senators an exceptional sense of responsibility, and dispose them to an unwonted desire to be dispassionate and fair. The ratification of treaties is a much more serious matter than the consideration of nominations which every session constitutes so constant a diversion from the more ponderous business of legislation. It is in dealing with nominations, however, that there is the most friction in the contact between the President and his overlord, the Senate. One of the most noteworthy instances of the improper tactics which may arise out of these relations was the case of that Mr. Smythe, at the time Collector for the port of New York, whom, in 1869, President Grant nominated Minister to the Court of St. Petersburg. The nomination, as looking towards an appointment to diplomatic service, was referred to the Committee on Foreign Relations, of which Mr. Charles Sumner was then chairman. That Committee rejected the nomination; but Smythe had great influence at his back and was himself skilled beyond most men in the arts of the lobby. He accordingly succeeded in securing such support in the Senate as to become a formidable dog in the manger, not himself gaining the appointment, but for a time blocking all other appointments and bringing the business of the Senate altogether to a standstill. Smythe himself is forgotten; but no observer of the actual conditions of senatorial power can fail to see the grave import of the lesson which his case teaches, because his case was by no means an isolated one."—W. Wilson, *Congressional government*, pp. 230-236.—"This claim [of the treaty-making power on the part of the Senate] would lead us to question whether Congress is the sole legislative organ of the nation, and to inquire whether it was not the purpose of the Constitution to create two law-making agencies—the one composed of the representatives of the people and the Senate, subject to the veto of the President, and the other made up of the President and the Senate and any real or nominal foreign power taking the place of the representatives of the people. This question would seem a somewhat idle one, were it not for the fact that claims of so sweeping a character have occasionally been put forth from the very beginning of the government, concerning the scope of the treaty-making power, that they make it necessary to ask it. The issue involved is certainly an important one, and will justify a more than cursory examination. It will be well, therefore, to consider briefly the true scope of the treaty-making power as compared with the legislative power, so far as the assertion of legislative authority in the former is concerned. The Constitu-

tion, with great particularity, established the mechanism of the central government, and then, as that government must of necessity have relations with foreign states, it conferred upon the President in a few words the power to make treaties by and with the advice and consent of two-thirds of the Senate. The sixth article of the Constitution then provided that 'this Constitution, and the laws of the United States which shall be made in pursuance thereof; and all treaties made, or which shall be made, under the authority of the United States, shall be the supreme law of the land; and the judges in every State shall be bound thereby, anything in the Constitution or laws of any State to the contrary notwithstanding.' It has been contended by some eminent men that it followed from this article that there were two methods of making laws,—one by the Congress and the other by the treaty-making power, and that the laws made in either way were of equal validity; and even that those made by Congress were subject to the limitations of the Constitution, to which those made by treaty need not conform. The conflict began during the administration of President Washington. Chief Justice Oliver Ellsworth, at the time of the controversy over the Jay treaty, uttered a very sweeping dictum. He gave it as his opinion, but not in a judicial proceeding, that 'the instant the President and the Senate have made a treaty, the Constitution makes it the law of the land, and of course all persons or bodies in whatever station or department within the jurisdiction of the United States are bound to conform their actions and proceedings to it. Such a treaty *ipso facto* repeals all existing laws so far as they interfere with it . . . but on the other hand a treaty cannot be repealed or annulled by statute.' This opinion, it will be observed, would emphatically make the treaty-making power the supreme legislature and treaties the paramount law of the land, repealing all inconsistent laws of Congress and not at all subject to repeal by the regular law-making authority so carefully carved out by the Constitution. Attorney-General Charles Lee at the same time expressed the opinion that 'it is manifest that if a treaty contains any stipulations inconsistent with acts of the legislature, it supersedes them. If a nation has a law and makes a treaty by which it is agreed that the law shall thereafter cease, it exercises the power which it hath to repeal its own laws.' Some have even gone so far, as I have just stated, as to contend that the power to legislate by treaty was more untrammelled than the action by Congress, for many limitations are imposed expressly upon the latter, while the former power appears to be without any express limitation whatever. From this extreme construction it would follow that the framers of the Constitution had such a profound distrust of the people, as to provide that when they were acting through their Representatives there should be important limitations upon them and upon the Senators as well, but when their Representatives were dispensed with, the limitations might safely be dispensed with also, provided some foreign potentate should sanction what might be done. It would thus appear that it was not so much jealousy of governmental power, as jealousy of the people, that animated the framers of the Constitution. Thus, for instance, while Congress might not establish a state church or abridge the freedom of speech or of the press, the President and two-thirds of the Senate and a foreign power might do those things which in terms are only prohibited to Congress. It is a little startling to contemplate some of the possi-

bilities, if this view were to prevail, but, as it has been put forth by some eminent gentlemen, I do not feel at liberty to ignore it entirely in considering the place of Congress in our system of government. . . . Contrary to the opinion of Chief Justice Ellsworth which I have cited, Congress has repealed treaties, and the courts have held that it possessed that power. This conclusion with regard to the relation of Congress to the treaty-making power seems to me to be clear. When a treaty is not self-operative in its terms, or where it trenches upon some subject confided by the Constitution to Congress, the passage of a law is necessary to give effect and vitality to treaties, but sometimes it has not, and the power to pass laws making them vital, or to refuse to pass laws for such a purpose, is equally within its sovereign legislative discretion."—S. W. McCall, *Business of Congress*, pp. 6-8, 15-16.—See also TREATIES, MAKING AND TERMINATION OF: Treaty-making power.

On various occasions in the history of the United States, there have been serious conflicts over the ratification of treaties by the senate.

1794.—Jay Treaty. See U. S. A.: 1794-1795.
1869.—Johnson-Clarendon Treaty rejected. See ALABAMA CLAIMS: 1862-1869.

1870.—Santo Domingo Treaty of annexation rejected. See HAITI: 1804-1880.

1897.—Hawaiian Islands annexed. See HAWAIIAN ISLANDS: Discovery, etc.

1897.—Arbitration Treaty with Great Britain rejected. See U. S. A.: 1897 (January-May).

1899.—Treaty of Paris with Spain, over control of Philippines. See U. S. A.: 1899 (January-February).

1919.—Peace Treaty and League of Nations. See U. S. A.: 1919 (July-September): Discussion of the League of Nations.

Senatorial courtesy.—"The custom has grown up of permitting the Senators practically to dictate the nominations from their respective states in the first instance, and then by something which is called senatorial courtesy, to decide the question whether or not they shall be confirmed."—S. W. McCall, *Business of Congress*, p. 158.

