DESCARTES, René (1596-1650), French philosopher. In 1617 he entered the army as a volunteer in order to widen his experience and served under Maurice of Nassau, Tilly and Buquoy; left the army four years later; 1629, retired to Holland, where he prepared most of his work; 1649, went to Sweden in answer to the invitation of Queen Christina. "Descartes, like Bacon, resolutely sets his face against the old authorities and, like him, emphasizes the practical character of all philosophy. 'Philosophy is a perfect knowledge of all that man can know, as well for the conduct of his life as for the preservation of his health and the discovery of all the arts.' Unlike the English empiricist [Bacon] however, he takes mathematics as the model of his philosophical method; study logic, he tells us, and practise its rules by studying mathematics. . . . At the same time, he accepts the fundamental principles of the time-honored idealistic or spiritualistic philosophy and attempts to adapt them to the demands of the new science: his problem is to reconcile mechanism and the notions of God, soul, and freedom. . . . Among Descartes's works are the *Discours de la méthode* (which appeared with *Dioptries, Meteors, and Geometry* in a series of *Philosophical Essays*) in 1637; *Meditations de prima philosophia* (to which were added objections by several learned men, Arnauld, Hobbes, Gassendi, and others, together with rejoinders by the author himself), 1641; *Principia philosophia*, 1644; *Les passions de l'âme*, 1650."—F. Thilly, *History of philosophy*, pp. 272-273.—See also ALGEBRA; EUROPE: Modern: Revolutionary period; FRENCH LITERATURE: 1608-1715; MEDICAL SCIENCE: Modern: 17th century: Descartes and the dawn of modern physiological science.

DESCENT, Doctrine of. See EVOLUTION: Basis of theory of organic evolution.

DESCHANEL, Paul Eugène Louis (1856-1922), French statesman and author. Vice-president of Chamber of Deputies, 1896, and its president, 1898-1902; president of the commission on foreign and colonial affairs, 1905-1912; president of Chamber of Deputies, 1912-1914; president of France, 1920, resigning on account of ill health. His writings have dealt chiefly with political subjects.—See also FRANCE: 1920 (January).

DETMOND, town in Germany, southwest of Hanover. See **SAXONS**: 772-804.

DETROIT, American city of great commercial importance, and largest in the state of Michigan; situated on the Detroit river. It possesses a splendid harbor with a water front of nearly eleven miles. The Detroit river is here a boundary between the United States and Canada and is sometimes referred to as the "Dardanelles of the New World." "The name Detroit is from the French 'd'étroit,' meaning the strait and was so called because of its situation on the narrow strait connecting Lake St. Clair with Lake Erie. The history of Detroit is closely interwoven with that of the whole northwest, which began as early as Canada and Virginia."—H. Keep and M. Burton, *Guide to Detroit*, p. 5.

1648.—First occupied by the **Coueurs de Bois**. See **COUREURS DE BOIS**.

1670.—Visited by La Salle.—In 1670 La Salle stopped at Detroit but made no permanent settlement.

1686-1701.—First French forts.—**Cadillac's founding of the city**.—At the beginning of the war called "Queen Anne's War" (1702) "Detroit had already been established. In June, 1701, la Mothe Cadillac [Commandant of the French territory near Detroit], with a Jesuit father and 100 men, was sent to construct a fort [Fort Pontchartrain] and occupy the country; hence he is spoken of as the founder of the city. In 1686, a fort [called Fort St. Joseph] had been constructed to the south of the present city, where Fort Gratiot now stands, but it soon fell into decay and was abandoned. It was not the site selected by Cadillac."—W. Kingsford, *History of Canada*, v. 2, p. 408.—"Fort St. Joseph was abandoned in the year 1688. The establishment of Cadillac was destined to a better fate and soon rose to distinguished importance among the western outposts of Canada."—F. Parkman, *Conspiracy of Pontiac*, v. 1, p. 213.

1701-1755.—Importance to the French. See **CANADA**: 1700-1735.

1760.—French settlement when surrendered to the English.—"The French inhabitants here are settled on both sides of the river for about eight miles. When I took possession of the country soon after the surrender of Canada they were about 2,500 in number, there being near 500 that bore arms (to whom I administered oaths of allegiance) and near 300 dwelling houses. Our fort here is built of stockadoes, is about 25 feet high, and 1,200 yards in circumference. . . . The inhabitants raise wheat and other grain in abundance, and have plenty of cattle, but they enrich themselves chiefly by their trade with the Indians, which is

here very large and lucrative."—R. Rogers, *Concise account of North America*, p. 168.

1763.—**Pontiac's siege**. See **PONTIAC'S WAR**.

1775-1783.—Held by the British throughout the War of Independence. See **U. S. A.**: 1778-1779: Clark's conquest.

1805.—Made the seat of government of the territory of Michigan. See **INDIANA**: 1800-1818.

1805-1847.—Development from a village to capital of the state.—Detroit was incorporated as a village in 1815, and in 1824 it was chartered as a city by the Legislative Council of Michigan territory. It served as capital of the territory from 1805 to 1837 and as capital of the state of Michigan from 1837 to 1847 when the seat of the government was moved to Lansing.

1812-1813.—Surrender of General Hull.—American recovery. See **U. S. A.**: 1812 (June-October); 1812-1813: Harrison's northwestern campaign.

1812-1916.—Growth of the city.—**Industries**.—**Automobiles**.—Organization of the Bureau of Governmental Research.—"The real development of the community began immediately after the war of 1812. Since then, few cities have enjoyed such a steady and rapid growth. In 1830, Detroit was the fifty-third city in size among American municipalities, in 1910 Detroit stood ninth, and today, [1916] it stands in fourth place. The present rapid increases in population, building construction, commerce and industry indicate that it has not yet reached its final rank among the cities of America."—T. L. Munger, *Detroit and world trade*, p. 114.—"The advent of the automobile, in fifteen years, has made Detroit the most distinctively industrial center in the United States. . . . In the first five years of the active automobile industry at Detroit, from 1904 to 1909, the value of this output increased from six to sixty million dollars. In 1915 this valuation had increased to over \$260,000,000. . . . Having already established a manufacturing product-value aggregating upwards of a hundred million dollars before the automobile came to be a factor, Detroit led in the making of stoves, varnishes and paints, pharmaceutical preparations, electrical furnaces and was sixteenth in rank among the manufacturing cities of the country. . . . Detroit today [1916] has more than three-quarters of a million population, makes more than \$600,000,000 worth of manufactured goods annually—among them more than half of all the automobiles manufactured in America—and is one of the most important shipping points in the country."—R. C. McLean, *Detroit, the industrial city (Western Architect, Oct., 1916, pp. 120, 136)*.—"The Detroit Bureau of Governmental Research was organized March 22, 1916: (1) To get things done for Detroit through co-operation with persons who are in office, by increasing efficiency and eliminating waste, and (2) To serve as an independent, non-partisan agency for keeping citizens informed about the city's business."—*Citizen and the city government (Detroit Bureau of Governmental Research, July, 1917, p. 2)*.

1917-1919.—Manufacture during the World War.—"With the start of the European War in 1914, a number of Detroit factories accepted war orders from the various allied nations, and so when the United States declared war against Germany, on April 6, 1917, Detroit was prepared industrially to some degree for the vast flood of domestic war orders that poured in. . . . Chief among the Detroit munition products were the Liberty airplane motor, the special recoil mechanism for French howitzers, Eagle boats, shells, gun caissons, store wagons, tractors, tanks, motor

trucks, uniforms, gas masks, helmets, and one concern manufactured complete airplanes."—T. L. Munger, *Detroit and world-trade*, pp. 27-28.

ALSO IN: A. E. Parkins, *Historical geography of Detroit*.—L. P. Powell, *Historic towns of the western states*, pp. 87-119.

1918-1920.—New charter.—Satisfactory results.—"Detroit adopted a new charter in 1918 'as a war measure.' The short ballot was not adopted in full, but a 42-man council elected from twenty-one wards gave way to a nine-man council under a strong mayor. . . . They [the people of Detroit] went through the procedure of drafting, adopting, and putting to work a new charter in which there is a unique combination of the board of directors principle, the general manager plan, and the ancient theory of an elective mayor and council. After nearly two years of experience under this plan the great majority of tax payers and voters are satisfied. . . . Since its adoption June 25, 1918, by a majority of almost eight to one, it has received nine amendments, none of which caused the slightest change in its fundamental principles. . . . [The framers] sought a modern constitution in which local experience and local personnel were not shunted aside entirely. Thus they excluded at the time proportional representation, a city manager chosen by a commission, and insistence on one-man commissions. The accepted rule was to substitute one for more than one, but the exceptions, such as the water board, the arts, city plan, and other boards, prevailed wherever satisfactory results were being attained with division of responsibility. . . . [The framers placed] all governmental activities in charge of a mayor and nine council-men, all chosen at large on a non-partisan ballot, and for a term of two years. . . . Abnormal growth has brought its difficulties, such as lack of houses, and thousands of transients who never heard of civic interest. Our worst obstacle is the perennial controversy over street car transportation. . . . James Couzens [was elected mayor in 1918] . . . on a platform which derided politics and politicians. Business men predominate in the nine-man council. . . . Of the council members, five were members of the old and grossly objectionable ward council—these five, however, standing for progress, and three of them known as of the minority. . . . Few cities, big or little, are willing to put so much responsibility on their mayors as Detroit has done."—W. P. Lovett, *Detroit and its new charter*, pp. 149-151.—The charter abolished the Board of Estimates and placed the power of determining appropriations and bond issues in the hands of the mayor and his council. Elections are held at a separate time from those of the nation and state; the ballot is non-partisan; the judges hold office for four years and are elected on a general ticket. The charter changed the Board of Education, made up of a member from each ward, to a board of seven members elected on a general ticket and holding office for six years.

1919-1922.—Purchase of street railway.—At the time of Mayor Couzens's election the people voted to acquire the street railway system, but the company's terms could not be agreed upon. After a protracted street railway war the mayor was re-elected and took office in 1921. The company finally agreed to sell, and the purchase was authorized at a special election, April 17, 1922.

1920.—Reform in judicial machinery.—"The city of Detroit has recently established an important innovation in its judicial machinery. In place of the two former more or less independent courts—the police court, of three judges, having

jurisdiction of misdemeanors, and the recorder's court, of two judges, having jurisdiction of felony and city ordinance cases—there now exists a single criminal court, to be known as the recorder's court, which possesses all kinds of criminal jurisdiction. This change is expected materially to reduce the delays and uncertainties inherent in the former system, which secured for professional criminals comfortable respites; this protection, under the old system, came, in felony cases, from the provision for preliminary hearing in the police court and trial in the recorder's court; in misdemeanor cases, from the provision for trial in the former court with right of appeal and new trial in the recorder's court. The bill was bitterly fought in the 1919 session of the state legislature, and the opponents secured some modifications of the original bill, one of them requiring reference of the bill to the voters of Detroit. Following a keenly contested popular campaign, the act was approved at the election held April 5 of this year by a vote of 106,132 to 30,617."—F. W. Croker, *Michigan, 1920: Detroit Courts (American Political Science Review, Nov., 1920, no. 4)*.

1920.—Adoption of platoon plan of education.—"The 'Gary plan', modified into the 'platoon or duplicate plan', has been adopted as the official policy of the schools of that city [1920]. . . . The platoon school offers a type of organization and building in which a well-balanced, modern curriculum may be provided and effectively used. . . . Fifteen of these 'platoon schools' are now organized, and fifteen more are under organization. The school officials have determined upon a 'gradual reorganization of the elementary system on the platoon basis.' . . . The Board of Education stands solidly behind this policy. . . . The realization of this undertaking will place within the reach of Detroit children elementary school facilities unexcelled by those of any other city in the United States."—J. K. Hart, *Platoon schools in Detroit (Survey, Oct. 9, 1920, pp. 60, 70)*.

1921.—Unemployment.—Establishment of unemployment bureau.—"In Detroit, Fred R. Johnson, associate secretary of the Detroit Community Union, reports that it is estimated that the automobile industry is running at about 30 per cent of its normal capacity. According to his reckoning, from 100,000 to 125,000 workers have been laid off with the closing or partial closing of factories. The situation is being somewhat relieved, he says, by the large number of unattached men and families who are leaving the city for their previous homes. It has been estimated that not to exceed 75,000 of those who were laid off remain in Detroit. With these, however, Detroit has undertaken to deal constructively. Concerning the measures of relief and adjustment which have been proposed, Mr. Johnson says: The municipality itself has taken a progressive stand. With the approval of Mayor James Couzens the Department of Public Welfare established an employment bureau through which employment on public work in the various city departments is being provided. Out of 11,204 registered to date with this bureau 3,857 have been given work. Mr. Couzens is now advocating that the city should at once begin the construction of the bridge over the Detroit River to Belle Isle for which \$3,000,000 was voted at a recent city election."—*Unemployment in Detroit (Survey, Jan. 8, 1921, p. 527)*.—See also HOUSING: United States.

DEUTSCHE BANK.—"The rapid development of the Deutsche Bank [of Berlin] from its establishment in 1870 quickly placed it in the front rank of German credit institutions. For many years now it has been by far the largest bank in Germany, excluding the Reichsbank. The New York branch was opened in 1871. In 1886 was formed the subsidiary Deutsche Ueberseeische Bank [Banco Aleman Transatlantico], later the Mexikanische Bank für Handel und Industrie, and in 1889 it helped to create the Deutsch-Asiatische Bank [and, in company with other German banks it helped to finance the Anatolian Railway in Turkey; in 1903 it took part in the promotion of the Bagdad Railway]. Prior to the War the parent institution controlled subsidiaries, or was allied with institutions operating, in almost every country, but hostilities placed a ban upon its foreign activities, and its business is now largely confined to its numerous offices in Central Europe. In 1917 two banks—the Schlesischer Bankverein of Breslau and the Norddeutsche Creditanstalt of Koenigsberg—were absorbed, and in 1920 similar arrangements were made with the Hannoversche Bank, the Privatbank zu Gotha, and the Braunschweiger Privatbank, whilst the already close relations existing with the Wuerttembergische Vereinsbank and the Hildesheimer Bank have since been further strengthened. The inflation which characterised German finance in 1920 resulted in a very large increase in the figures of the Bank's business for that year, the turnover reaching the enormous sum of 1,281,552,229,719 marks, or nearly treble the previous year's total and practically ten times the 1913 turnover. As, however, the mark had fallen to less than one-tenth its pre-War value, it is evident that if assets and liabilities were converted into their gold equivalents the 1920 figures would have been lower than those for 1913. It will be noted that the nominal increase in the business of the Bank during last year occurred mostly under deposits, among the liabilities, and under advances and bills receivable, on the assets side of the balance sheet. Acceptances display a marked contraction from their pre-War volume, even without allowing for the attenuated value of the mark. Investments, Stock Exchange loans, and participations in syndicates are items which show little alteration since before the War. Net profits for 1920 amounted to 173,742,242 marks, were about treble those of 1919, and five times those of 1913. If profits had increased in proportion to turnover, those for 1920 should have been ten instead of five times the 1913 figure. A dividend of eighteen per cent., against twelve per cent. in the preceding year, was declared."—*The Statist*, v. 98, Dec. 10, 1921, p. 981.—"By the increase of capital and its fusion with the Deutsche Petroleum-Aktien-Gesellschaft in May, 1922, the Deutsche Bank increased its resources (in capital and reserves) by more

than two billion marks."—*Die Bank*, Aug., 1922, p. 111.—See also **WORLD WAR**: Diplomatic background: 73, i.

DEUTSCHLAND AND U-53, Cases of.—The *Deutschland*, an unarmed German merchant submarine, in 1916 made two trips to America, bringing drugs and dyestuffs and returning with rubber and nickel. On her second return voyage, she was captured by the British. In the same year the armed submarine *U-53* visited Newport, R. I., and later sank several British vessels off the American coast. The two cases excited widespread discussion.—See also **SUBMARINES**: 1913-1920; U. S. A.: 1916 (July): Voyage of the *Deutschland*; **WORLD WAR**: 1916: IX. Naval operations: b.

"**DEUTSCHLAND ÜBER ALLES**," German semi-national anthem and popular slogan, both much heard during the World War. Allied sympathizers regarded it as meaning Germany ruling over all; Germans publicly explained that it means that a German should hold the interests of the fatherland superior to all other things; thus, "Germany over (i.e., before) everything."

DEVA, one of the Roman garrison towns in Britain, on the site of which is modern Chester, taking its name from the castra or fortified station of the legions. It was the station of the twentieth legion.—T. Mommsen, *History of Rome*, bk. 8, ch. 5.

DE VALERA, Edward (Eamonn) (1882-), leader of revolutionary party in Ireland; member of Sinn Fein organization and took leading part in the Easter revolution of 1916; sentenced to death; sentence commuted to penal servitude for life; released in general amnesty of June 15, 1917, and elected member of Parliament for East Clare; elected "President of the Irish Republic" by the Sinn Fein convention of October 26-27, 1917; president of the Gaelic league since 1917; entered into negotiations with Great Britain with a view to an Irish settlement, 1921; fighting against the Irish treaty with England, 1922. DE VICK, Henry, German inventor. See **INVENTIONS**: Ancient and medieval: Measurements.

DEVIL, general term for a spirit of evil. It is applied especially to the Christian and Jewish Satan, the supreme antagonist of God and good. He is believed to be a former angel, doomed to everlasting misery on account of his revolt against the divine supremacy, but permitted during a limited time to afflict men and tempt them to evil. He is supposed to be the leader of an army of malign spirits, who execute his designs, tempt and persecute human beings, and torment the wicked after death. He is sometimes believed to take possession of the bodies of living persons, and to

inspire them to become leaders in evil-doing or teachers of wickedness, or to drive them insane.

DEVIL'S CAUSEWAY, popular name of an old Roman road in England which runs from Silchester to London.

DEVIL'S HOLE: Ambuscade and massacre at.—On September 19, 1763, during the progress of Pontiac's War, a train of wagons and pack-horses, traversing the Niagara portage between Lewiston and Fort Schlosser, guarded by an escort of twenty-four soldiers, was ambuscaded by a party of Seneca warriors at the place called the Devil's Hole, three miles below the Niagara cataract. Seventy of the whites were slain, and only three escaped.—F. Parkman, *Conspiracy of Pontiac*, v. 2, ch. 21.

DEVIL'S ISLAND, French penal colony, situated off the coast of French Guiana, South America, celebrated as the place of imprisonment of Captain Alfred Dreyfus. See FRANCE: 1894-1906.

DEVIL-WORSHIPPERS. See YEZIDIS.

DEVLIN, Joseph (1872-), Irish Nationalist. See IRELAND: 1920.

DEVON COMMISSION, royal commission appointed in 1843 to investigate the occupation of land in Ireland. See IRELAND: 1843-1848.

DEVONPORT, Hudson, Ewbanke-Kearley, 1st viscount (1856-), British food controller, 1916-1917. See PRICE CONTROL: 1914-1918: World War: Great Britain.

DEVONSHIRE, Victor Christian William Cavendish, 9th Duke of (1868-), governor-general of Canada. See CANADA: 1916 (November).

DEVONSHIRE, third largest county in England, situated in the southwest of the kingdom, famous for its wild moors, the beauty of its landscape and coasts, and for the richness of its cultivated land which comprises about three-fourths of the area. The Druidic and other ruins which still exist on the moors show that Devon had a considerable British population, over which the Saxons are said to have established supremacy by infiltration rather than conquest. In the end of the eighth century, the district became part of the kingdom of Wessex, and before the end of the ninth century the amalgamation of the people seems to have been complete. Many of the "hundreds" into which the land was divided still retain the boundaries which appear in the Domesday Book of the eleventh century. Devon was not favorable to Harold, and therefore suffered comparatively little at the time of the Norman Conquest, though great fiefs were parcelled out among the Norman barons, whose descendants brought war into the county during the long struggle between Matilda and Stephen. It was divided between Yorkists and Lancastrians during the Wars of the Roses in the fifteenth century, but throughout the Civil War which distracted England in the seventeenth century, both Devon and its western neighbor Cornwall enjoyed a measure of peace. From time immemorial the tin miners of Devon held special courts for the regulation of mining customs. These courts, called "stannaries" courts from the Cornish word *stean* (Latin *stannum*, tin), originally met in open air "parliament" on one of the tors. Later they were held at Tavistock, Ashburton, Chagford and Plympton. They were abolished in 1896 by an act which transferred their jurisdiction to the county courts. Among the famous men of England who were natives of Devon were Drake, Hawkins and Raleigh of Elizabethan times.—See also BRITAIN: 6th century; DUMNONII.

DE VRIES, David Pieterszen, Dutch colonial

settler in America. See DELAWARE: 1629-1631; NEW YORK: 1638-1647.

DE VRIES, Hugo (1848-), Dutch botanist. See EVOLUTION: Mutation theory of De Vries.

DEWAR, Sir James (1842-), British chemist; experimented with the liquefaction of gases. See CHEMISTRY: Physical: Laws of gases; INVENTIONS: 19th century: Liquefaction of gases.

DE WET, Christian Rudolph (1854-1922), noted Boer military leader; prominent in the two wars against England, 1880-1881 and 1899-1902; in the latter, commander-in-chief of the Orange Free State forces; 1885-1897, member of the Orange Free State Volksraad; 1907, elected to Parliament, and, 1907-1915, minister of agriculture, Orange River Colony; 1908-1909, a representative in the Closer Union convention. At the outbreak of the World War he took part in a rebellion directed against the British connection and was held a prisoner for six years. Author of "Three Years' War."—See also SOUTH AFRICA, UNION OF: 1900 (June-December); 1901 (January); 1914; WORLD WAR: 1914: VI. Africa: b, 1.

DEWEY, George (1837-1917), American naval officer. Served under Admiral Farragut in the Civil War; in command of Asiatic fleet in Spanish-American War; and destroyed the Spanish fleet in the battle of Manila Bay, May 1, 1898; raised in rank from commodore to admiral of the navy, the only American officer to hold that title; member of the first Philippine commission.—See also U. S. A.: 1898 (April-July); (May-August).

DEWEY, John (1859-), American philosopher and educator. See EDUCATION: Modern developments: 20th century: General education: United States: Experimental schools.

DE WITT, Cornelius (1623-1672), Dutch naval officer. See NETHERLANDS: 1672-1674.

DE WITT, John (1625-1672), Dutch statesman, grand pensionary of Holland. See NETHERLANDS: 1651-1660 to 1672-1674.

DHANIS, Francis (1861-1909), Belgian baron and colonial administrator. See AFRICA: Modern European occupation: Beginnings of European exploration: 1897.

DHIHAD, or Jihad. See DAR-UL-ISLAM.

DHULEEP SINGH (1838-1893), maharajah of Lahore. He fought unsuccessfully against the progress of British rule in India, and spent the latter part of his life in virtual exile.—See also INDIA: 1845-1849.

DIACONOFTSCHINS, Russian sect of dissenters founded by Alexander the Deacon at Veska in 1706.

DIADOCHI, or Diadokii, immediate successors of Alexander the Great, who divided his empire. "The word diadocbi means 'successors,' and is used to include Antigonus, Ptolemy, Seleucus, Lysimachus, etc.—the actual companions of Alexander."—J. P. Mahaffy, *Story of Alexander's empire*, ch. 5.—See also MACEDONIA: B. C. 323-316.

DIADORA, ancient name for Zara. See ZARA.

DIALA RIVER, river of Mesopotamia rising in Persia and flowing into the Tigris near Bagdad. During the World War it was the scene of conflict between the Turks and the British and Russians. In 1916 and 1917 the Turks were temporarily driven back but regained the Diala in May, 1917, after the outbreak of the Russian revolution, the British, however, remaining in Bagdad.—See also WORLD WAR: 1917: VI. Turkish theater: a, 1, iii; a, 1, v; c, 4, i.

DIAMOND, Battle of (1795). See IRELAND: 1795-1796.

DIAMOND FIELDS: In Southwest Africa. See SOUTHWEST AFRICA: 1908-1914.

In Griqua, South Africa.—Discovered 1867. See GRIQUAS.

DIAMOND JUBILEE, Queen Victoria's. See ENGLAND: 1897 (June).

DIANA, Roman goddess of the Moon. See MYTHOLOGY: Germanic: Sources of knowledge, etc.; also ARTEMIS.

DIANA, Temple of. See TEMPLES: Stage of culture represented by temple architecture.

DIARBEKR, or Diarbekir, town in Northern Mesopotamia. See AMIDA, SIEGES OF; TURKEY: Map of Asia Minor; WORLD WAR: 1915: VI. Turkey: d, 1.

DIASPORA, scattered communities of Jews outside of Palestine. Generally this word is applied particularly to the dispersion among the Hellenic and Roman peoples. The diaspora resulted in some cases from a voluntary search for new commercial opportunities, in other cases from conquest by stronger peoples.—See also JEWS: B. C. 332-167; B. C. 116.

DIAZ, Armando, Italian general. In 1911, as a colonel, he served in Libya against the Turks; on November 8, 1917, was appointed commander-in-chief of the Italian armies, succeeding General Cadorna; the following year he achieved the overwhelming victory over Austria, known to the Italians as Vittorio-Veneto. See WORLD WAR: 1917: IV. Austro-Italian front: d, 4; 1918: IV. Austro-Italian theater: b.

DIAZ, Felix, Mexican general, nephew of Porfirio Diaz. See MEXICO: 1914-1915.

DIAZ, Porfirio (1830-1915), president of Mexico. Served under Alvarez in his revolt against Santa Anna, 1854; fought with Juarez and the Liberal party in the War of Reform, 1855-1861; during the French invasion (1862) and the landing of the emperor Maximilian (1864) took an active part; provisional president, 1876; president, 1877-1880, 1884-1910, resigned in May, 1911. The presidency of Diaz marked a new epoch in the history of Mexico. He reorganized the national finances, encouraged home industries, established railroads and telegraphs, and united the people of the country under his autocratic rule.—See also MEXICO: 1867-1892; 1898-1900; 1904-1905; 1909; 1910-1913; U. S. A.: 1914 (April): Mexican situation.

DIÁZ DE LA PEÑA, Narcisse Virgille (1807-1876), French painter of the Barbizon school. See PAINTING: Europe (19th century).

DIAZ DEL CASTILLO, Bernal (c. 1402-1581), Spanish soldier. See MEXICO: 1519 (October).

DIBBS, George Richard (1834-1904), Australian statesman. See AUSTRALIA: 1894-1895.

DIBRA, town in eastern Albania, occupied by the Bulgarians in 1915. See WORLD WAR: 1915: V. Balkans: b, 4.

DICASTERIA.—The great popular court, or jury, in ancient Athens, called the *Heliaea*, or *Heliastæ*, consisting at one time of six thousand chosen citizens, was divided into ten sections, called *Dicasteria*. Their places of meeting also bore the same name.—G. F. Schömann, *Antiquities of Greece: The state, pt. 3, ch. 3*.—See also ATHENS: B. C. 445-431.

DICK BILL (1903). See NATIONAL GUARD, UNITED STATES.

DICKENS, Charles John Huffam (1812-1870), English novelist. As a young man he worked chiefly as a parliamentary reporter; made two trips to the United States in 1842 and 1867; in 1858 began giving a long series of public readings, which eventually broke down his health. Among his best known novels are "David Copperfield" and "Oliver Twist."—See also ENGLISH LITERATURE:

1832-1880; BIBLE, ENGLISH: Modern estimates of the Bible.

DICKINSON, Jacob McGavock (1851-), secretary of war in President Taft's cabinet. See U. S. A.: 1909 (March): Inauguration of President Taft.

DICKINSON, John (1732-1808), American statesman and publicist. Member of Delaware Assembly, 1760; of Pennsylvania Assembly, 1762-1765, 1770-1776; of Stamp Act Congress, 1765; of First Continental Congress, 1774-1776; served in the Revolutionary War, rising in rank from private to brigadier general; member of Second Continental Congress, 1779-1780; governor of Delaware, 1781-1782; governor of Pennsylvania, 1782-1785; member of Constitutional Convention, 1787; wrote "Declaration of Rights," "Petition to the King," first draft of "Articles of Confederation," and other state papers.—See also U. S. A.: 1765; Stamp Act Congress; 1767-1768; 1774 (September); 1776 (July).

DICKMAN, Joseph Theodore (1857-), American World War general in command of the 3d Division. See WORLD WAR: 1918: II. Western front: n, 2; XI. End of the war: c.

DIEBITSCH, Hans Karl Friedrich Anton, Count (1785-1831), Russian general. See POLAND: 1830-1832.

DIEDENHOFEN, Battle of (1639). See GERMANY: 1634-1639.

DIEDERICHS, Admiral von (d. 1808), commanded five German ships which entered Manila harbor, after Admiral Devey's victory in 1808, at the same time that Captain Chichester, with three British ships, arrived.

DIEPPE, seaport of France at the mouth of the Argues river, on the English channel. In 1442 it was besieged by the English and in 1694 was bombarded and destroyed by the joint action of the English and Dutch fleet. See FRANCE: 1694.

DIERJAVINO, Gabriel Romanovitch (1743-1816), Russian poet. See RUSSIAN LITERATURE: 1752-1816.

DIES ATRI.—The days on which the Romans thought it unlucky to undertake business of importance—for example, the day after the Calends, Nones and Ides of each month—were called *Dies Atri*.—W. Ramsay, *Manual of Roman antiquities, ch. 11*.

DIES FASTI; DIES NEFASTI; DIES FESTI. See FASTI, and LUDI.

DIESKAU, Ludwig August von (1701-1767), German general in French service. See CANADA: 1755 (September).

DIET, "an assembly, council, . . . Parliament. . . . The peculiar sense of the word undoubtedly arose from a popular etymology that connected it with the Lat. 'dies,' a day, esp. a set day, a day appointed for public business; whence, by extension, a meeting for business, an assembly."—W. Skeat, *Etymological dictionary*.

Germanic.—"The annual general councils and special councils of Charles the Great did not long survive him, and neither his descendants nor their

successors revived them. They were compelled, to be sure, both by custom and by policy to advise with the chief men of the kingdom before taking any important step or doing anything that depended for success on their consent and coöperation, but they varied the number of their counsellors and the time, place, and manner of consulting them to suit their own convenience. Great formal assemblies of counsellors summoned from all parts of the realm were termed Imperial Diets (Reichstage); small, or local, or informal assemblies of a similar kind were known as Court Diets (Hoftage). Princes and other royal vassals, margraves, palsgaves, Graves, barons, and even royal Dienstmänner, were indiscriminately summoned, but the Diets were in no sense representative bodies until the Great Interregnum [see GERMANY: 1250-1272] when certain cities acquired such influence in public affairs that they were invited to send delegates. The first Diet in which they participated was held at Worms in February, 1255, by King William of Holland. Most of the cities of the Rhenish League were there represented, and they constituted an important factor of the assembly. The affairs of the church shared attention with temporal affairs in the Diets until the Popes succeeded in making good their claims to supremacy in spiritual matters. Thereafter they were altogether left to synods and church councils. . . . Imperial Diets and Court Diets continued to be held at irregular intervals, whenever and wherever it pleased the king to convene them, but Imperial Diets were usually held in Imperial cities. These were not such heterogeneous assemblies as formerly, for few royal vassals, except princes, and no royal Dienstmänner whatever were now invited to attend. Graves and barons, and prelates who were not princes, continued to be summoned, but the number and influence of the Graves and barons in the Diets steadily waned. Imperial cities were for many years only occasionally asked to participate, that is to say, only when the king had especial need of their good offices, but in the latter half of the 14th century they began to be regularly summoned. Imperial Diets were so frequently held during the Hussite War and thereafter, that it became pretty well settled what persons and what cities should take part in them, and only those persons and those cities that were entitled to take part in them were regarded as Estates of the realm. In the 15th century they developed into three chambers or colleges, viz., the College of Electors [see GERMANY: 1125-1272], the College of Princes, Graves, and Barons, usually called the Council of Princes of the Empire (Reichsfürstenthum), and the College of Imperial Cities. The Archbishop of Mentz presided in the College of Electors, and the Archbishop of Salzburg and the Duke of Austria presided alternately in the Council of Princes of the Empire. The office of presiding in the College of Imperial Cities devolved upon the Imperial city in which the Diet sat. The king and members of both the upper Colleges sometimes sent deputies to represent them, instead of attending in person. In 1474 the cities adopted a method of voting which resulted in a division of their College into two Benches, called the Rhenish Bench and the Swabian Bench, because the Rhenish cities were conspicuous members of the one, and the Swabian cities conspicuous members of the other. In the Council of Princes, at least, no regard was had to the number of votes cast, but only to the power and influence of the voters, whence a measure might pass the Diet by less than a majority of the votes present. Having passed, it was proclaimed as the law of the realm, upon receiving

the king's assent, but was only effective law in so far as the members of the Diet, present or absent, assented to it. . . . Not a single Imperial Diet was summoned between 1613 and 1640. The king held a few Court Diets during that long interval, consisting either of the Electors alone, or of the Electors and such other Princes of the Empire as he chose to summon. The conditions of membership, and the manner of voting in the College of Electors and the College of Imperial Cities remained unchanged. . . . The cities long strove in vain to have their votes recognized as of equal weight with the others, but the two upper Colleges insisted on regarding them as summoned for consultation only, until the Peace of Westphalia settled the matter by declaring that 'a decisive vote (votum decisivum) shall belong to the Free Imperial Cities not less than to the rest of the Estates of the Empire.' Generally, but not always, the sense of each College was expressed by the majority of votes cast. The Peace of Westphalia provided that 'in religious matters and all other business, when the Estates cannot be considered one body (corpus), as also when the Catholic Estates and those of the Augsburg Confession go into two parts (in duas partes euntibus), a mere amicable agreement shall settle the differences without regard to majority of votes.' When the 'going into parts,' (itio in partes) took place each College deliberated in two bodies, the Corpus Catholicorum and the Corpus Evangelicorum. The king no longer attended the Imperial Diets in person, but sent commissioners instead, and it was now the common practice of members of both the upper Colleges to send deputies to represent them."—S. E. Turner, *Sketch of the Germanic constitution*, ch. 4, 5 and 6.—"The establishment of a permanent diet, attended, not by the electors in person, but by their representatives, is one of the most striking peculiarities of Leopold's reign" (Leopold I, 1657-1705). This came about accidentally rather than with intention, as a consequence of the unusual prolongation of the session of a general diet which Rudolph convoked at Ratisbon, soon after his accession to the throne. (See also EUROPE: Renaissance and Reformation: Catholic reformation.) "So many new and important objects . . . occurred in the course of the deliberations that the diet was unusually prolonged, and at last rendered perpetual, as it exists at present, and distinguishes the Germanic constitution as the only one of its kind—not only for a certain length of time, as was formerly, and as diets are generally held in other countries, where there are national states; but the diet of the Germanic empire was established by this event for ever. The diet acquired by this circumstance an entirely different form. So long as it was only of short duration, it was always expected that the emperor, as well as the electors, princes, counts and prelates, if not all, yet 'the greatest part of them, should attend in person. . . . It is true, it had long been customary at the diets of Germany, for the states to deliver their votes occasionally by means of plenipotentiaries; but it was then considered only as an exception, whereas it was now established as a general rule, that all the states should send their plenipotentiaries, and never appear themselves. . . . The whole diet, therefore, imperceptibly acquired the form of a congress, consisting solely of ministers, similar in a great degree to a congress where several powers send their envoys to treat of peace. In other respects, it may be compared to a congress held in the name of several states in perpetual alliance with each other, as in Switzerland, the United Provinces, and as

somewhat of a similar nature exists at present in North America; but with this difference,—that in Germany the assembly is held under the authority of one common supreme head, and that the members do not appear merely as deputies, or representatives invested with full power by their principals, which is only the case with the imperial cities; but so that every member of the two superior colleges of the empire is himself an actual sovereign of a state, who permits his minister to deliver his vote in his name and only according to his prescription.'—S. A. Dunham, *History of the Germanic empire*, v. 3, bk. 3, ch. 3 (quoting Putter's *Historical development of the Germanic constitution*).—On the later diet of the Germanic confederation, see GERMANY: 1789; 1814-1820; 1848 (March-September): Constitution of the Empire; AUSTRIA: 1848; CITIES, IMPERIAL AND FREE, OF GERMANY.

DIOBOLY.—Pericles "was the proposer of the law [at Athens] which instituted the 'Dioboly,' or free gift of two obols to each poor citizen, to enable him to pay the entrance-money at the theatre during the Dionysia."—C. W. C. Oman, *History of Greece*, p. 271.—See also ATHENS: B. C. 461-431.

DIOCESSES OF THE ROMAN EMPIRE.—"The civil government of the empire was distributed [under Constantine and his successors] into thirteen great dioceses, each of which equalled the just measure of a powerful kingdom. The first of these dioceses was subject to the jurisdiction of the Count of the East. The place of Augustal Prefect of Egypt was no longer filled by a Roman knight, but the name was retained. . . . The eleven remaining dioceses—of Asiana, Pontica, and Thrace; of Macedonia, Dacia and Pannonia, or Western Illyricum; of Italy and Africa; of Gaul, Spain, and Britain—were governed by twelve vicars or vice-prefects."—E. Gibbon, *History of the decline and fall of the Roman empire*, ch. 17.—See PRETORIAN PREFECTS.

DIOCLES, Laws of.—A code of laws framed at Syracuse, immediately after the Athenian siege, by a commission of ten citizens the chief of whom was one Diocles. These laws were extinguished in a few years by the Dionisian tyranny, but revived after a lapse of sixty years. The code is "also said to have been copied in various other Sicilian cities, and to have remained in force until the absorption of all Sicily under the dominion of the Romans."—G. Grote, *History of Greece*, pt. 2, ch. 81.

DIOCLETIAN (Gaius Aurelius Velerius Diocletianus) (245-313), Roman emperor, 284-305. See ROME: Empire: 192-284; 284-305; 303-305; and ALEXANDRIA: 206; BRITAIN: 284-305.

Court of Diocletian. See NICOMEDIA: 292-305. Imperial guard. See PALATINI.

Abdication.—"The ceremony of his abdication was performed in a spacious plain about three miles from Nicomedia [May 1, 305]. The Emperor ascended a lofty throne, and, in a speech full of reason and dignity, declared his intention, both to the people and to the soldiers who were assembled on this extraordinary occasion. As soon as he had divested himself of the purple, he withdrew from the gazing multitude, and, traversing the city in a covered chariot, proceeded without delay to the favourite retirement [Salona] which he had chosen in his native country of Dalmatia."—E. Gibbon, *History of the decline and fall of the Roman empire*, ch. 13.—See also SALONA.

DIODORUS, surnamed Siculus, a Greek historian. See HISTORY: 14.

DIODOTUS I (c. B. C. 256), Seleucid satrap of Bactria. See **BACTRIA**.

Diodotus II (c. B. C. 240), son and successor of Diodotus I; made an alliance with the Parthians.

DIONONDADIES, Indian tribe. See **HURONS**.

DIONYSIA AT ATHENS.—"The four principal Attik Dionysiak festivals were (1) the Dionysia Mikra, the Lesser or Rural Dionysia; (2) the Dionysia Lenaia; (3) the Anthesteria; and (4) the Dionysia Megala, the Greater or City Dionysia. The Rural Dionysia, celebrated yearly in the month Posideon (Dec.-Jan.) throughout the various townships of Attike, was presided over by the demarch or mayor. The celebration occasioned a kind of rustic carnival, distinguished like almost all Bakchik festivals, by gross intemperance and licentiousness, and during which slaves enjoyed a temporary freedom, with licence to insult their superiors and behave in a boisterous and disorderly manner. It is brought vividly before us in the 'Acharnes' of Aristophanes. . . . The Anthesteria, or Feast of Flowers, celebrated yearly in the month Anthesterion (Feb.-March), . . . lasted for three days, the first of which was called Pithoigia, or Tap-barrel-day, on which they opened the casks and tried the wine of the previous year. . . . The Dionysia Megala, the Greater or City Dionysia, celebrated yearly in the month Elaphebolion (March-April) was presided over by the Archon Eponymos, so-called because the year was registered in his name, and who was first of the nine. The order of the solemnities was as follows: I. The great public procession. . . . II. The chorus of Youths. III. The Komos, or band of Dionysiak revellers, whose ritual is best illustrated in Milton's exquisite poem. IV. The representation of Comedy and Tragedy; for at Athenai the stage was religion and the theatre a temple. At the time of this great festival the capital was filled with rustics from the country townships, and strangers from all parts of Hellas and the outer world."—R. Brown, *Great Dionysiak myth*, ch. 6.—See also **DRAMA**: Origin.

DIPLOMATIC AND CONSULAR SERVICE: Distinction and functions.—Diplomatic and consular agents may both be described as representing abroad the interests of sovereign states. There is, however, an important distinction. A

diplomatic agent carries on political relations between the state by which he is sent and the state to which he is accredited; he is a means of communication between states. A consul, on the other hand, "is not, as such, an international agent. He is an official of the country for which he acts, intrusted with duties of a multifarious kind in a foreign country, and permitted by that country to discharge them within its borders."—F. Smith, *International law*, p. 79.—While both officials are entrusted with the protection of the interests of their country and of their fellow-citizens, the functions of the diplomatic agent are political, those of the consul mainly commercial. The consul "is not like the diplomatic agent, directly concerned with affairs of state; he has no representative character, though in effect he is often the local representative of the diplomatic agent accredited to the state."—G. G. Wilson and G. F. Tucker, *International law*, p. 103.—A consul may even be charged with a diplomatic mission; but the two services are distinct, not only in function, but in historical development.

Consular service: Origin and development.—

The consular institution, like the diplomatic, claims great antiquity. "The Egyptians, apparently as early as the fourteenth century B. C., intrusted the trial of certain maritime cases to a designated priest. The Mediterranean merchants appealed to the *judicium mercatorum et maritimum* in the sixth century B. C. The Greek *proxenos* performed some consular functions. Rome later had similar public servants."—*Ibid.*, p. 190.—These officials were natives of the states in which they resided, however, and acted for that state in dealing with foreigners. The modern system of sending consuls from one state to reside in another state and there perform their duties in behalf of their fellow-countrymen, goes back "to the second half of the Middle Ages. In the commercial towns of Italy, Spain, and France the merchants used to appoint by election one or more of their fellow-merchants as arbitrators in commercial disputes, who were called *Juges Consuls* or *Consuls Marchands*. When, between and after the Crusades, Italian, Spanish, and French merchants settled down in the Eastern countries, founding factories, they brought the institution of consuls with them, the merchants belonging to the same nation electing their own consul. The competence of these consuls became, however, more and more enlarged through treaties, so-called 'Capitulations,' between the home States of the merchants and the Mohammedan monarchs on whose territories these merchants had settled down. The competence of the consuls comprised at last the whole civil and criminal jurisdiction over, and protection of, the privileges, the life, and the property of their countrymen. From the East the institution of consuls was transferred to the West. Thus, in the fifteenth century Italian consuls existed in the Netherlands and in London, English consuls in the Netherlands, Sweden, Norway, Denmark, Italy (Pisa). These consuls in the West exercised, just as those in the East, exclusive civil and criminal jurisdiction over the merchants of their nationality. But the position of the consuls in the West decayed in the beginning of the seventeenth century through the influence of the rising permanent legations on the one hand, and, on the other, from the fact that everywhere foreign merchants were brought under the civil and criminal jurisdiction of the State in which they resided. This change in their competence altered the position of consuls in the Christian States of the West altogether. Their functions now shrank into a general supervision of the commerce and navigation of

their home States, and into a kind of protection of the commercial interests of their countrymen. Consequently, they did not receive much notice in the seventeenth and eighteenth centuries, and it was not until the nineteenth century that the general development of international commerce, navigation, and shipping drew the attention of the Governments again to the value and importance of the institution of consuls. The institution was now systematically developed. The positions of the consuls, their functions, and privileges, were the subjects of stipulations either in commercial treaties or in special consular treaties, and the single States enacted statutes regarding the duties of their consuls abroad, such as the Consular Act passed by England in 1826."—L. Oppenheim, *International law*, pp. 463-465.—The consular service of the United States was reorganized by the acts of 1906 and 1908, and was put under the civil service system, with appointment by examination, and promotion on merit. (See CIVIL SERVICE REFORM: 1906-1909.) The following summary was compiled shortly after that time. The effects of the World War on the foreign services have, of course, been profound, and are not yet fully determined. "Our consular service . . . consists of the following: five consuls-general at large; fifty-seven consuls-general; eighteen vice consuls-general; twenty-five deputy consuls-general; forty-two vice and deputy consuls-general; two hundred and forty-one consuls; seventy vice consuls; twenty deputy consuls; one hundred and fifty-three vice and deputy consuls; three hundred and seven consular agents; seventeen consular assistants; eight marshals; twenty-four interpreters; thirteen student interpreters. . . Consular representation is maintained by this government at six hundred and five different places, in forty-seven different countries."—F. Van Dyne, *Our foreign service*, pp. 128-129.—The duties of the various officers are prescribed in detail in the "United States Consular Regulations" promulgated by the president.—See also CONGRESS OF THE UNITED STATES: SENATE: POWERS; SUPREME COURT: 1789-1835; U. S. A.: 1895 (September); EXECUTIVE: EXEQUATOR; EXTERRITORIALITY: Application to consuls.

Consular service: Status in non-Christian countries.—"Fundamentally different from their regular position is that of consuls in non-Christian States, with the single exception of Japan. In the Christian countries of the West alone consuls have, as has been stated before, lost jurisdiction over the subjects of the appointing States. In the Mohammedan States consuls not only retained their original jurisdiction, but the latter became by-and-by so extended through the so-called Capitulations that the competence of consuls comprised soon the whole civil and criminal jurisdiction, the power of protection of the privileges, the life, and property of their countrymen, and even the power to expel one of their countrymen for bad conduct. And custom and treaties secured to consuls inviolability, extritoriality, ceremonial honours, and miscellaneous other rights, so that there is no doubt that their position is materially the same as that of diplomatic envoys. From the Mohammedan countries this position of consuls has been extended and transferred to China, Japan, Korea, Persia, and other non-Christian countries, but in Japan the position of consuls shrank in 1899 into that of consuls in Christian States."—L. Oppenheim, *International law*, pp. 479-480.—Consular jurisdiction is now generally felt as a derogation of sovereignty by nations making the concession. It was abolished in Egypt and mixed courts established in 1870. Turkey attempted to abrogate the system in 1914.

Diplomatic service: Origin and development.—"The right of sending Embassies on *extraordinary* occasions, is as old as Society itself. There are scarce any customs which begin sooner to appear, nor is there a tribe of savages so low in the scale of Humanity, as not to feel the necessity of adopting them. It may therefore almost be said to amount to a *natural* right; certainly, at least, the intercourse of mankind would be forever retarded, if the attempts of nations to communicate with one another, were attended even with the apprehension of insecurity. Hence the universal opinion concerning the sacredness and inviolability of the character of an Ambassador, within the territories of those to whom he is addressed. . . . All this, however, does not amount to that right of custom, now so universal in Europe, of entertaining public Ministers for a regular continuance of time at the Court, and in the Cabinets, as it were, of each other; a circumstance remarkable in itself, and unknown to almost all other nations. . . . Ambassadors in *Ordinary* have been attributed by some to Ferdinand the Catholic, whose policy led him to entertain them at various courts, as a kind of honourable spies; by others, with no small probability, to an imitation of the Pope, who had long been in the habit of sending *Nuncios* to reside at various courts in the service of religion. . . . But, whatever was their origin, the jurists seem to agree that they are not of natural right; . . . and, however universal they may since have grown, doubts . . . were apparently entertained of their utility. . . . So late as 1660, a Member of the Polish Diet asserted, that the Ambassador of France had no cause of residence there, and that as he did not return home, according to the custom of Ambassadors, he ought to be considered as a spy. Two years afterwards, the Deputies proposed very warmly to send home all Ambassadors whatsoever, and to make a law regulating the time of their stay; and even the Dutch, who, one would imagine, had greater reason than the Polish nobles for encouraging an intercourse with foreigners, debated in 1651, how far this sort of embassy was of any advantage to them."—R. Ward, *Foundation and history of law of nations*, pp. 477-478, 483-484.—The institution of permanent embassies is ascribed by other writers to the Italian states, and in particular to Venice. That the general distrust of them was not wholly unfounded is evident from the many cases of conspiracy and intrigue which arose in the sixteenth and seventeenth centuries. Adoption of the custom was made possible only by the growth of the rule of non-interference in domestic affairs. "The rise of permanent legations created the necessity for a new class of State officials, the so-called diplomatists; yet it was not until the end of the eighteenth century that the terms 'diplomatist' and 'diplomacy' came into general use. And although the art of diplomacy is as old as official intercourse between States, such a special class of officials as are now called diplomatists did not and could not exist until permanent legations had become a general institution. . . . During the sixteenth century a distinction between two classes of diplomatic envoys gradually arose, and at about the middle of the seventeenth century, after permanent legations had come into general vogue, two such classes became generally recognized—namely, extraordinary envoys, called Ambassadors, and ordinary envoys, called Residents; Ambassadors being received with higher honours and taking precedence of the other envoys. Disputes arose frequently regarding precedence, and the States tried in vain to avoid them by introducing during the eighteenth century another class—namely, the so-called Minister Pleni-

potentiary. At last the Powers assembled at the Vienna Congress came to the conclusion that the matter ought to be settled by an international understanding, and they agreed, therefore, on March 19, 1815, upon the establishment of three different classes—namely, first, Ambassadors; second, Ministers Plenipotentiary and Envoys Extraordinary; third, Chargé d'Affaires. And the five Powers assembled at the Congress of Aix-la-Chapelle in 1818 agreed upon a fourth class—namely, Ministers Resident, to rank between Ministers Plenipotentiary and Chargés d'Affaires."—L. Oppenheim, *International law*, pp. 418, 423-424.—"Only the great Powers possess the highest class of agent, technically called ambassadors, at all; and they only send them to each other. The other classes are employed by and sent to the smaller States, each State as a rule reciprocating in kind."—J. Lorimer, *Institutes of the law of nations*, v. 1, p. 242.—Previous to the World War, the United States had ambassadors in ten countries: Great Britain, France, Germany, Russia, Italy, Japan, Spain, Brazil, Turkey and Austria-Hungary; envoys extraordinary and ministers plenipotentiary in thirty-four; ministers resident in two. Since 1914, the diplomatic envoys from the United States to Argentina, Chile, Peru, Spain and Belgium have been raised to the rank of ambassadors. It is interesting to note the widespread use since 1914 of the older custom of special commissions or embassies. The most important phases of coöperation among the Allies were entrusted not to the resident ambassadors, but to special missions usually of experts empowered to deal with specified matters.—See also ASYLUM, RIGHT OF: Right of asylum in legations and embassies; EX-TERRITORIALITY: Application to diplomatic agents.

"DIPLOMATIC REVOLUTION," phrase applied to the interval between the War of the Austrian Succession and the Seven Years' War (1756), when France repudiated the alliance of Frederick the Great and joined hands with Austria, her old enemy, in an alliance arranged by Prince von Kaunitz-Rietburg. This new alliance took France away from Prussia, and by forcing England and Prussia into alliance gave Frederick strength to commence the invasion of Silesia which produced the Seven Years' War.

DIPYLUM, double gate between inner and outer Ceramicus. See CERAMICUS OF ATHENS.

DIRECT ACTION "can, in a general way, be defined as the use of some form of economic power for the securing of ends desired by those who possess that power. Taken in this general sense it is merely another name, where employed by the workers, for the strike [or for sabotage, the "strike on the job"], when used by the employers, for the lock-out. It is an attempt on the part of the workers or of the employers to extract advantages for themselves by their control over the economic life of society."—W. Mellor, *Direct action*, p. 1.—This use of economic methods of compulsion is particularly contrasted with political methods.—"Against direct action which seeks ends that are not likely to threaten the structure of Capitalism itself, very little criticism is raised. The history of

the hundred years of Trade Unionism and of the last hundred years of Capitalist development is the history of the greater acceptance by 'the community' of the idea that an employer has the right in combination with other employers, to refuse to continue his business except on his own terms, and that the workers have an equal right to refuse to sell their labour power on terms that they deem unsatisfactory. The strike for higher wages, or shorter hours, is today regarded as perfectly legitimate, if not justifiable, and a whole series of laws has been passed to enable the Trade Unions to engage in this particular form of direct action."—W. Mellor, *Direct action*, pp. 16, 17.—"There has recently arisen for consideration the question how far a strike called for political objects—'direct action,' as the journalists have called it—that is a strike to interfere with or constrain the government in conduct which the trade unions do not approve, can be said to be a strike in contemplation or in furtherance of a trade dispute."—H. H. Slessor, *Laws [English] relating to trade unions*, pp. 72-73.—On August 4, 1920, a threat of war by Great Britain against Russia in aid of Poland was made. "On August 9, a Joint Conference of the Trades Union Congress, the Labour Party and the Parliamentary Labour Party was held at the House of Commons, and the following resolution, calling into being the Council of Action, was passed—'That this Joint Conference, representing the Trades Union Congress, the Labour Party and the Parliamentary Labour Party, feel certain that war is being engineered between the Allied Powers and Soviet Russia on the issue of Poland, and declares that such a war would be an intolerable crime against humanity; it therefore warns the Government that the whole industrial power of the organized workers will be used to defeat this war. . . . 'And that a Council of Action be immediately constituted to take such steps as may be necessary to carry the above decisions into effect.' . . . On August 13 the National Labour Conference demanded—'(1) An absolute guarantee that the armed forces of Great Britain shall not be used in support of Poland, Baron Wrangel, or any other military or naval effort against the Soviet Government. (2) The withdrawal of all British naval forces operating directly or indirectly as a blockading influence against Russia. (3) The recognition of the Russian Soviet Government and the establishment of unrestricted trading and commercial relationships between Great Britain and Russia. The Labour Movement further refuses to be associated with any Alliance between Great Britain and France, or any other country, which commits us to any support of Wrangel, Poland, or the supply of munitions or other war material for any form of attack upon Soviet Russia.'"—Wm. Mellor, *Direct action*, pp. 152-155.—The miners' strike in England, 1920-1921, and the miners' strike of 1920-1921 in West Virginia are also instances of direct action.

DISCIPLES, Church of the. See DISCIPLES OF CHRIST.

DISCIPLES OF CHRIST.—"This body, often called also Christians, was one of the results of the great revival movement which began in Tennessee and Kentucky in the early part of the present century. Rev. Barton W. Stone, a Presbyterian minister who was prominent in the revival movement, withdrew from the Presbyterian Church, and in 1804 organized a church with no other creed than the Bible and with no name but that of Christian. One of his objects was to find a basis for the union of all Christian believers. A little later Thomas and Alexander Campbell, father and son, who came from Ireland, where the former had been a Presbyterian minister, organized union societies in Pennsylvania. Changing their views as to baptism, they joined the Redstone Association of Baptists. Shortly after, when Alexander Campbell was charged with not being in harmony with the creed, he followed the Burch Run Church, of which he was pastor, into the Mahoning Baptist Association, which, leavened with his teachings, soon ceased to be known as a Baptist association. In 1827, after some correspondence with Rev. B. W. Stone and his followers of the Christian Connection, there was a union with a large number of congregations in Ohio, Kentucky, and Tennessee, and the organization variously known as 'Disciples of Christ' and 'Christians' [also popularly designated 'Campbellites'] is the result."—H. K. Carroll, *Religious forces of the United States*, ch. 18.—The latest statistics available in 1922 reported 8,408 church organizations and 1,226,028 members of the denomination in the United States.—United States Census, *Religious bodies*, 1916, pt. 2, p. 249.—See also CHRISTIAN CHURCH; CHURCHES OF CHRIST.

DISCONTO-GESELLSCHAFT.—"The Disconto-Gesellschaft was established in 1851 by a former Prussian Minister of Finance [David Hansemann] to provide cheap credit accommodation for its members, mostly small traders and business men. In 1856 the institution was reorganized as a commercial bank proper [with a capital of ten million thalers], and, under expert management, it rapidly developed. [The bank is both limited and unlimited, its constitution being based upon the commandite principle.] During [the] last century its business was centralized in Berlin, but, following more recent tendencies, it has in the last three decades opened several branches outside

that city. It had already, however, become interested in many concerns working far afield, e.g., the La Plata Bank (since sold to the Deutsche Bank), the German Trade and Plantation Company, in the South Sea Islands, the Brasilianische Bank für Deutschland, the Banco de Chile y Alemania, and many others. The London office was opened in 1900, and its business liquidated, of course, after the outbreak of the [World] War. Liquidation proceedings in connection with this and the Metz branch have not yet been concluded. During the War the Bank embarked upon a large amalgamation programme. In 1917 the Sudddeutsche Disconto-Gesellschaft and the Königsberger Vereinsbank were absorbed. A working arrangement was entered into with the Vereinsbank in Hamburg. In 1918 five provincial banks—the Magdeburger Bankverein (capital, 17,000,000 marks), the Westfälische-Lippische Vereinsbank, Bielefeld (capital, 7,000,000 marks), the Westentsche Vereinsbank, Munster (capital, 2,750,000 marks), the Gronauer Bankverein (capital, 1,000,000 marks), and the Rheiner Bankverein (capital, 1,000,000 marks)—were taken over. Affiliated also are the Norddeutsche Bank, Hamburg, and the A. Schaaffhausen'scher Bankverein A.-G., Cologne. The Disconto-Gesellschaft specializes more than its competitors in the promotion of companies, and is closely connected with a large number of industrial enterprises. Comparison of balance-sheet figures over the past six years is of little value, on account of the continued depreciation in the value of the mark. It may be noted, however, that the volume of business has risen approximately in proportion to the decline in currency values. Net profits have not risen, however, in the same degree. Those for 1920 amounted to 153,727,582 marks, out of which a dividend of sixteen per cent. was declared."—*The Statist*, v. 98, Dec. 10, 1921, pp. 981-982.—In December, 1921, the authorized capital was 400,000,000 marks; and the total capital and reserve amounted to 1,237,950,000 marks.

DISSENTERS (or Nonconformists), "general name used in England and Wales for those who belong to any (Protestant) sect, to distinguish them from members of the Church of England. The term came into use soon after the Revolution of 1688, and its origin is indicated by words used

in the title and body of an Act passed in that year, in which those formerly called 'Nonconformists' are styled 'Their Majesties' Protestant subjects dissenting from the Church of England.'—J. H. Blunt, *Dictionary of sects*, p. 125.—See also ENGLAND: 1558-1566; 1662-1665; 1672-1673; 1687-1688; 1711-1714; 1827-1828; also FRIENDS, SOCIETY OF: Origin.

DISTRICT COURT, United States, one having its jurisdiction limited to a defined district. See COURTS: United States: Organization of federal courts.

DISTRICT OF COLUMBIA: Location.—The federal District of Columbia, in which the national capital of the United States is situated, was originally a square of ten miles, lying on both sides of the Potomac river, partly ceded to the United States by Maryland, in 1788, partly by Virginia, in 1789. The portion southwest of the river was retroceded to Virginia in 1846. The present area of the district is seventy square miles. The district is controlled by the federal government, through a board of three commissioners, the city of Washington having no municipal incorporation. "The District of Columbia exists by virtue of the provision of the Federal Constitution giving Congress exclusive jurisdiction over a district not exceeding 10 miles square which shall be ceded to the United States for the purpose of the seat of Government. The reason for this provision of the Federal Constitution is found in the early history of the Continental Congress and of Congress under the Articles of Confederation. The Federal Government, in its infancy and in its feebleness, found itself unable to command respect, maintain dignity, or even to protect its own peace and safety if required to meet in a city in some one of the States where the police authority and the maintenance of public order was entirely under the control of the local sovereignty. This was the compelling cause of the creation and establishment of the District of Columbia. It was desired that Congress should have exclusive jurisdiction over sufficient territory to establish in peace, dignity, and safety the National Capital, and to protect the administration of the national power and the sessions of the National Legislature."—W. P. Borland, *Congressional Record*, Mar. 3, 1915.—See also WASHINGTON, D. C.

Constitutional status.—"Two reasons are commonly given for the present anomalous government of our national capital. The one which appeals especially to those inhabitants of the capital who favor the present government is based on the practical operation of past governments compared with that of the present system. The other, one which has seemed sufficient to a number of prominent men who have looked into the matter, is based on the provision of the United States Constitution which established the federal district. President

Taft, in an address at a banquet given him by the leading citizens of Washington on May 8, 1909, explained the denial of self-government on constitutional grounds in the following words: 'This was taken out of the application of the principle of self-government in the very constitution that was intended to put that in force in every other part of the country, and it was done because it was intended to have the representatives of all the people control this one city, and to prevent its being controlled by the parochial spirit that would necessarily govern men who did not look beyond the city to the grandeur of the nation and this as the representative of that nation.' At present Congress exercises over the District of Columbia, in addition to its national powers, all the powers of a State, including the power to control local government. Even of the purely local powers some are directly exercised by Congress, the local officials having very limited functions. Moreover, the local officials are either directly or indirectly appointed by and are responsible to the national government; and the inhabitants, who number one-third of a million, are absolutely unrepresented in their government, local, quasi-state or national, except through the uncertain medium of public opinion. In practice, public opinion is very largely taken into account, but its influence must always remain uncertain and decidedly inferior to that of actual representation. President Taft and others hold that actual representation is impracticable under the Constitution; but the opposite view is held by many prominent men, both local and national, and the matter can scarcely be considered as settled. . . . It seems reasonably certain, from the absence of contrary evidence, that the Constitutional Convention did not seek to deprive the people of the District of Columbia of their political privileges. The sole aim of that body was to secure the national government from state interference. In view of certain alleviating circumstances, more potent than now, the Convention felt itself justified in sacrificing some of the political privileges of the people to the security of the national government; but certainly this sacrifice was anything but an end sought. It was found necessary to sacrifice participation in national affairs, since the machinery for it apparently could not be placed in operation under the peculiar plan whereby the capital was separated from the states; but the Convention certainly did not contemplate the irrevocable perpetuation of this sacrifice if some means of placing that machinery in operation should appear in later years under changed conditions. The case of the exercise of state functions is similar, except that a slavish perpetuation of the method originally deemed expedient was still less contemplated. The matter of local government, however, is quite different. There was no apparent obstacle to the operation of local self-government, even under the peculiar system established for the capital, and consequently as is amply shown by the interpretation of the Federalist and of the early Congresses, no anomaly whatever was here contemplated. It may be inquired: How, then, did the well established idea of constitutional prohibition arise? In the early days of the capital the reproaches of 'tyranny' and 'slavery,' occasioned by the denial to the district of anything like state government and by its exclusion from participation in national government, were frequently met by citing the Constitution, as was the case in the House of Representatives in 1803; and it is probable that an extension and perversion of this idea is the cause of the attempt to make the Constitution cover the additional 'tyr-

anny' and 'slavery' of non-representative government in local affairs. But such an attempt involves the assertion that all the popular governments of the district, municipal as well as territorial, until the institution of the commission system in 1874, were unconstitutional; and in view of the conclusive sanction of the signers of the Constitution themselves such an assertion is obviously an absurdity. The constitutional argument for a 'benevolent despotism' in local affairs is quite untenable, and that system must rest on purely practical arguments or fall."—G. W. Hodgkin, *Constitutional status of the District of Columbia (Political Science Quarterly)*, v. 25, pp. 257, 258, 269, 270.—"Washington is not only primarily a national capital; it is exclusively a national capital. It belongs to the people of the Nation. It has been determined that no government can exist in the District of Columbia, no matter what its form may be, which is independent of the Federal Government. The District of Columbia is not, never has been, and never can be an organized political entity like a State, nor even a corporate political entity like a municipality, with power to deal on a contractual basis with the Federal Government. I say this because it seems to be fashionable in discussing the affairs of the District to use the term 'organic act' in referring to the act of 1878, and to talk of a solemn contract as though some contractual relations existed between two relatively equal bodies which could not be violated or altered without the consent of both. The reference to any particular act of Congress creating or altering its relations to the District of Columbia as an organic act, in the sense that word is used, in creating a new entity in the system of States, is a legal absurdity. Congress is charged not only with the right but with the duty to deal with the District from time to time as altered conditions may justify. It is absurd to talk of an act as though it were irrevocable and beyond the power of amendment, or as though it were a contract based upon some form of valuable consideration. The only restriction upon the power of Congress to deal with the District is that it shall not invade private property rights except within the well-defined limitations of the exercise of the police and taxing power. Congress can exercise all of the usual powers of taxation over the District which are exercised by States through their municipalities or otherwise over the property of private citizens. Congress has not relinquished, waived, nor bargained away any portion of its taxing power, and it has no moral right to exempt private property in the District, either real or personal, from the operation of laws imposing taxes which are usual and necessary in other portions of the United States."—W. P. Borland, *Congressional Record*, Mar. 3, 1915.

1663.—Plantation of Frances Pope.—This plantation is supposed to have been on the site now occupied by the city of Washington.

1751.—Town of Georgetown laid out.—This town was incorporated in 1780, and later became part of the city of Washington.

1790.—Adoption of site as future capital.—On July 16, 1790, Congress adopted the site of the future city as the seat of government, the capital to be moved there after the year 1800.

1791-1798.—Name legalized.—"The first official mention of the district by name is in a letter of the original Commissioners dated September 9, 1791, in which they state: 'We have agreed that the Federal district shall be called the Territory of Columbia,' etc. (p. 94). They had no specific authority of law to name it. The first mention of the name 'District of Columbia' in an act of Con-

gress is in the *title*, but not in the body, of 'An act authorizing a loan for the use of the city of Washington, in the District of Columbia, and for other purposes therein mentioned,' approved May 6, 1796; but a previous statutory use of the name appears in the fourth section of the act of the Maryland legislature, approved in November, 1793, entitled 'A further supplement to the act concerning the Territory of Columbia and the city of Washington' (p. 114). The seat of government is mentioned in at least one act of Congress as the Territory of Columbia and the District of Columbia, indiscriminately. (2 Stats., 193 and 194.) Although the territory at the seat of government is referred to in various statutes as the District of Columbia, it was not until February 21, 1871, that Congress directly legislated on the subject of naming it, which it did by the following clause in the act of that date, entitled 'An act to provide a government for the District of Columbia': That all that part of the territory of the United States included within the limits of the District of Columbia be, and the same is hereby, created into a government by the name of the District of Columbia, by which name it is hereby constituted a body corporate for municipal purposes. (16 Stats., 419.) But this act omitted to define the limits to which it referred. Congress, obviously in doubt as to the sufficiency of that action, again legislated on the subject, in the act entitled 'An act providing a permanent form of government for the District of Columbia,' approved June 11, 1878, as follows: That all the territory which was ceded by the State of Maryland to the Congress of the United States, for the permanent seat of the government of the United States, shall continue to be designated as the District of Columbia. (20 Stats., 102.) In this latter act Congress definitely indicated the territory it names."—W. Tindall, *Origin and government of the District of Columbia*, p. 11.

1800-1874.—Suffrage in the District.—"The right to vote in the District of Columbia for President of the United States and other national officers, which was extant at the time the territory embraced in the District was ceded to Congress was exercised by the qualified voters in the District in the Presidential election of November, 1800. It remained in force until the first Monday in December, 1800, when, as announced in the opinion of Justice Cranch, the exclusive jurisdiction of Congress over the District took effect. The qualifications of voters in the portion derived from Maryland were at that time as follows: All free men above 21 years of age having a freehold of 50 acres of land in the county in which they offer to vote, and residing therein, and all free men having property in this State above the value of £30 current money, and having resided in the county in which they offer to vote one whole year next preceding the election shall have a right of suffrage, etc. (Constitution of Maryland.) When the District ceased to be a part of Maryland, its residents, no longer being residents of any county of Maryland, consequently lost the right to vote in the elections of that State. The qualification of voters in the portion of the District derived from Virginia at the time of the cession was the possession of a certain amount of real property in the county in which the vote was cast. (Vol. 8, p. 306, Hening's Statutes at Large of Virginia.) When that part of the District ceased to be under the jurisdiction of Virginia, that right of suffrage in the District accordingly expired. Although the citizens of the District of Columbia ceased to vote for national officers after the first Monday in December, 1800, they were subsequently vested with

right of suffrage in municipal matters, as herein-after shown under the head of 'The cities of Washington and Georgetown,' and the form of municipal government created by the act of Congress of February 21, 1871, but that right has not existed in the District since June 20, 1874, when the latter form of government was abolished."—*Ibid.*, p. 17.

1835-1836.—Petitions for abolition of slavery. See U. S. A.: 1831-1836.

1850.—Attempt to abolish slavery in fugitive slave law. See U. S. A.: 1850 (April-September).

1861.—Peril during Civil War. See U. S. A.: 1861 (April): Activity of rebellion, etc.

1862.—Abolition of slavery. See U. S. A.: 1862 (April-June).

1867.—Negro Suffrage Bill passed, over president's veto. See U. S. A.: 1867 (January).

1871-1874.—Reorganization of the District.—By law of Congress (1871) the three separate parts of the district were united into one. The government was to consist of a council of eleven members appointed by the president of the United States and a House of Delegates consisting of twenty-two elected by the people of the district and a delegate to sit in the House of Representatives, also elected by the people. From 1871-1874 "the District enjoyed a Territorial form of government with a species of local autonomy. In 1874 this local government broke down. The policemen, firemen, and city employees were unpaid, an enormous public debt had been contracted. The credit of the District was entirely exhausted, and at the same time the tax burden was very grievous. The physical appearance of Washington at that time must have been ludicrous if we believe the account of Louisa M. Alcott. She described in detail the pigs she met on Pennsylvania Avenue and their individual traits and habits. I suppose the cows still fed in Lafayette Square at that time. The debt which had been incurred for public improvements was out of all proportion to the population of the city, and any tangible results were scarcely apparent. Various reasons were given for this humiliating condition. It is said that the great number of ex-slaves who poured into Washington during and following the Civil War demoralized the local government and introduced an element of ignorance and corruption which made home rule impossible. This may be partially true, but the demoralizing effects of the Civil War were by no means confined to Washington. Hundreds of municipalities and a score of States were struggling with the unusual burdens and revolutionary changes of that period, and they were required to meet their problems unaided by the Federal Government."—W. P. Borland, *Congressional Record*, Mar. 3, 1915.

1878-1890.—Changes in form of government.—**Description of the present government.**—"The present local government of the District of Columbia is a municipal corporation having jurisdiction coincident with the territory which 'was ceded by the State of Maryland to the Congress of the United States for the permanent seat of the Government of the United States.' (20 Stats., 102), and which had been subject to the two municipal governments immediately preceding it. This government is administered by a board of three Commissioners, having in general equal powers and duties. Two of them, who must have been actual residents of the District for three years next before their appointment, and have during that period claimed residence nowhere else, are appointed from civil life by the President . . . and confirmed by the Senate of the United States, for a term of three years each, and until their successors are appointed and qualified. Attorney-

General Devens rendered an opinion July 7, 1880, that the term of office of any Commissioner appointed from civil life, whose predecessor shall or shall not have served a full term of three years, is three years from the date of his appointment and until his successor shall be appointed and qualified, and not for the unexpired part of such predecessor's term. The other Commissioner is detailed from time to time by the President of the United States from the Engineer Corps of the United States Army, and shall not be required to perform any other duty. (20 Stats., 103.) The act of June 11, 1878, prescribes that the Commissioner so detailed shall have lineal rank above that of captain; but this requirement is qualified by the joint resolution approved December 24, 1890 (26 Stats., 113), which provides that he—may in the discretion of the President of the United States, be detailed from among the captains or officers of higher grade having served at least fifteen years in the Corps of Engineers of the Army of the United States. Three officers of the same corps, junior to said Commissioner, may be detailed to assist him by the President of the United States. (28 Stats., 246.) The senior officer of the Corps of Engineers of the Army who shall for the time being be detailed to act as assistant (and in case of his absence from the District or disability, the junior officer so detailed) shall, in the event of the absence from the District or disability of the Commissioner who shall for the time being be detailed from the Corps of Engineers, perform all the duties imposed by law upon said Commissioner (26 Stats., 113). It has been the unvarying practice of the residents to appoint one of the civil Commissioners from each of the two most prominent national political parties but there is no statutory provision on the subject."—W. Tindall, *Origin and government of the District of Columbia*, p. 141.—See also WASHINGTON, D. C.: 1873-1915.

1913.—Public Utilities Commission created by law.—Blue sky law passed.—By this law loans above 6 per cent must be made by license, after a public hearing, and the giving of a bond; 1 per cent interest per month is the maximum allowed in any case.

1918.—Minimum wage law passed by Congress.—Part played by District of Columbia in World War.—The minimum wage law applies to male employees as well as female. It sets the wage standard at an amount sufficient to keep a worker and family in good health and on a normal standard of life. The district furnished 15,030 soldiers in the World War. A quartermasters' camp, Camp Meigs, was located at Washington and a chemical camp, Camp Leach.

1921.—Housing case in the Supreme Court. See SUPREME COURT: 1921; WASHINGTON, D. C.

DITTMANN, Wilhelm, German leader of Independent Socialists, member of Council of Commissars. See GERMANY: 1918 (November); 1918-1919 (December-January).

DIU, small island off the Western coast of India, belonging to Portugal. See PORTUGUESE INDIA.

DIVAN, council of state of Turkey. See SUBLIME PORTE.

DIVINE RIGHT OF KINGS. See ABSOLUTISM; BILL OF RIGHTS, ENGLISH: 1680; DEMOCRACY: Middle Ages; Progress during 17th and 18th centuries; ENGLAND: 1135-1154; GERMANY: 1804-1809; MYTHOLOGY: Japan: Fundamental ideas; RUSSIA: 1916: Russian absolutism; WORLD WAR: Causes: Indirect: j.

DIVING APPARATUS. See INVENTIONS: 16th-17th centuries: Diving bell; 18th century: Improved diving bell; 20th century: Diving apparatus.

DIVODURUM, the Gallic name of the city afterwards called Mediomatrici—now Metz. See **METZ**: Original names.

DIVONA, city in France, in the department of Lot, which is the modern Cahors. See **CADURCI**.

DIVORCE LAWS. See **WOMAN'S RIGHTS**: B. C. 2250-538; B. C. 600-300; B. C. 300-A. D. 300; 300-1400; **COMMON LAW**: 1858; **SUFFRAGE**, **WOMAN**: England: 1819-1860; **PAPACY**: 1917-1918.

DIWANI, native Indian word used to denote a minister of state usually of the Mogul government. See **INDIA**: Political divisions; 1757-1772.

DIX, John Adams (1798-1879), American soldier and politician. Served in army, 1818-1828; adjutant-general of New York, 1830-1833; secretary of state of New York, 1833-1840; member of New York Assembly, 1842; United States senator, 1845-1849; secretary of the treasury, 1861; served as Union general during the Civil War; minister to France, 1866-1869; governor of New York, 1873-1875.—See also **PRINTING AND THE PRESS**: 1861-1865; U. S. A.: 1860-1861 (December-February).

DIXIE, term applied to the Southern states. Its origin is obscure. It is said that a New Yorker named Dixie owned many slaves who had to go South. They looked upon their old home in New York as a paradise, but in time transferred the term "Dixie's land," used in their songs, to their new southern home. "Dixie" is also the name of two or three popular ballads.

DIXMUDE, town in Belgium on the Yser about fifteen miles north of Ypres. In the World War, the area to the northwest was flooded by cutting the dikes, in order to form a barrier to German advance. See **WORLD WAR**: 1914: I. Western front: u, 1, 2 and 7; v, 1 and 2; w, 19; 1918: II. Western front: m.

DIXON, Jeremiah, English surveyor. With Charles Mason he ran the boundary line between Maryland and Pennsylvania, popularly known as "Mason and Dixon's Line," in 1764-1767. See **PENNSYLVANIA**: 1760-1767.

DJAMBI, district in Sumatra notable for its petroleum oil fields. See U. S. A.: 1921 (April-July).

DJEBEL TARIK, ancient Arab name for Gibraltar. See **AFRICA**: Ancient and medieval civilization: Arab occupation.

DJEM, Turkish prince. See **JEM**.

DJEMAL PASHA. See **JEMAL PASHA**.

DJENGHIS-KHAN, the very mighty khan. See **RUSSIA**: 1237-1294.

DJIBOUTI. See **JIBUTI**.

DMITRI PAVLOVITCH (1891-), Russian grand duke who was in the plot to murder Rasputin. See **RUSSIA**: 1916-1917; **WORLD WAR**: 1917: III. Russia and the Eastern front: c, 1.

DMITRIEV, Ivan Ivanovitch (1760-1837), Russian author. See **RUSSIAN LITERATURE**: 1800-1852.

DMITRIEV, Radko, Bulgarian general. Served in the Balkan Wars of 1912-1913; victor at Kirk Kilisse, and Lule-Burgas; renounced his allegiance to Bulgaria when that country entered the war against the Allies; was in Russian service in the World War and took a prominent part in the Russian drive through Galicia, 1914-1915, commanding the Russian troops at the Battle of Gorlice, where Mackensen broke through prior to the reconquest of Galicia.—See also **WORLD WAR**: 1915: III. Eastern front: c; i, 3.

DNIEPER, river in Russia which rises in Smolensk and flows into the Black sea. In ancient times, it was known as the Borysthenes. See **BORYSTHENES**; also **UKRAINE**.

DNIESTER, river which rises in Galicia and flows into the Black sea. It forms the north-eastern border of Bessarabia. In the World War there was much fighting on the Galician banks of the river, between the Russians and the Austrians.—See also **WORLD WAR**: 1915: III. Eastern front: a, 2; f, 6.

DOAB, in India, a region between two rivers, a term applied especially to the region between the Ganges and the Jumma, acquired by the English in 1801. See **INDIA**: 1798-1805.

DOBELL, Sir Charles Macpherson (b. 1869), English general who in 1914-1915 led the campaign in the Cameroons district of Africa; 1916, was in the Sinai campaign; 1917, in the Egyptian campaign. See **WORLD WAR**: 1914: VI. Africa: a; 1915; VIII. Africa: c; 1916: VI. Turkish theater: h, 2, v; 1917: VI. Turkish theater: c, 1; c, 1, v.

DOBERDO, plateau in Italy south of Gorizia, which was a region of fighting during the World War. See **WORLD WAR**: 1915: IV. Italy: d.

DOBRIN, Knights of the Order of the Brethren of. See **PRUSSIA**: 13th century.

DOBROVSKY, Joseph (1753-1829), Bohemian writer. See **BOHEMIAN LITERATURE**: Its significance; Rôle in Slavic mythology.

DOBRUDJA, Rumanian province on the Black sea bordered by Bulgaria on the south and by the Danube river on the west and north; a low and swampy region consisting chiefly of the marsh lands along the southern bank of the Danube. The district was ceded to Rumania by Bulgaria at the close of the Balkan War in 1913. The country was overrun by the German forces under Mackensen in the fall of 1916. The treaty of Bucharest (1918), forced upon Rumania by the success of German arms, provided for the complete surrender of Dobrudja. The province, however, went back into the hands of the Rumanians with the signing of the armistice, November 11, 1918.—See also **BALKAN STATES**: Geographical position; also map showing distribution of nationalities; 1878; 1921: Rumania; **RUMANIA**: 1875-1881; 1912-1913; **WORLD WAR**: 1916: V. Balkan theater: c, 5; c, 6, ii; 1917: V. Balkan theater: d, 1.

DOBUNI, tribe of ancient Britons who held a region between the two Avons. See **BRITAIN**: Celtic tribes.

DOCETISM, heresy of the early Christian church which taught the absence of any material substance in the body of Christ, which was held to be only an apparent or phantom reality. Clement of Alexandria first mentioned the Docetæ as a distinct sect, founded by Julius Cassianus. The extreme view assumed that even the birth, acts, sufferings and crucifixion of Christ were only apparent and denied the resurrection and the ascension. The more moderate of the Docetæ acknowledged no real union between the ethereal person of Christ and the human body of Jesus. Docetic thought pervaded the doctrines of the Gnostics and Manichæans, and its tendencies have persisted into later periods of ecclesiastical history. "We note another phase of gnosticism in the doctrine so directly and warmly combated in the epistles of John; we refer to docetism—that is, the theory which refused to recognize the reality of the human body of Christ."—E. Reuss, *History of Christian theology in the Apostolic Age*, p. 323.

Also in: A. Harnack, *History of dogma*, v. 1, pp. 256-259, v. 2, pp. 276 ff., 370, v. 3, p. 16, v. 4, pp. 138 ff.

DOCIMASIA.—"All magistrates [in ancient Athens] whether elected by cheirotonia or by lot, were compelled, before entering upon their office,

to subject themselves to a Dokimasia, or scrutiny into their fitness for the post."—G. F. Schömann, *Antiquities of Greece: The State*, pt. 3, ch. 3.

DOCTRINAIRES (Society of Christian Doctrine), a society founded at Rome in 1562 by Marco de Sadis Cusani of Milan. The aim of its members, priests and laymen, was to promote Christian instruction among the youth. In 1747 it was united by Benedict XIV. to the Fathers of Christian Doctrine, a French religious order founded in 1592 by César de Bus with the object of promoting Romanism and checking Calvinism. The strength of the order diminished after the Revolution.

DOCTRINAIRES, the name given to Royer-Collard and his colleagues among the moderate Royalists in France after the second restoration of Louis XVIII in 1815. The name, first applied in derision, spread rapidly. Among those to whom it was applied were the duc de Richelieu, de Serre, Lainé, Maine de Biran, Pasquier, Beugnot, de Bar-

ante, Cuvier, Mounier, Guizot, the duc de Broglie, Decazes. All of these were closely united by the political principles for which they stood, although they came from many different classes and groups. Their object, according to Decazes, was to "nationalize the monarchy and to royalize France." They opposed the extreme party of Ultras who wished to undo the work of the Revolution. In 1816, Guizot presented the views of the Doctrinaires in his treatise "*Du gouvernement représentatif et de l'état actuel de la France.*" The chief supporters of the party were ex-officials of the empire, who believed a monarchy to be necessary, but wished to avoid the evils both of Napoleon's tyranny and of the *ancien régime* by a liberal policy. The history of the Doctrinaires as a party was short, extending only from 1816 to 1830. In 1816 Louis XVIII, frightened by the Ultras' violence in 1815, gave them his support; in 1830 Charles X annihilated them when he took as his minister the prince de Polignac, an Ultra, and began the struggle with Liberalism which resulted in his overthrow. The Doctrinaires had never, by any real difference in principle, been separated from the Orleanists, and during the revolution of 1830 they became absorbed with that group. (See also FRANCE: 1830-1840.) The word "Doctrinaire," naturalized in English, has come to be applied to a theorist as distinguished from one who is practical and active.

DOCUMENTS

The following is a list of the documents, under the headings of (1) Constitutions, (2) Treaties, (3) Laws, (4) State papers and messages, (5) World War, (6) Peace Movement, and (7) Miscellaneous, the text of which is given in full or in part, in these volumes.

DOLES, distribution of gifts in charity, in England. See CHARITIES: England: 1683-1747.

DOLICHOCEPHALIC MEN, a term used in ethnology, signifying "long-headed," as distinguishing one class of skulls among the remains of primitive men, from another class called brachycephalic, or "broad-headed," and applied to existing races.—See also ARYANS: Distribution; ANTHROPOLOGY: Physical; PACIFIC OCEAN: People.

D'OLIER, Franklin (1877-), first national commander of the American Legion; elected November 12, 1919, and served for one year.

DOLLAR, Stabilizing of. See STABILIZING THE DOLLAR.

DOLLAR DIPLOMACY, term referring to the United States' policy of furthering commercial interests through diplomacy. It has been most

frequently applied to her policy in the Caribbean and the Orient. "President Roosevelt in expressing this new phase of our policy said: 'If a nation shows that it knows how to act with reasonable efficiency and decency in social and political matters, if it keeps order and pays its obligations, it need fear no interference from the United States. Chronic wrongdoing, or an impotence which results in a general loosening of the ties of civilized society, may in America, as elsewhere, ultimately require intervention by some civilized nation, and in the Western Hemisphere the adherence of the United States to the Monroe Doctrine may force the United States, however reluctantly, in flagrant cases of such wrong-doing or impotence, to the exercise of an international police power. In fact this policy was anticipated in the statesmanlike utterance of President Hayes against a joint Isthmian Canal when he declared that the capital invested . . . in such an enterprise must, in a great degree, look for protection to one or more of the great powers of the world.'"—A. B. Hall, *Monroe Doctrine and the Great War*, pp. 96-97.—"Writing in 1914, ex-President Taft observed that the Monroe Doctrine . . . is based on a wise policy in our own interest to exclude from this hemisphere the selfish political interference of European governments and their appropriation of territory, not for the purpose of increasing our power of territory, but for the purpose of promoting the prosperity, independence, and happiness of the peoples of these two continents and so of insuring our own peace and safety. While no clean-cut cases of 'selfish political interference' or of 'appropriation of territory' have arisen in recent years, certain conditions in the Caribbean countries have called for the utmost vigilance to prevent European powers, who have acquired commercial holdings in the Caribbean, from merging these interests into political dominion. In this group of Latin-American powers, the governments generally are not strong, life and property are insecure, revolutions are frequent, and the collection of both public and private debts is extremely uncertain. As a result European countries are frequently called upon by citizens to enforce their claims. The nation may be bankrupt or may refuse a settlement. The European countries may then seek to take over temporarily the fiscal administration of the country to secure the payment of their claim, they may take a portion or all of the territory in satisfaction of their demands, or they may by a show of force compel their immediate payment if the funds are actually available. It is obvious that the first two alternatives would constitute 'political interference' or 'appropriation of territory' that would violate our established policy, and it is equally clear that the last alternative is not only dangerous to American interests but in many cases would be abortive. We cannot safely permit European nations to occupy American territory, and yet to deny them what may be the only effective means of redress, is indefensible. This situation has forced the United States to a third alternative—interference in the affairs of these weak republics so far as it is necessary to settle the just claims of foreign powers."—A. B. Hall, *Monroe Doctrine and the Great War*, pp. 95-96.—"Steadily, quietly, almost unconsciously, the United States was drawn by dealings with the Caribbean nations far out of the traditional course of isolation and non-interference. Republican and Democratic statesmanship alike yielded to the logic of circumstances. Opinion on the new policy was divided, and confusion arose from failure to distinguish two underlying purposes. One was to safeguard not only the Monroe Doctrine, but practical rights in

Porto Rico, the Panama Canal, and Cuba, by maintaining political and economic stability in and around the Caribbean. The other was to give special protection to American capital invested in the Caribbean lands. Upon the first of these objects there was substantially only one view. The argument was that the task assumed was imposed by the conditions and the times; that so long as the United States would not allow other powers a free hand in the western hemisphere, we were in honor bound to maintain order and security in the American states; that not territory and power, but the political stability and financial security of these states was sought, in the interest of both natives and foreigners; and that the proprietorship of the Canal laid upon the nation a special obligation to shield the waterway from extra-American attack and competition. Upon the use of the power of the government to protect the interests of private investors in backward countries, judgment was less favorable. 'While our foreign policy,' asserted President Taft, 'should not be turned a hair's-breadth from the straight path of justice, it may be well made to include active intervention to secure for our merchandise and our capitalists opportunity for profitable investment which shall inure to the benefit of both countries concerned.' Taft followed out this view systematically, but under a rapid fire of criticism. He was charged with fostering 'dollar diplomacy,' with permitting the government to be made the cat's-paw of adventurous business interests, and with sacrificing the national dignity and security. Government encouragement and guarantee of loans and other investments in Latin America meant to put the army and navy at the service of private interests. It raised the question, too, whether the United States would be willing to allow other nations to back up private enterprise in the Latin American states in the same manner. If the debts of American citizens were to be collected by force, either European powers must be permitted to collect debts of their nationals in the same manner, or the United States must make such collections for them. Either alternative offered difficulties. Hence opponents of the Taft policy urged that the United States, once committed to the active support and defense of money-lenders, mine operators, plantation owners, and other concession-holders and exploiters in the Caribbean lands, would be found to have entered upon a perilous path, from which withdrawal would be difficult or impossible; while the actions that such a policy would force upon her would rouse the suspicions of Latin American peoples and ruin the chances of building up a genuine Pan-American spirit. These considerations carried much weight with the Wilson Administration. For a time it drew back from the course marked out by its predecessor, and at no stage did it base its acts in behalf of American influence in the Caribbean on the desire to propagate American business and financial power in that quarter. It recognized that the advantage of the private investor might be promoted by measures which also served the larger interest of the country, but it felt that such assistance should be subsidiary, or even incidental. After 1913 our Caribbean policy was, therefore, less frankly shaped to back up the enterprises of 'big business.' Such actual changes as took place, however, were in motive rather than method; for the broader demands of the national interest still irresistibly impelled the government to spread theegis of its authority over the whole of the Caribbean region.—F. A. Ogg, *National Progress (American Nation Series)*, pp. 262-264.

"The case of SANTO DOMINGO afforded the first

clear example of the application of this new aspect of our foreign policy. Santo Domingo had been the scene of countless revolutions. For seventeen years Ulysses Heureaux ruled by a policy of terrorism. A semblance of law and order was secured, but with his assassination in 1899, the little republic lapsed into its original state of chronic lawlessness. By 1904 the national debt was thirty-two million dollars, and not even the interest could be paid. European intervention was threatened and it was rumored that French and Italian vessels were on the way. An appeal was made to the United States. President Roosevelt was confronted squarely with the problem of assuming responsibility for the finances of the bankrupt government or seeing European countries seek relief by methods that might be inimical to the interests of his government. President Roosevelt drew up a protocol which virtually made this government a receiver for the bankrupt country. The United States was to adjust all claims of foreign creditors and assume control of the custom houses. Fifty-five per cent of the receipts were to be applied to the cost of collecting the customs and the reduction of the debt and interest, the other forty-five per cent to be applied to domestic expenses. The Senate refused to ratify the treaty, and President Roosevelt entered into an executive agreement with the republic embodying practically the same terms. The President justified his general policy because 'There was imminent danger of foreign intervention. The previous rulers of Santo Domingo had recklessly incurred debts, and owing to her internal disorders she had ceased to be able to provide means of paying the debts. The patients of her foreign creditors had become exhausted, and at least two foreign nations were on the point of intervention, and were only prevented from intervening by the unofficial assurance of this government that it would itself strive to help Santo Domingo in her hour of need. In the case of one of these nations, only the actual opening of negotiations to this end by our government prevented the seizure of territory in Santo Domingo by a European power.' The agreement was so successful that, two years later, a new treaty, embodying the same general policy, was negotiated and ratified. The public debt, which was scaled down to twenty million dollars by discarding fraudulent claims, was refunded by New York bankers. . . .

"In December, 1909, President Zelaya, of NICARAGUA, was swept from office by a revolution. The finances were hopelessly involved, and the new government looked to the United States for help. A convention was drawn providing that loans advanced to Nicaragua by American bankers should be secured by placing American officials in charge of customs. The Senate failing to ratify the treaty, President Taft carried out its policy by an executive agreement. The proceeds were to be employed in the common interest of Nicaragua, the American bankers, and British creditors. Later another treaty was signed in which the United States agreed to pay three million dollars to Nicaragua, to be expended on public works and education, in return for which the latter country was to grant to the United States exclusive and perpetual canal rights across its territory, a naval base on the Gulf of Fonseca, and substantial control of finances and foreign relations. America would thus obtain a protectorate. The treaty was not then accepted by the United States Senate but was later ratified in 1916, some minor changes having been made in the meantime. The political relations were similar to those established with Cuba by the Platt Amendment. . . .

"In the meanwhile conditions in HAITI were rapidly coming to a climax. For the last decade conditions had been growing steadily worse. The people were hopelessly incompetent for self-government. The climax came in 1014 when Germany and France made formal demand for the control of the customs. The outbreak of the European war prevented this, and subsequently Haiti suspended payments on all its obligations. Revolution again broke out; the Dominican and French legations were outraged, the United States was compelled to land marines to establish order, and finally, in the summer of 1915, to take over the administration of the customs."—A. B. Hall, *Monroe Doctrine and the Great War*, pp. 98-100, 102.—See also HAITI, REPUBLIC OF: 1911-1916.

DÖLLINGER, Johann Joseph Ignaz von (1799-1890), German Roman Catholic theologian and historian who opposed the dogma of papal infallibility. See PAPACY: 1860-1870.

DOLMEN, prehistoric monument of large upright stone slabs, with a flat stone as a roof, and designed as a sepulchral chamber. See AFRICA: Races of Africa; Prehistoric peoples; CROMLECHS; EUROPE: Prehistoric period; Neolithic period.

DOMESDAY, or *Doomsday Book*, roll or register, in the Latin language of land and land holders in England, prepared by order of William the Conqueror, and finished in 1086. See CENSUS: Medieval; JURY, TRIAL BY; ENGLAND: 1085-1086.

DOMINGUEZ, Francisco Atanasio, Franciscan friar who explored in the western United States, seeking a direct route to Monterey, California, from Mexico.—See also COLORADO: 1776-1858; UTAH: 1540-1776.

DOMINIC, Saint (1170-1221), native of Calaroga in the north of Spain; 1215, founded the order of Dominican friars; active in suppressing the Albigenses, chiefly, it is said, by his work in the conversion of the people.—See also ALBIGENSES: 1209; DOMINICAN FRIARS; INQUISITION; 1203-1525; MONASTICISM: 13th century.

DOMINICA, British West Indian island, one of the Leeward group. See WEST INDIES: 1897.

DOMINICAN FRIARS, an order of mendicant friar preachers founded by St. Dominic, a prior of Osma in north central Spain early in the thirteenth century. They are to be distinguished by their

white habit and scapular, similar in form to that of the Augustinians, with black cloak and pointed cap, and were from their costume sometimes called the "Black Friars." "The youth of Dominic had been that of a student and a cleric. Early in the thirteenth century he accompanied his bishop on a diplomatic mission for the king of Castile, and they also visited Rome. In passing through Toulouse on their way north and again on their return they were shocked by the prevalence of heresy. Dominic determined to remain there and devote himself to religious work."—L. Thorndike, *History of medieval Europe*, p. 450.—After toiling for ten years in this mission "the zeal of the Spaniard Dominic was roused at the sight of the lordly prelates who sought by fire and sword to win the Albigensian heretics to the faith. 'Zeal,' he cried, 'must be met by zeal, lowliness by lowliness, false sanctity by real sanctity, preaching lies by preaching truth.'"—J. R. Green, *History of the English people*, v. 1, p. 255.—He therefore presented to Innocent III the idea of "training a body of men to combat heresy and teach the people the true faith. This order, known as the 'Friars Preachers' was confirmed in 1216 by Innocent's successor and by the time of Dominic's death in 1221 was spreading over Europe. . . . [The Dominicans rose side by side with the somewhat similar order of the Franciscans.] Although the temperaments and ideals of their founders had differed considerably, Francis emphasizing poverty and social service and Dominic stressing orthodox teaching and preaching, the two orders came to be much alike and are usually spoken of together as 'Mendicant Friars,' although there has generally been a certain rivalry between them. . . . The ablest and most learned of the clergy were . . . apt to be found among the friars. Albertus Magnus and Thomas Aquinas were Dominicans."—L. Thorndike, *History of medieval Europe*, p. 451.—"Those zealous preachers had immense influence on the people and even on the Church. The Dominicans, whose particular mission it was to convert heretics, were invested with inquisitorial functions in 1229; but the tribunal of the Inquisition, although born in France at the time of the struggle with the Albigenses, fortunately failed to take root there and to extend as it did in Spain and Italy. The Dominicans in France went by the name of Jacobins because their first convent was built in the street of St. Jacques. . . . The austerity and exalted piety of the new monks, and the learning of some of their doctors, roused a spirit of emulation in the ancient orders and even in the secular clergy, where a stricter ecclesiastical discipline began to appear. Great opposition was roused, indeed, by the favor shown by the Pope to the mendicant orders. The bishops, the University of Paris, and especially the bold doctor of the Sorbonne, William de St. Amour, contested the right of the Pope to bestow upon mendicant monks the privilege of preaching and performing the duties of a parish priest. To which St. Thomas Aquinas replied, that if a bishop could delegate his powers within his diocese, the Pope could do as much within the limits of Christendom."—V. Duruy, *History of the Middle Ages* (12th ed., tr.), p. 280.—See also ABBEY: Architectural features; BLACK FRIARS; CHRISTIANITY: 11th-16th centuries; INQUISITION: 1203-1525; PHILIPPINE ISLANDS: 1600: Spanish power; also FRANCISCAN FRIARS; MONASTICISM: 13th century, etc.

DONATISTS.—"The Donatist controversy was not one of doctrine, but of ecclesiastical discipline; the contested election for the archbishopric of Carthage. Two competitors, Cecilius and Donatus, had been concurrently elected while the church was yet in a depressed state, and Africa subject to the

tyrant Maxentius [306-312]. Scarcely had Constantine subdued that province, when the two rivals referred their dispute to him. Constantine, who still publicly professed paganism, but had shown himself very favourable to the Christians, instituted a careful examination of their respective claims, which lasted from the year 312 to 315, and finally decided in favour of Cecilius. Four hundred African bishops protested against this decision; from that time they were designated by the name of Donatists. . . . In compliance with an order of the emperor, solicited by Cecilius, the property of the Donatists was seized and transferred to the antagonist body of the clergy. They revenged themselves by pronouncing sentence of excommunication against all the rest of the Christian world. . . . Persecution on one side and fanaticism on the other were perpetuated through three centuries, up to the period of the extinction of Christianity in Africa. The wandering preachers of the Donatist faction had no other means of living than the alms of their flocks. . . . As might be expected, they outdid each other in extravagance, and soon gave in to the most frantic ravings: thousands of peasants, drunk with the effect of these exhortations, forsook their ploughs and fled to the deserts of Getulia. Their bishops, assuming the title of captains of the saints, but themselves at their head, and they rushed onward, carrying death and desolation into the adjacent provinces; they were distinguished by the name of Circumcelliones: Africa was devastated by their ravages."—J. C. L. de Sismondi, *Fall of the Roman empire, ch. 4.*

DONATUS, the Great, ecclesiast of the 4th century. See **DONATISTS.**

DONATUS, Aelius (fl. 335), grammarian and commentator in Rome. His grammar was one of the first books printed from wooden blocks. See **PRINTING AND THE PRESS:** 1430-1456.

DONAUWÖRTH, town in Bavaria on the left bank of the Danube, northwest of Munich.

11th-13th centuries.—Early development.—The development of Donauwörth began in the 11th century and in the 13th it became the seat of the duke of Upper Bavaria.

1308-1607.—Free city.—It received the freedom of the Empire in 1308, but lost it in 1607 when its Protestant inhabitants interfered with the abbot of the Heilig Kreuz and the imperial law authorized the duke of Bavaria to punish it for its offense. See **GERMANY:** 1608-1618.

1631-1634.—Thirty Years' War.—Taken by Gustavus Adolphus and later by king Ferdinand. See **GERMANY:** 1631-1632.

1703-1714.—Free city.—Imperial freedom was restored to the city by Joseph I in 1703, but lost in 1714 by reincorporation of Donauwörth with Bavaria.

1704.—War of the Spanish Succession.—Marlborough and Prince Louis of Baden defeated the French and Bavarians. See **GERMANY:** 1704.

1805.—Napoleonic Wars.—Austrians under Mack were defeated by the French under Soult.

DONEGAL, hospital ship sunk: by Germans. See **WORLD WAR:** Miscellaneous auxiliary services: X. Alleged atrocities, etc.: e.

DONELSON, fort in Stewart county, Tennessee, captured by General Grant in 1862 during the Civil War. See **U. S. A.:** 1862 (January-February): Kentucky, Tennessee).

DONETZ COAL BASIN, situated in Southern European Russia, in the government of Ekaterinoslav.

Concessions to Germany in secret clause of Rapallo Treaty. See RAPALLO, TREATY OF (1922).

DONGAN, Thomas (1634-1715), earl of Limerick and colonial governor of New York.

CHARTERS granted to New York and Albany. See NEW YORK: 1684; 1686; MUNICIPAL GOVERNMENT: Development of the city, etc.

DONGOLO, a province of the Egyptian Sudan, with a Mohammedan population of mixed races; formerly an important part of Nubia. It was captured by the Dervishes but regained in 1896 by the Anglo-Egyptians under Kitchener. See EGYPT: 1885-1896.

DONIZETTI, Gaetano (1798-1848), Italian operatic composer. Studied under Mayr, Salari, and Gonzalez; later at Bologna; a facile writer with considerable melodic grace and charm; wrote sixty-three operas, of which "Lucia di Lammermoor," "Lucrezia Borgia," and "The Daughter of the Regiment" still survive.—See also MUSIC: Modern: 1813-1868.

DONJON, the principal tower of a castle or fortress. See NORMANS: Influence of Vikings.

DONNE, John (1573-1631), English poet. See ENGLISH LITERATURE: 1530-1660.

DONUM. See TALLAGE.

DONUS I, or Donnus (d. 678), pope from 676-678. Donus II is sometimes on the papal lists for 974, but this is a mistake. The word dominus, shortened in the expression *domnus, papa*, has been taken as a proper name.

DONZELLO. See D'AMOISEL.

DOOLEY, Henry Williamson (1871-), American soldier and merchant, involved in Supreme Court case questioning the status of new possessions of the United States. See U. S. A.: 1900-1901.

DOOMS OF INE.—"These laws were republished by King Alred as 'The Dooms of Ine' who [Ine] came to the throne in 688. In their first clause they claim to have been recorded by King Ine with the counsel and teaching of his father Cenred and of Hedde, his bishop (who was Bishop of Winchester from 676 to 705) and of Eorcenweld, his bishop (who obtained the see of London in 675); and so, if genuine, they seem to represent what was settled customary law in Wessex during the last half of the seventh century."—F. Seebohm, *English village community*, ch. 4.

DOOMS OF KING ALFRED, code of laws compiled by King Alfred chiefly from the West Saxon collection of Ine. See BIBLE, ENGLISH: 8th-11th centuries.

DOOMSDAY BOOK. See DOMESDAY BOOK.

DOORANEES, or DURANEES. See DURANI.

DOOTIGOLA, early name for Melbourne, city in Victoria, Australia. See MELBOURNE.

DORCHESTER, town in Massachusetts, settled by Puritans under the Rev. John White from Dorchester, England, which early had a characteristic municipal government. See MASSACHUSETTS: 1623-1629; Dorchester company; TOWNSHIP AND TOWN MEETING.

DORDOGNE, department of southwest France, in which troglodyte dwellings and relics are found in many localities.

DORDRECHT, or Dort, town in the Netherlands, twelve miles southeast of Rotterdam, where in 1618-1619 the famous Synod of Dort was held. In 1813 the town revolted against the French.—See also DORT, or DORDRECHT, SYNOD OF; NETHERLANDS: 1603-1610; 1813.

DORIA, Andrea (1466-1560), Genoese admiral who fought against the French. See ITALY: 1527-1529.

DORIA, Luciano (d. 1379), Genoese admiral who fought against the Venetians at the battle of Pola in 1379. See VENICE: 1378-1379.

DORIA, Pietro, Genoese admiral who fought against the Venetians. See VENICE: 1379-1381.

DORIA FAMILY. See GENOA: 1528-1559; ITALY: 1313-1330; 1527-1529; VENICE: 1378-1379; 1379-1381.

DORIAN, or Sikyonian School, very early art school of ancient Greece. See EDUCATION, ART: Greece.

DORIANS AND IONIANS.—"Out of the great Pelasgian population [see PELASGIANS], which covered Anterior Asia Minor and the whole European peninsular land, a younger people had issued forth separately, which we find from the first divided into two races. These main races we may call, according to the two dialects of the Greek language, the Dorian and the Ionian, although these names are not generally used until a later period to designate the division of the Hellenic nation. No division of so thorough a bearing could have taken place unless accompanied by an early local separation. We assume that the two races parted company while yet in Asia Minor. One of them settles in the mountain-cantons of Northern Hellas, the other along the Asiatic coast. In the latter the historic movement begins. With the aid of the art of navigation, learnt from the Phœnicians the Asiatic Greeks at an early period spread over the sea; domesticating themselves in lower Egypt, in countries colonized by the Phœnicians, in the whole Archipelago, from Crete to Thrace; and from their original as well as from their subsequent seats send out numerous settlements to the coast of European Greece, first from the East side, next, after conquering their timidity, also taking in the country, beyond Cape Malea from the West. At first they land as pirates and enemies, then proceed to permanent settlements in gulfs and straits of the sea, and by the mouths of rivers, where they unite with the Pelasgian population. The different periods of this colonization may be judged of by the forms of divine worship, and by the names under which the maritime tribes were called by the natives. Their rudest appearance is as Carians; as Leleges their influence is more beneficent and permanent."—E. Curtius, *History of Greece*, bk. 1, ch. 2.—In the view of Dr. Curtius, the later migration of Ionian tribes from southern Greece to the coasts of Asia Minor,—which is an undoubted historic fact,—was really a return "into the home of their ancestors"—"the ancient home of the great Ionic race." Whether that be the true view or not, the movement in question was connected, apparently, with important movements among the Dorian Greeks in Greece itself. These latter, according to all accounts, and the agreement of all historians, were long settled in Thessaly, at the foot of Olympus (see GREECE: Migrations). It was there that their moral and political development began; there that they learned to look at Olympus as the home of the gods, which all Greeks afterwards learned to do from them. "The service rendered by the Dorian tribe," says Dr. Curtius, "lay in having carried the germs of national culture out of Thessaly, where the invasion of ruder peoples disturbed and hindered their farther growth, into the land towards the south, where these germs received an unexpectedly new and grand development. . . . A race claiming descent from Heracles united itself in this Thessalian coast-district with the Dorians and established a royal dominion among them. Ever afterwards Heraclidæ and Dorians remained together, but without ever forgetting the original

distinction between them. In their seats by Olympus the foundations were laid of the peculiarity of the Dorians in political order and social customs; at the foot of Olympus was their real home."

—*Ibid.*, bk. 1, ch. 4.—From the neighborhood of Olympus the Dorians moved southwards and found another home in "the fertile mountain-recess between Parnassus and Ceta, . . . the most ancient Doris known to us by name." Their final movement was into Peloponnesus, which was "the most important and the most fertile in consequences of all the migrations of Grecian races, and which continued, even to the latest periods to exert its influence upon the Greek character." Thenceforward the Dorians were the dominant race in Peloponnesus, and to their chief state, Lacedæmonia, or Sparta, was generally conceded the headship of the Hellenic family. This Doric occupation of Peloponnesus, the period of which is supposed to have been about 1100 B.C., no doubt caused the Ionic migration from that part of Greece and colonization of Asia Minor.—C. O. Müller, *History and antiquities of the Doric race*, bk. 1, ch. 3.—The subsequent division of the Hellenic world between Ionians and Dorians is thus defined by Schömann: "To the Ionians belong the inhabitants of Attica, the most important part of the population of Eubœa, and the islands of the Ægean included under the common name of Cyclades, as well as the colonists both on the Lydian and Carian coasts of Asia Minor and in the two larger islands of Chios and Samos which lie opposite. To the Dorians within the Peloponnese belong the Spartans, as well as the dominant populations of Argos, Sicyon, Philus, Corinth, Troezen and Epidaurus, together with the island of Ægina; outside the Peloponnese, but nearest to it, were the Megarid, and the small Dorian Tetrapolis [also called Pentapolis and Tripolis] near Mount Parnassus; at a greater distance were the majority of the scattered islands and a large portion of the Carian coasts of Asia Minor and the neighbouring islands, of which Cos and Rhodes were the most important. Finally, the ruling portion of the Cretan population was of Dorian descent."—G. F. Schömann, *Antiquities of Greece: The State*, pt. 1, ch. 1.—See also GREECE: Migrations; ÆOLIANS; ASIA MINOR: Greek colonies; CRETE: Government; HER. CLIDÆ; SICYON, OR SIKYON.

DORIC ARCHITECTURE, oldest and simplest of the three Greek orders of architecture. See ARCHITECTURE: Classic: Greek, Doric and Ionic; ORDERS OF ARCHITECTURE.

DORIS AND DRYOPIS.—"The little territory [in ancient Greece] called Doris and Dryopis occupied the southern declivity of Mount Ceta, dividing Phokis on the north and northwest from the Ætolians, Ænians and Malians. That which was called Doris in the historical times, and which reached in the times of Herodotus nearly as far eastward as the Maliaë gulf, is said to have formed a part of what had been once called Dryopis; a territory which had comprised the summit of Ceta as far as the Sperchius, northward, and which had been inhabited by an old Hellenic tribe called Dryones. The Dorians acquired their settlement in Dryopis by gift from Hēraklēs, who, along with the Malians (so ran the legend), had expelled the Dryopes and compelled them to find for themselves new seats at Hermionē, and Asinē, in the Argolic peninsula of Peloponnesus,—at Styra and Karystus in Eubœa,—and in the island of Kythnus; it is only in these five last-mentioned places that history recognizes them. The territory of Doris was distributed into four little townships,—Pindus, or Akyphas, Bœon, Kytinion and Erineon. . . .

In itself this tetrapolis is so insignificant that we shall rarely find occasion to mention it; but it acquired a factitious consequence by being regarded as the metropolis of the great Dorian cities in Peloponnesus, and receiving on that ground special protection from Sparta."—G. Grote, *History of Greece*, pt. 2, ch. 3.—See also DORIANS AND IONIANS.

DORMANS, Battle of (1575). See FRANCE: 1573-1576.

DORNACH, Battle of (1499). See SWITZERLAND: 1396-1499.

DORPAT, or Dörpt, a city of Latvia formerly belonging to Russia, 157 miles northeast of Riga; is noted for its university, founded by Gustavus Adolphus in 1632; in the thirteenth century was conquered by the Teutonic order; in the fourteenth century became a Hansa town; during the World War was captured by the Germans (February, 1918); seat of the peace conference of Balts and Russians, 1919.—See also BALTIC STATES: Estonia: 1919-1920.

DORPAT, Treaty of (1920). See BALTIC STATES: Estonia: 1919-1920; FINLAND: 1920 (October-December).

DORPFELD, Wilhelm (1853-), German archæologist. See ÆGEAN CIVILIZATION: Excavations and antiquities: Mycenaean area.

DORR, Thomas Wilson (1805-1854), American politician. Member of Rhode Island assembly, 1833-1837; agitated extension of suffrage in the state and brought about a rebellion; convicted of treason and sentenced to life imprisonment, 1844, released 1845. See RHODE ISLAND: 1841-1843.

DORR REBELLION. See RHODE ISLAND: 1841-1843.

DORT, or Dordrecht, Synod of.—"In the low-countries the supreme government, the states-general, interfered [in the Calvinistic controversy], and in the year 1618 convoked the first and only synod bearing something of the character of a general council that has been convened by protestants. It assembled at Dort, and continued its sittings from November till May following. Its business was to decide the questions at issue between the Calvinists and Arminians; the latter party were also termed remonstrants. James [I.] was requested to send over representatives for the English Church, and chose four divines:—Carlton bishop of Llandaff, Hall dean of Worcester, afterwards bishop successively of Exeter and Norwich, Davenant afterwards bishop of Salisbury, and Dr. S. Ward of Cambridge. They were men of learning and moderation. . . . The history of this famous synod is told in various ways. Its decisions were in favour of the doctrines termed Calvinistic, and the remonstrants were expelled from Holland. . . . The majority were even charged by the other party with having bound themselves by an oath before they entered upon business, to condemn the remonstrants."—J. B. Marsden, *History of early Puritans*, p. 329.—See EDUCATION: Modern: 15th-16th centuries: Netherlands; NETHERLANDS: 1603-1610.

DORYLAEUM, Battle of (1097). See CRUSADES: 1096-1099.

DOSHISHA UNIVERSITY, Kioto, Japan. See UNIVERSITIES AND COLLEGES: 1871-1913.

DOSITHEANS, name given to two Samaritan sects, one ancient and connected with Zadok, the founder of the Sadducees; the other, probably contemporary with Jesus, claiming their leader, Dositheus, to be the Messiah.

ALSO IN: *New Schaff-Herzog religious encyclopedia*, v. 3, p. 495.

DOST MOHAMMED, Khan of Kabul, Amir of Afghanistan, 1826-1863. See AFGHANISTAN: 1803-1838; 1842-1869.

DOSTOIEVSKY, Feodor Mikhailovich (1821-1881), Russian novelist. Exiled in 1849 to Siberia, where his experiences of human suffering and degradation provided him with material for his subsequent writings, which are exceptional in their psychology.—See also RUSSIAN LITERATURE: 1851-1910.

DOSZA, peasant leader of the Kurucs (crusaders) against nobles in Hungary in 1513. See HUNGARY: 1487-1526.

DOU, Gerard (1613-1674), Dutch genre painter and a pupil of Rembrandt. See PAINTING: Dutch.

DOUAI, town of northern France, twenty miles south of Lille.

1667.—Taken by the French. See BELGIUM: 1667.

1668.—Ceded to France. See NETHERLANDS: 1668.

1710.—Siege and capture by Marlborough. See NETHERLANDS: 1710-1712.

1918.—Occupied by Allies. See WORLD WAR: 1918: II. Western front: m; r, 3.

DOUAUMONT, one of the forts surrounding Verdun, east of the Meuse. In 1916 it was the scene of fierce fighting between French and Germans, changing hands twice.—See WORLD WAR: 1916: II. Western front: b, 8, 13, 15, 17.

DOUAY VERSION OF THE BIBLE. See BIBLE, ENGLISH: Bible used in Roman Catholic churches.

DOUBLOON, or Doblón. See SPANISH COINS.

DOUGHBOYS, slang term applied to American soldiers, particularly the infantry.

DOUGHFACES, term in the American slavery controversy used for Northern men with Southern principles. The "Missouri Compromise" of 1820, in the United States, "was a Northern measure, carried by Northern votes. With some the threats of disunion were a sufficient influence; some, whom in the debate Randolph [John Randolph, of Virginia] called doughfaces, did not need even that. . . . There has been always a singular servility in the character of a portion of the American people. In that class the slaveholder has always found his Northern servitor. Randolph first gave it a name to live by in the term doughface."—W. C. Bryant and S. H. Gay, *Popular history of the United States*, v. 4, pp. 270 and 294.—The expression gradually gained prevalence and came to be applied to men like Pierce and Buchanan who belonged to the North but who courted the favor of the South.

DOUGLAS, Archibald, 5th Earl of (1391-1439), second duke of Touraine. See SCOTLAND: 1437-1460.

DOUGLAS, Aretas Akers- (1876-), English diplomat. See ENGLAND: 1902 (July).

DOUGLAS, James (1803-1877), Canadian administrator and chief founder of British Columbia. See BRITISH COLUMBIA; CANADA: 1805-1866.

DOUGLAS, James Sholto Cameron (1879-), English scientist, experimenter in pathological and bacteriological subjects. See MEDICAL SCIENCE: Modern: 19th century: Oponins.

DOUGLAS, Stephen Arnold (1813-1861), American political leader. Member of Illinois House of Representatives, 1836; Secretary of State of Illinois, 1841; Justice of the State Supreme Court, 1841-1843; member of the national House of Representatives, 1843-1847; United States Senator, 1847-1861; advocate of "popular" or "squatter sovereignty"; well known for his debates with Abraham Lincoln against whom he was opposed as candidate for the presidency.—See also FREE-

PORT DOCTRINE; U. S. A.: 1853-1854; 1856; 1858; 1860 (April-November).

DOUGLAS, Sir William (1858-), British major general prominent in the Gallipoli campaign of the World War. See WORLD WAR: 1915: VI. Turkey: a, 4, xvii.

DOUGLASS, Frederick (1817-1895), American negro orator, journalist and public official. Lecturer for Massachusetts Anti-Slavery Society, 1841-1845; editor of abolition newspaper, 1847-1860; commissioner for District of Columbia, 1871; New York state presidential elector, 1872; United States marshal for District of Columbia, 1877-1881; recorder of deeds for the district, 1881-1886; minister to Haiti, 1889-1891.

DOUMER, Paul (1857-), French statesman; was minister of finance, 1895-1896; governor-general of French Indo-China, 1896-1902; president of the French Chamber, 1905, and candidate for the presidency of the Republic in 1906, when he was defeated by Armand Fallières.—See also INDO-CHINA: 1893-1921; FRANCE: Colonial empire.

DOURO, or Duero, river of the Iberian peninsula which flows west across the Castilian table land and forms the frontier between Portugal and Spain for sixty-five miles. It crosses Portugal and enters the Atlantic Ocean three miles below Oporto.

Battle of (1580). See PORTUGAL: 1579-1580.

Wellington's passage of. See SPAIN: 1809 (February-July).

DOVER, English port on the straits of Dover, in the borough of Kent, and seventy-six miles southeast of London. It is on the main line of communication with the continent; hence has been considered the key to England; its castle, an important fort of the Middle Ages, embodies interesting early structures, Roman pharos, an ancient fortress church, Saxon remains and Norman towers; the naval battle of Dover (1217) was an important victory, overthrowing the power of the barons. It was one of the Cinque Ports. Great new harbor works were built there during the years of the World War.—See also CINQUE PORTS; DUBRIS.

DOVER, Strait of, body of water separating the southeast coast of England from the northeast coast of France. Recently there has been a project for increasing means of transportation, by tunneling under it. See CHANNEL TUNNEL.

DOVER, Tennessee, Battle of (1863). See U. S. A.: 1863 (February-April: Tennessee).

DOVER, Treaty of (1670). See ENGLAND: 1668-1670.

DOW, Neal (1804-1897), American temperance reformer. Twice mayor of Portland, Maine; member Maine legislature, 1858-1859; author of Maine prohibition law of 1851; served in Civil War, rising in rank from colonel to brigadier-general; candidate for president on Prohibition party ticket, 1880.

DOWAGER-EMPRESS OF CHINA. See TZE-HSI.

DOWER, Law of. See COMMON LAW: 1217.

DOWIE, John Alexander (1847-1907), Scottish divine, emigrated to Australia and thence to the United States; founder of Christian Catholic Apostolic Church in Zion.

DOWIEISM. See CHRISTIAN CATHOLIC APOSTOLIC CHURCH IN ZION.

DOWLAH, Suraj-ud. See SURAJ-UD DAULA.

DOWNIE, George (-1814), British naval officer in the war of 1812 in America. See U. S. A.: 1814 (September).

DOWNING STREET, London, built by Sir George Downing about 1663-1671. It is in the West End of London leading from Whitehall; con-

tains a small red brick house, No. 10, which is the residence of the prime minister where Cabinet meetings are held; also contains the Treasury building and Foreign Office, thus becoming a synonym for the administration.

DOWNPATRICK, municipal borough and cathedral town in Down county, Ireland.

1177.—Captured by De Courcy. See **ULSTER**: 1171-1186.

1260.—Battle.—Defeat of Ulster chiefs. See **ULSTER**: 1199-1260.

DRACHMA, name of a Greek measure of weight and a Greek coin. See **GREECE**: B. C. 4th century: Economic conditions; **TALENT**.

DRACO (fl. 7th century B. C.), Athenian legislator who codified the laws. See **ATHENS**: B. C. 624-621; **CODES**: B. C. 7th century.

DRACONTIDES (fl. 5th century B. C.), Athenian who proposed the rule of the Thirty Tyrants. See **ATHENS**: B. C. 404-403.

DRAFT. See **CONSCRIPTION**.

DRAFT RIOTS. See **NEW YORK CITY**: 1863; **U. S. A.**: 1863 (July): New York.

DRAGA, (d. 1903), Queen of Serbia, wife of King Alexander I. They were both assassinated in 1903. See **SERBIA**: 1885-1903.

DRAGO, Luis Maria (1850-1921), noted jurist and author of Drago doctrine. See **DRAGO DOCTRINE**.

DRAGO DOCTRINE.—"On December 29, 1902, Señor Luis M. Drago, minister of foreign affairs for the Argentine Republic, sent a note to Señor Mérou, the Argentine minister at Washington, which attracted widespread attention in Europe as well as in the United States. In this note, which was called forth by the attempt then being made by the allied powers (Great Britain, Germany and Italy) to collect certain claims against Venezuela by forcible means, Señor Drago stated . . . that the Argentine people were alarmed lest the action of the allied powers in Venezuela 'would establish a precedent dangerous to the security and peace of the nations in this part of America,' . . . and pointing to the danger lest European nations make use of 'financial intervention' as a pretext for conquest, [suggested] that the United States adopt or recognize the principle 'that the public debt [of

an American state] cannot occasion armed intervention, nor even the actual occupation of the territory of American nations by a European power.'"—A. S. Hershey, *Calvo and Drago doctrines* (*American Journal of International Law*, Jan., 1907, pp. 28-30).—President Roosevelt declared himself emphatically in favor of the principle, but it has failed of any genuine international endorsement.—See also **DEBITS**, **PUBLIC**: Latin America; **HAGUE CONFERENCES**: 1907; **MONROE DOCTRINE**: Latin American doctrines.

Also in: *House documents of 58th Congress, 2nd session*, pp. 1-5 (*text of the Drago note*).

DRAGON, **PENDRAGON**, a title sometimes given in Welsh poetry to a king or great military leader. Supposed to be derived from the figure of a dragon on their flags, which they borrowed from the Romans. See **CUMBRIA**.

DRAGONNADES, organized persecution of French Protestants by dragoons under Louis XIV. See **FRANCE**: 1681-1698; also **BOHEMIA**: 1621-1648.

DRAGUT, Torgud or Torghud (-1565), Turkish corsair who warred against the Spanish and attempted conquests in Africa. See **BARBARY STATES**: 1543-1560.

DRAKE, Sir Francis (1545-1595), English admiral; as captain of the *Judith*, assisted in attack on San Juan de Ulloa (gulf of Mexico), under Hawkins; 1572, took Nombre de Dios (Panama), and crossed the Isthmus to within sight of the Pacific; 1577-1580, commanded expedition to the Pacific and circumnavigated the world; 1581, mayor of Plymouth; 1585, took Santiago (Cape Verde), San Domingo (Dominican republic), Cartagena (South America), and St. Augustine (West Indies); 1587, sailed into Cadiz, and burned the Spanish fleet, thereby "singeing the king's beard," and delaying the sailing of the Armada; 1588, made vice-admiral, and sailed under Lord Howard against the Armada, which was destroyed; 1594, with Sir John Hawkins, commanded a fleet to the West Indies, where he died.—See also **AMERICA**: 1528-1648; 1572-1580; **ANTARCTIC EXPLORATION**: 1510-1810; **BUCCANEERS**: English; **CALIFORNIA**: 1543-1781; **CARACAS**: 1595; **ENGLAND**: 1587-1588, 1588: Destruction of Armada; 1588-1590; **FLORIDA**: 1580-1665; **PACIFIC OCEAN**: 1513-1764; **PORTOBELLO**

DRAMA

Origin.—Greek tragedy.—**Rise and development**.—"To the modern man a definition of drama might seem simple enough. A drama is 'a thing made to be acted': surely this is sufficient; and, indeed, acting touches the vital point of all drama. But the Senecan tragedies of Neronian Rome were not things 'made to be acted'; neither is much of the literary drama of Victorian England, Shelley's *Cenci* for example or Swinburne's splendid trilogy devoted to Mary Stuart. . . . As a point of departure, Aristotle's simple definition of drama as 'imitated human action' has not been bettered. The limitation, 'human,' is not less pertinent than the much debated term 'imitation.'"—F. E. Schelling, *English drama*, pp. 1-2.—"Wherever the dramatic art has existed as a native product of the soil it has always had its origin in the religious rites of an elementary worship, especially in the orgies which attended a personification of the powers of nature. So it was in India, whose drama is probably as ancient as that of Greece, while the strength and charm of the Attic drama was due to its unbroken connection with the worship of Bacchus, whence comes the origin of both tragedy and comedy."—A. Bates, ed., *Drama*, v. 1,

p. 12.—"The tragic drama . . . is to be traced back to the spring festivals of Dionysus, when the country people met together to open the casks of new wine, and to welcome with various rejoicings the renewed fertility of nature. On such occasions they were accustomed to celebrate the praises of their benefactor, the god of wine and vegetation, in a kind of hymn called the dithyramb; and from this hymn Greek tragedy is descended. . . . The dithyramb belonged to that type of performance which is called a choral dance; in other words, it was a hymn chanted by a chorus, and accompanied by illustrative gestures and motions."—A. E. Haigh. *The tragic drama of the Greeks*, pp. 13-14.—"Though the glory of the drama belongs to Athens, its first impetus was given among the Dorians. "The celebrated Arion, who raised the dithyramb to a splendid art-form, did much incidentally to aid this development. His main achievement in this regard is the insertion of spoken lines in the course of the lyrical performance; it seems, further, that these verses consisted of a dialogue between the chorus and the chorus-leader, who mounted upon the sacrificial table. . . . At this point drama begins to diverge from the dithyramb.

With comedy we are not here concerned. The drama of the spring festival may be called 'tragedy,' but it was in a quite rudimentary state. Its lyrics, sung by fifty 'satyrs,' would altogether outshine in importance the dialogue-interludes between chorus-leader and individual singers; the theme, moreover, would be always some event connected with Dionysus. Two great changes were necessary before drama could enter on free development: the use of impersonation in the interludes and the admission of any subject at will of the poet. The first was introduced by Thespis, who is said to have 'invented one actor.' The second was perhaps later, but at least as early as Phrynichus we find plays on subjects taken from other than Dionysiac legends. . . . Another great development is attributed to Pratinas—the invention of satyric drama. The more stately, graver features and the frolicsome, often gross, elements being separated, the way was clear for the free development of tragedy and satyric into the forms we know. But satyric work, though always showing playful characteristics and a touch of obscenity, was never confounded with comedy. Stately figures of legend or theology regularly appeared in it—Odysseus in the *Cyclops*, Apollo in the *Ichneutæ*—and it was a regular feature at the presentations of tragedy; each tragic poet competed with three tragedies followed by one satyric play. When the latter form changed its tone slightly, as in the work of the Alexandrian Pleiad, it approximated not to comedy but to satire."—G. Norwood, *Greek tragedy*, pp. 1-2.—"The first great poet of tragedy was Æschylus, who was born at Eleusis in 525 B. C. and died in Sicily in 456. . . . Of the seventy tragedies which he wrote only seven are extant. By his introduction of the second actor Æschylus is entitled to be called the creator of Attic tragedy. In his treatment of the chorus, his choice of themes, his development of the plot, and in his whole conception of the dignity of tragedy and of its mission as instructor of the people in morals, and religion, Æschylus laid down the lines which succeeding poets were to follow, with few important changes, so long as tragedy was cultivated in Greece. . . . Sophocles, the second great tragic poet of Athens, . . . made two important innovations in the dramatic art, the introduction of the third actor and the use of painted scenery. Sophocles is a true representative of the age of Pericles, of the fine aristocracy of culture which makes the period lying between 460 and 430 B. C. the greatest and most splendid of antiquity. His relation to letters is comparable to that of Pheidias to art. Euripides, on the other hand, was the poet of the extreme democracy, and stood for entirely different ideals; while Æschylus, whose early manhood fell in the stirring times in which Athens wrestled first with the tyranny for political freedom and then with the Persian Empire for her very existence, was of the more rugged type, sturdily striving to maintain the older ideals both in politics and in religion. Sophocles stands nearer to Æschylus than to Euripides, though only ten years older than the latter. [See also ATHENS: B. C. 461-431: Development of Greek drama.] Euripides was distinctly the representative poet of the last part of the fifth century. . . . The audience in the theatre now took less delight than formerly in the old-fashioned presentation of the old doctrines of religion as exemplified in the figures of mythology. They demanded striking scenes, clever reasoning, splendid oratory, harrowing situations, brilliant musical effects. If a poet could present a well-worn subject in a novel way, either by introducing subtle dra-

matic devices or by reshaping the myth, so much the better. Sophocles conceded not a little to this tendency of the times, but always maintained the lofty ideal of the tragic art which Æschylus had bequeathed. But Euripides was the very embodiment of the spirit of his age. A consummate playwright, he employed every dramatic and theatrical means to gain the desired effects, even sacrificing the harmony of the whole to the beauty and effectiveness of the parts."—E. Capps, *Homer to Theocritus*, pp. 192-239.

Greek comedy.—Three periods.—"The evolution of comedy is much simpler than that of its sister art, though as to its origin and earlier development there is little exact information. All that Aristotle can tell us is that it first took shape in Megaris and Sicyon, whose people were noted for their coarse humor and sense of the ludicrous, while Susarion, the earliest comic poet, was a native of a Megarian town. Add to this that it arose from the Phallic processions of the Greeks, as did tragedy from the dithyramb, and we have about all that is known as to the inception of the lighter branch of the drama. At country festivals held in celebration of the vintage it was the custom for people to pass from village to village, some in carts, uttering the vile jests and abuse unjustly attributed to the tragic choruses; others on foot, bearing aloft the Phallic emblem and singing the praises of Phales, the comrade of Bacchus. In cities it was also the custom, after an evening banquet, for young men to roam around the streets with torches in their hands, headed by a lyre or flute-player. Such a band of revellers was called a *comus*, and a member of the band a *comædus* or *comus-singer*, the song itself being termed a *comædia*, or comedy, just as a song of satyrs was named a *tragædia*, or tragedy. The Phallic processions were continued as late as the days of Aristotle, and we learn from one of the orations of Demosthenes that the riotous youths who infested the streets of Athens delighted in their comic buffooneries. Pasquinades of the coarsest kind were part of the exhibitions, and hence, probably, it was that comedy found a home at Athens during the time of Pericles, for it furnished the demagogues with a safe and convenient means of attacking their political opponents."—A. Bates, ed., *Drama*, v. 1, pp. 26-27.—"The real founder of comedy was Epicharmus of Sicily, a contemporary of Pindar and Æschylus. A poet of great creative power, he took the decisive step of introducing the plot. Before his time comic performances had not advanced beyond the stage of a series of episodes, each giving a fantastic or humorous situation, but on subjects unconnected with each other. There now was a more or less orderly progression from one episode to another, so that the comic subject received varied illustration in successive scenes. For a long time the comic performances in Attica were given at the festivals of Dionysus in an entirely unofficial manner. Soon after the Persian wars, however, they had assumed such importance and had reached such a state of literary excellence that they were admitted to the official programme of the great festival in March, the City Dionysia. At this time the principal comic poets, to whom this recognition was largely due, were Chionides and Magnes. From now on comedy steadily increased in importance and improved in technique, conforming itself, so far as its nature would allow, to the type of drama already established by tragedy. The number of actors who might be together on the scene was restricted to three, . . . and the number of the chorus was fixed at twenty-four—just double

the number employed in tragedy down to Sophocles' time. In form and manner comedy underwent a gradual but constant change from the time of the Persian wars. We distinguish three great periods: Old Comedy, down to about 390 B. C.; Middle Comedy, from about 390 to about 320 B. C., and the New Comedy, from 320 on. Attic comedy was not restricted to subjects drawn from mythology as was tragedy. Any situation in politics or society, any tendency in literature or religion or ethics, the foibles of the people or the idiosyncrasies of individuals—in short, any subject which the exuberant fantasy of the poet could summon up and turn to account for purposes of burlesque, parody, or satire, made an acceptable theme for the laughter-loving Athenians. The three great poets of the Old Comedy were Cratinus, Eupolis, and Aristophanes. The services of Cratinus in establishing the type of the comedy of this period were of the first importance. He was considered the most fearless exponent of the tendency to criticise and abuse individuals."—E. Capps, *Homer to Theocritus*, pp. 273-276.—"But it was not till the beginning of the Peloponnesian War that two gifted young writers, Eupolis and Aristophanes, eventually gave the Old Comedy an artistic form, wove the isolated bits of farce into a plot, and more or less abolished or justified the phallic element. After that comedy develops even more rapidly than tragedy. The chorus takes a more real and lifelike part in the action; its inherent absurdity does much less harm, and it disappears more rapidly. The last work of Aristophanes is almost without chorus, and marks the intermediate development known as the Middle Comedy, tamer than the Old, not so perfect as the New. Then comes, in weaker hands, alas! and brains less 'dæmonic,' the realisation of the strivings of Euripides, the triumph of the dramatic principle, the art . . . which aims self-consciously at being 'the imitation of life, the mirror of human intercourse, the expression of reality.' This form of art once established lasted for centuries. It began shortly after 400 B. C., when public poverty joined with artistic feeling in securing the abolition of the costly chorus, and when the free libel of public persons had, after long struggles and reactions, become finally recognised as offensive. It reached its zenith with Menander and Philémon about 300 B. C."—G. Murray, *History of ancient Greek literature*, pp. 212-213.

Physical features of the ancient Greek theater.—"The chief festival of the year was the 'great Dionysia,' held in the last days of March and the first of April, when Athens, at the period of her supremacy, was crowded with visitors from all parts of her federal empire, including those who had come to pay the taxes of tributary allies. . . . At first the stage of this open-air theatre was merely a table such as Thespis may have used, intended originally for the slaughter and preparation of sacrificial victims. On this the actor mounted to recite his monologue or take part in a dialogue with the chorus, and it was not until a second actor was introduced that the table gave way to a scaffold. In the background was a 'skéné,' or tent, from which the actors entered, and later this gave place to a house, the word skéné being later applied to all the part of the theatre assigned to the actors. In early days a movable painted wall, at a proper distance from the stage, served as a background, and as a screen for the tent. This was called the *proskénion* or, as we term it, *proscenium*, though the same word was afterward applied to the space in front of the stage. The painted wall could be easily moved

aside so as to reveal the interior of the tent or house, the inner floor being pushed into the foreground by means of special machinery. All these and other improvements were added before there existed at Athens any permanent temple of the drama."—A. Bates, ed., *Drama*, v. 1, pp. 32-34.

Chorus leaders.—"On account of their religious origin, the dramatic performances of the Greeks were treated as matters of State concern. The expenses of the chorus, which represented and originally included the entire population, were defrayed first by taxes, to which all were subject whose property exceeded three talents, and then by the contributions of wealthy citizens, chosen as *choragi* or chorus-leaders. It was the duty of the *choragus* to provide a chorus for all plays, whether tragic or comic, and to select and pay the teacher who trained them in their songs and dances. He must furnish quarters for the members of the chorus and supply them with such food and drink as would help to strengthen their voices. From Athens the drama spread throughout the Hellenic world, while the actor's profession was held in high esteem, for their art was regarded as a religious exercise as well as a source of entertainment. Companies of actors were almost as plentiful as now they are in the United States, some being richly endowed and all receiving valuable privileges. There were also bands of strolling players, who were held in much greater repute than with us, though ranking below the regular artists, who were Athenian citizens and not infrequently the authors of the plays in which they appeared. Hence the vitality of the Greek drama, which has no parallel in theatrical history, actors being the principal and sometimes the only agents for the diffusion of literary culture."—*Ibid.*, pp. 33, 43-44.

Drama transferred from Athens to Alexandria.—"It has been shown that Athens, the birthplace of Greek tragedy, continued to cherish the drama long after the decline of her imperial greatness. With each recurring year the Dionysiac festival was observed; new composers came forward; new tragedies were performed. But the later aspirants never attained the fame of the mighty three—Æschylus, Sophocles, Euripides, whose works were preserved in the public archives. A law was enacted, as we have seen, that none but these masterpieces should enjoy the favor of repetition. When Alexander the Great spread Hellenic civilization throughout the East, he celebrated his victories with scenic games. After his death theatres were built in all the cities where Greek influence prevailed. Alexandria, under the liberal government of the Ptolemies, became the new literary centre, and there tragic poets constructed dramas on the Attic models. Comedy also flourished, and won more favor among the mingled races of Egypt. The same course of events took place in Asia Minor, in Syracuse and the Greek cities of Southern Italy. These last were the channel through which the Attic drama was communicated to Rome and thus preserved to the modern world."—A. Bates, ed., *Drama*, v. 2, pp. 78-79.

Roman drama. — Spectacles. — Mimes. — Church's prohibition of the drama.—"Though in the Roman drama, even in the period of its decadence, as well as in its most productive age, native forms existed side by side with those imported from Greece, it was in the main but a reflex, and a somewhat feeble reflex, of Hellenic examples. The

Romans had little creative ability, or at least there are few traces of it in the works that have come down to us; for, except a few fragments, the only extant specimens of their classic drama are the plays of Plautus and Terence [see LATIN LITERATURE: B. C. 234-103], nearly all of them taken from the later comedy of the Greeks. In turning from the Greek to the Roman drama, it must be remembered that we are turning from a nation of artists to a nation of soldiers, from one whose literature was the finest in the ancient world to one that had few authors of creative genius, or even of distinctly marked individuality. For the origin of the Roman drama we must look, as among the Greeks, to the festivals which attended the religious celebrations of the country people, accompanied at a very early period with song and dance, speech and dialogue of a jocular and abusive character. Especially were marriage ceremonies made the occasion for such mirthful demonstrations, a custom that, in modified shape, has survived to the present day. . . . Yet, for a century or more, the Romans remained satisfied with the rude forms of entertainment already described. Their regular drama begins with the year 240 B. C., when the victory which ended the first Punic war was celebrated, according to Macedonian precedent, with the performance of a tragedy and comedy. The regular comedy of the Romans was called *palliata*, from the pallium, or mantle, worn by the actors. It dealt with Greek subjects and was modelled after the Greek comedians, chiefly those of the new comedy. . . . Lastly, in the brightest age of Roman literature, the dramatic poets, in the midst of a people fond of spectacle, even to madness, nevertheless wanted an audience for their poetry. In their triumphal processions, their gladiatorial games and beast fights, all the magnificence in the world, all the marvels of foreign climes were led before the eye of the spectator, who was also glutted with the most violent scenes of bloodshed. On nerves thus steeled what effect could be produced by the finer gradation of tragic pathos? It was the ambition of the grandees to display to the people, in a single day, the enormous spoils of foreign wars, on stages which were usually destroyed immediately after the use so made of them. . . . The ignoble end of the Roman—and with it of the ancient classical—drama has been already foreshadowed. The elements of dance and song, never integrally united with the dialogue in Roman tragedy, were now altogether separated from it. While it became customary simply to recite tragedies to the small audiences who continued to appreciate them, the pantomimus commended itself to the heterogeneous multitudes of the Roman theatre by confining the performance of the actor to gesticulation and dancing, a chorus singing the accompanying text. . . . Comedy more easily lost itself in the cognate form of the mimes, which survived all other kinds of comic entertainments. Talented women took part in these performances, by means of which, as late as the sixth century, a mima acquired a celebrity which ultimately raised her to the imperial throne. Meanwhile the regular drama had lingered on, enjoying in all its forms imperial patronage in the days of the literary revival under Hadrian; but the general taste for the spectacle of the amphitheatre, which reached its climax in the days of Constantine the Great, hastened the downfall of dramatic art in general. It was not absolutely extinguished even by the irruptions of the northern barbarians, but a bitter adversary had by this time risen into power. The whole authority of the Christian church had, without caring to distinguish between the nobler

and looser elements in the drama, involved all its manifestations in a sweeping condemnation, and when the faith of that church was acknowledged as the religion of the Roman empire, the doom of the theatre was sealed."—A. Bates, ed., *Drama*, v. 2, pp. 85-106.

"After the conversion of Constantine, the lustful and bloody spectacles were accursed by the church. It was to be expected that the Fathers should condemn the theater absolutely, since it was—in the sole aspect in which they had occasion to behold it—unspeakably vile. With the triumph of Christianity theatrical performances were abolished; and it must have seemed as tho the drama was destroyed forever. It is true that in some obscure nooks rural farces might linger, forgotten links in the chain that was to stretch from the Atellan fables to the late Italian comedy-of-masks. But this doubtful survival seems to have little significance, and apparently the break in the tradition of the theater was final and irreparable. When Constantinople supplanted Rome as the capital of civilization, dramatic literature, which had been a chief glory of Athens, ceased from off the earth. For a thousand years and more the history of the drama is all darkness and vacancy; and we have not a single name recorded of any author writing plays to be performed by actors, in a theater, before an audience."—B. Matthews, *Development of the drama*, pp. 103-109.—See also LATIN LITERATURE: B. C. (c.) 753-204, 264-169.

Medieval.—Causes of its unity of character.—Religious origin.—Amateur nature.—"The desire for the drama, which seems to be instinctive in human nature the wide world over, may have been dormant during the long centuries, or it may have found some means of gratifying itself unrecorded in the correspondence of the time or by the chroniclers. Acrobats there were, and wandering minstrels; and now and again we catch glimpses of singers of comic songs and of roving amusers who entertained with feats of sleight-of-hand, or who exhibited trained animals. These performers, always popular with the public at large, were also called upon occasion to enliven the solid feasts of the rulers. . . . In its origin again, the medieval drama was not unlike the drama of the Greeks,—in that the germ of it was religious, and that it was slowly elaborated from what was at first only a casual accompaniment of public worship. The new form had its birth actually at the base of the altar and at the foot of the pulpit; and it was fostered by the Christian church, the very organization that had cursed the old form when that was decadent and corrupted. The history of its development is very much the same throughout Europe; and the religious drama of England is very like that of France (from which, indeed, it is in some measure derived), just as the religious drama of Italy is like that of Spain, altho neither of these had any appreciable influence on the other. The reason for this uniformity is obvious enough. It was due to the double unity of the medieval world,—that which resulted from possession of the same religion and that which was caused by the consciousness of a former union under the rule of Rome. All the peoples of western Europe had inherited the same customs and the same traditions, because they had all been included in the Roman Empire, which had stretched itself from the Black Sea to the Atlantic. This is why it is that we find in the middle ages a unity of western and southern Europe closer

than ever before or ever since. Just before the Renaissance, the peoples of all these varied stocks, however much they might differ individually, were bound together by the common use of the Latin language and by the common dominion of the Roman law; they held the same beliefs and they yielded to the same superstitions; they revered the same ideals, they acted on the same theories, and they had very much the same habits. As yet the idea of nationality had not been born; and the solidarity of those speaking each of the modern languages had not been suggested. Europe was a unit because, altho it was segregated into towns and even into small provinces, these had not yet been compacted into distinct nations. To declare with certainty just where it was that the new drama first gave sign of life is quite impossible; and it is equally impossible to decide whether it sprang up of its own accord in half a dozen different places, or whether the first tempting suggestion of it was carried abroad from the church of its origin for adoption in churches widely scattered. There was far more migration in the middle ages than is admitted by those who consider them merely as a long period of stagnation."

—B. Matthews, *Development of the drama*, pp. 100-113.—"Medieval drama began afresh, without derivation from classical models, and in a society centuries beyond the Greek village chorus. But though its rise is therefore different in some respects, it is strikingly like in certain essentials. Medieval society, different enough otherwise, was similar in communal religious observance and in general ignorance of reading. The medieval community center was the church; and the drama arose, not by any popular action indeed, but from the communal observance of the great annual church festivals. . . . To make this interlude [at Easter] more impressive, the clergy had it chanted responsively by singers. . . . So at Christmas there were responses of the angels and the shepherds. These so effectively answered the popular feeling that in time other scenes from the sacred history were thus recited; the custom passed out of the church; and . . . the whole community, [in England] through its trade-guilds, [in France through the burghers], maintained an annual series of dramatic representations, setting all the main scenes of the Bible. . . . Miracles, these series were called, as representing the most dramatic scenes of Revelations; or mysteries, as representing the supernatural truths of the creed. Medieval drama, then, began as a popular performance, not communal in composition, but developed in response to a popular demand, and always answerable to the people."

—C. S. Baldwin, *Introduction to English medieval literature*, pp. 243-246.—"But altho the evolution of the passion-play from the liturgy is obvious, we find in the mystery, when it was presented in the language of the people by the craftsmen and the burghers, one element which is not an ecclesiastical origin;—we find the element of humor, of joyous gaiety, of vivacious realism, and often indeed of reckless vulgarity. Even before it was wholly independent of the church the new drama had felt the influence of popular taste, and it had taken over more than one of the accepted devices of the primitive comic play, such as the strolling buffoons were wont to perform. The brief farces of these wandering minstrels may have been mere dramatized anecdotes, practical jokes in dialog, pantomimic horse-play of an elementary type; they were wholly unliterary, and being often even unwritten, they have rarely been preserved. Yet it is perfectly possible that this medieval farce, with its hearty fun and its frankness of speech, is the

direct descendant of the rude humor of the Latin rustics, surviving unobserved and neglected through all the centuries of the dark ages, and serving humbly to satisfy, in some measure, the perpetual human desire for a story told in action. When at last the serious play had been developed out of the services of the church, this folk-drama was ready to supply the comic element, without which any representation of life must needs be one-sided. The middle ages had an appetite for allegory quite as vigorous as the liking for legend; and after the saintly biographies had been set on the stage as miracle-plays, allegory was also cast into dialog, and thus we have the moral-plays. . . . Popular as these plays were, it is only in a chance episode that any one of them is really raised into literature. The drama must be the most democratic of all the arts, since its very existence depends on the multitude; and it is therefore likely always to represent the average intelligence of any era. The long period known as the middle ages, whatever its literary unattractiveness, brought about a new birth of the acted drama. It aroused in the people the desire for the pleasures of the theater; and it began to train actors against the time when acting should once more become a profession. In considering the deficiencies of the medieval drama, we must never forget that the actors were all amateurs,—priests at first, and then burghers and craftsmen, students and clerks. . . . Throughout western Europe the folk-theater of the middle ages is very much the same everywhere; and in France as in England, in Italy as in Spain, we are shocked by the same irreverent commingling of the sacred and the profane, and by the same obtrusion of realistic farce into plays intended for edification."—B. Matthews, *Development of the drama*, pp. 123-157.

1100-1681.—Rise in Spain.—Italian influence.—Lope de Vega.—Dramatic evolution in France.—"To this period also [twelfth and thirteenth centuries] may be attributed the birth of the Spanish stage, long afterward to become the principal form of intellectual expression of the nation. Sacred mysteries had for some time been represented in the churches; but the wandering troubadours and juglars had evidently by this time begun to introduce profane and objectionable features into these representations, and one of the laws of the Siete Partidas sternly forbids this. It is noticeable that in denouncing these early actors, the law takes care to distinguish them from 'those who play on instruments and sing to solace kings and other great gentlemen'; and although the vagabonds found their burlesque representations of Judas or the devil and their indecent dances banished from the Church, we know that they carried their talents elsewhere; and within a century and a half after the publication of the Siete Partidas the embryo Spanish drama had become a favourite diversion not only of the vulgar who gaped at buffoons, but of the fine gentlemen and ladies of the courts, who listened to the witty conceits in the rhymed eclogues and dramatic narratives of Juan de Encina and his followers."—M. A. S. Hume, *Spanish people*, pp. 175-176.—As in other arts, Italy produced the earliest Renaissance drama, but the promise she held out failed of fulfillment. Without the unity that zeal for Catholicism gave to Spain and without the unity that enthusiasm for things English gave to the Elizabethans, the Italians were further handicapped by their classical heritage. Both tragedies and comedies continued to be closely modeled after the Greek and Roman. Changes appeared, however, in the adoption of musical airs (the forerunner of the opera), the use of elaborate settings, and the production

of a new form of comedy known as the pastoral drama.—“The first manifestation of the new Italian influence upon the Spanish stage was seen in the comedies of Bartolomé Torres Naharro, represented at Naples in the first quarter of the sixteenth century. These were no longer dramatized pastoral incidents, like the eclogues of Encina, nor stories in dramatic dialogue form, like the famous *Celestina*, but regular simple five-act plays. Castillejo, the sturdy opponent of Italian influence, soon after set all Madrid laughing at the wit, while it blushed at the immodesty, of his popular farces. But the rigid court of the emperor and his son did not encourage such diversions in high society, and the standard of excellence (and of decency) was necessarily a low one in plays written for the crowd, and represented before a blanket in a courtyard. Lope de Rueda, in the middle of the sixteenth century, appealed to a wider audience. His plays, short, simple, and witty, caught the public taste, and then the flood gates opened. Juan Malara and Juan de la Cueva wrote plays by the hundred, and movable scenery and appropriate dresses were introduced by another Naharro in 1570. Every village in Spain was constantly visited by wandering actors, and by 1582 two permanent companies were established in Madrid (in the Corrales of the Principe and the Cruz), and after the death of Philip II another courtyard adjoining the site of the present Teatro Real, near the palace, was devoted to representations for the amusement of the king and court. It was at the moment when all Spain, with the dramatic instinct of the race, was flocking to see plays, and found few good ones, that the great Lope, with his wit, his facility, and his ingenuity, appeared and transformed the Spanish stage, as his contemporary Shakespeare did for that of England. . . . The prodigious productive faculty of Lope de Vega had been accompanied by almost unrivalled genius, but even in his case overfacility led him often into work unworthy of him, and the same may be said of the great men who followed him, such as Calderon, Montalvan, Moreto, and Velez de Guevara. But these and several other writers contemporary with them succeeded by means of their best work in raising the Spanish drama of the time of Philip IV to the highest brilliancy, and set the fashion to the rest of Europe through Racine, Corneille, and Molière. It was in the work of the smaller men, who imitated them, that the real note of decadence was struck.”—*Ibid.*, pp. 405-406, 441.—See also SPANISH LITERATURE: 1500-1600; 1500-1680.—“Lope molded the Spanish drama to suit his own gifts; he stamped it forever with the impress of his own personality; and even if we must admit that Calderon [1600-1681], who came after, also rose higher, and that the younger surpassed the elder in the lyrical elevation of several of his plays, none the less we must remember always that the greatest dramas of Calderon are examples of a class of which Lope had set the first model. . . . What Lope was, so was the Spanish drama. . . . His influence on the stage of Spain was far more potent and more durable than that of Sophocles on the theater of Greece or of Shakspeare on the drama of England. . . . Lope de Vega was the earliest of the host of Spanish playwrights, and Calderon was almost the latest, outliving most of the other dramatic poets who had also revealed surpassing fertility of invention.—Guillen de Castro, to whom Corneille owed the ‘*Cid*,’ Alarcon, from whom he borrowed the ‘*Liar*,’ and Tirso de Molina, to whom Molière was indebted for the imperishable figure of Don Juan. There had

been only two playhouses in Madrid when Lope de Vega began to write for the theater; and before Calderon closed his career there were two-score. . . . Lope de Vega was a contemporary of Shakspeare; and Calderon survived Molière, who may be called the real mold of the modern drama. Before Calderon’s death Racine had elaborated a tragedy as severe as that of the Greek; but there is no trace of any immediate influence of the French stage upon the Spanish. Even the dramatists of England under Elizabeth responded to the Renaissance and profited by it far more than the playwrights of Spain, who refused absolutely to avail themselves of the marvelous model which the drama of the Greeks provided. . . . In this refusal . . . we see why the playwrights of Spain, with all their lyric affluence and all their luxuriance of invention, have left us plays which are almost as medieval in their handling of the larger problems of life as they are in their form.”—B. Matthews, *Development of the drama*, pp. 163-164, 184-185.—See also SPANISH LITERATURE: 1500-1600; 1500-1680.

“The drama in mediæval France, as elsewhere in Europe, was in origin the offspring of the Church. . . . The first real step in dramatic evolution was the detachment of this play from the services of the Church and its transference from the altar to the open air; and this change was soon followed by the great amplification of the original material, the introduction of lay actors, and the substitution of the vernacular for the ecclesiastical tongue; as e.g. in *La Représentation d’Adam*, of the twelfth century. . . . The most famous of [all the companies of religious actors] was the *Confrérie de la Passion*, which acquired the monopoly of acting *mystères* in Paris under letters-patent from Charles VI in 1402. For nearly one hundred and fifty years after this, this powerful company continued to give performances, now in one place, now in another.”—W. H. Hudson, *Short history of French literature*, pp. 17-18.

1500-1700.—French tragedy.—Comedy and Molière.—“The French followed the bent of their own genius, just as the Spanish had done, and the English; and this led them in time to a drama not so energetic as the English and not so full of surprises as the Spanish, but surpassing them both in the symmetry of its structure and in the logic with which its action was conducted. The narrowness of form which became in time one of the most marked peculiarities of the French drama was no doubt due mainly to the French liking for restraint, to a hereditary preference for rules of guidance; but it was also caused, in some measure, by the circumstances of the evolution of tragedy in France out of the miracle-play. When the mystery was turned out of the French churches, it erected out of doors and in the public square its long platform, with a row of mansions at the back to suggest the more necessary of the successive places where the episodes of the gospel-narrative were to be shown in action. Just as the earliest English theater was copied from the courtyard of an inn, because the strolling actors were accustomed to that, so in France, and for a like reason, the earliest theater was modeled on a tennis-court. It was long and narrow; and it had a shallow platform at one end.”—B. Matthews, *Development of the drama*, p. 228.—“In 1548 [the *Confrérie de la Passion*, a company of religious players] definitely established itself in part of the Hôtel de Bourgogne. This was the first regular theatre in France. That same year, as it happened, the Parliament of Paris prohibited the further representation of religious plays, and thereupon the Hôtel

de Bourgogne became the first home of the secular drama. Side by side with the *mystères* another form of religious drama flourished in the *miracles*, specimens of which have reached us from a period considerably earlier than that of the oldest surviving *mystères* themselves. . . . A third type of didactic play which was cultivated for a time with great industry was the *moralité*, which was the direct product of the mediæval love of allegory."—W. H. Hudson, *Short history of French literature*, pp. 19-20.—"Medieval drama closed with the great productions of Gringore which exemplify the political trend of the tetralogy, the final form of the medieval drama which combined morality and farce. 'The classical tragedy in the classical language,' and even in translation, was already no stranger to French audiences, and the principle of constructing modern vernacular plays on the same model had become familiar to the upper and learned classes by the practice of the Italians, with which they had become familiar, partly through the numerous visits, friendly and hostile, paid by Frenchmen to Italy in the early years of the sixteenth century, partly through the reproduction of these Italian plays at the courts of Francis I and Henri II. . . . Seneca, as the only extant Latin tragedian, had a monopoly of the classical language which they understood best and revered most heartily."—G. Saintsbury, *Short history of French literature*, p. 218.—"In 1552 Etienne Jodelle founded modern French tragedy by the production of Cléopâtre, and modern French comedy with Eugène. These formal compositions were of less interest to the public than the medieval forms and the French tragedians lacked the stimulus of an expectant public and were less intent on creating great dramas than on imitating models and formulating and keeping rules. . . . The long monopoly enjoyed by the *Confrères de la Passion* [a licensed group of actors] . . . undoubtedly had a bad effect, preventing competition and robbing the actors of their legitimate reward. . . . It was left to Corneille and Racine, aided and, perhaps, to some extent restricted by Richelieu and the Academy, to give France a drama which answered the demands of logical development and regularity of form."—J. W. Cunliffe, *Early French tragedy* (*Journal of Comparative Literature*, Sept.-Dec., 1903).—"While the influence of Malherbe was . . . cramping and withering poetry proper in France, it combined with some other causes to enable drama to attain the highest perfection possible in the particular style practised. In non-dramatic poetry, the only name of the seventeenth century which can be said even to approach the first class is that of La Fontaine. . . . But the names of Corneille, Racine, and Molière stand in the highest rank of French authors. . . . For a not inconsiderable time the fate of French tragedy trembled in the balance. During the first thirty years of the seventeenth century the most prominent dramatist was Alexandre Hardy [1575?-1621]. . . . His fertility was immense and he is said to have written some hundreds of plays. . . . Forty-one exist in print. . . . His plays being meant for acting and nothing else [he was himself an actor], . . . the scholarly but tedious exertions of the *Pléiade* school were out of the question. . . . His best play *Mariamne*, is powerfully written, is arranged with considerable skill, and contains some fine lines and even scenes; but . . . it still has . . . a certain thinness of interest. . . . During the first quarter of the century the theatre was exceedingly popular, and the institution of strolling troops of actors spread its popularity all over France. . . . Of the immediate predecessors of Corneille, and his earlier contem-

poraries, at least half-a-dozen are more or less known to fame, besides the really great name of Rotrou. Mairet, Tristan, Du Ryer, Scudéry, Claveret, and D'Aubignac, were the chief of these. . . . Among these . . . names, . . . that of Rotrou is pre-eminently distinguished. Jean de Rotrou was born . . . in 1609 [died 1650], and was thus three years younger than Corneille. . . . His *Hypocodriacque* [was] presented before he was nineteen. He formed with Cerneille, Colletet, Bois-Robert and L'Etoile, the band of Richelieu's 'Five Poets,' who composed tragedies jointly on the Cardinal's plans. He also worked unceasingly at the theatre on his own account. Thirty-five pieces are certainly and five more doubtfully, attributed to him. . . . By common consent two of [his plays], *Le Véritable Saint-Genest* and *Venceslas*, greatly excel the rest. . . . These plays . . . were not written until after the publication of Corneille's early masterpieces. . . . There is every reason to believe that though . . . Rotrou's best pieces were influenced by Corneille, the greater poet owed something at the beginning of his career to the example of his friend."—G. Saintsbury, *Short history of French literature*, pp. 262, 264-267.—"The whole system of classic tragedy has long since been abandoned as an outworn academic superstition, and its supposed aesthetic foundations have little or no meaning for us today. But within its cramping limitations some great and lasting work was produced, as we shall see on turning at once to its two supreme masters, Corneille and Racine. Pierre Corneille sprang from a Norman 'famille de robe,' and was born at Rouen in 1606. . . . His four great tragedies are *Horace* (1640), *Cinna* (1640), *Polyeucte* (1643), and *La Mort de Pompée* (1643). These, with *Nicodème* (1651), represent his powers at their highest, though mention must also be made of *Le Menteur* (1643), the best comedy of the French stage before Molière. . . . Though Corneille is properly regarded as the real father of French classic tragedy, the natural bias of his genius was undoubtedly toward the romantic. This is shown not only in *Le Cid* (1636), but also in some of his later plays, like the heroic comedy *Don Sanche d'Aragon*."—W. H. Hudson, *Short history of French literature*, pp. 74-75.—"Corneille, as has been said, . . . was one of Richelieu's five poets, but he was indocile to the Cardinal's caprices; and either this indocility or jealousy set Richelieu against *Le Cid*. This great and famous play . . . excited an extraordinary turmoil among men of letters, but the public never went wrong about it from the first." Corneille died in 1684. "He is certainly the greatest tragic dramatist of France on the classical model, and as a fashioner of dramatic verse of a truly poetic kind he has at his best few equals in the literature of Europe."—G. Saintsbury, *Short history of French literature*, pp. 267, 272.

"Corneille's one rival, Jean Racine, was thirty-three years his junior, for he was born in 1639 at La Ferté-Milon in Champagne. . . . In *Andromaque* (1667), which, according to Perrault, created as much excitement as *Le Cid* had done thirty-one years before, all the writer's distinctive qualities were fully revealed. This was followed by a comedy, *Les Plaideurs* (1668), a pungent satire on the law, after which came six more tragedies—*Britannicus* (1669), *Bérénice* (1670), *Bajazet* (1672), *Mithradite* (1673), *Iphigénie en Aulide* (1674), and *Phèdre* (1677)."—W. H. Hudson, *Short history of French literature*, p. 78.—Racine is "the typical representative of the literary ideal of the *grand siècle*, or rather of its golden age. . . . Racine is the creator of character-tragedy, of tragedy true to

life, as opposed to the tragedy of Corneille, whose inventive powers were applied to the creating of situations to which he afterwards accommodated his characters."—L. E. Kastner and H. G. Atkins, *Short history of French literature*, pp. 138-143.—"His tragedies may be divided into three classes. Of the first are those whose subjects he borrowed from the ancient Greek stage, and suited to the requirements of the French theatre. . . . *Phèdre* [is the masterpiece of this class]. After the production of *Phèdre* in 1677, Racine retired from the stage. . . . Twelve years of silence, solitude, and study of the Scriptures, prepared him for his third class of tragedies, those drawn from Holy Writ. At the pressing invitation of Madame de Maintenon, he wrote *Esther* (1689) and *Athalie* (1690) for representation by the young lady students of Saint-Cyr. *Athalie*, though it was declared by Boileau to be a masterpiece, and is generally allowed . . . to be his best work, was badly received, and his pity for the people drew on him the king's displeasure. Racine died, it is said, of the grief and disappointment this occasioned, though not till 1699."—C. Bridge, *History of French literature* (adapted from the French of M. Demogeot), pp. 138, 143, 191.—"The tragedies of Corneille and Racine followed the French rules of formality. The entire impression is one of artificiality, since the plays are not the healthy reflection of the conditions of their time. . . . His plays, like Racine's, were conditioned by the sophisticated taste of playgoers before whom they were performed. If we contrast the courtly audiences of Racine with the gathering of Athenian citizens to judge a drama of Sophocles, and with the spectators of all sorts thronging to applaud the plays of Shakspeare, we can see one reason why French tragedy lacks the depth and the sweep of the Greek, and why it has not the force and variety of the English. French tragedy appeared, as Taine has told us, when a noble and well-regulated monarchy, under Louis XIV, established the empire of decorum, the life of the court, the pomp and circumstance of society, and the elegant, domestic phases of aristocracy."—B. Matthews, *Development of the drama*, p. 251.

"The history of French comedy is remarkably different from that of French tragedy. In the latter case a foreign model was followed almost slavishly; in the former the actual possessions of the language received grafts of foreign importation, and the result was one of the capital importations of European literature. . . . At first it seemed as if Terence was to serve as a model for comedy just as Seneca had served as a model for tragedy. . . . French comedy of the seventeenth century, before Molière, is one of the subjects which have hardly any but a historical and antiquarian interest. . . . It was on the whole the lowest of literary styles during the first half of the century. With Molière it became at one bound the highest."—G. Saintsbury, *Short history of French literature*, pp. 279, 281.—"Though nothing of permanent importance had yet been accomplished, considerable progress had been made along many lines—in the management of plot, in the portrayal of character, in the representation of social life and manners—in the years immediately preceding the rise of the greatest comic dramatist of France and of modern times, Molière. Jean Baptiste Poquelin [afterwards called Molière] was born in Paris in 1622. . . . We may divide the bulk of Molière's plays into two groups—the lighter farces, which for the most part are broadly farcical, and the great comedies of character. . . . Of his farces (*Le Mariage forcé*, 1664; *Le Médecin malgré lui*, 1666; *M. de Pour-*

ceaugnac, 1669), it is enough to say that they overflow with fun and gaiety. . . . But delightful as these farces are in their own way (and no lover of rich, broad humour would wish for a moment to depreciate them), it is in the great comedies of character—and pre-eminently in *L'École des femmes* (1662), *Tartuffe* (1664-1666), *Don Juan*, (1665), *Le Misanthrope* (1666), *L'Avare* (1668), and *Les Femmes savantes* (1672)—that Molière's powers are to be found in their full perfection, and it is by virtue of these that he holds his place secure in the front rank of the dramatists of all the world."—W. H. Hudson, *Short history of French literature*, pp. 84, 86.—"Molière, younger than Corneille and older than Racine, is greater than either, partly because of his own superior genius and partly because the racial characteristics of the French can find their fullest expression rather in comedy than in tragedy. . . . Before Molière wrote, French comedy had been excessively romantic in manner. . . . Molière brought comedy back to reality. He dealt directly with life as he beheld it about him. . . . In this splendid series of comedies the age of Louis XIV starts again to life, with all its decorum, its social ease, its hardness of heart."—B. Matthews, *Development of the drama*, pp. 252, 258.—"In the eighteenth century there is little novelty in tragedy and such as there is, is not in the direction of real strength, though the drama seems popular as never before. . . . The drama became an interpreter of philosophy in the sense, not of metaphysical reflection, but of theorising on the defects of society and on their remedies."—C. H. Wright, *History of French literature*, p. 467.—"Molière [who was an actor before he was a playwright] soon acquired the favour of the king, and the *Précieuses ridicules*, the first of his really great work, gained for him that of the public. . . . The highest point of his genius was shortly reached; *Tartuffe*, the *Festin de Pierre*, and *Le Misanthrope* being the works of three successive years, 1664-6. . . . These [are] his three greatest comedies. . . . Independently of the characters which Molière shares with all the great names of literature—his fertility and justness of thought, the felicity of the expression in which he clothes it, and his accurate observation of human life—there are two points in his drama which belong, in the highest degree, to him alone. One is the extraordinary manner in which he manages to imbue farce and burlesque with the true spirit of refined comedy. . . . [He has] an unmatched faculty of intimating a general purpose under the cloak of . . . merely ludicrous incidents. . . . This general purpose (and here we come to the second point) is invariably a moral one. Of all dramatists . . . Molière is perhaps the one who has borne most constantly in mind the theory that the stage is a lay-pulpit, and that its end is not merely amusement, but the reformation of manners by means of amusing spectacles."—G. Saintsbury, *Short history of French literature*, pp. 281-282, 285.—"Molière had many followers, but of those who can properly be included within our present period only two are important enough to merit reference here—Regnard and Dancourt. Jean François Regnard (1655-1709) belongs very clearly to the school of Molière, whom he often imitated closely, but he had nothing of his master's depth and was entirely wanting in his moral earnestness. . . . *Le Légataire universel* (1708) is the most amusing of his plays. . . . His masterpiece [is] *Le Joueur* (1606). . . . Florent Carton Dancourt (1661-1725) . . . has far less claim than Regnard to literary distinction, but his numerous and lively comedies . . . caught the taste of the hour and he

enjoyed a great popularity."—W. H. Hudson, *Short history of French literature*, p. 91.

1558-1592.—Development of English drama.—Precursors and contemporaries of Shakespeare.—Marlowe and Kyu.—Lyly, Greene and Peele.—"Elizabethan literature is a term, employed somewhat loosely to denote the fruitful literary period which extends from the beginning of the reign of the last of the Tudor sovereigns to the Restoration of King Charles II (1558-1660). The term is defensible because, various and manifold as is the literature of this time, it is referable to that single impulse, justly called the Renaissance, which, working in ever-widening circles, transformed the medieval England of Chaucer into the modern England of Shakespeare. The English drama, like the drama in other countries of Western Europe, began in the service of the Church, and at first was merely symbolic and a part of ceremonial. It later passed through the didactic state, and served as a useful handmaid of religion, as an illustrator of the scriptures, and a censor of morals and conduct. It was not until the reign of Henry VIII that dramatic productions came somewhat to put aside these ulterior aims and ends, frankly to avow the pleasure of their auditors as their purpose, and thus to emerge into existence for an artistic end. With these stages of initial growth behind it, the drama became an art; and more, it grew to be the peculiar art in which the worldly and vigorous yet ideal and poetical age of Elizabeth found its most lasting and characteristic expression. For English drama reached in the days of Shakespeare a diversity of species combined with a rare and pervading quality of literary excellence unsurpassed in the literature of other ages and countries; and it finally subsided into a paucity of form and poverty of content by the Restoration which is surprising in view of its previous history. Save for some rudimentary forms, artistic English drama begins with the reign of Elizabeth. Its first great impulse ends with the closing of the theaters, due to the approaching Commonwealth Wars, in 1642. . . . With the accession of Henry VIII, in 1509, the old sacred drama was already in full process of decay, when Protestantism and controversy added their disintegrating influences from within, and the new foreign Humanism opened ideals to the drama hitherto undreamed. With untiring, vigorous, and redoubtable John Bale, Bishop of Ossory, we reach the first distinct personage in the authorship of English plays. . . . The history of the drama up to the coming of the Armada is bound up with the tastes and the fashions of the court. In view of the centralized power of the Tudors and the formation about the person of the sovereign of a brilliant and cultivated court, the personal character of the monarch came more and more to affect society and the literature and art which mirrored it."—F. E. Schelling, *Elizabethan drama* (1558-1642), v. 1, pp. xxiii-xxiv, 31, 98.—"It would be difficult to overestimate the influence of the court and the queen on the early pre-Shakespearean drama. Elizabeth was pleasure-loving by nature and fond of elaborate and stately ceremonies and sumptuous display. She was likewise in her way a patron of learning and an encourager of poetry and art; in a word, Elizabeth was a true daughter of the Renaissance. As to the drama, she found all the forms for its encouragement made ready to her hand. In employing them she was only continuing a long established usage. . . . Moralities and interludes were among these entertainments and those concerned in them acquired, as time went on, a more or less professional standing. The Office of the Revels, originally perhaps no more than a temporary ap-

pointment, had become since the days of Sir Thomas Cawarden in Henry VIII's reign, a place of importance, charged with the supervision of the entertainments at court."—F. E. Schelling, *English drama*, pp. 39-40.—"While scholars . . . vainly amused themselves with dramatic efforts which were never intended to be performed except by a group of amateurs before an audience of dilettants, the professional actors, banded into little companies, had called into being professional playwrights able to dramatize the stories of the Italian novelists and the themes of the Latin poets, then being translated in quick succession. . . . But as these wandering performers could not avail themselves of the various spectacular devices which were so helpful in retaining the interest of the medieval spectator, they were thus forced to lay stress especially upon those incidents of the story in which the attention of the audience could be aroused by sheer force of acting. The sudden development of the drama in this period is due in part at least to the growth of a class of professional actors, replacing the amateurs of the guilds. These professional actors would soon find the placid dialog of the medieval theater unworthy of their growing histrionic ability; and they would not long be content unless they had expressive characters to personate and absorbing passions to portray. As it is in the conflict of duty and desire that actors find most scope for the exhibition of their powers, any increase in the technical skill of the performers would tend at once to make the plays written for them more truly dramatic. . . . In those days the English inn was often a hollow square, with a central courtyard girt with galleries; and here, with the permission of the innkeeper, the strollers would put up a hasty platform around which the country-folk might stand, while the persons of quality could look down from the galleries. In London the performances in places of public entertainment drew such concourses of people that the city authorities were scandalized and strove to forbid them; and as a result the players—who had been wanderers hitherto—were forced to build houses of their own just outside of the municipal limits and to establish themselves permanently. . . . The new building was but a hollow square of about eighty feet each way, open to the sky in the center, and consisting of little more than a quadrangle of galleries, to be divided into 'rooms,' as they were then called, private boxes as we should now term them, for the accommodation of the more particular playgoers. The whole ground floor was the yard, wherein the solid body of the more vulgar spectators had to stand; and into this yard there was thrust out the stage, a platform perhaps forty feet square. Where the rear gallery ran across the stage there hung an arras, a heavy tapestry curtain, to cut off the space behind, which might be used as a dressing-room. The rear gallery itself, just over the platform, was also made useful, serving as a balcony, a pulpit, a roof, or whatever upper chamber might be called for in the progress of the play. The stage was so spacious that some of the spectators were allowed to sit to the right and to the left, on stools to be hired. There was no curtain to pull up or to pull aside; and there was absolutely no scenery of any kind."—B. Matthews, *Development of the drama*, pp. 193-195, 197.

"Marlowe's career as a dramatist lies between 1587, the year of the appearance on the stage of his *Tamburlaine*, and May, 1593, the date of his tragical and untimely death. Within these five years, Marlowe contributed, omitting minor plays and those of alleged authorship, four tragedies of a power, a fervor and passion such as the English

stage had not yet known, and of a pervading poetic charm and excellence which few of his great successors surpassed. . . . *Tamburlaine* details the story of a 'Scythian Shepheard' who 'by his rare and wonderful conquests,' so runs the title, 'became a most puissant and mighty monarch, and, for his tyranny and terror of war, was termed The Scourge of God.' . . . Marlowe's *Tamburlaine* performed three services to the English drama. It vindicated the independence of English tragedy from foreign guidance and conventions. . . . *Tamburlaine* infused once and for all into Elizabethan drama a force and a passion that, carried forward with accelerated impulse, led on to Marlowe's own higher achievements and to those of Shakespeare and Webster. Nor is Marlowe's humbler service in the matter of form less important in view of the after history of dramatic poetry. Blank verse, it is true, had already been timidly essayed in the tragedies *Gorboduc* and *Focasta*, and it was gracefully employed by Peele in comedy at a date at least problematically earlier than Marlowe. But Marlowe's was, after all, the triumphant demonstration of the fitness of blank verse as a musical, varied, and sufficient medium for the expression of serious poetry in dramatic form. . . . *The Tragical History of D. Faustus* . . . is little more than a succession of scenes, void of continuity or cohesion, except for the unity of the main figure and the unrelenting progress of the whole towards the overwhelming catastrophe. . . . And yet, broken torso that it is, there is a grandeur beyond description in this conception of the lonely grace-abandoned scholar, in whom the promptings of remorse betray alone the touch of human weakness, whose inordinate desire for power and knowledge, rather than mere gratification of appetite, have impelled to the signing of his terrible compact with the Evil One, and whose mortal agonies have in them a dignity which not even the medieval conception of hoofed and horned deviltry could destroy. . . . *The Famous Tragedy of the Rich Jew of Malta* was first acted subsequently to 1588 and was often revived under Henslowe's management. The character of Barabas the Jew, represented on the stage, as was doubtless Shylock, as a semi-humorous personage, is at first conceived with naturalness and moderation, but degenerates, after the second act, into pure atrocity and caricature. . . . And yet, as a play, *The Jew of Malta* marks an advance on both *Tamburlaine* and *Faustus*; and in its dramatic structure, as even more in that of *Edward II*, we have sufficient evidence to disprove the notion that Marlowe's was essentially an undramatic genius. . . . With the advent of creative genius in Kyd and Marlowe, the romantic drama shook itself free forever from the gyves of foreign convention, and from the imitative tutelage in which it had labored before.—F. E. Schelling, *Elizabethan drama*, 1558-1642, v. 1, pp. 226, 230-233, 239.—"The fascination of Marlowe's genius and the enduring success of his reform have tended to overshadow the important services rendered to dramatic progress by some of his contemporaries, notably by Kyd in tragedy and by Lyly and Greene in comedy. Of no leading Elizabethan playwright do we know so little as Thomas Kyd, yet persistent stage-tradition during earlier seventeenth century testifies to his remarkable influence and popularity. With the exception of *Tamburlaine*, no pre-Shakespearean play excited so much enthusiasm and was at the same time so widely ridiculed and parodied as *The Spanish Tragedy*. . . . He lacked Marlowe's sensitive ear, his joy in the roll of golden periods. But his dialogue at its best, has the quality of passionate directness and simplicity essential to the highest

dramatic achievement. The love-scenes, short as they are, between Belimperia and Horatio touch a responsive chord in our hearts, and the mingled agony and rage of Hieronimo are rendered with masterly power. In this complex delineation of character Kyd made a notable step forward, and he may justly claim to be the pioneer of introspective tragedy in England. . . . But, in spite of defects, *The Spanish Tragedy* is an organic creation, and fully deserved its widespread influence. It holds a unique place in dramatic literature, reaching back to *Gorboduc*, and forward to Shakespeare's early plays, probably even to Hamlet and King Lear. While tragedy was thus making rapid advances in the hands of Marlowe and Kyd, comedy was being raised to a higher level by John Lyly. . . . The distinctive features of Euphuism all reappear in Lyly's comedies. Excluding one or two doubtful plays, they are eight in number, and were acted by the 'children of the Chapel' and the 'Children of Paul's.' Six of them were performed in the presence of Elizabeth, and they were admirably adapted to gratify the prevalent court tastes. These six were *The Woman in the Moon*, *Campaspe*, *Sapho and Phao*, *Endimion*, *Gallathea* and *Midas*. As the titles show, the subjects were drawn from mythology or classical legend, but Lyly displayed extraordinary skill and originality in his manipulation of this traditional material. None of these comedies has much dramatic movement or plot, or can claim to be a play in the stricter sense. They are graceful and ingenious exercises of fancy on a chosen theme, and they partake of the qualities of the Masque. But they mark an important stage in the development of comedy. Except *The Woman in the Moon*, which was the earliest, and which retained the blank verse of the classical school, all these pieces were written in prose. . . . It is Lyly's distinction to have discovered its fitness for dramatic purposes, and to have handled it with notable success. . . . Among Shakespeare's predecessors the place second to Marlowe must be assigned to Robert Greene. . . . Like Lyly, he was novelist and playwright in one, and attained high excellence in both arts. . . . Of his early dramatic works, published previously to Marlowe's *Tamburlaine*, not one has survived. . . . *Alphonsus, King of Arragon*, which is almost certainly the earliest of his extant plays, is written in obvious imitation of *Tamburlaine*. Not only are Marlowe's style and diction faithfully copied, even to the almost literal reproduction of individual lines, but the whole plot of the drama is modelled upon that of its predecessor. . . . *Orlando Furioso* is similar in its general style to *Alphonsus*, and is written for the most part in equally inflated diction, but it shows a distinct advance both in constructive power and characterization. . . . While *Orlando Furioso* thus marks an evident advance upon *Alphonsus*, the two plays may be classed together as treating mediaeval and foreign subjects in a style modelled upon that of Marlowe. They thus differ from another group of dramas, belonging to the more matured period of Greene's art, which take for their theme English history and traditions, and which are written in far purer and less ornate verse, with an intermixture of really humorous prose scenes. To this group belong *James IV*, *Friar Bacon and Friar Bungay*, and *George-a-Greene*. . . . His genius had no massive strength, no rich depths of thought and imagination. It could not rise to the full height of the tragic argument, nor move the springs of supreme passion and pity. Yet Greene has a claim to the title of "Shakespeare's predecessor" in a very special sense. His art, though bounded in its range, is fundamentally akin to that of the mightiest of

the Elizabethans. It was he who, first among our Renaissance dramatists, succeeded in vitally connecting scenes of genuine comedy with the serious elements in his plays. He thus gave a practical answer to the criticisms of Sidney, and he set a precedent which, followed and infinitely bettered by Shakspeare, has become consecrated to all time. Connected with this is his skill, which Lyly shared, in blending together different plots, as in *Friar Bacon and Friar Bungay*, and *George-a-Greene*. Here too the greater dramatist trod in the same path with a far surer step, and the result is seen in the complex structures of *The Merchant of Venice*, *Much Ado About Nothing*, and *King Lear*. . . . There is yet another point in which Greene has remarkable affinity to his great successor. His best plays breathe a thoroughly national spirit, and they are instinct with love of English traditions, English virtues, and English familiar scenes. *Friar Bacon and Friar Bungay* and *George-a-Greene* set before us pictures of country life as natural and attractive as any in *Love's Labour's Lost* or *The Merry Wives of Windsor*. . . . Marlowe, Kyd, and Lyly surpass him in the originality of their genius, yet in temper and method he may claim a nearer kinship than any of them to the poet of Stratford, whose early successes caused him death-bed pangs of jealousy."—F. S. Boas, *Shakspeare and his predecessors*, pp. 62, 66-68, 77-78, 80, 85-88.—"Peele, though less prolific and many-sided than Greene, early won and late retained the reputation of a better poet. . . . The truth is that Peele exercised far less influence over the development of our Drama than either Lyly or Greene, not to mention Marlowe. . . . Marlowe determined the metre and fixed the form of tragedy. Peele discovered no new vein. It is in elegant descriptions, in graceful and ingenious employment of mythology, in feeling for the charms of nature, in tenderness of expression and sweetness of versification, that we find his highest poetical qualities. . . . His best, but also his earliest work, the 'Arraignment of Paris,' is distinguished by a certain sense of proportion, dignity of repose, and harmonious distribution of parts, which prove that he might have become a correct poet in that period of bombast and exaggeration. . . . Peele's 'Old Wives' Tale' deserves to be remembered because of its resemblance to 'Comus.' . . . So far as the history of our Drama is concerned, the chief interest of the 'Old Wives' Tale' lies in its setting. . . . 'David and Bethsabe,' regarded by some of Peele's critics as his masterpiece, presents us with a curious specimen of the Miracle Play in its most modern form."—J. A. Symonds, *Shakspeare's predecessors in the English drama*, pp. 563, 564, 566, 567, 570.

1592-1648.—Climax of Elizabethan drama.—Shakespeare.—His contemporaries and successors.—Height of English comedy.—Ben Jonson.—Decline of English drama under James I and Charles I.—Abolition by Puritan parliament.—"In the six or seven years that lay between Marlowe's *Tamburlaine* and his untimely death, the extraordinary variety of Elizabethan drama first exhibits itself to the full. The popularity of romantic tragedy and of chronicle history was all but simultaneous. The height of the domestic drama, of romantic comedy, and the comedy of manners came later. The heroic romance continued from Greene's *Orlando* to its bourgeois degradation in Heywood's absurd *Four Prentices of London* (1594); the *Tamburlaine* or conqueror plays, in *Cyrus*, *Alphonsus*, *Selimus*, and the lost *Scanderbeg*, maintained a steady popularity all but equaled by the series on palace intrigue and revenge represented in the plays on Titus, *The Lascivious*

Queen, and the early lost *Hamlet*. And all of these classes vied with the growing vogue of dramatized history of England which from mere interludes, like *Jack Straw*, and panoramic trilogies, like *Henry VI*, was raised through an unexampled variety to Marlowe's consummate tragedy of *Edward II* (1592) and the epic-dramatic completeness of Shakespeare's *Henry IV* and *Henry V* (1598-99). . . . From the death of Marlowe to the accession of King James, or, in parlance better suited to our subject, from *Richard III* (1593) to *Hamlet* (1602), we have the years *par excellence* Shakspearean. This was the hey-day of the chronicle history, which continued in ever-increasing vigor to the close of Elizabeth's reign, and in what may be termed the obituary plays, a year or two beyond."—F. E. Schelling, *Elizabethan drama, 1558-1642 v. 2*, pp. 405-408.—"Full as it is of flowing and fervent beauty, the effusive and elegiac style of 'King Richard II' is hardly more dramatic or life-like in many of the scenes than the very earliest manner of Marlowe; and the treatment of character is less coherent and consistent than the great elder poet's. . . . It is less obviously easy to decide on the complicated question of Shakespeare's share in the singularly unequal trilogy of 'King Henry VI.' The comparatively few scenes in the first part which bear the impression of his prentice hand are sometimes in rhyme . . . and sometimes in blank verse not always unworthy of that mighty master: the finest passage in the second is an evident and magnificent interpolation of Shakespeare's now almighty hand in its maturity of omnipotence: the third, a very fine tragic poem in its original form, was slightly and greatly improved by the critical as well as poetical manipulation of Shakespeare. The concluding play of 'King Richard III' is a more harmonious work of still youthful genius, in which there is but one elaborately finished figure among a crowd of powerfully designed sketches. Richard is Shakespeare's first great and perfect creation; admirable as well as terrible in his brilliant and dauntless intelligence, his fiery versatility of humour and of spirit, his unity and variety of character and of gifts. For the first time in all the literature of the world we are confronted with a great as well as a greatly wicked man. . . . The tragical history of 'King John,' though in many of its earlier scenes diffuse and rhetorical even to the verge of declamation and verbosity, shows in some points a distinct and decisive advance in general grasp of character and temperance of treatment. The trilogy of 'King Henry IV' and 'King Henry V' would suffice to show, not that Shakespeare was the greatest poet, but assuredly that Shakespeare was the greatest dramatist and the greatest humourist of all time. The majestic and impassioned poetry of the graver scenes should not, if it is possible that it should not, be eclipsed or overshadowed in the sight of students young or old by the presence and the rivalry of the greatest comic figure [Falstaff] that ever dawned upon the conception of the greatest comic poet ever born. And it is in a great historic and heroic trilogy that this matchless figure is set as in everliving relief by the deathless hand which carved and coloured it. . . . That Shakespeare should have chosen so singular a subject as that of his last English historic play is not stranger than that he should have handled it in so singular a fashion. From the opening to the close we are conscious of a certain defect in dramatic harmony of conception and poetic unity of action. The style of 'King Henry VIII' is unmistakably earlier than that of his last and greatest historic or tragic period."—A. C. Swinburne, *General introduction to*

the works of Shakespeare (Shakespeare's comedies, Oxford edition, pp. vii-viii, x, xii, xx-xxi).—"As to romantic comedy, nowhere is the supereminence of Shakespeare more striking; for while the lighter productions of these years teem with romantic situations, such as the love stories contained in plays like the older *King Lear*, *Old Fortunatus*, or Jonson's *Case is Altered*, this element is usually combined with others, as in these cases with a chronicle play, a tale of folklore, or a comedy of Plautine situation. It was left to Shakespeare, for the time almost alone, to pen, in *The Merchant of Venice*, in *Much Ado*, and in *Twelfth Night*, those light-some and charming pictures of the courtship and the heart's sorrows of young lovers, thrown into the enchanted land of Italy to veil but not conceal their true English natures, and thus add the

only struck out one or two fine touches of living humour, he has cancelled the whole of the admirable conclusion or dramatic epilogue which is morally and dramatically necessary to complete and to harmonize the work as a comic poem. . . . The subject of 'All's well that ends well,' however full of dramatic or emotional suggestion and scenic promise or possibility, is hardly so fit, perhaps, for theatrical as for narrative treatment. A curious and interesting short story in which not one of the leading agents can arouse any just or serious or healthy sympathy may serve well enough for the rather idle amusement of half an hour, but can hardly suffice for the groundwork of such a play as Shakespeare might have given us, had it pleased him to seek a subject elsewhere. . . . A single happy and ever blessed year, the last of the six-

SHAKESPEARE PERFORMING BEFORE QUEEN ELIZABETH

(From a contemporary print)

zest of novelty to their delightful adventures."—F. E. Schelling, *Elizabethan drama, 1558-1642*, v. 2, pp. 408-409.—"The delightful 'Comedy of Errors' is the very crown and flower of the young Shakespeare's humorous and fanciful work. . . . In the bright and boisterous farce called 'Merry Wives of Windsor' the reappearance of Falstaff and Mrs. Quickly is hardly as plausible as it is certainly amusing; and even as a picture of provincial manners in Shakespeare's time it can hardly be set beside the delightful scenes in which the genuine Shallow had enjoyed the somewhat costly privilege of introducing the genuine Falstaff to the humours and the comforts of country life. . . . Though Shakespeare has in some degree toned down the somewhat rough and broad brutality of the original humour [in *The Taming of the Shrew*], he has rather refined than improved on it; or at least he has improved on it only by a process of refinement in detail rather than in principle. And he has not

teenth century, saw the appearance in immortal print of three among Shakespeare's masterpieces. 'The Merchant of Venice' is perhaps the greatest and most perfect example of tragi-comedy on record. . . . There is less of dramatic romance and poetic attraction in the incomparable comedy of 'Much Ado About Nothing'; but it is, in that kind, the crowning work of Shakespeare. In high comedy he never surpassed the perfection of the two figures which at once gave to the play in common parlance the name of 'Benedick and Beatrice': in broad comedy he never exceeded the triumphant and transcendent humour which glorifies with loving laughter the names of Dogberry and Verges. 'A Midsummer-Night's Dream' is outside as well as above all possible or imaginable criticism. It is probably or rather surely the most beautiful work of man. No human hand can ever have bequeathed us anything properly or rationally comparable with this. . . . In 'Twelfth Night, or What

you will' . . . the fusion of broad and bright Rabelaisian fun with sweet and ripe Shakespearean poetry has given us something not less unique and only less delightful than the loveliest dream that ever lived in the living light of song. The double-sexed figure of the adorable Viola-Cesario was the spiritual parent . . . of a somewhat over-copious generation of she-pages, beginning with the still more famous and popular Bellario-Euphrasia of Beaumont and Fletcher. . . . The great undefinable poem or unclassifiable play which bears the surely half satirical title of 'Measure for Measure' stands too high by right of might in tragic impression to be seriously impaired or vitiated even by the moral flaw which induced even Coleridge to blaspheme. . . . The 'Winter's Tale' is as unique among poems as is Shakespeare among men: the tragedy, the comedy, the pastoral fusion of them both, the heavenly harmony of the close, are all alike beyond all expression of praise. And from Homer's day to Hugo's there has been no such loving and faithful picture of a child as Shakespeare has given in the tragedy with which it opens. . . . There is no such pastoral poetry, such pastoral drama, in the world. The harmony of sweet prosaic realism and sweeter poetic passion is so absolute and perfect that it only gains instead of losing by the sudden change of weather to passing storm-wrack of cloud and threatening wind of ravage. . . . The 'Tempest' is distinguishable from 'Cymbeline' and the 'Winter's Tale' by the stronger and more serious intervention of magical or supernatural activity. Among countless other claims on our special and wondering gratitude, it has the charm of evoking a reminiscence and provoking a comparison which one poet alone could endure. The gentle and joyful fancy which made fairyland of earth in the 'Midsummer Night's Dream' of youth is here transfigured into the passionate and thoughtfull imagination of a maturer and a mightier demi-god or man. The difference of the later and the earlier poem is the difference between Ariel and Puck."—A. C. Swinburne, *General introduction to the works of Shakespeare (Shakespeare's comedies, Oxford edition, pp. ix, xiii-xviii, xxiv-xxvi)*.—"This [*Romeo and Juliet*], the first tragedy of Shakespeare, if we set aside *Titus Andronicus*, certainly his first tragedy in which beauty and terror are harmonized, was published in quarto in 1597. . . . German critics have regarded Friar Laurence as a kind of chorus in the tragedy, and have drawn the edifying moral—"These violent delights have violent ends." But the rapture of the lovers does not of itself cause the tragic ending of their joy; their passion is pure and honourable from first to last. The hatred of the houses broods over their brief ecstasy like a thunderous fate. . . . Shakespeare was well aware that one who is charged with any great passion, however high and sacred, holds his life upon terms that are not easy and secure. But he represents the death of Romeo and Juliet as sacrificial; if peace comes at all it shall be through these martyrs of love. . . . The play is a noble dramatic hymn in honour of love, though it does not pretend to exhibit the whole of human life, into which such a passion as that of Romeo and Juliet may be taken up as a vivifying portion of the whole."—E. Dowden, *Introduction to Romeo and Juliet (Tragedies of Shakespeare, Oxford edition, pp. 205, 300)*.—"When Hamlet was written Shakspeare had passed through his years of apprenticeship, and become a master-dramatist. In point of style the play stands midway between his early and his latest works. The studious superintendence of the poet over the development of his thought and imaginings, very apparent in Shak-

speare's early writings, now conceals itself; but the action of imagination and thought has not yet become embarrassing in its swiftness and multiplicity of direction. . . . The mystery, the baffling, vital obscurity of the play, and in particular of the character of its chief person, make it evident that Shakspeare had left far behind him that early stage of development when an artist obtrudes his intentions. . . . After Hamlet came King Lear. Hamlet was, in fact, only the point of departure in Shakspeare's immense and final sweep of mind,—that in which he endeavoured to include and comprehend life for the first time adequately. Through Hamlet—perhaps also through events in the poet's personal history, which tested his will as Hamlet's will was tested—Shakspeare had been reached and touched by the shadow of some of the deep mysteries of human existence. . . . He had completed his English historical plays, which are concerned with this practical mastery of the world. . . . Having completed Henry V., for a short period he yielded his imagination and his heart to the brightest and most exuberant enjoyment. Around the year 1600 are grouped some of the most mirthful comedies that Shakspeare ever wrote. Then, a little later, as soon as Hamlet is completed, all changes. From 1604 to 1610 a show of tragic figures, like the kings who passed before Macbeth, filled the vision of Shakspeare; until at last the desperate image of Timon rose before him; when, as though unable to endure or to conceive a more lamentable ruin of man, he turned for relief to the pastoral loves of Prince Florizel and Perdita; and as soon as the tone of his mind was restored, gave expression to its ultimate mood of grave serenity in *The Tempest*: and so ended. During these years the imaginative fervour of Shakspeare was at its highest, and sustained itself without abatement. . . . But now in unbroken series, year by year, one great tragedy succeeds another. Having created Othello surely the eye of a poet's mind would demand quietude, passive acceptance of some calm beauty, a period of restoration. But Othello is pursued by Lear, Lear by Macbeth, Macbeth by Antony and Cleopatra, Antony and Cleopatra by Coriolanus. It is evident that the artist was now completely roused. . . . The comedies of Shakspeare had, in comparison, played upon the surface of life. The Histories, though very earnest, had not dealt with the deeper mysteries of being. . . . Of the tragic story [of Othello] what is the final issue? The central point of its spiritual import lies in the contrast between the two men, Iago and his victim. Iago, with keen intellectual faculties and manifold culture in Italian vice, lives and thrives after his fashion in a world from which all virtue and all beauty are absent. Othello with his barbaric innocence and regal magnificence of soul must cease to live the moment he ceases to retain faith in the purity and goodness which were to him the highest and most real things upon earth. Or if he live, life must become to him a cruel agony. . . . There is therefore, Shakspeare would have us understand, something more inimical to humanity than suffering—namely, an incapacity for noble pain. To die as Othello dies is indeed grievous. But to live as Iago lives, devouring the dust and stinging—this is more appalling. Such is the spiritual motive that controls the tragedy. . . . There is a line in the play of Macbeth, uttered as the evening shadows begin to gather on the day of Banquo's murder, which we may repeat to ourselves as a motto of the entire tragedy, 'Good things of day begin to droop and drowse.' It is the tragedy of the twilight and the setting-in of thick darkness upon a human soul. . . . The tragedy of

King Lear was estimated by Shelley, in his Defence of Poetry, as an equivalent in modern literature for the trilogy in the literature of Greece with which the *Œdipus Tyrannus*, or that with which the Agamemnon stands connected. King Lear is, indeed, the greatest single achievement in poetry of the Teutonic, or northern genius. . . . In King Lear, more than in any other of his plays, Shakspeare stands in presence of the mysteries of human life. . . . But while Shakspeare will present life as it is, and suggest no inadequate explanations of its difficult problems, he will gaze at life not only from *within* but, if possible, also from an extra-mundane, extra-human point of view, and gazing thence at life, will try to discern what aspect this fleeting and wonderful phenomenon presents to the eyes of gods. Hence a grand irony in the tragedy of Lear; hence all in it that is great is also small; all that is tragically sublime is also grotesque. Hence it sees man walking in a vain shadow; grouping in the mist; committing extravagant mistakes; wandering from light into darkness; stumbling back again from darkness into light; spending his strength in barren and impotent rages; man in his weakness, his unreason, his affliction, his anguish, his poverty and meanness, his everlasting greatness and majesty. Hence, too, the characters, while they remain individual men and women, are ideal, representative, typical; Goneril and Regan, the destructive force, the ravening egoism in humanity which is at war with all goodness; Kent, a clear, unmingled fidelity; Cordelia, unmingled tenderness and strength, a pure redeeming ardour. As we read the play, we are haunted by a presence of something beyond the story of a suffering old man; we become dimly aware that the play has some vast impersonal significance, like the Prometheus Bound of *Æschylus*, and like Goethe's *Faust*. We seem to gaze upon 'huge, cloudy symbols of some high romance.'—E. Dowden, *Shakspeare*, pp. 125-126, 222-224, 242-244, 257-259.—“The first in apparent date of Shakespeare's Roman tragedies . . . [Julius Caesar] sets before us the one man of Shakespeare's making who stands high above all his fellows in sublime simplicity of innate and inevitable heroism. . . . The faultless and ideal figure of Marcus Brutus as painted by William Shakespeare shines out for all time in serene and superb disproof of the doubtless reasonable as well as plausible belief that the perfect heroism of perfect humanity must needs be unattractive if not repellent to the instinctive sense or apprehension of average and inferior mankind. . . . The tragic and romantic story of *Coriolanus* could only be treated, if not altogether from the patrician point of view which misguides the hero to his destruction, in such fashion as to leave that magnificent rebel and ruthless enemy to his country the supreme figure of the tragedy. . . .

“The scheme of Shakespeare's third and last Roman play [Antony and Cleopatra] is so vast as to put it out of comparison with the others: the scene leaps and flies about with the trackless impulse of lightning from Africa to Europe and back, after a flash into Asia by the way: the number of its changes is as difficult to keep count of as the number of the characters involved. . . . This is the greatest love-poem of all time.”—A. C. Swinburne, *General introduction to the works of Shakespeare (Shakespeare's comedies, Oxford edition, pp. xxvi, xxxii-xxxiv)*.—“But yet there is a somewhat deeper note struck in the companion poem of ‘*Cymbeline*.’ Though *Perdita* may be the sweetest of all imaginable maidens, *Imogen* is the most adorable woman ever created by God or man. Her single figure might well suffice to distinguish its

designer as the supreme creator of imaginative life in human and immortal character. . . . It is as hopeless to hope as it would be arrogant to assume that any tribute of praise or thanksgiving can glorify with any further glory the name that is above every other for variety in supremacy of powers and unity in diversity of genius. Of poetry pure and simple, imaginative and sublime, there is no master who has left us more: of humour there is no master who has left us as much of so high a quality and so deep an insight: of women as of men there is no poet who has created so many so surely endowed with everlasting life. . . . It is not only the crowning glory of England, it is the crowning glory of mankind, that such a man should ever have been born as William Shakespeare.”—*Ibid.*, pp. xxv, xxxvi.—“With the coming to England of the Scottish king and the social activity of a new court, a new impetus and new directions were imparted to the drama. The court and the gentlemen of the inns of court had produced nothing distinctive since the earlier successes of Lyly, save the premonitory masque of *Campion* and *Davison* in the *Gesta Grayorum* of 1594. Both were wedded to trumpery mumming and to Seneca in the modified French form which the Earl of Stirling was still practicing in *Monarchic Tragedies* after the earlier models of Daniel's *Cleopatra* (1594) and *Philotas* (1604). [Ben] Jonson (and Daniel in a very minor part) now developed the masque to its artistic if not to its sumptuary height; and, with the aid of *Inigo Jones*, the royal architect, introduced movable scenery, effects of change, color, and light as the customary accompaniments of theatrical performances at court. . . . Unquestionably the staging of plays on the London boards was profoundly affected and modified by the new devices at court. A second addition of the court poets of the early days of James to the teeming dramatic categories of the time was the pastoral drama; and here Daniel stands, despite the pastoral tone of certain of Peele's, Lyly's, and Shakespeare's earlier comedies, the indubitable corypheus of a new departure. . . . On the popular boards the succession of species in the earlier years of King James is more continuous of the past. The chronicle history, except for such obituary plays as Heywood's *If You Know Not Me You Know Nobody* (1604), ceases to hold the stage, although there were revivals, such as that of *King Henry VIII* (in 1613). The murder play, too, loses its impulse with *The Yorkshire Tragedy* (1605). But the domestic drama of less tragic type, romantic tragedy in variety greater than ever, history more particularly classical and foreign, and comedy romantic, realistic, and satirical, all held the stage in simultaneous profusion. . . . The years between the accession of King James and the retirement of Shakespeare likewise mark the height of English comedy. Though Shakespeare himself after *Measure for Measure* (c. 1604) turned to tragedy and ‘romance,’ the effect of his ideal treatment of romantic character in comedy was by no means lost on his greater contemporaries. . . . Above all do Beaumont and Fletcher disclose their romantic paternity in word and phrase. Jonson turned now from his futile warfare with the gulls and poetasters to the masque at court and to the composition of his learned Roman tragedies. . . . but he also found time to continue the practice of his comedies of humors, now tempered by his acceptance of English scene, his recognition of the superior claims of truth to personal satire, and converted into the most consummate comedies of manners in the range of the literature.”—F. E. Schelling, *Elizabethan drama, 1558-1642, v. 2, pp. 411-415*.—

WORLD'S GREAT DRAMATISTS

"His masterpieces in comedy, *Volpone* and *The Alchemist*, betrayed a fiery scorn of villainy and hypocrisy; the scenes and characters abounded, too, in strokes of effective humour. But Jonson's respect for the old comic tradition prevented him from abandoning himself freely to the varied dramatic impulses of the epoch. His Roman tragedies, *Sejanus* (1603) and *Catiline* (1611), despite the stateliness of the verse, more conspicuously sacrifice life to learning. The dramatic movement halts. With the versatility characteristic of the age Jonson at the same time exercised lyric gifts of quality that places him in the first rank of Elizabethan poets. For intellectual vigour he may be placed above all his contemporaries save Shakespeare. . . .

"George Chapman (1559?-1634), the translator of Homer, worked as a playwright somewhat in Jonson's groove, but he showed less vivacity or knowledge of life. Chapman's tragedies are obtrusively the fruits of studious research. He is by natural affinity a gnomic poet or philosopher who inclines to cryptic utterance. His plays often resemble a series of dignified and weighty soliloquies, in which the dramatist personally addresses himself to the audience in a succession of transparent disguises. At least eight . . . able playwrights of Jonson's generation sought . . . to continue the Shakespearean tradition, and they at times echoed, albeit hesitatingly, their master's wondrous powers of speech. They were all faithful followers of the common contemporary practice of collaboration, and it is not always easy to disentangle one man's contribution to a single play from another's. John Marston (1575?-1634), who began his career as a satirist, was in comedy a shrewd and cynical observer of human life, while as a tragic writer he could occasionally control the springs of pity and terror. Thomas Dekker (1570?-1641?) for the most part brought on the stage the society of his own time. He was far more realistic than most of his fellows, and a more truthful portrayeur of character. His sentiment was more sincere. But he had smaller faculty of imagination. His language, if simpler, was less glowing or stimulating. Thomas Heywood (d. 1650?) and Thomas Middleton (1570?-1627) energetically competed with Dekker and Marston for public favour. Each, in one work, at least—Heywood in his *Woman Killed with Kindness*, and Middleton notably in his *Changeling*—proved that he cherished a great conception of dramatic art. Heywood excelled Dekker in dramatic handling of domestic episode. Middleton sought to turn to dramatic account picturesque romance. But even the masterpieces of these two writers are defaced by carelessness in construction, and the rest of their work rarely rises above the level of fluent mediocrity. None of these dramatists, save perhaps Heywood, achieved marked success in the theatre. Only John Fletcher (1579-1625), and Philip Massinger (1583-1640), inherited in permanence any substantial share of Shakespeare's popularity. Shakespeare's place at the head of the dramatic profession was filled on his retirement by Fletcher, who made his earliest reputation as a writer of plays in a short-lived partnership with Francis Beaumont (1607-11). Beaumont's career closed before that of Shakespeare, and Fletcher continued his work either alone or with other collaborators, of whom the most constant was Massinger. Fletcher's alliance with Beaumont produced rich fruit in *The Maid's Tragedy*, and in the tragi-comedy of *Philaster* (c. 1611), to both of which Beaumont was the larger contributor. Fletcher was better fitted to

excel in comedy than in tragedy, and it is his brilliant dialogue and sprightly repartee that mainly gave his dramatic work distinction. . . . The merits of Fletcher's and Massinger's labours are, however, those of a declining epoch. They show intellectual agility rather than intellectual fertility. Their picturesque utterance inclines to over-elaboration, and there is a steadily growing tendency to mannerism and artifice. Moreover their moral tone is enfeebled. . . . Another contemporary dramatist of unquestioned eminence, John Webster (1580?-1625?) gave similar proofs of decadence. Webster concentrated his abundant energies on repulsive themes: his plots centre in fantastic crimes, which lie out of the range of art and life. But Webster, of all Shakespeare's successors, approached him nearest in tragic intensity. The last flickers of light which can be traced to the Elizabethan dramatic spirit are visible in the tragic genius of John Ford (fl. 1639) and in the miscellaneous ability of James Shirley (1596-1666). Ford's tragic romance of the *Broken Heart* was produced in 1633. It more closely accords with the classical canons of construction than with the Shakespearean, but the high poetic strain echoes the deep harmonies of Shakespearean tragedy. The name of James Shirley . . . closes that chapter in the history of the English drama which opened with Marlowe."—S. Lee, *Elizabethan Age of English literature (Cambridge modern history, v. 3, pp. 380-381)*.

With the successors of Elizabeth, the height of English drama was passed. Matters of national import which had quickened the pulses of the Elizabethans were untouched. Their old likes and dislikes remained, however, to color the drama—a close bond with Germany, a friendly feeling for France, which turned to suspicion as soon as Henry of Navarre ceased to occupy the throne, and a deep-seated hatred for Spain. Italy was still a place of charm to be used in conventional manner in literature. "The decline of the drama . . . [during the reigns of James I and Charles I] is due to 'the loss of a national spirit due to the occupancy of the throne by a foreigner,' for in those days King James was no less; the narrowing constituency of the stage referable to the spread of the Puritan spirit; the recent formation and growth of a metropolitan society; and, lastly, the tendency towards conventionality, characteristic of the later products of all literary schools."—F. E. Schelling, *Elizabethan drama, v. 2, pp. 422-423*.—After a series of restrictive acts which more and more narrowed the scope and freedom of the theatre, a final edict was passed on Sept. 2, 1642, which entirely suppressed stage presentations. "The ordinance of 1642 had closed the theatres and brought to an untimely end the brilliant drama that had flourished with such luxuriance during three generations. In the civil war, the players followed the king almost to a man, though there are indications that some of them sought a livelihood in the continuance of the practice of their profession abroad. With the conclusion of the war, some of the players attempted entertainments of various kinds, only to be met with more drastic regulations by their triumphant Puritan enemies. . . . Angered by these efforts on the part of the actors, Parliament passed the ordinance of February, 1648, authorising the destruction of all playhouses and the compulsion of all actors, on pain of flogging and imprisonment, to enter into a recognisance 'never to act or play any plays or interludes any more.' Even with this, there seems to have been some connivance at performances during the Commonwealth; those in lesser authority could, on occasion, be reached so as to wink

at plays not too openly acted. And private performances could, of course, not be controlled. In later Commonwealth times the laws were less stringently enforced. Cromwell himself was no such enemy of the drama as the Parliament which had preceded him in power, though he, too, continued to invoke the law on occasion. During the ban upon the drama, various devices were employed to evade the letter of the law. Among them, by far the most successful was the 'droll' or 'droll humour,' which was commonly a single scene or situation, humorous or other, derived from some well known popular play and acted, or recited at least, in character."—F. E. Schelling, *English drama*, pp. 234-235.

1660-1800.—English Restoration.—Sentimental drama of Queen Anne.—Georgian era.—"The formal opening of the period of modern English drama may be dated from the issuing by Charles II, on 21 August, 1660, of letters patent conferring upon Thomas Killigrew and Sir William D'Avenant [Davenant] the right to 'erect' two companies of players. The advent of Charles II to the throne meant the restoration of drama, as well as of monarchy. The grant of 21 August was of large significance. It restored to English drama, with the seal of royal authority, rights and privileges of which it has never subsequently been deprived. Yet the act that thus conferred larger liberty upon the drama marks, in fact, the creation of a theatrical monopoly from whose shackles the London stage was not wholly freed for almost three centuries. For the moment, however, it was enough that the ban on English drama was formally lifted. The way, indeed, had already been opened for the resumption of theatrical activity. D'Avenant's productions at Rutland House had been followed by the performances of his operas, in 1658 and 1659, on the public stage at the Cockpit Theatre, in Drury Lane. In early February, 1660, General Monck entered London, and soon afterward a license for acting was given to John Rhodes, a London bookseller, said to have been previously connected with the Blackfriars Theatre as wardrobe-keeper. Before the issue of the patent of 21 August, three companies of actors had begun to be assembled—at the Cockpit, at the Red Bull, and at Salisbury Court, in Whitefriars."—G. H. Nettleton, *English drama of the Restoration and eighteenth century* (1642-1780), pp. 30-31. "The repertory of the earlier years of the Restoration was made up largely of revivals of 'the older drama, Fletcher leading in popularity, with Shakespeare a close second. After Davenant's example, it became the custom to alter the older plays on these revivals, a thing which indeed had long before been done, but never so brazenly avowed. There was scarcely a playwright, from Dryden and Betterton to Vanbrugh and Farquhar who did not take part in this merry game of pillaging and 'improving' the works of their predecessors."—F. E. Schelling, *English drama*, p. 238.—"The drama on the re-opening of the theatres was subjected to a flood of new influences. Paramount among these was the influence of the court, to which dramatists and actors alike hastened to pay the homage of servile flattery. This lack of independence on the part of the dramatists of the day, coupled with the general relaxation of morals

consequent on the restoration, account, in a large measure, for the degradation into which tragedy in England sank. While comedy retained, in its brightest manifestations at all events, some redeeming wit and humour, tragedy fell to a level of dulness and lubricity never surpassed before or since. . . . It has been seen how, notwithstanding all the changes which had taken place in the literary and social conditions of the times, and in those of the performance of plays, the theatres were reopened in 1660 with favourite old plays; but now, side by side with the surviving traditions, new influences were at work. Among these influences the operatic element, which owed its first introduction to D'Avenant, became specially powerful in tragedy, and helped to bring about its degradation. Another important factor in the development of tragedy, viz. the influence, direct and indirect, of French romance and drama, produced its first important result in the heroic play."—A. T. Bartholomew, *Restoration drama* (*Cambridge history of English literature*, v. 8, pp. 178-179).

