Lobby.—"The Lobby" is the name given in America to persons, not being members of a legislature, who undertake to influence its members, and thereby to secure the passing of bills. The term includes both those who, since they hang about the chamber, and make a regular profession of working upon members, are called 'lobbyists,' and those persons who on any particular occasion may come up to advocate, by argument or solicitation, any particular measure in which they happen to be interested. The name, therefore, does not necessarily impute any improper motive or conduct, though it is commonly used in what Bentham calls a dyslogistic sense. The causes which have produced lobbying are easily explained. Every legislative body has wide powers of affecting the interests and fortunes of private individuals, both for good and for evil. It entertains in every session some public bills, and of course many more private (*i.e.* local or personal) bills, which individuals are interested in supporting or resisting

When such bills are before a legislature, the promoters and the opponents naturally seek to represent their respective views, and to enforce them upon the members with whom the decision rests. So far there is nothing wrong, for advocacy of this kind is needed in order to bring the facts fairly before the legislature. . . . Just as a plaintiff in a lawsuit may properly employ an attorney and barrister, so a promoter may properly employ a lobbyist. But there is plainly a risk of abuse. In legal proceedings, the judge and jury are bound to take nothing into account except the law and the facts proved in evidence. It would be an obvious breach of duty should a judge decide in favour of a plaintiff because he had dined with or been importuned by him (as in the parable), or received £50 from him. The judge is surrounded by the safeguards, not only of habit but of opinion, which would condemn his conduct and cut short his career were he to yield to any private motive. The attorney and barrister are each of them also members of a recognized profession, and would forfeit its privileges were they to be detected in the attempt to employ underhand influence. No such safeguards surround either the member of a committee or the lobbyist. The former usually comes out of obscurity, and returns to it; the latter does not belong to any disciplined profession. Moreover, the questions which the committee has to decide are not questions of law, nor always questions of fact, but largely questions of policy, on which reasonable men need not agree, and as to which it is often impossible to say that there is a palpably right view or wrong view, because the determining considerations will be estimated differently by different minds. . . . The permanent professional staff of lobbyists at Washington is of course from time to time recruited by persons interested in some particular enterprise, who combine with one, two, or more professionals in trying to push it through. . . . A committee whose action can affect the tariff is of course surrounded by a strong lobby. Women were at one time among the most active and successful lobbyists at Washington. Efforts have been made to check the practice of lobbying, both in Congress and in State legislatures. Statutes have been passed severely punishing any person who offers any money or value to any member with a view to influence his vote. It has been repeatedly held by the courts that 'contracts which have for their object to influence legislation in any other manner than by such open and public presentation of facts, arguments, and appeals to reason, such as are recognized as proper and legitimate with all public bodies, must be held void.' It has also been suggested that a regular body of attorneys, authorized to act as agents before committees of Congress, should be created. A bill for this purpose was laid before the Senate in 1875."—J. Bryce, *American commonwealth*, v. 1, pp. 691-695.—When the Democrats came into power in 1913, Senator Overman was made head of a lobby committee, which, during 1914 made a thorough investigation of the activities of lobbyists in Washington. Soon afterwards Senator Kenyon of Iowa, a progressive Republican, introduced a bill for the registration of lobbyists. Senator Overman also introduced a bill along similar lines. No action was taken on either. In January, 1921, Senator Kenyon announced that he would again present his bill. If this legislation passes it will mean that every person who appears before a Congress committee, to discuss pending legislation, must either register on a "legislative docket" in the offices of the secretary of the Senate and clerk of the House

or he must be invited to appear by the committee in question. The bill also prohibits former members of Congress from acting as legislative agents. It requires the filing of itemized reports of all fees and expenditures of lobbyists. The punishment for violating the law is to be a fine of \$500 to \$5,000 and the barring of the legislative agent from all future lobbying or appearing before committees.

Caucus.—"There is still one feature of Congressional government which needs explanation, and that is the caucus. A caucus is the meeting of the members . . . of one party in private, for the discussion of the attitude and line of policy which members of that party are to take on questions which are expected to arise in the legislative halls. Thus, in Senate caucus, is decided who shall be members of the various committees. In these meetings is frequently discussed whether or not the whole party shall vote for or against this or that important bill, and thus its fate is decided before it has even come up for debate in Congress."

—W. W. and W. F. Willoughby, *Government and administration of the United States (Johns Hopkins University Studies, Series ix., nos. 1-2, ch. 9)*.—The caucus of the majority party, before the opening of each Congress, chooses the speaker and the floor leader; that of the minority chooses its leader and later presents his name as a candidate for the speakership, although this is a mere formality.—See also above: House of Representatives: The speaker and the committee system; and CAUCUS: United States: 1776-1800; 1804-1828.

Conference committees.—"It is a very common practice for one of the Houses to make amendments in measures sent to it by the other. Sometimes very many amendments are proposed, and the character of the legislation may be radically changed. One House or the other must recede, or both must yield something, so that they may meet upon common ground. A complicated procedure has thus grown up between the two Houses in order to bring them to an agreement. If the House which originated the bill accepts all of the amendments, which are proposed by the other House, it goes at once to the President, but if it refuses to concur, and the other House does not recede from its amendments, but insists upon them, it is the common practice for conference committees to be appointed. In cases, frequent in the early practice, but exceptional in later usage, where there have been differences over amendments, the Houses have come together even without the appointment of committees of conference. Requests for a conference come from the House which is in possession of the bill and the papers relating to it. Conferences are not confined to disagreements over amendments, but they have been held upon such subjects as questions of prerogative, the counting of the electoral vote, what titles it would be proper to give to the President and Vice-President, and upon other subjects of a general character. The conferences are usually held at the Senate end of the Capitol, and behind closed doors, although in some cases members and others have been permitted to make arguments before the committees. The House frequently instructs its conferees, although it does not inform the Senate of the fact, but the practice of the Senate is against instruction. The Senate insists upon free conferences, and, in some cases, when it has been informed that the House had given instructions, Senators have protested against the practice. In the event of failure of the managers first appointed to agree, sometimes other managers are appointed in their stead, and there have been frequent instances of protracted

conferences, and in some cases important bills have finally failed of passage through disagreement. The subjects submitted to the conference are only those in disagreement between the two Houses, and it is not in order for the managers to include matters which are not in dispute. Oftentimes amendments may be proposed by the conferees to the amendments in controversy, but they must be germane to them and cannot involve new matter, and they must also be confined within the extreme positions taken by the two Houses. Sometimes differences between the Houses are very radical, as in the case where one House has struck out of a bill sent to it all after the enacting clause and substituted a bill of its own, sometimes upon an entirely different subject. In such a case the jurisdiction of the managers is very wide, and their function becomes a highly responsible one. The most important bills are usually in conference near the close of a session when there is an impatience among the membership of the Houses to finish the transaction of the public business before adjournment. This circumstance increases the responsibility which the managers are under, for their action is apt to escape the critical scrutiny which it would receive at any other time, and it is pretty sure to be adopted. Reports of the conference committees are highly privileged, especially in the House of Representatives, where they are in order except during the reading of the journal, or while the roll is being called, or while the House is dividing upon any question. In the earlier practice it was not necessary that conference reports should be signed, but for a long time it has been the rule for the conferees to sign them and for them to appear in the journal. After the conferees have reached a final agreement, it is necessary for the Houses separately to adopt the report. After they have voted in its favor, the action becomes final so far as Congress is concerned, except in case of veto by the President."—S. W. McCall, *Business of Congress*, pp. 158-160.

Sessions.—"The Congress shall assemble at least once in every year, and such meetings shall be on the first Monday in December, unless they shall by law appoint a different day."—*Constitution of the United States, Art. 1, sect. 4*.—The first regular session of each Congress begins in December of each odd year and lasts until it adjourns, usually the following spring or summer. The second session lasts from December of each even year to the following Mar. 4. The President has the power to call special sessions when important matters make it necessary for Congress to meet. The long interval which usually elapses between the election of a representative and the beginning of his legislative work has been much criticised. "Under the present law, a Representative in Congress who has been turned down by the people legislates for that people in the second regular session. A man who has been defeated for reelection is not in a fit frame of mind to legislate for the people. There is a sting in defeat that tends to engender the feeling of resentment, which often finds expression in the vote of such members against wholesome legislation. That same feeling often produces such a want of interest in proceedings as to cause the members to be absent nearly all the second session."—J. F. Shafroth, *When Congress should convene (North American Review, Mar., 1897, p. 375)*.

Recent history.—The Congressional election of 1910 returned 227 Democrats and only 163 Republicans to the House of Representatives. This was the first time since 1892 that the Democrats

had had a majority in the House. (See also above: House of Representatives: The speaker and the committee system.) In 1912, for the second time since Buchanan's presidency, the Democrats gained control of both Houses. Their number in the House of Representatives increased to 291, while in the Senate they had a majority of six. (See also U. S. A.: 1912.) A special session of Congress was called in April, 1913, to consider the tariff question (see also U. S. A.: 1913 (April-December); and TARIFF: 1913). "Already, in a special session of the Senate, called March 4 to confirm appointments, the leadership of the upper chamber had passed definitely from the ultra-conservatives of the two parties to the progressive or radical elements. A new 'steering committee' of seven progressive and two conservative Democratic members was set up; assignments to the regular committees were to be made by this committee, subject to final action by the caucus; and every committee was henceforth to choose not only its chairman, but its conferees and its sub-committees. The new House was organized on similar lines. At a Democratic caucus, March 5, A. Mitchell Palmer of Pennsylvania was named for chairman of the majority caucus; Oscar W. Underwood of Alabama was again assigned to the post of chairman of the Ways and Means Committee and floor leader; and Champ Clark was renominated for the speakership. At the opening of the session, April 7, Clark was duly elected speaker over the Republican candidate, James R. Mann of Illinois, by a vote of 272 to 111. As in the preceding Congress, committee chairmanships went almost wholly to the South, not for sectional reasons, but because southern Democrats, as a rule, had been longest in service, and in Republican Congresses had held ranking places as minority members. . . . [In 1914 the Democratic] party suffered a reverse more serious than that of an ordinary off-year. Two seats were gained in the Senate, but the House majority was cut from 147 to 29. The Progressives also fared badly . . . and the Progressive group in the House was reduced from fifteen to seven. Joseph G. Cannon and many other Republican 'standpatters' regained their seats."—F. A. Ogg, *National progress*, pp. 213-214, 367.—See also U. S. A.: 1912-1916: Fate of Progressive Party; 1914 (November).—The 1916 election again reduced the Democratic majority. Each of the two great parties won 214 seats in the House of Representatives and the balance of power came into the hands of a small group of Independents. Nevertheless, when the new Congress met in 1917, Speaker Clark was reelected because the approach of war made the parties forget politics for a while. During the remainder of this session, and indeed until the end of the war, Congress played a very subordinate part in the government, waiting for the president to initiate all legislation and carrying out his suggestions without material changes. On October 25, 1918, President Wilson appealed to the country to return a Democratic majority in both the Senate and the House of Representatives "in order to back up and support the President." This letter caused much resentment throughout the country which may have contributed to the Republican victory in the Congressional elections. (See also U. S. A.: 1918 [November].) The Republicans elected 239 members of the House; the Democrats, 194; the Independents one; and the Socialists, one. In the Senate the Democratic majority of eight was changed to a Republican majority of two. The new Congress met in special session in May, 1919. Mr. Gillett, of Massachusetts, was elected speaker.

(See above: House of Representatives: The speaker and the committee system.) The old rule of seniority was the special object of attack by a group of insurgents. Even Mr. Gillett, though the candidate of the progressives, had been in Congress for thirteen continuous terms. Joseph Fordney, the chairman of the important Ways and Means Committee, had served ten terms continuously. Philip Campbell, chairman of the Rules Committee, had been in the House for eight continuous terms. The steering committee, which had replaced the speaker as the controlling power of the House, was made up of five men, with floor leader Mondell as chairman ex-officio, and with the old "standpatters" in the majority. Representative Longworth, a member of this committee, led the fight against the seniority rule and proposed that the steering committee be enlarged from five to nine members. But the Mann faction prevented any action on this proposal and retained its power. In the Senate the same struggle between standpatters and progressives took place. The opposition of the progressives was "directed chiefly against the plan to make Senator Penrose Chairman of the Finance Committee, and Senator Warren, of Wyoming, Chairman of the Appropriations Committee. It was also in a measure directed to the securing of important chairmanships for men who were out-and-out progressives. Both Mr. Penrose and Mr. Warren have been recognized as members of the Old Guard."—*Outlook*, June 4, 1919, p. 180.—Neither of these men was displaced. All committee assignments continued to be made in accordance with their wishes. However, as concessions to the progressive group, a rule was adopted which prohibits any one senator from being on more than two of the ten important standing committees and from being chairman of more than one. The election of 1920 was a Republican landslide. (See U. S. A.: 1920 [May-November].) The Republican majority in both houses was greatly augmented. The last session of 66th Congress, meeting in December, 1920, transferred to the Appropriations Committee of the House the right to handle all appropriation bills. Formerly these had been divided among the Naval, Military, Postoffice, Foreign Affairs, Appropriations and other committees. Concentration of all appropriations in the hands of this one committee was a preliminary step in the direction of a budget system. (See BUDGET.)

The 67th Congress began its first term March 4, 1921. The Senate was composed of 60 Republicans and 36 Democrats, and the House of Representatives of 301 Republicans, 131 Democrats and 1 Socialist (as of December 8, 1921). In the Senate, Henry Cabot Lodge was made chairman of the Committee on Foreign Relations. In the House, Frederick H. Gillett of Massachusetts was elected speaker; Joseph W. Fordney, Representative from Michigan, was made chairman of the Committee of Ways and Means, and Martin B. Madden of Illinois, Chairman of the Committee on Appropriations. The special session called by President Harding convened April 11, 1921, and ended November 23.

CONNECTICUT: Area.—Resources.—Population.—Connecticut is a state in the lower tier of New England states bordering on Long Island Sound with an area of 5004 square miles of which 145 are water. As a tobacco growing state, Connecticut has become one of the foremost in the country; out of its total acreage of 1,898,980 in improved lands, 24,400 acres were used in 1920 for tobacco culture, with a production of 36,112,000 pounds. The state has some mineral resources, principally granite, limestone, iron ore, trap rock, and clay rock. According to the 1920 census there were 4,104 manufacturing establishments, with the value of the output at \$545,472,000. The population was 1,380,631.—See also U. S. A.: Economic map.

River and name.—"The first discoveries made of this part of New England were of its principal river and the fine meadows lying upon its bank. Whether the Dutch at New Netherlands, or the people of New Plymouth, were the first discoverers of the river is not certain. Both the English and the Dutch claimed to be the first discoverers, and both purchased and made a settlement of the lands upon it nearly at the same time. . . . From this fine river, which the Indians call Quonehtacut [Quinni-tuk-ut], or Connecticut, (in English the long river) the colony originally took its name."—B. Trumbull, *History of Connecticut*, ch. 2.—According to Dutch accounts, the river was entered by Adriaen Block, ascended to latitude 41° 48', and named Fresh river, in 1614. See NEW YORK: 1610-1614.

Aboriginal inhabitants. See ALGONQUIAN (ALGONKIN) FAMILY.

1606-1620.—Included in King James' grant to Plymouth company. See AMERICA: Map of King James' grant.

1631.—Grant to Lord Saye and Sele, and others.—In 1631, the Earl of Warwick granted to

Lord Saye and Sele, Lord Brooke, Sir Richard Saltonstall, and others, "the territory between Narragansett River and the southwest towards New York for 120 miles and west to the Pacific Ocean, or, according to the words of President Clap of Yale College, 'from Point Judith to New York, and from thence a west line to the South Sea, and if we take Narragansett River in its whole length the tract will extend as far north as Worcester. It comprehends the whole of the colony of Connecticut and more.' This was called the old patent of Connecticut, and had been granted the previous year, 1630, by the Council of Plymouth [or Council for New England] to the Earl of Warwick. Yet before the English had planted settlements in Connecticut the Dutch had purchased of the Pequots land where Hartford now stands and erected a small trading fort called 'The House of Good Hope.'"—C. W. Bowen, *Boundary disputes of Connecticut*, p. 15.—In 1635, four years after the Connecticut grant, said to have been derived originally from the Council for New England, in 1630, had been transferred by the Earl of Warwick to Lord Saye and Sele and others, the Council made an attempt, in connivance with the English court, to nullify all its grants, to regain possession of the territory of New England and to parcel it out by lot among its own members. In this attempted parcelling, which proved ineffectual, Connecticut fell to the lot of the Earl of Carlisle, the Duke of Lennox, and the Duke of Hamilton. Modern investigation seems to have found the alleged grant from the Council of Plymouth, or Council for New England, to the Earl of Warwick, in 1630, to be mythical. "No one has ever seen it, or has heard of any one who claims to have seen it. It is not mentioned even in the grant from Warwick to the Say and Sele patentees in 1631. . . . The deed is a mere quitclaim, which warrants nothing and does not even assert title to the soil transferred. . . . Why the Warwick transaction took this peculiar shape, why Warwick transferred, without showing title, a territory which the original owners granted anew to other patentees in 1635, are questions which are beyond conjecture."—A. Johnston, *Connecticut*, ch. 2.—See also NEW ENGLAND: 1635.

1634-1637.—**Pioneer settlements.**—"In October, 1634, some men of Plymouth, led by William Holmes, sailed up the Connecticut river, and, after bandying threats with a party of Dutch who had built a rude fort on the site of Hartford, passed on and fortified themselves on the site of Windsor. Next year Governor Van Twiller sent a company of seventy men to drive away these intruders, but after reconnoitering the situation the Dutchmen thought it best not to make an attack. Their little stronghold at Hartford remained unmolested by the English, and, in order to secure the communication between this advanced outpost and New Amsterdam, Van Twiller decided to build another fort at the mouth of the river, but this time the English were beforehand. Rumours of Dutch designs may have reached the ears of Lord Say and Sele and Lord Brooke—"fanatic Brooke," as Scott calls him in 'Marmion'—who had obtained from the Council for New England a grant of territory on the shores of the Sound. These noblemen chose as their agent the younger John Winthrop, son of the Massachusetts governor, and this new-comer arrived upon the scene just in time to drive away Van Twiller's vessel and build an English fort which in honour of his two patrons he called 'Say-Brooke.' Had it not been for seeds of discontent already sown in Massachusetts, the English hold upon the Con-

necticut valley might perhaps have been for a few years confined to these two military outposts at Windsor and Saybrooke. But there were people in Massachusetts who did not look with favour upon the aristocratic and theocratic features of its polity. The provision that none but church-members should vote or hold office was by no means unanimously approved. . . . Cotton declared that democracy was no fit government either for church or for commonwealth, and the majority of the ministers agreed with him. Chief among those who did not was the learned and eloquent Thomas Hooker, pastor of the church at Newtown. . . . There were many in Newtown who took Hooker's view of the matter; and there, as also in Watertown and Dorchester, which in 1633 took the initiative in framing town governments with selectmen, a strong disposition was shown to evade the restrictions upon the suffrage. While such things were talked about, in the summer of 1633, the adventurous John Oldham was making his way through the forest and over the mountains into the Connecticut valley, and when he returned to the coast his glowing accounts set some people to thinking. Two years afterward, a few pioneers from Dorchester pushed through the wilderness as far as the Plymouth men's fort at Windsor, while a party from Watertown went farther and came to a halt upon the site of Wethersfield. A larger party, bringing cattle and such goods as they could carry, set out in the autumn and succeeded in reaching Windsor. . . . In the next June, 1636, the Newtown congregation, a hundred or more in number, led by their sturdy pastor, and bringing with them 160 head of cattle, made the pilgrimage to the Connecticut valley. Women and children took part in this pleasant summer journey; Mrs. Hooker, the pastor's wife, being too ill to walk, was carried on a litter. Thus, in the memorable year in which our great university was born, did Cambridge become, in the true Greek sense of a much-abused word, the metropolis or 'mother town' of Hartford. The migration at once became strong in numbers. During the past twelvemonth a score of ships had brought from England to Massachusetts more than 3,000 souls, and so great an accession made further movement easy. Hooker's pilgrims were soon followed by the Dorchester and Watertown congregations, and by the next May 800 people were living in Windsor, Hartford, and Wethersfield. As we read of these movements, not of individuals, but of organic communities, united in allegiance to a church and its pastor, and fervid with the instinct of self-government, we seem to see Greek history renewed, but with centuries of added political training. For one year a board of commissioners from Massachusetts governed the new towns, but at the end of that time the towns chose representatives and held a General Court at Hartford, and thus the separate existence of Connecticut was begun. As for Springfield, which was settled about the same time by a party from Roxbury, it remained for some years doubtful to which state it belonged."—J. Fiske, *Beginnings of New England*, ch. 3.

ALSO IN: J. G. Palfrey, *History of New England*, v. 1, ch. 11.—G. L. Walker, *History of the first church in Hartford*, ch. 4-5.—M. A. Green, *Springfield*, 1636-1886, ch. 1.

1636-1639.—Constitutional evolution.—"It must be noted that [the] Newtown, Watertown, and Dorchester migrations had not been altogether a simple transfer of individual settlers from one colony to another. In each of these migrations a part of the people was left behind, so that the Massachusetts towns did not cease to exist. And

yet each of them brought its Massachusetts magistrates, its ministers (except Watertown), and all the political and ecclesiastical machinery of the town; and at least one of them (Dorchester) had hardly changed its structure since its members first organized in 1630 at Dorchester in England. The first settlement of Connecticut was thus the migration of three distinct and individual town organizations out of the jurisdiction of Massachusetts and into absolute freedom. It was the Massachusetts town system set loose in the wilderness. At first the three towns retained even their Massachusetts names; and it was not until the eighth court meeting, February 21, 1636 (7), that it was decided that 'the plantacon nowe called Newtowne shalbe called & named by the name of Harteforde Towne. likewise the plantacon nowe called Watertowne shalbe called & named Wythersfield,' and 'the plantacon called Dorchester shalbe called Windsor.' On the same day the boundaries between the three towns were 'agreed' upon, and thus the germ of the future State was the agreement and union of the three towns. Accordingly, the subsequent court meeting at Hartford, May 1, 1637, for the first time took the name of the 'Genrall Corte,' and was composed, in addition to the town magistrates who had previously held it, of 'committees' of three from each town. So simply and naturally did the migrated town system evolve, in this binal assembly, the seminal principle of the Senate and House of Representatives of the future State of Connecticut. The Assembly further showed its consciousness of separate existence by declaring 'an offensive warr agt^t the Pequoitt,' assigning the proportions of its miniature army and supplies to each town, and appointing a commander. . . . So complete are the features of State-hood, that we may fairly assign May 1, 1637, as the proper birthday of Connecticut. No king, no Congress, presided over the birth: its seed was in the towns. January 14, 1638 (9), the little Commonwealth formed the first American Constitution at Hartford. So far as its provisions are concerned, the King, the Parliament, the Plymouth Council, the Warwick grant, the Say and Sele grant, might as well have been non-existent: not one of them is mentioned. . . . This constitution was not only the earliest but the longest in continuance of American documents of the kind, unless we except the Rhode Island charter. It was not essentially altered by the charter of 1662, which was practically a royal confirmation of it; and it was not until 1818 that the charter, that is the constitution of 1639, was superseded by the present constitution. Connecticut was as absolutely a state in 1639 as in 1776."—A. Johnston, *Genesis of a New England state* (*Johns Hopkins University Studies*, no. 11).—Following is the text of those "Fundamental Orders" adopted by the people dwelling on Connecticut river, January 14, 1638 (9), which formed the first of written constitutions: "FORASMUCH as it hath pleased the Almighty God by the wise disposition of his diuyn^e p^ruidence so to Order and dispose of things that we the Inhabitants and Residents of Windsor, Harteford and Wethersfield are now cohabiting and dwelling in and vpon the River of Conectecotte and the Lands thereunto adioyning; And well knowing where a people are gathered together the word of God requires that to mayntayne the peace and vnion of such a people there should be an orderly and decent Gouerment established according to God, to order and dispose of the affayres of the people at all seasons as ocation shall require; doe therefore assotiate and conioyne our selues to be as one Publike State or Comon-

welth; and doe, for our selues and our Successors and such as shall be adioyned to vs att any tyme hereafter, enter into Combination and Confederation together, to mayntayne and p^rsearue the liberty and purity of gospel of our Lord Jesus w^{ch} we now p^rfesse, as also the discipline of the Churches, w^{ch} according to the truth of the said gospell is now practised amongst vs; As also in o^r Ciuell Affaires to be guided and gouerned according to such Lawes, Rules, Orders and decrees as shall be made, ordered & decreed, as followeth:—1. It is Ordered, sentenced and decreed, that there shall be yerely two generall Assemblies or Courts, the one the second thursday in Aprill, the other the second thursday in September following; the first shall be called the Courte of Election, wherein shall be yerely Chosen frō tyme to tyme soe many Magistrats and other publike Officers as shall be found requisite: Whereof one to be chosen Gouvernour for the yeare ensueing and vntill another be chosen, and noe other Magistrate to be chosen for more than one yeare; p^ruided alwayes there be sixe chosen besids the Gouvernour; w^{ch} being chosen and sworne according to an Oath recorded for that purpose shall haue power to administer iustice according to the Lawes here established, and for want thereof according to the rule of the word of God; w^{ch} choise shall be made by all that are admitted freemen and haue taken the Oath of Fidellity, and doe cohabitte wthin this Jurisdiction, (hauing bene admitted Inhabitants, by the maior p^rt of the Towne wherein they liue,) or the mayor p^rte of such as shall be then p^rsent. 2. It is Ordered, sentenced and decreed, that the Election of the aforesaid Magistrats shall be on this manner: eury p^rson p^rsent and qualified for choise shall bring in (to the p^rsons deputed to receaue the) one single pap^r wth the name of him written in yt whom he desires to haue Gouvernour, and he that hath the greatest nūber of papers shall be Gouvernour for that yeare. And the rest of the Magistrats or publike Officers to be chosen in this manner: The Secretary for the tyme being shall first read the names of all that are to be put to choise and then shall seuerally nominate them distinctly, and eury one that would haue the p^rson nominated to be chosen shall bring in one single paper written vppon, and he that would not haue him chosen shall bring in a blanke; and eury one that hath more written papers then blanks shall be a Magistrate for that yeare; w^{ch} papers shall be receaued and told by one or more that shall be then chosen by the court and sworne to be faythfull therein: but in case there should not be sixe chosen as aforesaid, besids the Gouvernour, out of those w^{ch} are nominated, then he or they w^{ch} haue the most written pap^rs shall be a Magistrate or Magistrats for the ensueing yeare, to make vp the foresaid nūber. 3. It is Ordered, sentenced and decreed, that the Secretary shall not nominate any p^rson, nor shall any p^rson be chosen newly into the Magistracy w^{ch} was not p^rpownded in some Generall Courte before, to be nominated the next Election; and to that end yt shall be lawfull for ech of the Townes aforesaid by their deputies to nominate any two w^ho they conceaue fitte to be put to election; and the Courte may ad so many more as they judge requisitt. 4. It is Ordered, sentenced and decreed that noe p^rson be chosen Gouvernour aboue once in two yeares, and that the Gouvernour be always a mēber of some approved congregation, and formerly of the Magistracy wthin this Jurisdiction; and all the Magistrats Freemen of this Comonwelth; and that no Magistrate or other publike officer shall execute any p^rte of his or their Office before they are

seuerally sworne, w^{ch} shall be done in the face of the Courte if they be p^rsent, and in case of absence by some deputed for that purpose. 5. It is Ordered, sentenced and decreed, that to the aforesaid Courte of Election the seu^rall Townes shall send their deputies, and when the Elections are ended they may p^rceed in any publike searuite as at other Courts. Also the other Generall Courte in September shall be for making of lawes, and any other publike occation, w^{ch} concerns the good of the Comonwelth. 6. It is Ordered, sentenced and decreed, that the Gou^rnor shall, ether by himselfe or by the secretary, send out sumons to the Constables of eu^r Towne for the cauleing of these two standing Courts, on month at lest before their seu^rall tymes: And also if the Gou^rnor and the gretest p^rte of the Magistrats see cause vppon any spetiall occation to call a generall Courte, they may giue order to the secretary soe to doe wthin fowerteene dayes warning; and if yrgent necessity so require, vppon a shorter notice, giueing sufficient grownds for yt to the deputies when they meete, or els be questioned for the same; And if the Gou^rnor and Mayor p^rte of Magistrats shall ether neglect or refuse to call the two Generall standing Courts or ether of thē, as also at other tymes when the occations of the Comonwelth require, the Freemen thereof, or the Mayor p^rte of them, shall petition to them soe to doe: if then yt be ether denied or neglected the said Freemen or the Mayor p^rte of them shall haue power to giue order to the Constables of the seuerall Townes to doe the same, and so may meete together, and chuse to themselues a Moderator, and may p^rceed to do any Acte of power, w^{ch} any other Generall Courte may. 7. It is Ordered, sentenced and decreed that after there are warrants giuen out for any of the said Generall Courts, the Constable or Constables of ech Towne shall forthwth give notice distinctly to the inhabitants of the same, in some Publike Assembly or by goeing or sending frō howse to howse, that at a place and tyme by him or them lymited and sett, they meet and assemble thē selues together to elect and chuse certen deputies to be att the Generall Courte then following to agitate the afayres of the comonwelth; w^{ch} said Deputies shall be chosen by all that are admitted Inhabitants in the seu^rall Townes and haue taken the oath of fidellity; p^ruided that non be chosen a Deputy for any Generall Courte w^{ch} is not a Freeman of this Comonwelth. The foresaid deputies shall be chosen in manner following: eury p^rson that is p^rsent and qualified as before exp^rssed, shall bring the names of such, written in seu^rall papers, as they desire to haue chosen for that Employment, and these 3 or 4, more or lesse, being the nūber agreed on to be chosen for that tyme, that haue greatest nūber of papers written for thē shall be deputies for that Courte; whose names shall be endorsed on the backe side of the warrant and returned into the Courte, wth the Constable or Constables hand vnto the same. 8. It is Ordered, sentenced and decreed, that Wyndsor, Hartford and Wethersfield shall haue power, ech Towne, to send fower of their freemen as deputies to eury Generall Courte; and whatsoever other Townes shall be hereafter added to this Jurisdiction, they shall send so many deputies as the Courte shall judge meete, a reasonable p^rportion to the nūber of Freemen that are in the said Townes being to be attended therein; w^{ch} deputies shall haue the power of the whole Towne to giue their voats and allowance to all such lawes and orders as may be for the publike good, and unto w^{ch} the said Townes are to be bownd. 9. It is ordered and decreed, that the deputies thus

chosen shall have power and liberty to appoint a tyme and a place of meeting together before any Generall Courte to advise and consult of all such things as may concerne the good of the publike, as also to examine their owne Elections, whether according to the order, and if they or the gretest p^rte of them find any election to be illegall they may seclude such for p^rsent frō their meeting, and returne the same and their resons to the Courte; and if yt proue true, the Courte may fyne the p^rty or p^rties so intruding and the Towne, if they see cause, and giue out a warrant to goe to a newe election in a legall way, either in p^rte or in whole. Also the said deputies shall have power to fyne any that shall be disorderly at their meetings, or for not coming in due tyme or place according to appoyntment; and they may returne the said fynes into the Courte if yt be refused to be paid, and the tresurer to take notice of yt, and to estreete or levy the same as he doth other fynes. 10. It is Ordered, sentenced and decreed, that eury Generall Courte, except such as through neglecte of the Gou^rnor and the greatest p^rte of Magestrats the Freemen themselves doe call, shall consist of the Gouernour, or some one chosen to moderate the Court, and 4 other Magestrats at lest, wth the mayor p^rte of the deputies of the seuerall Townes legally chosen; and in case the Freemen or mayor p^rte of thē, through neglect or refusall of the Gouernour and mayor p^rte of the magestrats, shall call a Courte, y^t shall consist of the mayor p^rte of Freemen that are p^rsent or their deputies, wth a Moderator chosen by thē: In w^{ch} said Generall Courts shall consist the supreme power of the Comonwelth, and they only shall have power to make laws or repeale thē, to graunt luyes, to admitt of Freemen, dispose of lands vndisposed of, to seuerall Townes or p^rsons, and also shall have power to call either Courte or Magestrate or any other p^rson whatsoeuer into question for any misdemeanour, and may for just causes displace or deale otherwise according to the nature of the offence; and also may deale in any other matter that concerns the good of this comon welth, excepte election of Magestrats, w^{ch} shall be done by the whole boddy of Freemen. In w^{ch} Courte the Gouernour or Moderator shall have power to order the Courte to giue liberty of spech, and silence vnreasonable and disorderly speakeings, to put all things to voate, and in case the voate be equal to haue the casting voice. But non of these Courts shall be adorned or dissolved wthout the consent of the maior p^rte of the Court. 11. It is ordered, sentenced and decreed, that when any Generall Courte vpon the occations of the Comonwelth haue agreed vpon any sume or somes of mony to be leuyed vpon the seuerall Townes w^{thin} this Jurisdiction, that a Committee be chosen to sett out and appoynt w^t shall be the p^rportion of eury Towne to pay of the said leuy, p^rvided the Committees be made vp of an equal nūber out of each Towne. 14th January, 1638, the 11 Orders abouesaid are voted."—*Public Records of the Colony of Connecticut*, v. 1.