Impeachment.—"When the House exercises its constitutional powers of impeachment, the Senate is the court before which the charges must be made good. The managers on the part of the House appear at the bar of the Senate, and sometimes, as in the case of the impeachment of President Johnson, the members of the House of Representatives follow the managers in procession and attend upon the trial. . . . The course of the trial is generally the same as that of a court. The person impeached is summoned to answer the articles, and he may be represented by counsel. The Constitution provides that the votes of two-thirds of the Senators voting shall be necessary for a conviction."—*Ibid.*, pp. 156-157.—"Who may be impeached? Only the 'President, Vice-President, and all civil officers of the United States.' The list of civil officers includes ambassadors, members of the cabinet, judges of all federal courts, even post-masters; but it does not include members of either branch of Congress, nor, of course, officials of the several states. . . . [Members of Congress] are not civil officers of the United States. This was decided by the Senate in the famous Blount case (1797). Senators and representatives are officers of the states. . . . A civil officer . . . is liable to be impeached for any offence committed while holding office even though he should resign his post before the impeachment proceedings begin. That was one of the points made clear in the Belknap case (1876). . . . The grounds for

impeachment . . . are 'treason, bribery or other high crimes and misdemeanors.' The first two words of this phrase are definite enough, but the remaining part of it is ambiguous and has given rise to some differences of opinion. In general, however, it is now understood that civil officials are not to be impeached except for offences of grave misconduct or malfeasance in office. . . . In all there have been nine federal impeachments, only two of which have come within the last forty years. Only three have resulted in convictions. . . . The charges against President Andrew Johnson in 1868 were eleven in all, most of them having to do with reputed violation of the Tenure of Office Act which Congress had passed over the President's veto. . . . The Senate voted thirty-five to nineteen for conviction, but that was one vote short of the required two-thirds. . . . The most recent instance of a federal impeachment occurred in 1912 when a judge of the short-lived federal Commerce Court was impeached."—W. M. Munro, *Government of the United States*, pp. 170-173.—See also U. S. A.: 1868.—In addition to the powers of appointment, treaty ratification and impeachment, the Senate shares equally with the House the general powers of Congress, namely, those of taxation, national defence, commerce, coinage, the post-office, government of territories, creation of courts, etc. The one difference is that all revenue-raising bills must originate in the House. Nevertheless, the Senate frequently amends appropriation bills.

HOUSE OF REPRESENTATIVES

The House of Representatives was designed to be a very different chamber from the Senate. In the unamended constitution it was the only body deriving its responsibility directly from the people. The first house was to have had sixty-five members, but after the first census was taken a better distribution was made. It was provided that a census should be taken every ten years thereafter and the representatives in each state apportioned according to the population. There was never to be more than one representative for thirty thousand inhabitants and every state must have at least one representative.

Reapportionment of 1901. See U. S. A.: 1901 (January).

Reapportionment of 1921.—"In January, 1921, a bill was reported by the Census Committee of the House which would have increased the membership of the lower house from 435 to 483. A reapportionment under the 1920 census had become necessary and this meant either an increase in size or a reduction in the representation of the slower-growing states. As the latter course would not be pleasing to the delegations from those states, the Committee decided to fix the ratio of representation so that no state would lose a member.

The new bill sought to increase the basis of representation from 211,877 inhabitants to every member, to 218,979 inhabitants. Under this plan New York would have gained four new members; California, five; Pennsylvania, four; Illinois and Texas, three; Michigan and Ohio, four; Massachusetts, New Jersey and North Carolina, two; while fifteen states would gain one each. At the same time, the Census Committee recommended that an amendment to the Constitution be passed, limiting the size of the House to 500 members. Six members of the Committee filed a minority report on the Siegel reapportionment bill (named after the chairman of the Committee). This report opposed any increase in the membership of the House on the ground of unnecessary expense. 'There is no public service that can be rendered by 483 members that cannot be rendered just as efficiently, if not more so, by 435 members,' the report says. 'It is our opinion that there is no public demand for an increased membership of the House. Our citizens are already taxed more than \$5,000,000,000 per year to meet the annual public expenditures and we do not feel that the proposed additional burden is either necessary or can be justified.'—*Report of the minority members of the census committee on the Siegel reapportionment bill* (quoted in the *New York Tribune*, Jan. 9, 1921).—The main objection, however, to any increase in size is the unwieldiness of large parliamentary bodies. Even now the House is so large that real discussion is impossible. As a consequence there is very little careful consideration of pending measures. Only the heads of important committees and members who have seen years of service have an opportunity to discuss the subject under consideration. New members are ignored and their only chance for expressing opinions is the *Congressional Record* in which they may have speeches printed which have never been delivered. This was acknowledged by many members in the debate on the Siegel Bill. Strong protests against any increase in size came from prominent Republicans and Democrats including Representative Mondell, the Republican floor leader. Even members from states which would lose representation under any other plan opposed the bill. Representative Barbour, of California, introduced an amendment for a reapportionment which would keep the total size the same as it is now. Under this proposal Missouri, Indiana, Iowa, Kansas, Kentucky, Louisiana, Maine, Mississippi, Nebraska, Rhode Island and Vermont would have their representation reduced. On January 19, the House passed the Reapportionment Bill with this amendment. The entire purpose of the original bill was thus defeated. The present maximum is to be kept for the next ten years—a notable triumph for good government. The new ratio of representation will be one member for 242,267 inhabitants. Twelve seats will be taken away from the above mentioned eleven states and will be distributed among eight states as follows:—California, three; Michigan and Ohio two each; Connecticut, New Jersey, North Carolina, Texas and Washington, one each.—See also APPORTIONMENT.

Gerrymander.—"In the composition of the House of Representatives the state legislatures play a very important part. For the purposes of the election a state is divided into districts corresponding to the number of representatives the state is entitled to send to Congress. These electoral districts are marked out by the legislature, and the division is apt to be made by the preponderating party with an unfairness that is at once shameful and ridiculous. The aim, of course, is so to lay out the districts 'as to secure in the greatest pos-

sible number of them a majority for the party which conducts the operation'. . . This trick is called 'gerrymandering,' from Elbridge Gerry, of Massachusetts, who was vice-president of the United States from 1813 to 1817. It seems to have been first devised in 1788 by the enemies of the Federal Constitution in Virginia, in order to prevent the election of James Madison to the first Congress and fortunately it was unsuccessful. It was introduced some years afterward into Massachusetts. In 1812, while Gerry was governor of that state, the Republican legislature redistributed the districts in such wise that the shapes of the towns forming a single district in Essex county gave to the district a somewhat dragon-like contour. This was indicated upon a map of Massachusetts which Benjamin Russell, . . . editor of the 'Sentinel,' hung up over the desk in his office. The celebrated painter, Gilbert Stuart, coming into the office one day and observing the uncouth figure, added with his pencil a head, wings, and claws, and exclaimed, 'That will do for a salamander!' 'Better say a Gerrymander!' growled the editor; and the outlandish name . . . soon came into general currency."—J. Fiske, *Civil government in the United States*, pp. 216-218.—"There is a district in Mississippi (the so-called Shoe String district) 500 miles long by 40 broad, and another in Pennsylvania resembling a dumb-bell. South Carolina furnishes some beautiful . . . examples. And in Missouri a district has been contrived longer, if measured along its windings, than the State itself, into which as large a number as possible of the negro voters have been thrown."—J. Bryce, *American commonwealth*, v. 1, p. 121 (footnote), 1891.—See also APPORTIONMENT.

Qualifications. See above: Qualifications of representatives and senators.