"The term 'eighteenth century English drama' suggests a somewhat arbitrary chronology. Yet it has, perhaps, other justification than that of convenient reference. The year 1700 marks the death of Dryden, the dominant figure in restoration drama, and the retirement of Congreve, its most brilliant comic dramatist. Etherege, Wycherley, Lee, Otway and many other contemporaries of Dryden had already passed from the ranks of active dramatists. The growing protest against the immorality of the drama, vigorously expressed in Jeremy Collier's invective, *A Short View of the Immorality and Profaneness of the English Stage* (1698), shows that the old order has changed and is soon to yield place to new. The reign of queen Anne (1702-14) may be regarded, therefore, as a period of transition in English drama. Though the current of restoration comedy still runs strong in the first decade of the eighteenth century, in Vanbrugh's later works and in Farquhar's plays, the tide of drama turns with the moralised comedies of Colley Cibber and the sentimental dramas of Richard Steele. Meanwhile, tragedy, also, was showing signs of transition. The heroic drama of the restoration had torn passion to tatters; but the queen Anne age inclined more toward classical constraint than toward romantic licence. Even Nicholas Rowe, who, in *The Fair Penitent* (1703), followed an Elizabethan model and wrote *Jane Shore* (1714) 'in imitation of Shakespear's style,' shows classical tendencies in limitation of the number of characters, in restriction of dramatic action and in rejection of comic relief. His chief dramas—to use his own phrase, 'she-tragedies'—have an almost feminine refinement of tone. In the moralised sentiment with which they enforce their pathetic appeals there is a close kinship between the tragedy of Rowe and the comedy of Steele. In sentimental drama, pity is akin to love. . . . Notwithstanding the far-reaching influence of sentimental drama, the record of its rise and progress is but part of the English dramatic history of the eighteenth century. The queen Anne period was, essentially, a critical age, which fixed its standards largely on classical authority. To a very considerable degree, its playwrights reflect the influence of French classical drama and dramatic theory. Racine and Corneille were adapted for the English stage in a whole series of versions. Addison, whose critical influence was cast in favour of dramatic rule and regularity, put classical theory so effectively into practice in *Cato* (1713) that Voltaire hailed it as the first *tragédie raisonnable* in Eng-

lish. Stimulated by the successes of Ambrose Philips and Addison, other English playwrights turned to classical models and translated, though often with considerable freedom, such dramas as *Le Cid*, *Cinna* and *Iphigénie*. . . . To the adverse factors which threatened the ascendancy of formal tragedy and comedy must be added two theatrical developments of great significance. The second decade of the eighteenth century marks the introduction of English pantomime; the third, that of ballad-opera. . . . Henceforth, pantomime had to be numbered as one of the stock attractions of the eighteenth century stage. Hardly had pantomime firmly established itself in popular favour, when Rich. produced another formidable rival to regular drama in John Gay's *Beggar's Opera* (1728). This work marked the triumph of ballad-opera. . . . Like pantomime, ballad-opera, henceforth, must be regarded as a stock attraction of the theatre. During the Garrick era, its popularity was maintained by many operas like those of Isaac Bickerstaff, and the initial run of Sheridan's *Duenna* surpassed that of *The Beggar's Opera*."—G. H. Nettleton, *Drama and the stage* (Cambridge history of English literature, v. 10, pp. 67-71).—Fielding furthered the downward tendency of the drama by following the example of Lillo whose "London Merchant" was produced in 1731. In plays of this character, feelings of pity and terror were fostered in the audience by themes from contemporary life.—"The transfer of Fielding's literary activity from drama to novel suggests another potent factor in the decline of the drama. To the forces of Italian opera, pantomime, burlesque, ballad-opera, farce and spectacle, whose constant inroads had grievously thinned the ranks of regular drama, was now added a more dangerous if more subtle, rival of the boards. *Robinson Crusoe* (1719-20) and *Gulliver's Travels* (1726-7) had already fired the fancy of English readers. With Richardson's *Pamela* (1740), the English novel began its great period of literary dominance. It is not an accidental coincidence that the middle of the eighteenth century is marked by poverty in dramatic composition as well as by the strenuous advance of the novel. Nevertheless, two powerful forces helped to sustain the vitality of the theatre. Provided with a strong repertory of stock plays, the genius of actors was able to triumph even over the mediocrity of contemporary drama. It was the age of the player, not of the playwright. The period of which we speak is the era of Garrick."—*Ibid.*, p. 85.—Georgian audiences were too restricted to be representative of the nation. The eighteenth century was essentially a fireside era, given to tea-drinking, polite conversation, and letter-writing. It was to the "beau monde" that the theatre appealed for its exclusiveness and display. Hence the theatre assumed the manners and prejudices of the leisure class, with its repression of emotion and horror of indelicacy. The sentimental comedies of Steele are excellent examples of the favorite plays of the time which reached their height in the plays of Sheridan, centering about drawingroom diplomacy.

1700-1799.—French revolution.—Tragedies of Voltaire.—Comedy.—Its superiority to the tragedy of the period.—Beaumarchais.—"The dra-

matic work of the century reached, on the whole, a far higher standard of merit than its poetry. . . . The tragedy was a pure imitation of that of the preceding century, and rapidly tended to become stereotyped. The model of Racine and the theory of Boileau were enforced with relentless rigour, one man only, La Motte, making a bold and praiseworthy but unsuccessful attempt to break these conventional shackles. Voltaire alone . . . succeeded by his wonderful cleverness and marvellous technique in giving life to the dry bones, and in writing tragedies of real merit. Of comedy much better things are to be said. . . . First of the dramatists of importance in the century is Prosper Jolyot de Crébillon [1674-1762]. . . . His best-known plays are: *Atreïe* (1707), *Electre* (1708), and *Rhadamiste et Zénobie* (1711), the most famous and most characteristic of all Crébillon's work is rather melodrama than genuine tragedy."—L. E. Kastner and H. G. Alkins, *Short history of French literature*, pp. 164, 175.—The French Revolution, though it swept away the old régime in all other fields, made no change in the drama. The theaters were as popular as ever, but the classical form still held sway and there were no contributions of note to its monuments. "It will be seen that the positive achievements of drama during this period were considerably superior to those of poetry. The tragedies of Voltaire are prodigies of literary cleverness."—G. Saintsbury, *Short history of French literature*, p. 412.—"Voltaire . . . was the only writer of tragedy of real merit the century produced. He wrote altogether more than fifty plays. . . . During his three years' stay in England, he learnt to know Shakespeare, and was much influenced by him, and it is to this influence that we owe the chief improvements which he attempted in French tragedy. The principal of these were increased psychological observation, greater life and action, and greater diversity in technique and local color. . . . The two plays which are universally admitted to be his best are *Zaïre* (1732) and *Mérope* (1743). . . . Among [his] other best-known plays are *Œdipe* (1719), his first, an imitation of Sophocles; *La Mont de César* (1732), a . . . Shakespearian adaptation, . . . *Mahomet ou le Fanatisme* (1742). With comedy we come to much more important and original work, not least so being that of Pierre Chamblain de Marivaux [1688-1763]. . . . Admitted into the *salons* of the day, notably that of Madame de Lambert, he quickly found his true bent in comedies reflecting the tone of this side of Parisian life. . . . His best known plays are: *La Surprise de l'amour* (1722), his first great success; *Le Jeu de l'amour et du Hasard* (1730), *Le Legs* (1736), *Les Fausses confidences* (1737), *l'Épreuve* (1740). . . . To the graceful, elegant, refined, and somewhat affected prose style in which these delicate plays were written was given the name of 'marivaudage'. . . . The name of Alain René Le Sage [1668-1747] . . . is of importance . . . here. . . . His reputation as a writer of comedy depends upon two pieces, *Crispin de son maître* (1707), a farcical and extravagant but lively and most uncommonly witty play; and *Turcaret* (1709), his masterpiece, which is of much more solid and serious merit. . . . Pierre Claude Nivelles de la Chaussée (1692-1754) . . . wrote plays in which the interest was exclusively pathetic and tragic. In his earliest comedies there was a certain mixture of the comic and pathetic as in *Le Préjugé à la mode* (1735) but this comic element gradually disappeared, and in 1741 he produced in *Mélanide* a play in which the pathetic reigned alone, and the *comédie larmoyante* was fully established. . . . Diderot, of whom we shall

have to speak at far greater length elsewhere, partly carrying on the work of La Chaussée, established the theory of the *drame* as a *genre* of dramatic writing intermediary between tragedy and comedy. . . . Unfortunately, his theory was better than his practice, and his two dramas, *Le Fils naturel* (1757) and *Le Père de famille* (1785) are dull and declamatory, and without dramatic force. Most famous among the writers of comedy of the century is Beaumarchais, a man whose importance in his own day was by no means solely literary. Pierre Augustin Caron was born at Paris in 1732. . . . [He] took the name of Beaumarchais. . . . Into the many vicissitudes of his wonderful life . . . it is impossible to enter. It is sufficient to mention the famous lawsuits which indirectly led him to fame through the four *Mémoires*, written in 1774-1775, in which he ridiculed his judges in such frequent and witty satire as to raise himself at once to a pinnacle of literary celebrity. . . . He died in 1799. Beaumarchais' dramatic work is of a piece with his life, and his great creation, the character of Figaro, we might almost call a dramatization of himself. . . . In the *Barbier de Séville* (1775) we have Beaumarchais' bold satire of politics and society in its earlier stage, already keen and biting. . . . The *Mariage de Figaro* is the *Barbier de Séville* carried to a higher plane. . . . Its wonderful cleverness and brilliant wit were only in very small part responsible for [its] phenomenal reception, the real cause lying in the fact that it voiced the burning questions of the day. . . . It is this aspect of the Figaro plays which makes them . . . epoch-making works in the literature and history of France."—L. E. Kastner and H. G. Atkins, *Short history of French literature*, pp. 176-180.—"As a matter of general literary history, the drama during this time displays numerous evidences of life and promise, as well as of decadence. The gradual recognition of the vaudeville as a separate literary kind gave occasion to much work, the ephemeral character of which should not be allowed to obscure its real literary excellence, and founded a school which is still living and flourishing with by no means simulated life. The attempt of La Chaussée and Diderot to widen the range and break down the barriers of legitimate drama was premature, and not altogether well directed; but it was the forerunner of the great and durable reaction of nearly a century later. Still the actual dramatic accomplishment of this period, though in many ways interesting, and to a certain extent positively valuable, is not of the first class. . . . Hence, in a lesser degree, the drama of the eighteenth century shares the same disadvantage which has been noted as characterising its poetry. Its value is a value of curiosity, chiefly a relative value. Indeed, as a mere mechanical art, drama sank even lower than poetry proper ever sank; and for fifty years at least before the romantic revival it may be doubted whether a single play was written, the destruction of which need grieve even the most sensitive and appreciative student of French literary history."—G. Saintsbury, *Short history of French literature*, pp. 412-413.—"If we seek to know why . . . they have done better work in the drama than in any other department of literature, it is easy (although perhaps not altogether sufficient) to answer that it is because the dramatic is the form best suited for the expression of certain qualities in which the French excel the men of other races. Chief among these national characteristics are a lively wit, a love of effect for its own sake, a gift for writing beautiful prose, and a passion for order and symmetry and clearness."—B. Matthews, *French dramatists of the nineteenth*

century, preface.—See also FRENCH LITERATURE: 1552-1610; 1700-1794.

1700-1800.—German revolt under Lessing.—No doubt every century is more or less an era of transition; but surely the eighteenth century seems to deserve the description better than most. For nearly three quarters of its career, it appears to us prosaic in many of its aspects, dull and gray and uninteresting; but it was ever a battle-ground for contending theories of literature and of life. In the drama more especially it was able to behold the establishment and the disestablishment of pseudo-classicism. At its beginning the influence of the French had won wide-spread acceptance for the rules with their insistence on the Three Unities and on the separation of the comic and the tragic. At its end every rule was being violated wantonly; and the drama itself seemed almost as lawless as the bandits it delighted in bringing on the stage so abundantly. Throughout Europe, except in France, the theater had broken its bonds; and even in France, the last stronghold of the theorists, freedom was to come early in the nineteenth century. Lessing had undermined the fortress of pseudo-classicism; and the walls of its last citadel were to fall with a crash at the first blast on the trumpet of Hernani. . . . It was in Germany . . . that there arose a stalwart antagonist to withstand Voltaire, to destroy the universal belief in the infallibility of French criticism, and to disestablish the pseudo-classicism which needed to be swept aside before a rebirth of the drama was possible. Lessing was the best equipped and the most broad-minded critic of esthetic theory who had come forward since Aristotle; and he had not a little of the great Greek's commingled keenness and common sense. . . . It was in the stress of a contemporary controversy that Lessing set forth eternal principles of dramatic art. He went into the arena with the zest of the trained athlete; and he was never afraid to try a fall with Voltaire himself. In fact, it was especially in the hope of a grapple with the French dictator of the republic of letters that the German kept his loins girded. Lessing destroyed the superstitious reverence for the French theories; but he could build up as well as tear down. German literature was then at its feeblest period; and such original German pieces as might exist were almost as pitiful as the weak imitations of French tragedy. The German theater was battling for life; it was barren of plays worthy of good acting; it was almost as deficient in good actors capable of doing justice to a fine drama; and it attracted scant and uncultivated audiences without standards of comparison and therefore with little appreciation of either the dramaturgic art or the histrionic."—B. Matthews, *Development of the drama*, pp. 294, 295, 280, 281, 282.—"In *Miss Sara Sampson* (1755), the first German tragedy of common life, he [Lessing] emancipated the German stage from the absurd pseudo-classic prejudice that the representation of elevated feeling and deep emotion should be restricted to the sphere of kings and princes,—thus accomplishing for his own country what Lillo and Steele had done before him in England, what Nivelle de la Chaussée, Diderot, and others had attempted in France. In *Philotas* (1759) he impersonated, although in Greek disguise, the spirit of heroism and unswerving devotion to king and country which made the Prussia of the Seven Years' War. In *Minna von Barnhelm* (1767) he created the first unquestionably and unconditionally German characters of the modern German stage,

characters charged, as it were, with a sturdy individuality, and at the same time types of a people beginning to feel itself again as a whole, and to be again conscious of national responsibilities. In *Emilia Galotti* (1772) he gave voice to popular indignation at the oppression of the middle classes through a corrupt and vicious aristocracy, thus opening the battle which was to be carried on in the 'Sturm und Drang' movement, and which, in the classic days of Weimar and Jena, was to bring about the German counterpart to the French Revolution: the supplanting of the old aristocracy, based on birth and privilege, by a new aristocracy of intellect and culture."—K. Francke, *Social forces in German literature*, pp. 278-279.—*Nathan der Weise* (1779) is perhaps his best known play.—See also GERMAN LITERATURE: 1700-1832.

1711-1920.—SCANDINAVIAN drama and dramatists. See SCANDINAVIAN LITERATURE: 1711-1770; 1750-1850; 1814-1900; 1857-1910; 1888-1920.

1767-1878.—Early American.—"The first play written by an American and produced in America, it is said, was the tragedy *The Prince of Parthia*, by Thomas Godfrey, originally performed at the Southwark Theatre, Philadelphia, in April, 1767, by a company headed by Lewis Hallam. The author was an ambitious poet who died at an early age. His play, declared above mediocrity, formed an important part of the volume of his works published in 1765."—C. Andrews, *Drama today*, p. 61.—"As a branch of American Literature, American Drama has not, as yet, come into its own. Even such a late historian of letters as Professor Barrett Wendell has failed to take cognizance of its full existence. The American Theatre has peculiarly been cut aloof from literature, even though it has not been isolated from American life, or failed to reflect American taste. In a study of American Drama, which, in its bulk, is not literature in the strict sense of the word, it is necessary to know something of the social forces behind the theatre in this country. Until 1878, the American playhouse was dominated by the personality of the actor and the manager. While the Theatre, in those early days, seems to have lacked business organization as we know it now, the centres of theatrical activity, like New York, Philadelphia, Boston, Albany, Baltimore, Charleston, and New Orleans, were potent. Each actor had a repertory and a tradition; each theatre its own stock company. The standard of taste in those early days was classical, and, whenever it departed from Elizabethan and Restoration examples, theatregoers relied on French and German models. Previous to 1878, neither the actor nor the manager risked anything toward the encouragement of the American dramatist. Edwin Forrest, who offered prizes for original plays by native writers, and who thus encouraged Robert Montgomery Bird and John Augustus Stone, always prefaced his encouragement with the requirement that the dominant character in the play should fit his dominant personality. But the consciousness that the American Theatre should reflect American life was very early manifest. We had the type drama feeling its way from the beginning, and we had the occasional drama, dependent on historical movement of events. Our early sense of environment was detected in numberless Indian plays. As for the social drama, reflective of manners, it was likewise of an early growth, although it was an imitation of a style, not indigenous to the soil. Even as late as Bronson Howard's 'Saratoga,' American characters were exclaiming 'egad.'"—M. J. Moses, *Study course on*

the American drama (*Drama League Monthly*, Apr., 1916, p. 24).—See also AMERICAN LITERATURE: 1750-1861.

1773-1832.—German drama.—Sturm und Drang.—Dramatic work of Goethe, Schiller, and von Kleist.—"It was decreed by the young men [in Germany] that the poetry of the past must be cast aside as a sort of worn-out manufacture. . . . All the young men of genius were agreed that what was wanted was something new—wonderful—never dreamed of before in the world! Such men as Lenz, Müller, and Klingner undertook to supply the poetry wanted for the future, and wrote quite enough of it! In 1776, Klingner—who afterwards became rational, wrote a wild play called 'Sturm und Drang,' and these two words (storm and pressure), were accepted as the name of the period—also known as 'the time of the original geniuses.' . . . The influence [of the mental excitement that prevailed] . . . did not soon pass away, but remained in the days of the Romantic period. . . . It required a strong man, like Goethe, to come out, and but slightly injured, from the excitement of that time of rash innovations."—J. Gostwick and R. Harrison, *Outlines of German literature*, pp. 228, 229.—"In 1773 he published anonymously Götz von Berlichingen with the Iron Hand. . . . He wrote part of a Prometheus, and he planned a Julius Caesar. . . . His favourite form of tragedy was the situation of a woman whom her lover abandons, either from sheer fickleness of character or from prudential considerations. So it is with Marie in Götz von Berlichingen. . . . Finally there is a tragedy of desertion in Faust. When Goethe began to dramatise the Faust-saga, it is probable that he had no thought of carrying his dramatic action beyond the grave. . . . The year in which Nathan the Wise [Lessing] was published saw the completion of Iphigenia in the rhythmic prose which, for the time being, Goethe thought best adapted to the requirements of idealising style. . . . Torquata Tasso sprang from the same soil as Iphigenia and belongs to the same order of art. Its theme, to quote Goethe's own formula, is the disparity between talent and life. . . . In the Natural Daughter this idealising veil was made still thicker. . . . In 1797 he resumed work on the long neglected play [Faust]. . . . When the First Part was given to the world in 1808, discerning minds began to see that Goethe's design was something vast, stupendous, incommensurable; but just what it was in detail, they could not even now make out. They could see, however, that the part already completed contained some of the noblest imaginative poetry, the profoundest criticism of life, the most engaging realism, the most exquisite humour, and the most pathetic tragedy of woman's love, that had ever found expression in the German language. The second part published after his death, never achieved universal popularity."—C. Thomas, *History of German literature*, pp. 252-254, 257-258, 275, 278, 294-295, 298-299.

"In the year 1781 a play appeared which made all previous manifestoes of the literary revolution seem tame enough. It was 'The Robbers,' by Friederich Schiller (1759-1805), who was then twenty-two years old. . . . In 'The Robbers' the incurable defects of the social circumstances of Schiller's time are represented in the most glowing colors. The idea running through it, most vividly presented, can be thus expressed: 'The social conditions are rotten to the core; they need a complete reformation, through which it will become possible to the individual to make available the talent God has given him, without in that way falling into

discord with the social order.”—J. K. Hosmer, *Short history of German literature*, p. 429.—“Next Schiller published *Cabal and Love* which is [much] more vitally related than either of its predecessors to German life. It belongs to the family of Sara Sampson and Emilia Galotti in that its principal figure is a sentimental girl whose course of true love runs unhappily to a tragic end. Several other plays from which Schiller took hints present the same situation. But it was not in his nature to write a merely personal or domestic tragedy; in some way or other he always connects the calamity of the individual with the larger life of society. *Cabal and Love* is a drastic comment on class feeling as a factor in the social order, and on the infamies that might flourish, and often did flourish, beneath the glamour of court life in the eighteenth century.”—C. Thomas, *History of German literature*, p. 267.—It “breathes in every line the fierce resentment of a man whose soul was seared by the cruelty of irresponsible despotism. Of the four anti-revolutionary dramas it is by far the boldest, for it was most intimately related to the life of the moment. . . . [In it] the young Swabian boldly flagellates the vices and crimes of the petty tyrants of his own race. Never before or after did he unveil with such unflinching hand the festering sores of German politics, and no writer of his time lanced the abscess with such dauntless courage. It is the most resounding condemnation in German literature of the abuses of the *ancien régime*, which in its main features was soon to be swept away by the lava stream of the Revolution and the sword of Napoleon. It was more revolutionary than ‘*The Robbers*,’ for it was more concrete. . . . The fourth and greatest of the political dramas was also the last. ‘*Don Carlos*,’ produced in 1787, had taken five years to mature. . . . Unlike earlier plays, ‘*Don Carlos*’ was written in verse, and its ringing declamations became and have remained the current coin of reformers. The play also reveals an advance in intellectual maturity. The poet had begun his career with passionate denunciations of despots and crowned heads; but he learned to admire the kingly virtues of Frederick and Joseph, and he had tasted the goodness of the Duke of Weimar. . . . The play reveals Schiller’s entrance into a wider as well as a more tranquil world of thought than its predecessors, and marks the transition from *Sturm und Drang* to the standpoint of broad humanity which Herder and other leaders of thought already occupied. There is not less emotion, but there is more reflection; not less criticism, but more construction. With ‘*Don Carlos*’ the period of dramatic composition is interrupted for nearly a decade.”—G. P. Gooch, *Germany and the French Revolution*, pp. 211-212.—“Schiller opened his second dramatic period with the magnificent trilogy of ‘*Wallenstein*,’ his most elaborate production, upon which he worked for seven years. Artistically, it is imperfect, and he afterwards surpassed it. It is variously judged, but to my mind no plays of Schiller are so impressive. . . . The trilogy of ‘*Wallenstein*’ is a magnificent picture of the seventeenth century, faithful to the minutest details. . . . Some dramas of Schiller may have particular advantages over ‘*Wilhelm Tell*.’ For my own part I am more impressed by ‘*Wallenstein*,’ ‘*Marie Stuart*,’ the ‘*Maid of Orleans*,’ the ‘*Bride of Messina*’ have each their admirers. Certainly, however, ‘*Wilhelm Tell*’ is the best known and most popular, and perhaps it is right to say it is artistically the most perfect. In this Schiller reached more nearly than elsewhere that after which he had striven since he turned himself again to the drama, namely a good objective presentment, in

which he succeeded without denying his own great nature or pushing it into the background.”—J. K. Hosmer, *Short history of German literature*, pp. 430, 448, 451.—See also GERMAN LITERATURE: 1700-1832.—“Neither Goethe nor Schiller attained his . . . height before he reached the years of ripened manhood. Both began in the tumultuous fashion of ‘*sturm und drang*’ enthusiasts [which they afterwards laid by, and] . . . if one remembers what a degree of classic perfection, what a noble harmony of substance and form German literature reached in Lessing’s master-works, one cannot help feeling that Goethe’s and Schiller’s youthful effusions marked a decided lowering of æsthetic as well as moral standards. And yet, when we remind ourselves of the torrents of violent emotions let loose on the appearance . . . of ‘*Goetz*’ and the ‘*Robbers*’ . . . we may realize how far these works excelled those of Lessing in their immediate effect on the imagination and morals of the time.”—K. Francke, *Social forces in German literature*, pp. 336, 339.—“Extravagance, experiments, and lifeless routine marred the German drama after Schiller’s death. Stage managers cared for nothing but the success of the moment. . . . With the exception of William Schlegel’s translation of Shakespeare, [on which Ludwig Tieck and his daughter collaborated] the extreme section of the romantic school accomplished but little in the province of the drama. The two brothers Schlegel made each but a single essay in drama and without success. Tieck, Brentano and Arnim only produced dramas for reading, some . . . very extravagant, while all . . . lacked sustained beauty. . . . Heinrich von Kleist (1777-1811) . . . a tragic poet . . . wrote seven dramas. . . . Kleist’s language possesses a peculiar charm, though he had not a sure command of the elements of German grammar. His presentment of reality is very powerful, yet he can always transport us by a single stroke into a completely ideal sphere. He does not wish to touch our hearts but to storm them by tragic force. He develops his characters to the fullest extreme, stopping short at no horror or crime.”—W. Scherer, *History of German literature*, v. 2, pp. 302, 305.

1800-1900.—General dearth.—Struggle between classicism and romanticism.—Rebirth of the drama.—“The dawn of the nineteenth century was illumined by the last flickers of the red torch of the French Revolution; and its earlier years were filled with the reverberating cannonade of the Napoleonic conquests. It was not until after Waterloo that the battle-field of Europe became only a parade-ground; and this is perhaps one reason why there was a dearth of dramatic literature in the first quarter of the century and why no dramatist of prominence flourished,—excepting only the gentle Grillparzer far away in Vienna. Despite their survival in the Austrian theaters Grillparzer’s pleasing plays are no one of them epoch-making; altho they had more life in them than the closet-dramas upon which British hardy like Byron and Shelley were then misdirecting their efforts. Throughout Europe during the first score years of the century the acted drama was for the most part frankly unliterary and the so-called literary drama was plainly unactable, proving itself pitifully ineffective whenever it chanced to be put on the stage. In Germany the more popular plays were either sentimental or melodramatic; and sometimes they were both. In England the more serious dramas were frequently adapted or imitated from the German, while the comic plays—like those of the younger Colman—were often little better than helter-skelter patchworks of exaggerated incident and contorted caricature. In France tragedy was

being strangled in the tightening bonds imposed by the classicist rules; and comedy was panting vainly for a larger freedom of theme and of treatment. But even in France help was at hand; and in certain Parisian theaters, wholly without literary pretensions, two species were growing to maturity, destined each of them to reinvigorate the more literary drama . . . [the *comédie-vaudeville* of Scribe and the melodrama of Pixérécourt and Ducange]. The younger generation abhorred the artificiality and the emptiness of the plays presented at the Théâtre Français; and they were bitter in denouncing the absurdity of the rules. Like all literary reformers, they proclaimed a return to nature; and they asserted their right to represent life as they saw it, in its ignoble aspects as well as in its nobler manifestations. They claimed freedom to range through time and space at will, to mingle humor and pathos, to ally the grotesque with the terrible, and to take for a hero an outcast of the middle ages instead of a monarch of antiquity. . . . The playgoers as a body wanted in France early in the nineteenth century, . . . first of all, action; then they [craved] the display of passion to excite their sympathy; and finally they [relished] the depicting of human nature, to satisfy man's eternal curiosity about himself. These wants the old fogies of pseudo-classicism did not understand, and this is why the public received with avidity the earlier plays of the romanticists with their abundant movement, their vivacity, their color, and their sustaining emotion. Alexander Dumas came first with 'Henri III et sa Cour'; Alfred de Vigny followed speedily with his spirited arrangement of 'Othello'; and at last Victor Hugo assured the triumph of the movement, when he brought out 'Hernani' with its picturesqueness of scenery, its constant succession of striking episodes, its boldly contrasted characters and its splendidly lyrical verse. Significant it is that Hugo and Dumas were both of them sons of Revolutionary generals, while Vigny was himself a soldier."—J. B. Matthews, *Development of the drama*, pp. 296-297, 300-302.—During the middle fifty years of the nineteenth century, it was only in France that the drama flourished. In every other country it was overwhelmed by the great flowering of prose-fiction. Following the Franco-Prussian War, the French nation was pervaded with a general lassitude, so that when the rebirth of the drama did come, it was not in France that it made its first appearance, but in Norway with Ibsen. (See below: 20th century.)

1800-1921.—Modern Russian. See RUSSIAN LITERATURE: 1800-1852; 1855-1880; 1905-1921.

1815-1877.—English dramatists: Talfourd, Byron, Sheridan Knowles, Lytton, Taylor, Browning, Swinburne, Tennyson.—"Early in the nineteenth century in England the theatre had fallen to a very low place. In fact practically no good original dramas were written for the stage which was filled with translations from the French. 'The chief ground of hope,' [said Henry Morley], 'is in the fact that literature since the sixteenth century, has never drawn more closely to the drama that now in its later days is closed against it. . . . William Charles Macready produced Thomas Noon Talfourd's 'Ion' with success. Talfourd's two other plays, 'The Athenian Captive,' and 'Glencoe' were also successful, but the writing of dramatic poetry was not his work in life. He was a lawyer, and he died a judge. . . . A play by Robert Browning, 'A Blot on the Scutcheon' . . . although pathetic, appears to be injured by concession to a taste less healthy than the author's own. . . . There was in England all the machinery of a drama . . . houses in plenty . . . actors in plenty, but . . . no plays.

Meanwhile throughout the century there . . . had been growing steadily a vigorous dramatic literature parted from the stage. Byron produced plays—'Manfred' in 1817, 'Marino Faliero,' 'Sardanapalus,' the 'Two Foscari,' 'Cain,' in 1821, 'Werner' in 1822, without a thought of actors for them. . . . Sheridan Knowles . . . produced and acted plays with a good aim at literature in them, and feeble echoes of Elizabethan speech. His first play was 'Caius Gracchus,' acted at Belfast in 1815. 'Virgilius,' 'The Hunchback,' 'The Love Chase' and others followed . . . Lord Lytton also obtained good success in 'The Lady of Lyons' and 'Richelieu.' . . . The first plays of Henry Taylor showed that sound literature was still holding the drama. 'Isaac Commenus' appeared in 1832, 'Philip van Artevelde' in 1834. . . . Robert Browning, essentially a dramatic poet . . . would have made his genius more deeply felt, if there had been a stage to write for. He was turned, as far as a genius can be turned, from his true calling, and . . . added nothing to the fine series of dramatic writings produced between 1841 and 1846. That series included two plays 'Luria' and 'The Return of the Druses' that will surely live and breathe for the fit audiences, who will not be few, whenever our true English drama comes to life again within its proper home. Algernon Swinburne first won fame in 1864 by putting the music . . . in him into the shape of such a play as would have charmed an audience in ancient Athens, 'Atlanta in Calydon'. . . . Alfred Tennyson in his maturer days turned to drama. His 'Queen Mary' published in 1875, and written with the usual sense of a complete alienation of the modern English stage from all the best thought of its time, paid no regard to the limits of an acted play. When unexpectedly acted in 1876 it was shortened for representation by excision of its more dramatic part. . . . Fine play as it was it needed to have been either written or re-written for the stage. In 1877 appeared . . . Tennyson's second play 'Harold,' fitly proportioned for the stage, and actable whenever the time shall come, as it will, when Englishmen again are asked to wear their best minds in the theatre."—H. Morley, *Cassell's library of English literature*, v. 3, pp. 433, 434.

1817-1871.—German dramatists.—Grillparzer.—Hebbel.—"Born in a land [Austria] which from time immemorial has cultivated German poetry and song, but which in the march of centuries had become completely estranged from the progress of German thought; reared during a time of political stress, when the foundations of law and morality, of hereditary privileges and acquired rights were crumbling; meeting with many obstacles during the period of his youthful development, yet preserving his own individuality in spite of conflicting influences, the poet [Grillparzer] appeared before the public, at the age of twenty-six, with a work of rare maturity and power, and became at one bound the literary celebrity of his day, both in his native country and the greater German fatherland. . . . Compared with the wealth of his ideas and the extent of his studies, the total of Grillparzer's dramatic achievement appears quantitatively small. But he threw all the power of his genius into every one of his matured plays. He left to the world, aside from his 'Ahnfrau' and 'Das Leben ein Traum,' whose place in literature is still undetermined, ten dramatic works of the first rank—'Sappho,' 'Das goldene Vlies,' 'König Ottokars Glück und Ende,' 'Ein treuer Diener seines Herrn,' 'Des Meeres und der Liebe Wellen,' 'Weh dem, der lugt!', 'Libussa,' 'Esther,' 'Ein Bruderzwist in Habsburg' and 'Die Jüdin von Toledo.' Nothing furnishes more convincing proof

of the intrinsic greatness of all these works than the disagreement of the foremost critics as to which of them is the greatest. . . . Much critical ingenuity has been spent in the attempt to determine the final rank which Grillparzer is destined to occupy among the world's great dramatists. He has been assigned to one literary school and another, and the origin of various modern intellectual movements has been traced to his influence. He has been called the precursor of present-day realism, and characterized as 'the last of the classics and the first of the moderns.' But all his critics, whatever their point of view, have acknowledged the potency of his unique creations, that weave their spell about us, whether groping in dreamy irresolution or leaping into fiery passion. Grillparzer himself, with his sane and clear recognition of his merits, has claimed a place in German literature next to Goethe and Schiller, and posterity has fully ratified this claim. Prof. Jakob Minor, in his address at the centenary of Grillparzer's birth, has truly said: 'German literature possesses no other dramatic poet in whose works there is such complete accord between substance and form, between poetic power and dramatic requirement. No one else has so consistently refused to make the slightest concession to the claims of the stage and the art of the actor.' It was Grillparzer's absolute freedom from scholastic precept and hoary tradition that enabled him to create dramatic types of unsurpassed originality. In the breadth of his poetic horizon, as well as in depth of intellectual vision, he unquestionably ranks, among dramatists, of whatever country, next to Goethe. 'The distinction of a poet,' says Santayana, 'the dignity and humanity of his thought, can be measured by nothing, perhaps, so well as by the diameter of the world in which he lives.' Grillparzer created a vast realm of pure poesy and noble thought, and thither he carries with him spectator and reader—sufficient reward and glory for one who possessed, to borrow Morley's language as applied to Goethe, 'a proud and collected soul, loftily following its own inner aim.'—G. Pollak, *Franz Grillparzer and the Austrian drama*, pp. 30, 435, 439-440.—"Stronger marks of the Young German spirit of revolt are to be found in the works of Friedrich Hebbel (1813-1863), whose activity extends from 1841 to 1862, and is marked by strong dramatic instinct, powerful character drawing, and an intensity of passion that is usually extravagant and often grotesque or gruesome. His earlier works, for instance 'Judith' (1841) and 'Mary Magdalene' (1844), are violently sensational. Characteristic of his maturer talent are 'Agnes Bernauer' (1855), and 'The Niebelungen' (1862), his finest and most inspiring production."—B. W. Wells, *Modern German literature*, p. 389.

1828-1910.—Modern Scandinavian.—Bjerregaard.—Wergeland.—Björnson.—Ibsen. See SCANDINAVIAN LITERATURE: 1814-1900; 1857-1910.

1843-1895.—Adaptations on English stage.—Melodrama.—Gilbert's operettas.—Oscar Wilde.—"The removal in 1843 of a monopoly in the production of legitimate drama granted to Drury Lane and Covent Garden led to . . . a demand for new plays, a demand which was met for nearly forty years by adaptation from the French, an art in which Sydney Grundy, . . . was peculiarly proficient. During this period original English drama ceased to exist."—H. Williams, *Modern English writers*, p. 225.—But, "though adaptation was the rule of the day, it would be false to assume that there was no effort to write English plays. As rapidly as they could do so the dramatists were taking up new ground and occupying it. Out of

these conditions there developed a new group of playwrights, men who found their support in adaptation and as rapidly as possible wrote plays of their own. First of these is Dion Boucicault, . . . the author of two of the best comedies of his time, *London Assurance* (1844) and *Old Heads and Young Hearts* (1844). But the work for which he is chiefly remembered is his Irish drama beginning with *Colleen Bawn* (1860) and including *Arrah-na-Pogue* (1865) and the *Shaugraun* (1875)."—T. H. Dickinson, *Contemporary drama of England*, pp. 39-40.—"In acted comedy T. W. Robertson is commonly noted as the inaugurator of a new drama of real life; and after the reign of borrowed melodrama and farce his plays have, at least, the merit of individuality. . . . The realism of Robertson to his own age appeared absurd; to us it is artificial. . . . Nevertheless in contrast with the drama that went before, Robertson was a true innovator, a simple man who looked sincerely at life and attempted to render the English world he saw. The plays of Robertson were as a prophesying in the wilderness."—S. Jameson, *Modern drama in Europe*, p. 226.—"The delicate machine of the Robertsonian play did not long survive the death of the dramatist who originated it. . . . Dramatists were still timid. The way to fame still led through the dramatized novel and melodrama. Old plays were rewritten; the novels of Fielding, Goldsmith, Scott, Thackeray, and Dickens were dramatized. Melodrama increased in popularity. . . . These melodramas were not entirely vicious. There was a crude truth in them, an insistence upon reality and the social bond. . . . Among the great melodramas were Sims's *The Lights o' London* (1881), Sims's and Pettitt's *The Habour Lights* (1886), Paul Merritt's and Henry Pettitt's great Drury Lane spectacle *The World* (1884), and H. A. Jones's *The Silver King* (1882). In Wilson Barrett's *The Sign of the Cross* (1895) melodrama reached its climax."—T. H. Dickinson, *Contemporary drama of England*, pp. 68-71.

A burlesque of Tennyson's "Princess" which W. S. Gilbert "undertook to treat without 'willful irreverence' was an instant success. . . . Thereafter he wrote all kinds of plays, comedies, farces, melodramas, social dramas, verse tragedies, absurdities, writing under his own name and the pseudonym of F. L. Tomline."—T. H. Dickinson, *Contemporary drama of England*, pp. 68-69, 71, 72, 73.—"Sweethearts," "Tom Cobb," "Broken Hearts," and others followed in quick succession; but were forgotten in the success of the musical comedies in which he collaborated with Arthur Sullivan. The association of the two men began in 1871, and lasted for twenty years. Their first great success "Trial by Jury" (1875), was followed by "H. M. S. Pinafore" (1878), "Pirates of Penzance" (1880), "Patience" (1881), "Iolanthe" (1882), "Mikado" (1885), "Yeoman of the Guard" (1888), and a number of others.

"Wilde set a new example in the writing of comedy, brilliant, paradoxical, self-conscious, for after him it was impossible for any young writer to fall back upon the stereotyped theatrical manner, and, secondly, came the overpowering influence of Ibsen, which is still, if less forcibly, working its will upon English drama. The society drama of Oscar Wilde is the highest of its kind. In technical perfection it surpasses its French models: in subtlety of thought it stands high in modern drama. . . . There must be a secondary drama that demands as little as possible from thought or emotion, while degrading neither. Of this drama Oscar Wilde is the master. Spiritual power there is not in his plays, nor the inspiration that springs from

the triumph of a human soul over tragedy. Reminiscences of Dumas *filis* and Sardou there are, and a wit at times wearisome. But he was the master of an artistic comedy when most playwrights were bungling amateurs in a new style. In beauty of construction, in perfection of dialogue, and in artistic truth his work stands higher than any English drama of the past century. An artist, he never makes use of the tricks of other writers of the secondary drama: indignation, the reform of social evils, psychological discussion. But in easy words, spoken without thought or heart, a phrase, an epigram leaves us peering at the collapse of a social, intellectual, or emotional sham. *An Ideal Husband* [1895] is mechanical in construction. But the people that move between the narrow walls of a play modelled on Sardou have depth of feeling and more than a touch of beauty. . . . [The finest work of Oscar Wilde has an] originality and sanity of thought that places it above any single production of the realist drama of its time. *A Woman of No Importance* [1893] was written in the year of *The Second Mrs. Tanqueray* [Pinerol] and *Mrs. Warren's Profession* [Shaw]. . . . In technique, and in artistic truth, it belongs to another world. . . . The dramatic interest is not in the intrigue. It is in the rise and fall of the personal forces struggling for the soul of Gerald Arbuthnot. Superficially, it is a comedy of good form, played according to all the rules."—S. Jameson, *Modern drama in Europe*, pp. 129, 130, 131.—See also ENGLISH LITERATURE: 1880-1920.

1850-1921.—Modern French.—Origins.—Development.—Playwrights.—"The drama of modern France is not a development of the Romantic movement, still less a reversion to the classical type as it was understood by Ponsard and his School of Good Sense. It owes much to Diderot and the dramatic reformers of the eighteenth century, and more than it is always willing to confess, to Scribe. . . . During the generation that separates the first from the third Napoleon Scribe was without a rival in popular favor. . . . But . . . it must be admitted that Scribe never seeks to rise above the philistine realism of his audience. . . . Yet [he] plays an important part in the evolution of the drama, for he understood the art of the playwright as hardly another has done."—B. J. Wells, *Modern French literature*, pp. 353-354.—Among his best plays must be mentioned "Une chaîne," "La Camaraderie," "Le Verre l'eau" and "Adrienne Lecouvreur." "Since the time of Victor Hugo, France has produced three men whom general consent accords a place above their brethren in the long list of her brilliant modern playwrights. These three, in order of critical esteem, are Augier, Dumas *filis*, and Sardou."—A. L. Konta, *History of French literature*, p. 468.—Sardou's first poetic play, "Le Taverne des étudiants," produced in 1854, was hissed from the stage. Since then he has written more than fifty-five plays, from farce or satire to poetic melodrama. More than one of his plays must be counted failures, but among his best satires are "Rabagas" (1871), "La Famille Benoiton" (1865), "Nos intimes" (1861), "Nos bons villageois" (1866), and "Fernande" (1870). "The younger Dumas (1824-95) was, by intention, a moralist and reformer first of all, and, within the narrow limitations of his choice of subjects, he succeeded in establishing for himself a reputation second only to that of Augier."—*Ibid.*, p. 474.—Among his plays are "La Dame aux camélias" (1849), "Le Fils naturel" (1853), "Le Demi-monde" (1855), "La Supplique d'une femme" (1865), "L'Etrangère" (1876), "Denise" (1885), and "Francillon" (1887). "Where Dumas, despite, or because of, his brilliant

rhetoric, falls short as an ethical teacher, Émile Augier (1820-89) succeeds by virtue of his larger outlook, . . . and his happier and more wholesome treatment of social questions. . . . Augier's bid for immortality is through the analysis and exposition of character. . . . He . . . became famous when he was but twenty-four years of age; his play, *La Ciguë* (1844), unanimously rejected by the committee of the Théâtre-Français, was triumphantly produced at the Odéon."—*Ibid.*, p. 478.—"Le Mariage d'Olympe" (1855), "Le Gendra de M. Poirier" (1854), "L'Aventurière" (1848), and "Le Fils de Giboyer" (1862), are among his best plays. Maurice Maeterlinck was born in Belgium in 1862, and did not settle in Paris until 1886, but his work may properly be classed with French literature. He is a poet and essayist as well as playwright. His plays include "Monna Vanna," "L'Intruse," "Pelléas et Mélisande," "Joyzelle," and "L'Oiseau bleu" (The Blue Bird). Edmond Rostand, author of "Cyrano de Bergerac," "L'Aiglon," "Chantecler," and other notable plays, was one of the best of France's modern playwrights.

1860-1920.—Recent Italian. See ITALIAN LITERATURE: 1860-1920; 1880-1920; MUSIC: Modern: 1842-1921: Modern Italian school.

1865-1913.—Modern American drama.—Effects of the Civil War.—Chronicle plays.—Later developments.—Realism.—Plays of business and politics.—Psychological plays.—"The period of the American Civil War has been compared, with regard to its effect upon the native drama, to the period in which England was permeated with a strong sense of national pride aroused by the victories of Elizabeth's reign. . . . After the Civil War, American audiences began to take kindly to a sort of modern chronicle play, composed of more or less detached episodes of the battlefield and of war-time. And then, with the ultimate passing of the strong feeling which so long survived the war, this loosely built drama disappeared. As in the time of King James, audiences began to insist upon some degree of unity and a carefully constructed plot; they began to demand plays creating their own emotional effect, without extraneous aid. . . . Glancing down the list of playwrights who have flourished in America since the Civil War, one singles out first of all the name of Bronson Howard. The most significant specimen of his dramatic output is *The Henrietta*, perhaps the original of a long line of characteristic American dramas of business. . . . In *Sherandoah*, Howard contributed also one of the earliest of the loosely knit and episodic Civil War plays. The chief continuator in this line has probably been William Gillette. *Held by the Enemy* is a decided advance in the direction of the more compact Civil War play. . . . *Secret Service* . . . is . . . a well built melodrama. . . . In the progress of dramatic technique, however, Mr. Gillette occupies a place among the forerunners of modern visual realism, as substituted for the old-style rhetorical drama. . . . The untimely death, a few years ago, of Clyde Fitch cut short a career marked by great theatrical versatility and photographic power. About sixty-six plays in twenty years comprise his output. . . . Clyde Fitch began his work as a dramatist in 1890 with *Beau Brummel*, which achieved a much-heralded success. . . . [At] first, as in *The Moth and the Flame* and *A Modern Match*, he was for the most part conventional. Beginning with *The Climbers*, however, in 1907, his first nights offered a series of surprises. . . . [Later plays include] *The Girl and the Judge*, . . . *The Girl with the Green Eyes*, . . . *The Stubbornness of Geraldine*, and . . . *The Way of the World*. . . . Before his untimely death, Clyde Fitch said

that *The City* was his best play. It is undoubtedly striking, but it falls short of greatness because of his usual defect—a lack of unity in development as well as in theme. . . . If Bronson Howard inaugurated and Clyde Fitch advanced our one distinct American type of drama, the play of business and politics, it has remained for Charles Klein to lead in the further development of this genre. The American stage early turned realism to journalistic uses. . . . *The Battle* was a journalistic exploitation of the model tenement reform; *The Man of the Hour*, of municipal corruption; *The Dawn of a To-morrow*, of optimism as a panacea; *The Easiest Way*, of the social evil; *The Third Degree*, of modern police torture for confessions often false; *The Lion and the Mouse*, of the ruthlessness of 'big business.' . . . George H. Broadhurst is another writer who has contributed to the drama of business and politics, at least in *The Man of the Hour*. . . . Augustus Thomas . . . first became a definite figure in the world of the theatre through the writing of such racy and atmospheric melodramas as *Alabama* and *Arizona*. . . . Of late years Mr. Thomas has turned his attention to the expounding of a philosophy, which appears to be a mixture of determined modern optimism and the equally modern scientific treatment of unplumbed mental phenomena formerly classed as occult. In *The Witching Hour*, for instance, we have an exploitation of thought as a dynamic force partaking of the nature of action. In *The Harvest Moon* the theme is, similarly, the suggestive influence of environment upon character. Because of this singleness of theme, both of these plays are technically superior to *As a Man Thinks*, which loses effectiveness by not concentrating upon one idea. . . . In *Arizona* Mr. Thomas contributed an important item to that long list of Western plays, chiefly melodramas, originating in the frontier romances of Bret Harte. *The Heir to the Hoarah*, *Salomy Jane*, and *The Girl of the Golden West* are easily remembered titles in this group. Doubtless the most important of these cowboy and mining-camp stories is the late William Vaughn Moody's *The Great Divide*. Indeed, this . . . was for a time hailed as that nebulous desideratum, the 'great American drama.' . . . It is to be regretted that, in his second play, *The Faith Healer*, Moody relapsed into the non-objective. . . . It is 'literary,' a notable example of poetic prose, essentially a closet drama. Another American writer whose gift of style overshadows his dramatic power is . . . Percy Mackaye. In *Jeanne d'Arc*, *Fenris the Wolf*, *The Canterbury Pilgrims*, *Mater*, *Anti-Matrimony*, *The Scarecrow*, and *To-morrow* he has produced a series of plays either frankly in verse or in highly ornamented prose, all of them delightful to read and all strangely lacking in effectiveness for the stage. . . . Very different from the author of *To-morrow* are Messrs. Edward Sheldon and Eugene Walter, who stand among our leading continuators of the ultra-realistic tradition founded by the late James A. Herne. He, it will be recalled, blended humor and pathos, somewhat after the manner of . . . James Whitcomb Riley, in a series of repressed and homely dramas of rural naturalism, including *Hearts of Oak*, *Shore Acres*, *Sag Harbor*, and *Margaret Fleming*. The aim of this noteworthy pioneer was, of course, the exact reproduction of the particular. . . . [Eugene] Walter is known chiefly for his three successful plays, *Paid in Full*, *The Easiest Way*, and *Fine Feathers*. . . . Of like attainments in the realm of the realistic, but of considerably more uneven performance, is . . . Edward Sheldon. His first play, *Salvation Nell*, revealed his close observation and his sense of fact. . . . In

The Nigger, perhaps the most pretentious of this writer's works, we have the material for essential tragedy, offered first in the form of crude melodrama and later dwindling into platitudinous and anti-climactic talk. . . . In *The Boss* the tendency to utilize hackneyed situation and insufficiently motivated incidents becomes yet more marked. . . . It is pleasant to note, in this connection, that, with . . . *A Man's Friends*, . . . Ernest Poole has achieved a treatment of the modern political boss that is sincere and genuine throughout. . . . Fortunately for all concerned, . . . [Sheldon] has more recently produced, as his third offering of a single season, a much more acceptable play, bearing the significant title, *Romance*. . . . No discussion of our recent realistic drama would be complete without reference to . . . Charles Kenyon's three-act play of life in the slums, produced with Miss Margaret Illington in the leading part, under the title of *Kindling*. Here is a drama of unquestioned power and sincerity, as it is of distinctly unpleasant subject-matter. . . . It will be seen that the achievements of the American theatre thus far noted are principally in the direction of that most facile of the dramatic categories, the realistic melodrama. Everywhere the quest is for novelty, for striking situations, for that natural son of 'yellow journalism,' the 'punch,' and for mere slavish photography. Perhaps, after all, the most typical exponent of such national drama as America thus far boasts is . . . David Belasco. This 'wizard of the stage' triumphs through an actual subordination of the dramatic to the merely pictorial, and so is always laboring to establish a false standard of art. Naturally, he is the playwright of the ephemeral. He attains his 'effects' through a most sedulous attention to details. . . . Certain it is that the more important forms of the drama, such for instance as comedy of manners, have rarely attained distinction in the hands of American playwrights. Clyde Fitch, in the midst of much theatricism, contrived his occasional thumbnail sketches; and a few other writers, notably Messrs. Langdon Mitchell and George Ade, have added further portraiture of types to our gallery of comedy. Mr. Ade's *The College Widow* and *The County Chairman* certainly present a collection of easily-recognized small-town denizens. . . . In *The New York Idea*, Mr. Langdon Mitchell has drawn some highly amusing and familiar types of a frivolous 'society,' participating in a frothy satirical comedy. . . . In *The Man from Home*, Booth Tarkington and Harry Leon Wilson make a notable contribution to what Mr. Walter Pritchard Eaton felicitously denominates 'the American comedy of bad manners.' . . . Other Americans of to-day [written in 1913] whose work deserves mention, at least for its promise, are Rachel Crothers, George M. Cohan, Thompson Buchanan, Winchell Smith, Marion Fairfax, Richard Walton Tully, Edward Knoblauch [Knoblock], and Edward Locke. None of them has blazed any especially new trail, however, or even made any extraordinary contribution to that distinctly modern type of drama which is ultra-realistic as to details and facts and usually ultra-conventional and unreal as to fundamental veracity."—C. Andrews, *Drama to-day*, pp. 62, 64-68, 70, 72, 75-76, 78-79, 83-85, 89, 91-92, 94-95, 98-100, 102.

1871-1921.—Early years of the German Empire.—Sudermann and Hauptmann.—"As for the drama, the first fifteen years of the new empire brought forth little that now seems particularly noteworthy. Most important, perhaps, was the early work of Ernst von Wildenbruch"—C. Thomas, *History of German literature*, p. 382.—"In

the last decade of the century two men rose to prominence between whom it was long hard to accord the verdict of pre-eminence, Gerhardt Hauptmann and Hermann Sudermann. The latter was first to command a place for uncompromising naturalism on the German stage by his 'Honor' (1890) and 'Sodom's End' (1891). These achieved sensational success, while Hauptmann's 'Weavers' of 1892 left both public and critics more perplexed than satisfied. That there was a strange power here was obvious, but whether it was the herald of a new school or of dramatic anarchy was not immediately clear. . . . Sudermann, however, was the first to win more than sensational recognition for this new dramatic art. This he did by 'Home' (1893), better known to American theatre-goers as 'Magda.' This, like the two preceding dramas, deals earnestly yet serenely with the soul-destroying or soul-numbing effect of social conventions, whether of honor or duty. . . . This is the crown of Sudermann's dramatic achievement. . . . Instead of social satire and militant democratic protest we have in 'Morturi' (1896) an attempt to depict the feelings that would be produced by the certainty of impending death on men in varying stages of civilization from Gothic Rome to Modern Germany. 'Love in a Groove' (Das Glück im Winkel, 1896) also represents a moral rather than a social problem, as 'The Butterflies' War' of 1895 had already done. These plays mark a period of pause. They transpose the theme of 'Honor' and 'Home' into a minor key, and seem to make a perfunctory concession to the prejudices of the public by the reconciliation of protest with convention at the close. . . . Sudermann's latest development has been rather in the direction of the Symbolists. 'The Three Heron's Feathers' of 1899 and 'St. John's Eve' (Johannisfeuer, 1900) are much more suggestive of Maeterlinck's 'Tintagilis' or 'Pelleas' than they are of 'Home' or even of 'Honor.' The same instability, or, if one will, the same evolution, may be watched in the dramas of Gerhardt Hauptmann (b. 1862), who is probably the writer of greatest originality and promise now living in Germany. . . . With 'Lonely Lives' (1891) Hauptmann's originality begins to assert itself on what may be called realistic psychologic lines, and he begins also to be master of his tools in technic, though a most unconventional one. . . . 'The Weavers' (1892), Hauptmann's first sensational success, [is] technically less well constructed than 'Lonely Lives,' but superb in its suggestion of psychic mass in the struggle and defeat of Silesian operatives on strike. . . . With 'Hannele' of 1893 we part company with realism for a topsy-turvy idealism and psychologic experimenting in what the author calls a dream poem. This is Hauptmann's most unique and most pathetic creation, but ultra-unconventional as a drama. . . . His protean genius gives us a fairy drama, 'The Sunken Bell' (1897), in which there is the first strong touch of Symbolism, a reversion to romanticism such as we have just observed at the same date in Sudermann. . . . But there is no steadiness of development in this direction, either, for 'Driver Henschel' is an artistic reproduction of a prose sketch written in 1887. . . . Hauptmann begins by being democratically realistic; but the poet in him has gradually overcome the socialist, or rather it has transformed the materialist into an idealist, and the prophet of protest into the poet of social altruism. From this point of view 'Driver Henschel' is his masterpiece, firm in its naturalistic grasp, but tempered by spiritual restraint that comes from moral intuitions. Hauptmann has given here to the German working class the highest artistic expression of their own

weakness and of others' selfish strength. He has made himself the poet of the poor, the downtrodden, the lonely, the helpless, the perplexed, even the vicious."—B. W. Wells, *Modern German literature*, pp. 417-421.—See also GERMAN LITERATURE: 1900-1922.

1888-1921.—Problem play.—Shaw and Ibsen.—Close of the scholastic method.—Renaissance of English drama.—Influence of Russian drama.—New ideas in stage setting.—With 'The Magistrate,' 'The Schoolmistress,' and 'Dandy Dick'—all farces, . . . [Arthur Wing Pinero] attracted considerable attention, while 'Sweet Lavender' (1888), . . . brought him fame. Beginning with 'The Profligate' (1889), Pinero opened a period of great fecundity: farces, dramas, and comedies succeeded one another for many years, and established standards which were to obtain for over a decade. 'The Second Mrs. Tanqueray' (1893) was . . . considered the finest English play of the time."—B. H. Clark, *British and American drama of to-day*, pp. 3, 4.—"To regard Sir Arthur Pinero as the author of problem plays [as some do] is to do him an injustice. In some of his plays he has embraced, against his will, the attitude of the social philosopher; but his main intent appears to have been the provision of an entertaining drama creditably modelled to the requirements of the stage. . . . If, [however] he is to be regarded as a serious force in English drama he is to be judged by his . . . problem plays [which] rest on unlikely conditions and improbable solutions; and thus their moral significance is lost."—H. Williams, *Modern English writers*, pp. 229, 231.—"When . . . Bernard Shaw was pushing his way to notoriety as a young dramatic critic Shakespeare had long been dead and Ibsen was living, but their fame was in inverse ratio to their distance from the day. Shakespeare for nearly a century had been a fetish, revered by all as much as he was little known save to the few; Ibsen was a foreign writer of scandalous plays. The fame of Shakespeare was, the fame of Ibsen was not. In subservience to principles which had now become a second habit Mr. Shaw ranged himself on the side of Ibsen and began to smite at that huge idol, Shakespeare. . . . [Much] might be said to exhibit the contradictory nature of Mr. Shaw's main contention in the controversy of Shakespeare against Ibsen. The discussion is, however, chiefly valuable as a commentary upon Mr. Bernard Shaw's own plays. In his view Ibsen is great because he writes drama that is intellectual and moral, and Mr. Shaw, his disciple, is great because he writes plays with a moral purpose. . . . Not literary expression, not even characterisation does Mr. Shaw consider the chief thing, but the lesson conveyed by drama. Upon his theory a drama is an acted tract—the lesson the audience carries away is the important matter. . . . And if by morality we understand no more than a congruity with established manners and customs then Mr. Shaw may fitly be described as 'a specialist in immoral and heretical plays.' . . . *Widowers' Houses* was produced by the Independent Theatre in 1892. It is definitely a play with a moral purpose, for it is an indictment of the thousands of worthy and complacent people who live comfortably upon independent incomes without trou-

bling to inquire how those incomes are made. *Widowers' Houses* is a genuine problem play; for it raises a question and does not lay it with any clearly constructed alternative. . . . Mr. Bernard Shaw made a good beginning with this play. The dialogue is incisive, moves rapidly, and carries forward the action of the drama without the involutions and digressions of his later plays. . . . Mr. Shaw's men are better than their wives, sisters and daughters. Julia and Grace, for example, in *The Philanderer* (1893) are fictitious pieces of characterisation. . . . [*Widowers' Houses* and *The Philanderer* together with] *Mrs. Warren's Profession* . . . were printed in volume form as *Plays Unpleasant* together with a companion volume of *Plays Pleasant* (1898). In the volume of *Plays Pleasant* came *Arms and the Man*, produced in 1894, *Candida* (1897), *You Never Can Tell* (1900) and the one-act *Man of Destiny* (1897). The first of these, described by Brandes as 'a masterpiece whether it is considered from the psychological or the purely theoretical point of view,' has proved one of the most successful of Mr. Shaw's plays upon the stage, though it can scarcely be ranked with his more important compositions. . . . *Man and Superman* (1905) is his longest and most philosophical play. It resolves itself largely into talk which cannot be rendered effectively on the stage. . . . From this date forward the plays tend to fall into one of two classes—plays of satirical dialogue without action or plays of undisguised buffoonery sharpened with wit. In the former class may be placed *John Bull's Other Island* (1904), which satirises English misconception of Ireland and, in consequence, the English character, than which nothing is more ridiculous in Mr. Shaw's eyes, *Major Barbara* (1905), which attacks conventional systems of charity, *The Doctor's Dilemma* (1906), a vigorous satire upon the medical profession, *The Shewing-up of Blanco Posnet* (1909), 'a religious tract in dramatic form,' which met with the ban of the censor, and *Getting Married* (1908), which explains its theme in its title, . . . a comedy upon the . . . character of marriage. . . . In the second class fall *Fanny's First Play* (1911), an amusing play in lighter mood with an induction and epilogue in which dramatic critics are satirised, *Pygmalion* (1914), which is excellent farce, and *Great Catherine* (1913) in which once more the Englishman is satirised with undiluted buffoonery. . . . Of the sincerity and purposefulness of Mr. Bernard Shaw's writing there can be no manner of doubt. He has finally won his place because he is sincere and has a constructive message to deliver. Nobody who has strong convictions can hide his light under a bushel; and Mr. Shaw has powerful convictions and no passion for self-effacement."—H. Williams, *Modern English writers*, pp. 240, 241, 245, 246.—"A dignified product of the free theatre, a man who benefited from it in a certain solidity and finish of his plays, yet still failed of absolute achievement was St. John Hankin (1860-1909). Hankin . . . takes the substance of the realistic and didactic play of social groups and treats it by a method derived from a study of comedy of manners. He desired to be heard as a comedian, but he lacked the nonchalance of true comedy. He was a studious Oscar Wilde. . . . One wonders at the adequacy of his plays without admiring them. They have wit but no comedy flavor. They tell stories of ladies and gentlemen whom we respect without desiring to meet. Perhaps no writer of the time has left so little a trace of himself in his plays. In *The Two Mr. Wetherbys*, *The Charity that Began at Home*, *The Last of the DeMullins*, *The Cassilis Engagement*, we see

the scholastic method of playwrighting reaching its conclusion. Hankin's comedies . . . are wary. They hang upon none of the illusions. The characters are genteel, of good breeding, emancipated or so near it that they can handle the vocabulary of the enfranchised. One finds himself wishing that some of the new illusions of sophistication might be exchanged for some of the older illusions. There are two things only that can vitalize a work of art, a faith, or a cause. The first works constructively. The second works destructively. But in the dry zone beyond belief and enthusiasm art cannot dwell. What has been said for Hankin may also apply to Stanley Houghton (1881-1914), . . . little more than a competent workman. Houghton is a Hankin without comedy. . . . His work lacks the refinements of manners. *Hindle Wakes* organizes the 'new morality,' or unmorality, into a technical code. The right to joy is no longer a burning issue. It is a presumption. . . . [The play] is well done in that it is laconic and commonplace. But it is a perfect example of the 'little play.' It is neither ugly nor beautiful."—T. H. Dickinson, *Contemporary drama of England*, pp. 219, 220, 221.—"Masefield's principal contributions to modern literature are his vigorous and original narrative poems. . . . In his play, 'The Tragedy of Nan,' 'Nan' comes as near to true tragedy as any English play of recent years [written in 1915]. It is a play of remarkable power and beauty as regards conception and style; it is the work of a true poet. The author's belief that tragedy should be a vision of the heart of life is borne out in 'Nan' with pitiless cruelty. . . . 'Philip the King' and 'The Tragedy of Pompey the Great' have only a relative stage value, although they are full of striking lines, good scenes, and vigorous poetic passages."—B. H. Clark, *British and American drama of to-day*, pp. 140-141.—"Stephen Phillips (1868-1915) . . . made himself the most discussed poet in England by the publication in 1898 of 'Poems' . . . [which were followed in 1900 by *Paolo and Francesca*, a literary drama]. In book form the play won an immense success. Before *Paolo and Francesca* was produced Beerbohm Tree had produced the poet's *Herod* (1900). Thereafter Tree produced *Ulysses* (1902), *Nero* (1906), and *Faust* (1908), written with J. Comyns Carr. *Paolo and Francesca* was produced by George Alexander (1901). . . . Whatever may be said of Phillips, he must be granted two qualities: a true lyrical imagination and a command of the mechanics of the stage. But these did not make him a great dramatist. The two gifts seemed in fact to check each other. His most successful play was *Paolo and Francesca*, for in this his art was most flexible. . . . [But not even this,] which had some of the traits of the Elizabethan play, was as successful on the stage as it had been in the book."—T. H. Dickinson, *Contemporary drama of England*, pp. 151-153.—"We cannot but suspect that subconsciously the knowledge of a want of poetry has coloured . . . [John] Galsworthy's views upon the future of English drama (Some Platitudes Concerning Drama,' *Fortnightly Review*, December, 1909). It will probably, he prophesies, flow down two main channels 'situate far apart.' The one channel will be that of naturalism 'faithful to the seething and multiple life around us,' drama such as some are inclined to term 'photographic,' the other a poetic drama 'incarnating through its fantasy and symbolism all the deeper aspirations, yearnings, doubts and mysterious strivings of the human spirit.' . . . But, says Mr. Galsworthy, 'between these two forms there must be no crude unions; they are too far apart, the cross

would be too violent.' Here Mr. Galsworthy is speaking for himself and not for the possible drama. . . . For Mr. Galsworthy in person naturalistic and poetic prose-drama are 'situate far apart'; he is not only incapable of welding them, he can only write realistic drama. The poetry of *The Little Dream* (1911) fails, and that play of fancy, *The Pigeon* (1912) is ineffective dramatically and tedious as a morality. Poetry is not impartial and judicial; Mr. Galsworthy is by nature cold, impartial, judicial. He can present on the stage the clash of character with character, the war of the classes, the struggle of the poor and the rich, and he never depresses the beam of justice with his own finger. As a dramatist he is noteworthy, but he is never the great artist, for he is never lost to himself. . . . The importance of Mr. Galsworthy's work in modern drama does not lie in its artistic power, but in its moral implication and the ethical force of the author. That "The Moral" is the keynote of all drama' is the chief article of his faith. . . . In *The Silver Box* (1906), *Strife* (1909) and *Justice* (1910), conscious as we are that Mr. Galsworthy is a thinker with definite views of his own, these views are only apparent as they are shadowed forth by a presentation of life that is cold and impartial. . . . With Mr. Bernard Shaw Mr. Galsworthy is, then, the writer of plays with a moral, the author of tendency dramas. But unlike Mr. Shaw he makes no bid for popularity. Mr. Shaw must bask himself in the sunshine of applause or the atmosphere of execration; Mr. Galsworthy can pursue his own path. . . . [But, he] hardly makes us laugh, not only because he is wanting in humour, but because he is always a little strident and harsh."—H. Williams, *Modern English writers*, pp. 254-256.

"To Henry Arthur Jones, more than to any other single force, is due that Renaissance and 'uplift'—let the term be accepted in its best sense—of the contemporary English drama. Jones carries on the tradition of Congreve and Sheridan in high comedy. His best work, with the exception of 'Michael and His Lost Angel,' consists of comedies of manners. 'The Liars,' 'The Case of Rebellious Susan,' and 'Dolly Reforming Herself,' satires on contemporary society, are among the finest character plays of the day. Jones's work is characterized by close observation of the foibles of the upper classes and the aristocracy of England; a keen sense of humor—as opposed to the cleverness and wit of Wilde and Pinero—which brings him much closer to the English Restoration dramatists than any other of his day; and a keen sense of dramatic construction. Jones has written many comedies, but his melodramas—especially 'The Silver King' and 'The Middleman'—and his tragic play, 'Michael and His Lost Angel'—must be taken into account in any estimate of the dramatist's total output."—B. H. Clark, *British and American drama of to-day*, pp. 29, 30.—"Barrie is not a Romantic. . . . His work eludes definition as does the work of all men who are masters of their art. There is nothing like it in the whole of modern drama, and though to be unique is not to be great . . . few will be found to withhold from . . . Barrie any honouring word. Yet is 'great' an epithet of too little humanity for his whimsical and tender art? . . . The drama of J. M. Barrie has other qualities than those of grace and loving kindness, and other arts than the wizardry that sets men's thoughts wandering in forgotten places and their eyes searching for forgotten dreams. There is pity, infinite pity, and . . . infinite courage, defying suffering and age and death itself. Pity and courage alike have a fine, keen edge.

There is nothing sentimental in the mind that called them out, giving them life and form—the form, maybe, of an awkward boy, or a 'queer old divert' of a charwoman: it is a shrewd mind, quick to see the absurdity of our unconscious posturings even while it smiles at them. And if the true artist is he who makes life finer and nobler than it is, then is the author of *Quality Street* and *The Old Lady Shows her Medals* indubitably an artist, touching life with gentle fingers, making it braver, and sweeter to our lips."—S. Jameson, *Modern drama in Europe*, p. 211.

"Barrie has excelled all of . . . [the users of the child medium in art] in *Peter Pan*, the boy who wouldn't grow up. He 'has stripped off from himself the last flimsy remnants of a pretense to maturity.' *Peter Pan* is the supreme achievement in imagination of the modern English theatre. . . . The tendency toward fantasy found in Barrie has been taken up by other writers. It was supported in England by a neo-romantic tendency in the theatre of Europe. . . . The reaction from real things is expressed partly in return to a playful treatment of old formulas. Old stories are told with a new flavor, written either in playful verse or in flexible prose. Imagination was further freed by the coming of Oriental motives. Japan had been an influence in English art since 1880. In 1903 a Japanese company played in London. The influence of the Russian Ballet, of Max Reinhardt's productions in Berlin, brought an interest in the more garish coloring and more elemental themes of Persia and Arabia. New systems of staging and production based upon the ideas of Gordon Craig, of Bakst, of Reinhardt, began to arrive. There developed a new artist of the stage, the Decorator, more than the maker of sets and perspectives, the creator of *inscenierung*. . . . About 1911 the vogue of the picturesque and sensational began on the English stage . . . [and] awoke England to new ideas of stage beauty. . . . They began to exert an immediate influence on playwrights. Galsworthy writes *The Pigeon* and *The Little Dream*; Shaw writes *Fanny's First Play* and *Androcles and the Lion*, Masefield writes *The Faithful* on a Japanese theme. Other dramatists appear who have had no connection with the older movements of realism. . . . Edward Knoblauch's *The Cottage in the Air* (1909), a flimsy bit, and his next play, *Kismet*, a riot of sensation, both belong to England though the author was born an American. In Lord Dunsany's *The Gods of the Mountain* and other plays we are transplanted to a no-man's land of imagination. The man who had been responsible for this change in stage theory, or at least its prophet, was Gordon Craig. After fifteen years of public endeavor Craig's work is still 'a challenge of the future.' Enough of his ideas have already been accepted to show how vital they were, how instinct with creation under their destructiveness. . . . Craig has designed productions for several of Shakespeare's plays, only a few of which he has been able to render. His chief work has been done at his school in Florence, Italy, and through the columns of his magazine *The Mask*. With Craig our study of the modern English theatre ends on a note of speculation not unmingled with promise. Since 1914 the theatre of England has been standing still awaiting the turn of events."—T. H. Dickinson, *Contemporary drama of England*, pp. 233, 235-237, 240.—See also ENGLISH LITERATURE: 1880-1920.

1892-1921.—Irish theater.—"Through his poetry the Celtic spirit moves like a fresh wind," says H. S. Krans, in his 'William Butler Yeats,' Yeats brought to the theater great poetic gifts,

he went far to arouse interest in the past glory of his country; as propagandist, as manager, as lecturer, he has done more than any other, with the possible exception of Lady Gregory, to create a new and living art for Ireland, but he cannot be accounted a great dramatist. His vision is too limited, his genius too delicate, his temperament too subjective, to allow him to stand aloof and let his characters work out their destiny as human beings. . . . Yet his plays deserve consideration, as they are attempts at a new style of drama, not as to form but as to treatment of subject-matter, and literary style. . . . There is a mystical atmosphere in 'The Countess Cathleen' [1892] which is comparable with the earlier plays of Maeterlinck. . . . 'Kathleen ni Houlihan,' [1902] a prose play . . . is eminently effective on the stage."—B. H. Clark, *British and American drama of today*, pp. 181, 182, 185, 187.—"Among the other writers for the Abbey Theatre stage should be mentioned, at least, Lady Augusta Gregory . . . [J. M. Synge] and St. John G. Ervine. Lady Gregory has written many pleasant folk-tale comedies in a charmingly simple and racy idiom. In *Hyacinth Halcyon*, for example, we are introduced to the pompous talk and the laughable scheming of a simple and obscure people. . . . *Mixed Marriage*, by St. John G. Ervine, proposes the difficult problem of Protestant and Catholic national and matrimonial unions. The Catholic heroine's death alone brings the drama to a solution. In *The Magnanimous Lover* this writer has made his contribution to the growing list of latter-day denials that marriage is a complete reparation to a wronged girl. . . . In all the leading work of the Irish playwrights, simplicity and veracity lend the principal distinction to plays most skilfully adapted to the theatre. These authors, like the actors that have interpreted them, have sought for their material and their effects, not on the stage, but in life. . . . The lesson of their achievements is plain to all followers of the dramatic art."—C. Andrews, *Drama to-day*, pp. 164, 165, 167-168.—"The drama of J. M. Synge is the Irish Literary Theatre's justification of its existence, as it is that of Mr. Yeats, that he set Synge to writing pleasant plays. Before all things an artist, Synge understood that the language of the common folk is not the language of fine drama. Therefore, he gave to his plays the charm of a distinctive speech, the speech of the Irish peasant. . . . In so much as grace and poetry are inherent in the speech of these peasants, Synge's drama gains in charm. To that highest power, the power of high thought expressed in a language which, though general, is yet given nobility and beauty, it can lay no claim. Nevertheless it has a quality of sweetness, and at times, as in *Deirdre of the Sorrows*, the very speakers seem not people but passing sounds of music. . . . Synge's place among modern dramatists, though high, must necessarily be as far apart from the greatest as from the mediocre. He is an artist of uncommon quality, but he left too little to form a judgment of his real strength."—S. Jameson, *Modern drama in Europe*, pp. 213, 215.—"The dramatic movement in Ireland began as an attempt to produce literary plays; it brought forth poetic tragedy, intellectual drama, and realistic satire of contemporary life. Then, with Yeats as the dominating spirit, it was hoped that a school of writers . . . would arise and create a folk-drama, and poetic plays founded upon legendary lore. With the coming of J. M. Synge . . . realism took the place of romance . . . [and in his plays met its fullest development]. The newer playwrights have concentrated their atten-

tion upon the life of today. . . . The tradition of 'Celticism' has wholly disappeared from contemporary drama. . . . [But] it may be questioned whether the fate-burdened, tragic peasant of the plays of today is more true to the life of Ireland as it is actually being lived, than was the stage life of Boucicault and his school, or the visionary dreamer of the earlier works of Yeats and A. E. [G. W. Russell]. Almost the only followers of Yeats of any importance have been Lady Gregory, whose historical plays are not especially valuable as literature, nor powerful as drama, and William Sharp, whose plays remain unproduced. . . . The newer playwrights . . . [have turned] from art to life, and by doing so have laid the foundations of their art upon a firmer soil."—L. R. Morris, *Celtic dawn*, pp. 168, 169, 170.

20th century.—*Influence of Ibsen*.—Three strains in modern drama.—"In the final decade of the [nineteenth] century there was abundant evidence that the drama was rising rapidly in the esteem of thoughtful men and women. This higher repute was due in part, of course, to the respectful attention which was compelled by the weight and might of Ibsen's plays. It was due also to the efforts of younger dramatists in the various languages to grapple resolutely with the problems of life and to deal honestly with the facts of existence. Verga and Sudermann, Pinero and Echegaray, are names to be neglected by no one who wishes to understand the trend of modern thought. At the end of the century the drama might still be inferior to prose-fiction in English and in Spanish; but it was probably superior in German and in Italian. The theater was even beginning again to attract the poets; and Hauptmann and Rostand, D'Annunzio and Phillips, having mastered the methods of the modern stage, and having ascertained its limitations and its possibilities, proved that there need be no more talk of a divorce between poetry and the drama. When the last year of the century drew to an end, the outlook for the drama was strangely unlike that of a quarter-century earlier. Except in France, there was everywhere evidence of reinvigoration; and even in France there were not lacking playwrights of promise, like Hervieu. Perhaps everywhere, except in Norway, it was promise rather than final performance which characterized the drama; and yet the actual performance of not a few of the dramatists of the half-dozen modern languages was already worthy of the most serious criticism."—B. Matthews, *Development of the drama*, pp. 323-324.—"The recent drift toward the drama of ideas, so largely determined by Ibsen, may be accounted for by the pre-occupation of the time with matters scientific and humanitarian."—F. W. Chandler, *Aspects of modern drama*, p. 2.—"From the doctrine of evolution, Ibsen imports into the drama a new unit idea: the idea that the individual is the creature of the historical moment, of social environment, of physical heredity. We shall acquire no true comprehension of the dramatic art of our own time if we do not take into account these three persistent streams of tendency in contemporary thinking. The phenomenon of cosmopolitanism, first and foremost, confronts one upon every turn. . . . Beneath the pressure of social and humanitarian ideals, the literature of today has become surcharged with intention. The man of letters, turned publicist, has become animated by a spirit of service in behalf of society, of the present and of the future. . . . The philosophy, the social philosophy, in the brain of the modern dramatist has assuredly 'broken forth in their writings.' And to-day we confront an epoch

in art devoted to the task of holding up the mirror to society, exposing social abuse, and inspiring efforts toward the improvement of the existent social order."—A. Henderson, *Changing drama*, pp. 19-23.—"We catch a glimpse of one of the most striking characteristics of the modern theater,—its extraordinary cosmopolitanism which made possible the performance of 'Cyrano de Bergerac' and of the 'Doll's House' in every quarter of the globe. Not only can we find French and German plays acted frequently in New York, but we are glad to record that the English-speaking stage was again exporting its products, and that Mr. Bronson Howard's 'Saratoga' was performed in Berlin, Mr. Gillette's 'Secret Service' in Paris, and Mr. Piner's 'Second Mrs. Tanqueray' in Rome. Even more noteworthy is the fact that the playgoers of New York had been permitted to see an English play, 'Hamlet,' acted by a French company, a German play, 'Magda,' acted by an Italian company, and a Russian play, the 'Power of Darkness,' acted by a German company. An educated man to-day is more than a native of his own country: he is also a citizen of the world, just as the educated man was in the middle ages when all Europe was governed by the Church of Rome and by the Holy Roman Empire, and when all men of learning wrote in Latin and studied the same Roman law. . . . In the middle ages the drama was almost the same everywhere; and a French mystery was always very like an English mystery, just as an Italian sacred-representation was very similar to a Spanish sacramental-act. So at the beginning of the twentieth century the forms of the drama are almost identical throughout the civilized world. In structure there is little difference nowadays between an English play and a Spanish,—far less than there was when John Webster and Lope de Vega were almost simultaneously putting upon the stage the pitiful story of the sad Duchess of Malfi. . . . This elimination from our latter-day stage-plays of all the non-dramatic elements which are so abundant in the earlier periods of the drama has been accompanied, and indeed greatly aided, by certain striking changes in the physical conditions of performance, and, more especially, in the shape and size and circumstances of the theater itself. The modern playhouse is as unlike as possible, not only to the spacious Theater of Dionysus in Athens, with its many thousand spectators seated along the curving hillside, but also to the Globe Theater and its contemporary rivals in London and in Madrid, which were only unroofed court-yards."—B. Matthews, *Development of the drama*, pp. 326-328, 333-334.—See also RECREATION; THEATER.

DRANG NACH OSTEN (pressure to the East), the theory and practice of German and Austro-Hungarian expansion toward Saloniki; ended by the World War. "The strength of the Triple Alliance lay in the common interests that bound Germany and Austria. The latter, driven from Italy by Sardinia and from Germany by Prussia, sought to find compensation by expanding in the Balkans. A policy, known as the *Drang nach osten* . . . was inaugurated by Austria, with the object of getting a port on the Ægean Sea. In the way were Serbia and Montenegro, who could count on the assistance of Russia to oppose the extension of Austrian influence among the Slav states of the peninsula; hence Austria leaned heavily on Germany without whose backing she could make no headway in the *Drang nach osten*. Germany at first entered the alliance primarily as a protection against a war of revenge by France; but later, when she embarked in a vigorous policy in the Near East, she found Austria's assistance of great value to her."—J. S. Schapiro, *Modern and contemporary Europe*, p. 685.—This was the policy which led to the annexation by Austria of Bosnia and Herzegovina, to the "peaceful penetration" by Germany of Asiatic Turkey, and to the construction of the Bagdad railway, which was designed to lead to a like peaceful penetration of the rich commercial field in Persia.—See also BOSPORUS: 1878-1914; GERMANY: 1890-1914; Alteration of foreign policy.

DRAVIDIAN RACES.—"When the Brahmans succeeded in making their way into the kingdoms of the peninsula, including the realms of the Andhras, Cheras, Cholas, and Pandyas, they found a civilized society, not merely a collection of rude barbarian tribes. The Dravidian religion and social customs differed widely from those of northern India. Caste was unknown, as it now is in Burma, and the religion is described as demon-worship. The original demons have since been adopted by the Brahmans, given new names, and identified with orthodox Hindu gods and goddesses. The Hindu theory that mankind is divided into four *varnas*, or groups of castes—Brahman, Kshatriya, Vaisya, and Südra—was wholly foreign to the southerners. To this day Kshatriyas and Vaisyas do not exist among them. The laws of marriage and inheritance also differed completely from those of the Brahmans. Even now, when Hinduism, with its strict caste rules and its recognized system of law, has gained the mastery, the old and quite different Dravidian ideas may be traced in a thousand directions. The ancient Dravidian alphabet called Vatteluttu, of Semitic origin, is wholly distinct from any of the northern alphabets. Tradition as recorded in the ancient Tamil literature indicates that from very remote times wealthy cities existed in the south and that many of the refinements and luxuries of life were in common use. The good fortune of Tamil Land (*Tamilakam*) in possessing such eagerly desired commodities as gold, pearls, conch-shells, pepper, beryls, and choice cotton goods attracted foreign traders from the earliest ages. Commerce supplied the wealth required for life on civilized lines, and the Dravid-

ians were not afraid to cross the seas. Some day, perhaps, the history of Dravidian civilization may be written by a competent scholar skilled in all the lore and languages required for the study of the subject, but at present the literature concerned with it is too fragmentary, defective, and controversial to permit of condensation. Early Indian history, as a whole, cannot be viewed in true adequate treatment. Hitherto most historians of ancient India have written as if the south did not exist."—V. A. Smith, *Oxford history of India*, pp. 14-15.—See also INDIA: People; Languages; PACIFIC OCEAN: People; PHILOLOGY: 16; TURANIAN RACES AND LANGUAGES.

DRESDEN, capital of Saxony, one of the most important commercial and railway centers in Germany, situated a little over 100 miles south of Berlin, on the river Elbe, which divides the old town (Altstadt) from the new town (Neustadt). The palaces, Diet House and the famous Dresden museum are grouped on the left bank of the river, while the government departments are housed in handsome buildings in the Neustadt. The city is noted for its technical and scientific educational institutions. Its chief industries are gold and silver articles, machinery, pianos, paper. The famous Dresden china is made at Meissen, about fifteen miles away. In 1910 Dresden had a population of 529,326. See GERMANY: Map.

1745.—Peace of Dresden. See AUSTRIA: 1744-1745; GERMANY: 1740-1756.

1756.—Capture and occupation by Frederick II. See GERMANY: 1756.

1759-1760.—Capture by the Austrians.—Bombardment by Frederick. See GERMANY: 1759 (July-November); 1760.

1812.—Occupied by Napoleon. See AUSTRIA: 1809-1814.

1813.—Occupied by the Prussians and Russians.—Taken by the French.—Napoleon's entrance.—French reverses. See GERMANY: 1812-1813; 1813 (April-May); 1813 (August-October).

DRESDEN, German cruiser, one of von Spee's squadrons in 1914. After taking part in the battles of Coronel and Falkland islands, she was sunk on March 14, 1915, by the British cruisers *Kent* and *Glasgow*, off the island of Juan Fernandez. It was

alleged that by this act Chilean neutrality was violated.

DRESDEN CONFERENCES (1850-1851). See GERMANY: 1850-1851.

DRESDEN MUSEUMS.—"The capital of Saxony is particularly rich in museums and art galleries. It will long retain the designation of the Cradle of Rococo Art, and as a nursery of Art it must occupy a prominent place. The chief Galleries and Museums are the following: The Picture Gallery, Green Vault, Museum of Plaster Casts, Museum of Armoury, the Museums of Natural History, of Antiquities and of Porcelain. The Green Vault so called from the colour of its walls forms part of the Palace buildings, and contains a valuable collection of curiosities. Here are jewels, trinkets, and other small works of art, such as bronzes, enamels, vessels of gold, silver, and crystal. The Museum, completed in 1854, is a good example of modern architecture. The original foundation dates back to 1711-22, but it was left unfinished for more than a century. The Museum proper forms the north-east wing of the Zwinger. The Picture Gallery, engravings, drawings, and one room of casts are situated in the Museum, and the Zoological, Mineralogical Museums, and the casts are in the Zwinger. The Picture Gallery ranks with the Louvre. . . . The golden period of Italian Art is, perhaps, the best represented, and the Venetian Masters rank next. The collection of engravings, comprising some 350,000 plates, from the fifteenth century down to the present time, is probably the largest extant. . . . The Museum Johanneum, or Historical Museum, is well deserving of note. Here are weapons, armour, domestic chattels, costumes, and other objects, of historical and artistic value."—J. Greenwood, *Museums and art galleries*, pp. 323-324.

DRESDENER BANK.—"The Dresdener Bank, which was founded in 1872 to take over the private banking business of Michael Kasbel, has developed into one of the largest banks in Germany. The Berlin branch, opened in 1881, eventually became the head office of the institution, and Dresden receded to a secondary position. In pursuance of the policy of banking amalgamation which characterized Germany, as well as Great Britain, during the war years, the Dresdener Bank absorbed the Rheinisch-Westfälische Disconto-Gesellschaft of Aachen and the Maerkische Bank in 1917. By the first named . . . it gained a large control over the business obtainable from the Rhineland and Westphalia. In 1918 the Doebelner Bank, with a share capital of 2,500,000 marks, was taken over. More recently the banking firm of A. Hilger, at Duisburg, was acquired. A branch has been opened at Bucarest, where, however, unsettled political conditions have not proved favourable. The Amsterdam agency of Proehl and Gutmann has been reorganised as a subsidiary partnership-company. Throughout Germany the establishment of branches has continued, and probably will continue while inflationary conditions favour a policy of expansion. The Bank is also interested in the German-South-American Bank and the Deutsche Orientsbank. The London branch has not yet been completely liquidated. The original capital of the Dresdener Bank was 9,600,000 marks. Expanding with the development of business and the absorptions of other enterprises, it had risen to 130 million marks in 1899 and to 200 millions in 1910. At the close of 1920 the paid-up capital stood at 260 million, but during the current year, in view of the further depreciation of the mark, it was raised to 350 million. The currency inflation which occurred in Germany during 1920 resulted,

of course, in an increased nominal prosperity for the banks. During that year the total turnover on one side of the accounts amounted, for the Dresdener Bank, to 1,000 milliard marks, as against 400 milliard in 1919. The number of accounts rose from 427,850 in 1919 to 499,843 at the end of 1920; and with the greater volume of business the number of employees increased from 9,810 to 12,681. Increased commission charges adopted by the German Bankers' Association were in force during the whole of last year, and, as a result of this and the higher turnover, the gross profits, at 421,756,983 marks, were more than three times those of the previous twelvemonth. Despite augmented salaries and other expenses the net profits were also about treble those of 1919. A dividend of 12½ per cent was paid, as compared with nine per cent for the preceding year. The balance-sheet figures over recent years indicate an enormous nominal increase in business, but the concurrent scaling down of the value of the mark invalidates comparison. An increase of the capital to 550 million marks is proposed."—*The Statist*, Dec. 10, 1921, pp. 982, 984.—See also MONEY AND BANKING: Modern: 1871-1914.

DRESS. See COSTUME.

DREUX, Battles of (1562 and 1590). See FRANCE: 1560-1563; 1589-1590.

DREUX-BREZÉ, Henri Evrard, Marquis de (1762-1829), grand master of ceremonies under Louis XVI. See FRANCE: 1789 (June).

DREXEL, Anthony Joseph (1826-1893), American banker and philanthropist. See CAPITALISM: 19th century: United States; GIFTS AND BEQUESTS.

DREYFUS, Alfred (1859-), French artillery officer of Jewish birth, a native of Alsace, who in 1894 was accused of selling military information to the German government; was tried and convicted of treason; degraded and sent to Devil's Island, a penal settlement in French Guiana. Later his innocence was proved, he was reinstated with the rank of major, and decorated as a Chevalier of the Legion of Honor. See FRANCE: 1894-1895; 1894-1906; 1899 (February-June).

DRUIDS, members "of an order [for priesthood] in Celtic Gaul and Britain [and] . . . Ireland, which in pre-Roman and pre-Christian times had charge of religious rites. The subject is most obscure. The early disappearance of the Druids in Gaul and Britain before the advance of Roman civilization and in Ireland before Christianity, so obliterated traces of them that all information is ultimately derived from the classical writers, and from early Irish hagiological works. The name has been falsely connected with the Greek *δρῦς*: an oak; to which the worship in the oak groves gave factitious verisimilitude, but it is really derived from a Celtic root which bears the idea of magical dealing. . . . From the Irish side the *Tripartite Life of St. Patrick*, Adamnan's life of Columba, and a large number of scattered notices, mainly legendary . . . [give the impression] that the Gallic and British druids were an order wielding political power, since they influenced the choice of magistrates; social power, since they decided civil and criminal causes; and religious power, since they controlled sacred rites. They were rich, masterful and despotic. . . . The difference between the druidism of Britain and that of Ireland argues no close, or at least no continuous connection between the two."—G. W. Gilmore, *New Schaff-Herzog religious encyclopedia*, v. 4, pp. 9-10.—To the minimum of knowledge left by the ancient authorities, Welsh writers added a system of druidical philosophy and religious rites which, while it assumed to be a secret inheritance of the bards, was really an invention of modern times.—Pliny, alluding to the Druids' predilection for groves of oak, adds the words: 'ut inde appellati quoque interpretatione Græca possint Druidæ videri.' . . . Had he possessed knowledge enough of the Gaulish language, he would have seen that it supplied an explanation which rendered it needless to have recourse to Greek, namely in the native word 'dru, which we have in 'Drunemeton,' or the sacred Oak-grove, given by Strabo as the name of the place of assembly of the Galatians. In fact, one has, if I am not mistaken, been skeptic with regard to this etymology, not so much on phonological grounds as from failing exactly to see how the oak could have given its name to such a famous organization as the druidic one must be admitted to have been. But the parallels just indicated, as showing the importance of the sacred tree in the worship of Zeus and the gods representing him among nations other than the Greek one, help to throw some light on this point. According to the etymology here alluded to, the Druids would be the priests of the god associated or identified with the oak; that is, as we are told, the god who seemed to those who were familiar with the pagan theology of the Greeks, to stand in the same position in Gaulish theology that Zeus did in the former. This harmonizes thoroughly with all that is known about the Druids."—J. Rhys, Hibbert lectures, 1886, *Celtic heathendom*, lect. 2, pt. 2.—"Caesar says that the Druids were the judges on all points of law and equity and the distributors of all punishments and rewards. They had the power of excommunication against all who did not submit to their decrees, of excluding people of all ranks from all benefits of society and even from society itself; of deposing

princes and even of condemning them to death, a power not infrequently exercised; and of declaring war and peace. The Druids themselves were exempt from bearing arms and paying taxes. Divitiacus, the Arch-Druid, however, we learn from Caesar, was permitted to carry arms and was even entrusted with the command of a corps in one of Caesar's campaigns. He gives the following account of the effect of excommunication. 'If any person, either private or public, does not acquiesce in their decisions, they interdict him from their sacrifices. That is, among them, the severest punishment. Those who are thus interdicted are reckoned impious and accursed; all men depart from them; all shun their company and conversation, lest they should sustain some misfortune from their contagion; the administration of justice and the protection of the laws is denied to them and no honor is conferred upon them.' The excommunicated had also to walk with bare feet and wear black garments for the remainder of his life.—D. Wright, *Druidism (Open Court, v. 32, p. 684)*.—"Our traditions of the Scottish and Irish Druids are evidently derived from a time when Christianity had long been established. These insular Druids are represented as being little better than conjurers, and their dignity is as much diminished as the power of the king is exaggerated. . . . He is a Pharaoh or Belsazzar with a troop of wizards at his command; but his Druids are sorcerers and rain-doctors. . . . The Druids of Strabo's description walked in scarlet and gold brocade and wore golden collars and bracelets; but their doctrines may have been much the same as those of the soothsayers by the Severn, the Irish medicine-men or those rustic wizards by the Loire. . . . After the conversion of Ireland was accomplished the Druids disappear from history. Their mystical powers were transferred without much alteration to the abbots and bishops who ruled the 'families of the saints.'"—C. Elton, *Origins of English history, ch. 10*.

Points of agreement and difference between Irish and Gaulish Druids.—The chief points of agreement were as follows: "1. They had the same Celtic name in both countries: 'Druid.' 2. They were all wizards—magicians and diviners. 3. They were the only learned men of the time: they were judges, poets, professors of learning in general. 4. They were teachers, especially of the children of kings and chiefs. 5. Their disciples underwent a long course of training, during which they got by heart great numbers of verses. 6. They were the king's chief advisers: they were very influential, and held in great respect, often taking precedence even of the kings. 7. Among both the Irish and Gauls there were druidesses. 8. They had a number of gods; and many of the Irish gods were identical, both in names and chief functions, with those of Gaul."—P. W. Joyce, *Smaller social history of ancient Ireland, p. 101*.—They differed, however, in the following points: "1. The Gaulish druids were under one head druid, with supreme authority: and they held periodical councils or synods. There was no such institution in Ireland: though there were eminent druids in various districts, with the influence usually accorded to eminence. 2. The Gaulish druids held the doctrine of the immortality of the soul, as applying to all mankind: the soul of every human being passing, after death, into other bodies, i.e. of men, not of the lower animals. There is no evidence that the Irish druids held the souls of all men to be immortal. But in case of a few individuals—palpably exceptional—it is related that they lived on after death, some reappearing as other men, some as animals of various kinds, and a few lived on in Fairyland, without the interven-

tion of death. 3. Human sacrifice was part of the rite of the Gaulish druids, sometimes an individual being sacrificed and slain: sometimes great numbers together. There is no record of any human sacrifice in connexion with the Irish druids; and there are good grounds for believing that direct human sacrifice was not practised at all in Ireland. 4. The Gaulish druids prohibited their disciples from committing to writing any part of their lore, regarding this as an unhallowed practice. There is no mention of any such prohibition among Irish druids. 5. The Gaulish druids revered the oak, and the mistletoe when growing on it: the Irish druids revered the yew, the hazel, and the quicken-tree or rowan-tree."—*Ibid.*, p. 102.—See also BRITAIN: 61; CELTS: Religion.

Druidism.—"The Druids boasted a faith which appears to have been as imbued with life as that of any ancient or modern religious system, although little is known generally about it. Although their religion was polytheistic in character the Druids recognized a supremacy among the gods, this Supreme being represented by the sun. Next in point of rank came the lesser divinities, who were symbolized by the moon and stars, and, in course of time, all the celestial bodies were venerated with divine honors. This characteristic was not more marked in Druidism than in other religions of a like nature where the elements were venerated. The sun as sun was not worshiped. The arch-god was Bêl, whose glory was manifested in the sun, and in singing hymns to the luminous orb they manifested their worship to the Supreme and not to the emblem, paying their adoration to what they regarded as the supreme power and eternal being. It was doubtless this veneration of the celestial bodies which laid the foundation of the knowledge possessed by the Druids of astronomical science, to which Caesar and other writers have borne testimony. They were certainly in possession of sufficient knowledge of the motion of heavenly bodies to enable them to fix definite times for their festivals and religious ceremonies, all of which were regulated by the sun and moon, and to calculate on a thirty-year cycle of lunar years in which the month began at the sixth day. In common with the Gauls, Teutons, and Jews, they reckoned time from evening to morning. The Druids observed an extraordinary reticence with regard to the articles of their faith. Though great writers in other respects, they committed no part of their religious tenets or philosophy to writing, except in allegorical poems, the key to which was in the possession only of the initiated and professed, to whom the doctrines were taught orally and by them committed to memory. . . . The Druids represented the world as an enormous animal issuing out of the abyss from the abode of an evil spirit. In common with other nations and religious systems they had their Deluge tradition, but they represented that event as occurring in a lake called Llyn Llion, the waters of which burst forth and overwhelmed the face of the whole world. One vessel only escaped in the catastrophe and in this were a man and a woman and certain of the animal species. By these Britain was repopulated with human beings and animals. The name given to the man thus miraculously preserved was Hu the Mighty, but he is sometimes called Cadwaldr. He is frequently represented as the diluvial god and as such is generally attended by a spotted cow. The woman preserved in the ark from the deluge was called Ceridwen. She was regarded as the first

of womankind, with the same attributes as Venus, in whom were personified the generative powers. She is mentioned in several of the poems of the Bards who lived under the Welsh princes. Cuhelyn, a Bard of the sixth century, refers to her as Ogyrvan Ahmad, or the goddess Ceres. Ceridwen's first-born was named Morvran, or 'raven of the sea.' As an outcome of this British tradition of the Deluge, the Druids consecrated certain lakes as symbols of the event and looked upon the small islands which rose to the surface as mystical sanctuaries, because they were emblems of the ark. A rock, when discovered, was hailed as typifying the place of debarkation of Hu the Mighty, and here, on certain occasions, would be celebrated by 'the Druids of the Circle,' the Druids of high or advanced degree, mystical rites believed to be in commemoration of the salvation of the race from the waters of the flood. . . . It was a Druidical belief that water was the first principle of all things and existed before the creation of the earth in unsullied purity, but that its qualities were diminished when it became blended with the earth. Thus water was venerated because it afforded a symbol by its inexhaustible sources of the continual and successive benefits bestowed upon the human race and because of the mystical sympathy existing between the soul of man and the purity of water. The air was regarded as the residence of beings of a more refined and spiritual nature than humans, while fire was looked upon as a vital principle brought into action at the Creation. The earth was venerated because it was the mother of mankind, and particular honor was paid to trees as affording a proof of the immense productive power of the earth. For many centuries the Druids refused to construct enclosed temples, regarding it as an outrage to suggest that the deity could be confined within any limits, and the vault of the sky and the depth of the forest were originally their only sanctuary. Pomponius Mela tells us that the immortality of the soul was a Druidical doctrine which the Druids permitted to be published for political reasons. 'There is one thing,' he says, 'which they teach their disciples, which hath been made known to the common people, in order to render them more brave and fearless, namely, that souls are immortal and that there is another life after the present.' The precise character of this after-life has been the occasion of debate with authorities. Some hold that the Druidical belief in life after death included the tenet of transmigration, similar to the Buddhistic but differing from the Theosophical reincarnation; that is to say, that they believed in the possibility of the descent of the human into the animal species. They were apparently believers in the evolution theory, maintaining that the soul commenced its course in the lowest water-animalcules and passed through several successive graduated bodies until it reached the human species. Here the authorities diverge. According to some, at death, if the good qualities had preponderated over the evil, the soul would pass into Gwynnyd, or a state of bliss. But if the evil qualities had preponderated, then the soul would pass into an animal displaying the characteristics exhibited by the human being while on earth, though it would have further opportunities of ascent to the human and of ultimate translation to Gwynnyd, even though repeated falls should postpone this latter step for ages. Others have maintained that the Druids endeavored to persuade their followers that death was but an interlude in a succession of progressive human existences. In this or in some other world the soul would find a new body and lead another human life and so onward

in an infinite cycle of lives. This latter seems to be the more probable when it is remembered that one of their maxims was that money lent in this world would be repaid in the next and that they also believed that letters given to dying persons or thrown upon the funeral pile would be faithfully delivered in the next world. In one of these two ways, however, the fear of death was removed and people were thus instilled with courage in battle and warfare. Another debatable topic has been the question as to whether human sacrifices were practised by the Druids, though it seems hardly open to question in view of the categorical statement of Cæsar. Divitiacus is scarcely likely to have inspired or consented to the publication of the statement if it had not been true. Possibly, however, the explanation may be found in the assertion of some writers that the practice of human sacrifices was the survival of a pre-Druidic custom, particularly as human sacrifices do not appear to have formed part of the Irish Druidical practices, though in Britain, members of the Druidic community not only took part in, but presided at, these ceremonies. These human sacrifices were, in the main, legal executions, and an interval of five years generally elapsed between sentence and execution. They believed also that those who killed themselves to accompany their friends to the next world would live with them there so that there was no lack of victims who, in time of trouble, came forward as volunteers to offer themselves as expiation. Eager to rejoin their dear departed in a happier sphere, eager to ascend to the circle of felicity, the Celts gladly mounted the sacrificial stone and death came to them in the midst of a song of joy. The old Mosaic law of 'a life for a life' was also required by the laws of Cymry, but the fatal punishment inflicted by the executioner was regarded as the requital of the debt due to God and man. According to the laws of Dyonwal Moelmund the three forms of capital punishment practised were beheading, hanging, and burning. It is possible that the practice of burning was derived from Phenicia, where the yearly sacrifice of human beings by fire, which was part of the worship of Moloch, may have given rise to the custom of burning malefactors and prisoners taken in war and other immolations practised by the Druids. . . . According to Justin, the Druids declared that in times of public calamity the people could not be rid of the pestilence or trouble until they had dipped the gold and silver secured by them in a time of war in a lake, and he gives the following description of a similar ceremony: 'Many persons resorted to a lake at the foot of the Gevaudan mountain, consecrated to the moon under the name of Helanus, and thither cast, some the entire human habits, linen, cloth, and entire fleeces; others cast in cheese, wax, bread, and other things, every one according to his ability; they then sacrificed animals and feasted for several days.' . . . The Druids regarded repentance and purification as necessary duties. They observed one day in seven as peculiarly sanctified and made holy by the great Creator and were wont to dedicate one-tenth of their substance to religious purposes. The Druidical philosophy and religion were certainly equal, if not superior, to any of the philosophies and religions current in other parts of the world in their day. Manxmen ascribe to the Druids the excellent laws by which their island has always been governed, and the ancient Greeks, on their own confession, learned part of their philosophy and many of their fables from the Gauls.—D. Wright, *Druidism (Open Court, v. 3, pp. 678-684)*. —See also MYTHOLOGY: Celtic; Roman period, Christian era.

DRUIDS, Order of, founded in London, 1781; spread to America in 1833 and to Germany in 1872. The order is a secret friendly society, and in imitation of the ancient druids its lodges are called "groves."

DRUMCLOG, Battle of. See SCOTLAND: 1679 (May-June).

DRUM-FIRE, method of artillery preparation for infantry attack, in which the shots are timed with almost the rapidity and rhythm of drum-beating.

DRUMMOND, Sir Gordon (1772-1854), British general in the War of 1812. See U. S. A.: 1813 (December); 1814 (July-September).

DRUMMOND, William (d. 1677), governor of the colony of Carolina in 1663. See NORTH CAROLINA: 1663-1670.

DRUSES.—"Druses are the adherents of a composite sect which still exists in Syria, especially in the Lebanon. From their use of the Arabic language the Druses, who term themselves 'Confessors of the Unity (of God),' seem to be a mixture of Syrians and Arabs. Their type, on the other hand, would indicate that they are descendants of the pre-Mohammedan Aramaic population. The steady resistance of this liberty-loving community to the State has aided in the preservation of their religion through the centuries, while they feel, on the other hand, that they form a distinct nation simply because of their religious isolation. By their tenacity, cunning and valor they have succeeded in resisting all attempts at subjugation and still form a State within a State. They now number about 100,000 although in recent years political circumstances have led many families to migrate from Lebanon to the Hauran, where they have settled among the peasants and Bedouins of that region. It is worth noting that there are two Druse villages on Mt. Carmel, and they have a sanctuary there at which they perform a yearly sacrifice. The origin of the religion is closely connected with the Egyptian Fatimite calif al-Hakim biamrillah (996-1021). His chief object was the propagation of the tenets of the sect of the Ismailiyyah, the main source of the doctrines of the Druses, in Egypt, where the people were adherents of orthodox Sunnite Mohammedanism. . . . The doctrines of the Druses mark an advance over the tenets of . . . their immediate predecessors. . . . On the other hand, the Mohammedans consider the Druses infidels, and Islamic writings seldom mention them. The difficulty of a clear presentment of the confused doctrines of the Druses is increased by the fact that their religion is esoteric, its adherents being forbidden to reveal its mysteries to non-believers and being required to hide their religious books from all. . . . According to the teaching of the Druses, God is one, and the confession of his unity is the first duty of religion. . . . The last of the ten (or nine) incarnations of the Divinity was the calif al-Hakim. . . . In conformity with their doctrine of the immutability of bodies and spirits, the Druses make no religious propaganda whatever. When al-Hakim returns, however, he will either destroy or subjugate the misbelievers and will found an earthly kingdom in which his followers will rule in wealth."—A. Socin, *New Schaff-Herzog religious encyclopedia*, v. 4, pp. 11-13.

DRYGALSKI, Erich von (1865-), German explorer. See ANTARCTIC EXPLORATION: 1901-1909; Map of Antarctic regions.

DRYOPAINS, aboriginal people of ancient Greece, whose territory was in the valley of the Spercheus and extended as far as Parnassus and Thermopylae; but who were afterwards widely dispersed in many colonies. It is, says C. O. Müller, "historically certain that a great part of the Dryopians were consecrated as a subject people to the Pythian Apollo (an usage of ancient times, of which there are many instances) and that for a long time they served as such."—*History and antiquity of the Doric race*, bk. 1, ch. 2.—See also DORIS AND DRYOPIS; HERODULI.

DSUNOVAS, or Dunaan, Arabian prince. See ABYSSINIA: 6th to 16th centuries.

DUAL ALLIANCE.—(1) An alliance between France and Russia, started in 1891 and definitely established in 1897. The Anglo-French Agreement of 1904 created the so-called "Entente Cordiale"; and by the Anglo-Russian Agreement of 1907 was established the "Triple Entente." (2) The alliance between Austria and Germany concluded in 1879; by the adhesion of Italy in 1883 this became the Triple Alliance. See BALANCE OF POWER: Neutralization of states; ENTENTE CORDIALE; TRIPLE ALLIANCE: Austro-German Alliance of 1879; Effect of Russo-Japanese War; WORLD WAR: Causes: Indirect: c.

DUAL MONARCHY, name applied to Austria-Hungary after the Ausgleich of 1867. The emperor of Austria was also king of Hungary, and the government was invariably styled the "imperial and royal" (kaiserlich und königlich). See AUSTRIA: 1866-1867; AUSTRIA-HUNGARY; HUNGARY: 1856-1868.

DUALA, principal seaport and capital of the former German colony of Kamerun, now known as the Cameroons and divided by British and French, Duala being assigned to France; the town was captured by the Allies on September 27, 1914. See CAMEROONS: Exploration of the interior; WORLD WAR: 1914: VI. Africa: a; 1915: VIII. Africa: c, 1.

DUALISM, in theology the belief that the universe is ruled by two opposing principles, good and evil; the chief characteristic of Zoroastrianism. See ZOROASTRIANS.

DUANE, James (1733-1797), American lawyer and jurist, delegate to First Continental Congress. See U. S. A.: 1774 (September).

DUANE, William John (1780-1865), American lawyer; he was appointed secretary of the treasury by President Jackson. See U. S. A.: 1833-1836.

DUBAIL, Augustin Yvon Edmond (b. 1851), French general in command of the 1st Army after outbreak of World War; military governor of Paris, 1916; succeeded Castelnau to the command of the 2nd Army which operated in Lorraine in 1914. See WORLD WAR: 1914: I. Western front: g, 1.

DU BARRY, Marie Jeanne Becu, Comtesse (1746-1793), French adventuress, mistress of Louis XV. See FRANCE: 1723-1774.

DU BARTAS, Guillaume de Saluste (1544-1590), French Huguenot poet. See FRENCH LITERATURE: 1552-1610.

DU BELLAY, Joachim (c. 1522-1560), French poet and critic. See FRENCH LITERATURE: 1549-1580.

DUBH GALLS, Gaelic name for the people of Judland. See IRELAND: 9th-10th centuries.

DUBLIN, capital of Ireland; population 1911, 403,030; situated on Dublin Bay; built on both sides of the river Liffey, which divides it, roughly speaking, into two equal parts, the north and south. The Liffey, a tidal river, is lined on both sides by fine stone quays, and is dredged so as to admit vessels of twenty-three foot draught at high tide. The city is for the most part well built, with wide streets and an unusually large number of open squares, of which St. Stephen's Green, a beautiful public garden, is the largest. The public buildings, which are very fine, date from the prosperous days of the eighteenth century, and are neo-classic in style. The Parliament buildings are occupied by the Bank of Ireland, but the House of Lords has been preserved in its original state. Phoenix park, a fine park on the outskirts of the city, includes a public garden, zoological gardens, a race course, and a large parade ground. The botanical gardens at Glasnevin are also famous.—See also IRELAND: Historical map.

Origin of name.—Settlement founded c. 140.—Quarrel over the harbor of Dublin 150.—“The name of the capital of Ireland is as appropriate now as when it was first bestowed some two thousand years ago. It is a compound of two Gaelic words (Dubh-*linn*) which signify ‘the black pool.’ The place where the settlement was made (c. 140) ‘was the lowest practical ford on the Liffey. . . . Some unknown benefactor had paved the swampy crossing with wicker hurdles and the village was accordingly called ‘Baile-ath-Cliath, ‘the town of the hurdle ford.’ In 150 A. D. a warlike Irish king picturesquely styled ‘Conn of the Hundred Battles’ . . . was defeated by his rival Mogh of Munster . . . and obliged to consent to a division of his dominions. The line of demarcation was drawn across the county from High Street, Dublin, to the Atlantic Ocean at Galway. Mogh is said to have been dissatisfied because his portion did not include the harbor of Dublin, which must, therefore, already have been a place of considerable commerce. Disputes arose over this point and interminable tribal wars broke out afresh.”—D. A. Chart, *Story of Dublin*, p. 1.—“The city has been known by various names. The Irish called it Drom Choll-Coil, i.e. *the brow of a hazel-wood*, from the abundance of those trees growing about it. But this name must have prevailed before . . . it merited the character of a city. . . . It was called Eblana by Ptolemy, upon which word Mr. Baxter has a conjecture . . . that the word Eblana has been maimed, and that the true reading is Deblana, which proves to be the termination of two British words, *dur* and *thun*, i.e. *black water*, or a *black channel*, the bed of the Liffey in this place having been boggy and the water black.”—J. Warburton (and others), *History of the city of Dublin*, p. 47.—Jocelin “accounts for the name of Dublin by a legend of a Princess Dublina drowned in the Liffey, and restored to life through the prayers of a saint.”—S. A. O. Fitzpatrick, *Dublin*, p. 3.

448.—Christianity introduced.—Christianity was introduced in 448 when St. Patrick baptized the king of Baile-atha-clíath.

8th-12th centuries.—Danish kingdom.—In the eighth century the Danes swept down upon the

Irish coast, raided the country about Dublin, and finally seized the settlement. They held it until they were dispossessed by Strongbow and Henry II (Anglo-Norman conquest). See NORMANS: 8th-9th centuries; IRELAND: 9th-10th centuries; 1169-1200.

1014.—Battle of Clontarf and great defeat of the Danes. See IRELAND: 1014.

12th-14th centuries.—English occupation.—Prince John sent to Dublin.—Beginning of Dublin as a municipality.—Charters of Henry II and John.—Economic progress.—Occupation of Dublin by the English was far from peaceful, and, like the rest of Ireland, the city was torn by the feuds of rival factions. “The distant king of England dimly discerning that all was not well sent over viceroy after viceroy. Some of these simply feathered their own nests during their short stays; others became partisans of one faction or the other and made confusion worse confounded. In 1185 Henry sent across his son, Prince John, afterwards king, hoping that the presence of one of the royal family would still the contending parties. But John was a foolish petulant boy . . . who spent his days and nights in debauchery while the clean shaven dandies of his court insulted the proud Irish chiefs by plucking their beards as they came to make their submission to the son of the Great Henry. . . . A fierce rebellion burst forth immediately. Dublin Castle probably owes its existence to this misbehavior of Prince John.”—D. A. Chart, *Story of Dublin*, p. 22.—“The municipal history of Dublin may be said to commence with the charters of Henry II and John, but for centuries thereafter the citizens had little control of the affairs of their city. The fact that Dublin was the capital of the Pale and the lead quarters, as it continued to be for at least four centuries, of the English garrison in Ireland, brought it under the direct control of the resident viceroy under whatever title he might exercise that office. Nevertheless certain civic rights were from time to time conceded, rights stiffly upheld by the sturdy descendants of the Bristol colony and their Welsh co-partners. It was not however till the close of the seventeenth century that the complete control of the city was placed in the hands of the civic authorities, and for well-nigh two centuries thereafter they continued to rule it with a rod of iron. . . . It closely resembled the government of Florence in the 13th century by the ‘Arti’ or Guilds and had nothing in common with modern municipal rule; and it was not till 1841 under the provisions of the Irish municipal reform bill that by the exertions of Daniel O’Connell Dublin could rightly be termed an Irish city or that her citizens as a whole had any voice in ordering her affairs. . . . The Roman Catholic Archbishop of Dublin, Dr. Walsh, emphasized these facts, when, in an address delivered on 12th March, 1905, he referred to Dublin as ‘at one time the capital of the Pale, later on . . . the chief home and center of the English colony in Ireland, but today the chief center of one of the greatest forces at present working for the restoration of our national life,’ referring to the Irish language movement. The charter of Henry II . . . gave to the burgesses of Dublin freedom from all imposts throughout the united kingdom; and that of King John ordered that ‘the citizens shall have all their reasonable guilds as the burgesses of Bristol have or had.’”—S. A. O. Fitzpatrick, *Dublin*, pp. 215-216.—The city continued to grow, and “in 1251 a new coinage was struck in Dublin bearing the King’s head. In 1308 Dublin obtained its first water supply.”—D. A. Chart, *Story of Dublin*, p. 28.—“It was then [in the fourteenth century] a walled-in medieval town,

containing seven castles and a church of considerable size and was a place of much importance as the port of Dublin."—*Handbook of the city of Dublin*, p. 235.

1400-1600.—Continued conflicts between Irish and English.—Trinity College founded.—From Plantaganet to Stuart, Dublin was the scene of numerous conflicts. In 1591 Dublin university, commonly known as Trinity College, was founded by a warrant from Queen Elizabeth.

1646-1649.—Sieges in the Civil War. See IRELAND: 1646-1649.

1660-1703.—Restoration.—Transformation of Dublin under the first duke of Ormond.—Growth and destruction of the woolen industry in Dublin.—Up to this time no attempts had been made to enlarge the city or transform it from a walled town to a modern metropolis, "but the Restoration was to change all that. Under the auspices of an illustrious Irishman, the first Duke of Ormond, who held office as Lord Lieutenant for fifteen of the last twenty-five years of the de facto reign of Charles II a remarkable transformation took place. . . . Houses everywhere sprang up without the walls of Dublin. . . . The capital grew so quickly that it was noted in 1673 by Lord Essex, one of the Restoration Viceroy's, that 'the city of Dublin is now very near, if not altogether twice as big as it was at his Majesty's Restoration.'"—*Ibid.*, p. 288.—The period of the Restoration marks the height of the woolen industry in Dublin. "There is no industry which has been so intimately associated with the history of Dublin as the weaving industry and especially the weaving of wool. . . . The steadily growing prosperity of the Irish woolen industry aroused the jealousy of the West of England and Yorkshire clothiers. Petitions were sent up to Parliament from many English towns praying for the restriction of the Irish woolen industry. . . . It is to the eternal disgrace of the Irish Parliament that it was they and not the English Parliament who struck the first blow at the flourishing woolen trade. [From 1699 to 1703 the Parliaments of both countries passed restrictive measures.] The effect of these Acts was the complete crippling of the woolen industry in Dublin and throughout Ireland. . . . Numbers of Dublin manufacturers removed themselves and their capital to foreign countries where they would be permitted to carry on their calling undisturbed."—S. A. O. Fitzpatrick, *Dublin*, pp. 6-9.

1681-1689.—Introduction of the silk industry.—Parliament of James I.—Dublin owes one of its oldest and few remaining industries to a colony of French Huguenots who, forced from their native land by the policy of religious persecution adopted by Louis XIV, came to and found a refuge in Protestant Dublin. The Dublin Municipal Council welcomed them, and offered them the freedom of the city. The settlement of the Huguenots dates from 1681. Here they introduced the art of silk weaving, which flourished greatly during the eighteenth century."—*Ibid.*, p. 11.—James II held a parliament in Dublin in 1689 and founded a mint.

1700-1798.—Growth of Dublin.—Its prosperity.—Anti-union sentiment.—Effect of Grattan's parliament on Dublin.—Insurrection of 1798 and the arrest of Fitzgerald in Dublin.—The eighteenth century which ended in the union of Ireland to England and the removal of the Irish parliament from Dublin to London was marked by anti-union demonstrations on the one hand and a remarkable civic advance on the other. "In the middle of the 18th century it was in dimensions and population the second city in the empire, containing, according to the most trustworthy accounts, between 100,000

and 120,000 inhabitants. Like most things in Ireland, it presented vivid contrasts, and strangers were equally struck with the crowds of beggars, the inferiority of the inns, the squalid wretchedness of the streets of the old town, and with the noble proportions of the new quarter, and the brilliant and hospitable society that inhabited it. The Liffey was spanned by four bridges, and another on a grander scale was undertaken in 1753. St. Stephen's Green was considered the largest square in Europe. The quays of Dublin were widely celebrated."—W. E. H. Lecky, *History of England*, 18th century, v. 2, ch. 7).—In 1759 upon rumors of a possible union of Ireland with England "the mob in Dublin got out of hand, burst into Parliament, and searched for the journals. . . . Every member they encountered was compelled to swear hostility to union."—D. A. Chart, *Story of Dublin*, p. 104.—In 1783 Grattan's parliament came into being and had a profound effect on the prosperity of Dublin. The city "began to be honorably distinguished for the number of its foundations for the advancement of science and the mitigation of pain and suffering. The Royal Irish Academy was founded. . . . Hospitals arose all over the city. In 1784 the College of Surgeons was incorporated and built itself a house in Stephen's Green. . . . A penny post was established for the city. . . . There was a remarkable development of the means of communication."—*Ibid.*, p. 110.—Restoration of parliamentary liberties associated with Grattan were extinguished in less than twenty years "as a consequence of the agitation of the United Irishmen and the rising of 1798. That insurrection which was planned to commence on May 23 of that year was precipitated by the arrest in Dublin two months earlier of several of the chiefs of the movement, followed after a short interval by the capture and death in melancholy and dramatic circumstances of its principal leader, the ill-fated and picturesque patriot Lord Edward Fitzgerald. For some months after this event Dublin was under martial law."—*Handbook of Dublin*, p. 297.

1731.—Founding of Dublin Society. See EDUCATION, ART: Modern period: England, Ireland, Scotland.

1801-1908.—Phoenix Park murders.—Creation of St. Patrick's Park.—"None of the great movements [in Irish history] can be said to have originated in Dublin. . . . The great agitations of the nineteenth century—the movement for Catholic Emancipation, the Young Ireland movement, the Fenian rising in 1867, the Land League agitation of more recent years—though all of them enjoyed in a greater or lesser degree the sympathy of the Dublin populace—were movements which left the surface of Dublin life practically untouched and untroubled. A melancholy exception is to be noted in the tragic crime known as the Phoenix Park murders in 1882, when Lord Frederick Cavendish and Mr. [Thomas] Burke were the victims of the Invincible conspiracy. The last generation [to 1908] has witnessed the adornment of some of the leading quarters of the city; and the public spirited munificence of Lord Iveagh in cleaning away the dilapidated houses in the neighborhood of St. Patrick's Cathedral and in the creation of St. Patrick's Park has effected a striking improvement in the amenities of the poor quarters of the city."—*Ibid.*, p. 208.—On the other hand the removal of the parliament from Dublin to London (1801) materially affected the prosperity of the city, as the wealth of the town followed the parliament out of the country.

1803.—Emmet's attempt to seize the city. See IRELAND: 1801-1803.

1830.—Extent of charitable institutions. See CHARITIES: Ireland: 1830-1836.

1844.—Trial of Daniel O'Connell. See ENGLAND: 1841-1848.

1848-1866.—Cholera epidemic.—Queen Victoria's visit to Dublin.—Eighteen years of peace.—“For the next eighteen years Dublin was peaceful and progressive. The effects of the great famine, however, . . . were felt in the shape of a terrible epidemic of cholera, produced by the nettles, docks, and other garbage eaten by the starving people. In 1849 while the pestilence was still raging Queen Victoria, with a courage truly queenly, paid her first visit to her Irish dominions.”—D. A. Chart, *Story of Dublin*, p. 121.

1868-1900.—Water supply solved.—Rise of the suburbs.—Royal University founded.—Museum and library opened.—“In 1868 the problem of the water supply was solved. An aqueduct over twenty miles in length was constructed from the heart of the Wicklow mountains into the city. . . . The middle class left the heart of the city and went to dwell in the outskirts. . . . The Royal University of Ireland was set up in Dublin in 1879. In 1880 St. Stephen's Green was laid out at considerable expense and opened in its present form. . . . In 1800 the . . . Museum and Library in Kildare Street were opened. In 1900 the suburbs on every side except the south were incorporated with Dublin for municipal purposes.”—*Ibid.*, p. 123.

1873.—Great fire.—A great fire occurred in Dublin in 1873, and serious rioting broke out at the same time.

1887.—Charges against lord mayor.—The lord mayor was called to answer charges against the Crimes Act, and was subsequently imprisoned for two years.

1892-1897.—Series of disturbances.—During this period the new market of Dublin was destroyed by a great fire, several bomb explosions occurred and serious rioting broke out among the Parnellites.

1902.—Crimes Act.—Owing to extensive political troubles the provisions of the Crimes Act was extended to the city.

1908.—New Universities Act.—By the New Universities Act passed in 1908 the official existence of the Catholic University of Ireland was brought to a close. This Act suppressed the Royal University of Ireland and created two new universities in Ireland, both strictly undenominational. One has its seat at Belfast, and the other at Dublin. Dublin university has three colleges, one in Dublin, one in Galway, one in Cork.

1911-1913.—Labor troubles. See IRELAND: 1909-1914; LABOR STRIKES AND BOYCOTTS: 1900-1914.

1916.—Sinn Fein insurrection in Dublin. See IRELAND: 1914-1916; 1916 (April): Irish rebellion.

1917-1918.—Home Rule program. See IRELAND: 1917; 1917-1918.

1921.—Customs house destroyed.—Meetings of the Dail Eireann.—The customs house, one of the finest buildings in the city, was attacked by members of the Sinn Fein and burned. Meetings of the Dail Eireann, composed of elected members of the Sinn Fein, were held in the Mansion House throughout the year.

1922 (June-July).—Destruction of Four Courts.—During the fighting that took place between the republicans and the Free State troops much damage was done to the city. The Four Courts building, containing invaluable records of Irish history, was almost completely destroyed in the fighting and by explosions.

DUBLIN MUSEUM.—“The art and antiquities Section of the Museum was formally opened by the Lord Lieutenant on August 29, 1890, and is an imposing structure of the style of classic Renaissance. The Museum contains the collection made by the Royal Irish Academy—the richest in Europe in Celtic antiquities—and other objects illustrating the history and arts of Ireland, including casts of High Crosses and other monuments. The general collection contains Irish silver; various ceramic ware, Egyptian antiquities; Chinese, Japanese, and other Asiatic metal-work; Natural History, Geology, Botany, Mineralogy, and industrial exhibits.”—*Year's Art*, 1921, pp. 54-55.

DUBNO, town and former Russian fortress in Volhynia, Poland; in 1915 it was captured from the Russians by the Germans and later several times changed hands. Dubno formed one angle of the famous Volhynian Triangle, the other two fortresses being Rovno and Lutsk. See WORLD WAR: 1915: III. Eastern front: i, 6; 1916: III. Eastern front: a, 2.

DUBOIS, Guillaume (1656-1723), French cardinal and statesman. Councillor of state under the regency of the duke of Orleans, 1715; negotiated the Triple Alliance, 1717; became prime minister of France, 1722. See FRANCE: 1717-1719.

DUBRIS, or Dubrae, Roman port on the east coast of Britain which is now known as Dover. In Roman times, as now, it was the principal landing-place on the British side of the channel.—T. Wright, *Celt, Roman and Saxon*, ch. 5.

DUCAT, gold coin, formerly in exchange in European countries. See MONEY AND BANKING: Medieval: Coinage and banking.

DUCCIO DI BUONINSEGNA (c. 1255-1319), Siennese painter and architect. See PAINTING: Italian: Early Renaissance.

DUCES, title for Roman generals. See COUNT AND DUKE, ROMAN.

DUCHESNE, Jacques Charles René Achille (1837-), French soldier, leader of expedition which conquered Madagascar in 1895. See MADAGASCAR: 1894-1899.

DUCOMMUN, Elie (1833-1906), Swiss journalist, at one time chancellor of the Canton of Geneva; commissioned to organize the Bern International Bureau of Peace; adjudged half Nobel prize in 1902. See NOBEL PRIZES: Peace: 1902.

DUDELL, William Du Bois (1872-), English electrical engineer. See ELECTRICAL DISCOVERY: 1831-1921.

DUDEVANT, A. L. A. See SAND, GEORGE.

DUDLEY, Thomas, (1576-1653), second colonial governor of Massachusetts; 1630, arrived in the Bay Colony as deputy governor; was governor of the colony in 1634, 1640, 1645, 1650; was deputy governor thirteen times, and major general of militia in other years; “His fear of God was an ever present and deciding motive to him; no man in public action had a more single eye to public welfare.”—See MASSACHUSETTS: 1629-1630, and after.

ALSO IN: *Life of Mr. Thomas Dudley*, written as it is supposed by Cotton Mather (Deane, ed. 1870).

DUE PROCESS OF LAW, United States: Definition.—Origin.—“Neither the federal nor state constitutions have made any attempt to define what is ‘due process of law’ or its equivalent; nor have the courts been able to give a definition covering all possible cases. It has been said that they no longer attempt to define in a few words what is meant by these terms, but are disposed to ascertain their intent and application by gradual process of judicial inclusion and exclusion, as the cases pre-

sented for decision require, together with the reasoning on which such decisions may be founded. The phrase has the same meaning in both the fifth and the fourteenth amendments. Among the definitions which have been given of due process of law, the most widely accepted is probably that of Judge Cooley, as follows: Due process of law in each particular case means such an exertion of the powers of government as the settled maxims of law permit and sanction, and under such safeguards for the protection of individual rights as those maxims prescribe for the class of cases to which the one in question belongs. . . . The term 'due process of law,' 'due course of the law of the land,' and 'course of the common law,' . . . [are practically synonymous]. As applied to legislative enactments, due process of law means statutes that are general in their operation, and that affect the rights of all alike, and not a special act of the legislature, passed to affect the rights of an individual against his will, and in a way in which the same rights of other persons are not affected by existing laws. . . . As applied to judicial proceedings, due process of law means a law which hears before it condemns, which proceeds on inquiry, and renders judgment only after trial, law in its regular course of administration through courts of justice; . . . a prosecution or suit instituted and conducted according to the prescribed forms and solemnities for ascertaining guilt, or determining the title to property; . . . by a competent tribunal having jurisdiction of the case and proceeding on notice and hearing."—*Corpus juris*, v. 12, pp. 1188, 1190, 1191, 1192, 1193.—"That a person shall not be deprived of life, liberty, or property without an opportunity to be heard in defense of his right is a rule founded on the first principles of natural justice, and is older than written constitutions. This rule is the foundation of the constitutional guaranties of due process of law. It was expressed in the provision of Magna Charta which protected every freeman in the enjoyment of these natural rights unless deprived of them 'by the Judgment of his Peers, or the Law of the Land'; and from this original are derived the guaranties expressed in the various American constitutions. . . . [The words were first used in a statute of Edward III in which, according to a statement made in his "Institutes," by Sir Edward Coke, it was used as an equivalent for "the law of the land."] The fifth amendment to the constitution of the United States provides that 'no person shall . . . be deprived of life, liberty, or property, without due process of law.' This amendment, it is well settled, constitutes a restriction on the federal government only, and not on the states. . . . The fourteenth amendment provides: 'Nor shall any State deprive any person of life, liberty, or property, without due process of law.' As clearly indicated by the language used, this amendment constitutes a limitation on the powers of the states. It adds nothing to the rights of one citizen against another, but simply furnishes a guaranty against any encroachment by the state on the fundamental rights which belong to every citizen. . . . The constitutions of almost all the states contain a similar guaranty, either in the words of the fifth amendment above quoted or in words of the same import and meaning."—*Ibid.*, pp. 1193, 1194.

Constitutional guaranties and rights.—"The guaranties of due process of law extend to every governmental proceeding which may interfere with personal or property rights, whether the proceeding be legislative, judicial, administrative, or executive, and relate especially to that class of rights the protection of which is peculiarly within the province of the judicial branch of the government.

The want of due process of law may arise either from the fact that the law attempted to be enforced is void or that the forms of law have not been observed. The courts of Tennessee [for example] have so frequently considered the question whether class or special legislation is 'the law of the land' within the meaning of the constitutional provision now under consideration that it is proper to state briefly the result of their investigation. That result is the establishment of the following rule: In order for class legislation to become the law of the land within the meaning of the constitution, it must . . . (1) . . . be so framed as to extend to and embrace equally all persons who are or may be in the like situation and circumstances; and (2) the classification must be natural and reasonable, not arbitrary and capricious. In other states also it has occasionally been considered that special legislation was in conflict with the law of the land. While the constitution contains no description of those processes which it was intended to allow or forbid, yet clearly it was not left to the legislative power to enact any process which might be devised. There must be a course of legal proceedings according to those rules and principles which have been established by our jurisprudence for the protection and enforcement of private rights. . . . [But] the constitutional guaranties that no person shall be deprived of life, liberty, or property without due process of law, do not limit, and were not intended to limit, the subjects on which the police power of a state may lawfully be exerted. . . . In general, the constitutional right to be secure against deprivation of life, liberty, or property without due process of law extends to all natural persons within the jurisdiction of the United States. The guaranty, therefore, protects women, Indians, and, to a limited extent, alien immigrants. . . . The 'liberty' protected by the constitutional guaranties as to due process of law is that of natural, and not of artificial, persons. So far as their property rights are concerned, however, private corporations are 'persons' within the scope of the guaranties, and in this respect they fall within the protection of the constitution. While the amendment or repeal of corporate charters, in pursuance of a reserved power so to do, does not constitute a violation of the guaranty of due process of law, yet, . . . there is no well considered case in which it has been held that a legislature, under its power to amend a charter, might take from a corporation any of its substantial property or property rights. . . .

"The terms 'life' and 'liberty' are used in the constitutional guaranties in a broad sense as including all personal, as distinguished from property, rights. The right to life includes the right of the individual to his body in its completeness and without dismemberment. The 'liberty' that is guaranteed against invasion without due process of law embraces not only freedom from imprisonment, but also freedom in the enjoyment and use of one's faculties, in going where one pleases, in the choice and pursuit of a vocation or occupation, and in the making of contracts, subject, of course, to such restraints as may be imposed under the powers delegated to congress and under the police power reserved by the states, for the security and promotion of the general welfare. A law which should make it a crime for men either to live in, rent, or sell their houses, would amount to a deprivation of personal liberty without due process of law. . . . The right to make contracts is both a liberty and a property right, and is within the protection of the guaranties against the taking of liberty or property without due process of law. Neither the states nor federal governments, therefore, may im-

pose any arbitrary or unreasonable restraint on the freedom of contract. This freedom, however, is not an absolute, but a qualified, right, and is, therefore, subject to reasonable restraint in the interest of the public welfare. . . . The legislature without violation of the guaranty of due process of law, may prescribe the qualifications of public officers, the method of their election or appointment, and their powers and duties. . . . Military law is due process as to those engaged in military and naval service, and in like manner martial law constitutes due process when duly proclaimed by the executive. Accordingly courts-martial may constitutionally be empowered to try and punish military offenses. However, before a person can be punished for disobeying an order of a military officer in a territory where martial law has been declared, he must be given notice of the charge against him and an opportunity to prepare and present his defense, and his guilt must be adjudicated by some competent tribunal. . . . Due process of law in a criminal case requires a law creating or defining the offense, a court of competent jurisdiction, accusation in due form, notice and opportunity to answer the charge, trial according to the settled course of judicial proceedings, and a right to be discharged unless found guilty. However, no particular form of procedure is required, and where the conditions just enumerated are fulfilled, there is no violation of the guaranty of due process of law."—*Ibid.*, pp. 1195-1202.

Meaning determined by jurisdiction.—"The law by which the question of due process is determined is the law of the jurisdiction [the place] where the offense was committed and the trial is had. Within constitutional limits, the state and federal governments have full control over criminal procedure within their respective jurisdictions. . . . While the guaranties of due process of law require that trials in criminal cases in the state courts shall be in accordance with the prescribed forms and judicial procedure of the state, they do not restrict the states to any particular mode of procedure. . . . The guaranty of due process of law does not require a plenary suit and a trial by jury in all criminal cases, and hence, in the absence of any provision to the contrary in the state constitutions, the several state legislatures may provide for the trial of accused persons without a jury, or before a jury of less than twelve; and may provide that failure to demand a jury in certain cases shall be a waiver of the right to a jury trial otherwise existing. In like manner, no violation of the guaranty of due process of law results from state statutes otherwise constitutional which prescribe the qualifications of persons eligible to jury service, or the manner of selecting the jury. The fact that a jury was ineligible does not constitute a denial of due process to a convicted person where no objection was seasonably made. But the action of state officers in willfully and arbitrarily excluding from jury lists the names of negroes otherwise qualified has been held to constitute a denial of due process of law to negroes tried by a jury thus selected."—*Corpus juris*, v. 12, pp. 1202, 1207-1208.

ALSO IN: J. I. C. Hare, *American constitutional law*, v. 2.

Decisions as to judicial procedure.—"Several decisions deal with the privileges of accused persons. The Fourth, Fifth and Sixth Amendments [to the Constitution of the United States] are the ones involved. The first reads thus: The right of the people to be secure in their persons, houses, papers, and effects, against unreasonable searches and seizures, shall not be violated, and no warrants shall issue but upon probable cause, supported by

oath or affirmation, and particularly describing the place to be searched, and the person or things to be seized." Amendment Five reads thus: "No person shall be held to answer for a capital or otherwise infamous crime unless on a presentment or indictment of a grand jury, except in cases arising in the land or naval forces, or in the militia, when in actual service in time of war or public danger; nor shall any person be subject for the same offense to be twice put in jeopardy of life or limb; nor shall be compelled in any criminal case to be a witness against himself, nor be deprived of life, liberty, or property, without due process of law; nor shall private property be taken for public use without just compensation." The words of the Sixth Amendment are as follows: "In all criminal prosecutions the accused shall enjoy the right to a speedy and public trial, by an impartial jury of the State and district wherein the crime shall have been committed, which district shall have been previously ascertained by law, and to be informed of the nature and cause of the accusation; to be confronted with the witnesses against him; to have compulsory process for obtaining witnesses in his favor, and to have the assistance of counsel for his defense."

"We learn that the powers of the grand jury to investigate are original and not dependent for their exertion upon the approval or disapproval of the court (*United States v. Thompson*, 251 U. S. 407); that it is valid to try several defendants together and treat them as a single defendant for the purpose of peremptory challenges (*Stilson v. United States*, 250 U. S. 583); that a person found guilty of murder and sentenced to life imprisonment is not placed twice in jeopardy if on a second trial, the first having been reversed on writ of error sued out by the accused, he is again found guilty, and then sentenced to death (*Stroud v. United States*, 251 U. S. 15). Also, it appears, no self-incrimination results from the use of letters which were written by accused after his crime and which came into possession of the prison officials under established practice reasonably demanded for the maintenance of discipline. . . .

"A more notable case in the same field is that of *Silverthorne Lumber Company v. United States*. (251 U. S. 385.) Representatives of the department of justice arrested the two Silverthornes, and, while they were detained, went 'without a shadow of authority' to the office of the Silverthorne Company and made a clean sweep of all books, papers and documents there found. Later an order was issued for the return of these, but meantime the government representatives had had them photographed. The question in the instant case was whether the two Silverthornes were in contempt of court for refusing to respond to a subpoena ordering them to bring the original documents into court, which subpoena had been sought on the strength of the knowledge gained in consequence of the illegal act of seizure. It was held that the government cannot thus profit by its own wrong-doing. Said Justice Holmes, of the Government's endeavor to avail itself of knowledge obtained by illegal means: 'The proposition could not be presented more nakedly. . . . It reduces the Fourth Amendment to a form of words.' The case should be collated with *Adams v. New York*, 192 U. S. 585 and *Weeks v. United States*, 232 U. S. 383. See also *Flagg v. United States*, 147 C. C. A. 367, 233 Fed. 481, which is cited by Justice Holmes with approval. In the instant case the Chief Justice and Justice Pitney dissented."—E. S. Corwin (*American Political Science Review*, Feb., 1921, pp. 56-58).

Relation to taxation.—"The most important cases reviewing state laws have arisen in connection with taxation, and of these the most significant is that of *Green v. Frazier*, (253 U. S. 233) in which the legislative program of the nonpartisan league of North Dakota, carrying with it such enterprises as a state bank, a state warehouse, elevator and flour mill system, and a state home building project, was sustained against the objection that it sought to authorize taxation for purposes not public, and therefore the taking of property without due process of the law. The court recited the fact that this rather ambitious program had been sanctioned 'by the united action of the people of the state, its legislature, and its courts.' For the rest, said Justice Day, who spoke for the unanimous court, 'with the wisdom of such legislation and the soundness of the economic policy involved, we are not concerned. Whether it will result in good or harm is not within our province to inquire.' The doctrine of 'public purpose' was introduced into the jurisprudence of the Supreme Court by Justice Miller, who brought it from Iowa, and was originally based on 'general principles.' See *Loan Assn. v. Topeka*, 20 Wall. 665. Later it was based on the 'due process' clause of the Fourteenth Amendment: *Fallbrook Irrig. Dist. v. Bradley*, 164 U. S. 155. The instant case was preceded by *Jones v. Portland*, 245 U. S. 217, where the court sustained an act of the state of Maine authorizing the establishment of municipal fuel yards."—*Ibid.*, pp. 62-63.

Regulation of public utilities.—"Several cases dealing with the regulatory powers of the states in relation to public utilities reiterate or extend familiar principles, in interpretation of the 'due process of law' clause of the Fourteenth Amendment, to wit: (1) In all cases where maximum rates set by a state public service commission are claimed by an owner to be confiscatory, the state must provide a fair opportunity of submitting the issue to a judicial tribunal for determination upon its own independent judgment of both the law and the facts. (2) Every part of a railway system over which a passenger is entitled to ride must be included in the computation to determine whether a given rate is profitable, and the passenger service, including sleeping car, parlor car and dining car service, must be treated as a whole. (3) Railway companies may not be compelled by a state administrative order to install cattle weighing scales at stations to which cattle are shipped, it having been shown that such scales have no direct part in transportation and indeed have come to be used, where they have been installed, not by shippers but by buyers and sellers of cattle. (4) A milling company cannot be compelled to continue the public operation of a railroad at a loss; if the railroad continues to exercise its charter rights, it may be required to perform its charter obligations, even at a loss, but it is free to stop its losses by stopping its business. (5) An oil pipe line, constructed solely to carry oil for particular producers under private contract, cannot be converted into a public utility by legislative fiat, otherwise private property might be taken without just compensation; but a pipe line voluntarily devoted by the owner to the use of the public is a public utility and subject to regulation as such. (6) If a city wishes to clear space for the construction of a street lighting system of its own by removing the instrumentalities of a privately owned system occupying the streets under legal franchise, it must make compensation for the rights appropriated, since it is not acting for the public health, peace, or safety, but in a proprietary or quasi-proprietary capacity. . . .

Outside the cases just mentioned, the 'due process of law' clause furnishes the basis of decision in surprisingly few cases. From one such case we find that the state may abolish the defence of contributory negligence, not only in employers' liability cases, but generally. (*Chicago R. I., and P. R. Co. v. Cole*, 251 U. S. 54.) From another we learn that the Fourteenth Amendment does not require a state to make loss of earning power the sole basis for a statutory compensation scheme for workmen who are injured without fault on the part of the employer, and that, accordingly, whether allowance should be made for facial or head disfigurement is a question for the state alone to determine. (*New York C. R. Co. v. Bianc*, 250 U. S. 506.) Still another decision upholds the right of the state to forbid persons from soliciting employment in the prosecution or collection of claims, including claims for personal injury; *McCloskey v. Tobin, Sheriff (Texas)*, 252 U. S. 107. As Justice Brandeis remarks in his opinion, 'The evil against which the regulation is directed is one from which English law has long sought to protect the community through proceedings for barratry and champerty,' while another reiterates familiar doctrine with reference to the power of eminent domain. The necessity and expediency of a taking where the purpose is public are legislative questions, and all that due process of law requires is that the owner have opportunity to be heard on the matter of compensation and that the compensation awarded be paid without unreasonable delay, not necessarily before the taking. Several special assessment cases add little to learning on that topic."—*Ibid.*, pp. 65-67.

Judicial decisions.—**Delegation of taxing powers.**—"The tax equalization Act of Georgia provides that the Board of County Assessors shall meet each year and fix a fair valuation upon both real and personal property. It further provides that if a taxpayer is dissatisfied with the action he may, within ten days, demand an arbitration by a board made up of three persons—one appointed by himself, one by the assessors, and the third appointed jointly by the two others. The law further provides that they shall render their decision within ten days from the date of naming of the arbitration board, otherwise the decision of the Board of Assessors shall stand and be binding. In the instant case the plaintiff made his return, valuing his property at \$44,000. The County Board of Assessors, without hearing, raised the assessment to \$80,000. Notice was then given to the plaintiff of the increase. The plaintiff demanded an arbitration board, which met and decided that the amount fixed was excessive but could not agree upon the correct assessment. The levy was attacked on the ground that it violated the Due Process of Law clause of the constitution. Twice the Supreme Court of Georgia held the law constitutional. On removal of the case to the United States Supreme Court, it was held that if the legislature of the state, instead of fixing the tax itself, commits to the subordinate body the duty of determining whether and in what amount, and upon whom the tax shall be levied, due process of law requires that at some stage of the proceedings before the tax becomes irrevocably fixed the taxpayer must have the opportunity to be heard, of which he must have notice, whether by publication or by some statute fixing the time and place of the hearing. Further, the court held that in this case the taxpayer is subject to an assessment made without notice and hearing, and that the taxpayer did not receive any notice, nor was the opportunity ever given him to be heard before the assessment was finally made against

him; that the statute contemplated only a hearing in the event of his dissatisfaction and through the Board's arbitration, which was not such a hearing as came within the contemplation of the Fourteenth Amendment."—R. M. Goodrich, *National Municipal Review*, March, 1921, pp. 198-199.

DUFAURE, Jules Armand Stanislas (1798-1881), French statesman. Minister of public works in the Soult ministry, 1839-1840; became minister of interior 1848; member of the assembly and minister of justice, 1871, 1875, 1877; president of the council, 1876; resigned permanently from office, 1879. See FRANCE: 1875-1889.

DUFAY, Charles François (1699-1739), French officer and chemist. See ELECTRICAL DISCOVERY: Early experiments.

DUFAY, Guillaume (1400-1474), greatest master of the first Flemish school of composition. Made many reforms regarding musical notation; cultivated four-part writing so successfully that it became the foundation of all choral writing; held appointments of canony in Cambrai and in Mons; manuscripts preserved in the Sistine Chapel, the Vatican, at Bologna, and in the Bodleian, Oxford. See MUSIC: Medieval: 1350-1500.

DUFF, Alexander (1806-1878), Scottish missionary in India. See INDIA: 1813-1835; MISSIONS, CHRISTIAN: India.

DUFF, Lyman Poole (1865-), Canadian supreme court judge. See CANADA: 1917.

DUFFERIN AND AVA, Frederick Temple Hamilton Blackwood, 1st Marquis of (1826-1902), British statesman, diplomat and author; 1855, attached to the Austrian mission; 1860, sent to Syria to inquire into massacre of Christians; 1864, undersecretary of state for India; 1866, undersecretary for war; 1868, chancellor of the duchy of Lancaster; 1872-1878, governor-general of Canada; 1879-1881, ambassador to Russia; 1881-1884, ambassador to Turkey and also engaged in restoring order in Egypt; 1884-1888, viceroy of India; 1888-1891, ambassador to Italy; 1891-1896, ambassador to France; was created marquis in 1871; 1878, elected president of the Royal Geographic Society; 1891, lord rector of Glasgow University. He was the author of a number of books on Irish problems. See EGYPT: 1882-1883.

DUFRESNE, Marion, French explorer in the eighteenth century. See ANTARCTIC EXPLORATION: 1519-1819.

DUGALL, Celtic term for Vikings. See NORMANS: 8th-9th centuries.

DUGDALE, Sir William (1605-1686), English antiquary. See HISTORY: 2, 5.

DUGOMMIER, Jean François Coquille (1736-1794), French soldier, commander at the siege of Toulon. See FRANCE: 1793 (July-December): Progress of war of coalition.

"**DUGOUT**," primitive shelter excavated in a hill or bank, extensively used in the World War. A dugout was usually on that side of a trench toward the enemy. Some, especially the German dugouts, were fitted up with many comforts and conveniences. The term is also applied to a primitive boat made from a tree trunk which has been hollowed out. See TRENCH WARFARE: Beginning.

DU GUESCLIN, Bertrand (c.1320-1380), constable of France. See FRANCE: 1360-1380; SPAIN: 1366-1369.

DUISBURG, city in Rhenish Prussia fifteen miles north of Düsseldorf near the mouth of the Ruhr. Center of important coal, timber and grain trade. Held by the Belgians since the signing of the armistice, being a bridgehead on the Rhine. See FRANCE: 1921 (March 8).

DUKE, Roman: Origin of the title. See COUNT AND DUKE, ROMAN.

DUKE'S LAWS, code of the province of New York. See NEW YORK: 1665.

DUKHOBORS, members of a Russian religious sect which first attracted attention through its communistic ideas in the latter half of the eighteenth century. The government permitted them to come together as a clan and form a settlement at "Milky Waters," near the sea of Azov early in the nineteenth century. Later, as the clan's interpretation of the maxim, "Whoso denies his God shall perish by the sword," justified the practice of secret assassinations, it was banished by the Russian government to the Caucasus. Notwithstanding the anarchistic theories of the sect, its form of government was that of submission to a leader who had despotic power. Trouble over the succession of this despotism naturally resulted, and in 1808-1809 over 7,000 followers of Peter Verigen, one of the claimants to power then in exile in Siberia where he had adopted some of Leo Tolstoy's views, emigrated to Canada in order to gain exemption from military conscription. Verigen, upon his release from exile, joined them in 1902. Many of his followers have recently broken away from the new community and only a few of the more ignorant regard him with the superstitious reverence which he formerly commanded.

DUKHONIN, General (d. 1917), Russian commander. In December 1917, he was killed by the Bolsheviks. See WORLD WAR: 1917: III. Russia and the Eastern front: q.

DUKLA PASS, route from Galicia through the Carpathians to Slovakia (formerly northern Hungary); captured by the Russians in March 1915; recovered the following May by Austro-German forces under von Mackensen. See WORLD WAR: 1914: II. Eastern front: d, 3; 1915: III. Eastern front: c.

DULCIGNO, seaport of Montenegro on the Adriatic sea. See MONTENEGRO: 1874-1880; LONDON, TREATY OR PACT OF.

DULCIMER, musical instrument. See INVENTIONS: Ancient and medieval: Stringed instruments.

DULCINISTS, or Apostolicals, name given to the followers of Dulcino, a leader of the sect of Apostolic Brethren founded by Gerard Sagarelli of Parma late in the thirteenth century. "The members of this sect made little or no alterations in the doctrinal part of the public religion; what they principally aimed at, was, to introduce among Christians the simplicity of the primitive times, and more especially the manner of life that was observed by the apostles. Gerhard Sagarelli, the founder of this sect, obliged his followers to go from place to place as the apostles did, to wander about clothed in white, with long beards, dishevelled hair, and bare heads, accompanied by women whom they called their *Sisters*. They were also obliged to renounce all kinds of property and possessions, and to preach in public the necessity of repentance, while in more private assemblies they declared the approaching destruction of the corrupt church of Rome, and the establishment of a more glorious church, that, according to the prophecies of the abbot Joachim, was to arise from its ruins. . . . No sooner was the unhappy leader of this fac-

tion committed to the flames than he was succeeded in that character by a bold and enterprising fanatic, name Dulcinus, a native of Novara, who published his predictions with more courage, and maintained them with more zeal than his predecessor had done . . . and acting not only in the character of a prophet, but also in that of a general, he assembled an army to maintain his cause. . . . [He] was at length taken prisoner, and put to death at Vercelli in the most barbarous manner, in the year 1307, together with *Margaret*, whom he had chosen for his *spiritual sister*. . . . The terrible end of Dulcinus was not immediately followed by the downfall of his sect which still subsisted in *France*, *Germany*, and in other countries, and stood firm against the most vehement efforts of its enemies, until the beginning of the XVth century, when under the pontificate of Boniface IX. it was totally extirpated."—J. L. Mosheim, *Ecclesiastical history*, v. 3, pp. 290-292.

DULGIBINI AND CHASAURI.—"These people [tribes of the ancient Germans] first resided near the head of the Lippe, and then removed to the settlements of the Chamavi and the Angrevarii, who had expelled the Bructeri."—Tacitus, *Germany*, ch. 34, *Oxford trans.*, note.—See also SAXONS.

DULUTH, city of Minnesota at the west end of Lake Superior and the mouth of the St. Louis river. Due to its position it has grown to be one of the finest commercial ports of the country. The place received its name from Sieur du Lhut, a French explorer and trader who in about 1678 built a stockaded trading-post on the north shore of Lake Superior at the mouth of the Pigeon river. Duluth, however, was not permanently settled until 1853. For some years thereafter its growth was rather slow, but with the building of railroads, the opening of Lake Superior to commerce and the development of the Vermilion and Mesabi iron ranges an unparalleled era of prosperity and growth set in. This was most marked between the years 1880 and 1890. Its population in 1920 was 98,917.

DUMA, lower house or representative council of the Russian parliament, 1906-1917. See *RUSSIA*: 1905 (October); 1905-1906; 1906; 1907-1912; 1914-1915; 1916: Opposition of Duma to Cabinet; 1917 (March 8-15); *SUFFRAGE, MANHOOD*: Russia: 1905-1917; also *EUROPE*: Modern period: Russia in the nineteenth century.

DUMAS, Alexandre (1802-1870), French dramatist and novelist. His book "The Three Musketeers" is the most famous of the "Cloak and Sword" romances. His sympathy with revolutionary ideas was manifested in 1830 and 1848. See *DRAMA*: 1800-1900; *FRENCH LITERATURE*: 1800-1921; Romantic and idealistic novel writing.

DUMAS, Alexandre (1824-1895), French dramatist, the son of Alexandre Dumas the great dramatist and novelist. Among his works are "La Dame aux camélias," "L'Ami des femmes," "La Princesse George." See *DRAMA*: 1850-1921.

DUMAS, Jean Baptiste André (1800-1884), French chemist. His researches were mainly in organic compounds and radicals and in the phenomena of substitution in organic chemistry. See *CHEMISTRY*: Organic: Defined; General: Modern: Lavoisier.

DU MAURIER, George Louis Palmella Busson (1834-1896), English novelist and illustrator. See *ENGLISH LITERATURE*: 1880-1920.

DUMBA, Constantin Theodor (1856-), Austro-Hungarian ambassador to the United States; recalled in 1915 on American demand, because of his connection with crimes against industrial plants. See *U. S. A.*: 1915 (June): Protests by Central Powers against trade with Allies.

DUMBARTON, borough town and seaport, chief town of the county of Dumbarton in Scotland. See *ALCLYDE*.

DUM-DUM BULLET.—The dum-dum bullet, about which there was much discussion at The Hague Peace Conference, is constructed to spread slightly at the point. All modern rifle bullets have an outer jacket of hard metal, to take the grooving of the gun-barrel. "Originally the jacket was thickest at the point, and so strong that, while penetration was enormous, stopping power was wanting; in other words, one bullet might easily go through half a dozen men, yet, unless it happened to hit a vital spot or a bone, they need not be disabled, and might therefore continue to fight. This was amply illustrated in the Chitral campaign, during which our soldiers began to lose confidence in their weapon, while the enemy, quick to recognize the different effect of volleys, were inclined to attack British infantry armed with the Lee-Metford rather than native infantry armed with the Martini-Henry. The Indian military authorities at once set about designing a bullet which, while maintaining range, should have the required stopping power. The result was the dum-dum bullet—so named after the place near Calcutta where it is made—of which much has been heard. The difference in appearance between it and the original pattern is comparatively slight. The shape is exactly the same, but the jacket is differently arranged; instead of having its greatest strength at the point, it is weakest there—indeed, at the apex a small part of the core is uncovered, but does not project."—*Quarterly Review*, July, 1899.—At the first Hague Peace Conference all of the nations represented, except Great Britain and the United States, declared that they would ban the dum-dum bullet. Great Britain used it against "uncivilised peoples" only, until the second Hague conference when she too agreed to accede to the declaration prohibiting its use. The dum-dum bullet has never been used in the United States army, and the reasons for refusal to accede to the declaration were of a technically legal character. During the World War charges and counter-charges of the use of dum-dum bullets by their opponents were brought by all the armies. These charges were denied by the governments of all the warring nations.

DUMNONII.—"It is . . . a remarkable circumstance that the Dumnonii, whom we find in the time of Ptolemy occupying the whole of the south-western extremity of Britain, including both Devonshire and Cornwall, and who must therefore have been one of the most powerful nations in the island, are never once mentioned in the history of the conquest of the country by the Romans; nor is their name found in any writer before Ptolemy. . . . The conjecture of Mr. Beale Poste . . . that they were left in nominal independence under a native king . . . appears to me highly probable."—E. H. Bunbury, *History of ancient geography*, ch. 23, note B.—There appears to have been a northern branch of the Dumnonii or Damnonii, which held an extensive territory on the Clyde and the Forth. See *BRITAIN*: Celtic tribes.

DUMONT D'URVILLE, Jules Sébastien César (1790-1842), French navigator. See *ANTARCTIC EXPLORATION*: 1819-1838; Map of Antarctic regions; *PACIFIC OCEAN*: 1764-1850.

DUMOURIEZ, Charles François (1739-1823), French general and revolutionist; fought in Seven Years' War; sent to Sweden on diplomatic mission; fell into disgrace and was imprisoned in Bastille, and later at Caen; restored to favor by Louis XVI and made commandant of Cherbourg; 1788, was made major general; 1790, followed Lafayette and Mirabeau; 1790, joined the Jacobins; 1792, Minister of Foreign Affairs; resigned to lead Army of the North successfully against the Duke of Brunswick, whom he defeated at Valmy; invaded Austrian Netherlands; won the victory at Jemappes; 1793, defeated by Austrians, was denounced as a traitor; endeavored to carry his army over to the royalist cause, and, failing, deserted to the Austrians. Later he settled in England. See FRANCE: 1792 (August-September); (September-December); 1792-1793 (December-February); 1793 (February-April).

DUN AENGUSA, great stone circular fort crowning the western hill of Inishmore, one of the Aran islands on the west coast of Ireland. It rises to over 300 feet above the sea, and is one of the most conspicuous high grounds in the Aran group.

"Of all the early forts of Ireland we may say that only one has appealed to the imagination, and even to the affection, of the nation, as a building, and become, with most antiquaries, the type and symbol of countless similar structures, all subordinate to it in interest. . . . The facts that the fort had attracted the notice of the learned for over two hundred years, while its compeers lay undescribed till the middle of the last century; and that on the revival of sound archaeology it was studied and most impressively described by some of our greatest scholars—Petrie, O'Donovan, Ferguson, and Dunraven—all told in its favor. . . . If we would seek out the history of this ancient fort, we must go back to an oft-told tale—that of 'the sons of Umór.' . . . The legend that centres at Dun Aengusa related to the period before the tribe of Fergus settled on the hills of Bureen, over three centuries before Lughad, Conall, and Enna, the conquering Dalcassian Princesses, on the edge of recorded history (A.D. 360-400), added the southern fringe of Connacht to north Munster, from which it eventually usurped the name Thomond. The song told how a Firbolg tribe—the Sons of Umór, or Huathmór—after an exile in the Hebrides, got settlements in the Boyne Valley. Oppressed by the perennial land question—their rack-rent paid to Tara—they fled to Connacht, were befriended by its heroic queen, 'Maevae of the Cattle Foray,' and were settled round Clew Bay and Galway Bay about the beginning of our era. They settled westward, along the pleasant coasts, as far as Dun Aengusa in Aran. The [Red Branch] knights who stood securities for the Firbolgs to the King of Tara claimed the penalty; so the Huamorian warriors, Cing, Cimbi, Irgus, and Conall (son of Aengus of Dun Aengusa), met in deadly combat the Red Branch knights—Ross, Conall-Cernach, Cet, and Cucbullin. The Firbolgs fell, and the settlements were broken up, leaving a legend and their reputed forts—'vacuae sedes et inania arcana'—as their monument to our days. . . . The existence of so mighty a fortress as Dun Aengusa or Dun Conor in these little islands has puzzled many. Whence came 'the troops of slaves who raised them?' has been asked. The probable explanation, in face of the evidences of modification, and addition in these and other stone forts, is that their construction spread over long periods of time, perhaps at intervals, rebuilding taking place as required. . . . In fact the collection of the stones was the main trouble; and if horses or oxen were

used, this was greatly lessened.' Instead of 'troops of slaves,' it is possible that a small tribe, working a few years at a time, at intervals over a couple of centuries, could, in a place where stone so abounded, build even a fortress as vast as the Aran 'Dun.'—T. J. Westropp, *Study of the fort of Dun Aengusa* (*Proceedings of the Royal Irish Academy*, v. 28, sect. c, pp. 1, 3, 6).

DUN COW, Book of the, ancient Celtic manuscript. See MYTHOLOGY: Celtic: Christian era.

DŪNA, or Southern Dvina, a river of Russia rising in the Tver government and flowing into the Gulf of Riga. It is from 500 to 600 miles long. During the World War it formed a barrier against the German advance.

DUNAAN, or Dsunovas (fl. 6th century), Arabian prince. See ABYSSINIA: 6th to 16th centuries.

DUNAJEC, a river of Galicia, now a part of Poland. Rises in the Carpathians and joins the Vistula about forty miles west of Cracow. Was the scene of protracted fighting during the World War.

DUNANT, Jean Henri (1828-1910), Swiss writer, the author of "Un souvenir de Solferino," a work which led to the Geneva convention in 1864 and the founding of the Red Cross Society in the same year. See NOBEL PRIZES: Peace: 1901; RED CROSS: Character and aim.

DUNBAR, a parliamentary borough in Haddingtonshire, Scotland.

1296.—Battle. See SCOTLAND: 1290-1305.

1339.—Siege.—The fortress of Dunbar, besieged by the English under the earl of Salisbury in 1330, was successfully defended in the absence of the governor, the earl of March, by his wife, known afterwards in Scotch history and tradition as "Black Agnes of Dunbar."

1650.—Battle. See SCOTLAND: 1650 (September).

DUNCAN I, king of Scotland, 1034-1040. See SCOTLAND: 1039-1054.

Duncan II, king of Scotland, 1093-1094.

DUNDALK, Battle of (1318). See IRELAND: 1314-1318.

DUNDEE, John Graham of Claverhouse, Viscount (c. 1649-1689), Scottish soldier; 1681, combined in himself the sheriffships of Wigton, Dumfries, Kirkcubright and Annandale, and was exceedingly active against the covenanters; in 1686, became major general; 1688, Viscount Dundee; supported the cause of James II, and after the escape of that monarch raised the flag of revolt in the Highlands against the new order; was mortally wounded at the Pass of Killiecrankie. He gained for himself the reputation of a cruel and ruthless persecutor of the covenanters, whom he "endeavored to destroy" by quartering his troops among them, and "eating up their provisions." Nevertheless he showed greatness in his leadership of the lost cause of James II, the last hope of which expired at his death. See SCOTLAND: 1679 (May-June); 1681-1689; 1689 (July).

DUNDEE, parliamentary borough and seaport in Forfarshire, Scotland; has fine docks, harbors and public buildings; important linen, jute and hemp manufactures, and is famous for its marmalade. Its estimated population in 1919 was 185,388.

1645.—Pillaged by Montrose. See SCOTLAND: 1644-1645.

1651.—Storm and massacre by Monk. See SCOTLAND: 1651 (August-September).

DUNDONALD, Thomas Cochrane, 10th earl of (1775-1860), British naval commander, critic of naval corruption. Entered Parliament, 1806; falsely accused and convicted of originating a fraudulent report of Napoleon's death for specula-

tive purposes, 1814; expelled from the navy and Parliament, but almost immediately reelected member for Westminster. Commanded the Chilean naval forces in their revolt against Spain, 1817-1822, during which period he contributed largely to their success; non-fulfillment of contracts caused him to resign; left the Chilean service for that of Brazil, 1823; commanded the Brazilian navy until 1825, when he fell out with the Brazilians and returned to Europe; commanded the Greek navy, 1827-1828. In 1832 he was exonerated from the charges on which he had been imprisoned in 1814 and restored to his rank in the British navy. See PERU: 1820-1826.

DUNES, Battle of (1658). See ENGLAND: 1655-1658.

DUNGANS, Dzungars or Tugani, Mohammedan tribe. See YAKUB BEG, DOMINION OF.

DUNKARDS, or Dunkers.—"The Dunkards or German Baptists, or Brethren, are of German origin, and trace their beginning back to Alexander Mack, of Schwartzenu, Germany. Early in the 18th century Mack and several others formed a habit of meeting together for the study of the New Testament. They were convinced that its doctrines and principles of church order were not being faithfully followed, either by the Lutheran or the Reformed Church. They therefore resolved to form a society of their own. Alexander Mack was chosen as their pastor. Persecution soon arose and they were scattered. In 1719 most of them got together and came to the United States, settling in Pennsylvania, where their first church was organized about 1723."—H. K. Carroll, *Religious forces of the United States*, ch. 19.—"As the Dunker communities in America grew in strength and power there was a gradual departure from the early form of government and method of discipline, which were distinctively congregational; and the district, state, and annual meetings became practically courts, much after the presbyterian system of polity. Against this there was considerable protest by those who held that the final power should be vested in the local church. The result was that in 1882, there was a division and those who preferred the simple congregational form of government withdrew and organized under the name of 'The Brethren Church' though they were generally known as 'Progressive Dunkers.' Of late years there has been a movement toward the reunion of the two bodies."—*United States Census, Religious bodies*, 1916, pt. 2, p. 162.—"As the outcome of . . . division there are three branches, known as the Conservative, the Progressive, and the Old Order Brethren. There is, besides, a fourth called the Seventh-Day Baptist, German. This was due to a secession from the Dunkards led by Conrad Beissel in 1728. Beissel and his disciples observed the seventh day of the week as the Sabbath and adopted a communal life."—H. K. Carroll, *Religious forces of the United States*, p. 131.—The latest statistics available in 1920 reported 1197 church organizations and 133,626 for these four, and a fifth division called Church of God or New Dunkers.—*United States Census, Religious bodies* 1916, pt. 2, p. 153.—The community founded by Conrad Beissel was named Ephrata. Celibacy was looked upon as a state of holiness, and while marriage was not forbidden it meant exclusion from the community, which was semi-monastic. The first house was built in 1735. The Sabbath school was begun about 1740, and was kept up for about thirty years, and the day school, which was excellent, was older. During the French and Indian Wars, the school, together with the meeting house and other buildings, was used as a refuge by the

inhabitants of neighboring settlements, and during the Revolutionary War (the school house was used) as a hospital for the revolutionary soldiers. In early times the members of the community wore a distinctive dress of white. It was not numerous even in its most prosperous days. Beissel, the founder, was the master spirit of the brotherhood, and with his death it sank into decay and dwindled to less than a score of people.

DUNKELD, Battle of. See CAMERONIAN REGIMENT; SCOTLAND: 1689 (August).

DUNKIRK (French Dunkerque), fortified port of France on the straits of Dover; engaged in manufacturing, shipbuilding, and fishing; an English possession from 1658 to 1662. According to the census statistics of 1911 its population was 38,801.

1631.—Unsuccessful siege by the Dutch. See NETHERLANDS: 1625-1647.

1646.—Siege and capture by the French.—Importance of the port.—Harborage of pirates. See NETHERLANDS: 1625-1647.

1652.—Recovered by the Spaniards. See FRANCE: 1652.

1658.—Acquired by Cromwell for England. See ENGLAND: 1655-1658; FRANCE: 1655-1658.

1662.—Sold by Charles II to France. See ENGLAND: 1662.

1713.—Fortifications and harbor destroyed. See UTRECHT: 1712-1714.

1748.—Demolition of fortifications again stipulated. See AIX-LA-CHAPELLE: Congresses: 2.

1763.—Demolition of fortifications pledged once more. See SEVEN YEARS' WAR: Treaties.

1793.—Unsuccessful siege by the English. See FRANCE: 1793 (July-December): Progress of the war of coalition.

1914-1918.—In the World War.—Dunkirk with other Channel ports of Calais and Boulogne, was for the Germans a military objective, but the French, Belgians and British successfully defended all three towns and preserved their lines of communication with England. Dunkirk, however, was subjected to long distance bombardment by the Germans during the latter part of the war. See CHANNEL PORTS; WORLD WAR: 1915: X. War in the air.

DUNMORE, John Murray, Earl of (1732-1800), English colonial governor of Virginia. See OHIO: 1774; VIRGINIA: 1775; 1775 (April-June); 1775-1776.

DUNMORE'S WAR (1774), Indian war waged on the western frontier of Virginia. See OHIO: 1774.

DUNNICHEN, Battle of (685). See SCOTLAND: 7th century.

DUNRAVEN, Edwin Richard Wyndham-Quin, Earl of (1812-1871), British archaeologist. See ROUND TOWERS.

DUNS SCOTUS, John (c. 1265-1308), "The spirit of opposition to the Thomistic system [see AQUINAS, THOMAS] found expression in the thought of John Duns Scotus, a native of England or Ireland and a member of the Franciscan order. . . . His fame rests not so much on his constructive ability as on his dialectical acumen and skill as a critic, his title, 'the subtle doctor,' being well earned. He was influenced by Roger Bacon and Alexander Hales, and regarded Augustine and Anselm as the highest authorities. The Franciscans made him the doctor of their order."—F. Thilly, *History of philosophy*, p. 208.—See also EDUCATION: Medieval: 9th-15th centuries: Scholasticism; ETHICS: 5th-15th centuries; EUROPE: Middle Ages: Thirteenth century, etc.; UNIVERSITIES AND COLLEGES: 1348-1826.

DUNSTABLE, John (1370-1453), earliest of the English composers, sometimes called the inventor of composition. A Spanish manuscript, in the Escorial (Spain), makes reference to him as the first man to compose music, and continental contemporaneous writers recognized him as their model. Little is known of his work, but recent discoveries in the libraries of Oxford, Modena, Bologna and Trent include masses, motets, antiphones, French and Italian songs.

DUNSTAN, St. (c. 925-988), English scholar, archbishop of Canterbury. See ENGLAND: 959-975; ENGLISH LITERATURE: 6th-11th centuries.

DUNSTER FORCE, British division operating in the Caucasus and Mesopotamia under General Dunsterville during the World War. See WORLD WAR: 1918: VI. Turkish theater: b, 6; b, 9.

DUNSTERVILLE, Arthur Bruce (1859-), British general serving in Mesopotamia and in the Caucasus during the World War. See WORLD WAR: 1918: VI. Turkish theater: b, 6; b, 8; b, 9.

DUPES, Day of (1630), famous in French history because of Richelieu's unexpected victory in 1630. See FRANCE: 1630-1632.

DUPIN, André Marie Jean Jacques (1783-1865), French lawyer and statesman. Defender of the rights of the bourgeoisie; counselor and procurator general of the Cour de Cassation in the reign of Louis Philippe; president of Chamber of Deputies, 1832-1840; president of legislative committee which drafted the constitution after the revolution of 1848. See FRANCE: 1899 (February-June).

DUPLEIX, Joseph François, Marquis (1697-1763), French statesman and administrator. He was governor-general of the French possessions in India from 1742 to 1754, and contended unsuccessfully against the spread of British influence in India. See INDIA: 1743-1752.

DUPLEX PRINTERS' CASE. See **BOYCOTT**: 1921.

DUPONT, Samuel Francis (1803-1865), American admiral. Leader of an attack on Charleston, South Carolina (1863) in which he was defeated. See U. S. A.: 1863 (April: South Carolina).

DÜPPEL, town on the eastern coast of Schleswig. See **GERMANY**: 1861-1866.

DUPPELN, Battle of (1848). See **DENMARK**: 1848-1862.

DUPPLIN MOOR, Battle of (1332). See **SCOTLAND**: 1332-1333.

DUPRÉ, Jules (1812-1889), French painter, one of the chief members of the Barbizon school. See **PAINTING: Europe** (19th century).

DUPUY, Charles Alexandre (1851-), French statesman. Minister of public instruction, 1892; president of chamber of deputies, 1893; premier and minister of interior, 1893-1895; 1898-1899; elected senator for Haute-Loire, 1900. See FRANCE: 1899 (February-June).

DUPUY, Raymond (1080-1160), French Grand Master of Malta; organizer of the Hospitallers of St. John. See **HOSPITALLERS OF ST. JOHN OF JERUSALEM, KNIGHTS**: 1118-1310.

DUQUESNE, Abraham (1610-1688), French naval commander, famous for his defeat of the Danish fleet in 1643 and his expeditions against pirates. See **BARBARY STATES**: 1664-1684.

DUQUESNE, Fort, French fort established in 1754 on the present site of Pittsburgh. See **CANADA**: 1758.

DURA, Treaty of, the humiliating treaty of peace concluded with the Persians, A. D. 363, by

the Roman emperor Jovian, after the defeat and death of Julian, his predecessor.—G. Rawlinson, *Seventh great oriental monarchy*, ch. 10.

DURAND DE VILLEGAGNON, Nicholas (1510-1571), French Huguenot in command of an expedition which arrived in the Bay of Rio de Janeiro in 1555. See **FLORIDA**: 1562-1563.

DURANGO, state and city of the same name in north-central Mexico. See **MEXICO**: 1910-1913.

DURANI, powerful Afghan race; and name taken by Ahmed Abdalee and his followers, when the former founded the Durani dynasty, on the death of Nadir Shah of Persia. See **INDIA**: 1747-1761.

1753.—Conquest of Kashmir. See **KASHMIR**.

DURANT, Henry Fowle (Henry Welles Smith) (1822-1881), American lawyer and philanthropist; founder of Wellesley college. See **GIFTS AND BEQUESTS**.

DURAZZO, Neapolitan dynasty of. See **ITALY (Southern)**: 1343-1389; 1386-1414; 1412-1447.

DURAZZO, seaport of Albania (see BALKAN STATES: Map) called by the ancients Epidamnus and later Dyrrhachium.

Origin of the city (B. C. 625). See **CORCYRA**.

Provoking cause of the Peloponnesian war. See **GREECE**: B. C. 435-432.

B. C. 48.—Cæsar's reverse. See **ROME: Republic**: B. C. 48.

1081-1082.—Siege by Robert Guiscard. See **BYZANTINE EMPIRE**: 1081-1085.

1204-1318.—Held by the despot of Epirus. See **EPIRUS**: 1204-1350; **ALBANIA: Medieval period**.

1501.—Under Turkish rule. See **ALBANIA**: 1478-1880.

1912.—Captured by Serbians. See **BALKAN STATES**: 1912-1913; **TURKEY**: 1912-1913.

1914-1918.—Occupied by Italians during the World War.—Durazzo was occupied by the Italian troops (December, 1915) with the consent of Essad Pasha, an Albanian who had established a principality of his own after the flight of Prince William of Wied in 1914. At the close of the war the Italians evacuated Durazzo. See **WORLD WAR**: 1914: III. Balkans: e; 1915: IX. Naval operations: b, 5; 1916: V. Balkan theater: a; 1917: IX. Naval operations: b, 1 and 2.

DURBAR (Persian Darbar), Indian court or levee, originally used for the hall or palace in which judgments or decrees were promulgated, the word has come to mean an audience given by an officer of state, especially by the king-emperor or his son, the viceroy or one of the governors, or by one of the native princes. A durbar is held with great state, and splendor of ceremonial, and only on occasions of importance. For instance, Lord Lytton, as viceroy, held a great durbar in 1877 when Queen Victoria was proclaimed empress; Edward VII was proclaimed emperor at a durbar held by Lord Curzon in 1903; George V held a durbar of unusual magnificence in 1911, when he was crowned emperor of India. Imperial durbars are held at Delhi, which has been proclaimed capital of the country. See also INDIA: 1903 (January); DELHI: 1911.

DÜRER, Albrecht (1471-1528), German painter, draughtsman and engraver; artist *par excellence* of the German Renaissance; native of Nuremberg; journeyed twice to Italy and twice to the Netherlands; the Emperor Maximilian was his friend and patron; left an immense number of works, oil-paintings, wood-cuts, and copper-engravings; productions in these two latter groups are conceded to be the greatest of their kind; was also the author of several treatises on geometry, human proportions, etc. See **PAINTING: German**.

DURHAM, northern county of England, the ancient palatinate of Durham. There is a city of the same name, the county town of Durham, noted for the beauty of its cathedral and its fine 16th century town hall. The county has important lead, zinc and coal mines, and, depending upon the coal mines extensive manufactures, such as ship-building on the Tyne, iron manufactures, paper, glass, bottles, earthenware, chemicals. Even before the conquest the bishops of Durham had a considerable amount of political power over their possessions which by the receipt of gifts and endowments had grown to large proportions.

684.—Origin.—First grant of land by Egrith to Cuthbert, bishop of Lindisfarne.

9th century.—Endowment by Guthred the Dane.—The county was endowed by Guthred the Dane with the district between the Tyne and Wear, extending west to Watling street.

995.—Establishment of see.—The see of Dunholme was established when the monks of Lindisfarne carried there the remains of St. Cuthbert to save them from desecration by the Danes.

1075-1596.—Exercise of princely powers.—In 1075 Bishop Walcher bought the earldom of Northumbria, and claimed princely powers. Thenceforth the diocese had its own government, the development of which coincided closely with the regal government, and at one time the bishop even protested against the ecclesiastical overlordship of the archbishop of York. Various efforts were made to curtail the power of the bishops, and in 1536 the act of Resumption took from them power of appointing the judiciary, or pardoning offenses against the law. The terms of this act show clearly the powers which had been wielded by the bishops. Hereafter, it states, the name of the king was to be substituted in legal proceedings for the name of the bishop; offenses were to be said to be against the king's peace and not the peace of the bishop. In 1596 further restrictions were made.

1646-1836.—Change in jurisdiction.—In 1646 during the Protectorate the palatinate was abolished; but after the restoration it was revived, and existed until 1836 when by Act of Parliament jurisdiction was vested in the crown.

DURHAM, John George Lambton, 1st Earl of (1792-1840), English statesman. In 1813 he went to parliament as the Liberal member for Durham. He was one of the four framers of the Reform Bill of 1832. After fulfilling two missions to Russia, once as ambassador extraordinary, he was appointed governor-general of Canada (1838). This post he relinquished later because of the animosity of Lord Brougham. He was an advocate of liberal changes in colonial policy, and his views were embodied in the famous *Report on the Affairs of British North America*, 1839. See CANADA: 1838-1843.

DURHAM, Battle of (1346). See NEVILLE'S CROSS OR DURHAM, Battle of.

DUROBRIVÆ.—A name given to two Roman towns in Britain, one of which has been identified with modern Rochester, the other with the town of Castor, near Peterborough.

DUROBRIVIAN WARE. See CASTOR WARE.

DUROC, Geraud Christophe Michel, Duc de Frioul (1772-1813), French general and diplomatist. As grand marshal of the palace he was at the head of the imperial household and was Napoleon's trusted friend and confidant.

DUROCOBRIVÆ.—An important market-town in Roman Britain, supposed to have been situated at or near modern Dunstable.—T. Wright, *Celt, Roman, and Saxon*, ch. 5.

DUROTRIGES. See BRITAIN: Celtic tribes.

DUROVERNUM, Roman town in Britain identified with modern Canterbury. See CANTERBURY.

DURY, town in France, south of Amiens. See WORLD WAR: 1918: II. Western front: 1:1.

DURYEA, Charles E., American automobile mechanic, builder of the first American gasoline car in 1892. See AUTOMOBILES: 1889-1905.

DUSHAN, Stefan. See STEPHEN DUSHAN.

DÜSSELDORF, town on the right bank of the Rhine in Germany. Its rapid growth and industrial development were due largely to its position at the junction of several main railway lines. The town suffered greatly in the Thirty Years' War and the War of the Spanish Succession. In 1795 it was surrendered to the French and in 1805 it became the capital of the Napoleonic duchy of Berg. Ten years later it passed once more into Prussian possession. See EDUCATION: Modern developments: 20th century: World War and education: Re-education; FRANCE: 1921 (March).

DUTCH EAST INDIA COMPANY. See EAST INDIA COMPANY, Dutch.

DUTCH EAST INDIES, the Dutch possessions in the Malay archipelago, including among others Sumatra, Celebes, Madura, Java, Banca and Lombok. See MALAY ARCHIPELAGO; CELEBES; FLORES; JAVA; LOMBOK; SUMATRA; RAILROADS: 1919: Dutch East Indies; U. S. A.: 1921 (April-July).

DUTCH GAP CANAL. See U. S. A.: 1864 (August: Virginia).

DUTCH REFORMED CHURCH. See CHRISTIAN REFORMED CHURCH.

DUTCH GUIANA. See GUIANA.

DUTCH REPUBLIC, modern Netherlands. It was formerly a state which gained its independence from Spain in 1581 and converted into the Batavian republic in 1795. See NETHERLANDS: 1577-1581; 1584-1585; 1648-1665.

DUTCH SCHOOL OF PAINTING. See PAINTING: Dutch.

DUTCH WEST INDIA COMPANY, established in 1621 with rights to a monopoly of trade and colonization on the American and African coasts. See DELAWARE: 1629-1631; 1638-1640; 1640-1656; 1664; NEW YORK: 1621-1646; 1664-1674; BRAZIL: 1510-1661.

DUTCH WEST INDIES. See WEST INDIES.

E

EADMUND, or **Edmund** (c. 981-1016), king of England at the time of the Danish conquest; known as "Ironside." See **ENGLAND**: 979-1016.

EADWARD. See **EDWARD**.

EAGAN, Charles Patrick (1841-), American general. See **U. S. A.**: 1898-1899.

EALDORMAN.—"The chieftains of the first settlers in our own island bore no higher title than Ealdorman or Heretoga. . . . The name of Ealdorman is one of a large class; among a primitive people age implies command and command implies age; hence in a somewhat later stage of language the elders are simply the rulers and the eldest are the highest in rank, without any thought of the number of years which they may really have lived. It is not perfectly clear in what the authority or dignity of the King exceeded that of the Ealdorman. . . . Even the smallest Kingdom was probably formed by the union of the districts of several Ealdormen."—E. A. Freeman, *Norman conquest*, ch. 3, sect. 1.—"The organisation of the shire was of much the same character as that of the hundred [each shire containing, however, a number of hundreds], but it was ruled by an ealdorman as well as by a gerefa, and in some other respects bore evidence of its previous existence as an independent unity. Its gemot was not only the scir-gemot but the folc-gemot also, the assembly of the people; its ealdorman commanded not merely the military force of the hundreds, but the lords of the franchises and the church vassals with their men. Its gerefa or sheriff collected the fiscal as well as the local imposts. Its ealdorman was one of the king's witan. The ealdorman, the princeps of Tacitus, and princeps, or satrapa, or subregulus of Bede, the dux of the Latin chroniclers and the comes of the Normans, was originally elected in the general assembly of the nation. . . . The hereditary principle appears however in the early days of the kingdom as well as in those of Edward the Confessor; in the case of an under-kingdom being annexed to a greater the old royal dynasty seems to have continued to hand down its delegated authority from father to son. The underkings of Hwiccia thus continued to act as ealdormen under Mercia for a century; and the ealdormanship of the Gyrwas or fen-countrymen seems likewise to have been hereditary. The title

of ealdorman is thus much older than the existing division of shires, nor was it ever the rule for every shire to have an ealdorman to itself as it had its sheriff. . . . But each shire was under an ealdorman, who sat with the sheriff and bishop in the folkmoet, received a third part of the profits of the jurisdiction, and commanded the military force of the whole division. From the latter character he derived the name of heretoga, leader of the host ('here'), or dux, which is occasionally given him in charters."—W. Stubbs, *Constitutional history of England*, ch. 5, sects. 48-49.—See also **ENGLAND**: 959-975.

EARL.—"The title of earl had begun to supplant that of ealdorman in the reign of Ethelred; and the Danish jarl, from whom its use in this sense was borrowed, seems to have been more certainly connected by the tie of comitatus with his king than the Anglo-Saxon ealdorman need be supposed to have been."—W. Stubbs, *Constitutional history of England*, ch. 6, sect. 66.—See also **EORL**; **EALDORMAN**.

EAST INDIA COMPANY, British.—The British East India Company was incorporated, Dec. 31, 1600, by a royal charter of Queen Elizabeth under the title of "the Governor and Company of Merchants of London, trading into the East Indies." This charter was to run for fifteen years but in 1609 it was renewed in perpetuity save that it might be revoked for the good of the kingdom, on three years' notice. The first governor was Sir Thomas Smythe and there originally were only 125 stockholders. "When the hundred years of the Portuguese monopoly of Asiatic trade with Europe came to an end with the appearance of the Dutch in 1596 and of the English in 1600 in Asiatic seas, the merchants of the two great Protestant trading nations made first for the Spice Islands. It was the peppers, and the spices of the Further East that promised the largest profits; and the first factories as the establishments were called where stocks . . . were collected for conveyance to Europe by the annual fleet, were founded by both the Dutch and the English in the islands of Java and Sumatra. The rivalry between the Dutch and the English merchants was extreme, . . . but as the seventeenth century proceeded the rival nations gradually separated their areas of Asiatic trade. The Dutch East India Company devoted itself mainly to the importation of peppers and spices, and for this reason concentrated its energies upon the Spice Islands, Ceylon and the Malabar coast of India, while the London East India Company, without surrendering its desire to compete in this lucrative business, fixed its attention rather upon India, and fostered its trade with Surat and Bengal and, after its foundation in 1639, with Madras. Towards the close of the seventeenth century, when English power in Europe was increasing while that of the Dutch was waning, the affairs of the London East India Company were vigorously managed by a great statesman. Sir Josiah Child, whose imperial ideas forshadowed a century before their time the great events which were to make the English masters of India, resolved to press the claims of his Company to a larger share of the trade of the Further East. He was unable, indeed, to recover Bantam in Java (which had for a time been the London East India Company's chief spice and pepper factory) owing to the intrigues of the Dutch, but the expedition sent for that purpose in 1684 founded a factory at Bencoolen in Sumatra, protected by fort Marlborough, which became eventually the nucleus of

the East India Company's establishments in the Further East. He made vigorous efforts to open up a profitable trade with China and Japan, but there likewise the Dutch were before him and a long time was to elapse before the English traded on an equality with the Dutch in those distant seas. Batavia, the capital of the Dutch Indies, was better placed than Calcutta or Madras to control the trade of the Further East; and the English writers in the beginning of the eighteenth century describe in bitter terms the relentless opposition of the Dutch to all their efforts to establish themselves in their rival's sphere of influence. It was true that the Dutch and the English were allies in Europe and fought side by side against France in the war of the Spanish Succession, but at that very time appeared Hall's History of the Barbarous Cruelties and Massacres committed by the Dutch in the East Indies, a little book which had a wide circulation and exerted considerable influence at the time of its publication in 1712. The English free merchants or 'interlopers,' as they were officially termed, made great inroads on the monopoly of the Dutch trade in the Further East, as well as on that of the chartered English merchants, as can be seen from the pages of that most entertaining of interloping sea-captains, Alexander Hamilton, whose New Account of the East Indies, published in 1727, is full of narratives of his successfully outwitting both Dutch and English officials. During the first half of the eighteenth century the interlopers carried on the brunt of the fight with the Dutch, while the East India Company's station at Bencoolen was harassed from Batavia and prevented from making adequate returns for the capital expended for its maintenance. But the middle year of the century witnessed a change in the situation. The triumphs of the English in India reacted upon their positions in the Further East. Clive's daring in facing responsibility, and the victory of Forde over the Dutch expedition sent into Bengal in 1759, definitely assured the predominance of the English in the Further East as well as India, and when Warren Hastings came to the helm of the East India Company's affairs in India, a fresh effort was made to use the recognised power and prestige of the Company's government to expand the volume of English trade in the Malay Peninsula, in the Spice Islands and in China seas. The triumphant conclusion of the struggle with France for the predominance in India extended the sphere of influence of the East India Company to the eastern side of the Bay of Bengal. In earlier years their attempt to open trade with Burma and Siam had culminated in disaster. In 1687, the Company's servants at Mergui in Tenasserim, where a trade had been opened with the Siamese, were massacred, and a similar slaughter at Negrais in 1750 closed the attempt commenced six years earlier to open up commerce with the Burmese. But the free-trading or 'interloping' captains continued to carry on their venturesome business of commerce without intervention of protection of forts or factories."—H. M. Stephens, *Administrative history of the British dependencies in the Further East*, pp. 5-6.—In 1833 the company lost its trade monopoly and in 1858 its political power was transferred to the crown. The later history of the company is so woven into the history of India itself that the reader is referred to the following sections, INDIA: 1600-1702: 1679-1823; 1660-1720; 1757-1772; 1770-1773; 1784; 18.3-1833; 1853; 1857; 1858-1863.—See also BRITISH EMPIRE: Expansion: 17th century: India; ENGLAND: 1832-1833; OUDE; STRAITS SETTLEMENTS: Conquest and settlement; TARIFF: 17th-18th centuries; 1689-1721.

EAST MARCH.—In its German form it gave its name to Austria (Oesterreich). See **AUSTRIA**: Introduction; Birthplace.

EAST ST. LOUIS, St. Clair county, Illinois, was incorporated as a town in 1861, and obtained a city charter in 1865. It is an important manufacturing centre, and is also known for its stockyards. In 1917 the famous race riots occurred there.—See also **RACE PROBLEMS**: 1905-1921.

EASTER, a holy day, commemorating the resurrection of Christ. There was a theological dispute between the representatives of the Irish and Roman churches over the date of Easter. See **CELTIC CHURCH**: 597-817; **PAPACY**: Supremacy of the Roman See.

EASTER ISLAND: **Geography**.—**Discovery**.—**Ancient culture**.—**Social life**.—Easter Island, about thirteen miles long and at most seven miles broad, lies 2,000 miles west of South America and 1,700 from Rapa. It was first discovered by Roggeveen on Easter day, 1722. At that time the Polynesian inhabitants probably numbered between 2,000 and 3,000. In 1863 a large number of natives were kidnapped and transported to Peru to work on the guano diggings. The following year a Jesuit mission reached the island and Christianized the few inhabitants who had been left behind. "The famous Easter Island images are stone carvings representing men from their waist upwards, with hands sometimes nearly meeting in front. The most remarkable features are the greatly distended lobes of the ears, within which a disc is occasionally indicated. They vary in height from 6 ft. to 30 ft., but are usually from 12 ft. to 20 ft. high; some were surmounted by a cylindrical stone hat of red lava. Great numbers of these are to be seen, mostly in a broken condition, some near the sites where they were erected. Most lie near the quarries from whence they were hewn; others, again, remain in process of manufacture, not yet separated from the parent rock where they were carved, in a recumbent or standing position. Usually several

statues were erected on quadrangular platforms of stones, *ahu*. . . No one now living remembers a statue standing on a terrace; but we know from the accounts of the early voyagers that the statues, or the greater number of them, were still in place in the eighteenth century, and by the early part of the nineteenth century not one was standing. The images owed their fall to deliberate vandalism during the internecine warfare . . . in Easter Island. . . . A unique feature in the former culture of Easter Island were the famous tables with incised ideographs. These were made by professors in the art, who had isolated houses in various localities where they taught their pupils. No transliteration of the tablets can now be made; those that have been published by previous writers cannot be accepted as veracious. . . . The whole of social existence revolved round the bird cult, and it was the last of the old order to pass away. The main object of the cult was to obtain the first egg laid by the migratory sooty tern on three rocky islets. The winner of the egg, known as the bird-man, remained for a year in an isolated house, five months of which were spent in strict *tabu*. He did not wash, and spent his time sleeping all day, and only came out to sit in the shade. Food was brought as a gift; those who did not contribute were apt to have their houses burnt. The bird-man, however, did not actually obtain the egg; this was secured for him by a servant, who also had to be secluded. . . . It has been suggested that the builders of the ancient monuments were some mysterious people who have disappeared; but we may now regard the remains as having been made by the ancestors of the present population. Large platforms, truncated pyramidal and other structures of variously sized stones, were widely distributed throughout Oceania, and, though those of Easter Island have local peculiarities, they fit in with the general scheme of such structures elsewhere. . . . Easter Island thus presents itself as an isolated variant of a farflung culture. The inhabitants are Polynesians, but, like so many other Polynesians, they exhibit considerable variation in physical characters. There are also traces of complexity in the culture of Polynesia which point to another racial element. . . . The artificially extended lobes of the ears, sometimes with inserted large discs, and the prominent overhanging brow of the statues, the aquiline nose of the wooden figures; and more particularly the carvings in relief of sooty terns and symbolic bird-men and various ideographic signs in the script have close parallels in Melanesia, and especially in the Solomon Islands. . . . We may thus provisionally conclude that a migration with at least a very strong Melanesian element first reached Easter Island, and that at a later time a wave of Polynesian immigrants arrived and dominated the long-eared Melanesians, though retaining many of the old customs."—*Times* (London) *Literary Supplement*, January, 1920.—See also **PACIFIC OCEAN**: People; B. EASTERN ORTHODOX CHURCH.—"The Eastern Orthodox Churches, known historically as the 'Eastern Church,' and in modern times as the 'Greek Orthodox Church,' the 'Eastern Catholic Church,' the 'Holy Orthodox Catholic Apostolic Eastern Church,' and popularly as the 'Greek Church' are the modern representatives of the Church of the Byzantine Empire. . . . The organization for the general government of the different Orthodox Churches varies in different countries. In general there is a council, at the head of which, as president, is a bishop elected usually by the people. Historically and at present in some cases, this presiding bishop is called patriarch. . . . The most important service is the liturgy, the chief part of which is the celebration of the Eucharist."—U. S. Census, *Religious bodies*, 1916, pt. 2, 250-251.—See also CHRISTIANITY: 330-606; 9th-10th centuries; 11th-13th centuries: Extent of Christendom; ECCLESIASTICAL LAW: 1453-1917; FILIOQUE CONTROVERSY; IDOLATRY AND IMAGE WORSHIP: 8th-10th centuries; PAPACY: Supremacy of the Roman See; 1198-1303; 1431-1448; 1894; SLAVS: 1830-1914; EUROPE: Map of central Europe: 1618.

EASTERN QUESTION.—The term "Eastern question" has been applied to the problems involved in the destinies of various countries of Asia. The Near-Eastern, or Eastern, question concerns the parts of the former Turkish empire, while that of the Far East deals with China, Japan, Korea and adjacent territories. In recent years the term "Middle East" has come to be applied to Persia, India and Afghanistan. The first occasion on which the problems of the Ottoman empire received the name of the Eastern question seems to have been that connected with the revolt of Mehemet Ali in 1031 (see TURKEY: 1831-1840). M. Guizot, in his "Memoirs," when referring to that complication, employs the term, and remarks: "I say the Eastern Question, for this was in fact the name given by all the world to the quarrel between the Sultan Mahmoud, and his subject the Pacha of Egypt, Mehemet Ali. Why was this sounding title applied to a local contest? Egypt is not the whole Ottoman empire. The Ottoman empire is not the entire East. The rebellion, even the dismemberment of a province, cannot comprise the fate of a sovereignty. The great states of Western Europe have alternately lost or acquired, either by internal dissension or war, considerable territories; yet under the aspect of these circumstances no one has spoken of the Western question. Why then has a term never used in the territorial crises of Christian Europe, been considered and admitted to be perfectly natural and legitimate when the Ottoman empire is in argument? It is that there is at present in the Ottoman empire no local or partial question. If a shock is felt in a corner of the edifice, if a single stone is detached, the entire building appears to be, and is in fact, ready to fall. . . . The Egyptian question was in 1830 the question of the Ottoman empire itself. And the question of the Ottoman empire is in reality the Eastern question, not only of the European but of the Asiatic East; for Asia is now the theatre of the leading ambitions and rivalries of the great powers

of Europe; and the Ottoman empire is the highway, the gate, and the key of Asia."—F. P. Guizot, *Memoirs to illustrate the history of my own time*, v. 4, p. 322.—Among English writers, the term "the Eastern question" has acquired a larger meaning, which takes in questions connected with the advance of Russia upon the Afghan and Persian frontiers.—Duke of Argyll, *Eastern question*.—"From time immemorial Europe has been confronted with an 'Eastern Question.' In its essence the problem is unchanging. It has arisen from the clash in the lands of South-Eastern Europe between the habits, ideas, and preconceptions of the West and those of the East. But although one in essence, the problem has assumed different aspects at different periods. In the dawn of authentic history it is represented by the contest between the Greeks and the Persians, the heroic struggle enshrined in the memory of Marathon, Thermopylae, and Salamis. To the Roman the 'Eastern Question' centred in his duel with the great Hellenistic monarchies. In the early Middle Ages the problem was represented by the struggle between the forces of Islam and those of Christianity. That struggle reached its climax, for the time being, in the great battle of Tours (732). The chivalry of Western Europe renewed the contest, some centuries later, in the Crusades. The motives which inspired that movement were curiously mixed, but essentially they afforded a further manifestation of the secular rivalry between Cross and Crescent; a contest between Crusaders and Infidels for possession of the lands hallowed to every Christian by their association with the life of Christ on earth. . . . In the vocabulary of English diplomacy the 'Eastern Question' was not included until the period of the Greek War of Independence (1821-9), though the phrase is said to be traceable at least as far back as the battle of Lepanto (1571). A definition of the 'Question,' at once authoritative and satisfactory, is hard to come by. . . . The 'Eastern Question' may be taken . . . to include: First and primarily: The part played by the Ottoman Turks in the history of Europe since they first crossed the Hellespont in the middle of the fourteenth century; secondly: The position of the loosely designated Balkan States, which, like Greece, Serbia, Bulgaria, and Roumania, have gradually re-emerged as the waters of the Ottoman flood have subsided; or like Montenegro, were never really submerged; or, like Bosnia, the Herzegovina, Transylvania, and the Bukovina, have been annexed by the Habsburgs; thirdly: The problem of the Black Sea; egress therefrom, ingress thereto; the command of the Bosphorus and the Dardanelles, and, above all, the capital problem as to the possession of Constantinople; fourthly: The position of Russia in Europe; her natural impulse towards the Mediterranean; her repeated attempts to secure permanent access to that sea by the narrow straits; her relation to her co-religionists under the sway of the Sultan, more particularly to those of her own Slavonic nationality; fifthly: The position of [the former] Habsburg Empire, and in particular its anxiety for access to the Aegean, and its relations, on the one hand, with the Southern Slavs in the annexed provinces of Dalmatia, Bosnia, and the Herzegovina, as well as in the adjacent kingdoms of Serbia and Montenegro; and, on the other hand, with the Roumans of Transylvania and the Bukovins; and finally: The attitude of the European Powers in general, and of England in particular, towards all or any of the questions enumerated above."—J. A. R. Marriott, *Eastern question*, pp. 1-3.—See also AFGHANISTAN: 1869-1881; BALKAN STATES: Geographical position; 1878; 1912; 1913; BERLIN, CONGRESS OF; BOS-

PORUS: 1914-1918; 1832-1878; ENGLAND: 1873-1880; RUSSIA: 1853-1854; 1854-1856; TURKEY: 1831-1840; 1861-1877; 1877-1878; 1878.

EASTERN RUMELIA, name given to that portion of the Balkan peninsula which lies between the Balkan mountains on the north and Thrace in the south. It is inhabited predominantly by Bulgarians. The Treaty of Berlin of 1878 left Eastern Rumelia under Turkish domination. [See BALKAN STATES: 1878.] But in 1885 a popular revolt overthrew the authority of the Sultan and led to union with the principality of Bulgaria. See BULGARIA: 1885-1886; BALKAN STATES: 1885; THRACE: 1878-1913.

EASTPHALIA or Eastfalia, one of the three main divisions of the old Duchy of Saxony as it existed under the Carolingian empire. See SAXONY.

EATON, Dorman Bridgman (1823-1899), American lawyer, prominent in civil service reform; on Civil Service commission; drafted Pendleton Act; author of several books on civil service and municipal government. See CIVIL SERVICE REFORM: United States: 1870-1880.

EATON, Theophilus (c. 1500-1658), first colonial governor of New Haven. See CONNECTICUT: 1638.

EATON, William (1764-1811), American naval agent to Barbary states; consul at Tunis, 1799-1803. See U. S. A.: 1806-1807.

EBBSDORF, or Luneburg Heath, Battle of (A. D. 880), fought in old Saxony, the northwestern part of modern Germany between the Germans and the Danes, or Northmen. The Germans were terribly beaten, and nearly all who survived the fight were swept away into captivity and slavery. The slain received "martyrs' honours; and their commemoration was celebrated in the Sachsen-land churches till comparatively recent times. An unexampled sorrow was created throughout Saxony by this calamity, which, for a time, exhausted the country;—Scandinavia and Jutland and the Baltic isles resounded with exultation."—F. Palgrave, *History of Normandy and England*, bk. 1, ch. 4.

EBBSFLEET, now Cliff's End, Isle of Thanet, Kent, supposed first landing-place in Britain of the Jutes, under Hengest, 440 or 450, when English history, as England, begins. It was also the landing-place, 597, of Augustine and his fellow missionaries when they entered the island to undertake the conversion of its new inhabitants to Christianity. See ENGLAND: 440-473; 597-685.

EBENEZER, Battle of. See JEWS: Israel under the Judges.

EBENEZER COMMUNITY, German religious communistic society. See SOCIALISM: 1843-1874.

EBERSBURG, Battle of. See GERMANY: 1809 (January-June).

EBERS, Georg Moritz (1837-1898), German Egyptologist and novelist. He discovered and edited the famous medical papyrus known as the "Papyrus Ebers," which is now in the library of the University of Leipzig. Perhaps his most important scientific work is "Ägypten und die Bücher Moses" (1867-1868).—See also MEDICAL SCIENCE: Ancient; Egyptian and Babylonian; SCIENCE: Egyptian and Babylonian.

EBERT, Friedrich (1870-), German statesman and president of German republic. Elected to

the Reichstag in 1908 and attained prominence as an advocate of socialism; presided at the Socialist Congress at Würzburg in 1917, and was appointed leader of the Socialist Majority party. Foreseeing the coming of defeat to the German army, he urged that the war be ended; elected President of the German republic, March, 1919. See GERMANY: 1918 (November); 1919.

EBIONISM, the heresy (so branded) of a sect of Jewish Christians, which spread somewhat extensively in the second, third, and fourth centuries. "The characteristic marks of Ebionism in all its forms are: degradation of Christianity to the level of Judaism; the principle of the universal and perpetual validity of the Mosaic law; and enmity to the apostle Paul." The name of the Ebionites came from a Hebrew word signifying "poor."—P. Schaff, *History of the Christian church, second period*, ch. 4, sect. 68.—See also CHRISTIANITY: 100-300: Syrian churches.

EBLANI. See IRELAND: Tribes of early Celtic inhabitants.

EBOLOWA, town in the Cameroons, West Africa, occupied by the French in 1915. See WORLD WAR: 1915: VIII. Africa: c, 6.

EBONITE, black variety of hard rubber. See INVENTIONS: 19th century: Industry.

EBORACUM, or Eburacum (York).—Military capital of Roman Britain, and afterwards of the Anglian kingdoms of Deira and Northumbria. In Old English its name became Eorforwick, whence, by further corruption, resulted the modern English name York. The city was one of considerable splendor in Roman times, containing the imperial palace with many temples and other imposing buildings. See ENGLAND: 547-633; YORK.

EBURONES, Destruction of.—The Eburones were a strong Germanic tribe, who occupied in Cæsar's time the country between Liège and Cologne, and whose ancestors were said to have formed part of the great migrant horde of the Cimbric and Teutones. Under a young chief, Ambiorix, they had taken the lead in the formidable revolt which occurred among the Belgic tribes, 54-53 B. C. Cæsar, when he had suppressed the revolt, determined to bring destruction on the Eburones, and he executed his purpose in a singular manner. He circulated a proclamation through all the neighboring parts of Gaul and Germany, declaring the Eburones to be traitors to Rome and outlaws, and offering them and their goods as common prey to any who would fall on them. This drew the surrounding barbarians like vultures to a feast, and the wretched Eburones were soon hunted out of existence. Their name disappeared from the annals of Gaul.—C. Merivale, *History of the Romans*, ch. 10.—See also BELGÆ; GAUL: B. C. 58-51.

ALSO IN: Cæsar, *Galic Wars*, bk. 5, ch. 25-58; bk. 6, ch. 1-34.—G. Long, *Decline of the Roman republic*, v. 4, ch. 13-14.

ECBATANA, capital of Astyages, last ruler of the Median Empire captured by Cyrus, 549 B. C. It was afterwards the summer residence of the kings of Persia, and later was made the capital of the kings of Parthia. "The Southern Ecbatana or Agbatana,—which the Medes and Persians themselves knew as Hagmatân,—was situated, as we learn from Polybius and Diodorus, on a plain at the foot of Mount Orontes, a little to the east of the Zagros range. [See BABYLONIA: Map of Egyptian, Assyrian, Babylonian and Median powers.] The notices of these authors . . . and others, render it as nearly certain as possible that the site was that of the modern town of Hamadan. . . . The chief city of northern Media, which bore in later times the names of Gaza, Gazaca, or Canzaca, is

by side with texts from the Bible. Isidore's forgeries were received as genuine; ampler collections were made. The names of Regino of Prüm, who wrote early in the tenth, of Burchard of Worms, who wrote early in the eleventh, of Ivo of Chartres, who died early in the twelfth century, stand out among those of the compilers. A chronological arrangement of materials gave way to a logical and legal arrangement, and the compiler would sometimes weave his quotations together with notes and speculations of his own, would go near to writing something that we should call a text-book."—F. Pollock and F. W. Maitland, *History of English law*, v. 1, pp. 90-91.

449-1066.—**Distinction between lay and ecclesiastical jurisdiction.**—"In the time of our Saxon ancestors, there was no sort of distinction between the lay and the ecclesiastical jurisdiction: the county court was as much a spiritual as a temporal tribunal; the rights of the church were ascertained and asserted at the same time, and by the same judges, as the rights of the laity. For this purpose the bishop of the diocese, and the alderman, or, in his absence, the sheriff of the county, used to sit together in the county court, and had there the cognizance of all causes, as well ecclesiastical as civil: a superior deference being paid to the bishop's opinion in spiritual matters, and to that of the lay judges in temporal."—W. Blackstone, *Commentaries*, bk. 3, p. 61.

1066-1087.—**Separation of ecclesiastical from civil courts.**—"William I (whose title was warmly espoused by the monasteries, which he liberally endowed, and by the foreign clergy whom he brought over in shoals from France and Italy, and planted in the best preferments of the English church), was at length prevailed upon to . . . separate the ecclesiastical court from the civil: whether actuated by principles of bigotry, or by those of a more refined policy, in order to discountenance the laws of King Edward, abounding with the spirit of Saxon liberty, is not altogether certain. But the latter, it not the cause, was undoubtedly the consequence, of this separation: for the Saxon laws were soon overborne by the Norman justiciaries, when the county court fell into disregard by the bishop's withdrawing his presence, in obedience to the charter of the conqueror; which prohibited any spiritual cause from being tried in the secular courts, and commanded the suitors to appear before the bishop only, whose decisions were directed to conform to the canon law."—W. Blackstone, *Commentaries*, bk. 3, pp. 62-63.—"The most important ecclesiastical measure of the reign, the separation of the church jurisdiction from the secular business of the courts of law, is unfortunately, like all other charters of the time, undated. Its contents however show the influence of the ideas which under the genius of Hildebrand were forming the character of the continental churches. From henceforth the bishops and archdeacons are no longer to hold ecclesiastical pleas in the hundred-court, but to have courts of their own; to try causes by canonical, not by customary law, and allow no spiritual questions to come before laymen as judges. In case of contumacy the offender may be excommunicated and the king and sheriff will enforce the punishment. In the same way laymen are forbidden to interfere in spiritual causes. The reform is one which might very naturally recommend itself to a man like Lanfranc."—W. Stubbs, *Constitutional history of England*, v. 1, sect. 101.

1100.—**Reunion of civil and ecclesiastical courts.**—"King Henry the First, at his accession, among other restorations of the laws of King Edward the Confessor, revived this of the union of

the civil and ecclesiastical courts. . . . This, however, was ill-relished by the popish clergy, . . . and, therefore, in their synod at Westminster, 3 Hen. I, they ordained that no bishop should attend the discussion of temporal causes; which soon dissolved this newly effected union."—W. Blackstone, *Commentaries*, bk. 3, p. 63.

1135.—**Final separation of civil and ecclesiastical courts.**—"When, upon the death of King Henry the First, the usurper Stephen was brought in and supported by the clergy, we find one article of the oath which they imposed upon him was, that ecclesiastical persons and ecclesiastical causes should be subject only to the bishop's jurisdiction. And as it was about that time that the contest and emulation began between the laws of England and those of Rome, the temporal courts adhering to the former, and the spiritual adopting the latter as their rule of proceeding, this widened the breach between them, and made a coalition afterwards impracticable; which probably would else have been effected at the general reformation of the church."—W. Blackstone, *Commentaries*, bk. 3, p. 64.

1139-1150.—**Decretals of Gratian.**—"The fame of earlier laborers was eclipsed by that of Gratian, a monk of Bologna, that city which was the center of the new Roman jurisprudence. He published, between the years 1139 and 1142, a book which he called *Concordantia discordantium canonum*, but which was soon to become for all mankind simply the *Decretum Gratiani*, or yet more simply the *Decretum*. It is a great law book. The spirit which animated its author was not that of a theologian, not that of an ecclesiastical ruler, but that of a lawyer. One large section of the work is taken up with the discussion of hypothetical cases (*causae*); he states the various questions of law (*questiones*) that are involved in these cases; he endeavors to answer those questions by sorting, and weighing the various 'authorities' which bear on them. These authorities consist of canons, new and old, decretals, including the Isidorian forgeries, principles of Roman law, passages from the fathers and the Bible. The *Decretum* soon became an authoritative text-book and the canonist seldom went behind it. It never became 'enacted law'; the canonist had for it rather that reverence which English lawyers have paid to Coke upon Littleton than that utter submission which is due to every clause of statute."—F. Pollock and F. W. Maitland, *History of English law*, v. 1, p. 92.

1160-1545.—**Ecclesiastical courts before and after the Reformation.**—"The ecclesiastical courts have a longer history than the courts of Common Law and Equity. At all periods in their long history prevailing theories as to the relations between Church and State have influenced both the law which they administer and their position with regard to the English judicial system. . . . [See also CONSTITUTIONS OF CLARENDON.] The law administered by these courts and their relation to the English (and American) judicial system falls naturally and chronologically into two divisions: (a) *The Pre-Reformation Period*: Throughout this period political and religious ideas were dominated by the theory of the survival of the Holy Roman Empire. It may be that in the common affairs of life, in the smaller associations in which men were grouped in a feudal state, this theory played little direct part. But in the law of the church, as administered in the Ecclesiastical Courts throughout Latin Christendom, it was all important. The Roman Empire had not perished. The Roman Emperor, represented by the Emperor of Germany, still ruled the world in matters temporal; the Pope

in matters spiritual. . . . (b) *The Post-Reformation Period*: At the beginning of the 16th century, many circumstances combined to show that the old theories as to the relations between Church and State were breaking down. All over Europe, centralized territorial states were taking the place of the loosely knit feudal monarchies of the Middle Ages. The wealth and conception of the church, and more particularly the abuses of the Ecclesiastical Courts, were exciting extreme unpopularity. The doctrines of the church, also, were beginning to be assailed with the more effective weapons which the New Learning had provided. The better class of ecclesiastical statesman saw clearly that some reform was necessary."—W. S. Holdsworth, *History of English law*, v. 1, pp. 352, 359.