1637.—Pequot War. See NEW ENGLAND: 1637.

1638.—Planting of New Haven colony.—"In the height of the Hutchinson controversy [see MASSACHUSETTS: 1636-1638], John Davenport, an eminent nonconformist minister from London, had arrived at Boston, and with him a wealthy company, led by two merchants, Theophilus Eaton and Edward Hopkins. Alarmed at the new opinions and religious agitations of which Massachusetts was the seat, notwithstanding very advantageous offers of settlement there, they preferred to establish a separate community of their own,

to be forever free from the innovations of error and licentiousness. Eaton and others sent to explore the coast west of the Connecticut, selected a place for settlement near the head of a spacious bay at Quinapiack [or Quinnipiack], or, as the Dutch called it, Red Hill, where they built a hut and spent the winter. They were joined in the spring [April, 1638] by the rest of their company, and Davenport preached his first sermon under the shade of a spreading oak. Presently they entered into what they called a 'plantation covenant,' and a communication being opened with the Indians, who were but few in that neighborhood, the lands of Quinapiack were purchased, except a small reservation on the east side of the bay, the Indians receiving a few presents and a promise of protection. A tract north of the bay, ten miles in one direction and thirteen in the other, was purchased for ten coats; and the colonists proceeded to lay out in squares the ground-plan of a spacious city, to which they presently gave the name of New Haven."—R. Hildreth, *History of the United States*, v. 1, ch. 9.—"They formed their political association by what they called a 'plantation covenant,' 'to distinguish it from a church covenant, which could not at that time be made.' In this compact they resolved, 'that, as in matters that concern the gathering and ordering of a church, so likewise in all public offices which concern civil order, as choice of magistrates and officers, making and repealing of laws; dividing allotments of inheritance, and all things of like nature,' they would 'be ordered by the rules which the Scriptures hold forth.' It had no external sanction, and comprehended no acknowledgment of the government of England. The company consisted mostly of Londoners, who at home had been engaged in trade. In proportion to their numbers, they were the richest of all the plantations. Like the settlers on Narragansett Bay, they had no other title to their lands than that which they obtained by purchase from the Indians."—J. G. Palfrey, *History of New England*, v. 1, ch. 13.

1639.—Fundamental agreement of New Haven.—"In June, 1639, the whole body of settlers [at Quinnipiack, or New Haven] came together to frame a constitution. A tradition, seemingly well founded, says that the meeting was held in a large barn. According to the same account, the purpose for which they had met and the principles on which they ought to proceed were set forth by Davenport in a sermon. 'Wisdom hath builded her house, she hath hewn out seven pillars,' was the text. There is an obvious connection between this and the subsequent choice of seven of the chief men to lay the foundation of the constitution. . . . Davenport set forth the general system on which the constitution ought to be framed. The two main principles which he laid down were, that Scripture is a perfect and sufficient rule for the conduct of civil affairs, and that church-membership must be a condition of citizenship. In this the colonists were but imitating the example of Massachusetts. . . . After the sermon, five resolutions [followed by a sixth, constituting together what was called the 'fundamental agreement' of New Haven Colony], formally introducing Davenport's proposals, were carried. If a church already existed, it was not considered fit to form a basis for the state. Accordingly a fresh one was framed by a curiously complicated process. As a first step, twelve men were elected. These twelve were instructed, after a due interval for consideration, to choose seven out of their own

number, who should serve as a nucleus for the church. At the same time an oath was taken by the settlers, which may be looked on as a sort of preliminary and provisional test of citizenship, pledging them to accept the principles laid down by Davenport. Sixty-three of the inhabitants took the oath, and their example was soon followed by fifty more. By October, four months after the original meeting, the seven formally established the new commonwealth. They granted the rights of a freeman to all who joined them, and who were recognized members either of the church at New Haven or of any other approved church. The freemen thus chosen entered into an agreement to the same effect as the oath already taken. They then elected a Governor and four Magistrates, or, as they were for the present called, a Magistrate and four Deputies. . . . The functions of the Governor and Magistrates were not defined. Indeed, but one formal resolution was passed as to the constitution of the colony, namely, 'that the Word of God shall be the only rule attended unto in ordering the affairs of government.'—J. A. Doyle, *English in America: The Puritan colonies*, v. 1, ch. 6.—'Of all the New England colonies, New Haven was most purely a government by compact, by social contract. . . . The free planters . . . signed each their names to their voluntary compact, and ordered that 'all planters hereafter received in this plantation should submit to the said fundamentall agreement, and testifie the same by subscribing their names.' It is believed that this is the sole instance of the formation of an independent civil government by a general compact wherein all the parties to the agreement were legally required to be actual signers thereof. When this event occurred, John Locke was in his seventh year, and Rousseau was a century away."—C. H. Levermore, *Republic of New Haven*, p. 23.

1639-1662.—Alleged blue laws of New Haven.—"Just when or by whom the acts and proceedings of New Haven colony were first stigmatized as Blue Laws, cannot now be ascertained. The presumption, however, is strong that the name had its origin in New York, and that it gained currency in Connecticut, among episcopalian and other dissenters from the established church, between 1720 and 1750. . . . In the colony of New Haven, before the union with Connecticut, the privileges of voting and of holding civil office were, by the 'fundamental agreement,' restricted to church-members. This peculiarity of her constitution was enough to give color to the assertion that her legislation was, pre-eminently, blue. That her old record-book contained a code of 'blue laws' which were discreditable to puritanism, and which testified to the danger of schisms, became, among certain classes, an assured belief. To this imaginary code wit and malice made large additions, sometimes by pure invention, sometimes by borrowing absurd or arbitrary laws from the records of other colonies. And so the myth grew. . . . No specimens of the laws so stigmatized seem to have been published before 1781, when 'a sketch of some of them' was given to the world by the Rev. Samuel Peters in 'A General History of Connecticut.'" In this "History," it is said, were collected all the extravagant stories that had been set afloat during the previous fifty years.—J. H. Trumbull, *True blue laws of Connecticut and New Haven, Introd.*—See also BLUE LAWS; SUNDAY OBSERVANCES: United States.

1660-1664.—Protection of the regicides at New Haven.—"Against the colony of New Haven the king had a special grudge. Two of the regicide judges [Whalley and Goffe], who had sat in the tribunal which condemned his father, escaped to New England in 1660 and were well received there. . . . The king's detectives hotly pursued them through the woodland paths of New England, and they would soon have been taken but for the aid they got from the people. . . . After lurking about New Haven and Milford for two or three years . . . they sought a more secluded hiding place near Hadley."—J. Fiske, *Beginnings of New England*.

1662-1664.—Royal charter and annexation of New Haven to the river colony.—"The Restoration in England left the New Haven colony under a cloud in the favor of the new government: it had been tardy and ungracious in its proclamation of Charles II.; it had been especially remiss in searching for the regicide colonels, Goffe and Whalley; and any application for a charter would have come from New Haven with a very ill grace. Connecticut was under no such disabilities; and it had in its Governor, John Winthrop [the younger, son of the first governor of Massachusetts], a man well calculated to win favor with the new King. . . . In March, 1660, the General Court solemnly declared its loyalty to Charles II., sent the Governor to England to offer a loyal address to the King and ask him for a charter, and laid aside £500 for his expenses. Winthrop was successful, and the charter was granted April 20, 1662. The acquisition of the charter raised the Connecticut leaders to the seventh heaven of satisfaction. And well it might, for it was a grant of privileges with hardly a limitation. Practically the King had given Winthrop 'carte blanche,' and allowed him to frame the charter to suit himself. It incorporated the freemen of Connecticut as a 'body corporate and polittique,' by the name of 'The Governor and Company of the English Collony of Conecticut in New England in America.' . . . The people were to have all the liberties and immunities of free and natural subjects of the King, as if born within the realm. It granted to the Governor and Company all that part of New England south of the Massachusetts line and west of the 'Norroganatt River commonly called Norroganatt Bay' to the South Sea, with the 'Islands thereunto adioyneinge.' . . . It is difficult to see more than two points in which it [the charter] altered the constitution adopted by the towns in 1630. There were now to be two deputies from each town; and the boundaries of the Commonwealth now embraced the rival colony of New Haven. . . . New Haven did not submit without a struggle, for not only her pride of separate existence but the supremacy of her ecclesiastical system was at stake. For three years a succession of diplomatic notes passed between the General Court of Connecticut and 'our honored friends of New Haven, Milford, Branford, and Guilford.' . . . In October, 1664, the Connecticut General Court appointed the New Haven magistrates commissioners for their towns, 'with magistraticall

powers, established the New Haven local officers in their places for the time, and declared oblivion for any past resistance to the laws. In December, Milford having already submitted, the remnant of the New Haven General Court, representing New Haven, Guilford, and Branford, held its last meeting and voted to submit, 'with a *salvo jure* of our former rights and claims, as a people who have not yet been heard in point of plea.' The next year the laws of New Haven were laid aside forever, and her towns sent deputies to the General Court at Hartford. . . . In 1701 the General Court . . . voted that its annual October session should thereafter be held at New Haven. This provision of a double capital was incorporated into the constitution of 1818, and continued until in 1873 Hartford was made sole capital."—A. Johnston, *Genesis of a New England state*, pp. 25-28.

1666.—New Haven migration to Newark, New Jersey. See NEW JERSEY: 1664-1667.

1674-1675.—Long Island and the western half of the colony granted to the duke of York.—In 1674, after the momentary recovery of New York by the Dutch, and its resurrender to the English, "the king issued a new patent for the province, in which he not only included Long Island, but the territory up to the Connecticut River, which had been assigned to Connecticut by the royal commissioners. The assignment of Long Island was regretted, but not resisted; and the island which is the natural sea-wall of Connecticut passed, by royal decree, to a province whose only natural claim to it was that it barely touched it at one corner. The revival of the duke's claim to a part of the mainland was a different matter, and every preparation was made for resistance. In July, 1675, just as King Philip's war had broken out in Plymouth, hasty word was sent from the authorities at Hartford to Captain Thomas Bull at Saybrook that Governor Andros of New York was on his way through the Sound for the purpose, as he avowed, of aiding the people against the Indians. Of the two evils, Connecticut rather preferred the Indians. Bull was instructed to inform Andros, if he should call at Saybrook, that the colony had taken all precautions against the Indians, and to direct him to the actual scene of conflict, but not to permit the landing of any armed soldiers. 'And you are to keep the king's colors standing there, under his majesty's lieutenant, the governor of Connecticut; and if any other colors be set up there, you are not to suffer them to stand. . . . But you are in his majesty's name required to avoid striking the first blow; but if they begin, then you are to defend yourselves, and do your best to secure his majesty's interest and the peace of the whole colony of Connecticut in our possession.' Andros came and landed at Saybrook, but confined his proceedings to reading the duke's patent against the protest of Bull and the Connecticut representatives."—A. 1685-1687.—Hostile king and the hidden charter.—Sir Edmund Andros in possession of the government.—"During the latter years of the reign of Charles II. the king had become so reckless of his pledges and his faith that he did not scruple to set the dangerous example of violating the charters that had been granted by the crown. Owing to the friendship that the king entertained for Winthrop, we have seen that Connecticut was favored by him to a degree even after the death of that great man. But no sooner had Charles demised and the sceptre passed into the hands of his bigoted brother, King James II., than Connecticut was called upon to contend against her sovereign for liberties that had been affirmed to her by the most solemn muniments known to the law of England. The accession of James II. took place on the 6th day of February 1685, and such was his haste to violate the honor of the crown that, early in the summer of 1685, a *quo warranto* was issued against the governor and company of Connecticut, citing them to appear before the king, within eight days of St. Martin's, to show by what right and tenor they exercised certain powers and privileges." This was quickly followed by two other writs, conveyed to Hartford by Edward Randolph, the implacable enemy of the colonies. "The day of appearance named in them was passed long before the writs were served." Whiting was sent to England as the agent of the colony, to exert such influences as might be brought to bear against the plainly hostile and unscrupulous intentions of the king; but his errand was fruitless. "On the 28th of December another writ of *quo warranto* was served upon the governor and company of the colony. This writ bore date the 23d of October, and required the defendants to appear before the king 'within eight days of the purification of the Blessed Virgin.' . . . Of course, the day named was not known to the English law, and was therefore no day at all in legal contemplation." Already, the other New England colonies had been brought under a provisional general government, by commissioners, of whom Joseph Dudley was named president. President Dudley "addressed a letter to the governor and council, advising them to resign the charter into the king's hands. Should they do so, he undertook to use his influence in behalf of the colony. They did not deem it advisable to comply with the request. Indeed they had hardly time to do so before the old commission was broken up, and a new one granted, superseding Dudley and naming Sir Edmund Andros governor of New England. Sir Edmund arrived in Boston on the 19th of December, 1686, and the next day he published his commission and took the government into his hands. Scarcely had he established himself, when he sent a letter to the governor and company of Connecticut, acquainting them with his appointment, and informing them that he was commissioned by the king to receive their charter if they would give it up to him."—G. H. Hollister, *History of Connecticut*, v. 1, ch. 14.—On receipt of the communication from Andros, "the General Court was at once convened, and by its direction a letter was addressed to the English Secretary of State, earnestly pleading for the preservation of the privileges that had been granted to them. For the first time they admitted the possibility that their petition might be denied, and in that case requested to be united to Massachusetts. This was construed by Sir Edmund as a virtual surrender; but as the days went by he saw that he had mistaken the spirit and purpose of the colony. Andros finally decided to go in person to Con-

necticut. He arrived at Hartford the last day of October, attended by a retinue of 60 officers and soldiers. The Assembly, then in session, received him with every outward mark of respect. After this formal exchange of courtesies, Sir Edmund publicly demanded the charter, and declared the colonial government dissolved. Tradition relates that Governor Treat, in calm but earnest words, remonstrated against this action. . . . The debate was continued until the shadows of the early autumnal evening had fallen. After candles were lighted, the governor and his council seemed to yield; and the box supposed to contain the charter was brought into the room, and placed upon the table. Suddenly the lights were extinguished. Quiet reigned in the room, and in the dense crowd outside the building. The candles were soon relighted; but the charter had disappeared, and after the most diligent search could not be found. The common tradition has been, that it was taken under cover of the darkness by Captain Joseph Wadsworth, and hidden by him in the hollow trunk of a venerable and noble oak tree standing near the entrance-gate of Governor Wyllys's mansion. The charter taken by Captain Wadsworth was probably the duplicate, and remained safely in his possession for several years. There is reason to believe that, some time before the coming of Andros to Hartford, the original charter had been carefully secreted, and the tradition of later times makes it probable that, while the duplicate charter that was taken from the table was hidden elsewhere, the original charter found a safe resting place in the heart of the tree that will always be remembered as The Charter Oak. This tree is said to have been preserved by the early settlers at the request of the Indians. 'It has been the guide of our ancestors for centuries,' they said, 'as to the time of planting our corn. When the leaves are the size of a mouse's ears, then is the time to put it in the ground.' The record of the Court briefly states that Andros, having been conducted to the governor's seat by the governor himself, declared that he had been commissioned by his Majesty to take on him the government of Connecticut. 'The commission having been read, he said that it was his Majesty's pleasure to make the late governor and Captain John Allyn members of his council. The secretary handed their common seal to Sir Edmund, and afterwards wrote these words inclosing the record: 'His Excellency, Sir Edmund Andros, Knight, Captain-General and Governor of his Majesty's Territory and Dominion in New England, by order from his Majesty, King of England, Scotland and Ireland, the 31st of October, 1687, took into his hands the government of this colony of Connecticut, it being by his Majesty annexed to the Massachusetts and other colonies under his Excellency's government. Finis.' Andros soon disclosed a hand of steel beneath the velvet glove of plausible words and fair promises."—E. B. Sanford, *History of Connecticut*, ch. 16.—See also NEW ENGLAND: 1686; MASSACHUSETTS: 1671-1686.

1689-1701.—Reinstatement of the charter government.—"April, 1689, came at last. The people of Boston, at the first news of the English Revolution, clapped Andros into custody. May 9, the old Connecticut authorities quietly resumed their functions, and called the assembly together for the following month. William and Mary were proclaimed with great fervor. Not a word was

said about the disappearance or reappearance of the charter; but the charter government was put into full effect again, as if Andros had never interrupted it. An address was sent to the king, asking that the charter be no further interfered with; but operations under it went on as before. No decided action was taken by the home government for some years, except that its appointment of the New York governor, Fletcher, to the command of the Connecticut militia, implied a decision that the Connecticut charter had been superseded. Late in 1693, Fitz John Winthrop was sent to England as agent to obtain a confirmation of the charter. He secured an emphatic legal opinion from Attorney General Somers, backed by those of Treby and Ward, that the charter was entirely valid, Treby's concurrent opinion taking this shape: 'I am of the same opinion, and, as this matter is stated, there is no ground of doubt.' The basis of the opinion was that the charter had been granted under the great seal; that it had not been surrendered under the common seal of the colony, nor had any judgment of record been entered against it; that its operation had merely been interfered with by overpowering force; that the charter therefore remained valid; and that the peaceable submission of the colony to Andros was merely an illegal suspension of lawful authority. In other words, the passive attitude of the colonial government had disarmed Andros so far as to stop the legal proceedings necessary to forfeit the charter, and their prompt action, at the critical moment, secured all that could be secured under the circumstances. William was willing enough to retain all possible fruit of James's tyranny, as he showed by enforcing the forfeiture of the Massachusetts charter; but the law in this case was too plain, and he ratified the lawyers' opinion in April, 1694. The charter had escaped its enemies at last, and its escape is a monument of one of the advantages of a real democracy. . . . Democracy had done more for Connecticut than class influence had done for Massachusetts."—A. Johnston, *Connecticut*, ch. 12.—"The decisions which established the rights of Connecticut included Rhode Island. These two commonwealths were the portion of the British empire distinguished above all others by the largest liberty. Each was a nearly perfect democracy under the shelter of a monarchy. . . . The crown, by reserving to itself the right of appeal, had still a method of interfering in the internal affairs of the two republics. Both of them were included among the colonies in which the lords of trade advised a complete restoration of the prerogatives of the crown. Both were named in the bill which, in April, 1701, was introduced into parliament for the abrogation of all American charters. The journals of the house of lords relate that Connecticut was publicly heard against the measure, and contended that its liberties were held by contract in return for services that had been performed; that the taking away of so many charters would destroy all confidence in royal promises, and would afford a precedent dangerous to all the chartered corporations of England. Yet the bill was read a second time. . . . The impending war with the French postponed the purpose till the accession of the house of Hanover."—A. Bancroft, *History of the United States* (Author's last revision), v. 2, pt. 3, ch. 3.

1765.—Revolt against the Stamp Act.—“The English government understood very well that the colonies were earnestly opposed to the Stamp Act, but they had no thought of the storm of wrath and resistance which it would arouse. It was a surprise to many of the leaders of public affairs in America. . . . Governor Fitch and Jared Ingersoll, with other prominent citizens who had done all in their power to oppose the scheme of taxation . . . counselled submission. They mistook the feeling of the people. . . . The clergy were still the leaders of public opinion, and they were united in denunciation of the great wrong. Societies were organized under the name of the Sons of Liberty, the secret purpose of which was to resist the Stamp Act by violent measures if necessary. . . . Mr. Ingersoll, who had done all in his power to oppose the bill, after its passage decided to accept the position of stamp agent for Connecticut. Franklin urged him to take the place, and no one doubted his motives in accepting it. The people of Connecticut, however, were not pleased with this action. . . . He was visited by a crowd of citizens, who inquired impatiently if he would resign.” Ingersoll put them off with evasive replies for some time; but finally there was a gathering of a thousand men on horseback, from Norwich, New London, Windham, Lebanon and other towns, each armed with a heavy peed club, who surrounded the obstinate stamp agent at Wethersfield and made him understand that they were in deadly earnest. “The cause is not worth dying for,” said the intrepid man, who would never have flinched had he not felt that, after all, this band of earnest men were in the right. A formal resignation was given him to sign. . . . After he had signed his name, the crowd cried out, ‘Swear to it!’ He begged to be excused from taking an oath. ‘Then shout Liberty and Property,’ said the now good-natured company. To this he had no objection, and waved his hat enthusiastically as he repeated the words. Having given three cheers, the now hilarious party dined together.” Ingersoll was then escorted to Hartford, where he read his resignation publicly at the court-house.—E. B. Sanford, *History of Connecticut*, ch. 29.—See also U. S. A.: 1765; News of the Stamp Act in the colonies.

1776.—Assumes to be a “free, sovereign and independent state.”—“In May, 1776, the people had been formally released from their allegiance to the crown; and in October the general assembly passed an act assuming the functions of a State. The important section of the act was the first, as follows: ‘That the ancient form of civil government, contained in the charter from Charles the Second, King of England, and adopted by the people of this State, shall be and remain the civil Constitution of this State, under the sole authority of the people thereof, independent of any king or prince whatever. And that this Republic is, and shall forever be and remain, a free, sovereign and independent State, by the name of the State of Connecticut.’ The form of the act speaks what was doubtless always the belief of the people, that their charter derived its validity, not from the will of the crown, but from the assent of the people. And the curious language of the last sentence, in which ‘this Republic’ declares itself to be ‘a free, sovereign, and independent State,’ may serve to indicate something of the appearance which state sovereignty doubtless presented to the Americans of 1776-89.”—A. Johnston, *Connecticut*, ch. 16.—See also U. S. A.: 1776-1779.

1818.—Assembly vs. Courts.—Governor “Oliver Wolcott, the father of the constitution of 1818 . . . placed before the Assembly the questions soon to be discussed in the convention of 1818. There was need of wise statesmanship; mills were having a hard time in the business depression, farmers were burdened by taxes on stocks, dairy products, and tillage; money was scarce; the majority had a scanty living; trades were few and wages low. A farm hand averaged fifty cents a day, paid in provisions. Women of all work drudged for fifty cents a week, while a farm overseer received a salary of seventy dollars a year. The wealthy had small incomes. It was said that the rich and prosperous Pierpont Edwards, the eminent lawyer of New Haven, had an income of two thousand dollars a year from his practice. The Assembly had encroached upon the courts; in 1815, it had set aside the conviction of a murderer, and the judge, Zephaniah Swift, appealed to the public to vindicate his judicial character, insisting that the ‘Legislature should never encroach on

the Judiciary, otherwise, the Legislature would become one great arbitration, that would engulf all the courts of law, and sovereign discretion would be the only rule of decision,—a state of things equally favorable to lawyers and criminals.' The committees to which the governor's suggestions were referred did little. A barren act of toleration was passed, retaining the certificate clause. Determined to carry the day in 1818, the winter previous to election was a time of strenuous agitation; at the spring elections the reform ticket won, seating Wolcott in the governor's chair again, giving an anti-Federal majority in both Senate and House. It was voted that the freemen should assemble in town meetings on the following fourth of July to elect as many delegates as representatives in the Assembly, to meet in a convention at Hartford, August 26, 1818, to form a constitution. Members of all creeds and of no creeds met at that place; seven of them were in the convention that ratified the Constitution of the United States, and such venerable Federalists were there as Stephen M. Mitchell, Jesse Root, and John Treadwell. Earnest leaders of the Established Order were there, as well as the powerful men of the new party of Toleration and Reform, whose founder, Pierpont Edwards, the youngest son of Jonathan Edwards, brought his profound legal lore to the convention. Alexander Wolcott of Middletown, the founder and father of the Jefferson school of politics in the state was there, and Oliver Wolcott was chosen to preside. A committee of twenty-four, three from every county, was appointed to draft a constitution, and five of these were of the Federalist party. The debates were long and thorough, but in the end the Toleration party triumphed, winning for the people all that had been promised, securing 'the same and equal powers, rights, and privileges to all denominations of Christians.' The constitution of 1818 was modeled after the old charter, and contained much of that famous and invaluable instrument, but it declared more clearly the principles of personal liberty. It established the rights of suffrage on personal qualifications, discarding property conditions. It reorganized the courts, separating them from the legislature, reducing the number of judges nearly one-half, and in the higher courts continuing them in office until seventy years old, unless impeached. Amendments to the constitution were provided for. The legislature was to consist of two branches; the upper to be known as the Senate, to consist of fourteen members; the lower branch to be called the House of Representatives; the towns, being the unit of organization, retained their former number of delegates without regard to population. There were to be annual elections, and the meetings were to be held alternately in Hartford and New Haven, thus saving, as was estimated, fourteen thousand dollars a year. The governor was given the veto power though a majority of the legislature could override his action. The union of church and state was dissolved, and all other bodies were put on the same level of self-support. There were other minor changes; Methodist, Baptist, and Universalist ministers had been practically excluded from marrying people, and that injustice was remedied. Formerly, Yale College was the only literary institution favored by the legislature; under the new rule Trinity College received a charter, despite strong opposition; and one was granted later to the Methodist College at Middletown [Wesleyan]. Teaching the catechism, which had been enforced by law, was made optional, and Congregational ministers stepped down from the place

of political power. The lower magistracy was distributed as equally as possible among the various political and religious interests, and the judges in the higher courts were appointed for other reasons than that they were members of the Standing Order."—G. L. Clark, *History of Connecticut*, pp. 349-351.—See also AMENDMENTS TO CONSTITUTIONS: Other methods of amending state constitutions.

1818-1820.—Early industries of the state.—Primary importance of agriculture.—Manufacturing.—Organization of towns.—Obstacles to growth of new industries.—"A hundred years ago a beginning had been made in each of the industries in which Connecticut now takes first place among the states. The beginnings were so small in some cases that if we did not know to what they have grown we might never notice them, but already in 1818 Connecticut was known as the land of steady habits, the home of 'Yankee notions,' clocks, and tinware. Her people were noted for their spirit of industry and enterprise, and for the spirit of traffic which had led thousands of them abroad, where they were to be found all through the South vending tinware and the clocks. . . . [At this time] there was no place in Connecticut that we today should call a manufacturing town. Agriculture was still the staple occupation of the state. Almost as universally as on the manors of medieval England the people in the New England rural communities of those days 'made all they needed and needed all they made,' and we cannot suppose that the conditions in the 'cities' were very different. There were five cities in the state, all having been incorporated in 1784 on the basis, it would seem, of their commerce, which was in all of them important at that time. These were New Haven, New London, Hartford, Norwich, and Middletown. . . . The manufactures of New Haven were almost negligible. They numbered: 1 hat factory, 1 rail factory, 1 powder mill, 1 cotton factory, 2 paper mills, 17 boot and shoe factories, and 1 comb maker. The only thing that suggests the manufacturing city of a later date is the entry '8 Chaise & wagon makers, some of which carry on the business on an extensive scale.' . . . New London's specialty was fishing. A few years later her whaling industry was surpassed only by New Bedford's, and this was in addition to her fishing 'from Cape Cod to Egg Harbour' and her 'coasting trade with the Southern States.' Norwich, too, carried on a considerable coastwise commerce, but here there were beginnings of the cotton industry. Besides a cotton factory of 1200 spindles, she had in 1818 two paper mills, two manufactories of morocco leather, and one wool factory. Middletown and Hartford did more manufacturing. In the former were two woolen and two cotton mills 'with considerable reputation.' Here also were made swords, pistols, and rifles for the United States government, and it was reported that the swords 'have been esteemed equal in every respect if not superior to those imported.' Besides these manufactures in Middletown there were six tinware factories and small establishments for making buttons, pewter, combs, paper, powder, rope, twine, muffs and tippets. In Hartford there were still more manufactures—a looking-glass factory producing \$30,000 worth annually, one whip-lash factory making \$10,000 worth each year, one machine card factory making \$10,000 worth, one cotton factory of 320 spindles, one coppersmith employing 20 men, three distilleries, five potteries, two tinware factories, one employing 36 men, fifteen shoe factories, and one button factory, one

bell foundry, one paper hanging manufactory, and one pewter factory. These five cities represent the highest manufacturing development then found in the state. . . . The statement that in 45 Connecticut towns there was real manufacturing going on must not be interpreted as saying that any of these were 'manufacturing towns.' A 'town' in the Connecticut vocabulary is not a collection of houses side by side. A town is the unit of political division of the state, a township. Each town is bounded on all sides by other towns, never set down alone in the midst of a county as in the South. Within the town there may be villages, or boroughs, or even cities. . . . Nowadays a city may be co-extensive with its town, and usually is, but when President Dwight wrote his statistical account of New Haven the city, as we have seen, comprised but six square miles out of the eighteen in the town of New Haven, and of those six miles but one square mile was thickly settled. . . . The people who were living in Connecticut in 1820 were eminently well fitted for manufacturing. They were ingenious and well educated, and had always, even while living in their isolated town groups, maintained a fairly high standard of living. Every farmer was a skilled mechanic as well. In the villages the blacksmiths, as we have seen, were deterred by none of the difficulties of making ordinary hardware. The result of all the household manufacture that was carried on was a huge fund of mechanical skill and aptitude ready and anxious to turn to any pursuit which would make it easier to earn a living. On the other hand the state was poorly supplied with raw material. Neither her distilleries nor her flour mills could expand very much on the amount of grain Connecticut farms would produce; the iron mines of Litchfield County were as good as any in New England, but they were not good enough to compete with the mines soon to be opened in New Jersey. Copper and all other metals are found in the state but in quantities too small to pay for the working. Cotton, of course, had to be imported. We cannot say the same of wool, but to this day Connecticut farmers would rather raise dogs than sheep, and though for a number of years sheep raising was carried on extensively, little came of the promise given in 1818 that the state would raise a large quantity of fine merino wool. This lack must not be overestimated, however, for an ingenious people with transportation facilities is never daunted by want of raw material. Another obstacle to the development of manufactures was the lack of capital. . . . Even in the largest city of the state [New Haven] there was but little accumulated capital."—G. P. Fuller, *Introduction to the history of Connecticut as a manufacturing state* (*Smith College Studies in History*, v. 1, no. 1, pp. 4-5, 7-8, 12, 27).