Procedure.—"The procedure of the House of Representatives is much more complicated and technical than that of the Senate, and changes in the rules of the former body are of more frequent occurrence. . . . The rules of the House of Representatives of the first Congress have come down to our time with omissions, additions, and amendments, that appeared from time to time to be necessary, and some of the rules of that House have continued in force with very little change to this day. The rules as they now stand represent a gradual development, and nearly every material change can be traced to the increase in membership, or amount of business, or to some other changed condition in the House. The most important single revision was that of 1860. The revision twenty years later dropped a number of rules that were practically obsolete, rearranged others, and added a few new ones. The only revision since the latter time, that of 1890, left nearly two-thirds of the rules untouched, and changed the remaining eighteen only in four important particulars—the counting of a quorum, the size of the quorum of the Committee of the Whole, the dilatory motion, and the order of business; so that the rules of to-day represent, as Mr. Dalzell says, 'an evolution, the outgrowth of the parliamentary experiences, necessities, and exigencies of all the hundred years and more of our congressional life. The book of rules contains no rule that had not a reasonable necessity for its adoption in the first instance.' I do not mean to assert that none of the rules in the code is lacking in wisdom, but that the rules as a mass are the work of no one man, and are the outgrowth of our parliamentary experience. This slow and gradual change and approach to permanency give to the rulings of Speakers and of the Chairman

of the Committee of the Whole, and to the practice and customs of the House, a great value, and make especially true of the House the statement of Mr. John Sherman, made in 1896, that 'precedents and customs are this day the chief law of both Houses of Congress.' Mr. Jefferson prepared a parliamentary manual for the use of the Senate over which he presided when Vice-President, and it has been accepted as authority also in the House since that time. In 1837 a rule was adopted, which still remains in force, providing that Jefferson's rules should govern the House in all cases in which they were applicable and were not inconsistent with the rules of the House. The manual is an excellent compendium of general parliamentary law, as it existed one hundred years ago, but it is not frequently referred to in the proceedings of the House. When the first session of a Congress assembles, either on the day fixed by the Constitution, which is the first Monday in December, or upon some earlier day in the instances when it is convened in extraordinary session by the President, or by law, the Senate is an organized body, but the House of Representatives is not."—S. W. McCall, *Business of Congress*, pp. 20, 32-33.

Speaker and the committee system.—"In the choice of its Speaker the House is hampered by no restriction of law or Constitution; but a custom based on parliamentary and on colonial precedents requires that the Speaker shall always be a member of the House. Strict parliamentary law dictates, moreover, that the candidate for Speaker shall not be a member upon whose seat there is any probability of a question. Nevertheless both Jones and Carlisle were elected Speaker with their seats contested and the question unsettled. The only necessary qualifications are, then, those required of all members of the House of Representatives: the age of twenty-five years, citizenship, and the resignation of any other federal office. The *motives which govern the choice of Speaker* lie deep in the complicated practice of American government, and the more hotly contested elections at the same time include some of the most interesting crises of American history, and illustrate the growing recognition of the Speaker's power. In practice, the choice of a Speaker depends less upon his qualities as a moderator, his experience as a public man, and his personal character, than upon the complex interplay of political factions striving for mastery in their own party. The Speaker is the party leader, but when the dominant party finds itself with no generally accepted chieftain, as was the case upon Mr. Carlisle's resignation to go into the Senate [1889], the struggle for that position begins. As the parliamentary duties of the Speaker are important, parliamentary knowledge and experience naturally have some weight in his election. In every Congress there are many new members who usually know little or nothing of the rules of the House. They feel their ignorance and helplessness and say, 'We must have some one to preside over us who really understands and knows all about these things.' Nine Speakers had previously presided in their State legislatures. . . . Previous service in the House has some weight, although it is never a decisive factor. . . . The average length of congressional service before an election to the chair has been about seven years. When the majority in Congress does not change, the Speaker is usually reelected, unless meanwhile he accept some other elective or appointive office. There are, however, occasional exceptions to this rule. Several Speakers have served three terms.

© Harris & Ewing

JOINT SESSION OF THE UNITED STATES CONGRESS

. . . Furthermore, even after an interval of minority life, an ex-Speaker would, as a general thing, be reelected if his party should come in again. . . . Among the complicated motives which govern the election for Speaker, not the least is the strife for sectional advantage. Although it is universally admitted that a man is not fit for the Speakership who is capable of using his office for sectional ends—such as securing local favors through the organization of the committees, or undue influence in the conduct of business in the House—yet the cry of locality is always heard at the time of the election. Sometimes it is argued that a State has particular claims on the Speakership for some special service rendered the party, or for her constancy in returning a larger majority, or, if a doubtful State, for giving any majority at all. There has been a feeling, moreover, that the States should share equally in the honors and spoils of the national government. Of much greater influence than any sectional claims in the Speaker's election are the many private schemes of individuals and corporations. Men with special interests to be advanced, or those anxious to obtain government subsidies in aid of some commercial enterprise, take an active part in the election of the man from whom they hope to get the most assistance; and since often their very fortunes depend upon the result, they make the most strenuous efforts to procure his election. If the struggle is close, the candidate whose friends can offer the best inducement to the trading element may be successful. . . . While the formal election takes place in the House at the opening of each Congress, the real election has already been consummated in the party caucus. . . . [See CAUCUS.] As there have seldom been more than two parties of any consequence in Congress, it is usually known immediately after the congressional elections have taken place which of the two great parties—since 1856 the Democratic and the Republican—will have the majority of the House and consequently the Speaker. The question in the election of the Speaker is then simply which Republican or which Democrat it is to be. By means of the caucus this question, with all the heat and passion, the scheming and wire-pulling incidental to it, is transferred from the House to a body where the factions of party can fight freely against one another without alliance with members of the other party and without too freely exposing internal dissensions. The Constitution of the United States leaves to the House not only the choice but the *mode of choosing* its presiding officer. The first duty of every new House is to elect its Speaker. The Clerk of the last session calls the unorganized house to order, and, pending the election of Speaker, decides all questions of order; the roll of members made up by the Clerk having been called and the presence of a quorum announced, the House, on motion of some member, proceeds immediately to the election of Speaker. It was long a question whether the election of Speaker or the right of a member to his seat presents a question of higher privilege and therefore of prior discussion, but since the act of March 8, 1863, the election of Speaker has always been given the precedence. . . . These preliminaries settled, the chairmen of the respective party caucuses nominate in the House the men chosen as candidates for the Speakership, and the question is then decided by a majority of votes cast. The manner of voting was changed in 1841 from the ballot to a *viva voce* vote, a change proposed in several preceding Congresses. There was a growing feeling that every one ought to vote openly and be responsible for his vote, that if a