1164.—**Constitutions of Clarendon.** See CONSTITUTIONS OF CLARENDON.

1285-1660.—**Temporal courts assume jurisdiction of defamation.—Gradual decline in the jurisdiction of the church courts.**—"To the Spiritual Court appears also to have belonged the punishment of defamation until the rise of factions on the case, when the temporal courts assumed jurisdiction, though not, it seems, to the exclusion of punishment by the church. The punishment of usurers, cleric and lay, also belonged to the ecclesiastical judges, though their movables were confiscated to the king, unless the usurer 'vita comite digne poenituerit, et testamento condito quae legare decreverit a se prorsus alienaverit.' That is, it seems, the personal punishment was inflicted by the Ecclesiastical Court, but the confiscation of goods (when proper) was decreed by the King's Court."—Melville M. Bigelow, *History of procedure*, p. 51.—"The activity of the church courts was great until the Reformation; and, before that momentous change, the King's courts found in them formidable rivals. At the very beginning of the period, the so called statute of *circumspecte agatis* (A. D. 1285—13 Edward 1 St. III) makes handsome admissions as to the competence of ecclesiastical tribunals; though it incidentally affirms the hotly contested claim of the royal judges to issue writs of prohibition when the church courts are exceeding their jurisdiction. The famous Statute of Heresies in 1414 virtually gave the ecclesiastical judge the power of life and death, as well as forfeiture, over laymen. [See also DE HERETICO COMBURENDO.] Even the Reformation, though it affirmed the sovereign judicial supremacy of the Crown, and virtually destroyed the legislative independence of the Church, did not, at first, seriously curtail the jurisdiction of the Church courts. It was not until the greatly abused privilege of 'benefit of clergy' was taken in hand by Parliament, that a serious breach was made in ecclesiastical jurisdiction; for the failure of the royal judges to maintain the compromise laid down by the constitutions of Clarendon on the subject of 'criminous clerks' (due to the horror excited by the murder of Becket) is the one striking defeat in their history. But a statute of 1531 (23 Hen. VIII. c. 1) deprived all but genuine clerics of the privilege of exemption from criminal liability, in serious charges, and, five years later (28 Hen. VIII. c. 1) the deprivation was extended to genuine clerics. A statute of Elizabeth effected a sweeping reform in this direction; and thus the most scandalous of all ecclesiastical privileges tended to disappear. The greatest changes were, however, brought about by the civil war. For, though the long Parliament, which abolished episcopacy and ecclesiastical jurisdiction in 'root and branch,' was formally repealed at the Restoration, much of the work formerly done by the church courts had, during the Commonwealth, been per-

formed by the secular courts; and the successors of these, though they paid lip-service to the restored church, were resolutely bent on retaining their newly acquired jurisdiction. The wonder really is, not that the church courts should have lost, during the Interregnum, practically all their jurisdiction in such matters as defamation, fraud and perjury, but that they should have succeeded in recovering jurisdiction in matrimonial and testamentary matters."

—E. Jenks, *Short history of English law*, pp. 74-5. 1401.—**Statute authorizing the burning of heretics.** See DE HERETICO COMBURENDO.

1453-1917.—**Reforms of Peter the Great.—Jurisdiction and administration of the Russian church.—Eastern Church.**—Ecclesiastical law was administered by the Greek and Russian orthodox catholic churches similarly to the Western catholic church until the end of the Byzantine period. Then the civil administrators, in common with those in Europe under the Roman church, began to encroach upon the political and legal powers of the church authorities. The legal jurisdiction of the Russian church was greatly restricted by Peter the Great. He was imbued with the reform spirits he found prevalent in Holland and England and reformed the church as well as the government of Russia. The legal powers of the Russian church are now administered by the consistoria, or provincial courts of the leading cities, and the Synod. Their work is assigned to them by the civil courts and is confined to strictly religious matters. Divorce cases are all remitted from the civil courts to the Synod. The Consistoria do not try them. "The Russian Holy Synod takes [until 1917] precedence over all the other great bodies of the state; it replaces the patriarch, with all his rights and privileges; originally, it was more of a representative assembly, comprising the different ranks of the clergy, and bishops were in a numerical minority; now, in accordance with the practice of the early church, which placed authority in the hands of its bishops, the episcopal element predominates. The three metropolitans of Kiev, Moscow and Petrograd are entitled to membership by right of their offices and the latter is presiding officer; the Exarch of Georgia is also admitted upon the same ground; the other members are appointed by the emperor. . . . It would be an error to suppose that the emperor (or present governmental head) is in any spiritual sense, like the Pope of Rome, the head of the church. If, in any legislative acts he is so termed, it is only in his capacity of administrator of its affairs, and, as such, his authority is restricted by the canons, by tradition and by oecumenical decrees. All questions of dogma and discipline are beyond his control; never has a tsar, unless it be the demented Paul, claimed any rank in the clerical hierarchy; at the altar he yields homage to the priest in common with the humblest of his subjects; he is simply, as he is designated in the catechism, the administrator and protector of the church."—A. F. Heard, *Russian Church*, pp. 156-157.

1545-1904.—**Loss of unity.—Numerous sources of the law.—Codification ordered by Pius X.**—"After the fourteenth century, except for its contact with the collections we have just treated of, canon law loses its unity. The actual law is found in the works of the canonists rather than in any specific collection; each one gathers his texts where he can; there is no one general collection sufficient for the purpose. It is not a case of confusion, but of isolation and dispersion. The sources of law later than the 'Corpus Juris' are the decisions of councils, especially of the Council of Trent (1545-1563), which are so varied and important that by

themselves they form a short code, though without much order; the constitutions of the popes, numerous but hitherto not officially collected, except the 'Bullarium' of Benedict XIV (1747); the Rules of the Apostolic Chancery; lastly the decrees, decisions, and various acts of the Roman Congregations, jurisprudence rather than law properly so called. For local law we have provincial councils and diocesan statutes. It is true there have been published collections of councils and Bullaria. Several Roman Congregations have also had their acts collected in official publications; but these are rather erudite compilations or repertoires. We are to-day farther away than ever from a single accurate code of ecclesiastical law, owing to the mass and variety of documents, and also because no regulation is presumed abrogated unless it is abrogated expressly by a new law. From this one can appreciate the utility as well as the difficulty of the codification undertaken by Pius X. . . . Many times during the nineteenth century especially at the time of the Vatican Council . . . the bishops had urged the Holy See to draw up a complete collection of the laws in force, adapted to the needs of the day. It is true, their requests have been complied with in regard to certain matters; Pius X in his 'Motu proprio' of 19 March, 1904, refers to the constitution 'Apostolica Sedis' limiting and cataloguing the censures 'latæ sententiæ,' the Constitution 'Officiorum,' revising the laws of the Index; the Constitution 'Conditæ' on the religious congregations with simple vows. These and several other recent documents were, moreover, drawn up in short precise articles, to a certain extent a novelty, and the beginning of a codification. Pius X has at length officially ordered a codification, in the modern sense of the word, for the whole canon law."—*Catholic encyclopedia*, v. 9, pp. 63-64.

1790.—Civil constitution of the clergy in France. See CIVIL CONSTITUTION OF THE CLERGY IN FRANCE.

1857-1859.—Ecclesiastical courts deprived of matrimonial and testamentary causes in Great Britain.—"Matrimonial causes, or injuries respecting the rights of marriage, are another . . . branch of the ecclesiastical jurisdiction. Though, if we consider marriages in the light of mere civil contracts, they do not seem to be properly of spiritual cognizance. But the Romanists having very early converted this contract into a holy sacramental ordinance, the church of course took it under her protection, upon the division of the two jurisdictions. . . . One might . . . wonder, that the same authority, which enjoined the strictest celibacy to the priesthood, should think them the proper judges in causes between man and wife. These causes, indeed, partly from the nature of the injuries complained of, and partly from the clerical method of treating them, soon became too gross for the modesty of a lay tribunal. . . . Spiritual jurisdiction of testamentary causes is a peculiar constitution of this island [Great Britain]; for in almost all other (even in popish) countries all matters testamentary are under the jurisdiction of the civil magistrate. And that this privilege is enjoyed by the clergy in England, not as a matter of ecclesiastical right, but by the special favor and indulgence of the municipal law, and as it should seem by some public act of the great council, is freely acknowledged by Lindewode, the ablest canonist of the fifteenth century. Testamentary causes, he observes, belong to the ecclesiastical courts 'de consuetudine Angliæ, et super consensu regio et suorum procerum in talibus ab antiquo regno.'"—W. Blackstone, *Commentaries*, bk. 3, pp. 91-95.—See also WOMAN'S RIGHTS: 300-1400.—Jurisdiction in testamentary causes was

taken away from the ecclesiastical courts by Statutes 20 and 21 Vic., c. 77 and 21 and 22 Vic., chaps. 56 and 95, and was transferred to the court of Probate. Jurisdiction in matrimonial causes was transferred to the Divorce Court by Statute 20 and 21 Vic., 85.

1915.—Original date of publication of the new code.—Originally, 1915 was set as the date for the publication of the new code ordered by Pope Pius X in 1904, but with Italy's entry into the war the publication had to be postponed.

1917.—New code published.—Arrangement of the code.—The codification of the canon law ordered in 1904 by Pope Pius X "was carried out under the direction of Cardinal Gasparri, and a commission of cardinals was appointed to examine, modify, and correct the proposed canons. The five original members of the commission were Cardinals Ferrata, Gennari, Cavicchioni, Vives y Tuto and Cavagnis, with Cardinal Gasparri as *ponens*; these five scholars having died during the course of the undertaking their work was continued by Cardinals Vincenzo Vannutelli, de Lai, Martinelli, Pompili, Bisleti, Van Rossum, Giustini and Lega. . . . After the death of Pius X the completed work was ratified, approved, and sanctioned by His Holiness Pope Benedict XV, as announced by his Bull 'Providentissima Mater Ecclesia' (27 May, 1917), which decreed that the prescriptions of the Code should have the force of law from Pentecost, 19 May, 1918. . . . The Code is divided into five books. The first book (can. 1-86) deals with certain general regulations, the relation of the Code to the Oriental Church, to concordats, to the liturgy, to custom, to statutory law, and to privileges. The second book (can. 87-725) treats of persons: clerics, religious, and laics; the third book (can. 726-1551) of things: sacraments, sacred places, and times, Divine service, teaching authority of the Church, benefices and church property; the fourth book (can. 1552-2195) with ecclesiastical procedure: trials, beatifications and canonizations, special proceedings against clerics; and the fifth book (can. 2195-2414) with crimes, punishments, and special offenses."—*Catholic encyclopedia*, Supplement 1, v. 17, pp. 215-216.

ELECTICISM, (from Gr. *Eklegein*, "to gather"), "a term applied to a system of philosophy or theology that strives to incorporate the truth of all systems, or to the method by which such a synthesis is made. In philosophy the best example of eclecticism is found in the Neoplatonism of the Alexandrine School, while among modern eclectics Leibnitz and Cousin may be mentioned. Since an eclectic system is necessarily a loose piece of mosaic work, rather than an organized body of original thought, the term in philosophy has come to be one of reproach. In theology eclecticism first appeared at Alexandria. Typical examples of eclectics are Clement of Alexandria, Origen, and Synesius, who drew from classical and pagan, as well as from Christian sources."—*New Schaff-Herzog religious encyclopedia*, v. 4, p. 71.—A somewhat different point of view is taken by Hegel: "Since the form of philosophy which arose in Alexandria did not attach itself to any of the earlier philosophic schools, but recognized all the different systems of philosophy, and more especially the Pythagorean, Platonic, and Aristotelian, to be in their various forms but one, it was frequently asserted to be Eclecticism. Brucker . . . is the first to do so, as I have found, and Diogenes Laërtius gave him the occasion thereto, by speaking . . . of a certain Potamo of Alexandria, who not so very long before . . . had selected from the different philosophies their principal maxims and the best of their teaching. Then Diogenes goes on to quote several passages from Potamo, saying that this writer had produced an eclectic philosophy; but these maxims drawn from Aristotle, Plato, and the Stoics are not of importance, and the distinguishing characteristics of the Alexandrians cannot be recognized therein. Diogenes is also earlier than the Alexandrian School; but Potamo, according to Suidas . . . was tutor of the stepsons of Augustus, and for the instructor of princes, eclecticism is a very suitable creed. Therefore, because this Potamo is an Alexandrian, Brucker has bestowed on the Alexandrian philosophy the name of Eclectic; but that is neither

consistent with fact, nor is it true to history. Eclecticism is something to be utterly condemned, if it is understood in the sense of one thing being taken out of this philosophy, and another thing out of that philosophy, altogether regardless of their consistency or connection, as when a garment is patched together of pieces of different colours or stuffs. Such an eclecticism gives nothing but an aggregate which lacks all inward consistency. . . . An eclectic philosophy is something that is altogether meaningless and inconsequent; and such a philosophy the Alexandrian philosophy is not. In France the Alexandrians are still called Eclectics. . . . In the better sense of the word the Alexandrians may, however, very well be called eclectic philosophers, though it is quite superfluous to give them this designation at all. For the Alexandrians took as their groundwork the philosophy of Plato, but availed themselves of the general development of philosophy, which after Plato they became acquainted with through Aristotle and all the following philosophies, and especially through the Stoics; that is to say, they reinstated it, but as invested with a higher culture. . . . In this sense even Plato is eclectic since he harmonized Pythagoras, Heraclitus, and Parmenides; and the Alexandrians are also thus eclectic, seeing that they were just as much Pythagoreans as Platonists and Aristotelians; the only thing is that this term always at once calls up the idea of an arbitrary selection. . . . All the earlier philosophies could therefore find a place in that of the Alexandrians. . . . Thus the Neo-Platonic philosophy arose beside the others, and partly upon their ruins, and overshadowed the rest, until finally all earlier systems were merged therein. It therefore did not constitute an individual philosophical school similar to those which went before; but while it united them all in itself, it had as its leading characteristic the study of Plato, of Aristotle, and of the Pythagoreans."—G. W. F. Hegel, *History of philosophy*, v. 2, pp. 400-403.

ECONOMICS.—"Economics, or political economy, is the social science which treats of man's wants and of the goods (i.e., the commodities and services) upon which the satisfaction of his wants depends. It analyses wants, classifies goods with reference to them, and considers all of the circumstances which affect the production and distribution, or sharing, of goods among the individuals who compose society. In discussing production and distribution economists treat the same problems that engage the attention of business men, but from a social rather than an individual point of view. It is to emphasize this distinction that economics is styled a 'social science.' A definition easy to remember is that economics is the 'social science of business.'"—H. R. Seager, *Introduction to economics*, p. 1.—"With the growth of . . . modern ideas of scientific method, the name *economics*, which is essentially that of a science, is gradually being substituted for the older term *political economy*, which was in some respects more applicable to an art."—A. T. Hadley, *Economics*, p. 13.—"Closely

related to economics are the other social sciences, sociology, politics, law, and history. By some writers sociology is made to include all of the social sciences, not excepting economics. Others define it as the science which treats of the beginnings of society and of the first principles of social organization. Still a third group understands the term to include problems connected with society's treatment of its dependent classes. Whichever of these definitions is accepted, the relation of sociology to economics need cause no confusion. The latter has to do primarily with contemporary conditions and with the relations between independent, self-supporting individuals and families, and the goods upon which their well-being depends. Politics treats of the political organization of society, and law is the aggregate of rules and regulations through which formal expression is given to the social will. Neither is likely to be mistaken for economics, although both influence largely the business institutions and practices with which economics is concerned. The political organization determines what classes shall have a dominant influence in choosing the laws that are to be passed and enforced, and laws themselves establish standards to which all must conform. . . . History, in the broadest sense, is the narrative of past events. To the economist economic or industrial history, the narrative of past events touching relations between men and goods, is of special significance. In fact, a knowledge of the principal facts of modern industrial history is so necessary to an understanding of present economic phenomena."—H. B. Seager, *Introduction to economics*, p. 2.

Greek theory.—The history of economics deals with a science,—a body of classified knowledge; it is usually limited to times in which economic ideas have become distinct, unified and organized, but expressions of thought on economic subjects have come down to us from times as early as the Oriental theocracies. Before Adam Smith economic subjects were treated either in a monographic way or in connection with ethics and political philosophy. The Babylonians had ideas concerning interest and mortgages; the Phoenicians thought about commerce and bills of exchange; the Greeks wrote on the subject of division of labor. The three writers among the Greeks most interesting to the economist are Plato, Aristotle and Xenophon—Both Xenophon and Aristotle have treatises upon the specific subject of Economics, but these are devoted principally to domestic economy or the management of the household—however, the more important economic ideas of the Greek writers are derived from their works which deal primarily with political and ethical subjects. Plato, in his "Republic," describes a Utopia in the form of a communistic state which he claimed would correct all the ills of society. He included a communism even of wives and children, and strange as it may seem, admitted slavery as a base for his social superstructure. The "Laws" of Plato is more practical, dealing largely with existing institutions. Aristotle's "Politics" has influenced theologians of the Middle Ages and through them entered the thought and life of their time. The influence spread also into the institutions of the twentieth century. Aristotle defended the institution of slavery on the grounds that the ruling classes might have the leisure for state-craft, art and literature—he also defended the institution of private property and formulated surprisingly accurate ideas about money and its functions. He condemned interest, however, because, as he expressed it, money is barren. Both Plato and Aristotle fully appreciated the advantages of the division of labor and the necessity of a certain

amount of traffic and exchange, but they both shared the common prejudice against trade and commerce. Perhaps the most characteristic quality of Greek economic thought is the thorough subordination of economics to ethical and political considerations. They did not regard wealth as of fundamental importance to either the individual or the state.—Based on R. T. Ely, *Outlines of economics*.

Romans.—The Romans were not remarkable for independent thought. Their economic ideas were borrowed from the Greeks, and show the same general characteristics as the ideas of Plato and Aristotle. Commerce and trade were held in contempt particularly when carried on in a small way. "Interest taking was thought by some to be as bad as murder." Agriculture, on the other hand, was highly esteemed, and was later generally recommended for the prevailing degeneracy. Among other agricultural problems discussed by the Romans were those of intensive versus extensive culture and slave versus free labor. The Roman law, the *corpus juris civilis*, is the most remarkable legal system the world has ever seen and is unsurpassed for carefulness and accuracy of statement. Probably as a training for economic studies Roman law is among the most valuable branches of learning. It gives us also invaluable information about the economic institutions and measures of Rome. Perhaps the most important contribution of the Romans to economic thought was the development of jurisprudence as a science.—*Ibid*.

Early influence of Christianity.—The greatest economic contributions of Christianity were the revolutionary ideas of the honorableness of toil and the equality of men before God. The clergy were encouraged to earn their livelihood by manual labor, and the laymen were exhorted to free their slaves as soon as they had become Christians. With respect to money and trade, however, the effect of Christianity was to strengthen and impress the teachings of Aristotle.—*Ibid*.

Middle Ages.—Theories of the canonists.—Economic ideas found more formal expression in the treatises of the schoolmen and medieval theologians who expounded the church or canon law. The *Corpus juris canonici* has a definite system of economic thought which, though largely theoretical and intended for the ecclesiastical courts, came in time to be widely applied in secular affairs through the power of the confessional, the pulpit, and the wide jurisdiction of the ecclesiastical courts. The doctrines of the canonists were derived in part from biblical injunctions against usury and the pursuit of wealth. The early Christian fathers frequently went so far as to condemn private property and set up the ideal of communism among the faithful, but this was only an ideal and private property was early recognized as a necessary evil. This ideal, however, was powerful enough to keep alive the doctrine that the maintenance of the poor was a binding obligation. Following the philosophies of Greece and Rome, trade and commerce were regarded as greatly inferior to agriculture and handwork as a source of livelihood. However, as commerce developed trade had to be recognized by the churches and the doctrine of *justum pretium* was formulated—the doctrine that every commodity has a just price, or value, which it is sinful for the seller to exceed. The modern trades-union doctrine of a "fair wage" and the decision of our courts concerning reasonable charges illustrate the hold which ethical ideas of this sort have even at the present time. Another important economic doctrine of the canonists was the prohibition of usury, which originally signified any interest, not neces-

sarily excessive interest, on a loan. Interest taking by the clergy had been prohibited as early as the fourth century; but in 1311, at the council of Vienna, interest was absolutely prohibited regardless of the civil law; and by the middle of the fourteenth century, the prohibition of interest had, in many places, been incorporated into the civil law. Gradually, however, the church was forced to change its attitude and in 1545 a law was passed in England legalizing an annual interest rate not to exceed ten per cent. By this time the doctrines of mercantilism were fast gaining ground.—*Ibid.*

ALSO IN: A. A. Trevor, *History of Greek economic thought*.—G. O'Brien, *Essay on medieval economic teaching*.

17th-18th centuries.—Mercantilism.—“With the rise of nations and the growth of money economy came mercantilism and the dawn of economics as a science,—though it was but the first faint flush announcing what was soon to be. Economic topics were given more frequent, extended, and, above all, more distinct attention. Wealth was highly appreciated. Its chief source was considered to be commerce, partly no doubt on account of an over-emphasis of ‘treasure.’ In their empirical studies and policies concerning foreign trade, balance of trade, and taxation, the Mercantilists laid the foundation for further development. In general theory, some fragmentary discussions of value and the analysis of the factors of production are noteworthy.” Mercantilism, as a doctrine, was first systematically developed in the beginning of the seventeenth century by an Italian writer, Serra. This formed the beginning of economics as a science and the dawn of modern economic thought. “Sir James Stuart (1712-1780) was the chief English mercantilist writer of the 18th century and has been called the ‘Last of the Mercantilists.’ The economic thought of the German States and Austria for some three hundred years was known as Kameralism—a German Mercantilism, that is closely related to more recent German economics.”—L. H. Haney, *History of economic thought*, pp. 528-529.

18th century.—Physiocrats.—Laissez faire theory.—“The real founding of the science of Economics . . . came to pass about the middle of the eighteenth century, being closely associated with the contemporaneous revolution in social philosophy. Then it was that the Physiocrats, or *Économistes*, in reaction against Mercantilistic policies, elaborated the old Greek idea of nature and natural freedom as handed down through the Middle Ages. Wealth, they held, comes from Nature, and arises from her bounty. Agriculture, instead of commerce, thus took the center of the stage. And in the place of regulation, *laissez faire* [or *laissez faire*] became the watchword. Naturally the service of the Physiocrats was largely negative, consisting in greater freedom from hampering regulations and taxes. More positively, their scheme of distribution became the father of succeeding attempts to trace the round of production, exchange, distribution, and consumption. Their emphasis of land and its surplus (*produit net*) was an influential conception. And, above all, their attempt to formulate a body of exact principles separate from morals, politics, and jurisprudence gave economics its first claim to be a science.”—*Ibid.*, p. 529.—The chief representatives of the Physiocrats were François Quesnay (1694-1774), Jean Vincent de Gournay (1712-1759) and Anne Robert Jacques Turgot (1727-1781).—See also PHYSIOCRATS; TARIFF: 18th century; EUROPE: Modern: Revolutionary period.

18th century.—Adam Smith and the “Wealth of Nations.”—“Building upon the thought of English predecessors and the Physiocrats, and influenced by a different environment, he [Adam Smith] turned from ‘nature’ or agriculture as the source of wealth, and gave to labor that position. While, on the whole, a believer in free trade and *laissez faire*, he was more of an opportunist, and was less rigid and absolute in applying his doctrines. Smith’s work was fuller and more comprehensive than that of Quesnay or Turgot, and the firm establishment of Political Economy may justly be dated from the ‘Wealth of Nations’ (1776) . . . Much of what is here written concerning the Classical School will apply to him only in part.”—*Ibid.*, p. 530.

18th-19th centuries.—Rise of the classical school.—Liberalism.—Characteristics of the classicists.—“The ‘Wealth of Nations’ soon gained ascendancy in the leading countries, and the followers are mostly to be classed as members of the Classical School. There were, however, three main branches, corresponding to as many different national environments. In England, a group of economists, with whom the designation ‘classical school’ is generally associated, . . . centered around Ricardo, accepting his doctrines of rent and adding the Malthusian principle of population. [See also MALTHUSIAN DOCTRINE; STATISTICS: Laws of growth of population.] With this group, the problems of distribution of wealth were for the first time given chief attention; the main framework of their economic thought consisted of the theory of value and the shares of the factors of production, land, labor, and capital. In their reasoning, the interests of these factors were made more or less antagonistic, and their views tended toward pessimism,—a tendency logically connected with materialism and individualism. Value was regarded as cost-determined, and was treated as an objective phenomenon by the dominant element. In France, J. B. Say (1803) contributed to the arrangement and classification of the new science. There, a larger element of the eighteenth-century nature philosophy remained, and the general tendency was toward idealism and optimism. This general tendency being in logical accord with the philosophy of Socialism, it is easy to explain the fact that in France the earliest nineteenth-century socialistic propaganda flourished. ‘Liberalism’ was the term which came to be applied to French classicists, and in general to the continental followers of the English classical political economy. German economists, largely on account of their Kameralistic background, had a somewhat different notion of economics. Though Smith had a small group of very close followers, Ricardo was not so generally accepted, and the abstract theorizing on problems in distribution is not often found. The significance of national lines and moral forces was more recognized, and administrative and financial matters were given more attention. Remembering the differences among its branches,—and especially its relatively slight hold on Germany,—it may be said that the members of the old Classical School stood for certain philosophical tendencies, a closely associated methodology, and a group of characteristic economic doctrines. As to their philosophy, it was speaking generally and in a pretty sweeping fashion, materialistic utilitarianism. They considered tangible, material things; they were individualistic—‘the alliance of political economy with Utilitarianism may be said to have given a new lease of life to the individualism of the eighteenth century’; they were hedonistic, emphasizing deliberate calculation of pleasures and pains almost

to the exclusion of habits and instincts. Yet the development of economics along truly scientific lines was hampered by the dominance of an ethical element in their thought which was based upon the preceding individualistic nature philosophy; for 'freedom of competition' was made an ultimate test. The results of perfect freedom were not to be questioned. Freedom, moreover, was generally a purely formal concept, meaning freedom from legal restraint, and the like, rather than real economic freedom. Hand in hand with this philosophy went an abstract-deductive method. Some of the most marked characteristics of the doctrines of the Classicists may be stated as follows. To them, value generally meant objective exchange value. Estimation by the subject received scant attention,—though this is less true of France than of England. Accordingly, the part played by utility was underemphasized. Value was regarded as determined by cost, and throughout a greater part of the classical period there was a constant tendency to emphasize labor-pain costs as the ultimate thing. They often confused the entrepreneur with society, shifting their viewpoint from one to the other; for there was no clear appreciation of the distinction between the idea of ultimate social costs and the expenditures of the business undertaker. . . . Their idea was that welfare depends upon a stock of material goods, and production was encouraged without regard to the law of diminishing utility. Lacking the idea of marginal utility, they did not realize the limitations of their viewpoint. The school held to the tripartite division of the factors of production,—land, labor, capital,—and emphasized the distinctness of each. All believed in the peculiar importance of land and the margin of cultivation, but there was a split in the ranks over the merits of the landholders' interests. The Classicists of the dominant type, however, all consciously or unconsciously upheld the interests of capital and of the capitalist class, making capital an independent factor upon which labor was thought of as being largely dependent. Needless to say, the foregoing principles and theories found expression in the advocacy of a body of rules and action, the art of applied economics. Such rules as concerned poor-relief, tariff, taxation, and organized labor, are well-known examples. The members of the Classical School were largely practical in their purposes, and much of their thought appeared in pamphlets dealing with the issues of their day."—L. H. Hancy, *History of economic thought*, pp. 530-532.

19th century.—**Opposition to the classicists.**—Lauderdale and associates.—**Nationalistic criticism.**—**Socialism.**—"Almost as soon as they began to take shape, critics rose against these philosophical ideas, methods, and economic doctrines [of the classicists]; and as they grew and hardened, dissenting schools came into existence. Several of the earliest critics (e.g. Lauderdale, Rae, Sismondi) accepted individualism and materialism in part, but stood for a recognition of the lack of harmony between public and private interests, and for a contrast between utility and exchange value. With an unconscious ethical basis, the possibility of overproduction was implied or stated. Next one notes a nationalistic criticism, a criticism most characteristically German, though it found expression in America. Opposing the validity of the cosmopolitanism of the classical theory, such men as Adam Müller and Friedrich List stressed the importance of the state and of national lines as limiting the application of economic laws. Such thinkers were idealistic in their tendencies, one evidence of their idealism being their exaltation of the

political institution and their opposition to individualism. They opposed free trade as a general rule. Then Socialism presented a still more radical opposition to the dominant classicism. Beginning with the utopian, bourgeois thinkers like Saint-Simon, Owen, and Fourier, the Socialistic thought tendency reached a climax with the materialistic and revolutionary doctrines of Marx and Engels from 1848 on. As Socialism developed, it underwent a striking transformation in philosophy. From idealism, it passed through an attempt at realism to materialism. From associationism, through nationalism (State Socialism), it passed to internationalism. This development attended a growing revolutionary aspect. Now, more lately, with more opportunist and 'evolutionary' tendencies, the materialism of Marx has been questioned. Socialism as a *positive* force is logically connected with the philosophy of idealism."—*Ibid.*, p. 533.—See also SOCIALISM; COLLECTIVISM; LABOR ORGANIZATION.

19th century.—**Forerunners of the historical school.**—Mill's "Principles."—"Meanwhile, especially in Germany and England, signs of a coming revolt against the dogmatism of the Classical School appeared in the forerunners of the Historical School. Sismondi, Müller, and List, and Richard Jones may be mentioned, and the significance of the French philosopher, August Comte, in this connection is not to be forgotten. While the preceding opponents had assailed the philosophical and ethical system of the Classical School, this movement was primarily directed against the method; though it was necessarily closely related to the philosophy on the one hand, and the logic of the theory on the other. It was stimulated by the Hegelian philosophy and the current developments in jurisprudence, philology, and ethnology. But before the historical movement could culminate, John Stuart Mill attempted a restatement of the classical system, his *Principles* appearing in 1848. Mill's face was turned toward new things, but his mind was filled with the teaching of Ricardo. The result is that his work has been justly called unfinal and transitional. . . . Mill's *Principles* is more largely devoted to what is sometimes called social economics than were the works of most of the Classicists, and dynamic problems, such as the future of the labor classes and the tendency of profits to a minimum, are given much attention. . . . Mill's restatement could not be permanently accepted. While its style, spirit, and sound logical merits have given it a wider reading than any other English work on economics, it was built of diverse elements which were not closely enough analyzed nor consistently coordinated. Later Classicists (Fawcett, Cairnes) attempted to give a more precise and consistent statement of the terms of definitions, and at points refined and perfected the analysis of the forces of distribution; but the classical economics fell into considerable disrepute."—L. H. Hancy, *History of economic thought*, pp. 534-535.

19th century.—**German historical school.**—"Contemporaneously with Mill, the scattered tendencies to revolt against the abstract deductive methods of the Classical School were brought to a head and fully developed by the German Historical School, beginning with Roscher, Hildebrand, and Knies. There was a corresponding, though less influential, movement in England. All the time, too, German and later American economists were working toward an analysis of gross profits which led to important developments in the theory of capital interest, undertakers' gains, and pure profits; and during Mill's life-time the as-

saults of English and American writers (Longe, Leslie, Thornton, Walker) led to the almost dramatic downfall of the wages-fund theory."—*Ibid.*, p. 535.

19th century.—Utility theory.—Rise of the Austrian school.—"One little spring which had begun almost unnoticed to trickle into the troubled current of economic thought has not been mentioned. This was the idea of utility and the subjective in questions of valuation. Suggestions of the idea had appeared here and there, but Lloyd (1834) and Gossen (1854) first made it exact by distinguishing marginal utility, the latter's treatment being much the fuller. Then, in the seventies, Jevons, Walras, and Menger won a hearing for the idea, and further progress was made toward utilizing it in the explanation of market values. It was under the stimulus of the marginal-utility idea that a new school arose which, while largely following the Classical School in philosophy and method, sought to reconstruct its theories upon a subjective basis. This is the significance of the Austrian School. Menger was the Austrian pioneer; Wieser will ever be remembered for his work on the general theory of value; and Böhm-Bawerk, while doing excellent work in the same field, has gained most prominence in the particular problem of valuation of capital, and interest. Phillipovich is the author of some of the best-balanced work by this school. A leading motive of the school has been a desire for unity and consistency in theory,—a desire which finds expression in rebellion against the two-sided determination of value by demand (utility) and supply (cost),—and a great service has been a more unified and consistent application of principles of valuation. The influence of the school has been deep and widespread, being very noticeable in America."—*Ibid.*, pp. 535-536.

19th century.—Neo-Classicism.—"What may be called the neo-classical school has arisen in England under the leadership of Professor Marshall. This school seeks to combine the valid criticism of various dissenting groups with the sound portion of the classical doctrines. Thus the marginal-utility idea is not accepted as in any degree supplanting the classical theory of value, but as being merely a refinement of the utility side: value remains as an objective point of equilibrium between the forces expressed in demand and supply. A considerable body of economists in America and Germany is in accord with this synthesis."—*Ibid.*, 536.

19th century.—Effect of Christianity on economic doctrines.—General characteristics.—Le Play.—"Everyone who knows the Bible at all or has the slightest acquaintance with the writings of the early Fathers must have been struck by the number of texts which they contain bearing upon social and economic questions. . . . But not until the middle of the nineteenth-century do we meet with social doctrines of a definitely Christian type, and not till then do we witness the formation of schools of social thinkers who place the teaching of the Gospel in the forefront of their programme, hoping that it may supply them with a solution of current economic problems and with a plan of social reconstruction. It is not difficult to account for their appearance at this juncture. Their primary object was to bear witness to the heresy of socialism, and the nature of the object became more and more evident as socialism tended to become more materialistic and anti-Christian. It became the Church's one desire to win back souls from the pursuit of this new cult. It was the fear of

seeing the people—her own people—enrol themselves under the red flag of the Anti-Christ that roused her ardour. . . . Both doctrines and schools are of a most heterogeneous character, ranging from authoritative conservatism to almost revolutionary anarchism. . . . As a negative trait we have their unanimous repudiation of Classical Liberalism. . . . The new doctrines are also distinct from socialism, despite the fact that their followers frequently outbid the socialists in the bitterness of their attacks upon capital and the present organisation of society. They refuse to believe that the creation of a new society in the sense of a change in economic conditions or environment is enough. The individual must also be changed. . . . From a constructive standpoint they defy classification. They have a common aspiration in their hope of a society where all men will be brothers, children of the one Heavenly Father, but many are the ways of attaining this fraternal ideal. . . . Le Play's school is very closely related to the Classical Liberal, some of its best known representatives actually belonging to both. There is the same antipathy to socialism and the same dread of State intervention. It seemed to him that no society could ever hope to exist for any length of time and still be content with the rule of natural laws, which merely meant being ruled by the untamed instincts of the brute. It must set to and reform itself."—C. Gide and C. Rist, *History of economic doctrines*, pp. 483-487.

19th century.—Social Catholicism.—Leaders of the movement.—Program.—"About the same time we find Monseigneur von Ketteler, Bishop of Mayence, preaching a doctrine which drew its inspiration, not from 'the false dogmas of '89,' but from the institutional life of the Middle Ages, from the guilds and the other corporative associations, which are minutely described by him and his disciples, especially Canon Moufang and the Abbé Hitze. Some such institutional activity was again to form the corner-stone of Social Catholicism. During the period of the Second Empire most of the Social Catholics seem to have fallen asleep, but they were aroused from their slumbers by the disaster of 1870. The Comte Albert de Mun proved the inspirer this time, and his noble eloquence, which led to the formation of unions of Catholic working men, was instrumental in giving the movement a vigorous start. The same period witnessed the appearance of *L'Association catholique*, a review which took as its programme the study of economic facts in a Catholic spirit—an object that has always been kept steadily in view. Organisation in the form of corporations was given first place in the Social Catholic programme. . . . What the Social Catholics wished to do was to build up the new social structure upon the basis of the modern trade union, or upon syndicalism. . . . With this as the foundation they looked forward not merely to the development of a new society, but also to the rise of a new ethic. . . . Early in the history of the movement they tried to organise a kind of mixed *syndicat* consisting both of masters and men, because this seemed to them to offer the best guarantee for social peace. But the results proved disappointing, and they were soon forced to relinquish that idea and to content themselves with a separate organisation of masters and men co-operating only in matters relating to the regulation of work or the settling of differences."—*Ibid.*, pp. 496-498.

19th-20th centuries.—Social Protestantism or Christian Socialism.—"Social Protestantism, or Christian Socialism as it is known in England, has a birthday which may be determined with some

degree of accuracy. It was in the year 1850 that there was founded in England a society for promoting working men's associations, having for its organ a paper entitled *The Christian Socialist*. Its best known representatives were Kingsley and Maurice, who subsequently became respectively professors of history and philosophy at Cambridge. . . . The object which the Christian Socialists had in view . . . was the establishment of working men's associations. . . . The reawakened interest in the possibilities of association which exercised such a fascination over John Stuart Mill in 1848 had touched their imagination. . . . Such associations seemed to be just the economic instruments needed if a transformation was ever to be effected, and the very process of establishing them, it was hoped, would supply a useful means of discipline in the subordination of individual to collective interests. But the process of disillusion proved as rapid as it was complete. Contrary to what was the case in France, it cannot be said that they were ever really attempted in England. . . . Christian Socialism in England, though it has survived its founders, has been obliged to change its programme. It has abandoned the idea of a producers' association, but still advocates other forms of co-operation. Just now [about 1908] its chief demand is for a re-organisation of private property, which is a particularly serious question in England, where the land is in the hands of a comparatively few people."—C. Gide and C. Rist, *History of economic doctrine*, pp. 503-506.

19th-20th centuries.—Influence of Carlyle, Ruskin, Tolstoy.—Literary influences.—"No review of Christian Social doctrines, however summary, can afford to omit the names of certain eminent writers who, though belonging to none of the above-mentioned schools, and having no definite standing either as socialists or economists, being for the most part *littérateurs*, historians, and novelists, have nevertheless lent the powerful support of their eloquence to the upholding of somewhat similar doctrines. Tolstoy and Ruskin are the best known representatives of this movement on the borderland of Social Christianity, although they are by no means the only ones. . . . Thomas Carlyle also deserves mention. . . . [His "Chartism" (1839), "Past and Present" (1843), and "Latter-day Pamphlets" (1850), express his rebellion against the economic theory and system of the time.] Chronologically he precedes both Tolstoy and Ruskin, and his influence upon economic thought was greater than either of theirs. But we could hardly put him among the Christian Socialists because of his extreme individualism, and if he were to be given a place at all it would be with such writers as Ibsen and Nietzsche. His economic ideas, however, run parallel to Ruskin's; and nowhere except perhaps in the choruses of the old Greek tragedies do we get anything approaching the passion which is displayed in their declamations against the present economic order."—*Ibid.*, pp. 510-511.—The succession may be traced from Carlyle through Ruskin ("Unto this Last" [1860], "Munera Pulveris" [1872] and "Fors Clavigera" [1871-1884]) to J. A. Hobson ("Work and Wealth: a human valuation" [1914]).

20th century.—Developments.—Mathematical revival.—Change in socialism.—Revival of liberalism.—Solidarism.—"The beginning of the twentieth century reveals at least four dominant tendencies. In the first place there is a quite unexpected revival of theoretical studies. Pure economic theory, which had been deliberately neglected

by the Historical school, by the State and Christian Socialists, was in 1875 again taken up by a group of eminent writers who flourished in England, France, and Austria. . . . They have succeeded in substituting an attractive and ingenious theory of prices for the somewhat halting hypothesis put forth by the Classical theorists. The success of the method in other fields of economic inquiry is every day enhancing its reputation. A number of writers both in America and Europe (excepting France, perhaps) are engaged upon this task, following in the wake of Walras, of Jevons, and of Menger. Diagrams, algebraical formulæ, and subtle reasoning again characterise the works of economists. Pure economics, so much derided since the days of Ricardo, has once more justified its claim to a position of honour, and despite keen opposition it is attracting attention everywhere. From the point of view of economic science this is the most notable fact of recent years. Parallel with this has gone on a profound change in socialism. . . . All pretension to set up a proletarian in opposition to a *bourgeois* economics has been renounced [in the theorizings of recognized economists]. 'It is necessary,' says M. Sorel somewhere, 'to abandon every thought of transforming socialism into a science.' In fact, French syndicalists, English Fabians, and German revisionists have rallied with more or less good grace to the scientific ideas of Pareto, Marshall, or Böhm-Bawerk. But the real reason for this change of attitude is the strong desire to devote themselves with greater vigour to the social and political demands of socialism. The general strike, the creation of *syndicats*, the establishment of co-operative societies [see also CO-OPERATION], and the problems of municipal socialism are attracting more and more attention, whereas the theory of surplus value is falling into the background. Even more striking still, . . . is the attempt made by some of them, especially the advocates of land nationalisation—to reconcile Liberalism and socialism upon the basis of a doctrine that is Classical *par excellence*—the theory of rent. This is not the only change that socialism has undergone. The ideal of collectivism which long prevailed among the working classes was that of a centralized sovereign authority, and the active part taken by the collectivist party in the legislative and even in the administrative work of some countries still further encouraged this belief. But the old revolutionary spirit, always individualistic to the core, was still alive, especially in the Latin countries, and it began to show signs of impatience at the turn things had taken. And so we witness among the working classes a revival of Liberalism, harsh and violent in its expression perhaps, and doubtless very different from the founders.' Smith and Bastiat would have some difficulty in recognising it, and with a view to avoiding confusion with the older doctrine it has assumed the name *libertaire*, but it is generally known by the no less authentic title of 'anarchism.' This tendency towards extreme individualism and anarchy, of which there is unmistakable evidence even in the annals of the International, has gained the ascendancy over the working classes, leaving a deep mark upon the recent syndicalist movement in France and Italy. At the same time there has also appeared among writers of the *bourgeois* class a kind of philosophical and moral anarchism which affords further proof of the revival of individualism. Owing to these transformations in the theories of individualism and socialism, that other doctrine which in an earlier book went by the name of State Socialism has also undergone a change. In France, at any rate, it has reappeared under the name of Soli-

darism, which attempts a justification of State intervention by basing it on new foundations and confining it within just limits. It thus really represents an effort at synthesising individualism and socialism.—C. Gide and C. Rist, *History of economic doctrines*, pp. 515-516.

ECORCHEURS, Les.—In the later period of the Hundred Years' War, after the death of the Maid of Orleans, when the English were being driven from France and the authority of the king was not yet established, lawless violence prevailed widely. "Adventurers spread themselves over the provinces under a name, 'the Skinners,' Les Ecorcheurs, which sufficiently betokens the savage nature of their outrages, if we trace it to even its mildest derivation, stripping shirts, not skins."—E. Smedley, *History of France*, pt. 1, ch. 14.

ECTHESIS, edict of Heraclius introducing Monothelism into the church. See MONOTHELITE CONTOVERSY.

ECU, Order of the. See BOURBON, HOUSE OF.

ECUADOR: Geographic description.—Climate.—Resources.—"The republic of Ecuador, officially known as *La República del Ecuador* [with an estimated population in 1915 of 2,000,000 and an area between 116,000 and 276,000 square miles, since the frontiers are unsettled] occupies a triangular shaped territory fronting on the Pacific coast, and extending eastwardly across the Andes into the Amazon valley. On the northeast it is bounded by the republic of Colombia and on the south by the republic of Peru. [See LATIN AMERICA: Map of South America.] Ecuador takes its modern name from the fact that it lies directly under the equator, which traverses the northern part of the country. Ecuador is, in point of size, the smallest of the South American republics, with the exception of Uruguay. Its area cannot be regarded as fully determined, for the boundary with its southern neighbor is still in dispute. The maps of the country are very defective. Those issued by Peru claim a large part of the territory which Ecuador regards as her own, whilst the Ecuadorian maps extend their limits into the region which Peru claims, and in which the latter country has established certain outposts and occupation."—C. R. Enock, *Ecuador*, p. 91.—"Numerous islands belong to the Republic, some of them being situated either close to the coast or at comparatively short distances, while others, like the Galápagos Archipelago (q. v.) are 600 miles, if not more, from the continent. The constitution of Ecuador describes the territory of the Republic as consisting 'of the Provinces which formed what was called in olden times the Presidencia de Quito and the Archipelago of Galápagos.'"—*Bureau of the American republics*, Bull. no. 64 (1892).—"The three principal topographical features of Ecuador are the low-lying

lands on the sea coast and the river Guayas, the great mountain ranges of the interior, and the valleys that intersect them. The flat country near the seaboard contains a large area of fertile soil, but the malarious climate precludes all idea of the land being available for settlement by immigration from abroad. In the valleys at elevations of 4000 feet and upwards, the climate is temperate and combined with rich virgin lands, suggesting a possibility of development some day, when means of transport are created to overcome the physical obstacles to locomotion which now hinder all progress. From the higher mountain ranges rise up the great peaks of the Andes, . . . all covered with perpetual snow."—C. R. Akers, *History of South America*, p. 585.—"The diversity of climate in Ecuador, produced by the difference in altitude of the various zones, enables many kinds of fruits, vegetables, and other crops to be cultivated with success, and the exuberant vegetation is as varied as it is abundant. Almost anything that will grow in tropical, semi-tropical, or even temperate climates, can be produced in Ecuador within 200 miles of the coast. The great staples of the country are cocoa, panama hats, ivory, nuts, coffee, hides, gold, rubber, toquilla straw (for hats), bananas, and tropical fruit. Only a fraction of the territory of this naturally rich state is as yet exploited, and both cotton and tobacco should soon be added to the list of staple products."—C. D. Fife, *States of South America*, p. 255.

Inhabitants.—Government.—"About 40 per cent of the people of Ecuador are Indians, 50 per cent mixed Indians and Spanish or Mestizos, and only about 2 per cent of the population are pure Spanish or white. Many think that this mixture of races has brought down the level, as the Indian is usually considered a more desirable worker than the mestizo, and compares favorably with him in the matter of morals."—C. S. Cooper, *Understanding South America*, p. 92.—"The government of Ecuador is, under the constitution of the State divided into three powers, the Legislative, the Executive and the Judicial, and is Republican in form. The President is elected by popular vote, and is assisted by a council of State composed of fourteen members which is a consultative body of the Executive. There is a Senate and a House of Representatives. The territory of the Republic is divided into fifteen provinces, which are subdivided into Cantons, Parishes and Municipalities. There is a Governor as head of each Provincial Executive, a Jefe Político in every Canton and a Municipal Council for each important town."—C. D. Fife, *States of South America*, p. 248.—See also ELECTIONS, PRESIDENTIAL: South American republics.

Aboriginal inhabitants. See ANDEBIANS.

Aboriginal kingdom of Quito and its conquest by the Peruvians and the Spaniards.—"Of the old Quito nation which inhabited the highlands to the north and south of the present capital, nothing is known to tradition but the name of its last king, Quito, after whom his subjects were probably called. His domains were invaded and conquered by the nation of the Caras, or Carans, who had come by sea in balsas (rafts) from parts unknown. These Caras, or Carans, established the dynasty of the Scyris at Quito, and extended their conquests to the north and south, until checked by the warlike nation of the Puruhas, who inhabited the present district of Riobamba. . . . In the reign of Hualcopo Duchicela, the 13th Scyri, the Peruvian Incas commenced to extend

their conquests to the north. . . . About the middle of the 15th century the Inca Tupac Yupanqui, father of Huaynacapac, invaded the dominions of the Scyris, and after many bloody battles and sieges, conquered the kingdom of Puruha and returned in triumph to Cuzco. Hualcopo survived his loss but a few years. He is said to have died of grief, and was succeeded by his son Cacha, the 15th and last of the Scyris. Cacha Duchicela at once set out to recover his paternal dominions. Although of feeble health, he seems to have been a man of great energy and intrepidity. He fell upon the garrison which the Inca had left at Mocha, put it to the sword, and reoccupied the kingdom of Puruha, where he was received with open arms. He even carried his banners further south, until checked by the Cañares, the inhabitants of what is now the district of Cuenca, who had voluntarily submitted to the Inca, and now detained the Scyri until Huaynacapac, the greatest of the Inca dynasty, came to the rescue." On the plain of Tiocajas, and again on the plain of Hatuntaqui, great battles were fought, in both of which the Scyri was beaten, and in the last of which he fell. "On the very field of battle the faithful Caranquis proclaimed Pacha, the daughter of the fallen king, as their Scyri. Huaynacapac now regulated his conduct by policy. He ordered the dead king to be buried with all the honors due to royalty, and made offers of marriage to young Pacha, by whom he was not refused. . . . The issue of the marriage was Atahuallpa, the last of the native rulers of Peru. . . . As prudent and highly politic as the conduct of Huaynacapac is generally reputed to have been, so imprudent and unpolitic was the division of the empire which he made on his death bed, bequeathing his paternal dominions to his first-born and undoubtedly legitimate son, Huascar, and to Atahuallpa the kingdom of Quito. He might have foreseen the evil consequences of such a partition. His death took place about the year 1525. For five or seven years the brothers lived in peace." Then quarrels arose, leading to civil war, resulting in the defeat and death of Huascar. Atahuallpa had just become master of the weakened and shaken empire of the Incas, when the invading Spaniards, under Pizarro, fell on the doomed land and made its riches their own. The conquest of the Spaniards did not include the kingdom of Quito at first, but was extended to the latter in 1533 by Sebastian de Benalcazar, whom Pizarro had put in command of the Port of San Miguel. Excited by stories of the riches of Quito, and invited by ambassadors from the Cañares, the old enemies of the Quito tribes, Benalcazar, "without orders or permission from Pizarro . . . left San Miguel, at the head of about 150 men. His second in command was the monster Juan de Ampudia." The fate of Quito was again decided on the plain of Tiocajas, where Rumiñagui, a chief who had seized the vacant throne, made a desperate but vain resistance. He gained time, however, to remove whatever treasures there may have been at Quito beyond the reach of its rapacious conquerors, and "where he hid them is a secret to the present day. . . . Traditions of the great treasures hidden in the mountains by Rumiñagui are eagerly repeated and believed at Quito. . . . Having removed the gold and killed the Virgins of the Sun, and thus placed two objects so eagerly coveted by the invaders beyond their reach, Rumiñagui set fire to the town, and evacuated it with all his troops and followers. It would be difficult to describe the rage, mortification and despair of the Spaniards, on finding smoking ruins instead of the treasures which they had expected.

. . . . Thousands of innocent Indians were sacrificed to their disappointed cupidity. . . . Every nook and corner of the province was searched; but only in the sepulchres some little gold was found. . . . Of the ancient buildings of Quito no stone was left upon the other, and deep excavations were made under them to search for hidden treasures. Hence there is no vestige left at Quito of its former civilization; not a ruin, not a wall, not a stone to which the traditions of the past might cling. . . . On the 28th of August, 1534, the Spanish village of Quito [San Francisco de Quito] was founded."—F. Hassaurek, *Four years among Spanish Americans*, ch. 16.

1802.—Beginning of boundary trouble with Peru. See LATIN AMERICA: 1778-1824.

1821-1854.—Emancipation of slaves.—The abolition of slavery in the republic of Ecuador was initiated when it was a part of the republic of Colombia (see below 1822-1888). By the law of 1821 it was provided that the children of slaves, born after its publication in the principal cities, should be free. In Ecuador the completion of emancipation was reached in 1854.

1822-1888.—Confederated with New Granada and Venezuela in the Colombian republic.—Dissolution of the confederacy.—In 1822 "the Province of Quito was incorporated into the Colombian Republic [see COLOMBIA: 1819-1830]. It was now divided into three departments on the French system: and the southern-most of these received its name from the Equator (Ecuador) which passes through it. Shortly after Venezuela had declared itself independent of the Colombian Republic [1826], the old province of Quito did the same, and placed its fortunes in the hands of one of Bolivar's lieutenants, named Flores. The name of Ecuador was now extended to all three departments. Flores exercised the chief authority for 15 years. The constitution limited the Presidency to four; but Flores made an arrangement with one of his lieutenants called Roca-Fuerte, by which they succeeded each other, the outgoing President becoming governor of Guayaquil. In 1843 Flores found himself strong enough to improve upon this system. He called a convention, which reformed the constitution in a reactionary sense, and named him dictator for ten years. In 1845 the liberal reaction had set in all over Colombia; and it soon became too strong for Flores. Even his own supporters began to fail him, and he agreed to quit the country on being paid an indemnity of \$20,000." During the next 15 years Ecuador was troubled by the plots and attempts of Flores to regain his lost power. In 1860, with Peruvian help, he succeeded in placing one of his party, Dr. Moreno, in the presidency, and he, himself, became governor of Guayaquil. In August, 1875, Moreno was assassinated.—E. J. Payne, *History of European colonies*, pp. 251-252.—After the assassination of President Moreno, "the clergy succeeded in seating Dr. Antonio Barrero in the presidential chair by a peaceful and overwhelming election. . . . Against his government the liberal party made a revolution, and, September 8, 1876, succeeded in driving him from power, seating in his place General Ygnacio de Veintemilla, who was one of Barrero's officers, bound to him by many

ties. . . . He called an obedient convention at Ambato, in 1878, which named him President ad interim, and framed a constitution, the republicanism of which it is difficult to find. Under this he was elected President for four years, terminating 30th August, 1882, without right of re-election except after an interval of four years."—G. E. Church, *Report on Ecuador (Senate Ex. Doc. 69, U. S. 47th Cong., 2d Sess., v. 3)*.—President Veintemilla seized power as a dictator, by a pronunciamiento, April 2, 1882; but civil war ensued and he was overthrown in 1883. Senor José M. P. Caamaño was then chosen provisional president, and in February, 1884, he was elected president, by the legislative body.—*Statesman's Year-book*, 1889. 1832.—Acquisition of Galápagos islands. See GALÁPAGOS ISLANDS.

1888-1899.—Case of the Esmeralda.—Successful revolution.—General Alfaro made executive chief.—Government measures against the church.—"The term of Caamaño's presidency was marked by several revolutionary outbreaks; but these were suppressed, and in 1888 Dr. Antonio Flores followed, with a term of four years' rule free from political disturbance. This condition, however, did not endure, for upon the election of his successor, Dr. Luis Cordero, in 1892, the country was once more plunged into political strife and bloodshed. The cause of these troubles was somewhat peculiar, in having been due to foreign affairs rather than to domestic matters. It was the period of the war between China and Japan, and in 1894 the Government of Chile, having arranged for the sale of the cruiser *Esmeralda* to Japan, and desirous of avoiding international complications, caused the transfer of the vessel to Japan through Ecuador. The method proposed, for the transference was that in Ecuadorian waters of the Galápagos Islands, 600 miles off the mainland, the flag of Ecuador should be replaced by the flag of Japan, and the vessel delivered to the representatives of that country, who had come over to receive it. This arrangement was, in fact, carried out, and the *Esmeralda* was transferred to the Japanese colonies in the lonely waters of the Galápagos. But the transaction did not meet with popular approval in Ecuador, and when the part taken therein by President Cordero became known popular indignation was aroused and caused, or was made the excuse to cause, a revolution which was headed by General Eloy Alfaro. A year's desultory fighting between the rival forces disturbed the troubled republic, and as a result of the final battle the Government forces were overcome, and President Cordero abandoned his office and escaped from the country."—C. R. Enock, *Ecuador*, p. 83-84.

ALSO IN: C. E. Akers, *History of South America*, pp. 581-582.

General Eloy Alfaro, the revolutionary leader, was inaugurated executive chief of the republic on November 4, 1895. "An Administration was now formed by General Alfaro, who took the title of Supreme chief of the Nation with dictatorial functions, and no change was made in this autocratic form of government until 1897, when he determined to be proclaimed the Constitutional President of the Republic. This was done on February 6, when the Dictator became the legal President for a term of four years ending in February, 1901. The new head of the State lost no opportunity of curtailing the power of the Church. Much of the Church property was confiscated, and the inmates of religious houses are said to have fled in considerable numbers to other countries. In October, 1896, a National Convention was held and the

constitution revised. Among other changes, it imposed limitations on the former power of the Church, and extended religious freedom to other sects. "This attitude of Alfaro towards the clergy aroused bitter hostility in many quarters, and on more than one occasion efforts were made to fan it into revolutionary action against the authorities; but the various seditious outbreaks that took place between 1896 and 1900 were not of serious importance and were for the most part nipped in the bud before the leaders could consolidate their forces. Alfaro was therefore able to maintain his position until the end of his term."—C. E. Akers, *History of South America*, pp. 582-583.—In 1897 the Indians who supported Alfaro two years before were admitted to citizenship.

1890.—Represented at first International American congress. See AMERICAN REPUBLICS, INTERNATIONAL UNION OF: 1890.

1901-1906.—Revolutions.—General Eloy Alfaro who was made president by the revolution of 1895 was succeeded peacefully in 1901 by General Leonidas Plaza, and the latter, in turn, by Lugardo Garcia. "Lizardo Garcia, part negro, was president of Ecuador for four months in 1905. A revolution headed by Alfaro broke out January 19, 1906, and Garcia was soon unseated. He was accused of dishonesty, chased out of the country, and then formally acquitted provided that he would remain an exile. Garcia's valuable cacao plantation, capable of earning \$30,000 a year, has practically become a waste and his family is ostracized. A mob without weapons started the so-called battle of Guayaquil in 1906 in which one hundred and twenty persons were killed. The mob intimidated the police and secured their arms. Almost at once the worthless, vagabond army, composed of impressed ruffraff and innocent and ignorant natives from the hills, digested the situation and joined the winning side as it always does. . . . Garcia made little resistance."—C. S. Osborn, *Andean land*, v. 2, pp. 192-193.

1901.—Represented at Second International American congress. See AMERICAN REPUBLICS, INTERNATIONAL UNION OF: 1901-1902.

1904.—Boundary dispute with Colombia.—Arbitration agreed upon. See COLOMBIA: 1904-1905.

1905.—Arbitration of boundary question with Peru. See PERU: 1905.

1906.—Represented at third International American congress. See AMERICAN REPUBLICS, INTERNATIONAL UNION OF: 1906.

1910.—Represented at fourth International American congress. See AMERICAN REPUBLICS, INTERNATIONAL UNION OF: 1910.

1911-1912.—Emilio Estrada elected to succeed General Eloy Alfaro as president.—Revolution.—General Leonidas Plaza, president.—"In January [1911] Señor Emilio Estrada was elected President of Ecuador to succeed General Eloy Alfaro. In August the latter was induced, it is said, by strong pressure, to retire before the close of his legal term. One cause was, apparently, the negotiations with the United States government for the lease to it as a naval station of the Galápagos Islands, a project which was abandoned owing to the popular hostility to it."—*Annual Register* 1911, p. 503.—See also GALÁPAGOS ISLANDS.—"Ecuador opened the year [1912] with revolution. On the death of President Estrada a Provisional Government was formed, and after heavy fighting at Guayaquil, severe loss of life being reported, the Provisional Government succeeded at the end of January in getting the mastery. Ultimately ex-president Alfaro and other revolutionary leaders were taken

out of prison and lynched at Quito. . . . Señor Zaldumbido, President of the Senate, acted as President provisionally. In April General Leonidas Plaza was elected President, to come into office August 31."—*Ibid.*, 1912, p. 490.

ALSO IN: C. R. Enoch, *Ecuador*, pp. 87-88.

1913-1915.—**Revolution.**—In the autumn of 1913 a revolt was started by Carlos Concha, who was irritated by the liberal tendencies of Plaza. The government troops led by Colonel Valesco defeated Colonel Concha's troops, capturing Riobamba, the rebel stronghold. On December 15 Concha and his troops took the city of Esmeraldes. Several attempts were made at the beginning of 1914 to retake the city but each was unsuccessful. The government ordered the entire navy to cooperate with the army. They were temporarily successful, but the city again fell into the hands of the rebels. In March Colonel Concha withdrew from the city and President Plaza entered. The city was again besieged, the Federals having 500 men killed. Andrade and Pacquel, two rebel leaders, were captured in April [1914] and it was reported that the revolution was over, but it was not until February 1915 that it reached an end when Colonel Concha himself was captured.

1916.—**Boundary dispute settled with Colombia.** See COLOMBIA: 1916.

1916.—**Presidential election.**—Alfredo Baquerizo Moreno elected.—General Plaza was succeeded in 1916 by Alfredo Baquerizo Moreno, who was elected January 12th, for the term 1916-1920. Serious disorders occurred during the elections.

1918.—**Peonage abolished.**—A decree of October 20, 1918, provided for the abolishment of peonage in Ecuador. The same decree did away with life imprisonment. Before the passage of this decree peons were compelled by law to remain on an estate as long as they were indebted to the owner. The decree also cancelled all debts owed by the peons.

1919.—**Treaty with Japan.**—On March 31, 1919, the exchange of ratifications of the treaty of friendly relations, commerce and navigation, was made between Japan and Ecuador. The treaty was arranged in Washington [D. C.] August 26, 1918, and was promulgated in Ecuador on July 22, 1919."—*Latin-American Year Book*, 1920, p. 378.

1919-1920.—**Paris conference.** See PARIS, CONFERENCE OF: Outline of work; VERSAILLES, TREATY OF: Conditions of peace.

1920.—**New oil legislation.**—**Government.**—"A new oil decree was issued by President Baquerizo Moreno, on January 20, 1920, concerning petroleum fields. The decree was issued in conformity with law passed by Congress on October 18, 1919 by which the President was authorized to determine the taxes which should be paid for the exploitation of petroleum deposits. The most essential features of the decree are as follows: During the year 1920, the oil wells in operation shall pay to the Government 6 per cent. on the gross production, as a licence fee. Oil fields not in actual operation are required to be registered at the office of the Government of the Province in which they are located. The office will issue licences for the extraction of the number of gallons of oil in proportion to the tax paid. Any oil extracted in excess of this amount shall be considered contraband. No well shall be permitted to be in operation without being previously registered at the Government office."—*Latin-American Year Book*, 1920, p. 380.

1920 (April).—**Amicable relations established between Colombia and Ecuador.**—"On April 4, 1920, an important interview between Marco Fidel Suarez, President of Colombia, and Alfredo Ba-

querizo Moreno, President of Ecuador, took place on the Rumichaca Bridge over the Carchi River, on the boundary line of these two Republics. This interview resulted from the treaty of peace which amicably settled the boundary disputes between the two countries by means of a joint boundary commission [see COLOMBIA: 1916]."—*Meeting of the presidents of Colombia and Ecuador (Bulletin of the Pan American Union, July, 1920, p. 55).*

1920 (June).—1921 (February).—**First biplane flight over the Andes.**—**Establishment of aviation school and aerial mail service.**—"In June, 1920, the owners of the oldest daily newspaper in Ecuador, *El Telegrafo*, purchased a biplane in Italy of the Newport model, fitted with a rotary 130-horsepower 7-cylinder motor. It secured at the same time the services of Lieut. Elia Liut, the aviator pilot of the Italian army, who held the world speed record from 1916 to 1920, and the expert mechanician Giovanni Fedelio. . . . Trial flights were made which proved successful. . . . [On November 2, 1920] the aviator made his first attempt to start on the first lap of the flight which was to take him from Guayaquil to the city of Cuenca; but, in spite of weather prognostications a dense fog covered the solid mass of the Cordillera, and Lieut. Liut was compelled to return to his starting point. Two days later (Nov. 4) he again attempted the ascent, and this time Lieut. Liut and his biplane *Telegrafo I*, passed successfully over the Azuat Pass in the western range of the Ecuadorian Andes, at a height of about 19,000 feet, landing at Cuenca after a flight lasting 1 hour and 55 minutes. Two weeks later Nov. 19 . . . the second stage of this remarkable flight was achieved. Lieut. Liut flew without mishap from Cuenca to the inter-Andean city of Riobaniba, almost brushing on the way the perpetual snows of Chimborazo, the fourth highest mountain in the world. . . . About the middle of November, Ferruccio Guicciardi a countryman of Lieut. Liut, arrived in Ecuador to continue the flight over the northern ranges, making the trip in two stages from Quito to Ibarra on the 9th of February, 1921, and from Ibarra to the frontier city of Tulcan. Upon the successful completion of these flights the Government of Ecuador, realizing the importance of aviation service in the future of the country, decided to establish aviation schools. Without delay the services of the aviators, who had been brought to Ecuador through the public spirit and initiative of *El Telegrafo*, were secured and large sums of money were voted by congress for the purchase of machines and other necessary equipment and expense. . . . On the first flight of *Telegrafo I*, the aviator carried 512 postal cards, thereby inaugurating the Ecuadorean aerial mail service, which is to be extended greatly in the near future."—*Aviation development in Ecuador (Bulletin of the Pan American Union, May, 1921, pp. 475-476).*

1920 (August).—**New administration.**—"The Presidential term in Ecuador is of four years' duration. On August 31, 1920, the regime of Dr. Alfredo Baquerizo Moreno came to an end, and Dr. Jose Luis Tamayo assumed, in Quito, the office of Chief-Magistrate. Dr. Tamayo is, like his predecessor, a lawyer by profession and a native of Guayaquil. . . . Ecuador's pressing need for a more rigid administration will win for the new President the cordial support of the great majority, and certainly the best of the citizens."—*New Administration in Ecuador (Pan American Magazine, Nov., 1920, p. 290).*

1921.—**Proposed railway.**—**Italian steamship service.**—"Steps have been taken for the construc-

tion of a railway from the port of Esmeraldas, in the direction of Quito, to Santo Domingo de los Colorados. This road will make accessible about 1,000,000 acres of virgin forest lands lying in a practically level country at an elevation of about 2,000 feet. When the line is completed to the national capital it will be the shortest and most direct route from Quito to the coast. The first 30 miles of the road will open to traffic rich lumber and tagua regions now inaccessible. The Ecuadorean Government has contracted with the Italian trans-Atlantic companies and the Societa Nazionale di Navigazione for a regular steamship service between Guayaquil and other ports of the Republic and Italian ports. The mails of the Government of Ecuador are to be carried free, and a reduction of 25 per cent from the regular tariff charges is allowed the Government on freight and passenger traffic. The steamship company is exempt from port charges."—*Bulletin of the Pan American Union*, March, 1921, p. 276.—See also LATIN AMERICA.

ECUMENICAL COUNCIL. See COUNCILS OF THE CHURCH; ECUMENICAL COUNCIL.

EDDAS.—"The chief depositories of the Norse mythology are the Elder or Saemund's Edda (poetry) and the Younger or Snorri's Edda (prose). In Icelandic Edda means 'great-grandmother,' and some think this appellation refers to the ancient origin of the myths it contains. Others connect it with the Indian 'Veda' and the Norse 'vide,' (Swedish 'vela,' to know)."—R. B. Anderson, *Norse mythology*, ch. 7.—"The word Edda is never found at all in any of the dialects of the Old Northern tongue, nor indeed in any other tongue known to us. The first time it is met with is in the Lay of Righ, where it is used as a title for great-grandmother, and from this poem the word is cited (with other terms from the same source) in the collection at the end of Scaldscaparmal. How or why Snorri's book on the Poetic Art came to be called Edda we have no actual testimony. . . . Snorri's work, especially the second part of it, Scaldscaparmal, handed down in copies and abridgments through the Middle Ages, was looked on as setting the standard and ideal of poetry. It seems to have kept up indeed the very remembrance of court-poetry, the memory of which, but for it, would otherwise have perished. But though the mediæval poets do not copy Edda (i. e., Snorri's rules) they constantly allude to it, and we have an unbroken series of phrases from 1340 to 1640 in which Edda is used as a synonym for the technical laws of the court-metre (a use, it may be observed, entirely contrary to that of our own days)."—G. Vigfusson and F. Y. Powell, *Corpus Poeticum Boreale*, v. 1, introd., sect. 4.—See also SAGAS; SCANDINAVIAN LITERATURE: 1120-1250.

EDDY, Samuel (1769-1830), American jurist. See RHODE ISLAND: 1647-1776.

EDEA, colonial station in the Cameroons, on the Sanaga river. It was occupied in 1914 by the British under Dobell. See WORLD WAR: 1914: VI. Africa: a; 1915: VIII. Africa: c, 2.

EDELWEISS TROOPS, special mountain troops in the Austrian army so-called from their wearing a sprig of Edelweiss (white Alpine flower) as a badge. See WORLD WAR: 1917: IV. Austro-Italian front: e, 5.

EDEN, George. See AUCKLAND, GEORGE EDEN, EARL OF.

EDEN, Garden of, according to Hebrew tradition, the spot where man was first put after his

creation. The derivation of the name from the Hebrew 'eden, delight, is almost as much disputed as the location of the garden. The latter has been variously placed: in southern Babylonia; in Armenia; near the sources of the Tigres and Euphrates; in the region of Damascus; and even in Australia and the United States. Although the Bible seems to give a definite account of its geography, two of the rivers mentioned (Pison and Gihon) cannot be located. "And the Lord planted a garden eastward in Eden; and there he put the man whom he had formed. . . . And a river went out of Eden to water the garden; and from thence it was parted, and became into four heads. The name of the first is Pison: that is it which compasseth the whole land of Havilah, where there is gold. . . . The name of the second river is Gihon: the same is it that compasseth the whole land of Ethiopia. And the name of the third river is Hiddekel: that is it that goeth toward the east of Assyria. And the fourth river is Euphrates."—*Gen.* 2:8-14.—Sir William Willcocks, a noted British engineer, has attempted to locate the Garden of Eden from the point of view of geology instead of that of philology. "Sir William Willcocks delivered an interesting lecture . . . before the members of the Royal Geographical Society on the subject of 'The Garden of Eden and its Restoration.' Lord Curzon was in the chair.

"Sir William thought that the Garden of Eden, the first civilized settlement of the Semites, the ancestors of the Children of Israel, was situated on the Upper Euphrates between Anah and Hitt. The wearing down, however, of the cataracts deprived the settlers of the waters of the river which had watered their garden, and they travelled eastwards and could see nothing behind them but the bitumen springs on the East of Eden, which seemed to them like flaming swords in the hands of the offended Seraphim. The Garden of Eden of the Semites must have been near the outcrop of hard rock, upstream of Hitt, where water could be led off from above a rapid and utilized for irrigating, with gardens situated a little down-stream and above the reach of the highest floods."—*Times* (London) *Weekly edition*, June 14, 1912.

EDESSA, ancient Macedonian city. Edessa, or Ægæ, the ancient Macedonian capital, "a place of primitive antiquity, according to a Phrygian legend the site of the gardens of Midas, at the northern extremity of Mount Bermius, where the Lydias comes forth from the mountains. . . . Ægæ was the natural capital of the land. With its foundation the history of Macedonia had its beginning; Ægæ is the germ out of which the Macedonian empire grew."—E. Curtius, *History of Greece*, bk. 7, ch. 1.—See also MACEDONIA.

EDESSA, ancient Mesopotamian city, modern name Urfa. Its history can be vaguely traced in the early Babylonian-Assyrian period. From the fourth to the sixth centuries, it was the chief center of Syrian learning and literature. The alleged correspondence between one of its kings (Abgar V) and Jesus was probably fabricated by the accomplished hand of Eusebius.—See also OSRHOENE.

Church. See CHRISTIANITY: 100-300: Syrian churches.

260.—**Besieged by Persians.**—**Defeat of Valerian.** See PERSIA: 226-627; ROME: Empire: 192-284.

1097-1144.—**Frank principality.**—On the march of the armies of the First Crusade, as they approached Syria, Baldwin, the able, selfish and self-willed brother of Godfrey of Bouillon, left the main body of the crusaders, with a band of fol-

lowers, and moved off eastwards, seeking the prizes of a very worldly ambition, and leaving his devoted comrades to rescue the boly sepulchre without his aid. Good fortune rewarded his enterprise and he secured possession of the important city of Edessa. It was governed by a Greek prince, who owed allegiance to the Byzantine emperor, but who paid tribute to the Turks. "It had surrendered to Pouzan, one of the generals of Malek-shah, in the year 1087, but during the contests of the Turks and Saracens in the north of Syria it had recovered its independence. Baldwin now sullied the honour of the Franks, by exciting the people to murder their governor Theodore, and rebel against the Byzantine authority [other historians say that he was guilty of no more than a passive permission of these acts]; he then took possession of the place in his own name and founded the Frank principality of Edessa, which lasted about 47 years."—G. Finlay, *History of Byzantine and Greek empires*, 716-1453, bk. 3, ch. 2, sect. 1.—See also CRUSADES: 1096-1099; 1147-1149; JERUSALEM: 1099-1131.

Modern period.—Since 1144 it has passed through various hands: Turkish, Egyptian, Byzantine, Mongolian, Turkoman, and Persian. It was finally recaptured by the Turks in 1637. In 1895 the Turks inflicted two terrible massacres on the Armenian natives of Urfa. The territory including Urfa was taken from the Turks during the World War.

EDINBURGH, the capital of Scotland and the county town of Edinburghshire or Midlothian, situated about two miles south of the Firth of Forth. Its name is derived from Edwin, the Saxon king of Northumbria, who captured the city from the Picts in 617. In the ninth century we find it referred to as Edwinesburgh. For the more remote history of Edinburgh the historian must fumble and grope among relics in a mist of unauthentic tales. (See ENGLAND: 547-633.) It seems that an ancient Welsh tribe built a fort on the present site of Edinburgh castle, around which a village grew. For three centuries the Romans occupied the country, and when they withdrew British tribes entered to take their place. Soon the fierce Picts came and subdued them.

11th-12th centuries.—Saxon and Norman settlers.—Becomes royal residence.—David I founds abbey of Holyrood.—After Edwin's con-

quest, Saxon, and later Norman colonists flocked to the city which became the royal residence of Malcolm Canmore and his descendants. (See SCOTLAND: 1066-1093.) In the twelfth century Canmore's son, David I, was induced by his piety and munificence to found the abbey of Holyrood in the low ground eastward of the city. In spite of this increased prestige the city failed to expand largely because it was a frontier town in the lowlands exposed to invasions from both north and south.

15th century.—Refuge for Scottish kings.—Becomes capital of Scotland.—Prosperity checked by religious disturbances.—In the fifteenth century the Scottish kings found a safe refuge from their turbulent nobles behind the impregnable walls of the castle. It was not, however, until after the death of James I in 1436 that Edinburgh became the actual capital of Scotland, the seat of the Scottish Parliament. The coronation of James II took place at Holyrood abbey rather than at Scone. From that time on Edinburgh enjoyed many special privileges conferred on it by the kings. In 1450 Edinburgh became a walled town and for a time the growth of the city was limited by its walls, but in the reign of James III the city spread to the south. This period of prosperity came to an abrupt end at the opening of the sixteenth century. Through this century the city suffered from the religious tumult in which Mary, queen of Scots and John Knox were such prominent figures.

1707-1723.—City at the time of the union and after.—The accession of James VI of Scotland to the throne of England in 1603 and the subsequent union of England and Scotland in 1707 deprived Edinburgh of much of its prominence. It is said that grass grew then in High street. At the time of the union, "Edinburgh, though still but a small town, excited the admiration of travellers who were acquainted with the greatest cities of England and the Continent; nor was their admiration entirely due to the singular beauty of its situation. The quaint architecture of the older houses—which sometimes rose to the height of nine, ten or eleven stories—indeed, carried back the mind to very barbarous times; for it was ascribed to the desire of the population to live as near as possible to the protection of the castle. The filth of the streets in the early years of the

18th century was indescribable. . . . The new quarter, which now strikes every stranger by its spacious symmetry, was not begun till the latter half of the 18th century, but as early as 1723 an English traveller described the High Street as 'the stateliest street in the world.' . . . Under the influence of the Kirk the public manners of the town were marked by much decorum and even austerity, but the populace were unusually susceptible of fierce political enthusiasm, and when excited they were extremely formidable. . . . A city guard, composed chiefly of fierce Highlanders, armed and disciplined like regular soldiers, and placed under the control of the magistrates, was established in 1696; and it was not finally abolished till the present century. Edinburgh, at the beginning of the 18th century, was more than twice as large as any other Scotch town. Its population at the time of the union slightly exceeded 30,000, while that of Glasgow was not quite 15,000, that of Dundee not quite 10,000, and that of Perth about 7,000."—W. E. H. Lecky, *History of England in the 18th century*, v. 2, ch. 5.

1736.—The Porteous Riot.—"The circumstances of the Porteous Riot are familiar wherever the English tongue is spoken, because they were made the dramatic opening of one of his finest stories by that admirable genius who, like Shakespeare in his plays, has conveyed to plain men more of the spirit and action of the past in noble fiction, than they would find in most professed chronicles of fact. The early scenes of the 'Heart of Midlothian' are an accurate account of the transaction which gave so much trouble to Queen Caroline and the minister [Walpole]. A smuggler who had excited the popular imagination by his daring and his chivalry was sentenced to be hanged; after his execution the mob pressed forward to cut down his body: Porteous, the captain of the City Guard, ordered his men to fire, and several persons were shot dead: he was tried for murder, convicted, and sentenced, but at the last moment a reprieve arrived from London, to the intense indignation of a crowd athirst for vengeance: four days later, under mysterious ringleaders who could never afterwards be discovered, fierce throngs suddenly gathered together at nightfall to the beat of drum, broke into the prison, dragged out the unhappy Porteous, and sternly hanged him on a dyer's pole close by the common place of public execution."—J. Morley, *Walpole*, ch. 9.

1745.—Young Pretender. See SCOTLAND: 1745-1746.

1760.—Accession of George III.—The accession of George III in 1760 marked a revival of literary, social and economic activity.

1800-1911.—City rebuilt.—George V's coronation.—The city was largely rebuilt and beautified in the early nineteenth century, so that to-day Edinburgh is frequently referred to as the "Modern Athens." The appropriateness of this appellation becomes all the more striking when we reflect on the wealth of literary associations that embellish the city:—Robert Burns, Walter Scott, Jeffrey, John Wilson ("Christopher North"), Brougham, etc. In 1843 Edinburgh became the center of a secession movement from the Established Church of England ending in the founding of the Free Church of Scotland. Modern conditions and especially the introduction of railroads have robbed the city of much of its isolated exclusiveness. The coronation of George V in 1911 at Holyrood revived the ancient glory of Edinburgh as the capital of Scotland. Edinburgh is not a large commercial or industrial town, though it has many banks, insurance offices and factories. It is chiefly noted

today for its civic beauty, its educational facilities, its law-courts, and its literary taste and culture.

1920.—Boundaries extended.—In August, 1920, an act known as the Edinburgh Boundaries Extension and Tramways Act was passed by Parliament and received the assent of the king. The act added to the city of Edinburgh the territory comprised in the town burgh of Leith, which had become surrounded by the city, the villages of Colinton, Corsorphine, Cramond, Liberton and that part of Inveresk which had not already been taken over. The public utilities, of the whole of this greater area, public property and education passed under the jurisdiction of the city authorities.

EDINGTON (Ethandon), Battle of (878). See ENGLAND: 855-880.

EDISON, Thomas Alva (1847-), American electrical inventor; was a newsboy on the Grand Trunk Railway at the age of twelve; 1863, became a telegraph operator; 1864, invented an automatic telegraph repeater; 1869 or 1870, established his laboratory at Newark, N. J., and laid the foundation of his great business of scientific invention; 1878, made Chevalier of the Legion of Honor; 1892, received Albert medal of Society of Arts of Great Britain; 1915, awarded a Nobel prize for physics; 1916-1917, president naval consulting board, and board of inventions. See ELECTRICAL DISCOVERY: Electric lighting: 1841-1921; also Telegraphy and telephony: Telephone: 1875-1893; INVENTIONS: 19th century: Phonograph; AVIATION: Development of airplanes and air service: 1896-1910.

EDMONTON, capital of the province of Alberta; population, 1921, 58,627; situated on the north bank of the Saskatchewan river, in a fertile agricultural district, served by all three of the Canadian transcontinental railways. In 1778 a trading post of the North-West Company was built at this place, which, when the war between the companies ended, became Fort Edmonton, a flourishing fort of the Hudson's Bay Company. It is still a great fur-trading center. In 1896, it was a mere village, but grew rapidly before 1905 when it was made the capital of the province. Since that time the development of the numerous coal mines in the vicinity has added to its industrial and commercial importance. The city is well laid out, with wide streets. The electric light and power works, water, telephone and street railway systems are public property, and operated by the city corporation.—See also CANADA: 1905.

EDMUNDS, George Franklin (1828-1919), American lawyer and legislator. Member Vermont legislature, 1854-1859; president *pro tem* of state Senate, 1861-1862; member United States Senate, 1866-1891; member Electrical Commission, 1877.

EDMUNDS ACT. See UTAH: 1882-1893.

EDOMITES, or Idumeans.—"The Edomites were descended from Edom, or Esau, the son of Isaac and brother of Jacob. They were settled in the mountains of Seir, which extended along the eastern side of the great valley of Arabah, between the Dead Sea and the Elantic Gulf. In a valley among these mountains, the remains of Petra, the chief city of Edom, have only lately been discovered, and have been viewed with much wonder on account of the beautiful tombs and other monuments hewn in the surrounding cliffs. While the land was comparatively depopulated.

during the Captivity of the Jews in Babylon, the Edomites established themselves in the south-eastern parts of Judæa, whence . . . that quarter came to be called Idumæa, or the country of the Idumæans or Edomites."—J. Kitto, *Palestine*, pp. 6-7.—"From a very early period the Edomites were the chief of the nations of Arabia Petræa. Amongst the branches sprung, according to Arab tradition, from the primitive Amalika, they correspond to the Arcam, and the posterity of Esau, after settling amongst them as we have seen, became the dominant family from which the chiefs were chosen. The original habitation of the Edomites was Mount Seir, whence they spread over all the country called by the Greeks Gebalene, that is the prolongation of the mountains joining on the north the land of Moab, into the Valley of Arabah, and the surrounding heights. . . . Saul successfully fought the Edomites; under David, Joab and Abishai, his generals, completely defeated

them, and David placed garrisons in their towns. In their ports of Elath and Eziongeber were built the fleets sent to India by Hiram and Solomon. . . . After the schism of the ten tribes, the Edomites remained dependent on the King of Judah."—F. Lenormant, *Manual of ancient history of the East*, bk. 7, ch. 4.—See also NABATHEANS; JEWS: Early Hebrew history; AMALEKITES; CHRISTIANITY: Map of Sinaitic peninsula.

EDRED, or Eadred, king of Wessex, 947-955.

EDRISITES.—After the revolt of Moorish or Mohammedan Spain from the caliphate of Bagdad, the African provinces of the Moslems assumed independence, and several dynasties became seated—among them that of the Edrisites, which founded the city and kingdom of Fez, and which reigned from 829 to 907.—E. Gibbon, *History of the decline and fall of the Roman empire*, ch. 52.—See also CALIPHATE: 715-750.

EDUCATION

INTRODUCTION

Definition.—Education has been defined by Dr. Nicholas Murray Butler as "a gradual adjustment to the spiritual possessions of the race." Professor Paul Monroe has said that "the essential characteristic of the educational process" is "the fitting of the child to his physical and social environment through the appropriation of the experience of previous generations." As we trace the development of educational theories and processes through ancient, medieval and modern times, we can study both the evolution of civilization, of human thought and ideals, and the varying skill with which each generation communicates its wealth of experience to the next.

ANCIENT

B. C. (c) 40th-6th centuries.—**Egypt**.—"In the education of youth [the Egyptians] were particularly strict; and 'they knew,' says Plato, 'that children ought to be early accustomed to such gestures, looks, and motions as are decent and proper; and not to be suffered either to hear or learn any verses and songs other than those which are calculated to inspire them with virtue; and they consequently took care that every dance and ode introduced at their feasts or sacrifices should be subject to certain regulations.'"—J. G. Wilkinson, *Manners and customs of the ancient Egyptians*, v. 1, p. 321.—"The children were educated according to their station and their future position in life. They were kept in strict subjection by their parents, and respect to old age was particularly inculcated; the children of the priests were educated very thoroughly in writing of all kinds, hieroglyphic, hieratic, and demotic, and in the sciences of astronomy, mathematics, etc. The Jewish deliverer Moses was educated after the manner of the priests, and the 'wisdom of the Egyptians' became a proverbial expression among the outside nations, as indicating the utmost limit of human knowledge."—E. A. W. Budge, *Dwellers on the Nile*, ch. 10.—"On the education of the Egyptians, Diodorus makes the following remarks:—"The children of the priests are taught two different kinds of writing,—what is called the sacred, and the more general; and they pay great attention to geometry and arithmetic. For the river, changing the appearance of the country very materially every year, is the cause of many and various dis-

cussions among neighbouring proprietors about the extent of their property; and it would be difficult for any person to decide upon their claims without geometrical reasoning, founded on actual observation. Of arithmetic they have also frequent need, both in their domestic economy, and in the application of geometrical theorems, besides its utility in the cultivation of astronomical studies; for the orders and motions of the stars are observed at least as industriously by the Egyptians as by any people whatever; and they keep record of the motions of each for an incredible number of years, the study of this science having been, from the remotest times, an object of national ambition with them. . . . But the generality of the common people learn only from their parents or relations that which is required for the exercise of their peculiar professions, . . . a few only being taught anything of literature, and those principally the better class of artificers.' Hence it appears they were not confined to any particular rules in the mode of educating their children, and it depended upon a parent to choose the degree of instruction he deemed most suitable to their mode of life and occupations, as among other civilised nations."—J. G. Wilkinson, *Manners and customs of the Egyptians*, v. 1, pp. 175-176.—"There is nothing like being a scribe,' the wise say; 'the scribe gets all that is upon earth.' . . . The scribe is simply a man who knows how to read and write, to draw up administrative formulas, and to calculate interest. The instruction which he has received is a necessary complement of his position if he belongs to a good family, whilst if he be poor it enables him to obtain a lucrative situation in the administration or at the house of a wealthy personage. There is, therefore, no sacrifice which the smaller folk deem too great, if it enables them to give their sons the acquirements which may raise them above the common people, or at least insure a less miserable fate. If one of them, in his infancy, displays any intelligence, they send him, when about six or eight years old, to the district school, where an old pedagogue teaches him the rudiments of reading, writing and arithmetic. Towards ten or twelve years old, they withdraw him from the care of this first teacher and apprentice him to a scribe in some office, who undertakes to make him a 'learned scribe.' The child accompanies his master to his office or work-yard, and there passes entire months in copying letters, circulars,

legal documents, or accounts, which he does not at first understand, but which he faithfully remembers. There are books for his use full of copies taken from well-known authors, which he studies perpetually. If he requires a brief, precise report, this is how Ennana worded one of his:—'I reached Elcphantine and accomplished my mission. I reviewed the infantry and the chariot soldiers from the temples, as well as the servants and subordinates who are in the houses of Pharaoh's . . . officials. As my journey is for the purpose of making a report in the presence of his Majesty, . . . the course of my business is as rapid as that of the Nile; you need not, therefore, feel anxious about me.' There is not a superfluous word. If, on the other hand, a petition in a poetical style be required, see how Pentoirit asked for a holiday. 'My heart has left me, it is travelling and does not know how to return, it sees Memphis and hastens there. Would that I were in its place. I remain here, busy following my heart, which endeavours to draw me towards Memphis. I have no work in hand, my heart is tormented. May it please the god Ptah to lead me to Memphis, and do thou grant that I may be seen walking there. I am at leisure, my heart is watching, my heart is no longer in my bosom. languor has seized my limbs; my eye is dim, my ear hardened, my voice feeble, it is a failure of all my strength. I pray thee remedy all this.' The pupil copies and recopies, the master inserts forgotten words, corrects the faults of spelling, and draws on the margin the signs or groups unskillfully traced. When the book is duly finished and the apprentice can write all the formulas from memory, portions of phrases are detached from them, which he must join together, so as to combine new formulas; the master then entrusts him with the composition of a few letters, gradually increasing the number and adding to the difficulties. As soon as he has fairly mastered the ordinary daily routine his education is ended, and an unimportant post is sought for. He obtains it and then marries, becoming the head of a family, sometimes before he is twenty years old; he has no further ambition, but is content to vegetate quietly in the obscure circle where fate has thrown him."—G. Maspero, *Life in ancient Egypt and Assyria*, ch. 1.—"In the schools, where the poor scribe's child sat on the same bench beside the offspring of the rich, to be trained in discipline and wise learning, the masters knew how by timely words to goad on the lagging diligence of the ambitious scholars, by holding out to them the future reward which awaited youths skilled in knowledge and letters. Thus the slumbering spark of self-esteem was stirred to a flame in the youthful breast, and emulation was stimulated among the boys. The clever son of the poor man, too, might hope by his knowledge to climb the ladder of the higher offices, for neither his birth nor position raised any barrier, if only the youth's mental power justified fair hopes for the future. In this sense, the restraints of caste did not exist, and neither descent nor family hampered the rising career of the clever. Many a monument consecrated to the memory of some nobleman gone to his long home, who during life had held high rank at the court of Pharaoh, is decorated with the simple but laudatory inscription, 'His ancestors were unknown people.' It is a satisfaction to avow that the training and instruction of the young interested the Egyptians in the highest degree. For they fully recognised in this the sole means of cultivating their national life, and of fulfilling the high civilising mission which Providence seemed to have placed in their hands. But above all things

they regarded justice, and virtue had the highest price in their eyes."—H. Brugsch-Bey, *History of Egypt under the Pharaohs*, v. 1, p. 22.—"The education of the young Egyptian, in brief, was through the religion, morality, law, and social customs of his native land. The general influences of the inherited civilisation would of course be felt in different ways according to the social position and opportunities of the children. Compared with the youth of other nations the Egyptian of the lower classes grew up, we may think, too patient of toil and the stick; but, spite of the oppressive conditions of life, there seem to have been prevalent a mildness, kindness, and equity of disposition and a simplicity of life and domestic relations which an organised educational system might have failed to secure. . . . All, however, lacked the education which free political life gives, and we find that, where this is the case, it operates to deprive men of initiative, reacting on the whole intellectual life, making it torpid and content with the *status quo*, whatever that may be. Doubtless, the political constitution was, to begin with, itself an expression of a certain racial temperament, but it reacted on the popular mind so as to confirm natural predisposition. If we may make a distinction between individuality and that personality which comes into life along with the free exercise of self-conscious reason, we should say that, there was in the ancient Egyptian a marked individuality exhibiting itself in a keen practical intelligence, but that personality as we find it in European nations was absent. Nor do we find this sense of personality, with which is always associated the idea of self-direction and self-government, in any of the Oriental races, except the Persians (and that empire was a short-lived phenomenon) and the Jews; and it is interesting to note that this strong sense of personality existed, in both cases, side by side with an intense monotheism. . . . The practical intelligence of the Egyptian race had an immense field for its activity. They had to devise the engineering works which enabled them to utilise the Nile; and every year they had a recurring struggle to maintain their supremacy over it. With comparatively little foreign trade they had themselves to produce the articles of necessity and luxury which a growing nation requires. Thus all the industrial arts flourished, and, apart from the professions, every boy had an industrial or technical education from his own father. We are told in these days that manual work is educative, but how much more educative the prolonged and careful training required for the acquisition of a skilled trade with all its traditions! The Egyptian boy had this. On the spiritual side he, was under powerful influences, he breathed an atmosphere of mystery and awe, and lived in the constant presence of gods, and in expectation of immortality. His crude conceptions of the unseen were, it is true, associated with magic and sorcery; but has modern Europe no superstitions equally absurd? . . . It is difficult for us . . . to realise the extent to which the constant presence of unseen powers pressed on the daily life of a race like the Egyptians. . . . In the bringing up of children there seems to have been much kindness. They had their toys and games and nursery stories like other children all the world over. . . . It is possible that the facilities for obtaining school instruction in ancient Egypt have been much exaggerated. But, theoretically at least, all that was known or knowable was open to all except such esoteric doctrines (if any) as the higher priesthood may have possessed. There is evidence that if there were not numerous elementary schools scattered over the country, yet teachers might al-

ways be had, and that reading and writing and the elements of arithmetic were accessible to those who desired instruction. There is no evidence, however, it seems to me, that the labouring class received any benefit from these schools save in exceptional cases; but there was nothing to prevent a clever boy, whose parents were well-disposed, receiving elementary instruction. On the whole, I cannot see that on this point modern exploration has added much to the information given by Diodorus Siculus, i. 81, who says, 'A little reading and writing are taught, but not to all; but to those engaged with the industrial arts.' At the chief provincial cities, (in connection with the Temple which was the centre of the civic life) more advanced instruction was obtainable, including the writing and reading of the hieratic and hieroglyphic characters and mathematics. These higher schools doubtless supplied the professions. . . . What else he might study or acquire depended on his aims and ambitions."—S. S. Laurie, *Historical survey of pre-Christian education*, pp. 39-42.

B. C. (c) 35th-6th centuries.—Babylonia and Assyria.—"The primitive Chaldeans were pre-eminently a literary people, and it is by their literary relics, by the scattered contents of their libraries, that we can know and judge them. As befitted the inventors of a system of writing, like the Chinese they set the highest value on education. Education, however, was widely diffused. . . . Assur-bani-pal's library was open to the use and enjoyment of all his subjects, and the syllabaries, grammars, lexicons, and reading-books that it contained, show the extent to which not only their own language was studied by the Assyrians, but the dead language of ancient Accad as well. It became as fashionable to compose in this extinct tongue as it is now-a-days to display one's proficiency in Latin prose, and 'dog-Accadian' was perpetrated with as little remorse as 'dog-Latin' at the present time. One of the Babylonian cylinders found by General di Cesnola in the temple-treasure of Kurium, which probably belongs to the period of Nebuchadnezzar's dynasty, has a legend which endeavours to imitate the inscriptions of the early Accadian princes; but the very first word, by an unhappy error, betrays the insufficient knowledge of the old language possessed by its composer. Besides a knowledge of Accadian, the educated Assyrian was required to have also a knowledge of Aramaic, which had now become the 'lingua franca' of trade and diplomacy; and we find the Rabshakeh (Rab-sakki), or prime minister, who was sent against Hezekiah by Sennacherib, acquainted with Hebrew as well. The grammatical and lexical works in the library of Nineveh are especially interesting, as being the earliest attempts of the kind of which we know, and it is curious to find the Hamiltonian method of learning languages forestalled by the scribes of Assur-bani-pal. In this case, as in all others, the first enquiries into the nature of speech, and the first grammars and dictionaries, were due to the necessity of comparing two languages together; it was the Accadian which forced the Semitic Assyrian or Babylonian to study his own tongue. And already in these first efforts the main principles of Semitic grammar are laid down clearly and definitely."—A. H. Sayce, *Babylonian literature*, pp. 71-72.—"The Babylonians were the Chinese of the ancient world. They were essentially a reading and writing people. . . . The books were for the most part written upon clay with a wooden reed or metal stylus, for clay was cheap and plentiful, and easily impressed with the wedge-shaped lines of which the characters were composed. But besides clay, papyrus and possibly

also parchment were employed as writing materials. . . . The use of clay for writing purposes extended, along with Babylonian culture, to the neighbouring populations of the East. . . . It is astonishing how much matter can be compressed into the compass of a single tablet. The cuneiform system of writing allowed the use of many abbreviations—thanks to its 'ideographic' nature—and the characters were frequently of a very minute size. Indeed, so minute is the writing on many of the Assyrian (as distinguished from the Babylonian) tablets that it is clear not only that the Assyrian scribes and readers must have been decidedly short-sighted, but also that they must have made use of magnifying glasses. We need not be surprised, therefore, to learn that Sir A. H. Layard discovered a crystal lens, which had been turned on a lathe, upon the site of the great library of Nineveh. . . . To learn the cuneiform syllabary was a task of much time and labour. The student was accordingly provided with various means of assistance. The characters of the syllabary were classified and named; they were further arranged according to a certain order, which partly depended on the number of wedges or lines of which each was composed. Moreover, what we may term dictionaries were compiled. . . . To learn the signs, however, with their multitudinous phonetic values and ideographic significations, was not the whole of the labour which the Babylonian boy had to accomplish. The cuneiform system of writing, along with the culture which had produced it, had been the invention of the non-Semitic Accado-Sumerian race, from whom it had been borrowed by the Semites. In Semitic hands the syllabary underwent further modifications and additions, but it bore upon it to the last the stamp of its alien origin. On this account alone, therefore, the Babylonian student who wished to acquire a knowledge of reading and writing was obliged to learn the extinct language of the older population of the country. There was, however, another reason which even more imperatively obliged him to study the earlier tongue. A large proportion of the ancient literature, more especially that which related to religious subjects, was written in Accado-Sumerian. Even the law-cases of earlier times, which formed precedents for the law of a later age, were in the same language. In fact, Accado-Sumerian stood in much the same relation to the Semitic Babylonians that Latin has stood to the modern inhabitants of Europe. . . . Besides learning the syllabary, therefore, the Babylonian boy had to learn the extinct language of Accad and Sumer. . . . The study of foreign tongues naturally brought with it an inquisitiveness about the languages of other people, as well as a passion for etymology. . . . But there were other things besides languages which the young student in the schools of Babylonia and Assyria was called upon to learn. Geography, history, the names and nature of plants, birds, animals, and stones, as well as the elements of law and religion, were all objects of instruction. The British Museum possesses what may be called the historical exercise of some Babylonian lad in the age of Nebuchadnezzar or Cyrus, consisting of a list of the kings belonging to one of the early dynasties, which he had been required to learn by heart. . . . A considerable proportion of the inhabitants of Babylonia could read and write. The contract tablets are written in a variety of running hands, some of which are as bad as the worst that passes through the modern post. Every legal document required the signatures of a number of witnesses, and most of these were able to write their own names. . . . In Assyria, however,

education was by no means so widely spread. Apart from the upper and professional classes, including the men of business, it was confined to a special body of men—the public scribes. . . . There was none of that jealous exclusion of women in ancient Babylonia which characterizes the East of to-day, and it is probable that boys and girls pursued their studies at the same schools. The education of a child must have begun early.”—A. H. Sayce, *Social life among the Babylonians*, ch. 3.—See also LIBRARIES: Ancient: Babylonia and Assyria.

B. C. (c) 22d-6th centuries.—China.—“It is not, perhaps, generally known that Peking contains an ancient university; for, though certain buildings connected with it have been frequently described, the institution itself has been but little noticed. It gives, indeed, so few signs of life that it is not surprising it should be overlooked. . . . If a local situation be deemed an essential element of identity, this old university must yield the palm of age to many in Europe, for in its present site it dates, at most, only from the Yuen, or Mongol, dynasty, in the beginning of the fourteenth century. But as an imperial institution, having a fixed organization and definite objects, it carries its history, or at least its pedigree, back to a period far anterior to the founding of the Great Wall. Among the Regulations of the House of Chow, which flourished a thousand years before the Christian era, we meet with it already in full-blown vigor, and under the identical name which it now bears, that of Kwotszekien, or ‘School for the Sons of the Empire.’ It was in its glory before the light of science dawned on Greece, and when Pythagoras and Plato were pumping their secrets from the priests of Heliopolis. And it still exists, but it is only an embodiment of ‘life in death.’ its halls are tombs, and its officers living mummies. In the 13th Book of the Chowle (see Rites de Tcheou, traduction par Edouard Biot), we find the functions of the heads of the Kwotszekien laid down with a good deal of minuteness. The presidents were to admonish the Emperor of that which is good and just, and to instruct the Sons of the State in the ‘three constant virtues’ and the ‘three practical duties’—in other words, to give a course of lectures on moral philosophy. The vice-presidents were to reprove the Emperor for his faults (i. e., to perform the duty of official censors) and to discipline the Sons of the State in the sciences and arts—viz., in arithmetic, writing, music, archery, horsemanship and ritual ceremonies. . . . The old curriculum is religiously adhered to, but greater latitude is given, as we shall have occasion to observe, to the term ‘Sons of the State.’ In the days of Chow, this meant the heir-apparent, princes of the blood, and children of the nobility. Under the Tatsing dynasty it signifies men of defective scholarship throughout the provinces, who purchase literary degrees, and more specially certain indigent students of Peking, who are aided by the imperial bounty. The Kwotszekien is located in the northeastern angle of the Tartar city, with a temple of Confucius attached, which is one of the finest in the Empire. The main edifice (that of the temple) consists of a single story of imposing height, with a porcelain roof of tent-like curvature. . . . It contains no seats, as all comers are expected to stand or kneel in presence of the Great Teacher. Neither does it boast anything in the way of artistic decoration, nor exhibit any trace of that neatness and taste which we look for in a sacred place. Perhaps its vast area is designedly left to dust and emptiness, in order that nothing may intervene to disturb the mind in the contemplation of a great name which

receives the homage of a nation. . . . In an adjacent block or square stands a pavilion known as the ‘Imperial Lecture-room,’ because it is incumbent on each occupant of the Dragon throne to go there at least once in his life-time to hear a discourse on the nature and responsibilities of his office. . . . A canal spanned by marble bridges encircles the pavilion, and arches of glittering porcelain, in excellent repair, adorn the grounds. But neither these nor the pavilion itself constitutes the chief attraction of the place. Under a long corridor which encloses the entire space may be seen as many as one hundred and eighty-two columns of massive granite, each inscribed with a portion of the canonical books. These are the ‘Stone Classics’—the entire ‘Thirteen,’ which formed the staple of a Chinese education, being here enshrined in a material supposed to be imperishable. Among all the Universities in the world, the Kwotszekien is unique in the possession of such a library. This is not, indeed, the only stone library extant—another of equal extent being found at Singanfu, the ancient capital of the Tangs. But, that too, was the property of Kwotszekien ten centuries ago, when Singan was the seat of empire. The ‘School for the Sons of the Empire’ must needs follow the migrations of the court; and that library, costly as it was, being too heavy for transportation, it was thought best to supply its place by the new edition which we have been describing. . . . In front of the temple stands a forest of columns of scarcely inferior interest. They are three hundred and twenty in number, and contain the university roll of honor, a complete list of all who since the founding of the institution have attained to the dignity of the doctorate. Allow to each an average of two hundred names, and we have an army of doctors sixty thousand strong! (By the doctorate I mean the third or highest degree.) All these received their investiture at the Kwotszekien, and, throwing themselves at the feet of its president, enrolled themselves among the ‘Sons of the Empire.’ They were not, however—at least the most of them were not—in any proper sense alumni of the Kwotszekien, having pursued their studies in private, and won their honors by public competition in the halls of the Civil-service Examining Board. . . . There is an immense area occupied by lecture-rooms, examination-halls and lodging-apartments. But the visitor is liable to imagine that these, too, are consecrated to a monumental use—so rarely is a student or a professor to be seen among them. Ordinarily they are as desolate as the halls of Baalbec or Palmyra. In fact, this great school for the ‘Sons of the Empire’ has long ceased to be a seat of instruction, and degenerated into a mere appendage of the civil-service competitive examinations on which it hangs as a dead weight, corrupting and debasing instead of advancing the standard of national education.”—W. A. P. Martin, *Chinese, their education, philosophy and letters*, pp. 85-90.—See also LIBRARIES: Modern: China.—“The following brief survey of the history of examinations in China is, I believe, substantially correct:—“So early as at the commencement of the Chow dynasty, B. C. 1115, the government was accustomed to examine candidates for offices; and this time we are not left in doubt as to the nature of the examination. The Chinese had become a cultivated people, and we are informed that all candidates for office were required to give proof of their acquaintance with the fine arts, viz. music, archery, horsemanship, writing and arithmetic, and to be thoroughly versed in the rites and ceremonies of public and social life, an accomplishment that ranked as a sixth art. These six arts, expressed in

the concise formula, *li, yo, shay, yu, shu, su*, comprehended the sum total of a liberal education at the period, and remind us of the *trivium* and *quadrivium* of mediaeval schools. Under the dynasty of Han, after the lapse of another thousand (900?) years, we find the range of subjects for the civil service examinations largely extended. The Confucian ethics had become current, and a moral standard was regarded in the selection of the competitors, the district magistrate being required to send up to the capital such men as had acquired a reputation for *hiao* and *lien*—filial piety and integrity—the Chinese rightly considering the faithful performance of domestic and social duties in the best guarantee for fidelity in public life. These *hiao-lien*, these 'filial sons and honest subjects,' whose moral characters had been sufficiently attested, were now subjected to trial in respect to their intellectual qualifications. The trial was two-fold, first as to their skill in the six arts already mentioned, and secondly as to their familiarity with one or more of the following subjects, the civil law, military affairs, agriculture, the administration of the revenue, and the geography of the empire, with special reference to the state of the water communications. This was an immense advance on the meagre requirements of the more ancient dynasties. Passing over another thousand . . . years, we come to the era of the Tangs and the Sung, about 700 A.D., when we find the standard of literary attainment greatly elevated, the graduates arranged in three classes and officials in nine, a classification which is still retained. Arriving at the close of the fourth millennium, under the sway of the Mings and Tsings of the present day, we find the simple trials instituted by Shun expanded into a colossal system which may well claim to be the growth of four thousand years."—S. S. Laurie, *Historical survey of pre-Christian education*, pp. 122-123.

B. C. (c) 15th-5th centuries.—India.—"The Chinese," says Wuttke, 'educate for practical life, the Indians for the ideal: those of earth, these for heaven; . . . those educate their sons for entering the world, these for going out of it. Those educate their sons in the laws of the state, these teach them the essence of the godhead. Those lead their sons into the world, these lead them out of the world into themselves. Those teach their children to earn and to enjoy, these to beg and to renunciate.' . . . There early arose (probably 1,000 years B. C.) Brahmanic settlements called Parishads, which approximated closely to what we should call collegiate institutions of learning. These Parishads were in later times understood to consist of twenty-one Brahmins well-versed in philosophy, theology, and law; but, in their beginnings, three able Brahmins in a village, learned in the Vedas and competent to maintain the sacrificial fire, constituted a Parishad. . . . To these centres men who wished to devote their lives to learning and who belonged to the caste might go and receive instruction in the Vedas, and in such traditional law and astronomy and philosophy as was current. Private schools also existed, conducted by scholarly men at their own venture, and to these many boys were sent for training, giving personal and menial service in return for instruction. These boys did not necessarily belong to the Brahmanical caste. Prior to the above rudimentary form of educational organisation it would appear that at the period of transition from the Vedic to the Brahmanic stage of religious development (say about 1200 B. C.), the courts of the kings were the centres of such culture as existed. Priests, of course, were attached to these courts, and in connection with them there

grew up what may be called 'schools' for the study and handing down of the sacred hymns and sacrificial practices. Megasthenes, the Greek, who lived in North India three centuries before the Christian era, and indeed all the Greeks, spoke of the Brahmanical priests as the 'caste of philosophers;' and with truth, for metaphysics played as large a part in the forming of the Hindu religion as the Vedic hymns did. We are not, consequently, to look on the Brahmins as if they were, in the narrow sense, a priestly order. They were a caste, and men of Brahmanical descent constituted the aristocracy of India—an aristocracy with which learning and character were closely associated. The Chinese aristocracy, after the abolition of feudalism, was, as we found, not only associated with, but founded on, intellect, and renewed itself in every successive generation. This large Brahmanical body was, on the contrary, hereditary, but the members of it always received the highest education which India could afford. Among them were the recognised chiefs of all learning as well as of religion, and they discharged many important functions in the State. In every Brahmanic family it still is, we are told, the custom to study and learn by heart a particular Veda. Those who desired to prosecute the higher studies were attached to particular Brahmins who devoted themselves to the work of instruction. A thoroughly equipped Brahmin was understood to acquire by heart all the sacred books. . . . And when we consider that the Brahmanic colleges taught all the astronomy and mathematics known, and frequently carried their pupils into the elaborate linguistic treatise of Panini, we must recognise in the substance of the highest Hindu education a fully adequate course of liberal study, embracing as it did theology, philosophy, language, and science, while including the whole of the national literature as that gradually took shape. . . . While the memorial acquisition of the sacred writings, and this with scrupulous fidelity, was the chief object of Brahmanical instruction, the minds of the young Brahmins were brought into contact with philosophical systems and the general literature of the country. In such a course of study there was both discipline and culture. . . . As to the rest of the nation, it would seem certain that the teaching and schools of the Brahmins were not only open to the caste of warriors and the industrial caste, but that they were expected to take advantage of them. There was no esoteric doctrine. The only exclusive privilege of the Brahmins was not doctrine but the functions of priest and teacher. Advantage was taken by many in the two castes next in order of this freedom to learn. The warriors, moreover, had a course of discipline in martial exercises. Of the industrial castes, while some of these studied portions of the ancient books, we do not find that as a class they had any special instruction in reading, writing, and arithmetic. Boys followed the occupations of their parents, and received domestic training in these. Megasthenes, the Greek, speaks about 300 B. C. of the absence of the art of writing among the Indians. The art of writing certainly existed long before the time of Alexander's raid in India, but the habit of replying on oral teaching and memory was inveterate, and the writing down of traditional literature was even looked upon with some suspicion. In the transactions of ordinary life, as well as in learning, there can be no doubt that great reliance was placed on the memory. The remark of Megasthenes, however, puts it beyond doubt that among the population generally, writing was little known. I can find no evidence of arithmetic being taught to the industrial class, but we have to remember

that the very elementary arithmetic required in each occupation would be acquired under his master as part of the apprentice work of every boy. The lowest caste did the menial work of the nation, and learned nothing. Speaking generally, then, we may say that for 1,000 years B. C. the Brahmanical education was extensive and thorough, and that it was shared in to a certain extent by a considerable number in the second and third castes. It was, however, entirely oral in the earlier centuries; but later, it embraced reading and writing, and an introduction to the epic literature as well as to the sacred books: probably also to mathematics. Apart from such literary and religious education as the more ambitious might gain for themselves by the help of the Brahmanic teachers, the members of the second and third castes received their education from the laws, tradition, and customs of their country as handed down through the family. It seems to me, however, that it was to the village commune, so universal a feature of Indian social organisation, that the young chief owed the education which is elsewhere chiefly given by family tradition. These communes have always exercised a potent influence; and I am the more disposed to substitute the commune for the family as the vehicle and organ of the education of tradition, because of the position of woman among the Hindus. . . . What was the nature of this traditional oral village teaching? Apart from religious and ceremonial acts and the settlement of questions moral and legal arising among themselves, we may safely say that the teaching was of a kind that naturally would find acceptance among a religious, contemplative, and ethically disposed people—the teaching of fables, allegories, and parables. These fables seem to have been numerous. And that this must have been so we find from two works published in post-Christian times which contain popular stories embodying the moral faith of the people. Their oldest collection of fables and proverbs is called the ‘Pantschatantra;’ it dates from the fifth century after Christ, and was translated in the sixth century into Persian under the name of ‘The Friend of Knowledge;’ then from Persian into the Arabic, from the Arabic into the Greek, Turkish, Syrian, Hebrew, Spanish, Italian, English, French, and German. . . . The position of the woman among the Hindus was always that of subordination and subjection to the man. . . . As might be expected from this view of the place of woman, she was excluded from all instruction. So strong, indeed, was the prejudice against the education of women, that the power to read and write was regarded as a reproach to them. The only exception was in the case of the dancing girls—these being daughters of various castes devoted, when yet children, to the services of the temple. As servants of the temple and ‘maidens of the god,’ the dancing girls had to cultivate their intelligence; mothers of households, on the contrary, their heart only, lest they should be drawn away by intellectual cultivation from domestic duties. The female servants of the temple were instructed in reading, writing, music, dancing, and singing. Their duties were to sing the praises of the god they served, and to dance on festive occasions. They were divided into two classes—the better class being confined within the temple, and restricted to temple services; the second and lower class being allowed greater freedom, and permission to perform at marriage festivities and the banquets of the nobility.”—S. S. Laurie, *Historical survey of pre-Christian education*, pp. 166-174.—See also BRAHMANISM; CASTE SYSTEM OF INDIA.

B. C. (c) 14th-A. D. 6th centuries.—Judea.—

Schools of the Prophets.—Council of Seventy.—Education in Josephus' time.—“According to the statement of Josephus, Moses had . . . prescribed ‘that boys should learn the most important laws, because that is the best knowledge and the cause of prosperity.’ ‘He commanded to instruct children in the elements of knowledge (reading and writing), to teach them to walk according to the laws, and to know the deeds of their forefathers. The latter, that they might imitate them; the former, that growing up with the laws they might not transgress them, nor have the excuse of ignorance.’”—E. Schürer, *History of the Jewish people in the time of Jesus Christ*, v. 2, p. 47.—“In his [Samuel's] time we first hear of what in modern phraseology are called the Schools of the Prophets. Whatever be the precise meaning of the peculiar word, which now came first into use as the designation of these companies, it is evident that their immediate mission consisted in uttering religious hymns or songs, accompanied by musical instruments—psaltery, tabret, pipe and harp, and cymbals. In them, as in the few solitary instances of their predecessors, the characteristic element was that the silent seer of visions found an articulate voice, gushing forth in a rhythmical flow, which at once riveted the attention of the hearer. These, or such as these, were the gifts which under Samuel were now organized, if one may say so, into a system.”—Dean Stanley, *Lectures on the history of the Jewish Church*, lecture 18.—In the fourth century B. C. the Council of Seventy Elders “instituted regularly appointed readings from the Law; on every sabbath and on every week day a portion from the Pentateuch was to be read to the assembled congregation. Twice a week, when the country people came up from the villages to market in the neighbouring towns, or to appeal at the courts of justice, some verses of the Pentateuch, however few, were read publicly. At first only the learned were allowed to read, but at last it was looked upon as so great an honour to belong to the readers, that every one attempted or desired to do so. Unfortunately the characters in which the Torah was written were hardly readable. Until that date the text of the Torah had been written in the ancient style with Phœnician or old Babylonian characters, which could only be deciphered by practised scribes. . . . From the constant reading of the Law, there arose among the Judæans an intellectual activity and vigour, which at last gave a special character to the whole nation. The Torah became their spiritual and intellectual property, and their own inner sanctuary. At this time there sprang up other important institutions, namely, schools, where the young men could stimulate their ardour and increase their knowledge of the Law and its teachings. The intellectual leaders of the people continually enjoined on the rising generation, ‘Bring up a great many disciples.’ And what they enjoined so strenuously they themselves must have assisted to accomplish. One of these religious schools (Beth-Waad) was probably established in Jerusalem. The teachers were called scribes (sopherim) or wise men; the disciples, pupils of the wise (Talmude Chachamim). The wise men or scribes had a two-fold work; on the one hand they had to explain the Torah, and on the other, to make the laws applicable to each individual and to the community at large. This supplementary interpretation was called ‘explanation’ (Midrash); it was not altogether arbitrary, but rested upon certain rules laid down for the proper interpretation of the law. The supreme council and the houses of learning worked together, and one completed the other. A hardly perceptible, but

most important movement was the result; for the descendants of the Judæans of that age were endowed with a characteristic, which they might otherwise have claimed as inborn, the talent for research and the intellectual penetration, needed for turning and returning words and data, in order to discover some new and hidden meaning."—H. Graetz, *History of the Jews*, v. 1, ch. 20.—

"Josephus repeatedly commends the zeal with which the instruction of the young was carried on. 'We take most pains of all with the instruction of children, and esteem the observance of the laws and the piety corresponding with them the most important affair of our whole life.' 'If any one should question one of us concerning the laws, he would more easily repeat all than his own name. Since we learn them from our first consciousness, we have them, as it were, engraven on our souls; and a transgression is rare, but the averting of punishment impossible.' In like manner does Philo express himself: 'Since the Jews esteem their laws as divine revelations, and are instructed in the knowledge of them from their earliest youth, they bear the image of the law in their souls.' . . . In view of all this testimony it cannot be doubted, that in the circles of genuine Judaism boys were from their tenderest childhood made acquainted with the demands of the law. That this education in the law was, in the first place, the duty and task of parents is self-evident. But it appears, that even in the age of Christ, care was also taken for the instruction of youth by the erection of schools on the part of the community. . . . The later tradition that Joshua ben Gamla (Jesus the son of Gamaliel) enacted that teachers of boys . . . should be appointed in every province and in every town, and that children of the age of six or seven should be brought to them, is by no means incredible. The only Jesus the son of Gamaliel known to history is the high priest of that name, about 63-65 after Christ. . . . It must therefore be he who is intended in the above notice. As his measures presuppose a somewhat longer existence of boys' schools, we may without hesitation transfer them to the age of Christ, even though not as a general and established institution. The subject of instruction, as already appears from the above passages of Josephus and Philo, was as good as exclusively the law. For only its inculcation in the youthful mind, and not the means of general education, was the aim of all this zeal for the instruction of youth. And indeed the earliest instruction was in the reading and inculcation of the text of scripture. . . . Habitual practice went hand in hand with theoretical instruction. For though children were not actually bound to fulfil the law, they were yet accustomed to it from their youth up."—E. Schürer, *History of the Jewish people in the time of Jesus Christ*, v. 2, pp. 47-50.

B. C. 7th-6th centuries.—Persia.—"All the best authorities are agreed that great pains were taken by the Persians—or, at any rate, by those of the leading clans—in the education of their sons. During the first five years of his life the boy remained wholly with the women, and was scarcely, if at all, seen by his father. After that time his training commenced. He was expected to rise before dawn, and to appear at a certain spot, where he was exercised with other boys of his age in running, slinging stones, shooting with the bow, and throwing the javelin. At seven he was taught to ride, and soon afterward he was allowed to begin to hunt. The riding included, not only the ordinary management of the horse, but the power of jumping on and off his back when he was at speed, and

of shooting with the bow and throwing the javelin with unerring aim, while the horse was still at full gallop. The hunting was conducted by state-officers, who aimed at forming by its means in the youths committed to their charge all the qualities needed in war. The boys were made to bear extremes of heat and cold, to perform long marches, to cross rivers without wetting their weapons, to sleep in the open air at night, to be content with a single meal in two days, and to support themselves occasionally on the wild products of the country, acorns, wild pears and the fruit of the terebinth-tree. On days when there was no hunting they passed their mornings in athletic exercises, and contests with the bow or the javelin, after which they dined simply . . . and then employed themselves during the afternoon in occupations regarded as not illiberal—for instance, in the pursuits of agriculture, planting, digging for roots, and the like, or in the construction of arms and hunting implements, such as nets and springes. Hardy and temperate habits being secured by this training, the point of morals on which their preceptors mainly insisted was the rigid observance of truth. Of intellectual education they had but little. It seems to have been no part of the regular training of a Persian youth that he should learn to read. He was given religious notions and a certain amount of moral knowledge by means of legendary poems, in which the deeds of gods and heroes were set before him by his teachers, who recited or sung them in his presence, and afterwards required him to repeat what he had heard, or, at any rate, to give some account of it. This education continued for fifteen years, commencing when the boy was five, and terminating when he reached the age of twenty. The effect of this training was to render the Persian an excellent soldier and a most accomplished horseman. . . . At fifteen years of age the Persian was considered to have attained to manhood, and was enrolled in the ranks of the army, continuing liable to military service from that time till he reached the age of fifty. Those of the highest rank became the body-guard of the king, and these formed the garrison of the capital. . . . Others, though liable to military service, did not adopt arms as their profession, but attached themselves to the Court and looked to civil employment as satraps, secretaries, attendants, ushers, judges, inspectors, messengers. . . . For trade and commerce the Persians were wont to express extreme contempt."—G. Rawlinson, *Five great monarchies of the ancient Eastern world*, v. 3, pp. 238-242.—After the death of Cyrus, according to Xenophon, the Persians degenerated, in the education of their youth and otherwise. "To educate the youth at the gates of the palace is still the custom," he says; "but the attainment and practice of horsemanship are extinct, because they do not go where they can gain applause by exhibiting skill in that exercise. Whereas, too, in former times, the boys, hearing causes justly decided there, were considered by that means to learn justice, that custom is altogether altered; for they now see those gain their causes who offer the highest bribes. Formerly, also, boys were taught the virtues of the various productions of the earth, in order that they might use the serviceable, and avoid the noxious; but now they seem to be taught those particulars that they may do as much harm as possible; at least there are nowhere so many killed or injured by poison as in that country."—Xenophon, *Cyropædia and Hellenics* (trans. by J. S. Watson and H. Dale, pp. 284-285).

B. C. 7th-A. D. 3rd centuries.—Greece.—PLATO AND ARISTOTLE.—GREEK PEDAGOGY.—A description of

the Athenian education of the young is given by Plato in one of his dialogues: "Education," he says, "and admonition commence in the first years of childhood, and last to the very end of life. Mother and nurse and father and tutor are quarrelling about the improvement of the child as soon as ever he is able to understand them: he cannot say or do anything without their setting forth to him that this is just and that is unjust; this is honourable, that is dishonourable; this is holy, that is unholy; do this and abstain from that. And if he obeys, well and good; if not, he is straightened by threats and blows, like a piece of warped wood. At a later stage they send him to teachers, and enjoin them to see to his manners even more than to his reading and music; and the teachers do as they are desired. And when the boy has learned his letters and is beginning to understand what is written, as before he understood only what was spoken, they put into his hands the works of great poets, which he reads at school; in these are contained many admonitions, and many tales, and praises, and encomia of ancient famous men, which he is required to learn by heart, in order that he may imitate or emulate them and desire to become like them. Then, again, the teachers of the lyre take similar care that their young disciple is temperate and gets into no mischief; and when they have taught him the use of the lyre, they introduce him to the poems of other excellent poets, who are the lyric poets; and these they set to music, and make their harmonies and rhythms quite familiar to the children, in order that they may learn to be more gentle, and harmonious, and rhythmical, and so more fitted for speech and action; for the life of men in every part has need of harmony and rhythm. Then they send them to the master of gymnastic, in order that their bodies may better minister to the virtuous mind, and that the weakness of their bodies may not force them to play the coward in war or on any other occasion. This is what is done by those who have the means, and those who have the means are the rich; their children begin education soonest and leave off latest. When they have done with masters, the state again compels them to learn the laws, and live after the pattern which they furnish, and not after their own fancies; and just as in learning to write, the writing-master first draws lines with a style for the use of the young beginner, and gives him the tablet and makes him follow the lines, so the city draws the laws, which were the invention of good law-givers who were of old times; these are given to the young man, in order to guide him in his conduct whether as ruler or ruled; and he who transgresses them is to be corrected, or, in other words, called to account, which is a term used not only in your country, but also in many others. Now when there is all this care about virtue private and public, why, Socrates, do you still wonder and doubt whether virtue can be taught?"—Plato, *Protagoras* (*Dialogues*, trans. by Jowett, v. 1).—The ideas of Aristotle on the subject are in the following: "There can be no doubt that children should be taught those useful things which are really necessary, but not all things; for occupations are divided into liberal and illiberal; and to young children should be imparted only such kinds of knowledge as will be useful to them without vulgarizing them. And any occupation, art, or science, which makes the body or soul or mind of the freeman less fit for the practice or exercise of virtue, is vulgar; wherefore we call those arts vulgar which tend to deform the body, and likewise all paid employments, for they absorb and degrade the mind. There are also some liberal arts quite proper for a free-

man to acquire, but only in a certain degree, and if he attend to them too closely, in order to obtain perfection in them, the same evil effects will follow. The object also which a man sets before him makes a great difference; if he does or learns anything for his own sake or for the sake of his friends, or with a view to excellence, the action will not appear illiberal; but if done for the sake of others, the very same action will be thought menial and servile. The received subjects of instruction, as I have already remarked, are partly of a liberal and partly of an illiberal character. The customary branches of education are in number four; they are—(1) reading and writing, (2) gymnastic exercises, (3) music, to which is sometimes added (4) drawing. Of these, reading and writing and drawing are regarded as useful for the purposes of life in a variety of ways, and gymnastic exercises are thought to infuse courage. Concerning music a doubt may be raised—in our own day most men cultivate it for the sake of pleasure, but originally it was included in education, because nature herself, as has been often said, requires that we should be able, not only to work well, but to use leisure well; for, as I must repeat once and again, the first principle of all action is leisure. Both are required, but leisure is better than occupation; and therefore the question must be asked in good earnest, what ought we to do when at leisure? Clearly we ought not to be amusing ourselves, for then amusement would be the end of life. But if this is inconceivable, and yet amid serious occupations amusement is needed more than at other times (for he who is hard at work has need of relaxation, and amusement gives relaxation, whereas occupation is always accompanied with exertion and effort), at suitable times we should introduce amusements, and they should be our medicines, for the emotion which they create in the soul is a relaxation, and from the pleasure we obtain rest. . . . It is clear then that there are branches of learning and education which we must study with a view to the enjoyment of leisure, and these are to be valued for their own sake; whereas those kinds of knowledge which are useful in business are to be deemed necessary, and exist for the sake of other things. And therefore our fathers admitted music into education, not on the ground either of its necessity or utility, for it is not necessary, nor indeed useful in the same manner as reading and writing, which are useful in money-making, in the management of a household, in the acquisition of knowledge and in political life, nor like drawing, useful for a more correct judgment of the works of artists, nor again like gymnastic, which gives health and strength; for neither of these is to be gained from music. There remains, then, the use of music for intellectual enjoyment in leisure; which appears to have been the reason of its introduction, this being one of the ways in which it is thought that a freeman should pass his leisure. . . . We are now in a position to say that the ancients witness to us; for their opinion may be gathered from the fact that music is one of the received and traditional branches of education. Further, it is clear that children should be instructed in some useful things,—for example, in reading and writing,—not only for their usefulness, but also because many other sorts of knowledge are acquired through them. With a like view they may be taught drawing, not to prevent their making mistakes in their own purchases, or in order that they may not be imposed upon in the buying or selling of articles, but rather because it makes them judges of the beauty of the human form. To be always seeking after the useful does not become free and exalted souls. . . . We reject the profes-

sional instruments and also the professional mode of education in music—and by professional we mean that which is adopted in contests, for in this the performer practises the art, not for the sake of his own improvement, but in order to give pleasure, and that of a vulgar sort, to his hearers. For this reason the execution of such music is not the part of a freeman but of a paid performer, and the result is that the performers are vulgarized, for the end at which they aim is bad.”—Aristotle, *Politics* (*Jowett's translation*), bk. 8.—“The most striking difference between early Greek education and ours was undoubtedly this: that the physical development of boys was attended to in a special place and by a special master. It was not thought sufficient for them to play the chance games of childhood; they underwent careful bodily training under a very fixed system, which was determined by the athletic contests of after life. . . . When we compare what the Greeks afforded to their boys, we find it divided into two contrasted kinds of exercise: hunting, which was practised by the Spartans very keenly, and no doubt also by the Eleans and Arcadians, as may be seen from Xenophon's ‘Tract on (Hare) Hunting’; and gymnastics, which in the case of boys were carried on in the so-called palaestra, a sort of open-air gymnasium (in our sense) kept by private individuals as a speculation, and to which the boys were sent, as they were to their ordinary school-master. We find that the Spartans, who had ample scope for hunting with dogs in the glens and coverts of Mount Taygetus, rather despised mere exercises of dexterity in the palaestra, just as our sportsmen would think very little of spending hours in a gymnasium. But those Greeks who lived in towns like Athens, and in the midst of a thickly populated and well-cultivated country, could not possibly obtain hunting, and therefore found the most efficient substitute. Still we find them very far behind the English in their knowledge or taste for out-of-door games. . . . The Greeks had no playgrounds beyond the palaestra or gymnasium; they had no playgrounds in our sense, and though a few proverbs speak of swimming as a universal accomplishment which boys learned, the silence of Greek literature on the subject makes one very suspicious as to the generality of such training. . . . In one point, certainly, the Greeks agreed more with the modern English than with any other civilized nation. They regarded sport as a really serious thing. . . . The names applied to the exercising-places indicate their principal uses. Palaestra means a wrestling place; gymnasium originally a place for naked exercise, but the word early lost this connotation and came to mean mere physical training. . . . In order to leave home and reach the palaestra safely as well as to return, Greek boys were put under the charge of a pædagogus, in no way to be identified (as it now is) with a schoolmaster. . . . I think we may be justified in asserting that the study of the epic poets, especially of the Iliad and Odyssey, was the earliest intellectual exercise of schoolboys, and, in the case of fairly educated parents, even anticipated the learning of letters. For the latter is never spoken of as part of a mother's or of home education. Reading was not so universal or so necessary as it now is. . . . We may assume that books of Homer were read or recited to growing boys, and that they were encouraged or required to learn them off by heart. This is quite certain to all who estimate justly the enormous influence ascribed to Homer, and the principles assumed by the Greeks to have underlain his work. He was universally considered to be a moral teacher, whose characters were drawn with a moral intent, and for the purpose of example

or avoidance. . . . Accordingly the Iliad and Odyssey were supposed to contain all that was useful, not only for godliness, but for life. All the arts and sciences were to be derived (by interpretation) from these sacred texts. . . . In early days, and in poor towns, the place of teaching was not well appointed, nay, even in many places, teaching in the open air prevailed. . . . This was . . . like the old hedge schools of Ireland, and no doubt of Scotland too. They also took advantage, especially in hot weather, of colonnades, or shady corners among public buildings, as at Winchester the summer term was called cloister-time, from a similar practice, even in that wealthy foundation, of instructing in the cloisters. On the other hand, properly appointed schools in respectable towns were furnished with some taste, and according to traditional notions. . . . We may be sure that there were no tables or desks, such furniture being unusual in Greek houses; it was the universal custom, while reading or writing, to hold the book or roll on the knee—to us an inconvenient thing to do, but still common in the East. There are some interesting sentences, given for exercise in Greek and Latin, in the little known ‘Interpretamenta’ of Dositheus, now edited and explained by German scholars. The entry of the boy is thus described, in parallel Greek and Latin: ‘First I salute the master, who returns my salute: Good morning, master; good morning, school fellows. Give me my place, my seat, my stool. Sit closer. Move up that way. This is my place, I took it first.’ This mixture of politeness and wrangling is amusing and no doubt to be found in all ages. It seems that the seats were movable. . . . The usual subdivision of education was into three parts; letters, . . . including reading, writing, counting, and learning of the poets; music in the stricter sense, including singing and playing on the lyre; and lastly gymnastic, which included dancing. . . . It is said that at Sparta the education in reading and writing was not thought necessary, and there have been long discussions among the learned whether the ordinary Spartan in classical days was able to read. We find that Aristotle adds a fourth subject to the three above named—drawing, which he thinks requisite, like music, to enable the educated man to judge rightly of works of art. (See above.) But there is no evidence of a wide diffusion of drawing or painting among the Greeks, as among us. . . . Later on, under the learned influences of Alexandria, and the paid professoriate of Roman days, subjects multiplied with the decline of mental vigour and spontaneity of the age, and children began to be pestered, as they now are, with a quantity of subjects, all thought necessary to a proper education, and accordingly all imperfectly acquired. This was called the encyclical education, which is preserved in our Encyclopædia of knowledge. It included, (1) grammar, (2) rhetoric, (3) dialectic, (4) arithmetic, (5) music, (6) geometry, (7) astronomy, and these were divided into the earlier Trivium, and the later Quadrivium.”—J. P. Mahaffy, *Old Greek education*, ch. 3-5.—“Reading was taught with the greatest pains, the utmost care was taken with the intonation of the voice, and the articulation of the throat. We have lost the power of distinguishing between accent and quantity. The Greeks did not acquire it without long and anxious training of the ear and vocal organs. This was the duty of the phonascus. Homer was the common study of all Greeks. The Iliad and Odyssey were at once the Bible, the Shakespeare, the Robinson Crusoe, and the Arabian Nights of the Hellenic race. Long passages and indeed whole books were learnt by heart. The Greek, as a rule, learnt no language but his own. Next to reading

and repetition came writing, which was carefully taught. Composition naturally followed, and the burden of correcting exercises, which still weighs down the backs of schoolmasters, dates from these early times. Closely connected with reading and writing is the art of reckoning, and the science of numbers leads us easily to music. Plato considered arithmetic as the best spur to a sleepy and uninstructed spirit; we see from the Platonic dialogues how mathematical problems employed the mind and thoughts of young Athenians. Many of the more difficult arithmetical operations were solved by geometrical methods, but the Greeks carried the art of teaching numbers to considerable refinement. They used the abacus, and had an elaborate method of finger reckoning, which was serviceable up to 10,000. Drawing was the crowning accomplishment to this vestibule of training. By the time the fourteenth year was completed, the Greek boy would have begun to devote himself seriously to the practice of athletics."—O. Browning, *Introduction to the history of educational theories*, ch. 1.—"It has sometimes been imagined that in Greece separate edifices were not erected as with us expressly for school-houses, but that both the *didaskalos* and the philosopher taught their pupils in fields, gardens or shady groves. But this was not the common practice, though many schoolmasters appear to have had no other place wherein to assemble their pupils than the portico of a temple or some sheltered corner in the street, where in spite of the din of business and the throng of passengers the worship of learning was publicly performed. . . . But these were the schools of the humbler classes. For the children of the noble and the opulent spacious structures were raised, and furnished with tables, desks,—for that peculiar species of grammateion which resembled the plate cupboard, can have been nothing but a desk,—forms, and whatsoever else their studies required. Mention is made of a school at Chios which contained one hundred and twenty boys, all of whom save one were killed by the falling in of the roof. . . . The apparatus of an ancient school was somewhat complicated: there were mathematical instruments, globes, maps, and charts of the heavens, together with boards whereon to trace geometrical figures, tablets, large and small, of box-wood, fir, or ivory, triangular in form, some folding with two, and others with many leaves; books too and paper, skins of parchment, wax for covering the tablets, which, if we may believe Aristophanes, people sometimes ate when they were hungry. To the above were added rulers, reed-pens, pen-cases, pen-knives, pencils, and last, though not least, the rod which kept them to the steady use of all these things. At Athens these schools were not provided by the state. They were private speculations, and each master was regulated in his charges by the reputation he had acquired and the fortunes of his pupils. Some appear to have been extremely moderate in their demands. . . . The earliest task to be performed at school was to gain a knowledge of the Greek characters, large and small, to spell next, next to read. . . . In teaching the art of writing their practice nearly resembled our own. . . . These things were necessarily the first step in the first class of studies, which were denominated music, and comprehended everything connected with the development of the mind; and they were carried to a certain extent before the second division called gymnastics was commenced. They reversed the plan commonly adopted among ourselves, for with them poetry preceded prose, a practice which, coöperating with their susceptible temperament, impressed upon the national mind

that imaginative character for which it was preëminently distinguished. And the poets in whose works they were first initiated were of all the most poetical, the authors of lyrical and dithyrambic pieces, selections from whose verses they committed to memory, thus acquiring early a rich store of sentences and imagery ready to be adduced in argument or illustration, to furnish familiar allusions or to be woven into the texture of their style. . . . Among the other branches of knowledge most necessary to be studied, and to which they applied themselves nearly from the outset, was arithmetic, without some inkling of which, a man, in Plato's opinion, could scarcely be a citizen at all. . . . The importance attached to this branch of education, nowhere more apparent than in the dialogues of Plato, furnishes one proof that the Athenians were preëminently men of business, who in all their admiration for the good and beautiful never lost sight of those things which promote the comfort of life, and enable a man effectually to perform his ordinary duties. With the same views were geometry and astronomy pursued. . . . The importance of music, in the education of the Greeks, is generally understood. It was employed to effect several purposes. First, to soothe and mollify the fierceness of the national character, and prepare the way for the lessons of the poets, which, delivered amid the sounding of melodious strings, when the soul was rapt and elevated by harmony, by the excitement of numbers, by the magic of the sweetest associations, took a firm hold upon the mind, and generally retained it during life. Secondly, it enabled the citizens gracefully to perform their part in the amusements of social life, every person being in his turn called upon at entertainments to sing or play upon the lyre. Thirdly, it was necessary to enable them to join in the sacred choruses, rendered frequently by the piety of the state, and for the due performance in old age of many offices of religion, the sacerdotal character belonging more or less to all the citizens of Athens. Fourthly, as much of the learning of a Greek was martial and designed to fit him for defending his country, he required some knowledge of music that on the field of battle his voice might harmoniously mingle with those of his countrymen, in chaunting those stirring, impetuous, and terrible melodies, called *pæans*, which preceded the first shock of fight. For some, or all of these reasons, the science of music began to be cultivated among the Hellenes, at a period almost beyond the reach even of tradition."—J. A. St. John, *Hellenes*, bk. 2, ch. 4.—"In thinking of Greek education as furnishing a possible model for us moderns, there is one point which it is important to bear in mind: Greek education was intended only for the few, for the wealthy and well-born. Upon all others, upon slaves, barbarians, the working and trading classes, and generally upon all persons spending their lives in pursuit of wealth or any private ends whatsoever, it would have seemed to be thrown away. Even well-born women were generally excluded from most of its benefits. The subjects of education were the sons of full citizens, themselves preparing to be full citizens, and to exercise all the functions of such. The duties of such persons were completely summed up under two heads, duties to the family and duties to the State, or, as the Greeks said, *æconomic* and *political* duties. The free citizen not only acknowledged no other duties besides these, but he looked down upon persons who sought occupation in any other sphere. *Æconomy* and *Politics*, however, were very comprehensive terms. The former included the three relations of husband to wife, father to children, and master to slaves and prop-

erty; the latter, three public functions, legislative, administrative, and judiciary. All occupations not included under these six heads the free citizen left to slaves or resident foreigners. Money-making, in the modern sense, he despised, and, if he devoted himself to art or philosophy, he did so only for the benefit of the State."—T. Davidson, *Aristotle*, bk. 1, ch. 4.

SPARTAN TRAINING.—"From his birth every Spartan belonged to the state, which decided . . . whether he was likely to prove a useful member of the community, and extinguished the life of the sickly or deformed infant. To the age of seven however the care of the child was delegated to its natural guardians, yet not so as to be left wholly to their discretion, but subject to certain established rules of treatment, which guarded against every mischievous indulgence of parental tenderness. At the end of seven years began a long course of public discipline, which grew constantly more and more severe as the boy approached toward manhood. The education of the young was in some degree the business of all the elder citizens; for there was none who did not contribute to it, if not by his active interference, at least by his presence and inspection. But it was placed under the especial superintendence of an officer selected from the men of most approved worth; and he again chose a number of youths, just past the age of twenty, and who most eminently united courage with discretion, to exercise a more immediate command over the classes, into which the boys were divided. The leader of each class directed the sports and tasks of his young troop, and punished their offences with military rigour, but was himself responsible to his elders for the mode in which he discharged his office. The Spartan education was simple in its objects; it was not the result of any general view of human nature, or of any attempt to unfold its various capacities: it aimed at training men who were to live in the midst of difficulty and danger, and who could only be safe themselves while they held rule over others. The citizen was to be always ready for the defence of himself and his country, at home and abroad, and he was therefore to be equally fitted to command and to obey. His body, his mind, and his character were formed for this purpose, and for no other: and hence the Spartan system, making directly for its main end, and rejecting all that was foreign to it, attained, within its own sphere, to a perfection which it is impossible not to admire. The young Spartan was perhaps unable either to read or write: he scarcely possessed the elements of any of the arts or sciences by which society is enriched or adorned: but he could run, leap, wrestle, hurl the disk, or the javelin, and wield every other weapon, with a vigour and agility and grace which were nowhere surpassed. These however were accomplishments to be learnt in every Greek palaestra: he might find many rivals in all that he could do; but few could approach him in the firmness with which he was taught to suffer. From the tender age at which he left his mother's lap for the public schools his life was one continued trial of patience. Coarse and scanty fare, and this occasionally withheld, a light dress, without any change in the depth of winter, a bed of reeds, which he himself gathered from the Eurotas, blows exchanged with his comrades, stripes inflicted by his governors, more by way of exercise than of punishment, inured him to every form of pain and hardship. . . . The Muses were appropriately honoured at Sparta with a sacrifice on the eve of a battle, and the union of the spear and the lyre was a favourite theme with the Laconian poets, and those who sang of Spar-

tan customs. Though bred in the discipline of the camp, the young Spartan, like the hero of the *Iliad*, was not a stranger to music and poetry. He was taught to sing, and to play on the flute and the lyre: but the strains with which his memory was stored, and to which his voice was formed, were either sacred hymns, or breathed a martial spirit; and it was because they cherished such sentiments that the Homeric lays, if not introduced by Lycurgus, were early welcomed at Sparta. . . . As these musical exercises were designed to cultivate, not so much an intellectual, as a moral taste; so it was probably less for the sake of sharpening their ingenuity, than of promoting presence of mind, and promptness of decision, that the boys were led into the habit of answering all questions proposed to them, with a ready, pointed, sententious brevity, which was a proverbial characteristic of Spartan conversation. But the lessons which were most studiously inculcated, more indeed by example than by precept, were those of modesty, obedience, and reverence for age and rank; for these were the qualities on which above all others the stability of the commonwealth reposed. The gait and look of the Spartan youths, as they passed along the streets, observed Xenophon, breathed modesty and reserve. In the presence of their elders they were bashful as virgins, and silent as statues, save when a question was put to them. . . . In truth, the respect for the laws, which rendered the Spartan averse to innovation at home, was little more than another form of that awe with which his early habits inspired him for the magistrates and the aged. With this feeling was intimately connected that quick and deep sense of shame, which shrank from dishonour as the most dreadful of evils, and enabled him to meet death so calmly, when he saw in it the will of his country."—C. Thirlwall, *History of Greece*, v. 1, ch. 8.

CONTRAST BETWEEN ATHENIAN AND SPARTAN EDUCATION.—"The education of the Hellene generally was an education, as we have seen, in gymnastic and music—music comprehending literary and moral training as well as music in its narrower sense. In gymnastic, including the training to physical endurance generally, the Spartan was much more exacting than the Athenian. The Athenian aimed at the perfect development of the body and the maintenance of health; the Spartan at making the body serviceable for the hardest tasks that could be imposed on it. Both, however, had in view the moral control to which good gymnastic training contributes. Neither the Spartan nor Athenian gymnastic, however, is to be compared with our modern British training by means of organised play. In our games both physical and moral ends are gained in a way which was, I believe, quite beyond the reach of the Greek system, and which almost fulfils Plato's conception of gymnastic as an education. In music, again, the Spartan . . . was educated, but only in the narrow and modern sense of the word music. Religious and national chants, metrical laws, choral songs, and heroic ballads were, however, taught, and indeed largely practised. The Athenian did all this, but, over and above, he acquired skill on a musical instrument, and he carried out musical education in its larger and literary sense of reading, writing, and arithmetic. The study of the national literature and the cultivation of literary taste by school recitations and by the public drama, were all attended to. The chief instrument in the education of mind among the Athenians, was in brief, literature; and this chiefly in the form of poetry. The Athenian education was (to use a modern expression) wholly humanistic, and yet it

had a very direct connection with the intellectual life of the boy when he became a fully-grown man. The Spartan education was ethical (in a very narrow sense) and conservative, resting on law and custom as sacred, and admitting of no development. The Spartan had a restricted definite and civic aim; the Athenian's aim, though never losing sight of the state, was broad as humanity itself. Reading and writing, in so far as they existed at Sparta, were esteemed only in so far as they were 'useful.' The Athenian view, on the other hand, is well expressed in the already cited remark of Aristotle: 'To be always in search of the useful by no means befits men who are magnanimous and who are freemen.' 'Give the fellow half a drachma, and let him be gone,' called out

SOCRATES

Euclid to his slave, when a pupil asked what advantage he would gain by mathematical study. To pursue even music with a view to being an expert and turning it to use, and not in the interests of a liberal education, was *banauasian*. The Spartan trained the citizen; the Athenian trained the man. Hence in all the arts which adorn human life the Athenians were great. They are still the masters of the modern world. After the school period was over, the education of the citizen went on, for it was a mere continuation of the work of the school. The drama, sculpture, architecture, painting, surrounded daily life with the noblest ideals. 'We carry them,' says Lucian in his 'Anacharsis,' 'to comedies and tragedies at our theatres, that whilst they behold the virtues and vices of past times, they may themselves be attached to the one and avoid the other; permitting our comic writers to expose and ridicule the citizens; and this we do, as well for their sakes who may grow better by

seeing themselves laughed at, as for that of the spectators in general who may thus escape being ridiculed for the like absurdities.' Thus was Athens throughout the life of each man a perpetual school in the best sense of that word, and not in the Spartan one. . . . The Athenian system was a free and voluntary system, the state merely supervising and laying down general rules, while carefully guarding the morals of the palaestra and gymnasium. In the laws ascribed to Solon are found injunctions to all parents to educate their children, and also certain rules for the schools, but these are all of a merely regulative character. In Sparta, on the other hand, the system was a state system—compulsory and gratuitous. Herein lies, partially, the explanation of its being so hardfast and inelastic. All were cast in one mould. . . . Sparta, quite consistently with its theory of life and education, took possession of the young citizen at the age of seven; Athens only at the ephobic age of eighteen. Again, in Athens we have professional schoolmasters; whereas in Sparta worthy citizens supervise the education of youth."—S. S. Laurie, *Historical survey of pre-Christian education*, pp. 278-281.

THE SOPHISTS.—AGE OF PERICLES.—"To meet the new wants of the age a new class of teachers arose, and these teachers were called Sophists. The name was used at first to denote any one who professed knowledge and was willing to impart it. It always included a large number of men teaching very various subjects, bound together in no way at all, professing no common set of opinions, working to no common end. We hear of some that were metaphysicians, but as a rule they were 'rhetoricians, grammarians, teachers of mathematics and of what was then known of physical science, teachers of music, teachers of virtue and of politics and of the art of success in citizen life, dialecticians, disputants and experimenters in logic.' They were in fact a sort of unorganised university, a number of lecturers on all subjects that were embraced in the intellectual horizon of the Greeks, without material organisation, and without any common intellectual basis. But the subject that they most usually taught, because there was the largest demand for it, was the art of speaking and arguing, rhetoric and dialectic: the art, that is, which would allow its possessor to shine in the meeting at the Pnyx or discomfit his adversary before the jury courts. In both places victory, and not the discovery of truth, is the object aimed at. It was the duty of the Sophists to teach a fluent and grammatical style, the correct use of words, the best method of rebutting or of eluding the arguments of an adversary, how to cover a weak case and how to attack a strong one. . . . The same spirit too seems to have animated them when they dealt with other subjects. When they treated of ethical questions they may often have upheld the principles of truth and justice, . . . but there is reason to think that they displayed as a rule a mere intellectual pleasure in juggling with arguments on the one side and the other, and in showing on how insecure a basis the traditional view of morality rested. They contrasted 'conventional' morality with 'natural' to the disadvantage of the former, and often made 'natural' morality consist in the declaration that 'might was right.'"—A. J. Grant, *Greece in the Age of Pericles*, pp. 301-302.—See also ETHICS: Greece: Ancient: B. C. 5th century.

SOCRATES AND THE PHILOSOPHICAL SCHOOLS.—"Before the rise of philosophy, the teacher of the people had been the rhapsode, or public reciter; after that event he gradually gives place to the

sophist (. . . one who makes wise), or, as he later with more modesty calls himself, the philosopher (. . . lover of wisdom). The history of Greece for centuries is, on its inner side, a history of the struggle between what the rhapsode represents and what the philosopher represents, between popular tradition and common sense on the one hand, and individual opinion and philosophy on the other. The transition from the first to the second of these mental conditions was accomplished for the world, once for all, by the Greeks."—T. Davidson, *Aristotle*, bk. 1, ch. 5.—"There is no instance on record of a philosopher whose importance as a thinker is so closely bound up with the personality of the man as it was in the case of Socrates. . . . His teaching was not of a kind to be directly imparted and faithfully handed down, but could only be left to propagate itself freely by stirring up others to a similar self-culture. . . . The youth and early manhood of Socrates fall in the most brilliant period of Grecian history. Born during the last years of the Persian war, he was a near contemporary of all those great men who adorned the age of Pericles. As a citizen of Athens he could enjoy the opportunities afforded by a city, which united every means of culture by its unrivalled fertility of thought. Poverty and low birth were but slender obstacles in the Athens of Pericles. . . . Socrates, no doubt, began life by learning his father's trade, . . . which he probably never practised, and certainly soon gave up. He considered it to be his special calling to labour for the moral and intellectual improvement of himself and others—a conviction which he felt so strongly that it appeared to him in the light of a divine revelation. Moreover he was confirmed in it by a Delphic oracle, which, of course, must not be regarded as the cause of, but rather as an additional support to his reforming zeal. . . . To be independent, he tried, like the Gods, to rise superior to his wants; and by carefully practising self-denial and abstemiousness, he was really able to boast that his life was more pleasant and more free from troubles than that of the rest of mankind. Thus he was able to devote his whole powers to the service of others, without asking or taking reward; and thus he became so engrossed by his labours for his native city, that he rarely passed its boundaries or even went outside its gates. He did not, however, feel himself called upon to take part in the affairs of the state. . . . Any one convinced as he was, that care for one's own culture must precede care for public business, and that a thorough knowledge of self, together with a deep and many-sided experience, was a necessary condition of public activity, must have thought that, to educate individuals by influence, was the more pressing need, and have held that he was doing his country a better service by educating able statesmen for it, than by actually discharging a statesman's duties. Accordingly, Socrates never aimed at being anything but a private citizen. . . . Just as little was he desirous of being a public teacher like the Sophists. He not only took no pay, but he gave no methodical course. He did not profess to teach, but to learn in common with others, not to force his convictions upon them, but to examine theirs; not to pass the truth that came to hand like a coin fresh from the mint, but to stir up a desire for truth and virtue, to point out the way to it, to overthrow what was spurious, and to seek out real knowledge. Never weary of talking, he was on the look out for every opportunity of giving an instructive and moral turn to the conversation. Day by day he was about in the market and public promenades, in schools and

workshops, ever ready to converse with friends or strangers, with citizens and foreigners, but always prepared to lead them to higher subjects; and whilst thus in his higher calling serving God, he was persuaded that he was also serving his country in a way that no one else could do. Deeply as he deplored the decline of discipline and education in his native city, he felt that he could depend but little on the Sophists, the moral teachers of his day. The attractive powers of his discourse won for him a circle of admirers, for the most part consisting of young men of family, drawn to him by the most varied motives, standing to him in various relations, and coming to him, some for a longer, others for a shorter time. For his own part, he made it his business not only to educate these friends, but to advise them in everything, even in worldly matters. But out of this changing, and in part loosely connected, society, a nucleus was gradually formed of decided admirers,—a Socratic school, which we must consider united far less by a common set of doctrines, than by a common love for the person of Socrates."—E. Zeller, *Socrates and the Socratic schools*, ch. 3.—See also ETHICS: Greece: Ancient: B. C. 5th century.—"Nowhere, except in Athens, do we hear of a philosophic body with endowments, legal succession, and the other rights of a corporation. This idea, which has never since died out of the world, was due to Plato, who bequeathed his garden and appointments in the place called after the hero Hekademos, to his followers. But he was obliged to do it in the only form possible at Athens. He made it a religious foundation, on the basis of a fixed worship to the Muses. . . . The head or President of Plato's 'Association of the Muses,' was the treasurer and manager of the common fund, who invited guests to their feasts, to which each member contributed his share. . . . The members had, moreover, a right to attend lectures and use the library or scientific appointments, such as maps, which belonged to the school. It was this endowment on a religious basis which saved the income and position of Plato's school for centuries. . . . This then is the first Academy, so often imitated in so many lands, and of which our colleges are the direct descendants. . . . The school of Plato, then governed by Xenocrates, being the bequest of an Athenian citizen who understood the law, seems never to have been assailed. The schools of Epicurus and Zeno were perhaps not yet recognised. But that of Theophrastus, perhaps the most crowded, certainly the most distinctly philo-Macedonian, . . . was the school which was exiled and which owed its rehabilitation not only to the legal decision of the courts, but still more to the large views of King Demetrius, who would not tolerate the persecution of opinion. But it was the other Demetrius, the philosopher, the pupil of Aristotle, the friend of Theophrastus, to whom the school owed most, and to whom the world owes most in the matter of museums and academies, next after Plato. For this was the man who took care, during his Protectorate of Athens in the interest of Casander, to establish a garden and 'peripatos' for the Peripatetic school, now under Theophrastus. . . . It is remarkable that the Stoic school—it too the school of aliens—did not establish a local foundation or succession, but taught in public places, such as the Painted Portico. In this the Cynical tone of the Porch comes out. Hence the succession depended upon the genius of the leader."—J. P. Mahaffy, *Greek life and thought*, ch. 7.—For an account of the Academy, the Lyceum, etc., see GYMNASIA, GREEK.

UNIVERSITY OF ATHENS.—“Some scholars . . . may doubt if there was anything at Athens which could answer to the College Life of modern times. Indeed it must be owned that formal history is nearly silent on the subject, that ancient writers take little notice of it, and such evidences as we have are drawn almost entirely from a series of inscriptions on the marble tablets, which were covered with the ruins and the dust of ages, till one after another came to light in recent days, to add fresh pages to the story of the past. Happily they are both numerous and lengthy, and may be already pieced together in an order which extends for centuries. They are known to Epigraphic students as the records which deal with the so-called Ephebi; with the youths, that is, just passing into manhood, for whom a special discipline was provided by the State, to fit them for the responsibilities of active life. It was a National system with a many-sided training; the teachers were members of the Civil Service; the registers were public documents, and, as such, belonged to the Archives of the State. The earlier inscriptions of the series date from the period of Macedonian ascendancy, but in much earlier times there had been forms of public drill prescribed for the Ephebi. . . . We find from a decree, which, if genuine, dates even from the days of Pericles, that the young men of Cos were allowed by special favour to share the discipline of the Athenian Ephebi. Soon afterwards others were admitted on all sides. The aliens who had gained a competence as merchants or as bankers, found their sons welcomed in the ranks of the oldest families of Athens; strangers flocked thither from distant countries, not only from the isles of Greece, and from the coasts of the Ægean, but, as Hellenic culture made its way through the far East, students even of the Semitic race were glad to enrol their names upon the College registers, where we may still see them with the marks of their several nationalities affixed. The young men were no longer, like soldiers upon actual service, beginning already the real work of life, and on that account, perhaps, the term was shortened from the two years to one; but the old associations lasted on for ages, even in realistic Athens, which in early politics at least had made so clean a sweep. The outward forms were still preserved, the soldier's drill was still enforced, and though many another feature had been added, the whole institution bore upon its face the look rather of a Military College than of a training school for a scholar or a statesman. The College year began somewhat later than the opening of the civil year, and it was usual for all the students to matriculate together; that is, to enter formally their names upon the registers, which were copied afterwards upon the marble tablets, of which large fragments have survived. . . . ‘To put the gown on,’ or, as we should say, ‘to be a gownsman,’ was the phrase which stood for being a member of the College; and the gown, too, was of black, as commonly among ourselves. But Philostratus tells us, by the way, that a change was made from black to white at the prompting of Herodes Atticus, the munificent and learned subject of the Antonines, who was for many years the presiding genius of the University of Athens. The fragment of an inscription lately found curiously confirms and supplements the writer's statement. . . . The members of the College are spoken of as ‘friends’ and ‘messmates’; and it is probable that some form of conventual life prevailed among them, without which the drill and supervision, which are constantly implied in the inscriptions, could scarcely have been enforced by the officials. But we know

nothing of any public buildings for their use save the gymnasia, which in all Greek towns were the centres of educational routine, and of which there were several well known at Athens. . . . The College did not try to monopolise the education of its students. It had, indeed, its own tutors or instructors, but they were kept for humbler drill; . . . it sent its students out for teaching in philosophy and rhetoric and grammar, or, in a word, for all the larger and more liberal studies. Nor did it favour any special set of tenets to the exclusion of the rest. It encouraged impartially all the schools of higher thought. . . . The Head of the College held the title of *Cosmetes*, or of rector. . . . The Rector, appointed only for a year by popular election, was no merely honorary head, but took an important part in the real work of education. He was sometimes clothed with priestly functions. . . . The system of education thus described was under the control of the government throughout. . . . It may surprise us that our information comes almost entirely from the inscriptions, and that ancient writers are nearly all silent on the subject. . . . But there was little to attract the literary circles in arrangements so mechanical and formal; there was too much of outward pageantry, and too little of real character evolved.” —W. W. Capes, *University life in ancient Athens*, ch. 1.—The reign of the Emperor Justinian “may be signalled as the fatal epoch at which several of the noblest institutions of antiquity were abolished. He shut the schools of Athens (A. D. 529), in which an uninterrupted succession of philosophers, supported by a public stipend, had taught the doctrines of Plato, Aristotle, Zeno, and Epicurus, ever since the time of the Antonines. They were, it is true, still attached to paganism, and even to the arts of magic.”—J. C. L. de Sismondi, *Fall of the Roman empire*, v. 1, ch. 10.—See also ATHENS: A. D. 529.

B. C. 6th-A. D. 5th centuries.—Rome: Early education.—Higher education under the empire.—Educators.—Curriculum.—“If we cast a final glance at the question of education, we shall find but little to say of it, as far as regards the period before Cicero. In the republican times the state did not trouble itself about the training of youth: a few prohibitory regulations were laid down, and the rest left to private individuals. Thus no public instruction was given; public schools there were, but only as private undertakings for the sake of the children of the rich. All depended on the father; his personal character and the care taken by the mother in education decided the development of the child's disposition. Books there were none; and therefore they could not be put into the hands of children. A few rugged hymns, such as those of the *Salii* and *Arval* brothers, with the songs in *Fescennine* verse, sung on festivals and at banquets, formed the poetical literature. A child would hear, besides, the dirges, or memorial verses, composed by women in honour of the dead, and sometimes too, the public panegyrics pronounced on their departed relatives a distinction accorded to women also from the time of *Camillus*. Whatever was taught a boy by father or mother, or

acquired externally to the house, was calculated to make the Roman 'virtus' appear in his eyes the highest aim of his ambition; the term including self-mastery, an unbending firmness of will, with patience, and an iron tenacity of purpose in carrying through whatever was once acknowledged to be right. The Greek palestra and its naked combatants always seemed strange and offensive to Roman eyes. In the republican times the exercises of the gymnasium were but little in fashion; though riding, swimming, and other warlike exercises were industriously practised, as preparations for the campaign. The slave pædagogus, assigned to young people to take charge of them, had a higher position with the Romans than the Greeks; and was not allowed to let his pupils out of his sight till their twentieth year. The Latin *Odyssey* of Livius Andronicus was the school-book first in use; and this and Ennius were the only two works to create and foster a literary taste before the destruction of Carthage. The freedman Sp. Carvilius was the first to open a school for higher education. After this the Greek language and literature came into the circles of studies, and in consequence of the wars in Sicily, Macedon, and Asia, families of distinction kept slaves who knew Greek. Teachers quickly multiplied, and were either liberti, or their descendants. No free-born Roman would consent to be a paid teacher, for that was held to be a degradation. The Greek language remained throughout the classical one for Romans; they even made their children begin with Homer. As, by the seventh century of the republic, Ennius, Plautus, Pacuvius, and Terence, had already become old poets, dictations were given to scholars from their writings. The interpretation of Virgil began under Augustus, and by this time the younger Romans were resorting to Athens, Rhodes, Apollonia, and Mytilene, in order to make progress in Greek rhetoric and philosophy. As Roman notions were based entirely on the practical and the useful, music was neglected as a part of education; while, as a contrast, boys were compelled to learn the laws of the twelve tables by heart [see *CORPUS JURIS CIVILIS*]. Cicero, who had gone through this discipline with other boys of his time, complains of the practice having begun to be set aside; and Scipio Æmilianus deplored, as an evil omen of degeneracy, the sending of boys and girls to the academies of actors, where they learnt dancing and singing, in company with young women of pleasure. In one of these schools were to be found as many as five hundred young persons, all being instructed in postures and motions of the most abandoned kind. . . . On the other hand, the gymnastic exercises, which had once served the young men as a training for war, fell into disuse, having naturally become objectless and burdensome, now that, under Augustus, no more Roman citizens chose to enlist in the legions. Still slavery was, and continued to be, the foremost cause of the depravation of youth, and of an evil education. . . . It was no longer the mothers who educated their own children: they had neither inclination nor capacity for such duty, for mothers of the stamp of Cornelia had disappeared. Immediately on its birth, the child was intrusted to a Greek female slave, with some male slave, often of the worst description, to help her. . . . The young Roman was not educated in the constant companionship of youths of his own age, under equal discipline: surrounded by his father's slaves and parasites, and always accompanied by a slave when he went out, he hardly received any other impressions than such as were calculated to foster conceit,

indolence, and pride in him."—J. J. Dollinger, *Gentile and the Jew*, v. 2, pp. 270-281.

"Besides schools of high eminence in Mytilene, Ephesus, Smyrna, Sidon, etc., we read that Apollonia enjoyed so high a reputation for eloquence and political science as to be entrusted with the education of the heir-apparent of the Roman Empire. Antioch was noted for a Museum modelled after that of the Egyptian metropolis, and Tarsus boasted of Gymnasia and a University which Strabo does not hesitate to describe as more than rivaling those of Athens and Alexandria. There can be little doubt that the philosophers, rhetoricians, and grammarians who swarmed in the princely retinues of the great Roman aristocracy, and whose schools abounded in all the most wealthy and populous cities of the empire east and west, were prepared for their several callings in some one or other of these institutions. Strabo tells us . . . that Rome was overrun with Alexandrian and Syrian grammarians, and Juvenal describes one of the Quirites of the ancient stamp as emigrating in sheer disgust from a city which from these causes had become thoroughly and utterly Greek. . . . That external inducements were held out amply sufficient to prevail upon poor and ambitious men to qualify themselves at some cost for vocations of this description is evident from the wealth to which, as we are told, many of them rose from extreme indigence and obscurity. Suetonius, in the still extant fragment of his essay 'de claris rhetoribus,' after alluding to the immense number of professors and doctors met with in Rome, draws attention to the frequency with which individuals who had distinguished themselves as teachers of rhetoric had been elevated into the senate, and advanced to the highest dignities of the state. That the profession of a philologist was occasionally at least well remunerated is evident from the facts recorded by the same author in his work 'de claris grammaticis,' sect. 3. He there mentions that there were at one time upwards of twenty well attended schools devoted to this subject at Rome, and that one fortunate individual, Q. Remmius Palaemon, derived four hundred thousand sesterces, or considerably above three thousand a year, from instruction in philology alone. Julius Caesar conferred the citizenship, together with large bounties in money, and immunity from public burthens, on distinguished rhetoricians and philologists, in order to encourage their presence at Rome. . . . That individuals who thus enjoyed an income not greatly below the revenues of an English Bishopric were not, as the name might lead us to imagine, employed in teaching the accidents of grammar, but possessed considerable pretensions to that higher and more thoughtful character of the scholar which it has been reserved for modern Europe to exhibit in perfection, is not only in itself highly probable, but supported by the distinctest and most unimpeachable evidence. Seneca tells us that history was amongst the subjects professed by grammarians, and Cicero regards the most thorough and refined perception of all that pertains to the spirit and individuality of the author as an indispensable requisite in those who undertake to give instruction in this subject. . . . The grammatici appear to have occupied a position very closely analogous to that of the teachers of collegiate schools in England, and the gymnasial professors in Germany."—E. Kirkpatrick, *Historical development of superior instruction* (*Barnard's American Journal of Education*, v. 24, pp. 468-470).—"During the first centuries, the teaching profession had no assured position, nor the esteem of an official security. Education was

in the Early Empire not regarded as a matter of State, and, in the second century, to a very slight extent, being, if anything, municipalized. Up to then education was a private concern, and only fostered by the immunity of teachers from town rates. This is confirmed by a communal decree . . . discovered, in South Portugal. . . . Elementary schools must have existed even in small provincial towns; only the larger cities had secondary schools in the sciences, or in the highest subject, viz. oratory. Hence children were sent to a larger town or to Rome for a good education. The school, kept by the elder Statius at Naples, received pupils from Lucania and Apulia; the school of one Flavius in Venusia, to which the big boys of influential centurions daily went with their slates and pencases, could not satisfy the paternal care of Horace's father: despite his poverty, he sent his son to Rome to be educated along with knights and senators. In the first years of Trajan, Como, having no teachers of rhetoric, had to betake itself to Milan, until Pliny the Younger proposed to contribute one third, together with the families interested, so as to pay a teacher at his native Como. He could not quite consent to promise the whole amount to the town, as municipalized schools were often in the gift of electioneering committees. As in this case, applicants used to go to Rome to gain practice, and, armed with letters from the great men of Rome, give public exhibitions of their ability to speak and to teach, in competition for the post. . . . Antoninus Pius assigned salaries, payable by the communes, to rhetoricians and philosophers in all of the provinces, and enacted their immunity from civic burdens in a decree; nominally applying to the League of Cities in Asia, but really to the whole Empire. In the larger cities there might be ten physicians, five rhetors, and five grammarians; in the smaller, seven, four, and four respectively, and in the smallest five of the first, and three of the two last. This allowance was obviously marginal, and wholly insufficient for cities, like Ephesus and Smyrna, two of the largest in the Empire; hence in rhetoric and grammar alone, these few official teachers must have been largely privately supplemented. Gellius often speaks of grammarians, in great repute at Rome as teachers, and never refers to the official teachers: were there any such in the *Athenaeum* founded by Hadrian, they must have been incommensurably few in comparison with the private tutors. . . . The grammarians, or teachers of the two languages and the poetical contents of each, often took single pupils and resident posts, or kept private schools; . . . as Quintilian says, they deemed themselves worthy of a larger theatre, and left mere pedagogy to the weaker brethren. But, for high fees, they would also take private pupils. Marcus Aurelius was ever grateful to his great-grandfather for his never having been to a public school, and for having had such a tutor, on the true calculation that, for this purpose, no expense could be too great. It was always men of lower standing who took up the teaching profession; and at Rome, freedmen, *peregrini*, provincials, who, consequent on Julius Caesar's grant of the franchise to teachers, flocked thither. Many of them came from Greece and the East, as Greek was eagerly learnt at Rome. Most of the teachers followed no inner call, but only the need of bread, as may be gathered from the fact that, of the most famous and learned grammarians or philologists of Rome in the first century, several (on the authority of Suetonius) only chanced on this occupation, or came to it as a makeshift. Many built up their knowledge, as slaves or freedmen in the service of erudites, or as

pedagogues accompanying a boy to school. The famous Orbilius had been servant to a magistrate, and then served in the foot and the horse. Marcus Valerius Probus of Berytus . . . only took to linguistics after losing every chance of a subaltern's post. Pertinax, the future Emperor, however, the son of a freedman wood-dealer, exchanged this profession, unsuitable to him, for military service. It was universally held that a teacher's bread was hardly won. . . . The work and conditions were severe, the gain scanty. . . . The lessons began at or before daybreak: the teacher had to be up and about, long before the smith or the weaver, to breathe air sullied by the boys' lamps, which begrimed the busts of Horace and Virgil in the schoolroom. The number of school hours varied, but, with the authority of Ausonius, was usually six. . . . But, in Greek-Latin schools, the pupils of midday went home for their early meal, changed and came back for the afternoon. The usual entering age, according to Paul of Aegina, whose rules more or less define the practice in the early centuries and in the West, was six or seven; geometry, grammar and gymnastics begun at twelve; the years from fourteen to twenty were given to higher mathematics and philosophy and the severer exercises. The teacher's worst task was to keep discipline among the excitable and fidgety boys, whose moral education he had to supervise like a father. Quintilian says one of the reasons of the preferability of school to home teaching is the formation of friendships and the incentive of equal rivalry. Others maintained that school-life corrupted morals, though boys of good family were accompanied there by their pedagogues: the reputation of the teachers was also often impugned. Discipline was enforced by the cane and the whip: only a minority (one of them Quintilian) took a humane view, condemning corporal punishment. The hardships of the teacher were often aggravated by the pretensions of the parents, over whose unreasonableness and over-fondness of their boys Orbilius wrote a whole book of complaints. . . . Private tutors, especially Greeks, complained, . . . of all kinds of maltreatment and humiliations, and that they scarcely earned enough to pay shoemaker or tailor: whilst Romans asserted that, in the houses of the rich, these foreigners were preferred to them. . . . Grammatical instruction at Rome was poorly paid. Juvenal gave 500 sesterces (5 gold pieces) as the fee for a year of eight months' work: but even thus the earnings for thirty scholars was only 15,000 sesterces . . . without deductions for rent, etc. . . . In Diocletian's tariff the monthly fees for reading and writing are fixed at fifty, for arithmetic or shorthand seventy-five, for Greek and Latin and Mathematics 200 denarii (then worth less than 4s). The competition was great; at the close of the Republic, there were twenty schools at Rome. Many schools were held in partnership, and older teachers (e.g. the friend of St. Augustine, Verecundus at Milan) employed assistants. . . . Professors of oratory were, to some extent, in similar difficulties. They, too, had to endure the whims of parents and the indiscipline of pupils, who often preferred dice or tops to the dying speech of Cato, and rubbed their eyes with oil, so as to malingering. Quintilian finds pleasure in recollecting that teachers arranged the class according to the work done; the value set on being top boy proves they were all still boys. . . . Martial calls Quintilian, as professor of oratory, 'the noblest guide of irresolute youth.' . . . St. Augustine found the Carthaginian boys so wild that he abandoned his school of oratory there and settled at Rome, where discipline was less lax.

And, at Rome, he fared so ill that he applied for a post at Milan. . . . But rhetoricians received more than grammarians (Juvenal mentions 2,000 sesterces . . . as the fee: their position was more assured and in greater esteem; the course was higher, taken by adults, and of practical necessity, as choice and flowing speech was the first requisite of culture, and indispensable for many situations and all the higher offices. Professorships of Greek and Latin oratory were then, in Rome and elsewhere, the only municipally paid posts: at Rome the salary was 100,000 (as much as a procurator of the third rank received, and four times as much as a military tribune). The first holder of the State Chair, founded by Vespasian, was the Spaniard Quintilian; he gained great wealth, and, as tutor to the princes, consular *insignia*. . . . After the second century, not only Rome, but nearly all the other cities and towns appointed rhetors, and the number of students at Rome increased considerably; for, being armed with recommendations from the famous teachers of Rome, they could most easily gain official posts in Italy and the provinces. Pliny requests Tacitus to select from his many admirers young men suitable to teach rhetoric at Comum. Fronto applies to his son-in-law Aufidius Victorinus for a recommendation for Antonius Aquila the rhetor to a public professorship in Gaul, in the cities of which teachers of Greek rhetoric held public appointments at the time of Strabo. Lucian boasts of being one of those, who held a highly paid post."—L. Friedländer, *Roman life and manners under the early empire*, v. 1, pp. 156-162.—See also HELLENISM: Hellenism and the Romans.

B. C. 3rd-A. D. 3rd centuries.—Alexandria: Library and museum.—"The foundation of the Great Library in particular was probably due in the first instance to Ptolemy Soter, acting under the advice of Demetrius, but the credit is often assigned to Philadelphus, who may have continued and completed his father's designs, though he was himself mainly interested in zoology. Philadelphus is also credited with the foundation of the splendid shrine of learning known as the *μυσεῖον*, 'the temple, or home, of the Muses,' which is described by Strabo, who visited Alexandria in 24 B. C., as forming part of the Royal quarter of the city, and as including a covered walk, an arcade furnished with recesses and seats, and a large building containing a common hall, in which the Scholars who were members of the Museum met for their meals. This learned body had endowments; and its president, nominated by the government, was called 'the priest of the Museum.' The provision for the maintenance of these Scholars was apparently on so liberal a scale that a satirical poet of that age, Timon of Phlius (writing about 230 B. C.), humorously called it a 'bird-coop of the Muses.' . . . But we may realise its character still better by regarding it as a kind of prototype of a College at Oxford or Cambridge, with its common hall for dining and its cloisters and grounds, and with some provision for the endowment of research. The members of the Museum probably received annual stipends; but whether the Library, as in an English College, was part of the buildings of the Museum, is unknown though it was probably very near them. We are also unaware whether there were any arrangements for instruction. Even 500 years after its foundation it is eulogised by Philostratus as a society of celebrities; in the following century the quarter of the city where it lay is described by Ammianus Marcellinus as 'having long been the home of eminent men,' while the last who is actually named as a member of the Museum

is the celebrated mathematician and neo-platonist Theon (fl. 380 A. D.), the father of the noble-hearted and ill-fated Hypatia (d. 415 A. D.). It is in connexion with the pathetic story of her life that the old associations of this memorable haunt of Alexandrian scholars and poets have been happily characterised by Kingsley:—"School after school, they had all walked and taught and sung there, beneath the spreading planes and chestnuts, figs and palm trees. The place seemed fragrant with all the riches of Greek thought and song."—J. E. Sandys, *History of classical scholarship from the sixth century B. C. to the end of the Middle Ages*, pp. 105-107.—"As time went on new Colleges were added to the original Museum; of which one was a foundation of the Emperor Claudius, and called after his name. . . . A diversity of teachers secured an abundance of students. 'Hitherto,' says Cave, 'as to a public emporium of polite literature, congregated, from every part of the world, youthful students, and attended the lectures in Grammar, Rhetoric, Poetry, Philosophy, Astronomy, Music, Medicine, and other arts and sciences'; and hence proceeded, as it would appear, the great Christian writers and doctors, Clement, . . . Origen, Anatolius, and Athanasius. St. Gregory Thaumaturgus, in the third century, may be added; he came across Asia Minor and Syria from Pontus, as to a place, says his namesake of Nyssa, 'to which young men from all parts gathered together, who were applying themselves to philosophy.' As to the subjects taught in the Museum, Cave has already enumerated the principal; but he has not done justice to the peculiar character of the Alexandrian school. From the time that science got out of the hands of the pure Greeks, into those of a power which had a talent for administration, it became less theoretical, and bore more distinctly upon definite and tangible objects. . . . Egyptian Antiquities were investigated, at least by the disciples of the Egyptian Manetho, fragments of whose history are considered to remain; while Carthaginian and Etruscan had a place in the studies of the Claudian College. The Museum was celebrated, moreover, for its grammarians; the work of Hephæstion 'de Metris' still affords matter of thought to a living Professor of Oxford; and Aristarchus, like the Athenian Priscian, has almost become the nickname for a critic. Yet, eminent as is the Alexandrian school in these departments of science, its fame rests still more securely upon its proficiency in medicine and mathematics. Among its physicians is the celebrated Galen, who was attracted thither from Pergamus; and we are told by a writer of the fourth century, that in his time the very fact of a physician having studied at Alexandria, was an evidence of his science which superseded further testimonial. As to Mathematics, it is sufficient to say, that, of four great ancient names, on whom the modern science is founded, three came from Alexandria. Archimedes indeed was a Syracusan; but the Museum may boast of Apollonius of Perga, Diophantus, a native Alexandrian, and Euclid, whose country is unknown. To these illustrious names, may be added, Eratosthenes of Cyrene, to whom astronomy has obligation so considerable; Pappus; Theon; and Ptolemy, said to be of Pelusium, whose celebrated system, called after him the Ptolemaic, reigned in the schools till the time of Copernicus, and whose Geography, dealing with facts, not theories, is in repute still. Such was the celebrated 'Studium' or University of Alexandria; for a while in the course of the third and fourth centuries, it was subject to reverses, principally from war. The whole of the Bruchion, the

quarter of the city in which it was situated, was given to the flames; and, when Hilarion came to Alexandria, the holy hermit, whose rule of life did not suffer him to lodge in cities, took up his lodgings with a few solitaries among the ruins of its edifices. The schools, however, and the library continued; the library was reserved for the Caliph Omar's famous judgment [that its books should all be burnt, since if their contents agreed with the Koran, they were of no use, for the Koran contained all necessary truth, while if they disagreed they ought to be destroyed]; as to the schools, even as late as the twelfth century, the Jew, Benjamin of Tudela, gives us a surprising report of what he found in Alexandria."—J. H. Newman, *Historical sketches: Rise and progress of universities*, ch. 8.—"In the three centuries which intervened between Alexander and Augustus, Athens was preëminently the training school for philosophy, Rhodes, on the other hand, as the only Greek state of political importance in which a career of grand and dignified activity was open for the orator, distinguished itself in the study of eloquence, while Alexandria rested its fame chiefly on the excellence of its instruction in Philology and Medicine. At a subsequent period the last mentioned University obtained even greater celebrity as having given birth to a school of philosophers who endeavored to combine into a species of theosophic doctrine the mental science of Europe with the more spiritual minded and profoundly human religions of the East. In the third century Alexandria became conspicuous as the headquarters of the Eclectics and Neo-Platonists."—E. Kirkpatrick, *Historical development of superior instruction (Barnard's American Journal of Education, v. 24, pp. 466-467)*.—See also LIBRARIES: Ancient: Alexandria; ALEXANDRIA; B. C. 282-264.

A. D. 1st-2nd centuries.—Catechumenical and catechetical schools.—"The early churches were bound together by no formal bond of union, and felt little need for such. . . . The chief concern was the moral regeneration of society through the moral regeneration of converts. To accomplish this, in face of the practices of Roman society, a process of instruction and a period of probation for those wishing to join the faith soon became necessary. Jews, pagans, and the children of believers were thereafter alike subjected to this before full acceptance into the church. At stated times during the week the probationers met for instruction in morality and in the psalmody of the Church. These two subjects constituted almost the entire instruction, the period of probation covering two or three years. The teachers were merely the older and abler members of the congregation. This personal instruction became common everywhere in the early Church, and the training was known as *Catechumenal*, that is, rudimentary, instruction. Two sets of catechumenal lectures have survived, which give an idea as to the nature of the instruction. They cover the essentials of church practice and the religious life. . . . It was dropped entirely in the conversion of the barbarian tribes. This instruction, and the preaching of the elders (presbyters, who later evolved into priests), constituted the formal schooling of the early converts to Christianity in Italy and the East. Such instruction was never known in England, and but little in Gaul. The life in the Church made a moral and emotional, rather than an intellectual appeal. In fact the early Christians felt but little need for the type of intellectual education provided by the Roman schools, and the character of the educated society about them, as they saw it, did not make them wish

for the so-called pagan learning. . . . After Christianity had begun to make converts among the more serious-minded and better-educated citizens of the Roman Empire, the need for more than rudimentary instruction in the principles of the church life began to be felt. Especially was this the case in the places where Christian workers came in contact with the best scholars of the Hellenic learning, and particularly at Alexandria, Athens, and the cities of Asia Minor. The speculative Greek would not be satisfied with the simple, unorganized faith of the early Christians. He wanted to understand it as a system of thought, and asked many questions that were hard to answer. To meet the critical inquiry of learned Greeks, it became desirable that the clergy of the Church, in the East, at least, should be equipped with a training similar to that of their critics. As a result there was finally evolved, first at Alexandria, and later at other places in the Empire, training schools for the leaders of the Church. These came to be known as *catechetical* schools, from their oral questioning method of instruction, and this term was later applied to elementary religious instruction (whence *catechism*) throughout western Europe. Pantaeus, a converted Greek Stoic, who became head of the catechumenal instruction at Alexandria, in 179 A. D., brought to the training of future Christian leaders the strength of Greek learning and Greek philosophic thought. He and his successors, Clement and Origen, developed here an important school of Christian theology where Greek learning was used to interpret the Scriptures and train leaders for the service of the Church. Similar schools were opened at Antioch, Edessa, Nisibis, and Cæsarea. . . . and these developed into a rudimentary form of theological schools for the education of the eastern Christian clergy. In these schools Christian faith and doctrine were formulated into a sort of system, the whole being tintured through and through with Greek philosophic thought. Out of these schools came some of the great Fathers of the early Church; men who strove to uphold the pagan learning and reconcile Christianity and Greek philosophic thinking."—E. P. Cubberley, *History of education*, pp. 92-94.

MEDIEVAL

Chaos of Barbaric conquest.—"The utter confusion subsequent upon the downfall of the Roman Empire and the irruption of the Germanic races was causing, by the mere brute force of circumstance, a gradual extinction of scholarship too powerful to be arrested. The teaching of grammar for ecclesiastical purposes was insufficient to check the influence of many causes leading to this overflow of learning. It was impossible to communicate more than a mere tincture of knowledge to students separated from the classical tradition, for whom the antecedent history of Rome was a dead letter. The meaning of Latin words derived from the Greek was lost. . . . Theological notions, grotesque and childish beyond description, found their way into etymology and grammar. The three persons of the Trinity were discovered in the verb, and mystic numbers in the parts of speech. Thus analytical studies like that of language came to be regarded as an open field for the exercise of the mythologising fancy; and etymology was reduced to a system of ingenious punning. . . . Virgil, the only classic who retained distinct and living personality, passed from poet to philosopher, from philosopher to Sibyl, from Sibyl to magician, by successive stages of transmutation, as the truth

about him grew more dim and the faculty to apprehend him weakened. Forming the staple of education in the schools of the grammarians, and metamorphosed by the vulgar consciousness into a wizard, he waited on the extreme verge of the dark ages to take Dante by the hand, and lead him, as the type of human reason, through the realms of Hell and Purgatory."—J. A. Symonds, *Renaissance in Italy: the revival of learning, ch. 2.*

4th-15th centuries.—Monastic schools.—"If institutions could do all, if laws supplied and the means furnished to society could do everything, the intellectual state of Gaulish civil society at this epoch [4th-5th centuries] would have been far superior to that of the religious society. The first, in fact, alone possessed all the institutions proper to second the development of mind, the progress and empire of ideas. Roman Gaul was covered with large schools. The principal were those of Trèves, Bordeaux, Autun, Toulouse, Poitiers, Lyons, Narbonne, Arles, Marseilles, Vienne, Besançon, &c. Some were very ancient; those of Marseilles and of Autun, for example, dated from the first century. They were taught philosophy, medicine, jurisprudence, literature, grammar, astrology, all the sciences of the age. In the greater part of these schools, indeed, they at first taught only rhetoric and grammar; but towards the fourth century, professors of philosophy and law were everywhere introduced. Not only were these schools numerous, and provided with many chairs, but the emperors continually took the professors of new measures into favor. Their interests are, from Constantine to Theodosius the younger, the subject of frequent imperial constitutions, which sometimes extended, sometimes confirmed their privileges. . . . After the Empire was divided among many masters, each of them concerned himself rather more about the prosperity of his states and the public establishments which were in them. Thence arose a momentary amelioration, of which the schools felt the effects, particularly those of Gaul, under the administration of Constantius Clorus, of Julian, and of Gratian. By the side of the schools were, in general, placed other analogous establishments. Thus, at Trèves there was a grand library of the imperial palace, concerning which no special information has reached us, but of which we may judge by the details which have reached us concerning that of Constantinople. This last had a librarian and seven scribes constantly occupied—four for Greek, and three for Latin. They copied both ancient and new works. It is probable that the same institution existed at Trèves, and in the great towns of Gaul. Civil society, then, was provided with means of instruction and intellectual development. It was not the same with religious society. It had at this epoch no institution especially devoted to teaching; it did not receive from the state any aid to this particular aim. Christians, as well as others, could frequent the public schools; but most of the professors were still pagans. . . . It was for a long time in the inferior classes, among the people, that Christianity was propagated, especially in the Gauls, and it was the superior classes which followed the great schools. Moreover, it was hardly until the commencement of the fourth century that the Christians appeared there, and then but few in number. No other source of study was open to them. The establishments which, a little afterwards, became, in the Christian church, the refuge and sanctuary of instruction, the monasteries, were hardly commenced in the Gauls. It was only after the year 360 that the two first were founded by St. Martin—one at

Ligugé, near Poitiers, the other at Marmoutiers, near Tours; and they were devoted rather to religious contemplation than to teaching. Any great school, any special institution devoted to the service and to the progress of intellect, was at that time, therefore, wanting to the Christians. . . . All things in the fifth century, attest the decay of the civil schools. The contemporaneous writers, Sidonius Apollinaris and Mamertius Claudianus, for example, deplore it in every page, saying that the young men no longer studied, that professors were without pupils, that science languished and was being lost. . . . It was especially the young men of the superior classes who frequented the schools; but these classes . . . were in rapid dissolution. The schools fell with them; the institutions still existed, but they were void—the soul had quitted the body. The intellectual aspect of Christian society was very different. . . . Institutions began to rise, and to be regulated among the Christians of Gaul. The foundation of the greater portion of the large monasteries of the southern provinces belongs to the first half of the fifth century. . . . The monasteries of the south of Gaul were philosophical schools of Christianity; it was there that intellectual men meditated, discussed, taught; it was from thence that new ideas, daring thoughts, heresies, were sent forth. . . . Towards the end of the sixth century, everything is changed: there are no longer civil schools; ecclesiastical schools alone subsist. Those great municipal schools of Trèves, of Poitiers, of Vienne, of Bordeaux, &c., have disappeared; in their place have arisen schools called cathedral or episcopal schools, because each episcopal see had its own. The cathedral school was not always alone; we find in certain dioceses other schools, of an uncertain nature and origin, wrecks, perhaps, of some ancient civil school, which, in becoming metamorphosed, had perpetuated itself. . . . The most flourishing of the episcopal schools from the sixth to the middle of the eighth century were those of: 1. Poitiers. There were many schools in the monasteries of the diocese at Poitiers itself, at Ligugé, at Anson, &c. 2. Paris. 3. LeMans. 4. Bourges. 5. Clermont. There was another school in the town where they taught the Theodosian code; a remarkable circumstance, which I do not find elsewhere. 6. Vienne. 7. Châlons-sur-Saone. 8. Arles. 9. Gap. The most flourishing of the monastic schools of the same epoch were those of: 1. Luxeuil, in Franche-Comté. 2. Fontenelle, or Saint Vandrille, in Normandy; in which were about 300 students. 3. Sithiu, in Normandy. 4. Saint Médard, at Soissons. 5. Lerens. It were easy to extend this list; but the prosperity of monastic schools was subject to great vicissitudes; they flourished under a distinguished abbot, and declined under his successor. Even in nunneries, study was not neglected; that which Saint Césaire founded at Arles contained, at the commencement of the sixth century, two hundred nuns, for the most part occupied in copying books, sometimes religious books, sometimes, probably, even the works of the ancients. The metamorphosis of civil schools into ecclesiastical schools was complete. Let us see what was taught in them. We shall often find in them the names of sciences formerly professed in the civil schools, rhetoric, logic, grammar, geometry, astrology, &c.; but these were evidently no longer taught except in their relations to theology. This is the foundation of the instruction: all was turned into commentary of the Scriptures, historical, philosophical, allegorical, moral, commentary. They desired only to form priests; all studies, whatsoever their nature, were directed towards this result. Sometimes they went

even further: they rejected the profane sciences themselves, whatever might be the use made of them."—F. Guizot, *History of civilization to the French Revolution*, v. 2, lect. 4 and 16.—The "laborious and varied knowledge acquired by the monks found in the education of youth an application equally natural and universal. We may safely affirm that this was the principal employment of monastic activity throughout the medieval period. The benefits of instruction were almost exclusively dispensed by their care from the ninth to the fourteenth century—that is to say, during the epoch of the Church's greatest power and splendour. When education passed into the hands of secular corporations by the foundation of universities, the religious orders in all countries nevertheless remained charged with the task of providing religious and intellectual training for a large proportion of Christian youth. . . . It may be said, in general terms, that every monastery was a school, and that these two words were almost always synonymous. The solitaries of the Thebaïde received from the hands of their friends who remained in the world, the children whom it was their mission to bring up. St. John Chrysostom shows that, in his time, the inhabitants of Antioch sent their sons to the monasteries to study. The rule of St. Benedict made an express mention of the care required for the education of pupils: the saint himself gave lessons to the young sons of Roman nobles. . . . But nothing, perhaps, shows more clearly how the work of education was identified with the monastic spirit than a charter preserved in the archives of St. Gall, in which a serf (*homme de corps*) of the abbey consecrated a part of his earnings to founding an annual bequest of a cup of wine to be given to each scholar of the abbey on Easter Day. . . . There were trained men who, like Bede, Boniface, Alcuin, and so many others, were at once the light and the glory of Christendom: thither gathered a crowd of students of all ranks and all countries—a crowd so numerous that the abbatial school of Fleury or St. Benoît-sur-Loir alone counted, in the tenth and eleventh centuries, its five thousand scholars. There were schools even in the *cells* or priories dependent on the principal abbeys, and that even from the ninth century; though those of the abbeys themselves were naturally of greater importance. While ordinary monasteries served as primary schools for the youth of the neighbourhood, more distinguished pupils were collected in the higher schools established in great and rich communities, under the direction of monks not less learned in secular literature than in theology. At the risk of repeating once again names already often mentioned, we will enumerate the monastic schools which, by the extent and variety of their teaching, and by the number of their pupils, became the true centres of education for all Christian races. In Italy these were Monte Cassino, Nonantula, Pomposa, and Classe; in Germany—Fulda, Fritzlär, Hersfeld, St. Gall, Reichenau, Corvey, Prüm, Hirschau, Wissembourg, Metloch, St. Maximin and St. Matthias at Treves, St. Alban at Mayence; in England—another St. Alban, Glastonbury, Malmesbury, Croyland, and St. Peter at Canterbury; in France and Belgium—Marmoutier, Fontenelle, Fleury, Lobbes, Aniane, Corbie, Ferrières, St. Germain d'Auxerre, St. Michael in Lorraine, St. Almand, St. Evroul, Gembloux, Bec, Cluny, Chaise-Dieu, St. Mayeul in the Puy. These were, in fact, the universities of Christian Europe, from the epoch of Charlemagne to that of St. Louis. Naturally these great schools were of two kinds; or rather, in each of the principal monasteries there existed two schools: an in-

ner one for the novices—the future monks—and for those children whom their parents destined for the life of the cloister; an outer one for those who were to return to the world, where, together with the sons of the warlike nobles, were received the clergy sent thither from different dioceses. There were, indeed, two distinct kinds of education, or of *discipline*, as it was called—monastic education and liberal education. . . . The monasteries of women, following the example of abbeys for men, contained schools where were trained not only the future novices, but also numbers of young girls destined for the life of courts or of the world. One of the oldest rules relating to convents—that of St. Césaire of Arles—required that all the sisters should be able to read, and that they should devote two hours daily to study."—Count de Montalembert, *Monks of the West from St. Benedict to St. Bernard*, v. v, pp. 117-118, 120, 123-124, 131.

West, *Alcuin and the rise of the Christian schools*.

"The monasteries . . . were [the] great centres . . . of liberal culture. . . . A Capitulary issued under Lewis the Pious and his advisers closed the schools in monasteries to all but those taking up the monastic life. . . . How far this order was observed it is difficult to say. That it was not followed everywhere is proven by the subsequent history of the monastery of St. Gall which, like Fulda and Reichenau, seems to have performed the functions of a university. . . . Leach [in his history of English schools at the Reformation] inclines to the belief that the educational work of the monks in England was closely restricted to those of their own order. He writes . . . 'Whether the monks ever even affected to keep a grammar school for any but their own number, among whom outsiders were not admitted, is quite doubtful.' It was in the monasteries that the traditions of learning were best conserved and cherished in the 9th and 10th centuries. . . . It was they that supplied upon the continent the need for advanced instruction which found expression in a petition presented by the bishops assembled at Paris in 820 for the establishment of three large public schools open to the monks and the clergy alike. . . . In addition to the schools within the monastery the monks frequently controlled as landlords schools in neighboring towns and villages. . . . The boys destined for monastic life, the 'oblats,' were from the first considered as members of the brotherhood. They participated in all religious services and took their turn in the performance of the other duties of the monks. The school, which they entered usually at the age of 7, stood within the enclosure of the monastery. Wherever as in some of the larger monasteries provision was made for the instruction of boys who were not to become monks, a separate building was provided outside the walls. . . . Great importance was attached to conduct. Numerous assistants were appointed to supervise the behavior of the pupils. . . . The changes most affecting the history of non-professional schools took place in the schools attached to the cathedrals and the collegiate churches. A collegiate church differed from a cathedral only in not having a resident bishop. It was a large church supported by endowment. Its functions were administered by a college, that is a collection or company of ecclesiastics consisting of a dean, canons, deacons, clerks, etc. . . . From the

first an essential function of these church colleges was the maintenance of a grammar school. . . . The cathedral and college schools are so nearly identical in character that they may be discussed together. They performed a variety of educational functions. The cathedral or college *grammar school* afforded an education to the youth, usually of aristocratic birth, who were destined for ecclesiastical preferment, and to such lay students as desired a more advanced school education. The head of the school was frequently known as the Scholasticus. In early times the custom arose of appointing the Scholasticus, on account of his learning, to the position of Chancellor. Hence later the two titles became practically synonymous. . . . The *song school* of the cathedral or collegiate church was apparently quite distinct from the grammar school. . . . It was under the direction of the Precentor and was attended by poor students who in return for board, lodging and tuition performed the duties of choristers. . . . In the song school the poor students, from whom usually the ranks of the country clergy were recruited, obtained not only a musical but a general literary education. . . . In time its work became confined to that of elementary instruction. . . . It became part of the regular duties of the song schoolmaster, *i.e.*, the assistant to the Precentor, to teach 'the petties,' *i.e.*, reading and writing. At Paris the Chancellor of Nôtre Dame had control over the 'Petty Schools' of the city. . . . Those of its students who needed more advanced instruction entered the grammar school. In 1312 a dispute arose between the grammar and song schoolmasters of Beverley, as to whether all the choristers of the church, or only the original number of seven, were to be admitted free to the grammar school. . . . The question was settled in favor of the former alternative. . . . Of the students of the grammar school, the regular clerical students for whom the school was primarily established, the 'scolares canonici,' held prebends, the income from which paid their expenses. . . . Along with these 'scolares canonici,' who were frequently of noble birth, some lay pupils of equal rank were received. Alcuin specifically refers to the students at York before his time as being sons of the nobility, some of whom pursued ecclesiastical while others pursued secular studies. . . . But in both schools there were frequently numerous poor students in addition to those members of the song school who supported themselves by acting as choristers. For the support of these, various means were devised, some of which are still employed. Some churches had large endowments for the support of poor students. The cathedral school at Bamberg, for instance, attracted many students because of the numerous mediæval scholarships and fellowships it was able to bestow. [See also EUROPE: Middle Ages: Roman civilization inherited, etc.] . . . Great dignitaries sometimes maintained a college of ecclesiastics in connection with their private chapels. And here as elsewhere the college maintained a grammar school. 'Every great man,' says Stubbs (Lect. Med. Hist., p. 142), 'had a great house and household with his chapel or collegiate church at his capital house and his school of clerks as well as pages.' The household college of chaplains of Archbishop Theobald satisfied to some extent the need that was afterwards met by the university system. Archbishop à Becket had among his chaplains a staff of professors on a small scale. . . . Much later in history we find the Earl of Northumberland employing his private college of priests in a variety of ways. . . . In such households young noblemen and others often acquired the training

requisite for a career as statesmen. The fact that the cathedral grammar school was likewise open to the laity had important consequences for the future of elementary and secondary education. As the students flocked to the cathedral school in continually increasing numbers, the Scholasticus became a supervisor and appointed others as teachers, first in the cathedral, and then in the supplementary schools established elsewhere in the diocese. Thus through growth of custom the Scholasticus came to be recognized as the official in control of the schools and teachers within the limits of the jurisdiction of the cathedral chapter. He issued licenses to teach, the prototypes of the university diplomas of later times. . . .

"The need of trained assistants in conducting religious services which in the cathedral and collegiate churches gave rise to the song schools was felt also in the smaller churches and led to the establishment of parish schools. That the purpose of these schools was merely that of giving instruction in religion and in the music and ceremonial of the church seems to be indicated in the . . . decretal of Gregory IX. . . . Where conditions were favorable and the need was felt the course of study of the parish school was expanded so as to afford more or less of a general education. . . . As to the frequency with which schools were maintained in connection with parish churches during the middle ages opinions differ. Quite a number of the Roman Catholic writers such as Janssen, Drane and Bro. Azarias believe that a relatively large proportion of the people received a general education in the middle ages through the agency of the parish school. . . . However the schools of the later middle ages may be classified, they all gave instruction in more or less of the same curriculum, consisting of an elementary course and that in the seven liberal arts. Excepting in some measure the highest institutions of learning subsequent to the 12th century, they were all alike grammar schools in that of necessity. . . . By far the greatest amount of time and effort was devoted to Latin which continued to be the one gateway (Janua) to learning. [See also CLASSICS: Place in education.] . . . There were comparatively few even among the nobility, who could afford to endow monasteries. Hence, instead of establishing a whole community of monks or priests, a man would bequeath property the income from which would support one or two priests to chant at stated intervals masses for his soul. Such an institution was a chantry. As the chantry priest had usually much spare time on his hands, he, sometimes at the request of the founder, sometimes on his own initiative, taught school. Hence a class of chantry schools. . . . 'And I wolle that the same conyngyng Priest keep a Gramer School continually in the said Town of Stopforde, as long as he shall contyneue there in the said service. And that he frely, without any wages or salarye . . . except only my salarye . . . shal teche al maner person's children, and other that will come to him to lerne.' . . . Property was sometimes left to endow a priest to assist in the services of a church or to say mass in honor of some favorite saint, frequently the Virgin Mary. Those holding such positions were known as stipendiary priests. Like the chantry priests they, sometimes on their own initiative, or again in conformity with the wishes of the founder, taught school. For example, in the chantry certificate reports concerning Alton we find, 'A stipendiary priest. Founded by one John Chawnflower to have continuance forever to the intent to assist ministration in the church of Alton and to teach children grammar.' . . . [Such schools were known

as stipendiary schools.] Another of the great variety of ways in which schools sprouted out from the ancient and complex organization of the church is illustrated in the case of Pountfrett. Here there was an endowment for a morrow mass priest, that is, a priest who was to say mass early in the morning so that laborers going to work could attend. Among the other duties of this priest were those of surveying the mending of the highways and of teaching a grammar school [known as a morrow mass school]. . . . Many schools originated in connection with hospitals, that is, almshouses. For example, in Carlisle . . . we find concerning the grammar school at Huntingdon, that 'The endowment now forms part of the revenue of the master and co-frater of the Hospital of St. John, founded—in the reign of Hen. II—for the relief of poor people and the keeping of a free grammar school at the cost and charge of the master of the said house.'—L. F. Anderson, *Study of medieval schools and school work (Pedagogical Seminary, v. 14, no. 2, June, 1907, pp. 254-267)*.—See also ABBEY; LIBRARIES: Medieval: Monastic.

5th-6th centuries.—Ireland.—Scotland.—Schools of Iona.—Popular accounts represent St. Patrick as "founding at least a hundred monasteries, and even those who consider that the greater number of the Irish colleges were raised by his followers after his death, admit the fact of his having established an episcopal monastery and school at Armagh, where he and his clergy carried out the same rule of life that he had seen followed in the churches of Gaul. . . . The school, which formed a portion of the Cathedral establishment, soon rose in importance. Gildas taught here for some years before joining St. Cadoc at Llancarvan; and in process of time the number of students, both native and foreign, so increased that the university, as we may justly call it, was divided into three parts, one of which was devoted entirely to students of the Anglo-Saxon race. Grants for the support of the schools were made by the Irish kings in the eighth century; and all through the troublous times of the ninth and tenth centuries, when Ireland was overrun by the Danes, and so many of her sanctuaries were given to the flames, the succession of divinity professors at Armagh remained unbroken, and has been carefully traced by Usher. We need not stop to determine how many other establishments similar to those of Armagh were really founded in the lifetime of St. Patrick. In any case the rapid extension of the monastic institute in Ireland, and the extraordinary ardour with which the Irish cœnobites applied themselves to the cultivation of letters remain undisputed facts. 'Within a century after the death of St. Patrick,' says Bishop Nicholson, 'the Irish seminaries had so increased that most parts of Europe sent their children to be educated here, and drew thence their bishops and teachers.' The whole country for miles round Leighlin was denominated the 'land of saints and scholars.' By the ninth century Armagh could boast of 7,000 students, and the schools of Cashel, Dindaleathglass, and Lismore vied with it in renown. This extraordinary multiplication of monastic seminaries and scholars may be explained partly by the constant immigration of British refugees who brought with them the learning and religious observances of their native cloisters, and partly by that sacred and irresistible impulse which animates

a newly converted people to heroic acts of sacrifice. In Ireland the infant church was not, as elsewhere, watered with the blood of martyrs. . . . The bards, who were to be found in great numbers among the early converts of St. Patrick, had also a considerable share in directing the energies of their countrymen to intellectual labour. They formed the learned class, and on their conversion to Christianity were readily disposed to devote themselves to the culture of sacred letters. . . . It would [take too long] . . . to notice even the names of all the Irish seats of learning, or of their most celebrated teachers, every one of whom has his own legend in which sacred and poetic beauties are to be found blended together. One of the earliest monastic schools was that erected by Enda, prince of Orgiel, in that western island called from the wild flowers which even still cover its rocky soil, Aran-of-the-Flowers, a name it afterwards exchanged for that of Ara-na-naomh, or Aran-of-the-Saints. . . . A little later St. Finian founded his great school of Clonard, whence, says Usher, issued forth a stream of saints and doctors, like the Greek warriors from the wooden horse. . . . This desolate wilderness was soon peopled by his disciples, who are said to have numbered 3,000, of whom the twelve most eminent are often termed the Twelve Apostles of Ireland. . . . Among them none were more famous than St. Columba, St. Kieran, and St. Brendan. The first of these is known to every English reader as the founder of Iona; and Kieran, the carpenter's son, as he is called, is scarcely less renowned among his own countrymen. . . . It was in the year 563 that St. Columba, after founding the monasteries of Doire-Calgaich and Dair-magh in his native land, and incurring the enmity of one of the Irish kings, determined on crossing over into Scotland in order to preach the faith to the Northern Picts. Accompanied by twelve companions, he passed the Channel in a rude wicker boat covered with skins, and landed at Port-na-Currachan, on a spot now marked by a heap of huge conical stones. Conall, king of the Albanian Scots, granted him the island of I, Hi, or Ai, hitherto occupied by the Druids, and there he erected the monastery which, in time, became the mother of three hundred religious houses. . . . Iona, or I-Colum-kil, as it was called by the Irish, came to be looked on as the chief seat of learning, not only in Britain, but in the whole Western world. 'Thither, as from a nest,' says Odonellus, playing on the Latin name of the founder, 'these sacred doves took their flight to every quarter.' They studied the classics, the mechanical arts, law, history, and physic. They improved the arts of husbandry and horticulture, supplied the rude people whom they had undertaken to civilise with ploughshares and other utensils of labour, and taught them the use of the forge, in the mysteries of which every Irish monk was instructed from his boyhood. They transferred to their new homes all the learning of Armagh or Clonard. . . . In every college of Irish origin, by whomsoever they were founded or on whatever soil they flourished, we thus see study blended with the duties of the missionary and the cœnobite. They were religious houses, no doubt, in which the celebration of the Church office was often kept up without intermission by day and night; but they were also seminaries of learning, wherein sacred and profane studies were cultivated with equal success. Not only their own monasteries but those of every European country were enriched with their manuscripts, and the researches of modern biblioplists are continually disintering from German or Italian libraries a Horace,

or an Ovid, or a Sacred Codex whose Irish gloss betrays the hand which traced its delicate letters."

—A. T. Drane, *Christian schools and scholars*, ch. 2.

6th-16th centuries.—Wide use of Latin language.—“Greek was an unknown tongue: only a very few of the Latin classics received a perfunctory attention: Boethius was preferred to Cicero, and the Moral Sentences ascribed to Cato to either. Rules couched in barbarous Latin verse were committed to memory. Aristotle was known only in incorrect Latin translations, which many of the taught, and some of the teachers probably, supposed to be the originals. Matters were not mended when the student, having passed through the preliminary course of arts, advanced to the study of the sciences. Theology meant an acquaintance with the ‘Sentences’ of Peter Lombard, or, in other cases, with the ‘Summa’ of Thomas Aquinas; in medicine, Galen was an authority from which there was no appeal. On every side the student was fenced round by traditions and prejudices, through which it was impossible to break. In truth, he had no means of knowing that there was a wider and fairer world beyond. Till the classical revival came, every decade made the yoke of prescription heavier, and each generation of students, therefore, a feebler copy of the last.”—C. Beard, *Martin Luther and the Reformation*, ch. 3.—“What at first had been everywhere a Greek became in Western Europe a Latin religion. The discipline of Rome maintained the body of doctrine which the thought of Greece had defined. A new Latin version, superseding alike the venerable Greek translation of the Old Testament and the original words of Evangelists and Apostles, became the received text of Holy Scripture. The Latin Fathers acquired an authority scarcely less binding. The ritual, lessons, and hymns of the Church were Latin. Ecclesiastics transacted the business of civil departments requiring education. Libraries were armories of the Church: grammar was part of her drill. The humblest scholar was enlisted in her service: she recruited her ranks by founding Latin schools. ‘Education in the rudiments of Latin,’ says Hallam, ‘was imparted to a greater number of individuals than at present’; and, as they had more use for it than at present, it was longer retained. If a boy of humble birth had a taste for letters, or if a boy of high birth had a distaste for arms, the first step was to learn Latin. His foot was then on the ladder. He might rise by the good offices of his family to a bishopric, or to the papacy itself by merit and the grace of God. Latin enabled a Greek from Tarsus (Theodore) to become the founder of learning in the English church; and a Yorkshireman (Alcuin) to organize the schools of Charlemagne. Without Latin, our English Winfrid (St. Boniface) could not have been apostle of Germany and reformer of the Frankish Church; or the German Albert, master at Paris of Thomas Aquinas; or Nicholas Breakspeare, Pope of Rome. With it, Western Christendom was one vast field of labor: calls for self-sacrifice, or offers of promotion, might come from north or south, from east or west. Thus in the Middle Ages Latin was made the groundwork of education; not for the beauty of its classical literature, nor because the study of a dead language was the best mental gymnastic, or the only means of acquiring a masterly freedom in the use of living tongues, but because it was the language of educated men throughout Western Europe, employed for public business, literature, philosophy, and science; above all in God’s providence essential to the unity, and therefore enforced by the authority of, the Western Church.”—C. S. Parker, *Essay on the history of classical education*

(quoted in Dr. Henry Barnard’s “*Letters, Essays and Thoughts on Studies and Conduct*,” p. 467).—See also UNIVERSITIES AND COLLEGES: University customs.