1818-1845. — Anti-slavery movement. — "The question arises in the mind of one who wishes a comprehensive view of the history of this state: What about the anti-slavery movement? Were the people too busy with their rapidly growing industry to take a deep interest in a struggle with the national curse? . . . For more than two hundred years, slavery was practiced in Connecticut. It reached its culmination in 1774, when there were 191,448 whites, and 6562 blacks, nearly all of whom were slaves. In 1774, as we have seen, the first action was taken against slavery, in the law prohibiting further importation of negroes into the colony. In 1800, there were 245,631 whites, 4331 blacks, and 931 slaves; and in 1840, there were seventeen slaves. It was found that slavery

was not only unprofitable as a business enterprise, but the negroes were becoming prominent in the criminal class; in 1822, one-fourth of the prisoners at Newgate were black; in 1828, one out of thirty-four of the population was black, and one in three of the convicts was a negro, so that there was ten times as much crime among the blacks as among whites. . . . Early in the nineteenth century, the colonization plan came to the front, not to suppress the slave trade or abolish slavery, but to establish a colony on the coast of Africa, whither negroes could return. This scheme was not so much a plaster on the open sore, as a mild sedative to the consciences of those who thought that something ought to be done. There was always a strong element in the state that opposed slavery; in 1806-1807, when Southerners sneered at the opposition of the North to the slave trade, Mosley of Connecticut said that if any of his section were convicted of being in the business, his constituents would thank the South for hanging them. In 1818, when a bill to enforce the fugitive-slave law was under debate in Congress, Williams of Connecticut opposed the clause permitting freemen to be dragged to another part of the country for trial. There were two significant laws passed by the legislature at the time when the question of the fugitive-slave law was disturbing the minds of many; one was a bill providing for a jury trial for alleged fugitives, and the other was a law which forbade any of the state officials to take part in fugitive-slave cases. The former suggests the sense of justice of the average citizen, the other a disposition to hold aloof from meddling,—that wariness that had such abundant illustration in affairs with Indians and royalist officers. In 1833, the New Haven Anti-Slavery Society was founded—one of the first societies in the country, based on the principle of immediate and unconditional abolition. It sent greetings to the old Pennsylvania abolition society, and received a cordial response. Among the leading spirits in the state were two ministers. . . . During the violent agitation through the state, the *Christian Freeman*, a newspaper in the interests of anti-slavery, was started in 1836, in Hartford, and from 1840, the opposition to slavery increased in the state, despite the conservatism of the manufacturers and traders, whose business relations with the South were important. In 1845, the Abolition or Liberty party nominated a full state and congressional ticket, though four years before, the ticket had appeared in the state."—G. L. Clark, *History of Connecticut*, p. 375.—See also EDUCATION: Modern developments: 20th century: General: United States: Negroes.

1821-1896.—Government and administration.—Constitutional revisions.—Settlement of boundary question.—General Practice Act.—Republican governors.—Democratic landslide.—Recovery of Republican power in the state.—Reform legislation.—"Since the famous constitution of 1818 was adopted, revisions have occurred at intervals of a few years; although the first, that of 1821, was in force for a quarter of a century. . . . The need of another revision was felt, and another commission was appointed to make a new revision, with a view to classifying, consolidating, and supplying omissions and giving notes and references according to its judgment. Many ancient titles which had become obsolete, as Concerning Slavery, Taverners, and the like, were left out; many penalties and fines were changed because inadequate or expressed in antiquated terms; and by careful condensation, the whole mass of statutes was abridged to a volume little larger

than the previous one. This was the revision of 1875. Important amendments were made soon after. In 1875, the date of the State election was set back from April to November, beginning in 1876. It was for this reason . . . that Governor Ingersoll's last term of office was shortened. A corresponding change was made in the terms of the members of the General Assembly, and in the sessions of that body. A needed reform was made in 1877, when married women were placed on an equality with men in the right to own and dispose of property. . . . So long ago as 1856, the terms of the judges of the Supreme Court and the Superior Court were reduced from 'good behavior' to eight years. . . . In 1880, the power of nomination passed to the Governor, the General Assembly still 'appointing' the men whom he nominated. . . . In 1884, one more important constitutional amendment was passed, making the State elections biennial, with a consequent extension of the Governor's term and the omission of the session of the Legislature on alternate years. These changes have not been made without much discussion between men of conservative and radical tendencies of thought. . . . During his term of two years, some notable measures were carried through the Legislature:—one, the amicable adjustment of the boundary between Connecticut and New York, a matter which had been discussed for a century and a half, and was at last settled by a joint commission which brought in a report that was accepted at once by the Legislatures of both States:—and another still more needed and beneficial improvement, the General Practice Act, by which the procedure in civil action and common law pleadings was greatly simplified and cleared of archaic encumbrances. . . . Hobart B. Bigelow, the next governor, a Republican, appointed his predecessor, Ex-Governor Andrews, a judge of the Superior Court; and in 1889, Judge Andrews's eminent ability on the Bench and his marked service in shaping the laws of the State were further recognized by Governor Bulkeley in his appointment as Chief-Justice of Connecticut, on the retirement of Chief-Justice Park. . . . Mr. Bigelow's name will always be remembered for his public spirit in 1876, while Mayor of New Haven, when he supported and urged two important works, of great advantage to the city and indirectly, to the State:—the building of the breakwater in New Haven Harbor, and the opening in that city of East Rock Park. . . . His successor, Thomas M. Waller, was a thorough politician. . . . [with] a reputation as one of the ablest Democratic political leaders of his time. . . . After retiring from office, Ex-Governor Waller accepted from President Cleveland an appointment as our Counsel-General in London. His successor as governor, Henry B. Harrison, had always been identified with the Republican party, having been one of the few who took part in its organization in 1855-56; and he had been the candidate for Lieutenant-Governor in those early days, with Gideon Welles heading the ticket. . . . In 1883, New Haven had made him her representative to the House, where he presided most ably as speaker. In the next year there was the political landslide which placed the Democratic party in power in Washington, during Cleveland's first term; but, in the State election for governor, Harrison had a plurality, and was elected by the General Assembly, according to the constitution of the State. . . . The Republicans carried the next election, putting in Phineas C. Lounsbury, the New York banker, the successful South Norwalk manufacturer, and resident of Ridgefield, as governor. He had been one of the

framers of the rigid 'option' laws with regard to temperance, and he gave his influence to the laws which were then made for restraining the running of railroad trains between ten and three o'clock on Sundays in the State. He felt that not only did the inhabitants require a quiet Sunday, but the trainmen needed a little rest. The popular demand for traffic and travel afterwards led to the repeal of this law. An act of the legislature of much more lasting and serious importance is associated with him,—the 'Incorrigible Criminal Act,' which provides that a criminal convicted for the third time of the same offence shall be sentenced to imprisonment for twenty-five years, which often amounts to a life sentence. Governor Lounsbury and the other promoters of this measure reasoned that repeated offences showed little desire for reformation, and that society ought to be protected from hardened criminals. As a pendant to this, the Reformatory bill was passed in 1806. By this, convicts, after two trials in a reformatory, will be sent back to prison, further efforts to reclaim them being considered useless."—F. Morgan, *Connecticut as a colony and as a state*, v. 4, pp. 143-145, 150-151, 155-158.

1845.—Industrial progress.—Increase of manufactures in the state.—Textile mills.—Hat factories.—Metal works.—Tinware factories and brass foundries.—Goodyear's improvements in processes of rubber manufacture.—"We must next see what changes took place in the state in the . . . twenty-seven years [from 1818-1845]. We choose this interval because in 1845 the state government took a census of the various branches of industry carried on within the state. . . . There were by this time 136 cotton mills in the state, as compared with 67 in 1818, and 119 woolen mills as against 66. The eastern side of the state was still the textile side, but cotton and woolen mills were scattered through the western half of the state quite as much as before. . . . The manufacture of cotton thread was well started by 1845. . . . In Litchfield County the iron industry was barely holding its own. . . . In 1845 the milling industry along the Sound had died out altogether. The towns where this had gone on—Sratford, Norwalk, Fairfield, and Stamford—were growing and prospering, but by this time they were making other things: boots and shoes, hats, and coaches and wagons especially, as well as some iron work. . . . Danbury was still the center of the hat-making business. It had now 57 hat and cap factories instead of 28. . . . It was in the making of her light metal wares that Connecticut had made real progress since 1818, and more and more the towns in the center of the state, in the district bounded roughly by lines drawn from Hartford to New Haven, to Bridgeport, to Waterbury, to Hartford, were absorbing the state's manufacturing growth. In all these towns—Hartford, East Hartford, Middletown, Berlin, Meriden, Wallingford, New Haven, Bridgeport, Derby, Naugatuck, Waterbury, Plymouth, Bristol, and Southington—industry was diversified, but there were specialties even in these. The number of things manufactured in any one of these towns is so great that it is bewildering to take them town by town and repeat what was made in each. . . . In fifty towns tinware was made, and there were 101 tinware factories listed. . . . In 1818 buttons had been almost the only manufacture in which brass was used in Connecticut, so far as we are told in Pease and Niles, though from the local histories we learn that a few small articles were then being cast from brass. By 1845 the two brass foundries of 1818 had been increased to forty-eight, of which six

were in Waterbury and employed 207 persons, and 14 were in Berlin and employed 197. . . . The making of coaches and wagons had begun in New Haven in 1818; by 1845 it was her most important industry and it remained so until after the Civil War. . . . To Charles Goodyear, born in New Haven and brought up in Naugatuck, the world owes the beginning of successful use of india rubber. . . . In 1830 Goodyear discovered that he could cure the rubber perfectly by the mixture of sulphur with the rubber at a temperature of 270 degrees Fahrenheit. This process he named vulcanizing and he secured a patent on it. . . . It was not until 1843 that the first factory using the Goodyear patents was opened. This was in Naugatuck, Connecticut, and was the property of Goodyear's brother, Henry Goodyear. In 1845 the industry had a good start in Connecticut for the real value of vulcanizing rubber quickly became apparent. [See INVENTIONS: 19th century: Industry.] . . . The making of boots and shoes for sale was now widespread, although none of the modern shoe-making machinery had been invented and the industry was still being carried on under the domestic system."—G. P. Fuller, *Introduction to the history of Connecticut as a manufacturing state (Smith College Studies in History, v. 1, no. 1, pp. 30-34, 37-38)*.

1861-1865.—Civil War.—"In the spring of 1861, Governor Buckingham was re-elected by a vote of 43,012 to 41,003 for James C. Loomis. April 16, he called for a regiment of volunteers, as there was not even a regiment of organized militia to fill President Lincoln's call on the commonwealth. The step was unauthorized by law, but the governor relied on the general assembly to validate it at the coming session. In this he represented the people exactly, for they had caught fire at the capture of Sumter. More than five times the State's quota volunteered,—fifty-four companies instead of ten. . . . The first Connecticut regiment did not reach Washington until May 13. To compensate for the delay, it came perfectly prepared, even to 50,000 rounds of ammunition, and rations and forage for twenty days. The second and third regiments followed within a day or two, all in the same condition of complete preparation. The three took part in the battle of Bull Run. They led the advance, opened the battle, were not demoralized, and covered the retreat,—a pretty fair record for 'mudsills' in their first battle. To illustrate the business habits which the Connecticut men carried into war-making, it is worth while to note that, when they marched back into their quarters near Washington, they not only brought their own camp equipage in perfect condition, but the camp equipage of three other regiments, and two pieces of artillery, which they had found abandoned and had thoughtfully taken possession of on the way. The three regiments were three-months' men, but their members reenlisted almost to a man; and the high character of these first Connecticut representatives in the field may be estimated from the fact that more than five hundred of them became commissioned officers during the war. Call after call was made for troops, and the old commonwealth kept her quota more than full. She had in the service at various times twenty-eight regiments of infantry, two regiments and three batteries of artillery, and one regiment and a squadron of cavalry, numbering 54,882 volunteers of all terms of service, or, if the terms are all reduced to a three-years' average, 48,181 three-years' men, 6,698 more than her quota. For a State with but about 80,000 voters, and about 50,000 able-bodied men on her militia

rolls in 1861, the percentage of volunteers is very high; indeed not more than one or two States excelled it. There were 97 officers and 1,094 men killed in action, 48 officers and 663 men who died from wounds, 63 officers and 3,246 men who died from disease, and 21 officers and 389 men who were reported missing. . . . The first great martyrs of the war—Ellsworth, Winthrop, Ward, and Lyon—were of Connecticut stock. A Connecticut general, with Connecticut regiments, opened the battle of Bull Run and closed it; and a Connecticut regiment was marshaled in front of the farm-house at Appomattox when Lee surrendered to a soldier of Connecticut blood. A Connecticut flag first displaced the palmetto upon the soil of South Carolina; a Connecticut flag was first planted in Mississippi; a Connecticut flag was first unfurled before New Orleans."—A. Johnston, *Connecticut, pp. 376-380*.

1869.—Law vests power of enforcement of child labor laws in Board of Education. See CHILD WELFARE LEGISLATION: 1866-1890.

1880-1920.—Industrial importance of Connecticut.—Growth of cities.—Increase of manufacturing.—Population.—Chief manufactures.—"It is shown that not until the decade between 1870 and 1880 were more than half of the inhabitants of Connecticut living under urban conditions. In the years between 1840 and 1870 the population had increased 73%. By 1880 it was double what it had been in 1840. In this same time, the number of people living in towns of less than 3,000 had decreased from 187,485 to 161,073, a decrease of 14%. The number of such towns had decreased from 115 to 113, so that the size of the average rural town had changed from 1530 to 1434. On the other hand, the number of persons living in towns of more than 10,000 had increased from 27,183 to 279,151, a tenfold increase. The number of towns in this class had grown from two to thirteen. Since Connecticut possesses no important commercial center like New York or Boston it is fair to conclude that this increase in urban population is also a growth in manufacturing population. A supplementary proof of the statement that it was in the decade 1870 to 1880 that Connecticut became predominantly a manufacturing state, in the sense that more than half her people earned their living by manufacturing or by occupations subsidiary to manufacturing, is found in the fact that in 1870 her population was almost exactly twice what it had been in 1820. . . . Bridgeport's rapid growth was occasioned by her manufacture of sewing machines, corsets, and metallic rim-fire cartridges, all of them new industries since 1845, and by her growing participation in the brass industry. Waterbury and Derby show how rapid was the expansion of the demand for rolled brass and its manufactures. If the population of the smaller towns in the Naugatuck Valley were to be added to these, the expansion would be even better realized. The census figures show what were some of the new uses for brass that had developed since 1845, but do not mention the fact that the German silver foundation for the plated silverware made in Meriden, the 'Silver City,' was made in these brass rolling mills of the Naugatuck Valley. The demand for brass which in the years since 1880 has outstripped all the others, the need of it for electrical supplies, is shown in its small beginnings in the census report for 1880. . . . New Haven's increase came from her making of carriages and, later, of hardware, corsets, and firearms; Hartford's from various things, but chiefly from her metal working machinery and her insurance interests. . . . It is interesting to note how much

Connecticut has contributed to the firearm industry of the world. The Colt revolver and the Gatling gun of Hartford, the Sharp's breech-loading rifle of Hartford and later of Bridgeport, the Union metallic cartridge of Bridgeport, and the Winchester repeating rifle of New Haven have all added to Connecticut's fame. Less well known brands of small arms have long been made in the state, and one firm of Hartford has made gun making machinery which has been sent all over the world, even to the royal arsenals of Germany—Spandau, Erfurt and Dantzig."—G. P. Fuller, *Introduction to the history of Connecticut as a manufacturing state* (*Smith College Studies in History*, v. 1, no. 1, pp. 54-55, 59-60).

1890-1892.—Election deadlock.—Contest over governorship.—"The first time that the secret ballot law was put in practice in Connecticut was in the State election on Nov. 4, 1890; and undoubtedly, lack of familiarity with the working details of the new system had much to do with the blunders and complications that led to the famous 'deadlock,' and caused that election to become a historic event in Connecticut annals, and the theme of prolonged and bitter controversy. For lack of the prescribed popular majority, the previous election of 1888 had gone, according to the provisions of the Constitution of the State, to the General Assembly, which declared the Republican candidate, Morgan G. Bulkeley of Hartford, Governor. In 1890, as in several previous elections, the introduction of the third party, the Prohibitionists, and even, in this instance, of a weak fourth, the Labor party, diverted the few votes that would have made decisive the choice of the people between the two leading parties. . . . The Democrats claimed a small majority for Morris; the Republicans asserted that a careful examination of the ballots would give a plurality to Merwin. That would take the election to the General Assembly; and as the Democratic majority in the Senate was 5, and the Republican majority in the House 15, the result was a foregone conclusion, if that step were resorted to. . . . When the General Assembly came together in January, 1891, with a Democratic Senate and a Republican House, and a disputed election to be settled by it within the first two days of the session, the conditions for trouble were rife. In accordance with their duty, the Board of Canvassers sent in the 'fair list' of votes, and 'the original returns of the presiding officers' for their appropriate action. . . . The question at once arose between the two houses whether the 'fair list' was to be regarded as final and conclusive, or whether the Legislature under its constitutional power of 'examination,' prior to its declaration of the candidates 'regularly chosen,' had the right to inquire into the truth of this list. . . . To complicate the matter still farther, the Democrats, both in the House and Senate, insisted that Morris had been elected Governor by the people, and that Mr. Bulkeley, who continued to exercise the duties of the office, had no legal standing in it; and, regarding him as a 'usurper,' they refused to recognize him as even acting Governor of the State. They therefore refused to concur in the passing of any laws or the performance of any legislative functions which would require his co-operation and approval. This position they insisted on to the end; and the result was that when, after a session of some weeks wasted in a fruitless dispute over the election, the Legislature finally adjourned, it did so without having passed a single law, made a single appointment to any office, or arranged the slightest provision for meeting the expenses of the

State for the two years that must elapse before the next session. . . . And at times, the abnormal situation was a serious misfortune; as when a judge of the Superior Court died in office, and, the Legislature refusing to act jointly, the Governor could not present a candidate, so that the vacancy existed for more than a year. Governor Bulkeley had great business responsibilities pressing on him, and his official duty kept him in office against his private wishes. In 1892, the following year, the question as to by what authority he continued to hold office was taken to the Supreme Court of the State in the *quo warranto* case of *Morris vs. Bulkeley*. After six weeks of careful consideration, the decision was given by Chief Justice Andrews. It was to the effect that Morris had not proved his alleged majority as a fact; that the General Assembly was entitled to investigate the 'returns' of an election; that the Constitution clearly demanded that the result should be declared on the second day after the election, and on no other; that 'an election that was not declared was as good as no election at all'; and that if Morris had not been legally elected, it was the business of Bulkeley to hold in office till his successor was qualified. . . . In 1892, Judge Morris was elected governor by an unquestioned majority, and peace reigned in the land."—F. Morgan, *Connecticut as a colony and as a state*, v. 4, pp. 159, 163, 165-169.

1890-1900.—Foreign immigration.—Changes in development of industrial towns.—"At first almost unnoticed, the army of Swedes and Russians and Poles and Italians, and dwellers from all parts of Europe, came in and followed the advance guard of Irish and Germans that had been in the country for a long time; but with a rather different effect on the commonwealth. At least 50,000 foreigners were added to its population in ten years, according to the census of 1900; the whole foreign-born population of the State amounting in that year to 238,000. This caused an important change in the character of the inhabitants. The small towns, which had always held the controlling influence, and that a conservative one, in State legislation, lost their standing in population, both relatively and absolutely; for while scores of their ambitious sons went forth to seek wider scope for their energies, thousands of wanderers came to the cities to secure the large wages which had attracted them thither. Then, too, capital no longer sought by preference villages and remote places for establishing great factories, but was often found selecting the large cities or towns. The cheap land and water-power of the country were more than counter-balanced by the facilities for organization and transportation in the cities."—F. Morgan, *Connecticut as a colony and as a state*, v. 4, p. 159.

1895.—Arbitration board created. See ARBITRATION AND CONCILIATION, INDUSTRIAL: United States: 1886-1920.

1895-1902.—Attempts to amend the state constitution.—Need for equalization of representation.—Convention to plan revisions.—Popular vote against proposed changes.—"The [political] war over, there was opportunity to consider a remodeling of the State Constitution, which, being cut in the fashion of bygone days, was no longer a comfortable fit for the body politic of the rapidly growing State. . . . The changes most urgently desired were equalization of representation, and election of the principal State officers by plurality rather than by a majority. Some steps were taken towards gaining such amendments in 1895, but they were rejected, and were canonized under the name of the 'lost amendments.' The latter benefit was

secured in 1901 by a constitutional amendment; and there will be no more elections by the General Assembly, unless two candidates should have the same and the highest number of votes. And the Senate is to be reapportioned in districts, not less than 24 nor more than 36, more nearly equal than before. But still disproportionate representation in both branches of the Assembly was undeniably open to criticism, and constant irritation in the cities on that account was apparent to every one. . . . From a commonwealth chiefly agricultural in its character, Connecticut, through the working of the Hinsdale Joint Stock Act,—framed by Theodore Hinsdale, a Connecticut man,—and through the advantages which she had long offered to business enterprises, had been transformed into a pre-eminently industrial and manufacturing State; and for that reason, her population, much changed in its *personnel*, had become concentrated in a few leading centres, making very great changes in the relative population of cities and small towns. . . . According to the Constitution, each town that was incorporated before the Revolution was entitled to two representatives;—if not so fortunate, then to one; and no town could have more than two. Hence the oft-quoted, because most glaring, discrepancy between New Haven with its 108,027 inhabitants, and Union, with 428, each being alike represented by two members in the House. Again, among the small towns themselves great inequalities existed—some with large and increasing numbers of inhabitants having only one representative. The number of towns had increased from 120 in 1818 to 168 in 1900. There was less excuse for the inequality in senatorial districts; for it is not evident that the town representation in the House was originally designed to vary with fluctuations of population; but the senators were especially intended to represent districts equal, as nearly as possible, in population. So far from the original intention had the apportionment drifted that it seemed to have lost all relation to population, one district having ten times the inhabitants of another. . . . It must be explained that, in order to revise the Constitution, that document provides that such action must be proposed by a majority of the House of Representatives, considered by the next General Assembly, and published with the Public Acts of that body. If, in the next succeeding Assembly, two-thirds of each house shall approve, it shall be put to the vote of the town meetings of the State legally warned. Then, if voted for by a majority of the voters at such meetings, it becomes a part of the Constitution. This carefully-planned blocking of the wheels of hasty change invested, very wisely, constitutional reform with all the dignity due to solemn deliberation; but, as it was designed to do, it clogged speedy achievement, and many clamored for something more prompt. . . . In despair of securing any action by the slow process judiciously demanded by the Constitution, Governor McLean at length consented to recommend what he had formerly opposed, a call for a convention for making the proposed changes. This proceeding was unconstitutional, but many hailed it as the only way to accomplish the desired end. The convention was accordingly called, and it assembled in Hartford, January 1, 1902. . . . For four months, comprising fifty-five working days, the convention sat; and during that time, it considered over sixty plans for revision. Of these, the most famous was the 'One and sixty,' by which the representatives of towns would be reduced to one each, irrespective of population, and the number of senators would be increased to sixty. This

idea, although long in dying, aroused the unanimous opposition of the press of the State, backed by public opinion. After untold and wide-spread agitation and suspense, and much curiosity as to the outcome of all this permutation of figures, a plan was approved and at last presented to the people, providing for two representatives for each town of 2,000 inhabitants, and one more for each 5,000 above 50,000, with a Senate of forty-five members, at least two senators to each county. By this, thirty would have been taken from the small towns and twenty-nine would have been added to the large ones. Alas! like many another compromise, it satisfied very few; and the constitution so revised, when put to the popular vote, was successful only in achieving distinct disapproval, and still worse, contemptuous indifference—the vote of the State being phenomenally small, and over three-fourths of the towns voting against it.”—F. Morgan, *Connecticut as a colony and as a state*, v. 4, pp. 186-190.

1898.—Spanish-American War.—“In doing her part, Connecticut was engaged busily through the spring of 1898 and Governor Cooke had scope for all his administrative ability. The strain was not long, like that of the Civil War, but from the blowing up of the *Maine* to the sensational victory at Santiago, it was necessary to prepare for the worst; and during the succeeding months there was need of vigilant care of the soldiers in camp. The response to President McKinley's call for 125,000 volunteers from the country, April 28, was prompt and patriotic. Even before the declaration of war, the Connecticut State organizations had offered themselves for any duty deemed necessary. Each one of the four regiments begged to be first on the field; but it was decided to make the choice by seniority of colonels; hence the First, Colonel Burdette, was designated. The order called for one light battery and two heavy batteries in addition to this regiment. Under the second call of May 25, the Third Regiment was sent. The First, as a regiment, was mustered into the U. S. Volunteers force, May 18th, at Niantic, and became the First Connecticut Regiment U. S. Volunteers. The Third had been the Third Regiment Connecticut National Guard before the war, and has since returned to that designation. The men enlisted for two years unless discharged before. The First Regiment Volunteer Artillery was not a U. S. Volunteer regiment, with the exception of Battery A. Light, which enlisted as a part of the regular army, and was known as the 'Yale Battery,' because a platoon in it—commanded by Lieutenant Herbert T. Weston, one of their number—was mostly composed of young men from Yale University. Of this regiment, Battery B had been infantry before the war, and after its close it returned to that branch of the service. Battery C existed only during the war; but the other batteries have continued as militia organizations. Thus it will be seen that the volunteers served under varying conditions. In this emergency of hurrying troops into camp, the executive department was greatly hampered by lack of funds. The General Assembly, not then in session, had made a specific appropriation for military purposes in 1897; but had so hedged it about with restrictions that unexpended money had been returned to the State Treasurer. However, a way out of the difficulty was found by appointing a State Board of Control, with the Governor at its head; and that created a fund for purchases. It was resolved to make preparation so complete that the men would be ready for service immediately after being mustered in, rather than to

strive to break a record by rushing poorly equipped troops to the front. Some States, in their eagerness hurried their men into the field with little more than the clothes they wore."—F. Morgan, *Connecticut as a colony and as a state*, v. 4, pp. 180-181.

1900.—Representation in State Legislature.—"It is sometimes asserted by apologists for the Connecticut situation, that no argument against town representation in the Connecticut House has been advanced that cannot be urged with equal or greater force against equal representation of the states in the United States Senate. There is this much of superficial likeness: in each instance two members are accorded to units having very unequal populations. Here, however, the analogy ends. In the first place, it does not hold in theory. Whatever they may have been two centuries ago, the towns are not now quasi-independent commonwealths. Regarding property, education, and family, they make no general laws to which only their inhabitants are subject. They are noble agencies of local government, subject to the frankly acknowledged dominance of the state. In the second place the analogy does not hold in experience. That there are certain evil features in our federal senatorial system is not to be denied, but careful study fails to show that the small states make common cause against the large, or vice versa; the states of small population are widely distributed and are of diverse character and interests. On the contrary, in the Connecticut Legislature the representatives of the small towns have repeatedly passed laws which hampered the cities, and have shifted burdens upon the cities in such manner as to make the old cry 'no taxation without representation' take on a new significance."—*American Academy of Political Science*, 1900, v. 15, pp. 233-234.

1902.—Care of deaf and blind children. See CHARITIES: United States: 1874-1902.

1910.—Legislation for vocational training.—Laws were passed in 1910 encouraging vocational training in public schools.

1913.—Education Act passed.—This act provided for a codification of all school laws, for vocational guidance and for model schools in each town for purposes of observation.

1913.—General banking law passed.—The general banking law passed in 1913 abolished special charters.

1917.—Labor legislation.—Women and children were prohibited from working more than forty-eight hours a week or working at night in restaurants, cafés, photograph galleries, or barber shops. In the larger cities night messenger service is forbidden to children under eighteen.

1917-1918.—Part played in World War.—During the World War Connecticut furnished 44,000 soldiers or 1.3 per cent of the whole force of the United States. This state was prompt in preparation and first to have state troops sent overseas. During the war Connecticut, industrially, was largely given over to war work, munition making, metal working and textile manufacturing.

"CONSCIENTIOUS OBJECTOR." See PEACE MOVEMENT: Outbreak of the World War.

CONSCRIPT FATHERS.—The Roman senators were so called,—"*Patres Conscripti*." The origin of the designation has been much discussed, and the explanation which has found most acceptance is this: that when, at the organization of the republic, there was a new creation of senators, to fill the ranks, the new senators were called "*conscripti*" ("added to the roll") while the older ones were called "*patres*" ("fathers"), as before. Then the whole senate was addressed as "*Patres et Conscripti*," which lapsed finally into "*Patres-Conscripti*."—H. G. Liddell, *History of Rome*, bk. 1, ch. 4.

CONSCRIPTION, enforced military service at the pleasure of the government. It is the opposite of recruiting or voluntary enlistment. The system is as old as history, and was employed through classical times. In Greece it was used by the Spartans in particular, and in Rome every citizen was compelled to serve in the army from his seventeenth to his forty-fifth year. During the Middle Ages the peculiarities of the feudal system displaced it, and it was not until the late eighteenth and early nineteenth century that it again came into use. In 1792 France revived the idea of conscription for the entire population, but the method of levying it was so poor that the army was soon made up of vagabonds and freebooters. In

1798 Jourdain's famous law was passed, but its value was materially affected by the evil practise of allowing the buying of exemption. (See FRANCE: 1798-1799; August-April.) German conscription began after the battle of Jena (1806), when Napoleon forbade Prussia to keep a standing army. By a system of universal military service, however, a huge reserve force was gradually built up.