man bolted the party nomination it was right that it should be known and the culprit punished accordingly. In 1880 this clause was dropped from the rules and a debate arose as to whether the rules should not state the manner of the Speaker's election, but it was decided that it might be an undesirable method of binding future Congresses. There is now, therefore, no provision in the rules in regard to the method of choice. If there be a definite third party, its candidate may be put regularly in nomination. Third parties have seldom had members enough to hold the balance of power, and they do not ordinarily make caucus nominations, but independent members sometimes make a separate nomination. Sometimes also, a discontented member refuses to vote for the nominee of his party; such was the action of Mr. Sherman Hoar in 1891. In general all the members of a party who are present vote for the caucus nominee. After the announcement of the vote the Clerk declares the Speaker duly elected, and he is conducted to the chair by the candidate whom he has defeated in the party caucus and the leader of the minority. There he makes his acknowledgments to the House for the honor which has been conferred upon him. The oath to support the Constitution is then administered by the member who has been longest in continuous service. The Speaker after himself taking the oath administers it to all other members present. The mace, symbol of the Speaker's authority, is then laid upon the table and the organization of the House is complete. . . . The Speakership is not only an institution, it is an opportunity, in which men of strong character have shown their leadership. Such men have more than occupied the place, they have employed it, and handed down a growing tradition of dignity and power. The degree of influence which any individual Speaker attains depends as much upon the man as upon the office. A member of the House of Commons said in debate in 1620, 'Mr. Speaker is but a servant to the House; and not a master nor a master's mate.' Now the Speaker of the House of Representatives may be either a servant, a master, or a master's mate. What strong Speakers can do may best be judged from what has been done by men like Clay and Carlisle and Reed. Before analyzing and discussing the powers of the Speaker let us study the *influence which individuals have had* upon the development of their office. In the first two Congresses [1780-1791; 1791-1793] parties were not yet clearly enough defined to make permanent division possible. Since the jealousies between States still played a large part in politics, the fact that Frederick A. Muhlenberg came from the central and important State of Pennsylvania may have had much to do with his election. The reason for the substitution of Trumbull in the next Congress may possibly have been that suggested by Hildreth,—the principle of rotation in office. Still Muhlenberg had shown signs of a leaning away from administration measures, and Trumbull may have been more trusted. In the Second Congress, however, clearly defined party divisions began to appear from out the chaos of unorganized forces. In 1793 for the first time political combinations were made; the anti-Federalists united on Muhlenberg for Speaker, and elected him by a small majority over the Federalist candidate, Theodore Sedgwick. In the Fourth Congress (1795-1797), although the Republicans had a small majority, the Federalists succeeded in electing Dayton Speaker by a vote of 46 to 31. This is almost the only instance we have of a man elected by a coalition of his own minority party

with a part of the majority. . . . The first three Speakers were respectable men, but by no means remarkable; the reason was simply that the House had not as yet attracted the ablest men in the country. It was not the fault of the House that its first Speakers were second-rate men; it put its ablest men into the chair. As the House gained in strength the Speaker gained in power. In 1799 the Federalists found themselves with a decided majority, and elected Theodore Sedgwick over Macon by a vote of 44 to 38. No one who reads the debates of that period can misunderstand Sedgwick's position. Although not one of the leaders of his party, he was one of its ablest members in the House. He was Speaker during the debates on the repeal of the Alien and Sedition acts, and gave his influence and casting-votes in favor of the Bankrupt act and the Sedition acts. . . . The election of Henry Clay in 1811 marks an important step in the development of the Speakership. He was chosen to lead the House and the country in the time of a great national crisis. Clay was the most popular of Speakers. Six times chosen to the office, his election was never seriously contested: often the vote which placed him in the chair was nearly unanimous, although it was not a period when the House was ready to follow any one, and during Clay's withdrawals there were close contests over the Speakership: whenever he chose to return he was elected Speaker by an overwhelming majority. The resolutions of thanks, usual at the end of each Congress, were with one exception voted unanimously to Henry Clay, and the enthusiasm which he aroused in the House was especially manifested on these occasions. . . . Henry Clay was elected more than any other Speaker as leader of the House. Never before and only once since has a member been distinguished with the honor of an election to the chair upon his first appearance in the House. In the two instances the honor was conferred for exactly opposite reasons: while Clay was given the Speakership as the representative of a certain definite policy, Pennington was chosen in 1859 because it was impossible to elect any one with a definitely avowed policy. The new principles set forth during Clay's long service [1811-1814; 1815-1820; 1823-1825] were: first, the increase of the Speaker's parliamentary power; secondly, the strengthening of his personal influence, and thirdly, the establishment of his position as a legislative leader. As a presiding officer Clay from the first showed that he considered himself not the umpire, but the leader of the House: his object was clearly and expressly to govern the House as far as possible. In this he succeeded to an extent never before or since equalled by a Speaker of the House of Representatives. Clay was the boldest of Speakers. He made no attempt to disguise the fact that he was a political officer. Speakers now, to be sure, following the example of such predecessors as Clay, seek to give their party every possible advantage from their position in the chair; yet, on occasions when nothing is to be gained by partisanship, they attempt to keep up the fiction of the Speaker as a parliamentary officer. But Clay had no thought of effacing himself in the least degree. He allowed no opportunity of expressing his attitude on the subjects that came before the House to pass unused. . . . It is true that no decision made by Henry Clay was ever reversed by the House. But it is not true, as his biographers tell us, that harmony was the chief characteristic of his service. The House was 'harmonious,' not because it always agreed

with the Speaker, but because he usually mastered it. . . .

"Since 1860 there has been but one Speaker (Mr. Keifer) [1881-1883] who was distinctly weak; every Speaker has systematically used his office as a political office; and no party or important group seriously questions that the Speaker is and should be a party leader. Owing to various causes the character of the government, and particularly of Congress, was materially changed during the Civil War; and the unmistakable and uninterrupted growth of the Speaker's political power, during and since that time, [until 1910], is one of the fruits of that fundamental change. In the previous struggle over slavery, from 1847 to 1861, the clash of parties and factions had prevented the Speakers from exercising a decisive influence; even men like Cobb and Banks could not restrain the torrent of angry debate. During the [Civil] war there was a large and eager majority, well marshalled, and the Speaker partook of its triumphs. The influence of party pressure at political crises must not be forgotten or its effects minimized; to each party it was a matter of such vital importance that the committees be constituted in its favor, that the contests to secure the maker of these committees were very serious: party needs were so urgent that it seems inevitable that the Speaker should have put his powers to the greatest service possible. . . . A member of Congress under Colfax [1863-1869] said of him: 'He sometimes announces the passage of a bill as if it were the triumph of his own work, not as if he were merely reading the record of the House.' In the debates of the House Colfax took an active part. . . . Colfax is believed to have modelled his Speakership after that of Clay. There are indeed some striking points of resemblance: Colfax made some attempt to become the legislative leader of the nation; both openly expressed the intention of retaining all the rights of a member. It happened, too, that Clay and Colfax possessed certain personal qualities in common; never perhaps, since Clay, had a Speaker equalled Colfax in that unflinching tact which is such a valuable possession for a presiding officer; Colfax, moreover, never neglected unconventional justice and impartiality; he possessed also an easy temper, and kindly, genial manner; indeed, his suavity and forbearance in guiding the House were sometimes criticised as excessive; still, while by his manner he avoided all odium, he kept the House in order and to its business."—M. P. Follett, *Speaker of the House of Representatives*, pp. 32-33, 35-36, 40-44, 69-72, 74, 97, 99-101.—"On the first day of the meeting of the Forty-First Congress, March 4, 1869, Mr. Blaine was chosen Speaker, by a strict party vote. . . . Mr. Blaine was master of his position from the day when he first took the gavel in his hand. He had the look and the bearing of a leader and commander. . . . No doubt the popularity of Mr. Clay was equal to that of Mr. Blaine. It is not easy to believe that it was superior. . . . Yet Blaine was a strong partisan, and used the power of his position more than did any of his predecessors, not merely to assist his own party to carry its measures and to defeat the obstructive tactics of the opposition, but also to promote or to hinder measures according as they did or did not commend themselves to his individual judgment. In other words he constituted himself a political leader. . . . In the important matter of committee appointments Mr. Blaine displayed excellent judgment and exercised great fairness. Many years after he had ceased to be Speaker the charge was brought