742-814.—Charlemagne and Alcuin.—“If there ever was a man who by his mere natural endowments soared above other men, it was Charlemagne [742-814]. His life, like his stature, was colossal. Time never seemed wanting to him for anything that he willed to accomplish, and during his ten years campaign against the Saxons and Lombards, he contrived to get leisure enough to study grammar, and render himself tolerably proficient as a Latin writer in prose and verse. He found his tutors in the cities that he conquered. When he became master of Pisa, he gained the services of Peter of Pisa, whom he set over the Palatine school, which had existed even under the Merovingian kings, though as yet it was far from enjoying the fame to which it was afterwards raised by the teaching of Alcuin. He possessed the art of turning enemies into friends, and thus drew to his court the famous historian, Paul Warnefrid, deacon of the Church of Rome, who had previously acted as secretary to Didier, king of the Lombards. . . . Another Italian scholar, St. Paulinus, of Aquileja, was coaxed into the service of the Frankish sovereign after his conquest of Friuli; I will not say that he was bought, but he was certainly paid for by a large grant of confiscated territory made over by diploma to ‘the Venerable Paulinus, master of the art of grammar.’ But none of these learned personages were destined to take so large a part in that revival of learning which made the glory of Charlemagne’s reign, as . . . Alcuin. It was in 781, on occasion of the king’s second visit to Italy, that the meeting took place at Parma, the result of which was to fix the English scholar at the Frankish court. Having obtained the consent of his own bishop and sovereign to this arrangement, Alcuin came over to France in 782, bringing with him several of the best scholars of York, among whom were Wizo, Fredegis, and Sigulf. Charlemagne received him with joy, and assigned him three abbeys for the maintenance of himself and his disciples, those namely, of Ferrières, St. Lupus of Troyes, and St. Josse in Ponthieu. From this time Alcuin held the first place in the literary society that surrounded the Frankish sovereign, and filled an office the duties of which were as vast as they were various. Three great works at once claimed his attention, the correction of the liturgical books, the direction of the court academy, and the establishment of other public schools throughout the empire. . . . But it was as head of the Palatine school that Alcuin’s influence was chiefly to be felt in the restoration of letters. Charlemagne presented himself as his first pupil, together with the three princes, Pepin, Charles, and Louis, his sister Gisla and his daughter Richtrude, his councillors Adalard and Angilbert, and Eginhard his secretary. Such illustrious scholars soon found plenty to imitate their example, and Alcuin saw himself called on to lecture daily to a goodly crowd of bishops, nobles, and courtiers. The king wished to transform his court into a new Athens preferable to that of ancient Greece, in so far as the doctrine of Christ is to be preferred to that of Plato. All the liberal arts were to be taught there, but in such a way as that each should bear reference to religion, for this was regarded as the final end of all learning. Grammar was studied in order better to understand the Holy Scriptures and to transcribe them more correctly; music, to which much attention was given, was chiefly confined to the ecclesiastical chant; and it was prin-

cipally to explain the Fathers and refute errors contrary to the faith that rhetoric and dialectics were studied. 'In short,' says Crevier, 'the thought both of the king and of the scholar who laboured with him was to refer all things to religion, nothing being considered as truly useful which did not bear some relation to that end.' At first Alcuin allowed the study of the classic poets, and in his boyhood, as we know, he had been a greater reader of Virgil than of the Scriptures. . . . The authors whose study Charlemagne and Alcuin desired to promote, were not so much Virgil and Cicero, as St. Jerome and St. Augustine; and Charlemagne, in his excessive admiration of those Fathers, gave utterance to the wish that he had a dozen such men at his court. The 'City of God' was read at the royal table, and the questions addressed by the court students to their master turned rather on the obscurities of Holy Writ than the difficulties of prosody. In one thing, however, they betrayed a classic taste, and that was in their selection of names. The Royal Academicians all rejoiced in some literary soubriquet; Alcuin was Flaccus; Angilbert, Homer; but Charlemagne himself adopted the more scriptural appellation of David. The eagerness with which this extraordinary man applied himself to acquire learning for himself, and to extend it throughout his dominions, is truly admirable, when we remember the enormous labours in which he was constantly engaged."—A. T. Drane, *Christian schools and scholars*, ch. 5.—"It was the aim of Charlemagne to correct or at least to lessen the provincial differences and local barbarities of style, expression, orthography, etc., in the rendering of Latin, and it was with this end in view that he planned out his great scheme of an imperial series of schools, through which should be established an imperial or academic standard of style and expression. This appears to have been the first attempt since the time of the Academy of Alexandria to secure a scholarly uniformity of the standard throughout the civilised world, and the school at Tours may be considered as a precursor of the French Academy of modern times. For such a scheme the Emperor was dependent upon the monks, as it was only in the monasteries that could be found the scholarship that was required for the work. He entrusted to Alcuin, a scholarly English Benedictine, the task of organising the imperial schools. The first schools instituted by Alcuin in Aachen and Tours, and later in Milan, were placed in charge of Benedictine monks, and formed the models for a long series of monastic schools during the succeeding centuries. Alcuin had been trained in the cathedral schools founded in York by Egbert, and Egbert had been brought up by Benedict Biscop in the monastery of Yarrow, where he had for friend and fellow pupil the chronicler Bede. The results of the toilsome journeys taken by Biscop to collect books for his beloved monasteries of Wearmouth and Yarrow were far-reaching. The training secured by Alcuin as a scribe and as a student of the Scriptures, the classics, and the 'seven liberal arts' was more immediately due to his master Ælbert, who afterwards succeeded Egbert as archbishop."—G. H. Putnam, *Books and their makers during the Middle Ages*, v. 1, p. 107.—See also SCHOOL OF THE PALACE, CHARLEMAGNE'S.

871-900.—England.—King Alfred.—The following letter of King Alfred reveals the state of education in England during his reign (871-900):

"King Alfred bids greet bishop Waerferth with his words lovingly and with friendship; and I let it be known to them that it has very often come into my mind, what wise men there formerly were throughout the English nation, both of sacred and secular orders . . . and also the sacred orders how zealous they were both in teaching and learning, and in all the services they owed to God; and how foreigners came to this land in search of wisdom and learning, and how we should now have to get them from abroad if we would have them. So general was its decay among the English people that there were very few on this side of the Humber who could understand their services in English, or translate a letter from Latin into English; and I believe that there were not many beyond the Humber. There were so few of them that I cannot remember a single one south of the Thames when I came to the throne. Thanks be to God almighty that we have any teachers among us now. . . . When I considered all this I remembered also how I saw, before it had been all ravaged and burnt, how the churches throughout the whole of England stood filled with treasures and books, and there was also a great multitude of God's servants, but they had very little knowledge of the books, for they could not understand anything of them, because they were not written in their own language. Therefore I think it is better, if you think so too, that we also should translate some of the books, which are most useful for all men to know, into the language which we can all understand, and should do as we very easily can with God's help if we have peace, that all the youth of our English freemen, who are rich enough to be able to devote themselves to it, should be set to learning, as long as they are not fit for any other occupation, until they are well able to read English writing: and further let those afterwards learn Latin who will continue in learning, and go to a higher rank. When I remembered how the knowledge of Latin had formerly decayed among the English, and yet many could read English writing, I began, among other various and manifold troubles of this kingdom, to translate into English the book which is called in Latin *Pastoralis*, and in English *The Herd's Book*, sometimes word for word and sometimes meaning for meaning, as I had learnt it from Plegmund my archbishop, and Asser my bishop, and Grimbold my mass-priest, and John my mass-priest. And when I had learnt it to the best of my ability, and as I could most clearly interpret it, I translated it into English; and I will send a copy to every bishopric in my kingdom; with a clasp on each worth fifty man-cuses. And I forbid in God's name anyone to take the clasp from the book or the book from the minister."—A. F. Leach, *Educational charters and documents*, 508 to 1000, pp. 23-25.—King Alfred "gathered round him at his own court the sons of his nobility to receive, in conjunction with his own children, a better education than their parents would be able or willing to give them in their own households. To this assemblage of pupils Asser has attached the name of school, and a violent controversy once distracted the literary world concerning the sense in which the word was to be understood, and whether it was not the beginning or origin of a learned institution still existing. In speaking of this subject, Asser has taken occasion to enumerate and describe the children who were born to Alfred from his wife Elswitha, daughter of Ethelred the 'Big,' alderman of the Gaini, and a noble of great wealth and influence in Mercia. 'The sons and daughters,' says Asser, 'which he had by his wife above mentioned, were Ethelred the

eldest, after whom came Edward, then Ethelgiva, then Ethelswitha, and Ethelwerd, besides those who died in their infancy, one of whom was Edmund. Ethelfled, when she arrived at a marriageable age, was united to Ethelred, earl of Mercia; Ethelgiva was dedicated to God, and submitted to the rules of a monastic life; Ethelwerd, the youngest, by the Divine counsels and admirable prudence of the king, was consigned to the schools of learning, where, with the children of almost all the nobility of the country, and many also who were not noble, he prospered under the diligent care of his teachers. Books in both languages, namely, in Latin and Saxon, were read in the school. They also learned to write; so that, before they were of an age to practise manly arts, namely hunting and such other pursuits as befit noblemen, they became studious and clever in the liberal arts. Edward and Ethelswitha were bred up in the king's court, and received great attention from their servants and nurses; nay, they continue to this day, with the love of all about them, and shew affability, and even gentleness, towards all, both foreigners and natives, and are in complete subjection to their father; nor, among their other studies which appertain to this life and are fit for noble youths, are they suffered to pass their time idly and unprofitably, without learning the liberal arts; for they have carefully learned the Psalms and Saxon books, especially the Saxon Poems, and are continually in the habit of making use of books.' The schools of learning, to which Asser alludes in this passage, as formed for the use of the king's children and the sons of his nobles, are again mentioned elsewhere by the same author, as 'the school which he had studiously collected together, consisting of many of the nobility of his own nation': and in a third passage, Asser speaks of the 'sons of the nobility who were bred up in the royal household.' It is clear, then, from these expressions, that the king's exertions to spread learning among his nobles and to educate his own children, were of a most active and personal nature, unconnected with any institutions of a more public character: the school was kept in his own household, and not in a public seat of learning. We may perhaps adduce these expressions of Asser as militating against the notion, that an University or Public Seminary of Learning existed in the days of Alfred. Though it is most probable that the several monasteries, and other societies of monks and churchmen, would employ a portion of their idle time in teaching youth, and prosecuting their own studies; yet there is no proof that an authorized seat of learning, such as the Universities of Oxford or Cambridge, existed in England, until many hundred years after the time of Alfred."—J. A. Giles, *Life and times of Alfred the Great*, ch. 21.—See also BIBLE, ENGLISH: 7th-8th centuries.

9th-15th centuries.—Saracenic and Moorish learning.—"Even as early as the tenth century, persons having a taste for learning and for elegant amenities found their way into Spain from all adjoining countries; a practice in subsequent years still more indulged in, when it became illustrated by the brilliant success of Gilbert, who . . . passed from the Infidel University of Cordova to the papacy of Rome. The khalifs of the West carried out the precepts of Ali, the fourth successor of Mohammed, in the patronage of literature. They established libraries in all their chief towns; it is said that not fewer than seventy were in existence. To every mosque was attached a public school, in which the children of the poor were taught to read and write, and instructed in the precepts of the Koran. For those in easier circumstances there

were academies, usually arranged in twenty-five or thirty apartments, each calculated for accommodating four students; the academy being presided over by a rector. In Cordova, Granada, and other great cities, there were universities frequently under the superintendence of Jews; the Mohammedan maxim being that the real learning of a man is of more public importance than any particular religious opinions he may entertain. In this they followed the example of the Asiatic khalif, Haroun Alraschid, who actually conferred the superintendence of his schools on John Masué, a Nestorian Christian. The Mohammedan liberality was in striking contrast with the intolerance of Europe. . . . In the universities some of the professors of polite literature gave lectures on Arabic classical works; others taught rhetoric or composition, or mathematics, or astronomy. From these institutions many of the practices observed in our colleges were derived. They held Commencements, at which poems were read and orations delivered in presence of the public. They had also, in addition to these schools of general learning, professional ones, particularly for medicine. With a pride perhaps not altogether inexcusable, the Arabians boasted of their language as being the most perfect spoken by man. . . . It is not then surprising that, in the Arabian schools, great attention was paid to the study of language, and that so many celebrated grammarians were produced. By these scholars, dictionaries, similar to those now in use, were composed; their copiousness is indicated by the circumstance that one of them consisted of sixty volumes, the definition of each word being illustrated or sustained by quotations from Arab authors of acknowledged repute. They had also lexicons of Greek, Latin, Hebrew; and cyclopedias such as the Historical Dictionary of Sciences of Mohammed Ibn Abdallah, of Granada."—J. W. Draper, *History of the intellectual development of Europe*, v. 2, ch. 1.—"The Saracenic kings formed libraries of unparalleled size and number. That of Hakem amounted to 600,000 volumes, of which 44 were employed in the mere catalogue. Upwards of 70 public libraries were established in his dominions. 100,000 volumes were numbered in the library of Cairo, and were freely lent to the studious citizen. The taste of the sovereign communicated itself to the subject, and a private doctor declared that his books were sufficient to load 400 camels. Nor were the Saracens less attentive to the foundation of schools and colleges. Eighty of the latter institutions adorned Cordova in the reign of Hakem; in the fifteenth century fifty were scattered over the city and plain of Granada. 200,000 dinars (about £100,000 sterling) were expended on the foundation of a single college at Baghdad. It was endowed with an annual revenue of 15,000 dinars, and was attended by 6,000 students. The princes of the house of Omeya honoured the Spanish academies by their presence and studies, and competed, not without success, for the prizes of learning. Numerous schools for the purpose of elementary instruction were founded by a long series of monarchs. . . . In this manner the Arabians, within two centuries, constructed an apparatus for mental improvement which hitherto had not been equalled save in Alexandria, and to which the Church, after ruling the intellect of Europe for more than five hundred years, could offer no parallel."—*Intellectual revival of the Middle Ages* (*Westminster Review*, Jan., 1876).

9th-15th centuries. — Scholasticism.—Schoolmen.—In the later times of the Roman empire, "the loss of the dignity of political freedom, the want of the cheerfulness of advancing prosperity, and the substitution of the less philosophical structure of the Latin language for the delicate intellectual mechanism of the Greek, fixed and augmented the prevalent feebleness and barrenness of intellect. Men forgot, or feared, to consult nature, to seek for new truths, to do what the great discoverers of other times had done; they were content to consult libraries, to study and defend old opinions, to talk of what great geniuses had said. They sought their philosophy in accredited treatises, and dared not question such doctrines as they there found. . . . In the mean time the Christian religion had become the leading subject of men's thoughts; and divines had put forward its claims to be, not merely the guide of men's lives, and the means of reconciling them to their heavenly Master, but also to be a Philosophy in the widest sense in which the term had been used;—a consistent speculative view of man's condition and nature, and of the world in which he is placed. . . . It was held, without any regulating principle, that the philosophy which had been bequeathed to the world by the great geniuses of heathen antiquity, and the philosophy which was deduced from, and implied by, the Revelations made by God to man, must be identical; and, therefore, that Theology is the only true philosophy. . . . This view was confirmed by the opinion which prevailed, concerning the nature of philosophical truth; a view supported by the theory of Plato, the practice of Aristotle, and the general propensities of the human mind: I mean the opinion that all science may be obtained by the use of reasoning alone;—that by analyzing and combining the notions which common language brings before us, we may learn all that we can know. Thus Logic came to include the whole of Science; and accordingly this Abelard expressly maintained. . . . Thus a Universal Science was established, with the authority of a Religious Creed. Its universality rested on erroneous views of the relation of words and truth; its pretensions as a science were admitted by the servile temper of men's intellects; and its religious authority was assigned it, by making all truth part of religion. And as Religion claimed assent within her own jurisdiction under the most solemn and imperative sanctions, Philosophy shared in her imperial power, and dissent from their doctrines was no longer blameless or allowable. Error became wicked, dissent became heresy; to reject the received human doctrines, was nearly the same as to doubt the Divine declarations. The Scholastic Philosophy claimed the assent of all believers. The external form, the details, and the text of this Philosophy, were taken, in a great measure, from Aristotle; though, in the spirit, the general notions, and the style of interpretation, Plato and the Platonists had no inconsiderable share. . . . It does not belong to our purpose to consider either the theological or the metaphysical doctrines which form so large a portion of the treatises of the schoolmen. Perhaps it may hereafter appear, that some light is thrown on some of the questions which have occupied metaphysicians in all ages, by that examination of the history of the Progressive Sciences in which we are now engaged; but till we are able to analyze the leading controversies of this kind, it would be of little service to speak of them in detail. It may be noticed, however, that many of the most prominent of them refer to the great question, "What is the relation between actual things and general terms?" Perhaps in modern times, the actual things would be more commonly

taken as the point to start from; and men would begin by considering how classes and universals are obtained from individuals. But the schoolmen, founding their speculations on the received modes of considering such subjects, to which both Aristotle and Plato had contributed, travelled in the opposite direction, and endeavored to discover how individuals were deduced from genera and species;—what was 'the Principle of Individuation.' This was variously stated by different reasoners. Thus Bonaventura solves the difficulty by the aid of the Aristotelian distinction of Matter and Form. The individual derives from the Form the property of being something, and from the Matter the property of being that particular thing. Duns Scotus, the great adversary of Thomas Aquinas in theology, placed the principle of Individuation in 'a certain determining positive entity,' which his school called *Hæcceity* or 'thisness.' Thus an individual man is Peter, because his humanity is combined with *Petreity*.' The force of abstract terms is a curious question, and some remarkable experiments in their use had been made by the Latin Aristotelians before this time. In the same way in which we talk of the quantity and quality of a thing, they spoke of its 'quiddity.' We may consider the reign of mere disputation as fully established at the time of which we are now speaking [the Middle Ages]; and the only kind of philosophy henceforth studied was one in which no sound physical science had or could have a place."—W. Whewell, *History of the inductive sciences*, v. 1, bk. 4, ch. 4.—"Scholasticism was philosophy in the service of established and accepted theological doctrines. . . . More particularly, Scholasticism was the reproduction of ancient philosophy under the control of ecclesiastical doctrine. . . . The name of Scholastics (*doctores scholastici*) which was given to the teachers of the *septem liberales artes* [seven liberal arts] (grammar, dialectic, rhetoric, in the Trivium; arithmetic, geometry, music and astronomy, in the Quadrivium), or at least some of them, in the Cloister-Schools founded by Charlemagne, as also to teachers of theology, was afterwards given to all who occupied themselves with the sciences, and especially with philosophy. . . . Johannes Scotus, or Erigena [ninth century] is the earliest noteworthy philosopher of the Scholastic period. . . . At the call of Charles the Bald he emigrated to France."—F. Ueberweg, *History of philosophy*, v. 1, pp. 355-484.—"Scholasticism, at the last, from the prodigious mental activity which it kept up, became a tacit universal insurrection against authority: it was the swelling of the ocean before the storm. . . . It was a sign of a great awakening of the human mind when theologians thought it both their duty and their privilege to philosophize. There was a vast waste of intellectual labor, but still it was intellectual labor, and, . . . it was not in the end unfruitful."—C. J. Stillé, *Studies in Medieval history*, ch. 13.—"Scholasticism had its hour of glory, its erudite doctors, its eloquent professors, chief among whom was Abelard (1070-1142). . . . At a time when printing did not exist, when manuscript copies were rare, a teacher who combined knowledge with the gift of speech was a phenomenon of incomparable interest, and students flocked from all parts of Europe to take advantage of his lectures. Abelard is the most brilliant representative of the scholastic pedagogy, with an original and personal tendency towards the emancipation of the mind. 'It is ridiculous,' he said, 'to preach to others what we can neither make them understand nor understand ourselves.' With more boldness than Saint Anselm, he applied dialectics to theology, and attempted to reason out

the grounds of his faith. The seven liberal arts constituted what may be called the secondary instruction of the Middle Age, such as was given in the claustral or conventual schools, and later, in the universities. The liberal arts were distributed into two courses of study, known as the 'trivium' and the 'quadrivium.' The 'trivium' comprised grammar (Latin grammar, of course), dialectics, or logic, and rhetoric; and the 'quadrivium,' music, arithmetic, geometry, and astronomy. It is important to note the fact that this programme contains only abstract and formal studies,—no real and concrete studies. The sciences which teach us to know man and the world, such as history, ethics, the physical and natural sciences, were omitted and unknown, save perhaps in a few convents of the Benedictines. Nothing which can truly educate man, and develop his faculties as a whole, enlists the attention of the Middle Age. From a course of study thus limited there might come skillful reasoners and men formidable in argument, but never fully developed men. The methods employed in the ecclesiastical schools of the Middle Age were in accord with the spirit of the times, when men were not concerned about liberty and intellectual freedom; and when they thought more about the teaching of dogmas than about the training of the intelligence. The teachers recited or read their lectures, and the pupils learned by heart. The discipline was harsh. Corrupt human nature was distrusted. In 1363, pupils were forbidden the use of benches and chairs, on the pretext that such high seats were an encouragement to pride. For securing obedience, corporal chastisements were used and abused. The rod is in fashion in the fifteenth as it was in the fourteenth century. 'There is no other difference,' says an historian, 'except that the rods in the fifteenth century are twice as long as those in the fourteenth.'—G. Compayré, *History of pedagogy* (trans. by W. H. Payne) ch. 4.—See also EUROPE: Middle Ages; Scholastic revival, etc.; Thirteenth century, etc.

9th-15th centuries.—Chivalry and training for knighthood.—"The duties of the boy for the first seven years of his service were chiefly personal. If sometimes the harsh principles of feudal subordination gave rise to such service, it oftener proceeded from the friendly relations of life; and as in the latter case it was voluntary, there was no loss of honourable consideration in performing it. The dignity of obedience, that principle which blends the various shades of social life, and which had its origin in the patriarchal manners of early Europe, was now fostered in the castles of the feudal nobility. The light-footed youth attended the lord and his lady in the hall, and followed them in all their exercises of war and pleasure; and it was considered unknighly for a cavalier to wound a page in battle. He also acquired the rudiments of those incongruous subjects, religion, love, and war, so strangely blended in chivalry; and generally the intellectual and moral education of the boy was given by the ladies of the court. From the lips of the ladies the gentle page learned both his catechism and the art of love, and as the religion of the day was full of symbols, and addressed to the senses, so the other feature of his devotion was not to be nourished by abstract contemplation alone. He was directed to regard some one lady of the court as the type of his heart's future mistress; she was the centre of all his hopes and wishes; to her he was obedient, faithful, and courteous. . . . [The page became a squire at the age of fifteen or six-

teen.] Personal service was considered so much the duty of a squire that his title was always applied to some particular part of it. . . . The most honourable squire was he that was attached to the person of his lord; he was called the squire of the body, and was in truth for the time the only military youth of the class: every squire, however, became in turn by seniority the martial squire. He accompanied his lord into the field of battle, carrying his shield and armour, while the page usually bore the helmet. He held the stirrup, and assisted the knight to arm. There was always a line of squires in the rear of a line of knights; the young cavaliers supplying their lords with weapons, assisting them to rise when overthrown, and receiving their prisoners. The banner of the banneret and baron was displayed by the squire. The pennon of the knight was also waved by him when his leader was only a knight, and conducted so many men-at-arms, and other vassals, that, to give dignity and importance to his command, he removed his pennon from his own lance to that of his attendant. . . . But whatever were the class of duties to which the candidate for chivalry was attached, he never forgot that he was also the squire of dames. During his course of a valet he had been taught to play with love, and as years advanced, nature became his tutor. Since the knights were bound by oath to defend the feebler sex, so the principle was felt in all its force and spirit by him who aspired to chivalric honours. Hence proceeded the qualities of kindness, gentleness, and courtesy. The minstrels in the castle harped of love as well as of war, and from them (for all young men had not, like Sir Ipomydon, clerks for their tutors) the squire learned to express his passion in verse. This was an important feature of chivalric education, for among the courtesies of love, the present of books from knights to ladies was not forgotten."—C. Mills, *History of chivalry; or Knighthood and its times*, pp. 43, 48-49.—See also CHIVALRY.

11th-12th centuries.—Rise of the universities.—Abelard.—"Up to the end of the eleventh century the instruction was, speaking generally, and allowing for transitory periods of revival, and for a few exceptional schools, a shrunken survival of the old 'trivium et quadrivium.' The lessons, when not dictated and learnt by heart from notes, were got up from bald epitomes. All that was taught, moreover, was taught solely with a view to 'pious uses.' Criticism did not exist; the free spirit of speculation could not, of course, exist. . . . As we approach the period which saw the birth of those institutions known as *Studia Publica* or *Generalia*, and ere long to be known as 'universities,' we have to extend our vision and recognize the circumstances of the time, and those changes in the social condition of Europe which made great central schools possible—schools to be frequented not merely by the young ecclesiastic, but by laymen. Among other causes which led to the diffusion of a demand for education among the laity, was, I think, the institution or reorganization of municipalities. It was about the end of the eleventh century that the civic Communes (*Communia*) began to seek and obtain, from royal and other authorities, charters of incorporation constituting their internal government and conferring certain freedoms and privileges as against the encroachment of lay and ecclesiastical feudal barons. . . . About the same time, and somewhat prior to this, trade guilds had been formed in many cities for mutual protection, the advancement of commerce, and the internal regulation of the various crafts. There immediately followed a desire for schools in the

more important commercial towns. In Italy such schools arose in Bologna, Milan, Brescia, and Florence; and in Germany they arose in Lübeck, Hamburg, Breslau, Nordhausen, Stettin, Leipsic, and Nürnberg. [See also UNIVERSITIES AND COLLEGES: 1575.] The distinctive characteristic of these city schools was, that they do not seem to have been under the direct control of the Church, or to have been always taught by priests; further, that the native tongue (German or Italian, as the case might be) was taught. Reading, writing, and a little arithmetic seem to have formed the staple of the instruction. The custom of dictating, writing down, and then learning by heart what was written—universal in the schools of the preceding centuries—was, of course, still followed in these burgh schools. This custom was almost inevitable. . . . The increased communication with Africa and the East through the Crusades had introduced men to a standard of learning among the Arabs, unknown in Europe. Outside the school, the order of chivalry had introduced a new and higher ethical spirit than had been known in the previous centuries. Civic communities and trade guilds were forming themselves and seeking charters of incorporation. Above all, the Crusades, by stimulating the ardour and exciting the intellects of men, had unsettled old convention by bringing men of all ranks within the sacred circle of a common enthusiasm, and into contact with foreign civilizations. The desire for a higher education, and the impulse to more profound investigation, that characterized the beginning and course of the twelfth century, was thus only a part of a widespread movement, political and moral. . . . While the Romano-Hellenic schools had long disappeared, there still existed, in many towns, episcopal schools of a high class, many of which might be regarded as continuations of the old imperial provincial institutions. . . . In Bologna and Paris, Rheims and Naples, it was so. The arts curriculum professed in these centres was, for the time and state of knowledge, good. These schools, indeed, had never quite lost the fresh impulse given by Charlemagne and his successors. . . . According to my view of educational history, the great 'studia publica' or 'generalia' arose out of them. They were themselves, in a narrow sense, already 'studia publica.' . . . Looking, first, to the germ out of which the universities grew, I think we must say that the universities may be regarded as a natural development of the cathedral and monastery schools; but if we seek for an external motive force urging men to undertake the more profound and independent study of the liberal arts, we can find it only in the Saracenic schools of Bagdad, Babylon, Alexandria, and Cordova. . . . To fix precisely the date of the rise of the first specialized schools or universities is impossible, for the simple reason that they were not founded. . . . The simplest account of the new university origins is the most correct. It would appear that certain active-minded men of marked eminence began to give instruction in medical subjects at Salerno [see also MEDICAL SCIENCE: Medieval: 10th-12th centuries], and in law at Bologna, in a spirit and manner not previously attempted, to youths who had left the monastery and cathedral schools, and who desired to equip themselves for professional life. Pupils flocked to them; and the more able of these students, finding that there was a public demand for this higher specialized instruction, remained at headquarters, and themselves became teachers or doctors. The Church did not found universities any more than it founded the order of chivalry. They were founded by a concurrence (not wholly fortuitous) of able men who had something they wished

to teach, and of youths who desired to learn. None the less were the acquiescence and protection of Church and State necessary in those days for the fostering of these infant seminaries. . . . Of the three great schools which we have named, there is sufficient ground for believing that the first to reach such a development as to entitle it to the name of a studium generale or university was the 'Schola Salernitana,' although it never was a university, technically speaking."—S. S. Laurie, *Rise and early constitution of Universities*, lect. 6-7.—See also UNIVERSITIES AND COLLEGES: 1231-1339; 1348-1826.—"Ideas, till this time scattered, or watched over in the various ecclesiastical schools, began to converge to a common centre. The great name of University was recognised in the capital of France, at the moment that the French tongue had become almost universal. The conquests of the Normans, and the first crusade, had spread its powerfully philosophic idiom in every direction, to England, to Sicily, and to Jerusalem. This circumstance alone invested France, central France, Paris, with an immense attractive power. [See also UNIVERSITIES AND COLLEGES: 1201-1679.] By degrees, Parisian French became a proverb. Feudalism has found its political centre in the royal city; and this city was about to become the capital of human thought. The beginner of this revolution was not a priest, but a handsome young man of brilliant talents, amiable and of noble family. None wrote love verses, like his, in the vulgar tongue; he sang them, too. Besides, his erudition was extraordinary for that day. He alone, of his time, knew both Greek and Hebrew. May be, he had studied at the Jewish schools (there were many in the South), or under the rabbis of Troyes, Vitry, or of Orléans. There were then in Paris two leading schools: the old Episcopal school of the parvis Notre Dame, and that of St. Geneviève, on the hill, where shone William of Champeaux. Abelard joined his pupils, submitted to him his doubts, puzzled him, laughed at him, and closed his mouth. He would have served Anselm of Laon the same, had not the professor, being a bishop, expelled him from his diocese. In this fashion this knight-errant of logic went on, unhorsing the most celebrated champions. He himself declared that he had only renounced tilt and tourney through his passion for intellectual combats. Henceforward, victorious and without a rival, he taught at Paris and Melun, the residence of Louis-le-Gros, and the lords flocked to hear him; anxious to encourage one of themselves, who had discomfited the priests on their own ground, and had silenced the ablest clerks. Abelard's wonderful success is easily explained. All the lore and learning which had been smothered under the heavy, dogmatical forms of clerical instruction, and hidden in the rude Latin of the middle age, suddenly appeared arrayed in the simple elegance of antiquity, so that men seemed for the first time to hear and recognise a human voice. The daring youth simplified and explained everything; presenting philosophy in a familiar form, and bringing it home to men's bosoms. He hardly suffered the obscure or supernatural to rest on the hardest mysteries of faith. It seemed as if till then the Church had lisped and stammered; while Abelard spoke. All was made smooth and easy. He treated religion courteously and handled her gently, but she melted away in his hands. Nothing embarrassed the fluent speaker: he reduced religion to philosophy, and morality to humanity. 'Crime,' he said, 'consists not in the act, but in the intention.' It followed, that there was no such thing as sins of habit or of ignorance—'They who crucified Jesus, not knowing him to have been the

Saviour, were guilty of no sin.' What is original sin?—'Less a sin, than a punishment.' But then, wherefore the redemption and the passion, if there was no sin?—'It was an act of pure love. God desired to substitute the law of love for that of fear.'—J. Michelet, *History of France*, v. 1, bk. 4, ch. 4.—'It is difficult, by a mere perusal of Abelard's works, to understand the effect he produced upon his hearers by the force of his argumentation, whether studied or improvised, and by the ardor and animation of his eloquence, and the grace and attractiveness of his person. But the testimony of his contemporaries is unanimous; even his adversaries themselves render justice to his high oratorical qualities. No one ever reasoned with more subtlety, or handled the dialectic tool with more address; and assuredly, something of these qualities is to be found in the writings he has left us. But the intense life, the enthusiastic ardor which enlivened his discourses, the beauty of his face, and the charm of his voice cannot be imparted by cold manuscripts. Héloïse, whose name is inseparably linked with that of her unfortunate husband, and whom Charles de Rémusat does not hesitate to call 'the first of women'; who, in any case, was a superior person of her time; Héloïse, who loved Abelard with 'an immoderate love,' and who, under the veil of a 'religieuse' and throughout the practice of devotional duties, remained faithful to him until death; Héloïse said to him in her famous letter of 1136: 'Thou hast two things especially which could instantly win thee the hearts of all women: the charm thou knowest how to impart to thy voice in speaking and singing.' External gifts combined with intellectual qualities to make of Abelard an incomparable seducer of minds and hearts. Add to this an astonishing memory, a knowledge as profound as was compatible with the resources of his time, and a vast erudition which caused his contemporaries to consider him a master of universal knowledge. . . . How can one be astonished that with such qualities Abelard gained an extraordinary ascendancy over his age; that, having become the intellectual ruler and, as it were, the dictator of the thought of the twelfth century, he should have succeeded in attracting to his chair and in retaining around it thousands of young men; the first germ of those assemblages of students who were to constitute the universities several years later? . . . It is not alone by the outward success of his scholastic apostolate that Abelard merits consideration as the precursor of the modern spirit and the promoter of the foundation of the universities; it is also by his doctrine, or at least by his method. . . . No one claims that Abelard was the first who, in the Middle Ages, had introduced dialectics into theology, reason into authority. In the ninth century, Scotus Erigena had already said: 'Authority is derived from reason.' Scholasticism, which is nothing but logic enlightening theology, an effort of reason to demonstrate dogma, had begun before Abelard; but it was he who gave movement and life to the method by lending it his power and his renown.'—G. Compayré, *Abelard*, pt. 1, ch. 2-3.—See also MEDICAL SCIENCE: Ancient; Women in medicine; UNIVERSITIES AND COLLEGES: 1240-1510: Nature of medieval universities; WOMAN'S RIGHTS: 1400-1600; 1500-1600.

13th-14th centuries.—**Guild education.**—"We are very prone to think . . . that the technical school is a modern idea. We assume that it owes its origin to the development of mankind in the process of evolution to a point where the recognition of the value of handiwork and craftsmanship has at length arisen. Nothing could well be less true than this. It is true that the eighteenth cen-

tury saw practically no education of this kind and it was only at the end of the nineteenth century that any modern nation even began to wake up to the necessity for it. In the older times, however, and, above all, in the thirteenth and fourteenth centuries, there was a magnificent training afforded the masses of the people in all sorts of arts and crafts and trades and occupations, such as can now be obtained only in technical schools. They did not call these teaching institutions technical schools, but they had all the benefits that we would now derive from such schools. This training the people of these times owed to the guilds. These were, of course, of many forms, the Arts Guilds, the Crafts Guilds, the Merchants Guilds, and then the various Trades Guilds. Boys were apprenticed to men following such an occupation as the youth had expressed a liking for, or that he seemed to be adapted to, or that his parents chose for him, and then began his training. It was conducted for five or six years usually in the house of the master or tradesman to whom he was apprenticed. The master provided him with board and clothes, at least, after the first year, and he gradually trained him in the trade or craft or industry, whatever it might be. After his apprenticeship was over the young man of eighteen or so became a journeyman workman and usually wandered from his native town to other places, sometimes going even over seas in order to learn the foreign secrets of his craft or art or trade, and after three years of this, when ready to settle down, presented evidence as to his accomplishments, and if this was accepted he became a master in his gild. If he were a craftsman or an artisan he made a lock or a bolt or some more artistic piece of work in the metals, base or precious, and if this sample was considered worthy of them by his fellow-gildsmen he was admitted as a master in the gild. This was the highest rank of workman, and the men who held it were supposed to be able to do anything that had been done by fellow-workmen up to that time. The piece that he presented was then called a masterpiece, and it is from this that our good old English word masterpiece was derived. This might seem a very inadequate training, and perhaps appeal to many as not deserving of the name of technical training or schooling. The only way to decide as to that, however, is to appreciate the products turned out by these workmen. It was these graduates of the apprentice-journeyman system of technical training who produced the great series of marvellous art objects which adorn the English cathedrals, the English municipal buildings, the castles and the palaces and the monasteries of the thirteenth century. It was the graduates of these schools, or at least of this method of schooling, who produced the wonderful stained glass, the beautiful bells, the finished ironwork, the surpassing woodwork, the sculpture, the decoration,—in a word, all the artistic details of the architecture of the wonderful Gothic periods of the thirteenth and fourteenth centuries,—which we have learned to value so highly in recent years."—J. J. Walsh, *Education, how old the new*, pp. 156-158.—See also GUILDS.

Summary.—**Schools of period.**—"Owing to the dominance of barbarian races and the instability of the political foundations of society preceding and during the Middle Ages, the energies of men were employed more and more exclusively in the bare maintenance of existence, and civilization and culture rapidly declined. The non-professional schools in which this culture was cherished and perpetuated ceased to exist throughout the greater part of Western Europe. The clergy of the Christian Church had risen to a position of religious, moral,

and intellectual leadership, and more or less of the culture of the Roman schools, which had assumed a definite, fixed form as the seven liberal arts, was found to be indispensable in their professional training. This training was afforded in schools connected with the monasteries and with the cathedral, collegiate, and later even the larger of the ordinary parish churches. The work of these schools varied greatly from place to place and from time to time. In some only the bare essentials of the elementary course were taught. In the great schools the entire course, including the subjects of the quadrivium, was given. As society gradually regained stability of organization and laymen began again to feel the need of systematic instruction in more or less of the liberal arts, they obtained it in these church schools. The growing demand of the lay classes for liberal education was met by the establishment of schools in connection with the various religious foundations which, as regards means of maintenance and external connection, may be roughly classified into chantry, stipendiary, guild, morrow-mass, and hospital schools. The fact that practically all the learning of the time was preserved in the Latin language made Latin grammar the main subject of study. As to content of course of study, the church schools may be divided into grammar and song schools. The latter, designed primarily to train choristers and assistants in the church services, gradually assumed in the great as well as in some of the small churches the character of elementary schools, teaching reading and writing and other subjects fundamental to the work of the grammar school. The faint beginnings of the secularization of the schools may be found in the formation in larger centers of population of annexes to the church or monastic schools, which were maintained more or less by the city and are known as the burg or city grammar schools. As a result of the development of commerce and industry the wealthy citizen or burgher class rose to a position of power and influence side by side with the nobility and the clergy. The busy life of the medieval centers of commerce and industry gave rise to educational needs of a more immediate and practical character than those met by the traditional course of study of the grammar schools. The systematization of the efforts made to satisfy these needs brought into existence a number of schools which have been imperfectly classified as writing, reckoning, and folk-schools. The grammar school may be said to survive in part in the high school of to-day. The common public school of to-day, inasmuch as it prepares for the high school, may be considered as the descendant of the medieval elementary or song school; inasmuch as it meets the more essential of the educational needs of the mass of people, it is the modern representative of the reading, writing, reckoning, and other folk-schools which originated in the Middle Ages. The conditions of the early medieval period being unfavorable to creative work in literature or science, the traditional course in the seven liberal arts was the more closely adhered to and school procedure became to a high degree formal. Yet among the teachers of this long period were many able and even brilliant men, and in the work of the best schools the principles of the inductive method, of apperception, and of correlation seem to have been more frequently observed than is generally believed."—L. F. Anderson, *History of common school education*, pp. 168-170.

MODERN

Influence of Renaissance and Reformation.—"Modern education begins with the Renaissance.

The educational methods that we then begin to discern will doubtless not be developed and perfected till a later period; the new doctrines will pass into practice only gradually, and with the general progress of the times. But from the sixteenth century education is in possession of its essential principles. . . . The men of the sixteenth century having renewed with classical antiquity an intercourse that had been too long interrupted, it was natural that they should propose to the young the study of the Greeks and the Romans. What is called secondary instruction really dates from the sixteenth century. The crude works of the Middle Age are succeeded by the elegant compositions of Athens and Rome, henceforth made accessible to all through the art of printing; and, with the reading of the ancient authors, there reappear through the fruitful effect of imitation, their qualities of correctness in thought, of literary taste, and of elegance in form. In France, as in Italy, the national tongues, moulded, and, as it were, consecrated by writers of genius, become the instruments of an intellectual propaganda. Artistic taste, revived by the rich products of a race of incomparable artists, gives an extension to the horizon of life, and creates a new class of emotions. Finally, the Protestant Reform develops individual thought and free inquiry, and at the same time, by its success, it imposes still greater efforts on the Catholic Church. This is not saying that everything is faultless in the educational efforts of the sixteenth century. First, as is natural for innovators, the thought of the teachers of this period is marked by enthusiasm rather than by precision. They are more zealous in pointing out the end to be attained, than exact in determining the means to be employed. Besides, some of them are content to emancipate the mind, but forget to give it proper direction. Finally, others make a wrong use of the ancients; they are too much preoccupied with the form and the purity of language; they fall into Ciceromania, and it is not their fault if a new superstition, that of rhetoric, does not succeed the old superstition, that of the Syllogism."—G. Compayré, *History of pedagogy*, ch. 5 (sect. 92-93).—See also EUROPE: Renaissance and Reformation.

14th-16th Centuries

Brethren of the Common Life.—One of the strongest educational influences in Western Europe during this period was that exercised by the "schools organized by the Brethren of the Common Life, described sometimes from the names of St. Jerome, or St. Gregory the Great . . . as Scholæ Hieronymitanæ or Gregorianæ, [which] owed their origin to the work of Geert Groot of Deventer (1340-1384) who [in 1381] founded an Association, or Brotherhood (it was never a monastic order under vows) of devout men who consecrated their lives to industry, teaching and learning, to which he gave its well-known title. In the period of the close of the Middle Ages and the beginnings of the Renaissance, which north of the Alps may be said to fall within the century 1430-1530, no schools were so well frequented or enjoyed so wide a reputation as those connected with certain houses of the Brethren. From the Netherlands, their place of origin, the schools spread to the Rhine, to Westphalia and to south-west Germany. Before 1500 those of Zwolle and Liège were large establishments of 800 scholars, and eight or ten others planted in large towns had attained hardly less renown. They were of the type of the 'Latin' or 'Trivial' school; 'Trivial' as teaching the subjects of the Trivium—Grammar, Dialectic and Rhetoric. Such schools,

whether civic or ecclesiastical in organisation, provided the middle or 'secondary' education of that age. In the best of them, the upper forms, as in a modern Public School, did work not distinguishable from that of the Faculty of Arts in a contemporary University. We are not to suppose a special affinity between the Brethren and the humanist spirit abroad in Italy; for at best we can discern in certain of their Houses, Deventer or Zwolle, an absence of distrust of learning, and a sympathy with higher aims and methods of education. . . . The relation of the Brothers to the school of any town where they had set up a House consisted chiefly in this: that they received as boarders into their house pupils attending as day boys the civic or parish Latin schools, watching over them spiritually and morally and no doubt aiding them in their studies. Only in a few cases is it known that the Brethren themselves taught in schools. On the other hand there were some amongst the masters of secular or ecclesiastical schools who were in sympathy with the Brothers without being members of the order. At Deventer, for instance, Hegius was not one of the Brethren; though he was obviously in close relations with them and several of his teachers belonged to their body. The school of which he was Head was attached to the church of St. Lebuin, as a corresponding school in England might be part of the Minster of Beverley or the Cathedral of Lincoln or Wells. Yet we have evidence of much closer association of Brethren and school in other places at the end of the century, and the influence of the Brethren was shown in a certain uniformity of type in the schools with which they were connected. There were special reasons for a more rapid progress in educational ideas in the Low Countries at this time. The practice of frequent change of posts, of short engagements of teachers, who often stayed but two or three years and then moved on elsewhere, the visits of merchants and ecclesiastics to Italy where the new schools made due impression upon the least observant, . . . led to an interchange of knowledge and of methods within the schoolroom, and silently moulded public opinion upon desirable learning. The accident of individuals and of situation counted for much."—W. H. Woodward, *Studies in education during the age of the Renaissance, 1400-1600*, pp. 82-84.

England, Lollardism and the Renaissance.—"The Renaissance in England, and chiefly in Oxford, was like a bitter and changeful spring. There was an hour of genial warmth, there breathed a wind from the south, in the lifetime of Chaucer; then came frosts and storms; again the brief sunshine of court favour shone on literature for a while, when Henry VIII encouraged study, and Wolsey and Foxe founded Christ Church [1532] and Corpus Christi College [1516]; once more the bad days of religious strife returned, and the promise of learning was destroyed. Thus the chief result of the awakening thought of the fourteenth century in England was not a lively delight in literature, but the appearance of the Lollards. [See ENGLAND: 1360-1414.] The intensely practical genius of our race turned, not to letters, but to questions about the soul and its future, about property and its distribution. The Lollards were put down in Oxford; 'the tares were weeded out' by the House of Lancaster, and in the process the germs of free thought, of originality, and of a rational education, were destroyed. 'Wyclivism did domineer among us,' says Wood; and, in fact, the intellect of the University was absorbed, like the intellect of France during the heat of the Jansenist controversy, in defending or assailing '267 damned

conclusions,' drawn from the books of Wyclife. The University 'lost many of her children through the profession of Wyclivism.'—A. Lang, *Oxford*, ch. 3.

15th-16th Centuries

Relation of Renaissance and Reformation.—"The schools of France and Italy owed little to the great modern movement of the Renaissance. In both these countries that movement operated, in both it produced mighty results; but of the official establishments for instruction it did not get hold. In Italy the mediæval routine in those establishments at first opposed a passive resistance to it; presently came the Catholic reaction, and sedulously shut it out from them. In France the Renaissance did not become a power in the State, and the routine of the schools sufficed to exclude the new influence till it took for itself other channels than the schools. But in Germany the Renaissance became a power in the State; allied with the Reformation, where the Reformation triumphed in German countries the Renaissance triumphed with it, and entered with it, into the public schools. Melancthon and Erasmus were not merely enemies and subverters of the dominion of the Church of Rome, they were eminent humanists; and with the great but single exception of Luther, the chief German reformers were all of them distinguished friends of the new classical learning, as well as of Protestantism."—M. Arnold, *Schools and universities on the Continent*, ch. 14.—See also EUROPE: Renaissance and Reformation: Erasmus and the Reformation.

Humanist aims in education.—"There is no doubt that the Humanists as a body were profoundly convinced of the practical character of Classical studies. It was said long ago of Vittorino that his aim was the development of 'the complete citizen.' Vergerius, at the outset of our period, is anxious to set forth the ideal of Education as the perfection of the man as Citizen, which he found in Aristotle. The choice of studies and the temper in which they are to be pursued should be determined by this general aim. Learning is not to be regarded as an excuse for withdrawal from active life and concern for the common good. Vittorino writes to Ambrogio, quoting Cicero with approval: *virtutis laus omnis in actione consistit*. That was his own ideal, and it was notorious that a full training for practical life was the leading purpose of the Mantuan school. This, indeed, is one of the characteristic marks of the lay spirit of Humanism, coinciding, as it did, with the objective temper of the Italian intelligence. Aeneas Sylvius impresses upon the young king Ladislaus a similar truth. He, too, quotes the sentence from Cicero in praise of action as distinct from self-absorption. He deprecates studies which may divert attention from the true ends of life; he instances, especially, Dialectic and Geometry. Such studies are legitimate in themselves, but their tendency is against practical interests. Letters, indeed, may be so studied that they produce a similar effect. But the examples of Demosthenes, Aristotle, Caesar and Pliny, show that, rightly pursued, literature proves the highest possible aid to genuine public spirit and to administrative capacity. Practical judgment in affairs is one main result of humanist teaching. So far he is in accord with Vergerius, who lays down that 'sound judgment, wisdom of speech, and integrity of conduct' are the qualities cultivated by liberal learning. The Prince, especially, needs this training: by it he may safely count on being able to detect flattery, wilful imposition, insincerity of counsel: his governing capacity will be established

on the firm basis of knowledge, and his wisdom will render him 'principum speculum,' and the adviser and moderator to whom neighboring rulers will naturally turn. In the professional training of the time, the study of antiquity when completed by its final course of ancient philosophy, was held to be the finest preparation for special studies, as Law, Medicine, or Theology. In Florence again no Humanist doubted that in Letters consisted the best preparation for the career of a Merchant or a Banker. But apart from the broader effects of classical culture it was held that on nearly every side of practical life the best guidance attainable was to be derived from the study of ancient books. Aristotle's *Politics* is the soundest manual of statecraft; Vegetius and Caesar are the best guides to the Art of War; Vergil, to agriculture. In ruling a household, Cicero, Plutarch *Upon Education*, and Francesco Barbaro, whose work *De Re Uxoribus* was regarded as worthy of a place in the noble company, could be safely relied upon. In all departments of government, in war, justice, council, and domestic policy, Literature is the one sure source of practical wisdom."—W. H. Woodward, *Vittorino da Feltre and other humanist educators*, pp. 183-184.—See also EUROPE: Renaissance and Reformation; Various Italian humanists; CLASSICS: Renaissance.

Italy the center of education.—School of Vittore dei Ramboldini at Mantua and Guarino of Verona at Ferrara.—"The fifteenth century is, above all, that of the many-sided man. There is no biography which does not, besides the chief work of its hero, speak of other pursuits all passing beyond the limits of dilettantism. The Florentine merchant and statesman was often learned in both the classical languages; the most famous humanists read the ethics and politics of Aristotle to him and his sons; even the daughters of the house were highly educated. It is in these circles that private education was first treated seriously. . . . There were Latin schools in every town of the least importance, not by any means merely as preparatory to higher education, but because, next to reading, writing, and arithmetic, the knowledge of Latin was a necessity; and after Latin came logic. It is to be noted particularly that these schools did not depend on the Church, but on the municipality; some of them too, were merely private enterprises. This school system, directed by a few distinguished humanists, not only attained a remarkable perfection of organisation, but became an instrument of higher education in the modern sense of the phrase. With the education of the children of two princely houses in North Italy institutions were connected which may be called unique of their kind. At the court of Giovan Francesco Gonzaga at Mantua (reg. 1407 to 1444) appeared the illustrious Vittorino da Feltre (b. 1397, d. 1446), otherwise Vittore dei Ramboldini. . . . He directed the education of the sons and daughters of the princely house, and one of the latter became under his care a woman of learning. When his reputation extended far and wide over Italy, and members of great and wealthy families came from long distances, even from Germany, in search of his instructions, Gonzaga was not only willing that they should be received, but seems to have held it an honour for Mantua to be the chosen school of the aristocratic world. Here for the first time gymnastics and all noble bodily exercises were treated along with scientific instruction as indispensable to a liberal education. Besides these pupils came others, whose instruction Vittorino probably held to be his highest earthly aim, the gifted poor, often as many as seventy together,

whom he supported in his house and educated, 'per l'amore di Dio,' along with the high born youths who here learned to live under the same roof with untitled genius. The greater the crowd of pupils who flocked to Mantua, the more teachers were needed to impart the instruction—which Vittorino only directed—an instruction which aimed at giving each pupil that sort of learning which he was most fitted to receive. . . . More stress was laid on pure scholarship by Guarino of Verona (1370-1460), who in the year 1420 was called to Ferrara by Niccolò d' Este to educate his son Lionello. . . . While still acting as tutor to Lionello, he had many other pupils from various parts of the country, and in his own house a select class of poor scholars, whom he partly or wholly supported. His evening hours till far into the night were devoted to hearing lessons or to instructive conversation. His house, too, was the home of a strict religion and morality. . . . The education given to women in the upper classes was essentially the same as that given to men. The Italian, at the time of the Renaissance, felt no scruple in putting sons and daughters alike under the same course of literary and even philological instruction. Indeed, looking at this ancient culture as the chief treasure of life, he was glad that his girls should have a share in it."—J. Burckhardt, *Civilisation of the Renaissance in Italy*, pp. 135, 213, 214, 215, 396.—"The language created by Dante as a thing of power, polished by Petrarch as a thing of beauty, trained by Boccaccio as the instrument of melodious prose, was abandoned even by the Tuscans in the fifteenth century for revived Latin and newly discovered Greek. Patient acquisition took the place of proud inventiveness; laborious imitation of classical authors suppressed originality of style. . . . As schoolmasters in a stricter sense of the term, it is not easy to exaggerate the influence exercised by Italian students. They first conceived and framed the education that has now prevailed through Europe for four centuries, moulding the youth of divers nations by one common discipline, and establishing an intellectual concord for all peoples; . . . [but this wealth of intellectual activity ended in a state of mental bankruptcy]. When we seek the causes which produced the decay of learning in Italy about the middle of the sixteenth century, we are first led to observe that the type of scholarship inaugurated by Petrarch had been fully developed. Nothing new remained to be worked out upon the lines laid down by him. Meanwhile the forces of the nation, both creative and receptive, were exhausted in the old fields of humanism. . . . Before the end of the sixteenth century Greek had almost ceased to be studied in Italy. This was the sign of intellectual death. All that was virile in humanism fled beyond the Alps. . . . Thus Italy, after receiving the lamp of learning from the dying hands of Hellas, in the days of her own freedom, now, in the time of her adversity and ruin, gave it to the nations of the North. Her work was ended. Three centuries of increasing decrepitude . . . were before her."—J. A. Symonds, *Renaissance in Italy*, pp. 55, 536, 540, 543, 544, 545.

Netherlands.—Influence of Brethren of the Common Life.—Synod of Dort.—Education after Reformation.—"In 1430, the Brethren [of the Common Life] had established forty-five branches, and by 1460 more than thrice that number. They were scattered through different parts of Germany and the Low Countries, each with its school subordinate to the head college at Deventer. It was in these schools, in the middle of the fif-

teenth century, that a few Germans and Netherlanders were, as Hallam says, roused to acquire that extensive knowledge of the ancient languages which Italy as yet exclusively possessed. Their names should never be omitted in any remembrance of the revival of letters; for great was their influence upon subsequent times. Chief among these men were Wessels, of Groningen, 'one of those who contributed most steadily to the purification of religion'; Hegius of Deventer, under whom Erasmus obtained his early education, and who probably was the first man to print Greek north of the Alps; Dringeborg, who founded a good school in Alsace; and Longius, who presided over one at Munster. Thanks to the influence of these pioneers in learning, education had made great progress among the Netherlanders by the middle of the sixteenth century. . . . We have the testimony of the Italian Guicciardini to the fact that before the outbreak of the war with Spain even the peasants in Holland could read and write well. As the war went on, the people showed their determination that in this matter there should be no retrogression. In the first Synod of Dort, held in 1574, the clergy expressed their opinion upon the subject by passing a resolution or ordinance which, among other things, directed 'the servants of the Church' to obtain from the magistrates in every locality a permission for the appointment of schoolmasters, and an order for their compensation as in the past. Before many years had elapsed the civil authorities began to establish a general school system for the country. In 1582, the Estates of Friesland decreed that the inhabitants of towns and villages should, within the space of six weeks, provide good and able Reformed schoolmasters, and those who neglected so to do would be compelled to accept the instructors appointed for them. This seems to have been the beginning of the supervision of education by the State, a system which soon spread over the whole republic."—D. Campbell, *Puritan in Holland, England and America*, ch. 2 and 20.

16th Century

Calvin and the Geneva schools.—Influence of Calvinism.—"From the point of view of American educational history the most important developments in connection with the Reformation were those arising from Calvinism. While the Calvinistic faith was rather grim and forbidding, viewed from the modern standpoint, the Calvinists everywhere had a program for political, economic, and social progress which has left a deep impress on the history of mankind. This program demanded the education of all, and in the countries where Calvinism became dominant the leaders included general education in their scheme of religious, political, and social reform. In the governmental program which Calvin drew up (1537) for the religious republic at Geneva, he held that learning was 'a public necessity to secure good political administration, sustain the Church unharmed, and maintain humanity among men.' In his plan for the schools of Geneva, published in 1538, he outlined a system of elementary education in the vernacular for all, which involved instruction in reading, writing, arithmetic, religion, careful grammatical drill, and training for civil as well as for ecclesiastical leadership. In his plan of 1541 he upholds the principle, as had Luther, that 'the liberal arts and good training are aids to a full knowledge of the Word.' This involved the organization of secondary schools, or *colleges* as he called them, following the French nomenclature, to prepare leaders for the ministry and the civil government

through 'instruction in the languages and humane science.' In the colleges (secondary schools) which he organized at Geneva and in neighboring places to give such training, and which became models of their kind which were widely copied, the usual humanistic curriculum was combined with intensive religious instruction. These colleges became famous as institutions from which learned men came forth. The course of study in the seven classes of one of the Geneva colleges, which has been preserved for us, reveals the nature of the instruction. The lowest class began with the letters, reading was taught from a French-Latin Catechism, and the usual Latin authors were read. Greek was begun in the fourth class, and, in addition to the usual Greek authors, the New Testament was read in Greek. In the higher classes, as was common also in German *gymnasia*, logic and rhetoric were taught to prepare pupils to analyze, argue, and defend the faith. Elocution was also given much importance in the upper classes as preparation for the ministry, two original orations being required each month. Psalms were sung, prayers offered, sermons preached and questioned on, and the Bible carefully studied. The men who went forth from the colleges of Geneva to teach and to preach the Calvinistic gospel were numbered by the hundreds. . . . The world owes much to the constructive, statesman-like genius of Calvin and those who followed him, and we in America probably most of all. Geneva became a refuge for the persecuted Protestants from other lands, and through such influences the ideas of Calvin spread to the Huguenots in France, the Walloons of the Dutch and Belgian Netherlands, the Germans in the Palatinate, the Presbyterians of Scotland, the Puritans in England, and later to the American colonies."—E. P. Cubberley, *History of education*, pp. 330-332.—See also EUROPE: Renaissance and Reformation: Geneva reformers.

Dean Colet and St. Paul's School, London.—Letter from Erasmus.—Dr. John Colet, appointed Dean of St. Paul's cathedral in 1505, "resolved, whilst living and in health to devote his patrimony to the foundation of a school in St. Paul's Churchyard, wherein 153 children, without any restriction as to nation or country, who could already read and write, and were of 'good parts and capacities,' should receive a sound Christian education. The 'Latin adulterate, which ignorant blind fools brought into this world,' poisoning thereby 'the old Latin speech, and the very Roman tongue used in the time of Tully and Sallust, and Virgil and Terence, and learned by St. Jerome, St. Ambrose, and St. Augustine,'—all that 'abusion which the later blind world brought in, and which may rather be called Blotterature than Literature,'—should be 'utterly abanished and excluded' out of this school. The children should be taught good literature, both Latin and Greek, 'such authors that have with wisdom joined pure chaste eloquence'—'specially Christian authors who wrote their wisdom in clean and chaste Latin, whether in prose or verse; for,' said Colet, 'my intent is by this school specially to increase knowledge, and worshipping of God and Our Lord Jesus Christ, and good Christian life and manners in the children.' . . . The building consisted of one large room, divided into an upper and lower school by a curtain, which could be drawn at pleasure; and the charge of the two schools devolved upon a high-master and a sub-master respectively. The forms were arranged so as each to seat sixteen boys, and were provided each with a raised desk, at which the head-boy sat as president. The building also embraced an entrance-

porch and a little chapel for divine service. Dwelling-houses were erected, adjoining the school, for the residence of the two masters; and for their support. Colet obtained, in the spring of 1510, a royal license to transfer to the Wardens and Guild of Mercers in London, real property to the value of £53 per annum (equivalent to at least £530 of present money). Of this the head-master was to receive as his salary £35 (say £350) and the under-master £18 (say £180) per annum. Three or four years after, Colet made provision for a chaplain to conduct divine service in the chapel, and to instruct the children in the Catechism, the Articles of the faith, and the Ten Commandments,—in English; and ultimately, before his death, he appears to have increased the amount of the whole endowment to £122 (say £1,200) per annum. So that it may be considered, roughly, that the whole endowment, including the buildings, cannot have

ERASMUS

represented a less sum than £30,000 or £40,000 of present money. And if Colet thus sacrificed so much of his private fortune to secure a liberal (and it must be conceded his was a liberal) provision for the remuneration of the masters who should educate his 153 boys, he must surely have had deeply at heart the welfare of the boys themselves. And, in truth, it was so. Colet was like a father to his schoolboys. . . . It was not to be expected that he should find the school-books of the old grammarians in any way adapted to his purpose. So at once he set his learned friends to work to provide him with new ones. The first thing wanted was a Latin Grammar for beginners. Linacre undertook to provide this want, and wrote with great pains and labour, a work in six books, which afterwards came into general use. But when Colet saw it, at the risk of displeasing his friend, he put it altogether aside. It was too long and too learned for his 'little beginners.' So he condensed within the compass of a few pages two little treatises, an 'Accidence' and a 'Syntax,'

in the preface to the first of which occur the gentle words quoted above. These little books, after receiving additions from the hands of Erasmus, Lilly, and others, finally became generally adopted and known as Lilly's Grammar. This rejection of his Grammar seems to have been a sore point with Linacre, but Erasmus told Colet not to be too much concerned about it. . . . Erasmus, in the same letter in which he spoke of Linacre's rejected Grammar . . . put on paper his notions of what a schoolmaster ought to be, and the best method of teaching boys, which he fancied Colet might not altogether approve, as he was wont somewhat more to despise rhetoric than Erasmus did. He stated his opinion that—'In order that the teacher might be thoroughly up to his work, he should not merely be a master of one particular branch of study. He should himself have travelled through the whole circle of knowledge. In philosophy he should have studied Plato and Aristotle, Theophrastus and Plotinus; in Theology the Sacred Scriptures, and after them Origen, Chrysostom, and Basil among the Greek fathers, and Ambrose and Jerome among the Latin fathers; among the poets, Homer and Ovid; in geography, which is very important in the study of history, Pomponius Mela, Ptolemy, Pliny, Strabo. He should know what ancient names of rivers, mountains, countries, cities, answer to the modern ones; and the same of trees, animals, instruments, clothes and gems, with regard to which it is incredible how ignorant even educated men are. He should take note of little facts about agriculture, architecture, military and culinary arts, mentioned by different authors. He should be able to trace the origin of words, their gradual corruption in the languages of Constantinople, Italy, Spain, and France. Nothing should be beneath his observation which can illustrate history or the meaning of the poets. But you will say what a load you are putting on the back of the poor teacher! It is so; but I burden the one to relieve the many. I want the teacher to have traversed the whole range of knowledge, that it may spare each of his scholars doing it. A diligent and thoroughly competent master might give boys a fair proficiency in both Latin and Greek, in a shorter time and with less labour than the common run of pedagogues take to teach their habble.' On receipt of this . . . Colet wrote to Erasmus: . . . "What! I shall not approve!" So you say! What is there of Erasmus's that I do not approve?"—F. Seebohm, *Oxford reformers*, ch. 6.

Erasmus and educational ideals.—Suggested reforms in the education of women.—"To no single scholar . . . is the cause of education in the sixteenth century under greater obligation than to Erasmus. His freedom from traditional prejudice, combined with his high scholarship and natural sagacity, enabled him to discern the conditions essential to the profitable acquirement of knowledge. . . . It was in the year 1510 that the celebrated John Colet [Master of St. Paul's School], . . . consulted him as to the choice of a master for a new school which he was proposing to found in London. . . . Colet's conception of the functions of the teacher was undoubtedly high; but he found Erasmus's yet higher. In fact, the letter in which the great scholar embodies the advice demanded, may be looked upon as one of the most remarkable compositions in the whole literature of the history of education. Erasmus held that a good teacher, even for boys, should

not only be a good Latinist, but should also know Greek; . . . that he should have studied the ancient philosophies; that he should have a knowledge of history, both sacred and profane, and likewise of geography and comparative philology."—H. D. Traill, *Social England*, v. 3, p. 88.—"His insight into child-nature is remarkable; he perceives the need of reforming the education of women; he deals in a spirit of sound common sense with the first stages of teaching, and with the possibilities indicated by boy-nature. He adopted the best ideas or curricula current in Italian schools. He has considered the methods of teaching language, the place of grammar, of construing and composition, and the kind of books likely to be helpful. Organisation and administration of schools, qualifications of masters, co-operation of parents with teachers, companionship, boy-interests, were subjects of long observation and reflection. Though never actually engaged in the teaching of children, Erasmus was essentially a practical 'educator,' whose advice no schoolmaster in Europe would have dreamt of disregarding. . . . It may be safely affirmed that to Erasmus, as to the great Italians, education was training for social service in church, state, city and family; yet the merely professional studies make little appeal to him. The development of individual capacity and erudition through the study of a great civilisation is the true means to effectiveness in every honourable walk in life. Practical experience is not an adequate preparation for the practical life itself. A liberal education is one common to all men whatever their career. It is analogous to the training of the 'Orator' as elaborated by Quintilian; it is practically identical with that of the 'Governor' as described by Erasmus' own disciple, Thomas Elyot. . . . The education of girls was a subject which occupied Erasmus in the later years of his life. The Italian ideal of a woman's training and status was familiar to him. But Erasmus was aware that the reasons for the neglect of girls' education in German lands were deeply rooted in social order. Public opinion, according but a low place to woman in society, was content with an instruction to correspond to it. Erasmus seems to have approached the question from the point of view of the uplifting of the home influences which mould the boys' early years. He demands a new standard of training for motherhood. Much as he deprecates the evil effects wrought by uneducated and frivolous women upon the mind and character of young children, he recognises to the full what is implied in the loss of the finely-tempered affection of the mother. Hence he looks upon the training of girls as necessarily marching with that of boys. Further, he believes that amongst the worst enemies of character stand triviality and indolence, which again are the consequences of lack of opportunity for the cultivation of lofty interests. The fuller life is the better life. He urges, therefore, that type of women's education on classical lines which was elaborated a century before by Lionardo Bruni, and was current in the more refined society of Italy: Erasmus had been impressed by the intellectual atmosphere of the More household at Chelsea, and desires to see home surroundings wholesome and cheerful, yet marked by sober decorum, the mother's wise and unselfish patience guiding rather than repressing the hopes and vitality of youth. The method of training girls accepted in German society of the time he holds up to scorn, as producing the worst faults which mark feminine nature—capriciousness, vanity, shallowness, love of intrigue. . . . Upon one point Erasmus lays especial stress. He makes a strik-

ing appeal to parents to respect the judgment and the feelings of their daughters in the momentous decision between the 'religious' and the married life. The personal note here struck is unmistakable."—W. H. Woodward, *Studies in education during the age of the Renaissance, 1400-1600*, pp. 115-117, 124-125.—See also EUROPE: Renaissance and Reformation; Erasmus and the Reformation.

Luther and common schools.—"Luther [1483-1546] . . . felt that, to strengthen the Reformation, it was requisite to work on the young, to improve the schools, and to propagate throughout Christendom the knowledge necessary for a profound study of the holy Scriptures. This, accordingly, was one of the objects of his life. He saw it in particular at the period which we have reached, and wrote to the councillors of all the cities of Germany, calling upon them to found Christian schools. 'Dear sirs,' said he, 'we annually expend so much money on arquebuses, roads, and dikes; why should we not spend a little to give one or two schoolmasters to our poor children? God stands at the door, and knocks; blessed are we if we open to him. Now the word of God abounds. O my dear Germans, buy, buy, while the market is open before your houses. . . . Busy yourselves with the children,' continues Luther, still addressing the magistrates; 'for many parents are like ostriches; they are hardened towards their little ones, and satisfied with having laid the egg, they care nothing for it afterwards. The prosperity of a city does not consist merely in heaping up great treasures, in building strong walls, in erecting splendid mansions, in possessing glittering arms. If madmen fall upon it, its ruin will only be the greater. The true wealth of a city, its safety, and its strength, is to have many learned, serious, worthy, well-educated citizens. And whom must we blame because there are so few at present, except you magistrates, who have allowed our youth to grow up like trees in a forest?' Luther particularly insisted on the necessity of studying literature and languages: 'What use is there, it may be asked, in learning Latin, Greek, and Hebrew? We can read the Bible very well in German. Without languages,' replies he, 'we could not have received the gospel. . . . Languages are the scabbard that contains the sword of the Spirit; they are the casket that guards the jewels; they are the vessel that holds the wine; and as the gospel says, they are the baskets in which the loaves and fishes are kept to feed the multitude. If we neglect the languages, we shall not only eventually lose the gospel, but be unable to speak or write in Latin or in German. No sooner did men cease to cultivate them than Christendom declined, even until it fell under the power of the pope. But now that languages are again honored, they shed such light that all the world is astonished, and every one is forced to acknowledge that our gospel is almost as pure as that of the apostles themselves. In former times the holy fathers were frequently mistaken, because they were ignorant of languages. . . . If the languages had not made me positive as to the meaning of the word, I might have been a pious monk, and quietly preached the truth in the obscurity of the cloister; but I should have left the pope, the sophists, and their anti-christian empire still unshaken.'"—J. H. Merle d'Aubigné, *History of the Reformation of the 16th century*, v. 3, bk. 10, ch. 9.—Luther, in his appeal to the municipal magistrates of Germany, calls

for the organization of common schools to be supported at public cost. "Finally, he gives his thought to the means of recruiting the teaching service. "Since the greatest evil in every place is the lack of teachers, we must not wait till they come forward of themselves; we must take the trouble to educate them and prepare them." To this end Luther keeps the best of the pupils, boys and girls, for a longer time in school; gives them special instructors, and opens libraries for their use. In his thought he never distinguishes women teachers from men teachers; he wants schools for girls as well as for boys. Only, not to burden parents and divert children from their daily labor, he requires but little time for school duties. . . . "My opinion is [he says] that we must send the boys to school one or two hours a day, and have them learn a trade at home for the rest of the time. It is desirable that these two occupations march side by side." . . . Luther gives the first place to the teaching of religion: "Is it not reasonable that every Christian should know the Gospel at the age of nine or ten?" Then come the languages, not, as might be hoped, the mother tongue, but the learned languages, Latin, Greek, and Hebrew. Luther had not yet been sufficiently rid of the old spirit to comprehend that the language of the people ought to be the basis of universal instruction. He left to Comenius the glory of making the final separation of the primary school from the Latin school. . . . Physical exercises are not forgotten in Luther's pedagogical regulations. But he attaches an especial importance to singing. "Unless a schoolmaster know how to sing, I think him of no account." "Music," he says again, "is a half discipline which makes men more indulgent and more mild." At the same time that he extends the programme of studies, Luther introduces a new spirit into methods. He wishes more liberty and more joy in the school. "Solomon," he says, "is a truly royal schoolmaster. He does not, like the monks, forbid the young to go into the world and be happy. Even as Anselm said: "A young man turned aside from the world is like a young tree made to grow in a vase." The monks have imprisoned young men like birds in their cage. It is dangerous to isolate the young."—G. Compayré, *History of pedagogy*, ch. 6 (sect. 130-134).

Melanchthon as the systematizer.—"Within fifteen years of his appointment of Wittenberg [1518, as professor of Greek] Melanchthon had become recognised as the supreme authority in Protestant Germany upon the organisation of universities and high schools, and had put into operation schemes for the remodelling of ancient universities (Wittenberg, Tübingen and others) and the foundation of modern ones (Marburg, Königsberg, etc.), which expressed at once the Germanic, humanist, and Protestant ideals of the new age. Further, Melanchthon as adviser to cities and to princes had set forth detailed plans for the establishment of new schools (such as Nuremberg and Magdeburg) and the reorganisation of many others. He devoted special pains to the development and inspection of humanist schools in Saxony under the direction of the Electoral Prince. And he maintained . . . a private school, preparatory to the courses in the faculty, in which we may recognise certain important principles of his doctrine of instruction. The work that Melanchthon did in North Germany was accomplished on not dissimilar lines by Sturm and Oecolampadius

on the Upper Rhine, by Zwingli at Zürich, and by Calvin and Cordier in western Switzerland. Apart from the especial note of Melanchthon's foundations, namely the intimate association of evangelical religion with classical teaching, his peculiar service to education lay in the impulse which he gave to systematic organisation of school instruction, which should correspond with the logical relations of the subjects themselves. The mediæval schools were in Germany slowly and imperfectly incorporating certain elements of the humanist curriculum without a radical modification of traditional methods. Neither books, nor assistant masters, nor processes of teaching were in harmony with the possibly enthusiastic aim of a head-master lately fired by a zeal for the new learning. Moreover the proper relation of grammar to composition and to construing was rarely understood. Authors were read for their contents before adequate vocabulary or knowledge of syntax had been acquired. *A priori* modes of studying 'physica' and scholastic logic wasted valuable years. The connection between the trivial, or Latin, school [teaching the trivium—grammar, logic and rhetoric] and the university was but confusedly understood, and the entire place of Latin and Greek viewed as language and as literature in a German university was wholly undetermined. It was the work of Melanchthon in the north and of Sturm in the south to co-ordinate education, as it was the achievement of Luther to provide its national stimulus. Melanchthon, in a word, supplied to the German Renaissance what Erasmus or Agricola lacked, namely a genius for system. It was his function to give practical application of educational theory and ideal as Erasmus had indicated it in his works and correspondence. . . . Melanchthon's 'schola privata,' which he set up in his own house at Wittenberg within a few years of his arrival, deserves attention as an attempt to remedy the defects to which he alludes in the tract above quoted. He carried on the experiment for not less than ten years, limiting his pupils to a number which admitted of direct personal instruction. His object was to provide thorough preparatory training for boys who were to pass on to a high school or the faculty of arts in a university. Hence the school was of the nature of a model Latin, or trivium, school, in respect at least of the standards of instruction given. The grounding in Latin was the main purpose of the teaching given. No specific courses were provided in religion, mathematics or 'physica.' These were taught through the instrument of Latin and from Latin authors. The rudiments of Greek, however, were taught, and this constitutes a distinction from the practice of the trivial school. Text-books were written by Melanchthon himself, containing selections from prayers, extracts from the New Testament, etc. Prose and verse composition were taught: Latin was spoken and Latin plays in abridged shape were performed, partly as relaxation, but mainly as an aid to conversational Latin. Melanchthon wrote prologues defending the practice, and offering moral interpretations of the scenes selected. He preferred Terence for the purpose, but included Seneca and at least one play of Euripides. Amongst the pupils there was a system of promotion and of competition, and the discipline was apparently of a thorough human sort. The pupils were all boarders, drawn from various German towns by the educational repute of Wittenberg."—W. H. Woodward, *Studies in education during the age of the Renaissance, 1400-1600*, pp. 215-216, 218-219.

Rabelais' Gargantua.—Rabelais' description of the imaginary education of Gargantua gives us the educational ideas of a man of genius in the 16th century: "Gargantua," he writes, "awaked, then, about four o'clock in the morning. Whilst they were rubbing him, there was read unto him some chapter of the Holy Scripture aloud and clearly, with a pronunciation fit for the matter, and hereunto was appointed a young page born in Basché, named Anagnostes. According to the purpose and argument of that lesson, he oftentimes gave himself to revere, adore, pray, and send up his supplications to that good God whose word did show His majesty and marvellous judgments. Then his master repeated what had been read, expounding unto him the most obscure and difficult points. They then considered the face of the sky, if it was such as they had observed it the night before, and into what signs the sun was entering, as also the moon for that day. This done, he was appareled, combed, curled, trimmed and perfumed, during which time they repeated to him the lessons of the day before. He himself said them by heart, and upon them grounded practical cases concerning the estate of man, which he would prosecute sometimes two or three hours, but ordinarily they ceased as soon as he was fully clothed. Then for three good hours there was reading. This done, they went forth, still conferring of the substance of the reading, and disported themselves at ball, tennis, or the 'pile trigone,' gallantly exercising their bodies, as before they had done their minds. All their play was but in liberty, for they left off when they pleased, and that was commonly when they did sweat, or were otherwise weary. Then were they very well dried and rubbed, shifted their shirts, and walking soberly, went to see if dinner was ready. Whilst they stayed for that, they did clearly and eloquently recite some sentences that they had retained of the lecture. In the mean time Master Appetite came, and then very orderly sat they down at table. At the beginning of the meal there was read some pleasant history of ancient prowess, until he had taken his wine. Then, if they thought good, they continued reading, or began to discourse merrily together; speaking first of the virtue, propriety, efficacy, and nature of all that was served in at that table; of bread, of wine, of water, of salt, of flesh, fish, fruits, herbs, roots, and of their dressing. By means whereof, he learned in a little time all the passages that on these subjects are to be found in Pliny, Athenæus, Dioscorides, Julius, Pollux, Galen, Porphyrius, Oppian, Polybius, Heliodorus, Aristotle, Cælian, and others. Whilst they talked of these things, many times, to be the more certain, they caused the very books to be brought to the table, and so well and perfectly did he in his memory retain the things above said, that in that time there was not a physician that knew half so much as he did. Afterwards they conferred of the lessons read in the morning, and ending their repast with some conserve of quince, he washed his hands and eyes with fair fresh water, and gave thanks unto God in some fine canticle, made in praise of the divine bounty and munificence. This done, they brought in cards, not to play, but to learn a thousand pretty tricks and new inventions, which were all grounded upon arithmetic. By this means he fell in love with that numerical science, and every day after dinner and supper he passed his time in it as pleasantly as he was wont to do at cards and dice. . . . After this they recreated themselves with singing musically, in four or five parts, or upon a set theme, as it best pleased them. In matter of musical instruments, he learned to

play the lute, the spinet, the harp, the German flute, the flute with nine holes, the violin, and the sackbut. This hour thus spent, he betook himself to his principal study for three hours together, or more, as well to repeat his matutinal lectures as to proceed in the book wherein he was, as also to write handsomely, to draw and form the antique and Roman letters. This being done, they went out of their house, and with them a young gentleman of Touraine, named Gymnast, who taught the art of riding. Changing then his clothes, he mounted on any kind of horse, which he made to bound in the air, to jump the ditch, to leap the palisade, and to turn short in a ring both to the right and left hand. . . . The time being thus bestowed, and himself rubbed, cleansed, and refreshed with other clothes, they returned fair and softly; and passing through certain meadows, or other grassy places, beheld the trees and plants, comparing them with what is written of them in the books of the ancients, such as Theophrastus, Dioscorides, Marinus, Pliny, Nicander, Macer, and Galen, and carried home to the house great handfuls of them, whereof a young page called Rhizotomos had charge—together with hoes, picks, spuds, pruning-knives, and other instruments requisite for herborising. Being come to their lodging, whilst supper was making ready, they repeated certain passages of that which had been read, and then sat down at table. . . . During that repast was continued the lesson read at dinner as long as they thought good: the rest was spent in good discourse, learned and profitable. After that they had given thanks, they set themselves to sing musically, and play upon harmonious instruments, or at those pretty sports made with cards, dice or cups,—thus made merry till it was time to go to bed; and sometimes they would go make visits unto learned men, or to such as had been travellers in strange countries. At full night they went into the most open place of the house to see the face of the sky, and there beheld the comets, if any were, as likewise the figures, situations, aspects, oppositions, and conjunctions of the stars. Then with his master did he briefly recapitulate, after the manner of the Pythagoreans, that which he had read, seen, learned, done, and understood in the whole course of that day. Then they prayed unto God the Creator, falling down before Him, and strengthening their faith towards Him, and glorifying Him for His boundless bounty; and, giving thanks unto Him for the time that was past, they recommended themselves to His divine clemency for the future. Which being done, they entered upon their repose."—W. Besant, *Readings in Rabelais*, pp. 20-29.—See also EDUCATION, ART: French leadership in the 16th century.

Sturm, the secondary school and the study of Latin.—"If the humanistic movement had little influence upon elementary school-work, it ultimately wrought great and lasting modifications of secondary school education. In the Protestant School under Sturm at Strassburg and in the schools of the Jesuits the humanistic secondary school assumed a definite and permanent form, which survives in the classical grammar school of to-day. John Sturm [1507-1589], after a preparatory education with the children of his father's patron, Count Manderscheid, attended a school at Liüttich [or Liège] under the control of the Brethren of the Common Life. Both the organization and curriculum of this school served Sturm as models in his subsequent work as organizer and director of schools. It consisted of eight carefully graded classes. The like proficiency of the members of each class was maintained by strict half-

yearly examinations. The course of study was humanistic. The medieval 'Doctrinale' of Alexander de Villa Dei was replaced by a course in grammar so concise as to facilitate the early reading of the Latin texts themselves. Only the classical Latin authors were read. After completing his course at the university of Louvain and devoting some time to studying and teaching at the university of Paris, Sturm undertook to complete the reorganization of the work of the Strassburg schools, so as to bring it into harmony with prevailing humanistic ideals. So successfully did he carry out this undertaking that the school became perhaps the most famous of its time. This success seems to have been due largely to the fact that Sturm was guided in his school-work by a clearly defined aim, which, though narrow, was yet well suited to the tastes and needs of his time. This aim was the cultivation of knowledge, piety, and eloquence. The eloquence desired was that in the Latin tongue, the knowledge to be imparted was mainly such as would aid in the appreciation and use of Latin. The work of the ten classes into which the school was divided was carefully graduated. Though the course comprehended nearly all the subjects of the traditional trivium and quadrivium as well as the Reformation studies of the Catechism and the Bible, yet every subject was made contributory so far as possible to the great central aim of developing in the pupil the ability to speak and write Latin in an elegant Ciceronian fashion. The careful attention paid by Sturm, Ascham [in England], the early Jesuits, and other educators of this period to methods of teaching Latin translation and composition resulted in a teaching efficiency in these subjects which compares favorably with that of our best modern schools."—L. F. Anderson, *History of common school education*, pp. 103-105.

Montaigne, a social realist.—"The reaction against humanism in France is brilliantly voiced by Michel Montaigne (1533-1592). The early education of Montaigne was meant to be an experiment, as it appears. His father put the little boy in charge of a German tutor who could not speak French, and who was to carry on all conversation in Latin. The child also learned Latin from house-servants, who never spoke French to him. The result was that at the age of six he could speak Latin. He was then sent to the famous College of Guienne, near Bordeaux, where he was graduated at the age of thirteen, and later he studied law. . . . Having ample means, and not caring seriously for politics, he spent much of his life in philosophic retirement at the paternal chateau of 'Montaigne,' writing brilliant essays on all sorts of subjects, but more particularly on French 'society' and on education in general. His essays on 'Pedantry' and 'The Education of Children' furnish us with his educational views. . . . When Montaigne discussed education, he had in mind a life of opportunity and individual fitness for the living present. His own contact with public men had taught him the utter futility of the formal humanism to which he had been subjected in his own education, and which was still very prevalent in his own country. . . . For such a life as he had in mind, 'wisdom' and 'character' were the great ends in view, and these ends rather than prescription by the ancients should determine the content and method of education. . . . The course of study might include some of the traditional studies, such as logic, rhetoric, geometry, and physics, and even Latin and Greek; but the emphasis should be placed on the

living languages, physical culture, and extensive travel under a tutor of good judgment, 'whose head is well tempered rather than well filled.' . . . In teaching the boy, 'Let the master examine him not only about the words of the lesson,' says Montaigne, 'but also as to the sense and meaning of them and let him judge of the profit he has made, not by the testimony of his memory, but that of his understanding.' He recommends that Latin and Greek should be learned by speaking them, and thus compliments the method employed in his own early education. . . . In purpose and content, the education which Montaigne recommends is clearly 'social realism' of a strongly individualistic type, while in method it is just as clearly 'sense-realism.' His influence on current practice, though we cannot trace it, owing to the difficult age in which he lived, must have been considerable, for he was widely read. Locke and Rousseau . . . followed his lead in their social realism, and Bacon and Comenius found his practical programme a direct road to sense-realism."—C. C. Boyer, *History of education*, pp. 255-257.

Schools in England.—"In England, during the sixteenth century, Wolsey, as a statesman, was alive to the advantages of education and desired much of the wealth of the church to be turned into that channel, and founded colleges, which he staffed with men of the new school, and financed in part from the proceeds of suppressed religious houses. . . . The earlier half of the reign promised well for education; but . . . the funds which Wolsey would have donated to that object were wanted for other purposes. . . . Nevertheless, in great families at least, the education of the younger members was carried to a high pitch. . . . It is to be noted, however [in Edward's reign], that of the church property acquired by the crown . . . a comparatively respectable, though still niggardly proportion was re-appropriated to educational purposes."—A. B. Innes, *England under the Tudors*, pp. 93, 97, 103.—"In 1545 [Henry VIII], the chapels and chantries were abolished, and out of the proceeds eighteen grammar schools established. . . . [In the reign of Edward VI, upwards of thirty grammar schools were founded, not a few owing to] the petition of the burgesses of some town, or that of the residents in the neighborhood of some suppressed monastery. The schools are generally described as free. . . . It would seem that they only partially supplied the place of the schools which had been swept away . . . for in the year 1562 we find Williams, the speaker of the House of Commons . . . [stating] that at least a hundred were wanting in England, that before time had been."—H. D. Traill, *Social England*, v. 3, p. 229.—"Leach estimates that there were in 1546 in the neighborhood of three hundred grammar schools in England for two and one-half millions of population or about one school for every 8,300 people; he finds evidence going to show that these schools were largely attended . . . [by the] middle classes whether country or town, the younger sons of the nobility and farmers, the lesser landholders, the prosperous tradesmen. [At one of these schools Shakespeare learned "little Latin and less Greek."] Latin was [then] employed in . . . [every walk in life]; 'a merchant, or the bailiff of a manor wanted it for his accounts, every town clerk or guild clerk wanted it for his minute books. Columbus had to study his voyages in Latin; the general had to study tactics in it. The architect, the musician, every one who was neither a mere soldier nor a mere handicraftsman wanted not a mere smattering of grammar, but a living acquaintance with the tongue as a

spoken as well as a written language. . . . Reading schools, song schools, and Latin grammar schools are found side by side. . . . It was no uncommon thing for the same boys to spend part of their time in one school and part in another vibrating between the two in the course of a day or week."—E. E. Brown, *Making of our middle schools*, pp. 17, 18.—"Foster W. Watson tells us that 'In the sixteenth and seventeenth centuries, modern subjects, e.g., mathematics, the natural sciences, and the vernacular languages, foreign and English, advanced with mighty strides, yet to these subjects the doors of the grammar schools, for the most part, remained closed.' . . . 'The Quadrivium, arithmetic, geometry, astronomy and music, had attractions for the noble, since they were the arts which particularly had relation to the activities of the practical world.' The unfavorable attitude of the grammar school toward the Quadrivium was due undoubtedly to the fact that the subjects which it incorporated could be found to have nothing in common with religion, or in fact with anything closely connected with religion. . . . Later on in this same book Watson says that 'The influence of the nobleman's view that mathematics should be studied in their relation to practical ends at least had this progressive element, viz., that any new practical invention, of proved service to warfare or the service of the state, must be accepted.' With this same spirit carried into practise, 'one of the merchant-princes of Queen Elizabeth's time, Gresham, showed the educational wide-mindedness of the merchant class in his foundation of Gresham College. He endowed professorships in divinity, astronomy, music, geometry, law, medicine and rhetoric.'"—H. Kimmel, *Status of mathematics (School and Society, Feb. 15, 1919)*.—It is to be noticed that no special provision was made for the education of the poor, but neither was there any obstacle placed in the way of any boy whose parents desired to send him to the grammar school,—provided he could find a place there.

Schools in Germany.—Although the belief that the clergy alone needed to be learned was still fixed in the popular mind, yet some idea of a universal need for education had become current before the sixteenth century, and some effort had been made in Germany to fill the want. "At the close of the Middle Ages, both the higher educational institutions and the schools for the people had been in a flourishing condition in most parts of the Empire; . . . the number of schools in the smaller towns and villages increased with every decade. . . . Between the years 1400 and 1521 we can point to nearly 100 school ordinances and school contracts in German and Dutch. The whole of North Germany felt the influence of the 'Brothers of the Common Life,' who combined . . . faithful adherence to the religious life and equal zeal for classical studies. From their schools and seminaries . . . went forth shoals of scholars who labored as schoolmen in Germany. . . . In almost all districts of Germany . . . educational institutes, greater and smaller, many of them of considerable importance, were seen springing up, and humanist studies gained wider and wider footing. [Unfortunately they were devoted chiefly to humanist studies, and were not rooted in national life. Consequently, in the political storms which surrounded the Reformation—and also because of the lack of funds caused by the greed of the

nobles and princes, who took for themselves the monastic property, with scarcely a thought of filling the place of the clergy in education—the schools decayed.] The schoolmen who had been of old esteemed and honored in public life as the imparters of the most valuable intellectual treasures [during that turbulent period] sank in the eyes of the masses to the status of a wage-earner. . . . Whereas formerly the burgomasters and town councillors had held it an honour to patronise and encourage education . . . too often these men looked on with indifference at the decay and ruin of the schools. . . . [There had spread over wide circles of German society a dull, materializing spirit, bent only on utility and gain. Preference was given to the German writing and arithmetic schools which prepared their pupils for the business of handicraftsmen and tradesmen.] In order to re-fill the deserted schools, Luther [advocated] . . . compulsory school attendance. 'I am of opinion,' he said, 'that rulers are bound to compel their subjects to send their children to school. . . . The custodes complain that they often have only three boys . . . and even if the peasants send their children to school in the winter, they take them away in the summer to put them to farm-work.' . . . [Little attention, however, was paid to the education of girls.] 'On the whole,' says Löschke, 'it is considered a very remarkable exception when girls also attend boys' schools; the towns which have German schools where girls are also admitted are very proud of themselves.' . . . In a few large towns, special schools for girls existed in no small number . . . [but] if we consider the work done . . . it does not appear justifiable to regard the girls' schools of the sixteenth century as the germ of our higher schools for girls. . . . [The method of teaching as in most countries at the time was brutal in the extreme.] 'The children [says Michael Neander, in 1582] are indeed made to waste their years with no profit at all, robbed of their youth, and plagued and tormented with all sorts of unnecessary instructions and precepts.' . . . The Tyrolese physician, Hippolytus Guarinoni, often recalled with shuddering in his old age the gruesome treatment which he had experienced as a child at school. 'It often happened to me, if I got up too late and went unwillingly to school, to be thrashed with a whip that had three lashes, and this . . . upwards of fifty and even seventy times. . . . I bear the marks of this treatment still in my body. . . . Numbers of boys are checked in their growth, . . . and can never be joyous at heart.' . . . [The teachers had not enough to live upon, let alone buy books . . . and eked out a living by other employment. The schools often looked like caverns.]—J. Janssen, *History of the German people*, v. 13, pp. 9-12, 30, 33, 57, 65.—"Two distinct types of schools stand out in the sixteenth century, the one German the other Latin. . . . The work of the German schools was purely elementary, catechism, reading, and writing being the principal or sole parts of the curriculum. In the latter part of the century there developed also German writing schools, . . . the purpose of which was to give special preparation to such boys as expected to enter the service of the state or community in the capacity of clerks, secretaries, and the like. The Würtemberg Ordinance of 1559 gives the first official recognition of the need of such institutions in a section which shows clearly that they were distinct from the ordinary vernacular schools. . . . Such vernacular institutions were naturally not intended to meet the needs of the learned class. Supplying such needs was the work

of the Latin school, an institution distinctly preparatory in its nature, with work leading up to university entrance. In a rather loose way, all these preparatory institutions were called *Particular Schulen*, in contrast with the university, *Studium Generale*. They were also called *Trivium Schulen*, as the curriculum was wholly or partly the *trivium* (grammar, rhetoric, and logic).—C. L. Robbins, *Teachers in Germany in the sixteenth century*, pp. 21-22.

16th and 17th Centuries

Jesuit teaching and schools.—"The education of youth is set forth in the Formula of Approval granted by Paul III. in 1540," to the plans of Ignatius Loyola for the foundation of the Society of Jesus, "as the first duty embraced by the new Institute. . . . Although the new religious [order was] . . . not at once able to begin the establishment of colleges, yet the plan of those afterwards founded, was gradually ripening in the sagacious mind of St. Ignatius, who looked to these institutions as calculated to oppose the surest bulwarks against the progress of heresy. The first regular college of the Society was that established at Gandia in 1546, through the zeal of St. Francis Borgia, third General of the Society; and the regulations by which it was governed, and which were embodied in the constitutions, were extended to all the Jesuit colleges afterwards founded. The studies were to include theology, both positive and scholastic, as well as grammar, poetry, rhetoric, and philosophy. The course of philosophy was to last three years, that of theology four; and the Professors of Philosophy were enjoined to treat their subject in such a way as to dispose the mind for the study of theology, instead of setting up faith and reason in opposition to one another. The theology of St. Thomas, and the philosophy of Aristotle, were to be followed, except on those points where the teaching of the latter was opposed to the Catholic faith."—A. T. Drane, *Christian schools and scholars*, p. 708.—"Wherever the Church was not actually persecuted, as in England, there sprang up educational institutions. Shortly after the death of the fifth General, Father Aquaviva, in 1615, the Society possessed three hundred and seventy-three colleges; in 1706 the number of collegiate and university establishments was seven hundred and sixty-nine, and in 1756, shortly before the suppression, the number was seven hundred and twenty-eight. In 1584 the classes of the Roman College were attended by two thousand, one hundred and eight students. At Rouen, in France, there were regularly two thousand. Throughout the seventeenth century the numbers at the College of Louis-le-Grand, in Paris, varied between eighteen hundred and three thousand. In 1627, the one Province of Paris had in its fourteen colleges 13,105 students, which would give an average of nearly one thousand to each college. In the same year Rouen had 1,068, Rennes 1,485, Amiens 1,430. In 1675 there were in Louis-le-Grand 3,000, in Rennes 2,500, in Toulouse 2,000. Cologne began its roll in 1558 with almost 800 students; Dillingen in Bavaria had 760 in 1607. At Utrecht in Holland there were 1,000; at Antwerp and Brussels each 600 scholars. Münster in 1625 had 1,300, Munich had 900 in 1602. The absolute

average is not known; three hundred seems, however, the very lowest. This would give to the seven hundred and more institutions a sum total of two hundred and ten thousand students, all trained under one system."—R. Schwickerath, *Jesuit education*, pp. 144-145.—Loyola "who had inserted in the authentic formula and charter of his Institute that watchword of his movements, 'Defence and Advance'; who had taken the whole world for the field of his operations, in defending and advancing; this cavalier of a new military type, who had only to show himself upon the field to gather around him the flower of youth as well as mature age, from college and university, from doctor's chair and prince's throne, left behind him, as the work of fifteen years from the foundation of the Order, about one hundred colleges and houses, distributed into twelve Provinces. The territorial divisions were named, after their chief centres, the Provinces of Portugal, Castile, Andalusia, Aragon, Italy, Naples, Sicily, Upper Germany, Lower Germany, France, Brazil, and the East Indies. Individuals under his orders had overrun Ireland, penetrated into Scotland, into Congo, Abyssinia, and Ethiopia. The East Indies, first traversed by Francis Xavier either on foot, or in unseaworthy vessels, signified the whole stretch of countries from Goa and Ceylon on the West, to Malacca, Japan, and the coast of China, on the East. Some of this activity might be credited to apostolic zeal alone, were it not that, wherever the leaders advanced into the heart of a new country, it was always with the purpose, and generally with the result, that the country was to be occupied with educational institutions. De Backer noted this in another connection, when, in the preface to his great work of bibliography, 'The Library of Writers of the Company of Jesus,' he says: 'Wherever a Jesuit set his foot, wherever there was founded a house, a college, a mission, there too arose apostles of another class, who labored, who taught, who wrote.' . . . One hundred and fifty years after the death of Ignatius, the collegiate and university houses of education numbered 760. Two hundred years after the same date, when the Order was on the verge of universal suppression, under the action of University men, Parliamentarians, Jansenists, Philosophers, and of that new movement which was preparing the Revolution, the Jesuit educational institutions stood at the figure, 728. The colleges covered almost the whole world, distributed into 39 Provinces, besides 172 Missions in the less organized regions of the globe. . . . At Goa, in Hindustan, the seminary, which was inferior to none in Europe, had for its students, Brahmins, Persians, Arabians, Ethiopians, Armenians, Chaldeans, Malabari, Cananorians, Guzarates, Dacnais, and others from the countries beyond the Ganges. Japan had its colleges at Funai, Arima, Anzuchzana, and Nagasaki. China had a college at Macao; and later on many more, reaching into the interior, where the Fathers became the highest mandarins in the service of the Emperor, and built his observatory. Towards the close of the eighteenth century a large number of colleges were flourishing in Central and South America. All of these disappeared, when the Order was suppressed."—T. A. Hughes, *Loyola and the educational system of the Jesuits*, pp. 68-70, 74.—"The Jesuits owed their success partly to the very narrow task which they set themselves, little beyond the teaching of Latin style, and partly to the careful training which they gave their students, a training which often degenerated into mere mechanical exercise. But the mainspring of their influence was the manner in which they

worked the dangerous force of emulation. Those pupils who were most distinguished at the end of each month received the rank of prætor, censor, and decurion. The class was divided into two parts, called Romans and Cathaginians, Greeks and Trojans. The students sat opposite each other, the master in the middle, the walls were hung with swords, spears and shields which the contending parties carried off in triumph as the prize of victory. These pupils' contests wasted a great deal of time. The Jesuits established public school festivals, at which the pupils might be exhibited, and the parents flattered. They made their own school books, in which the requirements of good teaching were not so important as the religious objects of the order. They preferred extracts to whole authors; if they could not prune the classics to their fancy they would not read them at all. What judgment are we to pass on the Jesuit teaching as a whole? It deserves praise on two accounts. First, it maintained the dignity of literature in an age which was too liable to be influenced by considerations of practical utility. It maintained the study of Greek in France at a higher level than the University, and resisted the assaults of ignorant parents on the fortress of Hellenism. Secondly, it seriously set itself to understand the nature and character of the individual pupil, and to suit the manner of education to the mind that was to receive it. Whatever may have been the motives of Jesuits in gaining the affections, and securing the devotion of the children under their charge; whether their desire was to develop the individuality which they probed, or to destroy it in its germ, and plant a new nature in its place; it must be admitted that the loving care which they spent upon their charge was a new departure in education, and has become a part of every reasonable system since their time. Here our praise must end. . . . They amused the mind instead of strengthening it. They occupied in frivolities such as Latin verses the years which they feared might otherwise be given to reasoning and the acquisition of solid knowledge. . . . Celebrated as the Jesuit schools have been, they have owed much more to the fashion which filled them with promising scholars, than to their own excellence in dealing with their material. . . . They have never stood the test of modern criticism. They have no place in a rational system of modern education."—O. Browning, *Introduction to the history of educational theories*, ch. 8.—See also JESUITS: 1540-1556.

1510-1570.—Ascham and "The Scholemaster."—Roger Ascham, the friend of Lady Jane Grey and the tutor of Queen Elizabeth, was born in 1515, and died in 1568. "It was partly with the view to the instruction of his own children, that he commenced [in 1563] the 'Schole-master,' the work by which he is most and best known, to which he did not live to set the last hand. He communicated the design and import of the book in a letter to Sturmius [Sturm], in which he states, that not being able to leave his sons a large fortune, he was resolved to provide them with a preceptor, not one to be hired for a great sum of money, but marked out at home with a homely pen. In the same letter he gives his reasons for employing the English language, the capabilities of which he clearly perceived and candidly acknowledged, a high virtue for a man of that age, who perhaps could have written Latin to his own satisfaction much more easily than his native tongue. But though the benefit of his own off-

spring might be his ultimate object, the immediate occasion of the work was a conversation at Cecil's, at which Sir Richard Sackville expressed great indignation at the severities practiced at Eton and other great schools, so that boys actually ran away for fear of merciless flagellation. This led to the general subject of school discipline, and the defects in the then established modes of tuition. Ascham coinciding with the sentiments of the company, and proceeding to explain his own views of improvement, Sackville requested him to commit his opinions to paper and the 'Schole-master' was the result. It was not published till 1670. . . . We . . . quote a few passages, which throw light upon the author's good sense and good nature. To all violent coercion, and extreme punishment, he was decidedly opposed:—"I do agree," says he, "with all good school-masters in all these points, to have children brought to good perfectness in learning, to all honesty in manners; to have all faults rightly amended, and every vice severely corrected, but for the order and way that leadeth rightly to these points, we somewhat differ." "Love is better than fear, gentleness than beating, to bring up a child rightly in learning." "I do assure you there is no such whetstone to sharpen a good wit, and encourage a will to learning, as is praise." . . . "The scholar is commonly beat for the making, when the master were more worthy to be beat for the mending, or rather marring, of the same; the master many times being as ignorant as the child what to say properly and fitly to the matter." . . . "This will I say, that even the wisest of your great beaters do as oft punish nature as they do correct faults. Yea many times the better nature is the sorer punished. For if one by quickness of wit take his lesson readily, another by hardness of wit taketh it not so speedily; the first is always commended, the other is commonly punished, when a wise school-master should rather discreetly consider the right disposition of both their natures, and not so much weigh what either of them is able to do, as what either of them is likely to do hereafter. For this I know, not only by reading of books in my study, but also by experience of life abroad in the world, that those which be commonly the wisest, the best learned, and best men also, when they be old, were never commonly the quickest of wit when they were young. Quick wits commonly be apt to take, unapt to keep. Some are more quick to enter speedily than be able to pierce far, even like unto oversharpe tools, whose edges be very soon turned."—H. Coleridge, *Biographia borealis*, pp. 328-330.

1530-1611.—Mulcaster and the coming of sense-realism.—"To Richard Mulcaster (1530-1611), rather than to Francis Bacon, belongs the credit of paving the way for sense-realism in England and the English-speaking world. The basis of Mulcaster's own education was laid at Eton under Nicholas Udall, a famous master. In 1548 he was at Cambridge as a king's scholar. He was graduated from Christ's College, Oxford, in 1556. Five years later he was appointed head master of Merchant Taylors' School, and taught there successfully for twenty-five years. His specialties were Latin, Greek, and Hebrew, but he devoted much time to music and the drama. . . . In 1596 he became head master of St. Paul's, and remained there until 1608. The Elizabethan Age, whose spirit he must have caught, transformed him in theory at least from the humanism to which he was subjected in his own education, and to which he was committed as head master of popular humanistic secondary schools, into a realist with

ideals that would have made him feel perfectly at home in the twentieth century. The two works upon which his reputation as an educational prophet rests are his 'Positions' (1581) and his 'Elementarie' (1582), both in his favorite, though now almost unreadable, English. . . . In his search after truth, Mulcaster . . . turned his attention to the living present rather than the dead past, and to nature rather than tradition. . . . As we should expect from the period in which he lived, Mulcaster emphasized religion, but kept the practical needs of the individual well to the front, and ranged himself rather on the side of democracy than that of aristocracy. . . . It was Mulcaster's idea that, 'for religion's sake and their necessary affairs,' an elementary course consisting of reading and writing English, together with music and drawing, should be offered to all children, boys and girls alike, . . . and to this course for the mind, physical culture was to be added on the ground that 'the soul and the body are copartners in good and ill.' . . . He advocated that after a grammar-school course of four years, promising boys should be sent to universities, including 'colleges for tongues, for mathematics, for philosophy, for teachers, for physicians, for lawyers, for divines.' In this matter Mulcaster, with the sense-realists of all centuries, bases professional training on individual fitness, and calls attention to the folly of educating a boy for the ministry when ploughing was his special talent. . . . Mulcaster strongly preferred public to private tutorial education, and emphasized the importance of healthful schoolhouses and proper play-grounds. His faith in the importance of education for the sake of religion and life led him to advocate compulsory attendance not only for boys but for girls. He respected the natural ability of the pupil, and advocated professionally trained teachers. He believed that elementary work was most difficult, and that therefore the teachers of elementary schools should have the smallest number of pupils and be paid best. . . . The aristocracy of his age and English conservatism helped to defeat the early realization of Mulcaster's advanced realism. The humanistic secondary schools, of which he was himself so large a part, were still too well entrenched in the English mind to permit much revolt, but his advanced views on primary education—especially his emphasis on the use of the mother tongue and expert pedagogy—entitle him to a place side by side with his more famous contemporary, Bacon, the father of English realism in higher education."—C. C. Boyer, *History of education*, pp. 257-260.

ALSO IN: A. F. Leach, *Schools of medieval England*.

1561-1626.—Bacon and the formulation of sense-realism.—"Francis Bacon (1561-1626) first formulated the principles of modern sense-realism. When he was hardly twelve years old his father, an officer of the crown, sent him and his brother Anthony to Trinity College, Cambridge. Here, where he remained three years, he began to distrust the scholastic philosophy of Aristotle. . . . [Bacon] deserves a unique place in the history of education by reason of several works which, through the interpretation of educational reformers, powerfully promoted sense-realism. These works were 'The Advancement of Learning' (1605), submitted in English, and the 'Novum Organum' (1620), which, probably because he failed to foresee the future of the English language, he published in Latin. . . . To . . . [these] must be added 'The New Atlantis,' an ideal social fable, in which his 'Solomon's House' was the prophecy of our

modern research university. . . . He held that higher education should have for its purpose, not merely pleasure or preferment, nor wealth of knowledge for display, but rather the advancement of the human race through religion and science. . . . The sciences were Bacon's favorite studies, for through them the forces of nature could be harnessed into useful inventions, thus promoting human progress, and, when pursued to 'depth of knowledge,' they would 'bring men's minds about to religion.' [He] . . . therefore undertook to formulate what he conceived to be the proper method of science, namely, induction, and, because he believed that this method was the opposite of Aristotle's deductive 'Organon,' and unknown to Aristotle, he gave his new book on methods the title 'Novum Organum' (New Instrument, or Method). In this book . . . he urged that the student of nature should first of all rid himself of 'idols,' or prejudices, and that, not depending at all upon imagination, the investigator should assemble and examine specimens of the phenomena under consideration, thus arriving at the facts, or particular truths; and that afterward he should compare cases where a certain effect was present with similar cases where the same effect was absent, thus, by successive eliminations, arriving at the class-truth, or law. . . . Although, as we see, Bacon had missed the very essence of induction, namely scientific imagination, or hypothesis, and its confirmation by subsequent trials, his brilliant treatment of the subject and his commanding position in the world had a very wonderful effect on thinkers, and helped to usher in science in the modern sense."—*Ibid.*, pp. 261-263.—See also EUROPE: Middle Ages; Scholasticism followed by humanism; Modern period: Revolutionary period.

1571-1635.—Ratke and the application of the Baconian reforms.—"One of the first to apply these great [Baconian] reforms in scientific method to the work of the school was Wolfgang Ratke [1571-1635]. After graduating from the University of Rostock, and finding himself ill-fitted for the clerical profession, he traveled in Holland and in England, where he was infected with the prevailing enthusiasm for the new scientific method recently set forth by Bacon. The system of school reform to which he devoted mainly the rest of his life manifests the influence of these new ideas. He emphasizes the importance of direct observation as a means of acquiring knowledge, and proposes the, at that time, novel plan of giving instruction in the arts and sciences in the mother tongue."—L. F. Anderson, *History of common school education*, p. 230.

1592-1671.—Comenius as the founder of modern method.—"To know Comenius [born in Moravia, 1592] and the part he played in the seventeenth century, to appreciate this grand educational character, it would be necessary to begin by relating his life; his misfortunes; his journeys to England [1638], where Parliament invoked his aid; to Sweden [1642], where the Chancellor Oxenstiern employed him to write manuals of instruction; especially his relentless industry, his courage through exile, and the long persecutions he suffered as a member of the sect of dissenters, the Moravian Brethren; and the schools he founded at Fulneck, in Bohemia, at Lissa and at Patak, in Poland."—G. Compayré, *History of pedagogy*, ch. 6, sect. 137.—He died in 1671. "Comenius's inspiring motive, like that of all leading educationalists, was social regeneration. He believed that this could be accomplished through the school. He lived under the hallucination that by a proper arrangement of the subject-matter of instruction, and by a sound

method, a certain community of thought and interests would be established among the young, which would result in social harmony and political settlement. He believed that men could be manufactured. . . . The educational spirit of the Reformers, the conviction that all—even the humblest—must be taught to know God, and Jesus Christ whom he has sent, was inherited by Comenius in its completeness. In this way, and in this way only, could the ills of Europe be remedied, and the progress of humanity assured. While, therefore, he sums up the educational aim under the threefold heads of Knowledge, Virtue, and Piety or Godliness, he in truth has mainly in view the last two. Knowledge is of value only in so far as it forms the only sound basis, in the eyes of a Protestant theologian, of virtue and godliness. We have to train for a hereafter. . . . By knowledge Comenius meant knowledge of nature and of man's relation to nature. It is this important characteristic of Comenius's educational system that reveals the direct influence of Bacon and his school. . . . It is in the department of Method, however, that we recognise the chief contribution of Comenius to education. The mere attempt to systematise was a great advance. In seeking, however, for foundations on which to erect a coherent system, he had to content himself with first principles which were vague and unscientific. . . . In the department of knowledge, that is to say, knowledge of the outer world, Comenius rested his method on the scholastic maxim, 'Nihil est in intellectu quod non prius fuerit in sensu.' This maxim he enriched with the Baconian induction, comprehended by him only in a general way. . . . From the simple to the complex, from the particular to the general, the concrete before the abstract, and all, step by step, and even by insensible degrees,—these were among his leading principles of method. But the most important of all his principles was derived from the scholastic maxim quoted above. As all is from sense, let the thing to be known be itself presented to the senses, and let every sense be engaged in the perception of it. When it is impossible, from the nature of the case, to present the object itself, place a vivid picture of it before the pupil. The mere enumeration of these few principles, even if we drop out of view all his other contributions to method and school-management, will satisfy any man familiar with all the more recent treatises on Education, that Comenius, even after giving his precursors their due, is to be regarded as the true founder of modern Method, and that he anticipates Pestalozzi and all of the same school. . . . Finally, Comenius's views as to the inner organisation of a school were original, and have proved themselves in all essential respects correct. The same may be said of his scheme for the organisation of a State-system—a scheme which is substantially, *mutatis mutandis*, . . . embodied in the highly-developed system of Germany. When we consider, then, that Comenius first formally and fully developed educational method, that he introduced important reforms into the teaching of languages, that he introduced into schools the study of Nature, that he advocated with intelligence, and not on purely sentimental grounds, a milder discipline, we are justified in assigning to him a high, if not the highest, place among modern educational writers." —S. S. Laurie, *John Amos Comenius*, pp. 217-226.

17th Century

Milton, a later humanistic realist.—Locke and the disciplinary idea.—"The marvellous hold

which the ancients continued to have on the mind of men long after the advent of realism is to be seen conspicuously in the great English poet John Milton (1608-1674). His early education was carefully supervised by tutors. He was an apt student, and when in 1624 he entered Christ's College, Cambridge, he was master of several languages, and had read philosophy and literature extensively. . . . In 1640 . . . the stress of times forced him to open a school on Aldersgate Street, London, where he maintained himself in part by teaching 'the sons of some gentlemen' for about seven years. . . . In 1644, at the suggestion of Samuel Hartlib, a disciple of Comenius and a friend of educational reforms, he wrote the 'Tractate on Education,' the brief treatise on which rests his claim to a place in the history of education. . . . Humanism and the Reformation had

COMENIVS

(Portrait after Wenceslaus Hollar)

conspired to produce Milton, so that, although he recognized the claims of the living present, he continued to look at life rather through the eyes of the ancients than his own, and thus failed to emancipate himself completely. This humanistic realism is the characteristic note of his 'Tractate on Education.' The religious impulse, as we should expect, was uppermost in Milton, and God's claims came first. . . . His famous definition of a complete and generous education shows plainly that, although religion and morality were uppermost in Milton's mind, he had not overlooked life as he found it in his age. Said he: 'I call that a complete and generous education which fits a man to perform justly, skilfully, and magnanimously all the offices, both public and private, of peace and war.' He evidently used the word 'justly' to call attention to social relations and moral obligation. His realism is evident in the use of the word 'skilfully,' for he connects it with the practical pursuits of peace and the patriotic services of war. Nor can it be doubted that in the use of the word 'magnanimously' Milton had in mind the promising young men of higher station who should occupy positions of trust and honor in life, and that for such responsible leadership the highest possible

preparations should be made. . . . The classics were to constitute the basis of the ambitious course which Milton proposed, and to the content of these that of the Hebrew, Chaldee, Syriac, and even Italian, was to be added for general culture. This classical training was to be supplemented with an extensive course in applied mathematics, and later on with an extensive training in the natural and social sciences, including history and law. Philosophy and theology were to top the structure. And all these subjects, including those of the sciences and applied mathematics, were to be studied out of books, and to make the matter worse, out of the books of the ancients. Milton did not forget music, foreign travel, and, in harmony with his own custom, as well as in obedience to the needs of the times in which he lived, he proposed strenuous physical training, in which, true to his bias for the past, he would combine what was best in Sparta and Athens. . . . Milton calculated that the boys whom he had in mind could finish the course which he proposed in his 'Tractate' in nine years, and maintained that an 'academy,' where the course could be completed without change of residence, was preferable to the conventional separation of the secondary school from the university. As an introduction to the ambitious classical course which he proposed, Milton recommended the so-called intensive plan of studying Latin, Greek, and other languages, asserting that in this way Latin and Greek might be 'learned easily and delightfully in one year.' Experience had taught him the importance of adapting the assignment of tasks to the capacity of students, and he vigorously condemned the custom of requiring immature students to work on themes and orations that taxed even mature students. He valued an atmosphere of good-will, and would have the teacher cultivate cordial relations between himself and the students, thus reducing discipline to a minimum."—C. C. Boyer, *History of education*, pp. 264-267.

"John Locke (1632-1704), the English philosopher, was a utilitarian sense-realist. . . . He was a student most of his life, devoting himself especially to physics, chemistry, medicine, psychology, philosophy, politics, and even theology. . . . In his 'Essay on Human Understanding,' in which he sought after 'the primal sources and the scope of human knowledge, denying the existence of innate ideas, presenting the mind as a sheet of white paper prepared to be written upon by experience which alone supplies the knowledge there impressed, and tracing the sources of all ideas to what he calls sensation and reflection.' This psychological doctrine, known as the 'tabula rasa,' or white paper, . . . was also virtually the position of the sense-realist Comenius. Locke put much work on this 'Essay' during his voluntary exile in Holland, and published it in complete form in 1690. The application of his sensation-psychology to the process of education is to be found in a little book on the 'Conduct of the Understanding,' an original companion-piece to the 'Essay,' which was published after his death. In 'Some Thoughts on Education,' published in 1693, Locke, as tutor of Lord Shaftesbury's son and grandson, applies his sense-realism as a mental process to a utilitarian curriculum specially selected for the 'sons of gentlemen,' thus running into a social realism that closely resembles that of Montaigne. Taking the two books together, we venture to

classify Locke as a utilitarian sense-realist in his views on education. . . . The opening sentence of Locke's 'Thoughts on Education' is his educational creed, stated in the briefest possible way, and the rest of the book is simply an elaboration. These are his words: 'A sound mind in a sound body is a short but full description of a happy state in this world; he that has these two has little more to wish for, and he that wants either of them will be but little the better for anything else.' . . . As a physician who had become his own patient in his early manhood, Locke had learned to emphasize hygiene, and advocated what has since become known as the 'hardening process.' . . . Much as Locke valued a sound body, he valued moral soundness more, placing it above all else. . . . As in his views on physical culture, so in character building, the process was to be habituation, the indefatigable submission of inclinations to the control of reason, until reason becomes master of desires. . . . In the curriculum which he recommends for the sons of gentlemen in his 'Thoughts,' he follows Milton and Montaigne very closely. The boy's intellectual education is to begin with such useful studies as reading, writing . . . in the vernacular, [and drawing,] arithmetic, geography, history, geometry, languages, and other studies are to be added as the boy's life may require. He should also travel if possible, but under the supervision of a safe tutor. . . . When dealing with the mental process of the learner, and the order in which the various subjects are to be mastered, Locke, as his 'Conduct' shows, and as his 'Essay' would lead us to believe, was as thoroughgoing a sense-realist as Bacon, Ratch, and Comenius. When, for example, the boy is able to take up a foreign language, it was to be the language of his neighbor—in the case of the English boy, French. This . . . was the idea of Comenius. Latin might be studied after the neighboring language. . . . The learning process should afford pleasure, thus serving as a stimulus; and mental growth should be secured by adding something new to the old, or, as we should say, by apperception. All these recommendations made Locke an advocate of child-study in the professional training of teachers. . . . According to Locke—and this point was long overlooked—the only 'royal road' to human efficiency, whether of body or mind, is vigorous training, or, as we now say, 'discipline.' Hence he advocates the hardening process in physical culture, the rational mastery of desires in morals, and the gymnastic study of such subjects as languages and the mathematics for intellectual excellence. . . . Although Locke spoke only for the 'sons of gentlemen,' and failed utterly to provide for the masses, he called the attention of the world to the importance of the practical in education as perhaps no one else had done before him, and he contended valiantly for an efficiency that can be attained only through hardness and difficulty, thus placing himself solidly against all softness and weakness. . . . He was read more on the Continent than in England, and such men as the brilliant Rousseau extended the English philosopher's influence to educational theory in general and to child-study in particular. His doctrine of 'formal discipline,' greatly modified, has come down, still powerful, to the twentieth century."—*Ibid.*, pp. 279-286.

England: Free grammar schools.—Education of gentlemen's sons.—Education of girls.—"What the grammar schools [of England] had come to be by the beginning of the seventeenth century, when American colonization began, may

be gathered from John Brinsley's *Grammar Schoole*, . . . first published in 1612. . . . Boys were commonly admitted at the age of seven or eight. Theoretically the schools were for those who could already read the New Testament, if they had not even made a beginning in the Latin accidence. In practice, however, nearly half the time of the teacher was devoted to beginners. When the Latin was once begun, English was sadly neglected. . . . The study of numbers was even more generally overlooked. It was no uncommon thing to find scholars almost ready for the university who were not able to make out the numbers of pages, chapters or divisions in the books they were reading. There were few good penmen in the grammar schools. . . . The accepted curriculum in Latin, to which the regular grammar scholar devoted nearly all his time was: Accidence, grammar, construing. With construing there was parsing and the making of Latin. . . . The boys were required to use only Latin in all of their intercourse while at school and devices of all sorts were employed to keep them from uttering a word of English. . . . When all necessary deductions have been made, it still cannot be doubted that John Brinsley exercised a wholesome influence on the school practice of the time through this and several other educational works which he published."—E. E. Brown, *Making of our middle schools*, pp. 19, 21.—"We are also told [by Watson] that 'the great Trading Companies, and especially the East India Company, took over hoys to be employed in their affairs beyond the sea,' and that 'after the foundation of the Mathematical School of Christ's Hospital in 1673, the teaching of Mathematics and Navigation, in which subjects Christ's Hospital was the pioneer school, prepared directly for apprenticeship to sea-captains serving in the Indian Navy.' Such statements as these only substantiate the fact that mathematics during its earlier history in England belonged to the arts, all of which were regarded as belonging to the sphere of practise. This, together with the idea that it did not lend itself to the religious side of life, forced arithmetic and geometry, as well as the other sciences, to make their appearance as a rule not in the grammar school, but in the writing school, which was a private school, and one too entirely separate from the former."—H. Kimmel, *Status of mathematics (School and Society*, Feb. 15, 1910).—In 1678 Christopher Wase published his little book on *Free Schools in England* [in which] he says 'there are of late Grammar Schools founded and endowed in almost every Market Town in England' in which the children of the town are to receive instruction free of charge. But he declares, on the other hand, that some counties are not well supplied with free schools in actual operation; that at the best one may see 'the maintenance but of very few in a County. . . . Many of the free grammar schools instead of bringing up the youth in learning are only Nurseries of Piety and Letters as preparatory to Trade.'—E. E. Brown, *Making of our middle schools*, p. 25.—"The education of gentlemen's sons varied. . . . Many a younger son, destined to the apprenticeship's apron, many an heir destined to hunt the coverts and exact the rentals of a small patrimony, were taught little beyond their letters. But a good education was established at more than one class of academy. In those frugal days, the sons of leading country families were sometimes sent first to the village school, and afterwards to the grammar school of the neighboring town, as John Hampden was sent to Thame. There, sitting on the same bench with the cleverest sons of farmers

and townspeople, the young gentlemen learnt many things. . . . In this way the upper and middle classes came to understand each other with great mutual advantage. . . . The belief that higher education can be bought only at a heavy price, and is therefore the monopoly of the rich, had not yet penetrated the English mind; it was, therefore the custom of parents . . . to send the clever boy of the family . . . to school and college, where, as he well understood, he was to prepare for his future profession. But, besides these grammar schools, the more exclusive Westminster, Winchester and Eton existed then as now. Also persons born to high position were sometimes brought up in their own homes by private tutors, and often by a tradition coming down from the Middle Ages, the households of lords and county magnates received specially favored sons of neighboring gentry into their homes, partly as scholars, partly as pages or companions. . . . The curriculum of the schools necessarily followed Cambridge and Oxford. . . . It was only in the rationalistic epoch of Charles II that critics ventured to enquire whether a little reading of innocent English authors, the writing of English exercises, and the principles of arithmetic, geometry and 'such alluring forms of learning' might not be made part of a school boy's education. . . . In spite of so many disturbing influences, the years 1640-1660 represent one of . . . [the] great English periods of educational extension and improvement. In the fifty years between 1601-51 as many schools were founded as had been founded in a century of Tudor rule. The movement reached its climax under the Puritans. . . . The schools of England certainly benefited by the Great Rebellion. . . . [But after the Restoration] by the Five Mile Act (1665) no clergyman or schoolmaster was to come within five miles of a city or a corporate town unless he declared that he would not 'at any time endeavor any alteration either in church or state.' As the Puritan Congregations were principally seated in the towns, . . . they were cut off from even private education. . . . Perhaps . . . [this Act] had a worse effect on education than anything the Puritans ever did [and probably had much to do with the neglect of education in the next century]."—G. M. Trevelyan, *England under the Stuarts*, pp. 11, 15, 19, 317, 341, 342.—The Five Mile Act and the Act of Uniformity (1662) resulted "in the establishment of a large number of private schools and academies by non-conformists, one of whom—Richard Frankland—is said to have had three hundred pupils. . . . Indeed the rapid increase of these academies in the last thirty years of the seventeenth century shows that some discretion was used as to carrying out the law so far as it was directed against institutions which were not endowed schools or universities. . . . The education of girls above the humblest rank was wholly private. Swift . . . in 'The Education of Ladies,' says, 'Their education is entirely left to their mothers, or they are sent to boarding schools, or put into the hands of English or French governesses, generally the worst that can be had for the money'; . . . 'common opinion,' he adds, 'restricted a woman's reading to the Bible or books of devotion. Lady Mary Wortley Montague . . . complains that it is looked upon as in a degree criminal to improve our reason, or fancy we have any.' . . . She received lessons in carving in order to take the head of her father's table; . . . she was taught French in childhood and Italian as a woman of twenty; Latin she studied surreptitiously. Elizabeth Elstob, author of the earliest Old English grammar, pursued her early education under simi-

lar discouraging circumstances. The education of girls was so superficial that Swift declares that 'not one gentleman's daughter in a thousand can . . . understand her own language or judge the easiest book written in it.' [The subjects taught in the best boarding schools appear to have been dancing, singing, writing, music, keeping accounts, with perhaps a little French and occasionally some Latin. Of the girls of the middle classes, Defoe states] 'Their youth is spent to teach them to stitch and sew, or make baubles; they are taught to read indeed, and perhaps to write their names.'—*Cambridge history of English literature*, v. 9, pp. 303, 402, 404.—In fact women and girls of the seventeenth century were presumed, according to Swift's dictum, not to have the capacity of arriving "in point of learning, to the perfection of a schoolboy."—See also RUGBY SCHOOL; WOMAN'S RIGHTS: 1650-1775.

 France: Jansenist schools.—"The time came in Europe—it was hastened by the misfortunes and the sorrows of the Thirty Years' War—when thoughtful men of every creed began to realize the insufficiency of a religion that did not satisfy the heart and provide life with powerful motives in the service of God. In France this conviction produced especially the teaching orders known as the Jansenists and the Christian Brothers, while in Protestant Germany it produced the Pietists. Cornelius Jansen (1585-1638), a Dutch professor at the University of Louvain, and later Bishop of Ypres, had made a profound study of St. Augustine, and reached conclusions regarding the grace of God somewhat similar to those of Calvin. Although his doctrines fell under the ban of the church, his followers, like the bishop himself, remained loyal to the church. Men of prominence and ability became deeply interested, and under the leadership of his friend the Abbé de St. Cyran, a number of them established themselves at Port Royal, near Versailles, to devote themselves to various ascetic activities through which they hoped to save souls. . . . The Port Royal Jansenists felt that the corruption to which flesh was heir could be eliminated, and the number of the elect saved, only by religious and moral watchfulness against the wiles of the devil. In 1643, Abbé de St. Cyran, moved by this profound concern for souls, laid the foundation of schools in which the children should be under supervision day and night. A school was to consist of twenty-five boys or less, and no master was to have personal charge of more than five or six pupils. For this reason, and also to keep the universities from thinking that, like the Jesuits, they were going to compete with them, the Port Royalists called themselves the 'little schools.' Similar arrangements were made for girls, who were placed in charge of women of rare and beautiful character. Like the 'Oratorians,' another teaching congregation founded in 1611, the Port Royal Jansenists accepted the philosophy of Descartes, and held to the development of 'reason,' thus coming into early conflict with the Jesuits, who . . . made much of authority and routine. The result was that in 1660, after [the Jansenist schools had had] an existence of less than a quarter of a century, Louis XIV, instigated by the Jesuits, suppressed the 'little schools,' and dispersed the teachers, thus, as Paroz says, robbing France of almost two centuries of progress. . . . The fundamental purpose of Jansenism, was to fortify the baptized soul against the wiles of the devil. This purpose was to be accomplished by inculcating genuine Christian piety as the only

sufficient guarantee. . . . Children were taken at nine or ten years of age and kept through the difficult years of the 'teens' if possible. 'Up to the age of twelve,' we are told, the pupils were occupied with sacred history, geography, and history, under the form of amusements, in a manner to develop their intelligence without wearying it. The regular course of study began at twelve and included the Greek and Latin classics, together with grammar, rhetoric, logic, mathematics, and the Church Fathers. Physical culture and science received scant notice. Said Nicole: 'The sciences should be employed only as an instrument for perfecting the reason.' . . . Accordingly they addressed instruction 'first to the senses' if possible, and used pictures. Pascal invented phonic spelling. The first schoolbooks were not Latin, but French texts prepared by the Port Royalists themselves, and excellent expurgated translations of the Greek and Latin classics, through which the learner was introduced to the thought before he took up the form or language of the classics. In this way, they bravely broke away from bondage to the past, and paved the way for the ultimate use of the mother tongue in secondary schools. Moreover, as disciples of Descartes in psychology, they strove to adapt instruction to the pupil's capacity, thus allying themselves with Comenius, Pestalozzi, and other great reformers of pedagogy. Much freedom was permitted in study and the conduct of recitations. . . . In school discipline the Port Royalists, contrary to prevailing custom, but in line with their rule of reason, relied on wholesome admiration of the teacher rather than on force, and therefore resolutely rejected corporal punishment on the ground that it hinders moral growth and piety. For the same reason, and because the only true rival of the pupil is his own higher self, they condemned the emulation and prizes so sedulously cultivated by the Jesuits. St. Cyran, . . . keeping this great purpose of building character for time and eternity in mind, went to the greatest pain to secure teachers who had the requisite qualifications, laying special stress on self-control, patience, and piety. 'Speak little,' said he, 'put up with much, and pray still more.' . . . It is probably true . . . that the atmosphere of excessive piety in the Port Royal school life must have chilled the natural spontaneity of childhood, but the experiment served as a protest to the noise and commotion so prevalent in the schools of the time. We are told that, owing to the exclusion of rivalry, the Port Royalists were 'never able to secure the energy, earnestness, and pleasing environment of the Jesuits.' On the other hand, we know that they escaped the deadening formality of routine, and thus promoted [a] . . . healthy mental growth. . . . While it is to be regretted that the 'little schools' were closed too soon to do the good which they were meant to do, it was probably best in the long run, for the dispersed teachers turned to writing, thus spreading their views, and in the long run giving Port Royal pedagogy a decided ascendancy over that of the Jesuits in France, an ascendancy which continues. Among the writers through whose books their ideas live are Nicole, the moralist and philosopher, who wrote 'The Education of a Prince'; Lancelot, the grammarian, who wrote 'Methods of Language Study'; Arnauld, a great theologian, who wrote text-books on grammar, logic, geometry, and 'The Regulation of Studies in the Humanities'; Pascal, a literary giant, who wrote the 'Provincial Letters' and 'Thoughts,' most terrible arraignment of the Jesuits; Fenelon, who wrote 'The Education of Girls,' and Rollin, who wrote 'Treatise on Studies.'—

C. C. Boyer, *History of education*, pp. 221-225.—See also PORT ROYAL AND THE JANSENISTS: 1602-1700.

France: Standard of education.—"At the opening of the seventeenth century, and far into the eighteenth century, the educational institutions of most of the European states were controlled and supported by the church and religious orders, assisted financially by private benevolence."—C. C. Boyer, *History of education*, p. 374.—"In France, from a very remote period the dame school seems to have existed in some measure and form, for a fourteenth century sculpture . . . depicts an establishment of this kind—a petty school for boys, kept by a woman. If there was any such thing in England, I have met no record of it; but the practice, from the early intimacy between those countries would be more apt to find its way first of all from the French into Scotland."—W. C. Hazlitt, *Schools, schoolbooks and schoolmasters*, p. 197.—At this period, national education in France may be said to have been non-existent. "That ignorance was almost universal among the lower classes is well known. In 1651, in the village of Cirey, there was no one who could read or write. In the Parish of Montacher, there were only four of the inhabitants who knew how to sign their names. Little more education was found among those who were better circumstanced than the peasantry. Those employed in bringing . . . provisions to Paris presented their petition, in which they stated that the majority of the suppliants could not read or write, and they asked to be allowed to employ clerks who could sign receipts in their name. Few valets or servants could read or write. . . . Education was in the hands of the colleges and the clergy, and the administration paid no [attention] . . . to it. Richelieu said that the number of colleges was already too great, it encouraged the poorest to have their children study, so that few were left for trade or war. . . . Education among the upper classes was often very superficial. From thirteen to sixteen [years] the young [noble] usually began his military service. Before that, the two things . . . [which] he . . . understood best were riding and dancing. . . . The brief studies of most of the young nobles left but a small trace of learning and the education of the girls was often still more neglected. [Richelieu's niece had to be sent to a convent to learn to read after her marriage.] Few of the great ladies could spell correctly. . . . There was indeed a circle of highly educated women at this time, but many of these were members of Parliamentary families."—J. B. Perkins, *France under Mazarin*, v. 2, pp. 392, 421.—"In 1688, [La Salle] . . . went to Paris to found schools there. Besides giving elementary instruction, the Brethren [see below: 17th-20th centuries: Christian brothers] also conducted technical schools to prepare young men for commercial and industrial pursuits. The first of these La Salle founded at Saint Yon, near Rouen. . . . The course of study outlined for elementary schools embraces reading, writing, orthography, arithmetic, and the catechism. As in the Port Royal schools, all the first lessons are to be given in the native language. Much attention is to be given to writing, according to the *Conduct*; and first lessons are to be followed by the writing of notes, receipts, and bills. . . . He conceived the plan of grading the pupils, and of giving the pupils of the same grade their lessons at the same time and of having them recite together. . . . La Salle also, more fully possibly than the Jesuits, realized the need of special training for teachers. In 1685 he opened at Reims a 'Seminary for Schoolmasters.' . . . When La Salle died

he had founded one normal school for the Order and four for the training of teachers in general, three practice schools, thirty-three primary schools, and the technical school at Saint Yon."—E. L. Kemp, *History of education*, pp. 232, 234.

Germany: Schools after Thirty Years' War.—The schools of Germany shared in the general ruin of the Thirty Years' War, especially the elementary schools which were just struggling to life. "As to popular education, the village schools, which the Reformation had not attempted to make much more than appendages to the village churches, had for the most part been swept away by the storms of the War; though it is interesting to find that, immediately after the proclamation of peace—in 1649—the Würtemberg Government, always specially intent upon the care of education in all its branches, sought to impress upon its subjects the general obligation of school attendance by their children. In the 'Latin schools' of the Catholic towns the Jesuits lost no time in resuming their activity where it had been interrupted; in the Protestant towns a new influence was needed to animate a system of teaching hardened and narrowed by confessional jealousy, and by the long-continued subordination of all intellectual effort to theological ends. This influence was found in the gradual assertion of the idea of individual education of the individual, which found expression in the pedagogic principles of the great Moravian, John Amos Comenius [see above: 1592-1671]. In the Universities, . . . formalism had . . . half-petrified student life [and] . . . the Universities isolated themselves from the life of the nation. '*Pennalism*'—the effort to codify the usages of student-life, especially with regard to the treatment of freshmen—reached so rank a growth that . . . the diet . . . [issued an ordinance]. This barbarity of manners had only too close a counterpart in the unprofitableness of University teaching, and its failure to communicate that highest impetus without which all academical life must sink into stagnation."—*Cambridge modern history*, v. 4, p. 424.

Germany: Francke and the pietistic movement.—Influence on schools.—"The somewhat extreme and exclusive cultivation of the reason during part of the seventeenth and eighteenth centuries brought about a reaction known particularly in Germany as the Pietistic Movement. . . . The aims of the schools established under the influence of this movement were predominantly religious. . . . August Francke (1663-1727), the leader of the movement in Germany, established schools for the very poor, the aim of which was 'to lead the children to a living knowledge of God and Christ and to train them up to a thorough Christianity.' From three to four of the seven daily school hours were given to instruction in religion. Much attention was given to prayer; not only teachers but pupils were required to pray 'from the heart.' Worldly pleasures were discouraged. There were no holidays. Play was forbidden to all the pupils. Teachers were to show the pupils 'its vanity and foolishness and how through it their hearts were drawn away from God to the injury of their souls.'"—L. F. Anderson, *History of common school education*, pp. 250-251.—In the seventeenth century also a profound influence on education was produced in Germany by August Hermann Francke, who established at Halle Burgher Schools, in which no Latin was taught; a Latin School, which was a secondary school designed to prepare its students for the university,

and a *Pedagogium*—a secondary school of a higher order. "In it were taught Latin, Greek, Hebrew, and French, besides German, arithmetic, geography, history, astronomy, geometry, music, botany, anatomy, and the elements of medicine. The most notable fact of all was that there was connected with it a botanical garden, and that it was equipped with a science cabinet, with physical apparatus, a chemical laboratory, conveniences for anatomical dissection, turning lathes, and machines for grinding glass. The students were to learn wood-turning, glass-grinding, painting, and sketching. The *Pedagogium* certainly was a modern school. . . . Whatever was good in the Reformation for religion and education seems to have ripened in Francke, and whatever was good in the text-books and the *Didactica* of Comenius seems to have come to abundant fruition in his work."—E. L. Kemp, *History of education*, pp. 239, 240.—See also UNIVERSITIES AND COLLEGES: 1694-1906.

ALSO IN: J. Adamson, *Pioneers of modern education*.

Holland: Schools state-owned.—High standard.—"In the schools . . . [of the fifteenth and sixteenth centuries], although they were fostered by the State, the teachers seem, in the main, to have been paid by their pupils. But as years went on, a change came about in this part of the system. It probably was aided by the noteworthy letter which John of Nassau, the oldest brother of William the Silent, the noble veteran who lived until 1606, wrote to his son Lewis William, Stadtholder of Friesland. In this letter, which is worthy of a place on the walls of every schoolhouse in America, the gallant young stadtholder is instructed to urge on the States-General 'that they, according to the example of the pope and Jesuits, should establish free schools, where children of quality as well as of poor families, for a very small sum, could be well and christianly educated and brought up. This would be the greatest and most useful work, and the highest service that you could ever accomplish for God and Christianity, and especially for the Netherlands themselves. . . . In summa, one may jeer at this as popish trickery, and undervalue it as one will: there still remains in the work an inexpressible benefit. Soldiers and patriots thus educated, with a true knowledge of God and a Christian conscience, item, churches and schools, good libraries, books, and printing-presses, are better than all armies, arsenals, armories, munitions, alliances, and treaties that can be had or imagined in the world.' Such were the words in which the Patriarch of the Nassaus urged upon his countrymen a common-school system. In 1609, when the Pilgrim Fathers took up their residence in Leyden, the school had become the common property of the people, and was paid for among other municipal expenses. It was a land of schools supported by the State—a land, according to Motley, 'where every child went to school, where almost every individual inhabitant could write and read, where even the middle classes were proficient in mathematics and the classics, and could speak two or more modern languages.' Does any reader now ask whence the settlers of Plymouth, who came directly from Holland, and the other settlers of New England whose Puritan brethren were to be found in thousands throughout the Dutch Republic, derived their ideas of schools first directed, and then supported by the State?"—D. Campbell, *Puritan in Holland, England and America*, chs. 2 and 20.—"In the seventeenth century no other country in the world developed educational facilities for the masses of the people with such rapidity and enthusiasm as Holland. Germany might have kept

pace with her if she had not suffered from the devastation of the Thirty Years' War, but that terrible struggle left her seriously crippled. . . . The teaching was often poor enough . . . [but] early in the seventeenth century there were already so many . . . [free] schools established that, it is claimed, it was almost impossible to find a person in Holland, even in the country, unable to read and write, provided he was old enough for such accomplishments."—E. L. Kemp, *History of education*, pp. 225, 226.

ALSO IN: L. Davidson, *History of education*.

Scotland: Influence of Knox.—Parish schools.—High standard.—"In the sixteenth century, Mulcaster in England would limit education to the few, but believed that everyone should be taught to read and write. In this John Knox in Scotland went beyond him, and advocated 'that each church should have a schoolmaster capable of teaching Latin and grammar at least. All children,' he wrote, 'must be educated, rich and poor.'"—A. Lang, *History of Scotland*, v. 2, p. 83.—Knox's ideals had a far-reaching influence, but it was long before they were realized in Scotland. "The Highland barons, following the example of their Lowland contemporaries, seized the revenues which Knox designed for the support of education. . . . But by this time, the question of national education could no longer be shelved. The more school work was frustrated, the more pressing and clamant the need of it appeared in the eyes of the governing authorities. . . . As early as 1609, James VI [First of England] had the subject of education in the Western Islands dealt with by an Assembly at Iona . . . under the presidency of Andrew Knox. . . . The measures they passed are still known as the 'Statutes of Icolmkil.' Of these the sixth provides 'that every gentilmen or yeaman within the saidis Islandis or any of them mail or femall . . . shall putt at the leist their eldest sone, or having no children mail, their eldest dochter to the scullis in the lawland. . . .' In this mandate it appears that the education of the daughters of chiefs and chieftains only became compulsory when there were no sons. . . . In 1616 . . . an Act of the Privy Council . . . practically made the provisions compulsory. . . . the first compulsory . . . [act] so far as the Highlands are concerned. . . . Later in the same year an Act was passed for the establishment of parish schools in Scotland, for among the objects aimed at was the extinction of Gaelic. . . . This policy of extinguishing the language of the . . . [Highland people] has been followed almost down to the present time. . . . For the next hundred years after the establishment of the parish schools . . . [they] held the field. One in each parish, which was the aim rather than the accomplished fact, was ridiculously inadequate. . . . Meanwhile the scholastic accomplishments of the middle and upper classes had developed apace. They not only received a regular education at local grammar schools, such as those at Inverness and Aberdeen, but were sent to the universities, and many of them abroad. . . . Nor was the education of the girls neglected. . . . By the year 1696 it became evident that . . . many places were utterly destitute of the means of education . . . and a new Act was framed authorising 'that there be a school and schoolmaster appointed in every parish not already provided.'"—M. MacLean, *Historical development of education in the Highlands*, pp. 5-10.—Even when this was done, only a small proportion of the children could reach the schools. Many of the parishes, especially in the Highlands, were very large, and the schools inaccessible for children. Along the seaboard, more than one

island was as a rule included in a parish, and in one case a rough sea passage of fifty miles had to be traversed to reach the church. Nevertheless "in Europe, Scotland was the one country that rivalled Holland in its interest in public instruction. In 1646 there was enacted a law requiring landlords to provide school-houses in every parish and employ teachers. This law was re-enacted in 1696, and seems to have been then very faithfully complied with. The supervision of these schools was vested in the presbyteries. [As the desire for education increased], in many of the schools, both in towns and villages, the masters taught Latin and Greek and prepared boys for the university."—E. L. Kemp, *History of education*, p. 229.

ALSO IN: J. Edgar, *History of early Scottish education*.

United States: Early colonial education.—To the Puritan Fathers, the Bible was the rule of life,

whose wages shall be paid, either by the parents or masters of such children, or by the inhabitants in general, by way of supply, as the major part of those who order the prudentials of the town shall appoint." Following on this, Plymouth opened a school in 1650, the same year that Connecticut enacted practically the same law as the parent colony. These schools were supported by per capita rates or taxes levied on the parents of the children who attended the school. The boys were supposed to be able to read, or at least to know the alphabet when they were admitted to school, and as early as 1651 dame schools, early precursors of the primary schools, appeared in New Haven. These very elementary schools were kept by women who were themselves able to read, and who were willing to teach their neighbors' children with their own, sometimes in the intervals of household work. Often they were kept by elderly, unmarried women,

A DAME SCHOOL

and ability to read it, one of their first rights, and their most precious privilege. Consequently, schools were established very early in the history of the northern colonies. The honor of establishing the first school, however, goes to the Dutch of New Amsterdam, where Adam Boelandson opened a school in 1633. He had been sent out for the purpose by the West India Company at the behest of the States General. Philemus Purmont was called upon, in Boston Town Meeting, in 1635, "to become schoolmaster for the teaching and nurturing of children." The other settlements rapidly followed suit, and we read of a school in Dorchester in 1640, Ipswich and Salem in 1641, Cambridge in 1642, Weymouth in 1643, Roxbury in 1645. In 1647 the Massachusetts legislature passed a law providing that "every township within this jurisdiction after the Lord hath increased them to the number of fifty house-holders, shall then forthwith appoint one within their town to teach all such children as shall resort to him, to read and write,

who adopted this means of eking out a living. They were probably the only means of education within the reach of many girls, throughout that century at least, when as little effort was made towards the education of women as in England at the same period. After the British occupation of New York in 1664, the parochial system was introduced there, at the same time that some private schools were established. How much was taught in the majority of these schools throughout the country it is difficult to say. Probably reading, writing, some spelling, and a very small smattering of arithmetic. Teachers in the country districts had little to offer. Life was hard, and as a rule, there was but little time to gain a thirst for book knowledge, even if the books had been at hand to assuage it. Nevertheless, a very early effort was made to provide higher education in the towns. The Massachusetts law, quoted above, ordered that "where any town shall increase to the number of one hundred families or householders,

they shall set up a grammar school, the master thereof being able to instruct youths so far as they shall be fitted for the university." The first grammar school was actually opened in Boston in 1635 and it is still in existence as the Boston Latin School, a name which probably very accurately described the first form of instruction which was obtained there. (See above: 17th century: England.) From these grammar schools have sprung the high schools of the present day. The Hartford Court ordered in 1600 that "two free schools be kept and maintained for the teaching of all such children as shall come there, after they can first read the psalter, to teach such reading, writing, arithmetic, the Latin and Greek tongues; the one at Hartford, the other at New Haven." The development of popular education was much slower in Pennsylvania and in the South, owing chiefly to the special circumstances which attended the settlement of the country. In Pennsylvania, the legislature did not concern itself with the subject, which was left to the churches with their scanty funds, and the scattered preachers were frequently teachers also. In fact "the custom of employing preachers as teachers and assuming their ability was quite general [but], there is one early instance of a license requirement. Thomas Macon, in 1693, was told that he could not keep school without a license and was ordered to procure a certificate of ability, learning and diligence."—K. M. Cook, *State laws (Bureau of Education, Bulletin no. 22, 1921)*.—In Virginia the large planters, who had most influence in public affairs, combined to engage private tutors for their families, and gave little or no thought to education for the poor settlers. Governor Berkeley writing in 1671 said: "I thank God there are no free schools nor printing presses, and I hope we shall not have them these hundred years." Later there were "field schools" for the support of which a number of families contributed, and "pauper schools" supported by public subscription, but it was long before Virginia developed her system of public schools. In the Carolinas, with their sparse settlements, there was little or no presence at book education among the poorer settlers. In the towns, however, in all the colonies, the apprenticeship system played an important part in educating the minds of the people, while the Massachusetts laws directed that all apprentices should be taught to read. The qualifications for the teachers of grammar schools were necessarily much higher than those looked for in teachers of the lower schools. During the colonial period the "requirements for teachers' certificates were very meager and indefinite, though some were always exacted. In New York, during the period of Dutch colonization, teachers were licensed by civil and ecclesiastic authorities. No one was allowed to teach without a license so obtained. During the English control, 1683 to 1689, it was decreed that 'no schoolmaster should teach without a license from the Archbishop of Canterbury or from the Bishop of London.' That requirements under either régime were not rigid is illustrated by the case of Johannes von Gilder, who was tolerably 'well acquainted with reading and writing; so it happened that several of the principal inhabitants advised and encouraged him to open a public school.' He then petitioned and was granted the privilege of 'keeping school.' In New England, as in New York, the character of the requirements was in some cases purely religious, some special form of religion being a prerequisite. In others, nationality was the determining factor, and in others academic proficiency was the desideratum. . . . The New Hampshire schoolmaster, like that of Massachusetts,

must be 'discreet of conversation and well versed in tongues.' This regulation was in force in 1647."—K. M. Cook, *State laws (Bureau of Education, Bulletin no. 22, 1921, p. 9)*.—"When New Hampshire became separate from Massachusetts, in 1693, it at once equally taxed all the inhabitants for the support of schools. In secondary and higher education the southern colonies vied with those of the north; but the public school idea did not take root there. This was due partly to the scattered condition of the population and partly to the peculiar type of social life. It is not wise to praise extravagantly the teaching in these first public schools, yet in New England it was common for the young graduates of Harvard to teach in the elementary schools before taking up a profession. One of the interesting features of the early New England schools was the hornbook. This was an English invention. It was a square paddle of wood or pasteboard furnished with a short handle. On it was pasted a sheet of paper containing the small and capital letters, the Arabic and Roman numerals, a number of syllables for spelling, and the Lord's prayer. Over the paper was fastened a transparent sheet of horn. It was one of the most convenient books ever invented, because its shape and strength adapted it to be applied to the body when the pupil lacked diligence, and thus made it serve as a stimulator. After the hornbook was mastered, the catechism was studied and the Bible was read. The arithmetic lessons were very simple. The hornbook was superseded finally by the primer, which resembled the handbook for children used in the German schools."—E. L. Kemp, *History of education, pp. 227, 228*.

17th-20th Centuries

Christian Brothers.—"Any description of popular education in Europe would be incomplete, which should not give prominence to the Institute of the Christian Brothers—or the Brothers of the Christian Doctrine [or Brothers of the Christian Schools]—including in that term the earliest professional school for the training of teachers in Europe; one of the most remarkable bodies of teachers devoted exclusively and without pay to the education of the children of the poor that the world has ever seen. . . . The Institute was established as a professional school in 1681, and to Abbé John Baptist de la Salle, belongs the high honor not only of founding it, but of so infusing into its early organization his own profound conviction of the Christ-like character of its mission among the poor, that it has retained for nearly two centuries the form and spirit of its origin. This devoted Christian teacher was born at Rheims on the 30th of April, 1651. . . . He was early distinguished for his scholarly attainments and maturity of character; and at the age of seventeen, before he had completed his full course of theological study, he was appointed Canon in the Cathedral church of Rheims. From the first, he became interested in the education of the young, and especially of the poor, as the most direct way of leading them to a Christian life;—and with this view, before he was twenty-one years old, he assumed the direction of two charities, devoted to female education. From watching the operation of these schools, conducted by teachers without professional training, without plan and without mutual sympathy and aid, he

conceived the design of bringing the teachers of this class of schools from the neighboring parishes into a community for their moral and professional improvement. For this purpose, he invited them first to meet, and then to lodge at his house, and afterwards, about the year 1681, he purchased a house for their special accommodation. Here, out of school hours and during their holydays, they spent their time in the practice of religious duties, and in mutual conferences on the work in which they were engaged. About this period, a large number of free schools for the poor were established in the neighboring towns; and applications were constantly made to the Abbé for teachers formed under his training, care, and influence. To meet this demand, and make himself more directly useful in the field of Christian education, he resigned his benefice, that he might give his whole attention to the work. To close the distance between himself, having a high social position and competence from his father's estate, and the poor schoolmasters to whom he was constantly preaching an unreserved consecration of themselves to their vocation—he not only resigned his canonry, with its social and pecuniary advantages, but distributed his patrimony, in a period of scarcity, in relieving the necessities of the poor, and in providing for the education of their children. He thus placed himself on a footing of equality—as to occupation, manner of life, and entire dependence on the charity of others—with the schoolmasters of the poor. The annals of education or religion show but few such examples of practical self-denial, and entire consecration to a sense of duty. . . . Having completed his act of resignation and self-imposed poverty, he assembled his teachers, announced to them what he had done, and sung with them a *Te Deum*. After a retreat—a period set apart to prayer and fasting—continued for seventeen days, they devoted themselves to the consideration of the best course to give unity, efficiency, and permanence to their plans of Christian education for the poor. They assumed the name of 'The Brothers of the Christian Doctrine,' as expressive of their vocation—which by usage came to be abbreviated into 'Christian Brothers.' They took on themselves vows of poverty, celibacy, and obedience for three years. They prescribed to themselves the most frugal fare, to be provided in turns by each other. They adopted at that time some rules of behavior, which have since been incorporated into the fundamental rules of the order. . . . In 1702 the first step was taken to establish an Institute at Rome, under the mission of one of the brothers, Gabriel Drolin, who after years of poverty, was made conductor of one of the charitable schools founded by Pope Clement XI. This school became afterwards the foundation of the house which the brothers have had in Rome since the pontificate of Benedict XIII., who conferred on the institute the constitution of a religious order. In 1703, under the pecuniary aid of M. Chateau Blanc, and the countenance of the archbishop, M. de Gontery, a school was opened at Avignon. . . . In 1780, the National Assembly prohibited vows to be made in communities; and in 1790, suppressed all religious societies; and in 1791, the institute was dispersed. At that date there were one hundred and twenty houses, and over one thousand brothers, actively engaged in the duties of the school room. The continuity of the society was secured by the houses established in Italy, to which many of the brothers fled. . . . In 1801, on the conclusion of a Concordat between the Pope and the government, the society was revived in France by the opening of a school at Lyons; and in 1815, they resumed

their habit, and opened a novitiate, the members of which were exempt from military service. At the organization of the university in 1808, the institute was legally reorganized, and from that time has increased in numbers and usefulness. . . . In 1842, there were 390 houses (of which 326 were in France), with 3,030 brothers, and 585 novices. There were 642 schools with 163,700 children, besides evening schools with 7,800 adults in attendance, and three reformatory schools with 2,000 convicts under instruction."—H. Barnard, *National education in Europe*, pp. 435-441.—The order "has extended its existence and activity into a number of countries in Europe, into Canada, into the United States, and into Africa and Asia. The Christian Brothers are now [1912] teaching in the different countries more than three hundred thousand primary pupils."—E. L. Kemp, *History of education*, p. 232.

18th Century

England: Dissenters' schools.—Public schools. —Education of the poor.—Dissenting educators were singled out for special attack . . . in the legislation under Anne which culminated in the Schism Act of 1714. [See ENGLAND: 1711-1714.] . . . The struggle had lasting and disastrous effects upon the history of English education. . . . In these academies such newer studies as mathematics, French and modern history formed part of the ordinary scheme of work. . . . After the Toleration Act [see ENGLAND: 1680 (April-August)], individual ministers started schools . . . of which it is now impossible to ascertain the number or even the origin and growth. . . . In their totality they present a brilliant galaxy of talent. . . . But the bent toward unitarianism frightened off the laymen, and effectually prevented the dissenting academies from leaving the deep mark on the English race and . . . educational system that might have been expected from the individual talent of their tutors, chief among whom was Joseph Priestly. . . . Nevertheless they did good service in the cause of history, literature, and modern studies, particularly in respect of modern sciences."—*Cambridge history of English literature*, v. 10, pp. 382, 383; v. 14, pp. 385, 386.—"Eton and Westminster were commonly accounted the public schools *par excellence* during the first half of the century, Winchester taking third place. Rugby's greatness only began [see RUGBY SCHOOL.] . . . in 1778-1794 while Harrow and Shrewsbury suffered decline. . . . Public schools retained their severity of discipline and roughness of manners, . . . while serious escapades were winked at or condoned. Many boys of rank were taught at home by tutors. Latin and Greek were the only educational instruments of which every boy could avail himself . . . but for boys who went through the entire course, Latin and Greek were literatures [not subjects as in schools of the present-day]. . . . Writing, arithmetic and . . . later . . . some mathematics were taught on half-holidays by teachers of inferior standing. Modern literature, English, French, drawing, dancing, fencing, were occupations for leisure hours."—*Cambridge history of English literature*, v. 10, pp. 382, 383; v. 14, pp. 385, 386.—Throughout the whole century, but little effort was made toward attacking the problem of popular, elementary education. "It is a remarkable fact that, during the whole of the eighteenth century, the task of educating the English poor, so far as it was undertaken at all, was left to the different religious denominations, and to the benevolence of individuals and voluntary associations. . . . The old law, which forbade the opening of any school with-

out the license of a bishop, [thus providing for the elimination of schools for Roman Catholics and dissenters] . . . was obsolete . . . but the government did nothing whatever to support education. . . . There were still many endowed schools dating from an earlier period, which gave free education to many children, and there had been a great and beneficent movement for the erection of parochial schools under Anne. . . . [But] for more than sixty years after the death of Anne, the history of education in England is almost a blank. . . . It was the prevailing feeling that the education of the people was entirely foreign to the duties of government, and . . . that education would only unfit the poor for the life allotted to them."—W. E. H. Lecky, *History of England*, v. 6, pp. 276, 277.—"A plan worked out [1780] by Robert Raikes, of Gloucester, in England, in the last quarter of the eighteenth century, attempted to solve the problem by providing instruction on Sundays and in the evenings in what became known as the Sunday school. The poor, young and adult, were thus enabled to attend school while earning a living in the factories and elsewhere. These Sunday schools were established in several towns and cities in America. Though their work was helpful, particularly in factory districts, it was too brief and intermittent to meet the needs of even the poorest classes. The instruction afforded was mainly in reading, writing, and religion. Gradually the secular instruction was dropped, and the work of the Sunday school became purely religious in character."—L. F. Anderson, *History of common school education*, pp. 276-277.—"That the established curriculum [in all the schools] was unsatisfactory is evident from the pains Knox—master of Tunbridge school from 1778 to 1812—took to show the inadequacy . . . of many private schools, commonly termed academies, which prepared boys for 'business' and 'the office.' Among many things, they professed to teach Latin or, more frequently, French, but Knox asserted their success was confined to reading and summing. Nevertheless within forty years, the number of such schools, and their efficiency, greatly increased. An increase was made during the century in endowed grammar schools, which however taught only English reading, writing and summing. The number of charity schools declined, . . . chiefly because the plan of instruction was bad and the teachers incompetent to teach. Sunday schools taught reading, writing, and, in some cases, simple arithmetic. In some cases the teachers were paid a small sum. These schools increased as rapidly as the charity schools declined. For those who could pay a few pence weekly there were, by the close of the eighteenth century, any number of privately conducted schools, many of them dame schools, which taught reading, writing and summing, either in the evening or daytime; and many men and women supplemented their domestic employment by teaching children. Both Mrs. Trimmer and Joseph Lancaster [who himself commenced his educational career by teaching a small school in addition to his business of weaving], commented unfavorably upon these schools, but their very existence expressed a crying need, even in villages, which they sought to satisfy. For the benefit of an even humbler rank 'schools of industry' gave instruction, for the most part to girls, in spinning, knitting and plain needlework, and to a smaller number of boys in gardening and minor handicrafts; in some cases . . . reading and writing were added. In method and intention, these English schools may be compared . . . to the experiment . . . which Pestalozzi began."—*Cambridge history of English literature*, v. 14,

pp. 389, 390.—Yet "the eighteenth century . . . was remarkable for the number of poor men who rose to high positions in church and state, and in the world of letters. In Cumberland and Westmoreland at the close of the century there were few illiterates."—A. E. Dobbs, *Education and social movements*, p. 67.—"What was true of the education of girls in England, at the close of the seventeenth century, was equally true down through the eighteenth. The mother tongue and drawing were regarded as studies especially appropriate to girls, and by the end of the century botany had been placed in the same category. The opinion was fairly general that girls of all but the highest social standing, or great wealth, ought to receive instruction of a distinctly 'useful' kind, the others were to acquire 'accomplishments.'"—*Cambridge history of English literature*, v. 14, p. 387.—See also WOMAN'S RIGHTS: 1673-1800; CLASSICS: 18th-19th centuries.

France: Infant schools.—Introduced by Oberlin.—Schools of the first republic.—"That the educational activities of the church [in France] were prompted not only by the narrowing interests of denominationalism but also by the broadening interests of philanthropy appears in such attempts as those of Pastor Oberlin. Jean Frederic Oberlin was a young Lutheran pastor whose charge in eastern France had been ravaged by war. Oberlin conceived the idea (1774) of giving some training to the very young children of the villages belonging to his charge. Thus arose toward the close of the eighteenth century the so-called 'infant schools' of France. They were day-nurseries into which physical exercises, singing, drawing, and other kindergarten exercises were woven."—C. C. Boyer, *History of education*, p. 347.—"Amidst all the strifes of its parties, committees of the Convention quietly laid the basis of the new social order by a splendid scheme of National Education (drawn up by Condorcet on Rousseau's ideas) in primary schools, central schools, and a normal school for the instruction of teachers. . . . The splendid scheme of national education, drawn up by the Convention during the Reign of Terror, had never taken deep hold on France. The primary or elementary schools were . . . very few in number: there were only 102 *écoles centrales*, where more advanced instruction was given; and the *écoles supérieures* for higher education, were doing little work. Grand as had been the aims of Condorcet and his co-workers, they had really effected little more than the destruction of the old clerical education."—J. H. Rose, *Revolutionary and republican era*, pp. 136-137.—The schools of the first republic had no resemblance to either those of the *ancien régime*, or of the later period. Teachers were forbidden to give work as a punishment. They were desired to inculcate "hatred of royalty, love of country, and republican virtues in their lessons." The schools were divided into three sections. In the lowest, boys were taught the reading, writing, arithmetic, Latin and drawing. In the intersection, natural science, mathematics, physics, and chemistry were the principal subjects; while the boys in the upper schools studied chiefly "Grammaire Générale." It was left to Napoleon to reorganize education in France.—See also WOMAN'S RIGHTS: 1700-1787.

Germany: Advance in state and compulsory education.—In the eighteenth century, Germany partly laid the foundations of her rapid advance in education in the nineteenth century. "The first efficiency move was made by Frederick William I of Prussia when in 1717 he issued a decree requiring parents to send their children to elementary schools, . . . devoted state funds to the establishment of rural schools . . . and, when he found it difficult to secure intelligent teachers, . . . founded the first training school for teachers . . . at Stettin. . . . Frederick the Great . . . issued in 1763 . . . general school regulations, by which . . . school attendance was made compulsory between the ages of five and thirteen years—or fourteen for those who could not pass the state tests; examination and license by a local inspector and clergyman were requisite for all teachers; the schoolmaster was required to teach on Sundays young unmarried people who were beyond school age. . . . In 1787, a central board was established. . . . All schools and universities were declared to be state institutions. . . . The code also provided for compulsory attendance, and the appointment of teachers by the state."—C. C. Boyer, *History of education*, pp. 337, 338, 340, 341.—"A great part of the German nation was already familiar with the idea that it was a right and duty of the state to enforce and extend public education and, . . . by the end of the eighteenth century, there had been established throughout Germany a strong intellectual tradition, which was predisposed to welcome a great development of public education under the supervision of the state."—C. H. Herford, *Germany in the nineteenth century*, pp. 107, 108.—"Most of the development of real schools and training-schools for teachers in the eighteenth century is traceable to the work of Francke. The real school was a new type of secondary school. It emphasized attention to mathematics, drawing, geography, history, natural science, and agriculture. It made study by direct observation a prominent feature of its work, or at least professed to do so. It was a triumphant step forward in the new educational revolution. The term *Real* was first used by Semler in 1739, in a report on his school at Halle. He had been intimately associated with Francke. The first famous *real* school was established in Berlin in 1747, by Johann Julius Hecker. There was soon a number of imitators. These early *real* schools made the mistake of trying to retain all the old and adding the new. They also made efforts to prepare for special callings. Their courses thus became too extensive, and the work was rendered defective. But they had come to stay. Growing conditions demanded them. They were the forerunners of our Latin-scientific and technical schools. . . . The first one of these schools to be known as a normal school was established in Vienna in 1771. The school was very much like many of the American normal schools. It was intended not only to train teachers, but to serve also as a model for imitation. It was a combination of elementary school, *real* school, and teachers' seminary. It became a part of a scheme for general education in Austria, whose accomplishment Maria Theresa placed in charge of John Ignacius von Felbiger. He was a Catholic abbot, who took deep interest in popular education and had been profoundly impressed by the education principles and labors of the Pietists. [Maria Theresa also endeavored to further the cause of education in Belgium. Her work was carried on by Joseph II.]"—E. L. Kemp, *History of education*, pp. 249, 250.

ALSO IN: F. Paulsen, *German education, past and present.*

Ireland: Lack of education.—Charter schools. —During the eighteenth century, education in Ireland was at the very lowest possible ebb. "National education had not yet been undertaken by the Parliaments of either England or Ireland as a serious duty, and the charter schools, which were still liberally supported, cast scarcely a perceptible ray on the dense mass of Catholic ignorance. In Trinity College, it is true, Catholics of the higher and middle orders were already admitted by connivance, though they could not yet obtain degrees or honors, but there was no provision for the poor. . . . For generations their education had been prescribed by law, and when the laws were repealed, the poverty of the priests and people, the absence of educational institutions and endowments, and the habits contracted during the penal laws were insuperable obstacles. The great mass of the Irish Catholics were either absolutely ignorant, or were left to the slight, uncertain, and often perverting teaching of the hedge schoolmaster. In 1787 indeed an extremely comprehensive system of national education was introduced by Orde, the Chief Secretary of the Duke of Rutland. He proposed to revive the schools in every parish, which had been enjoined by a statute of Henry VIII, to establish four large schools of a higher kind; . . . to reform the diocesan schools, and ultimately to found a second university. . . . The resolutions introduced by Orde passed, [but] . . . the death of the Duke of Rutland in October, 1787, led to the recall of Orde, and his project [was not carried into effect]."—W. E. H. Lecky, *History of England*, v. 6, pp. 451, 452.—In 1733, the charter schools in Ireland were founded. They were originally intended for the education of poor Protestants as well as Roman Catholics; but were afterwards confined to the latter, who were brought up in the schools in the Protestant faith. In 1803, however, Protestants were again admitted. Allowing for every exaggeration of partisanship reports, some of these schools were conducted as badly as the worst English schools held up to scorn by Dickens, while the boys who were educated there were, as a rule, afterwards treated with contumely by their compatriots.

ALSO IN: J. Godkin, *Education in Ireland.*—T. Corcoran, *State policy in Irish education, 1536-1816.*

Norway: Education left to the parishes.—In the eighteenth century, Norway began an effort to individualize education. "By a royal ordinance of 1739, an endeavour was made to introduce into the country a general school attendance, and a permanent school for each church parish. The measure, however, was never put into practice. On account of the scattered population, long distances, and lack of teachers, it was left by an ordinance of 1741, to the several parishes . . . to arrange their school affairs."—J. V. Heiberg, *Education (Norway)*, S. Konow and K. Fischer, ed., p. 266.

Russia: Schools of Peter the Great.—From the first Peter (the Great) did much to promote education, especially education of a practical sort. Schools of mathematics and navigation were established, about 1702, at Moscow, and in 1703 another school was founded there, at which geography, ethics, politics, Latin rhetoric, the Cartesian philosophy, dancing and the elements of French and German were taught. Great efforts were made to provide cheap books for the new schools. The chief worker in this field was the Protestant Pole, Ilia Kopsinski, who set up a press at Amsterdam and, having the privilege of printing all Russian books, issued a considerable number. In 1700 he

printed a version of Æsop, remarkable as being the first Russian translation from an ancient classical author."—*Cambridge modern history*, v. 5, p. 529.

United States: Status of education before and after the Revolution.—Barren as the eighteenth century was in educational achievements, some efforts were made by the American colonies in the direction of providing teachers for the youth of the country, especially in New England. "The Massachusetts law of 1701 required every grammar schoolmaster to be approved by the minister of the town and the ministers of two adjacent towns. According to the law of 1712, schoolmasters must secure the approbation of the selectmen of the town. Later, in 1789, it was required that masters of schools must be graduates of a college or university, though a certificate of proficiency from some learned minister might be taken in lieu of this. In Connecticut and New Jersey it was decreed at least as early as 1714 that selectmen should examine teachers as to their qualifications. Little is said as to the nature of these."—K. Cook, *State laws and regulations governing teachers' certificates* (*Bureau of Education, Bulletin no. 22, 1921, p. 9*).—"From the New Amsterdam Records, Vol. II, p. 348, we find that Jacob van Corlaar had taught reading, writing and ciphering. From the New York City Records, we find that in 1703 George Muirson was authorized and empowered to instruct in the 'art of arithmetic.' Andrew Foucauth was employed [in 1704] to teach an English and French School within the City of New York in arithmetic among other things. This was in September, 1704. The next year Henry Lindley was employed to teach the English and Latin tongues or languages in Jamaica, and also writing and arithmetic. Again it is stated that in July, 1712, Allan Jarratt obtained a license from Governor Hunter 'to teach writing, arithmetic and navigation and other parts of mathematics to all such persons as shall be desirous to be instructed therein within this city or province.' Clews says that 'at a council held in Philadelphia in 1759 it was shown that in the college, academy [founded in 1749] and charity school of that city 130 boys were taught mathematics.' . . . The last act to specify mathematics as one of the things to be taught was in 1710 when 'an act for the encouragement of learning was passed by the Assembly of South Carolina which reads in part thus: John Douglas shall be, and is hereby declared to be Master of a Grammar School in Charlestown, for teaching Greek and Latin Languages, and shall choose one usher to the said school, who is empowered and required to assist the master aforesaid in teaching the languages, reading, English, writing, arithmetic or such other parts of mathematics as he is capable to teach.'"—H. Kimmel, *Status of mathematics and mathematical instruction during the colonial period* (*School and Society, Feb. 15, 1919*).—It appears, therefore, that, what may be termed the secondary schools, and still more the primary schools, where they existed, compared very favorably with the English and continental schools of the period. Even so, the amount of instruction given in the elementary schools was pitifully small. The New England primer (published in 1727), and other primers of the same quality imported from England, were practically the only text books in use until late in the century, when Webster's "Institutes of the English language," or "Blue Backed Speller" which was published just after the Revolution, caused a revolution in the teaching of English, and provided the standard for the famous "spelling bees" which in the next century were the occasion of much inno-

cent amusement. Morse's Geography (published about 1792-3) made a welcome addition to the curriculum, in geography and reading, and Webster's chapter on United States history, which was printed at the back was used as a reader. Pike's "Elementary Arithmetic" was published in 1793, and became the chief text book for the study of arithmetic for nearly forty years. "In the lecture delivered before the American Institute of Instruction in 1830, by Warren Colburn, on the teaching of arithmetic . . . he says that [in the preceding century] 'it must be allowed by all that . . . fewer persons learned arithmetic than at present. At least fewer made any considerable progress in it. Very few females pretended to study it at all, and the number of either sex that advanced much beyond the four primary rules was very inconsiderable. And the learner was very seldom found who could give a satisfactory reason for any operation which he performed. . . . Scholars under twelve or thirteen years of age were not considered capable of learning it, and generally they were not capable. Many persons were obliged to leave school before they were old enough to commence the study of it.' . . . We are . . . told that problems were written or solved by the pupil upon the cheapest paper, often only on the margins of the pages in his book. He sometimes had to resort to the leaves of old day-books, backs of letters, or even birch bark, and wrote with ink made from the maple tree and coppers. Teachers were hardly expected to know fractions and make excursions into the rule of three. Often arithmetic was crowded into the evening. And then 'sums' were curtly given out by the teacher who usually had a 'key.' The pupil usually had a blank-book which was made of a quire of paper folded and sewed together. This was called his 'ciphering book.' It was in this book that he copied the 'sums' that had been approved by his master. Not only were the problem and its solution copied in the book, but also the rule governing the solution of the problem. The master himself generally possessed such a 'ciphering book' which he as a student had made and which now served as his source of 'sums' and rules. It was also his criterion of correct answers and methods. . . . It was only the boys that studied arithmetic, and . . . they were generally about thirteen years of age before they commenced to study even the rudiments."—H. Kimmel, *Status of mathematics and mathematical instruction during the colonial period* (*School and Society, Feb. 15, 1919*).—See also KENTUCKY: 1769-1797; NEW YORK CITY: 1795-1842; VERMONT: 1791-1914; and UNIVERSITIES AND COLLEGES: 1701-1717; 1746-1787; 1746-1896; 1754-1769; 1762-1769; 1770; 1793; 1794; 1795.

Basedow and the development of naturalism.—"Johann Bernhard Basedow (1723-1790) was the talented son of a Hamburg wigmaker. He refused to follow his father's vocation and ran away from home, attaching himself as servant to a gentleman in Holstein. This man soon discovered the remarkable ability of the boy, and persuaded his father to send him to school to the Hamburg Gymnasium, where he came under the moulding influence of Reimarus. Presently friends entered him at the University of Leipzig for a course in theology, but, after a rather irregular life, and a serious lapse from trinitarianism to deism in religion, he left the university. In 1749 he became private tutor

in Holstein to the children of Herr von Quaalen, . . . [for whom] he first developed his famous methods of teaching through conversation and play, connecting instruction with surrounding objects in the house, garden, and fields. In less than four years his distinguished patron secured a professorship for him in the Ritterakademie at Sorøe, Denmark, where he lectured for eight years, when the government, on account of the serious offense which he gave by his writings on religion, was obliged to transfer him to the gymnasium at Altona. It was at this juncture that Rousseau's 'Emile' came into Basedow's life as a confirmation of his methods of thinking and teaching, and as an inspiration to a fuller development of his pedagogy. The times were ripe for just such a revolution in education as Basedow, inspired by the 'Emile,' was about to undertake. 'Youth,' said Raumer, 'was in those days, for most children, a sadly harassed period. Instruction was hard and heartlessly severe. Grammar was caned into the memory, so were portions of Scripture and poetry. . . . Schoolrooms were dismally dark. No one conceived it possible that young children could find pleasure in any kind of work, or that they had eyes for aught besides reading and writing. The pernicious age of Louis XIV had inflicted on the poor children of the upper class hair curled by the barber, and messed with powder and pomade, braided coats, knee-breeches, silk stockings, and a dagger by the side—for active, lively children a perfect torture.' In short, children were treated as miniature adults, and education was largely a matter of instruction in deportment. . . . When . . . Basedow had explained his hopes and plans to Bernsdorf, the Danish minister of education, he was allowed to devote his whole energy to educational reforms. He began (1768) this work with an 'Address to Philanthropists and Men of Property on Schools and Studies and Their Influence on the Public Weal.' In this address he appealed to them for money to help him publish the books which he had submitted in outline and to organize a school in which the new ideas might be put to the test. Probably the most striking suggestions in the address were that the schools should be secularized and nationalized. At any rate, the response was prompt and gratifying. Money came to him from all classes of people and from many countries. The result was that in 1774 he was able to publish the books which he had planned. The first one, which he called 'Elementary Work,' was a text-book somewhat like the 'Orbis Pictus' of Comenius, which he had used with his private pupils, but powerfully modified by the naturalism of Rousseau's 'Emile,' and the second book, called the 'Book of Method,' a manual for parents and teachers, in which Rousseau's natural method of learning everything by experience was advocated with great perseverance. Foreign languages, for example, were to be learned not through grammars but through conversation. . . . Through his son's tutor, Behrisch, a friend of the poet Goethe, Prince Leopold of Dessau became so greatly interested in Basedow's plans that he determined to found an institute in which they should be put to the test. Accordingly, in 1774, Basedow was called to Dessau, and under his direction was opened the famous 'Philanthropinum.' 'Then, for the first, and probably for the last time,' as Quick puts it, 'a school was started in which use and wont were entirely set aside.' Everything was to be done 'according to nature.' Love of 'human nature,' as the name of the school implies, was to be the dominating purpose. . . . The school at Dessau was small, never numbering more than fifty children, but rep-

resenting both the well-to-do and the poorer population of the neighborhood. They were dressed and groomed for comfort and freedom of movement. Much valuable instruction was imparted in connection with outdoor games and plays, and nature was wooed in trips that added much to child happiness. The language of the children was the language of instruction, but Latin and French were also taught. The natural method was employed, in connection with acting-games, pictures, drawing, and stories. Other studies, like geography, history, and arithmetic, were not slighted, and the methods employed resembled the language method. Every boy was taught such handicrafts as turning, planing, and carpentry; but, with some deference to social demands, the rich boy spent only two hours a day on these exercises, while the boy who must earn a living by work spent six hours on them. Nothing but 'natural religion' was taught, the task of teaching revealed religion being referred to the home. . . . Basedow was in many ways quite unfit for his position, and soon lost it. Campe, who succeeded him, withdrew within a year and founded a similar school in Hamburg. Although the school at Dessau was closed in 1793, philanthropinums began to spring up all over Germany, and some of them had much influence on educational practice in general. One of these was established at Schnepfenthal by Christian Salzmann (1744-1811). This able man, whose school still lives, anticipated many of the reforms which Pestalozzi afterward introduced into primary education. These philanthropinums, together with the attractive literature which Basedow's followers produced, carried the new ideas into all parts of Germany and Switzerland, where they became the inspiration of Pestalozzi, Froebel, and Herbart. 'Hence,' as Doctor Graves says, 'despite his visionary disposition, his intemperance, and his irregularity of living, the reformer who first attempted to embody the valuable aspects of Rousseau's naturalism in the education of Germany was Basedow, rather than Pestalozzi, who afterward transformed it so much more successfully.'"—C. C. Boyer, *History of education*, pp. 298-302.

Rousseau and naturalism.—"Rousseau, who had educated himself, and very badly at that, was impressed with the dangers of the education of his day. A mother having asked his advice, he took up the pen to write it; and, little by little, his counsels grew into a book, a large work, a pedagogic romance ["Emile"]. This romance, when it appeared in 1762, created a great noise and a great scandal. The Archbishop of Paris, Christophe de Beaumont, saw in it a dangerous, mischievous work, and gave himself the trouble of writing a long encyclical letter in order to point out the book to the reprobation of the faithful. This document of twenty-seven chapters is a formal refutation of the theories advanced in 'Emile.' . . . In those days, such a condemnation was a serious matter; its consequences to an author might be terrible. Rousseau had barely time to flee. His arrest was decreed by the parliament of Paris, and his book was burned by the executioner. . . . As a fugitive, Rousseau did not find a safe retreat even in his own country. He was obliged to leave Geneva, where his book was also condemned, and Berne, where he had sought refuge, but whence he was driven by intolerance. He owed it to the protection of Lord Keith, governor of Neuchâtel, a principality belonging to the King of Prussia, that he lived for some time in peace in the little town of Motiers in the Val de Travers. . . . The renown of the book, condemned by so high an authority, was immense. Scandal, by attracting public atten-

tion to it, did it good service. What was most serious and most suggestive in it was not, perhaps, seized upon; but the 'craze' of which it was the object had, notwithstanding, good results. Mothers were won over, and resolved to nurse their own infants; great lords began to learn handicrafts, like Rousseau's imaginary pupil; physical exercises came into fashion; the spirit of innovation was forcing itself a way. . . . Three men above all the rest are noted for having popularized the pedagogic method of Rousseau, and for having been inspired in their labors by 'Emile.' These were Basedow, Pestalozzi, and Froebel. Basedow, a German theologian, had devoted himself entirely to dogmatic controversy, until the reading of 'Emile' had the effect of enlarging his mental horizon, and of revealing to him his true vocation. . . . Pestalozzi of Zürich, one of the foremost educators of modern times, also found his whole life transformed by the reading of 'Emile,' which awoke in him the genius of a reformer. . . . The most distinguished among his

JOHANN HEINRICH PESTALOZZI

disciples and continuators is Froebel, the founder of those primary schools . . . known by the name of 'kindergartens,' and the author of highly esteemed pedagogic works. These various attempts, these new and ingenious processes which, step by step, have made their way among us, and are beginning to make their workings felt, even in institutions most stoutly opposed to progress, are all traceable to Rousseau's 'Emile.' . . . It is true that 'Emile' contains pages that have outlived their day, many odd precepts, many false ideas, many disputable and destructive theories; but at the same time we find in it so many sagacious observations, such upright counsels, suitable even to modern times, so lofty an ideal, that, in spite of everything, we cannot read and study it without profit. . . . There is absolutely nothing practicable in his [Rousseau's] system. It consists in isolating a child from the rest of the world; in creating expressly for him a tutor, who is a phoenix among his kind; in depriving him of father, mother, brothers, and sisters, his companions in study; in surrounding him with a perpetual charlatanism, under the pretext of following nature; and in showing him only

through the veil of a factitious atmosphere the society in which he is to live. And, nevertheless, at each step it is sound reason by which we are met; by an astonishing paradox, this whimsicality is full of good sense; this dream overflows with realities; this improbable and chimerical romance contains the substance and the marrow of a rational and truly modern treatise on pedagogy. Sometimes we must read between the lines, add what experience has taught us since that day; transpose into an atmosphere of open democracy those pages, written under the old order of things, but even then quivering with the new world which they were bringing to light, and for which they prepared the way. Reading 'Emile' in the light of modern prejudices, we can see in it more than the author wittingly put into it; but not more than logic and the instinct of genius set down there. To unfold the powers of children in due proportion to their age; not to transcend their ability; to arouse in them the sense of the observer and of the pioneer; to make them discoverers rather than imitators; to teach them accountability to themselves and not slavish dependence upon the words of others; to address ourselves more to the will than to custom, to the reason rather than to the memory; to substitute for verbal recitations lessons about things; to lead to theory by way of art; to assign to physical movements and exercises a prominent place, from the earliest hours of life up to perfect maturity; such are the principles scattered broadcast in this book, and forming a happy counterpoise to the oddities of which Rousseau was perhaps most proud."—J. Steeg, *Introduction to Rousseau's "Emile."*

18th-19th Centuries

Pestalozzi and the beginning of the psychological movement.—In Switzerland, up to the end of the eighteenth century, the state of primary instruction was very bad. "The teachers were gathered up at hazard; their pay was wretched; in general they had no lodgings of their own, and they were obliged to hire themselves out for domestic service among the well-off inhabitants of the villages, in order to find food and lodging among them. A mean spirit of caste still dominated instruction, and the poor remained sunk in ignorance. It was in the very midst of this wretched and unpropitious state of affairs that there appeared, towards the end of the eighteenth century, the most celebrated of modern educators. . . . Born at Zurich in 1746, Pestalozzi died at Brugg in Argovia in 1827. This unfortunate great man always felt the effects of the sentimental and unpractical education given him by his mother, who was left a widow with three children in 1751. He early formed the habit of feeling and of being touched with emotion, rather than of reasoning and of reflecting. The laughing-stock of his companions, who made sport of his awkwardness, the little scholar of Zurich accustomed himself to live alone and to become a dreamer. Later, towards 1760, the student of the academy distinguished himself by his political enthusiasm and his revolutionary daring. At that early period he had conceived a profound feeling for the miseries and the needs of the people, and he already proposed as the purpose of his life the healing of the diseases of society."—G. Compayré, *History of pedagogy, ch. 18.*—"In spite . . . of Pestalozzi's patent disqualifications in many respects for the task he undertook; in spite of his ignorance of even common subjects (for he spoke, read, wrote, and cyphered badly, and knew next to nothing of classics or science); in spite of his want of worldly wisdom, of any com-

prehensive and exact knowledge of men and of things; in spite of his being merely an elementary teacher,—through the force of his all-conquering love, the nobility of his heart, the resistless energy of his enthusiasm, his firm grasp of a few first principles, his eloquent exposition of them in words, his resolute manifestation of them in deeds,—he stands forth among educational reformers as the man whose influence on education is wider, deeper, more penetrating, than that of all the rest—the prophet and the sovereign of the domain in which he lived and laboured. . . . It was late in life—he was fifty-two years of age—before Pestalozzi became a practical schoolmaster. He had even begun to despair of ever finding the career in which he might attempt to realize the theories over which his loving heart and teeming brain had been brooding from his earliest youth. . . . [In 1798] at fifty-

wishes [he writes] were now accomplished. I felt convinced that my heart would change the condition of my children as speedily as the springtide sun reanimates the earth frozen by the winter. Nor,' he adds, 'was I mistaken. Before the springtide sun melted away the snow from our mountains, you could no longer recognise the same children.' . . . Pestalozzi advanced to the main principles of his system of moral education. . . . He says:—'Nature develops all the human faculties by practice, and their growth depends on their exercise.' 'The circle of knowledge commences close around a man, and thence extends concentrically.' 'Force not the faculties of children into the remote paths of knowledge, until they have gained strength by exercise on things that are near them.' 'There is in Nature an order and march of development. If you disturb or interfere with it, you mar the peace and

PESTALOZZI AT STANZ

two years of age, then, we find Pestalozzi utterly unacquainted with the science and the art of education, and very scantily furnished even with elementary knowledge, undertaking at Stanz, in the canton of Unterwalden, the charge of eighty children, whom the events of war had rendered homeless and destitute. . . . The house in which the eighty children were assembled to be boarded, lodged, and taught, was an old tumble-down Ursuline convent, scarcely habitable, and destitute of all the conveniences of life. The only apartment suitable for a schoolroom was about twenty-four feet square, furnished with a few desks and forms; and into this were crowded the wretched children, noisy, dirty, diseased, and ignorant, with the manners and habits of barbarians. Pestalozzi's only helper in the management of the institution was an old woman, who cooked the food and swept the rooms; so that he was, as he tells us himself, not only the teacher, but the paymaster, man-servant, and almost the housemaid of the children. . . . 'My

harmony of the mind. And this you do, if, before you have formed the mind by the progressive knowledge of the realities of life, you fling it into the labyrinth of words, and make them the basis of development.' 'The artificial march of the ordinary school, anticipating the order of Nature, which proceeds without anxiety and without haste, inverts this order by placing words first, and thus secures a deceitful appearance of success at the expense of natural and safe development.' In these few sentences we recognise all that is most characteristic in the educational principles of Pestalozzi. . . . To set the intellectual machinery in motion—to make it work, and keep it working; that was the sole object at which he aimed; of all the rest he took little account. . . . He relied upon a principle which must be insisted on as cardinal and essential in education. He secured the thorough interest of his pupils in the lesson, and mainly through their own direct share in it. . . . Observation, . . . according to Pestalozzi (and Bacon had said the

same thing before him), is the absolute basis of all knowledge, and is therefore the prime agent in elementary education. It is around this theory, as a centre of gravity, that Pestalozzi's system revolves."—J. Payne, *Lectures on the history of education*, lect. 9.—"During the short period, not more than a year, which Pestalozzi spent among the children at Stanz, he settled the main features of the Pestalozzian system. Sickness broke out among the children, and the wear and tear was too great even for Pestalozzi. He would probably have sunk under his efforts if the French, pressed by the Austrians, had not entered Stanz, in January, 1799, and taken part of the Ursuline Convent for a military hospital. Pestalozzi was, therefore, obliged to break up the school, and he himself went to a medicinal spring on the Gurnigel in the Canton Bern. . . . He came down from the Gurnigel, and began to teach in the primary schools (i.e., schools for children from four to eight years old) of Burgdorf, the

FROEBEL

second town in the Canton. Here the director was jealous of him, and he met with much opposition. . . . In less than a year Pestalozzi left this school in bad health, and joined Krüsi in opening a new school in Burgdorf Castle, for which he afterward (1802) obtained Government aid. Here he was assisted in carrying out his system by Krüsi, Tobler, and Bluss. He now embodied the results of his experience in a work which has obtained great celebrity—"How Gertrude Teaches her Children" [also published in England under the title of 'Leonard and Gertrude']. In 1802 Pestalozzi, for once in his life a successful and popular man, was elected a member of a deputation sent by the Swiss people to Paris. On the restoration of the Cantons in 1804, the Castle of Burgdorf was again occupied by one of the chief magistrates, and Pestalozzi and his establishment were moved to the Monastery of Buchsee. Here the teachers gave the principal direction to another, the since celebrated Fellenburg, 'not without my consent,' says Pestalozzi, 'but to my profound mortification.' He therefore soon accepted an invitation from the inhabitants of Yverdon to open an institution there, and within

a twelvemonth he was followed by his old assistants, who had found government by Fellenburg less to their taste than no-government by Pestalozzi. The Yverdon Institute had soon a world-wide reputation. Pestalozzian teachers went from it to Madrid, to Naples, to St. Petersburg. Kings and philosophers joined in doing it honor. But, as Pestalozzi himself has testified, these praises were but as a laurel-wreath encircling a skull. The life of the Pestalozzian institutions had been the love which the old man had infused into all the members, teachers as well as children; but this life was wanting at Yverdon. The establishment was much too large to be carried on successfully without more method and discipline than Pestalozzi, remarkable, as he himself says, for his 'unrivalled incapacity to govern,' was master of. . . . The old man, when he died at the age of eighty, in 1827, had seen the apparent failure of all his toils. He had not, however, failed in reality. It has been said of him that his true fortune was to educate ideas, not children, and when twenty years later the centenary of his birth was celebrated by schoolmasters, not only in his native country, but throughout Germany, it was found that Pestalozzian ideas had been sown, and were bearing fruit, over the greater part of central Europe."—R. H. Quick, *Essays on educational reformers*, ch. 8.

19th Century

Fellenberg and industrial education.—While Pestalozzi was teaching at Burgdorf, "Emmanuel von Fellenberg (1771-1844), a young man of noble and wealthy parentage, had become wholly possessed with the idea that the wretched condition of the Swiss peasantry could be improved through the kind of education which Pestalozzi had tried at Neuhof. . . . Fellenberg's fundamental purpose was to combine industrial education—chiefly agricultural—with the elements of intellectual education, and thus to meet the pressing needs of the masses. Presently he added a 'literary institute' for the sons of wealthy land-owners, where the ordinary classical education was supplemented by physical culture and enough farm labor to produce a sympathetic understanding of the masses and their needs. Various practical accessories were added, such as a printing establishment, and even a school for girls was organized. A special effort was made to prepare teachers for the country schools. Fellenberg's idea—Pestalozzian industrialism as an integral part of education—has spread all over the world, and is pressing its claims with ever-increasing insistency not only upon Switzerland, its place of birth, but upon Germany, France, England, and America."—C. C. Boyer, *History of education*, p. 316.

Froebel and child education.—To Friedrich Froebel (1782-1852), a German, "we are indebted, directly or indirectly, for three . . . additions to elementary education—the kindergarten, the play idea, and handwork activities. . . . Of German parentage, the son of a rural clergyman, early estranged from his parents, retiring and introspective by nature, having led a most unhappy childhood, and apprenticed to a forester without his wishes being consulted, at twenty-three Froebel decided to become a schoolteacher and visited Pestalozzi in Switzerland. Two years later he became the tutor of three boys, and then spent the years 1808-1810 as a student and teacher in Pestalozzi's Institute at Yverdon. During his years there Froebel was

deeply impressed with the great value of music and play in the education of children, and of all that he carried away from Pestalozzi's institution these ideas were most persistent. After serving in a variety of occupations—student, soldier against Napoleon, and curator in a museum of mineralogy—he finally opened a little private school, in 1816, which he conducted for a decade along Pestalozzian lines. In this the play idea, music, and the self-activity of the pupils were uppermost. The school was a failure, financially, but while conducting it Froebel thought out and published (1826) his most important pedagogical work—*The Education of Man*. Gradually Froebel became convinced that the most needed reform in education concerned the early years of childhood. His own youth had been most unhappy, and to this phase of education he now addressed himself. After a period as a teacher in Switzerland he returned to Germany and opened a school for little children in which plays, games, songs, and occupations involving self-activity were the dominating characteristics, and in 1840 he hit upon the name *Kindergarten* for it. In 1843 his *Mutter-und Kose-Lieder*, a book of fifty songs and games, was published. This has been translated into almost all languages. . . . After a series of unsuccessful efforts to bring his new idea to the attention of educators, Froebel, himself rather a feminine type, became discouraged and resolved to address himself henceforth to women, as they seemed much more capable of understanding him, and to the training of teachers in the new ideas. Froebel was fortunate in securing as one of his most ardent disciples, just before his death, the Baroness Bertha von Marenholtz Bülow-Wendhausen (1810-93), who did more than any other person to make his work known. Meeting, in 1849, the man mentioned to her as 'an old fool,' she understood him, and spent the remainder of her life in bringing to the attention of the world the work of this unworldly man who did not know how to make it known for himself. In 1851 the Prussian Government, fearing some revolutionary designs in the new idea, and acting in a manner thoroughly characteristic of the political reaction which by that time had taken hold of all German official life, forbade kindergartens in Prussia. The Baroness then went to London and lectured there on Froebel's ideas, organizing kindergartens in the English 'ragged schools.' Here, by contrast, she met with a cordial reception. She later expounded Froebelian ideas in Paris, Italy, Switzerland, Holland, Belgium, and (after 1860, when the prohibition was removed) in Germany. In 1870 she founded a kindergarten training-college in Dresden. Many of her writings have been translated into English, and published in the United States."—E. P. Cubberley, *History of education*, pp. 764-768.—See also below: 19th-20th centuries: Spread of kindergartens.

Herbart and the organization of educational theory.—Pedagogical seminary at Jena.—"Taking up the [educational] problem as Pestalozzi left it, a German by the name of Johann Friedrich Herbart (1776-1841) carried it forward by organizing a truer psychology for the whole educational process, by erecting a new social aim for instruction, by formulating new steps in method, and by showing the place and the importance of properly organized instruction in history and literature in the education of the child. Though the two men were entirely different in type, and worked along entirely different lines, the connection between Herbart and Pestalozzi was, never-

theless, close. The two men, however, approached the educational problem from entirely different angles. Pestalozzi gave nearly all his long life to teaching and human service, while Herbart taught only as a traveling private tutor for three years, and later a class of twenty children in his university practice school. Pestalozzi was a social reformer, a visionary, and an impractical enthusiast, but was possessed of a remarkable intuitive insight into child nature. Herbart, on the other hand, was a well-trained scholarly thinker, who spent the most of his life in the peaceful occupation of a professor of philosophy in a German university. It was while at Königsberg, between 1810 and 1832, and as an appendix to his work as professor of philosophy, that he organized a small practice school, conducted a Pedagogical Seminar, and worked out his educational theory and method. His work was a careful, scholarly attempt at the organization of education as a science, carried out amid the peace and quiet which a university atmosphere almost alone affords. He addressed himself chiefly to three things: (1) the aim, (2) the content, and (3) the method of instruction. . . . Locke had set up as the aim of education the ideal of a physically sound gentleman. Rousseau had declared his aim to be to prepare his boy for life by developing naturally his inborn capacities. Pestalozzi had sought to regenerate society by means of education, and to prepare children for society by a 'harmonious training' of their 'faculties.' Herbart rejected alike the conventional-social education of Rousseau, and the 'faculty-psychology' conception of education of Pestalozzi. Instead he conceived of the mind as a unity, instead of being divided into 'faculties,' and the aim of education as broadly social rather than personal. The purpose of education, he said, was to prepare men to live properly in organized society, and hence the chief aim in education was not conventional fitness, natural development, mere knowledge, nor personal mental power, but personal character and social morality. This being the case, the educator should analyze the interests and occupations and social responsibilities of men as they are grouped in organized society, and, from such analyses, deduce the means and the method of instruction. Man's interests, he said, come from two main sources—his contact with the things in his environment (real things, sense-impressions), and from his relations with human beings (social intercourse). His social responsibilities and duties are determined by the nature of the social organization of which he forms a part. Pestalozzi had provided fairly well for the first group of contacts, through his instruction in objects, home geography, numbers, and geometric form. For the second group of contacts Pestalozzi had developed only oral language, and to this Herbart now added the two important studies of literature and history, and history with the emphasis on the social rather than the political side. Two new elementary-school subjects were thus developed, each important in revealing to man his place in the social whole. History in particular Herbart conceived to be a study of the first importance for revealing proper human relationships, and leading men to social and national 'good-will.' The chief purpose of education Herbart held to be to develop personal character and to prepare for social usefulness. These virtues, he held, proceeded from enough of the right kind of knowledge, properly interpreted to the pupil so that clear ideas as to relationships might be formed. To impart this knowledge interest must be awakened, and to

arouse interest in the many kinds of knowledge needed a 'many-sided' development must take place. From full knowledge, and with proper instruction by the teacher, clear ideas or concepts might be formed, and clear ideas ought to lead to right action, and right action to personal character—the aim of all instruction. Herbart was the first writer on education to place the great emphasis on proper instruction, and to exalt teaching and proper teaching-procedure instead of mere knowledge or intellectual discipline. He thus conceived of the educational process as a science in itself, having a definite content and method, and worthy of special study by those who desire to teach. . . . With these ideas as to the aim and content of instruction, Herbart worked out a theory of the instructional process and a method of instruction. . . . Interest he held to be of first importance as a prerequisite to good instruction. If given spontaneously, well and good; but, if necessary, forced interest must be resorted to. Skill in instruction is in part to be determined by the ability of the teacher to secure interest without resorting to force on the one hand or sugar-coating of the subject on the other. Taking Pestalozzi's idea that the purpose of the teacher was to give pupils new experiences through contacts with real things, without assuming that the pupils already had such, Herbart elaborated the process by which new knowledge is assimilated in terms of what one already knows, and from his elaboration of this principle the doctrine of apperception—that is, the apperceiving or comprehending of new knowledge in terms of the old—has been fixed as an important principle in educational psychology. Good instruction, then, involves first putting the child into a proper frame of mind to apperceive the new knowledge, and hence this becomes a corner-stone of all good teaching method. Herbart did not always rely on such methods, holding that the 'committing to memory' of certain necessary facts often was necessary, but he held that the mere memorizing of isolated facts, which had characterized school instruction for ages, had little value for either educational or moral ends. The teaching of mere facts often was very necessary, but such instruction called for a methodical organization of the facts by the teacher, so as to make their learning contribute to some definite purpose. This called for a purpose in instruction; the organization of the facts necessary to be taught so as to select the most useful ones; the connection of these so as to establish the principle which was the purpose of the instruction; and training in systematic thinking by applying the principle to new problems of the type being studied. The carrying-out of such ideas meant the careful organization of the teaching process and teaching method, to secure certain predetermined ends in child development, instead of mere miscellaneous memorizing and school-keeping."—E. P. Cubberley, *History of education*, pp. 759-762.

Belgian Congo: Growth of education. See BELGIAN CONGO: 1899.

Belgium: Conflict over state education.—In Belgium, where during the 18th century Maria Theresa, and her successor Emperor Joseph had endeavored to develop a system of education, "the Dutch king [William] attempted also to develop national education. He placed the three Universities . . . under State control. Many secondary and primary schools were founded all over the country, and public instruction made considerable progress."—E. Cammaerts, *Belgium*, p. 282.—In the second half of the nineteenth century, the schools were made a cause of political contention. "In 1878

all communal schools were placed under supervision of the state, and the teaching of religion was strictly forbidden. . . . [In consequence] private Catholic schools were built in nearly every commune. . . . Many of the state schools were deserted. In Flanders over 80 per cent of the children went to the Catholic schools. . . . The elections of 1884 resulted in . . . a large Catholic majority, . . . [by whom the new department of education was abolished. Authority over the state schools was given to the communal councils with power] either to maintain a state school, or . . . give a grant to a private school, provided that it conformed to the regulations, and submitted itself to inspection by the State. . . . Teaching of religion was made compulsory, whenever the parents desired it. Under this law, . . . in a large number of communes the teaching passed into the hands of the . . . [religious orders]."—*Cambridge modern history*, v. 12, pp. 251-252.—See also BELGIUM: 1886-1900: Education; SUFFRAGE, MANHOOD: Belgium: 1830-1921.

Canada: Struggle for a public elementary system.—Some of the school books used in Ontario in the middle of the 19th century "would be a curiosity now-a-days: Webster's spelling book, Murray's English grammar, Johnson's dictionary, Murray's English reader, Walkingame's arithmetic and the New Testament. Afterward were introduced geographies. . . . The first schools established in Binbrook, Saltfleet and Beverley townships [in the Niagara peninsula] were built of logs. . . . In the first school in Beverley, the alphabet and the first reading lessons were taught from shingles, upon which each lesson was written. In the earlier schools of the early days many were the difficulties which had to be encountered—sparsity of population, scarcity of money, want of school-houses, almost no school books, bad roads and other hindrances."—J. G. Hodgins, *Schools and colleges in Ontario*, v. 3, pp. 108, 109.—"The state of education [in Canada in the middle of the century] reflected the conditions of its life. In Lower Canada, [Quebec] the peasants still grew up woefully ignorant. For the upper classes there was an abundant provision of college instruction under clerical control. Upper Canada [Ontario] was in some ways less well provided for. The Assembly had begun the establishment of a public elementary system; but though the people were far from indifferent, State action was paralysed by the political troubles, by the agitation of the question of the clergy reserves, and difficulties between the denominations. Private enterprise, in spite of obstacles, had done much, but the common schools were still too few in number, and sadly insufficient both as regarded buildings, teachers and system. Yet here, and in the Maritime provinces, where educational progress had been more rapid, institutions providing the higher means of instruction had already been founded."—*Cambridge modern history*, v. 10, p. 695.—See also CANADA: 1890-1896; EDUCATION, AGRICULTURAL: Canada.

China: Reforms and reactions.—"The old education of China was concerned with the classics and some Chinese history. No science, nothing of geography or history or political economy of other nations was taught. The object of the student was to store his memory with characters and to cultivate a good literary style. There were no schools as a Westerner conceives schools. Playgrounds and recreation? The only recreation the student had was to walk in the garden which surrounded

his home, for it was in the homes that the classes were held. Usually the boys of one or perhaps of two families met together to write and drone over the characters set before them by the 'lao fu tzu' or old scholar. The system was impossible because in the first place the old teacher knew nothing about the rules of pedagogy and in the second place his curriculum consisted of but one or two subjects."—F. B. Lang, *Glimpses at China's middle schools* (*Educational Review*, Jan., 1920, pp. 58-61).—"The greatest advocate and active promoter of . . . educational reforms [in the late nineteenth century] was the illustrious Viceroy Chang Chih Tung, who . . . by his remarkable book, 'Learn,' of which millions of copies were distributed, prepared the minds of the people throughout the land for the sweeping reforms that were so soon to be launched. He outlined a complete system of schools and indicated the curricula from primary grades to university courses, embracing a mixture of Chinese classics and the modern learning of the West. He courageously advocated the abolishing of the 'eight-legged essay' and its accompaniments, and suggested that Buddhist and Taoist temples be converted into schools and the temple lands and incomes used for educational purposes. . . . The Emperor rapidly passed from a student to an ardent advocate of modern education, and issued in 1898 a series of most remarkable decrees, calling for the immediate inauguration of all the reforms suggested by Chang Chih Tung and even others. This literally shook the empire, and would doubtless have been successful but for the action of Yuan Shih Kai, then Viceroy of Chihli, and the most powerful military leader of the day. Warned by Yuan the Empress Dowager imprisoned the Emperor, and decapitated most of his progressive advisers. . . . This policy continued until 1900, when the Boxer outbreak caused the temporary abandonment of all modern schools and colleges in northern China. Some of them, including the Peiyang University, were even completely destroyed."—C. K. Edmunds, *Modern education in China*, pp. 10, 11.

England: Spread of popular education.—National Society for promoting education of the poor.—British and Foreign School Society.—Factory Act.—Factory and infant schools.—Toward the end of the eighteenth century "many Englishmen were willing to extend a modicum of instruction to the poor man as an act of grace. Individual opinion began to express itself loudly on the subject, . . . while Herbert Spencer, Thomas Sheridan, Andrew Bell, Joseph Priestley, William Wordsworth, John Brown, Thomas Paine and many others, each in his own way, proclaimed the right of every one to some modicum of education. The subject passed beyond the range of academic discussion on the appearance of Thomas Lancaster's 'Improvement in Education.' Apart from its account of the author's mode of organizing a school, the 'monitorial or mutual' system . . . the chief merit of this pamphlet lies in its scheme for . . . general elementary instruction, which he believed should be non-sectarian, noncompulsive and voluntary. [Briefly, his system consisted in employing older pupils to teach the younger ones, under the supervision of the teacher, thereby providing training of a sort for pupils who desired to become teachers, and also economy in administration. Doubtless it provided a means for the wider dissemination of some knowledge at a time when trained teachers were all but wholly lacking and over 90 per cent of the population was illiterate.] Lancaster believed it to be a panacea for all the ills of popular education at the time, and the sys-

tem had an influence, not yet wholly lost on elementary education in Great Britain, an influence almost equally great in Ireland, and a lesser hold in the United States. The discussion which raged about his proposal to make popular education undenominational resulted in the organization of two educational societies—'The National Society for promoting the education of the poor in the principles of the Established Church' (1811), and the 'British and Foreign School Society' (1814), [the successor of the Royal Lancasterian Institute, and Lancaster's committee, founded in 1808]. Thus the voluntary system of English elementary schools was begun, and a compromise between state interference and individualism was effected which lasted till 1870. . . . At first . . . these societies had no association with the state; but their contributions to national education were so many and so important that when, in 1833, Parliament agreed to an annual grant of £20,000 to be used in the erection of school houses, the money was handed to them for allocation. Efforts, by Acts of Parliament and otherwise continued to be made to increase the facilities for education [the grant was raised successively to £30,000, £40,000, and £160,000 a year], and to increase the usefulness of endowed grammar schools by permitting them to teach reading, writing and arithmetic as well as the classics, and the demand for popular instruction was partly met by Mechanics' Institutes (see below: Mechanics' Institutes) and by the Society for the Promotion of Useful Knowledge, which published books at a cheap rate, and in 1839 an attempt was made to provide for universal, compulsory education, [but met with such opposition that the measure was dropped, the provision for the appointment of school inspectors alone being retained]. The National and British and Foreign Societies had from the first trained their teachers, and the number of training colleges was now greatly increased. In 1846 . . . the Government still intent upon the creation of a corps of teachers, materially altered the monitorial system by permitting teachers to engage apprentice or pupil teachers, who, after five years' service with government pay, became eligible . . . for admission to one of the . . . state endowed training colleges. The establishment of an education department, for the supervision of elementary education, . . . did not satisfy the demand for increased educational facilities. Nearly as many children were believed to be without schools as were in attendance at all schools . . . put together. . . . Finally in 1870 the Government introduced a bill to provide for public elementary education in England and Wales, which was passed after six months of contentious debate. . . . Its purpose was supplementary . . . and designed to make the erection of schools compulsory where voluntary schools did not exist. . . . It was decided that rate payers . . . should elect school boards. . . . [Denominational religious teaching in 'Board' schools was forbidden.] Under this Act the principle of compulsory education was asserted . . . and was enforced by an Act passed in 1880."—*Cambridge history of English literature*, v. 14, pp. 390, 401, 404, 407.—"Early in the nineteenth century, in England, the Factory Act enacted that schools should be provided for children who were employed on half time. In most cases, the Act was hardly complied with. . . . [The Act provided that instruction should be given at least one day a week, but as no particular day was stipulated, many employers utilized Sunday for the purpose.] Some of the more enlightened employers [however] provided schools much above the average.

In more than one of these instruction was given to all comers. . . . [The factory school] system established by Robert Owen in 1816 in connection with his cotton mills at New Lanark stands in a class by itself, deserving the reputation which brought innumerable visitors every year from all parts of Europe. The full curriculum, commencing in an infants' department and extending over three grades of elementary instruction for children up to the age of twelve, concluded with evening classes which covered a five years' course in history, geography, music, and scientific and technical subjects. But it was on the earlier stages that its fame rested. The great aim, which represents all that is best in Owen's philosophy, was to instil habits of good-breeding and mutual consideration from earliest childhood and to develop every perfect gift. The dawning intelligence was stimulated by music, pictures, and object-lessons; and it was a maxim of the founder (which he abandoned with reluctance) that formal instruction should not commence before the age of ten. A constant change of employment banished monotony and kept the faculties alert. Manual training and bodily exercise were allowed their share in the building up of mind and character. Among the older children, a certain time was set apart for gardening and recreative employments. The boys danced in the Higbland costume, and both sexes sang and drilled together, performing military evolutions to the amazement of all comers and the confusion of some."—A. E. Dobbs, *Education and social movements, 1700-1850*, pp. 166-167.—In connection with this school, Robert Owen "established an infant school . . . [in which] the children were not to be 'annoyed with books.' They were to be taught about nature and common objects, but through familiar conversation and by means of models, paintings, maps, etc. In order that the education which they were to receive for about three years, beginning at the age of three, might include the body and morals as well as the intellect, instruction was combined with much singing, outdoor exercise, dancing, and other amusements. The experiment was a great success. The plan was carried to London, where Samuel Wilderspin became the great exponent of the system. He unfortunately made his London school a small copy of what a school for older children usually attempts, thus resolving the experiment into the process of producing infant prodigies, in whose rather overcrowded curriculum the memory work left little room for real education. Even the games became stereotyped and religious instruction an empty form. He popularized the infant school through lecture tours, and organized new schools everywhere. This result was greatly hastened by the organization in 1824 of an 'Infant School Society.' About a dozen years later Reverend Charles Mayo founded in London an organization whose purpose it was to train infant-school teachers. This society, known as 'The Home and Colonial School Society,' grafted Pestalozzianism upon the infant school. This emphasis on object-lessons and the cultivation of the senses redeemed the infant school somewhat from the Wilderspin formalism, but failed to infuse the real spirit of Pestalozzi's spontaneity into the curriculum. The desirable result, however, was largely attained when in 1874, four years after the infant schools had become a part of the primary school system of Great Britain, some of the methods and games of the kindergarten were incorporated."—C. C. Boyer, *History of education*, pp. 347-348; 361-362.

England: Mechanics' institutes.—Throughout the Middle Ages vocational education as applied to industries was effected through the guild system, and later by the system of apprenticeship which survived the guilds. With the introduction of machinery, however, the empirical teaching handed on by one workman to another was felt by the men themselves to be insufficient and ineffective. From their recognition of a need of more technical training sprang the Mechanics' Institutes of the eighteenth century, the beginning of all modern trade schools and instruction in technology. "The history of the Mechanics' Institutes extends from 1799, when Dr. George Birkbeck was appointed Professor of Natural Philosophy and Chemistry in 'Anderson's University' at Glasgow, to the 'fifties of the nineteenth century, when the Institutes, which had considerably changed their character, were beginning to be merged in the modern movement for technical instruction. Birkbeck's predecessor, Dr. John Anderson, Professor of Natural Philosophy in the University of Glasgow, had been in the habit of giving lectures upon experimental physics, which were attended, among others, by a certain number of workmen. Birkbeck himself, in the course of visiting the Glasgow workshops in order to superintend the making of some apparatus for his use at the College, found that the men in the shops were keenly interested in the new machines, and crowded with special curiosity round a model of the centrifugal pump. . . . Dr. Birkbeck left Glasgow in 1804, his classes being continued by his successor, Dr. Ure. In the twenty years following 1815 the movement to establish Mechanics' Institutes spread rapidly. The Edinburgh School of Arts was founded in 1821, the Glasgow Mechanics' Institution (by seceders from Anderson's Institution) in 1823, the London Mechanics' Institution and the Manchester Mechanics' Institution in 1824; and in the following year institutes were established in Huddersfield, Leeds, and a large number of other industrial towns. In 1837 a Union of Mechanics' and other Literary and Scientific Institutions was founded in the West Riding of Yorkshire. In 1830 a Metropolitan Association came into existence, and in 1847 a Lancashire and Cheshire Union of Mechanics' Institutions. In 1851 it was estimated that there were 610 institutes in England with a membership of over 600,000, that the number of lectures delivered in 1850 was 3,054, and that the number of students attending classes was 16,029. . . . The Mechanics' Institutes were an important step in the development of modern scientific and technological instruction. The Birkbeck Institute in London perpetuates the name of the founder of the movement. At Manchester, Huddersfield and elsewhere Technical Colleges have developed without a break from Mechanics' Institutes founded in the first half of the nineteenth century. The important Birmingham and Midland Institute sprang in 1853 from the same source. By making elementary instruction in science accessible to a large number of working people and creating a demand for cheap scientific literature, the movement exercised a valuable educational influence. It suffered, however, from certain defects which caused its original impetus to be almost exhausted by the middle of the nineteenth century."—*Adult education committee of the ministry of reconstruction, Final report*, pp. 14-15.

England: Voluntary and board schools.—Education acts of 1870, 1876, 1891 and 1897.—

Education of women.—"According to a careful and elaborate report in the year 1845, only about one in six, even of the children at school, was found able to read the Scriptures with any ease. Even for these the power of reading often left them when they tried a secular book. Of reading with intelligence there was hardly any; and about one-half of the children who came to school left, it was calculated, unable to read. Only about one child in four had mastered, even in the most mechanical way, the art of writing. As regards arithmetic, not two per cent. of the children had advanced as far as the rule of three. . . . The teaching of the schools was in the hands of men who had scarcely any training, and who had often turned to the work because all other work had turned away from them. Under them it was conducted upon that monitorial system. . . . The inquiries of the Committee of Council thus gave the death-blow, in public estimation, to the once highly-vaunted monitorial system. But how was it to be replaced? The model of a better state of things was found in the Dutch schools. There a selected number of the older pupils, who intended to enter upon the profession of teachers, were apprenticed, when they had reached the age of thirteen, to the teacher. . . . After their apprenticeship they passed to a Training College. . . . In 1851 twenty-five Training Colleges had been established; and these had a sure supply of qualified recruits in the 6,000 pupil teachers who were by that time being trained to the work. A mass of thorny religious questions had to be faced before a really national system could be established. . . . By common consent the time for a settlement was now come. . . . It was in this position of opinion that Mr. Forster . . . introduced his Education Bill in 1870."—H. Craik, *State in its relation to education*.—The new law made a clear separation, in one respect, between voluntary and Board schools. Both were to stand equally in relation to the national Education Department, under the Privy Council; but the voluntary schools were to have nothing to do with local rates, or rate aid, nor Local Boards to have any control over voluntary schools. Voluntary schools were built, and supported by voluntary contributions aided by state funds. These schools still exist, and are as a rule, more or less under denominational control. Board schools are built and supported by funds raised by local taxation, controlled by elected school boards, and are undenominational. "Until the establishment of the Board schools in 1870, the state could make no provision for compulsory education. The Act of 1870 and the Act of 1876 gave power to the local authorities to compel children between the ages of five and thirteen to attend school every day that the school was in session."—G. L. Jackson, *Privilege of education*, pp. 104, 105.—"In 1801, a bill passed Parliament which aims at making the elementary schools of the country free from the payment of fees. The bill as explained in the House of Commons, "proposed to give a grant of 10s. per head to each scholar in average attendance between five and fourteen years of age, and as regarded such children schools would either become wholly free, or would continue to charge a fee reduced by the amount of the grant, according as the fee at present charged did or did not exceed 10s. When a school had become free it would remain free, or when a fee was charged, the fee would remain unaltered unless a change was required for the educational benefit of the locality; and under this arrangement he believed that two-thirds of the elementary schools in England and

Wales would become free. There would be no standard limitations, but the grant would be restricted to schools where the compulsory power came in, and as to the younger children, it was proposed that in no case should the fee charged exceed 2d. . . . The bill was passed . . . [in July 1891]. The free education proposals of the Government are said to have been generally accepted throughout the country by both Board and Voluntary schools."—*Annual Register*, 1891, pp. 128 and 97, and pt. 2, p. 51.—See also ENGLAND: 1896-1897.