CONSERVATION OF NATURAL RESOURCES

Danger of forest destruction.—"By natural resources are meant those resources provided by nature which may be used for the benefit of man. The natural resources from the point of view of conservation may be divided into two classes: those so abundant as to be practically unlimited in quantity, and those less abundant which are so limited in amount as to be unequal to the present or future needs of man. The first class requires no special consideration. . . . The natural resources limited in quantity should be conserved. By their conservation is meant that they should remain as nearly undiminished as possible in order that this heritage of natural wealth may pass in full measure to succeeding generations. . . . The modern conservation movement is the direct result of the work of scientific men. The great question of conservation [in the United States] has been more forwarded by the rapid reduction of our forests than by any other cause. The forests are the one natural resource which has been so rapidly destroyed that in the early seventies it began to be appreciated that, if existing practice were continued, the end was not in the far distant future."—C. R. Van Hise, *Conservation of national resources in the United States*, pp. 1-3.—"Over a large part of the world the forest is now conquered. It is not only conquered, it is exterminated beyond any possible chance of natural recovery. It has now become important to civilization to preserve and restore the forest instead of struggling against it. Out of a land area of some 32½ billion acres there is little more than 5 billion acres remaining in forest—exclusive of brush land—or only one-sixth of the land area. The greatest change of course has taken place in Europe, where of a total land area of nearly 2½ billion acres there remain now barely 750 million acres in forest. Even of this, two-thirds are found in European Russia and Finland and about 250 million acres in the rest of Europe. In some countries—Great Britain, for instance—nearly 95 per cent of all the original forest is gone. In France, Spain, Belgium, Rumania, and Greece, from 80 to 90 per cent of the original forest has been destroyed; in Bulgaria, Serbia, and European Russia exclusive of Finland, from 60 to 70 per cent; and in North America the original forest has shrunk from some 822 million acres to 463 million acres in the course of three centuries.' In spite of the disappearance of the forest, and the wider use of steel, brick, and concrete, more wood is used today than ever before. In 1880 the United States consumed

annually 300,000 cords of pulpwood, today 6,000,000 cords are used. In 1911 the per capita consumption of wood in England was three times that of 60 years ago. The evil economic and social effects of forest devastation are prominent. It is estimated that in the United States there are 80,000,000 acres of idle land once forested that is mostly unfit for growing agricultural crops."—H. N. Whitford, *Forests and human progress (Journal of Forestry, v. 19, no. 1, Jan., 1921, pp. 59-60)*.—In the face of this growing shortage of timber, vast tracts of forest are annually destroyed by fire. Fires which are the result of natural causes are of course unavoidable; but the great majority of them are the direct result of carelessness. Lighted matches carelessly tossed aside, or campers' fires improperly extinguished, or left to smoulder, cause many hundreds of forest fires and immense and sometimes almost irreparable loss. Many fires are caused by the ignorance of campers of the fact that a fire may run for a long distance under the forest humus and again burst into flame. A Canadian writer upon this subject very aptly says: "When we examine this matter our pride is touched at once for we come right up against a fact that involves our obligations of citizenship and this fact is that we have allowed from two-thirds to three-fourths of our great forest heritage [in Canada] to be destroyed by fire within the past 75 years. Forest fires have destroyed the same logs on more than 1,000,000 square miles of good Canadian territory. A million square miles in 75 years burned; total forested area hardly twice that amount. It is only a problem of simple arithmetic to realize what that means for our forests, if these ravages continue. That isn't all. It takes nearly 75 years to produce a stick of spruce pulpwood and nearly twice that length of time to produce a 12-inch spruce sawlog, under the average growing conditions in the forest. . . . Fire protection is the most important problem in forestry policy to-day; in fact, it is one of the most important economic problems facing Canada at the present time. It transcends the tariff question in its importance in relation to the future prosperity of the country, yet I doubt if you will hear it mentioned in any political speech. . . . We will never accomplish adequate fire protection until public opinion is aroused on the subject to a greater extent than it has ever been done yet."—D. C. Howe, *Canada's gravest menace is the forest fire (Canadian Forestry Magazine, v. 17, no. 10, Dec. 1921, p. 535)*.

The consequences of the destruction of forests is serious in the extreme. "China at one time was well wooded. Prior to the exhaustion of her timber supplies she reached a stage in civilization and economic development beyond that of most other nations. She exhausted her forests centuries ago and has been without wood adequate for her essential needs for many generations. . . . It appears . . . that the progressive destruction of her forests far below the essential point of wood needs made the development of other industries impossible or extremely difficult. . . . There is every reason to believe if Japan had followed China's example, and had devastated and exhausted her forests, and made no provision for regrowth, we would hear little of Japan as a world power. Greece, once powerful and prosperous, fell from her high estate centuries ago. She swept the forests from her hills and mountains in attaining

proximity to countries still possessing vast forest areas and because of her cheap water transportation, could best of all get along with a small forest area has now, as a result of bitter experience during the war, worked out a plan for planting some 1,700,000 acres and providing a forest area sufficient to sustain her domestic needs in case of emergency for three years. France, which for over a century has been carefully husbanding her forests, is further elaborating plans for their careful management and is enlarging her forest nurseries for extensive planting. Germany, Switzerland, Italy, Norway, Sweden, and New Zealand are also considering means of increasing forest products. Even in our own country [of Canada] the maintenance and protection of existing forests has become a pressing question of the day."—H. N. Whitford, *Forests and human progress (Journal of Forestry, v. 19, no. 1, Jan., 1921, pp. 59, 60).*

Photo U. S. Forest Service

DESTRUCTION OF A WHITE PINE AREA BY FOREST FIRES

her power and in building her civilization and did not make provision for regrowth. She destroyed her forests . . . and lost her place in the sun. . . . Switzerland, a small nation of mountains and hills . . . has retained her forests. She still has wood, a basic resource. She is prosperous, and forward moving. . . . England, though a leader among nations in economic and industrial development, has reached her place of eminence in world affairs without maintaining an adequate domestic supply of wood. . . . She has been able to meet the need of her industries for wood by bringing it from the four ends of the earth. The recent war, however, has shown her the necessity for domestic wood resources, and she is now expending millions of pounds in reforestation."—J. W. Toumey, *Present situation in forestry (Science, Dec. 9, 1921, pp. 559, 560).*—"Nearly every civilized country at the present time has adopted or is considering measures for the perpetuation of the existing forests, or even for extending their present area. Thus England which, because of her insular position and

Meaning of reclamation.—Reclamation means the overcoming of natural destructive agencies in order to recover waste lands and make them fit for human use or occupation, for use in sheltering other tracts, or for conserving water heads or sources. Irrigation, for instance, may come under the head of reclamation. The planting of sand dunes is in its inception a reclamation project though it may afterwards fall into the category of forest conservation. The finest example of reclamation is perhaps to be found in Holland a large part of which may be looked upon as a reclamation project, begun probably before historic times, and carried on by systematic drainage, and a system of dikes, since the middle of the fifteenth century. "North Brabant, which not so long ago was covered with moor and marsh land, is . . . being rapidly brought under the plough. . . . In the course of centuries, Holland has been provided by importation, building up and ceaseless renovation, with a new top layer of mould as it were. . . . Four-fifths of the firm land . . . is

under cultivation, and . . . [the proportion] increases as the peat wastes of Brabant and Drenthe are drained. . . . [Zeeland] has been entirely rescued from the sea. All its component islands have to be defended on all sides against encroachments by sea and river floods. The whole of the land is below sea level. Nowhere else are the water wheels more powerful or more constantly at work. . . . [Yet] 'in point of agriculture, Zeeland is the richest province in the Low Countries.' . . . The draining of the lakes around Alkmaar and their conversion into polders became a most remunerative process. . . . For instance, there is the Beemster polder formed out of one of the forty-three lakes that used to cover the Alkmaar district, [which] has a superficies of 17,500 acres. . . . [This lake is] nearly twelve feet lower than Amsterdam, . . . [and] water has to be persistently drawn off, by the action of water-mills, to the sea. . . . [The sea] canals are flanked by very high embankments which . . . are the ramparts as it were of the islands of Walcheren and Beveland, which without them would be . . . submerged. The larger number of Dutch canals . . . were made first of all to control and turn into distinct channels the great volume of water [carried down by the rivers]."—D. C. Bouger, *Holland of the Dutch*, pp. 5, 137, 140, 141, 147, 55, 56.—"The Dollart has already been forced to surrender about 30,000 acres, and the Lauwer Zee about 38,000 acres to the polder-people! [A bill providing for the partial reclamation of the Zuider Zee was passed in 1918.] The engineers propose, after having separated the Southern portion from the Northern by a heavy dyke, to pump dry four separate parts of the Zuider Zee, . . . making a total of 530,000 acres, while between these new sea-polders a sheet of water would be left of 362,500 superficial acres area . . . the so-called 'Ijsel'—lake, . . . to collect the water from the polders, and also to receive the water from the rivers which at present fall into the Zuider Zee."—J. J. Feith, *Modern Holland*, p. 15.

ARGENTINA

1915.—Irrigation of sugar fields and vineyards.—"Irrigation by private enterprise has especially developed in Tucuman, where the characteristics of the sugar industry have determined this as the preponderant form of development for irrigation works. . . . The canals created by private initiative were transformed into a collective system, but under a measure of influence by the first owner. The abuses which developed as a result of these procedures determined official intervention, dictating the law of irrigation which today has caused most of these private irrigation enterprises to disappear, determining a cooperative management, controlled by an autonomous and independent authority under the form of law, but with an intervention of the government sufficiently decisive, even to the present time. The form of operation frankly cooperative has been developed particularly in Mendoza, where the wine grape industry has required an extreme subdivision of the property. . . . The creation of irrigation canals, being impracticable for each piece of small separate property, has required cooperative action which has developed a marked spirit of association in matters of irrigation, which concerns itself not only with the building of canals but also with their maintenance. In this province, as in that of San Juan, or rather in all those of the Andean region, there has been marked increase in these irrigation communities, which exist also in the Republic of Chile, under the name of Syndicates

of Irrigation Communities."—C. Wauters, *Present condition of irrigation in Argentina, paper no. 46 (Transactions of the International Engineering Congress, 1915, v. 11, pp. 673-674)*.

AUSTRALIA

1903-1915.—Forestry and irrigation.—During a brief visit to the United States in 1902, Sir Edmund Barton, then premier of the commonwealth of Australia, contributed to *The Independent* an article on "Australia and her Problems," in which he wrote:

"Another of our problems is in regard to forestry. We have planted some trees but not nearly enough of them, and cannot yet tell anything about results. Along with this tree planting, also, denudation of our timber has been going on, for Australian hard woods, being impervious to water, are now used all over the world for street paving purposes. Great harm has been done, and the waste is still going on, for our national Government cannot interfere in the matter, and the land owners are in many instances reckless. The remedy must come from the common sense of the people."

"The magnitude and importance of the . . . [forest areas of Australia] may be judged by the fact that . . . [they] comprise 107,037,000 acres of marketable timber. . . . At present [1903] the forest laws and regulations in force . . . are weak, unsystematic and inefficient. This has been acknowledged at different times by the various governments of the Australian States, but no scientific and comprehensive plan . . . has apparently been seriously considered or, at any rate, attempted."—E. T. Scammell, *Forest resources of Australia available for British commerce (Transactions Royal Scottish Arboricultural Society, 1903-1905 v. 17-18, p. 249)*.

The laws of all the three States [New South Wales, Victoria, and South Australia] diverting water from the Murray "make the water of natural streams the property of the Crown; and in all the States the larger irrigation works are owned and operated by the State authorities. . . . Settlement and occupation [of the part of the semi-arid portion of Australia] were . . . dependent upon a water supply being provided for household and stock purposes and this has to be brought to each farm by artificial means. Large storages have been built along the northern slopes of the dividing range and diversion weirs constructed in a number of the principal streams near the foot of this range. From these weirs small surface ditches have been built, in some cases a distance of two hundred miles. . . . On each farm, tanks have been made by throwing dams across depressions or excavating basins capable of holding from five hundred to five thousand cubic yards of water. . . . In New South Wales, as in Victoria, the only important irrigation development is on the Murray River and its tributaries. The principal irrigation district is at Yanco, in the valley of the Murrumbidgee River, the largest New South Wales tributary of the Murray. In this district about 40,000 acres are now being irrigated, but canals to irrigate about 275,000 acres . . . [were being built in 1915, the water being] in part, from the natural flow of the Murrumbidgee and, in part, from a reservoir. . . . which has a capacity of 766,000 acre-feet. The reservoir is located in the channel of the stream near its head, about 220 miles above the land to be irrigated, and water is turned down the river, as required, to supplement the natural flow. . . . From Echuca

to the mouth of the Murray, a distance of about 1000 miles, the river is navigable during certain months of the year. . . . The river is, however, diverted for irrigation and domestic purposes by all three States, and the time is approaching when these diversions will seriously reduce the period in which navigation is possible. . . . In order to perpetuate navigation, without sacrificing irrigation, the river had to be canalized, and in order to make this possible, the Agreement [between the States] provides that 35 locks, in all, shall be constructed, which will be so located and have such height as to give a minimum depth of water in the river of five feet. . . . When these locks are built, the water required to irrigate the lower districts will more than suffice to pass boats through the locks. . . . The Agreement provides that the three States shall construct two reservoirs to regulate the river's flow. One . . . at the headwaters of the river . . . to have a capacity of 1,000,000 acre-feet, . . . and stored water . . . to be divided equally between Victoria and New South Wales. The lower reservoir, to have a capacity of 500,000 acre-feet, is to be built near the South Australian border. . . . These storages will be filled during the high-water flow and turned into the stream again at the time of greatest need. With these two reservoirs in operation, it is believed that the Murray will furnish enough water to irrigate 1,400,000 acres of land. Of this supply, the allotment to South Australia is intended to enable that State to irrigate 200,000 acres, the remainder to go to the other States."—E. Mead, *Distribution of water in irrigation in Australia (Transactions of the International Engineering Congress, 1915, v. 11, pp. 614, 615, 636, 639, 640, 641)*.—"The existence of subterranean waters was discovered in the seventies; the first bore was made in 1879, and up to the present about 4,000 bores have been sunk, of which two-thirds are in Queensland. . . . The bore has been a great boon, and freed many stations from the worst effects of drought. . . . [although in some cases, the water is so heavily charged with some chemical as to be useless]."—M. Atkinson, *Australia (Economic and Political Studies, p. 351)*.

AUSTRIA

1510-1910.—Conservation and reforestation.—"In Tyrol, scantily populated, with one-third of its area unproductive and one-third forested, devastation continued until recent times in spite of the forest law of 1852, which instituted a forest police and forest administration of crown and communal forests. But in 1859 this organization was abolished before anything of value had been accomplished. In Krain, which was unusually well wooded, forest reservations were made for the use of the mines and furnaces in 1510 and 1515, taking in all forest lands within a given radius. . . . In Styria, nearly one-half wooded and one-third unproductive, a regulated management was attempted as early as 1572, and by subsequent forest ordinances of 1695, 1721 and 1767 devastation was to be checked. But the resistance of the peasants to the regulations and the inefficiency of the forest service were such that no substantial improvement resulted. In Galicia unusually extensive rights of user in the crown forests led to their devastation, and the attempts to regulate the exercise of these rights by ordinances in 1782 and 1802 were unsuccessful. . . . Before 1849 the forest properties which the Crown or State owned in the various territories were not managed as a unit or in any uniform manner, but a number

of separate provincial or territorial forest administrations which were often connected with mining administrations had existed, and these under the influence of the educated foresters issuing from the newly established forest school had been much improved. . . . Only when public attention and indignation had been aroused by a policy of selling State property, a change of attitude took place in 1872 which led to the present organization. This places the State forest administration in the Department of Agriculture, with an 'Oberlandforstmeister' and two assistants as superior officers, and the rest of the organization is also very nearly the same as that in vogue in most German States, each province having a directive service of 'Oberforstmeister' with 'Forstmeister' as inspectors, and 'Oberförster' with the assistance of 'Forstwärter' as executive officers. In addition a special corps of 'forest engineers' and 'superior forest engineers' is provided for the elaboration of working plans. Lately (1904) a re-organization of the central office provided, besides the department of administration of State and Funds forests, a department of reboisement and correction of torrents, and a department of forest police charged with the promotion of forest culture, including the education of foresters and similar matters. . . . An organization was created in 1856 which was to manage the State forests, supervise the management of corporation forests and exercise the forest police. . . . Not until the years 1871-74 was a similar service extended to other portions of the empire but at the end of that period the entire empire had been placed under the administration of the 'forest protective service.' . . . The details of the duties devolving upon this organization are found in a series of laws, applicable to different parts of the empire, which are based upon the recognition of protection forests, in which sanctioned working plans regulate the management. forcible reforestation and employment of competent foresters in these are obligatory. . . . Especially in Bohemia by 1848 most of the large baronial properties had been put under a regular system of management according to Saxon and Prussian precedent. The influence of the former was especially strong and Saxon foresters were largely employed to regulate the management. . . . In lower Austria the Vienna state forest of 70,000 acres had for a long time received attention; the first thorough forest survey and yield calculation being made in 1718-20, revised in 1782-86 and regulated for the shelterwood system in 1820. . . . The most noted work of reforestation which . . . occupied Austrian foresters . . . is that of the 'Karst,' a name applied to the waste lands in the mountain and hill-country of Istria, Trieste, Dalmatia, Montenegro and adjacent territory skirting the Adriatic Sea. It is a dry limestone country of some 600,000 acres in extent, stony and rough and overdrained. Originally well forested with conifers and hardwoods it had furnished for ages ship timber and other wood supplies to the Venetians. Through reckless cutting, burning and pasturing by the small farmers it had become almost entirely denuded, natural reforestation being prevented by these practices combined with the dryness of the soil, intensified by the deforestation. . . . The first attempt at planting was made by Trieste in 1842 and found some imitators, but with meager result. In 1865 the Austrian government, acting upon representations of the Forestry Association, undertook to encourage and assist private landowners in reforesting their Karst lands by remitting taxes on reforested lands for a period of years, by technical advice and by assistance with

plant material and money. By this move so much land was withdrawn from pasture and taxation that opposition was aroused among the cattle owners, which led to additional legislation during the years 1882 to 1887 and finally to the creation of a commission charged to select the lands which in the interest of the country required reforestation and to enforce this within a given time, the State expropriating the lands of objecting owners. . . . By 1897, of the 75,000 acres selected by the Commission as of immediate interest 15,000 acres had been planted, mostly with Austrian pine. . . . In addition some 50,000 acres of natural growth were merely by protection brought into productive condition. While this activity refers to the northern portion of the coast region, the Karst of Dalmatia farther south, being oak country, was mainly recuperated by protective measures. In 1873 the pasturing of goats was forbidden on areas of over one million acres in extent, which were found capable of reforestation. In 1876 the division of communal holdings was ordered and portions designated for forest use, some to be planted. As a result of these measures nearly 400,000 acres have been recuperated."—B. E. Fernow, *Brief history of forestry*, pp. 148, 151-154, 156, 157, 159, 160.

1914-1921.—Need of conservation.—In Austria "some of the best timber lands are being subdivided and parceled out to small owners. The firewood shortage is extremely acute, particularly in the neighborhood of Vienna and in the region of southwest Austria that lay behind the Austrian lines on the Italian front during the war and was cut over exceedingly heavily for the army. In any forests near cities, all regulations were necessarily suspended and an uncontrolled cutting for firewood took place last winter [1920], spoiling all the silvicultural and management plans for years to come. In the higher mountains, grazing has become much more intensive and has given rise to many articles and notes pointing to the disastrous effects of over-grazing, which is particularly unfortunate at this time as Austria must develop waterpower. It is apparently agreed on all sides that her best chance for economic development, lies in the use of the mountain streams for hydroelectric power. Austria lost her greatest forests by the breaking up of the monarchy and cessions to Italy [consequent on the Great War]. Poland and Czecho-Slovakia are now far more important as timber producers. Nevertheless the cause of forestry is not being forgotten, but indeed has become even more important since the remaining stands have an increased value not only for themselves, but for their watershed protection."—F. S. Baker, *Present-day forestry in Austria* (*Journal of Forestry*, May, 1921, p. 559).

Conservation of water supply. See below: Czecho-Slovakia.

BULGARIA

1878-1906.—Forest laws, ownership control.—Up to the epoch of the constitution of Bulgaria into an autonomous principality the history of economic forestry is extremely vague. We only know that at a distant epoch in its history the country was covered by virgin forests, thick and impassable. Unfortunately a great part of these forests has disappeared. The State left entire liberty to individuals to pasture their flocks in the forests. The communes possessed their own forests in which only members of the Commune could pasture their flocks or could cut wood;

rights which they exercised without measure or control, individual owners considered themselves absolute masters of their own property, to cut, or even to destroy without rendering account to anyone. Public interest in economic forestry was still unknown. The first act of the Bulgarian government for forestry protection was the ordinance of December 20, 1878, addressed to the governors of provinces, and directing them to provide special guards for the surveillance of the forests. Numerous other dispositions followed . . . and finally in 1884 the National Assembly voted a forestry law, which contained excellent practical dispositions. It divided the forests into three categories according as they belonged to the state, to the communes or to individuals. The general supervision was assigned to the Finance Minister. The technical work was confided to foresters (later inspectors of forests), one for each administrative department having under their orders a certain number of forest guards. . . . The intelligent minds in Bulgaria welcomed the law with enthusiasm; not so, however, the mass of the people. Habituated to cut without control, they did not submit to the new order of things without stubborn opposition. Five years later, however, the National Assembly voted a new law . . . which contained more efficacious provisions and truly rational work for the conservation of the forests dates from that time. New regulations also showed clearly to the forest inspectors in what direction they were required to bend their efforts. Measures were taken to make a description of the forests; so as to find the best modes of exploitation in use, provisional plans were stopped, and to accelerate afforestation a survey of the forests was commenced. Later the formation of detailed statistics, an exact description of all the forests, the fixation of limits and so on were proceeded with. A special course of géodésie was instituted for the young forest guards who were obliged to submit to an examination in theory and practice. In 1904 a new law settled once for all the questions relative to property in the forests.—St. Brantcheff, *Les forêts Bulgares* (*Le mouvement économique*, v. 3-4, Aug., 1906, pp. 180-193).

CANADA

1879-1921.—Irrigation.—Provincial legislation.—Forest protection.—Water conservation.—Protection of wild animals and birds.—"Calgary lies on the western and Regina on the eastern limit of a dry belt, in which the soil is, for the most part, very fertile. From time to time irrigation has been attempted in this district, the first scheme being on Fisk Creek as early as 1870. Numerous other small schemes were instituted, but it was not until 1893 that an undertaking of any magnitude was begun. . . . By the end of 1894 there were projects of all sizes to the number of seventy. By the year 1902 the number of ditches in operation was 169, capable of irrigating 614,684 acres. [Some of these small ditches have been abandoned.] About 1905 the . . . [Canadian Pacific Railway] became an active advocate of irrigation, and instituted the scheme which at present is the largest and most comprehensive reclamation in the Canadian West; a main channel with head works just below the Bow and Elbow Rivers carries water to irrigate land to the north and east of Calgary, while the principal undertaking is farther to the east, and there it has . . . constructed a large dam near Bassano to serve 513,000 acres of irrigable land."—M. C. Hendry, *Bow River power and storage* (*Report 1915, Sessional Paper, no. 25 e, Canada*, pp. 147, 148).—"The value of irri-

gation was proved in 1918 and 1919, two exceedingly dry seasons, when farmers, in the irrigated areas, who used their water properly, reaped enormous crops."—J. Castell Hopkins, *Canadian Annual Review*, 1920, p. 138.—"Notwithstanding war conditions, remarkable progress toward better forest conservation . . . [was] made during the . . . year [1919]. Mention of these developments may serve to accentuate the respects in which action is still most urgently required. . . . A conference, under the auspices of the Canadian Forestry Association, was held at Halifax in December [1918]. . . . The necessity of appointing a Provincial Forester [authorized in 1913] was emphasized by the severe fire losses in Nova Scotia in 1918. . . . Improvements in the administration of the fire laws were suggested. . . . The timber-testing laboratory, recommended by us in 1916 and 1917, has been established under a co-operative arrangement between the Dominion Forestry Branch, the Imperial Munitions Board, and the University of British Columbia. Attention has been devoted to war work, principally timber for aeroplane manufacture. . . . Last spring [1918] a forest-ranger course for returned soldiers was inaugurated at Vancouver. The most important water conservation work . . . under construction in Ontario . . . [in 1918 was] the International Nickel Co.'s Big Eddy conservation dam on the Spanish River, in Algoma district. This dam will raise the level of the river 100 feet, and will create a lake with an area of 15 square miles. Combined with the storage in the upper third of the Spanish River watershed, it will increase the minimum flow to over 1,800 cubic feet per second, or almost three times the natural low-water flow, namely, 675 cubic feet per second. It will also create a power site, where 15,000 . . . [horse power] can be continuously developed. The engineer who designed this work, Mr. Henry Holgate, states that: 'When this work is complete, the waters of the Spanish River . . . will be conserved to their full extent, and this will be one of the most complete systems of water conservation in Canada. Conserving water, and regulating . . . [the flow of] streams, is one of the most important subjects we have before us, and merits the co-operation and assistance of the Government, as it should be a cardinal principle in power development that the full efficiency of the water in the watershed be made use of, and this cannot be done unless carefully considered systems of storage are provided, so as to equalize the flow as nearly as possible throughout all seasons of the year.' . . . The Regulations under the Migratory Birds Convention Act are now operative, and, with few exceptions, the provinces have amended their legislation to conform with the terms of the treaty and are administering these laws, the Dominion taking action only when requested to do so by a province. The Regulations under the new Northwest Game Act are now in effect. They provide increased protection for the game and fur-bearers of . . . [the] northern regions [of Canada] which constitute so important an economic asset. The licensing of the fur trade will give a control that will ensure its adequate conservation. The musk-ox, wapiti and wood bison are now permanently protected. Point Pelee, Ont., the most southerly portion of Canada, has been established as a National park for the protection of the birds which concentrate there during migration or breed there. . . . The most important development [in New Brunswick] has been the enactment of legislation respecting forestry and forest fires. The Provincial Forester is now charged with forest protection, forest surveys, land classi-

fication, enforcement of cutting regulations, scaling timber and enforcement of fish and game laws, thus giving him . . . [very] comprehensive powers. . . . The Advisory Board took a strong stand against any unwarranted relaxation of . . . [the] game laws for the purpose of increasing the food supply. New Brunswick has now prohibited the sale of game, making, in all, three provinces that have adopted this policy so essential to game protection. Efforts are also being made to check the excessive slaughter of moose in the Yukon for the market. . . . The Committee on Fish, Game and Fur-bearing Animals and the Advisory Board on Wild Life Protection, jointly have called a conference of game officials of the Dominion and Provincial Governments and of others interested in the conservation of game, fur-bearing animals and wild life generally."—Commission of Conservation, Canada, *Report of the tenth annual meeting*, pp. 25-54.

1901-1921.—Tree planting on the prairies.—"Since the Spring of 1901 the forestry branch of the Department of the Interior has been carrying on a system of cooperative tree-planting with the settlers of the prairie districts of Manitoba, Saskatchewan and Alberta. . . . [for the purpose of] growing forest plantations and forest belts. . . . [The system] is distinctly cooperative in character. The Department furnishes officers to give expert advice and see to the carrying out of the terms of the agreement, . . . and assists the owner of the land by supplying him with seeds, cuttings or young trees, while on the other hand, the owner is required permanently to set apart a small portion of his land for tree growth and to do all the actual work of preparation and cultivation of the land so set apart, to plant the seeds, trees or cuttings and to take proper care of the young growth after planting according to the directions of the . . . agent of the Department." At the expiration of ten years sixteen million trees had been distributed and the forestry department was able to announce that this mode of wooding the plains had proved eminently satisfactory."—Department of the Interior of Canada, *Successful tree planters*, pp. 5, 6.—"Up to the spring of 1921, 60,000,000 seedlings and cuttings have been grown and distributed in the prairie territory. . . . Many other features have followed the establishment of the prairie shelter belt, notably the growing of small fruits and standard fruit trees. . . . There are now hundreds of splendid belts of trees throughout the three provinces affording pleasure and comfort to their owners."—*Remarkable development of tree planting on prairie (Canadian Forestry Magazine, Jan., 1922, pp. 560-561)*.