against him vaguely, that he had made corrupt appointments, by choosing members who would promote his own selfish interests. . . . No specific cases were ever mentioned, and . . . the charge was not brought against him during his incumbency of the office. . . . Its vagueness renders a formal refutation of it impossible."—E. Stanwood, *James Gillespie Blaine*, pp. 105, 121.—"Carlisle's term [1883-1889] is of the greatest interest because he boldly laid down in regard to the Speakership a principle which, if already gaining ground, had never been asserted so openly as it was throughout his administration. It was the principle that the powers of the Chair should be used, not in a spirit of balancing favors to majority and minority, not even in a spirit of obedience to the dictates of the majority, but in accordance with the Speaker's individual judgment. He considered it the Speaker's duty to be the leader of Congress, to have a definite legislative policy, and to take every means in his power to secure the accomplishment of the policy. He himself shirked neither the duty nor the responsibility; again and again he opposed the will of a large majority of the House by refusing recognition to members who wished to take up important business; his committees also, while fair and able, represented Carlisle's views more closely than any one's else. By every other means which his office afforded, he sought, entirely regardless of his position as chairman, to impose his will on the House and to be the real source of the legislation of the United States. . . . Yet Carlisle's course in the chair, whether deserving approval or blame, must not be considered as an underhand attempt to get power for himself. He was only carrying out his finest conception of the Speakership. It was not that he followed his own aims in spite of the old theory; he really wished to establish a new theory. Carlisle was one of the strongest of Speakers: a good parliamentarian, with power of command and force of purpose, he ruled the House for six years. Mr. Carlisle had not only the manner which wins quick popularity, but he had the ability which gains recognition and appreciation. He left the chair amid the enthusiastic approval of the House. The national election of 1888 for the first time since 1875 gave the Republicans control of the Presidency, Senate, and House of Representatives. It was an evidence of a purpose to use this advantage that a Speaker was chosen who had already shown a strong and energetic character. Mr. Reed [known as "Czar" Reed] accepted the increased powers of Speakership and added to them even new attributes. . . . He succeeded in gaining control of a House which showed signs in its beginning of extraordinary turbulence. Reed as well as Carlisle, moreover, insisted on his position of actual leader of the House. His attitude to the Republican party was the same as Carlisle's attitude toward the Democratic party: he sought not to represent his party, but to impose his own ideas upon it. A Republican member, Mr. Struble, of Iowa, is said to have made a speech during Reed's administration in complaint of 'his sitting in the chair with his feet on the neck of the Republican party.' A second marked feature of the dominations of both these men was the tendency to concentration of power. An interesting example is the constitution of their respective committees on Rules: in the Fiftieth Congress Carlisle, and in the Fifty-first Congress Reed, appointed the chairman of Appropriations, together with the Speaker, as the majority members of the Committee on Rules. The three men occupying the most powerful places in the House were thus as-

sociated, and formed a 'steering committee' by whose insistence the McKinley tariff of 1890 was forced through. They took the responsibility of legislation."—M. P. Follett, *Speaker of the House of Representatives*, pp. 115-117.—"The Speaker has the ordinary powers that go with the office of president of an assembly. He takes the chair at the moment of the assembling of the House, calls it to order, and causes the journal of the previous session to be read, having first examined and approved it. He has the duty of preserving order, and may cause the galleries to be cleared on account of disorderly conduct. He signs acts, addresses, and resolutions passed by the House, also warrants and subpoenas issued by its order, and even certifies the monthly pay vouchers of the members. He accords recognition to members desiring to call up business, to make motions, or to address the House. He decides all points of order subject to appeal, puts all questions to the House and announces the results, subject to a demand for verification upon rising vote, or a vote by tellers, or by a call for the yeas and nays. It has been charged, although rarely, in past times that the Speaker appointed weak members of the minority upon the great political committees, so as to put that party at a disadvantage with his own. It is doubtful whether there was ever any fair foundation for this charge, but under the practice inaugurated by Mr. Cannon [1903-1910] the minority members . . . [were] in effect selected by the minority leader. The Speaker . . . [requested] the member who . . . [was] nominated by the minority as its candidate for Speaker, and who . . . [was] its titular leader, to make the nominations of the minority members to the committee places, and almost invariably he followed the recommendations thus made. As a rule, the committees are fairly representative of both parties in the House. . . . The Committee on Rules . . . when an emergency arises . . . [may] call up for immediate action a special rule. . . . It may likewise bring in at any time orders giving the right of way to particular measures, fixing the time and conduct of debate, limiting the right of amendment, and, in fact, dealing with any part of the procedure of the House: but here again its propositions require the approval of a majority of the House, in order to become effective, and it must be remembered that, important as these powers are, they are for use in emergencies. Sometimes for months in succession this committee has been entirely inactive."—S. W. McCall, *Business of Congress*, pp. 131, 133, 135.—"Serious objection was made, however, to this centralization of power in the hands of the Speaker.

ALSO IN: D. A. Stanwood, *History and procedure of the House of Representatives*, pp. 41-62.

"Cannonism [so-called from the methods employed by Joseph G. Cannon] can be summed up very briefly. The Speaker, as a member and the dominator of the Committee on Rules, made the rules which gave him absolute and arbitrary power over all the activities of the House. He compelled complete obedience to his rules through committee assignments. . . . The Speaker was supreme and sufficient in himself for all ordinary purposes of obstruction. . . . Under the Cannon system, the Speaker was supreme, the floor leader a figurehead."—L. Haines, *Lawmaking in America*, pp. 6-7.—"The storm broke during the regular session of 1900-1910. Several insurgent members showed irritation under the rulings and other acts of the Speaker; till finally a leader of the group, George W. Norris of Ne-

braska, introduced, March 19, 1910, a resolution to increase the number of members of the Committee on Rules from five to ten to provide for the election of all members by the House, and to exclude the Speaker from membership. Objection was made that the resolution was out of order and after a dramatic parliamentary battle lasting throughout almost an entire night, the contention was sustained by the chair. On appeal from the decision, the Democrats and insurgent Republicans adroitly joined forces and accomplished the Speaker's defeat: whereupon they carried a rule closely following the lines of Norris's motion. The next step was a resolution to declare the speakership vacant and to proceed to the election of a new incumbent. . . . Cannon met the issue squarely and defied his enemies to depose him. It became clear that further action would break the Republican power in the House. Hence only eight of the insurgents supported the motion, which was lost by a vote of 155 to 192. The outcome of this dramatic episode was the transfer of most control over legislative procedure from the Speaker, or at all events from an oligarchy composed of the Speaker and his friends, to a committee chosen and controlled by the membership of the House. When, in 1911, the Democrats signaled their return to mastery in the House by stripping from the presiding officer [Champ Clark, 1911-1919] the appointment of all remaining standing committees and vesting this function in the Ways and Means Committee, subject to ratification, by the House, the chamber took fuller control over its affairs than it had exercised at any time since the Civil War."—F. A. Ogg, *National progress*, pp. 173-175.—In the spring of 1919, the Republicans, having a majority in the House of Representatives for the first time since 1911, elected Frederick H. Gillett to the speakership. His chief opponent was Representative Mann of Illinois, who was a leader in the days of Cannonism and who had made himself extremely unpopular by his votes and general attitude on many issues of the Great War. By electing Mr. Gillett to the speakership, however, the progressive element in the Republican party had not gained complete control of the House. The changes of 1911 had shorn the speaker of much of his power and increased the power of the committees. The Republican caucus of 1911 gave to a so-called Committee on Committees the right to appoint committees. This new body was controlled by Mr. Mann, former speaker Cannon, and other "standpatters." The new rule of procedure thus worked against the very men who had fought for its adoption in 1911.