"The great advance in the education of girls and women may be traced back to the early activities of the Governesses' Benevolent Institution, founded in 1843. The institution soon found that it could be most useful to governesses by making them capable of the work they undertook. For this purpose it secured the co-operation of professors of King's College, London, first for the examination of women as to their fitness to teach and then, as the result of examination, to conduct classes. Queen's College, London, was founded in 1848 as a home in which women could receive the necessary instruction. . . . The relationship between King's College and Queen's College was repeated between University College and Bedford College in 1849. . . . In 1865, girls were allowed to present themselves at the 'Local' examinations of Cambridge. . . . In 1869, Cambridge and London Universities instituted examinations for women. Emily Davies then started the college at Hitchin which in 1873, was removed to Girton; in 1860, courses of lectures were begun in Cambridge which led to the foundation of Newnham College. . . . Many girls' schools were opened or revived, many endowments, or revisions, were divided between boys' schools and girls' schools. . . . The University of London threw open its degree examination to women in 1878, Cambridge opened the triposes to them in 1881, and, three years later, Oxford allowed women to pass the examinations of its 'schools.' Colleges for women had been instituted at Oxford in 1879. The new universities made no distinction of sex in respect of teaching, emoluments, or degrees."—*Cambridge History of English literature*, v. 14, pp. 387, 429, 430.—Provision was made in all the parish elementary schools supported by the British and Foreign Society and the National Society, as well as in the 'board' schools, for education of girls, who were invariably taught sewing, as part of their school work.—See also ENGLAND: 1899 (August).

Finland: Ambulatory schools.—Primary instruction law.—"For centuries, elementary education in Finland was supervised by the Lutheran clergy, and in order that the wide, sparsely inhabited regions might not be neglected, 'ambulatory' schools were instituted. . . . In 1866 . . . the basis of a sound national system of education was laid in the passing of the Primary Instruction law. [Secondary education was re-organized in 1870. Up to that time, from early in the seventeenth century, the gymnasium had been the institution where higher education was given.]"—G. Renwick, *Finland to-day*, pp. 225, 227.

France: Free compulsory education.—Napoleonic reforms.—Development of girls' schools.—Training of teachers—"In 1801 the [infant school] system was brought to Paris, in 1833 the infant schools became a part of the national system of schools, but since 1881 they have

been known as 'maternal schools.' Although in the French system they are the substitute for the kindergarten, the kindergarten aim of development is subordinate to the Pestalozzian aim of imparting knowledge."—C. C. Boyer, *History of education*, p. 363.—"Bonaparte had . . . a vast field for his energies in re-organising (1802) the education of France. The expense of elementary instruction was now made the reason for delegating it to the local authorities, who had also to supervise and control all the private schools in their districts. Practically, very little was done for elementary education; but secondary education received a very characteristic development. The 30 most successful *écoles centrales* were now re-organised as *lycées*, where the pupils were to be drilled and trained in semi-military fashion, the lessons beginning and ending with the roll of drums; and, to bind these new schools as closely as possible to the State, 6000 pupils, called 'pupils of the nation,' were to receive their education free, most of these being sons of deserving soldiers and officials selected by Bonaparte himself. Technical and special schools were also soon founded; and we may notice here that later on Bonaparte completed his autocratic system of education by founding (1806) the University of France, organised in 17 Academies—one at Paris, the others at large provincial centres—to control all the public education of France in accord with his own will. Education, which had been up to 1790 in the hands of the clergy, became a powerful tool of the new State."—J. H. Rose, *Revolutionary and Napoleonic era, 1789-1815*, p. 137.—"The Napoleonic reforms in the early nineteenth century did nothing for the elementary schools, but private initiative during the Restoration founded the Society for Elementary Instruction and adopted the mutual or monitorial system, which at that time was also the center of educational interest in England and the United States. These schools became quite common throughout France and came in competition, therefore, with the simultaneous or class method of instruction used by the Brethren of the Christian Schools. . . . *Lycées and Collèges* for the purpose of giving secondary instruction were created by Napoleon in 1802—the Revolution had eliminated those previously existing."—G. L. Jackson, *Privilege of education*, pp. 96, 97.—Secondary schools for girls, however, were not legally established in France until 1880. Up to that time education for girls, beyond the elementary grade, was given only in convents or private schools. "A law was brought forward, by the Department of Education providing for primary education which was passed . . . in June 1833 [when Guizot was minister of public instruction]. This law invited the Catholics, in their own schools, which were thenceforth to be free, and even in the State schools, which were superintended by the parish priest and the catonal Commissions, to associate themselves with the officers of the State in the work of establishing 'internal and social peace.'"—*Cambridge modern history*, v. 10, p. 490.—"The state began to participate seriously in the extension and control of elementary education. The law decreed that there should be a school in every commune, or a group of two or three in case of sparse population. . . . Poor children were to be excused from paying tuition fees. The law accomplished great improvements and was revived in 1850."—E. L. Kemp, *History of education*, p. 304.—Under the Second Empire "in the department of primary education, the 'Congregations' (religious bodies) . . . by degrees gained possession of the schools. There were

60,579 primary schools in 1850; there were 68,761 in 1863. . . . The development of girls' schools, and the fact that the law of 1850 gave power to the communes to indulge their preference for 'Congregationalist teachers' explains the progress made by denominational education. . . . Between the years 1850 and 1863 the secular schools gained 376,080 pupils, the 'congregationalist' schools 588,000. . . . Nevertheless, 27 per cent. of the conscripts of 1863 were illiterate. . . . [The interest of the nation in education was thoroughly aroused after the Franco-Prussian war.] The law of June 16, 1881 established the right of the people to free primary education and this justified the government next year (March 28, 1881) in making it compulsory [for both sexes between the ages of six and thirteen]. Under certain conditions as to the degrees and character of the teachers, this last enacted law proclaimed the freedom of the primary schools, but, on the other hand, it prescribed the secularity and neutrality of all the State schools. In order to provide teachers for the work of public education, the Republic undertook the responsibility for their salaries and their training as regards the Normal Primary Schools of each department. Moreover, the Republic established at Saint Cloud and Fontenoy, near Paris, Normal Schools of the Higher Grade, where the teachers of these Normal Schools recruited from among the children of the people, received instruction whose influence should penetrate the minds of dwellers in the most remote hamlets—a great concerted effort on behalf of education with which the name of Jules Ferry is still associated. This was the period, moreover, when the Republicans established a scheme for the education of women of the middle classes, . . . by passing on December 21, 1880 and July 26, 1881, the laws dealing with schools and colleges for girls, and with the Normal School at Sèvres, whose object was to train mistresses for these schools."—*Cambridge modern history*, v. 12, pp. 117, 118.—"In 1805, ninety-one per cent of all the children of school age attended school regularly."—E. L. Kemp, *History of education*, p. 305.—See also EDUCATION, AGRICULTURAL: FRANCE; FRANCE: 1801-1809; 1830-1840; 1875-1880.

Galicia: Compulsory education. See GALICIA: 1861-1870.

Germany: Prussian leadership.—State organization.—Curricula and types of schools.—"Three things lie behind the growth of German education during the . . . century and explain its course. The first of these was the educational policy of several of the German States during the seventeenth and eighteenth centuries. The School Regulations of Weimar in 1610 established the principle of compulsory attendance at elementary schools as a civic duty. The *Schul-Methodus* laid down by Ernest the Pious of Gotha in 1642 gave more systematic effect to the same principle of State authority in education. The Rescripts of 1716 and 1717 made school attendance compulsory in Prussia by Royal Order. And this policy was consummated by the *Allgemeine Land-recht* of 1794, which formally declared schools and Universities in Prussia to be State institutions, and their establishment permissible only with the State's previous knowledge and approval. The same ordinance required all public schools and educational establishments in Prussia to be under the super-

vision of the State and to be subject at all times to its examination and inspection. It also declared that the teachers in all higher schools in Prussia were to be regarded as officials of the State. The current of administrative change in different parts of Germany had thus opened a channel for the quick passage of Fichte's ideas into the policy of Prussia. Fichte himself, convinced by the experience of Pestalozzi, had laid stress upon the need for universal education. 'In one word,' he said, 'the people ought to receive instruction, and indeed fundamental, solid and convincing instruction, not in religion only but also regarding the State, its purposes and its laws.' . . . The second of the facts which explain the rapidity of educational reconstruction in Germany during the earlier years of the nineteenth century was the existence of a strong and widely-diffused intellectual tradition. . . . The third fact which led to the re-shaping of the educational systems of Germany during the nineteenth century was the . . . [military disasters which ultimately] gave to Prussia the leadership in [Germany]. . . . The group of statesmen who, under the leadership of Stein, set themselves to re-create the fortunes of their country made . . . reform of public education . . . [one of the] cardinal features of the internal policy of the State. 'Most is to be looked for,' wrote one of this group of statesmen in 1808, 'from the education and instruction of youth. . . . There sprang from this belief a boldly-planned policy in public education. What the Prussian elementary schools owed to the ideas of Pestalozzi and to the inspiration of Fichte, Prussian secondary schools found in the guidance of Wilhelm von Humboldt, Süvern, Wolf and Schleiermacher. . . . Within the first forty years of the nineteenth century were thus laid, upon the basis of what had gone before, the intellectual foundations of modern Germany. The new *gymnasien* were established under the impulse of a passion for the Greek ideal of life and with the aim of imparting general culture and an all around education to the intellectual *élite* of German boyhood. The beginnings of higher technical education, based upon general culture, were successfully made, in all cases by the reorganization of technical institutions previously existing on a more modest scale. Elementary education was . . . reorganized. . . . Nearly forty training colleges were established in Prussia alone, many of them inspired by Pestalozzi's ideas. In Prussia again the *examen pro facultate docendi*, instituted in 1810, made the calling of secondary instruction in Prussia an independent profession. The reform of the leaving examination in 1812 unified the group of higher secondary schools which prepared their pupils for the Universities, and distinguished them from the lower secondary schools with their humbler intellectual aims. . . . The second period (1840-1870) was an era of reconsideration chilled and darkened by reaction. . . . In the elementary schools progress was checked by a fear of the political consequences of over-education. In 1849, at a conference of teachers in Prussian training colleges, King Frederick William the Fourth exclaimed: 'You, and you alone, are to blame for all the misery which the last year has brought upon Prussia. The pseudo-education of the masses is to be blamed for it. . . . I hated it from the bottom of my soul before I came to the throne, and since I became King I have done all I could to suppress it.' Attempts were made to restore elementary education to an antique simplicity of reading, writing, elementary arithmetic and strictly dogmatic religious instruction. The training colleges for elementary school teachers were bidden

to give up their ambitions for liberal education. The secondary schools, under the influence of Wiese, began to be diversified in their plans of study, in order to meet the growing needs of the commercial and industrial community. . . . The third period, 1870 . . . [onwards] has been one of marvellous advance, of administrative consolidation and of bold educational engineering. . . . The construction of the modern school system of Germany will stand out in history as a classic example of the power of organised knowledge in furthering the material prosperity of a nation."—C. H. Herford, *Germany in the nineteenth century*, pp. 107-111, 113.—'Latin and Greek formed the chief subjects of the curriculum, [in the *gymnasia*] while all other subjects were subordinated. Under the direction of Ludwig Wiese the school examinations were limited to the classics. In the meantime the demand for a modern curriculum that would afford some preparation for the new world of commerce and industry became increasingly insistent. The *real* schools could have met this demand, but, without the privileges granted to the gymnasium and in the face of the scholastic opposition to modern subjects, they failed to attract students. After the middle of the nineteenth century, however, in 1850, the *real* schools were organised as schools for imparting general culture and for laying the foundations of a general education in the fundamentals of knowledge. Two types of schools were now evolved, the *Realgymnasium* giving a nine-year course and including Latin and modern subjects, and the *Realschule* giving a shorter course without Latin. . . . In 1878 there was organised a third form of nine-year school, the *Oberrealschule*, offering a course in modern languages and sciences without Latin. . . . The requirements in religion, German, history, and geography were made the same for all types of schools, and almost the same in such other subjects as they had in common. To prevent over-pressure the number of hours for physical exercise was increased. The number of hours was also increased for German and this subject was made a rigorous requirement in the leaving examination. Modern history was not only given more attention, but was studied in greater detail. The classics in particular suffered, since the number of hours per week was reduced and allotted to other subjects."—P. Sandiford, *Comparative education*, pp. 142-144.—"There was during the greater part of the nineteenth century no pressing need for girls' schools equal in grade or character of work to the boys' nine year schools. Girls completed their education in public or semi-public schools, which ranked as *Mittelschulen*, at about sixteen years of age. The first Gymnasium for girls was founded in Berlin in 1803, followed in the same year by Carlsruhe, and in the next year by Leipsic."—G. L. Jackson, *Privilege of education*, pp. 125, 127.—See also GERMANY: 1872; WOMAN'S RIGHTS: 1867-1905.

Ireland: Foundation of National Board of Education.—"Early in the Nineteenth Century the Christian Brothers, a lay order founded by Brother

Ignatius Rice of Waterford, established its first schools. State grants began to be withdrawn from the schools which had monopolized them for two centuries and in 1831 the National Board of Education was founded. The work of this board proceeded upon two assumptions: First, that a system of national education ought to be available for all creeds and classes of the community in common; second, that it was the duty of the state to provide for moral and religious instruction in its primary schools. The latter assumption proved fatal in the end, though for a time it seemed as if the task which the new board had set before itself might be fulfilled. Schools under the new board were widely established, and clergy of all denominations helped to make them a success. But many of the Protestant clergy professed to see in the careful regulations of the board for the safeguarding of the distinctive religious convictions of the children an attack upon their own religious liberty; the Catholic clergy took offense at the domination of the board by the Protestant Archbishop of Dublin. . . . The system which began to operate in 1831 on a non-sectarian basis is now by the practically concurrent agreement of all the churches transformed into a strictly denominational system."—R. M. Henry, *Irish schools of tomorrow* (*Survey, Graphic number, Nov., 1921*).—In 1884 a professor in the Catholic University, testifying at a hearing by a Royal Commission, said of compulsory education:—"It is Utopian to think of applying it to Ireland . . . so far as the rural districts are concerned. . . . The proposal was submitted to a meeting of the Irish Catholic bishops and rejected as being unsuited to their flocks and the general circumstances of the country. More than three-fourths of the population being rural and living by agriculture compulsory education could never be enforced. [At that date there were 10,532 classed teachers in Ireland of whom 33 per cent were trained, 67 per cent untrained.] Training was introduced under the National Board in 1833. . . . [During four years, the training of masters] lasted for a short session of three months, but when I was head master of the model schools 1841-44 it was extended to four or five months. . . . Now they have extended it to ten months [afterward extended to two years]. The present training school is in Marlborough Street since 1837 . . . for all creeds but aid to Denominational Training Colleges, promised since 1860, has been ceded [1884] by the Government. In the year 1862, the Roman Catholic Bishops by solemn decree, decided that none of their clergy . . . were to be parties . . . to sending any teachers for training to Marlborough Street, and that brought the whole business to a deadlock in relation to Catholics, and that is the principal reason the number of teachers is so small. Yes, there are about 8,000 Catholic teachers, of whom only 27 per cent were trained, while of over 2,000 Protestant teachers, 52 per cent or nearly double the proportion, have been trained and for far longer periods. . . . Some mistresses were taught in the excellent convent schools, and some masters in the Christian Brothers Schools, but they form no considerable fraction of the thousands of untrained Catholic teachers."—*Evidence of Professor Kavanagh before Royal Commission on Technical Instruction* (1884), pp. 106-107, 114.—The witness also stated that at that time there were in the country 7,050 National Board Schoolhouses of which about two thirds were good while of the remaining third four fifths were middling and the other fifth bad. The books in use, he said, were

on the whole good and well-guarded.—See also IRELAND: 1840-1841; 1844.

Italy: Before and after unification.—"Before the union of the Italian states into the kingdom of Italy education lagged. Nevertheless since the beginning of the 19th century efforts had been made to provide popular education by means of elementary, communal schools, which were taught by members of the religious orders. In 1822 Charles Felix of Piedmont ordered that schools should be provided in every commune; but the poorer communes paid no attention to the law and before 1846 schools for girls were not even mentioned in the law. Secondary schools were state aided and did better work; but the classics alone were well taught and modern languages and literature, modern history and science were almost totally neglected. Things were better in Lombardy, which was well abreast of the times. Elementary education was compulsory (in theory) for all children between the ages of six and nine, and actually about 68 per cent of the boys and over 40 per cent of the girls received some education. Also infant schools on the English model were established in 1829. The schools were carefully graded and the towns had major elementary schools in which grammar and Latin were taught, and which led up to gymnasiums and lyceums of which latter there were twelve. Parma and Lucca had schools, few in number it is true, but fairly good and fairly well attended. On the other hand Modena can scarcely be said to have had the most elementary form of popular elementary education. In Tuscany there were schools for boys in every commune, but very few secondary schools and practically no provision was made for the education of girls. In the Papal States education for boys had a bare existence. There were schools for boys in every commune which were very poor with an equally poor attendance and but little attempt was made to teach girls. In fact popular opinion was against the education of girls as improper. In Naples again there were education laws on the statute books, with little attempt to enforce them. The law provided for an elementary school in every commune, and a secondary school in every province; but the city itself had but four elementary schools; almost none of the peasants could read; no provision was made to teach girls and the general ignorance was so great that it was required that one third of the members of a town council should be able to read and write." In Piedmont "Lanza, . . . minister of education, tried to raise the standard of the elementary and secondary schools. By a law of 1848 every commune was compelled to maintain an elementary school, and the attendance was now fairly good, over ten per cent, of the whole population being on the registers. But there was a great lack of good teachers, . . . while the curriculum of the numerous old-fashioned 'Latin schools' was quite unsuited to modern needs. Lanza's bill proposed to leave the private schools untouched, but gave his department limited powers of control over them, made teachers pass an examination, established normal schools, and fixed a minimum salary; it more or less regulated and modernized the Latin schools, and provided for the foundation of technical colleges. . . . Cavour, . . . was obliged to sacrifice his individual convictions, and the bill was carried. Its effect on the secondary schools

was instantaneous, and the number of pupils quadrupled in three years. . . . The poverty of the land went hand in hand with its ignorance. 'The real Quadrilateral, that has stopped us,' said Villari after the war [of liberty], 'is our seventeen million illiterates and five million dilettanti.' The old governments had left a terrible mass of arrears, which it needed more than one generation to make up. Over three-quarters of the population, in 1861, were illiterates, and in Naples and Sicily the proportion exceeded 90 per cent. Even in Piedmont and Lombardy one-third of the men and more than half the women could neither read nor write. The new kingdom was doing much to grapple with the evil. Rattazzi's law of 1859 had organised the education of the country. It compelled the communes to provide elementary teaching, and made the state and local bodies jointly responsible for secondary and higher education. Attendance at an elementary school was free and compulsory; and though the operation of the enforcing clauses was still suspended in parts of the country, there had been great activity in providing schools. The old governments spent about 8,000,000 lire annually in education; in 1868 the state and local bodies together expended five times as much. . . . Few communes anywhere now were without a school. The figures of attendance are conflicting, but there appear to have been at this time [1871] about 1,500,000 children at elementary day schools and another 200,000 at evening and Sunday schools, and though these represented only one-third of those of school age, it was as high a proportion as in Great Britain at the time. But there were still great deficiencies. One-sixth at least of the pupils attended the inferior clerical schools. In parts of the South not much more than one per cent. of the population went to any school. Parliament spared no time for educational reform, and though it appointed a Commission in 1863, no result had come of it. A succession of twenty-four Education Ministers in the twenty years after 1848 made it impossible to bring their Department up to the level of its work. . . . There was activity enough in certain directions,—in commercial development, in education, in journalism. But there was little strength or originality. Educated Italy seemed to have passed suddenly from youth to middle age, to have become serious, sceptical, pessimist. . . . In 1887 1,307,000 children attended school, but still only 7.5 per cent. of population, as against 14.5 in France and 16 in England and Wales at the same date. In 1895 the proportion was 8.31 per cent."—B. King, *History of Italian unity*, v. 2, pp. 41, 303, 304, 305, 304 note.

Japan: Old system discarded and western methods introduced.—"Education in Japan originated in the first foundation of the country. . . . But education, prior to the Restoration in 1867, had been restricted to a narrow scope, a certain class only enjoying its benefits. The subjects of study were also limited to Chinese and Japanese literature, much stress being laid upon morals. Soon after the Restoration the new Government directed serious attention to the subject of education, and consequently the old system was discarded and a new one, entirely different, and such as prevails in the civilized West, was introduced throughout the Empire."—M. Sawayanagi, *Present system of education, in Japan by Japanese* (A. Stead, ed.), p. 228.

New South Wales: Public Schools Act of 1866. See NEW SOUTH WALES: 1855-1803.

Norway: Development of national schools system.—At the beginning of the century "the

primary schools of the towns and villages of Norway were called, and arranged with the intention of being 'poor schools.' In certain towns, however, there were certain primary schools of a somewhat different stamp. A considerable improvement was made by the Act of 1848—preceded by the Act of 1827 relative to rural schools. The new Act determined that near every principal church in the country, there should be a permanent school, but otherwise ambulatory schools. . . . The Act of 1860 . . . enjoined the establishment of a permanent school in every school circle, fixed the minimum of hours for instruction, introduced several civil subjects, improved the condition and training of the teachers, and arranged the management and superintendence . . . in a better way. . . . The Act of 1889, now in force, considerably improved the elementary schools which from a school for the poor . . . has risen to a national school."—J. V. Heiberg, *Education (Norway)*, S. Konow and K. Fischer, ed., pp. 266-267).

Russia: Work of zemstvos.—"There were practically no primary schools in Russia until the *Zemstvos* took the matter in hand. . . . [In the province of Moscow especially] the *Zemstvo* brought the school within two miles of every inhabitant."—E. Lipson, *Europe in nineteenth century*, p. 110.—See also RUSSIA: 1809.

Scotland: Education Act of 1872.—The Parochial School Act of 1696 governed the elementary schools of Scotland until after the schism of 1843. Many of these parochial schools had bursaries or scholarships in their gift, and sent numbers of sturdy scholars to the universities. After 1843 the harmony of the schools, which were under control of the minister of each parish, was disrupted, and in many cases the Free Kirk maintained a school of its own. The results were rather disastrous, and consequently in 1872 the Education (Scotland) act was passed. This was built on the model of the English act and placed control of public education in the hands of parochial school boards, which were also given authority over academies, high schools and grammar schools.—See also SCOTLAND: 1750-1921.

Switzerland: Compulsory education.—Switzerland of the nineteenth century produced one of the most influential reformers of elementary education (Pestalozzi) (see above Modern: 18th-19th centuries: Pestalozzi), and thereafter "attached great importance to the education of the people. Since the thirties, the universal obligation of attending school has become a reality. Even the most remote Alpine villages attempted to make the elements of education accessible to their children."—*Cambridge modern history*, v. 11, p. 260.

United States: Evolution of the public school system.—In the beginning of the nineteenth century, the problem of providing competent teachers to fill the need of elementary schools in the United States was one that had to be faced. To help to solve it, Lancaster's monitorial system was adopted, about 1815, and remained in practice for about twenty years. (Lancaster himself was invited to America in 1818 and placed at the head of the school system in Philadelphia.) The monitorial system naturally was chiefly used in

the cities, where the idea was carried to its full logical conclusion. Parker is responsible for the statement that in Philadelphia there were ten monitory schools, one teacher to each, and an average of 284 pupils to each teacher. A few years later (1820), the infant school appeared, also from England, to take the place of the older dame schools. These infant schools were later merged in the primary schools. Long before this time, the place of the Latin schools began to be taken by academies, of which the best known are Philadelphia Academy, founded by Franklin in 1749, Germantown in Maryland, Andover in Massachusetts, Exeter in New Hampshire, Bethlehem and Nazareth, all dating from about the Revolution. Some of them, like those mentioned, developed into colleges. Others became the prototypes of the high schools, and thus the foundation of the modern school system grew to completion. Progress was at first very slow, and in the early part of the century the curriculum in the elementary schools was decidedly meagre. Late in the eighteenth and early in the nineteenth cen-

HORACE MANN

ture a number of American cities, following the example of English cities, organized subscription societies to provide education for the children of the poor. One of the earliest of these societies—"The Manumission Society," established in New York, in 1785—had for its object "mitigating the evils of slavery, to defend the rights (of blacks) and especially to give them the elements of education." The first school was opened in 1787 for negro children. The first free school for poor white children was opened by the same society in 1801; but the first schoolhouse building was not erected until 1800. The association was merged in the "Public School Society" in 1834. "It seems as if the farther south we go the more deeply rooted was the idea that education, except for the well to do, was a charity. In Pennsylvania and all the states to the south there existed an institution known as the pauper-school. This institution had been in use before the Revolution, and it persisted throughout the entire period under discussion. . . . Virginia, which may be taken as typical of the whole South, was even more devoted to the charity theory of education than were the New Yorkers and the Pennsylvanians. . . . In addition

to the time-honored private schools of the wealthy, and occasional denominational schools, so-called field schools were not uncommon during the period under discussion. They were part and parcel of the old colonial system of education under family auspices, being maintained by several neighboring families in cooperation. They were supported by tuition, or, like churches, by subscriptions. . . . Warren Colburn's *First Lessons in Arithmetic* on the Plan of Pestalozzi was published in 1821. Colburn in the first part of this book emphasized Pestalozzi's idea of imparting number ideas to children by the use of objects which they could count. . . . Parker ranks this book with the *New England Primer* and Webster's *Spelling Book* in importance; its influence, however, did not begin until near the close of the period under discussion. Notwithstanding the introduction of these new textbooks, the elementary curriculum remained very narrow. It consisted almost entirely of 'the three R's' (readin', 'ritin', and 'rithmetic). Geography, history, and grammar did not appear as subjects in most of the schools until after 1835."—R. L. Finney, *American public school*, pp. 47, 48, 54.

"From early in the [nineteenth] century, advocates of popular education had not been wanting: but the first man who fully understood the needs of the nation, and undertook to meet them in large practical ways, was Horace Mann. . . . Unlike Herbart, Froebel, and Rosmini, who were educational philosophers, Horace Mann was distinctly a practical man. . . . His appointment to the secretaryship of the Massachusetts Board of Education, an office which he held for twelve years, gave him just the opportunity which he needed, and desired, to bring the state of education, with suggestions of reform, before the public. The board itself had no executive power; but it could give information and advice, not only to the legislature, but to all the world. . . . [He] made up his mind that it should be not only ornamental, but in the highest degree useful. So he set out to collect facts and statistics of all sorts, and to consider projects of educational reform. [He visited Europe on this quest and brought back ideas on the Pestalozzian method and other systems which roused much opposition.] He embodied [the information obtained] in his famous twelve annual Reports, which must count among educational classics."—T. Davidson, *History of education*, pp. 246-248.—These reports had the direct result of rousing public opinion to the need for general education. Beginning with the reorganization of the Massachusetts school system, the circle of his influence widened, until it embraced the whole of the United States, and the present day free school system. Moreover, it was due to him that the first normal school was opened in Massachusetts (1839), and the formal training of teachers established. He was appointed president of Antioch College (Yellow Springs, Ohio), from 1852 to 1857, and while there advocated the co-educational movement, which was then looked upon with suspicion as being radical.

"Up to the time Henry Barnard began to write on schoolhouse construction (about 1840), no one had given any particular attention to the subject. Schoolhouses were 'home-made,' and, outside of the few large cities, were largely built without plans or specifications. For one of the early schoolhouses built in Providence, Rhode Island, the entire contract consisted of a very rough pen-and-ink sketch, on a single sheet of paper, showing windows, rafters, steeple, and length and breadth, and across this the contractor had writ-

ten: 'For the consider one thoutan two hundred dollars erect & build finde the matearels & paintent the fame and lay the foundations build the chimney and completed faid building fit for youse'; and signed his name. Many schoolhouses in the towns and rural districts were built in a similar manner until well after the close of the Civil War. In the rural districts 'a weatherboarded box' or an old log schoolhouse, with two or three windows on each side, a few wooden benches, and an un-jacketed stove in the middle of the room, answered all needs. In the cities a very ornate school architecture came in after the building of high schools began, but few high-school buildings erected before 1860 contained any rooms beside class recitation rooms, an office, and an assembly hall."—E. P. Cubberley, *Public education in the United States*, pp. 244-245.—Part of the trouble was caused by the scarcity of teachers, and the paucity of equipment of many. It is true that numbers of men made teaching in a country school a stepping stone on their way through college, and that earnest individual teachers did fine educational work; but on the whole education in rural districts was poor. Efforts were constantly made, however, to raise the standard, both by legislation, and by demanding higher educational attainments from prospective teachers, and the progressive programmes of examinations for certificates give a fair idea of the increasing number of subjects which were taught. Standards varied as they still continue to vary according to the conditions under which certificates are issued. "The power of certificating teachers was vested in local authorities first in practically all the States. This was indeed a matter of necessity and convenience and followed precedent set by the earliest settlers of New England and New Amsterdam. The early State and county authorities had neither a sufficient number of assistants to carry out such authority . . . nor traveling allowance and other requisites for effective enforcement of regulations. . . . New York was among the earliest States to establish State certification. . . . The authority to issue certificates was given the State superintendent in 1843. . . . In 1856 certificates were issued by both local school commissioners and the State superintendent, but the latter was empowered to prescribe the regulations under which they were issued. It appears therefore that the power to control certificates was centralized, but the authority was not exercised, extensively at least, until 1888. . . . In 1899 the supervision of teachers' classes passed to the State department, thereby centralizing and co-ordinating all agencies concerned with the preparation and licensing of teachers. Virginia, Montana, and Idaho are other States with similar systems. Some other States, however, accomplish similar results by requiring applicants for certificates to complete 'approved' courses in teacher-training institutions, or through representation of the State superintendent on the governing boards of teacher-preparing institutions. Missouri and Indiana in 1824 legalized the examination of teachers by district visitors and township trustees, respectively. . . . In 1837, Indiana provided by law for 'a selective estimate and ranking of teachers of the county by three examiners in each county appointed by the circuit court.' . . . Five years later, under provisions of the law of 1852, the certification of teachers was made one of the duties of the State superintendent of public instruction. . . . In 1873 the county commissioners became . . . county superintendents and assumed the responsibility of examining teachers. In Indiana thenceforth . . . the county superintendent

issued certificates of county-wide validity and the State superintendent those which were State-wide. In Michigan the first law provided that teachers should be examined and certificates given by township boards of school inspectors. These boards were replaced in 1867 by county superintendents. The same law . . . [still in operation] granted authority also to the State superintendent of public instruction to issue certificates good in the State. . . . In Pennsylvania the authority to grant certificates was given first to town committees elected by the people in much the same way as . . . in New England. This authority was transferred to county and State superintendents in 1854, where it has since remained. . . . Many of the States, particularly the older ones, had a development similar to those given. A few, like Arizona, established State centralization of the certificating powers with Territorial organization. . . . In general, the development is about as follows: Beginning with local district or township inspectors or examiners, the certificating power passed into the hands of county superintendents.

TYPICAL EARLY SCHOOL ROOM DESK

As State departments of education were definitely established and assumed importance and prestige, more and more educational power was granted them. Higher efficiency and more unified requirements were secured under these new conditions by including among the legal duties of the State department that of granting certificates of State-wide validity, and that of influencing or controlling the whole matter of certificating teachers. . . . In 1888 a demand for a change in the existing methods of certificating teachers was caused by the fact that political pressure was being used to secure certificates. It was believed that instituting a definite, uniform method of examination under control of the State department would prove an effectual way of securing higher standards. The use of uniform questions, at first voluntary, was later made obligatory; and subjects, questions, and grades for examination were prescribed by the State superintendent. It is interesting to note that, in the first uniform examination in 1887, not alone questions but answers were furnished, and a circular sent showing the amount of credit to be given for each question. The subjects given were arithmetic, geography, grammar, physiology, general questions, American history, civil government,

methods, school law, and algebra. Three grades of certificates were given. The law of 1887 provided for granting certificates to college graduates with experience. . . . [Massachusetts in 1827 required] "a certificate of qualification from the town school committee . . . before any teacher could be employed. The system of town certification of teachers still prevails in Massachusetts. When States and Territories were organized, the laws prescribed qualifications more definitely. In New York, from the beginning of its organization as a State, qualifications of some sort were exacted. . . . In 1841, when the county superintendency was established, the county superintendents were required to examine candidates and issue certificates of qualification. Testimonials of moral character and examinations testing ability to teach and 'learning' were required. The latter included spelling, arithmetic,

should be given by the inspectors to any person unless he was found qualified to teach reading, writing, and arithmetic. The Pennsylvania law of 1849 required teachers to hold a certificate enumerating the branches that they were capable of teaching, signed by a majority of the board of directors. These certificates were good for one year and renewable annually. . . . The law of 1867 provided that no teacher should receive a certificate who did not possess a fair knowledge of orthography, reading, writing, geography, English grammar, arithmetic, history of United States, and theory and practice of teaching. Wickersham says of this law: 'It was not expected that many teachers could pass an examination in the theory of teaching or even that many superintendents should be able to conduct such an examination, but it was thought that the time had come when all con-

TYPES OF EARLY SCHOOL HOUSES

1. Town school at Dedham, Mass., 1648.
2. Typical schoolhouse ("weather-boarded box"), 1840.
3. First state normal school building in United States, Bridgewater, Mass., 1846. (Dedicated by Horace Mann.)
4. Town hall, Lexington, Mass., in which the first state normal school opened, July 3, 1839.
5. First schoolhouse built by the Free School Society in New York City, 1809.

geography, history, and English grammar. In 1843 the State superintendent was authorized to issue certificates on 'such evidence as may be satisfactory to him.' . . . The law required that candidates for teachers' certificates should be examined in the 'several branches as usually taught in the primary grades, their moral character and their ability to teach and govern school.' No branches or grades of certificates were named, and the opinion of the inspectors was sufficient. In 1867, under the provisions of the county superintendent's law, applicants were required to be examined in orthography, reading, writing, grammar, geography, and arithmetic. Three grades of certificates were granted, good for from six months to one year in the county. In colonial Pennsylvania, though the custom of employing preachers as teachers and assuming their ability, was quite general, there is one early instance of a license requirement. . . . The first instance of stipulating subjects for examinations is found in the State law of 1834, according to which no certificate of qualification

cerned in the work of education should begin to study the principles of their profession.' In Indiana the examination given by township trustees covered the subjects of reading, writing, and arithmetic, with an occasional branch added if petitioned by patrons. The test was simple and certificates often might be had for the asking. In theory, the qualification of teachers was recognized. In practice, little discrimination was made. . . . Not until 1865 can it be said that the examining and licensing of teachers received systematic and dignified consideration. In that year the branches in which examinations were required were first specified and the duration of licenses fixed. These were of four grades, good for 6, 12, 18, and 24 months. The six common branches were required by this law: Physiology, history of the United States; elementary algebra; physical geography and elementary botany; elements of rhetoric and mental and moral science; Constitution of the United States; and the State school law. . . . In 1883 Indiana provided for a 'professional' license,

granted upon examination prescribed by the State board. Papers were graded and licenses issued by the State board of education. These instances are reasonably typical of the development of scholarship requirements for certification in other States. From exceedingly indefinite requirements each State passed first to the grammar, geography, physiology, United States history, and finally theory and practice of teaching were added as time passed. From the establishment of the first normal school in 1830, professional preparation for teaching became more and more common. Demands were increasing that certificates without examination be given to graduates of professional schools. In some States, Pennsylvania, for example, certificates were granted to normal graduates even before the power of certification was given to the State board or the State superintendent. By 1873 . . . a number of States recognized the demand in certification laws or in practice. The inclusion of the theory and practice of teaching as one of the subjects for examination . . . became a custom among many States, and gradually other professional studies were added. The rapid growth of the recognition of professional and academic study as preparation for teaching is shown by the fact that, by 1807, 28 States recognized graduation from normal schools and universities as evidence of qualification for certification without examination."—K. Cook, *State laws and regulations governing teachers' certificates* (Bureau of Education, Bulletin no. 22, pp. 6-12).—See also U. S. United States: Secondary education.—"Up to 1850 there were probably not over a dozen secondary schools in the United States publicly maintained. The founding of such institutions was left, in the interval, to church organizations and private individuals . . . [and] were generally called academies, [while] the public secondary schools became known as high schools. About the middle of the nineteenth century the high schools began to multiply with great rapidity. By 1880 the number had increased to nearly five hundred. Between 1890 and 1896 the number of pupils in high schools increased eighty-seven per cent. In 1897-98 there were reported five thousand three hundred and fifteen high schools, with an enrollment of four hundred and forty-nine thousand six hundred pupils. With the exception of the high-grade college preparatory schools, the academies have relatively declined both in numbers and attendance. In some sections they have entirely disappeared. The first academies and high schools as far as they were strictly secondary, that is, preparatory to higher institutions of learning, were classical schools. . . . Now nearly all secondary

schools provide at least two types of courses, classical and scientific. What has diversified the courses of study to the prevailing extent is the fact that there is no fixed standard of higher education and that most secondary schools have performed a double office. They have been both preparatory and supplemental, or continuation, schools. In fact, many of the high schools have not advanced beyond the latter character. In both high schools and academies many people complete their education. . . . A number of the giants in American history received no culture beyond that afforded them by the old academies."—E. L. Kemp, *History of education*, pp. 328, 337.—"In the United States the academy movement of the late eighteenth century marks the small beginnings of the extension to women of educational privilege above the elementary or common school grade. The academies of Massachusetts, notably Leicester, 1784; Medford, 1780; Westford, 1793; and Bradford, 1803, were the first to offer such opportunity. The academies were not connected with the public school system, charged a tuition fee, and were patronized largely by the middle class. During the first half of the nineteenth century, these schools multiplied rapidly in all the States, though they were found in largest numbers and were most successful in New York and Massachusetts. Another movement making possible secondary education for girls was inaugurated by the establishing of the High School for Girls in Boston in 1826. The novel and most important feature of this school was that it formed an integral part of the public school system of Boston and hence was open to all girls, free of cost, who were qualified to enter. The common school systems of the various states which offered elementary education upon equal terms to both boys and girls made it possible to look upon the attendance of girls in the high schools as a matter of course, when the common school system was extended upward. While there were a number of such schools previous to the Civil War, notably in New York, Massachusetts, and Ohio, the rapid growth of the high schools came after 1870. This movement from the first tended to lessen the number and influence of the academies. In the field of higher education, some collegiate training was offered in the Troy Seminary, New York, founded by Emma Willard in 1821 [later called Emma Willard School]; the Catherine Beecher Seminary of Hartford in 1822; the Ipswich Female Seminary in 1825; the Abbot Female Academy in 1829; and the Mount Holyoke Seminary in 1836 [from this seminary grew Mount Holyoke College, chartered in 1888]. These schools may be looked upon as forerunners of the movement for the higher education of women which gave rise to the woman's college. Elmira College, New York, was in 1855 the first of such institutions to offer courses and require such work for the degree as to place her on an equal footing with the colleges for men. Vassar, Smith, Wellesley, and Bryn Mawr, in the order of their founding, are well known examples of this particular means of extending the privilege of higher education to women. Another avenue with like purpose was opened by the founding of Oberlin College in 1833 where women were admitted on equal terms with men both to classes and to degrees. The University of Michigan in 1870 was the first of the state universities to become co-educational. All similar state institutions are now [1918] open to women with the exception of the Universities of Virginia, Georgia, and Louisiana."—G. L. Jackson, *Privilege of education*, pp. 125-130.—"Of colleges for women, Vassar was opened in 1865,

Wellesley in 1875, Smith in 1875, Bryn Mawr in 1885, Radcliffe in 1879, Barnard in 1889. All the universities save three or four are open to [women]. . . . In 1870 but 30.7 per cent of the colleges were coeducational, and 69.3 per cent were for men only.—E. C. Moore, *Fifty years of American education*, p. 81.—See UNIVERSITIES AND COLLEGES: 1804-1837; 1818-1821; 1862-1886; WOMAN'S RIGHTS: 1861-1910.

"Gradually . . . an ever-increasing opposition to the exclusively classical type of collegiate work grew up. This new point of view came to be called the 'Industrial Movement,' and may be looked upon as the initial educational expression of the great social and economic transformation that is now known as the Industrial Revolution. Although European in its origin, the Industrial Movement in education found a ready soil in America, both along the Atlantic seaboard and in the more remote parts of the country. In Mich-

EMMA WILLARD

igan, the State Normal School at Ypsilanti was the immediate result of this movement; so, too, in Illinois, the State Normal University at Normal. These schools 'were to give instruction in busbandry, agricultural chemistry, and animal and vegetable physiology,' as well as to prepare teachers for the public schools. In 1857, Michigan opened her State Agricultural College, the first fruit of the Industrial Movement in higher education, although Pennsylvania, in 1855, had established a 'Farmers' High School' which in 1863 became the state's College of Agriculture."—J. A. H. Keith, W. C. Bagley, *The Nation and the schools*, pp. 65, 212.—See also EDUCATION, AGRICULTURAL: United States.

United States: Beginning of commercial education.—Commercial education as such had its inception in the nineteenth century. "About the

middle of the fifties there were . . . [about] a dozen commercial schools scattered in the large cities from Boston and Philadelphia to Chicago and St. Louis. They had arisen with the idea of facilitating the entrance of young men into minor positions as clerks and bookkeepers. The instruction offered was very meagre,—some so-called commercial arithmetic, a little practice in keeping accounts, and a certain amount of ornamental penmanship made up the total. A school of this kind did not require a large force of teachers,—in many cases the entire instruction was given by one man. Nor was the equipment elaborate; a single room fitted with chairs and tables frequently sufficed. . . . Poor as such education must have been, it evidently filled a need, for commercial [or business] colleges thrived and multiplied and with success became still more successful. Increased popularity led to higher fees, longer courses, to the preparation of printed texts . . . the teaching force was increased; students were no longer adults wearied by daily labor; the commercial school began to draw young men and boys [and girls] looking forward to employment; day classes largely took the place of evening instruction; school equipment improved and gradually these institutions grew into the apparently permanent place in public favor which they enjoy to-day. . . . An interesting side light may be thrown on the growth of the commercial college by noticing for a moment the career of one of the leaders of the movement, Mr. S. S. Packard. . . . Mr. Packard began his work as an instructor in penmanship in a small school in Cincinnati as early as 1850. After teaching in various places—among others in Chicago—he opened the Packard commercial college in New York City, in the spring of 1858, as a link in the Bryant and Stratton chain of business colleges. . . . The 'chain' eventually embraced schools in fifty of the principal cities of the United States and Canada. . . . Mr. Packard's lead was followed by the other schools, and thus the foundation was laid for individual—if not competitive—work which has done so much to advance the character of business education . . . [throughout the United States]. In the early days of the school the students were mature young men, many of them having fought in the civil war, and coming home entered the school as a preparation for clerical positions. The course was intended to cover only about three months, and bookkeeping, penmanship, and business arithmetic only were taught. The school sessions were from nine to four, and from seven to nine in the evening, six days in the week. There were no vacations. No record was kept of attendance, as the students themselves were responsible, being in some cases partially employed during the day. The scholarship plan gave the privilege of unlimited attendance at any school in the 'chain.' In 1865 commercial law was added to the course, and later practical English and civics. In 1872 stenography was first taught, in classes only. The following year the typewriter was introduced. This was the first school to teach either stenography or typewriting . . . The career of Thomas May Pierce, of Philadelphia, illustrates in a similar way the growth of this department of our educational system. Starting out in 1865 with the meagre curriculum then offered, he increased the scope of the work, improved the equipment, introduced regularity and system into the instruction until, when he died in 1896, he had built up what might fairly be called a typical school of the better sort. . . . Similar careers may be found in all older and larger cities of the United States, all testifying to

the service which these schools have rendered the public. . . .

"Four institutions in the United States, the University of Pennsylvania in Philadelphia, the University of Chicago in Chicago, the University of California in Berkeley, Cal., the Columbia University in the city of New York, deserve special mention for their connection with this subject of higher commercial education. . . . In 1881 Joseph Wharton, Esq., a manufacturer of Philadelphia, gave to the University of Pennsylvania the sum of one hundred thousand dollars in order to establish a department in that institution for higher commercial training. A department was established known as the Wharton school of finance and economy, the object of which was the furnishing of an adequate education in the principles underlying successful business management and in the principles of civil government. The curriculum was two years in length and was made up largely of political economy, political science, accounting, mercantile law and practice, etc. A bachelor's degree was conferred upon the graduates from this school. To enter as a regular student the candidate must have completed the first two years of the regular four years' college course. . . . The growing demand for higher instruction in commercial subjects . . . turned the attention of several institutions toward the subject about the same time. The University of Chicago, which opened its doors in October, 1892, had included within its plan of work from the beginning a college of practical affairs. But it was not found practicable to undertake the organization of such a department until the year 1898, and students were enrolled in this college for the first time on the first of July of that year. The new department was given the title of the college of commerce and politics, and was organized as a co-ordinate department with the other colleges of arts and literature and science. . . . About the same time that the University of Chicago determined to adopt a scheme of higher commercial training, a report was made to the board of trustees of the University of California, by one of its members, urging the adoption of a similar course there. After an elaborate discussion, it was decided to erect an additional college in the university, to be known as the college of commerce."—E. J. James, *Commercial education, in Education in the United States* (N. M. Butler, ed.), pp. 658-659, 670-674, 688-689, 692-695).

United States: Industrial education.—"Industrial education in colonial times was confined entirely to the training received by the apprentice and to the provision, which was quite general, that the overseers of the poor should see that proper provision was made for teaching orphans and poor children various industrial occupations. This, however, had little or no influence on modern industrial education. The first indication of any attempt to meet the needs of apprentices and other industrial workers is undoubtedly the establishment of classes in industrial and mechanical drawing by the various mechanics' institutes and like organizations. The instruction was, for the most part, given in the evening and was for the benefit of apprentices. Franklin Institute, Philadelphia, had such classes in 1824; Ohio Mechanics' Institute, Cincinnati, in 1828. Several other organizations started classes of the same character before 1850. Many of the first evening high schools established after 1856 had a strong tendency in the industrial or semi-industrial line, as indicated by the name of the O'Fallon Polytechnic Institute of

St. Louis, and the Artisans' Night School of Philadelphia. These schools, however, gradually assumed the character of the regular high school, thus losing what little industrial character they had. . . . In 1872 a very important step was taken by the . . . commonwealth [of Massachusetts], when permission was given to any city or town to establish and support industrial schools, in which instruction might be given in the arts and in the various trades and occupations. It is true no city took advantage of this permission until 1898, when the Springfield Evening School of Trades was established, but the passing of the law clearly shows the purpose in the introduction of drawing into the schools. Another influence which must be considered in tracing the development of industrial education is that of the various institutes of technology and colleges of mechanic arts. These have affected industrial education proper mostly indirectly but none the less forcibly. The first of these to be established in this country was the Rensselaer Polytechnic Institute, which was established in 1824. The Morrill Land Grant Act of July 2, 1862, had a powerful effect on the establishment of such institutions. This, combined with the great commercial and industrial expansion immediately succeeding the Civil War, led to the rapid establishment of many agricultural colleges and colleges of mechanic arts throughout the country. In some of these, especially those for the negroes, the character of the education is distinctly industrial and they have been of great assistance in the industrial training of the negro. With these exceptions, this type of school is not intended to train workmen or even to develop foremen. They aim to produce the technical expert, the superintendents of agricultural and industrial production. Interest in some phases of industrial training was quickened by the various exhibits of drawing in the Centennial [Exhibition, at Philadelphia], in 1876. Of even greater interest were the exhibits of Russian schools in metal and the Swiss schools in wood (sloyd). Even before this, various experiments in industrial education were tried. In 1870, in Boston, the girls were required to take sewing and in 1874, in Jamestown, New York, typesetting was offered to both boys and girls. These efforts were spasmodic and did not result in any well formulated scheme of education along industrial lines. . . . The Manual Training School connected with Washington University, St. Louis, opened its classes in 1880, and was immediately followed by the establishment of manual training high schools in other cities, some public high schools, some under private management. [But it] was not until nearly 1890 that manual training was taught in the elementary school. The public eagerly welcomed the introduction of manual training, with the idea that in some way this would bring the much desired industrial or practical elements. It was freely said that these schools and classes were just what was wanted, because they would give every boy an opportunity of learning to be a carpenter. But they were doomed to disappointment. The leading educators deprecated this utilitarian aspect of manual training. It should not be saddled to anything practical. Its purpose was to train the eye and the hand together, to exercise the powers of observation, to train the reasoning power, and to strengthen the will. Consequently the work was entirely formal, there was no useful end in view, the type exercise was the universal form in which hand work appeared. This was nearly as far removed from industrial education as were the formal studies of the school curriculum."—Commissioner of Education of

Rhode Island, *Special report on industrial education*, pp. 64, 65.

United States: Training teachers.—"The Lancasterian higher schools in New York and elsewhere had, by 1810, evolved classes for educating monitors as teachers. . . . The result [of recommendations made by Governor Clinton in 1826, 1827] was the New York law of 1827, appropriating state aid to the academies 'to promote the education of teachers.' . . . In the *Report* for 1831 two academies report 'Principles of Teaching' as a new subject of study, and by 1835 five were offering instruction in this new subject. In 1834 the New York Legislature enacted 'the first law in this country making provision for the professional education of teachers for common schools.' Excepting the Lancasterian monitorial schools, and the private schools of Hall and Carter, this was the first form of the normal school idea in the United States. In this form the training of teachers was continued in New York State until the establishment of the first State Normal School, at Albany, in 1844, with David Page as principal. In 1840 teacher-training in the academies was re-established, and still exists in the high schools of the State. The training of teachers in the academies now became common everywhere. Among the older and more important ones, Philips Andover, for example, introduced an English course primarily to train teachers, and many other New England academies did the same. To the south and westward many academies also added instruction intended for teachers, and several offered instruction for teachers on the manual-labor part-time plan. . . . The publication of the Reports by Cousin (1835) and Stowe (1837), with their descriptions of the teacher-training seminaries of Prussia, together with the contact of Dr. Julius and the Reverend Charles Brooks (1845), united to give valuable support to the efforts of Carter, Mann, and a few others in Massachusetts who were laboring to inaugurate such schools there. . . . While Carter worked with the legislature, Brooks worked with the people, traveling over two thousand miles in his chaise and at his own expense throughout Massachusetts, during the years 1835-38, explaining the Prussian system of teacher-training and the Massachusetts need for such, and everywhere awakening interest in the idea by his enthusiastic portrayal. . . . On July 3, 1830, the first state normal school in the United States was opened in the town hall at Lexington, Massachusetts, with one instructor and three students. At the close of the first quarter there were but twelve students, and at the end of three years but thirty-one. The course of instruction was one year in length, but could be extended to two years. . . . The distinctive feature of the school was the addition of a Model School, in which the students observed and taught. . . . On September 5th, 1830, the State Board of Education opened another normal school at Barre, and the third at Bridgewater, in 1840."—E. P. Cubberley, *Public education in the United States, a study and interpretation of American education history*, pp. 288-290, 292.—By 1850 the New England doctrine of tax-supported free schools had been accepted in all the Northern States, and free schools had made their appearance in some of the states of the South. The normal school was from the first an essential feature, perhaps the chief feature of this great democratic movement for popular education. . . . Twenty-six states had by the beginning of the year 1867 created state school systems and state superintendents of public instruction to direct them. By that date there were 4 state normal

schools in Massachusetts, 2 in New York, 1 in Michigan, 1 in New Jersey, 1 in Illinois, 4 in Pennsylvania, 5 in Wisconsin, 1 in South Carolina, 3 in Vermont, 1 in Kansas, 2 in Maine, 1 in Maryland, and 1 in Delaware. City normal schools had been opened at New Haven, St. Louis, San Francisco, and in 3 towns in Indiana and 3 in Iowa. Upon the refusal of the legislature of Ohio to establish such a school the State Teachers' Association in 1855 started one. "The first normal schools received their pupils from the elementary schools. Framingham's requirements in 1867 were that the candidate must be at least sixteen years of age, must declare his intention to teach in the schools of Massachusetts, and 'must present a certificate of good physical, intellectual, and moral character, and pass a satisfactory examination in reading, spelling, writing, defining, grammar, geography, and arithmetic.' 'The course of study,' says this same circular of 1867, 'includes reading, with analysis of sounds and vocal gymnastics; writing; spelling, with derivations and definitions; punctuation; grammar, with analysis of the English language; arithmetic; algebra; geometry; physical and political geography, with map drawing; physiology; botany; zoölogy; natural philosophy; astronomy; mental and moral philosophy; school laws theory and art of teaching civil polity of Massachusetts and the United States; English literature; vocal music; drawing. The Latin and French languages may be pursued as optional studies, but not to the neglect of the English course.' And all this was to be done in a two-year course! Dr. Harris declared at the semi-centennial celebration of the founding of the Framingham Normal School, in 1888, that 'all normal-school work in the country follows substantially one tradition . . . and this traces back to the course laid down at Lexington in 1830.' . . . President Wayland sought to establish a course of instruction in the science of teaching at Brown University in 1850. His efforts were not successful. Horace Mann introduced such a course as an elective study at Antioch College in 1853. The University of Iowa had a normal department from 1856 to 1873, which became a chair of didactics after that date. In 1874 President Angell recommended that lectures be given to the senior class of the University of Michigan on the organizing and management of schools and the art of teaching. In 1879 the Regents, on the recommendation of the president and faculty of that university, established a chair of science and art of teaching, with a fivefold purpose, as they declared, of fitting university students for the higher positions in the public-school service, of promoting the science of education, of teaching the history and theory of education, of securing to teaching the rights and prerogatives of a profession, and of giving a more perfect unity to the state educational system. Since that time many universities and colleges have created similar chairs, which have not been slow in becoming energetic departments. For a long time their occupants were regarded with a good deal of suspicion by their more conservative colleagues in the academic family. They were not slow, however, in proving their usefulness, and it soon became apparent that the interest which they represented was too serious and far-reaching to be conserved by such inadequate means. Clark University, which opened in 1880, made ampler provision for it; and in 1808 Teachers College became a professional school of Columbia University, taking rank with the schools of law, medicine, and applied science."—E. C. Moore, *Fifty years of American education*, pp. 68, 89, 90, 91.

19th-20th Centuries

Herbartian movement and its contributions.—Influence in the United States.—Herbart died in 1841, without having awakened any general interest in his ideas, and they remained virtually unnoticed until 1865. In that year a professor at Leipzig, Tuiskon Ziller (1817-1883) published a book setting forth Herbart's idea of instruction as a moral force. This attracted much attention, and led to the formation (1868) of a scientific society for the study of Herbart's ideas. Ziller and his followers now elaborated Herbart's ideas, advanced the theory of culture-epochs in child development, the theory of concentration in studies, and elaborated the four steps [clearness, association, system (or classification), method] in the process of instruction, as described by Herbart, into the five formal steps [preparation, presentation, association, classification, and application] of the modern Herbartian school. In 1874 a pedagogical seminary and practice school was organized at the University of Jena, and in 1885 this came under the direction of Professor William Rein, a pupil of Ziller's, who developed the practice school according to the ideas of Ziller. A detailed course of study for this school, filling two large volumes, was worked out, and the practice lessons given were thoroughly planned beforehand and the methods employed were subjected to a searching analysis after the lesson had been given. . . . Between 1885 and 1890 a number of Americans, many of them graduates of the state normal school at Normal, Illinois, studied in Jena, and returning brought back to the United States this Ziller-Rein-Jena brand of Herbartian ideas and practices. Charles De Garmo's *Essentials of Methods*, published in 1889, marked the beginning of the introduction of these ideas into . . . [the United States]. In 1892 Charles A. McMurry published his *General Method*, and in 1897, with his brother, Frank, published the *Method in the Recitation*. These three books probably have done more to popularize Herbartian ideas and introduce them into the normal schools and colleges of the United States than all other influences combined. Another important influence was the 'National Herbart Society,' founded in 1892 by students returning from Jena, in imitation of the similar German society. For the first few years of its existence its publications were devoted to a discussion of interest, apperception, correlation, recitation methods, moral education, the culture-epoch theory, training for citizenship, the social function of history and geography, and similar subjects. This society is still [1918] rendering good service under the name of the 'National Society for the Study of Education,' though its earlier Herbartian character now has disappeared. Herbartian ideas took like wildfire over the United States, but particularly in the normal schools of the Upper Mississippi Valley. Methods of instruction in history and literature, and a new psychology, were now added to the normal school professional instruction. New courses of study for the training schools were now worked out, in which the elementary school subjects were divided into drill subjects, content subjects, and motor-activity subjects. Apperception, correlation, social purpose, moral education, [interest], and recitation methods became new words to conjure with. . . . From the normal schools these ideas spread rapidly to the better city school systems of the time, and soon found their way into courses of

study everywhere. Practice schools and the model lessons in dozens of normal schools were remodeled after the pattern of those at Jena, and for a decade Herbartian ideas and child study vied with one another for the place of first importance in educational thinking. The Herbartian wave of the nineties resembled the Pestalozzian enthusiasm of the sixties. Each for a time furnished the new ideas in education, each introduced elements of importance into . . . elementary-school instruction, each deeply influenced the training of teachers in normal schools by giving a new turn to the instruction there, and each gradually settled down into its proper place in our educational practice and history. . . . To the Herbartians we are indebted in particular for important new conceptions as to the teaching of history and literature, which have modified all our subsequent procedure; for the introduction of history teaching in some form into all the elementary-school grades; for the emphasis on a new social point of view in the teaching of history and geography; the emphasis on the moral aim in instruction; a new and a truer educational psychology; and a better organization of the technique of classroom instruction.

Spencer, Huxley, and the scientific tendency in education.—'About the middle of the nineteenth century [the "Origin of Species" was published in 1859] the discovery by Darwin of principles which raised the theory of evolution from the status of mere opinion to that of an illuminating scientific hypothesis led to an extraordinary vigorous and widespread interest in the natural and particularly the biological sciences, and this in different ways affected the theory and practice of school education. In the first place it led to a demand for a larger place for the sciences upon the school curriculum. One of the foremost advocates of this reform was Herbert Spencer. His views as to the importance of science are summarized by himself as follows: 'Thus to the question with which we set out—What knowledge is of most worth?—the uniform reply is—Science. This is the verdict on all the counts. For direct self-preservation, or the maintenance of life and health, the all-important knowledge is—Science. For that indirect self-preservation which we call gaining a livelihood, the knowledge of greatest value is—Science. . . . For that interpretation of national life, past and present, without which the citizen cannot rightly regulate his conduct, the indispensable key is—Science. Alike for the most perfect production and highest enjoyment of art in all its forms, the needful preparation is still—Science. And for purposes of discipline, intellectual, moral, religious, the most efficient study is, once more—Science. . . . And yet the knowledge which is of such transcendent value is that which, in our age of boasted education, receives the least attention.' Another forceful exponent of the claims of science to recognition in the common schools was Thomas Huxley. While doing justice to the importance of literary training as an element in education, he argues with great cogency for the study in school of the things and forces in nature with which man has to deal. 'Suppose it were perfectly certain that the life and fortune of every one of us would one day or other depend upon his winning or losing a game at chess. Don't you think we should all consider it to be a primary duty to learn at least the names and moves of the pieces? . . . Yet it is a very plain and elementary truth, that the life, the fortune, and the happiness of every one of us, and, more or less, of those who are connected with us, do depend upon

our knowing something of the rules of a game infinitely more difficult and complicated than chess. It is a game which has been played for untold ages, every man and woman of us being one of the two players in a game of his or her own. The chess-board is the world, the pieces are the phenomena of the universe, the rules of the game are what we call the laws of Nature. . . . What I mean by Education is learning the rules of this mighty game. In other words, education is the instruction of the intellect in the laws of Nature, under which name I include not merely things and their forces, but men and their ways; and the fashioning of the affections and of the will into an earnest and loving desire to move in harmony with those laws.' The reforms thus so vigorously advocated have been carried out in America not only in the development of scientific courses in high schools and colleges, but in increase of atten-

the kindergarten idea has made relatively small progress on the continent of Europe. Its spirit does not harmonize with autocratic government. In Germany and the old Austro-Hungary it had made but little progress up to 1914. Its greatest progress in Europe, perhaps, has been in democratic Switzerland. [Note.—Next, perhaps, would come Italy, which is strongly democratic in spirit. In the cities of Holland one finds many privately supported kindergartens, but the State has not made them a part of the school system. In Norway and Sweden the kindergarten practically does not exist. The kindergarten will always do best among self-governing peoples, and seldom meets with favor from autocratic power.] In England and France, the two great leaders in democratic government, the infant-school development, which came earlier, has prevented any marked growth of the kindergarten. In England, though, the infant

tion in the elementary school to such subjects as nature study and geography. The doctrine of evolution has made itself felt not only in a modification of the common school curriculum but in a broadening and deepening of the conception of school education. It has come to be looked upon as a phase of the evolutionary process, a process of more complete adaptation to and utilization of environment. This environment in the case of man is, for the most part, social. Hence the progress of the individual is conditioned by the progress of society and *vice versa*. It follows that the character of the education most valuable for a given individual is determined in some measure by the character, tastes, and pursuits of the society of which he is a member. In this way problems of education have become involved with those of sociology."—L. F. Anderson, *History of common school education*, pp. 293-295.

Spread of kindergartens.—Considering the importance of this work, and the time which has since elapsed [since Froebel's day (1782-1852)],

school has recently been entirely transformed by the introduction into it of the kindergarten spirit. In France, infant education has taken a somewhat different direction. In the United States the kindergarten idea has met with a most cordial reception. In no country in the world has the spirit of the kindergarten been so caught and applied to school work, and probably nowhere has the original kindergarten idea been so expanded and improved. The first kindergarten in the United States was a German kindergarten, established at Watertown, Wisconsin, in 1855, by Mrs. Carl Schurz, a pupil of Froebel. During the next fifteen years some ten other kindergartens were organized in German-speaking communities. The first English-speaking kindergarten was opened privately in Boston, in 1860, by Miss Elizabeth Peabody. In 1868 a private training-college for kindergartners was opened in Boston, largely through Miss Peabody's influence, by Madame Matilde Kriege and her daughter, who had recently arrived from Germany. In 1872 Miss Marie Boelte opened a similar teacher-training school in New York City, and in

1873 her pupil, Miss Susan Blow, accepted the invitation of Superintendent William T. Harris, of St. Louis, to go there and open the first public-school kindergarten in the United States. To-day the kindergarten is found in some form in nearly all countries in the world, having been carried to all continents by missionaries, educational enthusiasts, and interested governments. Japan early adopted the idea, and China is now beginning to do so. . . . The dominant idea in the kindergarten is natural but directed self-activity, focused upon educational, social, and moral ends. . . . Wholly aside from the specific training given children during the year, year and a half, or two years they spend in this type of school, the addition of the kindergarten to elementary-school work has been a force of very large significance and usefulness. The idea that the child is primarily an active and not a learning animal has been given new emphasis, and that education comes chiefly by doing has been given new force. The idea that a child's chief business is play has been a new conception of large educational value. The elimination of book education and harsh discipline in the kindergarten has been an idea that has slowly but gradually been extended upward into the lower grades of the elementary school. To-day [1920], largely as a result of the spreading of the kindergarten spirit, the world is coming to recognize play and games at something like their real social, moral, and educational values, wholly aside from their benefits as concern physical welfare, and in many places directed play is being scheduled as a regular subject in school programs. Music, too, has attained new emphasis since the coming of the kindergarten, and methods of teaching music more in harmony with kindergarten ideas have been introduced into the schools."—E. P. Cubberley, *History of education*, pp. 759-768.

MODERN DEVELOPMENTS: 20TH CENTURY

Changing theories.—During the last decade of the nineteenth century, theories of education began to change, or perhaps it might be better to say that educators began to realize the full meaning of the theories advanced by such men as Comenius, Erasmus and Ascham and nearer our own time by Pestalozzi, Froebel and others spoken of above. Since the beginning of the century these ideas have crystallized still further, and for what Ruskin stigmatizes as education for advancement the best educators seek to replace education which will bring out all the powers of the child, education which will not cease when the school room door closes on the boy or girl who has left it for the last time as a student. Even as early as the commencement of the nineteenth century the growth of the belief in the common right to knowledge manifested itself in institutions, such as those described below, some of which having served their day have been abandoned, while others have preserved their usefulness and continued to grow, or have developed into institutions of still greater value. It is now generally recognized that "Self-support through social service is the duty of every mature person. If this be one's duty, then all the things that contribute to this end are really materials in that person's education. If it be one's lot or choice to be a carpenter, the tools, the bench, the various woods, the instruments for measuring buildings, the nails, the locks, hinges,

etc., are really teachers, are really materials of education. There is nothing in the wide world—from soil to theory, from brick to sentiment—which is used in making an honorable living but that may become material in some person's education. Everything that enables a stone mason to make an honorable living by serving others helpfully is really the material out of which he quarries or builds himself."—J. A. H. Keith, *Elementary education, its problems and processes*, pp. 57, 58.—"Much progress has been made . . . towards substantial agreement on the reforms needed in American schools and colleges. They may be concisely stated as follows: reduce class work and the size of classes; increase individual work; reduce book work and mere memorizing; make the training of the senses a prime object daily, and cultivate every hour in every child the power to see and describe accurately; connect each lesson with something in the life of the child, so that he may see how it concerns him; make sure that every child learns to enjoy reading; teach related subjects together in the natural groups, not singly; enlist the interest of every pupil in his daily tasks, so that he shall be active and alert, led not driven, but always learning the value of co-operation discipline; use in schools such stimulating competition as both children and adults use in games; give every pupil much practise in determining facts and judging evidence; see to it that no child leaves school without possessing some skill of eye, ear or hand."—*Reforms in American schools (School and Society, Apr. 26, 1910, p. 510)*.

As a factor in democracy. See DEMOCRACY: Basis and value.

New ideas in the education of children.—Montessori system.—"Among the many changes demanded by educators in our methods of elementary training, perhaps that of discarding the class teacher is the most radical. The theory has found its application on the well known Gary system. True, this is but one of the features of the Gary plan; but it is essential to it. . . . [There are educators who believe that a pupil should no longer sit in the same room with the same teacher throughout the year, but every day . . . pass through a succession of rooms and before a succession of instructors, . . . [each of whom would devote his or her] entire time to this subject. . . . [If this idea is carried out in its fullest each room] will be equipped with the latest maps and globes, with charts and pictures, with lantern slides and apparatus for moving pictures. Everything here will be chosen with the double object of making the class-work instructive and interesting. The American child in St. Louis will not in the future listen to a dry description of Niagara Falls, but will see before it in moving pictures the sublime rush of waters. The child in the schools of Buffalo will view the onward flow and broad current of the Mississippi and the wide stretch of the Great Lakes, the cañons of Colorado, the wonders of Yellowstone Park, the snow-capped peaks of the Rocky Mountains. All this is obviously impossible with the present system where the teachers must be contented with a single globe and one or two faded maps. Natural history! What an inviting picture does the teacher of natural history present to her class. In the vicinity of the school she will make a collection that will astonish the less observant pupils. Her room will be a bewitching scene—every flower that blooms, every insect that chirps, every bird that sings. Children will wander forth from school to city parks or suburban woods to spy out every warbler or pluck clusters of wild flowers. They will read the book of nature around

them. From the study of local forms they will better understand the clusters which grow in other lands; and from the animal and bird life seen in the classroom and in the locality, they will be led to study other forms of life in other countries. Local collections will be supplemented by loans from the State department of education, which in turn will exchange with other States, with the government and even with the foreign countries. The work in the classroom will be supplemented by the more complete collection in the city museum. To this museum an expert will take the children, and the work there will cease to be an unmeaning visit under the guide of one who has never specialized in natural history. Yes, specialization will be the word, a specialist teacher for music, for drawing, for reading, for arithmetic. Every child will be taught by a specialist. This picture which we have drawn of the elementary school, and which, with but a few exceptions, is still only a picture, in high schools, at least in larger cities, has become a reality."—H. Spalding, *Differentiation of college professors* (*Catholic Educational Association Bulletin*, v. 14, no. 1, Nov., 1917, pp. 94-95).—Ideas of individual tuition are also applied in the teaching of very young children, as for example in the Montessori system. "The educational experiments . . . [made by] Doctor Maria Montessori . . . at Rome have attracted unusual attention. There, in connection with her work in the University of Rome, she became interested in the educational possibilities of the defective children, and, adapting materials used by Seguin, she devised 'didactic apparatus' [silk bobbins, blocks and cylinders] for the training of the senses. Her success with defectives brought her the opportunity of organizing infant schools for normal children in the poorest parts of Rome. Rooms opening out into a court were furnished according to her directions and called 'The Children's Houses.' The methods used in her experiments have been adopted by many schools in Italy and Switzerland and in other countries. With Rousseau and Froebel, Madame Montessori assumes that 'nature is right,' and that accordingly it is the teacher's function to observe, test, and direct rather than control children in the educative process. In the administration of this generally accepted principle, however, she provides less for 'group problems,' or social participation, on the part of the little people, and isolates herself far more from this participation than Pestalozzi and Froebel. Madame Montessori has probably attained to greatest success in her attempt to teach such formal subjects as reading, writing, and arithmetic. She has analyzed these subjects into elementary activities, which, when mastered by the child, prompt . . . [him], with very little help from the teacher, to master the subjects in question by spontaneous synthesis. . . . Perhaps the greatest contribution of Madame Montessori to education is the new sympathy with defective and subnormal children which her devotion to the cause inspires in teachers, and the resulting stimulus to the study of individual children in our schools."—C. C. Boyer, *History of education*, pp. 448-449.—Many Montessori schools were "opened in the United States, . . . [but] more critical examination of her ideas . . . [led] to their somewhat general rejection by most American educators. . . . Based on an outgrown faculty psychology, a psychologically unsound plan for sense training, and involving a too early start in the formal arts of learning, the method has been generally decided to be distinctly inferior to the modern Americanized kindergarten. . . . The method has its greatest value for subnormal chil-

dren."—E. P. Cubberley, *Public education in the United States*, pp. 321-322.

Extension work.—"Some phases of educational extension work developed in the United States independently of the colleges or other established teaching institutions. Beginning as early as 1831 the American National Lyceum aided in the spread of popular education by establishing lecture courses and debating clubs in many urban and rural communities. [See below: Lyceums.] A local organization of special importance . . . [is] the Lowell Institute in Boston, which originated in a bequest by John Lowell to provide for regular courses of free public lectures, which were inaugurated in 1839. The Lowell Institute lectures have been given by the most eminent men in America and Europe on all branches of natural science, political and social subjects, literature, and art. In addition, there were established classes in drawing, from which developed the Lowell School of Practical Design. Other local institutions of a somewhat similar character are the Franklin Institute and Drexel Institute in Philadelphia, the Brooklyn Institute of Arts and Sciences, and the Peabody Institute in Baltimore. More direct university activity in the movement for popular education began with the establishment of summer courses of instruction during the long summer vacations. Harvard began summer courses in geology and field work in natural sciences in 1869; and courses in other subjects were added from time to time. Summer instruction in law was begun at the University of Virginia in 1870; and other subjects were offered in later years. In 1874 the Chautauqua Assembly in New York began a systematic plan of popular education at first by summer courses of lectures, but later developed to include correspondence work and home study literary and scientific circles. [See below: Chautauqua.] . . . More specialized summer schools were also organized, as, for example, the Sauvies Summer School of Languages in 1876, the Chesapeake Zoological Laboratory of Johns Hopkins University in 1878, the Concord School of Philosophy and Literature (from 1879 to 1888), the Marine Biological Laboratory at Woods Hole, Mass., in 1888, the international Y. M. C. A. training school at Springfield, Mass., in 1887, and the School of Applied Ethics at Plymouth, Mass., in 1891. The name University Extension is first definitely associated with a movement which began in England in 1873, and rapidly developed to a considerable extent in that country. An address on this English system before the American Library Association in 1887 led to the beginnings of similar work in several cities (Buffalo, Chicago, and St. Louis) in connection with the municipal public libraries. In 1889, Teachers' College, later affiliated with Columbia University, offered elementary extension courses in science to the teachers in New York City and vicinity. A year later, the American Society for the Extension of University Teaching was organized in Philadelphia; and the following year similar societies were formed in Chicago, Cleveland, and Detroit. In 1891, the State of New York appropriated \$10,000 for university extension, by means of study clubs, traveling libraries, and other forms of home education. In December, 1891, a national congress of university extension was held in Philadelphia. At this meeting it was reported that in the four years since 1887 university extension in some form had been begun in 28 States and Territories. . . . After 1900, extension work by

universities and colleges was more thoroughly organized and attained increased importance. . . . As the work has developed, many institutions have reorganized and extended the system; while many other institutions have introduced some forms of extension work without any formal organization for this purpose. The forms and methods of extension teaching have been changed and developed in many ways. Summer courses have rapidly increased in numbers and attendance; and much of this work is now conducted on the same basis as the regular university classes, including advanced and graduate courses. Other extension classes are sometimes conducted on the same plan as the regular university work, and sometimes in a more elementary and less formal manner. Short courses and public lectures are given in large numbers. Correspondence study forms an important element in some institutions. Other services include aid to debating societies, the distribution of package libraries, the maintenance of municipal reference bureaus, and other forms of civic and social welfare. . . . Extension work is carried on to a considerable extent in some important institutions not included in the report noted above; and it is probable that more or less unorganized extension work is done at many other institutions."—*Proceedings of the Second Pan-American Scientific Congress, 1915-1916, sect. 4, pt. 1, pp. 639-640.*

Lyceum.—"The American lyceum was founded by Josiah Holbrook of Derby, Connecticut. The first fruit of his undertaking was the establishment in 1826 of the Millbury Branch, Number one, of the American Lyceum, a voluntary association of the farmers and mechanics of Millbury, Massachusetts, for the purpose of self-culture, community instruction, and mutual discussion of common public interests. . . . The development of Mr. Holbrook's plan was rapid. Twelve or fifteen nearby villages promptly followed the example of Millbury, and early in 1827 Worcester County, Massachusetts, organized the first county Lyceum. Mr. Holbrook traveled incessantly throughout Massachusetts and Connecticut, and personally organized many societies. By 1828 nearly one hundred branches of the American lyceum had been formed, and by the end of 1829 there were societies in nearly every state in the Union. Two years later their number increased to nearly one thousand, and in 1834 nearly three thousand town lyceums were scattered throughout the United States from Boston to Detroit and from Maine to Florida. The organization of county and state lyceums likewise proceeded rapidly. Massachusetts, being dissatisfied with its record of seventy-eight town and three county lyceums, in 1829 appointed a state board to promote county organization and hasten the establishment of a state lyceum. This state board effected the organization of a state lyceum in 1831. New York, however, had organized its state lyceum about six weeks earlier, and Florida was only a little behind Massachusetts. On May 4, 1831, New York City received the convention for the establishment of the National American Lyceum. One thousand towns in which lyceums were established were represented in this convention. The national organization was effected. For eight years annual meetings were held in New York City. The last national convention of this early movement was held in November, 1839. While the actual life of this national organization was brief, it accomplished definite results in its eight years of activity. It forwarded education in Cuba, Venezuela, and

Mexico; it gave our own common schools an impetus toward better things, and left behind many educational, literary, and lecture associations founded through its influence, all of which have left their mark on the educational life of the country. For the most part, the town lyceums continued uninterrupted by the discontinuance of the national association; some surviving for twenty, some thirty, and some fifty years. Certain of these original town lyceums exist even to-day; but, in the main, the old structure and the old conception of a lyceum have been replaced by the present lyceum, or lecture platform. . . . That the lecture platform of these early days exerted genuine influence upon American public opinion is certified by the list of men who devoted all or a considerable part of their time to the platform. . . . It is interesting to note that the early lists of lecturers offered by the bureaus contained such distinguished names as Ralph Waldo Emerson, Henry D. Thoreau, James Russell Lowell, Henry Ward Beecher, Edward Everett Hale, Theodore Parker, Horace Greeley, Louis Agassiz, Daniel Webster, Oliver Wendell Holmes, Charles A. Dana, James T. Fields, Wendell Phillips, George William Curtis, William Lloyd Garrison, Bayard Taylor, John B. Gough, and others."—G. Frank, *Parliament of the people (Century Illustrated Monthly Magazine, July, 1919).*

Chautauqua.—"In August, 1874, Bishop John H. Vincent and Lewis Miller organized at Lake Chautauqua, New York, the Chautauqua Sunday School Association. Designed at the beginning only for the study of the Bible and of such subjects as would directly assist in the teaching of the Bible, the idea of this association gradually enlarged to cover the entire field of education for adult persons out of school. Now for ten weeks every year at Chautauqua Institution at Lake Chautauqua there is conducted a summer assembly the lecture courses and study groups of which cover virtually the entire field of general education and the discussion of public affairs that are in the foreground of public thinking. This assembly has given rise to a large institution with extensive properties. This parent assembly was rapidly copied by communities throughout the country. In these communities, Chautauqua Associations were formed by local townfolk, and each summer for a few weeks programs of lectures, study groups, and discussion clubs, with a due portion of diverting music and entertainment, were carried out. . . . These assemblies brought to hundreds of small communities many of the distinguished men of letters and affairs of this and other countries, and effected thereby a broadening of the outlook of the townfolk that would have been difficult, if not impossible, through any other agency. After these independent Chautauqua assemblies had been scattered at strategic centers through the country, another stage of development was entered. Bureau managers undertook to carry Chautauqua programs into communities where the local townfolk had not, and might never, take the initiative in organizing an independent assembly. This resulted in the development of the so-called circuit Chautauqua system, under which a bureau prepares a standardized program and books it over a circuit of towns and cities. . . . To-day [1919] between fifteen and twenty thousand communities are reached by the lyceum, or lecture courses, and the Chautauqua, or summer assemblies. Over ten million persons listen to these lyceum and Chautauqua programs every year. Thus there has been built up by commercial firms or bureaus in co-operation with local committees of public-spirited

citizens a machinery of popular influence which touches every part of the United States and [has begun] to function in Canada, Australia, and New Zealand."—G. Frank, *Parliament of the people* (Century, July, 1919).

Correspondence schools.—"The International Correspondence Schools had their birth in a desire to improve the conditions of the miners of the State of Pennsylvania. The Mining Herald, a weekly newspaper of Shenandoah, Pa., established a department devoted to questions and answers relative to coal mining for the benefit of its readers. With the aid of competent engineers, a course in coal mining was printed which anyone able to read English could study at home. Within six months after the enrollment of the first student, October 16, 1891, a thousand men were studying the mining course by mail. From this beginning has been developed the present system of correspondence instruction. Created to teach a single subject, the schools now [1916] give instruction in 280 courses, covering almost every branch of technical education and dozens of other subjects ranging from advertising and salesmanship to poultry, husbandry and agriculture. These courses include 62,000 pages of text and 31,000 illustrations and cost \$2,500,000 to prepare. To conduct the work requires the hands and brains of more than 4,000 employees in America alone and hundreds in other countries of the world. They have enrolled more than 1,750,000 persons, representing every occupation in the realm of industry and every country on the globe; and approximately 100,000 new students are being enrolled each year. The foundation of a system is its textbooks. To teach successfully by correspondence requires an entirely different kind of textbook from that used for classroom work. These books must take nothing for granted save the ability to read. They must begin at the beginning and proceed by easy stages, leading the student forward by natural and carefully graded steps. They must foresee and meet his difficulties by full explanations, demonstrations, and illustrations. Books of this class are used by numbers of universities, colleges, Government schools, institutes of technology, and vocational schools in America. Successful home study depends upon a sustained interest on the part of the student. An Encouragement Department watches with a genuine personal interest the progress of their students. . . . Some of our best American colleges and universities have frankly admitted and adopted the method. The Chicago University, the Universities of Minnesota, Wisconsin, Nebraska, West Virginia, and several others have adopted the method and are achieving some satisfactory results. Latin America has proven a good field for correspondence schools. One school, besides offering courses written in English, also offers courses written in Spanish."—*United States Bureau of Education, Bulletin no. 25, 1916, pp. 76-77.*—See also PRISON REFORM: Results of prison reform movement.

Intelligence tests.—Binet and Simon.—**Standard scales.**—"Within the past ten years [1910-1919] we have . . . worked out and perfected another new and very important means whereby it is now possible to measure and classify children on the basis of their intellectual capacities. From the use so far made of this new measuring stick in retesting children once measured, at a later age, it is now confidently asserted that the degree of intelligence which a child has at six or eight or ten years of age is the degree of intelligence he will retain through life. . . . From the use of this new measuring stick, too, we have found

that there can be no arbitrary classification of children into such groups as dull, average, and bright. Instead, children shade off from one classification into another, all the way from idiocy at one end of the scale to superior genius at the other. As might be expected, most children fall into the relatively normal class, the curve shading off somewhat evenly in either direction. By means of a series of carefully selected and standardized mental tests, first worked out by Binet and Simon in France (1911), and revised and extended and adapted to use with American children by Terman (1916), we are now able to measure and give each child an intelligence rating (intelligence quotient; I. Q.). From this rating (I. Q.) we know somewhat accurately the possibilities of the child in school work. . . . The educational significance of this new means of measuring intelligence is very large. Questions relating to proper classification in school, grading, promotion, choice of studies, schoolroom procedure, vocational guidance, and the proper handling of subnormal children on the one hand and gifted children on the other, all acquire new meaning when viewed in the light of intelligence measurement. . . . When these new tests of intelligence have been applied to the children who experience difficulty in getting along in the regular school a flood of light has been thrown on the problem. Low mentality, retardation in school, truancy, immorality, and criminal tendencies are all tied up closely together. . . . Viewed in the light of this new knowledge, the importance of mental measurements to grade and classify intelligence, of the standard tests to determine lines of progress, and of all the special types of schools for delinquents and defectives . . .—differentiated course of study, over-age classes, non-English-speaking classes, supplemental coaching classes, industrial classes, home schools, disciplinary classes, parental schools, state industrial schools—acquire a new educational significance in the light of our recent discoveries as to the measurement and grading of intelligence."—E. P. Cubberley, *Public education in the United States, pp. 450-454.*—"Within the past decade [1910-1919] an entirely new means of attacking the problem has been developed through what are known as scientific tests. The movement is as yet only in its infancy, but so important is it in terms of the future that it bids fair to change the whole character of the supervision of the instruction in our schools. The scientific purpose of the new movement has been to try to evolve, by the careful measurement of schools and children, a series of standards of measurement (measuring sticks for school work) and units of accomplishment (time and effort evaluations of instruction) which can be applied to schools anywhere to determine, scientifically, the economy or wastefulness and the efficiency or inefficiency of the work being done. On the basis of such information the effectiveness of all kinds of instruction can be measured, schools in different places can be accurately compared, and time can be saved by eliminating over-emphasis in non-useful work. These tests and measures we now know as Standard Scales. So forcibly has this new idea of measurement appealed to the younger men that to-day probably hundreds of men and women are busy testing and perfecting scales for all kinds of measurements, new or improved scales are being proposed continually in the educational magazines, and a few very helpful books for the use of teachers have already been written on the subject. So far we have evolved fairly satisfactory scales for the measurement of: Arithmetical ability;

reasoning skill; handwriting; spelling; drawing; English composition; use of English; silent reading; oral reading; geography. For each of these subjects certain 'standard scores,' that is the amount of work with the tests which should be done by average pupils, of any age or grade, have been worked out. . . . With these standard tests and scores we can now measure an unknown class and say, rather definitely, that, for example, . . . the children are from 6 to 16 per cent above grade in the four simple arithmetical processes, but 21 per cent below in ability to reason on simple arithmetical problems; that they can read orally 16 per cent better than the average class, but are sadly deficient in thought-getting ability from silent reading; and that, in composition, they are 10 per cent below standard and can write much better than they can think. Still more, we can determine just where the difficulty lies, not only with schools or classes, but for individual pupils in classes as well. . . . Within the past five years [written in 1918] these tests have been used in School Surveys in a number of American cities, and those responsible for the conduct of the schools were told, as a result of the tests, where their schools stood in the matter of instruction. . . . The studies made with the use of the tests, too, have shown that in some school subjects we have been teaching far too much in quantity, giving too much school time to instruction in them, or over-emphasizing certain phases of the teaching of a subject to the neglect of other important phases. The children of Butte, for example, were learning to spell over 10,000 words, while all careful studies made of vocabularies show that 1000 words will cover the most commonly used and most commonly misspelled words, and that about 3500 words are all that need be taught. . . . On the basis of such studies, combined with studies as to the social usefulness of the various parts of the different school subjects, and studies as to the pedagogy of instruction, we have already been able to do something in the revision of our elementary school curriculum that has lightened the load and materially improved the instruction of what remains. By creating such measuring sticks for school work, both supervisors and teachers are given a far more definite aim than ever before for the work they are to do. Waste of energy through over- or under-emphasis of certain phases of the teaching process may be prevented. Principals and teachers can tell, from a glance at the results of standard tests, charted on a standard score card, whether or not any room or group of pupils is up to standard; what are the weak points; whether a room or a school is making progress; and in what rooms the load and the teacher are not properly adjusted. Teachers, in particular, can know definitely what results are expected of them, and at all times whether or not they are accomplishing them. Even pupils can, in some subjects, score their own records on standard score cards, calculate their growth in accuracy and speed, and compare their writing with the standardized writing of a writing scale hung in the room. The important underlying purpose in the creation of all such standards for measuring school work and for comparing the accomplishments of pupils, classes, schools, or school systems, is to give to supervisors and teachers means by which they may, quite definitely, measure the effectiveness of the work they do, and learn from the charted results where to shift the emphasis and how to improve the manufacturing process. . . . This recent development of tests and measures for instruction is a movement

looking toward scientific accuracy in teaching, and is comparable in importance to the introduction of the idea, in the sixties, of an orderly psychological development in children, to which a methodology of instruction should be applied."—E. P. Cubberley, *Public education in the United States*, pp. 446-450.

Education for the deaf, blind and feeble-minded

Deaf mutes: Progress: 16th-20th centuries.—"The earliest instance recorded of instruction given to the deaf in the English language is that of the Venerable Bede about the year 691, who tells of a deaf person taught to speak by Bishop John of York, related as though it were a miracle. After many years we meet accounts of other cases. Rudolph Agricola (1443-1485) of Grönigen, Holland, . . . cites in his '*De Inventione Dialecta*' a deaf man who could write. In Italy a little later we find certain deaf children whose instruction is mentioned by Pietro de Castro; while in the sixteenth century Girolamo Cardano (1501-1576), the distinguished physician of Pavia, attempted to state the principles of the education of the deaf, demonstrating the use of a written language for them, and advocating the teaching of speech. He further invented a manual alphabet, which was one of the first of its kind. In 1616 Giovanni Bonfaccio also wrote regarding the 'art of signing' and speech for the deaf. But it is to Spain that credit is to be given as being the first country of Europe where there are recorded accounts of successful instruction of the deaf. In 1550, . . . Pedro Ponce de Leon of the Order of St. Benedict taught, chiefly by oral methods, several deaf children [although his methods are lost, they were probably the ones put into practice by Juan Pablo Bonet]. . . . Great success must have attended his efforts, for in addition to the Spanish language and arithmetic, his pupils are reported to have mastered Latin, Greek and astrology."—H. Best, *The deaf*, pp. 121, 122.—Ramirez de Carion in Spain, Padre Lana Terzi, Fabrizio d'Acquapendente, and Affinité in Italy, are also well known men of the seventeenth century, who interested themselves in the education of the deaf.

"The first Englishman to deal with this science was John Bulwer, who in 1648 published a work called '*Philocophus, or the Deafe and Dumbe Man's Friend*.' . . . He was followed in 1662 by William Holder, D.D., and Dr. John Wallis, a Professor at Oxford, who severally gave their attention to the method. They practised on a few pupils, and wrote on the subject. Dr. John Conrad Amman, a learned Swiss physician practising in Holland, who in 1690 published a work, '*Surdus Loquens, or the Deaf Man Speaking*.'"—E. F. Boultsbee, *Help for the deaf*, pp. 24-26.—In the eighteenth century a forward step was taken by Jacob Rodrigues Pereire, or Pereira (1715-1780) [a Spanish Jew] who not only extended Bonet's manual alphabet into a dactylology of forty signs, to be used with one hand, but also utilized pantomimic expression, the natural language of the deaf, and, most important of all, invented the oral method (lip reading) by which many deaf have since been taught to speak and to understand spoken language. . . . He conducted a school for the deaf, [in Paris, where he] received his initial suggestions from Bonet's manual alphabet. Pereire became interested in the education of the deaf at Bordeaux, where he met a woman who was congenitally deaf. In order to qualify himself for the work to

which he had decided to dedicate his life, . . . he pursued special courses in medicine. The oral method which he devised was based upon a psychogenic theory, namely that the fundamental or primitive sense is touch, and that the other senses are only modifications or specializations of touch."—J. E. W. Wallin, *Problems of subnormality*, pp. 7-8.—"Prior to the eighteenth century, most of the early teachers were content to let their methods die with them. Not so those of later date; and no doubt the two men who stand out as being head and shoulders above their fellows at this time are the Abbé l'Épée and Samuel Heinicke. The former of these did good and benevolent work for the deaf, but as he laboured on other than Oral lines, one can but acknowledge his zeal and pass on to the great German teacher, Samuel Heinicke, 1723-90, who may be said to have been the founder of the German Oral System."—E. F. Boulton, *Help for the Deaf*, p. 20.—"In 1754 at Dresden . . . Heinicke became interested in the deaf, and a few years later started a school near Hamburg. In 1778, at the instance of the state, he moved to Leipsic, his school thus being the first public school for the deaf to be established. He was also the author of several books on the education of the deaf. . . . He was in fact one of the greatest teachers of the deaf, and the influence of his work has been felt in no small measure in America. In France, too, there were great names. . . . Abbé Deschamps in 1779 published at Orleans a work on the instruction of the deaf, largely favoring the oral method. It is to Charles Michel abbé de l'Épée, however, that is given the highest reverence of all the initial workers for the deaf, being the founder of the first regular school [established in 1775], and receiving nearly equal distinction for his impression on early methods of instruction—this being especially true in respect to America, where his influence in the introduction of the sign language has been greater than any other man's. . . . The achievements of de l'Épée were soon far-famed, and the people were taken with their novelty. Many honors were offered him, and his work was brought to the notice of the French Academy and approved. In 1791 his school was adopted by the state. The successor of abbé de l'Épée was abbé Sicard, and the work continued to flourish in France. . . . Thomas Braidwood, in 1760, opened a school in Edinburgh, Scotland. In 1784 a school was established in Rome, in 1788 in Madrid, and in 1801 in Genoa. In the early years of the nineteenth century other schools were started over Western Europe. Thus by the time that the work for the education of the deaf was to enter America, in the establishment of the first school in the second decade of the century, there were already in Europe a number of schools in existence."—H. Best, *The deaf*, pp. 125-127.

ALSO IN: J. E. Wallin, *Problems of subnormality*.

Sweden began to instruct the deaf early in the nineteenth century. "A regular system for instructing the deaf and dumb was founded in Sweden in 1808. . . . During the years 1864-89 . . . efforts were made to extend . . . instruction to all deaf and dumb children, and at the same time vigorous attempts were made to introduce the articulation method. . . . [In 1899 a new law made education of deaf mutes obligatory, and placed the burden on the towns and county councils, assisted by state aid.] The school age of the deaf is seven years."—J. Quinard, *Sweden*, pt. 1, p. 369.—"Nothing much was done in England to extend the German System till the year 1857, when a Manchester merchant, having two deaf children,

. . . opened a private school in London. Subsequently he was for twenty-eight years the head of the Institution for the Deaf in New Zealand, where he died, March, 1908. In 1867, mainly owing to the great generosity of the Baroness Mayer de Rothschild, a school for Jewish deaf and dumb children was founded in London. [Its] . . . success was so great that the Baroness determined to endow a school which should be undenominational. Thus through her influence . . . two separate schools were formed. . . . [A] teacher of note in these more modern days is Miss Hull, who commenced to teach the deaf in a private school at Kensington in 1863, using at first both speech and finger spelling, but confining herself to the latter method only when the pupils were born deaf. In 1868 she adopted Professor A. Melville Bell's visible speech symbols, and . . . in 1872 . . . visited several schools in the United States, among them . . . the Clarke School, Northampton, Massachusetts . . . and the Horace Mann School, at Boston, then under Professor A. Graham Bell, and Miss Fuller. Returning to England in 1873, she forever put aside the use of the finger alphabet. . . . In 1878 a Training College for the instruction of Teachers of the Deaf was opened at Ealing. In 1878 classes were opened by the late Dr. W. Stainer in the London School Board, and much good work is being done by an efficient staff of teachers."—E. F. Boulton, *Help for the deaf*, pp. 29-31.—"The first school for the deaf in America was established at Cobbs, near Petersburg, Virginia, in 1812 by . . . Col. William Bolling, who had two deaf brothers and one sister who were sent to Edinburgh, Scotland, for their education, and also, a deaf son and a deaf daughter, for whom the Cobbs School was established under the direction of a son of Thomas Braidwood who conducted the school for the deaf in Edinburgh. . . . In 1817, the first regular school for the deaf as we know them today was established in Hartford, Conn., by Thomas Hopkins Gallaudet whose son, Edward Miner Gallaudet (1837-1917) in 1864 established in Washington, D.C., what was then, and is today, the only institution in the world devoted to the higher education of the deaf, Gallaudet College. Other schools similar to the Hartford School were rapidly established in other states and today [1917] we have 64 public state residential schools, . . . 74 public private schools . . . with a total enrollment of 14,309 pupils and 1,944 instructors, and with buildings, grounds and equipment valued at over \$20,000,000. [As to methods of teaching, those in use in the United States are] the Manual method (using the sign-language, finger alphabet and writing) of which there is a variation that may be called the 'Alphabetic' wherein only the finger alphabet and writing are used; . . . the Oral method (using speech and speech-reading and writing) of which there is a variation that may be called the 'Auricular' wherein special attention is given to retaining and developing residual hearing through which instruction is given as far as possible; the Combined, or American system (a combination of all methods) in which the dominant idea is, 'Any method for good results—All methods and wedded to none.'—R. O. Johnson, *Standardization, efficiency, heredity in schools*, pp. 198, 199, 200.—"Public day schools for the deaf have sprung up in various places. The Horace Mann school of Boston is a notable example. They fill an unquestioned need, as many parents refuse to send their deaf children off to an institution. . . . A still further movement towards decentralization has come to pass in Wisconsin. Wherever in this state a few deaf children

can be gathered near their homes, state aid will be given to pay teachers sent there to teach them. And this movement is tending to become more and more general. All these day schools spread the oral method."—E. E. Allen, *Education of defectives*, in *Education in the United States* (N. M. Butler, ed.), p. 16.

Blind: Early educational attempts.—Invention and introduction of the Braille, etc.—Provision made in various countries.—Blind in public schools.—From the beginning of civilization the affliction of blindness has always commanded sympathy and respect. No definite steps were taken for the relief of the blind, however, until the early part of the Middle Ages, and it was not until the beginning of modern times that a belief in the possibility of general education of the blind was entertained. The earliest record of an institution for the blind is the hospital which was built by Basil the Great, bishop of Cæsarea in Cappadocia in the fourth century, and except for a retreat provided by St. Lyme, at Syr in Syria in the fifth century, nothing further appears to have been done for many years. The first European institution, designed especially for the blind, of which we have any knowledge was built at Le Mans, where it is said Bishop Bertrand founded a hospital for them in the seventh century. In the thirteenth century, Louis IX of France founded the Hospice des Quinze Vingts, for three hundred blind poor. This institution proved to be an enduring one, and still shelters the same number of adult blind, and reeducates them. These early institutions were all refuges, not educational institutions. We have no definite information on early attempts to educate blind youth, although Bede mentions as a miracle a blind man who was taught to read. From the thirteenth century onward, individual mention is made of educated blind persons; but the first definite mention of a scheme of education was suggested in the sixteenth century by an Italian named Girolamo Cardan, "who thought it possible to teach the blind to read and write by touch. In 1575 another Italian, Rampazetto, actually did teach some blind people to read by means of letters incised on thin wooden tablets, but the letters were immovable . . . a fresh tablet [carved by hand] was required for each page, and there was no means of re-duplication. Five years later Francesco Lucas used the same means with success in Madrid. An attempt was made by a Parisian printer to cast leaden type for the blind, but this was found to be both too heavy and cumbersome and too expensive. The first mention we have of writing by the blind is of a method used, if not invented, by Harsdörffer, a mathematician in Nuremberg, in 1651. He had a tablet covered with a thin coating of wax, on which letters could be traced, . . . after the manner of the ancient Romans with their tablets and stylus. In 1646 a book was written on the condition of the blind by an Italian; . . . [and published] in Italian and French under the title of *L'Aveugle affligé et consolé*." In 1670 there was a book written on the instruction of the blind by a Jesuit named Lana Terzia. . . . [Interesting instances are given of educated blind, one of whom was] Elisabeth Waldkirch, who was born in 1660 in Geneva. . . . Her father and his friend, Bernoulli, the Swiss savant, took a delight in teaching her. Bernoulli had the Alphabet incised deeply on a thin wooden board; she traced out the form of the letters with her finger, then with a pencil, and by this means learnt to write correctly on paper. . . . She learnt [also] to speak and write Latin, French and German. . . . [In 1650 Dalgarno,

in his treatise 'Didascalocophus' stated his belief that a deaf man might be taught to speak as certainly as a blind man could be taught to write.] The Encyclopædists who prepared the way for the social and political cataclysm of the Revolution, prepared also the way for the systematic education of the blind. [Diderot, in his 'Lettre sur les Aveugles,' written in 1749 brought the blind into prominence. In this letter he describes the education of Mademoiselle de Salignac, a blind girl, who was born in 1741.] He says: 'She had been taught to read by means of letters cut out. She sang with taste. . . . She also learned to play on the violin [and not only learned the latest dances, but taught them to her young friends]. I have seen the maps by which she studied geography; the parallels and meridians were marked out by threads of wool or of silk of varying thicknesses; the rivers and mountains by pinheads, . . . and the towns by drops of sealing-wax, proportioned to their size. . . . [It is said that Rousseau suggested the use of embossed letters, such as were afterwards used.] The first, and by far the greatest, [however] of the pioneers in the [general] education of the blind was Valentin Haüy, a Frenchman, . . . [who used embossed type in both large and small italics]."—E. R. Scott, *History of the education of the blind prior to 1830*, pp. 4-8.—"Haüy was a native of Picardy, and tried his earliest experiments on a blind youth named Le Sœur. He was so far successful that in 1784 he took his pupil to Paris, there to exhibit him as an example of what might be achieved by his methods. . . . [As a result of his efforts] the National Institution for the Young Blind (*l'Institution Nationale des Jeunes Aveugles*) the first educational institution for the blind founded in Europe . . . [was established in 1784. The Revolution was, however, disastrous to the school for though the revolutionary Government nominally took it under State protection, . . . the pupils were driven away and poor Haüy fled his country. The Emperor Paul of Russia having given him an invitation to visit his capital, . . . Haüy directed his steps thither, and on his way, calling at Berlin he was instrumental in founding a school for the blind there. His next seven or eight years he spent in St. Petersburg, and, in spite of much opposition, managed to start a school for the blind in that city. . . . When he returned to Paris, in 1817, Haüy found the institution there remodelled, with Dr. Guillié as its head."—W. H. Illingworth, *History of the education of the blind*, pp. 5, 6.—"Dr. Guillié . . . the reorganised 'Institut' owed its almost instant success. Not only did he obtain new instructional apparatus, and new type for printing embossed books and music, but he left no stone unturned to teach his pupils . . . handicrafts. They learnt spinning, weaving, knitting, chair caning, rope-making, shoemaking, and harness-making. . . . Nearly simultaneously with Haüy's efforts in France, Edward Rushton began the education of the blind in England. He began life adventurously, as mate on board a slaver, . . . and while endeavoring to relieve the sufferings of . . . [a consignment of negroes, who had been attacked by ophthalmia he] contracted the disease and became blind. . . . In 1701 the School for the Indigent Blind was founded in Liverpool, the first to be opened in England. . . . This school was quickly followed by others. A Blind School was opened at Bristol in 1703, and in St. George's-in-the-Fields, London, in 1799. In the meantime, in Scotland men's minds were turned to the blind by the example and the writings of Thomas Blacklock . . . who became blind when he was only six

months old. In spite of this he became a poet, a distinguished scholar, a Doctor of Divinity, [and author]. In 1783 he wrote the article on 'The Blind' in the *Encyclopædia Britannica*. . . . His influence undoubtedly helped to lay the foundation of the Edinburgh school opened in 1793 after his death. Dr. W. Klein, who was himself blind, founded a school in Vienna in 1804.] In Dublin the Richmond Asylum for the Blind was opened in 1810, and the Molyneux Asylum in 1815. In 1823 Lady Elisabeth Lowther brought home from Paris embossed books and types for her blind son, . . . and he printed for himself the Gospel of St. Matthew. The work of printing for the Blind was taken up by Gall in Edinburgh and by Alston in Glasgow [and by Edmund Fry in London]. In 1827 the former embossed some elementary works, but it was not until 1834 that he produced the Gospel of St. John. . . . About the year 1800 a French artillery officer named Barbier invented a telegraphic alphabet, which was adapted to the use of the Blind. He then had the happy thought that dots were easier to feel than lines, and from that he constructed a 'sonographic alphabet,' composed of different groupings of . . . dots ranged in two vertical columns. . . . A book was printed in it, but the small type was difficult to read."—E. R. Scott, *History of education of the blind prior to 1830*, pp. 11, 12.—Other systems used were those of Dr. S. G. Howe of the Perkins Institute, who used embossed English letters without capitals, and with angles instead of curves. The Friedlander system (Philadelphia) used Roman capitals. Frere of Blackheath (London), and Lucas of Bristol each used stenographic outlines.

Not much headway was made in the education of the Blind until Louis Braille, a blind pupil of the Institut Nationale in Paris, constructed the simple dot, or point, system of writing, "which is used now throughout Europe and has been adapted to many Asiatic and African languages. The first book in Braille print . . . was written in 1827. [The system was perfected in 1834] and its use, though at first confined to France, was gradually adopted by other countries."—E. R. Scott, *History of the education of the blind prior to 1830*, p. 13.—Braille is formed by an arrangement of raised dots. The characters are composed of six of these dots placed in an oblong, of which the vertical side consists of three, and the horizontal of two. With different combinations of these dots all the signs and contractions are made up. The system is also used for music notation. Some time after the invention of Braille, Dr. William Moon, a blind clergyman of Brighton, England, began to work on a system calculated to enable the blind to read with ease, and produced what is known as the Moon system of embossed type, a simplification of the Roman capitals. The first book in this type was published in 1847. Dr. Moon made missionary journeys to Europe and the United States for the purpose of arousing interest in the education of the blind. His system was adapted to a very large number of languages, and from its size is especially useful for people with work hardened hands, or for the illiterate, who have lost their sight in adult life. William Moon's son, Robert Moon, was afterwards superintendent of the Philadelphia Institute for the blind for many years. "In 1868 there was invented by William B. Wait of the New York Institute what came to be called the New York Point. . . . Some controversy has arisen as to the actual founder of this system. It has been claimed that it was Dr. John D. Russ, the first principal of the school who originated it. . . . Instead of being upright in

structure like the French model . . . [it is] two points high and one or more points long. . . . [The dots] are chosen upon the principle of frequency of recurrence, the fewest number . . . standing . . . for the most commonly used letters."—H. Best, *The blind*, pp. 405, 406.—In 1878 a modification of Braille was introduced into Great Britain. This modification was later changed by J. W. Smith of the Perkins Institute who to the six dot vertical cell of Braille added the New York Point principle of frequency of recurrence. This system is known as American Braille. All three dot systems were used in the United States with a consequent increase of difficulty in producing literature for the blind. To remove the confusion, after much discussion, it was finally decided in 1917-1918 to adopt the English modification of Braille, with further slight modifications, which however, do not prevent blind students from availing themselves of the mass of literature already produced in Great Britain and vice versa.

With the invention of Braille, adequate education of the blind was assured. Many countries had already made a beginning, and others soon followed their example, in both the old and new worlds. Argentina, for instance, has a National School for the Blind in Buenos Aires. The government of each of the States of Australia maintains a school. The first school for the blind in Belgium was opened in 1833, and was followed by a number of other institutions, all of them under the supervision of the church. Dom Pedro II of Brazil founded a school in Rio de Janeiro in 1853. This school, which is known as the Benjamin Constant Institution, is supported by the State.

In Canada there are three well-known institutions for the blind—at Halifax, Nova Scotia, and at Brantford, Ontario (both supported by the Dominion government), and at the city of Quebec. There are two well-equipped schools at Montreal, the McKay Institute (for Protestant children) and the school maintained by the Sisters of Charity. The excellent system of education of the blind in Denmark dates from 1811, when a private institution was opened at Copenhagen. This was taken over in 1858 by the government. A preparatory school was also established in 1808, to educate children up to their tenth year, when they enter the main school. In France, the National Institute, which is still the only state establishment for the blind, has not been enlarged since 1812. It has room for 225 pupils, 150 boys and 75 girls. The Braille school, founded about 1882, and adopted in 1887 by the department of the Seine is also a model school. Outside of these two well-known establishments the schools in France are, as a rule, small, and generally not well equipped for the special needs of the pupils. Some are departmental or communal; but almost all are due to private initiative. In Germany Valentin Haüy (see above), opened a school in Berlin in 1806. Zenne, the inventor of relief maps and globes, was appointed director of this the first school for the blind in Germany. It was followed by many others, and before the last decade of the nineteenth century thirty-three institutions had been established. For many years the mode of reading generally adopted was the common Roman alphabet; but Braille was later introduced. In Great Britain it is obligatory to send blind children to school between the ages of seven and sixteen. There are a large number of good residential schools throughout England and Wales, all of them private institutions or supported by private subscription or endowments, and school authorities are required by law to maintain children whose parents are unable to bear the ex-

pense at one of these schools. Scotland also has good facilities for the education of the blind. Ireland is not so well equipped in this respect, but nevertheless has several good schools, all private and denominational. The institution at Belfast is perhaps the best; there is an excellent Protestant school in Dublin, and two or three religious institutions are doing good work. Japan commenced the education of some at least of its blind at a very early date. "In 858 Prince Hitoyasu, a son of the . . . emperor lost his sight. . . . In 886, in memory of the blind prince . . . some blind officers were appointed to look after the welfare of the blind throughout the country. . . . In the beginning of the seventeenth century, the Government increased the tax which had long been levied . . . for the benefit of the blind, and protected them in every possible way . . . [and gave them many privileges]. Many of them contributed not a little to . . . [the arts]. In 1870, . . . the government abolished the posts of the blind officers [which had been in existence for centuries], and did away with the pensions for the blind. . . . In 1878 a school was founded for the benefit of the blind and dumb by the late Mr. Furukowa, who . . . invented most ingenious methods and instruments for their education. . . . Thanks to his example . . . we have now 17 blind schools and 20 blind and dumb schools, not to mention some ordinary schools where blind children are being taught together with sighted children."—T. Yoshimoto, *Past, present and future of the blind in Japan*, (*Report of International Conference on the Blind*, 1908, pp. 175-176).—In Norway the state upholds two asylums for the blind, where children are admitted at the age of nine years. They receive a primary school education, and in addition are educated for a practical life. The educational expenses of these institutions are paid by the state, and the maintenance of poor children is undertaken by the localities from which they come. A private school where blind adults may be re-educated is also supported by the government. In Sweden, education of the blind began as early as 1807, but only in conjunction with the education of the deaf. This proved unsuitable and a special Institute for the Blind [was] started at Stockholm (1879); afterward removed to Totemhede (1888). Two preparatory schools were also established, one in 1884, the other in 1890, and a technical school was . . . founded in 1884. [This school also accepts as pupils men who have lost their sight.] . . . Children are received into the preparatory schools at the age of seven."—J. Guinchard, *Sweden*, pt. 1, pp. 368-369.—The first School in Switzerland was established at Zurich in 1809, and was quickly followed by others at Berne, Schaffhausen, Freiberg and Lausanne. In the United States, "private ardor to begin the work of education of the blind had been smouldering for several years, when in 1829 certain gentlemen in Boston [notably Dr. John D. Fisher, a physician] obtained the incorporation of the 'New England asylum for the blind.' . . . By a most fortunate circumstance, the interest and services was obtained of a graduate of Brown university, Dr. Samuel G. Howe, who . . . became the American father and Cadmus of the blind. He went at once to Europe to study methods of instruction. Upon his return, in 1832, the school was opened with six pupils [in a house presented by T. H. Perkins, in whose honor it was named. It was here that Dr. Howe first demonstrated the fact that the blind deaf could be educated by teaching Laura Bridgman, and here also that Annie Sullivan, the teacher of Helen Keller, received her training]. In New York the act of incorporation of the New York institution for the

blind was passed in 1831, . . . and this school opened in March, 1832, antedating by a few months the school at Boston. In the very same year a German teacher of the blind, a Mr. Friedlander, came to Philadelphia, in the hope of starting a school for the blind there . . . [and as a consequence] the Pennsylvania institution for the instruction of the blind was opened in 1833. . . . The three schools at Boston, New York and Philadelphia are called the pioneer schools. All sprang from private effort and private funds. All were incorporated as private institutions, and remain so to this day. Two similar institutions for the blind have arisen in this country, that at Baltimore and that at Pittsburg. The origin of the state schools differs from that of the type above given only in that classes of trained pupils from the earlier schools were exhibited before the state legislatures, as well as before the people. State appropriations followed and the institutions were inaugurated as state institutions. The new schools sprang into being with astonishing rapidity. . . . Every state in the union makes provision for its blind of school age either in its own school or in that of a neighboring state."—E. E. Allen, *Education of defectives*, in *Education in the United States* (N. M. Butler, ed.), pp. 16-20.—The first kindergarten was opened in 1887 by Michael Agnans, who succeeded Dr. Howe at the Perkins Institute. There are now a number of these schools, and at least four states maintain nurseries where blind babies are cared for and trained until they are old enough for school. At the other extreme some of the states make an allowance of \$300 a year for the purpose of paying a reader for the blind student at a higher institution of learning. In Uruguay, a private institution known as the General Artigao Institute was founded at the beginning of the century. The average blind child can learn as much as the average sighted child, due allowance being made for the sense handicap under which the blind child labors, and as the blind may become more nearly self-supporting by mental work than by means of a handicraft, they are encouraged to develop any special talent they may have, which may be used as a means of recreation when it is not made a profession. The course of study has been greatly enriched of late years; commercial arithmetic and book-keeping, commercial law, typewriting, salesmanship, gardening, poultry-keeping have all been introduced in addition to the trades which have been taught from the beginning such as piano-tuning, chair-caning, hammock-making, broom-making, carpet-weaving, needle work. Stress is laid on gymnastics, which take the place of other exercises; modelling is very valuable, especially in childhood; arithmetic is taught by means of a special slate. Braille writing is done with a stylus, with the aid of an ingenious frame which permits of making raised dots on the reverse side of the paper. Small Braille typewriters have also been devised. For communicating with sighted people the ordinary typewriter is of the greatest value to blind people.

The most modern idea in education of the blind is that they shall be sent to public schools in order that from early childhood they may become accustomed to mingling with sighted people, and thus gain self-confidence, to the lack of which failure of the blind to achieve success is largely attributed. The first application of this scheme is said to have been made in Paisley, Scotland, where classes for blind pupils were established in the day schools. In Aberdeen the blind children have been educated for a number of years in an ordinary school which holds over 1,000 seeing children. In the London

County Council schools there are also classes for blind children. "The first systematic experiment in the United States of educating blind pupils in public school in conjunction with the seeing was begun in Chicago in 1900. . . . Briefly the method used is as follows: A room in a public school . . . is placed in charge of a special teacher . . . to teach the pupils to read and write a dot type. . . . [When a pupil can read and write with facility . . . he enters at once all classes except . . . [those for] writing and drawing. The special teacher keeps in close touch with the grade teacher, copying from the blackboard and book and either writing the matter for the pupil on the Braille writer or dictating it to him . . . a few of our schools . . . send selected pupils . . . to a near by high school, school of music, school of expression, college or university for continuation studies. Occasionally

recent times were, according to the financial standing of the family or its degree of respectability, kept at home, out of sight as much as possible, or were permitted to wander about the country to develop into beings who were termed variously "innocents," "naturals," or "simple," frequently often of criminal tendency, always liable to become dangerous. "During the Middle Ages the attitude assumed toward the feeble-minded was extremely vacillating. The court jesters and buffoons are said originally to have been imbeciles, while imbeciles furnished a good deal of the entertainment in the castles of the rich. This attitude of frivolity, however, changed to one of superstitious reverence. . . . Imbeciles were thought to be under the special protection of the divine and to hold communication with the unknown. . . . In England, through laws enacted during the reign of Edward II (1307

BLIND PUPIL (MARKED X) READING WITH THE CLASS

after a pupil has had several years at a residential school for the blind . . . he is advised to attend the high school of his home town."—O. H. Burritt, *Tendencies in work for blind in America in the twentieth century (Fourth International Conference on Blind, London, June, 1914)*, pp. 6, 7, 8.—The example of Chicago was followed by Cincinnati, Toledo and New York, and now a number of other cities are following the same method.

Feeble-minded.—The feeble-minded until quite

to 1327), imbeciles were even placed under the protective and administrative oversight of the king. The king administered the estates of 'natural fools,' providing for their sustenance and restoring the property to the legitimate heirs upon the demise of the owner. . . . Luther and Calvin openly denounced . . . [imbeciles] as possessed of the evil spirit, 'filled with Satan.' . . . The first organized public effort upon any scale . . . [to provide for the care of the feeble-minded in a] residential institution . . . was made in France in the middle of the seventeenth century by St. Vincent de Paul and his *Confrérie de Charité*. They gathered together in the Bicêtre . . . the homeless and the outcast and the bodily and mentally infirm. But even the most enlightened public efforts thus far put forth on the behalf of the feeble-minded were almost entirely limited to . . . [physical care]."—J. E. W. Wallin, *Problems of subnormality*, pp. 5, 6, 7.—"Real work with defectives of almost any type is less than one hundred years old. It is true that somewhat

earlier than that may be found some mention of the problem and some sympathetic utterances, particularly for the type known as cretins. In 1811 Napoleon had a census made of the cretins in one of the cantons of Switzerland. They numbered 3,000. In 1816 a school was established in Switzerland. But the first real beginning was not until 1837, when the famous Dr. Seguin began [in France] his work in systematic training of such children. About ninety years ago a few 'idiotic' children were taken into the Asylum for the Deaf and Dumb in Hartford, Connecticut, and trained with a fair degree of success. This, however, was not continued long. In 1845 agitation began in New York and Massachusetts which resulted later in the establishment of schools, the one in Barre, Massachusetts, the other in Syracuse, New York, in 1851. These were distinctly institutions for the feeble-minded."—H. H. Goddard, *School training of defective children*, p. xix.—"The more significant features of the study and care of feeble-minded and backward children since the middle of the last century are: . . . The establishment and development of public and private residential institutions for the training of feeble-minded children, and for the permanent segregation and colonization of feeble-minded adolescents and adults. The establishment of special public day schools or classes for the training of 'mentally deficient,' 'subnormal,' or 'backward' children. The scientific investigation of the problem of mental deficiency. The greatest recent advances in the study of subnormal mentality have resulted from the psychological and hereditary studies. . . .

"At the beginning of the present century residential training schools, workshops, and colonies for the feeble-minded were supported by the following countries of Europe: France, Germany, England, Denmark, Sweden, Norway, Finland, Jutland, Holland, Austria, Switzerland, Belgium, Italy, Scotland, Ireland, and Russia. Among the British colonies institutions were supported by Canada, South Africa, Australia, and Adelaide, and among the Oriental nations by Japan alone. The most generous institutional provisions in Europe are afforded by Germany, Denmark, Sweden, Switzerland, and England. France, the birthplace of the scientific study and training of imbeciles, now affords the most meager provisions of any of the leading European nations. France does not support any separate institutions for the feeble-minded, but still cares for the feeble-minded in departments of the Bicêtre and Salpêtrière. Within a period of thirty-five years (from 1846 to 1881) thirty-two government and private training schools and colonies for the feeble-minded had been established in Germany. The number of institutions in Germany at the present time is about one hundred. Only ten of these are state institutions, while the others are under private or church control [notably the famous institution at Bielefeld]. . . . Many of the institutions also contain epileptics. Saxony was the first German state to establish a state institution and to make the training of the feeble-minded compulsory by law. Some of the German institutions (such as Marienberg) at first aimed to be purely educational in character, but they have gradually added custodial divisions. The best German institutions, such as Küchenmühle, Marienberg, Alsterdorfer, and Bethel [Bielefeld] (primarily for epileptics), contain hospitals, assembly halls, large schools affording instruction in kindergarten, sensorimotor and literary work, workhouses and shops in which instruction is given in a large number of arts and crafts, and bothouses, gardens, and farms which provide profitable and healthful employ-

ment for the inmates. The institutions for the feeble-minded . . . in Germany are, I believe, under governmental supervision, administered by the Minister of Education, and the teachers are required to hold government licenses. The institutions in Denmark, Norway, Finland, and . . . Sweden are also under the supervision of the Minister of Public Instruction. In Norway the compulsory-school-attendance law includes imbeciles, and since 1877 all the institutions and classes for backward children have been under state control. Denmark maintains asylums for the custodial cases, farm colonies, day schools for 'backward' children, and workshops in which training is given in the handicrafts and to which feeble-minded persons may be legally committed for profitable employment. Sweden prefers small institutions, built to accommodate not more than about eighty inmates. These institutions, of which there are thirty-three, are usually in charge of women. The schools contain three classes of one year each, with a preliminary two-year course in which the pupils are carefully observed and classified. The program covers the primary grades and includes language lessons, the history and geography of Sweden, natural science, writing, arithmetic, drawing, singing, the catechism, physical training, manual training or sloyd, . . . wood, basket, brush and shoemaking, gardening, training in domestic employments, and physical training. After finishing their school training the boys are placed in 'workshops' located in the country, where they are employed at farming, gardening, and stock raising, while the girls are placed in shops usually located in the towns, where they are employed at tapestry, carpet-weaving, sewing, quilting, and lacemaking. . . . Switzerland, like Sweden, prefers small institutions. There are about thirty of these in Switzerland. . . .

"The Connecticut commission appointed to study the problem of feeble-mindedness reported that there was a 'settled conviction that idiots were so utterly helpless that it was a waste of time even to collect any statistics regarding them.' . . . In order to demonstrate to the law-makers the possibility of training feeble-minded children, experimental schools were located near the state capitals. The successful demonstrations afforded by these schools and the active propagandas waged by such pioneers as Howe, Seguin, Richards, Wilbur, Parish, and Kerlin, bore fruit in due season. Today [1917] thirty-three states in the Union support one or more institutions for the feeble-minded. Several states support more than one institution . . . New York maintains four, Massachusetts three (including a private school receiving state aid), Pennsylvania three (including the institution at Elwyn), and New Jersey two (including a private institution containing state-pay inmates)."—J. E. W. Wallin, *Problems of subnormality*, pp. 5-7, 25-31.

Special provision is now made in many places in the public schools for those children who are "merely backward—who, for some cause, local, environmental, physical, or somewhat mental, are slow or dull and cannot progress at the rate that our ordinary school curriculum presupposes. . . . Such children, in most cases, will come near the average when these handicaps are removed. This group is coming to be more and more wisely cared for, as the school physician is more and more generally employed and more fully understands his possibilities for usefulness. When this backwardness is due to . . . a somewhat sluggish brain which prevents the child from learning at the usual rate . . . [the] children . . . may require five years or more to do what average children do in

four. They are not mentally defective in the sense in which we use the term, but are *merely backward*. . . . The classes for slow pupils are intended for children of this type. . . . [On the other hand] the *mentally defective* or *feeble-minded* children [are] those who through either heredity or other causes are so badly retarded in mentality that they . . . will always be incapable of taking their places in the world in competition with others. This group is subdivided into . . . the high grade which we call *moron*, the middle grade or *imbecile*, and the low grade, or *idiot*. Idiots [and probably the lower half of the imbeciles] seldom get into the public schools. Their defect is so manifest that no one is tempted to try to teach them school subjects. . . . The better of the imbeciles, however, often get into the schools, and . . . attempts are sometimes made to teach them what they cannot by any possibility learn. The morons are the difficult class to recognize—the class that constitutes our great social menace. Because they look like normal children and, to the uninitiated, often seem normal, they are considered responsible, and burdens are laid upon them, which they are in reality incapable of carrying.”—H. H. Goddard, *School training of defective children (Introduction, pp. xv, xvi, xvii)*.—“The origin of the work of training the feeble-minded has two sources: one the school, and one the hospital; it lies between the department of education and the department of medicine. The schools for the deaf and blind found themselves asked to educate children that were also feeble-minded, and hospitals for the insane were asked to treat a large number of imbeciles. The educational element was at first most strongly developed. Hopes were entertained of making 50 or 75 per cent of the feeble-minded self-supporting; but that optimistic view had to be modified, and it is now seen that not more than 10 or 15 per cent can be made self-supporting in the sense that they can return to an independent life in the ordinary population. . . . The general principles of the treatment of this class of defectives as laid down by the Special Committee of the London Charity Organization Society in 1877 are still accepted. . . . The Committee recommended that their education should begin at the earliest moment at which they could dispense with a mother's care, and should be of a physical and industrial character; they should be especially encouraged to develop any talents in order to promote their self-respect and happiness. The Committee were not over-sanguine: they thought that a few might be returned to their homes, a larger number could be fitted for employment under superintendence, but the greater proportion would be unfit to be restored to society, and should have custodial care, under medical supervision, in an economical manner and, as far as possible, with industrial employment. They concluded with the statement, ‘Whatever be the cost of educating them, the cost of neglecting them is greater still.’ Concerning the special methods of education required, Dr. Barr says that as many of the lower grades are incapable of observation, they must be persistently taught what normal children acquire intuitively.—the proper mastication of food, the use of spoon, fork, and knife, the dressing and care of the body, the standing and walking unsupported, the very simplest matters of self-help; . . . their senses must be awakened and stimulated, attention attracted, imitation encouraged by simple occupations. For the higher grades there must be development of the emotions, through exercise in ethical acts, achieving habits; of the body by physical exercises and manual training to promote men-

tal activity; of the mind, achieving selfhood. And all these methods should be assisted by environment, association, amusement, and discipline. . . .

“The most hopeful aspect of work for the feeble-minded was that first undertaken in the United States, in institutions for the education of feeble-minded children. It was inevitable, since many of them could not be safely returned to the world, and as the institutions grew older, that numbers of adults should accumulate in the training schools. In recent years, the segregation and custodial care of adults—especially of feeble-minded women—has assumed a social importance even greater than the education of children. Many illustrations—such as that given by Mr. Amos W. Butler of Indiana, of 5 feeble-minded mothers of 19 children, 15 of whom had spent a total of 136 years in institutions, at an average expense of \$100 per year—have drawn attention to the necessity for preventing the reproduction of this class. The custodial care of the feeble-minded having been assumed by the managers of the schools for children, it was found that, under wise administration, the adult imbeciles could be useful in the work of the institution; and that it was better, therefore, to introduce the colony plan with appropriate segregation of classes, than to establish other new institutions for the custodial care of adults. For instance, at Elwyn [Pennsylvania] it was found that many feeble-minded women had a liking for children, and that they could be distinctly serviceable in taking care of the young children in the school department, a work which made them happier, and benefited their own malady as far as anything could. . . . New York, however, established special custodial homes for adult idiots and a home for feeble-minded women, and New Jersey has followed the example. . . . Massachusetts has solved the difficulty by establishing a farm colony for a selected class of the trained feeble-minded. . . . Groups of older boys are transferred from the school to the farmhouses and cottages and lead there a normal country life, earning a part of their livelihood and shielded from temptation and competition.”—A. G. Warner, *American charities, pp. 339-344*.—The special classes for backward children, alluded to above, have proved a valuable means of uncovering cases of feeble-mindedness, as well as of bringing out latent powers in children who might have fallen into the dependent class. “The idea of special classes in the public schools seems to have been suggested by Stötsner in Leipsic in 1863, and by Prof. August Shenck in America in 1878. As the result of the latter's agitation, two classes were started in Cleveland, Ohio. In 1892 Chicago formed a class; in 1896, Providence, Rhode Island, and Portland, Maine; in 1899, Philadelphia. In the year 1900 the first ungraded class in New York City was started. . . . In 1906 there were fourteen classes in Greater New York. Since that time the enormous growth of these classes is in itself both sufficient indication of the size of the problem and the reason for many shortcomings. In 1906 a special inspector of ungraded classes was appointed. The duties of this inspector were to superintend the establishment of these classes, to secure teachers, and to decide what children should be placed in the classes, together with general oversight and direction of the work.”—H. H. Goddard, *School training of defective children, pp. xix, 1*.—Intelligence tests are of great and increasing value in these classes. “In Boston, selected teachers are given an opportunity at city expense to observe the methods in the best schools for the feeble-minded, and a teachers' course is . . . offered at the New Jersey Training School for Feeble-minded Boys

and Girls, at Vineland. The movement is recognized as highly important not merely for the relief of the teachers of normal children in the public schools, but as a preventive measure. Such children become in many cases semi-criminal, or at least incapable of self-support. Among the group of backward children will be found those who with this special training and medical care may become normal, and among them also some who will prove to be really feeble-minded and in need of institutional care. In either case the work of prevention is economical as well as humane."—A. G. Warner, *American charities*, pp. 345-346.—"Few people realize the special ability, skill, and training required. These teachers have to be specialists, and therefore, experts. Again, few realize the nerve-racking work, the discouragements, difficulties, and even dangers the teachers have to face. An adequate salary is the least we can do for them."—H. H. Goddard, *School training of defective children*, pp. 62, 63.—The methods used, and the subjects taught in schools for the feeble-minded in the United States follow closely the same lines as the best schools in Europe. The school at Rome, N. Y., has found forestry to be an additional valuable subject for boys. Care of the feeble-minded in Great Britain is much less scientific than that of the blind, for instance, though great efforts have been made for some years to give them adequate institutional care. Special day schools are maintained in London and other cities for feeble-minded children of a high grade.

Seguin, *Idiocy and its treatment*.—*Education of feeble-minded* (*Feeble-minded Annual Conference Report*, 1913).—*Survey*, 1911-1912, pp. 1865, 1871, 1872.

Vocational education

Trade-school situation in Europe at the outbreak of the World War.—"In general the trade-school situation [in 1914] in Europe may be summed up very briefly: In Great Britain and Ireland we find both public and sectarian institutions, representing the all-day apprentice or trade school, the continuation school, and the evening instruction courses open to men, women, boys, and girls. The system, however, is comparatively recent in its development, having been built upon the experience of the continental countries [in all there are about 300 technical schools of all sorts in Great Britain, many of them private institutions]. In France we find the all-day trade school in its highest development, with special schools established for both boys and girls. The aim of these schools is to intensify the idea of artistic expression as well as to improve mechanical construction and efficiency in production. In Germany and Austria we find the continuation school, with the beginning of the all-day trade school in both countries. Belgium, Holland, and Switzerland seem to have developed a combination of the French and German systems, including in their plan the all-day trade school for apprentices and tradesmen. In Italy the day trade school only is found, with greater emphasis on the artistic side—sculpture, painting, jewelry, gold and silver smithing—than on ordinary manufactures. In this respect northern Italy differs greatly from the portion south of Florence, considerable manufacturing having been introduced."—F. L. Glynn, *Some trade schools in Europe* (*United States Bu-*

reau of Education, Bulletin, 1914, no. 23, p. 9).—As the vocational education in Europe is dealt with under the heads of primary and secondary education in the various countries no more than bare mention of the subject is made here.

Industrial education in the United States.—"Perhaps the simplest characterization of it [vocational or industrial education] would be education to earn a living. Vocational education sees the pupil as a prospective man of leisure. It would shape . . . [the pupil's] studies around a practical employment objective, rather than, as now, around a general ideal of culture. It would reorganize our elementary educational system by adding full time . . . continuation vocational courses to the traditional curriculum of the 'three R's.' Thus it would teach the child to *do* things rather than merely to *know* things; and under such a system the pupil would find school a practical stepping-stone to the all-necessary job. The movement for such education first arose . . . [about the beginning of the present century]. It came out of the painful realization that the much-vaunted democratic public school system [of the United States] was becoming neither democratic nor public. The original theory of the American public school was that equal opportunities should be accorded to every child. This worked in theory. Unfortunately, in practice . . . statistics indicated that between 80 and 90 per cent. of the public school pupils were forced by poverty to discontinue before or at the completion of the grammar grades. . . . [Moreover] although the majority of grammar school pupils were destined for the factory, they were forced to spend their precious school years in courses preparing them for high school. Although the manifest need of such children was education which would make them successful wage earners, the industrial objective was completely overlooked by the public schools. Instead of individualizing instruction, according to the future needs of the pupils, our school standardized instruction and took as the standard, not the majority but the minority. Here was a most patent wrong. Already, the schools had been toying with the industrial idea in the form of manual training. But manual training averaged only one and a half hours a week. . . . The need was for schools with distinct vocational courses, followed by continuation courses, after the child had gone to work, . . . [which would] give their pupils what few mechanics possess today—craftsmanship. The boy should learn industry as a whole. He should study all the supplementary subjects technical to his chosen craft. He should learn the inter-relation of industrial processes. All of his textbooks and courses in general subjects as well should be prepared from the vocational slant and should contribute toward a psychology of craftsmanship in his mind. The further argument for vocational education was supplied by the industrial situation itself. In previous periods young workers were trained into craftsmen by the apprentice system. . . . Unfortunately, the coming of the machine system virtually ended apprenticeship. The working-class boy had now no place to which to look for industrial preparation but the public school. And what did the public school offer him? . . . [Efforts have been made for many years, by some manufacturing firms, to educate or train their apprentices into expert machinists or foremen, but this education was limited to particular occupations and was for only a limited number of apprentices. At last] cautiously and experimentally school boards began to create continuation schools and amplify manual training courses.

Results began to accumulate. . . . But it was necessary, above all, that the Federal Government itself be gotten behind the movement to give it official standing. This was accomplished by the Smith-Hughes act of Feb. 23, 1917. Congress not only endorsed the movement, but voted an annual endowment to continue indefinitely. This endowment, graduated upward from \$1,655,586.72 for the first year to a maximum of \$7,367,000 to be attained in the year 1926 and continued thereafter, was to be expended by State Boards for Vocational Education which each State was called upon to appoint. It was to be given on condition that these State boards match it dollar for dollar. It was to be spent for instruction and teaching training in vocational education exclusively. To allot these funds among the States a Federal Board for Vocational Education was created. . . . In the early stages of vocational education the Federal Government enters into a partnership with the State—the State being the resident partner on the

the machinist's trade, study in a miniature machine shop, handle tools and do actual machine tasks. In Ohio, for example, where the chief industries include iron and steel, machine and foundry establishments, automobile works, rubber factories, ship-building plants, garment-making and jewelry manufacturing, the classes in the public schools are organized around these objectives. Figures for the fiscal year 1919-20 . . . [showed] twenty part-time trade extension centres, with thirty-five schools; four general continuation centres, with six schools; two all-day centres, with five schools; thirty evening class centres, with approximately 250 classes. The part-time trade extension classes enrolled 1,200 students; the general continuation schools 1,000; the all-day schools 150; the evening classes approximately 6,700. These figures are typical, and are borne out proportionately throughout the country. It may be added that the trade vocational instruction teaches the students to understand the whole industrial process, as well as their part of it, and

SCHOOL GARDENS

ground and doing the actual work, and the Federal Government the non-resident partner, investing from time to time the necessary sums of money. [The work of the board] is divided into three fields—agricultural, trade and industrial, and home economics. Agricultural instruction is always practical. It is given by three methods, destined to reach all groups of boys and men, in all-day schools for boys still in school; in short-course instruction for those already working on a farm, and in evening classes for older men who are practical farmers, but who wish to learn improved methods. The students operate actual farms under the supervision of their instructors, and are taught stock raising, soil culture, fruit cultivation, business and administration of farms, economics of the market, &c. The total net income from all these experimental farms for the year 1918-19—a total of \$832,487.60—demonstrates eloquently the success of this instruction. The same division into three classes of schools also operates in trade and industrial instruction. In each community different trades are selected, according to the employment needs of the district. Continuation-school pupils, preparing for

has a broad cultural scope. It teaches elementary economics, civics, and does not neglect the principles of good citizenship. Home economics is framed for girls to qualify them as homemakers. Cooking, homework and baby care are included. The instruction is all practical. That it is vitally necessary is proved by the census, which reveals that 60 per cent. of girls eventually marry. . . .

"The Federal funds are available only for the public schools. Though private schools have done magnificent pioneering in this task, it is felt that vocational education can realize its true magnitude only when it is a part of the public school system of the land. Not the least of the weaknesses of private vocational schools is the fact that the labor unions, which staunchly support public school vocational training, look with suspicion upon private vocational undertakings."—H. L. Fidler, *Vocational training and the new education* (*New York Times Current History*, Feb., 1922, pp. 775, 776, 777, 779, 780).—See also NEW JERSEY: 1913-1916; and below: World War and education: Re-education.

tion in the United States (*International Labor Review*, Nov., 1921).

Workers' Education

By the term "Workers' education" is meant, not industrial or vocational education, but education for working men and women, provided usually by their own organizations.

Belgium: Central board for workers' education.—"The Belgian Central Board for Workers' Education was founded in 1911. It is one third endowed, and two thirds supported by labor contributions. The Board is made up of representatives of the Labor Party, the labor unions and the cooperative societies. It exists to stimulate local effort. It induces labor organizations to use their own money for educational work. Its purpose is, according to its own constitution, to develop and coordinate all institutions that aim at 'providing the workers with such knowledge and qualities as will facilitate their emancipation as a class in every field.' Among the many enterprises of the Board, it is successfully working out a labor school system. This applies to the three groups of workers . . . by elementary local schools with cycles of lecture-lessons, district schools, and higher national schools. The national schools are specialized into trade union, cooperative socialist, political, a school for municipal councillors, and so on. This Belgian experiment is thus in its beginnings more systematized than the older British experiment. It recognizes more frankly the differences in the capacity of the students. On the other hand it has not had the long test of the British practice."—A. H. Gleason, *Workers' education*, p. 49.

Denmark: People's high schools.—"The People's High Schools of Denmark are in some respects like the university tutorial classes in England, but they have grown out of a somewhat different soil and have their own peculiar characteristics. These high schools are really boarding schools where young men and women from farms and from towns can come for short periods of study and inspiration. There is usually a winter term of five months for men and a three months' summer term for women. In some schools the winter courses are for both men and women. A few schools offer a two years' course. The tuition is extremely low and a large number of scholarships granted by the state enable the poorest student to enter. . . . Of the seventy high schools that were existing in 1918, a little over half gave a purely cultural education; history, literature, languages, mathematics, sociology, natural science and so forth. The remainder added technical subjects."—G. M. Fox, *When labor goes to school* (*National Board, Y. W. C. A., New York*, pp. 15-16).

England: Workers' educational association. — Ruskin College. — Labor College. — "The Workers' Educational Association was founded by a group of workpeople in 1903, with the object of stimulating the demand for higher education among their fellows. Its astonishingly rapid growth has been due mainly to the fact that it provided an outlet for forces that had long been gathering underground, but also, in part, to the method of organization adopted."—A. E. Zimmern, *Nationality and government*, p. 112.—"The formation of the first class in 1906 was due to a very wise use of University Extension at Rochdale, [of coöperation fame] where the W. E. A. branch, under the name of the Rochdale Education Guild, had become powerful. . . . Working men and women began to attend lectures in large numbers, and because they

reached out for something more, a new problem arose. After long reflection I came to the conclusion that the best thing to do would be to ask Rochdale to get thirty students to pledge themselves to make every attendance for two years and to write regular essays. If they would do this we could get the best tutor in England. . . . The Rochdale students pledged themselves for two years, and . . . a Balliol scholar, agreed to teach the class for the time being under the auspices of the Oxford University Extension Delegacy. . . . [As a result of the movement a committee of seven university representatives and seven labor men was appointed to endeavor to bring working men and the universities together. Their] report not only laid down clearly the lines upon which the new movement must be developed, but induced, throughout the whole of the English-speaking world, at least a new attitude towards Universities. . . . The Oxford Colleges rallied to the work, and useful contributions were made by several of them. . . . The publication of the Report drew in all the other Universities and University Colleges, and, before long, there was not a University nor a University College in England and Wales which had not established classes. More than that, they actually met in a Central Joint Advisory Committee for Tutorial Classes, . . . [which] is unique in that it is the first Committee upon which there were representatives of every University and University College in England and Wales. . . . Let it be said at once that students as a rule keep their pledges, that the first Rochdale Class continued for four, and the Longton class for eight years: . . . The quality of the work done revealed itself rapidly as good. . . . Mr. A. L. Smith, the Master of Balliol, [who has been] much quoted . . . declared that [for quality as well as quantity] 25 per cent. of the essays written were as good as the work done by [First-Class Honour] men . . . in the Final Schools of Modern History at Oxford. . . . Many trade union officials have as a result found that their work was more powerful, and that they themselves were better informed and equipped to deal with . . . [their] problems. As for the University professors themselves, they found a new joy in studying with these keen students, especially when they came up to the Universities for Summer Schools."—A. Mansbridge, *An adventure in working-class education*, pp. 37, 39, 40, 43.—In 1919-20 there were 230 of these tutorial classes in England and Wales. "The classes are financed partly by the universities, partly by grants from the Board of Education and local education authorities. These sources have been supplemented by the Gilchrist Trustees and the W. E. A. The class chooses the subject of study and approves the tutor sent by the Joint Committee. The student pledges himself to attend for two hours a week—one hour for discussion—during twenty-four weeks a year for three years, and to write each fortnight an essay."—A. H. Gleason, *Workers' education*, p. 41.

"It was in the 1840's that the idea of a college for working men first found expression in England, a People's College being opened in Sheffield in 1842. In 1854 a Working Men's College was opened in London by a little group of far visioned men among whom were John Ruskin and Charles Kingsley."—G. M. Fox, *When labor goes to school* (*Pamphlet, National Board, Y. W. C. A., p. 7*).—"In 1899 Ruskin College was established by three Americans—Mr. and Mrs. Walter Vrooman and Charles Beard. The Governing Body was constituted of university men and trade union leaders. The location of Ruskin College is Oxford. [It has accommodations for fifty students.] Its purpose is

the provision of education for adult members of the working class in history, economics, political science, literature, and other branches of the social sciences. It seeks to offer 'a training in subjects which are essential for working class leadership.' . . . [In 1910 Ruskin was reorganized, and the administration was placed in the hands of working class representatives, with three consultative members.] Six hundred students have passed through the college in one and two year courses. . . . More than 10,000 have carried on the correspondence courses. . . . In 1909 certain of the students . . . 'revolted,' and established the Central Labor College (now the Labor College). They believed that Ruskin was imbibing university atmosphere, instead of steering a working class revolutionary movement. The instruction [in the Labor College] is based . . . upon the recognition of the antagonism . . . between capital and labor, [following the teaching of Karl Marx. It] is owned and controlled by the Board of labor organizations. . . . There are three persons on the Board from the South Wales Miners' Federation, and three from the National Union of Railwaymen. . . . The College [which in 1911 was moved to London] had in 1920 twenty-nine residential students. One thousand students attend the local lecture courses . . . classes held in South Wales, Lancashire, Northumberland, Durham, and industrial centres. All told, the Labor College reaches six thousand students a year [including those who take advantage of the correspondence courses].—A. H. Gleason, *Workers' education*, pp. 44, 45, 46.

Also in: A. Mansbridge, *Adventure in working-class education*.—A. E. Zimmern, *Nationality and government*.

France: *Universités populaires*.—"The *Universités Populaires* are perhaps the most interesting of all the French institutions for Adult Education. They came into existence about the year 1900 and there were 138 in existence in 1903. The idea was an old one, . . . but it was not until the close of the nineteenth century that the idea of Adult Education really caught the imagination of the working classes in France. In Paris some *Universités Populaires* were formed under the influence of professors and students of the University; but others were formed both in Paris and elsewhere by the *syndicats* or trade unions. . . . The general idea has been officially described by the Secretary of the Central Society of the *Universités Populaires* as follows: 'A *Université Populaire* is a secular association for the development of the higher education of the people, which serves to further the mutual education of citizens of every condition, which provides places of meeting to which the worker can come when his day's toil is ended, to learn, to rest and to amuse himself.' Obviously, therefore, some of these institutions are working men's clubs, some are lecture societies and others are merely appendages of a local co-operative society or local branch of a *syndicat*. Series of lectures are given where the *Université Populaire* is in touch with University professors and students, and in such centres groups are formed for the special study and discussion of literature and philosophy. There was a considerable decrease in the number of *Universités Populaires* in the years immediately preceding the war. In 1912-13 there were 136, and in 1913-14 only 85. . . . The movement almost disappeared, . . . [during the war, but] latterly the number increased again from 30 in 1916-17 to 44 in 1917-18. It appears [however] from the official report that they are generally groups for reading in common rather than audiences for lectures or classes."—*Adult Education*

Committee of the Ministry of Reconstruction, Great Britain, Final report, 1919, pp. 364-365.

Germany: *Workers' school and educational committees*.—"One of the earlier experiments made by the Labour movement in Germany was the Workers' School in Berlin, which was founded in 1891 in great part through the energy of Wilhelm Leibknecht. Its activities are carried on [1919] by means of evening classes in history, political economy and natural science. . . . The School takes rooms in six districts of Berlin, at which courses of 10 lessons each were given at a charge of one mark for the course. A library, with 2,750 volumes, is at the service of students. The total number of students who passed through the classes from 1891 to 1914 . . . [was] 15,000. In 1914 it was decided that the School should be subordinated to the general plan for the workers' education under the Education Committee for Greater Berlin. . . . The German labour movement in general has taken an active interest in education in recent years and has organised lectures, classes and entertainments on an extensive scale. The Social Democratic Party decided, at its Congress at Mannheim in 1906, to devote some attention to the education of its members, and the Trade Union Congress at Dresden in 1911 made a similar decision. The result was that Education Committees were established for this purpose. In 1909 there were 124 in the German Empire, and in 1914 there were 287 local and 63 district Education Committees of the Social Democratic Party. In 1912 a District Education Committee was founded for the whole of Greater Berlin, and during the winter of 1913-14, 36 courses were arranged by the Committee. The subjects dealt with included 'The scientific basis of the modern Labour movement,' socialism, general political history, &c. There were 42 scientific lectures and two Beethoven concerts. The trade unions in Berlin have their own libraries. Forty-two trade unions possess amongst them 34 libraries, containing in all 55,916 volumes."—*Adult Education Committee of the Ministry of Reconstruction, Great Britain, Final report, 1919, pp. 368-369.*

Italy: *Work of the Umanitaria Society*.—"School for Workers and Co-operators founded at Rome in 1920."—"The Umanitaria Society for the protection of emigrants was the first to take account of . . . [the] need [for trade union education] and in 1910 made a notable effort to satisfy it by establishing a 'practical school of co-operation, social welfare, and social legislation,' supplemented by a 'social museum,' which produced excellent results. The curriculum included courses in political economy, the history of workers' organisations, labour legislation, industrial hygiene, statistics, technical subjects, book-keeping, emigration, agricultural science, popular literature, and in the management of producers' and consumers' co-operative societies. At the same time, this school could not be classed as a real trade union school, seeing that it aimed chiefly at providing instruction in social legislation and training men to be experts in labour questions, which is not the same thing as training future leaders of the trade union movement. . . . In 1919 the Umanitaria Society tried to satisfy these new demands and established two educational centres, one for co-operators and the other for organisers. This new type of school was first opened in 1920. The students, to the number of about sixty, were quartered in Milan at the Office of the Umanitaria Society from 15 April to 15 July. Most of them held bursaries, which were in general given by the Society. Two-thirds of the students attended the courses for co-operators; the rest attended the courses of the trade union section. . . .

In its plenary sitting on 22 April . . . [1921], the National Council of the General Confederation of Labour . . . recognised 'the urgent need of training a body of workers qualified to direct trade union organisation,' and accordingly decided to constitute 'a permanent trade union school, in connection with the General Confederation of Labour, supported by contributions from the labour funds and labour federations.' . . . The Catholic organisations, which even before the war had provided courses of social education in certain towns, have also been very active in establishing trade union and social education for workers. In March 1920 the Italian Confederation of Workers . . . which is the central organisation of Catholic labour, established its first course for workers, limited to forty pupils, in Rome. The students were drawn from various districts and received bursaries. The subjects taught included political economy, sociology, trade union administration, the law of collective disputes, labour legislation, the management of mutual benefit institutions, social insurance, besides elementary instruction in administrative, civil, constitutional, and commercial law; written and oral exercises were given, and examinations held at the end of the courses, on the results of which diplomas were conferred on the successful pupils, who afterwards received appointments as secretaries to the various Labour Associations. . . . The Italian Confederation also established in 1920 special courses for workers in agricultural organisations at Fermo, the centre of the vast agricultural district of the Marches. The curriculum included lectures on agricultural labour contracts and on crop-raising; the courses were attended by twenty-five land workers. Other institutions due to the initiative of the Catholic organisations . . . are the School for Workers and Co-operators, which was founded at Rome in 1920, and the courses of general education for organisers, which the Bank of Labour and Co-operation established at Rho (Milan) in March 1920. . . . After having made a first attempt in 1919, the Labour Office of the City of Rome established, in January 1920, a School of Social Education, including various special departments. There is a preparatory course for workers not possessing the necessary general education to enable them to follow the other courses; these other courses are the course on social training, which includes instruction in public and private law, political economy, statistics, labour legislation and social welfare legislation, history of organisations, bookkeeping, technology, and industrial hygiene; a practical course for co-operators, including instruction on the co-operative movement, co-operative legislation, and the management of co-operative societies; a course on the technique and economy of production, including instruction in theoretical and practical industrial economics, production and markets, labour politics, and labour legislation. Public lectures on the labour movement, social legislation, and social welfare complete the programme of the school, which is already attended by about a hundred students. It is under the direction of Mr. Mancini, and the instruction in each subject is entrusted to teachers who are specialists in their subjects."—*Workers' education in Italy (International Labour Review, July-August, 1921)*.

Norway: Working-men's colleges.—"Of late years, adult men and women, chiefly of the working classes, have been instructed in the so-called *Working-Men's Colleges (arbeiderakademier)* in the phenomena of nature and of human and social life, and in the development of human culture and its results upon thought and commerce. The first working-men's college was erected in Kristiania in

1885. Several towns and rural districts have since then followed its lead. . . . The instruction is given in the form of lectures (in the evening), with which is associated conversation upon the subject in hand. The lecturers have been scientific men, schoolmasters, military men, doctors, etc. Admission is generally free. The government grant to the working-men's colleges is equal to half what is furnished by the municipality, or acquired in any other way."—J. V. Heiberg, *Education (Norway, S. Konow and K. Fischer, ed., p. 279)*.

United States: Labor Union colleges and schools.—"The American experiments [in the education of workers] have been of many kinds. They have been state-aided, university-aided, independent of state and university. There has been education for labor given by wealthy benevolent trustees, as in Cooper Union [in New York]. There has been the Rand School on a party basis. There have been . . . [Cooperative] schools. There have been schools for a single union, like the International Ladies' Garment Workers' Union; groups of unions as in the United Labor Education Committee; the Central Labor Body of a city, as in the Boston Trade Union College; the State Federation of Labor, as in Pennsylvania. Much of the work of American labor education necessarily concerns itself with elementary and secondary courses in such subjects as English writing and speaking. . . . because of the racial and immigration problems. . . . As long as immigration brings a new group each year, classes in English, elementary mathematics and so on, will be necessary, [and] these classes absorb a large proportion of the energy of American workers' education. Already many of these adult elementary classes are taught in public buildings by public school teachers. . . .

"One object [of workers' education] is to train promising youths, [as leaders]. . . . Workers' education will train them in the technique of their particular union and industry, . . . [and] in the relation of that union and industry to society and the state. . . . It includes courses in labor law, the use of the injunction, workmen's compensation, industrial and health insurance, unemployment, Federal agencies of inspection, employers' use of a secret service, duties of the walking delegates. . . . A second object . . . is to give the more eager of the rank and file a social or civic education. . . . A third object . . . is to reach the rank and file with education for the love of it, with semi-entertainment with a cultural slant. Its aim is mass education.

"The International Ladies' Garment Workers' Union as a union has been 'the pioneer in education in the labor movement of America.' But there had been many efforts before its experiment. There had been a Workers' School, the Workers' Educational League, the Thomas Davidson School, the Bread Winners' or Wage Earners' College, the Jewish Workers' League, the Workmen's Circle . . . and since 1906, the Rand School of Social Science . . . in New York. . . . The idea of the Ladies' Garment Workers was not to initiate the education which would make trade unionists 'more efficient and better workers, but rather the kind of education that would make them more intelligent workers and citizens.' . . . In 1915, the Waist and Dress Makers' Union, Local 25, . . . of New York City, organized its own educational activities and concentrated them in a public school building under the name of Unity Center. The work was started on cooperation with the New York Board of Education, . . . [who assigned] teachers of English for special classes organized for Garment Workers members only. In addition to that, . . . [union

paid lecturers were engaged to lecture] on different subjects. . . . At the Philadelphia Convention of 1916 the question of labor education was more seriously taken up, and it was decided that the International [should] appoint a committee of five, and that fund of \$5,000 be appropriated at the disposal of this committee, to be spent for educational activities. . . . [This] committee . . . opened a few Unity Centers, thus laying a foundation for the Workers' University, which was opened in the Washington Irving High School in New York. . . . [The International has appropriated about \$15,000 a year for this University. At the Boston Convention in 1918] the Central Executive Board was instructed to spend \$10,000 yearly to carry on . . . [this] work of education. . . . [In 1920 there were] seven Unity Centers in Public School Buildings in the different parts of New York. . . . In each Unity Center there are classes in English, of elementary, intermediate, advanced and high school grade. The teachers are assigned by the Evening School Department of the Board of Education. At each Unity Center there is an Educational Supervisor, also assigned by the Department of Community and Recreation Centers of the Board of Education . . . [who gives] weekly physical training. The International arranges independently a series of lectures and lessons on the Labor Movement, Trade Unionism, and Economics. The rest of the curriculum deals with Health, . . . Literature, Music, Art, Educational Films, and talks on vital subjects. . . . In New York the Unity Centers have about 1,200 pupils, . . . [and there are about 300 at the Workers' University]. In Philadelphia, 350 garment workers are enrolled as regular students in the classes. . . . For the Garment Workers in Cleveland the Cleveland Board of Education pays for four instructors. The Garment Workers exercise complete jurisdiction over the planning of courses and the selection of teachers. The center of the educational work is the Headquarters of the union. Courses were begun on November 1, 1920. . . . The initiators of the United Labor Education Committee [in New York City] in 1918 were the United Cloth Hat and Cap Makers, at whose call all the conferences preliminary to the establishment of the Committee were held. Among the organizations affiliated at the beginning were the Amalgamated Clothing Workers of America . . . [which however] separated from the Committee, in order to establish their own educational department. The impulse for the Education Committee came from the needle trade unions, but carried to other unions until about twenty became affiliated. The United Labor Education Committee arranges for the affiliated organizations: (1) Lectures at the local union meetings. (2) Classes for the general membership, for shop chairmen, active members and officials. (3) Strike Service (making use of the leisure of strikers for education and recreation). (4) Slack Service (for the unemployed during industrial depression). (5) Forums. (6) Recreation Centers. (7) The Committee helps the locals to arrange their benefit performances at the lowest cost and so as to make them more educational . . . keeps in close touch with the labor educational organizations in this country and abroad. . . . Every local union elects one delegate to the Educational Council . . . and three delegates to the Annual Convention which elects the Executive Board. . . . [The Rand School in New York has co-operated with both the Educational Committee and the Amalgamated Clothing Workers of America. The latter organization carries on educational work independently, by lectures and classes, in New York, Rochester and Chicago. The

Pennsylvania Labor Education Committee, organized in 1920, by the Pennsylvania Federation of Labor, was converted into the Department of Education of the Pennsylvania Federation of Labor, and opened trade-union colleges and labor classes in several cities, including Philadelphia and Pittsburgh, where the instructors are recruited from among the university professors.] The courses given in these cities include: economics, history of the labor movement, industrial history, literature, public speaking, and English. . . . In the smaller towns the . . . [Federation] organizes circuits composed of five or six nearby cities, and stations a full-time lecturer in that district. This instructor gives one lecture a week in each of the circuits. . . . The Trade Union College of Washington, D. C., is under the trade unions of Washington and vicinity. The classes are one and two hours in length, part lecture and part discussion. Courses are offered in English, music, dancing, literature, mathematics, mechanical drawing, economics, history of the labor movement, elementary law, current labor questions, vocational education, industrial hygiene, cooperation, democratic control of industry. . . . A joint committee of the Chicago Federation of Labor and the Women's Trade Union League of Chicago in cooperation with the Board of Education holds educational classes for men and women. . . . At present [1920] three classes are being conducted successfully—the public speaking class, filled to capacity; the parliamentary law, and essentials in English. The element in attendance is composed in equal proportion of Americans and the foreign-born. The foreign-born are Russian Jews. The Trade Union College under the auspices of the Boston Central Labor Union was organized shortly after the end of the world war. . . . It was the first college to be established by the entire central labor body of a city, and this plan inaugurated in Boston has since been followed in Washington, D. C., in Seattle, and in other cities. . . . The early experience of the Boston Trade Union College showed that the purely theoretical or speculative courses were unpopular, and that the demand was primarily for courses . . . [of] practical value. For example, English composition and practice in discussion drew large numbers. The Workers' College of Seattle, founded in 1919, is under the control of the central labor council. . . . There are courses in the trade union movement, Marx, biology, English, parliamentary law, the American Constitution, the Soviet Constitution, the program of British Labor. . . . Other experiments are the Baltimore Community School (free tuition, independent of trade union control); the Chicago Workers' Institute. The Chicago Palatine Cooperative Union has opened a school. There have been the Work People's College in Smithville, Minn., the People's College—Fort Scott, Kansas; in San Francisco—The People's Institute; in Los Angeles—The Labor Temple (the educational work controlled by the Board of Education). [These various educational institutions are financed, organized and under the direction of the Labor Unions. They have not been long in existence, and, except in New York, the attendance is, for the most part small.]"—A. H. Gleason, *Workers' education*, pp. 6-9, 16, 17, 18, 21, 27, 32, 34.—See also RAND SCHOOL OF SOCIAL SCIENCE: 1906-1920; BOSTON: 1911-1919.—Bryn Mawr College has opened its halls for summer schools for working women; none except workers are admitted to the classes.

Evening schools

Origin.—Evening Schools seem to have begun their history in Germany, and to have grown out

of the Sunday Schools, which were established in the sixteenth century by Bishop Samland. Frederick the Great ordered that young married people and other adults who had not learned to read and write should attend these schools, in which the masters of the village schools were directed to give instruction. After the conquest of Silesia young people under twenty who belonged to the Roman Catholic church who were not attending school were required by the Church regulations to attend Sunday classes in reading and writing. These classes were extended to include the elements of a general education, and in some places instruction in handicrafts was given. As this required more time, recourse was had eventually to the evening hours, and thus the foundation of the evening schools was laid. The earliest full development of the evening school system, however, was made in England.

England: Early schools in industrial districts.—Government support.—School code of 1902.—Later development.—"During the last hundred years evening schools and classes, with other means for the further education of the people, have played a significant part in the social history of England. In no other country have they been more numerous or more varied in form and purpose, . . . or been more intimately connected with the currents of religious feeling and of social or political aspiration. For two generations they attempted to fill the gaps which were left by a very defective provision of elementary day schools. They furnished the first beginning of a system of technical instruction. . . . One of the earliest night schools in Great Britain was established [in 1784 or 1785] by David Dale for the children employed at the New Lanark Mills. . . . An early case of the foundation of night schools . . . was that opened in the Free Chapel of St. James, at Brighton, on November 1st, 1813, . . . [by] the Rev. James Marsh, for the benefit of those who attended no other school and who were employed during the day. . . . An example of the self-supporting night schools opened at this period in the mining and manufacturing districts by wandering teachers may be drawn from the early life of George Stephenson (1781-1848), the founder of the English railway system, . . . [who] went to a night school opened at Walbottle by a teacher Robin Cowens who taught him and a few other lads reading and spelling for 3d. a week. In the winter of 1799 Stephenson went to another night school opened [in the village of Newburn] by a Scotch teacher, Andrew Robertson, . . . [who] taught him arithmetic and charged 4d. a week. . . . In the mining districts of Durham and Northumberland . . . [in 1840] almost all the 'common day schools' . . . attended by boys and girls, were also opened during the winter between the hours of 7 and 9 'for the instruction of pitmen and others not able to attend during the day.' . . . In 1844 the Rev. F. C. Cook reports that Mr. Geary, a manufacturer in Norwich, 'allows no youth to attend his factory who is unable to read, and compels their attendance at an evening school until they arrive at years of maturity.' In the following years a considerable increase in the number of evening schools in the North of England is reported by the inspectors. 'Night schools are usually under the teaching of the national schoolmaster, and superintended by the clergyman of the place. The hours of instruction are generally from 7 or 8 p.m. to 9 and 10. In many places the young people of either sex come on alternate evenings.' . . . An important part in the furtherance of night classes had been taken during the previous years

(1844 onwards) by the promoters of the Ragged Schools, . . . [which were] begun by some Sunday school teachers in London. . . . The children's attendance was for short periods and instruction was but for one or two evenings a week. Gradually the work became more systematic. The schools were opened more frequently—some on every night of the week. Industrial training was added in many schools, and one paid teacher was added to the staff of nearly all of them. . . . The decisive step in regard to the subsidising of evening schools was taken by Government in 1851. In that year the Committee of Council on Education decided to encourage the combination of evening schools with existing elementary day schools. An evening school supplementary to a day school under inspection, would be allowed to receive grants for the purchase of books and maps at reduced prices.

"During the decade 1860-1870 a new form of evening school became popular through the action of the Department of Science and Art, which recognised and vigorously encouraged the growing interest of working men students in the study of physical science . . . [and] many workmen who saw the importance of gaining some elementary knowledge of science . . . resorted to the evening [science] classes . . . [which] have been one of the chief means of furthering technical knowledge in England. . . .

"[In 1862] the position of evening schools was clearly defined as continuative of day school work. . . . The Committee of Council stated . . . in the Revised Code, 1862, [that the evening schools under the Board of Education] 'should differ in nothing from the morning or afternoon meetings, except in the scholars who attend.' Its business is not secondary, but continued elementary, instruction. Attendance rapidly increased under the new regulations until after the passing of the Education Act of 1870, and the rapid development of elementary schools which succeeded and which reduced the great need for elementary classes, while at the same time it created a demand for greater facilities for secondary education in evening schools. In 1882 important changes were made in the evening school regulations. Grants were declined for children under fourteen or adults over twenty-one, and on the other hand were not confined to elementary subjects thus giving more freedom in the curriculum. . . . [By the Education Code of 1890 a revolutionary change was made. Elementary education was no longer required to be the principal part of evening school education. Consequent upon this new arrangement secondary subjects were more generously introduced and the history of the schools became one of rapid development. In 1893,] a new evening school code, which marks an epoch in the history of this branch of education in England and Wales [was introduced]. The old conception of the evening school was boldly swept away. Attendance of persons over twenty-one years of age was recognised for grants. . . . Grants were paid, as in day schools, upon the instruction of the school as a whole instead of upon the attainments of individual scholars. . . . [After the introduction of this code, numbers and attendance again increased, and in 1899-1900 the enrollment was over 500,000, and the average attendance over 200,000.] A change was again made in 1902 when the new Education Act combined the evening classes in scientific and commercial subjects, developed by the Counties and County Boroughs (under the Technical Instruction Act 1890), with the School Board classes, and unified the local administration of education under the County and County Boroughs Councils."

—M. E. Sadler, *Continuation schools in England and elsewhere*, pp. 1, 6, 7, 9, 11, 53-55, 67.

France: Classes for illiterates.—Continuation classes.—Industrial classes.—In France evening schools, which are under the department of primary instruction, are divided into three classes: *cours d'adultes*, for illiterates, *cours complémentaires*, continuation classes, *cours techniques*, industrial classes. They are taught as a rule by the public school teachers, generally given voluntarily and are generally supported by private subscription eked out by subsidies from the local governments. The state makes a small annual appropriation. Under a decree of 1887 attendance at one of these schools is not permitted before the age of thirteen. The first French evening school was opened in Paris in 1820, the idea probably being introduced from England. General subjects were taught and attendance increased rapidly until 1806, when the effect of compulsory education began to be fully felt, and numbers decreased. The schools still, however, form an important part of the continuation school system, and are carried on in the school buildings. Unfortunately attendance is not compulsory, and tends to be erratic.

Italy: Efforts to combat illiteracy.—Difficulties.—"The movement for the intellectual upraising of the worker in Italy embraces various public and private movements aiming at providing opportunities for adults to reach a reasonable standard of general culture, as well as movements aiming at equipping a certain number of workers with the technical knowledge required by them if they are to occupy administrative posts in their union organisations and co-operative societies; it is closely connected with the question of elementary education. Statistics of illiteracy are still high, in spite of the many strenuous efforts made to decrease it. . . . Italy has made great efforts to combat illiteracy, which is the result of very complex population, geographical, and economic factors. . . . In 1904 the Ministry of Public Instruction, with the financial assistance of the General Emigration Board, established evening classes. These classes were rapidly expanded; in 1913 they numbered 5,234 and catered for 146,500 pupils. The results obtained were not, however, very good. . . . The General Emigration Board now decided to establish evening classes in the districts from which the larger number of emigrants were drawn. . . . [and] initiated in 1920 its own independent movement to combat adult illiteracy. A programme contemplating the opening of 750 centres, providing education for 30,000 persons, was decided on in December, and steps were immediately taken . . . for organising classes in every commune in which there were ten or more illiterate adults. The indifference of many of the local authorities was at first a great difficulty, but, in spite of this, 759 schools had been opened in 570 different localities by 1 February 1921; there were in attendance 30,000 pupils. . . . In 1913 the General Emigration Board, acting with the Ministry of Public Instruction and at its expense, established evening centres with the object of providing special additional instruction for emigrants already able to read and write. These centres made little progress, and their number decreased rapidly after the war broke out.—*Workers' Education in Italy (International Labor Review, July-Aug., 1921)*.

Norway: Continuation schools.—"To meet the needs of the children that have left the primary school for continued instruction, *Night Schools (aftenskoler)* are also held with public and municipal assistance. The subjects are the same as in

the continuation school (principally Norwegian and arithmetic), and the instruction is in the hands of the primary school teachers. While the continuation schools are attended chiefly by children that have just left the primary school (age 15 and 16), the pupils in the night schools are rather older (17-19)."—J. V. Helberg, *Education (Norway)*, S. Konow and K. Fischer, ed., pp. 277, 278).

United States: Early schools.—Necessity for evening schools increased by immigration.—Types of schools.—Curricula.—The history of evening school education in the United States dates from before the Revolution, and therefore antedates that of England, although its development comes later than the development of the English system. The Society for the Propagation of the Gospel was responsible for the establishment of the first free evening school in America. It was opened in 1715, on Staten Island (New York) for slaves and other negroes. In 1789 the Manumission Society had evening schools for negroes in New York City. The Friends of Philadelphia followed with their schools for negroes, in 1787 and 1789. Prior to this, however, an evening school for boys had been opened in 1754 by the Moravians at Lititz, where "useful knowledge" was taught three evenings a week. This was perhaps the first instance of an industrial school in America. Some of the schools opened by the Friends in Philadelphia were for adult whites and adult negroes, and in 1790 the Philadelphia Society for the establishment and support of Charity Schools opened evening schools for apprentices, clerks and others of the same class. Evening schools were also opened for the education of the poor; but evidently these were staffed by voluntary teachers. In Massachusetts the first beginnings were made by religious bodies, although the selectmen of Salem in 1774 opened a night school for twelve boys, in which classes were held on three evenings a week. The real beginning of the movement in Boston began early in the nineteenth century, when church people objected to Sunday classes for secular instruction, which, following the English example, some charitably inclined people had begun. The classes were, therefore, transferred to evening hours on week days, and probably were the beginning of the excellent evening school system now in existence in Boston. The first school was opened in 1823, and in 1856 the attendance was almost twenty-five hundred. The first legislation on the subject of evening schools in the United States was passed in New York State in 1847, when the legislature authorized an appropriation of \$6000 a year for the evening instruction of young men and boys. The result surpassed expectation and the next year an appropriation of \$15,000 was allowed and schools were opened for women and girls. Following this success similar laws were passed by all the states in succession, and in the majority of the States, the establishment of evening schools wherever they are needed, is compulsory. The first evening school which approached the requirements of a high school was carried on in Cincinnati, Ohio, by the Mechanics' Institute and was open to apprentices and the sons of members on payment of an annual fee of fifty cents. This school was established in 1823, and was followed in 1841 by evening classes given by Woodward College. This school taught mercantile arithmetic and bookkeeping and mathematics as applied to industry, so that it might be termed the first industrial high school in the country. To Cincinnati also belongs the honor of establishing the first public high school, which opened its doors in October, 1856, and offered a

three year course. The first high school in New York was an evening school, opened in 1866. This school is still in existence. Some of the early high schools were especially designed to supply the needs of industrial workers, such as the O'Fallon Polytechnic Institute of St. Louis, 1868, and the Artisans' night school of Philadelphia, 1869. This school changed its curriculum gradually to that of an ordinary evening high school, and its name was so changed in 1898.

"The position in the world of education occupied by the School systems of the United States of America is in many respects of intense interest. . . . The great number of foreign families constantly arriving in the country forms one of the most difficult social and educational problems which the Government must solve. In addition, constant demands are being made on the educational administration by a keenly-striving and progressive commercial community, as well as by the calls of a huge industrial body, which claims for its artisan members a broader instruction in the arts and crafts than they can get in their ordinary daily experience. . . . By the system of education in the public day schools, a good deal is done to lay the foundation of American character and of intelligent citizenship. The evening school system is scarcely so thorough or so fully organised; but teachers and pupils alike seem to have great faith in its efficacy, and are striving towards more perfect attainment of their aims. The most difficult problem in the administration of evening schools in America lies, as in England, in securing regular attendance from the pupils. . . . Throughout the United States, the evening school system is based on the organisation of the public day schools, . . . [and] may conveniently be grouped into three main sections: The elementary evening schools; the evening high schools; the evening technical schools. . . .

"The elementary evening schools are somewhat limited in scope, being mainly preparatory to more complete and liberal work in the evening high and technical schools. They are usually grouped in three main divisions. (a) Classes for completion of the day school course; (b) Classes for foreigners desirous of learning to speak and write English; (c) Classes for adult students . . . who desire to study one or two special subjects. Many students in the elementary classes qualify during their first session, and can then elect to be drafted into the evening high school, or into the special classes of the elementary evening school. . . . The classes in the second division are doing a great work in assimilating the foreign element. One City Superintendent of Schools says, 'Our evening schools are not only giving education per se, but they are also making American citizens.' Thus in one evening school with over 600 male students on the books, . . . there were three classes of students . . . completing their day school course; six classes . . . learning to speak and write the English language. . . . Amongst these were classes of Germans, Greeks, Italians, Russians, Turks and Rumanians. Such classes are found in the smaller cities as well as in the larger centres of population. All the teachers in the evening schools must hold evening School Teachers' licenses. These are granted by the City Board of Education, but only after a practical test of the applicant's knowledge and capacity for the work to be undertaken. In the classes for foreigners, the teachers are, as a rule, not engaged in day school work. . . . The Evening Classes . . . [for adult students] mainly provide for elementary instruction in commercial subjects. Those who complete one session's work

in them are qualified for admission to the evening high or technical schools. . . . To the Evening High School every student comes with a fair minimum of educational equipment. The schools have as a rule a large membership, and are on a high plane of excellence. . . . The evening high schools are in a very real sense 'continuation' schools. Students are asked to study two subjects, and usually make choice of such 'subjects' as will help them to secure advancement in their daily work. . . . An attendance of fifteen students secures a permanent teacher, while in the elementary evening school an attendance of twenty is required. In the evening high school of Springfield (Mass.) an enrolment of ten students with an average attendance of seven is considered to be enough to justify the formation of a separate class, with responsible teacher. The public high school buildings, in which these classes are held, are furnished with all the educational apparatus that modern requirements demand. . . . The subjects of study for which there is most demand, are, in order of choice:—(a) Commercial Subjects, (b) English, (c) Mathematics, (d) Drawing. . . . One of these evening high schools [in New York] may be described as characteristic of the rest. . . . The classes included in branch (a) Stenography, Book-keeping, Business Arithmetic, and Commercial Law, these being directed not only to make good book-keepers, but also to give a broad general training which would enable the students to take honourable positions in public life; in branch (b), English Grammar, Business Letter Writing, English Composition, Literature, . . . Rhetoric, Oratory, and Debate; . . . in branch (c), Algebra, Geometry (Solid and Plane), and Trigonometry; in branch (d), Architectural, Mechanical, and Free-hand Drawing. There were also classes in Latin, French, German, Spanish, Practical Chemistry, Practical Physics, and History (including Political Economy and Civics). . . . The evening technical and trade schools form the highest branch of evening school work. The work in these institutions is purely technical, and appeals to men and women more forcibly than any general course. All provide opportunity for practical work . . . [and] at giving the workman a wider range of knowledge. They thus enable him to rise higher in his trade. . . . Usually such schools receive the approval of the local associations of workmen. . . . The attendance at the trade schools is as a rule remarkably good. The teachers are all practical men. The classes most in demand are machine-shop practice and tool-making. The classes in mechanical and architectural drawing, in plumbing, and in applied electricity come next in order of popularity. . . . At the end of the session the school's certificate is accepted by the workmen's organisations as showing the holder to be a fully practised workman. The schools are therefore a great advantage to the individual workman, in that they improve the quality of his work by giving him a wider range of practical knowledge, and enable him to obtain a higher and better paid position in his trade. Privately managed institutions like the Cooper Institute of New York, have a waiting list of applicants for many classes. At the Cooper Institute, as in some similar institutions, the diploma won by persistent study is almost of the rank and value of a University Degree."—M. E. Sadler, *Continuation schools in England and elsewhere*, pp. 643-645, 647-655.

tion, *Journal of Proceedings* (Winona, Minn.), 1905, pp. 570-576.—C. F. Warner, *Industrial training in public evening schools*.

World War and Education

The World War brought out the importance of vocational education and the great need of numbers of skilled workers in the field had to be met by special training in the camps. At the same time the demand for officers had to be met, and military training was combined with collegiate instruction in special engineering and other subjects. Moreover, at the close of the war, large numbers of men who for various reasons were unfit to return to their old occupations required reëducation through vocational training as well as surgical or medical care.—See also **WORLD WAR: Miscellaneous auxiliary services: VI. Military and naval equipment: b.**

Reëducation of disabled soldiers.—Efforts made toward industrial reëducation previous to World War.—Progress in various European countries, British empire and the United States.—“In 1897 there was established in Petrograd, in connection with the Maximilian Hospital, a shop for the manufacture of orthopedic apparatus and for the training of cripples in this trade. Later other equipment was acquired [and other trades taught] and in 1901 residential facilities were established. Cripples between the ages of fourteen and thirty . . . [were] received for instruction, . . . the average course of training . . . [being] four years in length. During the Russo-Japanese War the workshop was considerably enlarged. After the South African War there was established in Great Britain by the Incorporated Soldiers' and Sailors' Help Society workshops for the employment of 'disabled soldiers.' [There were established in 1899] in France . . . [in the] Department of the Seine, subsidized workshops for cripples and incurables of both sexes. The occupations carried on are the making of grass carpet, chair-caning, toy-making, and the like. These shops are more in the nature of relief agencies than training schools.”—D. C. McMurtrie, *Disabled soldier*, pp. 27-28.—In Milan also there was established a school for the vocational education of disabled civilians.—“A few years prior to the war, the authorities of the Belgian province of Hainsult decided that men crippled in industrial accidents should not be supported in idleness if they could be so trained as to restore their productive capacity. So they established in Charleroi a trade school for maimed men. The institution was wisely planned and the results of its work were successful.”—D. C. McMurtrie, *Re-constructing the crippled soldier*, p. 5.—Thus, in various parts of Europe, people were reaching the conviction that with the great increase in the number of industrial and war cripples, it was necessary to provide them with some means of occupation, and put them in the way of being partly, if not wholly, self-supporting. The distressing sight of the enormous number of war disabled, at the commencement of the World War, and a realization of the needless suffering, as well as the economic disadvantage entailed if a large part of this vast army were condemned to a life of idleness, quickened the growth of the idea. France and Belgium were the first to work out plans for the re-education of their disabled men; but before long most of the warring nations followed their example. The work of training the Australian wounded was commenced in England, at Weymouth, by the Australian Y. M. C. A. which “began teaching dis-

abled men useful trades that would enable them in spite of their physical disabilities to earn a livelihood on their return home. . . . When technical education was commenced by the Military authorities this department was handed over to them. To some extent the treatment of the problem of the disabled by Australia has varied from the treatment accorded by other overseas Dominions. The main point of variance has consisted in getting the disabled soldiers back to Australia for treatment as soon as possible. . . . In England some occupational instruction was given from the beginning in classes for which the Australian Red Cross was chiefly responsible, but later these classes were taken over by the Military Education Service. [In Australia] those of the disabled who were unable to pursue their old avocations were trained in other occupations to which disability was no bar. Some of this training was given in classes, some in industrial institutions.”—G. M. Long, *Treatment of disabled* (*Reveille*, England, Feb., 1919).—Belgium was the actual leader in the work of caring for the disabled. M. Schollaert, president of the Belgian House of Representatives, began this work at his country house at St. Adresse, near Havre, France, by permitting a number of convalescent soldiers, to whom he had given shelter, to commence work at their trades. Noting the improvement in the men who were at work, and in those who attempted to learn new trades, the minister brought the matter to the attention of the government, with the result that “M. de Broqueville, Belgian Minister of War, . . . decided as early as November, 1914, that soldiers who on account of their wounds would be unable in the future to practice their pre-war trades or vocations should not be discharged but simply declared *Candidats à la Réforme*, and kept on the army roll in order to be sent to a school of re-education. . . . [The badly disabled men who had already been discharged, some of whom were wandering around the country in England and France, were recalled, sent to the schools at Port-Ville near Vervins or at Mortain (afterwards closed) and Sainte Adresse in France, or to a colony maintained at Katwyk in Holland.] Naturally in the beginning there was indecision. The disorder caused by the invasion did not permit us to regulate without delay the status of the maimed. But we can say that since November 5, 1914, no soldier coming out of the hospital, maimed and in need of vocational re-education or re-adaptation . . . [has been left without succor]. The Belgian system of re-education was obligatory. As the men were still in service, the work which they turned out was used for the Belgian army, and the school at Port-Ville became self-supporting. Later a farm was added to this institution for instruction in agriculture. The Belgians, who perforce established only a few large institutions, found that on the whole if re-education is to be founded by a powerful society such as the State the large school is preferable, as affording a greater choice of vocations to the candidate for re-education. It also permits the man who has made a false start to begin again with the least loss of time.”—L. de Paeuw, *Vocational re-education of maimed*, pp. 13, 16, 40.

Also in: G. Harris, *Redemption of the disabled*.

Canada, among the British Dominions, was the first to see the necessity for reëducation. “The Military Hospitals Commission, a body charged with responsibility for all phases of rehabilitation was constituted [and opened its first hospital in 1916]. At some points the Commission . . . built training shops in connection with conva-

lescent hospitals; at others it provides instruction in co-operation with provincial or local trade schools, agricultural colleges, or the Y. M. C. A."—D. C. McMurtrie, *Re-constructing the crippled soldier*, pp. 5, 11.—After the war was closed, the work of the commission was turned over to the "Vocational Branch of the Department of Soldiers' Civil Re-establishment. . . . In retraining . . . two policies are open . . . (1) To take all these men, and train them in highly skilled trades. . . . (2) If they are skilled in some occupation, to build on that foundation, . . . or, if they have no former skill to build upon, to train them in some occupation, in which they will be able to earn the full going wage. . . . The second method has been adopted as a general principle . . . [and] the number of occupations in which men have been or are being trained by the department is 380. . . . Academic training . . . differs little from ordinary educational systems. . . . [But,] to accommodate the men entering and leaving at all times . . . the department has organized classes, taught by returned soldiers, for the carrying on of this work. . . . [For professional work, the men were sent to the colleges and universities. For mechanical training,] arrangements were made to have a number of students accommodated for preliminary training at the technical schools in Montreal, Toronto, Hamilton and London, but in most of the provinces no facilities of this kind existed. . . . The Nova Scotia Technical College and the Calgary Institute of Technology and Art were taken over by the department, . . . and conducted . . . as trade schools. . . . [McGill, Queen's and Toronto Universities, and the Universities of Saskatchewan and British Columbia,] placed their equipment and space at the disposal of the department, and additional equipment was added. . . . [In Manitoba,] the department built and equipped a trade school of its own. . . . The department . . . adopted the policy of using only for primary training, technical schools. . . . As soon as a trainee could safely carry on in an industrial organization, he was placed there under practically apprenticeship conditions as to work, but remaining under supervision . . . and receiving allowances [until he was pronounced competent]."—*Annual report of the work of the Department of Soldiers' Civil Re-establishment, Dec., 1919, pp. 30, 31, 32, 33, 34, 38, 39, 41, 47.*

"Serious vocational training for the disabled . . . soldiers was first proposed [in France] by M. Edouard Herriot, Mayor of Lyons . . . [on] November 23, 1914. Three weeks after broaching the subject, he opened in Lyons, . . . a municipal trade school for disabled soldiers. It grew rapidly, and by May of 1915 M. Herriot found himself obliged . . . to organize a second school. The first, known as the École Joffre, and the second, called the École de Tourvielle, have served as inspiration and model to most of those since formed. . . . In city after city . . . —Bourges, Montpellier, Saint-Étienne, Toulouse, Marseille, and others—associations formed for aiding the *mutilés* recognized the worth of M Herriot's idea. Early in 1915, there was formed in Paris under the leadership of Maurice Barrès, . . . the great *Fédération nationale d'assistance aux mutilés*, which in a few months . . . collected more than 2,000,000 francs for the purpose of rehabilitating the *mutilés* through work. The federation . . . established two schools of re-education in Paris, and . . . [gave] financial support to others. . . . In May, 1915, the national government opened a . . . trade school for disabled soldiers . . . at Saint-Maurice, just outside of Paris; a little later the City of

Paris commandeered a common school building and transformed it into a school for the maimed of the Department of the Seine. The Minister of Commerce organized special courses for *mutilés* in existing trade schools; the Minister of Agriculture did the same in the [provincial] agricultural schools. . . . Departments, municipalities, boards of technical instruction, employers' associations, trade unions, and private philanthropists, both French and foreign, joined in the movement, until . . . [in 1918 there were] more than one hundred reeducational institutions in France."—D. C. McMurtrie, *Re-constructing crippled soldiers of France (New York Medical Journal, May 4, 1918)*. —In March, 1916, the *Office National des Mutilés et Réformés de la Guerre* was created to coordinate the work under a ruling made in 1919. In accordance with a desire expressed at the congress of the disabled men's societies, training by an employer, in a workshop, or on a farm, was also recognized in France.

ALSO IN: *Training of disabled men in France (International Labor Review, Oct., 1921)*.

Germany began reeducation very early in the war, and here again a variation in the system used is found. "The chief thing to be noted about reeducation in Germany is that it goes on at the same time as the medical treatment; the two processes are simultaneous. . . . This has two causes: First . . . the strong conviction . . . that results can be obtained only by getting hold of a patient at the earliest possible moment of convalescence, and second, . . . since [re-training is unofficial and] the Imperial Government does not pay anything toward . . . [it], it is more economical for the care committees to attend to it while the men are in the hospitals. . . . The usual plan of the care committees, . . . is to give men their trade training while they are still in the military hospital, beginning it, in fact as soon as they are able to be out of bed. . . . Since the discipline of the hospital is military, the men can be assigned by the director to different shops to spend a certain number of hours every day. . . . [At Nürnberg the school facilities included a large sized piece of land and twelve workshops which had been fitted up by manufacturers; but] the plan more often followed is the outdoor plan, where the instruction takes place in the local trade schools. . . . The plan of any local care committee can, therefore, be elastic. In a small town it may simply arrange that its cripples be given free instruction at the local trade school. . . . In a large town, like Düsseldorf, where there are fifty hospitals, the committee has taken entire possession of a school building equipped with shops and tools and gives twenty courses open to men from all the hospitals."—R. Underhill, *Provision for war cripples in Germany (Red Cross Series 1, no. 13, June 8, 1918)*.—The great Düsseldorf school offered general education, theoretic trade and practical trade courses with shop work. All the hospitals which had any land gave courses in farming and gardening. The teaching in all the schools was done by volunteers. In addition many manufacturing firms made experiments in retraining their own employees.

In Great Britain arrangements were first made, for the reeducation of the men, with various technical schools, colleges, and industrial establishments. "In the past the work was carried on largely by voluntary philanthropic organizations, such as the Soldiers' and Sailors' Help Society and the Soldiers' and Sailors' Families Association. Various factors, however, . . . [led] to the realization that the nation must assume the re-

sponsibility. Accordingly, in April, 1917, . . . the machinery was created, . . . for the unification of the work of rehabilitation and re-education of disabled soldiers and sailors under the Ministry of Pensions. . . . When arrangements for a man's training have been completed, the place and length of instruction vary greatly, depending on many factors. A course in operating motor tractors, for example, may be completed in one month, while regular courses in chemistry, mining, and similar subjects offered in some of the universities, cover a period of four years."—D. C. McMurtrie, *Experience in the re-education of disabled soldiers in Great Britain*, pp. 4, 5, 8, 14.—In May 1919, "the responsibility for the industrial training of ex-service men was transferred to the Training Department of the Ministry of Labour . . . [which was] also empowered to provide industrial training for fit men who on account of joining the Forces . . . under 19, or for any other reason of a like character did not enter upon an apprenticeship to a skilled trade. . . . National Trade Advisory Committees (Disabled Sailors and Soldiers) have been set up by the Minister of Labour to advise the Ministry as to the conditions under which the training of disabled men in various industries can best be given, . . . and, generally, to secure a reasonable uniformity in the training. . . . [Training is given in] (a) employers' workshops. (b) private educational institutions. (c) Grant-aided technical schools and institutions. (d) Government instructional factories. (e) Government training centres not on the list of Government Instructional Factories. It is the policy of the Training Department . . . to increase . . . the facilities for institutional training which have been shown . . . to achieve far better results . . . than the placing of the raw trainee straight in a workshop. . . . For this purpose the Department have set up Government Instructional Factories in addition to the limited facilities available in Technical Schools."—*Conditions governing the industrial training of ex-service men (Ministry of Great Britain Labour, 1921, pp. 2, 5)*.

"At Bombay, India, is one of the most picturesque schools in the world. It is known as Queen Mary's Technical School for Disabled Indian Soldiers, and was founded . . . [in 1917] through the efforts of Lady Willingdon, wife of the Governor of Bombay. Soldiers of the Indian Army, of all ranks and classes, who . . . [were] disabled in action or pensioned for any reason as unfit for military service, [were] offered a course of instruction six months or longer in duration. . . . Besides poultry farming and agriculture, classes [were] started in tailoring, motor car driving and motor mechanics, knitting, carpentering, cinema operating, oil engine driving, fitting and turning, and elementary engineering."—D. C. McMurtrie, *Re-education of disabled soldiers at Bombay (New York Medical Journal, Aug. 24, 1918)*.

In Italy on "March 25, 1917, there was passed the law providing for the *Opera Nazionale per la Protezione ed Assistenza degli Invalidi della Guerra* (National Board for the Protection and Assistance of War Invalids). This law and the supplementary regulations published . . . in August, 1917, form the basis for all re-educational activities. . . . When the cure [of the disabled] has so far progressed that they will profit most from re-education, they are dismissed on . . . (short leave) [generally a month]. . . . After the term of leave . . . has expired, those . . . capable of re-education must present themselves, . . . at

the nearest re-educational school. The men excused from this duty are those helplessly crippled or those who give proof that they do not need re-education or can attend to their own. . . . The compulsory stay of any man at the school is limited by the law to fifteen days . . . [but] if he consents to training, he remains under military discipline. If he refuses, he receives his discharge from the local military authority. . . . The schools are responsible to the National Board in all matters of re-education and are subject to regular inspection. In matters of hygiene, sanitation, and discipline, they are responsible to the war department which inspects and furnishes disciplinary officers. . . . When a man is accepted for re-education he remains as a regular member of the army. He may remain at the school for a maximum period of six months. During this time the war department pays the school 3.50 lire a day for his maintenance, and pays the man a regular sum, according to his rank. [Unfortunately the schools had room for only about a fourth of those entitled to admission]."—R. Underhill, *Provision for cripples in Italy (Red Cross Series 1, no. 12, May 31, 1919)*.—Elementary schools were opened and trade courses were also given. Milan had a business and commercial course, and a farm course was started at Palermo.

In South Africa it was insisted that physical recovery and re-training should go hand in hand from the beginning. Vocational training was actually begun at the bedside; classes followed in the hospitals; then the men went into hostels, and were treated as out-patients but continued their studies in the hospital workshops; and finally, still in khaki, they went into factories. Ninety per cent. of the disabled voluntarily took training.

"Hardly was the Federal Board [of Vocational Education, of the United States,] in existence when it found itself swamped with extraneous war duties. On June 27, 1918, Congress enacted the Vocational Rehabilitation Act and put upon the new board the task of rehabilitating the army of disabled veterans who were already pouring back from France. It provided that these veterans, when not completely disabled, should be given vocational education, under the direct administration of the board."—H. L. Fidler, *Vocational training and new education (Current History Magazine, Feb., 1922)*.—"The first thing that the board did was to get the co-operation of as many existing institutions as possible; thus, up to the close of the last fiscal year, about 1,700 schools and colleges had been utilized in giving training to disabled men in courses approved by the Federal board, and more than 8,500 industrial, agricultural and commercial employing agencies had co-operated with the board in providing training 'on the job.'

"For carrying on this work, Congress has appropriated under several acts a total of \$129,000,000. Under the original act of June 27, 1918, the appropriation was \$2,000,000; under the act of July 11, 1919, the Sundry Civil bill and the Deficiency bill of July and November, 1919, and the acts of March 6 and July 5, 1920, there was a total of \$37,000,000 provided; the total for the whole fiscal years of 1920-21 was \$90,000,000. For the year 1921-22 it is estimated that \$78,000,000 will be required. . . . At the outset, fourteen districts were mapped out by way of preparing for ultimate decentralization, each district being responsible for carrying on the work within a prescribed area and for the work of directing local offices within the district. . . . Each local office is directly responsible for placing men

in training, for getting subsistence pay to men in training, and for continuous 'follow up' work. For the local office each disabled man represents a responsibility for the training of that man until he gets permanent employment. . . . Before a man can be put into training, his eligibility must be determined. Under the law it must be established that he was honorably discharged from the service, that his disability was incurred in service, that his disability constitutes a vocational handicap, and, finally that training is feasible. . . . So long as he lives, he may apply for reconsideration on reasonable ground. Once the soldier has been declared eligible, the problem arises of finding out both what he can do and what he wants to do. . . . In thousands of cases . . . illiteracy or totally inadequate schooling . . . [proves to be a fundamental handicap]. This handicap must be removed before specific vocational training can be undertaken. In

pendents during the period of training, and 66,000 had been approved as eligible under section 3 of the law, which provides training without maintenance."—J. S. Cummings, *Retraining war-disabled men* (*Times Current History Magazine*, Feb., 1922).—"In this immense laboratory of trainees [the Board] accumulated vocational data and developed vocational technique which has advanced the whole science of industrial education by at least a generation. . . . When finally the Veteran Division of the board was consolidated with the War Risk Bureau and the Public Health Division in a new Veterans' Bureau, Congress adopted the Federal board form to govern all three divisions. [Out of all this experience grew the industrial rehabilitation act, enacted on June 20, 1920, the administration of which was placed by Congress in the hands of the Board.] Here was a task almost incalculable in its potentialities. The whole vast field of men and

TYPEWRITING CLASS OF WORLD WAR VETERANS

Many one-armed men are in the class

every case a course of training must be arranged for, either in a school of college, or in an industrial or commercial establishment. . . . Every course has a definite objective, and the man is trained into employment. He may begin in a school and finish in a workshop, where he is placed on the permanent roll of employees; he may begin training 'on the job', shift to a school, and shift back to the workshop; or he may be in training part time in school and part time in the shop. Every combination of training is provided according to the individual needs of the man. . . . Over 250 different employment objectives have been defined for the 68,000 men placed in training, and more than 10,000 training agencies, including educational organizations, are cooperating with the board in assisting men to obtain these objectives. . . . To December 1, 1920, a total of over 160,000 disabled men had been approved as eligible for training. Of these, 94,000 had been approved as eligible under section 2 of the rehabilitation law, which provides tuition and support of the men and their de-

women disabled in industry now became potential beneficiaries of the board. The scope of the field can be imagined when we explain that every year more workers are injured in industry than the total number of war wounded whom the board has registered up to date."—H. L. Fidler, *Vocational training and new education* (*Times Current History Magazine*, Feb., 1922).—"The Federal act for vocational rehabilitation which became a law June 2, 1920, provides for cooperation of the Federal Government with the States in the vocational rehabilitation and return to remunerative occupation of persons disabled in industry or otherwise. . . . Appropriations are to be apportioned to the States on the basis of population, no State to receive less than \$5,000 as its allotment for any fiscal year. Before a State can be certified to receive allotments provided in the act it must, through legislative action, to quote the act—(1) Accept the provisions of the act. (2) Empower and direct the State Board for Vocational Education to cooperate with the Federal Board for Vocational

Education in the administration of the provisions of this act. (3) In those States where a State workmen's compensation board, or other State board, department, or agency exists, charged with the administration of the State workman's compensation or liability laws, provide that a plan of cooperation be formulated between such State board, department, or agency and the State board charged with the administration of this act, such plan to be effective when approved by the governor of the State. (4) Provide for the supervision and support of the courses of vocational rehabilitation to be provided by the State board. (5) Appoint as custodian for said appropriations the State treasurer.

"The Federal Board for Vocational Education is the agency charged with the administration of the act, and the procedure set up is similar to that set up in the vocational education (Smith-Hughes) act of 1917. Rehabilitation of disabled persons is a responsibility of the State, and the Federal Government does not assume the direction of the work within the States, nor does it undertake to establish direct contact with persons disabled in the States. The service of vocational rehabilitation provided in the act is purely a State's relations' service. . . . [Up to] September 30, 1921, [thirty-five] States have accepted the Federal act. Acceptance in other States is pending. In some States the legislature has not met since the passage of the Federal act. . . . [Twenty-five] States have set up special administrative machinery for the conduct of vocational rehabilitation work."—*Fifth Annual Report for Vocational Education, 1921, sec. 2, pp. 316, 317, 319.*

General education

Alaska.—Work of Bureau of Education.—Management of finances.—Teacher as social worker.—Colony building.—"The work of the Bureau of Education for the natives of Alaska included the Alaska school service, the Alaska medical service, and the Alaska reindeer service, with a field force in Alaska, in 1920, of 6 superintendents, 133 teachers, 9 physicians, and 13 nurses. . . . The entire work is under the direction of Mr. W. T. Lopp, superintendent of education of natives in Alaska, whose headquarters are in Seattle, which is more readily accessible to all parts of Alaska than is any point within the Territory itself. . . . The Territory has been divided into six school districts, each under the immediate supervision and direction of a district superintendent. One of these supervision districts contains fully 100,000 square miles. . . . The effectiveness and scope of the work are limited only by the amounts of the appropriations made by Congress. . . . The work is carried on for the benefit of adults as well as for children. In the Alaskan native community the school is the center of all activity—social, industrial, and civic. Each schoolhouse is a social center for the accomplishment of practical

ends. Many of the buildings contain, in addition to the recitation room, an industrial room, kitchen, quarters for the teacher, and a laundry and baths for the use of the native community. The schoolroom is available for public meetings for the discussion of the affairs of the village or, occasionally, for social purposes. . . . For the protection of the natives and in order more effectively and economically to reach a larger number of natives than it could in the small, scattered villages, the Bureau of Education has secured the reservation by Executive order of carefully selected tracts in various parts of Alaska to which natives can be attracted and within which they can obtain a plentiful supply of fish and game and conduct their own commercial and industrial enterprises. . . . Within the reservations it is possible to maintain better equipped and more efficient schools than can be provided for smaller villages, and to supervise cooperative stores and industrial enterprises maintained by the natives themselves. The settlements at Hyaburg, Noorvik, and Metlakatla are conspicuous successes in colony building."—*Bureau of Education, Bulletin no. 35, 1921, pp. 3, 4, 5, 6.*—See also ALASKA: 1920: Education.

Algeria: Popular education. See ALGERIA: 1898-1912.

Australia: Education of children.—Workers' tutorial classes.—Training of teachers.—In "the Commonwealth of Australia . . . each State has developed its own system of education, controlled and supported by the State authorities. Primary education is free in all the States and secondary education is free in some. Compulsory school attendance . . . is from 6 to 14; [except] in New South Wales . . . [where it] begins at 7. Every effort is made by the State authorities to reach the children in the sparsely settled centers, by means of central schools . . . where the children can be conveniently conveyed to school free of charge, or provisional schools, i.e., small schools in which the attendance does not exceed 8 or 10. When the numbers . . . [do] not warrant . . . a provisional school, half-time schools are formed, the teacher visiting these schools on alternate days. In some places the teacher goes from house to house. . . . 'Traveling' schools, the teacher being provided with a tent for himself and one to be used as a school . . . [have been tried as an experiment]. Often the State grants subsidies to a teacher engaged by two or more families; the teacher must, however, be officially recognized by the Department of Education. In localities where no facilities can be found . . . the children are reached by correspondence. This scheme seems to bring best results in homes where the parents or elder sisters or brothers can assist the young beginner. It has been successfully introduced in New South Wales, Victoria, and Tasmania. In Victoria the system was developed from the Teachers' College, and 120 isolated children were thus taught in June, 1917. Education in the Commonwealth is on the whole homogeneous. As each State developed independently, minor differences arose in the course of years. To make the work of the various departments more uniform and for the purpose of coordinating the school systems in the different States, the first conference of Australian directors of education was held in Adelaide in July, 1916. . . . The Workers' Tutorial Classes exist at present in all the States. Although controlled by the university, they receive Government grants (except in Western Australia) . . . [and are recognized as continuation schools in

Melbourne, where in 1917 about 4,000 students attended the classes]. The principal subjects offered are industrial history, economics, political science, and sociology. . . . Tutorial classes have been formed at the universities as well as in suburban and country centers. . . . The Department of Education in each State offers free tuition to returned . . . [soldiers from the World War] in all the technical colleges. . . . The training of teachers receives considerable attention on the part of educational authorities. . . . In recent years definite progress in this direction [has been] made in the States of Victoria and Tasmania. In Tasmania the new scheme of teachers' training, put into operation in January, 1918 . . . provides four district courses (a) A short [six months'] course which aims to prepare teachers for provisional schools and the less important positions in the primary schools. . . . (b) Infant [one year] course designed for prospective teachers in infant and kindergarten schools. . . . (c) Primary [one year] course designed to train teachers for the primary schools. The students must have completed two years of professional training in a State high school and have qualified for matriculation before entering the training college. . . . (d) Secondary [two year] course designed to train teachers for the secondary schools. It is open to promising students who have satisfactorily completed the primary one year course. . . . Before appointment the prospective teachers enter into agreement with the school authorities to serve the department for a certain length of time, which varies from two to five years, according to the expense and length of the course they have pursued.

"A similar scheme for the training of teachers was put into operation somewhat earlier in Victoria. Instead of one course, leading to the trained teachers' certificate, four courses have been provided, namely, a secondary, a primary, an infant, and a short course for teachers of small rural schools. Under a correspondence system rural teachers may receive further instruction by corresponding with the Melbourne High School. Similar arrangements are also made at the Teachers' College for country teachers . . . studying for an infant teacher's certificate. The training of teachers has been further greatly promoted by the courses on education recently introduced in some of the Australian universities; . . . [such as the lectureship on education] at the university of Tasmania. At the university of Western Australia education may be offered as a subject for a degree in arts; arrangements have also been made for a postgraduate diploma of education. . . . The spread of technical education continues in all the States of the Commonwealth. In recent years noteworthy measures for the purpose of reorganizing the technical schools have been taken in New South Wales, South Australian, and Tasmania. In *New South Wales* . . . two main courses of instruction have been established: (a) Trade courses for apprentices and (b) higher courses for students desiring to pursue their studies in the various trades and professions. . . . The trades courses are divided into two parts; the lower courses, covering a period of three years in the trade schools, and the higher, extending over two years in the technical colleges. A trade school leaving certificate admits the student without further examination to a technical college and thence to the university. . . . In 1916 there were three technical colleges . . . and 10 trade schools in [the State]; . . . classes in elementary technical

instruction were held in various smaller localities. The measures regarding apprenticeship inaugurated in New South Wales in 1914 were introduced a few years later in South Australia. . . . [Under the technical education of apprentices' act (1917)] each indentured apprentice, during the first three years of his apprenticeship, may be compelled to attend suitable technical classes for six hours per week for 40 weeks per year. Four of these hours shall be during the working hours and two in the evening. In *Tasmania* a . . . technical branch . . . was created in the Department of Education [in 1917]. Technical schools were . . . classified according to their courses as junior or senior technical schools. The junior technical schools [in which the course is for two or three years and is free] aim to give prevocational training in industrial, commercial, and domestic subjects. . . . The senior technical schools provide vocational training in industrial, commercial, art, and home-making subjects. The length of the courses varies from two to five years. . . . Progress in technical education has also been made in Victoria, where [in 1919 there were] seven junior technical schools. . . . In Queensland the first trade preparatory classes were inaugurated in 1917."—T. Bach, *Recent progress of education in Australia and New Zealand (Education in parts of the British empire, Bureau of Education, Bulletin no. 49, 1919, pp. 37-43)*.

Austria: Art instruction. See EDUCATION, ART: Modern period: Austria.

Belgium: Primary and secondary schools.—Curricula.—Act of 1914.—"Considering the illiteracy of the larger half of the population of Belgium, it may be surprising to learn that a primary school exists in every commune . . . and that the law of the land is free education for those who cannot pay for it. . . . In the primary schools education, except for those who . . . pass through the *écoles moyennes*, practically ceases at twelve, when the age of labour is reached, although the law assumes that education continues until the child is fourteen. . . . It is probable . . . that the poor results attained are traceable to the deficiencies of the teaching staff. . . . Those who . . . take a certificate at the [*écoles moyennes*, middle school] are eligible for mastership, and the appointment is made solely by the communal authorities. [The *écoles moyennes* and the superior schools known as *Athènes Royeaux* provide secondary education. The former are partly the latter wholly supported by the State. In these schools, the instruction given is of a superior kind.]"—D. C. Boulger, *Belgian life in town and country, pp. 155-157*.—"Primary instruction includes teaching of religion and morality, reading, writing, arithmetic, French, Flemish or German, according to the language spoken in the district, geography, Belgian history, elements of drawing, notions of hygiene, singing and gymnastics. The girls are also taught needlework, and the boys, in agricultural districts, a trade. (Under the law of 1914) Primary instruction . . . must be gratuitous and children of poor parents must be supplied with school (material) free. (There is also added instruction of a Fourth Degree) girls being taught the rudiments of agriculture and horticulture in the rural communes, as well as needlework, domestic economy, household management; and the boys, the rudiments of agriculture and horticulture in rural districts and those of natural science in other districts."—J. T. de C. MacDonnel, *Belgium, her kings, kingdom, and people, pp. 337, 343*.—"Act for compulsory Primary Education, Belgium, 19 May

1914, as amended 14 August 1919 and 13 November 1919, and 14 August 1920. Eight years' instruction is obligatory and is reckoned from the autumn of the year in which the child has attained his sixth year. Any child beginning his attendance later than at six years of age must remain the full time, unless he obtains his certificate of primary studies at the end of his thirteenth year. Even the Minister cannot authorize any departure from this regulation."—*Control of employment of children (International Labor Review, Nov., 1921)*.—See also BELGIUM: 1886-1909; EDUCATION, ART: Modern period: Belgium; SUFFRAGE, MANHOOD: Belgium: 1830-1921.

Bohemia: Classification of schools.—Growth from language struggle.—The rule of compulsory education from the sixth to the fourteenth year is in force in Bohemia. The curriculum includes "the Bohemian language (reading, composition, spelling and penmanship), arithmetic and elementary geometry, natural history, religion and gymnastics, with domestic science added for the girls. . . . Teachers for the elementary schools are trained in normal schools. [Boys are taught by men, girls by women.] The secondary schools include gymnasia and real schools. The gymnasia or classical schools prepare for the university, and the real schools, which lay special emphasis on the modern languages and sciences, prepare for the higher technical schools. The gymnasia have an eight year course and the real schools seven, although both require the equivalent of three or four years in an elementary school for admission. The elementary school system dates practically from 1848, when the struggle for the recognition of the national language was crowned with success. [Coördinate with these schools] are numerous kinds and grades of technical schools. Some of these fit for the higher institutes of technology, but most of them prepare for industry and commerce. . . . Besides the state schools there are numerous industrial schools maintained by the municipalities or by private associations. . . . In the larger towns commercial and industrial instruction are given in . . . continuation schools. . . . The arts and crafts movement . . . is one of the most marked features of the educational system of Bohemia. . . . There are also two institutes of technology in Prague."—W. S. Monroe, *Bohemia and the Czechs*, pp. 235, 236, 238, 240, 243.—See also BOHEMIA: Status of art and education.

Bulgaria: Schools in Bulgaria. See BULGARIA: Education.

Canada: Curricula.—Consolidated schools.—Training of teachers for elementary and secondary schools.—Macdonald movement.—Canadian courses of study are distinguished by the following characteristics: (1) the large number of obligatory subjects; (2) their uniformity throughout the province; (3) the relatively large emphasis laid upon (the three R's) as opposed to content subjects; (4) the frank acceptance of the disciplinary conception of studies; and (5) the thoroughness with which the different branches are taught. "In every province reading, spelling, grammar, composition, writing, arithmetic, geography, Canadian and British history, hygiene, including temperance or physiology, drawing, and nature study or elementary science are taught. . . . Ontario, in addition to the above, includes literature, physical culture, manners and morals, music, book-keeping, manual training, household science, and agriculture and horticulture in its course of study for elementary schools. Reading, literature, composition, spelling, gram-

mar, history, geography, writing, arithmetic, manners and morals are obligatory on all schools, and must be taken up without the omission of any of the prescribed topics or sub-topics. Hygiene, physical culture, art, nature study and vocal music, with few modifications, are obligatory, while, subject to certain conditions, book-keeping, manual training, household science, agriculture and horticulture are optional. The provinces of Alberta, Nova Scotia and Quebec teach civics as a separate subject, while elementary geometry in Alberta and elementary algebra under the Protestant committee in Quebec are taught during the last year of the public school course. Quebec Catholics have also an elaborate programme of moral and religious instruction, and, in addition, are required to teach both French and English to elementary-school pupils. The dual language problem also confronts the Protestant teachers of that province. Catholic Quebec is unique in one respect; Latin is taught to all elementary pupils after the third year of schooling. . . . Canada is just entering upon an era when different types of school are being evolved. She already has her schools of commerce, household science, physical training, agriculture, and technology. . . . The emphasis that Canada placed upon the three R's in the past was entirely justified. Education is more than a matter of book-learning. The pioneer's child learnt a large number of useful occupations in the home, and thereby acquired a very practical education. All that the school needed to do was to supplement this practical education by reading, writing and arithmetic of the most bookish or formal kind. But although pioneering still remains, it is for many Canadian children a thing of the past. The home is no longer an institution wherein the spinning and weaving of cloth and its manufacture into clothing are carried on; the factory and the department store have destroyed for ever many of the occupations with which the home was formerly concerned. Children can no longer educate the brain through their hands, or at least not so surely as aforetime, and the school, knowing the educational value of handwork of every description, begins to undertake such work. In progressive communities the time devoted to cooking, dressmaking, laundry-work, woodwork, basketry, gardening, printing and bookbinding, etc., indicates the importance that educators now place upon these occupations. . . . Yet Canada . . . still devotes about one-half of the school time to the teaching of tool subjects—subjects of little educational value in themselves, but educative only in their applications. It is not reading that educates, but *what* one reads. . . . Perhaps the most hopeful sign of the times, so far as rural education is concerned, is the consolidated school. In the west the consolidated school has been almost invariably an unqualified success. In Ontario it has failed almost as invariably. When the reasons for this are closely investigated, it is found that the smallness of the school section has most to do with it. . . . But consolidation in Manitoba, Saskatchewan and Alberta has resu^{ed} in the following permanent benefits: (1) Better school facilities, even with the added cost of the transportation it involves; (2) the employment of several teachers, the enlargement of classes, and the better grading of the pupils; (3) the development of manual and domestic training, school gardens, courses in agriculture, and school libraries; (4) the safeguarding of the health of the children by proper methods of transporta-

tion; (5) the employment of better teachers at bigger salaries (chiefly owing to the relief from rural isolation); (6) the development of a more intelligent interest in education among rural school communities, and the willingness of the bigger men to serve as trustees. Transportation and consolidation have, in a phrase, brought the benefits of an urban education to the doors of rural communities, without sacrificing that which is distinctively rural and best in rural life. . . . No country with a 'foreign' immigration can be wholly free of the bi-lingual problem in her schools, and Canada is no exception to the rule. Further complications arise through the presence of the French-Canadians, who cling most tenaciously to their language and customs. As the French-speaking people settle in solid units in various parts of Canada, they introduce the language problem wherever they go. . . . So far, . . . as schools in provinces other than Quebec are concerned, the French population can only claim rights to their language where such are given by a provincial education department through its regulations. . . . Alien languages, . . . as far as Canada is concerned, may be kept alive in the home and in the church, but not in the public schools. . . .