1906-1921.—Importance of Dominion's forests and waterways.—Protection of forests.—A Dominion Act of 1906 provides as follows: "All Dominion lands within the respective boundaries of the reserves mentioned in the schedule to this Act are hereby withdrawn from sale, settlement and occupancy under the provisions of the Dominion Lands Act, or of any other Act, or of any regulations made under the said Act or any such Act, with respect to mines or mining or timber or timber licenses or leases or any other matter whatsoever; and after the passing of this Act no Dominion lands within the boundaries of the said reserves shall be sold, leased or otherwise disposed of, or be located or settled upon, and no person shall use or occupy any part of such lands, except under the provisions of this Act or of regulations made thereunder." The schedule referred to lists twenty-one forest reserves in British Columbia, Manitoba, Saskatchewan, and Alberta. They are

placed under the management of the superintendent of forestry, for the maintenance and protection of the growing timber, the animals and birds in them, the fish in their waters and their water supply, the governor in council to make the needed regulations. "For the purpose of forest preservation, silviculture and reforestation, forestry branches have been established by the Dominion Government and by most of the provincial administrations. A total of 150 million acres have been allocated to forest reserves, and over these areas the organizations of the various Governmental branches exercise supervision. Their activities are directed first to the protection of their respective reserves from forest fires, and in this respect have, particularly in recent years, achieved a considerable degree of success. The total number of fires during 1916 was 891 as compared with 1455 in 1915 and 1986 in 1914. The total area burnt over in the last fully recorded year was 116,310 acres, of which area only 2000 acres could be classed as merchantable timber. The Dominion organization also oversees lumber operations and wood cutting within other areas, and in the reserve has commenced a system of reforestation, though as yet on a modest scale. Nurseries have been instituted, and last year some seven million trees were distributed for planting free of cost to the farmers on the western plains. . . . A word now as to Governmental control. Canadian industrial expansion has proceeded chiefly along lines of private initiative and enterprise. The stimulus of individual profit remains in almost every field the most potent force in our development. . . . Such of our [Canadian] resources as from time to time pass from public ownership into private hands are thereafter subjected to control only that waste and the locking-up for selfish and speculative ends may be avoided, and by no means that their legitimate earning power may be checked. The dictates of wise policy have suggested that our invaluable water-powers—an asset of a clearly distinctive character—should be to the utmost possible extent not only state-owned and controlled, but state-developed and operated. . . . The long years that are required in the production of a forest crop render forest management also a proper sphere of Government activity. But private enterprise has and will have in Canada abundant opportunity."—A. Meighen, *Canada's natural resources and their state control* (*Geographical Journal*, Aug., 1918, pp. 77-78).—"If there is one possession of the Dominion more than another the value of which we have failed to realize ourselves, it is our [Canadian] forest wealth. There are no good guesses as to the extent of this resource, for the reason that forest exploration even to this day is singularly incomplete. The best qualified experts we have, while reluctant to hazard an estimate, place the extent of tree-covered territory at between 500 million and 600 million acres, of which perhaps 300 million acres are covered with merchantable timber. The ravages of fire accompanying the progress of settlement have devastated vast areas and destroyed a deplorably large proportion of this element of our national capital. It is true the burnt-over mileage is in process of reforestation, but the rate of progress is slow. However, through the activities of provincial and federal authorities, organization for the control, conservation, and proper utilization of our forests is becoming more and more efficient. The forest area is spread over the length and breadth of the Dominion, except perhaps in the very farthest north, and is everywhere except there in quantities and locations commercially valuable. It is noteworthy that even

in the older provinces of Nova Scotia and New Brunswick the greater portion of the land is still tree-covered, the area in Nova Scotia being two-thirds of the whole, and in New Brunswick about four-fifths. The Province of Quebec is the most richly endowed; and so great is the entire supply that the utilization of our forests for lumber, fuel, pulp, and paper, though substantial and great enough to constitute one of the foremost of . . . [Canadian] exports and sources of wealth, is even under present conditions of administration very substantially less than the annual increase from natural causes alone. The pulp industry of Quebec in particular is extending with great rapidity, but as yet it is estimated—though with a degree of uncertainty due to the inadequacy of our investigations—that the depletion by use is not more than one-sixth of the natural growth. In the farther western provinces the proportion will be less. British Columbia has, as is well known, an empire of forest wealth. The trees in that province reach majestic proportions and attain a venerable age. Douglas fir, which is the principal variety, grows at times to a height of 300 feet and to a diameter of 15 feet. It is true that these dimensions are exceptional, but elevations of 250 feet and diameters of from 6 to 10 feet are common. The Sitka spruce—a variety which flourishes along the coast—has proven of superior value for aeroplane production, and is now being utilized in substantial quantities for that purpose. The large islands on the Pacific coast are especially fortunate in their forest possessions, and the annual growth in that region, due to climatic and soil conditions, is much more rapid than in the other portions of the Dominion."—A. Meighen, *Canada's natural resources and their state control* (*Geographical Journal*, Aug., 1918, pp. 76-77).—"There are now 39 forest reserves in the three Prairie Provinces and the Railway Belt of British Columbia, covering an area of 34,643 square miles, which is equivalent to a strip of land $4\frac{1}{2}$ miles wide stretching across the 833 miles between Winnipeg and Calgary. One of the great benefits which the forest reserves confer upon Western Canada is the storage capacity which they provide for the flood waters at the heads of the great rivers which flow through the prairies. The whole eastern slope of the Rocky Mountains may be considered as one vast reservoir to hold back streams and rivulets which flow down the mountain sides in springtime, caused by the melting of the winter's snow. Eminent agriculturists, looking at it from a purely agricultural standpoint, state that the maintenance of successful agriculture in the prairie depends upon this eastern slope being kept covered with a growing forest, and it is satisfactory to know that this whole slope, from the United States boundary northward to the northern part of Alberta, is now a great forest reserve. This fact of water storage is true of all other reserves in their location and degree."—J. Lawler, *Dominion forest reserves are the people's forests* (*Canadian Forestry Magazine*, v. 17, no. 10, Dec., 1921, pp. 520-521).

1920.—Conservation of fisheries. See U. S. A.: 1920 (July).

1920.—Fire protection.—"Dominion provincial, and private forest-organizations are now using airplanes, power launches, railway speeders, automobile trucks besides (the old-fashioned means of) protective work, and are calling men out to danger points by means of telephones, heliographs and other signalling apparatus."—W. MacMillan, *Forest fires and Canada's fur trade* (*Canadian Forestry Magazine*, Oct., 1921, p. 442).

CHINA

B. C. 2297-A. D. 1915.—Irrigation in China.—Flood control.—Maritime dikes and sea walls.—The Yellow river.—Ming dike.—“The history of attempted flood control in China dates from the sixty-first year of the reign of the Emperor Yao, 2297 B. C., and the technical knowledge of the engineers at that time would indicate that flood control was no new thing. From 2207 B. C. until today there is a more or less continuous record of the war between the floods and the people. The methods employed have always been the confining of the waters and the protection of the land by dykes and the draining of the land by canals. There has been no attempt to lessen the evils of floods by holding back the waters with high dams and reservoirs. Small reservoirs are much used to impound water for local irrigation, and the outlets of most of the lakes have crude, movable dams for the same purpose. In most cases flood control, land protection, and irrigation have gone hand in hand, and by far the greater part of this work has been done in the great delta plains of the Yangtze and Yellow River Systems. . . . In addition to the dyking of the rivers, the delta from Hangehow on the south to Tientsin on the north—eight hundred miles—is a network of canals for a width of one hundred to one hundred and fifty miles west from the sea. Within the area from Ningpo to the Yangtze, one hundred and eighty miles, and from the ocean west some one hundred sixty miles, there are over twenty-five thousand miles of canals, great and small; and none included are so small but that two small native boats may pass each other. From the Yangtze north to the old bed of the Yellow River and east of the Grand Canal, one hundred and twenty miles by one hundred and thirty miles, there is this same network of canals. North of the old bed of the Yellow River, it extends to the borders of Shantung, and north of Shantung, to Peking, with a diminishing number of canals. In this great delta plain of the Yangtze and Yellow Rivers there are not less than sixty thousand miles of canals for transportation which also serve for irrigation, drainage, and flood control. As protection from the ocean tidal waves, there are, south of the Yangtze, some three hundred miles of sea wall; and from the Yangtze north, for over one hundred miles, the great Maritime Dyke, built in 1027 A. D. The actual number of miles of dykes, canals, and sea walls in the Canton Delta cannot be stated, but they run into thousands of miles. . . . The Emperor Yao, in 2297 B. C., commanded Kwan to confine the rivers to definite channels and drain the land. For nine years he worked at his task, with no permanent results, and at last retired, leaving his son, the Great Yu, to complete the work. Yu, after seven years, succeeded [and as a reward was made emperor. (See CHINA: Origin of the people.)] . . . In what may be called the semi-arid sections, numberless small reservoirs are built by individual landowners and water impounded for use in times of drought. Much wonderful work has been done in the conservancy of water for irrigation purposes, especially in the rice-growing portions of China. But dykes are the universal method of protection from floods. . . . For the care of the dykes on the Yellow River there is a special department, very well organized in theory but most slackly administered. The river is divided into sections and is in charge of men whose fathers, grandfathers, great-grandfathers, . . . were born and brought up to this work. These men understand their work quite well, but

the men higher up know nothing of flood control, are changed often, and take no interest in the work. . . . Breaks do come in the dykes from time to time. In some cases the whole river breaks through and seeks a new channel, as in 1852. But in very many cases the break is repaired and the river forced back into its old channel. . . . More work has probably been done and more money expended upon flood control during the last two thousand years in and for the section of country east of the Grand Canal and from the Yangtze River north to the old bed of the Yellow River, than in all the remainder of China. This is a low, flat section but a few feet above sea level. The soil is very rich and the climatic conditions suited to the culture of rice and wheat. Bordering on the Grand Canal and being covered with a network of secondary canals, it has been in touch with China's markets for three thousand years. Not only was it the granary of China, but the whole sea coast was and is one vast salt manufactory. Before the coming south of the Yellow River, in 1324 A. D., the Huai River went to the sea in what is now known as the old bed of the Yellow River, flowing through the Hungtze Lake, which was then but one quarter its present size and of very considerable depth. The records of this section are quite complete from 450 B. C. to the present day; they are records of floods, loss of life and subsequent famine, together with a continuous fight by man against these forces of nature. . . . During the Tang Dynasty (1027) there was built the Great Maritime Dyke, extending from the Yangtze River to the Huai, parallel to the coast between the rice paddies and the salt pans. This dyke had eighteen gates for the passage of the flood waters to the sea in definite channels. It was fifteen feet high and was surmounted by forty-three towers, twenty feet high, from which signals were given, by fire at night and smoke by day, of the coming of either flood or tidal wave. The gates were opened for the floods to pass and closed against the tidal waves. Parallel to the Maritime Dyke is a canal for the transport of salt. The Grand Canal passes north and south through this whole section at nearly right angles to the natural line of flow. The waters are held in place by artificial dykes, and for greater portions of this distance the water level is above the surface of the adjacent country. The country on the east is much lower than that on the west side, owing to the gradual silting up of the land to the west. The Yellow River came south in 1324, and, at the east end of the Hungtze, appropriated the channel of the Huai. When in flood, the waters of the Yellow River backed up the Huai, raised the Hungtze Lake and flooded the entire country, north, south and west, often breaking through into the shallow lakes west of the canal, carrying away the canal and dykes and inundating the low country to the east. . . . To control the outflow of the flood and protect the Grand Canal, the great Ming Dyke was built, sometime in 1400 A. D., by the first Ming Emperors. This dyke was thirty-five miles long, built of earth, some twenty-five feet high and the top served as a broad highway. Several times it was broken and repaired. In the Manchu Dynasty, under Kang hi, much flood control work was done in this section and the entire Ming Dyke was faced with cut stone. It stands there today as a great example of what Chinese Emperors did for their country when Emperors ruled.”—C. D. Jameson, *Flood control in China, paper no. 31 (Transactions of the International Engineering Congress, 1915, v. 11.—Waterways and irriga-*

tion, pp. 254, 255, 256, 258, 261, 268, 271-273).

1915-1916.—Repair of flood works.—Afforestation.—In January, 1915, The Bureau of River Conservancy was appointed for Kwangtung Province, to make a survey and report on the Pei Kiang, Si Kiang and Tung Kiang, with a view to building and repairing dikes and other preventive flood works, and to provide a plan for extensive afforestation. The same year River Conservancy schools were established by the National Conservancy Bureau in Nanking and other provinces, to provide men to work out plans for river conservancy. Work on a scheme to reclaim low-lying lands, which had been flooded by the Huai Kiang was commenced. In the same year a bureau of forestry was organized and plans made for extensive afforestation and Sherfual, formerly director of the Bureau of Forestry, Philippine Islands, and William Purdom from Kew Gardens, London, were engaged to carry on the work.

CZECHO-SLOVAKIA

1897-1921.—Control of water supply in Bohemia.—“The Neisse river rises in Bohemia . . . near the German frontier. It is formed of a number of little streams . . . which come out of densely wooded hills and beautiful mountain valleys. It flows by a number of prosperous villages . . . crosses Saxony and enters the Oder in Prussia. Thus it involves three states, Bohemia, Saxony and Prussia. . . . There is no one government which has authority over it. . . . [and] the states which suffer are not those in which the damage originates. . . . On the 20th July, 1897, the Neisse suddenly . . . overran its banks and poured a destructive torrent down its valley. . . . [In the emergency Bohemia] could not act to aid Prussia; Germany could not aid Bohemia to pay for improvement and control. . . . [And, as the only means of overcoming the difficulty by which they were faced] the mayor of [the] little village of Reichenbach called a meeting of representatives of all the governments . . . and of the villages and industries involved. Four hundred men vitally concerned in the correction of the river, met at Reichenbach in response to this summons. . . . Following a happy suggestion they formed a ‘Genossenschaft’ or Fellowship, known in law as a Corporation ‘not—for profit’ . . . to undertake the work. . . . Engineers engaged by this fellowship made a thorough survey and planned six immense dams across the upper valleys of the Neisse. Tunnels through hills would divert practically all the little streams into the basins above these reservoirs. . . . The Bohemian and Austrian governments contributed liberally, half a million dollars that did not require to be paid back, and half as much more which bore no interest. Saxony and Silesia which had suffered from the flood, contributed altogether \$100,000 spread over ten years. The rest of the sum [required, \$1,500,000.] was raised on bonds from the banks and a levy was made upon the waterpower developed by the storage of water sufficient to pay the interest and eventually to retire the bonds. . . . The dams . . . are . . . massive and beautiful [and] make a great addition to the mountain landscape.”—J. L. Mathews. *Conservation of water*, pp. 48-52.—See also above: Austria: 1510-1910.

“The agitation for forest schools is especially strong in Czecho-Slovakia and the sentiment has been crystallized in a petition presented to the government to take over a small private school and make it a forestry branch of the Technical

School at Prague. While it is generally conceded that forest schools independent of all other institutions are the most desirable, the present poverty-stricken condition of the country necessitates either going without forest schools or making them branches of existing establishments, thus utilizing at least in part, buildings and faculties already in existence.”—F. S. Baker, *Present-day forestry in Austria (Journal of Forestry, v. 19, no. 5, May, 1921, p. 560).*

DENMARK

1815-1915.—Reclamation.—About a century ago “there were in Denmark some 2,200 square miles of unproductive heath land. . . . Today [1915] it is only about 900 square miles. This fine piece of work has been accomplished mainly by the society for Cultivating the Heath, which was founded in 1866 by Herr Dalgas. . . . Its chief energies are spent in irrigation, regulation of watercourses, building of roads, conversion of meadow into moorland, construction of drains, conveyance of marl, and in many cases peat-making, and the planting of suitable districts with trees.”—W. J. Harvey and C. Reppein, *Denmark and the Danes*, p. 139.

EGYPT

1898-1912.—Use of water power.—Assiut and Assuan dams.—Nile barrage. See EGYPT: 1884-1891; 1898-1901; 1909-1912.

1921-1922.—Effects of irrigation.—Building new dam in the Sudan.—“The system of irrigation generally in use in Egypt is one of free flow, with modifications to meet special cases, and with exceptions. For instance 20,000 acres at Kom Ombo have been reclaimed from a desert valley by means of a pumping system, and turned into a fertile expanse of well cultivated fields. “The origin of the ‘barrage’ method for forcing water into the high-level canals, in place of pumping it, is due in Egypt to the French engineers under Mohammed Ali. The first barrage which they built was a failure, mainly through scamped and hasty execution of the work, for the design was good. The method itself is as old as irrigation; if a delivery ditch has not enough water in it, and if the next man down the ditch raises no objection, the cultivator dams the ditch with earth until the water has ponded up high enough to overflow into his field-channels. Substitute the Nile itself for the ditch, and a permanent masonry structure a mile long, pierced with sluices, for the heap of earth, and the result is a Nile Barrage. . . . Land which was cultivable and rich in Roman times has now become a barren waste fringing the north of the Delta, the reclamation of which by drainage has always confronted the irrigation service of Egypt; it is now being taken in hand, and should ultimately add between 10 and 20 per cent. to the total cultivated area of the country. . . . The record of the work effected in two decades up till the time of the Assuan Dam, may be summarised as follows: the cotton crop doubled, thus practically doubling the country’s exports, the maturing of a maize crop assured by providing water soon enough for sowing, the areas under cultivation raised from 5,000,000 to 6,000,000 acres, the cost of raising crops lessened by the provision of free-flow water, and the general value of land throughout Egypt doubled. The cost of these achievements, as regards capital expenditure, was £4,000,000, or less than a sovereign an acre. The barrage at Zifta was finished a year before the contract time, owing to the energy of a junior

English official; the additional cotton matured successfully in consequence during that year was worth as much as the Zifta Barrage had cost. The Assuan Dam is said to have paid for itself to the country in the first season of its use, although it cost £3,000,000. . . . It was finished in time to store water for the summer supply of 1913, and the flood of this year turned out to be not only lower than any flood for a century past, but also the latest recorded, coming down weeks after the usual time. The extra 1,400,000,000 tons of water which the raised dam was holding just saw the business through. On the best estimates available it is considered that one-third of the cotton crop would otherwise have been lost, amounting to 2,500,000 kantars, worth about £3 a kantar, being sufficient to pay for the original dam, and for the raising of it, and still leave plenty of money to spare."—W. L. Balls, *Egypt of the Egyptians*, pp. 150, 155, 158, 159.—See also EGYPT: 1909-1912.—"On the lands of the Blue Nile, about 200 miles south of historic Khartoum, on the waters that come down from Abyssinia to Soudan, the British are building [1922] the largest dam in the world. Twenty thousand natives of the country are employed. . . . Hundreds of them have crossed the Red Sea from Arabia, others have walked from Nigeria and the French Congo. The vastness of the undertaking is seen in the fact that over a million tons of granite will be used. All this granite is being [taken from the] Segadi Mountain, near at hand. When the mighty dam—3,330 meters long—is finished, some 300,000 acres of land—eventually [perhaps] 3,000,000 acres—now lying useless, will be brought under cotton cultivation in the Soudan, giving work to thousands, and producing within the British Empire much needed raw material for the mills of Lancashire. The cost is borne by the Soudan Government. A great undertaking, calculated to bring in a great return."—*Times Current History*, Feb., 1922, pp. 775-780.

FINLAND

1835-1922.—Construction of canals.—Forest conservation.—"The characteristic patience and energy of the Finlander are nowhere more clearly shown than by the marvellous results he has attained by connecting and utilising the natural waterways of his country. Remote and barren districts in the interior have leapt into life and activity, and vast tracts of useless country have been reclaimed, since a steam syren first echoed through once lonely wastes, now occupied by thriving towns and prosperous factories. . . . As early as the twelfth century a commercial water-road existed from Lake Ladoga across the whole country, running in a north-westerly direction up to Uleaborg, on the Gulf of Bothnia—a primitive route this, with, of course, frequent intervals of land. To realise the magnitude of the work as it stands the reader must realise the hydrography of southern Finland; and this may be divided into three parts or districts: (1) the eastern section, comprising a hundred and twenty large lakes and some hundreds of smaller ones; (2) the central division, including Nyslott and Punkaharju, and consisting of six hundred and fifty lakes of various sizes, and innumerable marshes; and (3) the western district, which is of higher altitude than the other, and the streams of which are rendered less navigable by reason of torrents and rapids. The motive power, however, afforded by the latter for the use of factories and saw-mills amply compensates for a comparatively small water-traffic. The first really successful works were accomplished be-

tween 1835 and 1838, when canals were cut connecting Lakes Kanhevesi and Kallavesi. . . . In 1845 . . . work was commenced in real earnest, and eleven years later the Saima Canal, one of the greatest engineering feats of the nineteenth century, was an accomplished fact. Financially, it is a huge success."—H. de Windt, *Finland as it is*, pp. 63-65.

Formerly the peasants burned the forests to clear the land. "This method is now forbidden by law, but some time ago it was a common sight. It not only wasted timber, but burned much land into a desert. The first harvest after the burning was a rich one, but after that the land was useless."—G. Renwick, *Finland to-day*, pp. 200, 201.—"In addition to the state forests "there are large areas of communal and private forests. . . . There exists a law under which . . . [the owner of forests] is bound to take measures to reforest all areas of above twelve acres in extent which he clears, but it is a dead letter."—E. P. Stebbing, *Forests of Finland* (*Quarterly Review*, Apr., 1916, pp. 353, 355, 361).—"State supervision and control . . . have been responsible for great improvement in forestry practice and the increasing value of timber has gradually forced a higher standard of efficiency in lumbering methods."—E. Beck, *With a Canadian observer in Scandinavia* (*Canadian Forestry Journal*, Jan., 1922, p. 577).

FRANCE

1910-1917.—Forest administration.—Administration in African colonies.—Water supply in Sahara.—"The administration of the state forests is under the Minister of Agriculture as President of the Forestry Council, with a Director-General as Vice President and technical head, and three *Administrateurs Verificateurs généraux*, chiefs of the three bureaux into which the administration is divided, each with two chiefs of sections, Inspectors, and the necessary office staff. For purposes of the local administration the forest area is divided into 32 conservations, each under charge of a *Conservateur*, equivalent to the German Oberforstmeister. These are again sub-divided into *Chefferies* or *Inspections*, two to twelve in each conservation, which are administrative units, under the supervision of Inspectors (200) and Assistant Inspectors (210). In addition, a special service for forest-organization and reboisement employs 14 inspectors and some 20 assistants. The forest districts or *cantonments* (ranges) finally are under the direct charge of *Gardes généraux* (162), with the assistance of *Gardes généraux stagiaires* (67) and underforesters (*Brigadiers*) or guards (3,650); altogether a personnel of over 4,400 officials."—B. E. Fernow, *History of forestry*, pp. 108-109.—"In Tunisia there are two types of administration—an intensive form for the valuable cork-oak forests, and a cheaper, less intensive form for the alleppo pine (*P. halepensis*) forests, valuable chiefly for protection against erosion and wind or for a local fuel supply. The organization . . . is simple and aims at the fundamentals of forestry rather than at the minutia covered so thoroughly on the Continent. . . . The protection of the Djerid oases is of particular interest to American foresters. . . . These oases are valuable irrigated farms that must be protected against drifting sand, over-grazing, and erosion. On account of the native population, the laws in regard to the use of fire within or near forests are especially strict, but the administration realizes that interior settlements are of protective value since cultivated land forms admirable fire lines. . . . There can be no grazing on a forest for six years after a fire, and railroad

rights-of-way must be cleared of inflammable debris and, if necessary, additional fire lines constructed parallel to the track. There can be no deforestation in reserved forests, unless the wood is cut for use in protection against erosion, for the improvement of springs, or to stop drifting sand. A most important lesson to be gathered from a study of forestry in an arid country is the difficulty of restocking after the original forest has been destroyed, a principle which must apply with equal force in . . . [the Southwest of the United States]. . . . The methods of forestation, moreover, have an excellent application in southern California where the winter rains correspond so closely to those in Tunisia. On the more favorable situations, the seed-spot method of sowing is preferred; on the more difficult sites, ball planting must be resorted to, notwithstanding the additional expense. In order to reduce the cost of forestation, spacing as wide as six by eight feet is officially allowed, but, in practice, there are rarely more than 250 seed spots per acre. Sowing or planting just before or during the winter rains is the invariable practice. . . . Unquestionably, the progress made in Algerian forestry from 1900 on is due to the forest commission that made a careful study of conditions and suggested very radical improvements both in methods of administration and in laws. . . . It is very significant that this commission felt the preservation of existing forests and brush cover of vital importance to the health, prosperity, and habitability of Algeria. . . . The present conservator directly supervises 'chefferies,' or small forest subdivisions, which correspond closely to one of the detached units administered by American forest supervisors. . . . Notable plantations have been established at Constantine, Algiers, Orleansville, and Oran. Local species gave the best success, sown in seed spots or grown in essentially local nurseries. The cost of these plantations has been in the neighborhood of 45 to 63 francs (\$8 to \$12) per acre, and success was only attained after repeatedly stocking areas which had shown initial failure. . . . Forest administration in Corsica is hampered by an unruly population, by over-grazing, by fires, and, . . . especially, by lack of communication. There are federal, communal, and private forests, and the organization is the same as is found on the Continent. If it were not, however, for the inaccessibility of the Corsican pine, growing at a higher elevation than the maritime pine, but below the beech and fir, there would be but little forest wealth left on the island. The great lesson to be learned from a study of Corsican forestry is in the method of cutting the pine. The methods of determining the rotation and estimating the yield are similar to those in France; in Corsica, the methods are, however, less intensive. The dangers of over-cutting, owing to slack regulation in past years, are admirably illustrated by many of the Corsican forests where to-day one finds the growing stock depleted and exhausted."—T. S. Woolsey, *French forests and forestry*, pp. 2-5, 7-9.—The French have done another notable thing in regenerating and enlarging the oases of the Sahara, and bringing new ones to life, by using modern methods of boring artesian wells down to the reservoirs of water that in places lie on the layer of impervious rock, below the porous sand of the desert. "The rivers and torrents which descend from the mountains, partly from the great Atlas range, . . . partly from the mountain in mid-desert, pass beneath the sand until they encounter the water tight strata beneath; within they secretly circulate and extend for great distances."—L. M. Phillipps, *In*

the desert, p. 130.—In places springs rise to the surface, in [other] places where the water was near the surface the Arabs had dug down and reached it. But during years of warfare and misrule many of the springs had been choked up by sand, or the wells ruined or permitted to fall into decay, and the oases which they fed were ruined. Then came the French, with scientific methods to replace the rude art of the Arab well diggers, and by the close of the nineteenth century, in the Oved Rir district alone, the water supply had been increased 600 per cent.

1717-1922.—Destruction of forests on headwaters of Rhone and Garonne.—Resultant devastation.—Influence on Marseilles.—Reforestation of dunes and mountains.—"The wonderful mountains of the south and southeast of France, below Lake Geneva, have from the earliest times been heavily forested. In the days before the French Revolution these forests were strictly protected by national edict. But after the revolution the destruction began, at first in the plain, then ascending the mountain, as each landowner, fearing new changes of government, attempted to turn his property into cash. Out of these mountains run two important streams and many lesser ones—the two being the Rhone and the Durance. The Rhone was a navigable river of a swift current, emptying into the Gulf of Lyons; and the Durance was its chief tributary. When the forests were cut away these rivers began to receive increasing amounts of sand and gravel, which rolled along in their currents and made bars and obstructions and rapidly advanced the delta. For nearly a century navigation of the Rhone was practically impossible. In that hundred years—and the process is going on to-day—it has extended its delta from the point where it had been practically stationary since Roman times, out into the deep water of the Gulf of Lyons more than four miles, and in that advance has ruined the sea entrance to the river. That four miles represents the agricultural land of the mountains swept down and lost in the sea. But the loss has been far heavier than that. All through the mountains were little villages which had lived for centuries upon the products of the hills. In each village was a waterwheel turned by a steadily flowing mountain stream. The villages were prosperous and contented. With the destruction of the forests all this changed. The streams no longer flowed steadily but came in torrents, wrecking the mills and many houses, and then going completely dry. With the torrents came earth and gravel, so that in several cases villages have been within the past few years entirely buried in the debris brought down by the flood, the business streets being piled six or eight feet deep in gravel and boulders in a single night. Such destruction as took place in the Alps was repeated in the valley of the Garonne. All along the north slopes of the Pyrenees the shepherds burned the forests off to increase the pasturage. Their hope was vain, for once the forest was gone the . . . soil quickly followed it. The Garonne became unmanageable and so remains, and the sand swept out to sea was borne back by the sea upon the Gascogne coasts and there piled in great dunes which marched steadily inward, overwhelming farms and villages in sand, destroying fields, blocking rivers and brooks, and finally turning the whole of . . . [the Landes—the low plain of Gascony] into a marsh, . . . where shepherds went about on stilts to be above the bogs, and people died of the ravages of malaria and swamp fever. [As far back as 1717, and again in 1786, efforts had been made to plant the Landes.

Finally in the nineteenth century after the mischief caused by deforestation had been done,] to remedy this, and to correct the troubles in the Alps, France . . . [began] spending millions of dollars. On the head-waters of the Rhone she is planting forests, planting meadows, setting up all manner of devices to arrest the erosion, and most costly of all, in the beds of streams she is building numberless masonry dams to hold back not the water, but the moving bed of the stream itself. In the delta of the Rhone she [has spent] . . . other millions to make a canal in place of the natural river mouth choked by debris. In the upper Garonne also she is replanting forests and building the costly dams to hold back the mountains. And on the Gascogne coast she has planted 2,000,000 acres of pine and cork oak forest on the dunes to stop their traveling, to permit the opening of the drainage streams and to aid the sanitation of the Landes."—J. L. Mathews, *Conservation of water*, pp. 224-227.—The planting of the Landes has brought about an almost startling change in the aspect and habitability of the lower Garonne country. "The great achievement of France in forestry has been the establishment of protective forests where much destruction has been caused by floods. . . . This marvelous change has been brought about by the intelligent cultivation of pine forests. Immense forests now cover the [Gascogne] country, the sand dunes and marshes have long since disappeared, and the wood, charcoal, turpentine, rosin, and kindred industries have brought wonderful prosperity to the entire department, which was formerly the most barren and miasmatic in France. The climate is now mild and balmy, the great change being wrought by the forests. The thin layer of clay beneath the sandy surface, formerly impervious to water, has been so pierced by the roots of the pine that there is now thorough drainage to the spongy earth below."—*Reclamation of sand dunes and marshes in France* (U. S. Forest Service press notices, Aug. 6, 1909, pp. 1-2).—The work of reforesting the mountains is still going on, and must continue until fear of danger, caused by the absence of trees, is removed.

ALSO IN: T. S. Woolsey, *French forests and forestry*.

1918-1922.—Replanting of forests destroyed and cut during the World War.—Timber, which it is estimated cannot be replaced by replanting and growth inside of two hundred years, was destroyed in France by gun fire, or cut and used for the exigencies of warfare during the World War.

"Reafforestation is being carried on at feverish speed to rehabilitate the forest lands devastated by war, [but] no one questions the duty of the State to carry on this most necessary work. Impoverished as she is, France is expending much money and no little effort on these labors. The Water and Forest Board has been entrusted with the supervision and direction of the work of reconstructing the forests, and for that purpose has set up a special Forest Reconstruction Service. In each department which suffered from invasion there has also been established, independent of the usual forest inspections, a special so-called 'Forest Reconstruction Inspection.' . . . In the case of the parish and private forests the French parliament has set up a Fund, budgeted as 'Forest Reconstruction Works,' upon which the parish and private owners may draw for the means to re-establish their woods. These funds enable the Forest Board to effect restoration works, in agreement with private owners, in the latter's forests. . . . Nurseries

have been established by the Forest Service nearby the places where new planting is going on. Many sources, including Canada, are being drawn upon for the necessary seed. Delivery of plants and seeds has also been claimed from Germany as compensation in kind. Restocking is being carried on in accordance with a plan carefully elaborated by the Forest Board with special reference to the mutual adaptability of the soil to the seeds and with regard to ensuring a maximum yield of timber in a minimum period."—E. Beck, *With a Canadian observer in Scandinavia* (*Canadian Forestry Magazine*, v. 18, no. 1, Jan., 1922, p. 580).

GERMANY

1165-1852.—Origin of conservation in forests for the chase.—Early replanting.—Beginning of modern reforestation.—"Forests in Germany were originally communal property as some of them still are, and most of them remained so until the 13th century. Chiefly through use, it came to be recognized that the king had sole right in the hunting and fishing in certain forests, called ban forests, and could transfer these rights, together with the land, to his grantees. While in this way the freedom of the communal owners was undermined, the institution of ban forests had nevertheless its value in that it led to forest protection, restriction in forest use and restriction in clearing, all, to be sure, merely for the benefit of the chase. Special officers to guard the rights of the king, *forestarii*, chosen from the free and freedmen, and also superior officers, *forestmasters*, were instituted, to administer the chase and enforce the restrictions which went with it. Gradually . . . there came also a change in the political rights of the markers or commoners, the large barons interfering with their self-government, assuming for themselves the position of Obermärker, appointing the officials, issuing strict forest ordinances to regulate the cutting of wood, and finally the original right which every commoner had of supplying himself with wood material, became dependent upon permission in each case. . . . [In the tenth century when Otto the Great began to colonize the land east of the Elbe, the old Mark institution had fallen into disuse, and consequently the greater part of the forests became royal property.] The first prohibition of clearings is found at Lorsch in the Rhenish country in 1165, and other ordinances with such prohibition are on record in other parts in the 13th century. In 1237 at Salzburg clearings were prohibited in the interest of the salt mines, 'so that the cut forest may grow up to wood again,' and in other parts where mining interests made a special demand for props or charcoal the regulation of forest use was begun early. . . . In 1309 Henry VII ordered the reforestation of a certain stripped area by sowing. Of the execution of this order we have no record, but the first actually executed plantation on record is that by the city of Nuremberg in 1368 where several hundred acres of burned area were sowed with pine, spruce and fir and there is also a record that in 1449 this crop was harvested. In 1420 the city of Frankfort on the Main followed this example, relying on the Nuremberg seed dealer, whose correspondence is extant and who was invited to go to Frankfort, to give the necessary advice. . . . Toward the end of the period we find also various provisions which are unquestionably dictated by the fear of a scarcity of timber. The discovery that pasture prevents natural regeneration led to a prohibition of pasturing in the newly cut felling areas. In

1488 we find already a diameter limit of 12 inches . . . as a basis for conservative exploitation when the city of Brunswick is buying stumpage and in the contract is limited to this diameter and in addition obligated to leave 15 oaks or aspen per acre for seed trees. . . . We see, then, that the first sporadic and, to be sure, crude beginnings of a forest management in Germany may be traced back to the 14th and 15th centuries; but it took at least 250 to 350 years before such management became general."—J. B. Fernow, *Brief history of forestry*, pp. 31, 36-39.