"Under the rules, all bills, resolutions, and memorials are referred to the standing committees. These are some sixty in number in the House of Representatives, but they differ greatly in importance, according to the nature of their jurisdiction and the amount of work which they are required to do. The temporary prominence of some particular issue in politics will impart a transient importance to a given committee, which importance may be lost with a change of political conditions. . . . It is sometimes said of the House that it has as many leaders as it has chairmen of committees. But as it is unusual for more than half of the sixty committees to have bills before the House, the number of leaders, according to this definition, is very much reduced. . . . The chief work of the House is transacted in the first instance by fewer than a dozen committees, although at times a half dozen more may be important. The Committee on Ways and Means was established as a select committee in the first session of the First

Congress and in 1802 was made and has since continued to be a standing committee. It had jurisdiction over both revenue and appropriation bills, and it also exercised a general oversight over the public debt and the departments of government."—S. W. McCall, *Business of Congress*, pp. 45-47.—"Places upon important standing committees are much sought after. What factors determine who shall get the most coveted assignments? Length of service counts for a great deal, more than any other single factor. Places on important committees naturally go to congressmen of experience, not to new members. The chairmanships go to the leaders of the majority party; indeed it is sometimes said that the chairmen of the chief committees form the closest American analogy to the 'members of the government' in the House of Commons. The chairman of each committee is selected as a rule from among those who have in previous years served as members of that committee. The senior or 'ranking' member is next in line for promotion, provided, of course, that his party continues in control of the House. So, also, members of minor committees, after doing good service in one Congress, if reelected, are deemed entitled to promotion in the next. A member's own personal preferences are also ascertained and, so far as practicable, respected. Subject to these general principles, then, this is what now happens; first of all, the members of the House, each in their own party caucus, select the Committee on Ways and Means. The majority party selects fourteen members of this committee, while the minority chooses seven. This Committee on Ways and Means [since 1919 it is the Committee on Committees] then presents for adoption by the House a slate of all the other committees. On every Committee the dominant party is invariably given a majority. When the slate is presented, the House usually accepts it without any material change, and the committees so constituted remain intact until the end of that Congress, in other words during two sessions. So far as the actual composition of committees is concerned, too much weight must not be attached to the changes of 1910-1911. It is true that these changes impaired the Speaker's authority considerably, but in the main the members of the House get just about the same committee assignments to-day that they would have obtained before the change was made. Length of service, personal ability, amenability to party discipline, willingness to work harmoniously with others—these things rather than the vagaries of either Speakers or caucuses have always determined and are always likely to determine whether a congressman will be placed high up or low down on the list, no matter what the rules may provide. In that respect Congress is no different from any other body of sensible men."—W. B. Munro, *Governments of the United States*, pp. 200-201.

Progress of bills.—Introduction.—Hearings.—Calendars.—Three readings.—"The functions and powers of the committees may best be made clear, perhaps, by a brief explanation of the way in which bills are dealt with, step by step. In the first place any member of the House may present a bill or draft of a proposed law. It may be one that he himself has prepared and favors, or it may be one that any outside individual or organization has asked him to introduce. The procedure is simplicity itself; the congressman merely writes his name on the bill and places it in a box at the clerk's desk. Thousands of bills are put in during the opening days of each session. This freedom with which bills may be introduced has both good and bad features. It gives reality to

the citizen's constitutional right of petition and perhaps encourages the putting forth of new legislative ideas. On the other hand, it permits Congress to be deluged with all manner of eccentric proposals which have no chance whatever of being adopted. Presently all these bills are sorted out and are referred, under the rules of the House, to appropriate committees. If there is any doubt as to what committee should have a particular bill, the Speaker decides. If a measure is of great importance, the committee to which it is referred may assign it for preliminary consideration to a sub-committee. The work of these sub-committees has become increasingly important in recent years and in many cases the real work of getting measures in shape for presentation to Congress is performed by them. Committee proceedings are usually public, but executive sessions may be held when desired. In any case the committee or sub-committee will hear all who want to be heard either for or against the bill. This is done as a matter of courtesy, not of constitutional or legal right; but the opportunity to be heard is practically never denied to any one. If many persons desire to appear before the committee, the hearings may last, day after day, for weeks. Committees usually sit in the forenoon, and no committee, except the Committee on Rules, may hold meetings while the House is in session unless it secures special permission from the House itself. During these hearings a record of the proceedings is kept by the clerk of each committee. When a hearing is finished, the committee decides, either at once or on a later day, what report, if any, it will make to the House on the measure. Several courses are open to any committee with reference to a bill which it has had under consideration. It may favorably report a bill just as it stands. In that case the measure will have, under ordinary conditions, a good chance of passing, especially if the favorable recommendation of the committee is made unanimously. Or, again, the committee may approve the bill in some points but not in others. In that case it may redraft the measure and report it favorably in a new form. Here too the chances of passage are good. When a favorable report is made upon any measure, either in its original or revised form, the report goes to the Clerk of the House, who enters it upon the journal, and in due course it is set upon one of the calendars for a first reading. Certain committees have the privilege of reporting at any time directly from the floor of the House, although this is now not usually done. But in the great majority of cases the committee will not be favorably impressed with the measure at all, in which case it usually makes no report whatever. Over twenty thousand bills are introduced at each session of Congress, but the great majority of these have not the slightest chance of ever 'coming out of committee.' The simplest way to kill any proposal is, therefore, to have a committee refrain from reporting it, because no bill can be acted upon by the House until a committee sends it up. Since 1910 it has been possible, in certain cases, for the House to call up a bill from the hands of a committee and proceed to action upon it; but this is very rarely done. While favorable action by a committee does not, therefore, mean that a bill is assured of passage, adverse action, which is no action at all, is automatic execution. Most bills are guillotined by committees, as indeed they ought to be. The committees of Congress are, therefore, the great sifters of legislative proposals. Without them the introduction of bills would have to be rigidly limited or the whole mechanism