"No branch of Canadian educational effort deserves greater praise than that which is concerned with the academic and professional preparation of the teaching staff for elementary schools. . . . The ideal set before the country is that of a qualified teacher (or teachers) for every school. The teacher on permit or temporary licence is, therefore, a last resort. . . . Teachers may conveniently be classified according to the professional certificates which they hold. Besides teachers with provisional or limited certificates, teachers with first, second, or third class certificates are found in every province. As the country develops, the number holding only third class qualifications tends to diminish; those holding second and first to increase. . . . Ontario has a highly developed system of secondary schools. Continuation schools, high schools and collegiate institutes, as well as night high schools, are found there. Continuation schools are really rural high schools [with separate buildings, and independently staffed]. They can be organised only in districts which are not already served by high schools. The staff never exceeds three, and may be as few as the equivalent of one and a half full-time instructors. Only a general course of study may be attempted. . . . The normal age of transition from the elementary to the secondary is fourteen. Some educators believe that the change is made too late. They observe that in his studies the French or German graduate of a secondary school is about two years in advance of the corresponding Canadian or American boy. This is not to be wondered at. The European pupils has had nine years of secondary education, the Canadian only four. It is now believed that the time is mainly lost between the ages of twelve and fourteen. For pupils of these ages, be the intentions of educators and teachers ever so worthy, the school work becomes mainly a repetition of that which is done in the lower grades. The arithmetic, composition and geography are admittedly more advanced, whereas the European boy has exchanged these studies for algebra, geometry, foreign languages and sciences. As a matter of fact, fourteen is too late in life to make the transition from elementary to secondary studies. The transfer should not take place during the storm and stress of

adolescence. At that time pupils have already too many adjustments to make; why add those due to a new school environment? The change should be made not later than twelve, preferably at eleven or even at ten years of age. Further, no person can master foreign languages properly, either ancient or modern, who begins them as late as fourteen. . . . The standard secondary school of Canada is the high school of independent organisation with a four years' course of study. In a few sections of the Dominion, high schools with a six years' course have been developed. In others the high school is attached as an additional department to an existing elementary school, when the number of high-school pupils has grown sufficiently to warrant it. . . . The qualifications demanded of high-school teachers are, on the average, very high. The principal must hold a principal's or a first-class teacher's certificate, together with a degree from a Canadian or other approved university. The assistants must hold a high-school assistant's certificate, and in the collegiate institutes of Ontario a certain number of the staff must be holders of specialists' certificates as well. . . .

"Canadian education, especially on the vocational side, owes a great deal to the far-sightedness and generosity of the late Sir William C. Macdonald of Montreal. In brief, the aim of this benefactor was the uplift of rural communities through the reorganisation of rural education. Drawing, nature study, experimental science, manual training, agriculture and household science were either to be freshly introduced or to receive a new emphasis. . . . In 1899, the Macdonald Manual Training Fund was instituted. Manual training centres were organised in connection with the public schools in twenty-one places in all parts of Canada. These were guaranteed maintenance for a period, in most cases, of three years, and the pupils paid no fees. Teachers, specially qualified in manual training, were at first brought over from England, but, as time went on, Canadian teachers were trained in the subject. . . . The next project was to improve seed by careful growth and selection. A prize fund of \$10,000 was set apart, to cover a three-year period. Prizes were given to boys and girls who best selected the largest heads of the most vigorous plants, and grew seed from those heads on specially tended plots. . . . As a result of this activity, the crop yield of spring wheat in 1903 showed an average improvement of 18 per cent. in the number of grains per hundred heads, and 28 per cent. of increase in the weight of grains per hundred heads over that of 1900. The results from oats were equally encouraging. Out of this grew the Canadian Seed Growers' Association, which has done such marvellous work in connection with the improvement of the size and quality of the kernels, the even maturing of grain, the adaptation of varieties to suit local conditions of soil and climate, the purity of varieties and strains, the development of resistance to diseases, and the increase of productivity throughout the whole Dominion. Next in order came the Macdonald Rural Schools Fund, through which school gardens were established at each of five rural schools in each of five provinces. The cost of maintaining a peripatetic teacher, who taught nature study and superintended the gardens, for each group of five schools, was borne by the fund. The pupils were shown the value of seed selection, the rotation of crops, and the protection of crops against weeds, insects and disease. As a result of these demonstrations,

flourishing school gardens and school fairs sprang up in every province of the Dominion. . . . Having paved the way in these comparatively humble fashions, Macdonald next [endowed] . . . [the Macdonald Institute at] Ontario Agricultural College, Guelph, to train teachers. . . . Lastly, [he] established the college which bears his name at St. Anne de Bellevue, near Montreal, . . . incorporated with McGill University. . . . There are three departments, (1) the school of agriculture, (2) the school of household science, and (3) the school for teachers. . . . Considerable space has been given to the Macdonald Movement, for in it we find not only the origins of much that is best in Canadian education, but also the germs of many present-day vocational activities."—P. Sandiford, *Comparative education*, pp. 364, 366, 369, 386, 387, 402, 404, 412, 418, 420.—In 1921 a new Vocational Education Act was passed (by Ontario) and came into force on July 1. The new Act applies to home making schools and departments, Agricultural High Schools and departments, and Commercial High Schools and departments, in addition to the courses controlled by the former act. Day or Evening Schools may be organized. The Day Schools are designed to give a thorough training in the essentials of a general education as a basis for citizenship and vocational efficiency and at the same time to furnish specialized training in the subjects and operations which are fundamental to trades, industries and commerce. "The Evening Schools are for workers. The schools are liberally supported by Government grants. The school year extends from September to June."—*Canadian Almanac*, 1922, p. 453.—See also CANADA: 1905; 1912-1916; EDUCATION, ART: Modern period: Canada.

China: Changes after the Boxer rising.—Curricula.—Free education after 1912.—"After China had been humbled, [by the Powers, for the Boxer rising] the program of educational reform was again adopted. . . . Modern education progressed by leaps and bounds; and in the midst of reform came the Russo-Japanese War, which induced even greater efforts. The cry of the time was: What Japan has done, China can and will do. . . . While the earlier decrees provided for the official recognition of the graduates of modern schools, and for the modernization of the traditional school, those of 1905 abolished the old system of examinations and the old style school as well. . . . In 1903 a commission was appointed to devise a detailed plan for a national school system, and from 1905 to the end of the Manchu dynasty in 1911 there was an abundant issue of memorials, edicts, regulations, etc. . . . While many of these became immediately and truly effective, many others were never fully realized. . . . Even so the actual results appear truly remarkable considering the difficulties and the size of the problem. . . . A ministry of education was created . . . [and] assumed the educational functions previously assigned to the ministry of rites. . . . Whereas before the revolution the responsibility of establishing primary schools was not placed upon any specific authority, the new administration definitely assigns this duty to cities, towns, and villages. The establishment of middle schools is left to the provincial authorities; and, for the first time in Chinese history, middle schools for girls are specifically provided for on the same basis as those for the

boys. Higher primary schools may be established only after a sufficient number of lower primary schools have been provided. . . . The normal schools aim to train elementary school teachers; the higher normal schools, teachers for middle and normal schools. Normal schools are established by the Provinces; while provincial higher normal schools are supported from the national treasury. An elementary school is attached to each normal school, and each higher normal school has one elementary school and one middle school attached to it. Normal schools for girls have kindergartens attached. . . . Curricula changes have included the elimination of Chinese classics as a subject in itself and the introduction of new subjects of study having a social and industrial significance. The scheme in force is as follows: *Lower primary school* (four years).—Morals, mother tongue, mathematics, handwork, drawing, singing, and physical culture. Sewing for girls. Handwork is made compulsory. *Higher primary school* (three years).—Morals, mother tongue, mathematics, Chinese history, geography, physical science, handwork, drawing, singing, and physical culture, with agriculture for boys and sewing for girls. English or another foreign language may be added. *Middle school* (four years; only one course).—Morals, Chinese language, foreign language, history, geography, mathematics, nature study, physics, chemistry, government, economics, drawing, handwork, music, physical culture. *Girls' middle schools.*—Household arts, gardening and sewing are required; one hour less per week in each year being required than in the case of boys' middle school."—C. K. Edmunds, *Modern education in China*, (*Bureau of Education, Bulletin no. 44*, 1919, pp. 10, 11, 12, 16, 17).—"The advantages of the new education are so apparent that it requires but a cursory examination to show that the schools of today are infinitely superior to the home-study method. . . . Under the old method there was no 'lai wang' or intercourse with young people and consequently the boy grew up with the ideals of his elders. He was denied a natural boyhood. He never learned how to play. His ideals were narrow and he had no opportunity for self-expression. But with the organized school there came a school life and spirit which gave the student new ideas about society. The fellowship, games and entertainments in which he participates today are broadening his outlook and giving him a new view of life. The importance of the middle school in the life of the nation cannot be overestimated. Students in these schools are from fourteen to twenty years of age—the most plastic period of their lives. . . . The hopeful aspect of the educational situation in China is that the government has continued to support the schools."—F. B. Lanz, *Glimpse at China's middle schools* (*Educational Review, Jan.*, 1920, pp. 58-61).—Free education in China dates from the establishment of the republic in 1912. Since then remarkable progress has been made in all branches. "Already there is a bureau of education in every province, while official educational offices are found in each district. . . . Under the old empire . . . the Government directed an elaborate system of examinations in private schools, or with the aid of tutors. The Government provided an elaborate system of stone cells in which the examinations were carried on. It is significant that the famous stone cells, which have been used for centuries, have been abandoned in the past few years, and practically all of them destroyed. . . . China to-day

has six teachers' colleges, one of which has 400 students. These institutions are modeled after Teachers College, New York, and in several cases are directed by graduates of that institution. From these colleges hundreds of teachers are regularly sent forth to the public schools of China, who will, in turn, introduce new methods of education and new standards of efficiency. The Chinese school courses, as might be expected, are modeled largely on American lines. There is a well-developed Kindergarten system in China; but the education of the children begins, however, with the lower primary schools. As in America, this course covers four years, and is followed by a higher primary course of three years. After this comes a middle secondary section of four years, and then a six years' university course. The standard obtained in these schools is, for the most part, surprisingly high. The American influence in education in the schools has developed school and college athletics in every close imitation of American practices. . . . [This] incidentally, is having a tremendous influence on Chinese character. The students entering new schools, for instance, often have the ancient prejudice against doing any manual work. Their clothes are cumbersome and their fingernails are long and pointed. The school authorities have not tried to combat the prejudice of the centuries, but ingeniously introduced American football. The game proved so popular that the ancient robes and long fingernails have quickly disappeared. The Chinese are devoting special attention to instruction in the practical arts. The agricultural schools, which are largely based on American institutions and are usually directed by Americans, are extremely popular. Chinese girls in great numbers are receiving practical instruction in household arts. The newest ideas in management of the home, as developed in American schools, are being taught by American teachers or by Chinese teachers with American training. . . . The extent of the educational organizations of China comes as a surprise to the layman."—F. A. Collins (*New York Times*, Apr. 3, 1921).—See also CHINA: 1918 (November); WOMAN'S RIGHTS: 1900-1921.

Cuba: Primary schools.—Treatment of the poor.—Specialized education. See CUBA: Education.

Denmark: Compulsory education.—Secondary and trade schools.—"Administrative boards representing both the church and the state exercise control and supervision over the schools of Denmark. The State adopts the regulations governing programs and courses, the length of the school year, and the distribution of the vacations; it provides the facilities for the training of teachers, passes on petitions for grants and subventions, and attends to the general management of all the economic matters of the school. In the several communes, local school matters are dealt with by parish commissions. In the cities the commission consists of the pastor, the mayor, and two or three lay members; in the rural districts it is made up of the pastor and one or two lay members. Through these authorities the communes exercise a degree of supervision and inspection that in other countries is usually vested in officials of the State. Immediately above the parish boards stands the county council with its school direction, whose chief function is to appoint teachers from lists supplied by the parish and to have charge of the apportionment of teachers' remuneration and pensions. . . . The first compulsory school law was passed in 1814. As modified by later enactments now in effect,

it requires children to attend from 7 to 14 years of age, the period comprised in the elementary school. In the event of privation or sickness prevailing in the home, a pupil may be excused from attendance at school. . . . These regulations have been so strictly enforced that there is virtually no illiteracy. A careful record of absences is kept and reported, and when they are not accounted for in a satisfactory way fines are collected. . . . The length of the school year is 41 to 46 weeks, about 246 days. The local board determines the proportion of whole and half days per week in the district, often making it four whole days and two half days in winter, and three whole days and three half days in summer. The number of hours required per week is a minimum of 21, not counting gymnastics, drawing, manual training, sloyd, and household work for women. The regulations also fix the maximum number of pupils in a class as 37 for schools in the country and 35 in the city. At the age of 11 the pupils may enter on a four-year course in the intermediate school (Mellem-skole) with one year extra for those who desire to prepare for the modern school (realskole) examination, which admits the pupils to the gymnasium. The gymnasium offers courses along three lines: The classical, the modern language, and the mathematical-scientific. School reforms now under consideration propose to reduce these lines by the omission of the classical, including its subjects under one of the two remaining ones. The same trend in the secondary schools moves in the direction of giving more time to the study of English and German by omitting Latin. . . . There are 48 gymnasia, of which 8 offer all three lines, 29 offer 2, and 11 only 1. The total number of secondary schools in 1912—commercial, private, and State—was 218, of which 146 were coeducational, while 32 were exclusively for boys and 40 for girls. Tuition in the intermediate school is 120 crowns per year; in the gymnasium it is 150 crowns. In response to the demand for practical training for those who have completed the elementary course, a number of trade schools, continuation schools, and evening schools have sprung up. As the pupils of these are generally wage-earners, many trade schools have the schedule of hours so arranged that a pupil may take up selected studies without discontinuing his regular employment in the factory or the shop."—P. H. Pearson, *Schools of Scandinavia, Finland and Holland* (Bureau of Education, Bulletin no. 29, 1919, pp. 41-43).—See also EDUCATION, AGRICULTURAL: Denmark.

Egypt: Educational system. See EGYPT: 1901-1922.

England: Act of 1900.—Change in the school-leaving age. See ENGLAND: 1900 (February).

England: Primary and secondary schools.—Education Act of 1902.—Bill of 1906.—Commercial education.—"The teacher in English schools, and especially the head teacher, has far greater freedom than in any other country. The headmaster is invariably 'captain on his own deck.' In secondary schools the appointment and dismissal of teachers is largely in his hands; in both elementary and secondary schools, with the assistance of his staff, he frames his own curriculum and makes his own time-table. The Board of Education offers suggestions of various sorts, but if a teacher can produce a better scheme than the Board it is accepted without demur. Even experimentation in new methods of teaching and in the organisation of new departments within schools receive the official and financial encourage-

ment of the Board. England seems to fear one thing, namely, that the teaching shall present a deadly uniformity throughout the country and be unrelieved by the faintest spark of originality. . . . With the exceptions mentioned below every child in England who is physically and mentally fit is compelled to attend school between the ages of five and fourteen years. Children may be educated at home if the parents can prove to the satisfaction of the education committee that they are receiving an adequate education under skilful tutors. Every school in order to receive recognition for the earning of government grants must be in session 400 half-days per year. Each session must be of two hours' duration at least. As a matter of fact, most schools are open each year for 42 weeks (420 half-sessions), each week for 5 days, and each day for 5½ hours. Thus normally each child attends the elementary school for 210 days for each of nine years. The attendance of children from three to five years of age is also permitted, although discouraged by both central and local authorities. When the high average attendance (88 to 90 per cent.) is taken into account, it will easily be seen that English children spend a good deal of time in school. . . . A widespread system of part-time attendance spoils this rosy picture. . . . Compulsory attendance of children at school found its humble beginnings in the educational clauses of the Factory Acts of 1833 and 1844, which required children to attend school half the day on so many days per week. Half-time attendance at school was thus inaugurated as a sort of compromise. . . . The first Elementary Education Act, 1870, firmly established the system of half-time employment with half-time attendance at school. Under this act partial relief from compulsory attendance at school was granted to children between the ages of ten and thirteen who had reached a certain standard of education. . . . Exemption may still be obtained by passing a 'labour examination,' varying in difficulty from that of standard III. to that of standard VI., while since 1899, 300 attendances (morning or afternoon sessions) for each of five preceding years, not necessarily consecutive, have also sufficed for half-time exemption between twelve and fourteen years, and 350 attendances for full-time exemption between thirteen and fourteen. . . . In every country with a highly developed system of education there seems to be a general leaving age of fifteen for pupils who can continue their education beyond the minimum provided by the elementary school. . . . England began to solve this problem by introducing modern language, science, and mathematical courses into the higher classes of picked elementary schools. . . . Higher elementary schools are designed to provide an advanced higher elementary education for pupils from twelve to fifteen years of age. In certain special cases a fourth-year course is permitted. The curriculum must include a progressive course of study in English language and literature, in elementary mathematics, in history and geography, and provision must be made for special instruction bearing on the future occupations of the scholars, whether boys or girls. . . . Central schools have a commercial or industrial bias, or both, depending upon the character of the district in which they are situated. The commercial course seems to be the more favoured, probably because the graduates can immediately enter commercial houses without further preparation. In this course the branches studied include a foreign language (generally

French, though Spanish would be far more useful), science, including laboratory work, drawing, handicraft for boys, housecraft for girls, shorthand, bookkeeping, typewriting, English, history, geography, mathematics, singing, and physical exercises. In general the pupils are not specifically trained to be clerks or stenographers for fear of exploitation by the commercial world, but underlying principles are taught which have wide application in commerce and transportation. The content of the subjects is modified to suit the probable vocations of the pupils, and the practical side of the studies, especially in mathematics, drawing, and the foreign language, is emphasised. . . . Pupil-teachership still survives. The pupil-teachers are no longer indentured to a master, but to an educational committee. The period of apprenticeship has been reduced, step by step, from five to two years (except in rural districts where it may still be four years), while the age of entrance has been gradually raised from thirteen to sixteen years. . . . Training colleges when first established in England about 1840 were voluntary institutions organised and controlled by religious denominations. . . . With the growth of the virile provincial universities in the latter half of the century a demand arose for the extension of the facilities for university education to the elementary teacher. The Cross Commission in 1888 recommended the introduction of day-training colleges attached to some university or college of university rank. The code of 1890 carried out the suggestion, since when day-training colleges have multiplied rapidly. . . . [In 1914 England and Wales possessed 85 training colleges.] The English public schools, especially the nine great public schools—Eton, Harrow, Rugby, Winchester, Westminster, Charterhouse, Merchant Taylors, Shrewsbury, and St. Paul's—enjoy a world-wide reputation. In spite of many patent defects they have made a unique contribution to education, and are at once the envy and despair of many countries affecting to despise them. Of first-grade schools there are about sixty. . . . The public schools are invariably boarding-schools, though few are exclusively so, since boys from the immediate neighbourhood of the school are admitted as day pupils. The curriculum still remains predominantly classical, although since Arnold's reforms the sciences, mathematics, and modern languages have received a fairer share of attention. . . . The grammar schools for boys are for the most part endowed schools of old foundation. They are generally publicly managed and exhibit the traditional spirit of the public schools. What distinguishes them from the latter is the fact that, being day schools, they take on a local tone and character. They are cheaper and less exclusive than the public schools. They are also far more numerous."—P. Sandiford, *Comparative education*, pp. 187, 215, 216, 219, 220, 226, 229, 257, 258.—See also PUBLIC HEALTH: Great Britain.

The Act of 1902 empowered the nationalization of the Voluntary schools in England and Wales, and provided that public elementary schools should be managed by a board of managers appointed partly by the county council, partly by the local council, or, in the case of foundation schools, by a board of managers, appointed partly by the foundation managers, partly by the County Council, and the Local Council. Nonconformists objected to the law on the ground that it swept aside the local education boards, in favor of managers to be appointed by the county councils; that maintenance of denominational schools (apart from their fabrics) was thrown on the general public, who,

under the managerial system, would have no real control over any school, and that, in effect the law amounted to a new endowment of the Church of England. The Bill became law in December 1902, and was followed by "passive resistance" on the part of Nonconformists, many of whom allowed themselves to be imprisoned or their goods seized and sold for non-payment of rates. In Wales, county councils refused to put the Act into operation, and accordingly the Welsh Coercion Act of 1904 was passed. Its effect was small, however, for a new plan was devised by which every proceeding under the Coercion Act would be met by the resignation of county education committees and Managers of National Schools. The defeat of the Conservatives and Unionists in the Parliamentary elections of January, 1906, was ascribed very largely to popular dissatisfaction with the Education Act of 1902. Hence, on the resignation of the Balfour Ministry and the call of the Liberals, under Sir Henry Campbell-Bannerman, to the administration of the Government, the new masters of legislative authority were held to have received a mandate from the people to amend the objectionable law. On the 9th of April (1906) a Bill to that end was brought forward by Augustine Birrell, President of the Board of Education, and again the old disputes over denominational religious teaching in schools supported by the public at large were re-enlivened and reheated, in Parliament and out. In December it passed the House of Commons by a majority of 192, and went to the Lords. In the framing of the Bill it had been assumed that the overwhelming majority which swept the new Government into power had determined that the following principles should be enacted into law: 1. Unification of the public school system. 2. Complete local control where public funds are received. 3. Abolition of religious tests for teachers. In the House of Lords the Bill came under the Church influences which had dictated the Act of 1902, and it was slashed with amendments which would totally reverse its operation on all the controverted points. That procedure killed the measure, of course.—See also ENGLAND: 1906 (April-December).

"Secondary schools as a part of the government system have recently made their appearance. Up to 1902, approximately 5,000 boys and girls who had completed the work of the public elementary schools, were provided through scholarships with opportunity to secure secondary school training. By the Education Act of 1902, the local authorities were directed to advise with the Board of Education to the end that greater facilities for secondary education might be provided in their locality. In some places, these authorities have organized new schools for this purpose, and in others, grants have been made to schools already in existence, or scholarships have been awarded in them. Almost to a school, the practice of charging tuition, though the amount varies, is common. Such schools as are on the grant list, are legally required to hold 25 per cent. of their sittings free from tuition charges for qualified pupils from the public elementary schools. In 1912, there were 55,703 such pupils in attendance—a rather remarkable growth in the course of one decade. . . . The growth of secondary schools for girls of England also has been confined largely to the last fifty years [written in 1918]. Such schools were originally founded for the girls of the middle class. There are at present four types of secondary schools for girls; the private school which may be day, boarding, or both; the expensive boarding school with equipment, curriculum, prestige, and

the like after the manner of the Great Public Schools for boys; public secondary schools of first grade which prepare for college; and public schools of secondary grade which prepare for business, home life, and elementary school teaching positions. On the whole, the girls in England are about as well taken care of with respect to opportunities for securing secondary education as are the boys."—G. L. Jackson, *Privilege of education*, pp. 106, 127.—"The training of leaders in commerce is . . . a recent development that has taken place with the creation of local universities since the beginning of the present [twentieth] century. Situated as all of these are in industrial and commercial centers and free from the restrictive traditions of the older universities, the newer universities have proved to be more responsive to local needs. The following universities and university colleges have instituted faculties of commerce or commercial courses leading to the degrees or diplomas: Birmingham, Durham, Leeds, Liverpool, Manchester, Nottingham, Reading, Southampton, and institutions in London like the Birkbeck Institute and the London School of Economics. The courses require three years of study for the bachelor's degree and an additional year for the master's, while diplomas are granted after two years' work. The courses are conducted in close connection with the faculties of economics, and in the University of London, where there is no separate faculty of commerce, the examinations and degrees are offered in the faculty of economics. In all cases advisory committees, representing local chambers of commerce, education committees, bankers' and accountants' associations, assist the university faculties. The courses include political economy, geography, modern history, modern languages, the organization of industry and commerce, accounting, banking and exchange, methods of statistics, commercial law, and in some cases a science applicable to manufactures. . . . The statement of purpose of the faculty of commerce in the University of Birmingham may be applied to all. This is 'to furnish a systematic training, extending over a period of three years, for students who look forward to business careers. In planning the course of instruction two objects have been kept in view—(1) the combination of liberal culture with utility; and (2) a due regard for the different requirements of different branches of commercial life.'"—I. L. Kandel, *Commercial education in England* (*School and Society*, Apr. 15, 1916, pp. 547-548).

England: Art instruction. See EDUCATION, ART: Modern period: England, Ireland and Scotland.

England: Fisher Act of 1918.—"The Education Act, introduced by Mr. H. A. L. Fisher [minister for education] in 1917, the passage of which was delayed for almost a year, is one of the important achievements of the parliamentary session [of 1918]. The Education Act of [Aug. 8] 1918 is one of the most significant and far reaching of the war measures which necessity has imposed upon the nation. Its object is 'the establishment of a national system of public education available for all persons capable of profiting thereby.' It confers many new powers and imposes many new duties on the existing education authorities, and provides for the banding together of these authorities in federations, for the purpose of dealing with matters which can be more conveniently considered in relation to larger areas than those covered by the present authorities. It gives power to the authorities to provide nursery schools for children from the age of two years old; it imposes the duty of organising advanced instruction in elemen-

tary schools for children over the age of fourteen and of providing practical instruction in these schools or in central schools or classes; it requires the authorities to co-operate for the purposes of secondary education and for the purpose of supplying and training teachers. Beyond the elementary courses, it is now the duty of the authorities to provide free continuation schools, supplying suitable instruction and physical training for all young persons in their areas, and the authorities may also provide holiday or school camps, physical training centers, playing fields, swimming baths and centers for social and physical training for young persons and persons over the age of eighteen attending any of the educational institutions. The authorities thus have powers for providing means for the physical, intellectual and moral training of citizens from the earliest to the latest age. Medical inspection and treatment may be extended to all educational institutes, . . . and board and lodging may be provided near to a school for children living in remote areas. The age up to which a child must attend school . . . [is fixed at] fourteen, and an authority may extend this age to fifteen by bye-law, whilst, with the consent of the Board of Education, instruction may be continued to the age of sixteen or later, if the circumstances warrant such a course. After seven years from the appointed day, attendance at continuation schools will become compulsory on young persons between the ages of sixteen and eighteen subject to certain exceptions; in the meanwhile, young persons up to the age of sixteen must, subject to exceptions, as from the appointed day, attend for three hundred and twenty hours in each year unless this number of hours is reduced by the authority. Further severe restrictions have been enacted with relation to the employment of children and young persons, and the employment of a child in a factory, workshop, mine or quarry as defined in the Act, is forbidden altogether except in the case of a child who was lawfully so employed on the appointed day. Private schools, for the first time, are recognised as coming within the sphere of the administration of public education, and information with respect to such schools must be forwarded to the Board of Education within three months of the appointed day. Such schools may, if it is so desired, benefit by the medical inspection and treatment provided by the local education authority of the area, and may have the advantage of inspection by the Board of Education, and a report on such inspection free of charge to the governing body or headmaster. In non-provided schools, pupil-teachers and student-teachers are now to be appointed by the local education authority, and the managers of such schools may not close the school without giving eighteen months' notice to the local authority. . . . It will be seen, from this outline of some of the changes effected by the Act, that new and increased duties of vast importance have been placed upon the local education authorities of the country; that these are now brought into possible relation with the whole of the educational activities of the nation, and that it is upon these authorities that the legislation depends to carry into effect the many reforms embodied in the Act."—A. A. Thomas, *Education Act, 1918*, pp. xiii-xvi.—"Unhappily . . . some of the most important reforms that were to be secured by the Education Act of 1918 are to be shelved for a time, and several thousands of young people who should have been attending continuation schools will suffer for the remainder of their lives from the snatching away from them of the opportunity of an education that they so urgently

need."—H. W. Horwill, *Problems of local taxation in England (Political Science Quarterly, Dec., 1921, p. 571)*.—See also CHILD WELFARE LEGISLATION: 1918-1921.

Finland: Infant schools.—Folk schools.—Religious instruction.—Secondary Education.—Law of 1920.—"The most amazing thing about the people of Finland is their education, [and this] in spite of the fact that national education is of comparatively recent growth. In 1900, amongst Lutherans, (98.14 per cent. of the population) only 6 per cent. of those of fifteen years of age and under were illiterate. Taking the whole population of the country illiterates compose only 1.2 per cent. . . . [Infant schools, (lower folk schools)] plentiful in towns, began to appear about 1910 in the country where, previous to that time, the clergy generally superintended the education of very young children. The schools are under the National Education authority, subject to the ecclesiastical Department of the Senate, and are managed by local, popularly elected bodies. Pupils enter the Folk Schools for the four year course at the age of nine or ten, and are taught reading, writing, arithmetic, geography, natural sciences, drawing, singing, gymnastics, manual work. Religious instruction is given by the clergy. [In 1908 there were 2,663 schools in the country districts, as opposed to 457 in 1880.] The primary pupil may also go to what is called a Higher Folk School, which is state supported, and where instruction is specialized, great attention being paid to agriculture. Teachers for these schools undergo a four years' course of training at seminaries, of which there were eight in 1905. [For secondary education, the principal state supported school for boys is the lycéé, with an eight year course. Entrants must have had two years at a primary school, or their equivalent.] There are three kinds of lycéé—the classical, the modern, . . . and the normal . . . [the latter—also divided into classical and modern sections to train high school teachers]. Finland has its bi-lingual troubles, and to meet them something under a third of the lycéés are predominantly Swedish. For girls, there are state supported high schools with a five year course, followed, in Helsingfors, by continuation classes, three years, which take the pupils to the university. Private schools—state assisted—play a very important rôle. . . . There are, too, industrial, art, agricultural and forest schools."—G. Renwick, *Finland to-day*, pp. 227, 228.—The compulsory school law of 1920, provides that: "If the child has not reached the requisite standard of knowledge, attendance must be continued until the age of 14. The first or lower course extends over 2 years, and 4 years should be devoted to the second or higher course. The law provides that *throughout the country districts* continuation schools shall be opened for a minimum of four hours a week during 25 weeks for children who have attended primary schools which are unable to offer instruction for the statutory period of attendance. For such children attendance at the continuation school is compulsory. This applies especially to districts where the density of the population is less than three inhabitants to the square kilometre. It is enjoined upon communal authorities that in building new schools the demands of sparsely populated districts for educational facilities should be taken into consideration

and that wherever possible such districts should be grouped, so as to minimise distance difficulties which might exclude children from the benefits of public instruction. In districts where there is but one teacher to serve two schools the child's attendance may be reduced to 18 weeks. On the other hand, in a school where both the higher and lower courses are given by the same teacher 40 weeks' attendance may be required of the pupils."—*Control of employment of children (International Labor Review, Nov., 1921)*.—See also EDUCATION, ART: Modern period: Finland.

France: Advance in education.—Curricula.—L'art à l'école.—The whole system of education in Modern France is a unit, controlled by the ministry of Public Education. "In thirty-three years the illiterate have fallen from 18.03 per cent. to 4.26 per cent.; apart from this there is a vast effort made to keep pupils in touch with the schools after they leave them. (In addition there are evening schools which in 1908-09 numbered 31,637.) The Republic recognises the birthright of every child to a common education, and everything is done to help him to secure it. If he is prevented from attending school because he is shoeless or because he has inadequate food, the town is bound to provide the imperative needs. . . . The government [also provides] for the special instruction of abnormal or backward pupils. The teaching itself has been raised from scant ability to read and write a little arithmetic, history and the catechism to a standard equal to the best in any country. The branches taught are morals and civics, reading and writing French, elements of French literature, geography, history, elementary principles of law and of political economy, drawing, modeling, music. Twenty-five thousand schoolhouses have been built or rebuilt. From 1875 to 1905 the number of primary schools increased from 71,000 to 82,488, the number of teachers from 110,000 to 157,000, and the pupils from 4,716,000 to 5,654,794. The secondary schools have not undergone such a profound transformation as the others, but, as a whole, they have never been better or more numerous. The pupils . . . [had] increased from 129,000 to 195,000 [in 1913]. . . . [The] tendency to isolate the pupil from house and society is growing less . . . and the school tends to become life. The best school is not only the one in which the students stand high at examinations but the one in which they lead the best life. . . . The curricula without breaking all connection with Latin and Greek have been thoroughly modernized and German as well as English has . . . an important place. Recognizing the disciplinary and cultural value of the ancient classical languages, educators have made it possible for students . . . to acquire [the classics] in the latter part of their course. . . . Sciences have a place that is growing more and more absorbing. Philosophy is required for all complete secondary studies. The movement . . . [for the education of women] has acquired considerable momentum. . . . In 1906 there were 41 lycées and 68 other institutions giving to women a partial secondary education. . . . In 1903, 3,500 young women had matriculated in the universities. Numerous schools for women were created to prepare an efficient corps of primary teachers, and one was established at Sèvres to give the professors of secondary institutions for girls the high training which they need. . . . Sèvres lacks only the classics to make its work the best given to women anywhere. . . . What has been changed more than all else is the spirit of education. It is no longer the storing of the mind with abstract

formulae. . . . It is the free cheerful development of the child along the line of experience and reason, respecting and trusting his undeveloped powers. . . . It embodies all the best suggestions of psychologists . . . as well as those of the great contemporary educators. Its aim is no longer knowledge but the possession of what Fouillee called *idéés—forces*, which translate themselves into character."—J. C. Bracq, *France under the republic*, pp. 76-77, 79.—"At the close of the compulsory age period, further instruction is provided for two or three years in the higher primary schools. As in the German continuation schools, the higher primary continues the work of the primary school, and gives it at the same time a practical aspect. For those who because of employment are unable to attend the higher primary schools, evening schools are maintained which give specialized instruction based on the industries which are common in any particular locality. Schools of agriculture which charge a tuition fee, and schools for manual apprenticeship which are free, are open to those who have finished the elementary school course. . . . It is possible at about the age of ten to transfer from the elementary school to the *lycée* or the *collège*, as in Germany, but it is not the customary thing to do. The secondary schools have their own preparatory department, and children of a social status that takes for granted the pursuit of higher education attend these rather than the public elementary school. Individual bent is recognized in French secondary schools, as in the United States, by offering a large number of subjects within one institution rather than differentiating types of schools as in Germany. The French system differs from our own, however, in that students choose *courses*, but choice of subjects within the course chosen is very limited. Ordinarily, girls expecting to attend secondary school, as is the practice with the boys, enter an elementary school in connection with the *lycée* or the *collège*. The secondary schools for girls offer a course five years in length, which is two years less than that offered to boys, though since 1909 [written in 1918], some *lycées* extend the course so that girls may prepare for the universities. These are open to women on equal terms with the men."—G. L. Jackson, *Privilege of education*, pp. 98, 99.

"An important innovation in France is that of *l'art à l'école*, or art teaching in common schools, whereby is cultivated the love of beauty so especially needed by the masses. . . . This education also has been so decidedly differentiated as to adapt it better to the practical every-day life of French youth. There have been opened schools of apprenticeship, normal schools of cutting and fitting for girls, and important professional schools. There have been founded or transformed more than three hundred schools of design and decorative art. In Paris these schools contribute greatly to the superiority of taste and form visible in most of the fine goods made in that city. In many places the technical character of the schools is determined by local industries. In Roubaix . . . with tapestry, in Limoges with ceramics, in Nice with domestic decorations, in Rennes with sculpture, and in Calais with lace. More than 100,000 pupils attend these schools."—J. C. Bracq, *France under the republic*, pp. 77-79.—See also EDUCATION, ART: Modern period: France.

Germany: Under the empire.—"One Prussian school is much like another, and taking the German Empire as a whole it may be safely said that no such great differences would be found between

any two German schools as, for example, there exists between two schools in London or Manchester. This ideal means uniformity of standard, but it does not imply a high standard. . . . For purposes of instruction the Prussian elementary schools are still [1918] organised under the regulations of 1872. The schools, no matter what the number of grades may be, are divided into three sections: the lower, including the first three years of school life; the middle, covering the fourth and fifth years; and the upper for the last three years. . . . The curriculum includes . . . religion, German (including reading, writing, spelling, grammar, composition, and literature), arithmetic, geometry, 'real subjects' (*Realien*, including geography, history, and elements of nature study and natural science), singing, drawing, physical training for boys, and handwork for girls. The major part of the time is devoted to religion, German, and arithmetic. . . . The pupils are not expected to acquire an extensive knowledge of the subjects of the curriculum, but the little that they do learn they must learn well and be ready to produce when called upon. To save time the teacher furnishes the material to be studied. The pupil is not given a text-book and told to prepare a lesson for the next recitation. . . . Instead, the teacher presents the subject-matter and the pupils reproduce it. . . . The pupils are not expected to ask questions, since it is the function of the teacher to prepare his lesson in such a way that all difficulties are anticipated. With the exception of a general reader few books are employed. . . . The total number of elementary-school teachers in Prussia in 1911 was 117,162, of whom 92,406 were men and 24,756 were women. Prussia has always tried to retain men in the profession. . . . The course of training in Prussia and in most of the German states lasts six years. . . . The preparatory institutions give a course of three years to boys who have passed an examination, written and oral, in the subjects of the elementary school. . . . At the close of the three years' course the pupils on passing the leaving examination are qualified to enter the normal schools. . . . The first two years of the normal-school course are devoted to academic training and the theory of education, the last year is almost entirely professional. With the exception of a modern language, French or English, and agriculture the subjects of the curriculum are merely an expansion of the subjects of the elementary school. . . . The Prussian intermediate school (*Mittelschule*) is not an intermediate institution. It corresponds to the French and English higher primary schools. It is intended to furnish a somewhat more intensive study of the subjects of the elementary schools, especially in science and history, with the addition of a foreign language. Established originally under the *Allgemeine Bestimmungen* of 1872, this type of school . . . [was] reorganised under new regulations, issued in 1910 to prepare boys and girls to meet the new demands in trade, industry, and the fine arts. The school is organised on the basis of a nine-year course, the first three of which may be given in an ordinary elementary school. Pupils may thus be transferred to the *Mittelschule* proper at the age of nine and are expected to remain until they reach the age of fifteen. . . . The teachers are required to have passed the examination to qualify for permanent appointment in an elementary school and a special examination for teachers in intermediate schools. . . . The curriculum includes religion, German, history, geography, arithmetic with bookkeeping in the last year, nature study, writing, drawing, singing, handwork (gardening or domestic subjects), physical training, and one foreign language (French

or English) begun at the age of ten or eleven. . . . The aim of the German secondary schools is to impart a broad liberal education and practical preparation for position of expert leadership in the civil service or in the professions. . . . The nucleus of the present secondary-school system, the classical gymnasium, had its origin in the Renaissance-Reformation period, but owes its modern form to the reorganisation that took place in Prussian education under Von Humboldt at the beginning of the nineteenth century. It was at this period that the classical secondary school was given a position of pre-eminence. . . . There are . . . three schools offering nine-year courses, the *Gymnasium*, the *Realgymnasium*, and the *Oberrealschule*. Corresponding to these are three schools with courses only six years in length, the *Progymnasium*, the *Realprogymnasium*, and the *Realschule*. Like the elementary schools, the secondary are subject to the independent control of each state with the sole exception that uniformity of standard is secured throughout the Empire by the Imperial School Commission (*Reichsschulkommission*). . . . In Prussia secondary education is under the direction of the provincial school boards. . . . Secondary education forms a system entirely distinct from the elementary schools. The choice of a secondary school must be made at the age of nine, and the majority of pupils received their preparatory education in the *Vorschulen* or preparatory classes attached to the secondary schools and receiving pupils at the age of six; others are prepared privately or attend the elementary schools up to the age of nine. No provision exists to encourage the passage of pupils from the lower to the higher schools. This is illustrated by the fact that only about one pupil in ten thousand passes to a secondary school on completing the elementary school."—Important changes were made in this system by legislation after the republic was declared.—P. Sandiford, *Comparative education*, pp. 124, 128, 129, 131-134, 140, 142-145, 153.—"In 1903, Prussia reorganized the higher schools for girls and put the *Gymnasia* on the same footing with respect to the universities as those of the boys. . . . [Secondary education for girls was] left, until recently, to private enterprise and to the various municipalities; although some German states permit girls to attend the boys' schools. . . . Women were not allowed to matriculate in the German universities until 1903 when Munich opened her doors."—G. L. Jackson, *Privilege of education*, p. 126.—See also WOMAN'S RIGHTS: 1867-1905; BERLIN: General survey.—"I still know [1914] of no higher school which does not insist on the teaching of two modern languages in addition to the mother tongue, and often also two ancient languages; which does not earnestly endeavour to stuff the head of every child with the history of its own country and of the world, with political, physical and mathematical geography, with zoology, botany, mineralogy, geology, chemistry, physics, algebra, geometry, stereometry, trigonometry, religion and religious history: and there are many schools which extend even this programme. . . . Our elementary schools have become replicas on a small scale of the highest schools, and although we are all distressed about this overdose of learning, new subjects are ever knocking at the doors of these schools too: worse still, the doors have been opened to them and they are looking round for a place where they can settle near their comrades and then spread themselves out. . . . The veneer of knowledge so artistically applied to the thirteen year old children leaves them at the final examination three years later like highly polished but empty vessels. The veneer was not the

right one and three years of practical life have sufficed to rub it off."—G. Kerschensteiner, *Schools and the nation*, pp. 28-30.—See also POLAND: 1872-1912.

Germany: Under the Republic.—"At the base of the educational edifice there is the common or elementary school (*Grundschule*), which gives all children an equal education, from the point of view of length of time and content. This is the principle of the 'uniform' school. This does not mean, however, that everywhere and in all the states public schools must be organized after an invariable pattern. They are uniform in the sense that they are one in the conception underlying their establishment, in that they are inspired in every respect and exclusively by the same democratic principles, that no difference in instruction is made and that the economic and social position and the religious beliefs of parents are deliberately disregarded in according to children the right to an education. Above the common schools are the secondary and higher schools. The Constitution does not say how these are to be organized. It indicates only the idea that is to serve as a guide to legislators when they construct the educational edifice. . . . All children are naturally not compelled to go through the whole educational curriculum, but there is an obligatory minimum of instruction. Educational obligations are notably extended in the Constitution as compared to their former limits. [See Germany, Constitution of the Republic.] . . . In April, 1920, the . . . [law on the elementary school] was passed by the National Assembly. . . . According to this law, primary schools must be so organized that the first four years may at the same time serve as a preparation for secondary and higher education. Every child who has successfully graduated from the highest class of the elementary school must be sufficiently prepared to enter immediately a secondary or a higher school. Public preparatory schools and public preparatory classes are abolished. As for private preparatory schools, their suppression will take place only after a sufficiently long reprieve; their complete abolition need not take place until the commencement of the school year 1920-1930; since economic difficulties prevent the earlier abolition of these schools, and means must be taken to provide for the teachers who will be deprived thus of their occupations. Private instruction is not allowed except in particular cases and can only in special circumstances be substituted for the elementary school. The law does not touch instruction and training in auxiliary classes; nor does it concern itself with the instruction of children physically or mentally diseased. In addition a certain number of interesting innovations have been enacted into legislation. These have as their purpose the participation by parents and pupils in the administration of schools. On the one hand, in the secondary schools there are organized Students' Councils (*Schulgemeinden*). These Councils are formed by pupils of the three upper classes, who meet periodically in assembly to discuss questions of instruction—educational matters, quarterly reports, discipline, duties, etc. Teachers attend these meetings without the right to vote. Up to now these assemblies have had only the right to propose reforms without power as yet to make them operative. On the other hand, parents elect for each school a Parent's Council, one member for every fifty pupils. This Council concerns itself mostly with classes, examination and discipline. If a pupil has committed a fault involving the possibility of expulsion from the schools, it is before this Council that this question is taken. Teachers are sometimes admitted to these deliberations but

have not the right to vote."—R. Brunet, *New German constitution*, pp. 227-228, 233-234.—See also EDUCATION, ART: Modern period: Germany.

Hungary: School law.—The school law of Hungary, 1868, and amendments, and the Act for Enforcing Compulsory Attendance, 1921, provide for a "compulsory course . . . which shall extend over nine years: after six years' attendance at the elementary school, the child must attend the continuation school from the age of 12 to 15."—*Control of employment of children* (*International Labor Review*, Nov., 1921).

India: Educational system.—Introduction of English as a medium of instruction in secondary schools.—Primary schools.—Art instruction. See INDIA: 1835-1922; EDUCATION, ART: Modern period: India.

Ireland: National schools.—Intermediate Education Act of 1914.—"National schools were established as long ago as 1831; but attendance is not compulsory except under local option, which has established it in three-quarters of the towns and one-half of the counties in Ireland. The teaching, it is said, has been somewhat mechanical, and adjusted to the attainment of 'results'; but that, again, might—at any rate until recently—have been said with almost equal truth of the teaching in English elementary schools. Of late years a new spirit has shown itself: attention has been directed to manual and practical instruction: and the spread of Irish has probably helped to give a new vitality to the schools. More serious than the problem of primary is that of secondary education. A Board for Intermediate Education was created in 1878, and vested with a capital of £1,000,000, drawn from the Irish Church Fund, from which it was empowered to make grants to secondary schools; but it has not achieved any considerable measure of success. The teachers are too often insufficiently equipped; and as the grants are proportioned to results, cramming is said to be rife. On the other hand, the work of the Department of Agriculture and Technical Instruction has greatly strengthened the teaching of natural science and of technical subjects in all the secondary schools of Ireland since 1899. Experimental science and manual training have been introduced; and a system of inspection has eliminated, as far as these subjects are concerned, the evils of cramming. Ireland is to-day ahead of England in the art of linking the teaching of natural science with the economic life of the country, and of adjusting such teaching to its specific needs and character. New technical and commercial schools have been instituted: special training has been given in industries such as glove-making and woodwork; and, above all, a system of agricultural education has been organized, which is marked by a high degree of originality and vigour. There is the new and finely equipped Royal College of Science in Dublin: there is in each province a school of agriculture for farmers' sons; there are winter classes which they can attend in the slack time of the year; and there are the itinerant instructors of the Department, who are employed by the County Councils to lecture on agriculture and disseminate new ideas and methods. Meanwhile Parliament, by the Intermediate Education Act of 1914, has at last done something to improve the position of teachers in Irish secondary schools; and though there is much still to be done in the way of reform of secondary education in Ireland, it can at any rate be said that much has already been done which has still to be done in England."—E. Barker,

Ireland in the last fifty years (1866-1916), pp. 64-66.

Italy: Scuole popolare.—"The putting of the *scuole popolari* into operation is the most striking advance made in the field of Italian education during the past two years [1917-1918]. The legal enactment constituting them was the result of an organic growth, combining features of the plans submitted by the Minister of Industry, Commerce, and Labor, in December, 1916, and by Sig. Ruffini, then Minister of Public Instruction, in February, 1917. Their compositely social and educational character is well illustrated by the history of the origin and passage of the law establishing them. The salient points of the *scuole popolari*, both in organization and aims, are as follows: 1. The Government, with the consent of the local school council and the communes, was instructed to found a new type of school based upon the completion of the fifth and sixth elementary classes, and offering instruction of special and vocational character, as well as a development of the courses in the basic subjects, especially arithmetic and practical geometry, drawing, and the elements of physical and applied natural sciences. Such schools were to cover three years additional to the elementary schools, and in the case of communes reserving to themselves the management of the elementary schools, the power of further amplifying the *scuole popolari* was granted. 2. The entire three years' course was to take the name of *scuole popolari*, be recognized as an institution of public instruction in legal standing, and governed by special statute approved by royal decree on the recommendation of the minister. The teaching staff and the program of special and general courses were to be determined by the statute embodying the school. Courses in agriculture, horticulture, agricultural economics, and whatsoever other scientific pursuits were adapted to the climate and needs of the individual locality were to be fostered and taught intensively. Only those teachers that should have pursued special training courses in the subjects they were assigned to teach should be elected to the *scuole popolari*, and only upon the passing of examinations thereon. To be nominated as teacher of Italian, history, and civil ethics, geometry and arithmetic, the teacher must hold the diploma of the normal school or have served at least five years satisfactorily in the elementary public schools. The minimum salary of teachers in the *scuole popolari* was fixed as 2,000 lire (\$400) for communes having over 20,000 inhabitants and at 1,500 lire (\$300) for communes having less. The weekly schedule of instruction required of each teacher was to be 24 hours. For hours exceeding this he was to receive additional compensation of 80 lire (\$16) per annum for each hour, and for hours falling below he was to be required to render such assistance as the giunta of the commune should direct. 3. For admission to the *scuole popolari* the usual *maturità* examinations required for admission to the first class of the middle and complementary schools should not be valid. Only students completing in actual residence the work of the lower elementary school and passing the promotion examination of the fifth elementary grade were to be admitted to them. Students completing the work of the *scuole popolari* were to be admitted to the first classes of the technical and complementary schools upon the examinations and conditions fixed by the ministerial regulation. The leaving certificate of the *scuole popolari* should be recognized as equivalent to the leaving certificate of technical schools for admission to posts in various branches of the public service."—W. A. Montgomery, *Education in Italy*

Japan: Primary and secondary schools.—"Though the educational idea of the nation has gradually developed during the period of more than 2,000 years, yet the present system of education is really the outcome of the great changes effected in the very short period since the Restoration . . . It was in the year 1871, just one year after the adoption of the educational system in England, that saw the establishment of an independent Ministry called the Department of Education, whose head, the Minister of State for Education, became a member of the Cabinet. Two years later an Educational Code, comprising the whole system of Universities, secondary schools, primary schools, etc., was issued. Since then various improvements in the system have been carried out, until we have the organization existing to-day [1904]. The central administrative organ is the Department of Education, with a Minister of State at its head and a Vice-Minister under him. . . . The head of a city, town or village, . . . has charge of primary education; . . . the head of the 'gun,' or county, . . . supervises the educational affairs of towns and villages; . . . the local Governor, . . . controls both the primary and secondary education within his jurisdiction, under the supervision of the Minister . . . [of Education]. Primary schools are designed to give children the rudiments of moral education, and of education specially adapted to render them good members of the community, together with such general knowledge and skill as are necessary for daily life, due attention being paid to their physical development. . . . They are divided into ordinary . . . and higher primary schools . . . [but the two courses] may be established conjointly in one and the same school. The ordinary primary course extends over four years, and the higher primary course over two, three or four years. A supplementary course, extending over not more than two years, may also be arranged in order to give such instruction as is suitable to local requirements. The subjects of study in ordinary primary schools include morals, the Japanese language, arithmetic, and gymnastics. . . . Drawing, singing, or manual work, may be added, and, for females, sewing. The subjects of study in higher primary schools include morals, the Japanese language, arithmetic, Japanese history, geography, sciences, drawing, singing, and gymnastics, and, for females, sewing. In addition, agriculture, commerce, and manual work, may be included for boys, as well as the English language. . . . [Education is compulsory and as a matter of fact 90 per cent of the children of primary school age (six to fourteen years of age) attend school. Attendance at the higher primary schools is not compulsory, but about 60 per cent of the children pass to them]. A municipal or rural community is under obligation to establish and maintain one or more primary ordinary schools, sufficient in equipment to admit children of school age residing in its jurisdiction. The establishment of higher primary schools is not obligatory. . . . [Nominal fees of about five to ten cents a month for primary schools and fifteen to thirty cents a month for higher primary schools may be charged under special circumstances subject to the approval of the local governor; the larger fees in the case of city schools.] There are three classes of teachers for primary schools: the regular teachers, qualified to teach all the subjects in the regular course; assistant teachers . . . [and special teachers for] special subjects, such as drawing, singing, gym-

nastics, sewing, English, agriculture, commerce, or manual work."

"In comparing our secondary schools with those of other countries, it may be said that the Japanese are much like the modern secondary schools in Europe. [They are residential in so far as accommodations permit.] Candidates for admission to secondary schools must be over twelve years of age, and must have completed the second year's course of the higher primary school. . . . All teachers must be provided with a license, but when it is difficult to engage licensed teachers, those not possessing a license may be employed for the time being. The appointment and dismissal of teachers lie with the local Governor upon the recommendation of the head of a 'gun' or city. The salary of teachers for primary schools . . . is not less than 25s. nor more £10 a month, [but] an additional sum for rent may be granted. . . . [Pensions are granted to teachers who have been employed over fifteen years, and to their families after their death.] The object of secondary schools is to provide instruction in such higher subjects of general education as are necessary for boys of the middle class. In each of the existing forty-seven prefectures, at least one secondary school must be established and maintained. Private individuals may

three years may also be instituted for the benefit of those graduates who are desirous of pursuing some branches of study."—M. Sawayanagi, *Present system of education, in Japan by the Japanese* (A. Stead, ed.), pp. 229-231.—See also EDUCATION, ART: Modern period: Japan.

Japan: Normal schools.—Higher secondary schools. — **Technical schools.** — "The normal schools are of two kinds; ordinary normal schools . . . designed to train teachers for primary schools; . . . higher normal schools, to prepare teachers for secondary schools, girls' high schools, and ordinary normal schools. Each prefecture must establish at its own expense at least one ordinary normal school, which may be divided into male and female departments, . . . [or] established as independent institutions. The course of study extends over four years for males and three years for females. . . . A simpler or preparatory normal course to train regular teachers for ordinary primary schools may be added to the regular course. . . . [The curriculum is designed to enable the students to prepare to teach all the school subjects, and in addition pedagogy is taught and practice schools are provided.] Candidates for admission to the ordinary normal schools must be between fifteen and twenty years of age, and

© Newman Traveltalks and Brown & Dawson, N. Y.

JAPANESE SCHOOL BOYS UNDER MILITARY DRILL

also establish secondary schools in conformity with the regulations. The course of study occupies five years, with an optional supplementary course not to exceed twelve months. . . . [The subjects are morals, Japanese, Chinese, classics, foreign languages, history, geography, mathematics, natural history, science, elements of law and political economy, drawing, singing, gymnastics.] As a general rule, text-books used in secondary schools must be those examined and approved by the Minister of Education. In general, the number of pupils in one secondary school shall not exceed 400, though the number may under special circumstances be increased to 600. One class must not contain more than 50 pupils. The object of the girls' high school is to provide instruction in such higher subjects of general education as are necessary for girls of the middle classes. The course of study generally extends over four years, and occasionally five. In addition to the regular course, a supplementary course not exceeding two years may be provided. The subjects of study are morals, the Japanese language, a foreign language (English or French), history, geography, mathematics, sciences, music, gymnastics, to which pedagogics and manual arts may be added as optional subjects. Besides, for the benefit of those desiring to study such arts as are necessary to females, a special course for arts, extending . . . [from two to four years] may be established. A higher course covering two or

possess attainments at least equivalent to those who are qualified to serve as assistant teachers in ordinary primary schools. The pupils' expenses, including board and lodging, are supplied by the local treasury, and in return . . . the pupils are required to give their services . . . for ten years in the case of men, and five years in the case of women, . . . [after] graduation. . . . Higher normal schools [one at Tokyo, one at Hiroshima (opened in 1902)] are designed to train students as teachers of ordinary normal schools, secondary schools, and girls' high schools. . . . the expense . . . being defrayed . . . [by] the national Treasury. . . . The period of study extends over one year in the preparatory, three in the principal, and one in the post-graduate course. . . . [Secondary and primary schools provide practice in teaching. There is also a normal school supported by the treasury for women teachers of the girls' department of the ordinary normal schools, and girls' high schools. In all these schools the students' expenses are paid by the school.]

There are eight higher secondary schools, maintained by the State, as part of the school system. These schools, for which there is no equivalent in Western School Systems are preparatory to the Imperial University. "The use of the Japanese language alone is not yet sufficient for the purpose of University education without the accompaniment of foreign languages, some courses having to be con-

ducted in French, some in German, text-books in Japanese not existing—a fact explaining the *raison d'être* of the higher school. So much emphasis is laid on the foreign languages in the curriculum that in some classes as much as thirteen hours a week are devoted to them. The students have to choose English and German, or English and French or German and French. The chief aim is to train the students to fully understand foreign literature rather than to render them fluent conversationalists. . . . [These higher schools may be termed continuation schools, which form a connecting link between the secondary schools and the universities.] The object of technical schools is to provide necessary instruction to those aspiring to engage in industry, agriculture, commerce, etc. There are industrial schools, agricultural schools, and commercial schools; and in each there are three grades—lower, intermediate [locally maintained with the help of State aid], and higher. The number of the State higher technical schools is seven—two agricultural, two commercial, and three industrial. . . . Candidates for admission to technical schools of intermediate grade must be over fourteen years of age, and have received eight years' education in primary schools. The minimum course of study extends over six months, the maximum over four years. There are also technical supplementary schools."—M. Sawayanagi, *Present system of education, in Japan by the Japanese* (A. Stead, ed.), pp. 231-233, 235, 237.

Latin America: Educational provisions in the chief republics.—Commercial education.—Legislative provision has been made for both elementary and secondary education in the Latin American republics, but, partly owing to the large Indian populations, these provisions are, generally speaking, poorly observed. In Argentina "primary education is free, secular, and compulsory for children from six to fourteen years of age. For secondary education the Government provides some 40 national colleges, with between 12000 and 13000 pupils and 1300 teachers. Besides the Government colleges there are between 30 and 40 private colleges, with about 3000 pupils and about 400 teachers. There are 82 normal schools, with over 14,000 pupils, and nearly 2000 teachers. . . . [In Bolivia] the educational system is free and compulsory, and is under the care of the municipalities but only a very small proportion of the people can read and write. There are about 1000 primary schools in Bolivia, with close on 1400 teachers and nearly 60,000 pupils. For higher instruction there are about 20 establishments with about 1300 pupils, and for secondary education fully 30 establishments, with 2,600 pupils. . . . Education [in Brazil] is free but not compulsory, and the great body of the people . . . can neither read nor write. [See BRAZIL: 1911.] In Chile education is free but not compulsory, and, . . . no fewer than 40 per cent. of the population are illiterate. The State University and the Catholic University, the National Institute of Santiago, and the lycæums and colleges established in the capitals of the provinces, provide secondary and professional education. [See also CHILE: 1919.] . . . Though there is a ministry of Public Instruction [in Columbia], the Church, in fact, exercises supreme control in educational matters. Education is divided into *primary, secondary, professional, and artistic and industrial*. There are close on 6000 schools, with about 450,000 pupils. There are about 400 of these secondary and

professional schools, with about 34,000 pupils, and there are about 100 art and trade schools, with over 7000 pupils. . . . Primary education [in Ecuador] is free and compulsory. There are about 1300 primary schools, and there are also commercial and technical schools in Quito and Guayaquil. [In Peru] elementary education is nominally free and compulsory, but the law is not enforced. In Peru, there were, in 1919, 2880 primary schools with 195,680 pupils enrolled, and a staff of 4284 teachers. Thus a great advance has been made in primary education since 1906 when there were only 710 primary schools, with 49,000 pupils enrolled. . . . There are besides 277 pupils in the normal schools and 5202 pupils in the Government high schools. The Government maintains a high school in the capital of each of the departments to which pupils are admitted on payment of a moderate fee. . . . [In Uruguay] primary education is compulsory, and there are over 1000 primary schools, with over 100,000 enrolled pupils. There are also a preparatory school, a normal school, and various other establishments for secondary education. . . . [In Paraguay] education is free and nominally compulsory. There are national colleges (*high schools*) at Asuncion, Concepcion, Villa Rica, Encarnacion, Barrero Grande, Misiones, and Pilar. [See PARAGUAY: 1918.] Instruction [in Venezuela] is given both in public and private schools, but though entirely free, education in Venezuela is in a miserably backward condition. The Church is hostile to the national school system, and maintains a large number of convent schools and parochial schools."—A. R. H. Moncrieff, *New world of to-day*, v. 4, pp. 279, 272, 285, 275, 264, 266, 269, 280, 282, 261.

"The Latin-American mind lends itself readily to commercial education. . . . When once the need was fully recognized and commercial schools began to be established, they met with unusual favor. Their establishment and development in the different countries of Latin America has been in direct ratio with the commercial advance of the country. . . . In almost every case it was by act of government that the schools were established, and they have been from the very first an integral part of the national educational system. . . . They are of different types or grades. At the top of the list are the colleges or higher schools of commerce, such as the one at Buenos Aires which is a part of the University of Buenos Aires, and the one at Santiago, Chile, which, although not connected with the University of Chile, is of a rank that almost, if not quite, equals that of a university faculty. The more common grade, however, is the secondary school of commerce. This grade does not always require a completion of the studies of the elementary schools for admission. There are often two or three classes below the ordinary rank of high school, and two or three classes above the entrance grade of a high school. This is the type of the ordinary schools of commerce in Chile. Nearly every town of importance in this Republic has a commercial school of this grade. In some countries the commercial school is a section of the regular high school. This system of organization is in vogue in Cuba and Peru, for example."—*United States Bureau of Education, Bulletin no. 25, p. 36, 1916.*—See also LATIN AMERICA: 1901-1921: Education; UNIVERSITIES AND COLLEGES: 1551-1912.

Netherlands: Curricula.—New provisions in the constitution of 1920.—The system of education in Holland is very simple and practical and is compulsory between the ages of seven and thirteen. All teachers, of whatever grade, must pass a government examination. In the lower classes of the primary schools reading, writing and arithmetic are taught, but in the two upper forms, geography, history and botany or drawing, are added to the simple curriculum, of which chorus singing is always a part. The girls are taught sewing; and the boys are drilled. Secondary schools include lower, industrial, drawing and professional schools. The first of these are for the most part evening, and practically continuation schools, in which the occupation of the students strongly influences the type of instruction given. The subjects include one or more foreign languages, book keeping, and advanced drawing, and in some cases science and music. Industrial and drawing schools are technical schools, with a three year course, in which the trades are taught. These schools take the place of apprenticeship to a trade. Professional schools prepare for professionals. The curriculum embraces several modern languages, algebra, natural science and botany. The classics are taught in the upper forms. In addition to these schools, there are also the Burger schools for boys and girls, which parallel in some respects the work of the high schools.—Based on D. C. Boulger, *Holland of the Dutch*, pp. 69-74.—“The new educational provisions of the constitution which have recently [in 1920] come into force in the Netherlands read [in part] as follows: ‘1. Public education is the object of the assiduous care of the government. 2. Teaching is free, except for supervision by the government, and, moreover, as far as general education, both elementary and secondary, is concerned, except for the testing of the teacher’s capacity and morality, as regulated by law. . . . 4. In each municipality the authorities shall supply sufficient public general elementary education in a sufficient number of schools. In accordance with rules to be fixed by law, dispensation from this clause may be given, provided that opportunities for receiving such education be given. 5. The requirements of efficiency to which all education paid for by the state must conform are regulated by law. Freedom of spirit (*richtung*) shall be respected as far as private education is concerned. 6. . . . The freedom of private education in the choice of books and equipment and the appointment of teachers shall be respected. 7. Private general elementary education, which complies with the considerations regulated by law, shall be paid for by public money on the same basis as public education. The conditions on which private general and sectarian and preparatory higher education can claim subsidies of public moneys shall be regulated by law. 8. The sovereign will cause an annual report of the conditions of education to be submitted to the States General.’ The [London] *Times* Educational Supplement comments: ‘It fell to the lot of a Clerical Cabinet to give effect to this new clause of the Constitution. . . . His reforms naturally affect the financial position of the teachers in Holland very closely. Up till now the Act of 1878 has been in force, according to which the expenses for public elementary schools were divided between the state and the municipalities in such a way that the

municipality was responsible for school buildings, etc., while the state made a contribution towards teachers’ salaries. Before the new Act came into force, the state advanced to private schools the money required for school building, and for salaries a similar contribution to that which it gave to the municipality for the public schools. The result was that at most private schools it was found impossible to bring the salaries up to the level of the public school, while the public teachers, especially in large and rich towns, were comparatively well off. In order to establish equality, Dr. de Visser [Minister of Education] in 1919 passed an Act by which the state, assumes the entire responsibility for teachers’ salaries both at private and public schools, fixing them by Order in Council, and forbidding municipalities (for public schools) or school committees (for private schools) to add to them. Although the Order (issued December, 1920) fixes higher salaries for the towns than for the country the result will be that in towns like Amsterdam, Rotterdam, The Hague, the standard of teachers’ salaries at public schools is lowered, while it is raised in some poorer country parts. The private teachers, of course, will gain considerably by the arrangement. The Act was vehemently denounced by the public teachers, whose organization, “Bond van Nederlandsche Ouderwyzers,” is largely socialistic, but it was passed almost unanimously by Parliament.”—*School and Society*, April 16, 1921, p. 465.—“Under the education act as amended in 1921 the compulsory period covers a course of six years, which may be completed any time after the child is 12 and has passed through the class in which it was on reaching that age. The obligation to attend school ceases altogether when the child has passed through the class in which it was on reaching the age of 13.”—*Control of employment of children* (*International Labor Review*, Nov., 1921).—See also EDUCATION, ART: Modern period: Netherlands.

New Zealand: Lack of widespread compulsory education.—Schools for Maori children.—“Of all pupils entering standard 1, only 59 per cent finish the primary course, and 41 per cent never reach standard 6. To enable the latter to receive some kind of industrial education a more elastic scheme of admission to technical schools was devised and put into operation at the end of the year 1917. . . . Pupils over 14 years of age who have left the public schools not more than six months previously without obtaining a graduation certificate may, on the recommendation of the school inspector, enter a free technical school. The pupils thus admitted must select subjects bearing upon a trade or industry, including agriculture and domestic science. They must not take any commercial subjects. Compulsory continued education is at present provided only at the option of the local authorities in some 17 small areas [1918]. . . . At the third general meeting, held in June, 1917, by the council of education, an advisory body on the matter of education, it was resolved ‘that it should be compulsory for every child between the ages of 14 and 17 years living within 3 miles of technical classes to attend such for three hours a week and 30 weeks a year.’ In compliance with this regulation of 1917, three more centers were opened for continued education of the youth. . . . The Government supports a number of schools for the natives. At the end of 1917 there were in operation 118 native village schools attended by 4,622 Maori children. A large percentage of the Maori children also attend general public schools. A number of secondary

schools for Maori children, under control of denominational bodies, are subsidized by the Government, which provides free places for the native children. . . . With regard to secondary education, it is to be noted that of 9,517 pupils who in 1916 left the primary schools after having passed standard 6, 5,489 children, or 58 per cent, entered a secondary institution. Unfortunately, few finish the course. . . . The types of school that provide secondary education are: Secondary schools, technical high schools, district high schools, private secondary schools, and Maori secondary schools. There are no definite regulations governing the curriculum of secondary schools. These schools are mainly governed by the syllabuses of the various public examinations and by regulations issued by the Government with regard to the instruction of pupils holding free places. . . . All junior pupils holding free places in secondary schools must 'receive instruction in history and civics preparatory to a course in the elementary principles of economics to be taken at a later stage.' . . . Provision is also made for instruction in home science, cookery, laundry work, needlework, and home nursing for girls, and practical agriculture and dairy science or some other vocational subjects for boys."—T. Bach, *Recent progress of education in Australia and New Zealand (Education in parts of the British Empire, Bureau of Education, Bulletin no. 49, 1919, pp. 49-51)*.

Poland: Under the rule of Austria, Russia and Prussia.—Compulsory education, 1919.—"Compulsory education existed before the war in the provinces subject to Prussia and Austria. In Austria, education was compulsory for all children from 6 to 14 years, both in towns and villages. Any pupil who had not learned to read or write, or who had not sufficient notions of arithmetic and religion, could be compelled to attend school after the age of 14 years. . . . Education was free. Summer holidays lasted six weeks. It must be remarked, however, that these general provisions were not much observed in Galicia. Schools did not exist everywhere, and in many cases the courses only lasted for a year or two. Four years' schools, although provided for, were very rare. Supervision by the school authorities hardly existed, and parents were very often dispensed from sending their children to school. Compulsory education existed in those parts of the country formerly belonging to Prussia for children from 6 to 14 years of age. . . . In the old kingdom of Poland, and in the other provinces belonging to Russia, there was no compulsory education at all. Here and there in the country districts there were primary schools with classes lasting from three to four years, but attendance of them was absolutely optional. These schools were very few in number, at most two or three in a commune. . . .

"Almost immediately after the Russian evacuation of Poland in August 1915 the Civil Committee established at Warsaw proclaimed compulsory education throughout the country. When in 1917 the German Occupying Authorities granted a charter of autonomy to the country, and included public education in that charter, one of the first acts of those benefiting was to set up primary schools. But the chief legislative measure regulating education in reconstituted Poland has been the Decree of February 1910. Under the terms of this Decree education is compulsory for all children from 7 to

14 years of age. Any commune where there are more than 40 children of school age must establish a school. A common school may be established for several communes together, if there are less than 40 such children in each commune, provided that the area embraced shall have a radius not exceeding three kilometres. Provision is made for compelling communes to fulfil their duties. Pending the establishment of these schools, schools having a course of studies of from four to five years are recognised, but the Order of 8 August 1919 provides that in this case children shall be compelled to attend a supplementary class up to the age of 14 years, the period of attendance being from two to three years. The object is to encourage the general progress of education and to stimulate young people to a desire for further instruction. This supplementary instruction covers at least four hours a week and is continuous throughout the year. With a view to ensuring that the law on compulsory attendance shall be properly observed, and in order to induce parents to send their children to school, guardianship societies have been established, under the name of 'school guardians,' for one or more schools in the same locality. 'School guardians' have also other duties, such as the giving of assistance to poor children, the provision of conveyances for children living at a distance from the schools, and so on. They also prepare a list of children of school age in their area and communicate it to the school managers. The school year lasts from the beginning of September to the end of June, but the 'school guardians' may establish two interruptions of 14 days each during the seasons when field work is done; they may also change the attendance hours so as to facilitate such work, but may not reduce them."—*Technical agricultural education in Poland (International Labour Review, July-Aug., 1921, pp. 216, 217, 223-224)*.

Russia: Education under Bolshevik régime.—"The Bolsheviks who established compulsory education began by abolishing all existing schools, of every kind. In their place they established the Labor School, a co-educational, non-religious, uniform type of school, divided into two grades; the first a five year course for pupils from eight to thirteen years; the second a four year course for pupils from thirteen to seventeen years. Below the Labor School is a kindergarten for children from six to eight years of age. One teacher—or 'school workman'—is required for each twenty-five pupils. The moral basis of the school is to be 'productive work.' What exactly is meant by this phrase is not defined, but productive work is to be ultimately and organically connected with all the teaching. The school is to make the pupils acquainted with the most varied forms of production right up to the highest. Collective productive work and the organization of their own school life are to educate the future citizens of the Soviet Republic. In fact, school life is to give a foretaste of the Soviet Paradise. There are to be no home lessons, no obligatory tasks of any sort, examinations are altogether forbidden and punishments are abolished. On the other hand, hot lunches every day for all pupils are not only to be free but also compulsory. According to the anti-literacy decree issued by the Council of People's Commissaries: 'The whole population of the

Soviet republic must be able to read and write. All Russians between the ages of eight and fifty who are illiterate are bound thereby to learn to read and write in the Russian language or in their original tongue as they please. All literate persons may be called upon to assist in teaching the illiterate. The period in which illiteracy shall be abolished shall be fixed by the municipal or provincial soviet in each district. For adult citizens undergoing instruction in reading and writing the working day is abridged by two hours during the entire educational period. Citizens evading duties specified by this decree or in any way interfering with its provisions are subject to trial by the revolutionary tribunal.' [Failure to learn to read and write is punished by loss of voting and food privileges].—*Schools under the Bolsheviks (School and Society, July 5, 1919)*.—"The general task of administering the work of education in Soviet Russia is placed in the hands of the State Commission of Education, which is a sort of an interdepartmental body, consisting of representatives of the Commissariat of Education, the Central Executive bodies of the Teachers' Union, the trade and professional unions generally, the cooperative organizations, the Commissariat of National Minorities, and the Supreme Council of National Economy. . . . The administrative organization follows the lines of the whole administrative apparatus of government. Besides the central administrative institution, represented by the Commission and the Collegium, there are four stages in this apparatus, hierarchically subordinated to each other. These stages, starting at the bottom, are as follows: the *volost*, representing a group of villages; the *ouyezd*, representing a number of *volost*; the 'provincial,' corresponding geographically to the former divisions known as 'governments' or provinces; and the 'regional,' representing a group of provinces. For general administrative purposes, each *volost*, *ouyezd*, province, or region has its own Executive Committee, corresponding for purposes of local administration to the Central Executive Committee at the head of the whole system. And just as the Central Executive Committee has under its control the State Commission of Education, so each of the *volost*, *ouyezd*, etc. Executive Committees have a Division of Education, which is in charge of the actual work of administration. Moreover, each Division of Education has an advisory committee, known as the Soviet of Education."—L. Pasvolsky, *Education under communism: Structure of Soviet education (Educational Review, Oct., 1921)*.—According to the report of Lunacharsky, commissar of education: "By December, 1919, there were in the thirty provinces of Soviet Russia two thousand five hundred kindergartens and other institutions for children under school age, i.e., under seven years of age. Accommodations were thus provided for 200,000 children. Estimating the number of children under school age as four million facilities for pre-school education were available for five per cent. of the total number. The number of schools of the first stage or grade of the unified labor school was 46,472; of the second stage or grade, 2,632. Thus the total number of schools for children of school age was 49,104. . . . Lunacharsky's exact statement on this question reads as follows: 'At the present time twenty-seven per cent. of all the children of school age are receiving instruction.' . . . Dividing the total number of pupils by the total number of schools, we find that each school had, on the average, fifty-nine pupils, i.e., the usual number of pupils in one class of an American public school. . . . In the

domain of higher education, Lunacharsky stated in his report that 'the special care which the Commissariat of Education is devoting to the higher institutions of learning may be seen from the tremendous growth of the budget.' During the second half of 1919, over four hundred million rubles were spent for the maintenance of the universities and of the higher schools generally. What the Commissariat of Education had to show for this vast expenditure was a registration of 158,000 students, of whom, however (again, according to Lunacharsky's report), only 55,000 actually pursued studies. . . . In discussing the state of education in Petrograd, the Petrograd *Krasnaya Gazeta* declares that 'the schools are deaf to the pressing needs of the republic, and in them the children of the proletariat are torn away from the interests of their own class.' This official organ claims, for example, that in the schools of Petrograd the character of the British Parliament is studied in preference to the Soviet Constitution. And the 'Krasnaya Gazeta' seeks an explanation for this in the composition of the teaching personnel of the Division of Education. On the basis of an extensive investigation, the newspaper asserts that of the total of 24,839 persons who constitute the total personnel of the Division of Education, 9,439 are former bourgeoisie and bourgeois intelligentsia; 1,490 are former owners of property; 1,117 are former bureaucratic officials.' . . . According to Lunacharsky's report, there are only 200,000 pupils in the schools of the second stage. This means that of all children in Soviet Russia over the age of twelve, only two hundred thousand are officially registered as attending school; how many actually attend is unknown."—L. Pašvolsky, *Education under communism: Results of Soviet education (Educational Review, Nov., 1921)*.—See also RUSSIA: 1917-1920: Bolshevik laws; RUSSIA, SOVIET CONSTITUTION OF; CAUCASUS: 20th century.

Scotland: Education Act of 1918.—"The need of some reorganization . . . [was] perhaps greater in Scotland than in England, which, . . . developed a sound administrative system in 1902. The remarkable educational tradition of the country . . . tended to retard the development of an administrative reform more suited to modern needs, [although] successful as this tradition . . . [was] in selecting talent and promoting boys of ability, it . . . [was] not . . . effective in raising the general average. As in England, compulsory attendance laws were subject to local exemptions, voluntary measures for educating adolescent boys and girls were not successful, and in many parts of the country accessible secondary schools were not provided. Under the . . . [old] system there . . . [were] nearly 1,000 school boards elected *ad hoc* in the burghs and parishes; each voluntary and endowed school . . . [being] under its own administrative authority; while secondary education since 1908 . . . [had been] administered by nearly 40 secondary school committees. [See also CHARITIES: Scotland.] At the close of 1917 a bill to reduce this system to some more unified plan of organization was introduced in Parliament by the Secretary for Scotland, . . . [but met with considerable opposition and in] 1918, a new bill was substituted, giving effect to . . . [a] demand for *ad hoc* boards. [This bill was passed in 1918. Under it] the central administration is . . . in the hands of the Scotch Education Department, which is empowered to establish an advisory council consisting, to the extent of not less than two-thirds of its membership, of persons qualified to represent the interests of education. . . . The counties

and the five large burghs are set up as education authorities administered by boards specially elected for the purpose by the local government electors. . . . The [local] education authority . . . [is] required to raise money for education and control the expenditure; appoint, transfer, or dismiss teachers; establish or discontinue intermediate or secondary schools or control institutions for advanced technical instruction; and provide bursaries and facilitate attendance at secondary and higher schools. Further, the education authority is charged with the duty of preparing schemes for the adequate provision of free elementary, intermediate, and secondary schools, and for the support of certain schools charging fees, and of drawing up schemes of scales of salaries on the basis of a minimum national scale recommended by a departmental committee. Contributions must also be made by education authorities toward the maintenance of the training colleges for teachers in proportion to the number of fully qualified teachers in their areas, and aid may also be extended to central institutions and universities, provided reasonable representation on their governing bodies is granted. 'As an ancillary means of promoting education' an authority may furnish books for general reading not only to children and young persons but also to adults, and in this service is to cooperate financially and otherwise with public libraries, where they exist. . . . [The Act] provides for the establishment of nursery schools for children between the ages of 2 and 5, in which attention must be given to health, nourishment, and physical welfare. Compulsory school attendance begins at the age of 5 and is extended . . . to the age of 15, the pupils entering and leaving school on definitely fixed dates. No exemptions . . . may be granted to pupils under the age of 13. Child labor on school days between the hours of 6 o'clock in the evening and 8 o'clock in the morning is entirely prohibited, and children between 13 and 15 may be employed only if definitely exempted. . . . Street trading by children under 17 is forbidden, while no child under 15 may be employed in factories, workshops, mines, or quarries. Children leaving elementary schools at the age of 15, and not exempted by virtue of attendance at an intermediate or secondary school or of having reached the age of 17 and an equivalent educational standard, will be compelled to attend a continuation school up to the age of 18. . . . It was provided that the compulsory age limit . . . [should be raised to sixteen] within one year of the date . . . [of operation of the Act, and might be raised to eighteen at the option of] the department."—I. L. Kandel, *Scottish Education Bill, in Education in Great Britain and Ireland (Bureau of Education, Bulletin no. 9, 1919, pp. 115-119)*.—See also SCOTLAND: 1750-1921.

Serbia: National School Act, 1904.—"These orders and regulations on compulsory education are in force in Serbia, Montenegro and Voivodina. Instruction is provided from six years in the primary schools, and in communes where the higher course (5th and 6th class) is available, attendance at these is obligatory. A minimum of fifteen scholars is needed to provide this additional course. In places where there are no 5th and 6th classes, continuation courses are provided and children may attend these (voluntarily) for three winters. In rural districts there are also special classes for agricultural instruction; in the towns commercial and industrial classes are given. Nursery schools are provided for young children. Boys over ten years of age and girls over eleven years of age are not admitted into the first or junior class."—*Con-*

trol of employment of children (International Labour Review, Nov., 1921).

South Africa: Compulsory education.—Language difficulties.—Agricultural education.—"The system of education maintained in the four Provinces [of the Union of South Africa] is concerned primarily with the children of white parents. The education of the natives, who form the bulk of the population, remains in the hands of the missionaries, who maintain their own mission schools. The Government exercises some control over these schools and gives its financial support in the form of grants-in-aid. In all the Provinces education . . . [has been] made compulsory for the children of European extraction. No such provision exists for the children of other races. In some of the Provinces the tendency to increase educational facilities and to raise the compulsory age of the pupils has, in recent years, received official sanction by direct legislative measures. . . . An ordinance passed by the provincial council in 1917 makes the leaving age 15 instead of 14 and the leaving standard V instead of IV. The principle underlying compulsory education in that Province dates from the year 1905, when a school board act was passed making attendance compulsory for every child over 7 years of age and living within 3 miles of a State-aided school. . . . In the Province of the Transvaal a provision . . . issued by the Department of Education, authorizes the local school boards to raise the age and the standard of compulsion, if it is found desirable. This means that children over 15 years of age or those having reached the fifth standard may be compelled to continue their education at the option of the school boards. Furthermore, attendance in continuation classes can be made compulsory for children who are exempt from attendance at primary schools. . . . The language question presents considerable difficulties in South Africa. At present English and Dutch are recognized as the official languages in the Union, a fact which affects the schools to a considerable degree. In the Cape Peninsula instruction in the mother tongue is provided up to and including Standard IV, when the second language is gradually introduced. The languages hitherto taught in public schools were either Dutch or English, but as the conversational medium of large circles of the population is Afrikaans, or Africander Dutch, the school authorities sanctioned the introduction of this tongue as a regular school subject in the non-English classes. The more literary Dutch has thus been superseded by Afrikaans, especially in the lower grades of the elementary course. . . . In Natal, which is colonized almost throughout by British, the bi-lingual ordinance came first into operation in the year 1916, although a practical bi-lingualism has long obtained there with the approval of the department. The new ordinance reserves to the parents the right to decide as to the medium in which their children shall be instructed. In the Orange Free State, except where the parents object, both English and Dutch are taught to all children, and where possible, are used as equal media of instruction. . . . Provision for secondary education is made by public high schools or by advanced classes connected with the elementary schools. Present efforts are directed to the promotion of these classes to high-school grades wherever the scheme appears to be feasible. In the Province of the Transvaal 10 high schools have thus been created in addition to the 10 already in existence. The question of transition from primary to secondary schools has not been entirely settled in that Province. The Transvaal Teachers'

Association is of opinion that separate high schools should be built only for pupils who intend to matriculate. For the rest of the pupils the association urges the maintenance of advanced classes in the primary schools. . . . The higher school authorities, on the contrary, . . . [favor] the separation of primary and secondary schools. . . . In the Cape of Good Hope better adjustment and the abolition of the overlapping between the elementary and the secondary school course have been effected in recent years. The seventh grade of the elementary schools was abolished and the elementary course confined to six grades, these to be superseded by the secondary school course with a four-year syllabus. . . . Scientific training in the principles of agriculture and stock raising is making rapid strides in the Union. This training is carried on at four well-equipped agricultural schools conducted by the Department of Agriculture, as well as a number of experimental farms. . . . The cultivation of the soil, experimentation in plants, and the breeding of cattle are conducted on an extensive scale, not only for the benefit of the students enrolled, but also for the general farming population. . . . Missionary organizations provide schools not only for the native but also for other colored children in all the Provinces except the Transvaal. . . . [where] the schools for Eurafrikaners are under direct administration of the department and are supervised by the school boards on the same basis as the schools for Europeans. At the close of the year 1917 there were in that Province, in addition to schools for European children, 19 Government schools for colored children, with an enrollment of 2,681, and 330 subsidized mission schools with an enrollment of 21,421. In addition to the mission schools, the Government subsidized a number of Indian schools, notably in Natal, where 39 such schools receive grants-in-aid, while 5 schools for Indian children are directly maintained by the department of that Province."—T. Bach, *Recent progress of education in the Union of South Africa (Education in parts of the British empire, Bureau of Education Bulletin no. 49, 1919, pp. 54-60, 62)*.—See also SOUTH AFRICA, UNION OF: 1916.

Spain: Rapid progress.—Board of Education founded in 1907.—Achievements.—"Few people have observed the rapid progress [in Spain] of the educational movement which, in the hands of a small Committee of Reformers, has assumed national dimensions during the course of a decade. The recent history of educational development in Spain is a closed book to most people; yet it is doubtful if there is a more enthralling aspect of contemporary Spanish life, and there is none fraught with more vital significance to the future well-being of the country. A group of Spanish intellectuals has succeeded, since the Royal Decree of 1908, in reorganising the chief educational centres on modern principles, and an extensive State-scheme for the development of scientific training has added to the strength of an already notable intellectual movement. . . . A Royal Decree of January 11th, 1907, founded . . . the Board of Education and Scientific Research (*Junta para Ampliacion de Estudios é Investigaciones Cientificas*). . . . The achievement of the Board in its nine years of existence [prior to 1917] has been the European impress which it has given to Educational centres through a system of scholarships and grants for the benefit of students in foreign centres of education. The demolition of Spain's intellectual barrier was the first great step in the awakening of the country. It has been accomplished by an elaborate system connecting Spanish

education with the chief centres of learning abroad and promoting internal re-organisation through this stimulus of foreign example. . . . The new organisation provides for: (1) The selection and training of young students of the lower middle-classes and their support in the educational centres of foreign countries; (2) Committees of instruction in the great centres of learning in Europe as the means for proper supervision over the students on the part of the Board; and (3) Machinery for re-directing the students into the spheres of education, the Universities, *centros docentes*, elementary and secondary schools. . . . Changes in the way of internal re-organisation . . . have already followed as a result of this scheme. . . . The Board has also extended its aims to the general public. Mention only will be made of an enterprise which signalises more than anything else the power of this body as the factor in a Spanish awakening and renaissance, namely, the *Patronado de Estudiantes*, founded by a Royal Decree of May 6th, 1910. Its function has been the opening of facilities for travel and educational pursuits in foreign countries to the general public as distinct from educational students. This work has been promoted by an extensive propaganda among parents by means of lectures and pamphlets, with the establishment of a foreign service in their interests. The result of this campaign is that many thousands of parents have responded to the free services offered under the present scheme. Till Spanish educational life has itself been wholly re-organised and overhauled the alternative to the small opportunities and corrupt conditions in the Spanish Schools and Universities is the education of Spaniards in foreign countries. The advantages of this scheme have been made into a national appeal directed, not least, towards parents among the upper and ruling classes. They, in common with people of different and antagonistic views, stand to gain nothing from the vicious and demoralising conditions which prevail in Spain. Their sons were thus for some time anterior to the war being sent in increasing numbers to be educated in France, Great Britain, and Germany. . . . The significance of the popularisation of this custom in Spain needs scarcely to be commented upon. If these measures can be continued and developed on the lines foreshadowed, it is clear that the ranging of Spain into line with European thought and culture is . . . only a matter of time. . . . The strength and promise of the movement obviously lie in the development of the younger generation of students and teachers. Direct results were to be obtained, however, by improving the machinery already in existence. Until the Spanish Elementary Schools can be overhauled and modernised systematically, an attempt is being made to stimulate the teachers of the present generation to a sense of their responsibilities and the part which their profession is destined to play in the task of national reconstruction. Under the present conditions in Spain, the children—in the rural districts especially—are subject to no proper discipline or authority whatsoever, and both at home and at school are allowed to grow up in bad habits and without guidance, a state of things which is directly responsible for the situation . . . in the social life of the country. They are, in nine schools out of ten, under the wavering attention of ill-paid and half-starved teachers, who hold their positions, without proper qualifications, and are subject to no central supervision or control of any sort. A scheme has been developed through which these Elementary school-teachers are being united in bodies of forty or fifty during the summer vacations, and subjected to a

EDUCATION, 20th Century

course of University Extension lectures in Madrid, followed by continental tours and the study of foreign educational centres. It is sought to introduce through their agency better methods of teaching and a broader ideal of education into the Elementary Schools, as a preliminary to State action. . . . The hope of the country rests, primarily, in a State re-organisation of the Spanish national schools, universities, and educational centres. Let it be added that, remarkable as these changes are in all circumstances, they are of peculiar importance in face of the present situation in Spain and of the real national problem as students have long seen it. The movement, one cannot but perceive, affects intimately the whole Progressive question, and conveys the hope of an ultimate solution of this problem on sound, constructive principles."—S. Moxon, *Reconstruction in Spain* (*Contemporary Review*, Aug., 1917, pp. 206-210, 212).—See also CHILD WELFARE LEGISLATION: 1874-1905.

Sweden: Elementary and secondary schools.
—Curricula.—The history of education in Sweden dates back to 1686, when an ordinance forbade full church membership, or marriage, to anyone, man or woman, who could not read. In the eighteenth century, much progress was made, and in the nineteenth century the Public Elementary Statute was passed. At the present time, there are training colleges for teachers, with a three years' course, as well as for elementary and secondary school teachers, in which the course lasts for four years. Elementary schools include continuation courses, and also the higher elementary schools, and gain an element of permanency through the fact that a teacher cannot be removed except for inefficiency or misconduct. Instruction for out of the way districts is provided by ambulatory schools, at which the teacher gives instruction at one, two or three different places in the course of the year. The full elementary curriculum includes scripture study and catechism; Swedish, including reading, grammar, listening to reading, and reproducing the matter read, spelling, composition, writing; arithmetic and geometry; geography; Swedish history; natural history; drawing; singing; gymnastics and, where possible, gardening. Added to these are wood and metal sloyd for boys, and for girls needle work, craft, spinning, weaving, basket work and cookery. Study of these subjects is carried on much further in the continuation school especially in the higher elementary schools, where foreign languages, mathematics, book-keeping, hygiene, and political science are also taught. The People's High Schools, the *folkhögskolor*, follow the same lines as in Denmark, where they originated. The state secondary schools have come down from the medieval church schools, and the burgher schools, and are in great measure comparable to the German real schools and gymnasia. They are paralleled by girls' secondary schools, which in some cases admit boys, preparing for the boys' secondary schools into the preparatory classes, while some of the boys' state secondary schools have been made co-educational.
 —Based on *Sweden, Historical and statistical hand book*, pt. I.—The Elementary School Law of 1897, and amendments up to 1919, provides that "in certain circumstances the school council may authorize a child to defer entering school until the age of 9 years. Pupils who have failed to attain the standard of knowledge required of those leaving school may be required to continue attendance. Children reaching this standard before the age of 14 may be permitted to leave school; and in such cases must attend continuation schools for 2-3

years; 360 to 540 lessons are distributed over this period."—*Control of employment of children* (*International Labor Review*, Nov., 1921).

Switzerland: Art instruction. See EDUCATION, ART: Modern period: Switzerland.

United States: Systems of administration and curricula.—The systems of administration, academic and educational requirements for teachers, and consequently the curricula in the schools, vary throughout the United States. Generally speaking the systems of administration may be classed under five headings. "I. State systems . . . [in which the State retains control of and issues certificates]: New Hampshire, Rhode Island, Maine, New Jersey, Vermont, Delaware, Maryland, Virginia, West Virginia, North Carolina, Florida, Tennessee, Alabama, Louisiana, Minnesota, Iowa, North Dakota, South Dakota, Montana, Wyoming, Utah, New Mexico, Nevada, Arizona, Oregon, Washington, 26. II. State controlled systems [in which local authorities may issue certificates of which the State retains control]: New York, Kentucky, Missouri, Nebraska, Indiana, Illinois, Idaho, 7. III. Semi-State systems [in which local authorities examine papers of examination set by the State, and held under State regulations]: South Carolina, Georgia, Arkansas, Mississippi, Oklahoma, Texas, Kansas, Ohio, Michigan, Colorado. IV. State-county systems: Pennsylvania, California, Wisconsin, 3. V. State-local systems [in which both State and township committees have complete power of certification]: Massachusetts, Connecticut. . . . There is a tendency toward higher scholarship requirements which may be observed in several ways. When a new form of certificate is established, the qualifications demanded are usually higher and more specialized than formerly. Kindergarten, primary, and special subject certificates in most cases require high school and normal school or college graduation or the equivalent, including preparation for the special kind of work or subject for which they are issued. Certificates for administrative and supervisory positions practically all require the completion of four years of college or normal school training and in many cases an additional year of graduate work, including specialized study in administration and supervision. . . . When examinations are required, the subjects are divided as follows: (1) Traditional elementary school subjects: Reading; writing; orthography, punctuation, orthoepy; language, composition; grammar; arithmetic, mental and written; number work; geography; United States history, elementary civics, local history; physiology, hygiene, nature and effects of alcohol, stimulants, and narcotics. (2) Newer elementary school subjects: Drawing; music; nature study; agriculture; manual training; household arts, domestic science, etc.; physical training; current events. (3) Higher subjects (secondary and higher schools): Rhetoric, literature, algebra, geometry, languages, history, physics, chemistry, biology, economics, and such other branches as compose the standard high school and college curricula, and also cataloging and use of school libraries. (4) Professional subjects: Philosophy of education, history of education, psychology, school administration, theory and practice, methods, school law and State manuals, and such other professional subjects as may be named. . . . The idea of recognizing some professional training as necessary for any grade of certificate is growing in extent. The following States require some professional training in an approved school of secondary or higher grade as a prerequisite for the lowest grade certificate issued, 13 States, in addition to

those mentioned before—Minnesota, Vermont, New Hampshire, Michigan, Delaware, West Virginia, Oklahoma, Oregon, Wisconsin, South Dakota (after 1920), Montana, Wyoming, and Idaho. Twenty-one States have established teacher-training classes or normal training work in high school or in connection with high schools and recognize this training in their certification laws or regulations as fulfilling the requirements for some grade of certificate. These courses are given either as a part of the regular high-school courses, as is most common, or constitute a year's work in addition to four high-school years."—K. M. Cook, *State laws and regulations governing teachers' certificates*, (Department of the Interior, Bureau of Education, Bulletin no. 22, 1921, pp. 16, 20, 21, 23, 24).—"Practically every city elementary school has its supervising principal—one of whose duties is to aid the classroom teacher in disciplinary problems. Special supervisors—experts in one or another of the school subjects who exercise a more or less thorough oversight of the individual teacher's work. Similar systems are so rare outside cities that the few counties in which supervisory staffs have been created for the rural schools have gained at once a nation wide reputation."—J. A. H. Keith and W. C. Bagley, *Nation and the schools*, pp. 180, 190.—See also ALABAMA: 1916; ARKANSAS: 1917; DELAWARE: 1918-1921; MISSOURI: 1865-1920; NEW MEXICO: 1881-1917; OKLAHOMA: 1880-1916; VERMONT: 1791-1914; WYOMING: 1911; CIVICS.

United States: Training of teachers for elementary education.—"The history of education since the time of Horace Mann," says Dr. Harris, "is very largely an account of the successive modifications introduced into elementary schools through the direct or indirect influence of the normal school." The . . . normal schools . . . had increased to 273 in 1914, 232 of them being public and 41 private schools. Besides, there were 1189 public and 292 private high schools offering training courses for teachers. In all a total of 131,998 students were being made acquainted with the functions of the teacher and habituated under direction to the work of teaching. . . . There have been great departures from . . . [the] traditions . . . [of the early normal schools]. Normal schools now [1917] require their students to be graduates of high schools and find a two-year course all too short for proper instruction in the art of teaching. . . . [Compared with] the training which they give now . . . the training of fifty years ago . . . [was] but a promise and beginning of the larger and more helpful work which they are doing to-day. . . . The first teachers' institute was assembled by Dr. Henry Barnard in Hartford, Connecticut, in 1839. (Note.—Jacob S. Denman organized his first teachers' institute at Ithaca, on April 4, 1843.) He regarded it as only a temporary device for giving teachers an 'opportunity to revise and extend their knowledge of the studies usually pursued in district schools and of the best methods of school arrangements, instruction, and government under the recitations and lectures of experienced and well-known teachers and educators.' This 'temporary device' has lasted for seventy-seven years and has become a permanent feature of the school life of every state. The purpose of the institute has not changed. The words of its founder still state its program. In every corner of the land it provides a means of educational rededication and professional renewing and bids fair to last in

some form or other as long as children and schools and teachers exist. The spread of these two agencies for the training of teachers has during the last fifty years been the distinctive thing about them. While their work has been intensified, their benefits have been made nearly universal. But three new agencies for professional improvement have been created within that period. One of them is the summer school, another the Teachers' Reading Circle, and the third is university-extension courses. Chautauquas, after the type of their original in New York State, have been held in many places. Summer schools have become almost a regular feature of normal-school, university, and college work. And university extension teaching, after a period of lethargy, now seems to be firmly established both as a duty and a privilege of most of the great teaching centers. Certain states have thought it so indispensable that they have made it an integral part of their educational work. The Teachers' Reading Circle was the invention of an Ohio teacher in the year 1882. It is now nearly a nation-wide institution. . . . The University of Chicago has also established a college for education, and schools of education are now [1917] to be found in nearly all of the larger universities."—E. C. Moore, *Fifty years of American education*, pp. 66-70, 80-91.—"Most of the larger cities . . . maintain local training schools for elementary teachers, and could easily require reasonably high standards of preparation. With a few notable exceptions they demand but one or two years of professional training after the candidate has completed a high-school course. It is generally agreed that two years represent the lowest minimum that should be tolerated; yet even our largest and richest cities are content with this. Indeed, of all our public-school teachers, a most conservative estimate places the proportion that have met this standard at one in five. In England the proportion meeting a comparable standard is four in six, and in many of the countries of continental Europe the proportion is still higher. In so far as our policies of teacher-preparation are concerned, we are surpassed by some of our South American neighbors. A bulletin of the Federal Bureau of Education authoritatively asserts that the United States gives less attention to the preparation of public-school teachers than does any other civilized nation."—J. A. H. Keith and W. C. Bagley, *Nation and the schools*, pp. 65, 212-213.—The normal schools are not at this time (1922) able to turn out anything like an adequate number of trained teachers, nor is the salary paid to the average teacher anything like adequate to the needs of an educated, well-trained man or woman. No matter how earnest the teacher may be, his or her usefulness must be lowered by the pinch of circumstances or by the impossibility of obtaining adequate tools in the way of books, magazines, and the fact that it takes the savings of two or three years or more to pay for one session at a summer school. It is small wonder that numbers of school teachers in the United States rapidly leave the profession, or that the Bureau of Education in a middle western state can report that the average term of service of the rural-school teacher is two years.—See also MISSOURI: 1865-1920; NORTH CAROLINA: 1900-1920; Education; also above: 19th century; United States: Training teachers.

ALSO IN: T. E. Finnegan, *Teachers' training agencies*.

United States: Consolidated rural schools.—Perhaps the most important educational develop-

ment of the century in the United States is the increase in the numbers of consolidated rural schools. The "little red school house"—the one man school, does not, except in isolated sections, meet the needs of increased population in a complex age. "Sixty per cent. of the next generation of American voters are enrolled in the schools classed as rural by the standards of the Federal Bureau of Education. . . . Either the units must be small; or if the small units are consolidated in central schools, the expense of transporting pupils must be met."—J. A. H. Keith and W. C. Bagley, *Nation and the schools*, p. 186.—This in an increasing number of instances is being done. "The idea of the consolidation of schools is spreading very rapidly into every state of the union. . . . Randolph County, Indiana (which is) over 95 per cent consolidated (is an example of what may be accomplished in this direction.) . . . In place of 131 abandoned one room schools, there are 21 consolidated schools, 5 of which have both graded and high school departments. Six of the latter are in the open country. [In April 1920, ninety-six per cent. of the eighth grade graduates were in high schools, showing that] from an educational and social standpoint, among the young folks alone these schools have vast possibilities. . . . Marshall County, Iowa, . . . contains 576 square miles. . . . There are fourteen consolidated school districts in the county, and six consolidations partly within the county and partly within adjoining counties. The size of the districts ranges from 12 to 28 square miles. . . . In 1920 this state had 340 consolidated schools. [With such consolidation, either on a township or community basis, it is possible, not only to get enough money to provide schools but also to make provision for the social side of life, which is essential in almost all cases, for a full education of all the faculties.]"—A. W. Hayes, *Rural community organization*, pp. 58, 62, 63, 71.—The idea has become prevalent that the consolidated school is the best instrument for the enforcement of the compulsory education laws, which, in some rural districts, have been practically ignored. "The annual reports of the Commissioner of Education disclose that about one-half of the Nation's children are enrolled in the Village and open-country schools. These twelve million children are laboring under distinct educational disadvantages. So far as the open-country schools are concerned, fully two hundred thousand of these schools may still be classed as one-room schools of pioneer type, which but poorly meet the needs of modern agricultural life. Their teachers are largely immature, inexperienced, poorly trained, and of limited vision of rural needs and problems. The school year is much shorter than it ought to be, enrollment of school population is in many States low, daily attendance is often irregular, and compulsory-attendance laws are not always enforced as they should be. The course of study in the small schools is often badly planned and the subjects poorly taught, and financially they are meagerly supported in comparison with what is invested in education elsewhere. Recent educational surveys have disclosed that in certain States the level of school education must be measured by about six and one-half years of school attendance for the villages and less than five years for the rural districts. Such limited education can not furnish the intelligent leadership required at this present time of entrance upon the new era of scientific agriculture. . . . The district unit, which in the early days was the only kind of organization possible, has largely outlived its use-

fulness as a unit of school organization and administration. Unquestionably it is the cause of much of the inefficient and ineffective schools to be found in many sections. . . . There are probably 212,000 schools of the one-teacher type still in use in rural communities, the only means of education open to the large majority of rural children. It is now accepted as good national policy to reorganize the small schools to meet the needs of the new era of commercial agriculture. Many of these schools can never be converted into large centralized schools for topographical and other reasons. In broken mountain districts or in sections of the country cut by streams and ragged coast lines, or in sparsely settled regions, such reorganization is seldom feasible and should not be urged. . . . For rural schools, the new standard requires, first of all, a teacher who has preferably had his professional training in one of the special schools for rural teachers, a person of rural mind and in love with rural life, who understands its difficult problems. He must be hired by the year, living at the school in a home provided by the community. . . . [For the ordinary rural schools] it is probably safe to say that the period of experimentation in . . . consolidation has passed. The movement has now been accepted as good national policy . . . [and in 1918 there were] about 10,500 consolidated schools in the United States. . . . These are schools with two or more teachers, resulting from the centralization of two or more schools, providing facilities of the graded-school type. The most satisfactory type of consolidated school is planned to give the rural community just the kind of education required by an agricultural population. Broadly cultural and yet practical; preparing them for happy, wholesome, remunerative living on the land. . . . Up to [1919] . . . 122 rural-school departments . . . [had] been established in the normal schools. Many of the departments are in charge of a director, who usually teaches rural sociology and economics, and one or two other instructors, one of whom is a rural critic teacher. Altogether 84 of these departments . . . [were making] use of rural practice schools, either erected on the campus or located in near-by country districts; 97 other normal schools offer specific courses for training rural teachers, some limiting the courses to the summer sessions. The above enumeration shows an increase of almost 100 per cent in these facilities over what the schools offered in 1915."—H. W. Foght, *Rural education (Department of Interior, Bureau of Education, Bulletin no. 7, 1919, pp. 3-5, 11-13)*.

ALSO IN: *United States Bureau of Education, Bulletins* (1916) nos. 24, 29, 41, 44, 48, (1914) nos. 5, 31, 33, 35, 44, (1918) nos. 3, 27, 31.

United States: Secondary schools.—Junior high schools.—"The secondary school in the United States, usually called the high school, is not designed for a particular class of people. It is the second step in the common educational scheme, receiving its pupils after they have finished the work of the elementary school and continuing their studies for four years. In its origin this school was preceded by the Latin grammar school and the academy, both of them designed to train the children of the upper classes for professional life or governmental service. The high school was established on these lines, particularly to bridge the gap between the public elementary school and the public university. In some sections this school is practically the creation of the last two decades. Where this is the

case, as in the south, there are still many private schools of this sort preparing the children of the wealthier people for college. But the influence of the private secondary school is waning. . . . The secondary school in the United States is a small school, with few students, few teachers, and the great majority of students of this age receive their education in this type of school. In the larger cities, where some thirty per cent. of the high-school pupils are enrolled, we find large schools with large teaching staffs, splendidly equipped, and able to provide varied types of work. . . . Despite the cosmopolitan character of the student body, and despite the varied aims and ambitions of the students, the singular fact remains that the programme of studies is almost

number of courses only can be given. This has resulted in the fact that college preparatory work is largely given, while the number of pupils preparing for college and professional life has steadily decreased. . . . A common type of small high-school programme is the following, taken from a small New England high school: *First Year:* English composition and literature; Ancient history; Beginning Latin; Algebra. *Second Year:* English composition and literature; Medieval history; Caesar, Books I-IV.; Plane geometry. *Third Year:* English literature; Modern English history; Cicero (six Orations) or Beginning German; Physics or bookkeeping. *Fourth Year:* English composition; American history and government; Virgil I-VI. or German; Chemistry or

MORRIS HIGH SCHOOL, NEW YORK CITY

uniform throughout the country. This is due not so much to regulation from higher authorities as to the origin of the school and to its limited facilities. When the high school was formed it took as its purpose the preparation of pupils for college. The colleges had taken as a basis for preparation the work of the private secondary schools of the east. No better illustration of this can be found than in the development of high schools in the south in the . . . fifteen years [prior to 1918]. From an almost total lack of high schools in this section in 1900, there are now high schools scattered all over the south. This progress, in great measure, has been due to the professors of secondary education in the state universities, who becoming educational evangelists, spread the high-school doctrine. To-day their recommendations are most powerful in determining the character of these schools. Further, since most of the schools are small, a limited num-

ber of courses only can be given. This has resulted in the fact that college preparatory work is largely given, while the number of pupils preparing for college and professional life has steadily decreased. . . . A common type of small high-school programme is the following, taken from a small New England high school: *First Year:* English composition and literature; Ancient history; Beginning Latin; Algebra. *Second Year:* English composition and literature; Medieval history; Caesar, Books I-IV.; Plane geometry. *Third Year:* English literature; Modern English history; Cicero (six Orations) or Beginning German; Physics or bookkeeping. *Fourth Year:* English composition; American history and government; Virgil I-VI. or German; Chemistry or

Typewriting and shorthand."—P. Sandiford, *Comparative education*, pp. 58-60, 63-64.
 "Within the last ten years [written in 1922] there has been a great deal of discussion regarding the proper division of the twelve years which have represented the common range of public schooling. Psychological considerations indicate that a division should be made at the end of the sixth rather than the eighth year. Practical experience with seventh and eighth grade pupils reveals a considerable marking of time in the last two years of the eight-year elementary course. The demands of time economy call for the earlier beginning of certain subjects than the ninth year, both for vocational and for college preparatory ends. The desire to keep open the doors of opportunity as long as possible for all children points to the desirability of greater freedom for self-discovery before they are compelled to choose seriously and definitely a life calling. The gen-

eral utility of manual education and the probability that the great majority of pupils will become industrial workers or farmers, constitute a reason for greater attention to work with tools and materials. These and other reasons have prompted the organization of an intermediate or junior high school, composed of the seventh, eighth, and ninth grades or some other combination of intermediate grades, in which the various educational modifications mentioned above may be introduced. The junior high school idea is having wide adoption and promises to become the standard form of organization over the country at large for the intermediate grades."—E. H. Reisner, *Nationalism and education since 1789*, pp. 536-537.—See also EDUCATION, ART: Modern period: United States.

ALSO IN: *Cardinal principles of secondary education* (U. S. Department of Education, Bulletin no. 35, 1918).—Russell Sage Foundation, Com-

without any supervision by the national government. . . . The organization and training of the national army also brought clearly into view the fact that a significant portion of the young men liable to military service were not acquainted with the English language, and that this ignorance made it more difficult to produce promptly an effective army and navy. Private persons and private incorporated societies had already seen that this ignorance of the English language on the part of alien operatives was impairing efficiency and productiveness in various American industries, and had taken some measures to remedy locally this evil. . . . The war has brought home to millions of young men and to other millions of their relatives, friends and acquaintances that in the new kind of fighting, by means of innumerable applications of chemical and physical science, the soldier or the sailor needs intelligence, personal initiative, well-trained senses,

CLERICAL AND VOCATIONAL TRAINING FOR ENLISTEES

parative study of Public School Systems in forty-eight States.—D. L. Sharp, *Education in a democracy*.

United States: Illiteracy.—The army tests revealed the fact that practically one man out of every four (24.9%) was unable to meet the relatively simple test of intelligent reading and intelligible writing.—Based on J. A. H. Keith and W. C. Bagley, *Nation and the schools*, p. 196.—Merely to be able to spell out with great labor the headlines of the newspaper is perhaps a slight advance over complete illiteracy; the ability to write one's name laboriously is perhaps better than not to be able to write at all but the advance is so slight as to be almost negligible. "This illiteracy was conspicuous in the army and navy, which the government undertook to recruit rapidly by draft, and was at once seen to present serious obstacles to the rapid training of effective government forces. The public promptly perceived that the prevention of illiteracy [which averaged 25% among the drafted men] was a national interest, which should never have been left to the states

and some skill of eye, ear or hand. All the belligerent governments have learned this lesson. They have learned that armies need a large proportion of skilled workmen in the field, at the front as well as behind the front. They have learned that every private soldier or sailor needs to understand orders, to remember them, and to comprehend the plan and objects of a given attack, so that he can carry out the orders even if no officer or non-commissioned officer be left to guide him. If then a nation may be called on to put an effective army into the field at short notice, its schools should have given constant attention to the training of the senses and the memory and to the acquisition of skill. All American schools must, therefore, add to their present programs, which are based chiefly on literature and mathematics, instruction in the sciences of observation in the arts and crafts, and in the elements of music, drawing, modeling and architecture; and must give all pupils practice in the use of their own eyes, ears and hands in productive labor, and in the inductive method of

reasoning. The war has also placed in a clear light the need all over the world of a more productive agriculture, and has shown how that need may be satisfied through giving instruction to children and adults in the means of increasing agricultural productiveness through the study of soils, seeds, food plants, domestic animals and the best means of cultivating and improving the soil. It follows that the teaching of agricultural science and art should be an important feature in the education of every child in both the urban and the rural population. Fortunately, the agricultural arts afford admirable means of training children and adults to accurate seeing and recording and then to sound reasoning on the records made. . . . These facts suggest strongly the urgent need of modifying profoundly the programs of American elementary and secondary schools. They must no longer cling almost exclusively to languages and literature and the elements of mathematics. They must give a considerable part of school time to the sciences and arts, and to the acquisition by every pupil of some skill of eye or hand or both, and at the same time must increase rather than diminish the amount of training they give in memorizing to hold, in discrimination between the true and false, the wise and the foolish, the good and the bad, in the selection of premises, and in sound reasoning. . . . Because of the complete detachment of church from state in . . . [the United States], and of the existence . . . of a great variety of churches based on different dogmas and creeds, . . . all of which are tolerated and protected by the national and state governments, it has been considered impossible to allow in the . . . [public schools] any of the teachings or practises ordinarily called religious. A bad result of this condition is that there has been in the public schools no systematic inculcation of duty towards parents, neighbors, teachers, friends or country, or of reverence towards God. . . . It is one of the best lessons of the war that millions of American youth trained in schools of this negative character as regards things spiritual—many of whom were not connected with any church— . . . developed in the presence of the hardships, horrors and risks of war sentiments which may be properly called religious, and might be expressly inculcated in American public schools.”—C. W. Eliot, *Defects in American education revealed by the war* (*School and Society*, Jan. 4, 1919, pp. 1, 4, 5, 8).—Two-thirds of the total adult illiteracy is in the rural communities. In consolidated schools there is greater opportunity for careful grading, as in some city schools, where distinctly backward children are now removed from the regular class-rooms and taught in special groups while in the country schools the moron and the gifted child sit side by side.—See also AMERICANIZATION: Coöperation by the public schools; Effect of World War; CIVICS.

ALSO IN: E. C. Moore, *What the war teaches about education*.

United States: Junior colleges: Definition, development and purpose.—“The term ‘junior college’ is now widely accepted as applying to those institutions, either public or private, which offer the first two years of the standard college course, above and beyond the standard 15 units of high-school work. . . . The junior college movement, . . . this new departure in education, found its first significant expression at the University of Michigan in the early eighties. Later, in 1892, it was taken up almost simultaneously by the Universities of Chicago and California. . . . In

these institutions there was not only a reorganization of the liberal arts colleges into upper and lower divisions, or junior and senior colleges, but that also definite steps were taken toward the reorganization of the high schools and colleges of the country in accordance with this idea. Both institutions encouraged high schools to extend their courses so as to include at least one and ultimately two years of standard college work. The University of Chicago in particular emphasized also the necessity of small colleges limiting their work to the first two years rather than attempting to offer the full four years of college work. [The] . . . movement made little headway during the next 15 years. The most significant event during that time was the organization of a junior college in connection with the high school at Joliet, Ill., in 1902. This institution is now perhaps the oldest junior college in operation, and its apparent success of 16 years speaks much for the junior college movement as a whole. In 1907 the legislature of the State of California passed an act permitting high schools to offer the first two years of standard college work in addition to the regular four-year high-school course . . . [and since that time the movement has made rapid growth]. A number of public high schools in California, Illinois, Michigan, Minnesota, and Iowa . . . now [1919] . . . offer one or two years of standard college work. During the same period, and especially since 1911, when the University of Missouri launched a vast educational experiment by accrediting the small colleges of that State, the junior college idea has made wonderful progress in connection with the small and poorly equipped colleges of the country.”—(*United States Bureau of Education, Bulletin no. 35, 1919, pp. 6, 40-42*).—“Three types of junior colleges have recently evolved in this country. The first type, exemplified in the junior colleges of California, is an integral part of the State educational system. The establishment of junior colleges in connection with the city school system tends to keep at home . . . in the local junior colleges large numbers of, freshmen and sophomores who . . . otherwise would overcrowd the large universities and make difficult the prosecution of advanced collegiate and university work. . . . The second type . . . found in Missouri and in the South and Southwestern States, [is] . . . largely the result of the contraction of small denominational colleges whose degrees and equipment failed to meet the high standards of the leading State universities of those regions. The third type of junior college has . . . appeared in Wisconsin, the State legislature having granted the State normal schools the privilege of reorganizing their work on the junior college plan.”—S. P. Capen and W. C. John, *Survey of higher education, 1916-1918* (*United States Bureau of Education, Bulletin no. 22, 1919, pp. 14-15*).

United States: Incorporation of the General Education Board. See GENERAL EDUCATION BOARD.

United States: Commercial schools.—“The opportunities for formal school preparation for a business career which are . . . offered in the United States may be roughly divided into four classes. First: The ‘commercial college’ of the well-known type, an institution of which the merits have been frequently underrated, but which

has already accomplished much good. . . . Second: The business courses of the public high school, meagre and illiberal hitherto, but growing constantly richer, more popular and more generally introduced. . . . Third: Private endowed schools, more or less technical in character, introducing commercial courses which, in their best form, seem tending to realize the desirable standard of secondary business education. Fourth: College and university courses, which promise to embody the conception of higher business instruction in colleges of commerce, the work of which, largely technical, will not be inferior to the ordinary undergraduate courses of our American universities, and which, under favorable circumstances, will parallel for the future business man the advantages which have been hitherto offered in graduate courses for those who are preparing for other careers."—E. J. James, *Commercial education (Education in the United States)*, pp. 656-657.—Among the other chief centers of higher commercial education in the United States are the Amos Tuck School of Administration and Finance (1900) of Dartmouth College, the School of Commerce, Accounts and Finance (1900) of New York University, and the Graduate School of Business Administration (1908) of Harvard University. "While most European educators in the latter half of the nineteenth century were harking back to Herbart and Froebel, new forces in educational thought were gradually manifesting themselves in the [United States]. . . . The starting point was found in the familiar idea . . . that the teacher can only do his work to good purpose on the basis of a sound knowledge of child nature. . . . But there were new factors in the old problem. . . . [Evolution had given new views of childhood and youth. The advance of scientific method had made exact child study a matter of necessity.] From a realization of these things rose the American child-study movement. . . . The pioneer in this movement was Granville Stanley Hall (b. 1846), at a later date the distinguished president of Clark University. In 1883 he began the work . . . with an enquiry regarding *The Contents of Children's Minds on Entering School*. [Thence he proceeded, with the aid of assistants, to explore the mind of the child, and finally wrote his great book on *Adolescence*. The movement spread like wildfire, first throughout America, and then throughout the world, and by the last decade of the century there was evidence that scientific study of the child had become part of modern practice in teaching. . . . John Dewey (b. 1859) had much in common with Dr. Hall. His ideas on education, however,] though quite as revolutionary as Hall's, seem more in touch with the actualities of life."—W. Boyd, *History of western education*, pp. 413-414, 418.

United States: Experimental schools.—An "important attempt at the solution of the problem [of the overburdening of the school curricula] has been along the line of abandoning largely the old subject-classification, and teaching 'projects' instead. The work of John Dewey, in the experimental elementary school he conducted for some years [1896-1903] at Chicago, was pioneer work along this line. Making motor expressions, social participation, and the industries of life the ideas around which instruction centered, and making the school reproduce the typical conditions of social life, he constructed a course of study based largely on occupations, projects, and social demands, and continually calling for expression rather than receptivity. In his school the work of the teacher was largely that of

planning, guiding, and interposing 'pedagogical interference' to direct the activities of the children along lines that would be helpful and educationally profitable. The old formal school subjects, with set times for classes, were replaced by studies, projects, and activities, . . . into which were introduced number, speech, reading, writing, drawing, manual work, history, and geography, as needed to understand or work out the project of the day or week. The school resembled a combination of a kindergarten and series of workshops more than an ordinary school."—E. P. Cubberley, *Public education in the United States*, p. 445.—"A still more fundamental reorganization, or rather a construction along new lines from the bottom upward, is represented by the school system recently built up at Gary, Indiana. This represents one of the most original pieces of constructive work ever attempted in American education. The essential idea underlying the plan is 'the use of all the educational opportunities of the city, all the time, for all the people, and in a way which reveals to young and old that what they are doing is worth while.' The schools run on a four-quarter plan, each quarter of twelve weeks' duration; the school plant is a playground, garden, workshop, social center, library, and a traditional-type school all combined in one; the elementary-school and the high-school work are both given under the same roof; some of the high-school subjects begin as early as the fifth grade; specialization in the instruction and, in consequence, departmental instruction run through the schools; classes in the special outdoor activities and shop work are carried on at the same time as indoor classes, thus doubling the capacity of the school plant; the school day is eight hours long, with the school plant open also all day Saturday; continuation schools and social and recreational centers are conducted in the same plant in the evenings; and play and vocational work are important features of the instruction in all schools. Each school is, in effect, a world in itself, busily engaged in the work and play and government of the world, and so well do such activities and a highly flexible curriculum meet the needs of all classes that the need for most of the promotional machinery and special-type classes and schools is here eliminated."—E. P. Cubberley, *Public school administration*, p. 317.

"In the Lincoln School, [an experimental school attached to Columbia University] an attempt is being made to organize a curriculum which emphasizes the interests and activities of actual life—social, civic, industrial, physical, intellectual, and ethical—thus endeavoring to lead pupils to an appreciation of school work as organically connected with the interests of the home and community. Particular attention is directed to improvement of the ways and means of instruction and to the development of courses of instruction which are based upon the varied interests and activities of society. No subject-matter is included in the courses of study merely because of traditional requirements, or merely for formal disciplinary ends, since it is desired to experiment with the theory that the best disciplines are secured through the use of materials which are in themselves related to common thought, use, and ideals.

The Lincoln School began its work on October 1,

1917. It now [1921] has an enrollment of 215 pupils, including boys and girls, distributed throughout the twelve grades. The classes are relatively small, since it is desired that none shall exceed 20 pupils, in order that the attention of teachers may be directed primarily to constructive work rather than to the heavier burdens of teaching which are involved in caring for larger numbers of pupils. Constructive experimentation is being carried out in the high school in the sciences, mathematics, history and civics, English, modern languages, and industrial arts. In the elementary school similar experiments are being conducted in the reorganization of instruction in the fundamental subjects of reading, history, writing, spelling, arithmetic, and music.—*Teachers' College Bulletin*, 1921-1922, p. 131.—The considerations which led the General Education Board, which supports the school by appropriations, "to cooperate with Teachers' College in establishing an experimental school may be briefly stated. The improvement of subjects of study and school methods is a creative task, involving the construction of new curricula in both new and old subjects, the production of textbooks and other organized material, from which obsolete and useless matter has been eliminated and to which new material of value has been added. Work of this type can best be done by teachers who, possessing scholarship, originality and teaching skill in unusual measure, can test the new product in the classroom, molding it and modifying it until it is suited to its intended use. A given school system is not likely to contain a considerable proportion of unusual or creative teachers, and even these are more or less lost in the large body of instructors; moreover, . . . an entire system, . . . is too unwieldily to depart widely from the type of school work with which the public is familiar, and it is almost impossible to make an exception of a single school so as to devote it to experimental purposes. Finally, routine burdens are so heavy that the time and energy needed for cooperation in constructive work are apt to be lacking. . . . The school is organized on the six-three-three basis—that is, it is . . . made up of six elementary grades, three junior high school grades, and three senior high school grades."—*Lincoln School of Teachers' College (School and Society)*, Feb. 22, 1910, pp. 228-229).—"The variety of work undertaken requires a lengthened school day and also a lengthened school week. In addition to increased time for the classroom, time must be found for shop work, cooking, library, gymnasium, and individual projects of various kinds. The longer day, enlivened by such activities, . . . is regarded as desirable by pupils as well as teachers. It seems clear that a shorter day of conventional character really makes more severe physical demands on pupils than does a longer day in which better distribution of work is secured. Therefore the intermediate classes remain in school until 3 p. m., junior and senior high school pupils until 4 p. m., and, by special permission, sometimes even later."—*General Education Board Annual Report, Description of Lincoln School*, 1918-1919, pp. 58, 59.—For platoon schools see DETROIT: 1920: Adoption of Platoon plan.

United States: Religious bodies in the field of education.—"The Board of Missions for Freedmen has for its task the greatest possible contributions toward the educational development of the Negro race in the South. This is a prob-

lem which has confronted the church ever since the emancipation of the Negro . . . until now it is concerned with more than 8,000,000 colored people, largely in rural communities, scattered throughout 13 States. When the fact is considered that 30 per cent of these 8,000,000 people are illiterate, it can readily be seen that the church is committed here to a most important work. The schools maintained by this board have a property value of approximately \$1,100,000—

Number of day schools.....	140
Number of boarding schools.....	27
Total number of schools.....	167
Enrollment	18,708

"The Baptist Church, North, owns and controls through its Home Mission Society 23 schools for the Negroes of the South, 13 being of college grade and 10 of secondary grade. It owns one school for the higher education of the Indians and several for elementary education. It also conducts one school in Cuba and one in Porto Rico. . . . [Something less than a third of the pupils at these schools receive industrial education in some form, and a number are prepared for the ministry. The] school properties are valued at \$1,454,000 in 1918. Catholic schools for the education of Indian children numbered in 1917-18, 63. They include 8 day and 55 boarding schools, and in many instances offer industrial and agricultural training. Of the boarding schools, 3, located in Alaska, receive some support from public funds, in the form of salaries paid certain of their teachers. Of the remaining boarding schools, 14 are partly supported, not out of public funds, but out of Indian tribal funds. The balance of these schools (38) are entirely supported by the church, as is the case with all the day schools. Catholic schools for Negroes include parish establishments, agricultural and industrial schools and some colleges. They represented a total of 132 in 1917-18. These schools are supported by endowments and by the voluntary offerings of Catholics collected and distributed through the Catholic Board for Mission Work among the Colored People, and the Commission for Catholic Missions among the Colored People and Indians. . . . The Catholic school system in the United States at present embraces elementary or parish schools, high schools, academies, colleges, ecclesiastical seminaries, universities, and a great variety of schools of a special or vocational type, such as novitiates, normal schools, industrial schools, orphans," and the schools for Indians and negroes. The elementary schools represent by far the largest division of the system, and are now established over the entire country. The Catholic church in the United States consists of 14 arch-dioceses and 87 dioceses. Each of which has its elementary schools. The total number for 1917-18 being 5,748 and the total of pupils 1,593,407. The ordinary unit of administration for the elementary schools is the diocese. All parish schools consequently come under the immediate jurisdiction of the bishop, the head of the diocese. The diocesan systems are usually presided over by school boards and superintendents, or other officers appointed by the bishop of the diocese.

"No other department in the Catholic school system has attracted more general attention in the past decade than the secondary. A marked activity has set in in the various teaching communities to meet the increasing need for high schools created both by the rapidly growing

parish-school system on the one hand and the colleges on the other. The entrance into the field of the parish high school and the central high school, the latter for the accommodation of the children of a larger section or of a group of parishes, has had a pronounced effect on the movement. . . . [In 1915] there were 1,276 Catholic secondary schools in the United States. Of these 473 were for boys and girls; 125 were exclusively for boys; 577 were exclusively for girls; 100 were connected with colleges. They enrolled in the year reported a total of 74,538 pupils, 34,708 of whom were boys and 39,740 were girls. A more detailed study of the high schools containing boys showed that of the 438 schools investigated, all but 29 were directly connected with one or more parish schools. This was not found to be true of the high schools for girls. Of the 577 schools listed only 165 had any parish connections, the majority being academies conducted independently of the parish schools by the teaching communities."—*Educational work of the churches in 1916-1918* (Bureau of Education, Bulletin no. 10, 1919, pp. 33, 29, 52, 44-47, 48).—See also Y. M. C. A.: 1885-1890.

United States: North American Indians.—"After the [American] revolution, congress and the country as a whole were so much absorbed with the duties of self-establishment that little heed was paid to Indian education. A number of minor appropriations are recorded on the basis of treaties with a few tribes, and at a few points missionary zeal continued a fitful activity. During the first quarter of the nineteenth century, however, a great religious revival again directed general attention to Indian education as a Christian and national duty. Missionary bodies took up the work with renewed zeal. Congress responded in 1819 with an appropriation of \$10,000 in addition to certain treaty obligations. In 1820 the president was authorized to apply this sum annually in aid of societies and individuals engaged in the education of Indians. In 1823 the sum of \$80,000 was expended in 21 schools maintained by missionary bodies; \$12,000 of this amount had been contributed by the government. In 1825 the number of such schools had risen to 38, the entire expenditure for these to \$202,000, of which the government, directly and indirectly, had contributed \$25,000. In 1848 there were reported in operation 16 manual training schools, 87 boarding schools and other schools. These schools continued to increase in number and efficiency up to 1873. They were under the control of missionary bodies with such scanty aid from the government as the small appropriations afforded. Only a few small day schools had been established by the government directly under treaty provisions. After this time, however, the government entered upon an era of almost feverish activity in the establishment of strictly government schools; first, day schools, then boarding schools and industrial training schools. Congress kept pace with this zeal in the liberality of its appropriations. In 1877 it appropriated for schools, outside of treaty provisions, \$20,000, in 1880 \$75,000, in 1885 \$902,800, in 1890 \$1,364,568, in 1895 \$2,060,695, in 1899 \$2,638,390. During this period the average attendance rose in similar ratio from 3,508 in 1877 to 19,648 in 1898. The increased appropriations by congress for the education of Indians naturally stimulated a desire on the part of the government to control the expenditures directly and in detail. Possibly this desire was much enhanced by the fact that such expenditure opened to the party in power a

rich field for patronage. At the same time it was discovered that the constitution, by implication at least, forbade the appropriation of public funds for denominational purposes. Concurrent conclusions, unfavorable to government support of missionary schools, were further strengthened by the fact that the Roman Catholic church had gradually outstripped the Protestant missionary bodies and was absorbing the lion's share of government support. During the first half of the century the Protestant missionary organizations had had well nigh a monopoly of government support; but, later on, the Roman Catholics had wrested from them the preponderance. In 1889 the Catholic church drew from the appropriations for this purpose \$347,672, as against \$128,518 drawn by Protestant bodies. In 1892 these amounts had risen to \$394,756 for the Catholics and \$160,874 for the Protestants. In 1893 the Methodist Episcopal church withdrew from participation in government aid without, however, abandoning its schools. In 1895 this example was followed by the Presbyterians and Congregationalists, in 1896 by the Friends, and in 1897 by the remaining Protestant denominations. This left only the Catholics in the field with an appropriation of \$198,228. This process was aided by congress which, in 1804, had declared its policy of gradually abandoning all support of denominational schools. This policy has since been followed, so that in 1899 the appropriation was reduced to \$116,862."—W. N. Hailmann, *Education of the Indian, in Education in the United States* (W. M. Butler, ed.), v. 2, pp. 943-945.—See also INDIANS, AMERICAN: 1919; 1920: Existing schools, etc.; U. S. A.: 1885-1891.

United States: Negroes.—Pre-revolutionary beginnings.—Opposition.—Post Civil War conditions.—"The first schools for Negroes were private ones, such as everywhere preceded public schools. In 1704 one such school was opened in New York, in 1770 one in Philadelphia, and in 1798 one in Boston. In certain places in what is now the Middle West private schools became largely supported by manumitted Negroes. In the South efforts were of course more sporadic; but deserving of attention is the education which Negroes received through private or clandestine sources. More than one slave learned the alphabet while entertaining the son of his master. As early as 1764 the editor of a paper in Williamsburg, Va., had established a school for Negroes; and about 1800 a Negro, the Rev. John Chavis, passed 'through a regular course of academic studies' at Washington Academy, now Washington and Lee University. In Charleston for a long time before the Civil War free Negroes could attend schools especially designed for their benefit and kept by white people or other Negroes. The course of study not infrequently embraced such subjects as physiology, elementary physics, and plane geometry. After John Brown's raid the order went forth that no longer should any Negro teach Negroes. This resulted merely in a white person's being brought to sit in the classroom. [Such a school as this, however, stands out in the surrounding darkness. Some of the states had laws against the education of negroes on their statute books. South Carolina in 1740 prohibited the teaching of writing to slaves. A law passed in Georgia in 1770 imposed a fine of twenty pounds

for teaching either reading or writing to slaves, and another followed it up in 1829 by forbidding any negro to receive instruction. Virginia in 1819, Louisiana in 1830, North Carolina in 1835, and later Mississippi and Missouri passed laws of equal severity. The other Southern States did not forbid schools for free negroes. It may be laid down as a general rule that no attempt was made, and no desire could be felt to make an attempt to educate negroes as a class while slavery existed as an institution. Approximately 95 per cent. of the negro population was illiterate at the close of the Civil War.] On the outbreak of the Civil War, . . . Negro schools were closed altogether. In the Northern states two institutions for the higher education of the Negro were established before the Civil War, Lincoln University in Pennsylvania in 1854 and Wilberforce in Ohio in 1856. . . . [In 1834 the Oberlin trustees] took the advanced ground of admitting Negro men and women on equal terms with white students. . . . In 1865 about one-third of the students were of the Negro race, and Oberlin still leads Northern colleges in the number of Negro graduates, especially women."—B. Brawley, *Short history of the American negro*, pp. 104-105.—"In the free states of the north . . . there was no prohibition by the state against . . . instruction, but there was a very pronounced popular sentiment against it. . . . In 1833 the Connecticut legislature enacted . . . [a black law which forbade the establishment of any kind of school whatsoever, for the education of negroes, not inhabitants of the State, without consent in writing by the majority of the civil authority and of the selectmen of the town. The occasion of this law was the opening of a school for colored pupils by Prudence Crandall in Canterbury. Miss Crandall was prosecuted, arrested, an attempt was made to burn and later to demolish her house and finally she was compelled to abandon her school. The law was repealed in 1838.] Schools established for the education of Negro youth were assaulted and wrecked in other free states, but . . . private schools sprang up in all the middle and New England states, Pennsylvania, New York and Massachusetts leading in the work. . . . Except the Institute for colored youth at Philadelphia, Lincoln university, in Chester county, and Avery institute at Allegheny City, all in Pennsylvania, [these schools were gradually absorbed into the public school system]. As late as 1830 no negro could matriculate in any of the middle or New England states."—B. T. Washington, *Education in the United States*, pp. 11-12, 14.

ALSO IN: C. G. Woodson, *Education of the negro prior to 1861*.—J. T. Jones, *Negro education*. "Both during and after the [Civil] War many schools were opened for negroes by Freedmen's Aid Societies, various philanthropic associations, and denominational boards or committees. As public schools were established for negroes, some of these organizations curtailed their work and others withdrew altogether. Others persisted, however, and new schools have been founded by these and similar organizations, by private philanthropy, and also by negro churches. As a result there are independent schools, state schools, and Federal schools. The . . . Bureau of Education [1919] reports 653 schools for negroes other than regular public schools. Of these 28 are under public control, 507 are denominational schools . . . and 118 are classed as independent. This last group includes not only the great national schools, such as Tuskegee and Hampton, but small private enterprises supported chiefly by

irregular donations. . . . State and Federal appropriations at the date of the report reached about \$963,000. During the first years after the downfall of the Reconstruction governments the negro received a fair proportion of the pittance devoted to public schools. Governor Vance of North Carolina, in recommending in 1877 an appropriation to the University for a 'professorship for the purpose of instructing in the theory and art of teaching' went on to state that 'a school of similar character should be established for the education of colored teachers.' . . . Instead of establishing the chair of pedagogy recommended by Governor Vance, the Legislature appropriated the money to conduct the summer school for teachers at the University. An appropriation of equal amount was made for negroes and similar allowances have been continued to the present. . . . Other States have established normal schools for negroes, but in none of them is the supply of trained negro teachers equal to the demand. The negro public schools were organized along the same lines as the white, so far as circumstances permitted, but the work was difficult and remains so to this day. . . . The enthusiasm for education displayed [by the negroes] just after emancipation gradually wore off, and many parents showed little interest in the education of their children. Education had not proved the 'open sesame' to affluence, and many parents were unwilling or unable to compel their children to attend school. . . . It must also be remembered that the negro tenant farmer is migratory in his habits and that he often moved in the middle of the short term. Consequently the whole value of the term might easily be lost by the transfer. . . . Partly because of . . . opposition on the part of the negroes themselves, partly because industrial training is more expensive than purely academic training, and partly because such training has only recently been recognized as part of education, the South has made little provision for the industrial education of the negro at public expense. According to the *Report on Negro Education*, few of the agricultural and mechanical schools maintained partly by the Federal land grants and partly by the States are really efficient. A few state or city schools also give manual training. About one-third of the private schools for negroes offer industrial courses, but much of this work is ineffective. . . . Hampton and Tuskegee are known to do excellent work, and a few of the smaller schools are to be classed as efficient; but in the great majority of negro schools the old curriculum is still followed. . . . The percentage of school attendance of negro children is lower than in the case of white children. Very few negro children, whether because of economic pressure, lack of ability, or lack of desire for knowledge, complete even the fifth grade. Among negroes there is little real demand for high school instruction, which is more expensive than elementary instruction. Therefore, the proportion of the total funds spent for negro education might properly be less than their numbers would indicate. . . . However, when all allowances have been made, it is obvious that the negro is receiving less than a fair share of the appropriations made by the Southern States for education. The inadequate public schools for negroes have been excused or justified upon the ground that private and church schools are supplying the need. This is true in some localities, for the great majority of negro private schools, no matter by what name they are called, are really doing only ele-

mentary or secondary work. These schools, however, only touch the beginnings of the problem and have served in some degree to lessen the sense of responsibility for negro education on the part of the Southern whites. Where there is one of these schools supported by outside philanthropy, the public school is likely to be less adequately equipped and supported than in the towns where no such school exists. But at best, these schools can reach only a small proportion of the children."—H. Thomson, *New South*, pp. 173, 174, 175, 176, 177, 180, 181.—"There are also a number of private schools of undoubted value, like the schools located at Manassas, Va.; Calhoun, Snow Hill, and Mt. Meigs, Ala.; St. Helena Island, S. C.; Utica, Miss.; and others, which are largely supported by contributions from the North. Moreover, all the states of the South have founded normal schools for the training of Negro teachers, such, for example, as the well-known institutions at Normal and Montgomery, Alabama; Pine Bluff, Arkansas; Tallahassee, Florida; Frankfort, Kentucky; Baton Rouge, Louisiana; Alcorn, Mississippi; Greensboro and Winston-Salem, North Carolina; Orangeburg, South Carolina; Nashville, Tennessee; Prairie View, Texas; and Petersburg, Virginia."—*General Education Board, An account of its activities, 1902-1914*, pp. 191-192.—See also GENERAL EDUCATION BOARD; JEANES FOUNDATION; SLATER FUND; U. S. A.: 1865-1866; 1868-1876.

EDUCATION, Agricultural: Australasia.—"The State governments [in Australia] pay close attention to agricultural education. Each State of the mainland has a special Department of Agriculture and staff of experts in all branches of crop-raising and live stock. Agricultural colleges and experimental farms have been established, and some of these are engaged in farming on an extended scale. In 1911 these institutions had almost 9,000 acres under crop, and owned upwards of 60,000 head of live stock. In addition to the education given at the colleges and farms, the experts travel extensively and deliver lectures in the settled districts. The state also imports purebred live stock for use by the farmers and distributes large quantities of seed for experimental

purposes. The Commonwealth is taking similar action in the Northern Territory."—H. S. Gullett, *Economic conditions and industries* (Oxford Survey of the British Empire, Australasia, p. 209).—"There are also numerous agricultural schools and colleges where scientific and practical agriculture is taught to pupils who have passed through the ordinary schools. . . . There are five agricultural colleges in the Commonwealth, . . . [and] also a number of experimental farms and agricultural high schools. In addition, there are many technical institutions that also provide agricultural instruction."—P. E. Lewin, *People of Australasia* (Oxford Survey of the British Empire, Australasia, p. 318).—In New Zealand "there is an agricultural school not far from Christchurch called the Lincoln School of Agriculture, which is affiliated to Canterbury College at Christchurch."—R. Stout and J. L. Stout, *Population and government* (Oxford Survey of the British Empire, Australasia, p. 456).

Austria.—"Although the importance of agricultural education was understood, and attempts were made to realize it, in the seventeenth and eighteenth centuries, it was not until after the settlement of 1867 that this subject received much support from the Government. . . . The agricultural educational organization consists of an agricultural academy, four agricultural colleges, and eleven agricultural schools. In addition to the State institutions, there are four private agricultural schools. In connection with the academy there are . . . (1) The station for experimenting in machinery; (2) the chemical experiment station; (3) the seed-testing station; (4) the veterinary station; (5) the meteorological station; (6) the agricultural committee. There are two grades of agricultural education: the Ackerbauschule, where the pupils are chiefly taught practical and necessary knowledge; and the advanced course of the institutes, in which the course lasts for three years. . . . For the further diffusion of agricultural knowledge the Government provides technical professors to study and advise on special products, a travelling lecturer to go round the country spreading agricultural knowledge and advising on agricultural matters, three monthly written courses of practical instruction, popular lectures on wrong methods, suggesting improvements, and model homesteads giving examples for small proprietors to follow."—G. Drage, *Austria-Hungary*, pp. 336-337.

Belgium.—In 1888 or 1889 Belgium followed the example of France in providing for agricultural education in the primary schools; continuation classes were organized in between twenty-five and thirty centers and traveling schools were so well established that between the years 1890 and 1893 the successful students at these institutions averaged over 150 a year. In 1905, according to B. S. Rowntree, five private agricultural schools were subsidized by the State. The attendance was small (only 180) but a number of secondary schools also received subsidies on condition of giving five hours' instruction in agriculture each week. Eleven secondary schools at this time taught agriculture and domestic economy to girls. Soon after school tuition in agriculture was supplemented by a staff of trained experts, employed by the State, each member of which promotes agriculture by lectures to the general public, special courses for women and soldiers, and individual advice to farmers. This forms the most important part of the system of agricultural education. In 1898 the appropriation for State agricultural education was about \$94,000, and ten years later had risen to about \$151,000. A few of the State experts—*agronomes*

de l'état—are attached to the office of the Minister of Agriculture in Brussels, but the majority of them are scattered over the country, apportioned according to districts. Before the interruption of the World War, conservation and reclamation of worn-out land and marked increase in production had testified to the success of the government's system of scientific education for the farmer. "The country has also State schools of agriculture, horticulture, arboriculture, technical education, domestic economy, and cooking. It maintains fifty-four dairy schools for men in which capable managers of co-operative creameries are formed."—J. de C. MacDonnell, *Belgium, her kings, kingdom and people*, p. 342.—"In Belgium itinerant housekeeping schools . . . [give] free instruction in domestic economy, agriculture, dairying, kitchen gardening, care of the home, and many other branches. In recent years the four or five months' courses formerly given have been replaced by courses lasting seven or eight days. The Farm Women's League, a branch of the peasants' league or 'Boerenbond Belge,' which continued its activities during the war, is composed of circles of farm women. These circles promote lectures on 'domestic economy,' 'education of children,' 'care of milk,' 'hygiene,' 'culinary art,' 'women on the farm,' 'family life,' and similar subjects. At the request of the league several circles of farm women instituted itinerant housekeeping courses in their communities."—*Farmers in European countries assisted by "schools" similar to those in America (Weekly News Letter, Jan. 14, 1920)*.—"A Belgian law of 15th November 1919 regulates Agricultural instruction, which is taught in two colleges, in one in the French language, in the other in Flemish; in high schools of agriculture; in elementary schools of agriculture; and by lectures and classes intended to spread agricultural knowledge."—*International Year Book of Agricultural Legislation, 1919*, p. xi.—The State College at Gembloux provides a choice of a three or four year course, the University at Louvain has its agricultural departments, and a Veterinary College is located at Brussels.

ALSO IN: B. S. Rowntree, *Land and labour lessons from Belgium*.

Canada.—"Apparently agricultural education in North America had its beginning in the farm school established by François de Laval, the first Bishop of Canada, about 1668, or near that date. He established the 'Lesser Seminary,' where 'the children of artisans and peasants were taught farming, and the various mechanical arts, and thoroughly grounded in the doctrines of the Church.' According to Parkman, the school had not much success in the direction indicated. In 1836, a school bill was introduced into the Legislative Assembly of Upper Canada 'to authorize the trustees of any school district to raise, levy, and collect the moneys as voted, and therewith to lease or purchase a lot or parcel of land or farming utensils, seeds, grains and grasses for the use of the teachers of the school, or to be annually apportioned among the scholars of the school or otherwise employed and occupied for the profit and instruction of the school, or parts thereof in horticulture, agriculture, or in otherwise growing plants, fruits, grasses, and grains as the Trustees, together with the school teacher for the time being, may think fit.' In 1847, when the first normal school was established at Toronto, arrangements were made to give the subject of agriculture a prominent place. Daily lectures were given in agricultural chemistry, demonstration plots were laid out, and practical experiments in field crops and fertilizers were conducted. In

1849, Lord Elgin, the Governor-General, offered two agricultural prizes of five pounds and three pounds, respectively, to the two students who should at the end of each half year pass the best examination in the subject of agricultural chemistry. Agricultural colleges, the first of which was established in 1874, are now at work in every province."—A. H. Leake, *Means and methods of agricultural education*, pp. 11-12.—"The Ontario agricultural college at Guelph was established in 1874 with the twofold object of training young men in the science and art of farming and of conducting experiments. . . . [The college, which has a world-wide reputation, carries on valuable laboratory and field experimental work.] The introduction of improved varieties of crops, the prevention of crop diseases and the great advances in the dairy industry which Ontario has been able to show in the last few years, are largely due to the results achieved by these experimental departments. In connection with the work of the Guelph College is the experimental union which includes several thousand farmers. . . . This conducting of field trials of manures, methods of cultivating . . . forage and grain crops has an enormous influence on the trend of public opinion regarding field-work. . . . [In 1899 agriculture was made an obligatory study in the public schools. In the same year a competition in seed growing by school boys was begun. The response induced Sir William Macdonald to offer large prizes, and the result of the competition] led to the Canadian Seed-Growers' Association, organised for the purpose of improving the crops of Canada. In 1906 it was estimated that these competitions were responsible for an increase in Canadian crops to an extent of half-a-million dollars. What is more to the point, . . . it also proved that children could easily be interested in agriculture."—W. L. Griffith, *Dominion of Canada*, pp. 290-291.—"The number of agricultural schools and colleges in Canada has, during the past few years, greatly increased chiefly on account of the keen interest shown by practical men towards agricultural education. The more modern of these institutions devote much attention to instruction of a practical nature, endeavouring thereby to train young men for the actual practice of farming. Of this latter type are the newly established Alberta Schools of Agriculture. These schools were established by the Government of Alberta in order to bring an agricultural education within the reach of farmers' sons and daughters in the province. At present there are three such institutions in operation at Vermilion, Claresholm, and Olds, which towns are respectively situated in Northern, Southern, and Central Alberta."—P. S. Ure, *Alberta schools of agriculture (World's Work, v. 35, no. 208, March, 1920, p. 314)*.—"Under the Agricultural Instruction Act (3 Geo. V, c. 5), appropriations are annually payable by the Dominion Government to each of the Provincial Governments of Canada for the encouragement of agriculture 'through education, instruction and demonstration carried on along lines well devised and of a continuous nature' and for the purpose of assisting in the work of veterinary colleges established in the provinces. The appropriation for the year 1920-21 amounts to \$1,100,000 and is allocated by provinces as follows: Prince Edward Island, \$31,749.22; Nova Scotia, \$81,716.69; New Brunswick, \$64,110.80; Quebec, \$271,113.76; Ontario, \$336,303.26; Manitoba, \$77,113.11; Saskatchewan, \$81,728.48; Alberta, \$66,965.62; British Columbia, \$60,199.06; Veterinary Colleges, \$20,000.00."—*Agricultural Instruction Act (Canada Year Book, 1920, p. 259)*.—See also EDUCATION:

Modern developments: 20th century: General education: Canada.

China.—“A surprisingly large part of the educational literature in China relates to the agricultural courses. The reports show that at present the various agricultural courses are the most popular branches of instruction. . . . American teachers have been of great service to China, for instance, by showing them how to improve rice by selection. In the experiment stations, the latter experiments are being made, both by wet and dry cultivation, with 200 different varieties of rice. In a few years American methods have enabled the Chinese to increase the size of many of their fruits several times over.”—F. A. Collins (*New York Times*, Apr. 3, 1921).

Denmark.—“Of the eighty high schools [in Denmark] thirty have an agricultural side; and there are, in addition, about twenty agricultural schools . . . all similar in their method of organization and management. The agricultural schools grew out of the high schools as a branch from the parent stem, and afterwards as separate institutions followed similar methods except that agriculture and the related sciences formed the main part of the subject-matter of the curriculum. . . . At the head of all the institutions established to give agricultural training, is the Royal Agricultural and Veterinary Institute at Copenhagen. This is the supreme teaching body. . . . The course of study extends over two years, but a supplementary third-year course is given. . . . [In this college] no attempt [is] made to train . . . the [students] in any branch of practical farming. . . . Attached to the college are large research laboratories, which receive an annual subsidy from the state in addition to the annual grant of \$70,040 given to the college.”—A. H. Leake, *Means and methods of agricultural education*, pp. 243-246.

England and Wales.—“The need for an efficient system of agricultural instruction began to be generally recognized in 1887. . . . At that time the provision for agricultural education of any sort was extremely scanty and [although Oxford had established a chair of agriculture in the eighteenth century] the independent colleges at Cirencester, Downton, Aspatria, and Hollesley Bay seem to have been the only centres at which general instruction in agriculture was given in England, and none of these were of a type altogether suitable for the ordinary tenant farmer. . . . In 1888 Parliament voted a sum of £5,000 to be distributed in the form of direct grants to Agricultural and Dairy Schools, and for assistance in agricultural experiments. . . . The Board [of Agriculture and Fisheries] have since 1888 made grants, which now [1913] amount to about £18,500 per annum, in aid of the higher agricultural education provided at Universities, and at University and Agricultural Colleges in England and Wales. In addition, most of the counties of England and Wales provide agricultural education of a less advanced character, either through a permanent staff of instructors, or through instructors attached to one of the Colleges referred to above. In many cases both systems are adopted. The Board make grants in respect of this work, and grants are also available from the Development Fund for the further extension of education of this type, and especially for the erection and maintenance of farm schools and farm institutes. In a few counties farm schools are already in existence, and in others a more or less permanent institution exists which may be regarded as the nucleus of such a school. . . . [In 1800 the Local Taxation Act provided a new stimulus for] agricultural education by placing at

the direct disposal of County Councils large sums of money for technical instruction. The result of this Act was that a considerable sum of money, amounting in recent years to £80,000 or £90,000 annually, has been expended by local authorities in aid of agricultural education. . . . For many years the bulk of the Board's funds has been devoted to assisting educational institutions working for groups of counties, many of them of the type of a University College, but . . . grants have also been given to certain other centres acting in a more restricted area. . . . Degrees of B.Sc. in agriculture are granted by the Universities of Wales, Leeds, Durham, and London, and students can be prepared for graduation at Bangor and Aberystwyth (University of Wales), Leeds, Newcastle (Durham University), and Wye (University of London), while at Cambridge the ordinary B.A. degree may be obtained through the medium of a 'Special' Examination in Agricultural Science. . . . The subjects cover the whole field of agriculture, and are of an advanced scientific character. A number of institutions grant diplomas in agriculture. . . . Courses last from two to three years, and include practical work. At Cambridge . . . agriculture . . . is usually taken as a post-graduate course, and, while not confined to graduates of the University, . . . is intended chiefly for students who have either taken an Honours Degree in Natural Science, or have passed the Special examination in Agricultural Science for the . . . B.A. degree. In most cases these courses of study also serve as a preparation for the examination for the National Diploma in Agriculture awarded jointly by the Royal Agricultural Society and the Highland and Agricultural Society of Scotland. . . . Most of the institutions also provide instruction extending over shorter periods, suited more especially for young men, farmers' sons, and others who intend to become practical farmers. . . . Instruction in dairying is given at most of the Agricultural Colleges as part of the ordinary training, but dairying also forms a separate subject in which short courses of practical and theoretical instruction are given. The subject receives, however, special attention at the University College, Reading, . . . and at the Midland Agricultural and Dairy College, Kingston, Derby. . . . The only College of University type in which a special [two years'] course in horticulture is arranged is that at Reading. It is designed for students who intend to take up horticulture as a career. . . . A one year's course is also provided for . . . teachers of botany and horticulture in primary and secondary schools. . . . The National Fruit and Cider Institute partakes very largely of the nature of a station for experimental research, but . . . fruit-growers and cider-makers may obtain assistance and advice . . . [while working pupils are received] for . . . instruction in fruit-growing. Courses of instruction for young gardeners in the principles and operations of horticulture, including fruit, vegetable, and flower culture, are arranged in connection with the County Technical Laboratories, Chelmsford.”—Board of Agriculture and Fisheries, *Agricultural education and research in England and Wales* (1907 and 1913), Leaflet no. 197.—“That part of the United Kingdom comprising England and Wales possesses [written in 1921] an extensive system of agricultural education well coordinated under the general supervision of the education branch of the Ministry of Agriculture and Fisheries. . . . The Agricultural Education Conference organized in 1910 meets at more or less regular intervals. In each of the provinces is established an advisory council

staff . . . [which] supplies technical advice and conducts general and special investigations of local problems."—C. L. de Vault, *U. S. Vice-Consular Commerce Reports*, no. 113, 1921, pp. 936, 937.

France.—France was the pioneer in agricultural education by the State. The work for primary schools was begun, very logically, in the normal schools in 1879. In 1882 it was extended to the rural primary schools; and in 1896 the course of study was revised and placed on a thoroughly satisfactory basis. "Agriculture is recognised as a department of the administration. Elementary agriculture is taught in the primary schools where children learn to distinguish between plants, grasses and soils; often a plot of ground is attached to the school, which serves as an experimental farm. The school teachers are supplied with training in the subject by department professors, who . . . give courses of lectures in the *écoles normales*. The rest of the system of agricultural education falls under the Minister of Agriculture. Three classes of schools are provided—(1) the *fermes-écoles*; (2) the *écoles pratiques* or *régionales*; (3) the *écoles nationales*. The fabric is crowned by the Institut Agronomique which was removed from Versailles and reconstituted at Paris in 1876. It forms a faculty of agriculture. The *fermes-écoles* are numerous and useful. . . . Many of these primary agricultural schools preceded state administration and were founded by private enterprise after the Restoration, but in October 1848 they were recognised as part of the administrative system of the State. Lads enter these farm schools as apprentices, not as pupils. They must not be over sixteen at the time of entrance; they are fed and treated as labourers; they go through a course of two or three years; . . . if they show any decided aptitude they may obtain a bursary at one of the *écoles nationales*. The cost of each farm pupil to the state is about £10 (\$50); the State also defrays the expenses of the salary of the director and his assistants. The director obtains the labour of the pupil for nothing, and manages the farm for his own profit, and at his own risk. The *écoles pratiques* are assisted and superintended by the State. It was intended that these should be distributed among the twelve agricultural districts into which France is divided. These agricultural high schools are designed for the sons of the wealthier class of cultivators. The cost is from £16 to £20 a year. The pupils learn agriculture and the elements of physics, chemistry, natural history, botany, veterinary science, and stock breeding. The three *écoles nationales* are placed in the centers of three districts of France [at] Grignon near Versailles, . . . Grand Jouan, near Nozay, . . . Montpellier formerly La Saulsaie. All three schools were founded before the Second Empire, Grignon [bought by Charles X] in 1827, Grand Jouan in 1832, La Saulsaie in 1840. They were all of them adopted by the State in 1848. The course of instruction lasts two and a half years; and each year is divided into two terms. . . . All the pupils are required to pass the entrance examination, unless they have previously taken the degree of Bachelier ès-Sciences. . . . Besides these schools . . . there are special schools such as sheep, cheese and dairy farms, the gardening establishment at Versailles, the school of drainage and irrigation at Lézardeau, the three veterinary schools at Lyons, Alfort and Toulouse, and horse-breaking schools like that near Caen. In 1879 departmental professors were appointed, whose duties are two-fold, under the direction of the Minister of Education. . . . They lecture at the normal schools to pupils who are being trained

as school-masters; under the instructions of the Minister of Agriculture, they hold conferences in each canton with the agriculturists, teachers and proprietors, perambulate all the country villages to observe agricultural processes, keep in touch the various local societies, and spread the knowledge of improvements. . . . There is a veterinary officer attached to each *arrondissement*, who has received a [veterinary school] diploma entitling him to practise. The State interests itself in the breeding of horses, cattle and sheep. The Ministry of agriculture contains, for instance, a Directeur des Haras, who has under him inspectors-general and inspectors. At the Haras du Pin there is a free school, in which is taught every detail [of] the management of horses. There are twenty-one *dépôts* of the great Haras de Pompadour; and [large numbers of state owned stallions]. Nor is the State aid confined to education and the improvement in live stock. Each *arrondissement* has its Ingénieur des Ponts et Chaussées who assists proprietors in all drainage operations."—R. E. Prothero, *Pleasant land of France*, pp. 52-57.—Three schools have been established for the training of girls in the work they may be called upon to undertake with relation to farming.

"A French decree of 23rd June 1920 contains provisions for regulating the execution of the law of 2nd August 1918 on the organization of public instruction in agriculture. The decree is divided into three heads, the first of which deals with the National Institute of Scientific Agriculture and orders its working, prescribing various conditions to be observed for the admission of pupils, for examination and for the carrying out of instruction; the second deals with agricultural schools, experimental schools, special technical agricultural schools, and winter and seasonal agricultural schools; and finally, the third contains general provisions. A French law of the 5th August 1920 contains new provisions to insure more perfect working of the agrarian schools, and to this end the Ministry for Agriculture is granted extra funds to be devoted to the purchase of material for instruction of an experimental character."—*International Yearbook of Agricultural Legislation*, v. 10, 1920, p. xxx.

Germany.—A movement to unite agricultural education with the university began in Germany in 1826, with Friedrich G. Schulze, of Jena. In 1847 the agricultural academy of Poppelsdorf was founded as an adjunct of the University of Bonn, under the administration of the Prussian ministry of agriculture. The first purely agricultural university-institute in Germany was founded in Halle in 1863, followed by similar institutions at Leipzig in 1869, Giessen in 1871, Königsberg in 1876, Breslau in 1881. Göttingen University also has an agricultural institute. All of these are controlled by the ministry of education. The (formerly Royal) Prussian Landwirtschaftliche Hochschule (Agricultural High School) in Berlin was constituted by royal decree in 1881. The school is composed of an amalgamation of the Landwirtschaftliches Lehr-Institut (1859), the Agricultural Museum (1867), and the former Agricultural Academy of Proskau. "Germany, and especially Prussia, has developed a most efficient system of agricultural education. . . . The information given below relates to Prussia. . . . The policy aimed at in Prussia was, in the first place, to secure facilities for the study of agriculture in institutions of university rank; it was recognised that before suitable instruction could be provided for small farmers there must first of all be careful study of methods and principles, such as is only possible

at institutions possessing a large and well-trained staff. Between the years 1847 and 1881, seven institutions for providing higher education were founded; in 1906 an eighth was established; six of the eight are large and flourishing, two of them being agricultural colleges and four university departments of agriculture. . . . German agricultural colleges have had other than financial advantages. The German military system stimulates the young agriculturalist to continue his school education until he is able to pass the fairly stiff examination that entitles him to spend only one year in military training . . . Again, . . . German agriculture has been influenced to a greater extent than English farming by business methods and ideals, and the need for properly educated men as managers of estates is much more commonly recognised in Germany than in England. Hence, a useful career in developing agricultural domains is open to successful students from the academic institutions of Prussia. . . . These various advantages have resulted in a substantial number of Germans studying agriculture at universities or colleges. Up to 1910 some 65,000 had been trained at Prussian institutions. The influence of the farming of these men on the cultivation of German soil cannot be proved by figures; but there can be no doubt that the readiness which German farmers have shown to adopt the aids to production which the XXth century has placed within their reach is due to the leavening of the mass by educated agriculturalists. So soon as substantial progress had been made in the study of agriculture at the universities, when teachers had been trained and textbooks written, Prussia began to provide instruction for peasant cultivators, and . . . great progress has been made in this direction. The task of reaching the German peasant farmer was a difficult one, and many complaints were made of his slowness and backwardness, but the increased production of Germany clearly proves that he has been reached, for the peasant farmer tills 70 per cent. of the land. Several methods of providing agricultural instruction of an elementary kind for the children of the smaller farmers have been tried. The most successful is the winter course, similar in character to the organised courses of instruction now being developed in English counties. Of these courses, there were 212 in Prussia in 1910. In addition there were 17 schools meeting throughout the year. The total attendance at the 229 schools and winter courses was 10,500 in 1911-12. . . . In addition to the general agricultural schools there were 114 special schools, including 70 farriery, 15 dairy, and 14 gardening schools. Short courses, both general and special, for adult farmers are also provided. . . . A feature of the Prussian system is that in the summer months the teachers employed in winter schools visit the pupils at their homes and advise on farming questions. Peripatetic instructors [or official agricultural lecturers] have proved very successful and their numbers have . . . been much increased. . . . Official lecturers are usually engaged by chambers of agriculture and agricultural societies, and not . . . by local authorities. The official chambers of agriculture provide about one-third of the salaries and expenses and the State contributes two-thirds. Fifty-two of the lecturers are specialists on live stock; 26 deal with general agricultural questions; 12 with dairying; 10 with poultry; 9 with seed-selection. Among other subjects claiming travelling lecturers are national economy and book-keeping. Agricultural education of secondary school grade has also . . . been developed in Prussia; twenty schools have been established at which, in 1911, 3,800 pupils were in

attendance. The total expenditure on agricultural instruction in Prussia in 1910 was about £484,000, of which 40 per cent. came from State grants, 37 per cent. from endowments, fees, &c., 17 per cent. from local authorities, and 5 per cent. from chambers of agriculture and societies. . . . Reviewing the position of agricultural education just before the outbreak of war, Professor von Bümker of Berlin in a paper contributed to the Monthly Bulletin of Agricultural Intelligence of the International Agricultural Institute, Rome, observes that the total outlay (£190,000) by the Government was very moderate for a State like Prussia.—T. H. Middleton, *Recent development of German agriculture* (Pamphlet, Board of Agriculture and Fisheries, Great Britain, 1916, pp. 23-26).

Hungary.—“The cultural significance [for the farming population] of the continuation courses was particularly enhanced by the regulations and syllabus for a continuation course in agriculture (issued in 1902), in which the instruction in school was brought into close agreement with the requirements of practical life, by enabling the children . . . to acquire technical agricultural training. . . . Continuation schools for technical instruction in agriculture gradually took the place of general continuation courses all over the country, and were able to make up for the deficiencies of the latter by offering a scientific education in that most important branch of culture. In these agricultural schools the subjects of instruction are partly theoretical, partly practical [and include] . . . natural history, geography, physics, chemistry, history and constitutional history. . . . The practical courses in agriculture are held on the model farm and in the garden attached to the school. There are separate continuation schools of this kind for boys and girls. . . . The managers of such schools may establish local schemes of work in agreement with local conditions (branches of agriculture prevailing in the particular district); consequently there are continuation schools with special courses in viticulture, forestry, cultivation of the soil, fruit-culture and kitchen-gardening respectively. . . . Among the continuation schools for technical instruction in agriculture there are some which possess model farms, etc., of large extent: on the latter special professional teachers are employed to give technical and practical instruction in agricultural science. These schools, provided with model farms, of which there are 45 in the country, are called . . . (agricultural continuation schools with expert teachers). These latter, too, may be engaged in special instruction in various branches of agriculture as detailed above.”—A. Appoyni, *Elementary education, in Hungary of today* (P. Alden, ed.), pp. 205, 206.

India.—“The introduction of agriculture as a primary school subject in the rural districts seems to have been begun in India in the Central Provinces where the reform of village schools was made in 1893-1894, but was not very successful until the schools were completely remodelled in 1899. In the Central Provinces of India ‘Kamdars’ are engaged in this work. Agricultural shows and conferences are also held and demonstration farms are maintained.”—*Farmers in European countries assisted by “schools” similar to those in America* (Weekly News Letter, Jan. 14, 1920).—“In each province there is a Director of Agriculture, usually a member of the Civil Service who has received a special training, with a staff of experts in botany, chemistry, &c. Most provinces also now have an agricultural college, where a course is taught leading to a university diploma. Experimental farms have been established in many places, and a cen-

tral institute for agricultural research, at Pusa in Bihar, has been endowed by the munificence of an American gentleman; [Henry Phipps of New York who during Lord Curzon's administration presented a fund of \$150,000 to be used in research work at the viceroy's discretion. Knowing the need of agriculture, Lord Curzon devoted the money to this subject. The institute was opened in 1907.] Though the work is yet in an early stage, and some disappointments have been experienced, distinct progress has been made in several directions. Approved varieties of cotton and wheat have been formed by selection, and seeds of both are now eagerly accepted by the cultivators. Iron ploughs and pumping machinery have been widely introduced in some parts. Insect pests and plant diseases have been studied with profit. The advantage of particular manures, &c. for particular crops has been determined. Not least in importance, by means of agricultural shows, practical demonstrations, addresses and pamphlets in the vernacular, the cultivators are slowly learning that government is not only desirous of helping them, but that it understands their point of view and does not despise the small things which naturally seem all-important in their eyes. It is by recognizing the conditions under which Indian agriculture can be carried on and by establishing friendly relations with the cultivators, as much as by scientific research, that any permanent advance can be achieved."—J. S. Cotton, *Agriculture (Oxford Survey of the British Empire, Asia, pp. 135-136)*.

Ireland.—The Albert Agricultural College at Glasnevin, Ireland, established in 1838, was the first higher institution in the United Kingdom devoted solely to the study of agriculture. Since that time, and particularly since the passage of the land acts, which created a large class of small land owners, a great deal of attention has been paid to agriculture, in which in most districts, a high degree of efficiency has been attained. Moreover, consistent efforts are being made to improve live stock in view of the fact that owing to its moist climate Ireland is essentially a pastoral country, and its agriculture is largely based upon farm stock. "The department of Agriculture and Technical Instruction is responsible for the movement to improve all kinds of livestock throughout Ireland, by a system of inspection and approval of breeding animals. . . . For agriculture, there are employed in each county a number of county itinerant instructors in agriculture, horticulture, bee-keeping, poultry, and butter making. The instructors in poultry and butter making are women. In the thirty-three counties there are employed [1916] for this work approximately 138 instructors. In addition there are employed by the Department forty-three 'overseers,' who are special instructors devoting their entire time to assisting the new farmers in the newly settled regions opened up by the Congested Districts Board. The work of these men has already been mentioned. The county itinerant instructors devote their time to advising farmers relative to their farm work, conducting field experiments and demonstrations, and in lecture work. In addition, from November to March they are employed in teaching the winter agriculture classes. These winter agriculture classes, open to young men living on farms, are held in two or three places in each county, extending approximately through sixteen weeks. Similar classes for girls and women are conducted by the women instructors in poultry and dairying. The itinerant instructors also act as inspectors for the Department in various agricultural schemes performed by local authorities under the general direction of the Department of

Agriculture and Technical Instruction. . . . For the more formal education in agriculture are maintained several classes of schools. There are five Agricultural Stations which are in reality practical farm schools for farm apprentices. One located at Athenry may be described as the type. This Station school consists of a six hundred acre farm conducted as nearly as possible as a model commercial farm under the immediate direction of a competent farmer. Assisting this farmer is one instructor, most of whose time is given to class-room work. On the farm are living thirty young men students who are admitted to the school for a twelve months' term. During this complete year they do all of the farm work, devoting practically ten hours a day to farm labor and three hours a day to class-room work. . . . At Glasnevin, a few miles north of the City of Dublin, is maintained . . . the Albert Agricultural College. This is also a one-year school attended principally by boys who have completed the one-year course at the various Station schools or have had equivalent training elsewhere. The . . . College is located on a fully equipped modern farm. The boys here devote much more of their time to class-room work, but are still required to do much practical work on the farm. At the completion of their one-year course, those whose work has been most satisfactory are awarded scholarships to the Royal College of Science . . . in Dublin, where they receive a full four-year course equivalent to that given in the best agricultural colleges in the United States. None of their time is given to farm practice, as they are all perfectly familiar with the farm practice from their two years' experience before entering the Royal College. . . . For girls there is a similar system of schools; the most promising girls attending the schools conducted by the itinerant county instructors in dairying and poultry are awarded scholarships in the Munster or the Ulster Dairy Institute. There are also maintained what are known as schools of rural domestic economy. In these schools girls are taught the things that the rural housewives need most to become efficient housekeepers and homemakers. . . . In addition to this they are taught dairy work, poultry raising, and kitchen gardening, arithmetic, and other regular school subjects. Courses are one to two years in length. . . . At the Munster and Ulster Dairy Institutes all girls take a one-year course in practical work in dairying, poultry keeping, and in household arts. The arrangements are very similar to those at the agricultural Station schools for boys. The most promising girls, upon the completion of the one-year course, are sent to the Munster Institute, where two years' additional work is provided to fit them for itinerant instructors in various counties or for instructors in the schools of rural domestic economy. All of this work . . . is under the Irish Board of Agriculture and Technical Instruction."—A. C. Monahan, *Extension teaching in agriculture and household arts in Ireland (Catholic Educational Review, March, 1916, pp. 224-227)*.—"In Ireland . . . where agriculture has made marvellous progress during the past quarter of a century, the results attained have been mainly due to education, and there are in it at present 19 Schools of Agriculture of one kind or other, and 159 Itinerant Instructors besides Inspectors of Co-operative Societies of which there are about 1,000 in the country."—F. B. Smith, *Union of South Africa (Report on Agricultural Education for the year 1st April, 1918, to 31st March, 1919, p. 6)*.

Italy.—"The subsidized Agricultural Committees (*Comizi agrari*), [in Italy] founded in 1866 and revived with much parade in 1883, have had to

transform themselves or die of anæmia. Most of the agricultural schools are admitted failures; the forestry school at Vallombrosa boasts twelve teachers to thirty-six students. Schemes to encourage tobacco culture have been spoilt, because the State imposes exorbitant taxes and takes the produce at an unremunerative price."—B. King and T. Okey, *Italy today*, p. 182.—"According to the latest statistics, Italy has 278 chairs of agriculture that are occupied by men of professional training who are engaged in itinerant instruction. The cost of this work is more than \$400,000 a year—an expense shared by the State, the Province, and the local organization. Since the close of the war many courses are being held in mechanical agriculture to instruct farm laborers in the use and repair of farm machines. Courses in farm book-keeping for young men and young women are also contemplated. Thirty-eight of the itinerant instructors specialize in certain subjects, such as silkworm raising, mulberry culture, cheese making, viticulture, fruit growing, and plant diseases."—*Farmers in European countries assisted by "schools" similar to those in America* (Jan. 14, 1920).—"An Italian decree No. 673 of the 6th May 1920 provides for the organization of travelling chairs of agriculture and their staff complement. An Italian decree of the 3rd June 1920, No. 876, regulates the duties of the travelling chairs of agriculture. The chairs are subject to the control of a supervising commission which is charged to approve the rules, draw up the budget, nominate the director of the chair and his staff. The chairs are instituted and supported by the several interests concerned united in a consortium which forms the Supervising Commission."—*International Yearbook of Agricultural Legislation*, v. 10 (1920), p. xxxii.

Japan.—"The Agricultural College of the Tōkyō Imperial University is the only institution in the empire through which the highest agricultural knowledge is imparted. Of the higher agricultural schools, there are two established by the Government at Sapporo and Morioka, and a private one in Tōkyō. Those lower in grade than middle schools number more than a hundred, besides not a few supplementary schools where elementary instruction in agriculture is given to boys who have completed the course of study in a primary school. Apart from these, there are numerous educational institutions where instruction in the science of agriculture is given . . . for the benefit of those who devote themselves to farming, to say nothing of popular lectures on the subject, which are constantly delivered throughout the empire. In 1894 the Government enacted a law to the effect that a part of the expenses necessary for the maintenance of agricultural schools and 'Nōji Kōshūjo' should be defrayed by the State, to the great advantage of agricultural education, which, from that time on, has been growing more and more in importance, the number of schools newly established becoming larger and larger. . . . There are a large number of experimental farms in various parts of the country, of which the most important are the National Experimental Farm in Tōkyō, with its three branch stations, and thirty-nine local farms. In these, various important matters relating to agriculture, . . . have been carefully studied, with such excellent results that the yield of the crops now increases year by year and their quality is improved to a considerable degree. In the case of the prefectural experimental farms there is a provision for granting them a certain measure of State aid. There is an experimental garden in the prefecture of Shizuoka, a branch of the Tōkyō National Experimental Farm, where various kinds of foreign

vegetables and fruit trees, as well as native ones, are on trial cultivation. Many of the local experimental farms now possess similar gardens. . . . Prefectural and district associations of agriculturists have a number of experts attached to them who visit them and give instruction in all departments. These itinerant teachers of agriculture, . . . go round the places under their charge, teaching the farmers how to improve their work and directing them in practical processes. In this way, whenever experiments on Government farms prove successful, they are carried into practice amongst the agricultural classes at large. The Government establishment, in Tōkyō and Kyōto, of the "Sangyō Kōshūjo" (place where instruction in raising silkworms and reeling silk is given) is . . . [devoted to the improvement of] sericulture and filature. These *kōshūjo* serve the purpose of schools for men and women who want to become experts [in] . . . sericulture and silk manufactures."—S. Okuma, *Fifty years of new Japan*, v. 1, pp. 570, 571, 572.

Norway.—"In the course of the . . . twenty or thirty years [prior to 1914] the state has by several measures tried to benefit agriculture. Such measures are under the supervision of a managing director working under the Department of Agriculture. . . . The *Agricultural College*, since its establishment in 1859, has been connected with the model farm at Aas near Kristiania. Up to the year 1897, advanced instruction was here given only to agriculturists, but in the above-mentioned year the school was enlarged so as to become also a college for gardeners, dairy farmers, surveyors and foresters. The Agricultural College is managed by a director, and the staff of teachers consists of nine professors and ten instructors and assistants."—G. Tandberg, *Agriculture* (Norway, S. Konow and K. Fischer, ed., pp. 329, 330).

Poland.—"Technical agricultural education in Prussian Poland [prior to independence] was under the direction of the Ministry for Agriculture, Forestry, and Crown Domains; . . . [which] entrusted the supervision, and in part the organisation, of elementary agricultural schools . . . to the chambers of agriculture. In the primary school agricultural science had no place worth mentioning. . . . More important were the technical courses for young villagers from 15 to 16 years of age, who had already passed through the primary school. . . . Residential training centres . . . were built for twenty or more pupils and gave both theoretical and practical instruction in two to three year courses, . . . in all practical agricultural operations on model farms attached to the schools. . . . Winter training courses . . . were either established at a fixed centre, or were arranged on a kind of travelling system. The travelling instructor lived in the villages during the winter, and had a suitable building placed at his disposal for his instructions. . . . In addition to these general training centres, special training centres existed, chiefly for gardening and dairy farming, . . . for the use of the rural population, and were intended to educate a class of farmers. The secondary schools admitted those wishing to enter agriculture as a paid career. . . . The leaving certificate or diploma entitled the pupil, after two years of agricultural practice on an estate, to enter any of the German higher schools of agriculture. . . .

"German nationals only were admitted to the agricultural training centres provided for the rural population. The Polish community, recognising that it was essential to secure for their members a share in the latest acquisitions of agricultural science, established its own system of agricultural training centres for adults under the name of

'agricultural clubs.' These organisations could not replace a regular agricultural education, but, . . . their success was considerable. . . . Detailed information as to technical training in agriculture in the Austrian Provinces is lacking. As a rule, the Austrian Government entrusted the supervision of elementary agricultural training centres to the Agricultural Societies of Cracow and Lwow (Lemberg). These elementary centres were organised on the model of the Prussian centres. . . . The Russian Government was opposed to all attempts at agricultural education in their Polish provinces. . . . As there was no compulsory education and as the private organisation of schools was prohibited, agriculture could not be taught in any form in the primary schools in this part of the country. The efforts of the community could only be directed to the organisation of agricultural continuation centres or to technical courses for adults. The oldest training centre in elementary agricultural studies was that of Sobieszyn, founded by private initiative in 1866. A three years' course was given; there was a farm attached and residence was provided. . . . [The course at this school was found to be too long for the ordinary farm pupil, and a short course of eleven months was arranged for pupils who could already read and write and had had some experience in farming. Five Centres for this course, with farm experimental and boarding establishments, were in existence before the war. There were also six parallel courses given in domestic economy schools for women, and five centres gave a five months' course for men.] The agricultural clubs . . . were a very important factor in providing technical training in agriculture for adults. The figures for 1913 prove how wide was their activity. There were 1,051 clubs with about 100,000 members. . . . Of special institutes mention must be made of the important School of Horticulture at Warsaw, subsidised by the Agricultural Society of Warsaw. This institute offered two courses, one for jobbing gardeners capable of attending to small gardens and orchards, the other for professional gardeners capable of managing large horticultural establishments. The curricula for the agricultural training centres also included horticulture. . . . There were no advanced schools of agriculture in Russian Poland, as the Government invariably refused to authorise them. The agricultural courses at Warsaw, which were begun in 1911, were academic in character; they conferred no diploma, and consisted almost exclusively of lectures on theory. A parallel course in horticulture was started in 1913, and use was made of an experimental garden of six hectares. . . . A Russian advanced school of agriculture existed at Poulavy, formerly a Polish model estate. . . . As practically no Poles were admitted as students, it was without influence on the progress of Polish agriculture."—*Technical agricultural education in Poland (International Labor Review, July-August, 1921).*

"During the first three years of its existence the Polish State concentrated all its efforts on the organisation of . . . primary schools. Some attempt, however, has been made to raise the standard of technical agricultural training centres. The legislative work in this direction is already almost complete. In the first place, it was felt that such training centres must be created and must have model farms attached, and in the second place, it was essential to secure the attendance of the agricultural and working population. But this could not be done unless the problem of technical agricultural training were, in a manner, linked up with the problem of agrarian reform. Agrarian reform in Poland, under the Act of 15 July 1920, took the

form of dividing the great agricultural estates and of helping to establish farmers on land acquired under agreement or by compulsory purchase. The work is to be entrusted to a Central Estates Office appointed *ad hoc*. Section 15 of the Act stipulates that before parcelling out any estate the Central Estates Office must consult the Ministry of Agriculture; . . . the Ministry is entitled to reserve all lands or buildings suitable for agricultural training centres. Section 59 of the same Act stipulates that small owners and agricultural workers, who were formerly students at such a centre, shall have priority in regard to the benefits of agrarian reform. In other words that they shall have the first right to acquire parcels of land. While the Act of 15 July smoothes the way for the work of the training centres, their organisation is really based on a special Act of 9 July 1920, 'relating to popular training centres of agriculture.' This Act provides for centres of technical instruction in agriculture, public or private. Private centres cannot be established without the consent of the Minister of Agriculture, and the Ministry is charged with seeing that the curricula are up to standard. Public centres are attached to the state, the districts, or to chambers of agriculture. State centres will be established by decision of the Minister of Agriculture as they are called for from time to time. District centres, on the other hand, must be established, . . . for [both boys and girls]. In establishing these compulsory public courses in agriculture under the Act, the district authorities and chambers of agriculture will be granted large assistance from the state. It will (1) give them a free grant of the land needed for the training centre and its model farm; (2) allocate to them for building purposes a sum equal to one-fourth of the amount of the estimate approved by the Minister of Agriculture and, in addition, advance one-half of the total estimate as a long-term loan at 3 per cent. interest; (3) provide the teachers' salaries. In addition to this general financial assistance, the Ministry must . . . allow other grants, which must be budgeted for in its annual estimates. . . . A maximum period of twenty years is allowed under the Act for the organisation of training centres throughout the country. In order to adapt the instruction closely to local requirements, a supervising committee is constituted in each district . . . to supervise the regular working of the centres and of the model farms, . . . [and] represent the interests and requirements of the training centres on the small district diets. Each committee is to consist of three representatives of the small district diet and of the chamber of agriculture, a representative of the Ministry of Agriculture, and an inspector of primary schools: the heads of the training centres in the district will attend in a consultative capacity. . . . The state has been able to display much greater activity in the sphere of advanced agricultural education. . . . Before the war Poland possessed only two advanced schools of agriculture, at the University of Cracow and at Dublany in Little Poland. There are now six, two in each of the three parts of the country. The advanced schools of Little Poland remain unchanged. In the former Prussian provinces the newly-founded University at Posen has established a Faculty of Agriculture and Sylviculture analogous to that at Cracow and conferring similar diplomas and degrees. In addition, an Institute of Agriculture has been opened at Bydgoszcz (Bromberg), side by side with the experimental institute already existing, with a two years' course for students who have had six years' instruction in a secondary school. . . . The three years' agronomic courses at Warsaw, founded in 1911 . . . have been

transformed into Advanced School of Agriculture; . . . the most important agricultural teaching centre in the country. . . . The dignity of Doctor of Agrarian Sciences is conferred only on students who continue their studies and write an original thesis constituting, according to the regulations, a real contribution to scientific knowledge."—*Technical agricultural education in Poland (International Labour Review, July-August, 1921)*.

Russia.—"The act of 1904 on agricultural education constitutes the basis of the organization of the agricultural schools. This act places all private schools of this kind under the supervision of the ministry of agriculture and imperial domains, providing at the same time for the maintenance of schools controlled directly by that ministry, and for a considerable part of the support of private schools, the zemstvo schools being included in the latter class. . . . The agricultural schools are divided by the act into three classes, lower or primary, middle or secondary, and higher schools. . . . The secondary schools are defined by the act as 'having for their object the furnishing to students of a practical agricultural education, based on scientific principles, in order to prepare them for agricultural work.' The higher primary schools are described as 'established for preparation for practical farming,' and the elementary schools as having for their object the 'preparation, mainly by practical instruction, of men informed and skilled in respect to farm work.' In the elementary division are also included 'practical agricultural schools,' limited to certain special agricultural branches, such as gardening, vine culture, wine making, butter making, and caring for cattle. These practical schools are intended to prepare trained laborers in the branches enumerated. . . . The secondary schools represent the normal type of technical schools, like those established in Germany and other western European countries. They are organized and managed admirably. Some of them have existed a long time; the Moscow school, for example, was founded in 1822. These schools have a curriculum of wider scope than is necessary for the purely practical instruction of peasant youths in modern farming. . . . Still, . . . [they] help to diffuse the new ideas in agriculture among the population in an indirect way, . . . [by attracting] the attention of the peasantry to their experimental fields, the imported breeds of cattle and horses, the use of modern machinery and scientific methods. . . . In many cases the schools maintain breeding centers for the improvement of the local breeds of cattle. Another important function of the secondary schools is that of furnishing teachers to the primary schools, which multiply very rapidly. . . . Some secondary agricultural schools [give] . . . pedagogical courses whose object is to prepare teachers for primary agricultural schools. . . . Pedagogical courses at the Kharkoff Agricultural School were established in the year 1896 for the purpose of giving instruction in special subjects and natural history to teachers of primary agricultural schools. . . . The students were obliged to sign a pledge to serve at least three years as teachers after the completion of the courses, or to return the amount that the Government had spent for their education. The courses were managed by the director of the Kharkoff Agricultural School, aided by the pedagogic council, composed of the teachers of the courses and presided over by the director. . . . The Bessarabian School of Viticulture and Wine Making, though classed as a secondary agricultural school, has a distinct organization and a special purpose. . . . It has for its aim, . . . the preparation of specialists and managers for vineyards, wine

factories, and wine cellars. The school is located in Kishinev, in the Province of Bessarabia. It was established in 1804 and reorganized in 1911 in conformity with the act of 1904 on agricultural education. . . . Graduates of secondary agricultural schools may continue their education in higher agricultural schools. . . . Graduates of the Viticultural School are given an opportunity to continue studies in their special branch by entering the higher viticultural courses in Yalta, Crimea. . . . Experimental fields where the peasants can observe the results obtained by better methods of cultivation are maintained in numerous districts of the Empire, and agricultural experts are stationed throughout the country to advise the peasants in all matters pertaining to cultivation. Popular lectures on agriculture and related subjects are also arranged in villages, and the lecturers often travel over a wide stretch of country. . . . In this movement an important part is performed by the 'zemstvos,' . . . [which] turn back to the population . . . in the form of educational and welfare activity [most of the money raised by them by taxation]. The total sum expended by the zemstvos for agricultural development in 1911 was 11,400,000 rubles. A considerable part of this amount was spent for agricultural education, both elementary and secondary. The zemstvos are very active in this work, the number of schools founded and maintained by them rivaling that of the government schools."—W. S. Jesien, *Secondary agricultural schools in Russia (Bureau of Education, Bulletin no. 4, 1917, pp. 9, 16, 17, 19, 20)*.

Scotland.—"Means for propagating a knowledge of the best methods of cultivation are adopted in Scotland quite as much as in England. [The first chair of agriculture in Great Britain was established in the University of Edinburgh in 1790.] The Highland and Agricultural Society of Scotland, dating as far back as 1784, has the start by half a century of the Royal Agricultural Society of England [1838]. . . . A number of prizes, distributed into classes, are annually given by the Society, for the practice of agriculture and special crops, woods and plantations, improvement of waste lands, agricultural machinery, all kinds of live stock, dairy produce, and cottages and gardens. . . . The Society has an agricultural museum at Edinburgh, where may be seen models of all the implements used in Europe, samples of all kinds of cultivated grain, and reduced models of the animals which have obtained prizes since the beginning of the competitions. . . . Special newspapers, cheap pamphlets, local meetings, subscription lectures, diffuse, as in England, all kinds of information on the subject of husbandry; and as a testimony to the scientific interest attached to these studies, there has been for many years past a chair of agriculture in the justly-esteemed University of Edinburgh."—L. de Lavergne, *Rural economy of England, Scotland and Ireland, pp. 295-296*.

South Africa: Plan for agricultural education. See EDUCATION: Modern developments: 20th century: General education: South Africa.

Sweden.—"The institutions affording instruction in Agriculture are under the control of the Board of Agriculture and are essentially of four types. *Agricultural schools . . . Farmers' schools . . . Schools of Agricultural Economy . . . and Agricultural High Schools.* . . . The first steps for the promotion of agriculture . . . were taken during the 18th century by private individuals. . . . Among these may be mentioned, . . . Jonas Alströmer, who, in 1748, extended the sheep-breeding school he had established as early as 1730 . . . in Västergötland, as as to form a kind of high school

of agriculture and forestry, intended for young men who had enjoyed a university education. This educational establishment existed with some State support for about a decade, and was probably one of the earliest agricultural schools in the world. A new impulse was given in 1834, when Edvard Nonnen opened a college at Degeberg, near Lake Vänern. . . . The institute in question continued to exist very successfully until 1853, as a mixed-system college with a higher and a lower division. . . . It was from the Agricultural Society of Örebro Län that the plan issued for the earliest actual lower-grade agricultural school, giving theoretical and practical instruction—chiefly the latter. The school, . . . continued its labours during the years 1813-18, but was then obliged to close, on account of financial difficulties. However, after [the] . . . repartition of land, . . . numerous proposals were made for the establishment of agricultural schools, intended principally for the training of farm-managers. Finally, . . . the first State-supported school was opened in 1840. . . . [and was] soon succeeded by many others. . . . In the middle of the 18th century, it was imagined that the higher instruction in agriculture could be promoted by establishing chairs at the University, in '*res rustica et agricultura*,' but these were soon done away with as they did not lead to any positive result. A good many years passed, however, before Sweden obtained a *higher agricultural educational institute* established by the State itself, viz., that of *Ultuna*, near Uppsala, founded in 1848, and that at *Alnarps*, near Lund, opened in 1862. . . . During the seventies there arose as an extension of the People's High Schools . . . so-called Farmers' Schools giving exclusively theoretical instruction. These were recognized officially in 1887, and in the same year there was opened . . . the first farmers' school supported by the State. During the last few years, . . . new measures have been taken to provide the great numbers of small farmers of Sweden with suitable instruction in agriculture. Special schools have also been established for young women, under the title of schools of agricultural economy. . . . The aim of the Agricultural Schools is to impart instruction in the principles [and practice] of practical agriculture. . . . The instruction is given: (a) in a two-years' course, . . . for the training of farm-managers; (b) in a one-year's course, intended to provide young farmers with general practical and theoretical instruction in agriculture. . . . Farmers' Schools are intended to give a knowledge of the principles of agriculture, chiefly with a view to the conditions obtaining on middle-sized and smaller farms. . . . In this connection may be mentioned the State-supported travelling studentships, . . . the journeys being made under the guidance of some trained farmer or an agricultural expert . . . to other parts of the country—or even to Denmark—where anything instructive can be found worth seeing or hearing. . . . In every län there are one or several thoroughly trained experts, whose task it is to give advice and information to agriculturalists. Ambulatory teachers and farming instructors are also employed for the purpose of giving small farmers guidance in the measures necessary for the promotion of agriculture. . . . The Schools of Agricultural Economy have as their mission the imparting to young women of practical and theoretical instruction in household economy and the farmwork executed by women in that part of the country where the several schools are situated. . . . The Agricultural High Schools have as their object the imparting of instruction in agriculture, based on scientific investigation. The High Schools embrace . . . (1) A two-years' course intended to give

instruction in the theoretical principles necessary for a rational method of agriculture, and (2) a one-year's experts' course, consisting of a continuation course based on the former one for agriculturalists, . . . and intended for the training of experts and teachers of farming. . . . [The study of pedagogics is one of the subjects in the course for experts.] The Swedish Moor Culture Association . . . was founded in 1886, . . . to further the utilization of the extensive moors of the country, and, . . . [among other things] to spread a knowledge of the best method of cultivating moors, bogs, and marshes. . . . Lecturing tours are made every winter by the culture-engineers of the Association . . . [and] since the year 1906, the Association has given a course of instruction in moor-cultivation for small farmers and moor cultivators, with lectures, demonstrations, and excursions."—J. Guinchard, ed., *Sweden: Historical and Statistical Handbook*, pt. 2: *Industries*, pp. 125, 126, 127, 129, 131, 147, 152, 153, 154, 155.

Switzerland.—"The agricultural and forestry departments of the [Federal] Polytechnic [School, founded in 1855], in its 'technology,' as signifying science applied to industrial arts, has advanced these interests to positions that otherwise could never have been attained. Switzerland in physical respects is not a bountiful motherland, neither the climate nor soil is good for agriculture, yet it is surprising what good results are obtained through the general diffusion among the agricultural class of much technical information, susceptible of easy apprehension and ready application. Swiss agriculture, to make any return, cannot be a mechanical routine, but must be intelligent if not scientific. What is known as practical farming would not return the seed and labor involved. As an intelligently and scientifically-directed industry, it has assumed a prosperous and profitable condition. The agricultural course in the Polytechnic is thorough and comprehensive. It covers the mechanical and chemical composition of the soil; the scientific basis as to the rotation of crops; the periods of growth at which plants take their nitrogen; how draining improves land; and many other similar matters varied in their application. . . . In the single crop of grass, which is of such great value in its relation to the extensive Swiss dairy interest, in its cultivation, grazing, and harvesting, the suggestions and counsel emanating from the agricultural department of the Polytechnic have been of incalculable value. The amount of this crop, from a cold and barren soil, and the uses to which it is turned would seem incredible to the American farmer. The Swiss farmer, to accomplish so much, must know something of the chemical analysis of the grass, both in the natural and dried state; the feeding value of like weight in the different varieties, in an equally moist or dry condition; the final stage of growth which they ought to be allowed to attain; suitability for permanent or other pastures; the adaptability of grasses for certain soil; their duration, ability to resist drouth, and strength to over-power weeds. Then come questions of hay-making, ensilage, the management of old and new grass-lands; on these and many others the peasant is enlightened and constantly advised, not only by the Polytechnic but from cantonal agricultural schools at Rütte (Bern), Strickhof (Zurich), Sursee (Luzern), and at Brugg (Aargau). There is an institution for experimental vine growing at Lausanne; a school of gardening at Geneva; and dairy schools at Sornthal (St. Gallen), and Trayveaux (Freiburg). From time to time lectures and short courses of instruction are given in different parts of the country on horticulture and vine-culture,

fodder-growing, cattle-breeding, by which some knowledge of the theory and technical details of agricultural science is given, with the view of awakening a spirit of enterprise in the more remote districts of the country."—B. Winchester, *Swiss republic*, pp. 289-291.

United States: Agricultural Societies and fairs in 18th and early 19th century.—Professorship of Agriculture at Columbia College.—"At first the improvement of our husbandry was the work of a few men. . . . George Washington was one of the earliest and one of the most influential of these. . . . It was while we were still under the Articles of Confederation that a beginning was made in the formation of agricultural societies. Pennsylvania and South Carolina had established such societies before the adoption of the Constitution. New York, Massachusetts, and Connecticut followed during Washington's Administration. The publications of these societies had begun to appear before the close of the eighteenth century, and agriculture fairs came into being in the first decades of the nineteenth century. Various endeavors to secure the establishment of a national board of agriculture had led . . . to the first seed distributions through the National Patent Office, and to the first separate agricultural appropriation in 1854. . . . Historically it has been found extremely difficult to bring the subject of agriculture into any manageable pedagogic form. . . . It would be difficult to say just where and how systematic instruction in the principles of agriculture took its rise in this country. Such instruction was given in some sort in Moor's Indian School, out of which Dartmouth College arose, back even in colonial days. . . . Some of the old line colleges showed at least good will toward the scientific aspects of agriculture, Columbia even establishing a professorship under which agriculture was ranged alongside of other sciences. Just at the middle of the century the State of Michigan provided in its constitution of 1850 for the establishment of an agricultural school, and seven years later this institution, the first of its kind and grade in the United States, was ready to enroll its first students. Pennsylvania had already incorporated its Farmers' High School, but it was preceded by two years in the actual opening by this State Agricultural College of Michigan."—E. E. Brown, *Development of agricultural education*, pp. 50, 51.—"The legislature of Maryland incorporated . . . [an] agricultural college in 1856, which was, however, in part a private institution. . . . The institution was opened for students in September, 1850. . . . Marshall P. Wilder first urged the importance of establishing an agricultural college in Massachusetts . . . in 1840, . . . and finally in 1856 succeeded in obtaining from the legislature a charter of the Massachusetts school of agriculture. The Massachusetts agricultural college was not regularly opened, however, until 1867. The general assembly of the state of Pennsylvania incorporated the Farmers' high school, now the State College, in 1854 . . . and the college was opened for students in the winter of 1850. . . . Closely related to these agricultural schools were the scientific schools established at Yale and Harvard between 1840 and 1850, in response to the same demand for a new education. John P. Norton was appointed professor of agricultural chemistry, vegetable and animal physiology at Yale college, New Haven, Connecticut, in 1846. Thus was begun the Sheffield scientific school, which was more of an agricultural institution than any of the other schools of that time."—C. W. Dabney, *Agricultural education (Department of Education, Monographs*

on Education in the United States, St. Louis Universal Exposition, 1904, pp. 18, 28).

United States: Land grant colleges.—The first bill authorizing land grants to agricultural colleges, introduced into the House of Representatives December 14, 1857, by Justin S. Morrill, was passed by Congress but vetoed by President Buchanan. "Nothing daunted by this defeat, Mr. Morrill introduced a new bill in the House in December, 1861, bestowing 30,000 acres of land for each member of Congress upon the several states for the establishment of industrial colleges. Ben Wade of Ohio introduced the bill in the Senate on May 2. It passed both Houses in spite of an adverse report by the House committee on public lands, and was approved by President Lincoln July 2, 1862. . . . In the midst of the excitement of the great [Civil] war little attention was paid to this most remarkable gift of about 13,000,000 acres of land to promote the cause of education. Having been passed during a war, it is not surprising that the act provided that every college receiving the benefits of the land-grant should give its students instruction in military science. . . . The object of the grant is expressed in remarkably broad terms, as follows: 'The endowment, support and maintenance of at least one college where the leading object shall be, without excluding other scientific and classical studies, and including military tactics, to teach such branches of learning as are related to agriculture and mechanic arts, in such manner as the legislature of the states may respectively prescribe, in order to promote the liberal and practical education of the industrial classes in the several pursuits and professions of life.' Believing that the time had arrived when the agricultural and mechanical colleges should have additional support, Mr. Morrill and other friends of industrial education in the United States began in 1889 to formulate plans to secure a second appropriation from the national treasury. Mr. Morrill introduced another bill in Congress providing for the further endowment of the colleges, which passed and was approved by President Harrison on August 30, 1890. This act, generally known as the second Morrill Act, provides that there shall be appropriated annually to each State out of the funds arising from the sale of public lands, as in the case of the agricultural experiment stations, the sum of \$15,000, for the year ending June 30, 1890, and an annual increase by the additional sum of \$5,000, to such appropriation for ten years thereafter until the appropriation shall become \$25,000, at which figure it shall remain fixed. The act says that this appropriation shall be applied 'only to instruction in agriculture, the mechanic arts, the English language, and the various branches of mathematical, physical, natural and economic science, with special reference to their applications to the industries of life, and to the facilities for such instruction.' Provision was made at this time for separate institutions for white and colored students in such states as desired to make this arrangement. Being limited in its application this act has done even more than the original one to stimulate industrial education in the United States."—*Monographs on education in the United States, St. Louis Universal Exposition, 1904*, pp. 20-26.—"The Morrill Act of 1862 gave rise to a system of colleges and today there will be found one in every state and territory, besides several for the colored people of the South. Up to 1800, these colleges had been not wholly satisfactory and the farming class was not patronizing

very fully their agricultural courses. The fault belonged both to the college and to the farmers. The farmers were skeptical of the value of agricultural education, and the colleges were often out of sympathy with the real needs of the farmers, and in fact found it difficult to break away from the pedagogical ideals of the old education régime. Since 1890, however, there has been a complete change of sentiment in this respect, particularly in the Middle West. There the 'land-grant' colleges, whether separate colleges or whether organized as colleges of state universities, are securing magnificent buildings of agriculture, are offering fully equipped courses, and are enrolling as students some of the best men in college, whom they are educating not only for agricultural teachers and experimenters but also for practical farmers. Of course, there are many grave problems connected with this subject, many farmers who do not yet respond to the call for educated agriculturists, and some colleges that do not yet appreciate their opportunity. But the change for the better has been so marked that all agricultural educators are extremely optimistic."—K. L. Butterfield, *Chapters in rural progress*, pp. 187-188.—"Forty-four institutions offer opportunity for graduate instruction in agriculture. The six agricultural colleges that do not offer such work are those of Arkansas, Colorado, Connecticut, Porto Rico, South Carolina, and Utah. Thirty-four offer only a master's degree and 10 offer a doctor's degree. The land-grant institutions offering doctor's degrees for work in agriculture are those of California, Illinois, Massachusetts, Minnesota, Missouri, Nebraska, New Jersey, New York, Ohio, and Wisconsin. . . . Thirty-eight colleges offer short curricula either in the winter or summer. Some offer several curricula in various subjects and of varying duration. In most cases these are winter curricula covering periods of from 10 days to 5 months. Many institutions hold six-day conferences known usually as 'farmers' week.' These or other curricula of less than 10 days are not included in the tabulations. In some cases short curricula are offered during the summer months. South Carolina, for instance, offers special work in cotton grading during the month of August. Texas offers six weeks of the same kind of work during June and July. In most cases a certificate of attendance is given upon the completion of the various short curricula. Thirty-eight of the colleges offer an opportunity for study for a period of from 4 to 12 weeks during the summer. In most cases regular undergraduate courses are offered, so that matriculated students who take them may receive credit toward graduation. Many institutions offer also special curricula for unmatriculated students. Purdue offers a 12 weeks' session; Kansas State Agricultural College and Louisiana State University offer sessions of 9 weeks; the Universities of Illinois, Missouri, and Nebraska, and the Oklahoma College offer sessions of 8 weeks; North Carolina College of Agriculture and Clemson College offer sessions of 4 weeks; and the remaining offer sessions of 6 weeks."—C. D. Jarvis, *American agricultural colleges* (Dept. of Interior, Bureau of Education, Bulletin no. 29, 1918, pp. 13, 14, 16).—"Many of the separate agricultural colleges have, . . . quite as high requirements for admission as any of the state universities, and do as high a grade of work as the best of them. On the whole, it appears that practical agriculture occupies the highest place in the separate colleges, though more research in the sciences pertaining to agriculture is being carried on in the universities. . . . At present the agricultural colleges content themselves with

giving their students a fair general knowledge of the sciences underlying agriculture, horticulture, and the animal industry, with opportunities to acquire experience in some one line of practical work. . . . Perhaps the colleges and universities having departments of agriculture are doing more immediate good to the largest number of persons through their short courses and their special schools for dairying, horticulture, etc., than through the long course. These short courses are designed to meet the wants of young farmers who desire practical, helpful instruction in agriculture after leaving the high schools and before taking up their chosen vocations. A number of the colleges maintain courses in agriculture of twelve weeks beginning the first of January of each year. They usually include lectures on feeds and feeding, breeds of live stock, elementary agricultural chemistry, physics of soils, meteorology, elements of vegetable physiology, the chief facts of veterinary science, dairying, horticulture, and some of the leading facts of bacteriology."—C. W. Dabney, *Agricultural education* (Department of Education, Monographs on Education in the United States, St. Louis Universal Exposition, 1904, pp. 29, 30, 35, 37).—See also EDUCATION: Modern: 19th century: United States: Secondary education; and Modern developments: 20th century: Vocational education: Industrial education in United States.

United States: Experiment stations.—**Experiment Station Acts.**—"Next in importance to the Morrill Acts comes the Hatch Act of 1887. This act appropriates \$15,000 to each State for the purpose of conducting experiments and research. In 1888, the Office of Experiment Stations became a separate bureau of the Department of Agriculture to serve as the official head of all the experiment stations receiving the benefits of the act. There had been experiment stations before this. The first one supported by the State was in Connecticut, where an appropriation therefore was made by the legislature in 1875. Prior to 1888, there had been twenty experiment stations in the United States, but in that year alone, owing to the encouragement of the Hatch Act, twenty-six new ones were established. The Adams Act of 1906 provides still further aid for research. This act appropriates \$5,000 annually, with an increase of \$2,000 each year until the sum of \$30,000 shall have been reached. When the Adams Fund has matured, the United States Government will be appropriating about one and a half million dollars annually for experiment station work. In addition to this, the individual states are now appropriating more for research than the Federal Government appropriates."—A. H. Leake, *Means and methods of agricultural education*, pp. 15-16.

United States: Farmers' Institutes.—**Boys' Clubs.**—The Farmers' Institute is to "the adult farmer what the agricultural school is to his son. They were the outgrowth in part of the public meetings of agricultural societies and state boards of agriculture, and in part of the extension work of colleges and universities. The object of these institutes is to bring the workers in the agricultural sciences and the practical agriculturists together for the discussion of questions of mutual interest. Through such discussion the farmer gets the benefit of the information which the scientist has obtained in the course of his investigations, and the scientist learns what the farmer's needs and difficulties are. The results of the practical tests made by the farmer of the scientist's theories are also brought out. . . . Institutes in the United States are carried on . . . most commonly, . . . by the state commissioners, the state boards of agriculture, or the agri-

cultural colleges. In some states there is an independent organization with a secretary of institutes in charge. Some states make special appropriations for institutes, others merely allow a limited amount of the funds appropriated for the board of agriculture or college to be used for this purpose. Institutes are held usually during the winter or after the crops are 'laid by' in midsummer . . . and continue in session from one to three or four days. . . . Closely related to the farmers' institute are the various other methods of agricultural college extension work, such as co-operative field experiments, correspondence courses in agricultural sciences, reading circles for farmers, and itinerant agricultural schools. Co-operative field experiments were inaugurated soon after the establishment of the colleges for agriculture. The college or station makes plans and supplies the fertilizers or gives prescriptions for the same, with full directions as to methods of carrying out the experiments. The farmers report . . . and the different results are compared and published. A great deal of good has been accomplished in this way. . . . Similar methods have been used in testing seeds of field and garden crops, and in testing insecticide and fungicide materials and methods. Such co-operative experiments have done much to promote the study of scientific agriculture in the states, and especially to develop habits of observation among the younger farmers. . . . Instruction by correspondence and by courses of home reading in agriculture have been well developed under the direction of the State college of Pennsylvania."—C. W. Dabney, *Agricultural education (Department of Education, Monographs on Education in the United States, St. Louis Universal Exposition, 1904, pp. 37, 38, 39)*.—"As far as the records of the United States Department of Agriculture go, they indicate that the first Boys' Corn Club was organized in Macoupin County, Illinois, in 1890. It grew out of the failure of the Farmers' Institute to secure an attendance. The Secretary of the Institute conceived the idea of distributing some good ears of corn and bring them to the annual meeting of the Institute. He reasoned that if the boys came, their fathers would come also. He was not mistaken—they came in large numbers. In this and other counties in Illinois, as well as in other states of the middle west, this idea was taken up right generally between 1900 and 1905. . . . When Dr. Seaman A. Knapp began to organize Boys' Clubs as Junior Farm Demonstration Work, the Boys' Corn Clubs of the middle west had passed the zenith of their activity and usefulness and were somewhat on the decline. After the Farm Demonstration Work had been going on for about four years, it was reported from Mississippi, from Texas and other states in 1906-07, that the boys wanted to have a hand in this new enterprise. Dr. Knapp realized the possibilities of utilizing the energies of these newly formed purposes. . . . He grasped the idea of having the Corn Club Boys demonstrate to the nation and to the world that the South could grow large yields of corn."—O. B. Martin, *Demonstration work*, pp. 40, 41.

United States: Demonstration Work.—"The Farmers' Co-operative Demonstration Work conducted by the United States Department of Agriculture through the Bureau of Plant Industry was inaugurated under authority of Congress in January, 1904, primarily because of the depredations of the Mexican cotton boll weevil in the State of Texas. . . . The . . . Demonstration Work is conducted under the Bureau of Plant Industry by a special agent in charge, who reports directly to the Chief of the Bureau. A corps of field agents,

classified according to territory in charge, as state, district, and county agents, is employed. . . . The term 'demonstration farm' is used to designate a portion of land on a farm that is worked strictly according to our instructions. This is visited by an agent as often as once a month, if possible, to see that these instructions are carried out and to give any further advice necessary. A 'coöperator' is a farmer who agrees to work a part or all of his crop according to our instructions, but a department agent only visits him in exceptional cases. . . . The Farmers' Co-operative Demonstration Work is a system by which the simple and well-established principles of successful farming are directly taught to the men on the farms. . . . One of the most serious problems in the reform of agricultural methods has been how to influence the farmer to adopt improved practices. It has been found that the mere dissemination of printed information sometimes does not accomplish this result, and therefore the method of neighborhood farm demonstrations in coöperation with progressive farmers has been evolved. The effect of a field demonstration is immediate and positive, and reaches all classes."—S. A. Knapp, *Demonstration work on southern farms (U. S. Department of Agriculture, Farmers' Bulletin 422)*.—From this work resulted the Smith-Lever Act of 1914.

United States: Smith-Lever Act.—Its effects.—"This act for the encouragement of agricultural extension was approved May 8, 1914, by President Wilson. One college in each state, to be designated by the Governor as the recipient of the funds, is to receive perpetually from the Federal Government \$10,000 annually without requiring an additional appropriation from the State. The act also makes provision for additional annual appropriations, based on the rural population. To share in these additional funds, the State must duplicate the additional amount granted by the Federal Government. The purpose of the act is to provide for coöperative agricultural extension work. The instruction is to be given only to persons not attending or resident in any of the colleges. None of the money is to be used for 'the purchase, erection, or the repair of buildings, or the purchase, or rental of land, or in college course teaching, promoting agricultural trains, or other purposes not specified in the act, and not more than five per cent. of each annual appropriation shall be applied to the printing and distribution of publications.'"—A. H. Leake, *Means and methods of agricultural education*, p. 16.—"In 2,400 counties in the United States there is Co-operative Agricultural Extension work in progress under the Smith-Lever Act and related Federal and State legislation. . . . [The Smith-Lever Act nationalized the demonstration and Boys' Club work] and combined it with the Extension work carried on by the Agricultural Colleges and the United States Department of Agriculture. Under this broader plan the work has been extended throughout the country . . . and has grown immensely in effectiveness and in the favor and support of the farming people. In 1914, when the Smith-Lever Act became effective, there were Agricultural Agents in 930 counties and Home Demonstration Agents in 280 counties, principally in the Southern States. . . . [In 1919] including the County Agents with the supervisory officers and local assistants, 2,874 men are employed in the County Agricultural work and 1,705 women in the Home Demonstration work. There are also about 500 men and women specially employed as leaders of Boys' and Girls' Clubs, and the County Agents also engage in this work. The Colleges and the United States Department of Agriculture main-

tain about 1,500 Extension Specialists who supplement the work of the County Agents and aid them in various ways. Many other officers of the Department and the Colleges and Experiment Stations also contribute to the Extension work. Thus the farming people have a force of over 6,500 trained men and women whose personal service is being actively used in the effort to solve their practical problems. . . . The benefits which have already accrued from this system of practical education are widespread and numerous. Agricultural production has been increased and improved. In the South the steady progress of the boll weevil has been met with measures which have kept the cotton crop at a high level and have brought about a system of 'safe farming' under which the South has greatly increased the production of foods and feedstuffs. . . . In the North such things as seed selection and testing, measures to repress plant and animal diseases, campaigns against insect and other animal pests and introduction of purebred livestock, have had great beneficial results."—A. C. True, *Five years of the Smith-Lever Extension Act*, pp. 3-6, 10, 11.

United States: Training in secondary and primary schools.—"One of the most difficult and most important phases of agricultural education is that of a secondary grade. . . . This problem is being approached from many standpoints. . . . Wisconsin is trying the experiment of two country schools of agriculture. Occasionally the public high school will be found offering a course in agriculture. Several states are experimenting in one or more of these lines. . . . One of the most interesting movements in agricultural education has been an attempt to introduce nature-study and even the elements of agriculture into the country schools. Cornell University has taken the lead in advocating 'nature-study' purely, for the schools; and the University of Missouri has perhaps been the leader in advocating that the work be made even more definite and practical, and that the country pupils shall be taught, during their early years even, 'the elements of agriculture.' Both plans are being worked out with a fair degree of success, and many other states are carrying out the work in some form or other. Of course the idea is not a new one, but its present application is a timely one."—K. C. Butterfield, *Chapters in rural progress*, pp. 188-189.