Great changes were made in forest-ownership during the seventeenth century, and much damage was done to the woods. Under the doctrine of the Roman law that superior ownership in the land lies in the prince, the historic position of the Mark, on common land was perverted, and the land became the property of the prince. Moreover, the princess claimed all ownerless tracts after the Thirty Years' War. "The peasants' forest property . . . had by the 19th century been almost entirely dismembered, part having come into the hands of the princes, part having been divided among the Märker and part having become corporation forest in the modern sense. . . . The forest conditions naturally deteriorated continuously until the end of the 18th century; the virgin woods were culled of their wealth and then grew up to brush. . . . More serious enemies than the exploitation of the timber proved the pasturing of cattle, the removal of the litter, and above all the fires. . . . As late as 1778 the necessity of keeping the rides or fire lanes open in the forests of Eastern Prussia is justified by the statement that . . . 'not a single acre of forest could be found in the province that had not been burnt in former or later times,' and that 'the people are still too much accustomed to the ruthless use of fires, so that no punishment can stop them.' . . . With the beginning of the 18th century besides prescriptions against wasteful use, definite *forest policies* had become quite general, with a view to forest preservation and improvement of forest conditions, and also to providing wood at moderate prices. . . . The oldest attempts of controlling private forest property are found in Bavaria (1516), Brunswick (1500) and Württemberg (1614). Here forest properties were placed either entirely under the supervision of the princely forest administration, or, at least, permission for intended fellings had to be secured. Later these restrictions were considerably reduced in rigor (Bavaria, 1789). In Prussia private forest property remained free from government interference well into the 18th century. . . . But in 1766 Frederick the Great instituted a rigid supervision providing punishment for fellings beyond a special budget determined by experts. . . . Finally, in some parts (Hesse-Kassel, 1711; Baden, 1737), the entire management of . . . communal forests was undertaken by the government. In Prussia, by the Order of 1754, the foresters of the State were charged with the supervision of the communal forests, in which they were to designate the trees to be felled and the cultures to be executed; but . . . the execution of this supervision was but indifferently performed. In 1749 a special city forest order placed the city forests in Prussia under the provincial governments, requiring for their management the employment of a forester and the inspection of his work by the provincial forestmaster. . . . The last hundred years or so has seen in Germany the development of fully established forest policies and the complete organization of stable forest administrations, based upon thorough and careful recognition of the principles

of forest management and intensive application of silvicultural methods. . . . The change in forest treatment from the conditions prevailing during the previous period was largely due to the change in property relations, and especially to the establishment of *state forests* [when much of the crown lands of the petty princes fell to the State, and when owing to the secularization of church property the lands of the church institutions were taken by the State]. In Bavaria, it became at last necessary (1852) to positively forbid the further establishment of new servitudes or rights of user. Laws having in view the dissolution or buying out of these rights were issued in Bavaria in 1805 and in Prussia in 1821. . . . The progress in the abolishment of these rights was slow, until money exchange was permitted (as in Saxony, 1832)."—*Ibid.*, pp. 43-45, 49, 51, 52, 86, 90.

1815-1914.—*Modern administration.*—"A fully organized forest administration, in the modern sense, . . . could hardly be said to exist until after the wars of liberation (1815) which had undoubtedly retarded the peaceful development of this as well as of other reforms."—*Ibid.*, p. 113.—Then there began the work which the United States has now undertaken. "New forests were planted, wherever the land was unsuitable for other purposes. This planting was done year after year, so that each year a new tract would come to maturity. Forest wardens watched for fires, and laws forbade careless hunters setting fires in the woods. Timbermen were forced to gather and burn what twigs from the slashings could not be used in the still or burned for charcoal, and broad lanes were left through the forests as stops for fires. In this way there arose those magnificent German forests which now return the empire an average net annual profit of two dollars and a half for each acre, on land which is otherwise unusable; and, besides, give their services free for the storage of water and for the retention of the soil."—J. L. Mathews, *Conservation of our national resources* (*Atlantic Monthly*, May, 1908).—"The condition of the forests depends largely on the amount of control exercised by the state authorities. It is best in all cases in the state forests, it is almost equally as good in the corporation forests under state control, and is poorest in the private forests, particularly those of small holders. The control of the corporation forests is perfect in a few of the smaller states only, notably Baden, Hesse. . . . also in some districts in Prussia where the corporation forests are managed by the state authorities, the wishes of the villagers or corporate owners being, however, always duly considered. In a large portion of Prussia, in Württemberg, and in Bavaria the corporation provides its own foresters; but these, as well as their plans of operation, must be approved by the state authorities, so that here the management is under strict control of the state, and favorable forest conditions are at least partially assured. In Württemberg the corporation is given the choice of supplying its own foresters or else of joining their forests to those of the state. This has led to state management of nearly 70 per cent of all corporation forests. Only the corporation forests of Saxony and those of a small part of Prussia are without any supervision. Of the private forests, those of Prussia and Saxony, involving 69 per cent of all private forests of the empire, are entirely free from interference. They can be managed as the owner sees fit, and there is no obstacle to their devastation or entire clearing and conversion into field or pasture. The remainder of the private forests are under more or

less supervision. In most districts a state permit is required before land can be cleared. Devastation is an offence, and in some states, notably Württemberg, a badly neglected forest property may be reforested and managed by state authorities. In nearly all states laws exist with regard to so-called 'protection forests,' i.e. forests needed to prevent floods, and blowing, land and snow slides, or to insure regularity of water supply, etc. Forests proved to fall under this category are under special control."—B. E. Fernow, *Economics of forestry*, pp. 294, 317-318.

"The actual administration [of the State forests] now lies in the hands of technical men (*oberland-forstmeister*) with a council of deputies (*Land-forstmeister*) all of whom have passed through all the stages of employment from the district managers up. This central office or 'division of forestry' is either attached to the department of agriculture, or to that of finance, and has entire charge of the questions of personnel, direction of forest schools, of the forest policy of the administration, and the approval of all working plans, acting in all things pertaining to the forest service as a court of last resort. The working plans are made and revised by special commissioners in each case, or, as in Saxony, under the direction of a special bureau, with the assistance of the district manager. Upon the basis of the general working plan prepared by these commissions an annual plan is elaborated by the district managers with consultation and approval of the provincial and central administration. These plans contain a detailed statement of all the work to be done through the year, the cost of each item and the receipts expected from each source. This annual working plan requires approval by the provincial administration, which is constituted as a deliberative council, consisting of a number of Forstmeister with an Oberforstmeister as presiding officer. The titles of these officers, to be sure, and the details of procedure vary somewhat in different states, but the system as a whole is more or less alike."—B. E. Fernow, *Brief history of forestry*, pp. 114, 115.

GREAT BRITAIN

1917-1921.—**Reforestation.**—There are some forest areas in England, known as the royal forests, . . . including what is left of the New Forest and the Forest of Dean, and amounting in all to 115,000 acres of which only 57,000 acres are really wooded. Up to 1917 or 1918 these forests were on the whole absolutely mismanaged. In 1877 a law was passed which forbade cutting or planting in the New Forest. In 1900 there was just one well-made planting plan that for the forest of Dean. Since the World War, however, "England has commenced what France first undertook two or three centuries ago; what the German states began at almost the same time, and Denmark a little later; what Sweden and Norway faced twenty-five to fifty years ago, and what Canada and the United States must face today. Although, in the centuries succeeding its inception, the forest policy of the continental European nations has become such a part of their daily life that they are prone to forget it ever had a beginning, we must not forget that, almost without exception, they took up forestry only when the almost complete exhaustion of their forest resources showed that their very existence depended upon them. . . . It seems strange, perhaps, that England could so long have avoided the issue, but the circumstances of British colonization in the New World and the facilities for lumber import engendered by her con-

trol of the seas, were undoubtedly responsible. Periodically, to be sure, the government took some interest in growing trees, especially in the days of wooden ships, but when steel tonnage drove the old wooden vessels from the seas that interest again flagged, and England found herself at the beginning of the war an importer of 90 per cent of the timber she consumed. . . . In 1916 and 1917, faced with the necessity of allocating her ships to the importation of food, Great Britain awoke to find her forest resources far below their possible extent or productive capacity. To supply the pit props for her mines and help take care of other war and home needs one-half of all the productive wood-lands of the United Kingdom fell before the ax. . . . The British military authorities were among the first to urge the reforestation of the woodlands cut during the war, and the investigation committee which was the outgrowth of their efforts brought forward a still more astounding fact. The United States and Canada, said the report, were rapidly advancing toward a degree of destructive deforestation which would eventually remove them from consideration as large timber exporting countries. High lumber prices in Sweden and Norway had only served to emphasize to those nations the importance of conserving their timber supply by a restriction upon the output. France and even Germany could not quite supply their own needs and that nation which did not conserve and build up its own natural resources would be the first to suffer. So much was the British Parliament taken aback by the findings of this committee that it passed almost immediately a bill embodying its recommendations. Fundamentally, the law which created the British Forest Commission is simply a recognition of the government's cardinal duty of assuming the largest share of the burdens of reforestation. It recognizes, however, that the government could not and should not attempt a forest monopoly, and provides for assistance to private owners. . . . Under the efficient leadership of General Lord Lovat, who in the capacity of Commander-in-Chief of all British Forest troops during the war, had become fully alive to the situation, and supported by appropriations from Parliament, based upon a ten-year budget system, the British Forest Commission began to function almost immediately after the passage of the act. . . . Hundreds of new nurseries have sprung up in England, Wales, Scotland and Ireland, and under an arrangement with the Crown forest authorities who originally controlled the great forest parks of Windsor, New Forest and similar districts, the already established nurseries of the whole country have been drawn upon for more than sixteen million seedlings. Nearly every section of the United Kingdom now displays many acres of healthy tree plantations. . . . Under Parliamentary instruction the committee does not stop with the replanting of the forests cut during the war, but has made a scientific study of the utilization of those miles of waste lands along the sea and amid the Scottish heath which have hitherto been almost entirely unproductive."—A. N. Pack, *England's new forest policy* (*American Forestry*, v. 27, no. 330, Dec., 1921, pp. 751-753).—During the war, Liverpool, Edinburgh and Lanarkshire commenced the work of afforesting part of the areas of their large catchment basins, a work which had already been begun by the city of Manchester.

HUNGARY

1788-1906.—**Forest management.**—"Although since 1809 forest inspectors had been employed to look after the execution of the forest laws, mismanagement and forest destruction by promiscuous cutting, pasture and fire remained the rule and with the advent of the railroads in 1850 increased apace. . . . At present, of the 23 million acres of forest the State owns 16%, corporations somewhat over 20%, churches, cloisters and other institutes 7.5% and the balance is owned privately. Of the private properties the majority consists of large holdings and about ten per cent are entailed, a hopeful condition for conservative management. Yet with an export of 10 to 12 million dollars or more, exploitation would appear still to be general, and devastated areas abound. . . . The State interests were in 1879 placed under the administration of the Department of Agriculture with a technical forester at the head . . . assisted by four section chiefs, one in charge of the State forest administration, one for the administration of corporation forests, one for the elaboration of working plans and one, with the assistance of 20 forest inspectors having supervision of the execution of all forest laws. Otherwise the general features of German administrative measures prevail. . . . The law of 1879 provides government supervision of the management of corporation and of protection forests (1 million acres in the mountains and on sand dunes), and prescribes that land unfit for farming, i.e., absolute forest soil (three-quarters of all forest land), no matter by whom owned, is to be reforested within six years after having been stripped. Mountain forests, which are classed as protection forests, as well as entailed properties, must be managed according to working plans approved by the forest department. . . . Similar to the Landes in France there exist in various parts of Hungary extensive sand wastes and shifting sands, partly caused by deforestation. Ever since 1788 legislation has attempted to secure a rehabilitation of these waste areas, which cover in all some 600 square miles. In 1817 a first systematic beginning was made in the Banat. . . . By 1842 the total plantations amounted to about 12,000 acres and by 1869 some 20,000 acres had been reforested and parts of the plantations had begun to yield profits. But even to-day there are still large areas in a desert condition."—B. E. Fernow, *History of forestry*, pp. 165, 166, 167.

INDIA

1350-1639.—**Irrigation canals.**—"The west Jumna Canal was opened about A. D. 1350 by Firoz Shah Tughlak, but had only a feeble irrigation: falling into neglect and decay. . . . It was subsequently repaired . . . about the year A. D. 1558, and finally—much improved and extended by order of the Emperor Shah Jahan some sixty years later—it delivered water into the palaces and streets of Delhi. Having quite ceased to flow into the anarchy of the eighteenth century it was taken in hand by the British, under Lord Hastings, and now measures four hundred thirty-three miles with two hundred fifty-nine miles of distributing channels, irrigating nearly four hundred thousand acres of land and returning to the State [India] an annual profit of over 10 per cent. . . . In 1639 the Ravi Canal was begun to take water to Lahore."—H. G. Keene, *History of India*, pp. 5, 116.

1805-1921.—**Forestry in British Burma.**—"The

unskilled character of the labor . . . makes efficient forest control doubly difficult and great credit is due the British foresters for their splendid success in administering and improving an area of some 367,000 square miles that produce an annual net revenue of some \$6,000,000. According to [C. G. Rogers, formerly Chief Conservator of Forests in Burma.] . . . a definite statement of Indian forest policy was not made until 1894. . . . In 1805 steps were taken to combat the growing deficiency of oak for British naval construction by working the teak forests on the Malabar Coast, but through private influence the efficient management which had been secured was abolished in 1823. In 1842 forest conservation was again revived and a small local forest department for Malabar was organized; in 1847 the Bombay Conservator of Forests was appointed, and in 1827 a special examination of the forest resources of Burma was authorized. In 1837 the serious absence of young growth was reported and when in 1852 the Province of Pegu was annexed by the British (now Lower Burma) all forests were declared to be government property and a superintendent was appointed. Technical forestry in British India was, according to Mr. Rogers, really commenced in 1856, when the late Sir Dietrich Brandis was appointed Superintendent of Forests in Pegu. From this time on, there has been a steady development along technical lines as well as in administrative organization, and in the successful commercial management of a vast forest property. . . . The forest administration of each large province is under a Chief Conservator, or Conservator (corresponding to District Forester); the divisions or sub-divisions under a Deputy Conservator (or Forest Supervisor); the ranges under a Ranger and the beats under a Forester, the lowest grade. The policy is controlled by the Government of India through an Inspector General under general financial rules which are laid down, resolutions on policy, personal inspection, by reserving the right to appoint Conservators and Chief Conservators (except in Madras and Bombay), by forest legislation and the imperial forest code (except Madras and Bombay which have their own special codes), and lastly through the civil service regulations, civil account code, and the general laws. According to Rogers: 'The Inspector-General of Forests is the chief adviser to the Government of India and to local governments in the management of State forest property. . . . During a large portion of the year he tours through the forests and records his recommendations. Except in Madras and Bombay plans for the working of the forests are prepared in consultation with him, or, if prepared under the supervision of a Chief Conservator, communicated to him so that he may have an opportunity of making suggestions to the local governments. Subject to the control described, local governments of the major provinces are responsible for their own forest administration. The Chief Conservators, or Conservators, are their immediate advisers in forest matters, and spend a considerable part of the year touring; they control all forest business within the financial or other powers accorded to them. . . . Divisional forest officers are responsible for carrying out the provisions of working plans. Where a regular plan has not yet been compiled, they have to prepare and carry out an annual plan of operations. They control revenue and expenditure subject to definite financial powers. When on tour they check the works in progress, control protection of the forest, and demonstrate various silvicultural operations. They have to initiate schemes for the development of their forests.'"—T. S. Woolsey, *Forestry*

in *British India (Journal of Forestry, v. 19, no. 5, May, 1921, pp. 550, 552, 553).*

1876-1913.—Wells and irrigation canal works.—“In the extreme west of the Indo-Gangetic plain—in country which is practically rainless—irrigation is essential. Sind depends as much upon the Indus as Egypt upon the Nile. . . . In Sind, . . . the whole of the cultivated area is irrigated; in the Punjab two-fifths; in the United Provinces between a quarter and a third, and in Madras a quarter. In British India as a whole about one acre in six is irrigated. . . . In the upper portion of the Indo-Gangetic plain the well has for ages been literally the life-spring of mankind, providing the inhabitants not merely with drink but with subsistence. . . . Wells must have been used here for irrigation from remote antiquity. . . . In Northern India the construction of permanent wells is undoubtedly advancing, although, viewed statistically, progress is masked by the abandonment of old wells in tracts to which canal irrigation has been extended. In Southern India the number of wells is reported to have increased by as much as 40 per cent. during the twenty-five years 1876 to 1900. . . . For many years past the State has offered to assist cultivators to construct wells by lending them the necessary capital at a low rate of interest. . . . The crystalline area of the peninsula is distinguished by the abundance of its irrigation tanks. . . . The most impressive irrigation works are, however, the State canals, which are comparable with large rivers in the volume of water they carry. . . . Two of the existing canals from the river Jumna were initiated by Moghul rulers for the irrigation of their demesnes. But, speaking generally, the canal system of India is the creation of the State, and is an asset with which the country has been endowed by the British Government within the last two generations. Canals owned and managed by the State irrigate an area of about seventeen million acres: their construction has cost over £35 millions and it is calculated that the value of the crops that are raised by them *annually* returns to the country four-fifths of this large sum. . . . The circumstances of the peninsula are unfavourable to the construction of large canals, since the ground surface is not even, and the river-beds lie deep below the level of the country. . . . The most notable of the peninsular canals are those which give water to the level deltas of the Godávári, Kistna and Cauvery rivers. The Cauvery system is of ancient date, the cross-river anicut upon which it depends having been constructed 1,500 years ago. But it owes its development, and the other two systems their initiation, to British engineers. The three canals irrigate two and a half million acres of productive rice land, and support a population in such circumstances of well-being as are rarely enjoyed by Indian cultivators. The typical canals of India are, however, those of the Indo-Gangetic plain. They are of two classes—inundation and perennial. The former simply draw water from the rivers on to the land during the monsoon season, when the rivers are in high flood. Of this type are most of the canals which give life to Sind and to large tracts of arid country in the south of the Punjab. They are generally serviceable only for crops that are grown during the monsoon. Perennial canals are more elaborate

undertakings. Their object is to provide water during the dry season as well as the monsoon, and for this purpose it is necessary that the level of the river's dry-season supply should be raised very considerably by a large masonry dam, or barrage. . . . Ten large perennial canals, irrigating eight million acres, are fed by Himalayan rivers, flowing through the Punjab and the United Provinces; and, since these rivers are partly snow-fed and rise in the spring with the melting of the snows, they replenish the canals at a time when the plains are at their driest. Two of the most recently constructed Punjab canals have within the last ten years [written in 1913] practically created new countries. Their courses traverse land which was originally uninhabited desert; they have covered it with cornfields, having attracted settlers in multitudes. The Chenáb canal has in this way reclaimed two million acres of land, and supports a new population of nearly a million. There is, of course, a risk in interfering with Nature on so stupendous a scale. Water poured across a country through many thousands of miles of distributing channels soaks into the subsoil and raises very greatly the subsoil water-level. In the Punjab the river-beds are not deep enough to act as drains; large areas have become water-logged and a problem has arisen which will tax very greatly the ingenuity and the resources of the State engineers. Further east—in the province of Bengal—three systems of canals have been constructed. The area which they irrigate is not inconsiderable—nearly a million acres—but in ordinary seasons their water is not in great demand, and they have, so far, failed to earn full interest on their capital. Within recent years two large canals have been made in Upper Burma. They irrigate 175,000 acres situated in or near the dry zone, and return 4 per cent. on their cost of construction.”—B. Fuller, *Empire of India, pp. 73-81*.—For the first twenty miles of the Ganges canal, the works are very remarkable. “For the canal intersects the drainage of the Lower Himalaya, and has to be carried across rivers which often become furious torrents. . . . One torrent blows harmlessly in a broad artificial bed over the canal which runs below; over another . . . more than two miles wide, the canal, . . . virtually the whole Ganges, is carried by an aqueduct.”—J. Strachey, *India, pp. 237, 238*.

IRELAND

1846-1922.—Lack of conservation.—Coniferous plantations of 1846.—Land Purchase Act of 1903.—Reckless denudation.—“As regards its present condition Ireland is the most poorly wooded country in Europe—except Iceland. . . . All Ireland's wood and plantations . . . [amounted in 1914] merely to 1.4 per cent. of its total area; and this is less than one-third of the general average for Great Britain, itself very poorly wooded in comparison with other European countries. One great disadvantage of this want of woodlands in Ireland is the absence of the beneficial shelter they would afford mechanically against cold, cutting winds; and this kindly shelter is badly wanted in such a wind-swept country, where grazing in the open field and on the unprotected hillside is the chief method of stock-raising. But even this inadequate area under woodland is being rapidly decreased through the operation of the Land Purchase Act, 1903, by clearances without replantation, while the character of the cuttings in the remaining woods is such as must soon result in considerably deteriorating their quality. . . . More

than two-thirds of the total woodland area consist of mixed woods in which broad-leaved trees (and particularly the oak) predominate; while about 64,000 acres, or less than one-third, are coniferous crops in which the larch predominates and forms the most valuable timber. The mixed woods chiefly of broad-leaved trees are the remains of the original copsewoods formerly worked for timber and bark, and of the old plantations which now for the most part are demesne woods and ornamental plantations serving as shelter belts around the residential portions of large estates, though many of the oak coppices have either been interplanted with larch and pine or have been left to fall into a scrub-like condition, much neglected and intermixed with self-sown softwoods such as birch, willow, and alder. The coniferous plantations as yet uncleared have all been formed . . . since the great famine in 1846-7, and consist chiefly of larch, Scots pine, and spruce and silver fir grown on poor land and mainly with a view to profit, though many plantations made with coniferous trees have also been formed as game-coverts and shelter-belts, and are managed chiefly for the preservation of game, "a fine wood for cock" being one of the most highly valued portions of an Irish estate. . . . Ireland's woodlands, already far too small for her economic requirements, are gradually decreasing in area; while the cutting out of the best trees, in woods that are "picked over," leaves only inferior timber standing, so that there is a large and growing proportion of "skeleton woods," stocked only with about one-third to one-half of the crop they might be bearing. . . . The various Land Acts have had a destructive influence on Irish woodlands. On large estates being broken up, the interests of many landlords had naturally lessened in the wooded portions; and even where resident landowners might be desirous of planting, this could only be done on outlying parts of their estates, isolated from the central demesne portion. Thus some large proprietors were anxious to sell timber growing on land with which they would soon have no further concern; and with regard to such cases, which were very numerous, the Land Act of 1903 had made no provision for dealing with woodlands on estates being sold to tenants, except in Section 4, which remained practically inoperative through no financial clause having been added to give effect to it, in order to enable advances to be made to trustees for the purchase of any portion of an estate sold under the Act, and for preserving the woods and planting other suitable land. When estates were purchased by the Estates Commissioners (under Sections 6-8) the only terms they were allowed to offer for the woods were such as must be unsatisfactory to the owner, who was then only too glad to sell the timber to the first merchant making him an offer; and even where woods passed to tenant purchasers, the Commissioners were unable to offer any terms or to take any steps to induce the purchaser to refrain from selling the timber in like manner."—J. Nisbet, *Aforestation in Ireland (Nineteenth Century, v. 76, Sept., 1914, pp. 648-649, 652-563)*.—The denudation of the country is still being rapidly carried on. Hills which twenty years ago were crowned with woodlands are bald spots. Mountain sides which grew vigorous plantation, are waste stretches of heather. Low lying land, incapable of cultivation, and from which the woods have been cut have gone back to bog or swamp.

ITALY

B. C. 800-A. D. 1915.—Irrigation canals.—Use for navigation and hydro-electric power.—"The

climate conditions of Italy might be compared, in general terms, and with only some few exceptions, with those prevailing in the Western States of America, called the 'semi-arid' regions. . . . However, if we travel along the plains of Piedmont and Lombardy, we can see the most exuberant green meadows of trefoil and lucerne, even during July or August. . . . This most satisfactory change in the natural conditions of the land is brought about . . . by scientific irrigation. Irrigation is an art that, in Italy, has been practised from time immemorial (from the time of the Etruscans and the Romans), and has been brought down through the Middle Ages to its present state of perfection. Thanks to irrigation, the waste, sandy plains of Piedmont and Lombardy—where only stunted grass and wild shrubs could live in normal conditions—were transformed into rich rice fields and prosperous meadows, which give as many as 7 or 8 cuttings of lucerne per year. It is to irrigation that the vegetable gardens all along the Tyrrhenian Coast and the orange groves in Liguria, Sardinia and Sicily owe their existence. . . . [In fact about 17%—3,458,000 acres—of the cultivated land is irrigated, in addition to the irrigated meadows.] When only small quantities of water are required . . . the water is generally obtained from wells dug in the sandy subsoil at the foot of the hills and around the coasts. . . . In the North, on the other hand, small, but very modern, centrifugal pumps driven by oil or electric motors . . . are more in use, lifting the water from 10 to 12 metres . . . and occasionally up to 40 metres. . . . Some parts of the Roman Compagna, and also around Naples, are literally honeycombed with a network of narrow tunnels (a great many of Etruscan and Roman origin are still in good working order) that collect and bring to the surface at a lower level the rain water that percolates through the fissured volcanic formation of these regions. . . . Many similar tunnels also exist in other regions of Italy, where the ground is composed of 'conglomerate,' and are called *pozzi allacciati*, or 'connected wells'. These serve for irrigating small plots of land. The most interesting, however, are the 'infiltration tunnels' (*gallerie filtranti*) of Southern Italy, which play a very important part in the cultivation of oranges, early vegetables and similar high-priced products. There are some regions, especially in Sicily and Calabria, with large valleys filled with deep deposits of alluvium, which, during the rainy season, become saturated with water, almost forming an underground reservoir. This water percolates slowly in the form of underground drainage. In these cases it is usual to drive a small tunnel in an oblique direction so as to intercept this underflow. . . . The water comes naturally to the surface and can be distributed over the fields at a lower level without need of pumping. . . . In some parts of Lombardy and in the province of Modena, there are large volumes of water flowing underground from the lakes or the mountains to the River Po; and . . . the water can easily be tapped by ordinary wells . . . and conveyed by a deep cutting to the surface of the fields at a lower level, thus forming a sort of artificial spring, called *fontanile*. . . . Some of these *fontanili* . . . irrigate several hundred acres of meadow land, called *marcite*, which are considered the most valuable in Italy. . . . [As the water from the wells is slightly warm, not only are the meadows green in winter, when all around is covered with snow, but they produce seven or eight cuttings of grass per year. Impounding reservoirs, for the collection of the winter rainfall, are also resorted to.]

These impounding reservoirs may vary from the modest cistern of some few hundred cubic metres capacity . . . to large reservoirs or artificial lakes of many millions of cubic metres capacity. For instance, one . . . in construction [in 1915] on the River Tirso in Sardinia, with a dam 55 m. . . . high, will impound 350 million cubic metres . . . of water, and will be, for the present, the largest in Europe. It will, however, be surpassed by two similar reservoirs soon to be commenced, one on the Bradano . . . and the other on the Fortore . . . in Apulia, and by a third, on the Simeto . . . in Sicily, which will be able to store up respectively 13,840 million, 13,180 million and 12,150 million cubic feet of rain-water. . . . Large reservoirs, or artificial lakes, of many million cubic metres capacity have been formed in several valleys of the Alps or of the Apennines by high dams of earth, rock-fill or masonry, the latter being generally used. . . . It may be well here to add that all of the water from the large reservoirs of Italy serves, first, for hydro-electric power, and afterwards, for irrigation; otherwise, it would not be possible to pay the interest on the capital invested. . . . Many [of the] irrigation canals date back to the Middle Ages and are used also for inland navigation—in fact, this is a feature of the Italian canals called *navigli*, i.e., to serve both for irrigation and navigation purposes. It was on these *navigli* that Leonardo da Vinci built the first locks to allow boats to pass from one reach of a canal to another at a lower or a higher level. The oldest is the 'Naviglio Grande' of Milan, [about 50 miles long] built in the 12th century. . . . The canals of modern times, . . . [built] since Italy was united in one State—merit special attention. The largest and longest of all is the Cavour Canal, with a development of about 70 miles of main canals and about 950 miles of secondary canals and distributing ditches; that is, a total of over 1000 miles. It was begun in 1855 by a private company that failed, and was bought over and finished, in 1866, by the State. . . . This canal . . . was the means of transforming the almost barren region of Piedmont, of 250,000 acres of gravelly lands—growing only stunted timber and bushes, . . . into the most fertile rice fields and meadow-lands of Italy. . . . [There are other large canals, notably one near Grosseto, in Central Italy built to use the waters of the Ombrone which carries down as much as 10% of silt. This had already been done around Ravenna, Grosseto and other places, where large marshes have been transformed into arable land.] The Compagna Romana . . . is being rapidly transformed—from an almost waste land, very thinly populated by poor, nomadic peasants—into good corn land and meadow land, with proper farm buildings and a settled population. At present, some parts of it can compare with the best districts of Lombardy, thanks to the land being more fertile, owing to its volcanic origin, and to a larger amount of sunshine during the year. Thus, irrigation begins to have a beneficial social influence around Rome, in a region of about 450,000 acres that was considered almost beyond redemption and where malarial fever reigned supreme."—L. Luiggi, *Italian irrigation, paper no. 40 (Transactions of the International Engineering Congress, 1915, v. 11, pp. 539, 531, 534-537, 539, 540, 542, 543, 551, 555, 556, 566, 570, 573)*.