of law-making would soon become hopelessly clogged. When a measure is reported to the House by a committee, it is placed on one of the calendars so that it will be given its various readings and voted upon. There are three calendars. One of them, known as the Union Calendar, contains all favorably reported measures relating to avenue, appropriations, and public property. A second, called the House Calendar, includes all public bills not included in the foregoing category. The third, known as the Calendar of the Committee of the Whole, or the Private Calendar, makes a place for all measures of a private character. Matters on each calendar are not necessarily, or even usually, taken up in order; they may be called up out of turn. At every daily session there is a 'morning hour,' so-called (it may be an hour or a whole day), for the consideration of general bills called up from one of the calendars by committees which have favorably reported upon them. Then, if time permits, the House goes into Committee of the Whole to discuss revenue or appropriation bills, or, failing these, some other public bills on the House Calendar. The regular order of business is frequently interrupted, however, by reports from privileged committees, by the established practice of setting aside certain days each month for the consideration of particular matters, or by the discussion of business brought in under a suspension of the rules which the House can authorize at any time by a two-thirds vote. It is desirable, moreover, that important measures, usually those which provide money for urgent purposes, may on necessary occasions gain the right of way, and this is secured by the action of the Committee on Rules, which may report a special rule putting such bills ahead of other business. Every bill, of whatever sort, must have three readings in the House. The first reading is by title only; the second is a reading of the whole measure, and at this stage amendments may be offered; the third reading is also by title unless some member requests that it be again read in full which hardly ever happens. If the measure passes to its third reading, it is engrossed and must go through a further formal stage of being finally passed by the House before it is sent to the Senate for concurrence. Four methods of voting are used. The common plan is by *viva voce* vote. Any member may doubt the result and call for a rising vote. If a certain number of members so demand, the vote is again taken by tellers who are appointed by the Speaker. The members pass between the tellers and are counted. Finally, the constitution provides that if one-fifth of the members ask for it, the ayes and nays shall be recorded. A roll-call must always take place when the passing of any measure over the President's veto is being decided. The debate on a bill almost invariably takes place upon the question of ordering it to a third reading, although it sometimes continues upon the question of final passage. Reconsideration may also be asked for after the House has voted at either of these stages. When the measure succeeds in running this entire gauntlet of readings and votes, it does not become a law, of course, but merely goes to the Senate, where substantially a similar course of procedure is encountered. When a bill is reached on one of the House calendars or is called up out of turn, the usual practice is for the chairman or some other member of the committee which has reported it favorably to open the debate. If the favorable report has not been made unanimously, some minority member of the committee then follows with a speech in opposition. When members of the

committee have had their say, other congressmen are recognized in their turn, and thus the debate runs on. No member may address the House for more than one hour without unanimous consent, and when the House is in Committee of the Whole, speeches are limited to five minutes only."—*Ibid.*, pp. 201-205.

Committee of the Whole.—"The Committee of the Whole House, as its name implies, is simply the same body in another form. . . . The Speaker of our House by authority conferred in the rules names the chairman of the Committee of the Whole. There is no report of the proceedings, except the stenographic report in the Congressional Record, other than that made by the chairman of the Committee to the House when the Committee rises, and when that report is made, it is spread upon the records of the House. A vote by yeas and nays cannot be taken in the Committee of the Whole. . . . Very important business is transacted in Committee of the Whole, and its sessions occupy the greater part of the time of the House. There are two Committees of the Whole, technically, one of the 'Committee of the Whole House on the State of the Union' and the other the 'Committee of the Whole House.' In the latter, . . . bills of a private nature are considered. . . . The Committee of the Whole House on the State of the Union is the really important Committee, and its calendar includes revenue bills and the public bills which require an appropriation of money. . . . A quorum . . . is one hundred members, which is slightly more than one-half as large as the quorum of the House itself. . . . The proceedings in Committee are somewhat free and informal. . . . After the consideration of a measure has been completed in Committee, . . . it votes to rise, the Speaker resumes the chair, and the chairman of the Committee reports . . . the action of the Committee upon the bill. . . . The House must act upon the report . . . to make it effective."—S. W. McCall, *Business of Congress*, pp. 74-77.

ACTIVITIES OF THE HOUSE AND SENATE

Powers.—"The powers of the House of Representatives include all those of the Senate except treaty-making and confirmation of appointments. In addition the House has the exclusive right to initiate money bills and to bring impeachment proceedings. [The impeached officials are then tried by the Senate as described above. See above: Senate: Impeachment.] The constitution contains eighteen clauses expressly granting powers to the national government, hence the customary reference to 'the eighteen powers of Congress.' . . . The powers granted to Congress by these eighteen clauses are those which the makers of the constitution agreed upon as being either necessary for the maintenance of a vigorous central government or of such a general character that they could not be left to the precarious tutelage of the several state legislatures."—W. B. Munro, *Government of the United States*, p. 216.—"The powers of Congress, delegated to it as a whole, or to its respective Houses, and largely regulative of congressional membership and procedure, may be described as necessary parliamentary powers, excepting the powers of the respective Houses in the selection of President and Vice-President."—F. N. Thorpe, *Essentials of American constitutional law*, p. 20.—"But when we speak of the legislative powers vested in Congress, we do not mean, commonly, these strictly parliamentary powers; rather do we mean another group or class of powers in-

cluded under such headings as 'taxation,' 'money,' 'commerce,' 'banking,' 'the army,' 'the navy,' 'territory,' and others of notable rank. . . . Practically it is congressional legislation which, sooner or later, brings out clearly,—or at least as clearly as the government of the United States can bring out,—the real nature of the government. It is congressional legislation that determines the objects and the extent of taxation, both direct and indirect; that regulates commerce, coins money, and fixes its value; affords equal protection to citizens, and applies the police power of the United States. It is congressional legislation which largely determines the jurisdiction of federal courts and assigns duties and powers to the President. In brief, the legislative powers vested in Congress reflect the convictions of the people of the United States of the eighteenth century, when the trend of political thought was to dethrone kings and to enthrone legislatures, with basic regard for individualism. . . . The American people did not create an omnipotent Congress, but they created a Congress having few limitations and these they practically nullified by the 'sweeping clause' which empowers Congress 'to make all laws which shall be necessary and proper for carrying into execution,' the powers granted, 'and all other powers vested by this Constitution in the government of the United States, or in any department or officer thereof.' The phrase 'necessary and proper' practically includes all the purposes of government, and these the Constitution itself sets forth, as To form a more perfect Union, To establish justice, To insure domestic tranquility, To provide for the common defense, To promote the general welfare, To secure the blessings of liberty to themselves ('the people of the United States) and their posterity. This exercise of power by Congress is essentially political, and Congress alone is judge of 'the choice of means and is empowered to use any means which are in fact conducive to the exercise of a power granted by the Constitution.' This conclusion is inevitable. A legislative body could exist on no other principle. May Congress abuse its powers? Possibly. The remedy is through popular election of members of either House, and repeal of the laws which—even though their constitutionality be sustained by the courts, may, in the judgment of the people, transcend limits popularly supposed to be placed on Congress. Thus there are two checks on congressional legislation: the courts of law and the votes of the people. It follows that the American sovereign—the people—may by their votes approve or condemn congressional legislation—approval or condemnation resulting in a continuance or a change of membership of Congress, in conformity to the relative strength of political parties. It is here that part of the unwritten constitution is disclosed. The written Constitution contains no reference to political parties, but actual government in the United States is by and through political parties who, as organized agencies of the public mind, give expression, in large measure, to the unwritten constitution. Interpretation of the Constitution, and of course, of the powers of Congress, is largely interpretation by political parties. Congress exercises any of its powers as an agent of its sovereign, the people of the United States. . . . Unless restrained by the federal Constitution the power of Congress as to mode, form or extent of taxation is unlimited."—*Ibid.*, pp. 21, 25-28, 38, 53.—"Some, who have not denied the necessity of the power of taxation, have grounded a very fierce attack against the constitution, on the language in which it is defined. It has been urged and echoed, that power