EDUCATION, Art: Egypt. — Greece.—In the most primitive of human society, the home is the sole agency of formal education. The next step was the apprentice system, which has existed from immemorial times, and is still the chief method of art instruction in many countries. The ancient Egyptians seem to have departed from it only in the art of architecture. "The profession of architect in some respects took precedence over any other. . . . The education of the architect in the Temple school of architects doubtless embraced much sacred as well as historical learning, a knowledge of writing and mathematics, and that part of engineering which concerns itself with the strength of materials and practical dynamics."—S. S. Laurie, *Historical survey of Pre-Christian education*, pp. 38, 47.—"In Periclean Athens the possibilities of artistic training had certainly existed. In the *Protagoras* . . . it is suggested that the lad Hippocrates might 'go to this young fellow who has been in Athens of late, Zeuxippos of Heraclea. Every day that he was with him he would improve as an artist.' Earlier in the same dialogue Sokrates remarks that his friend might go to Polykleitos or Pheidias, and pay to be taught sculpture. The large number of boys who became apprentices to

the potters at Athens must have learned line-drawing and designing and painting from the earliest times. But art probably did not become a usual part of a liberal, as distinct from a technical, education till the middle of the fourth century. . . . By 300 B. C. no doubt art had become a regular part of the educational curriculum; for the philosopher Teles, who probably lived about that time, mentions the gymnastic trainer, the letter master, the musician, and the painter as the four chief burdens of boys."—K. J. Freeman, *Schools of Hellas*, pp. 114-115.—Polygnotos (who flourished c. B. C. 470-455) an older contemporary of Pheidias "is the first immortal name in the history of painting and with it some of the ancient writers themselves make the history of painting begin. [He was a native of Thasos] and was the son and pupil of Aglaophon. . . . He was the head of a school, or at least a group of painters aiming in the same direction, who gathered round him in Athens."—A. Woltmann and K. Woermann, *History of ancient, early, and medieval painting*, p. 42.—"Myron [5th century B. C.] is reputed to have been a fellow-pupil with Pheidias in the Studio of the Argive sculptor Ageladas, but while Pheidias completely drops the Argive theme and manner, Myron finds the Argive tradition congenial. . . . [Myron] was accounted a master of anatomy and action, but weak in the rendering of the face. . . . Polychitos was born in the Peloponnesus and studied and worked in Argos. . . . His fame was enormously increased in antiquity by the composition of a treatise of sculpture known as the 'Canon.' In this treatise . . . a comprehensive law of proportions was laid down. . . . Questions of attitude and pose were disposed of. . . . In illustration of these principles Polychitos chose one of his own statues, the Doryphorus, which for this reason became known in turn as the Canon."—H. H. Powers, *Message of Greek art*, pp. 195, 200, 202.—The Dorian or Sikyonian school, "is the first that deserves to be called, in the full sense of the word, a school; since the masters who composed it are the first of whom we learn that they made the training of pupils a regular part of their profession, and accordingly laid particular stress upon academical correctness, which they cultivated theoretically with the help of mathematics, and practically by conscientious study of nature. . . . Eupompos [fifth century B. C.] a contemporary of Parrhasios who] is considered the founder of the Sikyonian school. . . . [considered that an] artist who wished to succeed must go first of all to nature as his teacher. His pupil Pamphilos brought the school to maturity. The course of teaching in his studio is said to have lasted twelve years, and the fee was a whole talent. The renowned Apelles was among his pupils. It was Pamphilos who recognized and introduced the necessity of scientific study for the painter, especially the sciences of number and geometry; it was through his influence that the teaching of drawing was established in all the boys' schools of Greece. . . . [One of his pupils Melanthios may have introduced the practice of obtaining assistance from pupils. Plutarch states that his famous picture of Aristratus on the car of Victory] was painted in co-operation with his pupils. . . . [Euphranor, Theban school, pupil of Aristides,] who was also celebrated as a sculptor is said to have left treatises on human proportions and colour."—A. Woltmann and K. Woermann, *History of ancient, early, and medieval painting*, pp. 51, 52.

Roman and Early Christian.—"It has been claimed that Roman Gaul had many schools of art. The schools established in the principal towns of

Gaul, at Lyons, Vienne, Arles, . . . sheltered and formed numerous artists. . . . Lately come in the development of the ancient world born full grown, our civilization threw in the *milieu* of the Roman decadence, a brilliant but fugitive light. . . . [But] before the new [barbarian] deluge . . . all that was able to survive of intellectual culture took refuge in the monasteries. The artists of the Merovingian period were the bishops and the monks. (St. Martin directed the construction of the first monastery of Gaul. . . . Saint Agricola built at the end of the fifth century several churches of his diocese. . . . St. Germain of Paris built about 550 a church to St. Vincent, which afterwards became St. Germain-des-Prés). . . . The bishops themselves built their *basiliques* modeled and chiseled their 'aposeles and martyrs'. . . . The cloister from its nature is everywhere and always a school. . . . Artists must then salute as their first ateliers all the monasteries of the Merovingian period that we know."—L. Courajod, *L'École royale des élèves protégés*, pp. iii, v, vi.—From early Christian times painting was largely used for the decoration of churches, in order, according to Gregory II, "that those who are ignorant of the scriptures may at least see on the walls what they are unable to read in books." . . . In the presence of [the great mosaic in the apse of St. Pudencia on the Esquiline] we cannot but perceive not only that the decadence of antique art . . . has come to a temporary halt, but even that a certain new impulse has made itself felt. This was . . . the consequence of conscious care and encouragement. The increased activity of architecture . . . had aroused a demand for better trained powers. Libanius relates how in his time the young men forsook the schools of the rhetoricians and philosophers at Antioch, and streamed in crowds to the studios of the painters. Laws were enacted by Constantine (A. D. 334 and 337) to promote the training of architects. The schools of art now once more encouraged the observance of traditions; strictness of discipline and academical training were the objects kept in view; and the student was taught to work not independently by study from nature, but according to the precedent of the best classical models. [To this period belong the great mosaics, which show careful training not only in art but also in craftsmanship.]—A. Woltmann and K. Woermann, *History of ancient, early, and medieval painting*, pp. 42, 51-52, 16.

Medieval and Renaissance.—"The practice of art during the Romanesque period lay principally in the hands of ecclesiastics, though recent researches tend to prove that this was by no means as exclusively the case as was formerly supposed. . . . One branch of art alone, that of illuminating manuscripts was entirely carried on by monks. . . . For the rest, although not the sole centres of . . . education or artists the monasteries, from the great extent to which art was used for ecclesiastical purposes, were certainly the chief places for their meeting and higher training, especially north of the Alps, where the lingering influence of antiquity was feebler than in the south. . . . 'Of artistic education disseminated by the monasteries we have evidences in writings as well as in the works of art themselves. The tradition was in part a literary one; rules and recipes were handed down, copied, collected and classified, by generation after generation.' In the thirteenth century art became emancipated from the influence of the monasteries, and the guilds of painters grew up, with the system of apprenticeship which belonged to the guilds. 'The manner of study adopted by the artists of the thirteenth century is exemplified in a precious sketch-book of the French Stone-Mason Villard de

Honnecourt, in the National Library at Paris. Of strict drawing of the figures or close study of the nude, there is no question; if the artist in any instance works from a model, he succeeds but very imperfectly in reproducing it. . . . Among travelling sketches are some taken from works of art . . . but direct references to nature are also found . . . animals were sometimes studied from life. . . . But the forms are never thoroughly grasped. . . . We gather from Villard's sketch-book how by accommodating the human body to definite geometrical figures, such as triangles or segments of circles, a formula has been provided, which even the least skillful could apply with some measure of success."—A. Woltmann and K. Woermann, *History of ancient, early, and medieval painting*, pp. 255, 356, 360.—Formal instruction in schools had its early inception in Bohemia. "To the Emperor Charles IV who reigned in 1348, probably belongs the honour of having established in Bohemia the first organized school of German painting. It never attained any particular distinction . . . and is mentioned only for its priority in time. . . . Of much greater importance is the school of Cologne in regard to whose origin history has as yet been silent. . . . Meister Wilhelm, [who] appeared about 1358, and was settled at Cologne between 1370 and 1380, is now regarded as the practical founder of the school."—A. G. Radcliffe, *Schools and masters of painting*, p. 242.

The craftsman painters had the advantage of tradition handed down from the time of the early Greeks, and of treatises passed on from one generation to another. "The earliest medieval worship note book [extant, known as] the Byzantine MS., the Lucca MS. and *Compositiones*, in Italian handwriting of the eighth century, is evidently translated in part at least from Greek originals. . . . A great part of the Lucca MS. is repeated in the *Mappae Clovicula* (the little key of drawing) a MS. of the twelfth century. . . . As it contains one or two English words, this MS. was probably written in England. The French chemist Berthelot has shown that the industrial practices of these related MSS. (Papyrus, Lucca, Clovicula) were linked with certain scientific and mystic (alchemical) theories which subsisted without interruption in the trade notes of the arts and crafts from the Roman Empire through the Carolingian period and onwards; . . . [Theophilus a German monk (probably a worker in metal) wrote the *Schedula Diversarum Artium* probably at the end of the eleventh or beginning of the twelfth century.] The *Schedula* . . . belongs to the same technical school as the earlier documents we have been considering. . . . Thus it links the later MSS. which closely resemble it to that Byzantine art of which it is a product, and which itself was founded on the classical tradition. These later documents are the *Hermeneia* which is the old Greek church manual from mount Athos, and Cennino's *Trattato* [written in 1337]. A group of French MSS. of French origin belong to the same school as the *Schedula* . . . [two of which] seem to date from about the turn of the twelfth and thirteenth centuries, or earlier. . . . They embody a good deal of the material of Theophilus either showing that his mark was a widely used authority, or that both writers compiled from a written or oral technical tradition practically the same in all monasteries where painting was carried on. [Something of the old manner of using these treatises was learned at] Mount Athos, where the *Hermeneia*, Guide to Painting . . . was found in the year 1839, by Didron, in use by the primitive monks of that

strange town of monasteries. It professes to be the teaching of a painter, Manuel Panselinos, of Thessalonica, whom Didron calls the Giotto of the school, who lived in the eleventh or twelfth century. . . . One wants to linger over this weird survival of the old-world *bottega* with masters and journeymen and apprentices, where the book of the art was laid open in the midst and the pupils read from it in turns in a loud voice, as the others painted in obedience to its directions."—C. J. Herringham, *Pedigree of the Trattato*, in *Introduction to Art of the old masters as told by Cennino Cennini*, pp. xxv, xxviii, xxix.—It is probable that in Italy, with its wealth of tradition, painters were never so dependent upon the church for instruction as their fellows in more northern countries. At any rate, it is probable that Cimabue learned his art in the workshops of a lay artist, whether of Greek or Latin nationality, and himself carried on the practice of receiving apprentices, the most famous of them being Giotto of whom Cennino wrote, "Do you follow the method of coloring which I shall point out to you, because Giotto the great master followed it. He had Taddeo Gatti the Florentine for his disciple for four-and-twenty years. . . . Taddeo had Agnolo his son; Agnolo had me for twelve years, whereby I gained this manner of colouring, which Agnolo coloured with more charm and freshness than Taddeo his father, [Cennino gives an interesting account of the life of an apprentice pupil in his day]. Know that you cannot learn to paint in less time than this. In the first place, you must study drawing for at least one year, on tablets; then you must remain with a master at the workshop, who understands working in all parts of the art; you must begin by grinding colors, and learn to boil down glues, to acquire the practice of laying grounds on panels, to work in relief upon them; and to work them smooth and to guild; to engrave well; and this for six years; afterwards to practise colouring, to adorn with mordants, to make cloth of gold, and to be accustomed to paint on walls, for six more years; always drawing without intermission either on holidays or workdays. And so, through long habit, good practice becomes a second nature. Adopting other habits, do not hope ever to attain great perfection. There are many who say they have learned the art without having been with a master. Do not believe them, for I give you this very book as example: even studying it day and night, if you do not see some practice with some master, you will never be fit for anything, nor will you be able with good face to stay among the masters. . . . The first year was a preliminary trial. If the master was satisfied at the end of that time, the boy was bound to him for twelve years. In the later years of the apprenticeship the lad's earnings helped to pay his board and lodging. The pupil was sworn never to divulge the secrets of the art until he became a master himself, when he was allowed to teach them to his own pupils, first binding them to secrecy."—*Book of the Art of Cennino Cennini*, pp. 60, 87, with note from *ancient Practice of Painting*, I. cxviii.—The youth of Leonardo da Vinci is an excellent example of the instruction in art given in his day. "His father took him, like any other art apprentice, to the studio of . . . Andrea Verocchio, by whom Perugino and Lorenzo di Credi were also educated. . . . [There he remained until the age of twenty-five] studying his draperies from clay figures covered with wet linen; perfecting himself in exactness, yet softness of drawing, shading and relief; till his style became so entirely formed that future years needed only to develop, but never to alter it. . . . Michel Angelo . . . at the age of

fourteen . . . was permitted to enter the Florentine studio of Ghirlandajo to whom he was apprenticed for three years . . . [but Ghirlandajo feared his pupil] might prove superior to the master, and before the three years were over, the contract was broken." [Raphael received his early instruction from his father. After the death of his father in 1494 he received desultory lessons from obscure painters but in 1495 was placed in the studio of Perugino.] During the eight years' occupied by his studies, he made rapid progress, often worked on important pictures of that master . . . and thoroughly acquired Perugino's method."—A. G. Radcliffe, *Schools and masters of painting*, pp. 127, 128.

"From the XIII century teaching of the arts [in France] was exclusively by apprenticeship, with all its advantages and inconveniences. But at the beginning the dangers of the reciprocal isolation of the various arts, the fatal influences of the *Maitris* [or administrative bodies of the art corporations,—the French guilds] were overcome by the favorable circumstances which surrounded the great Gothic epoch. . . . The vast enterprises of Cathedrals and public monuments were great public schools; to speak more justly still, they were veritable academies . . . where the pupils of various masters . . . were brought together and formed a . . . small society in which were developed between people of different status principles the most exquisite and most refined of an incomparable aesthetic. . . . During the Renaissance apprenticeship continued to be in France the only legal and regular means of education, but did not remain the only means. . . . The artists began to travel, that is to say, to compare. At this time, even in Italy, the instruction first continued to be by apprenticeship, but the practice was lighted by doctrines, fortified and corroborated by theory. . . . The atelier became veritably a school, and academies were born in all parts. Have I need to recall the marvellous teaching of the primitive academies, the names of Leonardo da Vinci, of Bramante, of Raphael? All the great Italian artists of the XV century were theoreticians; their ateliers were academies."—L. Corajod, *L'École royale des élèves protégés*, pp. xxviii, xxx, xxxii.—Modern academies have grown out of the ancient brotherhoods of artists. "The custom among artists of associating for a practical end, under the auspices of religion, goes far back into the Middle Ages. We know of one society of *Mosaïstes* [early] in the 11th century.

"A little later, about the year 1060, Didier, abbé of Mont-Cassin, called to his abbey the most skilful painters, to give leçons to the youths. According to Missirini that company of artists formed the first academy . . . a designation which we believe to be inexact, and which ought to be replaced by that of confraternity. . . . [Numerous confraternities were organized and were] invariably placed under the *invocation* of St. Luke [who was regarded as a skilful painter, a medieval tradition which probably had its origin in the work of the Florentine Luc, who painted a large number of Madonnas, in the XII century, and was regarded as a saint]. At Venice . . . there was before 1290 a company of painters under the invocation of St. Luke. . . . Sixty years later (1340) the Florentine painters followed the example of those of Venice; they founded a brotherhood which assembled, according to the custom of the time, in the Church of Saint Maria Novella. In 1355 Sienna imitated Florence; a society of painters was constituted there at the moment when the plague ceased to sadden that city ordi-

narily so cheerful. The composition of these fraternities was rather singular. Beside the painters, one saw there the workmen: gilders, varnishers, coffer and scabbard makers, saddlers were there in numbers. When the art of modern times came out of its swaddling clothes, [it was more or less under the influence of the heavy hand of industry]. Even in the fifteenth century the predecessors of Raphael painted diptiches for the churches; for the bourgeois, coffers, armoires, seats; for warriors, bucklers, and harness. . . . So close a community between the artist and the artisan was of great benefit to industry, because the beautiful and the useful were closely united. It had, however, an irritating side. The artist laid claim to a preëminence . . . which the artisan of the same confraternity was little disposed to accord him. [The struggle between them was happily of short duration in Italy. In France it was drawn out to the close of the 19th century.] . . .

"It is at Milan that we find the first Academy. Ludovic Sforza, surnamed the *Moor* founded it towards 1484 and it was Leonardo da Vinci whom he charged to direct it. Although we lack details, of the existence of that academy there can be no doubt. . . . In (Florence about the year 1561 the old corporation of Santa Maria Novella was dissolved. . . . Fra Giovanni Montorsole, a skilful sculptor, undertook to restore it, but under the name of an academy. . . . [In 1503 St. Luke's academy in Rome was founded. Twenty years before this Girolamo Muziano superintendent of the works of the Vatican, had undertaken to replace the venerable brotherhood of St. Luke by an academy. He obtained permission from Pope Gregory XIII in a bull directed to the Vicar-general of Rome, which cited the low state into which art had fallen in Rome. It goes on] to remedy these inconveniences they have thought that it would be well to found at Rome an academy of beaux arts and to confide its direction to men who are consummate in their practice, and whose duty will be to diligently instruct the young men in the Christian doctrine, to render them pious, men of good manners, and finally to exercise each of them in the practice of art according to his intelligence and capacity. . . . They demand the foundation of a congregation under the invocation of St. Luke in one of the least frequented churches in Rome. . . . [And the erection] near the said church of a hospice to receive the intelligent young people who come to Rome from all the corners of the earth . . . to deliver themselves to the arts . . . a hospice where they will be welcomed and have their costs defrayed for the space of three years. [The bull goes on to give permission to concede to the painters and sculptors who had petitioned for it a license to found such a school in perpetuity, to choose a little frequented church for their purpose,] and to receive and appropriate all the goods movable and immovable, alms, legacies and other advantages . . . of which the académie and brotherhood will be gratified in future. Fortune reserved to Federico Zuccaro the honor of putting into execution the plans of Muziano. . . . He obtained from Sixtus V confirmation of the bull signed by Gregory XIII. November 14, 1503, all the artists of Rome found themselves reunited in the little church of Saint-Martin at the foot of the capitol under the presidency of Zuccaro, whom they had proclaimed Prince of the Académie of St. Luke. . . .

"This académie shows by what gradation the brotherhoods were transformed into academies.

. . . Two classes composed it. [In the one were all the qualified skilful artists; in the other mediocre artists, those who conserved the old name of *confrérie*; even artisans whose trade depended on the beaux-arts. Honesty, and the offer of a candle, that is all that was demanded of a candidate. This was the beginning of the academy of St. Luke at Rome.]—*Dictionnaire de l'Académie des beaux-arts*, v. 2, pp. 62-67.—Apparently about the period of the formation of the early academies, the students in the Italian *bottegas* ceased to be full apprentices, and the studio system of free pupils who gathered round a famous master was already in vogue. Dürer the son of a goldsmith was first apprenticed to his father's trade but afterward transferred to the tuition of Michael Wohlgemuth, with whom he studied three years and in 1490 set out on his wandering years of travel. He, too, had pupils, but none of his scholars achieved any celebrity. Rubens had many pupils who assisted him in accomplishing over three thousand works. One of these was Anthony Van Dyck. The practice of studying with another artist was likewise current in Spain. Thus we learn that Velasquez . . . [had as pupil] Francisco Hírraro, who, however, left him and went to Pacheco who was censor of paintings for the Inquisition. This Pacheco wrote a treatise on the art of painting, in which specific directions for painting were given. "Draperies to the throat are of course a necessity. Ungloved hands may be permitted, but unshod feet are severely condemned. . . . Before his death it was Murillo's great desire to establish an academy of art in Seville. This he accomplished in 1658. . . . But the academy . . . soon languished, and in less than fifty years became extinct."—A. G. Radcliffe, *Schools and masters of painting*, pp. 348, 364.

French leadership in the 16th century.—Academies in the 17th century.—In the sixteenth century began the foundation of the academies of painting with their accompanying schools. "While Italy offered to Europe that magnificent spectacle . . . [of her art] . . . Italian artists were called to France; . . . [and] were assigned the construction and ornamentation of a palace . . . It was a vast enterprise comparable to . . . the construction of the great cathedrals of the Middle Age. . . . Living together, architects, painters and sculptors created a veritable academy, the first official and common school of art, in France. M. Vitet has perfectly indicated . . . existence of these two currents of French art of the XVI century. On the one side the *maitrise* with its old proceedings, with its works which . . . move us as the last sigh of the Gothic school; the other, the school of Fontainebleau, with instruction which, unhappily did not emanate directly from the great masters, but which restored the excellent method of theoretic education. The history of teaching, . . . of the XVI century lies in the struggle of the two principles represented by the *maitrise* and by the school of Fontainebleau. Penetrating each other, . . . they assured to France a superiority in the arts which she has not since lost."—L. Courajod, *L'École royale des élèves protégés*, pp. xlvii-xlviii, lxxxv.—"Flemish workmen were brought to Fontainebleau by Francis I., who there established, in 1539, a manufactory of tapestry which was kept up by his successors; a hundred years later Colbert, Minister of Louis XIV., took the manufactory of the brothers Gobelin under his protecting care, and secured for France a large share of the lace manufacture by establishing the works of Alençon; and in the following reign the famous porcelain

works at Sèvres were established. Royal in their origin, the works in the Rue Mouffetard and at Sèvres are still Government establishments, not dependent on profit for their existence, but encouraged in the production, regardless of cost, of work of the highest merit; and the instruction there imparted to generations of workmen, trained under circumstances so favourable to the attainment of excellence, has necessarily had great influence on the art-industries of France."—J. C. L. Sparkes, *Schools of art (Health Exhibition Hand Books, v. 8, p. 748)*.—As early as 1391 the Maîtrise de St. Luc had united the most notable of the painters and sculptors of Paris into an examining body or jury to pass on the materials used by artists and gilders, and prosecute them in case of fraud. This body, which was formed to overcome an abuse itself became in time an abuse, a source of oppression, and the cause of the backward state of art in France. All painters and sculptors were compelled to belong to it, and its members strenuously opposed the formation of an academy. It was not until the seventeenth century that the artists in France became strong enough to overcome its tyranny. In 1648 the academy of painters and sculptors was authorized by the council of regency under the influence of le Brim. The maîtrise then founded a public school in the academy of St. Luke. Between 1661 and 1666 the academy of painters and sculptors received new authorisation and was taken under the protection of the king and his great minister Colbert. An annual gift of 4,000 livres was made to defray the cost of teaching, and the French academy at Rome, was instituted. The prix de Rome, which carries a scholarship to this famous school, is still the greatest prize of the year for the students of art in France.

ALSO IN: L. Vietet, *L'Académie Royale de peinture et de sculpture*.

France: Eighteenth century.—"At the close of the eighteenth century there were in France (1) the school opened and held in the Louvre by the Academy of Painting and Sculpture, (2) the little school of artist pupils, . . . (3) the school opened and staffed by the academy of architecture, (4) the academy of France in Rome, (founded 1666), (5) the school of the Gobelins, (6) the school of architecture founded in 1747 by Blondel [an architect] under the name of the school of arts, (7) the royal free school of drawing founded in 1766 by Bachelier, (8) all the schools of drawing of the provincial towns."—L. Courajod, *L'École royale des élèves protégés* (1874), pp. xlvii, lxxxv.—The royal free school of drawing was open to apprentices, or to children who were designed for artisans in various trades, carpenters, masons, opticians, embroiderers, ribbon makers, watch makers, gilders, fan makers, engravers on metal, jewelers, and many others, and the studies were divided into three kinds: geometry and architecture; the figure and animals; flowers and ornament. It was open from seven in the morning until half past five in summer, and in winter from nine o'clock until the close of the day. 1500 young people at one time received instruction in this school.

Modern period.—Art schools.—Art schools as we understand them are institutions of modern date. Great academies of the fine arts which originally developed out of the bottegas and ateliers of mediæval times and lesser art schools have been established in various cities in almost all modern countries, and beside them studio instruction by artists is still carried on, although the practice of the artist-teacher obtaining assistance

from his artist pupils has fallen into general disuse. The great bulk of art teaching, however, is given in art schools. Industrial art schools which are of great importance are the outcome of the demands of the industrial age, and were made necessary not only by the disappearance of the old system of apprenticeship but by the need for designs to be used for the modern production in bulk by machinery as opposed to the individual artistic production of the old time master workman.

AUSTRIA.—"The movement in favor of art-industrial education has not only extended to Austria, but is more marked than anywhere else. . . . Drawing in the schools for general education has gradually been brought nearer to its real destination; and in this respect Austria had the advantage of other states, as the subject had always been compulsory in her Real-Schools. For, although these schools had formerly aimed principally at technical education, drawing had obtained a sound basis in them, and the methods of teaching had had time to define themselves in the course of a number of years. On the part of art-science, the higher importance of instruction in drawing was also urged with constantly increasing emphasis. . . . [An] enactment on this subject . . . dated Sept. 1, 1873, . . . contains the detailed plan of instruction for freehand drawing in the People's and Middle Schools. . . . [Special attention is paid to drawing in the industrial schools, which form a distinctive part of the Austrian educational system.]"—J. Langl, *Modern art education*, pp. 10, 11.—The royal academy in Vienna had for its origin in a society of painters founded by the emperor Leopold III., transformed into an academy des beaux-arts by the empress Maria Theresa, and reorganized in 1812 by the emperor Francis I. In addition to the royal academy, there is in Vienna an important school of decorative art, the foundation of which was established in 1867.

BELGIUM.—By the end of 1876, art schools existed in "Antwerp, Ghent, Brussels, Dinant, Namur, Liège, . . . The whole of the Belgian system of art instruction has a certain resemblance, whether it is practiced for the development of artists or those who practice industrial art. . . . The schools are supported from three different sources. The Government, the Commune, and the Province all contribute to their maintenance. The Municipality provides the building, the Government and Province contribute money for the professors' salaries and for exhibitions for students. . . . Antwerp is a Royal Academy of Fine Art, and the instruction is arranged with the intention of developing a painter, sculptor, or architect to the highest point. . . . In the Fine Art Section . . . if [students] are not passed on into the highest class in two years, it is assumed that they have no strong gift for their profession of painter, and are denied the privileges of the school. . . . [In Brussels there is a Royal Academy of Fine Arts, housed in a building which was erected in 1876.] Being . . . unable to investigate the system of work followed by the Academy, I had the greater opportunity of seeing the practical working of the art-work in primary schools, and in those which correspond with . . . [English] night classes. . . . At Namur is an academy of painting and drawing, conducted on the same general principles as that at Antwerp. . . . At Liège, I found an Art School of 300 students on the usual plan, i.e., a seat or place to each elementary student, ample space in large rooms, specially lighted, and graduated classes working up to the highest Art School practice. . . . The school at Ghent is in some sort the

most interesting school of any in Belgium, for here the pure and simple government system is carried out without any mixture of local influence to modify or suppress any part of the scheme. The course is planned for a three years' practice in the elementary rooms, to be supplemented by a further course of two years in advanced classes."—J. Sparkes, in *F. Waller's report on art schools*, pp. 31-33, 36-37.

CANADA.—"In 1875 and 1876 the School of Art and Design [of Ontario] was organized, . . . and out of this, in 1912, grew the Ontario College of Art. During the period when the Marquis of Lorne was governor-general of Canada the Royal Canadian Academy of Arts was founded. . . . The Toronto Art Students' League was founded in 1890. . . . There are now various art schools in the different cities in both Ontario and Quebec."—*Canada and its provinces*, v. 12 (*Missions, Arts and Letters*, pt. 2, p. 635).—Drawing is also taught in both the primary and secondary schools.

ENGLAND.—IRELAND.—SCOTLAND.—"In . . . [the British Isles] the school of the individual great artist upon the continental plan seems to have had no counterpart. Favourite portrait-painters have [in England], now and then, employed a staff of subordinates to paint the draperies, and fill in the backgrounds of their works, but the persons thus employed have been mechanics rather than artists. Northcote was the pupil of Reynolds, and Harlowe was taught by Lawrence; but in neither case was there much attempt at maintaining a school of manner, as it would be understood out of England. . . . In England the foundation of a National Academy, or of an institution in any measure manifesting the characteristics of a National Academy, took place long subsequent to the rise of the foreign Academies. . . . The encouragement given to the painter during the first half of the eighteenth century was insignificant enough. . . . He must get on as well as he could, educating, improving, helping himself. . . . For the benefit of his brother artists and of himself, therefore, Sir Godfrey Kneller . . . instituted a private drawing Academy in London in the year 1711. . . . It was probably of this institution that Hogarth wrote in 1760, describing it as founded by some gentlemen painters of the first rank, who, in imitation of the Academy of France, introduced certain forms and solemnities into their proceedings which were objectionable to several members, and led to divisions and jealousies in the general body. Finally, the president and his followers, finding themselves caricatured and opposed, locked out their opponents and closed the Academy. Sir James Thornhill, . . . [historical painter to George I] then submitted to the Government . . . a plan for the foundation of a Royal Academy which should encourage and educate the young artists of England." But the Government negated the proposition and Sir James opened a private Drawing Academy which was closed upon his death in 1734. But a school had now become indispensably necessary to the artists of the day. After a time they forgot their differences, and Hogarth proposed that all members should equally contribute to the maintenance of an establishment, and should possess equal rights of voting. For many years the academy, thus founded with Hogarth's help "existed in a most satisfactory manner. To this school of Hogarth's, as we may fairly consider it, the majority of the English painters of the reign of George II. and the early part of George III., owed much of their art-education."—D. Cook, *Art in England*, pp. 55, 57-62.—In 1768, a number of artists, among them Benjamin West and William

Chambers, an architect, enlisted the aid of George III in founding "a society for promoting the arts of design," one of the objects of which according to the plan presented to the king was to be the establishment of a "school of Academy of design . . . and an annual exhibition open to all students of distinguished merit." This was the origin of the English Royal Academy of Arts, which for charter has the plan (called the Instrument), on which the king wrote "I approve of this plan; let it be put into application" and signed it. The Schools were opened in January 1769. "The Dublin Society, founded as early as 1731, and incorporated by Royal Charter in 1740, claims to be the first body in the United Kingdom to offer premiums for the encouragement of drawing and the promotion of art. . . . It was urged that the establishment of a public and free drawing school would tend to advance the arts, and the society built a large room in 1741, suitable for the purpose, on their premises in Shaw's Court, Dame Street, Dublin. . . . The schools from the date of their establishment, were called the 'Drawing Schools of the Dublin Society,' and received an annual grant from the Irish Parliament of £500, which was continued during 105 years. In 1840 an additional grant of £500 was made by the Board of Trade, upon the amalgamation of the old schools (whose chief aim was high art education) with the newly instituted schools of design, which had for their particular object the direct application of art to manufactures. It is worthy of remark that this school, established by the Dublin Society in 1741, has since been in operation without intermission, and has been most successful in training architects, sculptors, designers, and pictorial artists. The Society of Arts—or, to give it its full and more suggestive style, the Society for the Encouragement of Arts, Manufactures, and Commerce—was instituted in London in 1754, and incorporated by Royal Charter in 1847. . . . A School of Design was one of its first offshoots. [William] Shipley himself superintended it, and Richard Cosway, the celebrated miniature painter, received the first premium of £5. . . . The Society's earliest attempts to foster artistic knowledge and to impart it to the rising generation were supported by the action of the Duke of Richmond, who had brought from Italy a rich collection of marbles and casts from the antique [and] . . . threw open his collection to the public as a drawing school, under the direction of Wilton and Cipriani, two of the original members of the Royal Academy. . . . [According to Burnet] this was the first public school which was opened where a knowledge of the beauties of the antique was to be learned. . . . Mention must next be made of the establishment of . . . an institution, the importance of whose functions it would be difficult to over-estimate—the British Museum. . . . Here again it was individual, rather than legislative, action which was the motive force. Until the middle of the . . . [eighteenth] century the project of establishing a national museum was not entertained in England. The idea found expression in the will of a public benefactor, Sir Hans Sloane, who directed that his collection of manuscripts, books, works of art, and objects of natural history, which had cost him £50,000 should be offered to the nation for £20,000. The offer was accepted. . . . The Museum was opened at the beginning of 1759."—J. C. L. Sparks, *Schools of art (Health Exhibition Hand Books*, v. 8, pp. 747-756).—See also PAINTING: Modern: England.—After the World's Fair of 1851 the British Government adopted a definite program of art education, with the following features:

"(1) To encourage the formation of Museums in Industrial and Hight Art. (2) To throw these open to the people without charge, and connect with each an Art School taught upon the best methods. (3) To make drawing a prominent and compulsory part of public school education. (4) To establish a Central Training School for Art Masters, particularly in the applications of Art to Industry. (5) To establish Art Schools in all the manufacturing centres and large towns of the United Kingdom. (6) To establish special industrial Art schools wherever special manufactures demanded them. (7) To establish evening drawing-schools for the benefit of the working-classes—chiefly of adults. (8) To throw open libraries and other facilities of education to the people. (9) To extend the system of common-school education. (10) To establish professorships of Art in the universities of Oxford, Cambridge, and London, and make Art a part of a liberal education."—W. Burney, *Art education*, p. 18.—This was the beginning of national system of education in art, and especially in industrial art, of which the Royal College of Art at Kensington is the head. The great increase in artistic results which were soon apparent in Great Britain attracted the attention of continental countries, and as a consequence much more attention has been paid to the teaching of art in common schools. England also maintains an academy in Rome, founded in 1823. The British School in Rome, founded in 1912, has faculties of painting, sculpture, architecture and engraving. There is also a British school in Athens for the study of Greek art and archæology.

"During the post-intermediate stage in Scottish secondary schools, drawing is included as an elective study. . . . The purpose and scope of this post-intermediate drawing instruction may perhaps best be indicated by the following extract from the official circular. . . . 'As to the character of the courses, there will doubtless be general agreement in favour of concentration in one or other of two principal groups. Drawing, Painting, and Modelling would constitute the first group, the work in one or more of these mediums being carried to a high standard of advancement. In the second group, Drawing and Painting would again appear, along with the study of Design and Applied Art as embodied in the practice of suitable Art Crafts. In the second group, the study of Architecture should be introduced, largely to assist in the formation of proper conceptions in Design—true construction in all cases coming before decoration. Some knowledge of the history and progress of Art might reasonably be expected in both groups.' . . . A chair of Fine Art was instituted 34 years ago [written in 1912] in the University of Edinburgh, and its courses in fine art and in classical archæology are now accepted as qualifying for ordinary and honours degrees. . . . So far as the constructive and executive sides of art study are concerned, these are already generously provided for in well equipped and capably staffed schools and colleges of art and crafts, situated in various parts of the country. In Scotland, the four university centres are thus provided, and in Edinburgh and Glasgow especially. . . . For pupils who intend to take up some branch of art as their life work, the present tendency is to leave school about the age of 15 to 16 after obtaining the intermediate certificate, and to proceed direct to a school of art."—J. T. Ewen, *Art in the university* (*Fourth International Congress for Art Education: Drawing and art applied to industries*,—*Vorbericht*, July, 1912, pp. 283-285).

FINLAND.—"Sunday and Evening Schools for the

practice of drawing have been opened in all of the more important places; and the higher artistic training of working-men is provided for by the Industrial School at Helsingfors. In most of the People's Schools drawing is also practiced. . . . In spite of these diversities, a certain unity prevails in the instruction in drawing; and it is practiced everywhere, even in the infant-classes. In the Elementary Schools . . . geometry has also been introduced, and this subject is continued in the Secondary Schools. In the Industrial Schools, which are almost identical with the (former) Austrian Lower Real-Schools, . . . drawing receives careful attention, especially in the technical sections; it is also practiced in the institutions for training teachers, and the candidates must pass an examination in the subject."—J. Langl, *Modern art education*, pp. 133-134.

FRANCE.—At the time of the French Revolution, the academies and schools of art, which were in existence at the end of the eighteenth century, were disrupted, including the important schools in Paris. But, when Napoleon reorganized the institution now known as the Institut de France, he included the Ecoles des beaux arts, which embrace the schools of architecture, painting, sculpture and engraving as well as musical composition. In these schools, instruction is given in ateliers and also in *concours*. They also hold the examinations for the prix de Rome, which entitle the holders to scholarships in the French Academy in Rome. After the success in industrial art which was achieved in England, in the nineteenth century, France began to pay renewed attention to the teaching of art, and since the end of the century a number of industrial art schools have been maintained, and instruction in drawing has been widely diffused in the schools. In spite of the suppression of the Academy of Painting and sculpture during the revolution, according to some authorities, the schools continued to exist, or at least their tradition has been carried on. In 1816, the schools of the academy were united in the Ecole des beaux arts, which, however, is divided into three sections, painting, sculpture, and architecture, the latter of which has had a very great influence on architecture in America. In 1863, the school lost self-government and became a state institution, to which admission is gained by examination and in which instruction is free. Painting is done in ateliers, in which the students are divided into *nouveaux* and *anciens*, the anciens being the critics of the nouveaux, where drawing and modelling from the antique and from life are taught in classes which are open daily. The *cours* are open to students of the school, of the ateliers, and outsiders who have obtained cards of admission. They include history of art, and architecture, general history, and history of archæology, anatomy, perspective, mathematics, geometry, physics and chemistry, stereotomy and elevation of plans, building laws, theory of architecture, ornamental design, decorative composition. There is also a special course for students who desire to be admitted to the section of architecture. Women have been admitted since 1897. The grand prix de Rome is the chief prize of the Ecole des beaux arts. The Ecole speciale d'architecture in Paris was founded by Emile Trelât, and was recognized by the state in 1870. The national school of design for girls, founded in 1813 by Madame Frère de Montizon was re-organized in 1881. There are also a number of private academies, such as the Colarossi, La Grande Chaumière, Académie Julien, a school of decorative arts, which is subsidized by the government. Also, the Société Nationale de

l'art à l'école, founded in 1907, has its headquarters in Paris, and sections in all the large provincial cities. Its aim is the general elevation of artistic taste throughout the country. There are national schools of art at Bourges, and Dijon; and national schools of decorative art at Aubossom, and Limoges, devoted respectively to tapestry and the decoration of porcelain; one at Roubaix, and a national school at Nice which more nearly corresponds to an école des beaux arts. The school at Lyons, which has had a great influence upon the silk textile industry, was founded in the middle of the eighteenth century to instruct designers for the manufactories of Lyons. "The Academy of France in Rome occupies in the sphere of art the same rank as universities in the Domain of Science. . . . In an epoch where material interests are so powerful, an institution which gives to the young, victors of the academie des beaux-arts five years assured to study and work, five years when the necessity of gaining his living . . . will not come to trouble him . . . that institution . . . has a right to be respected."—*Dictionnaire de l'Académie des beaux-arts*, v. 2, p. 97.—See also EDUCATION: Modern developments: 20th century: General education: France.

GERMANY.—"After German art, at the commencement of [the nineteenth] century, had begun to develop itself in men of great talent, . . . more especially under the patronage of the Bavarian princes, art-industry . . . continued, for a long time, to play a subordinate part. . . . Drawing, which, outside of the Art-Schools, used to be practiced only in the Industrial Improvement Schools, and in the Sunday and evening classes, has . . . [since that time been] introduced into the institutions for general education, . . . [In 1870 drawing was still an elective study in the Real-Gymnasia, but had already gained a good foothold in the Industrial and Technical Schools, and Industrial Improvement Schools.] Each of the German state capitals has an art academy, dating in general from the eighteenth or nineteenth century. The Munich academy, which dates from 1809, is the best. The Berlin academy follows as second, and then come Dresden, Carlsruhe, Stuttgart, Weimar and Düsseldorf. In Munich, the interests of art-industry are principally cared for by the Royal Art-Industrial School and the Art-Industrial Association, while the cultivation of art proper is made over to the Academy of the Arts of Design, . . . In Nuremberg both tendencies [the fine arts and industrial art] are united in one institution,—the oldest among the art-schools of Germany (founded by Joachim v. Sandrart, 1606-1688), . . . The organization of the Nuremberg Art-School . . . together with its supplementary art-historical and anatomical lectures . . . leaves nothing to be desired. . . . The efforts of instruction in drawing in all the German Art-Schools are principally devoted to the thorough comprehension of form, and by far too little stress is laid upon picturesque illusion. . . . Art-industry in Munich, the same as in Nuremberg, likewise bears a specifically local character. Here, in consequence of a richer development of art in general, peculiarly pleasing motives of a romantic tendency have been intermixed with the German elements, and have been introduced into all branches of art-industry with peculiar skill. . . . Instruction in drawing . . . [began about 1872] to gain a better foothold in the People's and the Middle Schools of Prussia, although more slowly than in the South of Germany. . . . Drawing . . . plays a more important part throughout the Industrial Schools of . . . [Saxony] as it becomes a necessity wherever special

branches are to be successfully cultivated. . . . By the People's School law of 1873, drawing has . . . been made compulsory in the lower schools, in some of which, however, it had already been carefully practiced before."—J. Langl, *Modern art education*, pp. 33, 35, 44, 45, 48, 50-51, 60, 72-73.—There are important art schools or academies at Berlin, Breslau, Cologne, Düsseldorf, Munich, and local schools at Cassel, Karlsruhe, Darmstadt, Dresden, Frankfort, Gotha, Nuremberg, Stuttgart, and other places, and a large polytechnic school in Aix-la-Chapelle. The Royal Academy of Arts at Berlin includes "a valuable atelier system of instruction. The professors have each a studio, and some two, where their students work after they have passed through the schools. Into these studios other students than those of the academy may enter as private pupils of the professors. These studios are most useful adjuncts to the academy system, and the classes in general. In addition there are three *meister ateliers*, or head masters' studios, into which the best students graduate. . . . In Berlin, there are several distinct schools for the education of artists and designers; of these, the principal are: The Royal Academy of Fine Arts [founded in 1694]; The Academy for Architecture; The Academy for Industries; The Museum and School for Industrial Art."—J. C. L. Sparkes, in F. Wallers, *Report on art schools*, p. 43.—"Arts and crafts schools under the auspices of State or City exist in nearly every district, and the pupils receive there a generous artistic education for very small fees. The system of teaching is, however, rather mechanical, and the young artists once they have finished their course of instruction find it difficult to break away from the routine."—R. M. Berry, *Germany of Germans*, p. 235.

INDIA.—"Art schools have for some years past [written in 1904] been maintained at Calcutta, Lahore, Bombay and Madras. Their scope does not altogether exclude modern art; but they are principally concerned with the art handicrafts of the country, which it is their object to strengthen and revive by the elaboration of design upon traditional lines and the improvement of technique. They can claim some gratifying successes. But it has not been easy to induce men of the artisan class to attend them; and the students drawn from other classes have commonly made use of their diplomas simply in order to obtain employment as clerks."—B. Fuller, *Empire of India*, p. 94.

ITALY.—"In the industrial districts of Italy drawing is indeed more than a desideratum, and therefore finds the most careful cultivation. The 'scuola tecnica' very generally has also the character of a technical school in which technical aims take the precedence of the elements of general education."—J. Langl, *Modern art education*, p. 109.—The Academy of St. Luke in Rome still holds the most important place in the art life of the country. It is, however, followed closely by the academies of Naples, Milan, Turin and Florence, all of which carry down their traditions from the time of the renaissance. Turin and Milan are the great centers of instruction in the decorative arts. There are also important schools in Perugia, Pisa and Sienna.

JAPAN.—"In 1888 the Commission for investigating National Painting was changed into the Tōkyō Art School, where national arts were principally taught. In Kyōto a City Art School had been started in 1880. . . . The men who quickly recognized the excellence of Western Art and Science induced the Tokugawa Government to found the Institute for the Investigation of Foreign Books in 1857. Here Western painting also was

taught, with Tōgai Kawakami as instructor. . . . Western painting in Japan, which was first introduced through the Dutch and made only a feeble start, has developed rapidly since the opening of the country. . . . [In 1873] Yuichi Takahashi . . . started a private art school. . . . In 1874, Shin-kurō Kunisawa, who had been to England to study painting, came back and started a school called the *Shōgidō*, where he taught many students. . . . In 1876 the Imperial Engineering College (*Kōbu Daigaku*) was founded, and included an Art Department, over which the Italian artist Fontanesi was placed. . . . But, in 1883, the school was closed, causing a temporary halt in the progress of Western art in Japan. . . . One reason that led to the abolition of the Art Department in the Imperial Engineering College was the rise of the nationalistic movement in Art . . . for as the real value of native Art . . . came to be again recognized through the enthusiastic appreciation of foreigners, the awakening reacted on Western Art. Consequently, with this renaissance of national painting the Government of Paintings Exhibition stopped accepting Western paintings, the newly established Art School stayed its courses in Western painting, and in public schools pencil drawing, which until then had been in vogue, was replaced by brush drawing. . . . In 1888, [however] such men as Koyama, Matsuoka, Asai, and Kawamura . . . formed the Měiji Fine Art Association, giving an exhibition annually, and attempting to arouse public interest. Six years later, Kiyoteru Kuroda and Keiichiro Kume came back from France and introduced a new school of painting . . . and induced the Tōkyō Art School to start a new course in Western painting in 1896, and to appoint them as professors. . . . The Japan Art Society, and the Tōkyō Art School also, had departments of sculpture. The Tōkyō Sculptors' Association was subsequently founded, and in these three places the national style of carving was principally cultivated; and besides ivory carving, which was brought to a high degree of perfection through the foreign demand, carving in wood was practised after the manner of ancient Buddhist artists. . . . In the Tōkyō Art School wood carving was principally taught, and as young artists flocked thither, the art was in a very flourishing state from 1887 to 1897, showing much advance in workmanship. . . . A course in sculpture [was established] in the Art Department of the Imperial Engineering College. This was formed purely on Western lines, and . . . the European art of modelling was taught there for the first time in Japan. . . . In 1898, Hidéo Takaminé, Director of the Tōkyō Art School, decided to adopt Western methods in the department of sculpture, and . . . encouraged modelling from the life in clay. . . . The science of architecture is taught at the College of Engineering, Imperial University, and a number of trained architects in Japanese or Western style have been produced, and both in design and in execution the art is progressing steadily."—S. Okuma, *Fifty years of New Japan*, v. 2, pp. 346-347, 349-353.

NETHERLANDS.—"According to the law of 1857, the elements of the knowledge of form and of drawing were admitted into primary instruction. . . . In the Middle Schools, regulated by law since 1863, drawing plays a more important part, especially in those which have been destined for the education of the working-classes. Formerly there existed only Drawing-Schools proper, in which instruction was confined to freehand and linear drawing, and so-called Industrial Schools. . . . The Royal School for the Arts of Design at Bois-le-Duc, the Academy of the Arts of Design at the Hague,

and the Industrial School organized by the Society of Working-men at Amsterdam, are among the best of these institutions. In the higher Citizens' Schools, four hours in each of the two lower classes, two hours in each of the three upper classes, are devoted to drawing."—J. Langl, *Modern art education*, pp. 140, 141.

NORWAY.—Drawing is taught in all the schools commencing with the primary school, and is one of the special subjects taught in the country schools. "The *Royal Art and Industrial School* in Kristiania was founded in 1818. According to the arrangements of 1888 now in force, the object of the school is to train artists and mechanics and teachers in the special subjects of the school. . . . Instruction is given in freehand drawing, construction, ornament, modelling, architectural drawing, special drawing for handicrafts, and decorative painting. Lectures are also given in perspective, statics, arithmetic and geometry. No one is admitted as a pupil before having completed his 14th year. . . . In 1899, there were 14 public drawing schools or night schools outside Kristiania. They are chiefly intended for mechanics' apprentices. The government grant to these schools is contingent upon the providing of premises and fittings by the municipalities, and the contribution by them of an amount equal to that contributed by the state. . . . [At this school there are both day and evening classes.]"—J. V. Heiberg, *Education (Norway)*, S. Konow and K. Fischer, ed., p. 293).

RUSSIA.—"A considerable number of industrial artists and draughtsmen leave the [Stroganoff] school annually, and impart its tendencies to the industries; but, besides these artists, the institution also educates the drawing-teachers for other institutions (in the provincial towns), which follow similar aims. Instigated by the Stroganoff school, drawing, especially in Moscow, has made very satisfactory advances since 1867. The subject has not only been introduced into the Elementary and Real Schools as a compulsory study, but . . . Sunday schools for persons engaged in industrial pursuits have also been organized, and at the University a special drawing course has been opened for the students, not to speak of the Drawing-Schools which many manufacturers have established for the benefit of their own workmen."—J. Langl, *Modern art education*, p. 129.—There was in Petrograd a famous academy of art, which, after the Revolution was abolished, (April 14, 1918), and the work of art education placed in the hands of the Commissariat of Education. In the place of the schools formerly maintained by the Art Academy the Bolshevik government established state art schools, in which the instructors were to be elected by the students. According to the report issued by the Commissar of Education in 1919, seven of these schools had been instituted; but, although the registration was large, the attendance appeared to be small.

SWITZERLAND.—There is . . . in Geneva a school of industrial art . . . under the direction and administration of the Council of State of the Canton. . . . Two classes of students are admitted, viz., regular scholars, who attend regularly and continuously either a general course of art study or some particular branch, such as carving, bronze founding, goldsmith's work, etc.; and special students, apprentices, workmen, and others who arrange to receive instruction at stated hours. . . . The courses of study embrace modelling and carving in plaster, stone, and wood; *repoussé* work in metals; painting in water-color, in enamel, and on china; casting and chasing of bronze and the precious metals; work in wrought iron and engraving,

besides the regular work of drawing-schools in general, such as drawing from the cast, from plants and flowers, and from the living model. . . . All the regular pupils are also required to attend the evening schools of the city. . . . Drawing, industrial as distinguished from artistic, is taught in all Swiss schools; not as an accomplishment, but as of paramount utility. It is considered that 'drawing' lies at the bottom of all industrial training. . . . The schools for wood-carving have a fully organized faculty, and the word faculty is used advisedly, for the classes have an almost amusing resemblance to an academic course. . . . A school for ornamental work and design in wood-carving at Brienz is supported by the Canton; and at Interlaken the wook-workers enjoy, free of charge, the services of a 'Master Modeller,' furnished by the Canton. There are separate schools for the study of wood-engraving, sculpture, and art cabinet-making."—B. Winchester, *Swiss republic*, pp. 287, 288, 289.

UNITED STATES.—In 1791, Charles Wilson Peale tried to have an art school established in Philadelphia. His efforts were not at that time crowned with success, but they bore fruit in 1805, when the Pennsylvania Academy of Fine Arts was opened, the first of a long line of academies and art schools throughout the country. It was followed in the course of the next twenty-five years by the National Academy of Design, New York, which, after an infelicitous beginning as the American Academy of Arts was organized as the National Academy of Design in 1826. The academy has been affiliated with Columbia University. In 1844, the Philadelphia School of Design for Women was founded, and was at the same time the first school of design, and the first drawing school for women in the United States; Cooper Union, in New York, with day classes for women, and evening schools for men, was founded in 1857 by Peter Cooper the philanthropist, and gave such an artist as Augustus St. Gaudens to the country; next came Chicago, in 1867, with the Academy of Design, which developed into the Art Institute of Chicago; the Corcoran School of Art, in the Corcoran Gallery in Washington began work in 1870, the same year that saw the incorporation of the Boston Museum of Fine Arts, from which has grown the Boston School of Drawing and Painting. In 1873 the Massachusetts Normal Art School was also established in Boston, in 1874; the Art Students' League of New York branched off from the Academy of Design in 1876. It is, as its name implies, a coöperative institution, and is partly governed by the students themselves; and a number of other art league schools have been organized, following its pattern. This school closes the roll of those which were either established or in course of organization before the Centennial Exposition in Philadelphia awakened the New World as a whole to something like appreciation of art in its various branches. Of the more important schools opened since that time, the Art Academy of Cincinnati really dates back to 1860 when it was established as the McMicken School of Design. The Rhode Island School of Design which was established in 1877 is unique among the early schools in that its principal avowed object was the "instruction of artisans in drawing, painting, modelling and designing, that they may apply the principles of art to the requirements of trade and manufacture." The Western Reserve School of Design for Women, also an early school, was established in 1877; but changed its name in 1891 to that of the Cleveland School of Art. Many schools of art have been added to these pioneers

which with a few others were founded in the nineteenth century. In addition most of the colleges and universities give art courses, for which credit is given, or have important schools of art as part of the university corporation. Of these the Yale School of Fine Arts (1864) is the pioneer. A number of these schools have valuable prizes or scholarships in their gift, some of them leading to study abroad, the goal of all students being the prizes which provide for tuition in the American Academy at Rome, to architects, sculptors and painters alike. These Roman scholarships are open to all artists who are native Americans.—See also AMERICAN ACADEMY IN ROME.

UNITED STATES: HIGH SCHOOLS.—"High-school courses of the past two years [written in 1918] indicate some significant and a few radical changes. Two influences . . . have been particularly strong in bringing about these developments. One is the widespread organization of junior high-schools, which has resulted in a closer articulation of elementary and secondary schools. The other is the rapid progress of vocational education. The organization of junior high-schools has brought into prominence many psychological as well as administrative questions. Educators especially interested in these questions have contributed, among other things, important considerations regarding some of the differences in the attitude of high-school students toward school work as compared with that of elementary school children. . . . Certain difficulties are evident in the organization of high-school courses in art. . . . (1) There are seldom any accepted standards of attainment in art instruction in elementary schools which can serve as a dependable basis upon which high-school courses may be planned. (2) A large number of high-school instructors have been accustomed only to art school ways of teaching drawing and design. These studio methods are generally adapted only to those who possess special aptitudes for drawing. This difficulty is being remedied because cities and towns in increasing numbers are requiring that the instructor in art shall have some normal training, including general principles of education and practice teaching under skilled supervision. (3) Except in the larger high schools, where a number of classes exist, it is difficult to arrange a course which offers progress from year to year, . . . for example, an introductory class in drawing may be made up of pupils from the first, second, third, and fourth year groups. . . . Under present conditions high-school art courses may be broadly classified as follows: (1) Courses in drawing and design which are organically related to industrial and constructive work, including household art. (2) General art courses, which correspond somewhat to traditional art-school courses and which appeal particularly to pupils with special art interests. (3) Courses consisting of illustrated lectures, readings, and class recitations which present a survey of art. The character of these three types of courses is indicated more in detail as follows: High-school courses in drawing and design are coming to be more and more closely correlated with industrial and constructive work. . . . The relation is rapidly becoming more organic. The problems of the drawing and design classes are now largely the actual current problems of the industrial and vocational classes. In many cases the pupils spend alternate periods in the shop and the art classroom, dealing with the same problems in both classes. Sometimes the industrial departments take over much of the art instruction dealing with their projects. Working drawing, appearance

drawing, and design have become intimately related."—W. Sargent, *Instruction in art in the United States* (Bulletin no. 43, 1918, pp. 8-9, 11-13).

UNITED STATES: UNIVERSITIES.—"Art instruction in colleges and universities may be broadly classified as follows: (1) Courses in history of art. (2) Courses involving studio work related as laboratory work to academic courses, and dependent for credit upon association with these courses. (3) Studio work credited independently. The trend of recent development in these groups of courses has been as follows: Historical and archaeological researches have steadily increased the range and value of the material for these courses, especially in the fields of Egyptian, Cretan, Chinese, and primitive American art. Very large additions to the number of original examples of art available for study in this country have been made during the past . . . [few] years."—*Ibid.*, pp. 19-20.

UNITED STATES: MUSEUMS IN EDUCATION.—OTHER SCHOOLS.—"Art museums have always been a most important factor in art education in America, and their influence is extending rapidly. This development is due in part to the increase in number of museums and in the size and quality of their collections, and in part to improved means of making their collections available. Most modern museums have established close relations with the communities in which they exist, and have put forth every effort to make their collections of use as a stimulus and guide to the art student and industrial worker and as a means of artistic pleasure and inspiration to the general public. . . . The large proportion of the works exhibited in the permanent collections of the museums of to-day have a genuine artistic significance. . . . Besides the regular displays of collections owned by the institution, nearly every museum has a succession of exhibitions of works of special interest, including current productions of pictorial and industrial art [which are all of great educational value]. Societies now exist for the promotion of American art, and their patronage in the form of prizes and purchases is an added influence [not only on art education in general but] in bringing to these exhibitions much of the best in modern American painting, sculpture, and design. . . . Besides making art productions of the past and present available, museums are organizing further educational activities with increasing effectiveness. In the galleries, docents and guides are available; literature, lantern slides, photographs, and color prints of good quality are provided; and lecture courses and classes are organized. Many museums have their collections of lantern slides selected and arranged so as to be of use in the community, especially in the schools. Carefully prepared lectures in manuscript form, together with appropriate slides, are frequently available for the use of schools. A few museums have collections of slides which, for a small rental fee to cover packing, will be sent to various parts of the country. The Metropolitan Museum of New York and the Art Institute of Chicago (q. v.) are notable among the institutions which offer this wide opportunity. The bulletins published periodically by many museums have become important art documents. By them the acquisitions and opportunities of these institutions are made known to the public. The educational activities of museums and special art schools differ considerably, because each is experimenting with methods of meeting the needs of its locality. Reference can be made here to only a few, but the following are fairly typical of the various lines of effort. Some

of the lectures and classes . . . of the Metropolitan Museum of Art (q.v.) in New York City are the following: "For the public, Sunday afternoon lectures, illustrated and followed by visits to the galleries through the winter season. Story hours for children and adults, illustrated and followed by visits to the galleries. . . . For students of sculpture and painting in the art schools of New York, informal talks by painters and sculptors, with illustrations. For teachers in the public schools of New York City, gallery talks by the museum instructors. For elementary and high school pupils, lectures in co-operation with the American Museum of Natural History. . . . For sales people, buyers, and designers, three seminars. For the deaf, . . . illustrated lectures for those who can read the lips. For the blind, talks for children, illustrated with objects from the collection which may be handled. The Art Museum of Worcester, Mass., has set an admirable example in the activities of its children's department, the informal work in drawing, the Saturday story hour, and the gallery visiting.

"Inevitably, the most important results of this work can not be measured in figures; they are observed by those who know the children as individuals, in the increased capacity for spontaneous enjoyment of beauty wherever seen, and the deeper interest in the museum, leading even to a certain sense of part ownership in the collections which, through intimate association, have come to mean much to these 'younger citizens.' A large number of museums carry on systematic work in direct connection with the public schools and offer to teachers and pupils free admission to the galleries. The plans followed by the Museum of Fine Arts in Boston, the John Herron Art Institute in Indianapolis, the Carnegie Institute at Pittsburgh, and the Cincinnati Museum Association are typical of these activities. The Museum of Fine Arts in Boston, among numerous other opportunities which it furnishes, has established in another section of the city a Children's Art Center. Here children may see loan exhibitions and be helped in the study of them and guided in their own efforts to draw. Some 18,000 persons annually take advantage of the opportunity for free admission offered to school children and teachers by the John Herron Art Institute, of Indianapolis. It maintains a series of illustrated talks for grade-school children on popular subjects closely allied to art study. For high-school students a two-year lecture course is given on the history of art (one term each covering painting, architecture, sculpture, and the decorative arts), a full high-school credit being awarded to each student attending through the two years. A course in 'museum study,' . . . is a required part of the Indianapolis Normal School curriculum. In addition to these regular courses, all given at the museum, numerous classes come for special study. . . . In the art school which it maintains for professional training in drawing, painting, and the decorative arts, classes are conducted for teachers at special low prices and free classes for elementary and high-school pupils. In addition it offers scholarships for advanced work in art to pupils who show special ability. Recently, the free scholarship has been extended to cover the whole State of Indiana and a scholarship offered for each of the 92 counties in the State. . . . Another not uncommon affiliation is illustrated by the opportunity offered at Cincinnati, where high-school students may elect an art course which is arranged to allow five afternoons of work in the museum academy. Each afternoon's program includes three hours of drawing and painting. In-

struction in the history of art is given to these students at the museum. The museum circulates through the schools certain sets of lantern slides with a synopsis. . . . The scholarship plan of the Cleveland School of Art illustrates some of the types of scholarships which art schools offer to talented public-school pupils. This school offers working scholarships and a few money scholarships. . . . [In 1917] the 'Mutual service fund' was inaugurated. This is made up at present of eight purses of \$350 each. A talented pupil can have the benefit of one of these purses on condition that as soon as his earnings begin, the money be returned without interest, in installments to be paid either by the individual or by his employer—a certain percentage of his earnings monthly—until the whole is returned for another to use. The purses are given by individuals or organizations who come into personal touch with the beneficiary. The pupils whose abilities are recognized by the award of these scholarships are usually discovered in the high schools. Application is made through some special teacher of drawing who knows the facts about the pupil and his work. The Cleveland Museum, in addition to its regular gallery displays, has exhibitions of selected works of art in a place of honor and under special illumination, each for two weeks only. Illustrated leaflets are issued interpreting these selected works and giving references to helpful literature about them and the artists who produced them. . . .

"Practically all modern museums carry on one or more of the kinds of educational activity here mentioned. The foregoing examples have been cited only to illustrate types of work, all the specific instances of which are fortunately much too numerous to allow of individual mention. Art education related to industries has been prominent in America for many years. . . . Older schools have been improving their facilities, while new schools intimately related to local industries have arisen. The Grand Rapids School of Art and Industry, in Michigan, and the Federal School of Commercial Designing, in Minneapolis, are types of these newer schools. Most of the schools of industrial art offer special opportunities for school pupils whose vocational interests in this field have become evident. The scheme of affiliation worked out by the School of Industrial Art in Trenton, N. J., is typical of this sort of arrangement. Here pupils from the city schools may take courses for which the fees are merely nominal. Technical art courses are provided for pupils who have completed the junior high school, and an art teachers' course is offered for students in the normal school. . . . The national need for industrial design is strongly influencing the art departments in high schools and art schools. . . . Galleries are maintained in the heart of New York's shopping district, where exhibitions, organized in close cooperation with artists and with the trades, are held every month. Positions are secured, work sold, and advice given by artists and educators. Hours are assigned daily for personal interviews and examination of work. The Central States division was organized in the fall of 1918 in Chicago, and maintains an office in the Art Institute (q.v.)."—W. Sargent, *Instruction in art in the United States* (*Bulletin no. 43, 1918, pp. 24-31*).—See also ART GALLERIES AND MUSEUMS; ARTS AND CRAFTS MOVEMENT.

EGNATIAN WAY, Roman road constructed from Apollonia on the Adriatic to the shores of the Hellespont. It was finally carried to Byzantium.

EGYPT

Names.—"Egypt is designated in the old inscriptions, as well as in the books of the later Christian Egyptians, by a word which signifies 'the black land,' and which is read in the Egyptian language Kem, or Kami.* (Note: **Kamit* in the edition of 1801.) The ancients had early remarked that the cultivable land of Egypt was distinguished by its dark and almost black colour. . . . The neighbouring region of the Arabian desert bore the name of Teshar, or the red land . . . The Egyptians designated themselves simply as 'the people of the black land,' and . . . the inscriptions, so far as we know, have handed down to us no other appellation. . . . A real enigma is proposed to us in the derivation and meaning of the curious proper name by which the foreign peoples of Asia, each in its own dialect, were accustomed to designate Egypt. The Hebrews gave the land the name of Mizraim; the Assyrians, Muzur; the Persians, Mudraya. We may feel assured that at the basis of all these designations there lies an original form which consisted of the three letters M-z-r, all explanations of which have been as yet unsuccessful. Although I intend hereafter to consider more particularly the derivation of this puzzling name, which is still preserved at the present day in the Arabic appellation Misr, I will here premise the remark that this name was originally applied only to a certain definite part of Egypt, in the east of the Delta, which, according to the monuments, was covered and defended by many 'zor,' or fortresses, and was hence called in Egyptian Mazar (that is, fortified)."—H. Brugsch-Bey, *History of Egypt under the Pharaohs*, ch. 2.—"Brugsch explains the name Egypt by 'ha-ka-ptah,' i. e. 'the precinct of Ptah.' As Ptah was more especially the god of Memphis, this name would have come from Memphis."—M. Duncker, *History of antiquity*, bk. 1, ch. 1, note.—"The last use of Kem died out in the form Chemi in Coptic, the descendant of the classical language, which ceased to be spoken a century ago. It survives among us in the terms 'chemistry' and 'alchemy,' sciences thought to be of Egyptian

origin."—R. S. Poole, *Cities of Egypt (Introduction)*.

Historical antiquity.—The lists of Egyptian kings which have been found agree in presenting the name of Mena or Menes as that of the first Pharaoh of Egypt, and as such he is unhesitatingly

RELICS OF ANCIENT EGYPT
Flint Knives of the Stone Age in Egypt

accepted, although no contemporary monumental record of the fact has yet been discovered. "As to the era . . . when the first Pharaoh mounted the throne, the German Egyptologists have attempted to fix it at the following epochs: Boeckh, B. C. 5702; Unger, 5613; Brugsch, 4455; Lauth, 4157; Lepsius, 3892; Bunsen, 3623. The difference

between the two extreme points of the series is amazingly great, for its number of years amounts to no less than 2079. . . . The calculations in question are based on the extracts already often mentioned from a work by the Egyptian priest Manetho on the history of Egypt. That learned man had then at his command the annals of his country's history, which were preserved in the temples, and from them, the best and most accurate sources, he derived the materials for his work, composed in the Greek language, on the history of the ancient Egyptian Dynasties. His book, which is now lost, contained a general review of the kings of the land, divided into Thirty Dynasties, arranged in the order of their names, with the lengths of their reigns, and the total duration of each dynasty. Though this invaluable work was little known and certainly but little regarded by the historians of the old classical age, large extracts were made from it by some of the ecclesiastical writers. In process of time the copyists, either by error or designedly, corrupted the names and the numbers, and thus we only possess at the present day the ruins instead of the complete building. The truth of the original and the authenticity of its sources were first proved by the deciphering of the Egyptian writings. And thus

ANCIENT MODEL OF EGYPTIAN MUSICIANS
(Recent excavations)

the Manethonian list served, and still serves, as a guide for assigning to the royal names read on the monuments their places in the Dynasties."—H. Brugsch-Bey, *History of Egypt under the Pharaohs*, ch. 4.—See also MANETHO, LIST OF.

Brugsch-Bey dates the first twelve dynasties as follows: First dynasty: of Thinis: 4400-4166 B. C.—Second: of Thinis: 4133-4000.—Third: of Memphis: 3966-3766.—Fourth: of Memphis: 3733-3600.—Fifth: of Elephantine: 3566-3333.—Sixth: of Memphis: 3300-3066.—Seventh to the eleventh (a confused and obscure period): 3033-2500.—The Twelfth: of Thebes: 2466-2266.—H. Brugsch-Bey, *History of Egypt under the Pharaohs*, app. A.—A later reckoning from later discoveries of data, is given by the explorer of Egyptian antiquities, Mr. Petrie, in the following: "We . . . have as a starting-point for our backward reckoning the accession of the XVIIIth dynasty about 1587 B. C. From this we can reckon in the dynastic data given by Manetho; following this account rather than the totals of reigns, as he appears to have omitted periods when dynasties were contemporary, as in the 43 years for the XIth after the close of the Xth. Thus, from the above starting-point of 1587 B. C., we reach the following results, solely by using material which has been discussed and settled in this history on its own merits alone, and without any ulterior reckoning in total periods.

Dynasty	Years.	B. C.
Dynasty I	263	4777
" II	302	4514
" III	214	4212
" IV	277	3998
" V	218	3721
" VI	181 (T. P.)	3503
" VII	70	3322
" VIII	146	3252
" IX	100	3106
" X	185	3006
" XI	43	2821
" XII	213 (T. P.)	2778
" XIII	453	2565
" XIV	184	2112
" XVI	190	1928
" XVII	151	1738
" XVIII	260	1587
" XIX	—	1327

. . . In the present rough state of the astronomical data, and the doubts as to the MS. authorities, we have reached quite as close an equivalence as we may hope for; and at least there is enough to show us that we may trust to the nearest century with fair grounds of belief. These dates, then, are what I have provisionally adopted in this history; and though they are stated to the nearest year, for the sake of intercomparison, it must always be remembered that they only profess to go within a century in the earlier parts of the scale."—W. M. F. Petrie, *History of Egypt from the earliest times to the 16th dynasty*, ch. 11.

Origin of the ancient people.—"The Egyptians, together with some other nations, form, as it would seem, a third branch of that [the Caucasian] race, namely, the family called Cushite, which is distinguished by special characters from the Pelasgian and the Semitic families. . . . The Egyptian language . . . shows in no way any trace of a derivation and descent from the African families of speech. On the contrary, the primitive roots and the essential elements of the Egyptian grammar point to such an intimate connection with the Indo-Germanic and Semitic languages that it is almost impossible to mistake the close relations which formerly prevailed between the Egyptians and the races called Indo-Germanic and Semitic."—H. Brugsch-Bey, *History of Egypt under the Pharaohs*, ch. 1.—"It has been maintained by some that the immigration was from the south, the Egyptians having been a colony from Ethiopia which gradually descended the Nile and established itself in the middle and lower portions of the valley. But modern research has shown quite unmistakably that the movement of the Egyptians was in the opposite direction. . . . We must look, then, rather to Syria or Arabia than to Ethiopia as the cradle of the Egyptian nation."—G. Rawlinson, *History of ancient Egypt*, ch. 3.—"So far as our knowledge reaches, the northern edge of Africa, like the valley of the Nile as far as the marshes at the foot of the Abyssinian hills, was inhabited by nations who in colour, language, and customs were sharply distinguished from the negro. These nations belonged to the whites; their languages were most closely allied to the Semitic. From this, and from their physical peculiarities, the conclusion has been drawn that these nations at some time migrated from Asia to the soil of Africa. They formed a vast family, whose dialects still continue in the language of the Berbers. Assisted by the favourable conditions of their land, the tribe which settled on the Lower Nile quickly left their kinsmen far behind. Indeed the latter hardly rose above a pastoral life. The descendants of

these old inhabitants of the valley of the Nile, in spite of the numerous layers which the course of centuries has subsequently laid upon the soil of the land, still form the larger part of the population of Egypt, and the ancient language is preserved in the dialect of the Copts."—M. Duncker, *History of antiquity*, bk. 1, ch. 1.—See also *PHILOLOGY*: 12.

Summary of development of civilization. See *AFRICA*: Ancient and medieval; *Development of Egyptian civilization*.

Position and nature of the country.—Area and population.—Nile and its gifts.—Climatic conditions.—Resources.—"The Nile, which created the valley home of the early Egyptians, rises three degrees south of the equator, and flowing into the Mediterranean at over thirty-one and a half degrees north latitude, it attains a length of some four thousand miles, and vies with the greatest rivers of the world in length, if not in volume. In its upper course the river, emerging from the lakes of equatorial Africa, is known as the White Nile. Just south of north latitude sixteen at Khartum, about thirteen hundred and fifty miles from the sea, it receives from the east an affluent known as the Blue Nile, which is a considerable mountain torrent, rising in the lofty highlands of Abyssinia. One hundred and forty miles below the union of the two Niles the stream is joined by its only other tributary, the Atbara, which is a freshet not unlike the Blue Nile. It is at Khartum, or just below it, that the river enters the table land of Nubian sandstone, underlying the Great Sahara. Here it winds on its tortuous course between the desert hills, where it returns upon itself, often flowing due south, until after it has finally pushed through to the north, its course describes a vast S. In six different places throughout this region the current has hitherto failed to erode a perfect channel through the stubborn stone, and these extended interruptions, where the rocks are piled in scattered and irregular masses in the stream, are known as the cataracts of the Nile; although there is no great and sudden fall such as that of our cataract at Niagara. These rocks interfere with navigation most seriously in the region of the first, second and fourth cataracts; otherwise the river is navigable almost throughout its entire course. At Elephantine it passes the granite barrier which there thrusts up its rough shoulder, forming the first cataract, and thence emerges upon an unobstructed course to the sea. It is the valley below the first cataract which constituted Egypt proper."—J. H. Breasted, *History of Egypt*, pp. 3-4.—"To the north, in latitude $31\frac{1}{2}^{\circ}$ N., the Mediterranean forms its [Egypt] natural frontier; to the west it is limited by an indefinite line, generally west of longitude 25° E. through the waterless deserts of the Sahara; to the south, the provinces of the Sudan, which were in revolt under the Khalifa, extend to about 6° N. latitude; while east the Galla country, Abyssinia, Eritrea and the Red Sea, form the eastern border. To the north-east, the Gulf of Akabah, and an ill-defined line running from the port of Akabah in longitude 35° E., through the Desert of the Wanderings to Wadi Refah on the Mediterranean, separate Egypt from Asiatic Turkey. Thus Egypt, in its largest acceptation, has a length of over 1,800 miles, from near Alexandria to the borders of Uganda, and a maximum breadth of 800 miles in the latitude of Khartum. [The total area of Egypt proper, excluding the Sudan, is about 350,000 square miles.]"—W. H. Hume, *Egypt (International geography)*, p. 018.—"A little over a hundred miles from the sea the main stream enters the broad triangle,

with apex at the south, which the Greeks so graphically called the 'Delta.' This is of course a bay of prehistoric ages, which has been gradually filled up by the river. The stream once divided at this point and reached the sea through seven mouths, but in modern times there are but two main branches, straggling through the Delta and piercing the coast-line on either side of the middle. The western branch is called the Rosetta mouth; the eastern that of Damiette. The deposits which have formed the Delta, are very deep, and have slowly risen over the sites of the many ancient cities which once flourished there. The old swamps which must once have rendered the regions of the northern Delta a vast morass, have been gradually filled up, and the fringe of marshes pushed further out. They undoubtedly occupied in antiquity a much larger proportion of the Delta than they do now. In the valley above, the depth of the soil varies from thirty-three to thirty-eight feet, and sometimes reaches a maximum of ten miles in width. The cultivable area thus formed, between the cataract and the sea, is less than ten thousand square miles in extent, being roughly equal to the area of the state of Maryland, or about ten per cent less than that of Belgium. The cliffs on either hand are usually but a few hundred feet in height, but here and there they rise into almost mountains of a thousand feet. They are of course flanked by the deserts through which the Nile has cut its way. On the west the Libyan Desert or the Great Sahara rolls in illimitable, desolate hills of sand, gravel and rock, from six hundred and fifty to a thousand feet above the Nile. Its otherwise waterless expanse is broken only by an irregular line of oases, or watered depressions, roughly parallel with the river, and doubtless owing their springs and wells to infiltration of the Nile waters. The largest of these depressions is situated so close to the valley that the rock wall which once separated them has broken down, producing the fertile Fayum, watered by the Bahr Yusuf. Otherwise the western desert held no economic resources for the use of the early Nile-dwellers. The eastern or Arabian Desert is somewhat less inhospitable, and capable of yielding a scanty subsistence to wandering tribes of Ababdeh. A range of granite mountains parallel with the coast of the Red Sea contains gold-bearing quartz veins, and here and there other gold-producing mountains lie between the Nile and the Red Sea. Deposits of alabaster and extensive masses of various fine, hard, igneous rocks led to the exploitation of quarries here also, while the Red Sea harbours could of course be reached only by traversing this desert, through which established routes thither were early traced. Further north similar mineral resources led to an acquaintance with the peninsula of Sinai and its desert regions, at a very remote date. The situation afforded by this narrow valley was one of unusual isolation; on either hand vast desert wastes, on the north the harbourless coast-line of the Delta, and on the south the rocky barriers of successive cataracts, preventing fusion with the peoples of inner Africa. It was chiefly at the two northern corners of the Delta that outside influences and foreign elements, which were always sifting into the Nile valley, gained access to the country. Through the eastern corner it was the prehistoric Semitic population of neighbouring Asia, who forced their way in across the dangerous intervening deserts; while the Libyan races, of possibly European origin, found entrance at the western corner. The products of the south also, in spite of the cataracts, filtered in ever increasing volume into the regions of the lower river and

the lower end of the first cataract became a trading post, ever after known as 'Suan' (Assuan) or 'market,' where the negro traders of the south met those of Egypt. The upper Nile thus gradually became a regular avenue of commerce with the Sudan. The natural boundaries of Egypt, however, always presented sufficiently effective barriers to would-be invaders, to enable the natives slowly to assimilate the new-comers, without being displaced. It will be evident that the remarkable shape of the country must powerfully influence its political development. Except in the Delta it was but a narrow line, some seven hundred and fifty miles long. Straggling its slender length along the river, and sprawling out into the Delta, it totally lacked the compactness necessary to stable political organization. A given locality has neighbours on only two sides, north and south, and these their shortest boundaries; local feeling was

increase is usually interrupted for nearly a month from the end of September on, it is usually resumed again, and the maximum level continues until the end of October or into November. The waters in the region of the first cataract are then nearly fifty feet higher than at low water; while at Cairo the rise is about half that at the cataract. A vast and elaborate system of irrigation canals and reservoirs first receives the flood, which is then allowed to escape into the fields as needed. Here it rests long enough to deposit its burden of rich, black earth from the upper reaches of the Blue Nile. At such times the appearance of the country is picturesque in the extreme, the glistening surface of the waters being dotted here and there by the vivid green of the waving palm groves, which mark the villages, now accessible only along the dykes belonging to the irrigation system. Thus year by year, the soil which would otherwise be-

ANCIENT MODEL OF EGYPTIAN BOAT
(Recent excavations)

strong, local differences were persistent, and a man of the Delta could hardly understand the speech of a man of the first cataract region. It was only the ease of communication afforded by the river which in any degree neutralized the effect of the country's remarkable length. The wealth of commerce which the river served to carry it was equally instrumental in producing. While the climate of the country is not rainless, yet the rare showers of the south, often separated by intervals of years, and even the more frequent rains of the Delta, are totally insufficient to maintain the processes of agriculture. The marvellous productivity of the Egyptian soil is due to the annual inundation of the river, which is caused by the melting of the snows, and by the spring at the sources of the Blue Nile. "Freighted with the rich loam of the Abyssinian highlands, the rushing waters of the spring freshet hurry down the Nubian valley, and a slight rise is discernible at the first cataract in the early part of June. The flood swells rapidly and steadily, and although the

come impoverished in the elements necessary to the production of such prodigious harvests, is invariably replenished with fresh resources. As the river skims below the level of the fields again, it is necessary to raise the water from the canals by artificial means, in order to carry on the constant irrigation of the growing crops in the outlying fields, which are too high to be longer refreshed by absorption from the river. Thus a genial and generous, but exacting, soil demanded for its cultivation the development of a high degree of skill in the manipulation of the life-giving waters, and at a very early day the men of the Nile valley had attained a surprising command of the complicated problems involved in the proper utilization of the river. If Egypt became the mother of the mechanical arts, the river will have been one of the chief natural forces to which this fact was due. With such natural assets as these, an ever replenished soil, and almost unending waters for its refreshment, the wealth of Egypt could not but be chiefly agricultural. . . . Such opulent fertility of

course supported a large population—in Roman times some seven million souls—while in our own day [1909] it maintains over nine million, a density of population far surpassing that to be found anywhere in Europe. . . . [The estimated population in 1921 was 13,387,000.] In climate Egypt is a veritable paradise, drawing to its shores at the present day an increasing number of winter guests. The air of Egypt is essentially that of the deserts within which it lies, and such is its purity and dryness that even an excessive degree of heat occasions but slight discomfort, owing to the fact that the moisture of the body is dried up almost as fast as it is exhaled. The mean temperature of the Delta in winter is 56° Fahrenheit, and in the valley above it is ten degrees higher. In summer the mean in the Delta is 83°; and although the summer temperature in the valley is sometimes as high as 122°, the air is far from the oppressiveness

dry the soil, and there is never any malarial infection in Upper Egypt. Even in the vast morass of the Delta, malaria is practically unknown. Thus, lying just outside of the tropics, Egypt enjoyed a mild climate of unsurpassed salubrity, devoid of the harshness of a northern winter, but at the same time sufficiently cool to escape those enervating influences inherent in tropical conditions."—J. H. Breasted, *History of Egypt*, pp. 4-9.—"For many centuries Egypt was practically the granary of the Byzantine Empire, and wheat still plays an important part, occupying 50 per cent. of the fields in Upper Egypt and 30 per cent. in the Delta, and in the extent of its cultivation rivalling maize and durrah, or Indian millet. Clover, beans and barley are also grown, but in recent years cotton has tended to become the one crop of economic importance. . . . Cotton and tobacco are chiefly cultivated in Lower Egypt

ANCIENT MODEL OF EGYPTIAN BAKERY
(Recent excavations)

accompanying the same degree of heat in other lands. The nights even in summer are always cool, and the vast expanses of vegetation appreciably reduce the temperature. In winter just before dawn the extreme cold is surprising, as contrasted with the genial warmth of midday at the same season. To the absence of rain we have already adverted. The rare showers of upper Egypt occur only when cyclonic disturbances in the southern Mediterranean or northern Sahara force undischarged clouds into the Nile valley from the west; from the east they can not reach the valley, owing to the high mountain ridge along the Red Sea, which forces them upward and discharges them. The lower Delta, however, falls within the zone of the northern rainy season. . . . In spite of the wide extent of marshy ground, left stagnating by the inundation, the dry airs of the desert, blowing constantly across the valley, quickly

from April to August; cucumbers and watermelons also form an important local staple. Of recent years rice and sugar-cane have been introduced with success, the moist lowlands of the Delta being especially favourable to their development. Flax, henna, indigo, and castor-oil are also produced, flax forming a not unimportant article of export. Among fruit trees, the date palm holds the first place, groves of this tree extend along the banks of the Nile as far south as Fashoda, and it is grown in the oases and even in the wild valleys of the Sinai peninsula, but the dates produced are mainly for home consumption. The vine, orange, mandarin, lemon, melon and fig are also plentiful in the Nile valley, while bananas are cultivated in the Sudan. . . . The chief domestic animals employed in transport are the camel, donkey, horse, buffalo and ox, while flocks of goats and sheep, especially the long-eared

kharûf, constitute an important source of wealth. . . . The mineral resources are at present of secondary importance."—W. F. Hume, *Egypt (International geography, pp. 922-923)*.—See also ARCHITECTURE: Oriental: Egypt; HISTORY: 14.

Egyptian influence on world-civilization.—"Egypt exercised a three-fold influence upon the development of European civilization. By virtue of her own precocious acquirement of a culture far surpassing that of any of her contemporaries she came to occupy a dominant position among the kindred populations, who were still in the Neolithic age for centuries after Egypt had left it behind; and there can be no doubt that her influence must have slowly passed from tribe to tribe until the whole Mediterranean littoral became permeated with the leaven of Egyptian culture, which thus affected at their source the very springs of European civilization. . . . Her influ-

ence was manifold in its manifestations, and spread over a very wide span of time. It must have begun to have effect in Neolithic times; as we shall see in the following times, in Early Dynastic times it became a force, whose range was limited only by the bounds of the world of that remote civilization. At every epoch in later ages, at one time through the influence of the Jews and other Asiatics, at another through the intermediation of the Greeks and Romans, and still later of the Arabs, the world at large, and especially Europe, has received the impress of Egyptian civilization, in its customs, its arts and crafts, its medical and surgical knowledge and even in its beliefs and its literature."—G. E. Smith, *Ancient Egyptians and their influence upon the civilization of Europe, pp. 161-162*.—See also AMERICA: Theory of a cultural wave across Asia; EUROPE: Ancient: Greek civilization.

RECONSTRUCTION OF THE PYRAMID OF CHEPHREN
(After U. Hölscher)

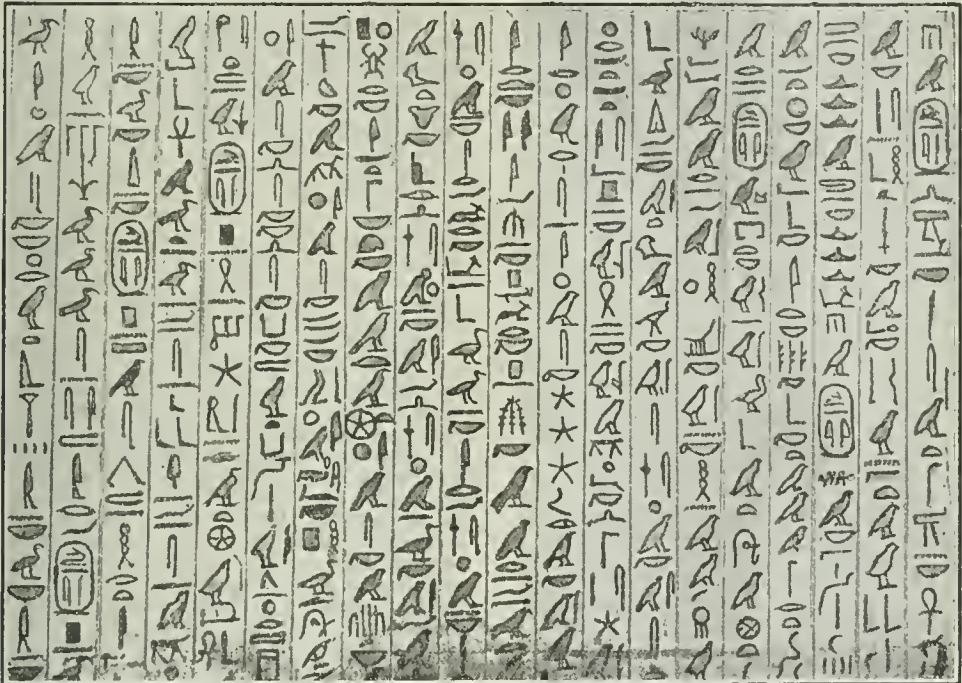

ence was brought to bear in a second and indirect manner, when at the dawn of her history she ventured on foreign enterprises, and, incidentally, taught the Asiatics the value of metal weapons, which knowledge gave them the passport into Europe and the means of inaugurating one of the really great epochs in the world's history. But there was another, which was also a less indirect, way in which Egypt directed the thoughts and energies of the peoples around the Mediterranean—the influence exerted upon other nations by the Egyptians themselves or by people who had actually seen their achievements in the Nile Valley. It is of the utmost importance to emphasize this means by which Egypt was able to impress her culture and her knowledge of copper upon Europe without the intermediation of any alien broad-headed middlemen. As Sergi has clearly shown, the presence of a few alien crania in North Africa does not in any way invalidate the contention that the Afro-Mediterranean civilization was purely indigenous. The power wielded in this way, per-

Monuments of the country.—"The most ancient architecture in the world is found on the edge of the vast solitude of the desert; there, on a plateau of rock, stands the Great Pyramid, a monument not only the most majestic, but also the most perfectly constructed, that man has ever achieved. More has been written about the pyramids than about any other monument of antiquity. The theories are as numerous as the books. Most of them are based upon measurements, and as no two authors gave the same, the theories were contradictory and improbable."—A. B. Gosse, *Civilization of the ancient Egyptians, p. 64*.—"It must be borne in mind that, while especial interest centres in the three pyramids, there are many more of these massive burial vaults, both near the necropolis of the ancient city of Memphis and scattered along the plateau of the Libyan desert for

a distance of twenty-five miles. The sides of the three great pyramids of Gizeh—Cheops, Chephren, and Mycerinus—face the four cardinal points of the compass. Cheops measures, approximately, seven hundred and fifty feet on each of the four sides. It is four hundred and fifty feet in height and covers an area of nearly thirteen acres. Its estimated weight is about seven million tons. Let one consider any ground-area of thirteen acres of land with which he is familiar, and in imagination pile upon it, in pyramidal order, blocks of stone with an average thickness of three feet, until the apex shall reach a point four hundred and fifty feet from the foundation, and he will then have gained some idea of the colossal dimensions of this silent witness of more than five thousand years of human life and activity. The first requirement for the actual construction of the pyramid appears to have been the levelling of the rock surface. This

the ground, it lies like some huge petrified form of prehistoric birth, half buried in the undulating sands. A tablet that has been found records the fact that as early as the time of Thothmes III., about 1500 B. C., it was still partly covered with sand; for on this tablet Thothmes makes record of a dream in which he is entreated by the Sphinx to clear away the sand. To the Egyptians the Sphinx was a symbol of Horus, the early morning sun,—the newborn light of morning, which had conquered darkness and overcome death with life. Facing the east, the Sphinx reflects the brilliancy of the sunrise, which illuminates the world after its conflict with the powers of darkness. It was thought that the kings were elected to represent the sun-god upon the earth, and the Sphinx was therefore symbolic of the divine nature of their mission. Near the great Sphinx is a granite temple, or tomb, discovered in 1853. In-

HEROGLYPHICS ON THE WALL OF THE DEATH CHAMBER OF A PYRAMID

was probably followed by the excavation of the subterranean chambers and the erection of a small truncated pyramid in the centre of the rock. If the life of the king were prolonged through the period covering the first stages of construction, he added new outside layers of stone to the surface in the form of great steps, following the outline of the first structure. This process was continued throughout the life of the ruler, the size of the pyramid varying according to the length of the reign. Thus the great pyramids may have reached their gigantic proportions. The summit was crowned with a pyramidal stone and the step-like spaces on the surface were filled so as to form a solid mass with four sloping sides. As this surface covering has disappeared, the summit is now accessible. . . . One of the chief objects of interest associated with the pyramids is the Sphinx of the desert. Hewn out of the solid rock to a height of sixty-six feet and spreading its great length one hundred and forty feet along

scriptions indicate that this temple, which lies below the level of the sand, was constructed by the pyramid-builders. The blocks of granite and alabaster that line the various chambers, and the granite piers that support the roof of the largest chamber, still have a most beautiful lustre. In a deep well in a corner of one of the rooms were found nine statues of Chephren. Numerous other tombs of great interest have been discovered near the pyramids, and undoubtedly great numbers still remain to be excavated, as the drifting sands shall disclose their sites."—W. S. Perry, *Egypt, the land of the temple builders*, pp. 10, 13, 146, 149, 150.

"The architecture of the temples displays the same features as the pyramids: dignity, grandeur and simplicity. Like them, too, astronomy and mathematics governed the plans and construction of the buildings, which were on the principle of the square, and were definitely oriented. A piece of ground having been selected as the site,

there was held the religious ceremony of 'the stretching of the cord' to fix the axis and the orientation, and to set out the plan in a workmanlike manner. The 'priest' 'read the sacred

ANCIENT MODEL OF EGYPTIAN WOMAN WITH
BASKET FILLED WITH POTTERY

(Recent excavations)

text during the laying of the foundation-stone,' and 'during the fixing of the four corners with accuracy by the four supports of heaven.' The temple was approached by a broad paved cause-

way, flanked on each side by sphinxes forming an avenue. Then frequently came several tall and graceful flagstaves and two noble obelisks fronting the entrance; the great feature of this were the pylons, massive towers flanking it on each side. Passing through the gates a large court was reached, surrounded by many pillars, then across the court another gateway leading into the hypostyle hall. This was generally very large, the lofty roof being supported by beautiful columns; behind this was the Sanctuary, which might be entered only by the priests; he who enters here must purify himself four times. Outside everything was brilliant with sunlight, the gay flagstaves, the polished obelisks and colossal statues, the decorative scenes on the pylons. Crowds thronged the court and the hypostyle hall on holidays; games and bull-fights took place in the avenue; everything made for gaiety. Inside it was totally different: silence and cool twilight pervaded all, in the recesses the gloom and the stillness deepened, and in the hidden sanctuary profound peace and darkness reigned. The earliest pillars of Egypt were fluted, with a base, and a simple abacus as a capital; the Greeks borrowed their Doric shaft from this order. Later the length was increased, and the capital was ornamented, generally in the form of a lotus bud, papyrus or palm; for here, as everywhere, the love of flowers and of nature influenced the art. There were seven or eight orders of pillars; they were generally built of half drums, each layer so placed that the joints were at right angles to the one below. The varieties of capitals were endless, and the orders were frequently combined into new forms, showing fertility of imagination and decorative skill. It may be asked whether the arch was used? The earliest true arch found so far belongs to the VIth Dynasty, but apparently the Egyptians did not make use of it for ornamental purposes. The vast and level landscape needed mass to relieve it, and yet to conform with nature; hence the massiveness of the pyramids and the immensity of the temple areas; the straight line, and not the curve, provided also the natural outline, and for that reason these two points became the chief characteristics of Egyptian architecture. Majestic, solid, severe and simple, and yet of noble proportions, it reached a perfection that has never been eclipsed."—A. B. Gosse, *Civilization of the ancient Egyptians*, pp. 82-88.

Religion.—"We assume that the prehistoric Egyptians, when they began to make the first . . . feeble progress towards civilization, were on the same basis as that on which we find many savage tribes of Africa. This most primitive stage, of animism lacks a clear conception of what we should call gods. It considers the whole world filled with spirits, some roaming freely about, some sedentary, some big and powerful, some rather insignificant. . . . The primitive Egyptians thus once had endless gods, if we may call them gods. The more the inhabitants of Egypt settled down and became agricultural, the more they paid attention to the local spirits. Originally every settlement seems to have had at least one local spirit which it worshipped exclusively by sacrifices and

magical ceremonies, not asking what its relation to the spirits of the neighboring village or town was, much less its relation to nature. Many of these cults survived in historical time without change and often also the various taboos attached to them. Sun, moon, stars, etc., probably were considered to have souls and may have been recognized as divine but seem to have found very little worship in earliest time."—W. M. Müller, *Egyptian religion, in Religions of the past and present* (J. A. Montgomery, ed.), pp. 36-37.—See also RELIGION: B. C. 2000-200; BOOK OF THE DEAD; MYTHOLOGY: Egyptian; PRIESTHOOD: In Egypt.

State organization in the early period.—Dwellings of the people.—"Supreme head of the whole complex of the national life stands forth the king—a greater figure, perhaps, in the earlier days of the Fourth Dynasty than he came to be later, but always immeasurably removed, in theory at least, from the greatest of his subjects. The reverence due to him was expressed in his title, 'The Good God,' in the prostrations which were required of everyone who entered his presence, and very significantly by the impersonal manner in which it was considered proper to refer to him. The title 'Per-O'—'Great House'—which first of all belonged to the palace, gradually came to be applied to the reigning monarch in a manner somewhat similar to that in which 'the Sublime Porte' has come to be applied to the Government of Turkey, and, in the form of 'Pharaoh,' has become for us the regular title of the Egyptian monarchs. According to invariable Eastern custom, the king was provided with a numerous harem. The chief wife, however, was the only one viewed as the official queen, and, owing to the importance attached by the Egyptians to the female line of descent, she occupied a position almost as influential as that of her lord [See also WOMAN'S RIGHTS: B. C. 2000-500.] The princes of the royal house were not permitted to lead idle lives. In the earlier days of the kingdom the Crown Prince was frequently also the Prime Minister, though this custom appears to have become extinct with the rise of the Fifth Dynasty. The children of the great nobles were sometimes admitted to intimacy with the young scions of the royal house, and shared in their education and their sports. The king himself, though so far removed in theory from his people, was by no means a mere *roi fainéant* [do-nothing king], but exercised a constant and active supervision over the affairs of his kingdom. His chief assistant was the Vizier, who was also Chief Justice of the land, and very often architect and superintendent of construction to boot. Under this chief administrator there was an army of officials of all sorts, attached to the Treasury, to the office of the Registration of Land, to that of the Inundation, and to various other departments. In theory, at least, all these departments were twofold, preserving in name the remembrance of the time when Egypt was divided into two kingdoms; but probably this became a mere fiction at a very early stage of the history. There was a highly elaborated system of law, of which, unfortunately, no part has been preserved; but there was no official class of judges, the law being administered in the

various districts by the local governors, many of whom boast of their integrity in the discharge of this important function. In cases of special moment a judicial commission was sometimes appointed, with powers to hear and to determine, as in the case of Queen Amtes, where Una, . . . was made judge. [See also DIPLOMATIC AND CONSULAR SERVICE: Consular service.] For administrative purposes the land was divided into local districts, or 'nomes,' of which there were about forty. These were administered by local governors, or 'no-

THE SACRED IBIS AT EDFU

marchs,' who were responsible to the central treasury and to the king. This system of devolution, while simplifying the administration of the country, led in the end to the destruction of the Old Kingdom; for these small States became each a kind of *imperium in imperio*, the local governors became more and more important, and at last, by the combination of their growing influence, the central authority was overthrown. This consummation was aided by the military system of the nation. There was no standing army, but each nome maintained its own body of local militia. These troops were liable to be called out by the

Pharaoh when occasion arose, and were then sometimes stiffened, as in the case of Una's expeditionary force, by regiments and brigades enlisted from among the tribes on the borders of the land. In addition to the forces thus more or less at the disposal of the Pharaoh, the various temples, like the abbeys of the Middle Ages, had each its own body of militia. This loose form of military organization, however convenient in many respects, was obviously a source of weakness and danger to the central authority. The local troops, raised and led by local governors, might easily become more attached to the interests of their particular nome or governor than to the larger but vaguer interests of the kingdom or the Pharaoh, and in the hands of an able and ambitious nomarch might be used as readily against the power of the central authority as in support of it—a state of things which was actually realized repeatedly in the course of the nation's history. [See also MILITARY ORGANIZATION: 2; 4.]

"At this stage of the national development no fixed capital existed. The locality of the court and capital was determined, for the time being, by the place which the reigning Pharaoh selected for his pyramid. Around this spot a new court grew up, which lasted as long as the reign; and when the king had passed away the court was again shifted to the new locality which had been chosen by his successor. In the days in question, however, the locality of the court was generally somewhere in the vicinity of the great city of Memphis. This mobility of so complex an organization as the royal court of Egypt was rendered possible by the character of Egyptian domestic architecture. Egypt has left us many temples and tombs, but practically no complete specimen of its palaces or of the houses of its noble class. Its cities have all perished, for the reason that the houses were of very lightest construction. No doubt the royal palaces, and even the mansions of the nobles, were of great size; but, as the climate dictated, they were of the most fragile materials, consisting mainly of wood and sun-dried brick. They were profusely, and in some instances very beautifully, adorned with designs in colour, and were richly furnished; but such methods of construction were, of course, totally unable to withstand the assaults of time, and in consequence we know of the structure and adornment of the Old Kingdom palaces and mansions only from pictured representations of them. The houses of the wealthier Egyptians were generally surrounded with gardens, carefully and tastefully laid out, and diversified with trees and shrubs, the chief feature of the design being frequently a piece of ornamental water. Very different from these beautiful, if fragile, villas were the houses of the common people, of which traces have come down to us. In the city life of Egypt under the Old Kingdom the working classes seem to have been huddled together in mud hovels packed closely side by side, with only narrow streets, or rather alleys, between the blocks; and overcrowding would seem to have been as characteristic of the cities in those far-off days as it is at the present time."—J. Baikie, *Story of the Pharaohs*, pp. 43-47.

Old empire and the middle empire.—"The direct descendants of Menes [or Mena] form the First Dynasty, which, according to Manetho, reigned 253 years. No monument contemporary

with these princes has come down to us. . . . The Second Dynasty, to which Manetho assigns nine kings, lasted 302 years. It was also originally from This [or Thisis], and probably related to the First. . . . When this family had become extinct, a Dynasty, originally from Memphis, seized the throne, forming the Third, and to it a duration of 214 years is attributed. . . . With the Fourth Dynasty, Memphite like the Third, and which reigned 284 years, history becomes clearer and monuments more numerous. This was the age of the three Great Pyramids, built by the three kings, Khufu (the Cheops of Herodotus), Shafra (Cheiren), and Menkara (Mycerinus). . . . The Fifth Dynasty came originally from Elephantine, at the southern extremity of Upper Egypt, and there possibly the kings generally resided, though at the same time Memphis was not deprived of its importance. . . . On the death of the last king of the Fifth Dynasty, a new family, of Memphitic origin according to Manetho, came to the throne. . . . Primitive art attained its highest point under the Sixth Dynasty. . . . But, from the time of the civil commotions in which Neit-aker [the Nitocris of Herodotus] perished, Egyptian civilization underwent a sudden and unaccountable eclipse. From the end of the Sixth Dynasty to the commencement of the Eleventh, Manetho reckons 436 years, and for this whole period the monuments are absolutely silent. Egypt seems then to have disappeared from the rank of nations; and when this long slumber ended, civilization commenced a new career, entirely independent of the past. . . . Thus ends that period of nineteen centuries, which modern scholars know as the Old Empire. . . . Thebes did not exist in the days of the glory of the Old Empire. The holy city of Amen seems to have been founded during the period of anarchy and obscurity, succeeding, as we have said, to the Sixth Dynasty. Here was the birthplace of that renewed civilization, that new monarchy, we are accustomed to call the Middle Empire, the middle age in fact of ancient Egypt. . . . From Thebes came the six kings of the Eleventh Dynasty. . . . We again quote the excellent remarks of M. Mariette: 'When, with the Eleventh Dynasty, we see Egypt awake from her long slumber, all old traditions appear to be forgotten; the proper names used in ancient families, the titles of functionaries, the style of writing, and even the religion—all seem new. Thus, Elephantine and Memphis are no longer the favourite capitals. Thebes for the first time becomes the seat of sovereign power. Egypt, moreover, has lost a considerable portion of her territory, and the authority of her legitimate kings hardly extends beyond the limited district of the Thebaid. The study of the monuments confirms these general views; they are rude, primitive, sometimes coarse; and when we look at them we may well believe that Egypt, under the Eleventh Dynasty, again passed through a period of infancy, as she had already done under the Third Dynasty.' A dynasty probably related to, and originally from the same place as these first Theban princes succeeded them. . . . This Twelfth Dynasty reigned for 213 years, and its epoch was one of prosperity, of peace at home and glorious achievements abroad. . . . Although the history of the Twelfth Dynasty is clear and well known, illustrated by numerous monuments, there is, nevertheless, no period in the annals of Egypt more obscure than the one closing with the Thirteenth Dynasty. It is one long series of revolutions, troubles, and internal dissensions, closed by a terrible catastrophe, the greatest and most lasting recorded in Egyptian

history, which a second time interrupted the march of civilization on the banks of the Nile, and for a while struck Egypt from the list of nations."—F. Lenormant and E. Chevallier, *Manual of ancient history of the East*, bk. 3, ch. 1-2.—See also MEMPHIS; THEBES.

Hyksos, or shepherd-kings.—According to the Manethonian account which the Jewish historian Josephus has preserved to us by transcribing it, the Egyptian Netherlands were at a certain time overspread by a wild and rough people, who came from the countries of the east, overcame the native kings who dwelt there, and took possession of the whole country, without finding any great opposition on the part of the Egyptians. They were called Hyksos, which Josephus interpreted as meaning shepherd-kings. "Hyk," he explained, meant king, in the holy language, and "sos" in the dialect of the people, signified shepherd. But Dr. Brugsch identifies "sos" with the name "Shasu," which the old Egyptians gave to the Bedouins, whose name became equivalent to shepherds. Hence Dr. Brugsch inclines to the ancient opinion transmitted by Josephus, that the Hyksos were Arabs or Bedouins—the Shasu of the Egyptian records, who hung on the northeastern frontier of Egypt from the most ancient times and were always pressing into the country, at every opportunity. But many objections against this view are raised and the different theories advanced to account for the Hyksos are quite numerous. Canon Rawlinson says: "The Egyptians of the time of Herodotus seem to have considered that they were Philistines. Moderns have regarded them as Canaanites, Syrians, Hittites. It is an avoidance rather than a solution of the difficulty to say that they were 'a collection of all the nomad hordes of Arabia and Syria' [Lenormant], since there must have been a directing hand. . . . On the whole, therefore, we lean to the belief that the so-called Hyksos or Shepherds were Hittites." G. Rawlinson, *History of ancient Egypt*, ch. 19.—See also HITTITES.

"It is maintained on good authority that the Hyksos, or Shepherd-Kings, had secured possession of the eastern frontier of Lower Egypt immediately after the close of the Twelfth Dynasty; that at this time the Thirteenth and the Fourteenth Dynasty ruled contemporaneously, the former in Upper, the latter in Lower Egypt; one was the legitimate, the other the illegitimate line; but authors are not in accord as to their right of priority. It is supposed that, while Egypt claimed the Thirteenth Dynasty as her own, the Hyksos usurped the mastery over the Fourteenth Dynasty, and governed through the agency of its kings, treating them meanwhile as vassal chiefs. These local kings had cities from which they were unable to escape, and were deprived of an army of defence. Such was the state of the country for 184 years, when the Fourteenth Dynasty died out, and when the Fifteenth Dynasty, constituted of six successive Hyksos kings, took the reins of government into their own hands. Lieblein, whose views we are now endeavouring to express, assigns as the date of the invasion of the Hyksos 2108 years B. C. . . . It is not improbable that the well-known journey of Abraham to Egypt was made during the early period of the reign of the Shepherd-Kings; whilst the visit of Joseph occurred near the close of their power."—E. Wilson, *Egypt of the past*, ch. 5.—"The Shepherds possessed themselves of Egypt by violence," writes Mariette-Bey, 'but the civilization which they immediately

adopted on their conquest was rather Egyptian than Asiatic, and the discoveries of Avaris (San) prove that they did not even banish from their temples the gods of the ancient Egyptian Pantheon.' In fact the first shepherd-king, Solatis himself, employed an Egyptian artist to inscribe . . . his title on the statue of a former legitimate Pharaoh. 'They did not disturb the civilization more than the Persians or the Greeks, but simply accepted the higher one they had conquered.' So our revered scholar Dr. Birch has summed up the matter; and Prof. Maspero has very happily described it thus: 'The popular hatred loaded them with ignominious epithets, and treated them as accursed, plague-stricken, leprous. Yet they allowed themselves very quickly to be domesticated. . . . Once admitted to the school of Egypt, the barbarians progressed quickly in the civilized life. The Pharaonic court reappeared around these shepherd-kings, with all its pomp and all its following of functionaries great and small. The royal style and title of Cheops and the Amenemhas were fitted to the outlandish names of Jannes, and Apapi. The Egyptian religion, without being officially adopted, was tolerated, and the religion of the Canaanites underwent some modifications to avoid hurting beyond measure the susceptibility of the worshippers of Osiris.'—H. G. Tomkins, *Studies on the times of Abraham*, ch. 8.—In an . . . Italian work ("Gli Hyksôs") by Dr. C. A. de Cara, "he puts together all that is ascertained in regard to them [the Hyksos], criticises the theories that have been propounded on their behalf, and suggests a theory of his own. Nothing that has been published on the subject seems to have escaped his notice. . . . His own view is that the Hyksôs represented a confederacy of various Asiatic tribes, under the leadership of the northern Syrians. That their ruling class came from this part of the world seems to me clear from the name of their supreme god Sutekh, who occupied among them the position of the Semitic Baal."—A. H. Sayce, *Hyksôs* (*Academy*, Sept. 20, 1890).—"Historical research concerning the history of the Hyksos may be summed up as follows:—I. A certain number of non-Egyptian kings of foreign origin, belonging to the nation of the Menti, ruled for a long time in the eastern portion of the Delta. II. These chose as their capitals the cities of Zoan and Avaris, and provided them with strong fortifications. III. They adopted not only the manners and customs of the Egyptians, but also their official language and writing, and the order of their court was arranged on Egyptian models. IV. They were patrons of art, and Egyptian artists erected, after the ancient models, monuments in honour of these usurpers, in whose statues they were obliged to reproduce the Hyksos physiognomy, the peculiar arrangement of the beard and head-dress, as well as other variations of their costume. V. They honored Sutekh, the son of Nut, as the supreme god of their newly acquired country, with the surname Nuh, 'the golden.' He was the origin of all that is evil and perverse in the visible and invisible world, the opponent of good and the enemy of light. In the cities of Zoan and Avaris, splendid temples were constructed in honour of this god, and other monuments raised, especially sphinxes, carved out of stone from Syene. VI. In all probability one of them was the founder of a new era, which most likely began with the first year of his reign. Down to the time of the second Ramses, four hundred years had elapsed of this reckoning which was acknowledged even by the Egyptians. VII. The Egyptians were indebted to their contact with them for much useful knowl-

edge. In particular their artistic views were expanded and new forms and shapes, notably that of the winged sphinx, were introduced, the Semitic origin of which is obvious at a glance. . . . The inscriptions on the monuments designate that foreign people who once ruled in Egypt by the name of Men or Menti. On the walls of the temple of Edfu it is stated that 'the inhabitants of the land of Asher are called Menti.' . . . In the different languages, . . . and in the different periods of history, the following names are synonymous: Syria, Rutennu of the East, Asher, and Menti.—"Since, on the basis of the most recent and best investigations in the province of ancient Egyptian chronology, we reckon the year 1350 B. C. as a mean computation for the reign of Ramses, the reign of the Hyksos king, Nub, and probably its beginning, falls in the year 1750 B. C., that is, 400 years before Ramses II. Although we are completely in the dark as to the place King Nub occupied in the succession of the kindred princes of his house, yet the number mentioned is important, as an approximate epoch for the stay of the foreign kings in Egypt. According to the statement in the Bible, the Hebrews from the immigration of Jacob into Egypt until the Exodus remained 430 years in that land. Since the Exodus from Egypt took place in the time of Meneptah II., the son of Ramses II.—the Pharaoh of the oppression—the year B. C. 1300 may be an approximate date. If we add to this 430 years, as expressing the total duration of the sojourn of the Hebrews in Egypt, we arrive at the year 1730 B. C. as the approximate date for the immigration of Jacob into Egypt, and for the time of the official career of Joseph at the court of Pharaoh. In other words, the time of Joseph (1730 B. C.) must have fallen in the period of the Hyksos domination, about the reign of the above-mentioned prince Nub (1750 B. C.)."—H. Brugsch-Bey, *History of Egypt under the Pharaohs* (ed. of 1891, by M. Brodrick), pp. 106-109, 126.—See also JEWS: Children of Israel in Egypt; Exodus.

About B. C. 1700-1400.—New empire.—Eighteenth dynasty.—"The dominion of the Hyksos by necessity gave rise to profound internal divisions, alike in the different princely families and in the native population itself. Factions became rampant in various districts, and reached the highest point in the hostile feeling of the inhabitants of Patoris or the South country against the people of Patomit or North country, who were much mixed with foreign blood. . . . From this condition of divided power and of mutual jealousy the foreign rulers obtained their advantage and their chief strength, until King Aahmes made himself supreme."—H. Brugsch-Bey, *Egypt under the Pharaohs* (ed. of 1891, by M. Brodrick).—The duration of the reign of this first Pharaoh of the new empire was twenty-five years. He was succeeded by his son Amenophis I and the latter by his son Thothmes I. "The reign of Thothmes I. . . . derives its chief distinction from the fact that, at this period of their history, the Egyptians for the first time carried their arms deep into Asia, overrunning Syria, and even invading Mesopotamia, or the tract between the Tigris and the Euphrates. Hitherto the furthest point reached in this direction had been Sharuhin in Southern Palestine. . . . Syria was hitherto almost an undiscovered region to the powerful people which, nurturing its strength in the Nile valley, had remained content with its own natural limits and scarcely grasped at any conquests. A time was now come when this

comparative quietude and absence of ambition were about to cease. Provoked by the attack made upon her from the side of Asia, and smarting from the wounds inflicted upon her pride and prosperity by the Hyksos during the period of their rule, Egypt now set herself to retaliate, and for three centuries continued at intervals to pour her armies into the Eastern continent, and to carry fire and sword over the extensive and populous regions which lay between the Mediterranean and the Zagros mountain range. There is some uncertainty as to the extent of her conquests; but no reasonable doubt can be entertained that for a space of three hundred years Egypt was the most powerful and the most aggressive state that the world contained, and held a dominion that has as much right to be called an 'Empire' as the Assyrian, the Babylonian or the Persian. While Babylonia, ruled by Arab conquerors, declined in strength, and Assyria proper was merely struggling into independence, Egypt put forth her arm and grasped the fairest regions of the earth's surface." The immediate successor of Thothmes I was his son, Thothmes II, who reigned in association with a sister of masculine character, queen Hatshepsut. The strong-minded queen, moreover, prolonged her reign after the death of this elder brother, until a younger brother, Thothmes III, displaced her. The third Thothmes was the greatest of Egyptian conquerors and kings. He carried his arms beyond the Euphrates, winning a memorable victory at Megiddo over the confederated kings of the Syrian and Mesopotamian countries. He left to his son (Amenophis II) "a dominion extending about 1,100 miles from north to south, and (in places) 450 miles from west to east." He was a great builder, likewise, and "has left the impress of his presence in Egypt more widely than almost any other of her kings, while at the same time he has supplied to the great capitals of the modern world their most striking Egyptian monuments." The larger of the obelisks now standing in Rome and Constantinople, as well as those at London and New York, were all of them produced in the reign of this magnificent Pharaoh. The two obelisks last named stood originally, and for fourteen centuries at the front of the great temple of the sun, in Heliopolis. They were removed by the Roman emperor, Augustus, 23 B. C., to Alexandria, where they took in time the name of Cleopatra's Needles,—although Cleopatra had no part in their long history. After nineteen centuries more of rest, these strangely coveted monuments were again disturbed, and transported into lands which their builder knew not of. The later kings of the eighteenth dynasty seem to have, none of them, possessed the energy and character of Thothmes III. The line ended about 1400 B. C. with Harmahib, who left no heirs.—G. Rawlinson, *History of ancient Egypt*, ch. 20.—See also ARABIA: Ancient succession and fusion of races.

B. C. 1600.—Extent of boundaries. See BABYLONIA: Map of Egyptian, Assyrian, Babylonian and Median powers.

About B. C. 1500-1400.—Tell el-Amarna tablets.—Correspondence of the Egyptian kings with Babylonia, Assyria, Armenia, Asia Minor, Syria and Palestine.—"The discovery made in 1887 by a peasant woman of Middle Egypt may be described as the most important of all contributions to the early political history of Western Asia. We have become possessed of a correspondence, dating from the fifteenth century B. C., which

was carried on during the reigns of three Egyptian kings, with the rulers of Babylon, Assyria, Armenia, Asia Minor, Syria, and Palestine, during a period of great activity, when revolutions which affected the whole history of the east shore lands of the Mediterranean were in progress; and we find in these tablets a contemporary picture of the civilisation of the age. . . . The Tell Amarna tablets represent a literature equal in bulk to about half the Pentateuch, and concerned almost exclusively with political affairs. They are clay tablets, varying from two inches to a foot in length, with a few as large as eighteen inches, covered with cuneiform writing, generally on both sides, and often on the edges as well. The peasantry unearthed nearly the complete collection, including some 320 pieces in all; and explorers afterwards digging on the site have added only a few additional fragments. The greater number were bought for the Berlin Museum, while eighty-two were acquired for England, and the rest remain either in the Boulak Museum at Cairo, or, in a few instances, in the hands of private collectors. . . . Tell Amarna (apparently 'the mound of the tumuli') is an important ruined site on the east bank of the Nile, about a hundred and fifty miles in a straight line south of Cairo. Its Egyptian name is said to have been Khu-en-aten, 'Glory of the Sun-disk.'—*Tell el-Amarna tablets (Edinburgh Review, July, 1893)*.—"The collection of Cuneiform Tablets . . . found [1887] at Tell el-Amarna in Upper Egypt, consisted of about three hundred and twenty documents, or portions of documents. The British Museum possesses eighty-two . . . the Berlin Museum has one hundred and sixty, a large number being fragments; the Gizeh Museum has sixty; and a few are in the hands of private persons. . . . In color the Tablets vary from a light to a dark dust tint, and from a flesh-color to dark brick-red. The nature of the clay of which they are made sometimes indicates the countries from which they come. The size of the Tablets in the British Museum varies from $8\frac{3}{4}$ inches x $4\frac{7}{8}$ in. to $2\frac{1}{8}$ in. x $1\frac{11}{16}$ in.; the longest text contains 98 lines, the shortest 10. . . . The greater number are rectangular, and a few are oval; and they differ in shape from any other cuneiform documents known to us. . . . The writing . . . resembles to a certain extent the Neo-Babylonian, i. e., the simplification of the writing of the first Babylonian Empire used commonly in Babylonia and Assyria for about seven centuries B. C. It possesses, however, characteristics different from those of any other style of cuneiform writing of any period now known to exist; and nearly every tablet contains forms of characters which have hitherto been thought peculiar to the Ninevite or Assyrian style of writing. But, compared with the neat, careful hand employed in the official documents drawn up for the kings of Assyria, it is somewhat coarse and careless, and suggests the work of unskilled scribes. One and the same hand, however, appears in tablets which come from the same person and the same place. On some of the large tablets the writing is bold and free; on some of the small ones the characters are confused and cramped, and are groups of strokes rather than wedges. The spelling . . . is often careless, and in some instances syllables have been omitted. At present it is not possible to say whether the irregular spelling is due to the ignorance of the scribe or to dialectic peculiarities. . . . The Semitic dialect in which these letters are written is Assyrian, and is, in some important details, closely related to the Hebrew of the Old Testament. . . . The documents

were most probably written between the years B. C. 1500 to 1450. . . . They give an insight into the nature of the political relations which existed between the kings of Western Asia and the kings of Egypt, and prove that an important trade existed between the two countries from very early times. . . . A large number of the present tablets are addressed to 'the King of Egypt,' either Amenophis III or Amenophis IV. Nearly all of them consist of reports of disasters to the Egyptian power and of successful intrigues against it, coupled by urgent entreaties for help, pointing to a condition of distraction and weakness in Egypt. . . . The most graphic details of the disorganized condition, and of the rival factions, of the Egyptian dependencies lying on the coastline of Phoenicia and Northern Palestine, are to be gathered from a perusal of the dispatches of the governors of the cities of Byblos, Beyrut and Tyre."—*Tell el-Amarna tablets in the British Museum, introd.*—"In the present state of cuneiform research I believe it to be impossible to give a translation of the Tell el-Amarna texts which would entirely satisfy the expert or general reader. No two scholars would agree as to any interpretation which might be placed upon certain rare grammatical forms and unknown words in the Babylonian text, and any literal translation in a modern language would not be understood by the general reader on account of the involved style and endless repetition of phrases common to a Semitic idiom and dialect. About the general meaning of the contents of the greater number of the letters there can be no doubt whatever, and it is therefore possible to make a summary of the contents of each letter, which should, as a rule, satisfy the general reader, and at the same time form a guide to the beginner in cuneiform. Summaries of the contents of the Tell el-Amarna tablets in the British Museum have been published in 'The Tell el-Amarna Tablets in the British Museum, with auto-type facsimiles,' printed by order of the Trustees, London, 1892, and it is hoped that the translation given in the following pages may form a useful supplement to that work. . . . No. 1. A Letter from Egypt—Amenophis III to Kallimma (?) Sin, King of Karaduniyash, referring to his proposed marriage with Sukharti, the daughter of Kallimma-Sin, and containing the draft of a commercial treaty, and an allusion to the disappearance of certain chariots and horses. No. 2. Letters from Babylonia—Burraburiyash, King of Karaduniyash, to Amenophis IV, referring to the friendship which had existed between their respective fathers, and the help which had been rendered to the King of Egypt by Burraburiyash himself; the receipt of two manahs of gold is acknowledged and a petition is made for more. No. 3. Burraburiyash, King of Karaduniyash to Amenophis IV, complaining that the Egyptian messengers had visited his country thrice without bringing gifts, and that they withheld some of the gold which had been sent to him from Egypt; Burraburiyash announces the despatch of a gift of lapis-lazuli for the Egyptian princess who was his son's wife. . . . No. 30. Letter from Abi-milki, governor of Tyre, to the King of Egypt, reporting that he believes Zimrida will not be able to stir up disaffection in the city of Sidon, although he has caused much hostility against Tyre. He asks for help to protect the city, and for water to drink and wood to burn, and he sends with his messenger Ili-milki five talents of copper and other gifts for the King of Egypt. He reports that the King of Danuna is dead and that his brother reigns in his stead; one half of the city of Ugarit has been de-

stroyed by fire; the soldiers of the Khatti have departed; Itagamapairi, governor of Kadesh, and Aziru are fighting against Namyawiza. If the King of Egypt will but send a few troops, all will be well with Tyre. . . . No. 43. Letter from the governor of a town in Syria to the King of Egypt, reporting that the rebels have asserted their independence; that Biridashwi has stirred up rebellion in the city of Inu-Amma; that its people have captured chariots in the city of Ashtarti; that the kings of the cities of Buzruna and Khalunni have made a league with Biridashwi to slay Namyawiza (who, having taken refuge in Damascus and being attacked by Arzawiya, declared himself to be a vassal of Egypt); that Arzawiya went to the city of Gizza and afterwards captured the city of Shaddu; that Itakkama ravaged the country of Gizza; and that Arzawiya and Biridashwi have wasted the country of Abitu. No. 44. Continuation (?) of a letter to the King of Egypt, reporting that, owing to the hostilities of Abd-Ashirta, Khâya, an official, was unable to send ships to the country of Amurri, as he had promised. The ships from Arvad which the writer has in his charge lack their full complement of men for war service, and he urges the king to make use of the ships and crews which he has had with him in Egypt. The writer of the letter also urges the King of Egypt to appoint an Egyptian official over the naval affairs of Sidon, Beyrut and Arvad, and to seize Abd-Ashirta and put him under restraint to prevent him obstructing the manning of the ships of war. . . . No. 58. Letter from the governor of a district in Palestine (?) to the governors of neighbouring states in the land of Canaan, informing them that he is about to send his messenger Akiya on a mission to the King of Egypt, and to place himself and everything that he has at his disposal. Akiya will go to Egypt by the way of Canaan, and the writer of this letter suggests that any gifts they may have to send to Egypt should be carried by him, for Akiya is a thoroughly trustworthy man."—C. Bezold, *Oriental diplomacy: being the transliterated text of the cuneiform despatches, preface*.—Under the title of "The Story of a 'Tell,'" Mr. W. M. Flinders Petrie, the successful excavator and explorer of Egyptian antiquities, gave a lecture in London, in June, 1892, in which he described the work and the results of an excavation then in progress under his direction on the supposed site of Lachish, at a point where the maritime plain of Philistia rises to the mountains of Judæa, on the route from Egypt into Asia. The chairman who introduced Mr. Petrie defined the word "Tell" as follows: "A Tell is a mound of earth showing by the presence of broken pottery or worked stone that it is the site of a ruined city or village. In England when a house falls down or is pulled down the materials are usually worth the expense of removing for use in some new building. But in Egypt common houses have for thousands of years been built of sun-dried bricks, in Palestine of rough rubble walling, which, on falling, produces many chips, with thick flat roofs of plaster. It is thus often less trouble to get new than to use old material; the sites of towns grow in height, and depressions are filled up." The mound excavated by Mr. Petrie is known as Tell el Hesi. After he left the work it was carried on by Mr. Bliss, and Mr. Petrie in his lecture says: "The last news is that Mr. Bliss has found the long looked for prize, a cuneiform tablet. . . . From the character of the writing, which is the same as on the tablets written in Palestine in 1400 B. C., to the Egyptian king at Tel el Amarna, we have a close agreement regard-

ing the chronology of the town. Further, it mentions Zimrida as a governor, and this same man appears as governor of Lachish on the tablets found at Tel el Amarna. We have thus at last picked up the other end of the broken chain of correspondence between Palestine and Egypt, of which one part was so unexpectedly found in Egypt . . . on the tablets at Tel el Amarna, and we may hope now to recover the Palestinian part of this intercourse and so establish the pre-Israelite history of the land."—W. M. F. Petrie, *Story of a "Tell" (City and the land, lect. 6)*.

B. C. 1414-1379.—Amenophis III.—Conquests and achievements.—"With the reign of Amenhotep III [Amenophis], who succeeded (1414-1379 B. C.), we reach the period of Egypt's greatest material splendor. Throughout the greater part of this reign of thirty-six years the tide of her prosperity was at its height, and though towards the close there were not wanting indications of that ebb which in the succeeding reign was to be so swift, yet Amenhotep, the most magnificent, if not the greatest, of Egyptian kings, went down to his grave in peace, without any apparent diminution of the power and splendour which had surrounded him during his life. Amenhotep III was the son of Tahutmes IV by his wife Mutemua, who may possibly have been the daughter of Artatama of Mitanni; but even a parentage doubly royal was not deemed sufficiently exalted for so splendid a monarch, and, as in the case of Hatshepsut, a legend was elaborated and afterwards engraven upon the walls of the great temple at Luqsor, according to which the king's real father was the god Amen, who had taken the shape of Tahutmes IV. The young king's accession was unmarked by any outbreak of restlessness. Syria, for once, was in a state of profound peace—so far, at all events, as regarded her relation with Egypt. [See also SYRIA: B. C. 1500-1000.] It was not till his fifth year that trouble in Nubia called him south. Passing the first cataract, he joined his forces with a local contingent raised by Merimes, the 'Royal Prince of Kush,' or Viceroy of Nubia, and at Abhat, probably above the second cataract, south of Wady Halfa, he met the rebellious Nubians. The result of the encounter was what might have been expected: the Nubians were routed, 312 of them were slain, and 740 prisoners of all ages and both sexes were taken. The success was commemorated by inscriptions at Konosso, at Aswan, and at Semneh, and, as a more permanent and conspicuous memorial of his victory, Amenhotep built a large temple at Soleb, near the head of the third cataract. This temple, whose ruins are still very considerable, was the largest Egyptian building ever erected in Nubia, measuring over 300 feet in length. Some time before his tenth year the king had married the celebrated Queen Tyi, the woman whose influence upon the history of Egypt was destined to be so great and ultimately so disastrous. There has been much dispute concerning the origin of this woman. It has been conjectured that she was either a North Syrian or a Mitannian princess. What is certainly known is that her father and mother were named Yuua and Thuua, and that both their tomb and that of the great queen, their daughter, were recently discovered in the Valley of the Kings. . . . After his Jubina expedition, Amenhotep seems to have enjoyed peace during all the rest of his reign. On one occasion he journeyed as far as Sidon; but, so far as appears, the errand which took him there was not warlike. Indeed, to

RECONSTRUCTION OF THE GATEWAY TO TEMPLE OF PHARAONIC TIMES

all seeming, his Empire in Asia was firmly established, and likely to remain secure. A few years were to show how little real solidity there was in its fabric; but meanwhile all was tranquil, and no enemy was within sight who could dispute, even for a moment, the supremacy of the great southern power. The policy of Tahutmes [Tethmosis] III. was now bearing its fruits. After each successive campaign he had carried down into Egypt as hostages the sons of the conquered chiefs; and as vacancies occurred in the succession, these young men, who had received an Egyptian training, were sent by the Pharaoh to occupy the thrones of their fathers; and thus a generation of princes grew up in Syria and Nahrina who had learned, if not to love Egypt, at least to know and respect her power. In fact, at this period the Egyptian court appears as the focus of that ancient world, and its king is the central luminary from whom all the surrounding royalties derive their light and guidance. As had happened in the case of Hatshepsut and Senmut, the splendid tastes of Amenhotep were seconded by the genius of a man who has left a great reputation in the land. This was the king's namesake, Amenhotep [Amenophis], the son of Hapu, who was the royal factotum, as Senmut had been in the earlier reign, and who so succeeded in impressing his fellow-countrymen with his supreme ability that his name gradually became the subject of legend, and he was classed with Imhotep and Hordedef as a divine genius whose counsel was 'as though one inquired at the oracle of God.' Under the skilled direction of this great man, Amenhotep III. proceeded to adorn Thebes with buildings before whose magnificence the former splendours even of Karnak were dimmed. The great structure by which his name is best remembered is the enormous temple which he reared, and which still stands at Luqsor [Luxor], about one mile and a half from the temple of Karnak.—J. Baikie, *Story of the Pharaohs*, pp. 153-155, 162-163.

B. C. 1379.—Amenophis IV.—Attempted religious reformation.—"In spite of the fact that many of his monuments have been preserved for us, Amenophis IV, who reigned about 1370 B. C., is of all the Pharaohs the most curious and at the same time the most enigmatic figure. In this land of Egypt, where tradition is all-powerful, amongst a people, 'the most religious of all men,' who had remained faithful to their gods for thousands of years, Amenophis IV devised and carried out a religious revolution, the disestablishment and disendowment of the great national god, Amon-Ra. He substituted for Amon the god Aton, whose worship he imposed upon the court, the priests, the Egyptian people, and foreign subjects. Father of the Pharaohs, conqueror of the stranger, Amon was, moreover, the god who, through his intermediaries, the priests, upheld the power and authority of the King in the internal government of Egypt. After the glorious reign of Thotmes [Tethmosis] I the royal house had been weakened by dynastic quarrels. The Pharaohs had been driven from the throne, supplanted by a woman, the Queen Hatshopsitu [Hatshepsut]; they had been recalled, then banished again; and finally they had been triumphant. The high-priests of Amon had concocted these intrigues, by turn giving and withdrawing their support. They had thus become, in very truth, the governors of the palace, exercising civil authority as well as religious functions. At the time of Hatshopsitu, prince Hâpousenb, under Amenophis III, Ptahmes, held the cumulative offices of 'chief prophet of Amon, ruler of all the prophets of the South and

of the North, governor of the city of Thebes, vizier of the whole of Egypt.' So much spiritual and temporal power, concentrated in one hand, was dangerous in a high degree to Pharaoh. Such ambiguous situations usually end in the servant's taking precedence of his master, ousting him little by little from the government, in order that some fine day, he may himself mount the throne. That is what came to pass some centuries later, at the end of the XXth dynasty, when the priests of Amon became the Pharaohs. This sacerdotal revolution was already in the air at the end of the XVIIIth dynasty; but Amenophis IV was the man who turned aside the natural course of events, breaking the power of the priests of Amon lest they should dethrone the kings. With a far-sighted view of the danger he attempted to overthrow the priesthood of Amon, by doing away, at one and the same time, with the priests and the god. From this point of view, the attempt of Amenophis IV was something more than a political reaction against the encroaching ambition of the high-priests of Amon. The reform of Amenophis IV was at the core a return to a more human form of religion—probably to an archaic ideal which had already flourished in the day of the Ancient Empire, when the god Ra ruled over the gods of the living. Amenophis IV reigned scarcely sixteen years, and, perhaps,—if we should judge from certain of his effigies (Plate VIII, 2),—the struggle with the priests of Amon broke down his health and brought upon him a premature old age. His work did not survive him. His second successor, Toutânkhamon, son of another wife of Amenophis III, restored the worship of Amon and the power of the high-priests, preparing thus, in a not far distant future (about three hundred years) for the accession of the priest-kings of Thebes. The temples of Aton were in their turn sacked, and the memory of Khounaton was dishonoured and reviled. In an official document of the XIXth dynasty, his name is not mentioned; he is designated by a periphrasis: 'The fallen one, the criminal of Khoutaton.' The reform of Amenophis IV hardly affected the development of Egyptian civilisation, but if it counts for little in the history of Egypt, it counts infinitely in the history of humanity. For the first time, perhaps, has man worthily sung his God. And for the first time, in the hymns of El-Amarna, there is expressed with sublime elevation, a feeling of gratitude for a God who is a universal Providence, who extends His care not only to men of diverse races but to animals and plants, a feeling of fraternity with the humblest being in Nature, who, endowed with life, may join in giving forth his praise to his Creator."—A. Moret, *Kings and gods of Egypt*, pp. 41-45, 64-68.

About B. C. 1350-1200.—First of the Ramesides.—Pharaohs of the Oppression and the Exodus.—"Under the Nineteenth Dynasty, which acquired the throne after the death of Har-em-Hebi [or Horemheb] the fortune of Egypt maintained to some extent its ascendancy; but, though the reigns of some war-like kings throw a bright light on this epoch, the shade of approaching trouble already darkens the horizon." Rameses I and his son, or son-in-law, Seti I, were involved in troublesome wars with the rising power of the Hittites, in Syria, and with the Shasu of the Arahian desert. Seti was also at war with the Libyans, who then made their first appearance in Egyptian history.—F. Lenormant and E. Chevallier, *Manual of the ancient history of the East*, bk. 3, ch. 3.—"King Sety [Seti] the First succeeded the first Rameses, who reigned only a short time,

and is famous for the temples he built at Abydos and Karnak. The sculpture of his reign, as illustrated by the bas-reliefs upon their walls, possesses a subtlety, a grace, though conventional, that has not been surpassed in Egyptian art. In imperial politics, also, he was active, restraining for a time the long-troublesome inroads of Libyan tribes and Mediterranean pirates upon his northwestern frontier, and rendering his authority more durable by introducing these peoples to his army. He also cleared the way to Southern Syria, where nomadic peoples were encroaching, and in his effort to regain that territory came into conflict with the Kheta, now revealed as the great centre of the Hittite confederation, seated in strongholds upon the Upper Euphrates and the Orontes in Northern

STATUES OF RAMESSES II BEFORE THE TEMPLE OF ABU

Syria. The war was waged chiefly in the Lebanon region, but it was under Rameses the Second, for his exploits named the Great [known to the Greeks as Sesostris], that the struggle grew most fierce. In the fifth year of his reign Kadesh itself, a royal stronghold of the Kheta, was carried after a battle made memorable by the sculptures in several of his temples that celebrate the victory. The king often led his armies in person, and a series of further campaigns lasting over 16 years, in which the Egyptian was not always victorious, was closed with a treaty, made in double, by which the equality of power on either side was recognised, and a mutual obligation undertaken to render military assistance when called upon. Though the boundary of territory is not defined, Palestine and Southern Phœnicia seemed to have remained with Egypt, while the Kheta claimed naturally their

sphere of influence in the north. The treaty was concluded B. C. 1304, in the 21st year of Rameses' reign, and the peace was cemented by alliance, Rameses receiving a princess of the Kheta in marriage. So ended a struggle which, if not in name, had in fact endured for several hundred years."—P. E. Newberry and J. Garstang, *Short history of ancient Egypt*, pp. 89-90.—See also PHœNICIANS: Origin; SIDON; SYRIA: B. C. 1500-1000.

"The extreme length of the reign of Ramses was, as in other histories, the cause of subsequent weakness and disaster. His successor was an aged son, Menptah, who had to meet the difficulties which were easily overcome by the youth of his energetic father. The Libyans and their maritime allies broke the long tranquillity of Egypt by a formidable invasion and temporary conquest of the north-west. The power of the monarchy was thus shaken, and the old king was not the leader to restore it. His obscure reign was followed by others even obscurer, and the Nineteenth Dynasty ended in complete anarchy, which reached its height when a Syrian chief, in what manner we know not, gained the rule of the whole country. It is to the reign of Menptah that Egyptian tradition assigned the Exodus, and modern research has come to a general agreement that this is its true place in Egyptian history. . . . Unfortunately we do not know the duration of the oppression of the Israelites, nor the condition of Lower Egypt during the Eighteenth Dynasty, which, according to the hypothesis here adopted, corresponds to a great part of the Hebrew sojourn. It is, however, clear from the Bible that the oppression did not begin till after the period of Joseph's contemporaries, and had lasted eighty years before the Exodus. It seems almost certain that this was the actual beginning of the oppression, for it is very improbable that two separate Pharaohs are intended by the 'new king which knew not Joseph' and the builder of Rameses, or, in other words, Ramses II., and the time from the accession of Ramses II. to the end of Menptah's reign can have little exceeded the eighty years of Scripture between the birth of Moses and the Exodus. . . . If the adjustment of Hebrew and Egyptian history for the oppression, as stated above, be accepted, Ramses II. was probably the first, and certainly the great oppressor. His character suits this theory; he was an undoubted autocrat who . . . covered Egypt and Lower Nubia with vast structures that could only have been produced by slave-labor on the largest scale."—R. S. Poole, *Ancient Egypt (Contemporary Review, Mar., 1879)*.—See also JEWS: Children of Israel of Egypt: Exodus.

About B. C. 1300.—Exodus of the Israelites. See JEWS: Exodus.

About B. C. 1200-670.—Decline of the empire of the Pharaohs.—From the anarchy in which the nineteenth dynasty came to its end, order was presently restored by the seating in power of a new family, which claimed to be of the Rameside stock. The second of its kings, who called himself Rameses III and who is believed to be the Rhampsinitus of the Greeks, appears to have been one of the ablest of the monarchs of his line. The security and prosperity of Egypt were recovered under his reign and he left it in a state which does not seem to have promised the rapid decay which ensued. "It is difficult to understand and account

for the suddenness and completeness of the collapse. . . . The hieratic chiefs, the high priests of the god Ammon at Thebes, gradually increased in power, usurped one after another the prerogatives of the Pharaohs, by degrees reduced their authority to a shadow, and ended with an open assumption not only of the functions, but of the very insignia of royalty. A space of nearly two centuries elapsed, however, before this change was complete. Ten princes of the name of Ramses, and one called Meri-Tum, all of them connected by blood with the great Rameside house, bore the royal title and occupied the royal palace, in the space between B. C. 1280 and B. C. 1100. Egyptian history during this period is almost wholly a blank. No military expeditions are conducted—no great buildings are reared—art almost disappears—literature holds her tongue." Then came the dynasty of the priest-kings, founded by Her-Hor, which held the throne for more than a century and was contemporary in its latter years with David and Solomon. The twenty-second dynasty which succeeded had its capital at Bubastis and is concluded by Dr. Brugsch to have been a line of Assyrian kings, representing an invasion and conquest of Egypt by Nimrod, the great king of Assyria. Other Egyptologists disagree with Dr. Brugsch in this, and Prof. Rawlinson, the historian of Assyria, finds objections to the hypothesis from his own point of view. The prominent monarch of this dynasty was the Sheshonk of Biblical history, who sheltered Jeroboam, invaded Palestine and plundered Jerusalem. [See also JERUSALEM.] Before this dynasty came to an end it had lost the sovereignty of Egypt at large, and its Pharaohs contended with various rivals and invaders. Among the latter, power grew in the hands of a race of Ethiopians, who had risen to importance at Napata, on the Upper Nile, and who extended their power, at last, over the whole of Egypt. The Ethiopian domination was maintained for two-thirds of a century, until the great wave of Assyrian conquest broke upon Egypt in 672 B. C. and swept over it, driving the Ethiopians back to Napata and Meroë. —G. Rawlinson, *History of ancient Egypt*, ch. 25. —See also ETHIOPIA.

B. C. 670-525.—Assyrian conquest and restored independence.—Twenty-sixth dynasty.—Greeks at Naucratis.—Although Syria and Palestine had then been suffering for more than a century from the conquering arms of the Assyrians, it was not until 670 B. C., according to Prof. Rawlinson, that Esarhaddon passed the boundaries of Egypt and made himself master of that country. His father Sennacherib, had attempted the invasion thirty years before, at the time of his siege of Jerusalem, and had recoiled before some mysterious calamity which impelled him to a sudden retreat. The son avenged his father's failure. The Ethiopian masters of Egypt were expelled and the Assyrian took their place. He "broke up the country into twenty governments, appointing in each town a ruler who bore the title of king, but placing all the others to a certain extent under the authority of the prince who reigned at Memphis. This was Neco, the father of Psammetichus (Psamatik I.)—a native Egyptian of whom we have some mention both in Herodotus and in the fragments of Manetho. The remaining rulers were likewise, for the most part, native Egyptians." These arrangements were soon broken up by the expelled Ethiopian king,

Taharak, who rallied his forces and swept the Assyrian kinglets out of the country; but Assur-Bani-Pal, son and successor of Esarhaddon, made his appearance with an army in 668 or 667 B. C. and Taharak fled before him. Again and again this occurred, and for twenty years Egypt was torn between the Assyrians and the Ethiopians, in their struggle for the possession of her. At length, out of the chaos produced by these conflicts there emerged a native ruler—the Psammetichus mentioned above—who subjugated his fellow princes and established a new Egyptian monarchy, which defended itself with success against Assyria and Ethiopia, alike. The twenty-sixth dynasty, of Sais, founded by Psammetichus, is suspected to have been of Libyan descent. It ruled Egypt until the Persian conquest, and brought a great new influence to bear on the country and people, by the introduction of Greek soldiers and traders. It was under this dynasty that the Greek city of Naucratis was founded, on the Canopic branch of the Nile.—G. Rawlinson, *Five great monarchies: Assyria*, ch. 9.—The site of Naucratis, near the Canopic branch of the Nile, was determined by excavations which Mr. W. M. Flinders Petrie began in 1884, and from which much has been learned of the history of the city and of early relations between the Egyptians and the Greeks. It is concluded that the settlement of Naucratis dates from about 660 B. C.—not long after the beginning of the reign of Psammetichus—and that its Greek founders became the allies of that monarch and his successors against their enemies. "All are agreed that before the reign of Psammetichus and the founding of Naucratis, Egypt was a sealed book to the Greeks. It is likely that the Phoenicians, who were from time to time the subjects of the Pharaohs, were admitted, where aliens like the Greeks were excluded. We have indeed positive evidence that the Egyptians did not wish strange countries to learn their art, for in a treaty between them and the Hittites it is stipulated that neither country shall harbour fugitive artists from the other. But however the fact may be accounted for, it is an undoubted fact that long before Psammetichus threw Egypt open to the foreigner, the Phoenicians had studied in the school of Egyptian art, and learned to copy all sorts of handiwork procured from the valley of the Nile. . . . According to Herodotus and Diodorus, the favour shown to the Greeks by the King was the cause of a great revolt of the native Egyptian troops, who left the frontier-fortresses, and marched south beyond Elephantine, where they settled, resisting all the entreaties of Psammetichus, who naturally deplored the loss of the mainstay of his dominions, and developed into the race of the Sebridae. Wiedemann, however, rejects the whole story as unhistorical, and certainly, if we closely consider it, it contains great inherent improbabilities. . . . Psammetichus died in B. C. 610, and was succeeded by his son Necho, who was his equal in enterprise and vigour. This King paid great attention to the fleet of Egypt, and Greek shipwrights were set to work on both the Mediterranean and Red Sea to build triremes for the State navy. A fleet of his ships, we are told, succeeded in sailing round Africa, a very great feat for the age. The King even attempted the task, of which the completion was reserved for the Persian Darius, the Ptolemies, and Trajan, of making a canal from the Mediterranean to the Red Sea. Herodotus says that, after sacrificing the lives of 120,000 men to the labour and heat of the task, he gave it up, in consequence of the warning of an oracle that he was toiling only for

the barbarians. . . . Necho, like his father, must needs try the edge of his new weapon, the Ionian mercenaries, on Asia. At first he was successful. Josiah, King of Judah, came out against him, but was slain, and his army dispersed. Greek valour carried Necho as far as the Euphrates. . . . But Nebuchadnezzar, son of the King of Babylon, marched against the invaders, and defeated them in a great battle near Carchemish. His father's death recalled him to Babylon, and Egypt was for the moment saved from counter-invasion by the stubborn resistance offered to the Babylonian arms by Jehoiakim, King of Judah, a resistance fatal to the Jewish race; for Jerusalem was captured after a long siege, and most of the inhabitants carried into captivity. Of Psammetichus II., who succeeded Necho, we should know but little were it not for the archaeological record. Herodotus only says that he attacked Ethiopia, and died after a reign of six years. But of the expedition thus summarily recorded we have a lasting and memorable result in the well-known inscriptions written by Rhodians and other Greek mercenaries on the legs of the colossi at Abu Simbel in Nubia, which record how certain of them came thither in the reign of Psammetichus, pushing up the river in boats as far as it was navigable, that is, perhaps, up to the second cataract. . . . Apries, the Hophra of the Bible, was the next king. The early part of his reign was marked by successful warfare against the Phœnicians and the peoples of Syria; but, like his predecessor, he was unable to maintain a footing in Asia in the face of the powerful and warlike Nebuchadnezzar. The hostility which prevailed between Egypt and Babylon at this time caused King Apries to open a refuge for those Jews who fled from the persecution of Nebuchadnezzar. He assigned to their leaders, among whom were the daughters of the King of Judah, a palace of his own at Daphnae, 'Pharaoh's house at Tahpanhes,' as it is called by Jeremiah. That prophet was among the fugitives, and uttered in the palace a notable prophecy (xliiii. 9) that King Nebuchadnezzar should come and spread his conquering tent over the pavement before it. Formerly it was supposed that this prophecy remained unfulfilled, but this opinion has to be abandoned. Recently-discovered Egyptian and Babylonian inscriptions prove that Nebuchadnezzar conquered Egypt as far as Syene. . . . The fall of Apries was brought about by his ingratitude to the Greeks, and his contempt for the lives of his own subjects. He had formed the project of bringing under his sway the Greek cities of the Cyrenaica. . . . Apries despatched against Cyrene a large force; but the Cyreneans bravely defended themselves, and as the Egyptians on this occasion marched without their Greek allies, they were entirely defeated, and most of them perished by the sword, or in the deserts which separate Cyrene from Egypt. The defeated troops, and their countrymen who remained behind in garrison in Egypt, imputed the disaster to treachery on the part of Apries. . . . They revolted, and chose as their leader Amasis, a man of experience and daring. But Apries, though deserted by his subjects, hoped still to maintain his throne by Greek aid. At the head of 30,000 Ionians and Carians he marched against Amasis. At Momemphis a battle took place between the rival kings and between the rival nations; but the numbers of the Egyptians prevailed over the arms and discipline of the mercenaries, and Apries was defeated and captured by his rival, who, however, allowed him for some years to retain the name of joint-king. It is the best possible

proof of the solidity of Greek influence in Egypt at this time that Amasis, though set on the throne by the native army after a victory over the Greek mercenaries, yet did not expel these latter from Egypt, but, on the contrary, raised them to higher favour than before. . . . In the delightful dawn of connected European history we see Amasis as a wise and wealthy prince, ruling in Egypt at the time when Polycrates was tyrant of Samos; and when Croesus of Lydia, the richest king of his time, was beginning to be alarmed by the rapid expansion of the Persian power under Cyrus."—P. Gardner, *New chapters in Greek history*, ch. 7.—See also NAUCRATIS; PHŒNICIANS: B. C. 850-538.

ALSO IN: W. M. F. Petrie, *Naucratis*.

B. C. 525-332.—Persian conquest and sovereignty.—"The death of the usurper Aahmes II brings to the foreground another son of the royal Egyptian family, Psemethok or Psammetichus, whose term of reign scarcely exceeded six months; and who was the last of the Egyptian Pharaohs. Cambyses, the Persian king, having assembled a powerful army for the purpose of invading Egypt and resenting the affront put upon him by Amasis, gave the chief command of his forces to Phanes, a Greek general, who had formerly served under Amasis, but had subsequently deserted him and had sought preferment amongst the Persians. Phanes led the Persian army across the desert of Arabia and through Syria, and confronted Psemethok on the Pelusiac branch of the Nile. Psemethok fought well and was bravely supported by his Greek mercenaries, but was not powerful enough to resist his opponent. He retreated to Memphis pursued by the Persian commander, and prepared to defend himself in that ancient fortress. But, unfortunately, a new cause of ill-feeling sprang up between the rival authorities; a Mytilene galley, in charge of a king's herald, was sent by Cambyses to summon the Egyptians to surrender; but they, in their anger, seized upon the vessel and destroyed its whole crew, including the sacred person of the herald. Thereupon, Cambyses made a furious assault on the city, slew 2,000 of its defenders, including the king's son, and carried off Psemethok himself as his prisoner. In his attacks on the Egyptians, Cambyses had the cunning to mass the sacred animals in the front of his army, and, to avoid wounding them, with their missiles, the Egyptian archers were seriously hampered. The nationality of the Egyptians had been greatly enfeebled through the disruption of the country, continued persistently for so many years, but was not wholly quenched. A conspiracy in favour of Psemethok was brought to light, and Psemethok himself became the victim. He was condemned to die by the horrible process, common among the Persians in those days, of swallowing the warm blood of a bull. With the remembrance of this act of hideous cruelty, the representative of an able and accomplished family of the native Pharaohs of Egypt, passes away from before our eyes, to give place to the new eastern power which by this time has grown up into overwhelming proportions, and was beginning to spread its waves westward through Syria and Egypt."—W. J. E. Wilson, *Egypt of the past*, pp. 427-429.

"The conquest of Egypt was followed by the submission of the neighbouring tribes. . . . Even the Greeks of the more remote Barca and Cyrene sent gifts to the conqueror and consented to become his tributaries." But Cambyses wasted 50,000 men in a disastrous expedition through the Libyan desert to Ammon, and he retreated from

Ethiopia with loss and shame. "Egypt became now for a full generation the obsequious slave of Persia, and gave no more trouble to her subjugator than the weakest, or the most contented, of the provinces."—G. Rawlinson, *Five great monarchies: Persia*, ch. 7.—"The Persian kings, from Cambyses to Darius II. Nothus, are enrolled as the Twenty-Seventh Dynasty of Manetho. The ensuing revolts [see ATHENS: B. C. 466-455] are recognized in the Twenty-Eighth (Saite) Dynasty, consisting only of Amyrtaeus, who restored the independence of Egypt (B. C. 414-408), and the Twenty-Ninth (Mendesian) and Thirtieth (Sebenntyte) Dynasties (about B. C. 408-353), of whose intricate history we need only here say that they ruled with great prosperity and have left beautiful monuments of art. The last king of independent Egypt was Nectanebo II., who succumbed to the invasion of Artaxerxes Ochus, and fled to Ethiopia (B. C. 353). The last three kings of Persia, Ochus, Arses, and Darius Codomannus, form the Thirty-First Dynasty of Manetho, ending with the submission of Egypt to Alexander the Great (B. C. 332)."—P. Smith, *Ancient history of the East (Students')*, ch. 8.—See also PERSIA: B. C. 486-405.

ALSO IN: S. Sharpe, *History of Egypt*, ch. 5.

B. C. 332.—Alexander's conquest.—"In the summer of 332 [after the siege and destruction of Tyre—see TYRE: B. C. 332, and MACEDONIA: B. C. 334-330] Alexander set forward on his march toward Egypt, accompanied by the fleet, which he had placed under the orders of Hephæstion." But, being detained on the way several months by the siege of Gaza (see GAZA: B. C. 332), it was not before December that he entered Egypt. "He might safely reckon not merely on an easy conquest, but on an ardent reception, from a people who burnt to shake off the Persian tyranny. . . . Mazaces [the Persian commander] himself, as soon as he heard of the battle of Issus, became aware that all resistance to Alexander would be useless, and met him with a voluntary submission. At Pelusium he found the fleet, and, having left a garrison in the fortress, ordered it to proceed up the Nile as far as Memphis, while he marched across the desert. Here he conciliated the Egyptians by the honours which he paid to all their gods, especially to Apis, who had been so cruelly insulted by the Persian invaders. . . . He then embarked, and dropt down the western or Canobic arm of the river to Canobus, to survey the extremity of the Delta on that side, and having sailed round the lake Mareotis, landed on the narrow belt of low ground which parts it from the sea, and is sheltered from the violence of the northern gales . . . by a long ridge of rock, then separated from the main land by a channel, nearly a mile (seven stades) broad and forming the isle of Pharos. On this site stood the village of Racotis, where the ancient kings of Egypt had stationed a permanent guard to protect this entrance of their dominions from adventurers. . . . Alexander's keen eye was immediately struck by the advantages of this position for a city, which should become a great emporium of commerce, and a link between the East and the West. . . . He immediately gave orders for the beginning of the work, himself traced the outline, which was suggested by the natural features of the ground itself, and marked the site of some of the principal buildings, squares, palaces and temples [see ALEXANDRIA: B. C. 332]." Alexander remained in Egypt until the spring of 331, arranging the occupation and administration of the country. "The system which he established served in some points

as a model for the policy of Rome under the Emperors." Before quitting the country he made a toilsome march along the coast, westward, and thence, far into the desert, to visit the famous oracle of Ammon.—C. Thirlwall, *History of Greece*, ch. 50.

B. C. 332-322.—Government under Alexander.—Cleomenes.—"For ten years after it fell to Alexander Egypt was under the provisional government established by the young king. He won the sympathies of the Egyptian priesthood by showing a tactful toleration of the religious prejudices of the inhabitants. His use of the native nobility in the civil division of the provisional government must have helped him greatly in establishing his administration without serious friction. The system devised was threefold. The military government was under three leaders; two for the land troops and one for the navy. These were Macedonians or Greeks. The civil administration remained under the control of two monarchs, the Egyptians Doloaspis and Petesis. The financial administration was centered in the hands of an able but unscrupulous Greek from Naucratis named Cleomenes. Owing to the fertility of Egypt this position was easily the most important of all, and Cleomenes, during the long absence of Alexander in the east, was able to assume and maintain the practical authority of a governor of Egypt. His greed of money led him into oppressions which alienated all classes of the Egyptians, especially the priesthood and the mercantile class. When Ptolemy I assumed control of Egypt as satrap immediately after the death of Alexander, the execution of Cleomenes (322 B. C.) won for him the support of the most powerful elements in the state."—G. W. Botsford and E. G. Sihler (ed.), *Hellenic civilization*, pp. 583, 584.

B. C. 323-30.—Kingdom of the Ptolemies.—"In the division of the empire of Alexander the Great between his generals, when he died, Ptolemy Lagus—reputed to be a natural son of Alexander's father Philip—chose Egypt [see MACEDONIA: B. C. 323-316], with a modesty which proved to be wise. In all the provinces of the Macedonian conquest, it was the country most easily to be held as an independent state, by reason of the sea and desert which separated it from the rest of the world. It resulted from the prudence of Ptolemy that he founded a kingdom which lasted longer and enjoyed more security and prosperity than any other among the monarchies of the Diadochi. He was king of Egypt, in fact, for seventeen years before, in 307 B. C., he ventured to assume the name [see MACEDONIA: B. C. 310-301]. Meantime, he had added to his dominion the little Greek state of Cyrene, on the African coast with Phenicia, Judæa, Cœle-Syria, and the island of Cyprus. These latter became disputed territory, fought over for two centuries, between the Ptolemies and the Seleucids, sometimes dominated by the one and sometimes by the other [see SELEUCIDÆ: B. C. 281-224 and 224-187]. At its greatest extent, the dominion of the Ptolemies, under Ptolemy Philadelphus, son of Ptolemy Lagus, included large parts of Asia Minor and many of the Greek islands. Egypt and Cyrene they held, with little disturbance, until Rome absorbed them. Notwithstanding the vices which the family of Ptolemy developed, and which were as rank of their kind as history can show, Egypt under their rule appears to have been one of the most prosperous countries of the time. In Alexandria, they more than realized the dream of its Macedonian projector. They made it not only the wealthiest city of their day, but the greatest seat

of learning,—the successor of Athens as the capital of Greek civilization in the ancient world.”—S. Sharpe, *History of Egypt*, ch. 7-12.—The first Ptolemy abdicated in favor of his son, Ptolemy Philadelphus, in 284 B. C., and died in the second year following. See MACEDONIA: B. C. 297-280.—“Although the political constitution of Egypt was not greatly altered when the land fell into Greek hands, yet in other respects great changes took place. The mere fact that Egypt took its place among a family of Hellenistic nations, instead of claiming as of old a proud isolation, must have had a great effect on the trade, the manufactures, and the customs of the country. To begin with trade. Under the native kings Egypt had scarcely any external trade, and trade could scarcely spring up during the wars with Persia. But under the Ptolemies, intercourse between Egypt and Sicily, Syria or Greece, would naturally and necessarily advance rapidly. Egypt produced manufactured goods which were everywhere in demand; fine linen, ivory, porcelain, notably that papyrus which Egypt alone produced, and which was necessary to the growing trade in manuscripts. Artificial barriers being once removed, enterprising traders of Corinth and Tarentum, Ephesus and Rhodes, would naturally seek these goods in Egypt, bringing in return whatever of most attractive their own countries had to offer. It seems probable that the subjects of the Ptolemies seldom or never had the courage to sail direct down the Red Sea to India. In Roman times this voyage became not unusual, but at an earlier time the Indian trade was principally in the hands of the Arabs of Yemen and of the Persian Gulf. Nevertheless the commerce of Egypt under the Ptolemies spread eastwards as well as westwards. The important towns of Arsinoë and Berenice arose on the Red Sea as emporia of the Arabian trade. And as always happens when Egypt is in vigorous hands, the limits of Egyptian rule and commerce were pushed further and further up the Nile. The influx into Alexandria and Memphis of a crowd of Greek architects, artists, and artisans, could not fail to produce movement in that stream of art which had in Egypt long remained all but stagnant. . . . If we may trust the somewhat over-coloured and flighty panegyrics which have come down to us, the material progress of Egypt under Ptolemy Philadelphus was most wonderful. We read, though we cannot for a moment trust the figures of Appian, that in his reign Egypt possessed an army of 200,000 foot soldiers and 40,000 horsemen, 300 elephants and 2,000 chariots of war. The fleet at the same period is said to have included 1,500 large vessels, some of them with twenty or thirty banks of oars. Allowing for exaggeration, we must suppose that Egypt was then more powerful than it had been since the days of Rameses.”—P. Gardner, *New chapters in Greek history*, ch. 7.—See also ALEXANDRIA: B. C. 282-246; EDUCATION: Ancient; B. C. 3rd-A. D. 3rd centuries; RHODES, ISLAND OF: B. C. 304.

“It must suffice, therefore, to observe that the history of the Ptolemies falls into an imperial period of four reigns and one hundred and twenty years (323-203 B. C.); and a domestic period, likewise of one hundred and twenty years (200-80 B. C.), in which the native peoples, encouraged by the weakness of the Ptolemies abroad, and by a ruinous schism between the military and the civil elements of the foreign-resident population, gained point after point at the expense of the dynasty. A third period follows of fifty years’ duration, in which Egypt was at the mercy, not now of the Roman Senate, but of the all-powerful

generals, who had dethroned it.”—W. S. Ferguson, *Greek imperialism*, pp. 151-152.—“In the days of Hellenism, when every king desired to be regarded a member of the civilisation which lay around the Ægean, the Mesopotamian power moved its capital to Antioch, and so the great old struggle is now called the struggle of Syria and Egypt. In the days of the first Ptolemy the conflict was doubtful. He made conquests in Palestine, and lost them again, and it has been observed that it was as easy to hold Egypt by way of defence, as it was difficult to enlarge it by conquest. The second Ptolemy was a man of peace and of policy, who did perhaps more than his successors in conciliating the Jews and making them friends of Egypt rather than of Syria. . . . The third Ptolemy was a great conqueror, who dismembered for a moment the whole empire of Syria, conquered Antioch, held its seaport Seleucia with an Egyptian garrison, and then made a progress into the East second only to that of Alexander. . . . The fourth and fifth Ptolemies were a lamentable instance of decay in a great family. . . . So the tables were turned, and in the latter days Syria, with its active and mature rulers, was more than a match for the infants who succeeded to the Egyptian throne. . . . These later kings, though living at Alexandria as their capital, though patronizing Greek letters, and posing as Hellenistic kings, had fallen under the influence of the national reaction, and all built great temples wherein they appeared as the darlings of the Egyptian gods. . . . With the seventh and ninth Ptolemies the reaction goes even farther. It is with Philometer that we find Jews coming to high official positions and beginning to make themselves felt as politicians; and presently the strong Egyptian policy of Physcon, and consequent flight of the learned men from the Museum, gave Greek influence a shock from which it never recovered. The ninth Ptolemy even employed an Egyptian to govern Cyprus—an unheard-of thing in earlier days.—When the Romans came to deal with the people of Egypt, they found it a strange and essentially oriental country, which they never could understand or control after the manner of the really Hellenistic kingdoms.”—J. P. Mahaffy, *Progress of Hellenism in Alexander’s empire*, pp. 79-83.—See also GREECE: B. C. 3d century.

B. C. 239.—Decree passed by assembly of priests at Canopus. See CANOPUS, DECREE OF.

B. C. 80-48.—Strife among the Ptolemies.—Roman pretensions.—“The throne of Egypt being disputed, B. C. 80, between Cleopatra Berenice, who had seized it, and her step-son, Ptolemy Alexander, then in Rome, the latter bribed the Romans to support his claims by making a will in which he named the Roman Republic as his heir. The Senate, thereat, sent him to Alexandria with orders that Berenice should marry him and that they should reign jointly, as king and queen. The order was obeyed. The foully mated pair were wedded, and, nineteen days afterwards, the young king procured the death of his queen. The crime provoked an insurrection in which Ptolemy Alexander was slain by his own guard. This ended the legitimate line of the Ptolemies; but an illegitimate prince, usually called Auletes, or ‘the piper,’ was put on the throne, and he succeeded in holding it for twenty-four years.”—S. Sharpe, *History of Egypt*, ch. 11.—“Ptolemy XIII, surnamed Auletes, or the ‘flute player,’ was a son of Ptolemy X; he was born about 95 B. C., and he became king of Egypt about 80 B. C., and died in 51. The excessive taxation which he imposed made the Egyptians rise against him, and in 58 he fled

to Rome and claimed the protection of the Senate, saying that he had been expelled from Egypt. The Romans decided to restore to him his kingdom, but took no steps to give effect to their decision; he then departed from Rome to Ephesus, where he lived in the temple of Diana. Gabinius, governor of Syria, was induced to favour his claims, and after defeating the Egyptians in three battles he restored Ptolemy XIII to the throne (55 B. C.). During the latter years of his reign riots were frequent. He repaired several of the temples at Kom Ombo, Edfū, and Karnak, but undertook no great work. Ancient writers state that he was addicted to vice and debauchery, and all agree in giving him a very bad character. He was a skilled player on the flute, and competed with professionals for the prize at public concerts. He left his kingdom by will to his daughter Cleopatra and his son Ptolemy XIV, surnamed Dionysos, who was to marry his sister, and brother and sister were to reign together.—E. A. W. Budge, *Short history of the Egyptian people*, p. 157.

B. C. 48-30.—Civil war between Cleopatra and Ptolemy XIV.—Intervention of Cæsar.—Reign of Cleopatra.—Defeat and death of Antony and Cleopatra.—“In 48 Cleopatra and Ptolemy XIV quarrelled, and the former left the country. Cæsar sent troops to support Cleopatra's claims, and they defeated Ptolemy's forces with great slaughter; Ptolemy himself was drowned in crossing a river. In 47 Cleopatra married her second brother, aged eleven, and he reigned with her as Ptolemy XV for two years, when he was murdered by Cleopatra, who wished Ptolemy XVI or Cæsarion, her son by Julius Cæsar, to be her co-regent. Cleopatra was born about 69 B. C., and after the death of her father, Ptolemy XIII (Auletes), became virtually sole monarch of Egypt. She visited Rome with Cæsar and her son Cæsarion and Ptolemy XV, and stayed there until Cæsar was murdered, 44 B. C. In 41 Mark Antony demanded from her an explanation of the part she had taken in the recent war, but having been entertained by her at a sumptuous banquet he fell entirely under her influence, and obeyed all her commands. At length he proclaimed publicly that Cleopatra was queen of Egypt, and then the Romans declared war against her. The forces of Antony and Cleopatra were utterly defeated, and, seeing this, Antony stabbed himself with his sword, and died from the wound, and Cleopatra caused herself to be bitten by an asp, and died from the effects of its poison. Cleopatra is said to have been able to speak eight languages, and her love for literature and interest in learning are shown by the fact that she made Antony give her the Library of Pergamum, and then transferred the 200,000 rolls which it contained to the Library of Alexandria. Cleopatra built a small temple at Hermonthis (the modern Armant, a few miles to the south of Thebes), and decorated the wall of the small chamber attached to it with reliefs in which the birth and rearing of her son Cæsarion were represented. In these Cleopatra, under the form of Isis, is visited by Amon-Rā, who becomes the father of Cæsarion, just as he was of Amenhetep III and of Hâtshepset fourteen or fifteen centuries earlier. The object of these reliefs was to make the Egyptians believe that Cæsarion was a son of Amen-Rā, and therefore the legal heir to the throne. On the death of Cleopatra Egypt became a province of the Roman Empire, and was governed by Roman Prefects.”—E. A. W. Budge, *Short history of the Egyptian people*, pp. 157-158.—See also ALEXANDRIA: B. C. 48-47; LIBRARIES: Ancient: Alexandria; ROME: Republic:

B. C. 47-46; AFRICA: Ancient and medieval civilization: Roman occupation.

B. C. 30.—Organized as a Roman province.—After the battle of Actium and the death of Cleopatra, Egypt was reduced by Octavius to the rank of a Roman province and the dynasty of the Ptolemies extinguished. But Octavius “had no intention of giving to the senate the rich domain which he tore from its native rulers. He would not sow in a foreign soil the seeds of independence which he was intent upon crushing nearer home. . . . In due time he persuaded the senate and people to establish it as a principle, that Egypt should never be placed under the administration of any man of superior rank to the equestrian, and that no senator should be allowed even to visit it, without express permission from the supreme authority.”—C. Merivale, *History of the Romans*, ch. 29.—See also ROME: Empire: B. C. 31-A. D. 14.

296.—Revolt crushed by Diocletian. See ALEXANDRIA: 296.

616-628.—Conquest by Chosroes, the Persian.—The career of conquest pursued by Chosroes, the last Persian conqueror, extended even to Egypt, and beyond it. “Egypt itself, the only province which had been exempt since the time of Diocletian from foreign and domestic war, was again subdued by the successors of Cyrus. Pelusium, the key of that impervious country, was surprised by the cavalry of the Persians; they passed with impunity the innumerable channels of the Delta, and explored the long valley of the Nile from the pyramids of Memphis to the confines of Æthiopia. Alexandria might have been relieved by a naval force, but the archbishop and the præfect embarked for Cyprus; and Chosroes entered the second city of the empire, which still preserved a wealthy remnant of industry and commerce. His western trophy was erected, not on the walls of Carthage, but in the neighbourhood of Tripoli: the Greek colonies of Cyrene were finally extirpated.” By the peace concluded in 628, after the death of Chosroes, all of his conquests were restored to the empire and the cities of Syria and Egypt evacuated by their Persian garrisons.—E. Gibbon, *History of the decline and fall of the Roman empire*, ch. 46.—See also PERSIA: 226-627.

1250-1517.—Mameluke sultans.—The Mamelukes were a military body created by Saladin. “The word means slave (literally ‘the possessed’), and . . . they were brought in youth from northern countries to serve in the South. Saladin

himself was a Kurd, and long before his accession to power, Turkish and Kurdish mercenaries were employed by the Caliphs of Bagdad and Cairo, as the Pope employs Swiss. . . . Subsequently, however, Circassia became the country which most largely furnished this class of troops. Their apprenticeship was a long and laborious one: they were taught, first of all, to read the Koran and to write; then followed lance-exercise, during which time nobody was allowed to speak to them. At first they either resided in the castle, or were exercised living under tents; but after the time of Sultan Barkouk they were allowed to live in the town [Cairo], and the quarter now occupied by the Jews was at that time devoted to the Circassian Mamelukes. After this period they neglected their religious and warlike exercises, and became degenerate and corrupt. . . . The dynasty of Saladin . . . was of no duration, and ended in 648 A. H., or 1250 of the Christian era. Then began the so-called Bahrite Sultans, in consequence of the Mamelukes of the sultan Negm-ed-din having lodged in Rodah, the Island in the Nile (Bahr-en-Nil). The intriguer of the period was Sheger-ed-dur, the widow of the monarch, who married one of the Mamelukes, Moez-eddin-aibek-el-Turcomany, who became the first of these Bahrite Sultans, and was himself murdered in the Castle of Cairo through this woman. . . . Their subsequent history, until the conquest of Egypt by Sultan Selim in 1517, presents nothing but a series of acts of lust, murder and rapine. So rapidly did they expel each other from power, that the average reign of each did not exceed five or six years . . . The 'fleeting purple' of the decline and fall of the Roman Empire is the spectacle which these Mameluke Dynasties constantly present."—A. A. Paton, *History of the Egyptian revolution*, v. 1, ch. 3-5. See also CALIPHATE: 1262-1543.

1517-1798.—Rule of the Mamluk Beys.—"After the capture of Cairo by Sultān Selim in 1517 the military affairs of Egypt and of Nubia as far as the Third Cataract were managed by twenty-four Mamlūk Beys, whose actions were supposed to be controlled by a Pāshā and a council of seven high officers of state. The principal military appointment was that of Governor of Cairo, or 'Shēkh al-Balad,' which at first was given to the ablest man among the twenty-four Beys. The country remained in a comparatively peaceful state until about 1700, when it was found that Bey after Bey throughout the land intrigued to obtain the governorship of Cairo, and that many murders took place as the result of their endeavours. By this time, too, the power of the Pāshā of Egypt had become purely nominal, and the Beys, headed by the Shēkh al-Balad, were to all intents and purposes masters of the Turkish province of Egypt and Northern Nubia. In 1763 the famous 'Alī Bey became Shēkh al-Balad. In 1768 he rebelled against the Sultān of Turkey, and succeeded in persuading the Council of Seven to drive out the Pāshā and to declare Egypt independent. In 1772 Muhammad Abū of Dhāhab and of 'Alī Bey's generals, rebelled against him, and was declared Shēkh al-Balad; he was subsequently made Pāshā of Egypt by the Sultān. After his death the supreme power was eventually shared by

Ismā'il Bey and Murād Bey, but in 1785 the Sultān despatched Hasan, his Lord High Admiral, to crush their authority and to make them pay the annual tribute. After a successful battle Hasan took Cairo, and chased Ismā'il and Murād into Upper Egypt, where a fierce fight between the two forces took place. Hasan was, however, obliged to withdraw on account of the war which broke out between Turkey and Russia, and Ismā'il returned to Egypt and was made Shēkh al-Balad. He died in the year of the terrible plague, 1790. In May, 1798, the French Expedition under General Bonaparte arrived in Egypt, and on July 5th Alexandria fell."—E. A. W. Budge, *Egyptian Sudan, its history and monuments*, pp. 200-210.

1803-1811.—Rise of Mehemet Ali to power.—Tracherous destruction of the Mamelukes.—"It was during the French occupation that Mohammad 'Alī [Mehemet Ali] came on the scene. He was born in 1768 at the Albanian port of Kaballa, and by the patronage of the governor was sent to Egypt in 1801 with the contingent of troops furnished by Kaballa to the Ottoman army then operating with the English against the French. He rapidly rose to the command of the Arnaut or Albanian section of the Turkish army, and soon found himself an important factor in the confused political position which followed the departure of the British army. The Memluk Beys had not been restored to their former posts as provincial governors, and were consequently ripe for revolt against the Porte; but their party was weakened by the rivalry of its two leaders, El-Elfy and El-Bardisy, who divided their followers into two hostile camps. On the other hand, the Turkish Pasha appointed by the Porte had not yet gained a firm grip of the country, and was perpetually apprehensive of a recall to Constantinople. Mohammad 'Alī at the head of his Albanians was an important ally for either side to secure, and he fully appreciated his position. He played off one party against the other, the Pasha against the Beys, so successfully, that he not only weakened both sides, but made the people of Cairo, who were disgusted with the anarchy of Memluk and Turk alike, his firm friends; and at last suffered himself, with becoming hesitation, to be persuaded by the entreaty of the populace to become [1805] their ruler, and thus stepped to the supreme power in the curious guise of the people's friend. A fearful time followed Mohammad 'Alī's election—for such it was—to the governorship of Egypt. The Turkish Pasha, Khurshid, held the citadel, and Mohammad 'Alī, energetically aided by the people of Cairo, laid siege to it. From the minaret of the mosque of Sultan Hasan, and from the heights of Mukattam, the besiegers poured their fire into the citadel, and Khurshid replied with an indiscrimi-

nate cannonade upon the city. The firing went on for weeks (pausing on Fridays), till a messenger arrived from Constantinople bringing the confirmation of the popular vote, in the form of a firman, appointing Mohammad 'Aly governor of Egypt. Khurshid shortly afterwards retired, and the soldiery amused themselves in the approved Turkish and (even worse) Albanian fashion by making havoc of the houses of the citizens. Mohammad 'Aly now possessed the title of Governor of Egypt, but beyond the walls of Cairo his authority was everywhere disputed by the Beys. . . . An attempt was made to ensnare certain of the Beys, who were encamped north of the metropolis. On the 17th of August, 1805, the dam of the canal of Cairo was to be cut, and some chiefs of Mohammad 'Aly's party wrote informing them that he would go forth early on that morning with most of his troops to witness the ceremony, inviting them to enter and seize the city, and, to deceive them, stipulating for a certain sum of money as a reward. The dam, however, was cut early in the preceding night, without any ceremony. On the following morning these Beys, with their Memlukes, a very numerous body, broke open the gate of the suburb El-Hoseyniyeh, and gained admittance into the city. . . . They marched along the principal street for some distance, with kettle-drums behind each company, and were received with apparent joy by the citizens. At the mosque called the Ashrafiyeh they separated, one party proceeding to the Azhar and the houses of certain sheykhs, and the other party continuing along the main street, and through the gate called Bab-Zuweyleh, where they turned up towards the citadel. Here they were fired on by some soldiers from the houses; and with this signal a terrible massacre commenced. Falling back towards their companions, they found the by-streets closed; and in that part of the main thoroughfare called Beyn-el-Kasreyn, they were suddenly placed between two fires. Thus shut up in a narrow street, some sought refuge in the collegiate mosque of the Barkukiyeh, while the remainder fought their way through their enemies, and escaped over the city wall with the loss of their horses. Two Memlukes had in the meantime succeeded, by great exertions, in giving the alarm to their comrades in the quarter of the Azhar, who escaped by the eastern gate called Bab-el-Ghureyyib. A horrible fate awaited those who had shut themselves up in the Barkukiyeh. Having begged for quarter and surrendered, they were immediately stripped nearly naked, and about fifty were slaughtered on the spot; and about the same number were dragged away. . . . The wretched captives were then chained and left in the court of the Pasha's house; and on the following morning the heads of their comrades, who had perished the day before, were skinned and stuffed with straw before their eyes. One Bey and two other men paid their ransom, and were released; the rest, without exception, were tortured, and put to death in the course of the ensuing night. . . . The Beys were disheartened by this revolting butchery, and most of them retired to the upper country. Urged by England, or more probably by the promise of a bribe from El-Elfy, the Porte began a leisurely interference in favour of the Memlukes; but the failure of El-Elfy's treasury, and a handsome bribe from Mohammad 'Aly, soon changed the Sultan's views, and the Turkish fleet sailed away. . . . An attempt of the English Government to restore the Memlukes by the action of a force of 5,000 men under General Fraser ended in disaster and humilia-

tion, and the citizens of Cairo had the satisfaction of seeing the heads of Englishmen exposed on stakes in the Ezbekiyeh. Mohammad 'Aly now adopted a more conciliatory policy towards the Memlukes, granted them land, and encouraged them to return to Cairo. The clemency was only assumed in order to prepare the way for the act of consummate treachery which finally uprooted the Memluk power. . . . Early in the year 1811, the preparations for an expedition against the Wahhabis in Arabia being complete, all the Memluk Beys then in Cairo were invited to the ceremony of investing Mohammad 'Aly's favourite son, Tusun, with a pelisse and the command of the army. As on the former occasion, the unfortunate Memlukes fell into the snare. On the 1st of March, Shahin Bey and the other chiefs (one only excepted) repaired with their retinues to the citadel, and were courteously received by the Pasha. Having taken coffee, they formed in procession, and, preceded and followed by the Pasha's troops, slowly descended the steep and narrow road leading to the great gate of the citadel; but as soon as the Memlukes arrived at the gate it was suddenly closed before them. The last of those who made their exit before the gate was shut were Albanians under Salih Kush. To those troops their chief now made known the Pasha's orders to massacre all the Memlukes within the citadel; therefore having returned by another way, they gained the summit of the walls and houses, that hem in the road in which the Memlukes were, and some stationed themselves upon the eminences of the rock through which that road is partly cut. Thus securely placed, they commenced a heavy fire on their defenceless victims, and immediately the troops who closed the procession, and who had the advantage of higher ground, followed their example. . . . 470 Memlukes entered the citadel, and of these very few, if any, escaped. One of these is said to have been a Bey. According to some, he leaped his horse from the ramparts, and alighted uninjured, though the horse was killed by the fall. Others say that he was prevented from joining his comrades, and discovered the treachery while waiting without the gate. He fled and made his way to Syria. This massacre was the signal for an indiscriminate slaughter of the Memlukes throughout Egypt, orders to this effect being transmitted to every governor; and in Cairo itself, the houses of the Beys were given over to the soldiery, who slaughtered all their adherents, treated their women in the most shameless manner, and sacked their dwellings. . . . The last of his rivals being now destroyed, Mohammad 'Aly was free to organize the administration of the country, and to engage in expeditions abroad."—S Lane-Poole, *Egypt*, ch. 8.

1840-1869.—Mehemet Ali and his successors.—Khedives.—Opening of the Suez canal.—“By the treaty of 1840 between the Porte and the European Powers, . . . his title to Egypt having been . . . affirmed . . . Mehemet Ali devoted himself during the next seven years to the social and material improvement of the country, with an aggregate of results which has fixed his place in history as the ‘Peter the Great’ of Egypt. Indeed,

except some additions and further reforms made during the reign of his reputed grandson, Ismail Pasha, the whole administrative system, up till [1883], was, in the main, his work; and notwithstanding many admitted defects, it was at his death incomparably the most civilised and efficient of then existing Mussulman Governments. In 1848, this great satrap, then verging on his eightieth year, was attacked by a mental malady, induced, as it was said, by a potion administered in mistaken kindness by one of his own daughters, and the government was taken over by his adopted son, Ibrahim Pasha, the hero of Koniah and Nezib. He lingered till August, 1849, but Ibrahim had already predeceased him; and Abbas, a son of the latter, succeeded to the viceregal throne. Though born and bred in Egypt, Abbas was a Turk of the worst type—ignorant, cowardly, sensual, fanatic, and opposed to reforms of every sort. Thus his feeble reign of less than six years was, in almost everything, a period of retrogression. On a night in July, 1854, he was strangled in his sleep by a couple of his own slaves,—acting, it was variously said, on a secret order from Constantinople, or at the behest of one of his wives. To Abbas succeeded Said, the third son of Mehemet Ali, an amiable and liberal-minded prince who retrieved much of the mischief done by his predecessor, but lacked the vigorous intelligence and force of character required to carry on the great work begun by his father. His reign will be chiefly memorable for the concession and commencement of the Suez Canal, the colossal work which, while benefiting the trade of the world, has cost so much to Egypt. [See CANALS: Asiatic: Suez Canal.] Said died in January, 1863, and was succeeded by his nephew Ismail Pasha, the second son of Ibrahim. As most of the leading incidents of this Prince's reign, as also the chief features of his character, are still fresh in the public memory, I need merely recall a few of the more salient of both. Amongst the former, history will give the first place to his creation of the huge public debt which forms the main element of a problem that still confronts Europe. But, for this the same impartial judge will at least equally blame the financial panderers who ministered to his extravagance, with exorbitant profit to themselves, but at ruinous cost to Egypt. On the other hand, it is but historical justice to say that Ismail did much for the material progress of the country. He added more than 1,000 to the 200 miles of railway in existence at the death of Said. He greatly improved the irrigation, and so increased the cultivable area of the country; multiplied the primary schools, and encouraged native industries. For so much, at least, history will give him credit. As memorable, though less meritorious, were the magnificent fetes with which, in 1869, he opened the Suez Canal, the great work which England had so long opposed, but through which—as if by the irony of history—the first ship that passed flew the English flag. . . . In personal character, Ismail was of exceptional intelligence, but cruel, crafty, and untrustworthy both in politics and in his private relations. . . . It may be mentioned that Ismail Pasha was the first of these Ottoman Viceroys who bore the title of 'Khedive,' which is a Perso-Arabic designation signifying rank a shade less than regal. This he obtained in 1867 by heavy bribes to the Sultan and his chief ministers, as he had the year before by similar means ousted his brother and uncle from the succession, and secured it for his own eldest son."—J. C. McCoan, *Egypt (National Life and Thought, lect. 18)*.

1854.—Beginning of missionary work. See MISSIONS, CHRISTIAN: Near East.

1870-1883.—Conquest of the Sudan.—Measures for suppression of slave-trade.—Government of General Gordon.—Advent of the Mahdi and beginning of his revolt.—In 1870, Ismail Pasha "made an appeal for European assistance to strengthen him in completing the conquest of Central Africa. [Sir Samuel] Baker was accordingly placed in command of 1,200 men, supplied with cannon and steam-boats, and received the title of Governour-General of the provinces which he was commissioned to subdue. Having elected to make Gondokoro the seat of his government, he changed its name to Ismailia. He was not long in bringing the Bari to submission, and then, advancing southwards, he came to the districts of Dufilé and Fatiko, a healthy region endowed by nature with fertile valleys and irrigated by limpid streams, but for years past converted into a sort of hell upon earth by the slave-hunters who had made it their headquarters. From these pests Baker delivered the locality, and having by his tact and energy overcome the distrust of the native rulers, he established over their territory a certain number of small military settlements. . . . Baker returned to Europe flattering himself with the delusion that he had put an end to the scourge of slave dealing. It was true that various slave-dealers' dens on the Upper Nile had been destroyed, a number of outlaws had been shot, and a few thousand miserable slaves had been set at liberty; but beyond that nothing had been accomplished; no sooner had the liberator turned his back than the odious traffic recommenced with more vigour than before through the region south of Gondokoro. This, however, was only one of the slave-hunting districts, and by no means the worst. . . . Under European compulsion . . . the Khedive Ismail undertook to promote measures to put a stop to the scandal. He entered into various conventions with England on the subject; and in order to convince the Powers of the sincerity of his intentions, he consented to put the equatorial provinces under the administration of an European officer, who should be commissioned to carry on the work of repression, conquest and organisation that had been commenced by Baker. His choice fell upon a man of exceptional ability, a brilliant officer trained at Woolwich, who had already gained high renown in China, not only for military talent, but for his adroitness and skill in negotiation and diplomacy. This was Colonel Gordon, familiarly known as 'Chinese Gordon,' who was now to add fresh lustre to his name in Egypt as Gordon Pasha. Gordon was appointed Governour-General of the Soudan in 1874. With him were associated Challé-Long, an American officer, who was chief of his staff; the German, Emin [Pasha, whose name was Dr. Eduard Schnitzer], medical officer to the expedition; Lieutenants Chippendall and Watson; Gessi [Pasha, an Italian], and Kemp, engineers. . . . Thenceforward the territories, of which so little had hitherto been known, became the continual scene of military movements and scientific excursions. . . . The Soudan was so far conquered as to be held by about a dozen military outposts stationed along the Nile from Lake No to Lakes Albert and Ibrahim. . . . In 1876 Gordon went back to Cairo. Nevertheless, although he was wearied with the continual struggle of the past two years, worn down by the incessant labours of internal organisation and geographical investigations, disheartened, too, by the jealousies, rivalries,

and intrigues of all around him, and by the ill feeling of the very people whom the Khedive's Government had sent to support him, he consented to return again to his post; this time with the title of Governour-General of the Soudan, Darfur, and the Equatorial Provinces. At the beginning of 1877 he took possession of the Government palace at Khartoum. . . . Egyptian authority, allied with European civilisation, appeared now at length to be taking some hold on the various districts, and the Cairo Government might begin to look forward to a time when it could reckon on some reward for its labours and sacrifices. The area of the new Egyptian Soudan had now become immense. Geographically, its centre included the entire valley of the Nile proper, from Berber to the great lakes; on the east were such portions of the valleys of the Blue Nile and Atbara as lay outside Abyssinia; and on the west were the districts watered by the Bahr-el-Ghazal, and the Bahr-el-Arab, right away to the confines of Wadai. . . . Unfortunately in 1879 Ismail Pasha was deposed, and, to the grievous loss of the Soudan, Gordon was recalled. As the immediate consequence, the country fell back into the hands of Turkish pashas; apathy, disorder, carelessness, and ill feeling reappeared at Khartoum, and the Arab slave-dealers, who had for a period been kept under by Baker, Gessi, and Gordon, came once more to the front. . . . It was Raouf Pasha who, in 1879, succeeded Gordon as Governour-General. He had three Europeans as his subordinates—Emin Bey, who before Gordon left, had been placed in charge of the province of the equator; Lupton Bey, an Englishman, who had followed Gessi as Governour on the Bahr-el-Ghazal; and Slatin Bey, an Austrian, in command of Darfur. Raouf had barely been two years at Khartoum when the Mahdi appeared on the scene. Prompted either by personal ambition or by religious hatred, the idea of playing the part of 'Mahdi' had been acted upon by many an Arab fanatic. Such an idea, at an early age, had taken possession of a certain Soudanese of low birth, a native of Dongola, by name Mohammed Ahmed. Before openly aspiring to the rôle of the regenerator of Islam he had filled several subordinate engagements, notably one under Dr. Peney, the French surgeon-general in the Soudan, who died in 1861. Shortly afterwards he received admittance into the powerful order of the Ghelani dervishes, and then commenced his schemes for stirring up a revolution in defence of his creed. His proceedings did not fail to attract the attention of Gessi Pasha, who had him arrested at Shekka and imprisoned for five months. Under the government of Raouf he took up his abode upon the small islands of Abba, on the Nile above Khartoum, where he gained a considerable notoriety by the austerity of his life and by the fervour of his devotions, thus gradually gaining a high reputation for sanctity. Not only offerings but followers streamed in from every quarter. He became rich as well as powerful. . . . Waiting till May, 1881, he then assumed that a propitious time had arrived for the realisation of his plans, and accordingly had himself publicly proclaimed as 'Mahdi,' inviting every fakir and every religious leader of Islam to come and join him at Abba. . . . Convinced that it was impolitic to tolerate any longer the revolutionary intrigues of such an adventurer at the very gates of Khartoum, Raouf Pasha resolved to rid the country of Mohammed and to send him to Cairo for trial. An expedition was accordingly despatched to the island of Abba, but unfortunately the means employed were inadequate to the task. Only a small

body of black soldiers were sent to arrest the agitator in his quarters, and they, inspired no doubt by a vague and superstitious dread of a man who represented himself as the messenger of Allah, wavered and acted with indecision. Before their officers could rally them to energy, the Mahdi, with a fierce train of followers, knife in hand, rushed upon them, and killing many, put the rest to flight; then, seeing that a renewed assault was likely to be made, he withdrew the insurgent band into a retreat of safety amongst the mountains of Southern Kordofan. Henceforth revolt was openly declared. Such was the condition of things in August, 1881. Chase was given, but every effort to secure the person of the pretended prophet was baffled. A further attempt was made to arrest him by the Mudir of Fashoda with 1,500 men, only to be attended with a still more melancholy result. After a desperate struggle the Mudir lay stretched upon the ground, his soldiers murdered all around him. One single officer, with a few straggling cavalry, escaped the massacre, and returned to report the fatal news. The reverse caused an absolute panic in Khartoum, an intense excitement spreading throughout the Soudan. . . . Meantime the Mahdi's prestige was ever on the increase, and he soon felt sufficiently strong to assume the offensive. His troops overran Kordofan and Sennar, advancing on the one hand to the town of Sennar, which they set on fire, and on the other to El-Obeid, which they placed in a state of siege. In the following July a fresh and more powerful expedition, this time numbering 6,000 men, under the command of Yussuf Pasha left Fashoda and made towards the Mahdi's headquarters. It met with no better fate than the expeditions that had gone before. . . . And then it was that the English Government, discerning danger for Egypt in this insurrection of Islam, set to work to act for the Khedive. It told off 11,000 men, and placed them under the command of Hicks Pasha, an officer in the Egyptian service who had made the Abyssinian campaign. At the end of December, 1882, this expedition embarked at Suez for Suakin, crossed the desert, reached the Nile at Berber, and after much endurance on the way, arrived at Khartoum. Before this, El-Obeid had fallen into the Mahdi's power, and there he had taken up his headquarters. Some trifling advantages were gained by Hicks, but having entered Kordofan with the design of retaking El-Obeid, he was, on the 5th of November, 1883, hemmed in amongst the Kasgil passes, and after three days' heroic fighting, his army of about 10,000 men was overpowered by a force five or six times their superior in numbers, and completely exterminated. Hicks Pasha himself, his European staff, and many Egyptian officers of high rank, were among the dead, and forty-two guns fell into the hands of the enemy. Again, not a man was left to carry the fatal tidings to Khartoum. Rebellion continued to spread. After being agitated for months, the population of the Eastern Soudan also made a rising. Osman Digna, the foremost of the Mahdi's lieutenants, occupied the road between Suakin and Berber, and surrounded Sinkat and Tokar; then, having destroyed, one after another, two Egyptian columns that had been despatched for the relief of these towns, he finally cut off the communication between Khartoum and the Red Sea. The tide of insurrection by this time had risen so high that it threatened not only to overthrow the Khedive's authority in the Soudan, but to become the source of serious peril to Egypt itself."—A. 1875-1882.—Bankruptcy of the state.—English and French control of finances.—Native hostility to the foreigners.—Rebellion, led by Arabi.—English bombardment of Alexandria.—“The facilities given by foreign money-lenders encouraged extravagance and ostentation on the part of the sovereign and the ruling classes, while mismanagement and corrupt practices were common among officials, so that the public debt rose in 1875 to ninety-one millions, and in January, 1881, to ninety-eight millions. . . . The European capitalists obtained for their money nominally six to nine per cent., but really not less than eight to ten per cent., as the bonds were issued at low rates. . . . The interest on these borrowed millions was punctually paid up to the end of 1875, when the Khedive found that he could not satisfy his creditors, and the British government interfered in his favour. Mr. Cave was sent to examine into Egyptian finances, and he reported that loans at twelve and thirteen per cent. were being agreed to and renewed at twenty-five per cent., and that some measure of consolidation was necessary. The two western Powers now took the matter in hand, but they thereby recognized the whole of these usurious demands. The debt, although under their control, and therefore secured, was not reduced by the amount already paid in premiums for risk. Nor was the rate of interest diminished to something more nearly approaching the rate payable on English consols, which was three per cent. A tribunal under the jurisdiction of united European and native judges was also established in Egypt to decide complaints of foreigners against natives, and vice versa. In May, 1876, this tribunal gave judgment that the income of the Khedive Ismail, from his private landed property, could be appropriated to pay the creditors of the state, and an execution was put into the Viceroyal palace, Er Ramleh, near Alexandria. The Khedive pronounced the judgment invalid, and the tribunal ceased to act. Two commissioners were now again sent to report on Egyptian finances—M. Joubert, the director of the Paris Bank, for France, and Mr. Goschen, a former minister, for England. These gentlemen proposed to hand over the control of the finances to two Europeans, depriving the state of all independence and governing power. The Khedive, in order to resist these demands, convoked a sort of Parliament in order to make an appeal to the people. From this Parliament was afterwards developed the Assembly of Notables, and the National party. . . . In 1877 a European commission of control over Egyptian finance was named. . . . Nubar Pasha was made Prime minister in 1878; the control of the finances was entrusted to Mr. Wilson, an Englishman; and later, the French controller, M. de Blignières, entered the Cabinet. [An enquiry was instituted into the finances during the summer, and exposed the rottenness of Ismail Pasha's fiscal policy.] Better order was thus restored to the finances. Rothschild's new loan of eight and a half millions was issued at seventy-three, and therefore brought in from six to eight per cent. net. . . . But to be able to pay the creditors their full interest, economy had to be introduced into the national expenditure. To do this, clumsy arrangements were made, and the injustice shown in carrying them out embittered many classes of the population, and

laid the foundations of a fanatical hatred of race against race. . . . In consequence of all this, the majority of the notables, many ulemas, officers, and higher officials among the Egyptians, formed themselves into a National party, with the object of resisting the oppressive government of the foreigner. They were joined by the great mass of the discharged soldiers and subordinate officials, not to mention many others. At the end of February, 1879, a revolt broke out in Cairo. Nubar, hated by the National party, was dismissed by the Khedive Ismail, who installed his son Tewfik as Prime minister. In consequence of this, the coupons due in April were not paid till the beginning of May, and the western Powers demanded the reinstatement of Nubar. That Tewfik on this occasion retired and sided with the foreigners . . . [was] the chief cause of his . . . [later] unpopularity in Egypt. Ismail, however, now dismissed Wilson and De Blignières, and a Cabinet was formed, consisting chiefly of native Egyptians, with Sherif Pasha as Prime minister. Sherif now raised for the first time the cry of which we have since heard so much, and which was inscribed by Arabi on his banners, 'Egypt for the Egyptians.' The western Powers, retorted by a menacing naval demonstration, and demanded of the Sultan the deposition of the Khedive. In June, 1879, this demand was agreed to. Ismail went into exile, and his place was filled by Mahomed Tewfik. . . . The new Khedive, with apathetic weakness, yielded the reconstruction of his ministry and the organization of his finances to the western Powers. Mr. Baring and M. de Blignières, as commissioners of the control, aided by officials named by Rothschild to watch over his private interests, now ruled the land.”—H. Vogt, *Egyptian War of 1882, pp. 2-3.*—“The grip of the control on Egyptian finances was now no sham, but grim reality. . . . Profiting by the knowledge which they had acquired in the Enquiry of 1878, the Comptrollers set foot a variety of reforms, procured the abolition of certain vexatious taxes, and prepared the ground for the International Commission of Liquidation, which sat in the summer of 1880 to arrange the settlement of the debt which Ismail Pasha had bequeathed to his country, and to provide for the future of the Egyptian finances.”—A. Colvin, *Making of modern Egypt, p. 23.*—“They devoted forty-five millions (about sixteen shillings per head on the entire population) to the payment of interest. The people were embittered by the distrust shown towards them, and the further reduction of the army from fifty to fifteen thousand men threw a large number out of employment. . . . Many acts of military insubordination occurred, and at last, on the 8th of November, 1881, the great military revolt broke out in Cairo. . . . Ahmed Arabi, colonel of the 4th regiment, now first came into public notice. Several regiments, headed by their officers, openly rebelled against the orders of the Khedive, who was compelled to recall the nationalist, Sherif Pasha, and to refer the further demands of the rebels for the increase of the army, and for a constitution, to the Sultan. Sherif Pasha, however, did not long enjoy the confidence of the National Egyptian party, at whose head Arabi now stood, winning every day more reputation and influence. The army, in which he permitted great laxity of discipline, was entirely devoted to him. . . . A pretended plot of Circassian officers against his life he dexterously used to increase his popularity. . . . Twenty-six officers were condemned to death by court-martial, but the Khedive, at the instance of the western Powers, commuted the

sentence, and they were banished to Constantinople. This leniency was stigmatized by the National party as treachery to the country, and the Chamber of Notables retorted by naming Arabi commander-in-chief of the army and Prime minister without asking the consent of the Khedive. The Chamber soon afterwards came into conflict with the foreign comptrollers. . . . This ended in De Blignières resigning his post, and in the May of 1882 the consuls of the European Powers declared that a fleet of English and French ironclads would appear before Alexandria, to demand the disbanding of the army and the punishment of its leaders. The threat was realized, and, in spite of protests from the Sultan, a fleet of English and French ironclads entered the harbour of Alexandria. The Khedive, at the advice of his ministers and the chiefs of the National party, appealed to the Sultan. . . . The popular hatred of foreigners now became more and more apparent, and began to assume threatening dimensions. . . . On the 30th of May, Arabi announced that a despatch from the Sultan had reached him, promising the deposition of Tewfik in favour of his uncle Halim Pasha. . . . On the 3rd of June, Dervish Pasha, a man of energy notwithstanding his years, had sailed from Constantinople. . . . His object was to pacify Egypt and to reconcile Tewfik and Arabi Pasha. . . . Since the publication of the despatch purporting to proclaim Halim Pasha as Khedive, Arabi had done nothing towards dethroning the actual ruler. But on the 2nd of June he began to strengthen the fortifications of Alexandria with earthworks. . . . The British admiral protested, and the Sultan, on the remonstrances of British diplomacy, forbade the continuation of the works. . . . Serious disturbances took place in Alexandria on the 11th. The native rabble invaded the European quarter, plundered the shops, and slew many foreigners. . . . Though the disturbances were not renewed, a general emigration of foreigners was the result. . . . On the 22nd a commission, consisting of nine natives and nine Europeans . . . began to try the ringleaders of the riot. . . . But events were hurrying on towards war. The works at Alexandria were recommenced, and the fortifications armed with heavy guns. The English admiral [Sir Frederick B. P. Seymour, afterwards Lord Alcester] received information that the entrance to the harbour would be blocked by sunken storeships, and this, he declared, would be an act of open war. A complete scheme for the destruction of the Suez canal was also discovered. . . . The English, on their side, now began to make hostile demonstrations; and Arabi, while repudiating warlike intentions, declared himself ready for resistance. . . . On the 27th the English vice-consul advised his fellow-countrymen to leave Alexandria, and on the 3rd of July, according to the 'Times,' the arrangements for war were complete. . . . Finally, as a reconnaissance on the 9th showed that the forts were still being strengthened, he [the English admiral] informed the governor of Alexandria, Zulficar Pasha, that unless the forts had been previously evacuated and surrendered to the English, he intended to commence the bombardment at four the next morning. . . . As the French government were unable to take part in any active measures (a grant for that purpose having been refused by the National Assembly), the greater part of their fleet, under Admiral Conrad, left Alexandria for Port Said. The ironclads of other nations, more than fifty in number, anchored outside the harbour of Alexandria. . . . On the evening of the 10th of July . . . and at daybreak on the 11th,

the . . . ironclads took up the positions assigned to them. There was a gentle breeze from the east, and the weather was clear. At 6.30 a. m. all the ships were cleared for action. At seven the admiral signalled to the Alexandria to fire a shell into Fort Ada. . . . The first shot fired from the Alexandria was immediately replied to by the Egyptians; whereupon the ships of the whole fleet and the Egyptian forts and batteries opened fire, and the engagement became general. . . . At 8.30 Fort Marsa-el-Kanet was blown up by shells from the Invincible and Monarch, and by nine o'clock the Téméraire, Monarch, and Penelope had silenced most of the guns in Fort Meks, although four defied every effort from their protected situation. By 11.45 Forts Marabout and Adjemi had ceased firing, and a landing party of seamen and marines was despatched, under cover of the Bittern's guns, to spike and blow up the guns in the forts. At 1.30 a shell from the Superb burst in the chief powder magazine of Fort Ada and blew it up. By four o'clock all the guns of Fort Pharos, and half an hour later those of Fort Meks, were disabled, and at 5.30 the admiral ordered the firing to cease. The ships were repeatedly struck and sustained some damage. . . . The English casualties were five killed and twenty-eight wounded, a comparatively small loss. The Egyptian loss is not known. . . . At 1 p. m. on the 12th of July, the white flag was hoisted by the Egyptians. Admiral Seymour demanded, as a preliminary measure, the surrender of the forts commanding the entrance to the harbour, and the negotiations on this point were fruitlessly protracted for some hours. As night approached the city was seen to be on fire in many places, and the flames were spreading in all directions. The English now became aware that the white flag had merely been used as means to gain time for a hasty evacuation of Alexandria by Arabi and his army. Sailors and marines were now landed, and ships of other nations sent detachments on shore to protect their countrymen. But it was too late; Bedouins, convicts, and ill-disciplined soldiers had plundered and burnt the European quarter, killed many foreigners, and a Reuter's telegram of the 14th said, 'Alexandria is completely destroyed.'—H. Vogt, *Egyptian War of 1882*, pp. 2-32.—The bombardment was directed only against the forts, and not the city. "Arabi Pasha and his troops withdrew into fortified positions in the interior, leaving Alexandria in flames."—A. Colvin, *Making of modern Egypt*.—The rising undoubtedly contained the germs of an Egyptian national movement, but Arabi was not the man to direct it aright. The massacre of Europeans at Alexandria is not now thought to have been committed at his instigation, and there is also a disposition to acquit him of complicity in the burning of the city after the bombardment of the forts. France, owing to the fall of Gambetta, had declined to join in the operations, and thenceforward Great Britain pursued her task in Egypt alone.

1882-1883.—Massacre and destruction in Alexandria.—Declared rebellion of Arabi.—Suppression by the English.—Banishment of Arabi.—English occupation.—The city of Alexandria had become "such a scene of pillage, massacre, and wanton destruction as to make the world

shudder. It was the old tale of horrors. Houses were plundered and burned; the European quarter, including the stately buildings surrounding the Great Square of Mehemet Ali, was sacked and left a heap of smoldering ruins; and more than two thousand Europeans, for the most part Levantines, were massacred with all the cruelty of oriental fanaticism. This was on the afternoon of the 12th. It was the second massacre that had occurred under the very eyes of the British fleet. The admiral's failure to prevent it has been called unfortunate by some and criminal by others. It seems to have been wholly without excuse. . . . The blue-jackets were landed on the 13th, and cleared the way before them with a Gatling gun. The next day, more ships having arrived, a sufficient force was landed to take possession of the entire city. The khedive was escorted back to Ras-el-Tin from Rameh, and given a strong guard. Summary justice was dealt out to all hostile Arabs who had been captured in the city. In short, English intervention was followed by English occupation. The bombardment of Alexandria had defined clearly the respective positions of Arabi and the khedive toward Egypt and the Egyptian people. . . . The khedive was not only weak in the eyes of his people, but he was regarded as the tool of England. . . . From the moment the first shot was fired upon Alexandria, Arabi was the real ruler of the people. . . . The conference at Constantinople was stirred by the news of the bombardment of Alexandria. It presented a note to the Porte, July 15, requesting the dispatch of Turkish troops to restore the status quo in Egypt. But the sultan had no idea of taking the part of the Christian in what all Islam regarded as a contest between the Moslem and the unbeliever. . . . In Egypt, the khedive had been prevailed upon, after some demur, to proclaim Arabi a rebel and discharge him from his cabinet. Arabi had issued a counter-proclamation, on the same day, declaring Tewfik a traitor to his people and his religion. Having received the news of the khedive's proclamation, Lord Dufferin, the British ambassador at Constantinople, announced to the conference that England was about to send an expedition to Egypt to suppress the rebellion and to restore the authority of the khedive. Thereupon the sultan declared that he had decided to send a Turkish expedition. Lord Dufferin feigned to accept the sultan's co-operation, but demanded that the Porte, as a preliminary step, should declare Arabi a rebel. Again the sultan was confronted with the danger of incurring the wrath of the Moslem world. He could not declare Arabi a rebel. . . . In his desperation he sent a force of 3,000 men to Suda bay with orders to hold themselves in readiness to enter Egypt at a moment's notice. . . . In the meantime, however, the English expedition had arrived in Egypt and was proceeding to crush the rebellion, regardless of the diplomatic delays and bickerings at Constantinople. . . . It was not until the 15th of August that Sir Garnet Wolseley arrived with his force in Egypt. The English at that time held only two points, Alexandria and Suez, which the entire Egyptian interior, as well as Port Said and Ismailia, were held by Arabi, whose force, it was estimated, now amounted to about 70,000 men, of whom at least 50,000 were regulars. The objective point of General Wolseley's expedition to crush Arabi was, of course, the city of Cairo. There were two ways of approaching that city, one from Alexandria, through the Delta, and the other from the Suez canal. There were many objections to the former route. . . . The Suez canal

was supposed to be neutral water. . . . But England felt no obligation to recognize any neutrality, . . . acting upon the principle, which is doubtless sound, that 'the neutrality of any canal joining the waters of the Atlantic and Pacific oceans will be maintained, if at all, by the nation which can place and keep the strongest ships at each extremity.' In other words, General Wolseley decided to enter Cairo by way of the Suez canal and Ismailia. But he kept his plan a profound secret. Admiral Seymour alone knew his purpose. . . . On the 10th, the transports moved eastward from Alexandria, as if to attack Abukir; but under the cover of darkness that night, they were escorted on to Port Said, where they learned that the entire canal, owing to the preconcerted action of Admiral Seymour, was in the hands of the British. On the 21st, the troops met Sir Henry McPherson's Indian contingent at Ismailia. Two days were now consumed in rest and preparation. The Egyptians cut off the water supply, which came from the Delta by the Sweet Water canal, by damming the canal. A sortie to secure possession of the dam was therefore deemed necessary, and was successfully made on the 24th. Further advances were made, and on the 26th, Kassassin, a station of some importance on the canal and railway, was occupied. Here the British force was obliged to delay for two weeks, while organizing a hospital and a transport service. This gave Arabi opportunity to concentrate his forces at Zagazig and Tel-el-Kebir. But he knew it was for his interest to strike at once before the British transports could come up with the advance. He therefore made two attempts, one on August 28, and the other on September 9, to regain the position lost at Kassassin. But he failed in both, though inflicting some loss upon his opponents. On the 12th of September preparations were made by General Wolseley for a decisive battle. He had become convinced from daily reconnoissance and from the view obtained in the engagement of September 9, that the fortification at Tel-el-Kebir were both extensive and formidable. . . . It was therefore decided to make the approach under cover of darkness. . . . At 1.30 on the morning of the 13th General Wolseley gave the order for the advance, his force consisting of about 11,000 infantry, 2,000 cavalrymen, and sixty field-guns. They had only the stars to guide them, but so accurately was the movement conducted that the leading brigades of each division reached the enemy's outposts within two minutes of each other. 'The enemy (says General Wolseley) were completely surprised, and it was not until one or two of their advanced sentries fired their rifles that they realized our close proximity to their works.' . . . The intrenchments were not carried without a severe struggle. The Egyptians fought with a desperate courage and hundreds of them were bayoneted at their posts. . . . But what could the rank and file accomplish when 'each officer knew that he would run, but hoped his neighbor would stay.' At the first shot Arabi and his second in command took horse and galloped to Belbeis, where they caught a train for Cairo. Most of the other officers, as the reports of killed and wounded show, did the same. The Egyptians fired their first shot at 4.55 A. M., and at 6.45 the English had possession of Arabi's headquarters and the canal bridge. The British loss was 57 killed, 380 wounded, and 22 missing. The Egyptian army left about 2,000 dead in the fortifications. . . . A proof of the completeness of the success was the entire dissipation of Arabi's army. Groups of soldiers, it is true, were scat-

tered to different parts of Egypt; but the army organization was completely broken up with the battle of Tel-el-Kebir. . . . 'Major-General Lowe was ordered to push on with all possible speed to Cairo. . . . General Lowd [reached] the great barracks of Abbassieh, just outside of Cairo, at 4.45 P. M., on the 14th instant. The cavalry marched sixty-five miles in these two days. . . . A message was sent to Arabi Pasha through the prefect of the city, calling upon him to surrender forthwith, which he did unconditionally.' . . . Before leaving England, Wolsey had predicted that he would enter Cairo on the 16th of September; but with still a day to spare the feat was accomplished, and Arabi's rebellion was completely crushed. England now stood alone. Victory had been won without the aid of France or the intervention of Turkey. In Constantinople negotiations regarding Turkish expeditions were still pending when Lord Dufferin received the news of Wolsey's success, and announced to the Porte that there was now no need of a Turkish force in Egypt, as the war was ended. France at once prepared to resume her share in the control; but England, having borne the sole burden of the war, did not propose now to share the influence her success had given her. And it was for the interest of Egypt that she should not. . . . England's first duty, after quiet was assured, was to send away all the British troops except a force of about 11,000 men, which it was deemed advisable to retain in Egypt until the khedive's authority was placed on a safe footing throughout the land. . . . What should be done with Arabi when the question of paramount interest, when once the khedive's authority was re-established and recognized. Tewfik and his ministers, if left to themselves, would unquestionably have taken his life. . . . But England was determined that Arabi should have a fair trial. . . . It was decided that the rebel leaders should appear before a military tribunal, and they were given English counsel to plead their cause."—J. E. Bowen, *Conflict of East and West in Egypt*, ch. 5-6.—"The trial, which had commenced before Lord Dufferin arrived in Egypt, was proving itself unsatisfactory to all concerned. The Government of the Khedive regarded it as superfluous; for had not the accused, after a series of outrageous insults to the Khedive and his Ministers, been taken in arms against them? To the counsel for the defence, the constitution of the Court, the procedure adopted, and the nature of the evidence offered, were equally objectionable. The Court was browbeaten by the lawyers, and humiliated by the exhibition of its own incompetency. The accused believed, or affected to believe, themselves foredoomed. The public, sympathising with the Khedive, was willing to approve the punishment of the prisoners as rebels who had taken up arms against their rulers, but declined to give credence either to the evidence offered on any other head of indictment, or to the impartiality of the Court. Lord Dufferin put an end summarily to the farce. Under arrangements sanctioned by him, the prisoners pleaded guilty to rebellion, and were exiled to Ceylon; and there, so far as they were concerned, the matter ended. Exile was the wisest punishment, probably, that could be arrived at in the circumstances; but it was attended with one drawback of grave and far-reaching importance. It was not to be gainsaid, on the one hand, that, if the Khedive held the rebels in his power, it was due to no merits of his Government, but to the exertions of British troops. Whatever had been the crime of Arabi and his associates, it was not for one

of the house of Muhammad Ali and of Ismail to strike at an Egyptian in the name of justice. The prisoners, in common with all Egypt, had suffered under the tyranny of Khedive Tewfik's father, as the generation before them had suffered under Muhammad Ali. But for British intervention, the prisoners and their friends would have thrown the whole house of Muhammad Ali, bag and baggage, into the Red Sea. The Khedive could not be allowed, under benefit of the intervention of a civilized Power, to make himself arbiter of their fate. It was for the Power that had subdued them to punish them. All this was unanswerable, and public opinion in Great Britain, flushed even by success over an Egyptian army, was disposed to show itself generous."—A. Colvin, *Making of modern Egypt*, ch. 1.—"Lord Dufferin . . . had been sent from Constantinople to Cairo, early in November, with the special mission of bringing order out of governmental chaos. In two months he had prepared a scheme of legislative reorganization. This was, however, somewhat altered; so that it was not until May, 1883, that the plan in its improved form was accepted by the decree of the khedive. The new constitution provided for three classes of assemblies: the 'Legislative Council,' the 'General Assembly,' and the 'Provincial Councils,' of which there were to be fourteen, one for each province. . . . Every Egyptian man, over twenty years of age, was to vote (by ballot) for an 'elector-delegate' from the village in the neighborhood of which he lived, and the 'electors-delegate' from all the villages in a province were to form the constituency that should elect the provincial council. . . . The scheme for reorganization was carried forward to the extent of electing the 'electors-delegate' in September; but by that time Egypt was again in a state of such disquietude that the British advisers of the khedive considered it unwise to put the new institutions into operation. In place of legislative council and general assembly, the khedive appointed a council of state, consisting of eleven Egyptians, two Armenians, and ten Europeans. The reforms were set aside for the time being in view of impending troubles and dangers in the Sudan."—J. E. Bowen, *Conflict of East and West in Egypt*, ch. 5-6.