1213-1921.—La Verna and Camaldoli forests. —Reforestation.—In 1213 Orlando, Count of Chiusi, a noble of large possessions in Casentino presented Monte Alverna to St. Francis of Assisi as a retreat. "Here St. Francis spent much of his

time and one of the features of the activities of his monks and followers was the cultivation of the splendid silver fir and beech forests. Since the year 1224, this fine old forest . . . has received continuous scientific care of its forests and today is one of the municipal forests of the city of Florence with a trained forester in charge. The forest of La Verna is sometimes referred to as the oldest known example of continuous forestry practice. Records have shown, however, according to Dr. Egidio Ferrari, an Italian Government forester, and the Prior Don Basilio, that the beautiful forest of Eremo di Camaldoli is not only the oldest example of continuous culture under scientific forestry methods, but it served its highest usefulness in helping to meet the great war emergency by supplying much needed timbers and lumber for the front. It seemed that for this very contingency, indeed, it had stored up a great forest reserve and fine old specimens of silver fir from 100 to 200 years of age were felled to meet the urgent call. . . . In the early days of the Casentino in Tuscany, a monk of noble blood, Romualdo, by name, established a wide reputation for his devotion and sanctity until he came to be called San Romualdo. The Count Maldolo, attracted to him and impressed by his kindly manner, made a present of his large forest domain of about 2,000 acres, lying high along the crest of the Apennine Mountains, about 50 miles south-east of Florence, in the headwaters of the storied Arno. . . . This was in the year 1012 and one of the stipulations of the gift was that the forest must be maintained for all time in good condition and must be 'planted, improved and cultured' according to the most approved principles of scientific forestry. . . . The Benedictine monks of this hermitage maintained the forest down to the year 1866, when it was taken over by the Italian Government. Later it was reorganized and placed under a government forester in 1872. . . . A large share of the forest is silver fir, with a small portion of beech and a still smaller area of Italian chestnut. The fir has proved to be the most profitable from the viewpoint of financial returns, as well as most pleasing from an æsthetic viewpoint. It is cut at an age of 90 to 100 years ordinarily. Beech may be cut for charcoal at 25 to 50 years of age, while chestnut is maintained largely for the nut crop. . . . The archives show, . . . that such excellent care and attention have been given the forest for the past several centuries that the area of mature and productive forest is larger today than ever before, the inferior species having been discouraged and 'weeded out,' while vacant spaces have been planted and brought under intensive cultivation. Many of the largest silver fir trees being cut for the army at the front had been planted over a century ago by the monks. . . . During the past several centuries, the forests of Italy have been neglected as much as those of almost any other country, and such forests as those of Camaldoli show practical and scientific examples of what can be done under a systematic and continuous forest practice. Only about 17 per cent of the total area of Italy is now under forest cover. The professors at the Royal Forestry College at Florence estimate that at least 30 to 35 per cent of the total area of the country should be covered with forests. Italy is an exceedingly mountainous country and land unsuited for agriculture or for vineyards, or olive trees should be turned into timber growth to supply the increasing demands of Italy. . . . After many years of experimentation and trials with various kinds of timber trees, the Italian foresters have

adopted the silver fir as the most promising species to cultivate in future forests. Many forests cut to maintain their vast army of 5,000,000 men at the front during the war have been replanted with the silver fir. Austrian prisoners were used for this work in war time."—N. C. Brown, *Ancient forest of Camaldoli in Italy* (*American Forestry*, v. 27, no. 334, Oct., 1921, pp. 624, 625, 628).

JAPAN

Ancient irrigation and forestry.—"In the days when people depended for their food mainly, if not entirely, upon the rice crop raised in wet fields, it is no wonder that irrigation was thought much of, and that any act affecting its proper working, as, for example, drawing off the water kept in a reservoir, or filling up a ditch for conducting water to a rice field, was regarded as penal. To excavate ponds and ditches for irrigation, indeed, formed a most important Government business in the agricultural districts of the country. Among others the Emperor Nintoku [4th or 5th century] succeeded in greatly improving the system of rice-field irrigation throughout the provinces of Kawachi and Settsu, as well as in constructing an excellent harbour at Naniwa in the latter province; and the populousness of the provinces adjoining Kyoto, the ancient capital, is to be attributed . . . to this great improvement, which made the soil exceedingly fertile. . . . The earliest historical record of forestry in the Empire of Japan is that relating to Susano-o-no-Mikoto, who, in mythical days had Japan cedars, *hinoki* (*Chamaecyparis obtusa*), and camphor trees planted with a view to building palaces and ships in after years from the timber they would furnish. Even in the days of such remoteness arboriculture seems to have been made much of, and the luxuriant and beautiful growth of trees in forests now met with almost everywhere throughout the country is undoubtedly the result of the scrupulous care with which they have been protected from ancient times. For forest trees have never been allowed to be recklessly cut down: to fell timber in mountains and forests there were three classes of woodmen under the control of the *Imibé* (a government office), who alone could engage in the work. To protect the forests, laws were established . . . to the effect that no trees should be cut down without special permission. . . . In the reign of the Emperor Ojin, superintendents of forests were appointed by Imperial order in various provinces, and placed under the general control of an Imperial prince."—S. Okuma, *Fifty years of New Japan*, v. 1, pp. 583, 585.

1867-1917.—Modern forestry.—"In the beginning of the era of Méiji [1867] the forest laws, which had been in force until then, became inoperative, and many a forest was left in consequence to be devastated and despoiled. But . . . both the Government and the people promptly turned their attention to preventing it. This was effected, first, by the classification of forests into those owned by the Government and those in private possession; then the Bureau of Forestry was reorganized, and under its jurisdiction all forests were divided into a certain number of districts; and lastly, officers for examining forest trees, schools where the science of forestry was taught, and exhibitions for mutual improvement in forestry were established throughout the country. These were followed by the publication of regulations, such as those relating to the public sale of Government forests and their products; those concerning precautions to be taken against

fires in forests and on moors; those as to the disposal, in special cases, of forests and moors owned by the Government, and their products, . . . In 1897 a law was enacted and published concerning forestry which contained full provisions for the superintendence, preservation, and police supervision of forests both in public and private possession and it embodied penalties for offences against the regulations. In 1899 another law was passed dealing with the management of the forests and fields owned by the Government and the disposal of their products. This law has codified and made clear all the rights and obligations. A further Forestry Law was promulgated in 1907. The work of forestry has quickly responded to these laws, and is rapidly contributing to the wealth of the nation, as well as preserving the land against natural calamities."—*Ibid.*, v. 1, pp. 565, 583, 585, 586.

JUGO-SLAVIA

1800-1921.—Forests in Serbia.—Forest academy in Sarajevo.—"At the beginning of the nineteenth century, Serbia was practically an immense old forest, consisting principally of oak and beech, while the mountains of Ujitsa district were covered by pine trees. The political emancipation of the country led to the devastation of a considerable portion of the . . . forests, as they were considered the common property of the peasants."—C. Mijatovich, *Servia and the Servians*, p. 234.—"All the forest administration in Serbia belongs to the forest section in the Ministry of Agriculture, Commerce and Industry. . . . The forests . . . are not the subject of extensive work, owing to the insufficiency of foresters." [In 1908 these forests covered 3,600,000 acres of which less than half belong to the state.]—M. Radovanovich, *Principal industries, in Servia by the Servians* (A. Stead, ed.), p. 258.

NEW ZEALAND

1885-1906.—Forest destruction.—State reserves.—"The splendid forests of New Zealand had for years been subject to a rapid process of destruction by forest fires and vandalism. It became evident that the supply of timber would not last many decades if something were not done to check the wastes and losses, moreover, the rainfall and river sources of wide districts were being seriously affected; and in many places . . . the removal of the trees . . . [left thin soil in the mountain slopes to be washed away by storms, leaving the rocks bare]. To stop these evils a Forest Act was passed in 1885 to provide for the reservation of State forests and the control and management of them by the government. . . . The law authorized the commissioner of State Forests to establish schools of forestry . . . grant licenses to cut timber and take measures to preserve and improve the forests. . . . In the financial statement presented to Parliament in 1902, the acting Premier said: 'Special attention is being given to the reservation of all forests upon the mountains and higher table lands to ensure the maintenance of rivers and streams, the gradual distribution of rainfall, the protection of the surface of the country from degradation, and the prevention of the destruction of lands in the valleys or their deterioration by the deposit of detritus.'"—F. Parsons, *Story of New Zealand*, pp. 143, 144.—"Forty years later than it should have been done, a Forest Department was created and several timber reserves placed under its control . . . by 1906, 2,300,000 acres were so protected. The Forestry Department, in addition to protecting the reserves placed

under its care, has also numerous tree nurseries in different parts of the Dominion . . . and forms plantations where they are known to be most wanted."—A. P. Douglas, *Dominion of New Zealand*, pp. 329, 330.

NORWAY

1857-1921.—Control of forests.—Forestry in the schools.—"It was only in 1857 that an effective control of the public forests was established in Norway, the attempts which had been made about the middle of the 18th century to introduce a regular forest administration having soon been discontinued. The forestry administration is now a part of the agricultural department, having a forestry director as its chief, and four forestry inspectors, 25 forestry managers, 2 forestry assistants, 10 forest planters, and 358 overseers and rangers as the working staff. . . . Commercial nurseries have been established in several places, as well as establishments for the collecting and sale of forest-tree seeds, the largest two being at Hamar and at Voss. Elementary instruction in the treatment and cultivation of forests is given at three forestry schools, and advanced instruction at the Agricultural College. In the course of the last 30 or 40 years, planting and scientific cultivation of forests have been undertaken both by the state—for instance in the treeless districts of Jæderen, near Stavanger . . . and by private persons with the assistance of the state. During the two or three years [prior to 1900] the interest in private forest-planting . . . [grew] rapidly, and . . . led to the establishment, in 1808, of a forestry society, embracing the whole country, and of which a forestry engineer, paid by the state, has the professional management. Forest-planting is gradually being introduced as a subject in the primary schools. . . . Since the year 1860 it has been the rule to appropriate money for the purpose of purchasing forests for the state, especially in districts nearly destitute of forests, and for the purpose of acquiring forests for the protection of other forests. This appropriation has of late years amounted to kr. 64,000 per annum, besides extraordinary grants for larger purchases. The greater part of the forest area purchased has not yet been restored to a good condition after previous ill-treatment. According as the condition of the public forests improves, the better will their financial status be, in comparison with what it has been up to the present time, although the numerous and troublesome privileges will always require relatively large expenses of administration."—K. A. Fauchald, *Forestry*, in *Norway* (S. Konow and K. Fischer, ed.), pp. 347-348.—"Incorporated companies are . . . debarred by law from increasing their holdings. . . . The private owners of today, however, need no restrictive laws to compel their lesson. The forest lands owned by the incorporated companies in Norway are the best kept of any as well as the most prolific in their annual yield."—E. Beck, *A Canadian observer in Norway* (*Canadian Forestry Magazine*, Sept., 1921, p. 411).

RUMANIA

1881-1920.—The forest service.—"Roumania, since 1881, has not only a forest administration for its 2,500,000 acres of state lands, but has also a very efficient and strictly enforced forest protection law, under which 84 per cent of all the forest lands, the total forest area being 6,800,000 acres, are declared protection forests, and their plans of management must be sanctioned by the state authorities. Since 1892, there is also estab-

lished a forest melioration fund, to which the state contributes 2 per cent of the gross revenue from its forest property, for the purpose of encouraging reforestation."—B. E. Fernow, *Economics of forestry*, p. 294.

RUSSIA

1862-1921.—Protection of forests.—Neglect of forest laws.—Loss by fire consequent on the chaos of the revolution.—"Russia's chief source of wealth is her magnificent forests. Excluding Siberia, she possesses 498,000,000 acres of wood . . . of which 206,400,000 are in private hands. At the era of liberation [1862] this vast territory was left under the control of landowners, whose impetuosity suggested the fatal expedient of selling timber which could not be reproduced in a century. Thus many of the southern provinces were denuded of trees; and the climatic conditions sensibly deteriorated. In April, 1888, a statute was passed for the protection of the remaining forest, which has been gradually extended to all parts of European Russia except the north, where the supply of timber is practically inexhaustible. This far-seeing measure regulates the conditions under which private persons may fell their trees, with a strict regard for the water supply. In return, landowners are given advice as to utilising their forests, and may obtain seeds and saplings from governmental nurseries. A special Board was created in every province to deal with forestry; and institutes were founded at St. Petersburg and Lublin in Poland for training young men in this recondite science. The area under timber in the private domains was placed under stricter control, and Russia is now on a level with her Western neighbours in all that relates to the management of forests."—F. H. Skrine, *Expansion of Russia*, 1815-1900, pp. 280-281.—"Upon Russia, as upon all young countries, the conservation problem has stolen like a thief in the night. Formerly the owner of a forest was not allowed to cut more than thirty per cent of it in a year, . . . but of late this law has become a dead letter, . . . [and as a consequence of the] loss of the cover, erosion has created veritable canons in some parts of the 'black soil' region. . . . The Volga is . . . [becoming] so clogged that dredges have to work constantly on the bars, in order to keep the channel free for navigation. The Dnyper too has become a problem [at Kiev]—since the extensive tree-felling in the Minsk swamps which feed it. . . . In late summer it sometimes has too little water for navigation."—E. A. Ross, *Russia in upheaval*, pp. 46, 47.—Forest fires swept the great timber belts in Central Russia in 1921 with such frequency that a catastrophe to the forest area is threatened. The Moscow 'Isvetia' places the responsibility upon the drouth, the carelessness of the peasants and the disorganization of the forest service. In 24 provinces 11,364 fires were reported, destroying or damaging 5,400,000 acres of timber. In 22 of these provinces the 'Isvetia' stated 20 per cent of the fully grown trees, 40 per cent of the middle growth, and 41 per cent of the young growth had been damaged.

SPAIN

1915.—Irrigation, and the need for irrigation.—"Ever since the expulsion of the Moors from Castile and Estremadura, the land has been allowed gradually to go almost out of cultivation for want of water, the wholesale devastation of forests, in combination with the lapse of all irriga-

tion, acting as a constantly accelerating cause for the arid and unproductive condition of the once genial soil. Irrigation has been the crying want of Spain for generations past; but even now the Government scarcely seems to have awakened to its necessity. . . . If the money no longer being expended in railways and docks were now devoted to irrigation wherever it is needed, a rapid change would become apparent over the whole face of the country. . . . Irrigation works have been more than once undertaken by the aid of foreign money, and under the charge of foreign engineers; but the people themselves—the landowners and peasant proprietors—were not ripe for it, and, . . . some of the canals which would have turned whole valleys into gardens have been allowed to go to ruin, or to become actually obliterated, while the scanty crops are raised once in two or three years from the same soil, which . . . would yield three crops in one year by the help of water. Difficulties arose about the sale of the water—a prolific cause of dispute even in the old irrigated districts. . . . As an example of what irrigation means in the sunlit fields of Spain, an acre of irrigable land in Valencia or Murcia sells for prices varying from £150 to £400, according to its quality or its situation, while land not irrigable only fetches sums varying from £7 to £20.”—L. Higgin, *Spanish life in town and country*, pp. 170-172.

SWEDEN

1828-1921.—Conservation of forests.—Forest regulations.—Origin of force in venery service.—“A very considerable section of the forests of North Sweden has been subjected to regulations ensuring system in the lumbering there. The immense importance of this will be seen more clearly, when it is remembered that the situation of these forests in the immediate neighborhood of the Scandinavian Alps renders their preservation invaluable, as a protection against over-severity of climate. . . . The Royal Ordinance of September 10, 1860, respecting the measures to be taken for preventing the destruction of the woods on the island of Götland; . . . was replaced by an enactment dated June 13, 1908, concerning the care of private woods in the island mentioned. This law, which in 1913 was also extended to the island of Öland, differs from the general forest law by the presence of a paragraph making it necessary to have the permission of the Forest Conservation Board before timber can be cut for any other purpose than to supply household needs, or in order to convert timbered land into gardens, arable land or pastures, or into building sites. . . . A law respecting ‘protective forests’ was issued on July 24, 1903, for the permanent retention of forests, the existence of which is requisite as a protection against drifting sand, or against the lowering of the tree-limit. After proper investigations, such forests have been set apart in the Läns of Jämtland, Västernorrland, and Kopparberg. The law enjoins that timber-felling for other than domestic requirements may take place only after a survey, which is made by the Forest Service, at the cost of the State, when the owner of the forest is entitled to have such a number of trees marked at once as is conformable with the regrowth of the forest, and its permanent survival. Should it be necessary to make great restrictions in the right of the owner to make use of the forest, special regulations in the matter must be made; if the

owner would rather sell the forest than submit to such restrictions, the State can expropriate the land. . . . The other private forests in Sweden are subject to the regulations of the law dated July 24, 1903, respecting the care of private forests. According to this law, in forests belonging to private persons, lumbering must not be carried on in such a way, nor, subsequent to lumbering-operations, may the ground be so treated, as to clearly endanger the re-growth of the timber. If there has been such mismanagement of the forest, the guilty person is obliged to take the steps necessary to secure re-growth. If the lumbering rights have been made over by the owner of the forest to another person, and the latter has been guilty of the above-mentioned mismanagement, the owner is responsible for the necessary restorative measures being taken. The burden of seeing that the law in question is properly carried out rests on the Forest Conservation Board, which must exist in every county council district where the law is in force, and on the officials and inspectors of the said Forest Conservation Board, as well as on the Forest Conservation Committee appointed by communes affected. . . . Besides being entrusted with the task of seeing that the laws dealing with the public forests are carried out, the said Boards have also to promote the proper economy of the private forests by spreading a knowledge of forestry, by making grants in aid of, and carrying out, the work of forest-culture, by supplying seed and plants, and by taking other measures calculated to promote improved forest economy. . . . The Swedish Forest Service dates its origin from a Venery Service established as early as the 16th century. The ‘deer and bird huntsmen’ and the ‘rangers and keepers’ mentioned at a still earlier date did not form a regular corps. The principal work, too, of the Venery Service, until the beginning of the 19th century, was connected with hunting, although in the middle of the 17th century, some attention seems to have been paid to forest economy. On behalf of forestry, however, the Venery Service did not do very much, until, after the founding of the Institute of Forestry in 1828, the officials were given an opportunity of gathering special information respecting the science. After the institution of the Board of Forestry in 1859, the head of the new department became the head of the Forest and Venery Services as well. . . . There are [also] 3 State Forest-Engineers employed in the Forest Service, . . . [who] are entrusted with the execution of forestry matters for private owners in those parts of the country where there are no Forest Conservation Boards. The forest-engineers are paid by the State, but they also receive fees from the private forest owners who have called for their assistance. . . . [Their] work . . . consists of forest-cultivation, draining of boggy woodland, the arrangement of thinning operations, and other forestry work, the giving of instruction in forest economy at agricultural schools, etc. . . . Until quite lately, the State establishments for giving instruction in forestry have consisted of the Institute of Forestry, . . . [for the] training [of] administrative officials, foresters—and the Schools of Forestry, two of which were intended to train pupils for entrance to the Institute, while the others were for the training of rangers. The Riksdag of 1912, however, decided that the Institute of Forestry should be transformed into a High School of Forestry, at which a higher course of instruction in the science could be given, corresponding to that imparted at the universities and other High Schools.”—J. Guinchard, ed., *Sweden*,

pp. 181-187.—“In 1918 it was found necessary to pass a stringent general law forbidding the cutting of young growing forests unless and until it was shown that such cutting was essential to their improvement.”—E. Beck, *Forestry in Sweden (Canadian Forestry Journal, Aug., 1921)*.

SWITZERLAND

1304-1922.—Forests and forest laws.—Protection against avalanches.—“Forest area in Bern dates from 1304. But the first working plan seems to have been made for the city forest of Zürich, . . . in 1680-1697, and to this day this corporation property, with its intensive and most profitable management, is the pride of all Switzerland. The Bernese cantonal forests were first surveyed and placed under management from 1725 to 1739 and fully regulated by 1765. An excellent forest code for Bâle was drawn up in 1755 by Bishop Joseph William; and in 1760 through the propaganda of the two scientific societies of Zurich and Bern, the teaching of forestry was begun, and forest organization in the two cantons secured in 1773 and 1786. The canton of Soleure (Solothurn) was the first to start a regular system of instruction, two citizens from each woodland district being given the opportunity to qualify themselves as foresters. . . . The example of Zurich and Bern in organizing the management of their forest areas was followed more or less by other cantons, but a really serious movement is not discernible until the beginning of the 18th century when with the impetus of modern life and trade the value of forest property increased, and most cantons issued regulative forest laws. . . . When a severe flood in 1830 had accentuated the protective value of forest cover . . . a general movement for better management began. . . . In 1874 it was determined to create a central bureau of forest inspection for the whole Bund in the Department of the Interior, and a law was passed in 1876 declaring the superior right of oversight by the Federation over the water and forest police in the high Alps, proposing to aid in the engineering and reboisement work necessary to correct the torrents, and to take measures for the preservation of these works and forests. . . . Finally by 1902 a revised law was passed establishing fully the present Federal forest policy. This law places the surveillance of all forest police in all forests of Switzerland in the Bund, the private forests as well as the public, i.e., State and communal or corporation forests.”—B. E. Fernow, *Brief history of forestry*, pp. 174-177.—This law is still in force.—“The inhabitants [of Switzerland] protect themselves from the risk [of damage by avalanches] as much as they can by building great walls and redoubts on the exposed sides of their villages and houses. These are usually constructed with an angle towards the mountains, much like the upstream buttresses of bridges, with the object of breaking the fall of the snow and turning it aside. . . . Everywhere, and in the most unexpected places, one meets with erections almost cyclopean, built not for defence against human foes, but to protect life and property from the more relentless force of nature, as well as to overcome its obstructions. To the same end is care devoted to the preservation, and even the restoration, of the Alpine forests. There was a time, and that not a century ago, when little thought was given to such matters. Forests were allowed to be used, cut down for firing, or for any other purpose, and no one ever gave a thought to planting young trees in their place. But gradually it came to be

perceived that this was inviting disaster, not only from avalanches, but from other causes, and the Confederation was empowered to take this matter of the forests under its own special supervision. Now, not only is the greatest care taken of all woodlands, but there is a regular system of re-forestation, with a school of forestry, supported by the Federal Government, equal probably to any in Europe. It is the duty of the cantonal governments to keep each its own forests in good condition, the Confederation reimbursing them for outlay up to from fifty to seventy-five per cent. of the total expense incurred.”—A. T. Story, *Swiss life in town and country*, pp. 18-19.

UNITED STATES

Early irrigation before the 19th century.—“Within the territory now comprising the arid region of the United States, irrigation has been practiced to a limited extent from prehistoric times. When the Spanish explorers entered the territory now forming the states of New Mexico and Arizona, they found the remains of ancient aqueducts and found the natives watering their crops. The Spaniards who remained in this territory continued and extended this practice, as the country was uninhabitable without it. In extent the practice was very limited, however, being confined principally to the Pueblos of the Indians and the missions of the Catholic fathers. This condition prevailed until about the middle of the nineteenth century, when American settlers began to come into the West from the East and North.”—R. P. Teele, *Irrigation in the United States*, p. 9.—“The growth of . . . [the] Nation by leaps and bounds makes one of the most striking and important chapters in the history of the world. Its growth has been due to the rapid development, and alas! that it should be said, to the rapid destruction of our natural resources. Nature has supplied to us in the United States, and still supplies to us, more kinds of resources in a more lavish degree than has ever been the case at any other time or with any other people. Our position in the world has been attained by the extent and thoroughness of the control we have achieved over nature; but we are more, and not less, dependent upon what she furnishes than at any previous time of history since the days of primitive man.”—T. Cleveland, Jr., *Primer of conservation (U. S. Department of Agriculture, Forest Service, Circular 157, Oct. 17, 1908, pp. 5-6)*.

1847-1901.—Beginnings of irrigation by Mormons.—First Federal legislation (1866).—Desert Land Act (1877).—Later amendments.—Carey Act (1894).—Amendments.—“The Federal Constitution makes no direct reference to irrigation or to the diversion of water from streams. Article IV, Section 3, providing that ‘Congress shall have the power to dispose of, and make all needful rules and regulations respecting the territory or other property belonging to the United States,’ has a bearing on irrigation for the reason that most of the land in the arid region was at one time the property of the United States. Amendment V, providing that ‘No person shall be deprived of life, liberty or property without due process of law; nor shall private property be taken for public use without just compensation,’ also has a bearing on irrigation, as the laws of most of the arid states provide that the use of water for irrigation is a public use, permitting of the condemning of private property for rights of way. The beginning of irrigation in the United States by Americans is usually attributed to

Brigham Young and the Mormon pioneers who settled in the Salt Lake Valley in 1847. . . . The fact is that in many parts of the West permanent habitation without irrigation was impossible, and wherever permanent settlements were made, either in the Southwest, in Southern California, or in Utah, the settlers soon began applying water to the soil for the production of crops. The Mormon settlement in Utah and the discovery of gold in California occurred at about the same time, and both the Mormon farmers and the California miners were compelled to irrigate to live. During his life Brigham Young insisted that the Mormon people should make agriculture their chief industry, but outside of Utah irrigation remained for some years an incident to mining or stock raising,

tected in the same, and the right of way for the construction of ditches and canals for the purpose herein specified is acknowledged and confirmed; whenever any person, in the construction of any ditch or canal, injures or damages the possession of any settler on the public domain, the party committing such injuries or damage shall be liable to the party injured for such injury or damage.' The amendment of July 8, 1870, is as follows: 'All patents granted, or preemption or homesteads allowed, shall be subject to any vested and accrued water rights, or rights to ditches and reservoirs used in connection with such water rights, as may have been acquired under or recognized by the preceding section.' It will be noted that under these laws the development of irrigation is

IRRIGATING IN KINGS RIVER VALLEY, FRESNO COUNTY, CALIFORNIA

although it was practised in this way throughout the West. From these small beginnings irrigation gradually spread, until 1870, when the first considerable colony depending on irrigated agriculture was founded at Greeley, Colorado, under the patronage of Horace Greeley. The first Federal legislation relating directly to irrigation was the Act of July 26, 1866. It is quoted in full below because it has been held that by this Act, and an amendment approved July 9, 1870, the Federal Government surrendered any control it might have had over the non-navigable streams of the arid region by reason of being the owner of the lands of that section: 'Whenever, by priority of possession, rights to the use of water for mining, agricultural, manufacturing or other purposes, have vested and accrued, and the same are recognized and acknowledged by local customs, laws and the decisions of courts, the possessors and owners of such vested rights shall be maintained and pro-

left to 'local customs, laws, and the decisions of courts,' and in that sense all irrigation is done under state laws. The Desert Land Act, approved March 3, 1877, provided for the procuring of title to 640 acres of arid land by conducting water upon and reclaiming the same within three years from the filing of a declaratory statement, and the payment of \$1.25 per acre. Patent is not granted until proof is made that the applicant has expended at least \$3 per acre in improvements, and that at least one-eighth of the land has been actually reclaimed. This Act applied originally to the states of California, Oregon, and Nevada, and to Washington, Idaho, Montana, Utah, Wyoming, Arizona, New Mexico, and Dakota, which were then territories. In 1891 its provisions were extended to Colorado. Desert lands are defined in the Act as 'lands exclusive of timber lands which will not, without irrigation, produce some agricultural crop,' and the determination of what may

be considered desert land is left to the Commissioner of the General Land Office. Under the Act of August 30, 1890, the acreage which may be taken under this Act by one person was limited to 320 acres. An Act approved October 2, 1888, provided for the investigation of the extent to which the arid region of the United States could be redeemed by irrigation, and the segregation of the irrigable lands in that region, and for the selection of sites for reservoirs and other hydraulic works necessary for the storage and utilization of water for irrigation. It provided also that: 'All the lands which may be hereafter designated or selected by such United States surveys for sites of reservoirs, ditches, or canals for irrigation purposes and all of the lands made sus-

be reserved. By the Act of February 26, 1897, the reservoir sites segregated under the former law were made subject to applications under the Right of Way Act of March 3, 1891, referred to hereafter, and the states and territories in which the sites were located were authorized to improve and occupy them under the same conditions as individuals or private corporation. This Act provided also that the charges for water coming from such reservoir sites should be subject to the control of the states or territories in which they were located. Several reservoir sites were segregated under these laws, but in general they resulted in the reclamation of little if any land. The Act of March 3, 1891, amending the Desert Land Act, provided also for the acquisition of rights of way

KLAMATH MAIN CANAL, OREGON-CALIFORNIA

Showing concrete lined canal and tunnel portal

ceptible of irrigation by such reservoirs, ditches, or canals, are from this time henceforth hereby reserved from sale as the property of the United States and shall not be subject after the passage of this Act to entry, settlement, or occupation until further provided by law; provided, that the President may at any time in his discretion by proclamation open any portion or all of the lands reserved by the provision of this act to settlement under the homestead laws.' Extensive surveys were made under this law and there was a general withdrawal from entry of all the public lands in the arid region. This withdrawal was very unpopular, and an Act of August 30, 1890, repealed the part of the law providing for the withdrawal of public lands from entry, except that reservoir sites already segregated were to continue to be reserved from entry until otherwise provided by law, and reservoir sites thereafter located were to

over public lands or reservations for canals and ditches by canal or ditch companies prior to actual construction. Various acts relating to rights of way for irrigation were passed up to February 15, 1901, when a general act superseding the others was passed. On August 18, 1894, Congress passed what is commonly called the Carey Act, the purpose of which, as expressed in the law, was 'to aid the public-land states in the reclamation of the desert lands therein.' This Act provided for granting to each of the states containing desert land, within the meaning of the Desert Land Act referred to above, such land, not exceeding 1,000,000 acres in each state, 'as the state may cause to be irrigated, reclaimed, occupied, and not less than twenty acres of each one hundred and sixty acre tract cultivated by actual settlers, within ten years next after the passage of this Act, as thoroughly as is required of citizens who

may enter under the said Desert Land Law.' The states are required to file maps showing the mode of contemplated irrigation, and to show also the source of the water to be used, and on the approval of the maps and plans the lands applied for are segregated and reserved from entry. The states are authorized to enter into all contracts necessary for the reclamation of the segregated lands, but are prohibited from leasing any of the lands, from disposing of them in any way whatever except to secure their reclamation, cultivation, and settlement, and from disposing of more than 160 acres to any one person. [See also U. S. A.: 1804: Legislation to promote reclamation.] This law was amended by the Act of June 11, 1896, authorizing the states to create liens against the lands segregated for the purpose of reclamation, but providing that under no circumstances shall the United States be in any manner liable for any such lien. The law was further amended on March 3, 1901, by extending the time for reclaiming segregated land to ten years from the date of segregation."—R. P. Teele, *Irrigation in the United States*, pp. 54-61.