'to lay and collect taxes, duties, imposts and excises, to pay the debts, and provide for the common defense and general welfare of the United States,' amounts to an unlimited commission to exercise every power which may be alleged to be necessary for the common defense or general welfare. No stronger proof could be given of the distress under which these writers labor for objections, than their stooping to such a misconstruction."—*Federalist*, No. 41.—The following limitations on these powers of Congress are found in the Constitution. "No Capitation or other direct Tax shall be laid, unless in Proportion to the Census or Enumeration. . . . No Tax or Duty shall be laid on Articles exported from any State."—*Constitution of the United States of America*, Article 1, sect. 9.—See also WAR POWERS OF THE UNITED STATES: Taxing power.—"Duties, excises, and imposts must be uniform throughout the United States, and this condition is a fundamental limitation. . . . The power to coin money belongs exclusively to Congress as a mark and necessary incident of sovereignty."—*F. N. Thorpe, Essentials of American constitutional law*, pp. 40-41.—The Constitution gives to Congress the power "to borrow money on the credit of the United States." There are no limits upon this power. The national debt began with the beginnings of our government. From 1836-1861 it was so small that the United States was the only important country in the world that had a surplus in its treasury. The Civil War, however, increased the debt tremendously. At the outbreak of the World War in 1914 our national debt amounted to about one billion dollars. Our participation in the war made it necessary for the government to borrow almost twenty billions during the two years 1917-1918. It was under the powers conferred by the borrowing clause of the Constitution that Congress, in 1791, chartered a great national bank. This first Bank of the United States lasted until 1811. The second bank was established in 1816 and came to an end in 1837.—See also DEBTS, PUBLIC: United States; and MONEY AND BANKING: Modern: 1790-1816; 1817-1833.—"The power of Congress to establish post offices and post roads is not an exclusive power, for the States are not prohibited to legislate on the same subject. But Congress has unlimited power over it and may designate what may be included in and what may be excluded from the mails. This exercise is doubtless of the police power. It does not follow that congressional establishing and regulation of post offices and post roads mean that Congress has power to deal with crime or immorality within a State in order to maintain that it possesses the power to forbid the use of the mails in aid of the perpetration of crime and immorality. So a postal law of Congress excluding lottery tickets from the mail is not an abridgment of the freedom of the press. Congress, by reason of the nature of its functions, is empowered to determine what shall and what shall not be carried in the mails, and the right of freedom of speech does not give the right to injure the objects or to defeat the purposes which government is ordained and established to further and protect. But the State, in exercise of its police power, may undoubtedly protect its citizens from injury springing out of that intercourse known as the mail service so long as it is wholly intrastate,—that is, within its jurisdiction [see also CENSORSHIP: United States]. Copyrights and patent rights are privileges granted by Congress for a term of years and are strictly statutory—for the United States has no common law. The States may exercise their powers in like manner,

subject to the essential condition that the Constitution is the supreme law of the land. Copyrights and patent rights are examples of rights which exist by act of Congress, but the right thus created does not annul the ordinary police power as put forth in the police regulations of a State."—*Ibid.*, pp. 42-43.—The Constitution gives to Congress the power to "promote the progress of science and the useful arts, by securing for limited times to authors and inventors the exclusive right to their respective writings and discoveries.

"By the Constitution Congress is empowered 'to regulate commerce with foreign nations, and among the several States, and with the Indian tribes.' The enormous powers Congress wields through this clause cannot be fully defined. The Supreme Court has not defined them. Like sovereignty itself, the exercise of its essential powers, even when delegated functionally in government, does not yield to the limits of definition. The decisions of the Supreme Court are not definitions of power over commerce so much as they are definitions of the particular exercise of the power of Congress within its jurisdiction, with respect to commerce, by the Constitution. . . . No evil contributed more to the feebleness of the old Confederation than its inability to regulate commerce. The mischief being great, the grant of power to correct the mischief was correspondingly great. . . . The commerce clause has become the authority for exercising the enormous powers of the national government as is illustrated, possibly, by the exercise of power under no other clause. . . . Commerce is intercourse, and comprehends traffic, navigation, telegraphic intercommunication, and consequently, communication by telephone, wireless, or signals. . . . The power to regulate commerce among the several States extends to commercial highways and to agencies employed in such commerce. Thus waterways capable of navigation and the free and unobstructed use of them are subjects of congressional legislation under the commerce clause. From this it follows that Congress legislates concerning these waterways, their protection, their dredging, the bridges that cross them, the boats that navigate them, the form, size, construction, command, and equipment of these boats, the inspection of boilers, the licensing of officers,—indeed, concerning navigation in its broadest application under the commerce clause. Vessels engaged in such commerce are described as 'the public property of the nation, and subject to all the requisite legislation of Congress.' In like manner, the national power to regulate commerce extends over interstate commerce when carried on by land transportation. Thus cars on railroads used in interstate commerce must be equipped with locomotives with driving-wheel brakes. To what length this regulation of commerce may be carried by Congress is unknown, nor can it be determined in advance. The limitations, if any, are of expediency. Thus in exercise of this vast power Congress may regulate hours of labor, wages, selection and use of material in construction of vehicles engaged in such commerce; the education, training, and conduct of persons engaged in handling such commerce; the age of employment; and physical equipment for the welfare of employees, as well as tariff rates and other incidents. But in the exercise of this power to regulate commerce Congress has legislated 'to protect trade and commerce against unlawful restraints and monopolies.' Individuals, or corporations under State laws, engaged in business, in so far as they are contracts, combinations in the form of trusts, or otherwise, or conspiracies in restraint of trade or commerce

among the several States are illegal. Doubtless Congress has made but a beginning in its exercise of this power."—*Ibid.*, pp. 63-64, 66-67, 70-72, 83.—See also **BOYCOTTS**; **TARIFF**; **TRUSTS**: United States.

"The Congress shall have power . . . to declare war, grant letters of marque and reprisal, and make rules concerning captures on land and water; to raise and support armies, but no appropriation of money to that use shall be for a longer term than two years; to provide and maintain a navy; to make rules for the government and regulation of the land and naval forces; to provide for calling forth the militia to execute the laws of the Union, suppress insurrections, and repel invasions; to provide for organizing, arming, and disciplining the militia, and for governing such part of them as may be employed in the service of the United States, reserving to the States respectively, the appointment of the officers, and the authority of training the militia according to the discipline prescribed by Congress."—*Constitution of the United States of America, Art. I, sect. 8.*—See also **MILITARY LAW**: Sources; **TERRITORIES AND DEPENDENCIES OF THE UNITED STATES**; **WAR POWERS OF THE UNITED STATES**: Congressional power over state militia; Distribution of power; Power of the President; Power to pass conscription laws; Power to wage war, etc.; **TREASON**.

Minor powers of Congress include the right to establish uniform rules of naturalization and bankruptcy; the standardization of weights and measures; the punishment of counterfeiting; the creation of subordinate federal courts; the punishment of piracy and "felonies committed on the high seas, and offences against the law of nations"; complete and exclusive jurisdiction over the District of Columbia. (See **DISTRICT OF COLUMBIA**: Location.) Congress also has control over the Primaries. See **SUPREME COURT**: 1921.