1883-1907.—Lord Cromer's administration.—In Lord Cromer, "during more than twenty years [from 1883-1907] the life of Egypt . . . centred, and from him all energy . . . radiated. . . . But for his patience and sagacity, united with perseverance which admits of no discomfiture, the success of British intervention must have been imperilled. The making of modern Egypt is the work of Lord Cromer; without him it might scarcely have been accomplished, and with his name it will remain identified. . . . [England] may congratulate herself on having installed in Cairo, . . . [in Sir Evelyn Baring, who later became Lord Cromer], the one man who, by natural aptitudes, by experience, and by character, was needed to secure her interests, and to ensure the well-being of the people for whom she had assumed responsibility. What has been the secret of Lord Cromer's success? That he has shown extraordinary capacity for labour, great financial and economic skill, untiring patience, high moral courage, much insight into native character; that he has gained the general confidence by habitually frank outspokenness and candour; all this, though true, scarcely supplies a sufficient answer to the

question. The solution is probably to be found on examining the line of policy which he . . . adopted. It . . . [was], in the non-controversial sense of the word, a distinctly liberal policy. Its aim . . . [was] the greatest good of the greatest number; general content based on general well-being. It . . . absolutely reversed every tradition of rule hitherto practised in Egypt. It . . . preferred the many to the few, and powerlessness to privilege. . . . It . . . recognized the claim of the native of the land for immunity from fiscal importunities. . . . Moral and material progress . . . [were not] lost sight of, but . . . [were] deliberately relegated to a subordinate place. The economic base of the Agent's policy . . . [was] the desire to leave an appreciable margin in the hands of the taxpayer, to allow it . . . to fructify in the pockets of the people. The basis of Lord Cromer's policy . . . [was] thus . . . sympathy with the Egyptian. He . . . put, as has been

stage of civilization?—A. Colvin, *Making of modern Egypt*, pp. 3, 406, 407, 408.

1884-1885.—General Gordon's mission to Khartoum.—Town beleaguered by the Mahdists.—English rescue expedition.—Energy that was too late.—“The abandonment of the Soudan being decided upon, the British Government confided to General Gordon the task of extricating the Egyptian garrisons scattered throughout the country. . . . Gordon's original instructions were dated the 18th January, 1884. He was to proceed at once to Egypt, to report on the military situation in the Soudan, and on the measures which it might be advisable to take for the security of the Egyptian garrisons and for the safety of the European population in Khartoum. . . . He was to be accompanied by Colonel Stewart. . . . Gordon's final instructions were given him by the Egyptian Government in a firman appointing him Governor-General. . . . Gordon arrived at Khartoum on the 18th February. . . . While Gordon was sending almost daily expressions of his view as to the only way of carrying out the policy of eventual evacuation, it was also becoming clear to him that he would very soon be cut off from the rest of Egypt. His first remark on this subject was to express ‘the conviction that I shall be caught in Khartoum’; and he wrote,—‘Even if I was mean enough to escape I have no power to do so.’ The accuracy of this forecast was speedily demonstrated. Within a few days communications with Khartoum were interrupted, and although subsequently restored for a time, the rising of the riparian tribes rendered the receipt and despatch of messages exceedingly uncertain. . . . Long before the summer of 1884, it was evident that the position of Gordon at Khartoum had become so critical, that if he were to be rescued at all, it could only be by the despatch of a British force. . . . Early in May, war preparations were commenced in England, and on the 10th of the month the military authorities in Cairo received instructions to prepare for the despatch in October of an expedition for the relief of the Soudanese capital. 12,000 camels were ordered to be purchased and held in readiness for a forward march in the autumn. On the 16th May a half-battalion of English troops was moved up the Nile to Wady Halfa. A few weeks later some other positions on the Nile were occupied by portions of the Army of Occupation. Naval officers were also sent up the river to examine and report upon the cataracts and other impediments to navigation. Still it was not till the 5th August that Mr. Gladstone rose in the House of Commons to move a vote of credit of £300,000 to enable the Government to undertake operations for the relief of Gordon. . . . It was agreed that there were but two routes by which Khartoum could be approached by an expedition. One by way of the Nile, and the other via Suakin and Berber. . . . The Nile route having been decided on, preparations on a large scale were begun. . . . It was at first arranged that not more than 5,000 men should form the Expedition, but later on the number was raised to 7,000. . . . The instructions given to Lord Wolseley stated that the primary object of the Expedition was to bring away Gordon and Stewart from Khartoum; and when that purpose should be effected, no further offensive operations of any kind were to be undertaken.”—C. Royle, *Egyptian campaigns, 1882-1885*, v. 2, ch. 12-18.—“First, it was said that our troops would be before the gates of Khartoum on January 14th; next it was the middle of February; and then the time stretched out to the middle of

LORD CROMER
(Egypt)

said, the claims of the administration in the second rank, when compared with the popular sentiment. He . . . habitually looked at all questions, not solely from the point of view of the educationalist, or the administrator, but as much as possible from the point of view of the Egyptian himself. . . . Lord Cromer . . . [never forgot] for a moment that he . . . was in Egypt on behalf of the people of Egypt; that every matter of internal administration or finance must be examined from the point of view of their interests; that it . . . [was] their revenues, their soil, their property, of which he disposed. Even his annual reports are in great measure addressed to an Egyptian audience. . . . ‘So far as my own part in the preparation of the annual reports is concerned, I may say that my wish has been to render them, so to speak, as educational as possible; that is to say, I have endeavoured, not merely to record a bald statement of facts, but also to turn the attention of the Egyptians . . . to the future which lies before their country, and to a variety of subjects of interest to all of them, as citizens of a State which is now rapidly striding towards an advanced

March. . . . Lord Wolseley offered a hundred pounds to the regiment covering the distance from Sarras to Debbeh most expeditiously and with least damage to boats. . . . He also dispatched Sir Herbert Stewart on the immortal march to Gâkdul. Stewart's force, composed principally of the Mounted Infantry and Camel Corps, and led by a troop of the 19th Hussars, acting as scouts—numbering about 1,100 in all—set out from Korti on December 30th. Its destination was about 100 miles from headquarters, and about 80 from the Nile at Shendy. The enterprise, difficult and desperate as it was, was achieved with perfect success. . . . On the 17th January Sir Herbert Stewart engaged the enemy on the road to Metemneh, and after defeating some 10,000 Arabs—collected from Berber, Metemneh, and Omdurman—pushed forward to the Abu Klea Wells. His tactics were much the same as those of General Graham at El Jeb, and those of the Mahdi's men—of attacking when thirst and fatigue had well-nigh prostrated the force—were at all points similar to those adopted against Hicks. Our losses were 65 non-commissioned officers and men killed and 85 wounded, with 9 officers killed—among them Colonel Burnaby—and 9 wounded. Stewart at once pushed on for Metemneh and the Nile. He left the Wells on the 18th Jan. to occupy Metemneh, if possible, but, failing that, to make for the Nile and entrench himself. After a night's march, some five miles south of Metemneh, the column found itself in presence of an enemy said to have been about 18,000 strong. Stewart halted and formed a zereba under a deadly fire. He himself was mortally hurt in the groin, and Mr. Cameron, of the Standard, and Mr. Herbert, of the Morning Post, were killed. The zereba completed, the column advanced in square, and the Arabs, profiting by Abu Klea, moved forward in echelon, apparently with the purpose of charging. At thirty yards or so they were brought to bay, so terrific was the fire from the square, and so splendidly served was Norton's artillery. For two hours the battle raged; and then the Arabs, 'mown down in heaps,' gave way. Meantime Sir Charles Wilson had made a dash for the Nile, where he found [on the 21st] steamers and reinforcements from Gordon, and the laconic message, 'All right at Khartoum. Can hold out for years.' . . . In the joy at the good news, none had stopped to consider the true meaning of the message, 'All right. Can hold out for years,' for none was aware that nearly two months before Gordon had said he had just provisions enough for 40 days, and that what he really meant was that he had come to his last biscuit. The message—which was written for the enemy—was dated Dec. 29."—A. E. Hake, *Story of Chinese Gordon*, v. 2, ch. 10.—"A delay of three days [had] occurred at Gubat, spent partly in removing the Egyptian troops and replacing them with Sudanese, as Gordon wished, and partly in making reconnaissances. At length on the 24th Sir Charles Wilson, who had succeeded to the command, started with two steamers on his perilous quest. The voyage took four days, and when Wilson sighted his goal he discovered that the Egyptian flag had disappeared from government house."—S. Low and L. C. Sanders, *Political history of England*, v. 12, *History of England during the reign of Victoria* (1837-1901) p. 361.—"The public, carefully kept in ignorance . . . and hopeful beyond their wont, were simply stupefied to hear, on Feb. 5, that Khartoum was in the hands of the Mahdi and Gordon captured or dead."—A. E. Hake, *Story of Chinese Gordon*, v. 2, ch. 10.—See also МАНОЛ.

"There was a strange, and to this day an unaccountable, delay about the measures to be taken for Gordon's rescue. People said that the Government had no hope of being able to do anything to save him. . . . At last an expedition was arranged to go out to the relief of Gordon. Perhaps it was but a half-hearted enterprise at the best. Perhaps the Government had only too good reason to believe that Gordon was beyond the help of any relief expedition. The trial had to be made, however, and the expedition was put under the command of a man as competent as could be found in England—Sir Garnet Wolseley. . . . The world soon heard the worst news of all. No commander could have forced his way under such difficulties to Khartoum in time to rescue General Gordon."—J. McCarthy, *History of our own times, 1880 to the diamond jubilee*, pp. 160, 161.—"It was undoubtedly the delay at Gubat that brought about the fall of Khartoum. Father Ohrwalder asserts that if twenty redcoats had arrived the place would have been saved, and that the mahdi, who had determined on retirement into Kordofan, only decided on attacking when he heard that the steamers were delaying their advance (*Ten Years' Captivity*, pp. 167-68). But Sir Charles Wilson in his narrative, *From Khorti to Khartoum*, points out that his first duty was to see that his small force, with its wounded, was secure from immediate attack, while there was nothing to show that a delay of a couple of days would make much difference. In any case Khartoum could have been relieved in good time if the expeditionary force had started from England, as Lord Wolseley urged, a few weeks earlier than it did."—S. Low and L. C. Sanders, *Political history of England*, v. 12, *History of England during the reign of Victoria* (1837-1901), p. 361 (footnote).—"It is difficult to give a positive answer to the question of whether General Gordon could have retreated from Khartoum, if no expedition had been sent to his relief. On March 27, 1884, Colonel Coetlogon, who was then at Cairo, wrote to me: 'The White Nile to Berber is very low, and there are only two small steamers that can make the passage; the river begins to rise about the middle of May. I consider that a retreat of a force by river is now impossible, even if unopposed, on account of the lowness of the river.' Would it, however, have been possible to have effected a retreat by land? It is almost certain that after May 26, on which day Berber fell into the hands of the Dervishes, retreat by land was impossible. When General Gordon was asked his reasons for remaining at Khartoum, he wrote in his Journal: 'The reasons are those horribly plucky Arabs,' and there cannot be any doubt that at the time he wrote these words (September 10, 1884), the explanation was sufficient. It is, however, not so certain whether, prior to May 26, the operation might not have been undertaken with a fair prospect of success. 'I wanted,' General Gordon wrote, on October 29, 'to capture Berber, which was the proper military operation.' 'Had it not been,' he wrote on September 19, 'for the defeat of Mehemet Ali Pasha, I should have got out at least two-thirds of those at Khartoum and Sennar.' On the other hand, the passage already quoted from his Journal shows that he did not care for the capture of Berber as it would 'not have done much towards the solution of the Sudan problem or withdrawal of the garrisons, while it might, on the other hand, have stopped the expedition for their relief.' It is impossible to draw any very definite conclusions from the evidence which is available on this subject. All that can be said is that the operation of retreat would

have been one of very great difficulty, but it is not certain that it would have been altogether impossible if it had been undertaken before the middle of May. It is clear, however, that inasmuch as General Gordon considered, first, that he was bound to establish some settled government at Khartoum, and secondly, that he was under an obligation to save the garrisons of Sennar, Bahrel-Ghazal, and the Equatorial Province, he never contemplated the possibility of withdrawing from Khartoum and leaving the other garrisons to their fate."—Lord Cromer, *Modern Egypt*, v. 1, pp. 572-574.—"The Government blundered, but it was not from pusillanimity; it was from its failure to realize the gravity of the situation which had arisen. The blunder did not lie in the refusal to accept responsibility for establishing a strong government in the Sudan, or in adopting the only alternative policy of evacuating the Sudan. But if the province was to be evacuated, the garrisons could only be withdrawn by a strong military force; and it would still be necessary to hold a sound strategical frontier in force. Instead of taking its measures accordingly, the Government announced emphatically that there should be no military expedition; and no strategic frontier was decided upon. Hitherto the British public had taken only a passing interest in Gordon; but when he went to Egypt it suddenly woke up to the fact that he was a very remarkable man. Its imagination, not easily stirred, was gripped by his personality; he became as he fully deserved to be, its hero. It would have cheerfully helped him to go his own way without regard to the consequences. But the Government had chosen him not that he might dictate their policy, but as the most efficient instrument for carrying it out. When he went up to the Sudan the situation had just been made more serious through a reverse suffered by an Egyptian force at the hands of the Mahdi's followers. Gordon had arrived at the conclusion that the Mahdi must be 'smashed,' and a strong government set up in the Sudan; to which end he demanded that he should have the assistance of one Zebehr, a notorious slaver, but a person of great influence. But he could have neither Zebehr, nor troops. Gordon got as far as Khartoum, and there he was in effect beleaguered before the end of March. The ministry in England succeeded in persuading itself that his movements were free, though already the queen was urging the necessity of sending an expedition to his relief. The ministry took the matter in consideration; but it was also thinking about the Franchise Bill and the House of Lords [see also ENGLAND: 1884-1885]; it was annoyed, not without excuse, because if Gordon had simply acted upon his instructions, instead of assuming that there would be a change of policy if he demanded it, he would never have been shut up in Khartoum; and it declined to believe that there was any need for haste. There was an apparently interminable controversy as to the best route for effecting the relief; and it was not till 1st September that Lord Wolseley left England to take the command of the expedition. . . . The Sudan was left to the Mahdi and his successor for eleven years. In England the failure to relieve Gordon was received with an outburst of sorrow and anger, though the denunciations of desertion and betrayal went a good deal further than the facts warranted."—A. D. Innes, *History of England and the British empire*, pp. 415, 416, 417.

1884-1891.—Origin of irrigation system.—Restoration of the old Nile barrage by Sir Colin Moncrieff.—Rossetta and Damietta branch barrages completed.—Among the many men who have had a share in bringing about the salvation of Egypt, none are entitled to greater credit than the irrigation engineers who were brought from India. Diplomats and statesmen unraveled the tangled skein of high politics, financiers produced order out of chaos, soldiers fought battles and swept back the advancing tide of barbarism; but the irrigation engineers created the wealth which made the work of the rest possible. The Nile was the final saviour of Egypt, and the engineers spread its fertilizing waters over the thirsty land. The beginnings of irrigation in Egypt are almost prehistoric, but the splendid irrigation system which now produces such rich crops on the banks of the Nile and in the delta is almost entirely the result of the British occupation. "As early as 1833 Mehemet Ali . . . began to lay the foundations of . . . a dam. But after a year or two the work was abandoned. It was not till 1842 that the French Engineer, Mougel Bey, succeeded in persuading the Viceroy to take up the idea again. The design of Mougel Bey was a magnificent one, and the mighty dam, which owes its inception to his genius, is one of the greatest irrigation works in the world. This is the famous Barrage, [which was sound in principle, but had suffered from neglect, and never fulfilled its original purpose until it was restored and improved under British direction. When Sir Colin Moncrieff arrived in Egypt from India to take charge of the works he found a scheme on hand by which a system of pumping water from the Nile was to be adopted for irrigation of the Delta.] Nobody had tried the experiment of restoring the Barrage. When Sir Colin Moncrieff started the notion of doing so, he was good-naturedly forgiven for his 'ignorance of the country, natural in a foreigner.' . . . But . . . the pumping contract was laid aside, and when the low-water season of 1884 came round, a first attempt was made to see how much water the Barrage could hold up if both the bridges were closed. The enterprise was entrusted to [William] Willcocks, and it turned out a signal success. . . . The effect produced was extraordinary. . . . Water in abundance made its appearance as late as the middle of June in districts where it had not been seen for years except during flood-time. And not only was the quantity increased, but, owing to the delivery being at a higher level, an immense saving was effected in the trouble and cost of lifting. The cotton crop for 1884 was nearly half a million kantars [kantar = 90½ lbs. approximately] above the highest figure of previous years. The experiment of 1884 was repeated in 1885 with even better results, so far as raising the level of the river was concerned. And, having succeeded for two successive years in patching up the Barrage, the Irrigation Engineers were able to make a very powerful appeal for a special grant to carry out its complete restoration. . . . Their task was a very heavy one. To ensure the stability of the Barrage against the pressure of a great body of water is a matter of remarkable difficulty. The gigantic weight of this structure rests on nothing but fine mud and sand. There

is no solid foundation attainable. Moreover, all the time that the Barrage was being repaired it had to be used, too; for after the successful experiments of 1834 and 1885, there would have been a tremendous outcry if something had not been done every summer to keep up the level of the Nile. . . . Every year, as soon as the flood was over, one half of one of the bridges was enclosed by a coffer dam, out of which all the water was pumped, so that the floorings of the arches were left dry . . . and the task of repairing the floor and strengthening and extending the great apron of masonry, . . . proceeded without a day's cessation, and for a great part of the time both night and day. Working thus under the highest pressure, and in the face of innumerable and unforeseen perils arising from the treacherous nature of the river-bed, the western half of the Rosetta Branch Barrage was finished in the winter and spring of 1886-87, and the eastern half in 1888-89. The eastern half of the Damietta Branch Barrage was similarly completed in 1887-88 and the western half in 1889-90. The arches of both bridges were supplied with iron gates in double leaves, moving in parallel grooves, and raised and lowered by overhead travelling winches. By the low-water season of 1891 the work was finished."—A. Milner, *England in Egypt*, pp. 239, 243-245.

1885-1896.—Abandonment of the Egyptian Sudan to the Dervishes.—Death of the Mahdi and reign of the Khalifa.—Beginning of a new Anglo-Egyptian movement for the recovery of the Sudan.—Expedition to Dongola.—After the failure to rescue General Gordon from the Mahdists at Khartoum the British government, embarrassed in other quarters, felt compelled to evacuate the Sudan. Before it did so the Mahdi had finished his career, having died of small-pox in June, 1885, and one of his three chief commanders, styled khalifas, had acquired authority over the Dervish army and reigned in his place. This was the Khalifa Abdullah, a chieftain of the Baggara tribe. Khartoum had been destroyed, and Omdurman, on the opposite side of the river, became his capital. The rule of the khalifa was soon made so cruelly despotic, and so much in the interest of his own tribe, that incessant rebellions in many parts of his dominions restrained him from any vigorous undertaking of the conquest of Egypt, which was the great object of Dervish desire. But his able and energetic lieutenant in the Eastern Sudan, Osman Digna, was a serious menace to the Egyptian forces holding Suakin, where Major Watson, at first, and afterwards Colonel Kitchener, were holding command, under General Grenfell, who was then the Egyptian Sirdar, or military chief. Osman Digna, however, was defeated in all his attempts. At the same time the Khalifa was desperately at war with the Negus, John, of Abyssinia, who fell in a great battle at Galabat (March, 1889), and whose death at the crisis of the battle threw his army into confusion and caused its defeat. Menelek, king of the feudatory state of Shoa, acquired the Abyssinian crown, and war with the Dervishes was stopped. Then they began an advance down the Nile, and suffered a great defeat from the British and Egyptian troops, at Toski, on August 17, 1889. From that time, for several years, "there was no real menace to Egypt," and little was heard of the Khalifa. "His territories were threatened on all sides: on the north by the British in Egypt; on the south by the British in Uganda; on the west by the Belgians in the Congo Free State, and by the French in the Western Sudan; whilst the Italians held Kassala on the east; so that the Khalifa preferred to hus-

band his resources until the inevitable day should arrive when he would have to fight for his position."

A crisis in the situation came in 1896. The Egyptian army, organized and commanded by British officers, had become a strong fighting force, on which its leaders could depend. Its sirdar was now Major-General Sir Herbert Kitchener, who succeeded General Grenfell in 1892. Suddenly there came news, early in March, 1896, of the serious reverse which the Italians had suffered at Adowa, in their war with the Abyssinians (see ITALY: 1895-1896). "The consternation felt in England and Egypt at this disaster deepened when it became known that Kassala, which was held by the Italian forces, was hemmed in, and seriously threatened by 10,000 Dervishes, and that Osman Digna was marching there with reinforcements. If Kassala fell into the hands of the Dervishes, the latter would be let loose to overrun the Nile valley on the frontier of Egypt, and threaten that country itself. As if in anticipation of these reinforcements, the Dervishes suddenly assumed an offensive attitude, and it was rumoured that a large body of Dervishes were contemplating an immediate advance on Egypt. . . . A totally new situation was now created, and immediate action was rendered imperative. Everything was ripe for an expedition up the Nile. Whilst creating a diversion in favour of the Italians besieged at Kassala, it afforded an opportunity of creating a stronger barrier than the Wady Halfa boundary between Egypt and the Dervishes, and it would moreover be an important step towards the long-wished-for recovery of the Sudan. The announcement of the contemplated expedition was made in the House of Commons on the 17th of March, 1896, by Mr. Curzon, Under-Secretary for Foreign Affairs. It came as a great surprise to the whole country, which, having heard so little of the Dervishes of late years, was not prepared for a recrudescence of the Sudan question. [But a vote of censure on the Egyptian policy of the government, moved by Mr. John Morley in the House of Commons, was rejected by 288 to 145.] . . .

"An unexpected difficulty arose in connection with the financing of the expedition. This is explained very plainly and concisely in the 'Annual Register,' 1896, which we quote at length:—"In order to defray the cost of the undertaking, it being obviously desirable to impose as little strain as possible on the slowly recovering finances of Egypt, it was determined by the Egyptian Government to apply for an advance of £500,000 from the General Reserve Fund of the Caisse de la Dette, and the authorities of the Caisse obligingly handed over the money. . . . However, the French and Russian members of the Caisse de la Dette protested against the loan which the Caisse had made. . . . In December (1896) the International Court of Appeal required the Egyptian Government to refund to the Caisse the £500,000 which they had secured. The very next day Lord Cromer offered an English loan to make good the advance. The Egyptian Government accepted his offer, and repaid immediately the £500,000 to the Caisse, and the result of this somewhat absurd transaction is that England has thus strengthened her hold in another small point on the Government of Egypt."—H. S. L. Alford, and W. D. Sword, *Egyptian Sudan, its loss and recovery*, ch. 4.

On March 21, the sirdar (Sir Herbert Kitchener) left Cairo for Assouan and Wadi Halfa, and various Egyptian battalions were hurried up the river. Meantime, the forces already on the frontier had moved forward and taken the advanced post of

the Dervishes, at Akasheh. From that point the sirdar was ready to begin his advance early in June, and did so with two columns, a river column and a desert column, the latter including a camel corps and a squadron of infantry mounted on camels, besides cavalry, horse artillery and Maxim guns. Ferket, on the east bank of the Nile, sixteen miles from Akasheh, was taken after hard fighting on June 7, many of the Dervishes refusing quarter and resisting to the death. They lost, it was estimated, 1,000 killed and wounded, and 500 were taken prisoners. The Egyptian loss was slight. The Dervishes fell back some fifty miles, and the sirdar halted at Suarda during three months, while the railroad was pushed forward, steamers dragged up the cataracts and stores concentrated, the army suffering greatly, meantime, from an alarming epidemic of cholera and from exhausting labors in a season of terrific heat. In the middle of September the advance was resumed, and, on the 23d, Dongola was reached. Seeing themselves outnumbered, the enemy there retreated, and the town, or its ruins, was taken with only a few shots from the steamers on the river. "As a consequence of the fall of Dongola every Dervish fled for his life from the province. The mounted men made off across the desert direct to Omdurman, and the foot soldiers took the Nile route to Berber, always being careful to keep out of range of the gunboats, which were prevented by the Fourth Cataract from pursuing them beyond Merawi."—C. Royle, *Egyptian campaigns, new and rev. ed., to Dec., 1899, ch. 70-71.*

The Emir who commanded at Dongola was a comparatively young man, Mohammed Wad el Bishara, who seems to have been possessed by a very genuinely religious spirit, as shown in the following letter, which he had written to the Dervish commander at Ferket, just before the battle there, and which was found by the British officers when they entered that place: "You are, thank God, of good understanding, and are thoroughly acquainted with those rules of religion which enjoin love and unison. Thanks be to God that I hear but good reports of you. But you are now close to the enemy of God, and have with you, with the help of God, a sufficient number of men. I therefore request you to unite together, to have the heart of a single man founded on love and unity. Consult with one another, and thus you will insure good results, which will strengthen the religion and vex the heathen, the enemies of God. Do not move without consulting one another, and such others, also, in the army who are full of sense and wisdom. Employ their plans and tricks of war, in the general fight more especially. Your army, thank God, is large; if you unite and act as one hand, your action will be regular; you will, with the help of God, defeat the enemies of God and set at ease the mind of the khalifa, peace be on him! Follow this advice, and do not allow any intrigues to come between you. Rely on God in all your doings; be bold in all your dealings with the enemy; let them find no flaw in your disposition for the fight. But be ever most vigilant, for these enemies of God are cunning, may God destroy them! Our brethren, Mohamed Koku, with two others, bring you this letter; on their return they will inform me whether you work in unison or not. Let them find you as ordered in religion, in good spirits, doing your utmost to insure the victory of religion. Remember, my brethren, that what moves me to urge on you to love each other and to unite is my love for you and my desire for your good. This is a trial of war; so for us love and amity are of utmost ne-

cessity. You were of the supporters of the Mahdi, peace be on him! You were as one spirit occupying one body. When the enemy know that you are quite united they will be much provoked. Strive, therefore, to provoke these enemies of religion. May God bless you and render you successful."

1895.—New anti-slavery law.—A convention to establish a more effective anti-slavery law in Egypt was signed on November 21, 1895, "by the Minister of Foreign Affairs, representing the Khedival Government, and the British diplomatic agent and consul-general. . . . This new convention will supplant that of August 4, 1877, which . . . was found to be defective, inasmuch as it provided no penalty for the purchaser of a slave, but for the seller only. An Egyptian notable, Ali Pasha Cherif, at that time president of the Legislative Council, was tried for buying slaves for his household, but escaped punishment through a technicality of the law hitherto escaping notice. . . . Under the existing regulations, every slave in the Egyptian dominions has the right to complete freedom, and may demand his certificate of manumission whenever he chooses. Thus, all domestic slaves, of whom there are thousands in Cairo, Alexandria, and the large towns, may call upon their masters to set them free. Many choose to remain in nominal bondage, preferring the certainty of food and shelter to the hardships and uncertainty of looking after themselves."—*United States, consular reports, Mar., 1906, p. 370.*

1897.—Italian evacuation of Kassala.—In 1897 the government of Italy decided to evacuate Kassala, on the Abyssinian frontier, directly eastward from Khartum, and it consequently became a part of Anglo-Egyptian territory.

1897 (June).—Census.—A census of Egypt, taken on June 1, 1897, showed a population of 9,700,000, the area being Egypt up to Wadi Halfa. In 1882 an imperfect census gave six and three-quarter millions. Twelve per cent. of the males can write, the rest are totally illiterate. There are, it is said, about 40,000 persons not really Egyptians, but who come from other parts of the Ottoman empire. The Bedouin number 570,000, but of these only 80,000 are really nomads, the rest being semi-sedentary. Of foreign residents there are 112,500, of whom the Greeks, the most numerous, number 38,000. Then come the Italians, with 24,500. The British (including 6,500 Maltese and 5,000 of the Army of Occupation) are 19,500; and the French (including 4,000 Algerians and Tunisians), 14,000. The Germans only number 1,300. The classification according to religion shows nearly 9,000,000 Moslems, 730,000 Christians, and 25,000 Jews. The Christians include the Coptic race, numbering about 608,000. Only a very small proportion profess the Roman Catholic and Protestant faiths. Amongst the town populations Cairo contains 570,000, Alexandria 320,000.

1897-1898.—Final campaigns of the Anglo-Egyptian conquest of the eastern Sudan.—Battles of the Atbara and of Omdurman.—"The winter of 1896-1897 was passed, undisturbed by the enemy. The extended and open front of the Egyptian army imperatively called for fresh guarantees against a Dervish invasion. The important strategic position of Abu Hamed was then held by the enemy, to dislodge whom was the objective of the 1897 campaign. The railway was boldly launched into the Nubian Desert; the rail-head crept rapidly and surely towards the Dervish post, until within striking distance of Abu Hamed: when the river-column by a forced

march, through difficult country, delivered an attack on 7th August. Abu Hamed was taken by the Egyptian army under Major-General (now Sir Archibald) Hunter, with trifling loss; and the effect of this victory caused the precipitate evacuation of Berber. The Dervishes withdrew; the Egyptians—not to lose so favourable an opening—advanced. Berber, the key to the Sudan, was promptly re-occupied. The railway was hastened forward; reinforcements were detained, before the close of the year, at a short distance from Berber; and the Anglo-Egyptian authorities gathered force for the last heat. British troops were called up. In this final struggle [1898] nothing could be risked. An Egyptian reverse would have redoubled the task on the accomplishment of which, having deliberately accepted it, we had pledged our honour. Mahmud, the Dervish emir, and that ubiquitous rascal Osman Digna, with their united forces, were marching on Berber. They, however, held up at the confluence of the Atbara, and comfortably entrenched themselves in a 'zariba.' Here the Sirdar came out to have a look at them. The Dervish force numbered about 19,000 men. The Anglo-Egyptian army was composed of 13,000 men. The odds were good enough for the Sirdar: and he went for them. Under the demoralization created by some sharp artillery practice, the Anglo-Egyptians stormed the 'zariba,' killed three-fourths of the defenders, and chased the remainder away. This victory [April 8, 1898], which cost over 500 men in killed and wounded, broke the Dervish power for offence and seriously damaged the Khalifa's prestige. With reinforcements, bringing his army up to 22,000 men, including some picked British regiments, the Sirdar then advanced slowly up the river. It was a pilgrimage to the Mahdi's tomb, in sight of which Cross and Crescent combined to overthrow the false prophet. This sanguinary and decisive engagement [before Omdurman] took place on 2nd September, 1898. The Khalifa was put to flight; his forces were scattered and ridden down. On the same evening, the sirdar entered Omdurman, and released the European captives. Subsequently, the British and Egyptian flags were hoisted together at Khartum; and divine service was celebrated at the spot where Gordon fell.—A. S. White, *Expansion of Egypt*, pp. 383-4.

"The honour of the fight [at Omdurman] must still go with the men who died. Our men were perfect, but the dervishes were superb—beyond perfection. It was their largest, best, and bravest army that ever fought against us for Mahdism, and died worthily of the huge empire that Mahdism won and kept so long. . . . Over 11,000 killed, 16,000 wounded, 4,000 prisoners,—that was the astounding bill of dervish casualties officially presented after the battle of Omdurman. Some people had estimated the whole dervish army at 1,000 less than this total; few had put it above 50,000. The Anglo-Egyptian army on the day of battle numbered, perhaps, 22,000 men: if the Allies had done the same proportional execution at Waterloo, not one Frenchman would have escaped. . . . The dervish army was killed out as hardly an army has been killed out in the history of war. It will shock you, but it was simply unavoidable. Not a man was killed except resisting—very few except attacking. Many wounded were killed, it is true, but that again was absolutely unavoidable. . . . It was impossible not to kill the dervishes: they refused to go back alive"—G. W. Stevens, *With Kitchener to Khartum*, pp. 32-34

1898 (September-November).—Fashoda inci-

dent.—"The Sirdar had hardly had time to make good the occupation of Omdurman when he learnt that only a day or two before the battle the Khalifa had received the news that a military force under a European commander had occupied Fashoda. He [had] at once sent two steamers up the White Nile to ascertain the truth of the report; and one of these boats returned on the 7th September to find Omdurman in the hands of the Sirdar, to whom the captain at once surrendered. Fashoda, he reported, was in the hands of a white force; his boat had been heavily fired on, and escaped with difficulty. Subsequent information tended to confirm the belief that the force at Fashoda was French, and the bullets found in the hull of the steamer were believed to be those of the French rifle. Sir Herbert Kitchener acted with his usual promptitude. He immediately quitted Omdurman with two gunboats and a force of 2000 men, and, on arriving at Fashoda, found it, as had been reported, in the occupation of Major Marchand and his troops, consisting of some 100 Sengalese soldiers, with eight French officers. After due exchange of salutations between the British and French commanders, the Sirdar informed Major Marchand of his intention to occupy Fashoda in the name of its lawful owner, the Khedive of Egypt. To this Major Marchand replied, as of course he was in duty bound to do, that he was there under the orders of his Government, and that he could not consent to haul down the French flag. With his overwhelming superiority of strength, it would naturally have been an easy matter for the Sirdar—as it would have been well within his right as commander of the Khedive's army—to have taken possession of the place by force; but the Sirdar, whose diplomatic tact and discretion were equal to his military skill, very wisely refrained from an act which, if it did not actually precipitate a war between the two Powers, would certainly have fatally compromised the prospects of a pacific issue of subsequent negotiations between them. He contented himself with hoisting the British and Egyptian flags beside that of France, and having placed a garrison at Sobat, a post still further south on the banks of the Nile, he returned to Omdurman. . . . The Sirdar returned to England to report. Lord Salisbury, in moderate but firm language, insisted on the withdrawal of France from Fashoda as an indispensable condition of our assent even to negotiate upon the matter, and an acute state of tension prevailed for some weeks between the two nations. The British position was in reality impregnable; it could not even be attacked, save from the standpoint of the untenable contention that the dominions abandoned by Egypt in 1884 became so much derelict territory which might be appropriated by the first comer.

"The French Government gave way. Major Marchand left Fashoda [Dec. 11, 1898], and returned to France, *via* Saukin and the Red Sea, to receive the well-deserved acclamations of his countrymen on his great feat of travel"—H. D. Traill, *England, Egypt and the Sudan*, pp. 197-202.—It is interesting to note that the name "Fashoda" no longer exists. In 1904, at the time of the inception of the Entente Cordiale, the British government changed the name to Kodok, thereby eradicating, to some extent, the memory of an unpleasant diplomatic incident.

1898-1901.—Barrage and reservoir works on the Nile.—In February, 1898, the khedive in Council approved a contract concluded with the British firm of John Aird & Co., for the construction of a dam or "barrage" across the Nile

at Assuan, drowning the cataracts and turning the river above into a vast storage reservoir; with another dam at Assiut, for the irrigation of Middle Egypt and the Fayum.

By a singular happening, the Nile flood of 1899 was the lowest recorded in the century, and gave an opportunity for the barrage and barely commenced irrigation works, to give a convincing foretaste of their value. According to the report of that year, "the distress was enormously less than on all occasions of a failure of the flood. The area of 'sharaki,' or land unirrigated and therefore untaxed, which had been 900,000 feddans [one feddan = 1.03 acres] in 1877, was only one-third of this in 1890. Even in this area, which lay principally in Upper Egypt, 'distress,' says Sir William Garstein, 'was hardly felt at all by the people. The immense amount of contract work in progress in the country enabled them to obtain a good daily wage and tided over the interval between the two crops.' In Lower Egypt 'the situation was saved by the Barrage, which, for the first time in its history, was regulated upon throughout the flood. Had it not been for the work done by this structure, there is little doubt that large areas of crop would have been lost. As it is, the cotton crop is very nearly the largest on record, and the maize crop was up to the average.'" In 1901, Sir John Aird and Sir Benjamin Baker completed their inspection of the great works at Assuan and preparations were made for laying the permanent foundations of the dam. At Assiut the great regulating dam across the Nile approached completion, the foundations being practically all in position.

1899 (January).—Anglo-Egyptian condominium established in the Sudan.—The following agreement between the British government and that of the khedive of Egypt, relative to the future administration of the Sudan, establishing a condominium or joint dominion therein, was signed at Cairo on January 19, 1899, and made public the same day:

Whereas certain provinces in the Sudan which were in rebellion against the authority of His Highness the khedive have now been reconquered by the joint military and financial efforts of Her Britannic Majesty's government and the government of His Highness the khedive; and whereas it has become necessary to decide upon a system for the administration of and for the making of laws for the said reconquered provinces, under which due allowance may be made for the backward and unsettled condition of large portions thereof, and for the varying requirements of different localities; and whereas it is desired to give effect to the claims which have accrued to Her Britannic Majesty's government by right of conquest, to share in the present settlement and future working and development of the said system of administration and legislation; and whereas it is conceived that for many purposes Wadi Halfa and Suákin may be most effectively administered in conjunction with the reconquered provinces to which they are respectively adjacent; now, it is hereby agreed and declared by and between the undersigned, duly authorized for that purpose, as follows:

ART. I. The word "Sudan" in this agreement means all the territories south of the 22d parallel of latitude, which: 1. have never been evacuated by Egyptian troops since the year 1882; or 2. which, having been by the late rebellion in the Sudan been administered by the government

of His Highness the khedive, were temporarily lost to Egypt, and have been reconquered by Her Majesty's government and the Egyptian government acting in concert; or 3. which may hereafter be reconquered by the two governments acting in concert.

ART. II. The British and Egyptian flags shall be used together, both on land and water, throughout the Sudan, except in the town of Suákin, in which locality the Egyptian flag alone shall be used.

ART. III. The supreme military and civil command in the Sudan shall be vested in one officer, termed the "Governor-General of the Sudan." He shall be appointed by khedivial decree on the recommendation of Her Britannic Majesty's government, and shall be removed only by khedivial decree, with the consent of Her Britannic Majesty's government.

ART. IV. Laws, as also orders and regulations with the full force of law, for the good government of the Sudan, and for regulating the holding, disposal, and devolution of property of every kind therein situate, may from time to time be made, altered, or abrogated by proclamation of the governor-general. Such laws, orders, and regulations may apply to the whole or any named part of the Sudan, and may, either explicitly or by necessary implication, alter or abrogate any existing law or regulation. All such proclamations shall be forthwith notified to Her Britannic Majesty's agent and consul-general in Cairo, and to the president of the Council of Ministers of His Highness the khedive.

ART. V. No Egyptian law, decree, ministerial arrête, or other enactment hereafter to be made or promulgated shall apply to the Sudan or any part thereof, save in so far as the same shall be applied by proclamation of the governor-general in manner hereinbefore provided.

ART. VI. In the definition by proclamation of the conditions under which Europeans, of whatever nationality, shall be at liberty to trade with or reside in the Sudan, or to hold property within its limits, no special privileges shall be accorded to the subjects of any one or more Power.

ART. VII. Import duties on entering the Sudan shall not be payable on goods coming from Egyptian territory. Such duties may, however, be levied on goods coming from elsewhere than Egyptian territory, but in the case of goods entering the Sudan at Suákin, or any other port on the Red sea littoral, they shall not exceed the corresponding duties for the time being leviable on goods entering Egypt from abroad. Duties may be levied on goods leaving the Sudan at such rates as may from time to time be prescribed by proclamation.

ART. VIII. The jurisdiction of the mixed tribunals shall not extend, nor be recognized for any purpose whatsoever, in any part of the Sudan, except in the town of Suákin.

ART. IX. Until, and save so far as it shall be otherwise determined, by proclamation, the Sudan, with the exception of the town of Suákin, shall be and remain under martial law.

ART. X. No consuls, vice-consuls, or consular agents shall be accredited in respect of nor allowed to reside in the Sudan, without the previous consent of Her Britannic Majesty's government.

ART. XI. The importation of slaves into the Sudan, as also their exportation, is absolutely prohibited. Provision shall be made by proclamation for the enforcement of this regulation.

ART. XII. It is agreed between the two governments that special attention shall be paid to the enforcement of the Brussels Act of the 2d

July 1890, in respect to the import, sale, and manufacture of fire-arms and their munitions, and distilled or spirituous liquors. Done in Cairo, the 19th January, 1890. (Signed) Boutros Ghali-Cromer.—A. S. White, *Expansion of Egypt, App. V.*

By a subsequent agreement signed July 10, the exceptions in the above relative to Suakin were abrogated.

1899-1900.—Final defeat and death of the Khalifa.—Capture of Osman Digna.—Condition of the Sudan.—The Khalifa, who escaped from the scene of his overthrow at Omdurman, in 1898, kept a following of his own tribe, the Baggaras, sufficient to give trouble for more than another year. At length, late in November, 1899, he was overtaken by Sir Francis Wingate, who succeeded General Kitchener as governor-general of the Sudan, and was killed in a battle fought near Gedil. Again Osman Digna, his able lieutenant, escaped; but in January of the following year the latter was captured and taken to Suez. In a report to Lord Salisbury, made on February 20, 1900, Lord Cromer, British agent and consul-general in Egypt, gave the following account of the general state of affairs in the Sudan: "The territorial situation may be briefly described as follows:—The frontier between the Soudan and the Italian Colony of Erythræa has now been delimited from Ras Kasar, on the Red Sea, to Sabderat, a few miles east of Kassala. Negotiations are proceeding which will, without doubt, result before long in the delimitation of the small remaining portion of the Italian frontier from Sabderat up to the point where it strikes Abyssinian territory. The most friendly relations exist between the British and Abyssinian Governments. The general basis of a frontier arrangement in respect to the country lying west of the Blue Nile has already been settled with the Emperor Menelek. When the survey party, now being employed, has finished its work, it may confidently be expected that the detailed delimitation will be carried out without much difficulty.

"An endeavour is being made to cut through the sudd which obstructs the White Nile, and thus open up communication with Uganda. To a certain extent this communication may be said to be already established, for a mixed party, consisting of British, French, and Belgian officers, with their followers, arriving from the South, recently succeeded in getting through and joining the Egyptian party, under Major Peake, which was engaged in cutting the sudd . . . From the moment of the Khalifa's crushing defeat at Omdurman, the desert and Kordofan tribes, with the exception of a certain number of Baggaras who still adhered to the cause of their Chief, threw in their lot with the Government. Most of these tribes, however, rendered but little active assistance to the Government in the subsequent operations against the Khalifa. Omdurman and the Ghezireh [the tract of country lying south of Khartoum, between the White and Blue Niles] were found to be full of Arabs belonging to the Kordofan and far western tribes, who had been brought from their homes by the Khalifa. They were without any regular means of subsistence, but, in the existing state of insecurity, it was for the time being impossible for them to return to their own districts. . . . The inhabitants of the districts which were raided by the Dervishes were obliged to take refuge in the Ghezireh, with the result that the situation remained practically unchanged until the Khalifa's overthrow and death. Since then, the main objects of the Government have been to

send back to their homes the inhabitants of the gum producing region, and to get rid of the useless mouths from the Ghezireh. In respect to the first point, some success has attended their efforts, but many thousands of Arabs belonging to tribes whose homes are in Kordofan and Darfour, still remain in the Ghezireh. . . . The attitude of the Nubas and of other tribes in Central and Southern Kordofan has, since the battle of Omdurman, been perfectly satisfactory. . . . Some long time must certainly elapse before prosperity returns to the tribes in the Soudan. The population has wasted away under Dervish rule."—*Great Britain, papers by command: Egypt, No. 1, 1900, pp. 43-44.*—See also *SUDAN*.

1901-1922.—Development of education.—"Before the English occupation great masses of Egyptians remained ignorant. Over 91 per cent. of the males and almost 00½ per cent. of the females could neither read nor write. . . . Public primary education for the poorer classes, aside from the mere learning of the Koran, was almost unknown. At the present time public schools are being established everywhere, and grants in aid of these schools are paid in proportion to the attendance and the records made by the pupils. Likewise, certain positions in the civil service can be filled only by those who hold certificates from schools of certain grades. As a consequence there has been a great awakening of interest. Most of the teachers of these public schools are Mohammedan, and the schools are non-Christian in their instruction. The Koran is still used as a text-book for many purposes, but the education is practical in its general nature. The children are taught, besides reading and writing, the elements of the sciences, and they choose either French or English as the foreign language which they will learn, and that in which they will receive instruction in the more advanced studies where Arabic text-books cannot readily be provided. It is a noteworthy fact that while, in the earlier days, French was the language more frequently chosen, nearly all the pupils are now selecting English. There are also provisions for training in law, medicine, agriculture, engineering, etc. The law school is the most popular, while the agricultural college—although the basis of Egyptian wealth and prosperity is and must always be agriculture—suffers from lack of pupils."—J. W. Jenks, *Egypt of to-day (International Quarterly Review, Oct., 1902)*.—"Not until 1916 were higher elementary schools started to take up the teaching where the elementary schools leave off, and to give in a four years' course, between eleven and sixteen, simple but practical instruction, suitably differentiated in urban and rural districts, and 'designed to develop the general capacities of pupils with a view to their early absorption in the business of life.' Perhaps the best thing that has been done so far for elementary education has been the delegation of powers . . . to the Provincial Councils. . . . In Western countries the attendance at elementary schools is usually estimated at about 16 per cent. of the population, it is only 3 per cent. in Egypt. . . . The one higher training college, rightly described by the Educational Adviser as 'the most important educational institution in the country,' had 235 students in 1913 and could not meet the increasing applications for admission, because the building in which it was located was not only old . . . but left no room for further expansion. . . . It may be said in extenuation of the present educational system that we did not create it, but found it already in existence at the time of the Occupation. It dates back

in part to Mehemet Ali and his French advisers, and his primary object undoubtedly was . . . to train up young natives for employment in Government offices and administrative services. Nor have the majority of Egyptians yet got beyond the stage of looking upon education as the avenue that leads to Government employment. Unfortunately, . . . that conception was allowed to go on dominating primary and secondary education, and up to 1916 the award of a Primary Education Certificate sufficed to qualify its recipient for appointment to Government service. . . . The proportion of illiteracy amongst the women of Egypt is still appalling. Only three per 1,000 knew how to read or write at the time of the last census in 1907, and the fraction is still probably well under one per cent. But the movement in favour of female education, which started in the upper classes, has been spreading downwards, and the old prejudice against it is dying out even in the rural districts. The Egyptian girls who are receiving some sort of instruction to-day in schools of all kinds under the management or inspection of the Ministry of Education number roughly 50,000. This is more than double the number in 1910, but it still represents only 6 per cent. of the total number of girls of school-going age. In addition to these, another 20,000 are receiving instruction in Egyptian 'private' schools, and the girls' 'private' schools have even a worse reputation than those for boys. . . . The girls' schools under the Ministry of Education are even more overcrowded than the boys' schools. Many of them have long waiting lists. They are wretchedly housed. Money for new school buildings was doled out grudgingly before the war, and now the whole housing problem is as acute in Egypt as at home. The question of high schools for girls has scarcely yet been approached, and the only training college for other than elementary teachers contains just ninety students. Yet the supply of qualified teachers for the better-class of girls' schools is a matter of no less urgency and difficulty than the provision of school buildings. Elementary education, in which also the Provincial Councils are beginning to take an intelligent interest, is still absolutely in its infancy and almost entirely confined to the old native *maktahs*, with just the most sorely needed improvements in their very primitive curriculum and squalid premises. The most promising feature is that of the 3,000 *maktahs* at present under Government inspection, 45—a little more than one in 100—have been set apart for girls only, and in these a large proportion of the teaching staff has now been trained in the Bulak Elementary Training College."—V. Chirol, *Egyptian problem*, pp. 221, 222, 224, 226, 227, 230, 231.

"The Ministry of Education has decided on carrying out a most comprehensive scheme of development, by means of which it is hoped that within a period of 20 years and at the cost of £20,000,000 in extraordinary expenditure, together with a maintenance charge of about £3,000,000 per annum, facilities of education would be provided for a number of children equal to one-tenth of the total population. Although approved some time ago, very little progress comparatively has been possible up to the present owing to the general financial stringency. . . . That a start, however, has been made is seen in the steady increase in the number of government schools during the past few years. . . . There will be, it is hoped, the sum of £70,000 available, partly for carrying out the most important items of the program, and partly for making certain extensions of classes

and other improvements in the existing schools. . . . The expenditure includes the grants-in-aid to many private schools which conform to certain required standards and other directly unremunerative charges, but the fact that the government schools do not pay their expenses shows what a struggle goes on in the case of the private schools, especially those that are not subsidized, in order to realize a reasonable profit. The problem of such schools is not an easy one. The Government is obliged to keep the fees of its schools low, otherwise few would be disposed to send their children to them. The private schools unless heavily subsidized, cannot afford to offer superior educational facilities, seeing that it must keep the fees as low or lower than those of the government schools in order to attract pupils. Under such circumstances it is not surprising that the majority of the private schools other than those maintained by Europeans, are generally far from efficient. . . . Lord Allenby [pointed out] in his last report the lack of good teachers. . . . [which] is becoming a serious problem in considering the extension of education. . . . Salaries must be increased to attract the right kind of men. . . . Those politicians who criticize so freely the policy which admits after 40 years of British tutelage only 8 or 9 per cent of the total population is literate, do not appreciate, or shut their eyes to, the many difficulties to be met—lack of funds, of teachers, of even public support, for most Egyptians view education as but a means of scrambling through certain examinations in order to qualify for Government employment. Fortunately there is no need to attempt to rush education upon the masses. Present developments show that the first essential is to develop a better understanding as to what education really stands for by fostering an interest in study for the sake of moral and intellectual advancement. . . . The majority of the population, the fellahen, require so far but little education other than that of the simplest nature, and village school teaching . . . will meet the need for several years to come. For higher education the country must be prepared to pay liberally."—*Christian Science Monitor*, March 25, 1922.

1902 (December).—Completion of the Assuan dam.—The great Assuan Dam, to control the waters of the Nile, was opened with formal ceremony on the 10th of December, 1902, in the presence of the Duke and Duchess of Connaught, the Khedive, Lord and Lady Cromer, and other distinguished personages. Earlier in the year the value of this important work of engineering had been enhanced by a treaty with the Emperor of Abyssinia or Ethiopia, which forbids constructions on the upper waters of the Nile, within the Abyssinian territory, which would arrest the flow of their waters. See ABYSSINIA: A. D. 1902.

1904.—Declarations of England and France concerning Egypt in the Agreements of the Entente of 1904.—Explanatory despatch. See ENTENTE CORDIALE.

1905.—Pan-Islamic preaching.—Pro-Turkish movement.—Turkish encroachments on the Sinai frontier.—"Whether ordered by the Sultan or the result of an instinctive religious wave, a new and definite crusade began to affect Egypt in the summer of 1905. Preachers appeared mysteriously in Cairo and spread rapidly through the country, giving a new and stricter interpretation to texts from the Koran, and preaching in strong terms the wickedness of obeying the infidel. These preachers mixed with the people in their

EGYPTIAN CEREMONIES FOR THE BURIAL OF THE DEAD

houses and cafés, and in the infinite leisure of a prosperous Oriental country doubtless found no lack of occasion for instilling their new doctrines. Then the Arabic native Press began to preach the same lesson, applying it specially to the Macedonian crisis and the piteous plight of the harassed Sultan. A new spirit came suddenly into political controversy. Any native defender of British rule was marked as a 'bad Moslem,' or 'a traitor to Egypt.' Argument was impossible; for any doubt of the Sultan was simply impiety. So the work went on bravely through the summer and autumn of 1905, while the British authorities looked on in surprise and perplexity. Lonely residents up country began to notice a change in the tone of the people. They felt the under-swell of a new and mysterious movement of religious feeling. Europeans who understood Arabic heard insolent remarks in the cafés as they passed by, and doctors in charge of invalids in lonely hotels noticed with alarm the sullen looks of their Arab servants, and their keen excitement over the Sultan's struggle. A spirit of nervous apprehension began to spread abroad among Europeans."—H. Spender, *England, Egypt and Turkey (Contemporary Review, Oct., 1906)*.

1906-1907.—Turks claim Sinai peninsula.—Denshawai riot.—Resignation of Lord Cromer.—"In 1906 a series of incidents occurred which may be described as the culminating point of the anti-English campaign. In the early summer of that year the Turks moved a number of troops into the deserts of Sinai to the east of the Suez Canal with the intention of claiming that territory as outside the sphere of Egyptian authority, and of pushing the frontier of the Khedive's dominions back to the borders of Egypt proper. The Porte had already made an attempt to gain unbridled possession of this territory in the early days of the British Occupation, and this second effort came as no great surprise to the authorities. It was met, however, by extreme firmness on the part of Lord Cromer; and on May 15 an ultimatum was addressed to the Porte, which stated that unless the Turkish troops were withdrawn and the old frontier definitely fixed, England would support the claims of Egypt by the whole might of the Empire. In view of this threat the Sultan reluctantly gave up all his demands, and the frontier was fixed in accordance with the Turco-Egyptian treaties of the time of Mohammed Ali. The Anglophobe sentiments of a certain class of Egyptians were now at their height, and there was a very grave danger of an anti-English rising in favour of the Sultan. British officials in the provinces were exposed to all manner of insults; and I recall personally many weeks of great anxiety when the massacre of all Christians was openly advocated in one's very presence, and the lonely days in remote districts were shadowed by the hourly expectation of disaster. Then came the news that some British officers in uniform had been attacked at the village of Denshawai [Denshawai], in Lower Egypt, while they were pigeon-shooting at the invitation of one of the local sheikhs; and it was generally felt that a rising was imminent. There can be no doubt that these officers had irritated the villagers by a somewhat indiscriminate acceptance of this invitation; but there could also be no question that under normal circumstances no more than a quiet complaint would have been made. As it was, however, the Englishmen were attacked by a savage crowd, and were obliged to run for their lives back to their distant camp, leaving one of their number dead upon the roadway. Lord Cromer took a very

serious view of this incident, more especially since it showed the native disrespect for the British uniform, the prestige of which was the only real guarantee of law and order in the land. He therefore insisted that the ringleaders of the riot should be tried for murder and executed, and that a number of the other offenders should be publicly flogged. The sentences were carried out a few weeks later in the village of Denshawai itself, in the presence of a detachment of British soldiers, and it is probable that by the severity of the action a general rising was averted. The execution was followed by a storm of protest in all sentimental circles throughout the world, and the Egyptian Nationalists were loud in their denunciation of British barbarism; but I think that mature consideration will place the blame for the whole affair very largely with the intriguers at the courts of the Khedive and the Sultan, whose object for some time past had been to inflame the minds of the inhabitants with anti-English animosity. In the following year, while yet the country was in a ferment, Lord Cromer resigned. His health had been entirely wrecked by his long residence in Egypt, and the disturbances of the last years had worried him very considerably."—A. E. P. B. Weigall, *History of events in Egypt from 1798 to 1914*, pp. 202-205.

1907-1911.—Administration of Sir Eldon Gorst.—Succeeded by Lord Kitchener.—Growth of Nationalist movement.—"At the time when Gorst took up office in 1907 the situation was extremely grave. . . . The tragedy of Denshawai in 1906 was still in the forefront of men's minds. The misunderstanding with Turkey in connection with the Sinaitic frontier had caused a more than usually excited outburst of anti-British feeling; and, had there been war, it is possible that the Egyptian army would have mutinied. Rumours of forthcoming massacres of Christians were frequent, and more than once the date was fixed for a general slaughter. Both in 1906 and 1907 a rising, directed against the English, was confidently expected; and there was one well-remembered night in Cairo when a total absence of British officers from the clubs and places of amusement revealed the fact that they were all under arms at their posts. Massacre was openly preached in the villages throughout the country, and many Europeans were subjected to insult. For some time the relations between the Khedive and the British Agent had been strained, and Sir Eldon Gorst made it his first concern to institute more friendly feelings. This he did with such marked success that his Highness was soon completely won over by the careful deference paid to his rank, and by the cordial attitude adopted towards his person."—A. E. P. B. Weigall, *History of events in Egypt from 1798 to 1914*, pp. 206-208, 212.—"No sooner had the Khedive laid aside his differences with the Agency than the Nationalists turned upon him, accusing him of disloyalty to his country, and threatening to dethrone him. It must have been with profound satisfaction that Sir Eldon watched this break between the Khedive and the Nationalists. The latter party had suffered a severe blow by the death of their leader, Mustafa Kamel Pasha, and now many internal quarrels occurred which hastened their fall. With the Khedive and all Egyptians who were loyal either to him or to the Occupation against them, their power could not be retained, and very soon their political redoubtability was reduced to an irritating but not very dangerous agitation. Looking back to the days of his tenure of office in

Egypt, one may now see that he successfully carried the rule of England on the banks of the Nile through a period of great danger and difficulty. His policy may have been distasteful to the British official, but it was fitted to the temper of the times; and there can be few now who do not realise at last that this peculiarly perilous phase of Egyptian history was most correctly diagnosed and treated by Sir Eldon. His early death from cancer removed him at the moment when his real power was beginning to be felt; and had he lived a little while longer his many calumniators and detractors would most assuredly have been silenced. . . . The death of Sir Eldon Gorst [July 12, 1911] led to the appointment of Britain's third Pro-Consul in Egypt, and a new epoch began on the banks of the Nile. . . . The good sense of the home government in appointing Lord Kitchener [July 16, 1911] to the vacant office was highly to be commended."—*Ibid.*, pp., 213, 233-234.

"During the threatened invasion of the Mahdi and the efforts for the reconquest of the Sudan, agitation was in abeyance. But Britain's sincere efforts to be fair, even to the point of partiality to the Moslem, did not succeed in winning their loyalty. The Nationalist movement broke out again after a time. For the Moslem prefers oppression from one of his own faith and race to justice and progress under the infidel foreigner. Pan-Islamic agitation from Turkey helped to revive Nationalism in Egypt and the new spirit moving upon Asiatic peoples was felt there also. Discontent and dissatisfaction grew apace; partly from the agitation of those shut out from former emoluments; partly from the exclusion of Egyptians from high civil and military offices; partly from the injustice of the capitulations which favoured foreigners even when criminals; partly from hostility to Christianity itself. This hostility was kept alive not only by the Ulama, but by the Europeanized Egyptians, who, often sceptical themselves, regarded Islam as the rallying cry for nationalism. The demand was, 'Cessation of British occupation and Home-Rule.' Khedive Abbas Hilmi was anti-English and the Council was manipulated by the Nationalists. The . . . [High Commissioner] Sir Eldon Gorst, tried a policy of accommodation and conciliation. Two parties, at least, existed among the Nationalists. The first and oldest was led by Ali Pasha Yusuf. They advocated reforms and the gradual withdrawal of Great Britain. Their newspaper was *Al Moayad*. The other party was led by [Mustafa] Kamel Pasha. He had been educated in France, loudly denounced everything British, and strenuously advocated immediate withdrawal, saying, 'Rather an unreformed Egypt than one reformed by the British; rather the Turks, for they at least are Moslems.' He was supported by the Sultan of Turkey. Their organ was the *Lewa*. The newspapers had great influence in exciting patriotic feeling, for while few of the people can read, story-tellers in the villages read and re-read the papers to groups. The movement was directly encouraged by the Minister of Education. Anglophobia was rampant in the schools, especially the School of Law. The Club of High Schools, founded for educational purposes, was turned into an organization of the Nationalist party. Students were continually involved in criminal investigations. Of the graduate Nationalist, W. N. Willis gives the following description (quoted in *The Near East*, from 'Anti-Christ in Egypt'): 'He is half-educated and wholly superficial. He is a nuisance to himself and a worry to everybody else.

Many of the foreign consuls play upon his vanity by sympathizing with him—with their tongues well planted in their cheeks. They simply make a tool of him in order to breed trouble and discontent.' Nationalist agitation reached a climax when, in February, 1910, Boutros Pasha, the Prime Minister and a Copt, an able supporter of British administration, was assassinated by Wardani. The power of Moslem fanaticism appears in the fetva or decree of the Grand Mufti, that Wardani should not be executed—(1) because he killed with a revolver, and Moslem law has said nothing about such a murder, (2) because the government entered process, and by Moslem law it should have been done by the relatives, (3) because it is not a capital crime for a Moslem to kill a Christian. Wide sympathy for the assassin existed among the Egyptians. It was at this time that former President Roosevelt passed through Egypt on returning from Central Africa. In an address at the University in Cairo he strongly condemned the murder. The Nationalists were greatly enraged, and hundreds of them made a demonstration against him, shouting, 'Down with Roosevelt!' 'Down with the Occupation!' The Copts have been alienated from the Nationalist party, whose cry, 'Egypt for the Egyptians,' is more truly, 'Egypt for the Moslems.' The Nationalism attaches itself to Islam and does not include in its scope the real Egyptians, the Copts, who are six hundred thousand, or one-tenth of the people, and proportionately the more intelligent. Indeed, it is said that a large proportion of the Nationalists were of Turkish, Kurdish, Circassian, and Syrian extraction. Moslem fanaticism has even awakened in the Christians a fear for their personal safety. The British Government awoke to the necessity of action and sent Lord Kitchener to be . . . [High Commissioner] with an iron policy. A press law was enforced with severe penalties. Offending editors were dealt with. Among these was Sheikh Abdul Aziz Shawish. He was a graduate of Al Azhar, lecturer on Arabic at Oxford, Inspector in the Egyptian Ministry of Education, an able writer and editor and a contributor to Nationalist journals. He was fiercely anti-English, and was for a while imprisoned for libel and sedition. Some editors fled to Geneva and Paris. There they published a paper called *El Kisas* ('The Punishment'). Its spirit is shown in its exalting the assassin of Boutros Pasha to the rank of hero and patriot. The Turkish Revolution of 1908 strengthened Nationalism in Egypt. The Young Turks actively promoted it, and the Ottoman High Commissioner, who represented the Sultan, had no occupation but to carry on intrigues and to try to inflame the spirit. Though Egypt was neutral in the war in Tripoli, yet Egyptians helped the Turks. A significant incident showed that Nationalism is not love for the Turks. Among those who assisted Turkey in Cyrenaica was the Egyptian Aziz Ali Bey. After the war he was court-martialled in Constantinople through the jealousy of Enver Pasha and Sheikh Shawish and condemned to death. The unjust sentence was protested against by the united voice of the Egyptian press and people, seconding the efforts of the two governments, and was accompanied by a vehement outburst of anger against the Turks until he was freed. Lord Kitchener, with severity, combined efforts to satisfy the people."—S. G. Wilson, *Modern movements among the Moslems*, pp. 233-237.

1907-1914.—Archæological research at Thebes. See THEBES.

1909-1912.—Description of Assuan dam and Assiut and Zifta barrages.—Esna barrage.—“The following descriptions of the dam at Assuan and of the Assiut and Zifta barrages are taken from a paper contributed by Colonel Sir Hanbury Brown, K. C. M. G., . . . to the Transactions of the American Society of Civil Engineers, at the International Engineering Congress of 1904, and printed in the Transactions of that Society, volume LIV, part C, 1905. The Assuan Dam is built on the granite rock which forms the crest of the First Cataract, 600 miles to the south of Cairo. The original design of the dam was the work of Sir William Willcocks; the dam, as actually built, was in principle the same as that originally designed, but was modified in details. It is about $1\frac{1}{4}$ miles (2000 m.) in length. Its height varies with the level at which sound rock was found, the maximum height from foundation being about 125 ft. (37 m.). The thickness of the dam at the top is 23 ft. (7 m.) and at the deepest part 81 ft. (25 m.), and the total weight of masonry in it is over one million tons. . . . The dam is pierced with sluice openings of sufficient area to pass the flood discharge of the river, which may amount to 500,000 cu. ft. per sec. There are 140 such openings 23 ft. (7 m.) high by 6 ft. 6 in. (2 m.) wide, and forty more of half that height and same width. Those sluice-gates which are subject to heavy pressure at the time of movement are of the Stoney roller pattern. Navigation is provided for by a ladder of four locks, each 263 ft. (80 m.) long by 31 ft. ($9\frac{1}{2}$ m.) wide. The cost of the dam was $2\frac{1}{2}$ million pounds. The reservoir above the dam, as built, is calculated to hold about 1300 million cubic yards of water with the water-surface at 106 m. above sea. It had originally been decided to build the dam 26 ft. higher, so as to hold up water to 114 m. above sea, which would have given a storage capacity in the reservoir of 3250 million cu. yd. But the Egyptian Government gave way before the strong protests against the submersion of Philae raised by archaeologists and artists, and the lesser project was adopted. . . . [The original project was later carried out, and the dam raised to its full height by 1912.]

“Both the Assiut and Zifta barrages are built on platforms, 0 ft. 0 in. (3 m.) thick and from 85 to 100 ft. (26 to 30 m.) wide, enclosed between up- and down-stream rows of cast-iron piles. . . . The Assiut Barrage is 900 yd. in length and has 111 bays of 16 ft. 5 in. (5 m.) width. . . . Two iron regulating gates, as in the old barrage, are worked in vertical grooves by an overhead winch, and provide for holding up a level of 0 ft. 0 in. (3 m.) of water. The Zifta Barrage has 50 bays, but is in other respects similar to the Assiut Barrage, except that it is designed to hold up 13 ft. of water.”—A. Colvin, *Making of modern Egypt (Appendix)*, pp. 417, 418.—An important addition to the irrigation works in Egypt, supplementing the great dam at Assuan and the Assiut barrage, was completed in February, 1900, when the Esna barrage was formally opened, on the 9th of that month. Esna is a town of some 25,000 inhabitants, situated in Upper Egypt, on the west bank of the Nile, and the work now completed will, even in the lowest of floods, ensure a plentiful supply of water to a great tract of land in the Nile valley from Esna, northwards. In deciding to undertake the construction of this latest barrage, at a point about 100 miles north of the Assuan reservoir, the government influenced by the great success of the Assiut barrage, but that work differs from the barrage in being

designed as a low-water summer regulator, whereas the function of the Esna barrage is to hold up the water in low floods.—See also CONSERVATION OF NATURAL RESOURCES: Egypt.

1911-1914.—Administration of Lord Kitchener.—Reforms of 1913.—“The campaign against continued British occupation assumed such alarming proportions that Sir Eldon Gorst . . . was compelled to admit that ‘the policy of ruling this country in coöperation with native ministers is, at the present time, incompatible with that of encouraging the development of so-called representative institutions.’ Further, he was of the opinion that: ‘The Egyptians have intellectually reached a stage when they should be quite capable of utilizing with advantage the facilities accorded to them for coöperating in the administration of the country. Nevertheless it cannot be denied that the recent experiment has, so far as the Legislative Council and General Assembly are concerned, proved a failure, and that the results derived from it have not been in accordance with our intentions or hopes.’ Such was the situation when in 1911 Lord Kitchener was named to succeed Sir Eldon Gorst as consul-general. Lord Kitchener’s reputation as a soldier who would not tolerate nonsense had a sobering effect on the Egyptian people. In his first report [*British Parliamentary Papers*, 1912-1913, *Egypt*, pp. 635-705] he minimized the political disturbances; ‘Egypt,’ he declared, ‘was not seething with disaffection.’ The widespread unrest which prevailed he attributed largely to ‘the totally unexpected action of Italy in declaring war against the Turkish Empire and proceeding to invade Tripoli and Cyrenaica.’ . . . In his second report, submitted March 22, 1913, the consul-general mentioned the Balkan Wars at the occasion of the continued Egyptian unrest, again declaring that politically Egypt was undisturbed. In this latter respect Lord Kitchener undoubtedly was deceived, for, as subsequent events proved, the political serenity was more apparent than real.”—H. J. Carman, *England and the Egyptian problem (Political Science Quarterly, Mar., 1921, pp. 60-61)*.—Lord Kitchener strove to improve laws which bore harshly on the peasants and to restrain the landlords from exploiting them. Among other valuable reforms, he introduced a Usury law which forbade the lending of money at more than nine per cent. and empowered the courts to inflict penalties for charging above that rate of interest. Usurers had preyed like parasites on the toiling peasants (fellahcen) for many years. It is a curious fact that, although usurious commerce is forbidden by Islamic doctrine, there had been no legislation on the subject in Egypt. Greeks, Levantines, Jews, Copts and even Moslems constituted the majority of the usurers operating in the provinces, extorting interest on money loaned at the rate of sixty per cent. and more. “Yet the British authorities have kept steadily in mind the wise suggestion of Lord Dufferin—that, in the fullness of time, representative institutions should be given to Egypt. In the spring of 1913, Lord Kitchener took up this matter again seriously and made an excellent report, recommending certain important changes in the electoral laws and in the existing form of popular representation. His suggestions were taken up by Parliament and embodied in the Electoral and Organic Law of July 21, 1913. The old ‘General Assembly’ has been abolished under the new law, and all popular authority concentrated in the Legislative Assembly which has become a real representative body. The number of deputies is increased to eighty-nine, including six

ministers, sixty-six elected members, and seventeen appointed to represent minorities and interests not otherwise provided for. Although the representation is indirect, the method is simple and well adapted to present conditions. Every male Egyptian, who is twenty years of age and has his name registered in the electoral list of his town or village, is entitled to vote, except soldiers, criminals, bankrupts, and disbarred lawyers. Every fifty voters choose an elector-delegate for a term of six years, who must be thirty years of age and a registered voter. He is to act for them in electing deputies to the provincial assemblies and to the national chamber. The proportion in the latter is intended to be about one member to every 200,000 of the population. One third of this assembly will be renewed every two years; and the term of office is six years. Deputies must be thirty-five years of age, registered voters of three years' standing, able to read and write, and must have paid at least two annual tax assessments of £E50 [fifty pounds Egyptian] on land, or £E20 if on a house. Holders of educational diplomas are required to pay only two-fifths of these taxes, or £E20 or £E3 as the case may be. The ministry may dissolve the Legislative Assembly at any time, but a new election must be held within three months. A bill has to be sent three times to the Chamber, however, for public discussion, and, in case of disagreement, one private conference must be held with the Government before a dissolution can be ordered. Laws relative to interior affairs, the organization of the powers of state, the civil and political rights of the people, and the public administration, cannot be promulgated without the advice of the Assembly; and all statutes must be countersigned by the President of the Council and the proper minister. No new tax—direct, personal, or land—can be established without the vote of this legislative body, which will sit yearly from November 1 to May 1. Its advice must be obtained on all public loans and on canal, drainage, or railway projects affecting more than one province; and the annual budget has to be submitted for its scrutiny forty days before the end of the fiscal year. The Assembly may even initiate legislation, provided it does not pertain to constitutional matters, receive private members' bills, and question the ministers after due notice. The provincial assemblies which are composed of two representatives from each sub-district, elected for four years, possess a large amount of control over local affairs and the introduction of public improvements, being permitted to vote five per cent of the annual land taxes without further approval and to supervise the (elementary) agricultural, industrial, and commercial education. To insure better public morals, all elections are to be declared void where any trace of fraud, violation of electoral laws, or irregularities by candidates or their agents is found. And all corruption, intimidation, and impersonation are punishable by heavy fines and imprisonment. To fit the masses for the proper use of the ballot and for greater self-dependence, great attention is being paid to the educational system. There are now [1913] some 2003 elementary public, 3051 elementary private ('Kuttabs'), and 203 higher, schools in the country, including nearly thirty industrial, agricultural, and commercial institutes, with a total attendance of over 321,300. Since the Ministry of Education, led by Mahommed Ali Pasha, began its systematic work in 1897-98, the public expenditure for education has risen from £E3,000 to £E64,000 in 1910."—N. D. Harris, *Intervention and colonization in Africa*, pp. 325-327.

1914.—World War.—When the World War broke out, "Egypt legally was still a part of the Turkish Empire and the sultan, under the existing treaties, had the right to demand Egyptian troops should he need them. In 1768 he had called upon Egypt for assistance in his struggle against Russia; during the Greek War of Independence his Egyptian vassal had been obliged to furnish an army; and in the Crimean War Egyptian soldiers had battled for the Turks. In her later struggles, notably the Tripolitan and Balkan wars, the Porte had been persuaded not to ask for Egyptian aid; by refraining from such a request Turkey saved Great Britain from what might have been an embarrassing position, but she did not, however, in any way invalidate her legal right. When war was declared between England and Germany on August 4, 1914, it was apparent that Germany would employ every means to destroy British control in Egypt. Even before the outbreak of hostilities it was obvious that the Germans in Egypt were bending every effort to antagonize the British administration in that country. Inasmuch as Egypt was by oft-repeated definition an integral part of the Turkish Empire, Great Britain was powerless to take any legal action. To meet the situation the British authorities boldly 'persuaded' the Egyptian government to regard itself as in a state of war with the Teutonic powers. Accordingly on August 6 the Egyptian Prime Minister, Hussein Rushdi Pasha, on the ground that 'the presence of the British army of occupation in Egypt renders the country liable to attack by the enemies of His Britannic Majesty,' published a 'Decision of the Council of Ministers' which practically amounted to a declaration of war. Expedient and justifiable though this act may have been, it was beyond doubt illegal; for in accordance with the terms of the Turco-Egyptian treaty, Egypt as a vassal state could not declare war and its political relations with other states could be conducted only through the Turkish sovereign. It really constituted an enforced act of rebellion on the part of Egypt for it obviously implied a definite repudiation of the suzerainty of the Sultan. No statement was made at this time by England that the Sultan's authority in Egypt had ceased to be recognized, nevertheless to all intents and purposes Egypt was henceforth completely independent of the Porte. This fact was strikingly apparent when three months after the outbreak of hostilities in Europe war was declared between England and Turkey. Technically Great Britain was at war with Egypt, for by treaty that country was still a part of the Ottoman domain and Egyptian forces a part of the Turkish army. Treaty stipulations were, however, entirely ignored and war measures directed against the Germans were extended to the Turks. During these turbulent days Abbas Hilmi Pasha, the khedive, was in Constantinople. Pro-Turk and pro-German in sympathy, he hated the English and desired to get rid of them. It was this desire to free himself not only from the 'British intruders' but from all restraint, that led him, prior to the outbreak of the war, to champion the nationalist movement. Selfish, overbearing and irresponsible, he soon proved a dangerous liability to the popular cause, so much so that by 1914 he was despised by the majority of his own subjects. . . . In casting his fortunes with the Central Powers Abbas Hilmi gave Great Britain opportunity to sever the formal ties which still united Egypt to the Ottoman Empire. The proclamation of martial law and the establishment of a very strict censorship early in November, 1914, were forerunners of this inevitable

EGYPT IN 1914

break; the bonds were completely severed on December 18 by issuance of a proclamation to the effect that 'Egypt is placed under the protection of His Majesty and will henceforth constitute a British Protectorate.' On the following day another proclamation announced that 'in view of the action of His Highness Abbas Hilmi Pasha, lately Khedive of Egypt, who has adhered to the King's enemies, His Majesty's government have seen fit to depose him from the Khedivate; and that high dignity has been offered, with the title of Sultan of Egypt, to His Highness Prince Hussein Kamel Pasha, eldest living prince of the family of Mohammed Ali, and has been accepted by him.' Thus Egypt after nearly four hundred years ceased to be even nominally a part of the crumbling Ottoman Empire, and the veiled protectorate which Britain had exercised for over thirty years became a protectorate in name as well as in fact. It is difficult to see precisely what ultimate advantage accrued to Great Britain by this change. It is true that her anomalous and questionable position in Egypt was 'regularized' but only by violating the reciprocal arrangement with the Entente Powers that no territorial changes should be made before the end of the war and then only by common agreement. Some British authorities go so far as to point out that it was possible for England to establish a protectorate only after she had gained the acquiescence of France and Russia by promising Syria to the former and possession of Constantinople and the Straits to the latter.—H. J. Carman, *England and the Egyptian problem (Political Science Quarterly, Mar., 1921, pp. 63-66)*.—"As to the future Government of Egypt, it was pointed out [in 1914] that the British Government considered themselves trustees for the inhabitants of Egypt, and accepted full responsibility for the defence of her territory against all aggression. All Egyptian subjects will be entitled to receive the protection of Great Britain. The disappearance of Turkish suzerainty will remove the various restrictions that had been imposed by firmans on the strength and organization of the new Sultan's army and on his bestowal of honours. As to foreign relations, they will be conducted, conformably to the responsibility assumed by Great Britain, through his Majesty's representative in Cairo. With regard to judicial administration the British Government have repeatedly expressed their view that the system of capitulations no longer harmonized with the development of the country; and therefore a revision will be made after the termination of the war. In all internal affairs Britain will remain faithful to the policy she has pursued, and will continue to work through and in close association with the constituted Egyptian authorities, in order to secure individual liberty, to promote the spread of education, to further the development of the country's natural resources, and as far as possible to associate the governed in the task of government. Religious convictions will be scrupulously respected; the British Government have no feelings of hostility towards the Khalifate, though Egypt is liberated from all political obligations to Constantinople. Finally, it was stated that the General Officer commanding his Majesty's forces is entrusted with the maintenance of internal order, and with the prevention of any attempts to render aid to the enemy."—C. Phillipson, *International law and the Great War, pp. 200-301*.—See also WORLD WAR: 1914: IV. Turkey: h.

1914.—Railway and industrial development. See AFRICA: Modern European occupation: 1914-1920: Lack of railway and industrial development.

1914.—Attempt to assassinate khedive.—Sir A. H. McMahon appointed High Commissioner.—An attempt was made in July to assassinate the Khedive, Abbas Hilmi, while he was on a visit to Constantinople; but was frustrated. Lord Kitchener, who was in England during the summer, had started on his return to Egypt when war was proclaimed, and he was recalled to take office as minister for war. He was succeeded in October by Sir A. H. McMahon, who received a High-Commissionership instead of the "former modest post of 'Agent and Consul-General,' the occupant of which was, technically, on a par with the Diplomatic Representatives of fourteen other Powers—not even *primus inter pares*, but ranking with them according to seniority."—M. McLlwraith, *Egypt in wartime (Fortnightly Review, Aug., 1917, p. 230)*.

1915.—Growing disaffection and unrest.—Disaffection became more and more apparent throughout the year. In January, the deposed khedive called upon the faithful to rise against the British. Three separate attempts—in April, July and September—were made on the life of the new Sultan, all of which were unsuccessful. At the third attempt, Fathi Pasha, Minister of Wakfs (charitable foundations), was wounded. In this case, as well as in the first instance the assassin was captured and executed. All three attempts appeared to be the work of individual fanatics, but nevertheless they showed an undercurrent of unrest which caused considerable anxiety. The firm attitude of the government, however, curbed agitation for the time.

1916-1917.—Resignation of Sir A. H. McMahon.—Appointment of Sir F. R. Wingate.—Commission on capitulations.—Toward the close of 1916, Sir Henry McMahon resigned, and in January was succeeded as High Commissioner by Sir F. R. Wingate, who for sixteen years had been Sirdar of the Egyptian army, and governor-general of the Sudan. In the Sudan, his administration had been extraordinarily successful and his appointment to the high commissionership, in view of the difficulties which were plainly discerned ahead, was received with much approval. About the same time a commission was appointed in Cairo "to study the legal and other changes involved by the impending abolition of the capitulations. The composition of this Commission is typical of Egyptian administration. It consists of three native Ministers, one of them being President, three British Advisers, one Frenchman, and one Italian—these last two being both eminent lawyers."—M. McLlwraith, *Egypt in wartime (Fortnightly Review, Aug., 1917)*.

1917.—Death of Sultan Hussein Kamel.—Succession of Ahmed Fuad Pasha. On October 9, Sultan Hussein Kamel died, and was succeeded by his brother Ahmed Fuad Pasha (b. 1868).

1918-1919.—Demands for independence.—Egypt at the Peace conference.—Disturbances.—Pacification.—Government changes.—"Buoyed up by the utterances of the allied statesmen, especially by those of President Wilson, Mr. Asquith and Mr. Lloyd George, regarding the right of small nations to self-determination, . . . [the Nationalists] raised the cry of 'complete independence.' Two days after the armistice had been signed they formally demanded the abolition of the protectorate and recognition of the complete

independence of Egypt. In answer the British High Commissioner, Sir Reginald Wingate, stated that he was unacquainted with the intentions of his government in regard to the future of Egypt. Anticipating this reply the Egyptian prime minister, Rushdi Pasha, asked that Egyptian representatives be permitted to proceed to London to discuss the status of Egypt with the British government; his request was flatly refused, whereupon he resigned. [Though his resignation was not formally accepted until early in March, 1919, Egypt was without a regular government for several weeks.] Undaunted, Saad Pasha Zaghlul next appealed to Mr. Lloyd George, M. Clemenceau, M. Orlando, and President Wilson, adjuring them to apply to Egypt the lofty principles they had proclaimed in defining their war aims—but to no avail. Despite the efforts of the military authorities to prevent it, the Egyptian leaders elected a national delegation to the Peace Conference; as soon as the Conference assembled this delegation proceeded to send to all the plenipotentiaries an exhaustive memorandum setting forth the program of the party of independence. Among other things it pointed with pride to the progress of the Egyptian people during the days of Mehemet Ali and his successors; it lauded the English for good accomplished during the occupation, but at the same time stressed Britain's oft-repeated assurance that her stay was merely temporary, emphasizing the detrimental effects of continued alien tutelage upon the moral and intellectual development of the nation; it enumerated in considerable detail the splendid services which Egypt had rendered to the Allies during the war, and denounced the protectorate as an illegal and unjustified war measure proclaimed without the consent or approval of the Egyptian people; recognition and complete independence for Egypt were demanded together with full sovereignty over the Sudan. The program guaranteed to fulfil Egypt's financial obligations and promised to safeguard the rights enjoyed by foreign communities settled in the country. In conclusion a bitter protest was registered against the arbitrary refusal of the British authorities to permit the Egyptian delegation to proceed to Paris as the representatives of the Egyptian people. [See also ST. GERMAIN, TREATY OF: Part 4, Sect. 2; VERSAILLES, TREATY OF: Part 4, Sect. 6.] The refusal to grant passports to representatives who would confer personally with the British government, or to permit the Egyptian delegation to proceed to Paris roused all Egypt to fever heat. Fresh fuel was added when it became known that a report on proposed constitutional reforms, drawn up by Sir William Brunyate, the Egyptian judicial adviser, completely ignored the national aspirations of the populace. Throughout the country local committees were formed, public meetings held and a campaign waged for 'freedom.' On every hand there were indications that the people were determined and that the situation was serious. . . . The British government refused to concede this fact; apparently it looked upon the nationalist movement as a shallow affair headed by a small group of discontented politicians. The climax came when on . . . [March 6, 1919] Saad Pasha Zaghlul and nine of his associates were summoned before the military officials and warned not to take action which might incite disorder or hinder or embarrass the work of the authorities. The news of this interview quickly circulated and on the following day the delegation issued a . . . protest which the authorities at once interpreted as . . . defiance of the warning. Accordingly on . . . [March 9] Saad Pasha Zaghlul, Mohammed Pasha

Mahmond, Ismail Pasha Sidki and Hamid Pasha el Bassal, the four most prominent members of the delegation chosen to represent Egypt at Paris, were arrested and secretly hurried from their homes to the Kass el-Nil [Kasr en Nil] barracks; the next morning they were . . . [deported to Malta]. Within a few days all Egypt was in revolt."—H. J. Carman, *England and the Egyptian problem* (*Political Science Quarterly*, Mar., 1921, pp. 68-70).

The riots started in Cairo on March 9. "The first to stir were, as usual, the students. They struck work and poured noisily into the streets. . . . Crowds began by gathering outside the railway station, where they waited in vain to greet the departing Four. . . . On the same day, street lamps and tramway cars were smashed in Sharia Mohamed Ali, in the heart of the modern Europeanized Cairo. The next morning, the 10th, large crowds of street roughs and holidaymaking workmen paraded the streets in various quarters . . . and did considerable damage to shops and public establishments. . . . Ultimately fire was opened on the crowd. There were several casualties and a large number of arrests. For three days the demonstrations had been confined to Cairo. But on Wednesday, the 12th, the trouble had already spread. The *fellaheen* were beginning to take a hand in the business of tearing up railway and telegraph lines. There was rioting at Tanta, Damanhour, Zagazig, Mansura, Shebib el Kom and Menouf. . . . An Order under Martial Law was posted on the walls and rained by aeroplanes all over the country, warning 'all whom it may concern that any person who destroys, damages, or tampers in any way with railway, telegraph, and telephone communications, or who attempts to commit any of these acts, is liable under martial law to be shot.' On the 15th the disorders extended to Upper Egypt. At Regga, the morning express from Cairo was attacked and pillaged. . . . At Wasta several trains, including goods trains, were completely sacked. An official of the Egyptian State Railways, Mr. A. T. Smith, was murdered. . . . At Hawamdieh, the large sugar factory was attacked by villagers. . . . At Beni-Suef, crowds invaded the Law Courts during a sitting, drove out the officials, and tried, but unsuccessfully, to get hold of the British judge. They then proceeded to attack the Mudirieh and various other Government offices, which they wrecked. . . . In Lower Egypt the main railway line was destroyed between Kaliub and Benha, and Cairo cut off from the whole of the Delta. . . . These quotations might be considerably amplified, for it was not till April 18th that Major-General Shea, to whom had been entrusted the restoration of order in Upper Egypt, reached Assuan, and occasional outbreaks of violence and some cases of armed resistance occurred even later. But the rebellion had been scotched by the end of March. In three weeks it had strewn Egypt with wreckage. A sum of £1,000,000 [was] allotted in [the yearly] Budget for the compensation of innocent sufferers, but it . . . [represented] only a small part of the damage actually done. . . . Whatever share of responsibility the blunders committed by British civil and military authorities during the war must bear for having sown the tempest, they would have incurred a still deeper responsibility had they flinched before the whirlwind when it came and plunged Egypt into anarchy. We owed it to Egypt to rescue her from anarchy, and she was rescued."—V. Chirol, *Egyptian problem*, pp. 177-181, 188-189.—At the commencement of the riots the high commissioner, Sir F. R. Wingate,

was absent from Egypt and General Allenby was on his way to England. The latter was ordered to return to Egypt immediately as "Special High Commissioner" and invested with plenary powers. He arrived in Egypt on March 25, 1919, and immediately rescinded the deportation order against the four nationalists. Rushdi Pasha then resumed his office, appealed to the people to preserve order, and resigned again on April 21. Next day the American diplomatic agent communicated to General Allenby President Wilson's recognition of the British protectorate, also expressing hopes for the realization of the autonomous aspirations of the Egyptian people. A general strike broke out towards the end of the month. General Allenby issued a proclamation demanding that all government employees who were absent without leave should return to their posts or be punished. "Every person who, by persuasion, threats, or violence, prevents, or seeks to prevent, any person from complying with this order will be liable to arrest and prosecution before a military court." This proclamation proved effective; the strike soon subsided. Egypt was without a cabinet for some weeks until, at the end of May, Mohammed Said Pasha accepted the premiership. Public excitement calmed down to almost normal conditions. At the end of October it was announced that "Field Marshal Viscount" Allenby had been appointed high commissioner for Egypt and the Sudan in succession to General Wingate. Lord Allenby issued a declaration on November 15 to the effect that the British government proposed to develop the autonomy of Egypt under British protection. There was a cabinet change in November, which produced a new ministry under Youssef Wahba Pasha. In December, a special mission with Viscount Milner, secretary of state for the colonies, as its chairman, arrived at Cairo to investigate the causes of the disorders in Egypt.

1920.—Milner mission's investigation.—Return of the commission.—Continuation of discussion with nationalists in London.—Joint memorandum to the government.—Continued disorder.—Lord Milner's party "was boycotted severely and found it difficult to get testimony of influential persons regarding what is best for the country. Members of the Egyptian delegation refused to appear. The mission traveled extensively in the country, however, and saw enough to convince it that the demand for independence was universal. This was accentuated by an announcement of the University on Jan. 7 urging Britain to 'recognize the complete independence of a country distinguished by a glorious heritage and a peculiar predominance in the Orient.' The commission returned to London last March, and Zaghlul with some of the Nationalist delegates followed it there in May. Meanwhile one of their number, Mahmud Pasha, came to Washington, set up an Egyptian Nationalist headquarter, and employed ex-Governor Folk of Missouri to forward their interests. The attitude of the Senate and the Administration was shown to be favorable, and Mr. Folk suggested that it would be advisable for the Nationalists to indicate to the Milner commission a basis of settlement which would be acceptable to the Egyptians. This advice was followed, and the conditions urged in London were: (1) Abolition of the protectorate; (2) internal independence, except foreign rights, public debts, and control of the Suez Canal; (3) external independence. These proposals were favorably received, and a joint conference was held, the outcome of which is the agreement of Great Britain to recognize the independence of Egypt."—*New York Times Current*

History, Oct., 1920.—See also SÈVRES, TREATY OF: 1920: Part 3: Political clauses: Egypt, etc.—During the summer an Egyptian deputation, headed by Zaghlul Pasha, held a series of conferences with the Milner commission in London. These continued from June till August, when Zaghlul returned to Egypt and informed his countrymen that an agreement on the question of independence had been arrived at, and he recommended its acceptance. In October the Nationalist delegation returned to London for further discussion, and early in November the following joint Memorandum, resulting from the conferences, was published:

1. In order to establish the independence of Egypt on a secure and lasting basis, it is necessary that the relations between Great Britain and Egypt should be precisely defined, and the privileges and immunities now enjoyed in Egypt by the capitulatory Powers should be modified and rendered less injurious to the interests of the country.

2. These ends cannot be achieved without further negotiations between accredited representatives of the British and Egyptian Governments respectively in the one case, and between the British Government and the Governments of the capitulatory Powers in the other case. Such negotiations will be directed to arriving at definite agreement on the following lines:—

3. (I.) As between Egypt and Great Britain a Treaty will be entered into, under which Great Britain will recognise the independence of Egypt as a constitutional monarchy, with representative institutions, and Egypt will confer upon Great Britain such rights as are necessary to safeguard her special interests, and to enable her to furnish the guarantees which must be given to foreign Powers to secure the relinquishment of their capitulatory rights.

(II.) By the same Treaty, an Alliance will be concluded between Great Britain and Egypt, by which Great Britain will undertake to support Egypt in defending the integrity of her territory, and Egypt will undertake, in case of war, even when the integrity of Egypt is not affected, to render to Great Britain all the assistance in her power within her own borders, including the use of her harbours, aerodromes, and means of communication for military purposes.

4. This Treaty will embody stipulations to the following effect:—

(I.) Egypt will enjoy the right to representation in foreign countries. In the absence of any duly accredited Egyptian representative, the Egyptian Government will confide its interests to the care of the British representative. Egypt will undertake not to adopt in foreign countries an attitude which is inconsistent with the Alliance, or will create difficulties for Great Britain, and will also undertake not to enter into any agreement with a foreign Power which is prejudicial to British interests.

(II.) Egypt will confer on Great Britain the right to maintain a military force on Egyptian soil for the protection of her Imperial communications. The Treaty will fix the place where the force shall be quartered, and will regulate any subsidiary matters which require to be arranged. The presence of this force shall not constitute in any manner a military occupation of the country, or prejudice the rights of the Government of Egypt.

(III.) Egypt will appoint, in concurrence with his Majesty's Government, a Financial Adviser, to whom shall be entrusted in due course the powers at present exercised by the Commissioners

of the Debt, and who will be at the disposal of the Egyptian Government for all other matters on which they may desire to consult him.

(IV.) Egypt will appoint, in concurrence with his Majesty's Government, an official in the Ministry of Justice, who shall enjoy the right of access to the Minister. He shall be kept fully informed on all matters connected with the administration of the law as affecting foreigners, and will also be at the disposal of the Egyptian Government for consultation on any matter connected with the efficient maintenance of law and order.

(V.) In view of the contemplated transfer to his Majesty's Government of the rights hitherto exercised under the *régime* of the Capitulations by the various foreign Governments, Egypt recognises the right of Great Britain to intervene, through her representative in Egypt, to prevent the application to foreigners of any Egyptian law now requiring foreign consent, and Great Britain on her side undertakes not to exercise this right except in the case of laws operating inequitably against foreigners.

Alternative:

In view of the contemplated transfer to his Majesty's Government of the right hitherto exercised under the *régime* of the Capitulations by the various foreign Governments, Egypt recognises the right of Great Britain to intervene through her representative in Egypt, to prevent the application to foreigners of any Egyptian law now requiring foreign consent, and Great Britain on her side undertakes not to exercise this right except in the case of laws inequitably discriminating against foreigners in the matter of taxation, or inconsistent with the principles of legislation common to all the capitulatory Powers.

(VI.) On account of the special relations between Great Britain and Egypt created by the Alliance, the British representative will be accorded an exceptional position in Egypt and will be entitled to precedence over all other representatives.

(VII.) The engagements of British and other foreign officers and administrative officials who entered into the service of the Egyptian Government before the coming into force of the Treaty, may be terminated, at the instance of either the officials themselves or the Egyptian Government, at any time within two years after the coming into force of the Treaty. The pension or compensation to be accorded to officials retiring under this provision, in addition to that provided by the existing law, shall be determined by the Treaty. In cases where no advantage is taken of this arrangement, existing terms of services will remain unaffected.

5. This Treaty will be submitted to the approval of a Constituent Assembly, but it will not come into force until after the agreements with foreign Powers for the closing of their Consular Courts and the decrees for the reorganization of the Mixed Tribunals have come into operation.

6. This constituent Assembly will also be charged with the duty of framing a new Organic Statute, in accordance with the provisions of which the Government of Egypt will in future be conducted. The Statute will embody provisions for the Ministers being responsible to the Legislature. It will also provide for religious toleration for all persons and for the due protection of the rights of foreigners.

7. The necessary modifications in the *régime* of the Capitulations will be secured by agreements to be concluded by Great Britain with the various capitulatory Powers. These agreements will provide for the closing of the foreign Consular

Courts, so as to render possible the reorganisation and extension of the jurisdiction of the Mixed Tribunals and the application to all foreigners in Egypt of the legislation (including legislation imposing taxation) enacted by the Egyptian Legislature.

8. These agreements will provide for the transfer to his Majesty's Government of the rights previously exercised under the *régime* of the Capitulations by the various foreign Governments. They will also contain stipulations to the following effect:—

(a) No attempt will be made to discriminate against the nationals of a Power which agrees to close its Consular Courts, and such nationals shall enjoy in Egypt the same treatment as British subjects.

(b) The Egyptian Nationality Law will be founded on the *jus sanguinis*, so that the children born in Egypt of a foreigner will enjoy the nationality of their father and will not be claimed as Egyptian subjects.

(c) Consular officers of the foreign Powers shall be accorded by Egypt the same status as foreign Consuls enjoy in England.

(d) Existing Treaties and Conventions to which Egypt is a party on matters of commerce and navigation, including postal and telegraphic Conventions, will remain in force. Pending the conclusion of special agreements to which she is a party, Egypt will apply the Treaties in force between Great Britain and the foreign Powers concerned on questions affected by the closing of the Consular Courts, such as extradition Treaties, Treaties for the surrender of seamen deserters, etc., as also Treaties of a political nature, whether multilateral or bilateral, e.g., arbitration Conventions and the various Conventions relating to the conduct of hostilities.

(e) The liberty to maintain schools and to teach the language of the foreign country concerned will be guaranteed, provided that such schools are subject in all respects to the laws applicable generally to European schools in Egypt.

(f) The liberty to maintain or organise religious and charitable foundations, such as hospitals, etc., will also be guaranteed.

The Treaties will also provide for the necessary changes in the Commission of the Debt and the elimination of the international element in the Alexandria Board of Health.

9. The legislation rendered necessary by the aforesaid agreements between Great Britain and the foreign Powers, will be effected by decrees to be issued by the Egyptian Government.

A decree shall be enacted at the same time, validating all measures, legislative, administrative, or judicial, taken under Martial Law.

10. The decrees for the reorganisation of the Mixed Tribunals will provide for conferring upon these Tribunals all jurisdiction hitherto exercised by the foreign Consular Courts, while leaving the jurisdiction of the Native Courts untouched.

11. After the coming into force of the Treaty referred to in Article 3, Great Britain will communicate its terms to foreign Powers and will support an application by Egypt for admission as a member of the League of Nations.

"The abolition of the capitulations is opposed by foreigners, wealthy middlemen, who exploit the trade of the country under cover of their respective flags and are exempt from taxation." On November 12 Lord Allenby, who had been temporarily out of the country, returned to Cairo and received a cordial welcome. "A counter-

demonstration by a crowd of extreme Nationalists occurred later in the centre of the city, in which great hostility was shown to the English and the Sultan, but the mob was quickly dispersed by the police. The next day the students struck and organized demonstrations all over Cairo. Windows were broken and street cars attacked. A British officer was shot and seriously wounded on Nov. 14, and four days later cafés and shops in the Shubra quarter, where the attack occurred, were ordered closed after dusk."—*New York Times Current History*, Apr., 1921, p. 93.

"There can be no doubt that when the British went to Egypt they never meant to stay there. No Englishman, official or unofficial, dreamed on the morrow of Tel-el-Kebir that we should be on the Nile to-day. When Lord Wolseley left 10,000 British troops in Egypt after crushing Arabi, he did so for the preservation of order. The very officers charged with clearing up the muddle left by the revolt and by Ismail's deplorable financial policy talked about 'a few months' or 'a year or two.' The last thing Mr. Gladstone's Government thought of was a permanent occupation of Egyptian territory. Even the rise of Mahdism in the Sudan did not affect this serene conviction. At first the British Government never troubled itself about the Sudan at all. When Hicks Pasha started on his fatal march, he did so at the bidding, or with the sanction, of the Khedive's Ministry. Great Britain expressly washed her hands of the whole affair. Had we watched Sudan policy as we should have done, General Hicks would probably never have started, and Khartum might never have fallen. It was the enormous encouragement given to the Mahdist revolt by the destruction of Hicks Pasha's army which set in motion the long train of events ending in the battle of Omdurman. We had to try to arrange afterwards the evacuation of the Sudan; then we had to try to rescue Gordon; and when we failed the British public slowly made up its mind that we could not leave Egypt until the inextinguishable tragedy of Gordon's death had been avenged. After Omdurman we were faced with the task of making a new Sudan. We had destroyed the Khalifa's murderous rule, and we had to take his place ourselves. Exactly the same thing happened in Lower Egypt in the eighties. We had disbanded the old Egyptian Army and quelled disorder, but some one had to build up a new Administration. Lord Granville, in his famous circular to the Powers in 1883, announced that we meant to withdraw from Egypt as soon as possible, but that meanwhile we had to undertake 'the duty of giving advice with the object of securing that the order of things to be established shall be of a satisfactory character, and possess the elements of stability and progress.' Giving advice would never have restored stability and progress to Egypt, and after Lord Dufferin had visited Cairo and prepared his scheme of reforms, it was slowly realized that we must carry them out ourselves. We need a man, and we found him in Lord Cromer."—*The Times (London)*, May 24, 1913.—"When Great Britain intervened in Egypt, the British government officially announced that its sole purpose was to 'restore the power of the khedive.' Indeed, on August 10 [1882], more than a month before the rout of the Nationalists, Mr. Gladstone said during a debate in the House of Commons: 'I can go so far as to answer the honorable gentleman when he asks me whether we contemplate an indefinite occupation of Egypt. Undoubtedly of all things in the world, that is the thing we are not going to do.

It would be absolutely at variance with all the principles of Her Majesty's government and the pledges we have given Europe and with the views, I may say, of Europe itself.' Immediate withdrawal was impossible, for without assistance the khedive seemed powerless to maintain order or to undertake the reforms so urgently needed to cure the existing economic and political ills, and British authorities argued, therefore, that the army of occupation should remain long enough to 'reestablish on a firm basis the authority of the khedive and to make provision for the future well-being of all classes of the Egyptian people.' It was with this understanding that Lord Granville in a note to the Powers under date of January 3, 1883, in referring to the presence of the British army in Egypt, declared that 'Her Majesty's government is desirous of withdrawing it as soon as the state of the country and the organization of the proper means for the maintenance of the khedive's authority will admit of it.' This statement of policy was emphasized and elaborated by Mr. Gladstone when on August 9, 1883, he asserted in the House of Commons that the government was opposed to permanent occupation or annexation: 'We are against everything that resembles it and approaches it, and against all language that tends to bring about an expectation of it. We are against it on the ground of the interest of England; we are against it on the ground of the specific and solemn pledges given to the world in the most solemn manner and under the most critical circumstances—pledges which have earned for us the confidence of Europe at large during the course of difficult and delicate operations, and which, if one pledge can be more sacred than another, special sacredness in this case binds us to fulfil.' For thirty years following this statement the Egyptian people were given similar assurances by official Britain: Lord Dufferin, Sir Charles Dilke, Lord Derby, Lord Salisbury, Lord Cromer, Sir Edward Grey and Sir Eldon Gorst emphatically declared that Great Britain had no intention of remaining in Egypt and, above all else, would never proclaim a protectorate. It was for this reason that Lord Dufferin vigorously opposed holding the Egyptian people 'in any irritating tutelage'; rather he preferred that 'they should lead their own lives and administer their own government unimpeded by any external anxieties and preoccupations.' On the other hand it was just as vigorously maintained that the Egyptians unaided could not work out their salvation; that they must first be schooled in the elements of self-government before they could enjoy the blessings of national independence. In other words Egypt must be 're-created' and made fit for Egyptians. Great Britain, it was contended, should remain as the Egyptian schoolmaster until there had been 'established on sure foundations the principles of justice, liberty and public happiness.'"—H. J. Carman, *England and the Egyptian problem (Political Science Quarterly, Mar., 1921, pp. 52-54)*.—"There followed, under English tutelage, thirty years of tranquillity, during which Egypt grew in population and steadily increased in prosperity and production. Slavery was abolished and the octroi discontinued. The fellahen waxed fat on their fertile farms, and the great university of El Azhar turned out 4,000 students a year from all parts of the Moslem world, becoming gradually a centre of Egyptian nationalism as well as of Moslem theology. Yet Great Britain retained control, and her unfulfilled pledge of abandoning the occupation of Egypt, given by Gladstone in 1882, was occasionally referred to

by European diplomatists as a glaring instance of British bad faith."—*New York Times Current History*, Oct., 1920, p. 22.

1921.—Lord Milner's report made public.—The "Report of the Special Mission to Egypt" (Cmd. 1131) was published on Feb. 10, 1921, five days after the resignation of Lord Milner from the cabinet. The Mission consisted of Viscount Milner, then secretary of state for the colonies (chairman); Sir Rennell Rodd, General Sir John G. Maxwell, Brigadier-General Sir Owen Thomas, M.P., Sir Cecil J. B. Hurst (Foreign office), and Mr. J. A. Spender, editor of the *Westminster Gazette*. The mission was charged "To inquire into the causes of the late disorders in Egypt, and to report on the existing situation in the country and the form of the Constitution which, under the Protectorate, will be best calculated to promote its peace and prosperity, the progressive development of self-governing institutions, and the protection of foreign interests." Referring to the memorandum of August 18, 1920, the report states that "This document, which presently came to be known as the Milner-Zaghlul Agreement . . . was not an agreement, but merely an outline of the bases on which an agreement might subsequently be framed." It was understood that Zaghlul Pasha and his friends "might make free use of it in public discussion in Egypt." The memorandum was in accordance with conclusions at which the commission had arrived before leaving Egypt; but "as a result of our discussions with Zaghlul Pasha and his associates, we were now prepared to go somewhat further." The record of this advance is clearly outlined in the section of the report dealing with the representation of Egypt in foreign countries (pp. 26-28): "It has always been, and is from our point of view, a fundamental principle that the foreign relations of Egypt should be under the general direction of Great Britain. . . . It is obviously impossible to expect that Great Britain should shoulder the responsibility of defending the integrity and independence of Egypt against all possible dangers, if that country were free to pursue a policy of her own in foreign affairs inconsistent with or prejudicial to the policy of Great Britain. This axiom none of the Egyptians with whom we were dealing ever attempted to dispute. They were quite prepared—in a Treaty of Alliance—to give whatever pledges might be necessary to exclude the possibility of any action on the part of Egypt which could cause embarrassment to her great Ally." Again "the impossibility of our assenting" to Egypt's being left "free to follow a foreign policy independent of Great Britain . . . was not disputed." The question was whether this principle necessarily involved the conduct of all her foreign relations remaining in British hands. The commission originally held that British control should be limited to Egypt's political relations, and that Egyptian commercial interests should be left in Egyptian hands; Egypt's representatives having only consular, not diplomatic, status. The Egyptian delegates, however, held quite other views, and considered that "the denial of diplomatic status to the representatives of Egypt . . . would make the settlement we were contemplating entirely unacceptable to their countrymen." They urged that Egyptian representatives "could not take any action injurious to British interests . . . without breaking the Treaty"; that the number of such representatives would be very limited, since Egypt did not desire, and could not afford, to have them in more than a few countries; and that the entrusting of Egyptian interests elsewhere to the care of Great Britain would mark

"the specially intimate character of the relations between the two countries." "The Commission," says the report, "could not but feel that these were weighty considerations"; but it expressed some uneasiness lest the presence of Egyptian diplomatists in a few European capitals and of foreign diplomatists in Cairo, with nothing to do, "might lead to much trouble," as they might be tempted "to justify their existence by transgressing their proper functions." The Egyptian delegates, however, "would not admit that there was any real danger of this happening": under the treaty, Egyptians would be the last to favour intrigues which might make mischief between them and Great Britain; and "the greatest safeguard which we could have . . . was the fact that the Egyptians themselves would be wholeheartedly in favour of an Alliance which fully recognised their national status and dignity." These arguments led the commission to reconsider their position on the question.

The paragraphs devoted to "The Defence of Imperial Communications" are likely to make more satisfactory reading for the British people. "It was quite impossible" for the commission to agree to the proposal that the British troops "should be stationed on the Suez Canal, and preferably on its eastern side." But while it is admitted that any force that Great Britain may keep in the country "should not be regarded in any sense as a garrison of Egypt," the question where it should be stationed was left open for the conclusion of the contemplated Treaty. The remaining paragraphs of this section are concerned with the British officials in the Egyptian service and reservations for the protection of foreigners. It is recognised that the Egyptians look forward, naturally enough, "to the time when the whole, or almost the whole, of the public service will be staffed by their fellow-countrymen"; and the commission is inclined to think that the importation of British officials has been somewhat overdone of late years. But while the retirement of the British officials would not mean that the country would relapse into the deplorable condition from which we rescued it, the "new model" would be exposed to dangers of deterioration if they were suddenly withdrawn or dismissed. "The number of Egyptians qualified by education and character to take part in the work of government on civilised principles has greatly increased since the occupation. All the Egyptians, even the humblest, have become so habituated to the new standard of orderly, equitable, and honest administration that a complete return to the abuses of the past would not be tolerated" (page 29). On page 30 the question is asked, "Will it still be possible to carry on the perpetual struggle against corruption and nepotism, and for promotion by merit and not by influence, with any measure of success? Such fears are not unnatural."

In regard to the protection of foreigners and the safeguarding of foreign interests, the report clearly states the reasons why the financial adviser and the official of the ministry of justice are to be appointed only in concurrence with the British government. Those reasons are fairly obvious; they are unlikely to be challenged outside Egypt. The retention of this very slight degree of control would be indeed a small price to pay for the removal of the incubus of the capitulations. A feature of the report which cannot be ignored is the distinction it draws between the official and the fellah, or, rather, between the attitude of these two types towards the mission. Thus, on the first page, we read of the strong contrast between "the

caution and reserve exhibited by the native official world" and "the storm of protest and disapprobation with which the arrival of the Mission was greeted by the native public and the native Press." Again, on page 9, reference is made to "the cordial and intimate relations which many old residents in Egypt, and not a few senior officials and their wives, have established with their Egyptian neighbours"; but this goodwill was, as we know, unable to prevent the boycott of the mission. That boycott, however, "carried out as it mainly was by students and schoolboys," was not approved "by educated Egyptians generally, or even by all those who held advanced Nationalist views." The unfortunate thing seems to have been that moral courage was lacking: "there were a large number of men who were really anxious to bring their views before the Mission, but were deterred from doing so by fear of the personal annoyance to which they might in consequence be exposed." In connection with the quotation above regarding officials, it may be noted that the report mentions the "particular resentment . . . occasioned in Egypt at the time of the arrival of the Mission by a recent increase in the numbers of the British engaged for the public service." The number of British officials has risen from a few hundred to upwards of sixteen hundred, with scales of pay higher than those of Egyptians; and though these higher scales are doubtless justifiable, they have been readily represented as constituting a grievance. It is satisfactory to learn that the mission does not regard as justified the oft-heard criticism that the quality of the British officials has deteriorated; but the critical sense of the Egyptians has been greatly developed.

An important contributory cause of the unrest in Egypt was "the manifest insuccess of educational policy resulting in the production of an unnecessarily large and ever-increasing number of candidates for official posts, provided with examination certificates, but destitute of any real educational culture." Almost inevitably a proportion of these failures turn to political agitation, and the report asserts that "Nationalist propaganda has been at work for many years in Egypt." Most people will agree that "the evolution of a sane and moderate Nationalist spirit might have been regarded with sympathy and interest"; but it is unfortunate that "political rivalries among the Western Powers led it from the first to assume an anti-British colour." Finally, among the causes of unrest, "there is the latent but ever-present impatience of the Moslem with Christian rule. . . . There is in the East a patriotism of religion which is an even more fundamental sentiment than the patriotism of home and tradition."

Two passages bearing on the fellah and the political agitator and his methods may be given from page 15:—"It has been said that "every Egyptian worth his salt is at heart a Nationalist." This is only true of the educated and semi-educated classes, who constitute less than 10 per cent. of the fourteen million inhabitants of Egypt. It would be meaningless as applied to the 92 per cent. of illiterates and especially to the fellahen, who are two-thirds of the whole people. The turbulent crowds of the great towns may indeed be easily worked up to excitement by political catchwords, which they vociferate without understanding. But the fellahen, as a body, are normally very indifferent to politics. They are a primitive peasantry, living on the land and by the land, to which they are passionately devoted. . . . But while their outlook remains limited, their independence has developed, and they are far more tenacious of

their rights than in the old days of despotism. On page 16 we read that "It is inconceivable that the sentiment of their social superiors of every class, of all the men who make opinion, should not in the long run profoundly affect the mass of the people. No doubt Nationalism as a political creed has little attraction for these unlettered millions, though they can easily be taught to repeat its catchwords. But then it is not so much by abstract political arguments that the extremist agitator seeks to win their support, as by the constant vilification of everything British and by subtly attributing every local disaster and every personal grievance to the malignity or incompetence of British officials. This campaign of mendacious denigration is carried on by many agencies, by preachers in the mosques, by country-bred students returning for the holidays, by all but a few organs of the Arabic Press. It is true that the fellah cannot, as a rule, read himself, but he can always be read to, and if everything that is spoken or written to influence him points the same way, the falsehood so sedulously instilled cannot fail ultimately to poison his mind." The Mission, however, was satisfied, even before leaving Cairo, that it would be a profound mistake to take the view that Nationalism is synonymous with violent Anglophobia and aims at the complete subversion of the existing system of government in Egypt.—Adapted from *The Near East*, Mar. 3 and Mar. 10, 1921.

1921.—British cabinet decision on Egypt's future.—Early in March the British government came to the conclusion that the status of Egypt as a protectorate was not satisfactory to either party, and they desired that official negotiations should be entered into in order to substitute for the protectorate a more satisfactory relationship. This decision was communicated to the sultan of Egypt. The announcement was made by Cecil Harmsworth, British under-secretary of state for foreign affairs, who stated: "His Majesty's government have addressed the following invitation to the Sultan of Egypt: 'His Majesty's Government, after a study of the proposals made by Lord Milner, have arrived at the conclusion that the status of protectorate is not a satisfactory relation in which Egypt should continue to stand to Great Britain. While they have not reached final decisions with regard to Lord Milner's recommendations, they desire to confer regarding them with a delegation nominated by your Highness with a view, if possible, to substitute for the protectorate a relationship which would, while securing the special interests of Great Britain and enabling her to offer adequate guarantees to foreign Powers, meet the legitimate aspirations of Egypt and the Egyptian people.'"—Thus, without waiting to submit the report of the special mission to Egypt to a discussion in Parliament, the government went one better than the Milner-Zaghlul agreement.

1921.—Preparation for independence.—Adly Yeghen Pasha premier.—Dissensions with Zaghlul Pasha.—Riots.—"In preparation for negotiations to carry out a scheme of independence for Egypt, a new coalition Cabinet was formed at Cairo on March 15, with Adly Yeghen Pasha as Premier, to conclude an agreement with Great Britain. . . . He at once received the support of the lawyers, the ulama and the students of El Azhar University. The armed police cyclists, who have attended the Ministers since September, 1919, were dispensed with, and there was every sign of popular approval. Zaghlul Pasha arrived from France on April 4 and had an enthusiastic reception. . . . Conferences were begun, at which differ-

ences were apparent between Zaghlul and Adly. The former intimated that the Presidency of the official delegation . . . to go to London to conduct the negotiations, should be reserved for him, and that acceptance of all his reservations by Great Britain should precede negotiations. It became apparent that the Zaghlulists were preparing to compel Adly to allow Zaghlul to formulate the delegations policy."—*New York Times Current History, May, 1921, p. 330.*—"On April 18 Zaghlul Pasha made his first public statement, affirming that he was whole-heartedly ready to co-operate with Adly Pasha's Cabinet provided it would declare that negotiations were to be opened for the purpose of abolishing the protectorate and securing the internal and external independence of Egypt, and if the Milner proposal be made to conform to the Nationalist reservations."—*Ibid., June, 1921, p. 511.*—The main reservation was that Great Britain should expressly abolish the protectorate, while others concerned the limitations of the functions of the financial adviser and of the British officials in the Ministry of Justice and the abandonment of the provision that the proposed treaty should not come into effect until the régime of the capitulations had been modified so as to satisfy the interests of foreign powers. During May semi-political riots broke out in Cairo and Alexandria, accompanied by indiscriminate shooting, incendiarism and plunder. The disturbances were attributed to the fact that Adly Pasha had refused to appoint either Zaghlul Pasha or any of his adherents for the London mission and had decided to go himself. In June a leader of the "Young Egyptians" named Mohammed Fahmy addressed the Council of the League of Nations at Geneva and requested that body to mediate between Great Britain and Egypt to secure independence.

1921.—Secret convention in London.—Text of proposed agreement between Great Britain and Egypt.—Rejection by Egypt.—Delegation's reply.—In July Adly Pasha came to London at the head of a delegation to discuss the status of Egypt with Lord Curzon, by whose insistence the greatest secrecy was preserved. "Both parties were morally pledged to the general lines of the Milner report. . . . But the agreement reached between Lord Milner and the Zaghlul delegation was indefinite on certain points, in particular with regard to the military question. Egypt, it was decided, was to confer on Great Britain the right to maintain a military force on Egyptian soil for the protection of her imperial communications, but it was left to the treaty to fix the place where the force should be quartered, with the proviso that the presence of this force should not constitute in any manner a military occupation of the country, nor prejudice the rights of the government of Egypt."—*Near East, Nov. 3, 1921, p. 562.*—On November 10, the text of a proposed convention between Great Britain and Egypt was handed to Adly Yeghen Pasha by Lord Curzon. The Egyptian delegation rejected these terms in a formal reply on November 15, and on December 3, the British foreign office published both these documents.

Proposed convention:

I.—Termination of Protectorate. 1. The Government of his Britannic Majesty agree, in consideration of the conclusion and ratification of the present treaty, to terminate the Protectorate declared over Egypt on December 18, 1914, and thenceforth to recognise Egypt as a Sovereign State under a constitutional monarchy. There is hereby concluded, and there shall henceforth subsist, be-

tween the Government and people of his Britannic Majesty on the one hand and the Government and people of Egypt on the other hand, a perpetual treaty and bond of peace, amity, and alliance.

II.—Foreign Relations. 2. The foreign affairs of Egypt shall be conducted by the Egyptian Ministry of Foreign Affairs under a Ministry so designated. 3. His Britannic Majesty's Government shall be represented in Egypt by a High Commissioner, who, in virtue of his special responsibilities, shall at all times be entitled to an exceptional position, and shall take precedence over the representatives of other countries. 4. The Egyptian Government shall be represented in London, and in any other capital in which, in the opinion of the Egyptian Government, Egyptian interests may require such representation, by diplomatic representatives enjoying the rank and title of Minister. 5. In view of the obligations which Great Britain has undertaken in Egypt, notably in respect of foreign countries, the closest relations shall exist between the Egyptian Ministry of Foreign Affairs and the British High Commissioner, who will render all possible assistance to the Egyptian Government in respect of diplomatic transactions or negotiations. 6. The Egyptian Government will not enter into any political agreement with foreign Powers without consultation with his Britannic Majesty's Government through the British High Commissioner. 7. The Egyptian Government will enjoy the right of appointing such Consular representatives abroad as their interests may require. 8. For the general conduct of diplomatic relations, and the consular protection of Egyptian interests in places where no Egyptian diplomatic or consular representative is stationed, his Britannic Majesty's representatives will place themselves at the disposal of the Egyptian Government, and will render them every assistance in their power. 9. His Britannic Majesty's Government will continue to conduct the negotiations for the abolition of the existing capitulations with the various capitulatory Powers, and accept the responsibility for protecting the legitimate interests of foreigners in Egypt. His Majesty's Government will confer with the Egyptian Government before formally concluding these negotiations.

III.—Military Dispositions. 10. Great Britain undertakes to support Egypt in the defence of her vital interests and of the integrity of her territory. For the discharge of these obligations and for the due protection of British Imperial communications, British forces shall have free passage through Egypt, and shall be maintained at such places in Egypt and for such periods as shall from time to time be determined. They shall also at all times have facilities as at present for the acquisition and use of barracks, exercise grounds, aerodromes, naval yards, and naval harbours.

IV.—Employment of Foreign Officers. 11. In view of the special responsibilities assumed by Great Britain and of the existing position in the Egyptian army and public services, the Egyptian Government undertake not to appoint any foreign officers or officials to any of those services without the previous concurrence of the British High Commissioner.

V.—Financial Administration. 12. The Egyptian Government will appoint in consultation with his Britannic Majesty's Government, a Financial Commissioner, to whom shall be entrusted in due course the powers at present exercised by the Commissioners of the debt, and who will more especially be responsible for the punctual payment of the following charges:—(i.) The charges for the budget

of the mixed courts. (ii.) All pensions or other annuities payable to retired foreign officials and their heirs. (iii.) The budgets of the Financial and Judicial Commissioners and their respective staffs. 13. For the proper discharge of his duties the Financial Commissioner shall be kept fully informed on all matters within the purview of the Ministry of Finance, and shall at all times enjoy the right of access to the President of the Council of Ministers and to the Minister of Finance. 14. No external loan shall be raised nor the revenue of any public service be assigned by the Egyptian Government without the concurrence of the Financial Commissioner.

VI.—Judicial Administration. 15. The Egyptian Government will appoint, in agreement with his Britannic Majesty's Government, a Judicial Commissioner, who, in virtue of the obligations assumed by Great Britain, shall be charged with the duty of watching the administration of the law in all matters affecting foreigners. 16. For the proper discharge of his duties, the Judicial Commissioner shall be kept fully informed on all matters affecting foreigners which concern the Ministers of Justice and of the Interior, and shall at all times enjoy the right of access to the Egyptian Ministers of Justice and of the Interior.

VII.—Sudan. 17. The peaceful development of the Sudan being essential to the security of Egypt and for the maintenance of her water supply, Egypt undertakes to continue to afford the Sudan Government the same military assistance as in the past, or, in lieu thereof, to provide the Sudan Government with financial assistance to an extent to be agreed upon between the two Governments. All Egyptian forces in the Sudan shall be under the orders of the Governor-General. Great Britain further undertakes to secure for Egypt her fair share of the waters of the Nile, and to this end it is agreed that no new irrigation works on the Nile or its tributaries south of Wadi Halfa shall be undertaken without the concurrence of a Board of three conservators representing Egypt, the Sudan, and Uganda respectively.

VIII.—Tribute Loans. 18. The sums which the Khedives of Egypt have from time to time undertaken to pay over to the houses by which the Turkish loans secured on the Egyptian tribute were issued will be applied as heretofore by the Egyptian Government to the interest and sinking funds of the loans of 1804 and 1891 until the final extinction of those loans. The Egyptian Government will also continue to apply the sum hitherto paid towards the interest of the guaranteed loan of 1855. Upon the extinction of these loans of 1804, 1891, and 1855 all liability on the part of the Egyptian Government arising out of the tribute formerly paid by Egypt to Turkey will cease.

IX.—Retirement and Compensation of Officials. 19. The Egyptian Government shall be entitled to dispense with the services of British officials at any time after the coming into force of this treaty on condition that such officials shall receive monetary compensation as hereafter provided, in addition to any pension or indemnity to which their conditions of service may entitle them. On the like conditions British officials shall be entitled to resign at any time after the coming into force of this treaty. The scheme shall apply to pensionable and non-pensionable officials as well as to employees of municipalities, provincial councils, or other local bodies. 20. An official dismissed or retiring under the terms of the preceding clause shall receive in addition to compensation a repatriation allowance sufficient to cover the cost of transporting himself, his family,

and his household goods to London. 21. Compensation and pensions shall be payable in Egyptian pounds at the fixed rate of 97½ piastres to the pound sterling. 22. A table of compensation, (a) for permanent officials, (b) for temporary officials, shall be prepared by the President of the Society of Actuaries.

X.—Protection of Minorities. 23. Egypt undertakes that the stipulations following shall be recognised as fundamental laws, and that no law, regulation, or official action shall conflict or interfere with these stipulations, nor shall any law, regulation, or official action prevail over them. 24. Egypt undertakes to assure full and complete protection of life and liberty to all inhabitants of Egypt, without distinction of birth, nationality, language, race or religion. All inhabitants of Egypt shall be entitled to the free exercise, whether public or private, of any creed, religion, or belief, whose practices are not inconsistent with public order or public morals. 25. All Egyptian nationals shall be equal before the law, and shall enjoy the same civil and political rights without distinction as to race, language, or religion. Differences of religion, creed, or confession shall not prejudice any Egyptian national in matters relating to the enjoyment of civil or political rights, as, for instance, admission to public employments, functions, and honours, the exercise of professions and industries. No restrictions shall be imposed on the free use by any Egyptian national of any language in private intercourse, in commerce, in religion, in the press or in publications of any kind or at public meetings. 26. Egyptian nationals who belong to racial, religious, or linguistic minorities shall enjoy the same treatment and security in law and in fact as the other Egyptian nationals. In particular, they shall have an equal right to establish, manage, and control, at their own expense, charitable, religious, and social institutions, schools, and other educational establishments, with the right to use their own language and to exercise their religion freely therein.

Delegation's reply:

"The Egyptian official delegation have taken cognisance of the draft handed to their president by Lord Curzon on the 10th inst. The delegation note that with regard to the majority of the questions which have formed the subject of our discussions and of notes exchanged between us during a period of four months, the draft reproduces the texts and the formulæ which were presented to us at the beginning of the negotiations and which we did not accept. Thus, with regard to the military question, which is one of capital importance, the draft not only supports, but even extends, the scope of the solution which we so resolutely opposed. The protection of Imperial communications, which in the conversations of last year was given as the only reason for the presence of a military force in Egypt, could not justify this solution. While it would have been sufficient to agree upon a zone in the region of the Canal, where the ways and means of Imperial communications and the force for their protection might have been localised, the draft confers on Great Britain the right to maintain military forces at all times, on any part of Egyptian territory, and places at her disposition all the ways and means of communication in the country. This constitutes occupation pure and simple, destroys every idea of independence, and suppresses even internal sovereignty. In the past military occupation, although it had only a temporary character.

sufficed to guarantee to Great Britain absolute control over the whole administration without the need of any textual treaty or any definition of the powers whatever. With regard to the question of foreign relations, the only point on which the original formula of the Foreign Office has been modified by the acceptance of the principle of representation, the right which has been recognised as ours is surrounded by so many restrictions that it becomes to a certain extent illusory. It cannot be thought that the Minister for Foreign Affairs would be able freely to undertake the responsibilities of his office, if he were compelled by a formal stipulation to maintain the closest relations with the High Commissioner, that is to say, in fact to submit to his direct control in the conduct of foreign affairs. Further, the obligation to submit to the consent of Great Britain all political agreements, even those that are not incompatible with the spirit of the alliance, constitutes a serious infringement of the principle of external sovereignty. Finally, the maintenance of the title of High Commissioner, which it is not customary to confer on diplomatic representatives accredited to independent countries, emphasises yet further the character of the political status proposed for Egypt. Again, the problem of the capitulations having been postponed, we had every reason to believe that there ought to be no further question of it in the agreement, and that it would be dealt with later by Egypt, the party chiefly interested, with the diplomatic co-operation of her ally. But now the problem is regarded as one that principally interests Great Britain, who takes upon herself from henceforth the protection of foreign interests and intends eventually to carry on alone the negotiations relative to the abolition of the capitulations. With regard to the Financial and Judicial Commissioners and their interference, in the name of the protection of foreign interests, with the whole internal administration of the country, interference going so far in certain cases, as regards the Financial Adviser, as to constitute a check on the Government and Parliament, we do not wish to touch again upon the objections put forward in our various notes. We must, however, say that from the discussions which followed on the postponement of the question of the capitulations we did receive the impression that an agreement would be reached with regard to the protection of foreign interests on other bases more compatible with the sovereignty of Egypt. With regard to the question of the Sudan, which had not yet been discussed, we feel bound to point out that it has been made the subject of provisions which we cannot accept, and which do not guarantee to Egypt the exercise of her indisputable right of sovereignty over that country and of control of the waters of the Nile. The foregoing observations render it unnecessary for us to analyse the draft, the spirit and scope of which they have sufficiently brought out. And the insistence with which it refers to the obligations of Great Britain, 'the special responsibilities' of the High Commissioner and the new reason given for the presence of the military force, viz., the protection of the vital interests of Egypt, have the effect of investing the draft with the quality of an actual deed of guardianship. When we accepted the mission with which his Highness the Sultan entrusted us, we hoped to conclude a treaty of alliance which, while truly establishing the independence of Egypt, would have safeguarded British interests, and Egypt as the ally of Great Britain would have held it a point of honour

scrupulously to fulfil the obligations which would have been incumbent upon her. But an alliance between the two peoples cannot be realised save with the condition that it does not constitute for one of them a permanent pact of subjection. The conciliatory spirit in which our discussions were conducted entitled us to look forward to the result of the negotiations with confidence. The draft which we have in our hands does not correspond with that expectation. In its present form it does not allow us to retain the hope of arriving at an agreement which will give satisfaction to the national aspirations of Egypt.

"After continuing negotiations for an Egyptian settlement . . . Adly Pasha's delegation gave up the task on November 19 and left the next day for Egypt. Britain, it was conceded, would find it easy to grant independence to the Egyptians, a single nation with one race and practically one religion, were it not that the right of Britain to guard her communications through the Suez Canal, keeping garrisons in Cairo and Alexandria, was insisted upon by the Foreign Office and refused by the Egyptians. Adly's contention was that British troops should be confined to the canal zone, that Egypt should control her own foreign relations and Britain abandon her claim to the Anglo-Egyptian Sudan, now under joint control."—*New York Times Current History, Feb., 1922, p. 866.*

1921.—Lord Allenby's note to Sultan of Egypt.—British government views.—Imperial policy.—Necessity for maintaining troops.—Promise of future termination of protectorate.—On December 3, when the British Foreign Office published the text of the proposed convention with Egypt, and the reply of Adly Pasha's delegation, Lord Allenby, British High Commissioner for Egypt and the Sudan, addressed the following communication to the Sultan:—"Your Highness:—I have the honour, in accordance with instructions received from his Majesty's Government, to place before your Highness the following statement of their views in connection with the negotiations that have recently taken place with the delegation despatched by your Highness under the presidency of his Excellency Adly Pasha. His Majesty's Government have presented to Adly Pasha the draft proposals for a treaty between the British Empire and Egypt which they were prepared to recommend to his Majesty the King and to Parliament and have learnt with keen disappointment that these are not acceptable to him. They regret it the more because they regarded their proposals as liberal in character and far-reaching in effect, and because they cannot hold out any prospect of reconsideration of the principle on which they are framed. It is therefore proper that they should acquaint your Highness fully with the main considerations by which they were guided, and with the spirit in which their proposals were made. One dominant fact has governed the association of Great Britain and Egypt for forty years, and must always govern it, namely, the close coincidence between Great Britain's interests in Egypt and the interests of Egypt herself. The independence and the prosperity of the Egyptian people are both of great importance to the British Empire. Egypt lies upon the main line of communications between Great Britain and the King's dominions to the east. The whole territory of Egypt is indeed essential to those communications, since the fortunes of Egypt are inseparable from the security of the Suez Canal zone. . . . The general success of that association during the

generation which preceded the Great War was universally recognised. When Great Britain first began to take an active interest in Egypt the Egyptian people were a prey to financial chaos and administrative anarchy. . . . If the Egyptian people are a vigorous and self-respecting nation to-day they owe that recovery largely to British assistance and advice. They have been secured against foreign intervention; they have been helped to create an efficient system of administration; large numbers of them have been trained in the arts of government; their power has steadily grown; their finances have prospered beyond all expectations; the welfare of all classes has been laid on firm foundations. . . . The outbreak of war between the great European Powers in 1914 made the association between the British Empire and Egypt of necessity more close. . . . In the extension of the war brought about by Turkey many thousands of the King's subjects from India, Australia, and New Zealand, as well as from Great Britain, were maimed or killed. Their graves in Gallipoli, Palestine, and Irak stand as witness of the great effort which Turkish intervention cost the British Commonwealth. Covered by their ranks Egypt passed scathless through that period of ordeal. Her losses were inconsiderable; her debt was not increased; her wealth is now greater than before the war, whilst economic paralysis lies heavy on most other lands. It is not wise for her people to overlook these facts or forget to whom they are owed. . . . Now, as in the past, the British Empire has to shoulder ultimate responsibility for the defence of your Highness's territories against external menace, as also for such assistance as your Highness's Government may at any time request in the maintenance of your authority at home. It must claim, moreover, the exclusive right of tendering such advice as your Highness's Government may require in the administration of the country, the conduct of its finances, the development of its judicial system, and the pursuance of its relations with foreign Governments. These claims are not, however, asserted with any desire to derogate from Egypt's enjoyment of the full rights of national self-government. . . . The treaty provisions which his Majesty's Government consider necessary to maintain these rights and cover these responsibilities were formulated in the draft proposals which Adly Pasha will communicate to your Highness. Of these the most essential are those relating to British troops. . . . Scarcely a generation has passed since she was rescued from anarchy, and there are signs that the extremest elements in the Nationalist movement are even now capable of plunging her back into the abyss from which she has so recently been raised. The anxiety of his Majesty's Government on this point has been aggravated by the unwillingness of your Highness's delegation to recognise that the British Empire must have firm guarantees against any such menace to its interests. . . . [His Majesty's Government] repeat, however, with emphasis, that their claims in this respect are not intended to involve the continuance of an actual or virtual protectorate. On the contrary, the ideal which they have sincerely at heart is that of an Egypt enjoying the national prerogatives and international position of a sovereign State, but closely wedded to the British Empire by a treaty guarantee of common aims and interests. With this end in view, they proposed to terminate the protectorate forthwith, to recognise Egypt as 'a sovereign State under a constitutional monarchy,' and to substitute for the present relation between the Empire and Egypt 'a perpetual treaty and bond of peace,

amity, and alliance.' Their hope was that Egypt, with a reconstituted Ministry of Foreign Affairs, would at once have despatched her own representatives to foreign Courts; and they would readily have supported an application on her part for admission to the League of Nations. The Egyptian nation would have thus secured at once the powers and privileges of a sovereign State. The rejection of these proposals by your Highness's existing Government creates a new situation. It will not affect the principle of British policy, but it necessarily reduces the measures which can now be carried out. His Majesty's Government therefore desire to state clearly where they stand. With regard to the immediate present, they cannot give effect to their proposals without the consent and co-operation of the Egyptian nation; but they maintain the desire, which they have long entertained, to provide for the ever-advancing development of native talent by an increase in the number of Egyptians employed in every branch, and notably in the higher branches of the Administration, hitherto too extensively filled by Europeans. They are willing to pursue, in consultation with your Highness's Government, the negotiations in foreign Courts necessary for the abolition of the capitulations, so that the international situation may be clear when the Egyptian legislation necessary to take the place of the capitulations is ready to be passed. They would wish that the powers now exercised by the Commander-in-Chief under martial law should be exercised only under the Egyptian civil law by the Egyptian Government, and they will gladly withdraw martial law as soon as the Act of Indemnity, which is indispensable for the protection of that Government as well as of the British authorities in Egypt, has been enacted and become operative in all the civil and criminal courts in Egypt. With regard to the future, his Majesty's Government desire to state in plain terms the policy which they intend to pursue. They understand that the proposals presented to your Highness's delegation were rejected on the ground that the safeguards for British and foreign interests contained in them would be fatal to the genuine exercise of self-government. They deeply regret that the maintenance of British troops in Egypt and the association of British officials with the Ministries of Justice and Finance should be so gravely misunderstood. The progress of Egypt towards her ideals will not only be retarded, but completely jeopardised, if her people are tempted to indulge their national aspirations, however sound and legitimate in themselves, without sufficient regard to the facts which govern international life. . . . The world is suffering in many places at the present time from the cult of a fanatical and purely disruptive type of nationalism. His Majesty's Government will set their face against it as firmly in Egypt as elsewhere. . . . They desire to see the work of Lord Cromer's generation completed, not recommenced. They do not aim at keeping Egypt in tutelage. On the contrary, they desire to fortify the constructive elements in Egyptian nationalism, to give them scope, and to bring nearer the full attainment of the national ideal. But they must insist on effective rights and powers to safeguard both Egypt's interests and their own until the Egyptian people have shown the capacity themselves to preserve their country from internal disorder and its inevitable corollary, the intervention of foreign Powers. The true line of advance for the Egyptian people is by co-operation with the British Empire, and not by antagonism to it. In this spirit of co-operation his Majesty's Government on their

side are prepared to consider any methods which may be suggested for carrying out the substance of their proposals, whenever your Highness's Government may so desire. They cannot, however, modify the principle on which their proposals are based or relax the essential safeguards which they contain. . . . It is for the responsible leaders of Egypt, in this second generation of her association with Great Britain, to prove by their acceptance and steady use of the national status now open to them that the vital interests of the Empire in their country may be progressively entrusted to their care.

"The Egyptians having declared, through the Press and in several speeches at public gatherings, that the Treaty proposed by Great Britain was unacceptable, the [Adly Pasha] Cabinet had no alternative but to resign. It resigned on Thursday afternoon [Dec. 8, 1921] handing to the Sultan a formal letter stating that as the Government had been unable to fulfil the mandate given to it by His Highness and the Egyptian people, it had no reason to continue in office. At the same time Adly Pasha handed in the Delegation's explanatory note on the negotiations. . . . Coincidental with the submission of the resignation, two strong appeals were issued by the dissentient members of Zaghloul's delegation—who have been supporting Adly Pasha—and the Egyptian Democratic Party respectively. Both documents reviewed the recent relations of Great Britain and Egypt, accused the British Government of having deceived Egypt, suggested that as Great Britain desired to maintain her rule over Egypt she should be left to shoulder alone the functions of Government, and warned any and every Egyptian that acceptance of Ministerial office under present conditions would be regarded 'as a stab in Egypt's back.'"—*Near East*, Dec. 22, 1921.—Sarwat Pasha was invited by the Sultan to form a ministry, but declined to do so.

1921-1922.—Agitation by Zaglul Pasha.—Strikes and riots.—British military action.—Arrest and deportation of Zaglul Pasha.—Sarwat Pasha's terms to Great Britain.—"Zaglul Pasha, on the day of Adly's arrival in Cairo, issued a manifesto stating that Britain had always toyed with Egypt, after the occupation promising evacuation and after the protectorate independence, but had thrown aside the mask and demanded that Egypt form part of the British Empire. He appealed to his followers to use their energies for the liberation of the country. . . . Rioting began in several places during the week before Christmas and on December 24 extended to Gizeh, where students raided the Government Survey offices, but were ejected by British troops, leaving five killed and twenty wounded. . . . British armed boats moved up the sacred river (the Nile) and airplanes circled over the tombs of the Pharaohs. . . . The disturbances were largely due to the forcible removal of Zaglul Pasha from Cairo to Suez early in the morning of Dec. 23 on his refusal to obey an order by General Allenby to refrain from political activity."—*Near East*, Jan. 5, 1922.—"Meanwhile, agitators had been at work all over Lower Egypt. Serious troubles flared out at Port Said and Suez, and the British military authorities were impelled to take over both towns. Rioting also occurred at Tanta, and on Christmas Day a curfew from 10 P.M. to 5 A.M. was instituted with the object of lightening the night patrol of the British troops. Strikes were declared by almost every section of Egyptian workers, whether professional or manual. The Government officials went out for three days, but their return

to duty was accelerated by the announcement that those absent would be deprived of their pay for the length of time they were away. Lawyers, all students, the cab-drivers, Cairo tramwaymen, and other sectional unions stopped work as a protest against the declared British policy and against the arrest of Zaghloul and his colleagues. On Christmas Day the curve of trouble rose to its highest. Renewed disorders were reported from practically all centres in Lower Egypt. . . . The British troops had occupied the most important caravels in Cairo on Friday; but there was one, near the Azhar University, which had been left to the local authorities. On Monday morning [Dec. 26] the mob determined to wreck this building. They attacked it, but the defenders were not playing the game with kid gloves on: they shot at the crowd, and they shot to kill. According to official information, five were killed and four wounded. This brought the casualties in Cairo up to about 20 killed and 70 or 80 wounded. Meanwhile, a number of isolated attacks had been made on Europeans, but never at any time during the trouble has there been any determined manifestation of xenophobia. Things became a little more serious at Suez on Monday [Dec. 26]. . . . The higher classes of the Egyptians began to recoil from the shock of the swiftly-moving drama which had been staged during the Christmas season, and there was a general tendency towards unity. The dissentient members of Zaghloul's old Delegation at once fraternised with such members of Zaghloul's committee as were left; and together they issued a proclamation through every line of which ran a feeling of bitter hostility to Britain. The Native Press also published envenomed articles, which conveyed everything but hints of reconciliation to British policy. . . . Quick action followed. The English *Egyptian Gazette* . . . (and the) *Istiklal* . . . were suspended for two days. . . . The returning calm allowed time for consideration of the political position. Obviously there was no hope of an Egyptian Cabinet in the circumstances, and the High Commissioner authorised the under-secretaries of the respective Ministries to assume the powers and functions of the Ministers provisionally, and pending the formation of another Cabinet. On Thursday evening Zaghloul and his five colleagues were deported to Ceylon. The news became generally known in Cairo and throughout the country on Friday evening [Dec. 30]."—*Near East*, Jan. 19, 1922.—"On Jan. 10, twenty-seven participants in the riots were sentenced to several months' imprisonment and a number of others were ordered flogged."—*New York Times Current History*, Feb., 1922.

1922 (January-February).—Lord Allenby's intervention.—British declaration to Egypt.—Protectorate ended.—"On December 6, Lord Allenby telegraphed to Lord Curzon: 'During the past twelve months I have more than once given it as my opinion that no signed agreement was practicable unless His Majesty's Government were prepared to accord to Egypt a higher degree of independence than they are clearly disposed to grant, and that it would therefore eventually be incumbent upon them to define their own policy and give effect to it. The situation which I foresaw has come into existence and it behooves us to deal with it. . . . I consider that the Draft Treaty definitely represents a policy which fulfils all our requirements so far as Egypt is concerned. This policy confers upon the people of Egypt a substantially greater participation in the conduct of their internal affairs, but at the same time ensures that our own vital interests are adequately safe-

guarded.' He was advising H. M. Government that 'the present moment is a favourable one . . . to adopt a strong line calculated to supply a constructive programme to those Egyptians who are not unwilling to co-operate with us'; and he recalled the fact that Adly Pasha at his last interview with Lord Curzon had asked why H. M. Government 'did not on its own initiative bring into operation the plan indicated in the rejected draft treaty.' Later in the same dispatch we read: 'I quite appreciate that the action I advocate would oblige His Majesty's Government to terminate the protectorate by a unilateral declaration on their part. You will recall that a step such as this was at one time suggested, and I cannot see why it should not be taken.' On December 12, the High Commissioner reports the terms on which Sarwat Pasha was ready to take office. A week later he reports that Sarwat 'has not yet been able to collect a Ministry.' Then, after a series of messages describing the arrest of Zaahloul and his lieutenants, and other events in Egypt, there is a message giving the Sarwat's proposals for the composition of a Ministry. It is interesting to note that all the names therein mentioned actually appear in the list of members of the Cabinet just formed [Mar. 6]. At the end of January, after first suggesting that Sir G. Clayton and Mr. Sheldon Amos should be sent to England to advise H. M. Government of the situation, the Government summoned Lord Allenby himself to London.—*Correspondence respecting affairs in Egypt (British Government White Paper, Cmd. 1502, Mar., 1922)*.—"Lord Allenby found himself confronted with an even more difficult situation than after the resignation of the Rushdi Cabinet in 1910. No responsible Egyptian would undertake to form a new Ministry except on conditions which the British Government refused to sanction. There was this difference, however, between 1910 and 1922, that Lord Allenby had had three years' experience of Egypt and had come to the conclusion that without the co-operation of a friendly Egyptian Government he could no longer carry on. . . . He gave his reasons why very frankly and fully. But British Ministers were still loth to believe him, and only when they realised the gravity of the situation which would have been created in Egypt, and perhaps also in Parliament, by his resignation, did they summon him over once more to 'advise.' He gave his advice and backed it up with such cogent arguments that he carried the position in Downing Street by storm, just as he had carried the Turkish positions in Palestine."—*Near East, Mar. 9, 1922*.

"As a result of his visit he was instructed to communicate to the Sultan the Declaration referred to above, together with a covering letter. These are as follows:—

"*Letter handed to Sultan Fuad by Lord Allenby.*

"Your Highness,—

"I have the honour to bring to your Highness' notice that certain passages of the explanatory note which I addressed to you on December 3, 1921, were interpreted, to my great disappointment, in a manner not in accordance with the intention and policy of his Majesty's Government.

"2. Judging by many comments which have been published on the subject of this note, it would appear that many Egyptians were under the impression that Great Britain was about to abandon her liberal and favourable attitude towards Egyptian aspirations and to make use of her special position in Egyptian order to maintain a political and ad-

ministrative régime incompatible with the freedom she had offered.

"3. Such an interpretation of the intentions of his Majesty's Government was quite mistaken. On the contrary, the explanatory note emphasised the dominating principle that the guarantees claimed by Great Britain are not designed to involve the continuance of an actual or virtual protectorate. Great Britain as it is stated therein, sincerely desires to see 'an Egypt enjoying the national prerogatives and the international position of a sovereign State.'

"4. If Egyptians have regarded these guarantees as being out of keeping with the position of a free country they have, on the other hand, lost sight of the fact that Great Britain has been obliged to claim them out of consideration for her own security in face of a situation which demands great prudence on her part, particularly in the matter of the disposition of her troops. Present world conditions, however, and the state of effervescence which has prevailed in Egypt since the Armistice are not permanent factors, and it is to be hoped that while, on the one hand, the former will eventually improve, on the other hand, the time will come when, in the language of the note, Egypt's record will give confidence in her own guarantees.

"5. As to any design to interfere in the internal administration of Egypt, his Majesty's Government have sufficiently stated, and repeat, that their most ardent desire is to place in Egyptian hands the conduct of their own affairs. The draft agreement proposed by Great Britain did not depart from this idea, and in making provision for the presence of two British officials in the Ministries of Finance and Justice, it was not her intention to use these two officials for the purpose of intervening in Egyptian affairs, but solely in order to preserve the contact necessary for protecting foreign interests.

"6. Such is the sole bearing of the guarantees that were demanded by Great Britain. They were claimed without any desire to impede Egyptians enjoying the full rights of a national Government.

"7. Animated as she is by these intentions, it will be understood that it is repugnant to Great Britain on the one hand, to see Egyptians delay by their own acts the realization of an ideal aimed at by both parties, and, on the other, to be compelled herself to intervene to re-establish order when it is threatened in such a way as to arouse the fears of foreigners and to involve the interests of foreign Powers. It would be much to be regretted if Egyptians should see in the exceptional measures which have recently been taken any prejudice to the ideal to which they aspire or an intention on the part of His Majesty's Government to alter the policy I have indicated. In taking these measures, the sole desire of His Majesty's Government has been to put an end to a harmful agitation which, by arousing popular passions, might have such consequences as to jeopardise the whole result of the efforts of the Egyptian nation. These measures were taken primarily in the interest of the Egyptian cause, which has everything to gain by being studied in an atmosphere of calm and friendly discussion.

"8. Now that tranquillity seems to be re-establishing itself, thanks to the wise spirit which is the root of the Egyptian character and asserts itself in times of crisis. I am happy to be able to announce to your Highness that his Majesty's Government are prepared to recommend the accompanying declaration for the approval of Parliament. This will, I am confident, establish a

régime of mutual confidence and lay the foundation for a satisfactory and final solution of the Egyptian problem.

"9. There is no obstacle to the re-establishment forthwith of an Egyptian Ministry for Foreign Affairs which will prepare the way for the creation of the diplomatic and consular representation of Egypt.

"10. The creation of a Parliament with a right to control the policy and administration of a constitutionally responsible Government is a matter for your Highness and the Egyptian people to determine. Should circumstances arise to delay the coming into force of the Act of Indemnity with application to all inhabitants of Egypt mentioned in the declaration accompanying this note, I desire to inform your Highness that I shall be prepared, pending the repeal of the proclamation of November 2, 1914, to suspend the application of martial law in respect of all matters affecting the free exercise of the political rights of Egyptians.

"11. It is now for Egypt to respond, and it is to be hoped she will justly appreciate the good intentions of Great Britain, and that reflection and not passion will guide her attitude.

"Declaration to Egypt.

"Whereas his Majesty's Government in accordance with their declared intentions, desire forthwith to recognise Egypt as an independent sovereign State; and

"Whereas the relations between his Majesty's Government and Egypt are of vital interest to the British Empire;

"The following principles are hereby declared:—

"1. The British Protectorate over Egypt is terminated, and Egypt is declared to be an independent sovereign State.

"2. So soon as the Government of his Highness shall pass an Act of Indemnity with application to all inhabitants of Egypt martial law as proclaimed on the 2nd November, 1914, shall be withdrawn.

"3. The following matters are absolutely reserved to the discretion of his Majesty's Government until such time as it may be possible by free discussion and friendly accommodation on both sides to conclude agreements in regard thereto between his Majesty's Government and the Government of Egypt:—

"(a) The security of the communications of the British Empire in Egypt;

"(b) The defence of Egypt against all foreign aggression or interference, direct or indirect;

"(c) The protection of foreign interests in Egypt and the protection of minorities;

"(d) The Sudan.

"Pending the conclusion of such agreements the *status quo* in all these matters shall remain intact."

—*Correspondence respecting affairs in Egypt (British Government White Paper, Cmd. 1592, March, 1922).*

1922 (March).—New régime opened.—First cabinet council.—Two British finance officials.—New Constitution promised.—Declaration of independence.—Sultan Fuad proclaimed king of Egypt.—British warning.—"The Sultan of Egypt presided over the first Council of his new Cabinet on March 6 at the Abdin Palace. The Council confirmed Mr. E. M. Dowson as Financial Adviser and Mr. F. T. Dillin as Under-Secretary of Finance and Posts. It is noteworthy that the Financial Adviser was absent from to-day's Council. The non-attendance of the Financial

Adviser to-day marks a step towards independence and, together with the appointment of the Egyptian Under-Secretaries in all the Ministries, should certainly be regarded as an earnest of the sincerity of our [British] intention to carry out what we promised. The new Constitution with which the country is to be endowed will entail the renunciation by the Sultan of certain of his prerogatives. . . Sarwat Pasha's letter to the Sultan accepting office gives the new Cabinet's programme. The Cabinet considers that satisfaction will be given to national aspirations by the immediate declaration of independence and by the fact that free and friendly negotiations will take place later on for the discussion of guarantees. The Cabinet declares its intention to draft a Constitution, with a new electoral law, providing for the establishment of Ministerial responsibility, which will permit Parliament to control the politi-

KING FUAD

First king of modern Egypt

cal and administrative work of the Government. The letter announces the creation of a Ministry for Foreign Affairs to pave the way for diplomatic and Consular representation abroad. Sarwat Pasha further declares that he assumes full responsibility for the administration of the country, and calls on the nation for support by maintaining peace and concord.—*The Times (London), Mar. 7, 1922.*

"The proclamation of the Sultan, Ahmed Fuad Pasha, as King of Egypt today was accompanied by the firing of salvos of 101 guns in Cairo, Alexandria and Port Said, and of 21 guns in all the other provincial Capitals [on March 16]. Field Marshal Viscount Allenby, hitherto the British High Commissioner, accompanied by members of his staff, called at the Royal Palace and congratulated King Fuad, whom he addressed as 'Your Majesty.' Through Premier Sarwat Pasha, the King addressed a letter to 'our noble nation,' in which he said in part: 'God has graciously permitted the independence of Egypt to be attained by our hands. We are grateful to God, and hereby

announce to the world that from today Egypt enjoys independence and sovereignty. We have taken for ourself the title His Majesty, King of Egypt, in order to insure the country's dignity and its international status. We ask God and the nation to bear witness that we shall endeavor to work for the welfare and happiness of our beloved country. We hope this day will inaugurate an era which will restore Egypt's grandeur.' A rescript issued by the Sultan last night announced that Egypt had become an independent and sovereign State and that the Sultan would assume the title King of Egypt."—*New York Times*, Mar. 17, 1922.

"King Fuad of Egypt's proclamation follows naturally upon the recent British abandonment of the protectorate and recognition of Egypt as an independent sovereign State. Great Britain's action did not of itself confer sovereign independence upon Egypt. By international law the right of proclaiming independence and securing recognition thereof belongs inherently to a country itself. Thus King Fuad is simply carrying out the new arrangement. Simultaneously all British Ambassadors and Ministers abroad have been instructed to inform all foreign Governments of Egypt's new status and of Great Britain's abandonment of the protectorate, at the same time pointing out that as far as Great Britain's special relations, established and recognized by all Powers for forty years, are concerned, the status quo will be maintained until such time as Egypt herself embodies them in the direct negotiation of a treaty with these countries. In defining these special relations the British Government has specifically and exclusively reserved to its own discretion the following matters: (1) Security of British Imperial communications in Egypt; (2) defense of Egypt against all foreign aggression or interference direct or indirect; (3) protection of foreign interests and foreign communities in Egypt. In notifying the world of its attitude in regard to these special relations, Great Britain proclaims its Monroe Doctrine toward Egypt and declares, to quote Prime Minister Lloyd George's dispatch of Feb. 27 to the Dominion Premiers, that 'we will not admit them to be questioned or discussed by another power; we will regard as an unfriendly act any attempt at interference in the affairs of Egypt by another power; we will consider any aggression against the territory of Egypt as an act to be repelled with all the means at our command.'"—*Ibid.* (*Special London cable*).—This declaration was re-emphasized on March 27 in a dispatch from Lord Curzon to all British diplomatic representatives abroad.

1922 (April–September).—Framing a constitution.—Decree fixing succession to throne.—New national flag.—Recognition by United States: Abolition of Capitulations negatived.—Restriction of drug traffic.—Outlines of constitution.—First American minister to Egypt appointed.—Increasing lawlessness.—A commission of thirty-five members, headed by Hussein Rushdi Pasha, who had been premier from 1914 to 1918, was appointed by the government in April to draft a constitution. Early in May it was reported that the commission had decided to decree in the constitution that the sovereignty of the king extended over the Sudan, since 1899 known as the Anglo-Egyptian Sudan, a great territory of some 950,000 square miles. On April 17 the king issued a rescript declaring the throne to be hereditary in the dynasty of Mehemet Ali and confirming his (the king's) son, Prince Fuad, as heir-apparent. Abbas Hilmi II, the ex-khedive, who had been deposed by the British in 1914, was expressly excluded from

the succession and the country; his property was later confiscated. A new national flag was adopted, composed of a white crescent and three white stars on a green background. The United States government recognized the new kingdom of Egypt on April 27, with the proviso that the proposed abolition of the Capitulations was not carried out. In May the import and export of deleterious drugs—opium, cocaine, hashish—were prohibited except under legal restrictions. During the summer and early autumn the drafting of the constitution was proceeded with. The Sudan was incorporated in the kingdom and the political divisions of the country were left unchanged. "All Egyptian subjects are equal before the law and have equal civil and political rights. All subjects belonging to racial, religious or political minorities have the same rights as any other person of Egyptian nationality. But this does not mean that they shall have proportionate representation in Parliament. The refusal of the commission to provide for proportionate representation has gravely offended the Copts, and the Coptic Bishop of Alexandria, vice-ruler of the Church and a member of the commission, resigned from it on June 10, because he did not desire to take part in a discussion that was becoming bitter. The Copts fear that the Moslems will ultimately control the Egyptian Parliament to the detriment of Coptic interests. That question, however, as well as the sovereignty of the Sudan, is reserved for future settlement between Britain and Egypt"—*New York Times Current History*, August, 1922, p. 899.—In June the first American minister to Egypt was appointed in the person of Dr. J. Morton Howell of Ohio. He was received in audience by the king on August 29. A disquieting feature marked the early period of Egyptian independence in the shape of an epidemic of lawlessness. During 1922 there were numerous cases of brigandage, kidnapping, murder and robberies. Great Britain felt obliged to make serious representations to the Egyptian government through General Allenby, the High Commissioner in Cairo, with a warning that, if the series of outrages against British officials did not cease, the British government would be compelled to reconsider its attitude towards Egypt.

1922 (May).—Represented at Genoa congress of oriental peoples. See GENOA CONGRESS OF ORIENTAL PEOPLES.

1922 (October).—Representation of minorities.—Future of the Sudan.—"Two important questions are uppermost in Egyptian politics—the representation of minorities in Parliament and the future of the Sudan. The Constitution Commission, by a vote of 15 to 7, rejected the proposal to guarantee a minimum representation of minorities in the new Parliament and vigorous protests are being heard from the Copts, the largest Egyptian religious minority, the Syrians and the Jews, all of whom demand the right to be represented in Parliament. To offset the commission's inclusion of the Sudan in the new kingdom, Lord Allenby went to Khartoum and met a group of thirty shieks of Sudanese tribes, who expressed their loyalty to the British Government. . . . Women are active [in Cairo] in fighting for the franchise and campaigning for the new Parliament preceding the October elections."—*New York Times Current History*, Nov., 1922, p. 331.

1922-1923.—Cabinet resignation.—Discovery of the tomb of Tut-ankh-Amen.—The Sarwat ministry resigned on the 20th owing to disagreement with the British over the question of the Sudan, culminating in a demand that this great territory should be specified in the new constitution as Egyptian, and under the dominion of the king of Egypt. Tewfik Nessim Pasha, a former premier, succeeded Sarwat Pasha with a strong ministry.

An important discovery of ancient Egyptian relics, valued at \$15,000,000, was revealed on Nov. 29 by Lord Carnarvon and his associate, Howard Carter, an American artist. These Egyptologists had conducted excavating operations for nearly sixteen years on the site of the royal Theban

couches, all gilt, with exquisite carving and heads of Typhon, Hathor, and lion. On these rested beds, beautifully carved, gilt, inlaid with ivory and semi-precious stones, and also innumerable boxes of exquisite workmanship . . . Beneath one of the couches was the State Throne of King Tutankhamen, probably one of the most beautiful objects of art ever discovered. There was also a heavily gilt chair with portraits of the King and Queen, the whole encrusted with turquoise, cornelian, lapis, and other semi-precious stones. Two life-sized bituminized statues of the King, with gold work, holding a golden stick and mace, faced each other, the handsome features, the feet, and the hands delicately carved, with eyes of glass and

THE VALLEY OF KINGS AT THEBES

Along the foot of these cliffs and cut within them are the tombs of the Kings of the xviii-xxth dynasties. The temple of Devi el-Bahri, built by Queen Hatasu and dating from 1600 B. C., is seen in the foreground. To the left of this temple the tomb of Tut-ankh-Amen was found.

ncropolis on the west bank of the Nile at Luxor. This extraordinary find, described as the greatest discovery of Egyptian art, consisted, among other objects, of the funeral paraphernalia of the Egyptian king, Tut-ankh-Amen, one of the heretic kings of the Eighteenth Dynasty, about the middle of the fourteenth century B. C. (see above: B. C. 1370.) Directly below the tomb of Rameses VI. was found a portal to what looked like a *cache*. "The sealed outer door was carefully opened; then a way was cleared down some sixteen steps along a passage of about 25 feet. The door to the chambers was found to be sealed as the outer door had been, and, as on the outer door, there were traces of reclosing. With difficulty an entrance was effected, and when at last the excavators managed to squeeze their way in, an extraordinary sight met their eyes, one that they could scarcely credit. First they saw three magnificent State

head-dress richly studded with gems. [These statues guarded the door of the tomb chamber itself, which had been broken into by some ancient marauder, and again sealed.] There were also four chariots, the sides of which were encrusted with semi-precious stones and rich gold decoration. . . . Other noteworthy objects were Royal sticks, . . . also a stool for a throne with Asiatics carved on it, denoting that the King had placed his foot on the neck of the Asiatic prisoners taken in war. There were some quaint bronze-gilt musical instruments and a robing dummy for Royal wigs and robes. There were also some exquisite alabaster vases with very intricate . . . design, all of one piece, and some handsome blue Egyptian faience, and enormous quantities of provisions for the dead, comprising trussed duck, haunches of venison, &c., all packed in boxes according to the custom of the time. There were some remarkable

wreaths, still looking evergreen, and one of the boxes contained rolls of *papyrus*, which are expected to render a mass of information. A further chamber revealed an indescribable state of confusion. Here furniture, gold beds, exquisite boxes, and alabaster vases similar to those found in the first chamber were piled high one on top of the other, so closely packed that it was impossible to get inside. Numbers of these treasures are in a fairly good state of preservation, but others are in a somewhat precarious condition."—Cairo Correspondent, *The Times* (London, Weekly edition), Dec. 7, 1922.—During January, 1923, the antechamber of the tomb was cleared; the collected relics were duly recorded, and, where necessary, placed in the care of experts to undergo a process of preservation. On Feb. 16, an entrance was made into the sealed chamber of the pharaoh's tomb. Here a great square canopy filled most of the space, the outer doors of which yielded, revealing an inner set of doors, encrusted with gold and precious stones, the seals of which were intact and showed no evidence of ever having been broken. On the walls were painted scenes from Tut-ankh-Amen's life, and there were canopic jars containing the heart and other organs of the dead king. In an adjoining chamber were new objects of artistic and historical value. By the end of the month, however, the entrance to the tomb was closed up and the removal of objects from the sarcophagus enclosure postponed until fall.

EL, AL or UL, three methods of transliterating the Arabic definite article. The same word also means "of the." The vague styles of pronouncing the vowels in Arabic have led Europeans to employ the three forms given above, though the vowel is originally the same in all cases: the first letter of the alphabet—"Alif" or "Elif" (Hebrew "Aleph," Greek "Alpha"). Thus, Abd-ul-lah (Abdullah) and Abdallah both mean "slave of God." There is no particular reason for describing a former Turkish sultan as Abdul Aziz and a later Moroccan sultan as Abd-el-Aziz (as is generally done), since the two names are absolutely identical, and should be spelled alike. When al, el or ul occurs before a so-called "sun-letter"—i.e.,

tay, thay, dal, dzal, re, ze, sinn, shinn, sad, dad, ta, tsa, or nun, the "1," itself a sun-letter, is silenced and the following consonant is doubled. Thus what is written Nur-el-din (light of the faith) is pronounced Nureddin; Koh-el-nur becomes Koh-en-nur (Kobinoor, "mountain of light"), Abd-el-Rahman (slave of the compassionate) becomes Abdurrahman; el-shems (the sun) turns into esh-shems, el-sabt (Sunday, "the seventh"), es-sabt.

ELAGABALUS (204-222), Roman emperor from 218 until 222, when he was murdered. See **ROME: Republic: 192-284.**

ELAM.—"Genesis calls a tribe dwelling on the Lower Tigris, between the river and the mountains of Iran, the Elamites, the oldest son of Shem. Among the Greeks the land of the Elamites was known as Kissia [Cissia], and afterwards as Susiana, from the name of the capital. It was also called Elymais."—M. Duncker, *History of antiquity*, bk. 2, ch. 1.—"Elam, like Babylonia, was a geographical region, not a state [see **ASSYRIA: Map**]. It contained a number of cities, some upland, like Susa, which has yielded all the detailed evidence we have as yet; some maritime, and probably engaged in oversea trade like Babylonian Erech; some, lowland and fenland settlements like Babylon and Lagash. The states, like those of Babylonia, had their own material interests, their own friendships and feuds, their own ideals of conduct and beliefs about the will of heaven. But in addition they clearly maintained a type of civilization which had a strong common likeness, and developed strong contrasts with that which prevailed beyond the Tigris. There were also two standing sources of trouble between the two regions. First, Babylonia is practically devoid of stone, of wood—with the exception of palm and willow—and of metals of any kind. Elam abounds, in all these, and Susa in particular is the key to some of the best and most accessible. More than this, Elam held a practical monopoly, for nowhere else beyond the lower Tigris is there water transport, or even a valley road, like those offered by the Kerkheh and Karun; the nearest alternative sources, in fact, are in Assyria, some three hundred miles away. Here, then, was a 'Naboth's vineyard' to tempt any Babylonian king who thought he was strong enough."—J. Myres, *Dawn of history*, pp. 123-125.—"In her struggles with Chaldaea, Elam was not successful during the earliest historical period of which we have obtained information; and, so far as we can tell at present, her princes long continued to own allegiance to the Semitic rulers whose influence was predominant from time to time in the plains of Lower Mesopotamia. . . . The worker of this change in the political condition of Elam and the author of her independence was a king named Kutir-Nakhhunte or Kutir-Na'khunde, whose name and deeds have been preserved in later Assyrian records, where he is termed Kudur-Nankhundi and Kudur-Nakhunde. This ruler, according to the Assyrian king Ashurbani-pal, was not content with throwing off the yoke under which his land had laboured for so long, but carried war into the country of his suzerain and marched through Babylonia devastating and despoiling the principal cities. This successful Elamite campaign took place, according to the computation of the later Assyrian scribes, about the year 2280 B. C., and it is probable that for many years afterwards the authority of the

King of Elam extended over the plains of Babylonia."—L. W. King and H. R. Hall, *Egypt and western Asia*, pp. 223, 236-237.—"Nor was this a passing inroad or raid of booty-seeking mountaineers. It was a real conquest. Khudur-Nankhundi and his successors remained in Southern Chaldea. . . . This is the first time we meet authentic monumental records of a country which was destined through the next sixteen centuries to be in continual contact, mostly hostile, with both Babylonia and her northern rival, Assyria, until its final annihilation by the latter [649 B. C., under Assur-bani-pal, who reduced the whole country to a wilderness]. Its capital was Shushan (afterwards pronounced by foreigners Susa), and its own original name Shushinak. Its people were of Turanian stock, its language was nearly akin to that of Shumir and Accad. . . . Elam, the name under which the country is best known, both from the Bible and later monuments, is a Turanian word, which means, like 'Accad,' 'Highlands.' . . . One of Khudur-Nankhundi's next successors, Khudur-Lagamar, was not content with the addition of Chaldea to his kingdom of Elam. He had the ambition of a born conqueror, and the generalship of one. The Chap. xiv. of Genesis—which calls him Chedorlaomer—is the only document we have descriptive of this king's warlike career, and a very striking picture it gives of it. . . . Khudur-Lagamar . . . lived, according to the most probable calculations, about 2200 B. C."—Z. A. Ragozin, *Story of Chaldea*, ch. 4.—"With the advent of the First Dynasty in Babylon Elam found herself face to face with a power prepared to dispute her claims to exercise a suzerainty over the plains of Mesopotamia. . . . From the date-formulae of Hammurabi's reign we learn that the struggle between Elam and Babylon was brought to a climax in the thirtieth year of his reign, when it is recorded in the formulae that he defeated the Elamite army and overthrew Rim-Sin, while in the following year we gather that he added the land of Emutbal, that is, the western district of Elam to his dominions. . . . But Rim-sin was only crippled for the time, and, on being driven from Ur and Larsam, he retired beyond the Elamite frontier and devoted his energies to the recuperation of his forces against the time when he should feel himself strong enough again to make a bid for victory in his struggle against the growing power of Babylon. It is probable that he made no further attempt to renew the contest during the life of Hammurabi, but after Samsu-iluna, the son of Hammurabi, had succeeded to the Babylonian throne, he appeared in Babylonia at the head of the forces he had collected, and attempted to regain the cities and territory he had lost. The portion of the text of the chronicle relating to the war between Rim-Sin and Samsu-iluna is broken so that it is not possible to follow the campaign in detail, but it appears that Samsu-iluna defeated Rim-sin, and possibly captured him or burnt him alive in a palace in which he had taken refuge."—L. W. King and H. R. Hall, *Egypt and western Asia*, pp. 239, 243-246.—It is among the discoveries of recent times, that Cyrus the Great was originally king of Elam, and acquired Persia by conquest.—See also **BABYLONIA: First Babylonian empire; PERSIA: B. C. 549-521.**

Treaty of (1800). See FRANCE: 1800 (January-June).

ELASTIC CLAUSE.—Article I, section 8, clause 18 of the constitution of the United States has been called the "elastic clause." It gives to Congress certain enumerated powers, (see CONGRESS OF THE UNITED STATES: Activities of the House and Senate: Powers) and also the right "to make all laws which shall be necessary and proper for carrying into execution the foregoing powers." This clause has been interpreted in two diametrically opposed ways; the so-called "strict constructionists" claiming that Congress should exercise only those powers explicitly granted to it by the constitution, and the "loose constructionists" holding that the constitution must be liberally interpreted and that Congress may assume intended and implied powers.—See also U. S. A.: 1801; 1803; also U. S. A., CONSTITUTION OF.

1735.—Ceded to Spain by Austria. See FRANCE: 1733-1735.

1802.—Annexation to France. See FRANCE: 1802 (June-October).

1814.—Napoleon in exile. See FRANCE: 1814 (March-April); (April-June).

ELBASSAN, town in Albania, sixty-four miles southeast of Scutari; taken by Bulgarian forces, 1916; occupied by the Italians, Oct. 7, 1918; now part of the independent state of Albania.

ELBE RIVER, European river formerly called Albis, which rises in the Reiselgebirge, and after a winding course through Bohemia, Saxony, and Prussia, flows into the North Sea at Cuxhaven. The river, which has been canalized for seventy-five miles, is navigable for barges to Aussig in Bohemia, and for ocean liners to Hamburg, sixty miles from its mouth which is ten miles wide. Canals connect it with the Oder, the Spree and the Trave. (See CANALS: Principal European canals; Germany.) This great water way has had an important influence on the commercial history of Germany. In 1919 it was internationalized by one of the provisions of the Treaty of Versailles.—See also GERMANY: 1901 (January); VERSAILLES.

EL DORADO: Quest of the legendary city of. —"When the Spaniards had conquered and pillaged

the civilized empires on the table lands of Mexico, Bogota, and Peru, they began to look round for new scenes of conquest, new sources of wealth; the wildest rumours were received as facts, and the forests and savannas, extending for thousands of square miles to the eastward of the cordilleras of the Andes, were covered, in imagination, with populous kingdoms, and cities filled with gold. The story of El Dorado, of a priest or king smeared with oil and then coated with gold dust, probably originated in a custom which prevailed among the civilized Indians of the plateau of Bogota; but El Dorado was placed, by the credulous adventurers, in a golden city amidst the impenetrable forests of the centre of South America, and, as search after search failed, his position was moved further and further to the eastward, in the direction of Guiana. El Dorado, the phantom god of gold and silver, appeared in many forms. . . . The settlers at Quito and in Northern Peru talked of the golden empire of the Omaguas, while those in Cuzco and Charcas dreamt of the wealthy cities of Paytiti and Enim, on the banks of a lake far away to the eastward of the Andes. These romantic fables, so firmly believed in those old days led to the exploration of vast tracts of country, by the fearless adventurers of the sixteenth century, portions of which have never been traversed since, even to this day. The most famous searches after El Dorado were undertaken from the coast of Venezuela, and the most daring leaders of these wild adventures were German knights."—C. R. Markham, *Introduction to Simon's account of the expedition of Ursua and Aguirre (Hakluyt Society, 1861)*.—"There were, along the whole coast of the Spanish Main, rumours of an inland country which abounded with gold. These rumours undoubtedly related to the kingdoms of Bogota and Tunja, now the Nuevo Reyno de Granada. Belalcazar, who was in quest of this country from Quito, Federman, who came from Venezuela, and Gonzalo Jimenez de Quesada, who sought it by way of the River Madalena, and who effected its conquest, met here. But in these countries also there were rumours of a rich land at a distance; similar accounts prevailed in Peru; in Peru they related to the Nuevo Reyno, there they related to Peru; and thus adventures from both sides were allured to continue the pursuit after the game was taken. An imaginary kingdom was soon shaped out as the object of their quest, and stories concerning it were not more easily invented than believed. It was said that a younger brother of Atabalipa fled, after the destruction of the Incas, took with him the main part of their treasures, and founded a greater empire than that of which his family had been deprived. Sometimes the imaginary Emperor was called the Great Paytite, sometimes the Great Moxo, sometimes the Enim or Great Paru. An impostor at Lima affirmed that he had been in his capital, the city of Manoa, where not fewer than 3,000 workmen were employed in a silversmiths' street; he even produced a map of the country, in which he had marked a hill of gold, another of silver, and a third of salt. . . . This imaginary kingdom obtained the name of El Dorado from the fashion of its Lord, which has the merit of being in savage costume. His body was anointed every morning with a certain fragrant gum of great price, and gold dust was then blown upon him, through a tube, till he was covered with it: the whole was washed off at night. This the barbarian thought a more magnificent and costly attire than could be afforded by any other potentate in the world, and hence the Spaniards called him El Dorado, or the Gilded One. A history of all the expeditions

which were undertaken for the conquest of his kingdom would form a volume not less interesting than extraordinary"—R. Southey, *History of Brazil*, v. 1, ch. 12.—The most tragic and thrilling of the stories of the seekers after El Dorado is that which Mr. Markham introduces in the quotation above, and which Southey has told with full details in "Expedition of Orsua," and "Crimes of Aguirre." The most famous of the expeditions were those in which Sir Walter Raleigh engaged, and two of which he personally led—in 1595, and in 1617-1618. Released from his long imprisonment in the Tower to undertake the latter, he returned from it, broken and shamed, to be sent to the scaffold as a victim sacrificed to the malignant resentment of Spain. How far Raleigh shared in the delusion of his age respecting El Dorado, and how far he made use of it merely to promote a great scheme for the "expansion of England," are questions that will probably remain forever in dispute.

See also RECALL; SHORT BALLOT; SUFFRAGE, MANHOOD; SUFFRAGE, WOMAN.

ELECTIONS, Presidential: Austria.—Under the Constitution of Austria, adopted on

October 1, 1920, the president of the republic is elected by the two Houses in joint session, for a term of four years, and may be re-elected once only.—See also AUSTRIA: 1920; SUFFRAGE, MANHOOD: Austria: 1921.

Chile. See CHILE: 1920 (June).

Czecho-Slovakia.—"It was provided [by the constitution passed by the National Assembly on February 20, 1920] that the president of the republic should be elected every seven years by the Two Houses of Parliament, sitting in joint session after the pattern of a presidential election in France."—*Annual Register*, 1920, p. 221.—See also below: France.

France.—"The supreme representative of the executive power in France to-day is a President elected by an absolute majority of the suffrages of the Senate and the Chamber of Deputies united as the National Assembly. It is at Versailles, in a wing of the magnificent chateau erected by Louis XIV, that this election takes place. . . . When the Assembly is convoked for a Presidential election the members vote without discussion. The urn is . . . placed in the tribune, and as an usher with a silver chain calls their names in a sonorous voice the members of the Assembly pass in a file in order to deposit their ballot-papers. The President of the session is the President of the Senate. . . . The President whom the National Assembly has just chosen is elected for seven years. He is re-eligible. Constitutionally speaking, there is nothing to prevent his being re-elected as long as he lives. . . . Let us suppose that the end of the seven years has arrived. It is necessary to proceed to a new election. How is the National Assembly to be convoked? The President in office is supposed to issue the convocation, and he should summon the Assembly at least a month before the legal term of his powers. If by some improbable chance he were to neglect this duty, the session would be held, according to a summons from the President of the Senate, a fortnight before the expiration of the Presidential powers. . . . In case of the decease or resignation of a President the two Chambers meet immediately with full powers. There may, however, be an interval of two or more days, during which France will have no President. During this short interval the Council of Ministers will be invested with full executive powers."—R. Poincaré, *How France is governed*, pp. 167-170.

Germany.—"The provisions regarding the President of the Republic are comparatively brief. He is chosen by the whole German people, and must have completed his thirty-fifth year. Further details concerning his election and qualification are left to subsequent legislation. His term of office, seven years, is what the French would call a *septennat persannel*. If a vacancy occurs, a new president is elected for a new period of seven years and not for the unexpired term. Pending such election, or in case of temporary incapacity, the chancellor performs the functions of the office. The President is not subject to prosecution except with the sanction of the Reichstag. The provision for his removal is unique. On proposal by two-thirds of the Reichstag he is subject to recall by popular vote. During the period between the vote of the Reichstag and the referendum, he is not permitted to exercise the functions of the office. In case the referendum sustains the President, it counts as a new election for the constitutional term of seven years and automatically entails the dissolution of the Reichstag."—W. J. Shepard, *The new German constitution* (*American Political Science Review*, Feb., 1920, pp. 40-41).

Poland.—The president of Poland is elected by a national assembly composed of both houses of the legislative assembly in joint session. His term of office is seven years.

Portugal.—The president of Portugal is elected by the members of the two houses of the legislature, for a term of four years. He may not be re-elected.

South American republics.—The election of the president and vice-president of Argentina is made by a body elected for the purpose by the voters of the provinces. The body of presidential electors equals the combined number of both houses. The presidential term is six years, and neither president nor vice-president may be re-elected until six years from the close of their term of office have expired. In contrast with this indirect method, the president of Brazil is elected by the direct vote of the people, and must have a majority of votes. The vice-president is elected in the same manner, and neither may stand for two successive terms. The term of office is four years. Chile also elects its president by indirect methods, by the vote of delegates, elected by the people. The term of office is five years (see also CHILE: 1920 [June]). Colombia, however, elects a president for four years, by direct vote. He is not eligible for reelection until after a full presidential term has expired. Ecuador and Paraguay also elect their presidents by direct vote for four years. The same may be said of the election of the president of Peru, whose term, however, is five years. He is not eligible for reelection for eight years after the expiry of his term of office. The president of Uruguay, who is elected by direct vote of the people for a term of four years, is ineligible for reelection for eight years after his term of office has expired. Under the amended constitution of 1914 the president of Venezuela is elected for a term of seven years, by a majority of the members of Congress. Under the law of 1909 he could not succeed himself; but as the new Constitution contains no prohibition of reelection, there is nothing, except a change in the political color of Congress, to prevent him from being chosen for one term after another during the course of his life.

United States.—"The executive power shall be vested in a President of the United States of America. He shall hold his office during the term of four years, and, together with the Vice-President, chosen for the same term, be elected as follows: Each State shall appoint, in such manner as the legislature thereof may direct, a number of electors, equal to the whole number of Senators and Representatives to which the State may be entitled in the Congress."—*United States constitution, Article II, Section 1, ¶1-2.*—[And these electors, meeting in their respective states, shall vote for president and vice-president, transmitting certified lists of their votes to the president of the Senate of the United States, who shall count them in the presence of the two Houses of Congress; and if no person is elected president by a majority of all the votes cast, then the House of Representatives shall elect a president from the three persons who received the highest numbers of the votes cast by the electors, the representation from each state having one vote in such election.]—Abstract, *Ibid.*, ¶2.—See also below: Electoral college.—"A plan was first adopted by the constitutional convention which provided for the selection of the President by the Congress, or, as it was then called, by the National Legislature. Various other plans were proposed, but only to be summarily rejected in favor of that which the convention had apparently irrevocably

decided upon. There were, however, among the members, some who, notwithstanding the action taken, lost no opportunity to advocate, with energy and sound reasons, the substitution of a mode of electing the President more in keeping with the character of the office and the genius of a popular government. This fortunate persistence resulted in reopening of the subject and its reference, very late in the sessions of the convention, to a committee who reported in favor of a procedure for the choice of the Executive substantially identical with that now in force; and this was adopted by the convention almost unanimously."—G. Cleveland, *Presidential problems*, pp. 7-13.—The expected operation of this plan has since been completely frustrated, by forces unforeseen at the time of the Constitutional convention.

PARTY GOVERNMENT.—"The rôle parties play in the politics of the country was not foreseen in 1787. By the close of Washington's second administration, party lines were closely drawn; and since this time, save during the Era of Good Feeling (1816-1824), there have been two powerful political parties, nearly matched in strength, one or the other of which has elected the President. Men divide on political questions; the resulting parties are resolved on giving effect to their ideas and politics; and to do this, organization and party machinery become necessary. This development of party government it is that has completely changed the operation of the electoral plan. How this came about, a sketch of the modes of making nominations will show."—B. A. Hinsdale, *American government*, p. 261.

NOMINATION BY CONSENT.—"In 1788 and 1792 Washington was nominated by the unanimous voice of the people, without delegates, conventions, or popular assemblies [see U. S. A.: 1789]. Adams was nominated for vice president in a similar way, but not with equal unanimity. In 1796, when the Federal and Democratic-Republican parties were already formed, Adams and Jefferson were designated as candidates by the common consent of their respective parties, and in 1800 Adams and Jefferson were again named in much the same way."—*Ibid.*

NOMINATION BY CONGRESSIONAL CAUCUS.—"The first step in the direction of making nominations by congressional caucus was taken in 1796, when the Democratic-Republican members of Congress agreed to support Jefferson and Burr. The second step was taken in 1800 when Adams and Jefferson were named as presidential candidates in secret caucuses of the Federal and Republican Senators and Representatives. But the first regular congressional nominating caucus was held in 1804, when the Republican members nominated Jefferson and Clinton for President and Vice President. From this time until 1824 the congressional caucus was as much the regular party machine for making nominations as the national convention is now."—*Ibid.*, p. 262.

NOMINATION BY STATE LEGISLATURES.—"Owing to the extinction of the Federal party organization, there was but one, or, more properly speaking, no, political party in the Era of Good Feeling. The four presidential candidates of 1824 had all belonged to the Democratic-Republican party. The congressional caucus had fallen into disrepute. A small number of Senators and Representatives nominated W. H. Crawford, of Georgia, for President, but the nomination hindered rather than helped him. The candidates of 1824 really stood on their personal merits. Still, legislative caucuses, legislatures, and even county conventions recommended their favorite statesmen to the support of

the country. Nominations were in fact made by the general agreement of certain sections of the people. In 1828 they were made in much the same way, except that no congressional caucus was held, and the State legislatures took a more important part."—*Ibid.*

NOMINATION BY NATIONAL CONVENTIONS.—"The first national convention was held by the Antimasons in 1831, and nominated William Wirt for President. The second was a National-Republican convention that nominated Henry Clay, also in 1831. The next year the Jackson men, or the Democratic party of recent times, held a convention to declare their 'highest confidence in the purity, patriotism, and talents of Andrew Jackson,' who had already been nominated by local conventions and State legislatures many times over, and to nominate a candidate for Vice President. Since that time national conventions have been regularly held by the several parties, except that the Whigs held none in 1836."—*Ibid.*—See also U. S. A.: 1832.—"In accordance with the new social leveling of the thirties and forties the Convention was made thoroughly representative. Originally each state was allotted as many delegates as it had electoral votes or members in Congress. In 1868 the representation was doubled. The delegates were chosen, until the advent of direct primaries, two by the party convention in each congressional district, and four delegates-at-large by the state convention. There are thus some 970 or 980 delegates in all. In the Republican Convention of 1916 the representation was reduced for districts where the party vote is negligible, as it is in the South."—C. Seymour and D. P. Frary, *How the world votes*, v. 1, p. 291.

WORK OF THE NOMINATING CONVENTION.—ITS UNIQUE POSITION.—ORGANIZATION IN THE CONVENTION.—FAVORITE SON AND THE DARK HORSE.—BALLOTING.—"Theoretically the historic party convention is the pure embodiment of delegated authority, a representative and democratic institution. Its services since its first appearance in the thirties have been many. It has stimulated a vigorous organization for the party above sectional lines and the local peculiarities of East and West, North and South, which traverse its structure. The argument heard at a large university in favor of compulsory morning chapel applies to the Convention. It is an impressive symbol of party unity, emphasizing its nation-wide constituency and begetting enthusiasm which oils the gears of our political engine. Serious mistakes have been avoided by the gauge it offers of a candidate's real popularity. Business men whose time is precious are spared the time and expense required by an elaborate campaign to get their names before the people; and the maturer judgment of the Convention has often picked able men who had not yet caught the public fancy. Searching publicity forces an honest and able management of the business of the National Convention. In spite of its haphazard mode of filling the highest offices in our government, it has taken such a hold on the popular imagination that it will probably long be retained."—*Ibid.*, p. 295.—"At first national conventions were very simple, having some features of the mass convention, but now they have become so thoroughly organized as to constitute real party parliaments. The national convention is the crown of the national caucus system, the simplest elements of which are seen in the primary meetings, or caucuses, and executive committees of wards and townships, and the more complex forms in city, county, district, and State conventions and committees. The like of this system is unknown in any other country. It is

the creature of purely voluntary effort; it is no part of the Constitution or laws; and yet it exerts an enormous influence upon the local, State, and National governments, and upon all political life. Its grand object is to increase party strength by concentrating it upon certain ends."—B. A. Hinsdale, *American government*, p. 263.—"The entire program of the nominating convention is mapped out for it, before ever the delegates arrive at the place of meeting. The officers of the Convention have been selected and have their impromptu speeches ready in their satchels. . . . The meetings of the Convention are opened with prayer by a local clergyman, in whose selection religious prejudices are scrupulously respected. It is a common practice for the clergyman to summon Divine aid to the cause of the party. The hall of meeting must be large enough to seat all the delegates and their alternates, and at the larger conventions a huge audience is also present. Bunting and flags abound, and brass bands stimulate the indispensable enthusiasm. . . . The first business after the formal roll call is the choice of a temporary chairman. For several weeks the Ring has had its appointee ready, but such is the importance of this office that there may be a contest. The Temporary Chairman appoints the Committees on Resolutions, on Credentials, and on Permanent Organization. He may name a Committee on Credentials which will bar out enough members from contested seats to swing victory to the side of his cohorts. He may cause the selection of a permanent chairman who will use his parliamentary authority to gag the opposition. The Temporary Chairman is therefore voted for by each delegate *viva voce* and is bound by oath to perform his duty fairly. While the Convention takes a recess the Committees now proceed to their work. The Committee on Resolutions perfunctorily approves the platform written for them by the party leaders. The Committee on Permanent Organization nominates for permanent officers the candidates whom the Boss dictates. Only before the Committee on Credentials is there great activity. Its function is to decide in the case of contesting delegations which has the right to be seated, and on its work may hang the control of the Convention. Its approval is eagerly sought because it vests the delegates who are seated with the badge of party 'regularity.' The work of all three committees is generally accepted without debate by the Convention. . . . In the Republican convention each delegate may vote as he pleases, even when his delegation has been instructed to cast a solid vote; and nominations are by a majority of all the delegates. On the other hand the Democratic party maintains here, as elsewhere, the doctrine of state integrity. If the delegation is instructed by its state to vote *en bloc*, its voice goes on the side of the majority within itself; otherwise the delegates are free to decide whether they shall vote individually or as a unit. This is the famous Unit Rule, which originated in the first Democratic national convention, and has held with slight modifications down to the national convention of 1916, where its supremacy was impugned. It was foreseen that with a majority vote under this system the delegates from Republican states might nominate their own favorite, who would then depend for election mainly on the votes of the solid South. In Democratic national conventions nominations have therefore been made since 1832 by a two-thirds vote. Although these and other rules are based only on precedent, they have quite the force of written law. The procedure in the nomination of a presi-

dent and a vice-president is similar to that in the choice of other officials, but the importance of the office and the historic struggles which have occurred in former conventions, evoke a dramatic intensity, an almost riotous enthusiasm, which has no parallel in a similar assembly elsewhere in the world. So huge is the crowd which attends, that a large city is necessary for a meeting place, Chicago being the favorite. The state delegations arrive *en masse* with brass bands and hosts of camp followers. The foremost politicians and statesmen of the country fill the hotels, and on the opening day the city is crowded to its utmost capacity. . . . The only interested persons whom etiquette does not allow to be present are the candidates themselves. Of these there are three types, the Favorite, the Favorite Son, and the Dark Horse. The Favorite is a man known all over the Union, high in his party counsels, who has already run a considerable part of the *cursus honorum*. To balance these assets he has accumulated in his career a large number of political opponents and his virtues have lost the charm of novelty. It is a truism to say that the most conspicuously able men are seldom raised to the Presidential chair. They are, like Henry Clay or James G. Blaine, too well known. The Favorite Son is a less familiar figure. With a strong following in his own state, he has little or none outside it, and the proposal of his name is generally a perfunctory manifestation of state pride, unless he comes from a large and doubtful state like New York or Ohio, whose electoral vote is worth conciliating. The Dark Horse must be colorless and unobjectionable. He may never have been thought of as a possibility, until his name is brought up on the Convention floor; or again his manager may have been grooming him in secret for the moment when the better known candidates are being deserted. Thus Pierce and Garfield were comparatively unknown before their nomination. A candidate of any of these classes must be able to undergo the most searching scrutiny of his political career, his business record, and the most intimate affairs of his private life. The names of the aspirants are placed before the Convention one by one in a roll call of the states with the old-fashioned Fourth of July oratory. As each name is proposed an attempt is made to stampede the delegates by prearranged cheering. . . . When all the nominations are in, the voting begins. After the first few ballots the delegates for the Favorite Sons see the hopelessness of their cause and hasten to 'climb on the band wagon' of one of the Favorites. As count follows count, a deadlock may develop between two leaders. The time is now fulfilled for the entry of the Dark Horse. Rather than yield to a hated opposition one of the leaders switches his supporters to the newcomer. So in 1880 Blaine telegraphed his managers to turn his votes over to General Garfield on the thirty-fourth ballot and assured the defeat of Grant. The landslide spreads and sometimes within a few ballots a comparatively unknown man has been elevated to the dizzy pinnacle. It is not unusual for a nominee to be chosen within the first three or four ballots, but often the contest continues for days. In 1852 Franklin Pierce was nominated on the 49th ballot, and in 1860 Stephen A. Douglas won on the 57th. Finally with as good grace as may be, the nomination is made unanimous, and the Convention then turns to the choice of a Vice-President."—C. Seymour and D. P. Frary, *How the world votes*, v. 1, pp. 277-278, 292-293.—"The convention system, the result of an insurrection against dictation from

office-holders, was not long a means for expressing popular wishes. The party management used it freely and deftly; it gave new opportunities for the skill of the professional political mechanic. And we are now seeking to get rid of this device originally established to give greater scope for popular desires; in the various states of the union we are now making attempts to establish systems of popular nomination, because it is believed that we can make the government our own by transferring to the people the right to say for whom they may cast their ballots. In national politics, too, we have come to have little faith in the nominating convention, though at times it is impressively subservient, in spite of the management, to popular demands, expressed in all sorts of unmechanical and unsystematic ways."—A. C. McLaughlin, *Courts, the constitution and parties*, pp. 123-124.

STEPS IN THE ELECTION OF PRESIDENT AND VICE-PRESIDENT.—"The whole course of progress from first to last embraces the several steps that follow:
1. The national conventions that make the nominations of candidates are constituted under fixed rules, and are called by regularly appointed committees. The conventions of the Republican and Democratic parties both consist of four delegates at large from each State, and twice as many district delegates as the State has Representatives in Congress. 2. In each State every political party participating nominates two electors at large, sometimes called senatorial electors, and as many district electors as it contains Representatives' districts. These candidates together make up its State electoral ticket. These two steps are in no way required by the Constitution or laws, but belong wholly to the sphere of party management. 3. On Tuesday following the first Monday in November the electors are appointed in all the States by a popular election. This is popularly called the presidential election, and it is so in fact, if not in law. This third step is taken by the authority of State laws, Congress fixing the time. From this time on the Constitution and laws take exclusive charge of the process. 4. On the second Monday in January the electors meet at their respective State capitals, and vote by ballot, according to the constitutional provisions for President and Vice President. They make three copies each of the two lists of ballots, naming the offices, the persons, and the number of votes, which they sign, certify, and seal. One of these copies they send by mail to Washington, addressed to the President of the Senate; one they send to Washington by a special messenger, addressed to the same person; and the third they deliver to the Judge of the United States District Court for the district in which the electors meet and vote. 5. On the second Wednesday of February the Senate and House of Representatives meet in the Hall of the House. The President of the Senate, in their presence, opens the certificates and hands them to the tellers appointed by the houses, who read and count the votes. The persons having the greatest number of votes, if a majority of all the electors appointed, he declares President-elect; the person having the greatest number of votes for Vice President, if a majority of all, Vice-President-elect."—B. A. Hinsdale, *American government*, pp. 263-264.

LECTORAL COLLEGE, ORIGIN, DEVELOPMENT AND THEORY.—TWELFTH AMENDMENT.—"There was no question which perplexed the Federal Convention [of 1787] more than the question as to the best method of electing the president. . . . At one time the Convention decided to have the presi-

dent elected by Congress, but there was a grave objection to this; it would be likely to destroy his independence, and make him the tool of Congress. Finally the device of an electoral college was adopted. [This device was similar to that in the Maryland state constitution.] Each state is entitled to a number of electors equal to the number of its representatives in Congress, plus two, the number of its senators [see also U. S. A.: 1787-1789; 1789-1792]. . . . At first the electoral votes did not state whether the candidates named in them were candidates for the presidency or for the vice-presidency. Each elector simply wrote down two names, only one of which could be the name of a citizen of his own state. . . . The candidate who had the largest number of votes, provided they were a majority of the whole number, was declared president. . . . By the twelfth amendment to the constitution, declared in force in 1804, the present method was adopted. The electors make separate ballots for president and for vice-president."—J. Fiske, *Civil government in the United States*, p. 225.—"By the Constitution each state is entitled to as many presidential electors as it has senators and representatives in Congress. The popular vote was to be cast, not for a President, but for electors. The chosen electors were to meet in their own states, vote for President, and transmit the result of their vote to Washington. In the presence of both Houses of Congress the President of the Senate should open the certificates, and 'the votes should then be counted.' Since each elector voted for two candidates without distinction, for President and Vice-President, more than one candidate might have a number of votes equal to a majority of the electors. If no one possessed such a majority, the House of Representatives was to choose a President from among the five highest on the list, the large number being a concession to the nominees from the small states. The votes were to be taken by states, and a majority of all the states was necessary for a choice. The Fathers deemed that they had put the election beyond the reach of popular tumult, and that the count before Congress would be a simple and dignified procedure in arithmetic. In no case has the intention of the framers of the Constitution been more entirely frustrated. The reason lies in the growth of conditions unforeseen or deemed undesirable by them. The first dispute arose in 1800, when the Democratic Republicans, though possessed of a majority in the college, failed to distinguish between Jefferson, the candidate for President, and Burr for Vice-President. To remedy the lack of a covering clause in the Constitution the Twelfth Amendment was passed requiring that the electors vote specifically for President and Vice-President as distinct officers. This amendment, however, was far from removing all grounds of contention. The Constitution forbids any United States official to be an elector. But suppose that through inadvertence electors had been chosen who were ineligible? Should a state's vote be annulled? Who was to do the counting? With Delphic inscrutability the Constitution says, 'The votes shall then be counted.' In the case of treble or quadruple returns, all claiming equal authenticity, who should decide on the legality of a state's vote? If the President of the Senate, was not that to place the election of the President in the hands of one man, perhaps a vitally interested participant? If Congress were to decide, what would happen in case of opposing majorities in the two Houses? What should determine statehood? Was Indiana a state in 1816, or Missouri in 1820?

Should an act of God disfranchise a state, as almost happened in Wisconsin in 1857? These and many other questions have troubled Congress perennially. The theory of the electoral college was that the electors, chosen for superior talents, emancipated from the subtle intrigue of party, should make in Olympian serenity a choice based solely on merit. This plan failed utterly and miserably within twelve years after it was put into effect, yet despite this fact the electoral college has endured for near a hundred and thirty years. No proven case of an elector betraying his responsibility to the party which chose him has occurred since three Democratic electors voted for John Adams in 1796 and kept Jefferson from the Presidency for four years. Senator Thomas H. Benton said: 'In every case the elector has been an instrument, bound to obey a particular impulsion, disobedience to which would be attended with infamy and with every penalty which public indignation could inflict. From the beginning these electors have been useless, and an inconvenient intervention between the people and the object of their choice.'—C. Seymour and D. P. Frary, *How the world votes*, v. 1, pp. 296-298.—See also APPOINTMENT.

DIFFICULTIES ARISING FROM THE SYSTEM OF THE ELECTORAL COUNT.—ELECTORAL COUNT ACT OF 1877.—"Even more haphazard has been the development of a system of counting the electoral votes. No clause in the Constitution has through its cryptic brevity more seriously threatened the peaceable existence of the government. In 1793 was established the machinery for a count which with the changes in 1887 has endured ever since. The President of the Senate was to open each ballot and declare its contents to one teller from the Senate and two from the House of Representatives. The tellers performed the arithmetical computation and reported it to the chairman who announced the result to Congress. The first election disputed as to electoral votes occurred in 1800. Jefferson and Burr had each seventy-three votes, John Adams sixty-five, and Thomas Pinckney sixty-four. The biographer of Burr, Matthew L. Davis, asserted that Jefferson, President of Senate, improperly accepted the four votes of Georgia for himself and Burr. Had these been cast out on the ground of irregularity all four candidates would have come before Congress, and Jefferson could not have been elected. From the outcry raised by the friends of Burr at Jefferson's election, as well as the protests of the Jackson men at J. Q. Adams' election in 1824, it may be judged whether the electoral college has been proof against 'the negotiations and intrigues of party.' After Jefferson became President, the Twelfth Amendment provided for the separate choice of President and Vice-President. An unforeseen complication arose over the vote of Wisconsin in 1857. The Act of March 1, 1792, had set the date for the vote by the electors in the states for the first Wednesday in December in order to 'close the opportunity as much as possible against negotiation, intrigue, and corruption.' A violent blizzard prevented the Wisconsin electors from reaching the state capital on that day, and the vote actually took place on the following day. Again, as in the case of Indiana in 1816 and Missouri in 1821 the knotty question was mooted as to who should decide the validity of a state's vote. Opinion was widely split, some holding that sole power resided in the President of the Senate, some asserting that 'the two Houses assembled together are a board of canvassers organized by the Constitution for the express purpose of counting

those votes,' and voting *per capita* in case of dispute. The theory of a *casus omissus* in the Constitution was advanced, and the imperative need of special legislation was urged. But in the true Anglo-Saxon spirit of *laissez-faire*, the question was allowed to drop from sight because it had not yet vitally affected an election. The issue which was evaded in 1857 recurred in the Hayes-Tilden contest of 1876 with such intensity that it could not again be downed. Tilden was conceded a plurality of 250,000 popular votes, but the undisputed electoral returns were 184 for Tilden and 163 for Hayes, with double returns in four states [see U. S. A.: 1876-1877]. In Florida there were charges of fraud, in both South Carolina and Louisiana there had been violence at the polls, and in the latter two state governments each claimed the right to certify returns. Any one of the twenty-two disputed votes from these states and Oregon (also contested) would have given Mr. Tilden the election. As the House was Democratic and the Senate Republican, no accord could be expected there in deciding upon the contested returns. Senator Edmunds of Vermont predicted civil war, but fortunately patriotism was stronger than party spirit. The Electoral Commission Bill, in every sense a temporary compromise, was enacted, forming a board of five Senators, five Representatives, and five Justices of the Supreme Court, to decide questions of multiple returns. The parties were exactly balanced in the Congressional members appointed. The statute had named two justices from each party and had left the choice of a fifth to the other four. The selection of a Republican Justice practically settled the election, for every vote given by the Commission was a strictly party vote of eight to seven in favor of the Republican returns. The threats of violence to prevent Mr. Hayes' inauguration were silenced by the praiseworthy moderation of Mr. Tilden, and by the promised withdrawal of troops from the South, but in many Latin countries a revolution would have shaken the state at far less provocation. Ten years later Congress at last passed the Electoral Count Act to prevent the recurrence of such a dangerous crisis. The Commission of 1877 had declared the lack of power of the Federal government to go behind the ultimate authority of the state in ascertaining the correct electoral returns, and this principle had met with increasing popularity. The Act of 1887 provided that each state must settle all electoral controversies at least six days before the meeting of the electors. The latter must send their certificates of election, signed by the Governor, to the President of the Senate. On the second Wednesday in February the votes are canvassed in joint session by two tellers from each House. In case of double returns, the certification of a Governor is the ultimate authority, unless claimed to be illegal, in which case Congress is to decide by concurrent vote. If the Houses disagree, the returns which have been certified under the state seal shall be preferred. Thus the responsibility for the electoral vote is thrown back upon the several states, as the Constitution seems to have intended; and Congress becomes only a court of last resort, acting when it is impossible to ascertain between two rivals and the true government of a state."—C. Seymour and D. P. Frary, *How the world votes*, pp. 301-304.—See also U. S. A.: 1887: Electoral Count Act.

RESULTS OF THE ELECTORAL SYSTEM.—"Three votes has a candidate having a smaller popular vote than his leading rival been successful in attaining the presidency. John Quincy Adams was

such a minority candidate in 1824, and Hayes was such in 1876. In 1888 Benjamin Harrison carried twenty States and had 233 electoral votes, although Cleveland had the votes of 100,000 more of his fellow-citizens, than had Harrison. One of the most anomalous cases is the vote for Douglas in 1860. Douglas carried only New Jersey and Missouri, yet his vote was over 500,000 more than that of Breckenridge, who carried the solid South, and was hardly 500,000 less than Lincoln's, who carried seventeen States, with 180 electoral votes [see also U. S. A.: 1860 (April-November)]. Evidently the Douglas leaven had permeated the entire North. Bell won in the three border States, Virginia, Kentucky, and Tennessee. The Lincoln-Douglas vote divided the North, but had little or no significance in the South. Viewed as an expression of the conflict of Northern sentiment as to the proper method of dealing with the question of slavery extension it shows that, among 3,200,000 Northern voters, the division of opinion was in the proportion of about $\frac{23}{40}$ against extension into the new Territories, to $\frac{17}{40}$ in favor of permitting the Territories to decide the question for themselves when they should become States. The policy of Lincoln and the war Congress is commonly supposed to have been triumphantly vindicated in 1864, for Lincoln had 212 electoral votes, from twenty-three States, while McClellan got only 21 electoral votes from three States. The popular vote for Lincoln in 1864 was 2,216,067, and the vote for McClellan, upon a platform which declared the war a failure, was 1,808,725, a difference of 408,342, in a total vote of a little over 4,000,000. Even in the midst of a civil war for the perpetuation of the Union, if the vote be an index of convictions, Union sentiment was only slightly preponderant, for about forty-five per cent. of Northern voters seem to have been ready to agree to a permanent separation of the States [see U. S. A.: 1864 (May-November)]. . . . The most impressive fact is the numerical resemblance between the votes of the two great parties. The natural effects of this close approximation are not fully felt, because under the general-ticket system the electoral result is widely different. Before the projection of the slavery question into the arena of national politics—when parties were forming upon the issue of arresting its extension into new Territories—the divergence between the total vote for each of the leading candidates was slight, denoting how evenly party lines may be drawn. During the Civil War and the reconstruction period there was a marked increase in the Republican majority, owing to the intensity of political excitement, but this increase would have disappeared if a vote had been given to the Southern States, which, upon one theory, were in the Union all the while they were battling to destroy it. With the restoration of these States to their old places the same close approximation of rival votes has reasserted itself. The only extraordinary departure from the normal is the vote [for President Roosevelt (2,545,515 plurality)] of 1904, due in great degree to the ascendancy which the President's personality had gained over the popular mind."—J. H. Dougherty, *Electoral system of the United States*, pp. 318-323.—Since 1904 there have been several "departures from normal." In 1912 President Wilson polled a plurality of 2,160,104 and in 1920 President Harding polled a plurality of 6,996,476.

PREDOMINATING EVILS OF THE ELECTORAL SYSTEM.—"One of the greatest evils of the general ticket system is the manner in which the vote of a large state tends to nullify those of a number

of small ones. Eight presidents have been elected by a minority of the total popular votes cast, two by a smaller vote than their leading opponent, because they gained the whole electoral vote of a pivotal state, even though by a bare plurality. In 1884 the outcome hinged on the result in New York, which finally went for Cleveland by 1149 votes. Had 575 citizens voted differently in New York State Blaine would have won by as large an electoral margin as that by which he was defeated. Each one of the thirty-six electoral votes of the state was controlled by sixteen voters. Consider the enormous premium put upon fraud in the large states in a close campaign, when a single dishonest ballot influences one fifth of the number of electoral votes necessary for a choice, instead of the three of Rhode Island or Idaho, or a single vote under the district system. The crowning fault of this hoary and useless electoral system is that it is not representative. Taking an average of all the elections since the general adoption of the general ticket system in 1832 the percentage of the electoral vote obtained by the winning candidate is never found to be an accurate index of his percentage of the votes cast for the candidates of the two great parties. The average percentage of the electoral vote falling to the winner has been sixty-six per cent, whereas that of the popular vote has been fifty per cent. Time and again the unwisdom, the injustice, of such a discrepancy has been demonstrated. In 1824 Jackson received 155,800 votes to Adams' 105,300, yet on the ballot in the House of Representatives (the electoral college had furnished no majority), Clay's influence turned the election to Adams. In 1860 Stephen A. Douglas, champion of squatter sovereignty, rolled up a popular vote within 500,000 of that of Lincoln, yet won but one-fifteenth of the latter's electoral vote. Douglas led Breckenridge by another 500,000, but his electoral vote was twelve and Breckenridge's seventy-two. Grant's percentage of the popular vote in 1872 was fifty-five; of the electoral vote eighty-four. The election of 1876 was bitterly disputed, and almost led to violence at the inaugural ceremony. Whether the Democratic or the Republican returns be accepted, the popular vote for Hayes was about 250,000 smaller than that for Tilden. The awarding of the vote of the electoral votes of Florida, Louisiana, South Carolina, and Oregon to Hayes gave him a majority of one in the electoral college [see also U. S. A.: 1876-1877]. The minority candidate was again elevated to the presidency in 1888 at the expense of the Democratic party. Cleveland outstripped Harrison by 100,476 votes, but was defeated in the electoral college by a margin of sixty-five. It has been proven beyond the shadow of a doubt that the connection between the popular vote and the filling of the highest office in the land depends entirely too much upon chance. . . . Even with the Electoral Count Act of 1887 the electoral system is still archaic, needlessly complex, and inadequate to present conditions. Any complication which thwarts the choice of the individual voter diminishes the significance of the ballot, and by that much discourages participation in the government. Under the general ticket system every vote cast for an unsuccessful candidate is as totally lost as if the voter had not troubled himself to go to the polls. In states which are consistently Democratic or Republican, the voter of the minority party has never yet deposited a ballot which had the slightest effect on the final result and he is therefore in reality disfranchised. If it is argued that a Democratic minority in one state balances a Republican

minority in another, the wide discrepancy between the popular vote and the electoral vote in the last century is proof of the contrary. The electoral college is worse than a fifth wheel to the coach of democracy; it is unrepresentative and on occasion has been the bone of dangerous contention."—C. Seymour and D. P. Frary, *How the world votes*, pp. 299-304.—See also U. S. A.: 1888.

EFFORTS TO ABOLISH ELECTORAL SYSTEM.—“The presidential election of 1824 put an end to the practice of caucus nominations, but it did not terminate the efforts for the abolition of the electoral system [see also U. S. A.: 1824]. Benton, in his *Thirty Years' View*, says that the resolutions presented in the Senate in December, 1823, were referred to a select committee of five, but as no definite action was taken the attempt was resumed in the session of 1825-6. . . . Benton, from the select committee, on January 19, 1826, made a report which elaborately set forth the grounds upon which the proposed amendment was supported. The proposed amendment dispensed with electors, created electoral districts in which a direct vote of the people was to be taken, and obviated ‘all excuse for caucuses and conventions to concentrate public opinion, by proposing a second election between the two highest in the event of no one receiving a majority of the whole number of district votes in the first election.’ When the subject came before the Senate, on May 8, 1826, Benton stated that its consideration had been discussed in the other branch of the legislature, for it was deemed inadvisable to carry on a dual debate at the same time. Such had been the issue of the discussion in the House that it was not deemed wise to take any further step to obtain a definite vote at the existing session. . . . The plan was unanimously recommended by the whole committee, but it did not receive the requisite support of two-thirds of the Senate. The disputed count of 1877 emphasized so sharply the defects in the present system that a number of amendments were proposed in the special session of Congress which commenced on October 15, 1877, and in the next succeeding regular session. Nearly all these amendments aimed to dispense with presidential electors, and two of them, . . . proposed to apportion the presidential votes of each State among the respective candidates according to the ratio of the popular vote for each.”—J. H. Dougherty, *Electoral system of the United States*, pp. 332, 334-335, 338, 354.—Efforts to abolish or radically change the electoral system have continued to be agitated. “The needed reform of the system is twofold: abolition of the electoral college, and some provision for making the Federal count simply a process in addition. It is not necessary in making an end of the electors to change the present relative weight of the states in the election. Each state could retain as many presidential votes as it now has electors. To insure proper representation for all in the choice of a President, let those votes be allotted to the various parties in direct ratio to the votes polled by them. No voter would then feel that his ballot was cast in vain, for even though he and his fellow sympathizers secured only a decimal part of a presidential vote in the state, that fraction would go to swell the total in the other states, instead of being entirely lost as at present. Let the state be the supreme authority in settling its own electoral controversies, Congress requiring only that the final returns should be unquestionably certified under the Governor's signature and the state seal, and refusing to accept other returns than these. The power of either House to disfranchise a state

then ceases, and the count at the seat of government involves simply the addition of the whole and fractional presidential votes bearing a state seal, and the proclamation of the person who has received a plurality thereof. The advantages of such a system are manifest. There can be no multiple returns, except in the event of two state governments both claiming authenticity. In any case the state itself is alone responsible if its vote is lost. The temptation to graft is minimized, for each fraudulent ballot affects only a ten thousandth part of a presidential vote. The proposed reform would on the other hand stimulate honest party life in such districts as the South, which are now consistently uni-partisan. It would give to all parties an effective voice in presidential elections, a condition indispensable in a government by discussion."—C. Seymour and D. P. Frary, *How the world votes*, v. 1, pp. 304-305.—See also AUSTRALIAN BALLOT; PRESIDENT: Comparative; UNITED STATES; U. S. A., CONSTITUTION OF; UNIT RULE.