1890-1921.—Enumeration of irrigated lands.—**Drainage of swamp lands.**—"The first enumeration of irrigated lands in the United States was made in connection with the census of 1890, and showed a total acreage irrigated in 1889, of 3,631,381 acres. The census of 1900 showed that in 1890 the acreage irrigated had increased to 7,527,600 acres, or had a little more than doubled in ten years. In 1909 the acreage had increased to 13,738,485 acres, not quite double the acreage irrigated in 1890. From these figures it appears that during the sixty-two years from 1847, when modern irrigation began, to 1909, the acreage irrigated increased at the rate of about 222,000 acres per year; during the period from 1889 to 1899 it increased at the rate of about 390,000 acres per year; and during the last decade at the rate of about 621,000 acres per year. . . . Since that time irrigation development was rapid for a year or two, and later has been almost at a standstill. It is probable that the acreage irrigated in 1914 was about 15,000,000 acres."—R. P. Teele, *Irrigation in the United States*, pp. 11-13.—"The Roosevelt Dam, in Arizona, the most important masonry structure yet undertaken by the Reclamation Service, was formally dedicated on the afternoon of March 18, [1911] by former President Theodore Roosevelt in the presence of Territorial officers, the Government engineers, and citizens from all parts of the Southwest."—C. J. Blanchard, *Roosevelt dam (Review of Reviews, Apr., 1911, p. 460)*.—See also ARIZONA: 1911.—"Though pumping was attempted as early as 1890 along the Illinois River, it was not until five years later that any considerable areas were mapped as projects. . . . By 1910 two separate plants were in operation aggregating 85,000 acres. . . . Along the Mississippi between Muscatine, Iowa, and Hannibal, Mo., over 150,000 acres of rich corn-belt land have been reclaimed by pumps, and the work is still in its infancy."—F. I. Anderson, *Farmer of tomorrow*, p. 88.—One of the most interesting and important of the drainage projects in the United States is the work of draining the swamplands around Lake Okeechobee in the Florida Everglades. "The completion of this drainage work will make available about 3,372,000 acres of muck land. . . . One acre of this muck land in the sections already drained and farmed will pasture from three to five head of cattle to the acre the year round. . . . Two staple crops a year can be grown on these muck lands and on small farms; it is

not unusual for three crops a year to be grown. . . . The engineer of this project, has brought the Everglades from a morass to a point where the dream of its enthusiasts is soon to be realized. . . . More than 15,000 acres of land are in cultivation or going into cultivation this coming year along the south, east and west shores of Lake Okeechobee, 'the liquid heart of Florida'. . . . Here on the southern shore of this great lake, the second largest in the United States, is a town of 1500 people, with paved streets, a municipal electric and water system, with a back country well developed, and . . . all of this has sprung out of the raw jungles in five years. It is difficult to write of the progress of this development. . . . It is hard to realize that rock roads are building across these 'Glades, where a few years ago unscrupulous land men boated their prospects to the land they were selling. It was this scandal, connected with the early days of the drainage work, which has been the chief factor in keeping the project from the recognition it deserves. It was this scandal also which has been responsible for the great project attaining its present state of development without much publicity. Quietly, and with even Floridians ignorant of the progress being made, the drainage work has crept up the hill, reached the summit, and from now on can coast downhill to a successful conclusion. All Florida is now awake to the great work, and the rest of the nation is beginning to stare into the 'Glades of South Florida.'"—J. J. O'Brien, *Wonders of the everglades drainage work of Florida (Manufacturers' Record, v. 70, Feb. 24, 1921, p. 101)*.—See also WYOMING: 1900-1905; WASHINGTON: 1890-1817.

1901-1906.—Conservation policy of Roosevelt administration.—**Reclamation Act (1902).**—**Forest Service in Department of Agriculture (1905).**—**Survey of Appalachians (1906).**—The keynote of a new determination in governmental policy in forest conservation was sounded by the president in his first message to Congress, on December 3, 1901, when he opened the subject largely and earnestly, saying, among other things, this:

"The preservation of our forests is an imperative business necessity. We have come to see clearly that whatever destroys the forests, except to make way for agriculture, threatens our well-being. At present the protection of the forest reserves rests with the General Land Office, the mapping and description of their timber with the United States Geological Survey, and the preparation of plans for their conservative use with the Bureau of Forestry, which is also charged with the general advancement of practical forestry in the United States. These various functions should be united in the Bureau of Forestry, to which they properly belong. The present diffusion of responsibility is bad from every standpoint. It prevents that effective coöperation between the Government and the men who utilize the resources of the reserves, without which the interests of both must suffer. . . . The President should have by law the power of transferring lands for use as forest reserves to the Department of Agriculture. He already has such power in the case of lands needed by the Departments of War and the Navy. . . .

"The wise administration of the forest reserves will be not less helpful to the interests which depend on water than to those which depend on wood and grass. The water supply itself depends upon the forest. In the arid region it is water, not land, which measures production. . . . The

forest and water problems are perhaps the most vital internal questions of the United States. . . . The reclamation of the unsettled arid public lands presents a different problem. Here it is not enough to regulate the flow of streams. The object of the Government is to dispose of the land to settlers who will build homes upon it. To accomplish this object water must be brought within their reach. . . . Whatever the Nation does for the extension of irrigation should harmonize with, and tend to improve, the condition of those now living on irrigated land. We are not at the starting-point of this development. Over two hundred millions of private capital have already been expended in the construction of irrigation works, and many million acres of arid land reclaimed. A high degree of enterprise and ability has been shown in the work itself; but as much cannot be said in reference to the laws relating thereto."—*President's message to Congress, Dec. 3, 1901.*

The highest quality of statesmanship is represented by such recommendations as these. So far as they concerned the proposed nationalization of irrigation works they bore fruit within a year, in the passage by Congress of the Reclamation Act of June 17, 1902. This Act "set aside the proceeds of the disposal of public lands for the purpose of reclaiming the waste areas of the arid West by irrigating lands otherwise worthless, and thus creating new homes upon the land. The money so appropriated was to be repaid to the Government by the settlers, and to be used again as a revolving fund continuously available for the work. The impatience of the Western people to see immediate results from the Reclamation Act was so great that red tape was disregarded, and the work was pushed forward at a rate previously unknown in Government affairs."

—T. Roosevelt, *Autobiography*, p. 431.—Less promptitude of action followed the president's urging of measures for forest preservation, and his warnings to Congress and the country, against the consequences of this inaction, were repeated from year to year. His message of December, 1904, carried an urgent plea for legislation to unify the national forest work. "I have repeatedly," he said, "called attention to the confusion which exists in Government forest matters because the work is scattered among three independent organizations. The United States is the only one of the great nations in which the forest work of the Government is not concentrated under one department. . . . The present arrangement is bad from every point of view. Merely to mention it is to prove that it should be terminated at once. All the forest work of the Government should be concentrated in the Department of Agriculture, where the larger part of that work is already done, where practically all of the trained foresters of the Government are employed, where chiefly in Washington there is comprehensive first-hand knowledge of the problems of the reserves acquired on the ground, where all problems relating to growth from the soil are already gathered, and where all the sciences auxiliary to forestry are at hand for prompt and effective cooperation." During its following session Congress took the desired action, and the whole forest service was transferred to the Department of Agriculture in February, 1905.

Early in June of that year the efforts of the president to waken attention to the seriousness of the forest destruction in the country were greatly helped by a notable convention at Washington of about twelve hundred men, having both inter-

est and knowledge in the matter, who came together to discuss the problems involved. They were mostly practical foresters, intelligent lumbermen, railway men, ranch-owners, engineers and miners, and their urgency of a systematic conservative treatment of the surviving forest wealth of the country carried great weight. In his message of 1906 the president submitted to Congress, a recommendation saying that the forests of the White mountains and the southern Appalachian regions need to be preserved, and "cannot be unless the people of the States in which they lie, through their representatives in the Congress, secure vigorous action by the National Government." This proposal encountered strong opposition and Congress was prevailed upon with difficulty to authorize a survey of the forests of the White mountains and the southern Appalachians, which resulted in a recommendation by the secretary of agriculture that 600,000 acres in the former region and 5,000,000 in the latter be purchased for a national reserve. A bill responsive to this recommendation was passed by the Senate, but rejected by the House, which appointed a commission to make further investigations in the matter. (See below: 1910-1912.)

On the eve of the adjournment of Congress in March, 1907, the president issued a proclamation adding some seventeen millions of acres of forest lands to the national forest reserves already established. This was just before he signed an act of Congress which abridged his authority to create reserves in Colorado, Wyoming, Montana, Idaho, Oregon, and Washington. It was a characteristic proceeding, for which the president had ample power under a statute of 1891, and it simply held the forests designated in safety from destruction until the question of their treatment was more carefully considered. Meantime they were sheltered from the axeman, while undergoing study. As a matter of fact, Roosevelt's successor, President Taft, did conclude that some of the lands reserved should be released for sale, and so ordered soon after he entered the executive office.

1902-1919.—**Working of the Reclamation Act.**—The Reclamation Act of 1902 "provided that the water users were to pay back the cost of the works to the Government in ten annual instalments. This was later (1913) extended to twenty annual payments. . . . When the . . . [Act] was passed, it was believed that with the financial backing of the Government, reservoirs of large size capable of supplying water to extensive areas at moderate cost could be constructed; thus, in 1902, began the great undertakings of the U. S. Reclamation Service. . . . The United States paid France only \$15,000,000 for the vast territory west of the Mississippi known as Louisiana. . . . It has already expended nearly this amount on one single irrigation project, the Salt River project in Arizona. . . . Thirty projects . . . are scattered over an area nearly as large as Europe outside of Russia. Many of them are among mountains where there were few people, where labour was exceedingly hard to secure and to retain; where all provisions, construction materials, machinery, and general supplies had to be transported long distances—in some cases over mountain roads 20 to 50 miles in length. . . . The great variety of engineering problems and the methods employed in their solution may be illustrated from a few of the projects. In North Dakota, in the Williston unit the engineers found it impossible to secure water from the Missouri River by gravity methods, but lignite beds existed on Government land a few miles away. Here they installed a modern

electric generating plant, using the lignite for fuel, and sent the current to a pumping plant installed on a barge anchored in the river, whence the water is pumped into a reservoir and is distributed by gravity to the land. . . . This project has not, however, proved very successful. . . . In Western Colorado is the Uncompahgre Valley, with a broad alluvial plain traversed by a small stream. Some miles away in a parallel valley is the larger Gunnison River flowing in a canyon. One valley had land without water and the other water without land. The engineers drove a tunnel 6 miles long through a mountain range and brought the water of the Gunnison to the valley of the Uncompahgre and it is irrigating 140,000 acres. In the Yuma project in California-Arizona, the main canal has to be on the California side of the river, where there is less land to irrigate than on the

railroad to this site a road had to be constructed, miles of it cut into the precipitous face of the mountains. This road alone cost a half-million dollars. The expense of getting timber and cement to this remote region, involving a waggon haul of 40 miles, would have been prohibitive. The engineers decided to develop hydro-electric power at the dam site, and they built a power canal 15 miles long costing a million and a half dollars, installed a power plant, and produced their power on the spot. . . . Power, cement, timber, labour, and food were wrung from the mountains and the desert, and the great [Roosevelt] dam was finished. It stores enough water to irrigate the dependent lands (200,000 acres) for two years, even if no rain fell in its catchment basin in that time. This project has 800 miles of canals; it cost over \$12,000,000 to construct; the power plant now

RIO GRANDE PROJECT, NEW MEXICO, SHOWING ELEPHANT BUTTE DAM

Arizona side. An enormous inverted siphon passing under the river has been constructed, and the surplus water is carried to the east side, where it is distributed. . . . The Arrowrock dam in Idaho is 349 feet high, and the Sun River dam in Montana is 320 feet high; the Elephant Butte dam, in New Mexico, 318 feet; and the Shoshone dam in Wyoming, 328 feet. Other dams have been built in broad, open valleys where great length and thickness but small height were requisite. The Hondo dam in New Mexico is only 25 feet high, but has a crest length of over 3 miles. The Nelson Reservoir dam in Montana is 30 feet high and 4 miles long. No two undertakings were alike. The ingenuity and resourcefulness of the engineers were tested anew with every project. No case illustrates this better than the Salt River project in Arizona. The topography of the region led to the adoption of a dam site 60-70 miles from the land which was to be irrigated. The nearest town of any size was 70 miles away, and the nearest railway 40 miles. The site selected for the dam was in almost inaccessible mountains. From the

sells electric power to the value of a half-million dollars a year, and a large part of the cost of the project may be paid for from this income. . . . In 1900 about one-tenth of the irrigated land was supplied with water by commercial companies. Four other methods of conducting irrigation enterprises have been devised, only one of which—the U. S. Reclamation projects—has had any considerable development. The other three are: (1) U. S. Indian Service enterprises; authorized by Congress, providing for the construction of irrigation works on Indian reservations by the U. S. Indian Service. (2) Carey Act enterprises; authorized by Congress, granting to each of the states in the arid region 1,000,000 acres of Government land on the condition that the State provide for its irrigation. (3) Irrigation districts; controlled by the water users, and organized under State laws. These three methods combined had not resulted in the irrigation of a million acres of land by 1900. . . . If the question is asked, Has Irrigation in the United States been a success? The answer is neither Yes nor No. It has been an

unquestionable success in many of the 55,000 separate enterprises. It has been a reasonable success in a still larger number, and it has also been a financial failure in many. No reliable figures are available, for no record has been made of the cases of failure. The boom given to irrigation in general by the passing of the U. S. Reclamation Act of 1902, and an enormous amount of advertising, led to the undertaking of many large corporate enterprises whose stocks and bonds were widely sold between 1902 and 1912. Many of these enterprises failed, and of those that are still operating 'few if any are paying any return on the capital invested.'—R. H. Whitbeck, *Irrigation in the United States* (*Geographical Journal*, Oct., 1919, pp. 223-224, 226-228, 230).

1907-1910.—Inland Waterways Commission (1907).—Conference of governors (1908).—Conservation Commission.—Second conference of governors.—Report of Conservation Commission (1908).—"A realization that natural resources were being needlessly wasted was first brought home to us by a threat of wood shortage. The forest problem opened the eyes of the people to the condition of our natural resources as a whole. It was seen that our national progress, even our national existence, depends upon reform in our methods of using the natural riches of the land; that it was time to set our national house in order, to take stock of our resources, and to lay plans for their wiser use in the future. The Inland Waterways Commission was appointed by the President [Roosevelt] in March, 1907. It reported to the President February 3, 1908, and on February 26 the President sent to Congress a message, transmitting the report, approving its findings, and urging that its recommendations be enacted into law. The work of the Commission had developed the wide-reaching importance of the waterways problem, and had taken up the relation of the waterways and the water supplies of the country to all of the natural resources affected. It brought into prominence the great need of conserving, not one or a few, but all of the natural resources of the country. At the suggestion of the Inland Waterways Commission, in order more fully to consider the far-reaching problems of conservation, the President, early last winter [1907], invited the governors of the States and Territories to a conference in Washington to consider the whole question. Men of national prominence, familiar from experience in business life with the four great classes of resources—the forests, waters, mines, and the soil—were also invited to the conference. The conferees met in the White House May 13-15, 1908."—T. Cleveland, Jr., *Primer of conservation* (*U. S. Department of Agriculture, Forest Service, Circular 157, Oct. 17, 1908, pp. 13-14*).—In all his endeavors to establish a national policy directed, systematically and scientifically, to the arresting of waste in the use and treatment of the natural resources of the country, President Roosevelt was assisted very greatly by the knowledge and the energetic public spirit of the chief of the national forest service, Gifford Pinchot. It is understood to have been on the initiative of Pinchot that the crowning expedient for stirring and determining public feeling on the subject was planned, early in the winter of 1908, when the president invited the governors of all the states and territories to a conference in Washington, for considering the whole question of an economic conservation of natural resources and concerting measures to that end. It was said, indeed, by the president, in addressing the meeting of governors, that if it had not been

for Pinchot "this convention neither would nor could have been called." The invitation went to others than governors,—to men of national prominence in public life, in scientific pursuits, in business experience, and to heads of great associations. The resulting assembly at the White House, on the 13th, 14th, and 15th of May, 1908, marked an epoch in American history. There were governors from forty of the forty-six States of the union, with the president and members of his cabinet, the justices of the Supreme Court, many Senators and Representatives from the Congress, and a distinguished gathering of such citizens as William Jennings Bryan, Seth Low, James J. Hill, Andrew Carnegie, John Mitchell and Samuel Gompers. All sides of the national thriftlessness that needed correction were discussed by men who could best describe the evils produced and best indicate the methods of remedy. Before adjourning their meeting the governors present adopted with unanimity a declaration in which they say:

"We agree that our country's future is involved in this: that the great natural resources supply the material basis upon which our civilization must continue to depend, and upon which the perpetuity of the nation itself rests. We agree, in the light of the facts brought to our knowledge and from the information received from sources which we cannot doubt, that this material basis is threatened with exhaustion. . . .

"We declare our firm conviction that this conservation of our natural resources is a subject of transcendent importance which should engage unremittingly the attention of the nation, the States, and the people in earnest coöperation. These natural resources include the land on which we live and which yields our food; the living waters which fertilize the soil, supply power, and form great avenues of commerce; the forests which yield the materials for our homes, prevent erosion of the soil, and conserve the navigation and other uses of the streams; and the minerals which form the basis of our industrial life, and supply us with heat, light, and power. . . .

"We commend the wise forethought of the President in sounding the note of warning as to the waste and exhaustion of the natural resources of the country, and signify our high appreciation of his action in calling this Conference to consider the same and to seek remedies therefor through coöperation of the nation and the States. . . .

"We agree in the wisdom of future conferences between the President, Members of Congress, and the governors of States on the conservation of our natural resources with a view of continued coöperation and action on the lines suggested; and to this end we advise that from time to time, as in his judgment may seem wise, the President call the governors of States and Members of Congress and others into conference.

"We agree that further action is advisable to ascertain the present condition of our natural resources and to promote the conservation of the same; and to that end we recommend the appointment by each State of a commission on the conservation of natural resources, to coöperate with each other and with any similar commission of the Federal Government."—The joint committee which the chairman of the second conference of governors was instructed to appoint, for the preparation of "a plan for united action by all organizations concerned with the conservation of natural resources," met at Washington on the 5th of March, 1909, for its first consultation. The Committee, of eleven members, consists of six chairmen

of State Conservation Commissions, and five who are members of the National Conservation Commission.

Action for the preservation and increase of forests has been stimulated in many if not all of the states of the union by the national agitation of the subject in these late years. Nowhere has the influence been more effective than in New York, which has not only greatly enlarged its control and improved its care and treatment of the extensive forest tracts in the Adirondack region, but has done even more important reforestation work in other parts of its territory. "James S. Whipple, forest, fish and game commissioner, has not only planted more trees in this State than have been planted in any other State, or even by the national government, but this year he has made another great advance in the reforestation movement. The

Washington, and was opened on December 8 under the chairmanship of William H. Taft.

In subsequently communicating to Congress on the 22d of January, 1909, the report of the National Conservation Commission, the President said: "With the statements and conclusions of this report I heartily concur, and I commend it to the thoughtful consideration both of the Congress and of our people generally. It is one of the most fundamentally important documents ever laid before the American people. It contains the first inventory of its natural resources ever made by any nation."

From the report itself it is only possible to glean a few of its most impressive and significant disclosures of fact. For example:

"The yearly growth of wood in our forests does not average more than 12 cubic feet per acre.

BIGHORN NATIONAL FOREST

Photo U. S. Forest Service

Showing thinning out and brush piling as done by experienced foresters

commission has sold to private land owners at cost 1,034,050 pine and spruce trees for reforestation land within the State."—*New York Evening Post*, Apr. 24, 1909.—These trees went to every county of the state, in numbers ranging from 50 to 200,000.—See also PENNSYLVANIA: 1910.

ALSO IN: Sixtieth Congress, 2d Session, *House Documents*, no. 1425.—C. R. Van Hise, *Conservation of natural resources in the United States*, pp. 381-389.—Conference of Governors, *Proceedings*, 1908.

State action on lines commended by the conference of governors had already been instituted in a number of states, and in many others it was promptly set on foot; so that the desired coöperative organization of effort was soon well under way. In 1908 a second conference of state governors, jointly with the state and national commissions, was found desirable, for consideration of the mass of facts collected as a basis for definite plans. The second conference was also held in

This gives a total yearly growth of less than 7,000,000,000 cubic feet.

"We have 200,000,000 acres of mature forests, in which yearly growth is balanced by decay; 250,000,000 acres partly cut over or burned over, but restocking naturally with enough young growth to produce a merchantable crop, and 100,000,000 acres cut over and burned over, upon which young growth is lacking or too scanty to make merchantable timber.

"We take from our forests yearly, including waste in logging and in manufacture, 23,000,000,000 cubic feet of wood. We use each year 100,000,000 cords of firewood; 40,000,000,000 feet of lumber; more than 1,000,000,000 posts, poles, and fence rails; 1118,000,000 hewn ties; 1,500,000,000 staves; over 133,000,000 sets of heading; nearly 500,000,000 barrel hoops; 3,000,000 cords of native pulp wood; 165,000,000 cubic feet of round mine timbers, and 1,250,000 cords of wood for distillation.

"Since 1870 forest fires have destroyed a yearly average of 50 lives and \$50,000,000 worth of timber. Not less than 50,000,000 acres of forest is burned over yearly. The young growth destroyed by fire is worth far more than the merchantable timber burned.

"One-fourth of the standing timber is lost in logging. The boxing of long-leaf pine for turpentine has destroyed one-fifth of the forests worked. The loss in the mill is from one-third to two-thirds of the timber sawed. The loss of mill product in seasoning and fitting for use is from one-seventh to one-fourth. Of each 1000 feet, which stood in the forest, an average of only 320 feet of lumber is used.

"We take from our forests each year, not counting the loss by fire, three and a half times their yearly growth. We take 40 cubic feet per acre for each 12 cubic feet grown; we take 260 cubic feet per capita, while Germany uses 37 and France 25 cubic feet. . . .

"Great damage is done to standing timber by injurious forest insects. Much of this damage can be prevented at small expense.

"To protect our farms from wind and to reforest land best suited for forest growth will require tree planting on an area larger than Pennsylvania, Ohio, and West Virginia combined. Lands so far successfully planted make a total area smaller than Rhode Island; and year by year, through careless cutting and fires, we lower the capacity of existing forests to produce their like again, or else totally destroy them. . . .

"By reasonable thrift we can produce a constant timber supply beyond our present need, and with it conserve the usefulness of our streams for irrigation, water supply, navigation and power. Under right management, our forests will yield over four times as much as now. We can reduce waste in the woods and in the mill at least one third, with present as well as future profit. . . . We can practically stop forest fires at a cost yearly of one-fifth of the value of the merchantable timber burned.

"We shall suffer for timber to meet our needs until our forests have had time to grow again. But if we act vigorously and at once, we shall escape permanent timber scarcity. [This report, it must be remembered, was dated 1908. Up to 1922 comparatively little has been done to reduce the rate of destruction or to repair the damage done.]

"Except in some cases through forestry, few catchment areas are controlled, and few reservoirs are large enough to hold the storm waters. The waste in the public and private projects exceeds 60 per cent. while no more than 25 per cent. of the water actually available for irrigation of the arid lands is restrained and diverted. There are in continental United States 282 streams navigated for an aggregate of 26,115 miles, and as much more navigable if improved. There are 45 canals, aggregating 2,189 miles, besides numerous abandoned canals. Except through forestry in recent years, together with a few reservoirs and canal locks, and movable dams, there has been little effort to control headwaters or catchment areas in the interests of navigation, and none of our rivers are navigated to more than a small fraction even of their effective low-water capacity.

1910.—Removal from office of Chief Forester Pinchot.—Investigation of charges against Secretary Ballinger. See U. S. A.: 1910-1913.

1910-1912.—Administration of President Taft.—Continuation of conservation policy.—Withdrawal of coal lands.—Earnestly upholding the

conservation policy instituted by his predecessor, President Taft, in a special message to Congress, January 14, 1910, recommended several measures of legislation, for which suggested bills had been drafted by the secretary of the interior. The withdrawal from private entry of coal lands was "increased during President Taft's administration, while R. A. Ballinger was Secretary of the Interior, so that the total area withdrawn to November 1, 1909, was 79,650,002 acres. In February, 1910, the Secretary of the Interior, in addition to the above, withdrew 588,000 acres of coal land in Wyoming. The total coal land withdrawal the first year of the Taft-Ballinger administration, *i.e.*, to March 4, 1910, amounted to 7,675,000 acres; and the form of withdrawal of 9,000,000 acres more was changed to cover all kinds of entry instead of coal alone."

—C. R. Van Hise, *Conservation of natural resources*, p. 37.—"The most notable single triumph of the conservation movement during the Taft administration was the Appalachian Forest Reserve Act, approved March 1, 1911. It set apart two million dollars a year, until June 30, 1915, for the upkeep of these lands as national forests."—F. A. Ogg, *National progress*, pp. 105-106.

1911.—Act of March authorizing surveys of headwaters, and establishment of national forests.—"On March 1, 1911, an . . . epochal step in forest policy was taken by the United States. This consisted in an act of that date (36 Stat. L., 961), that authorized the expenditure during the succeeding five years of eleven millions of dollars in the examination, survey, and acquisition of lands located at the headwaters of navigable streams, or of streams that were being developed for navigable purposes. Although the terms of the act were general, the purpose of advocates of the measure was to provide means for the establishment of national forests in the eastern states and particularly in the White Mountain and Appalachian regions. . . . [See above: 1901-1906.] The act of March 1, 1911, embraced another important provision authorizing co-operation between the federal government and the separate states or groups of states in forest fire protective measures on condition that any state receiving federal aid must have a law providing for forest fire protection and must spend at least as much as the federal government in such protective work. This act has received several amendments, but its main features remain unchanged. The utilization of minerals within the lands acquired was authorized by act of Aug. 11, 1916. . . . An Act of August 25, 1916 (39 Stat. L., 535), creating a National Park Service in the Department of the Interior, for the administration of all parks and reservations under the jurisdiction of the Department declared that the Secretary of the Interior 'may also upon terms and conditions to be fixed by him, sell or dispose of timber in those cases where in his judgment the cutting of such timber is required in order to control the attacks of insects or diseases or otherwise conserve the scenery or the natural historic objects of any such park, monument or reservation.'"—J. P. Kinney, *Development of forest law in America*, pp. 249, 250, 254.

—"During the crop season of 1914 the [Reclamation] service was prepared to furnish water to 1,240,875 acres. Of this area, 761,271 acres were actually irrigated, and 703,424 acres were cropped. To June 30, 1915, the total net expenditure of the Service was \$94,613,554; and the outlay approved by Congress for the fiscal year ending June 30, 1916, was \$13,530,000. Another important type of reclamation was the drainage of swamp lands. . . . In 1914, and again in 1915, Congress

appropriated sums to be used by the Department of Agriculture in carrying on an investigation of the wet-lands problem."—F. A. Ogg, *National progress*, pp. 112-113.

1914-1918.—Aerial forest patrol. See AVIATION: Development of airplanes and air service: 1918-1921: Air service after World War.

1914-1919.—Effects of the World War.—Revival of interest.—Special need for conservation.—"No small part of the interest aroused by this movement had been lost previous to the opening of the World War in 1914. We continued to use extravagantly and to look upon waste in a more or less complacent fashion. We occasionally reminded ourselves that we led the world in the production of wheat, corn, oats, meats, dairy products, cotton, coal, petroleum, iron, copper, and other important commodities. We not only had sufficient of these things to meet all of our home demands, but we exported large amounts as well. Such was the situation on August 1st, 1914, when Germany declared war against Russia. It very soon became evident that we should be called upon to furnish our allies with unprecedented quantities of the raw materials of commerce. The seriousness of the situation constantly increased. With millions of men serving in the armies and navies of our allies, and other millions taken from the productive occupations and devoting their entire time to the manufacture of war materials, our domestic problems multiplied. Throughout the war there was a tremendous increase in our exportation of wheat, barley, rye, oats, meats, iron, steel and copper. More and more the truth has been forced upon us that the most imperative need is for food. Guns, ships, shells, armies there must be, but forces without food avail nothing. And now in times of peace it is this country that must furnish not only the bulk of the food, but tremendous quantities of other raw materials as well. Careful investigation as to available and potential supplies in this and in other food-exporting countries showed that we could not possibly supply the materials which our allies needed if the war were to be successfully prosecuted, unless nationwide attention were given to conservation. Thus necessity and governmental control forced upon us the conservation movement."—A. H. and J. F. Chamberlain, *Thrift and conservation*, pp. 77-79.

Also in: *Bulletin of geological survey*, no. 537 (1913), *Classification of the public lands*.—National conservation commission, *Report III*, pp. 361-374.—Secretary of the Interior, *Annual report*, 1909, I, pp. 5-14.

1915-1921.—Burned forests.—More vigorous efforts towards reforestation.—Snell bill.—"From 1915 to 1918 [in the United States] an average of 9,400,000 acres of forest land were burned over each year, and in 1910 and 1910 the area was considerably larger. . . . Then the black-pine beetle is destroying timber by the billions of feet in the Pacific Northwest. Stated in another way timber is being cut at the rate of 26,000,000,000 cubic feet a year, or more than five times as fast as new timber is growing; while that of saw timber size is being cut and destroyed by fire, disease and insects at the rate of 56,000,000,000 board feet a year, or more than five and a half times the growth of such material. . . . Data from the U. S. Forest Survey show that a total of 17,000 acres have been planted by the Service up to the end of June 1920; 85,000 acres additional by the State Forestry Departments, and 350,800 acres by private individuals and corporations in 19 states. Adding the estimated planting in Nebraska, Kansas, Illinois, the Dakotas, Missouri and Oklahoma would swell

the private planting to a total of 750,000 acres, or a little more than a million acres planted by all the agencies . . . operating in this field in the United States, from the time when planting was first undertaken . . . [in the last quarter of last century]. The Snell bill [introduced into Congress in 1921] appropriates \$1,000,000 yearly for reforesting denuded lands in the National Forests. . . . This would provide for the reforestation of 100,000 acres a year, . . . although an ideal programme would be 1,000,000 acres a year carried on uninterruptedly for 81 years. To reforest the 81,000,000 acres of hopelessly denuded land which should be growing timber both because it is needed and also because this land is fit for nothing else would require at the rate provided for in the Snell Bill 810 years, and an original outlay of \$810,000,000. [Also 30 to 40 years are required to grow pulp wood, and 130 years to produce good saw timber. However] a forester never plants trees if he can get Nature to do it for him. Furthermore Nature, if given half a chance, will usually do it. . . . [But] the 81,000,000 utterly denuded acres is but a fraction of . . . [the forest area which requires attention] and something more must be done if the country is to have a timber supply at all commensurate with its needs a few years hence. That something is fire protection . . . which, [according to Col. W. B. Greely, Chief Forester of the U. S. Forest Service,] lies at the bottom of any National Policy of reforestation. . . . [Once the vast area of 325,000,000 of forest land timbered and cut over] is really protected from forest fires, three-fourths of our timber supply problem will be solved. . . . [But] only about 25 per cent of the necessary task of protecting forest lands is being done. . . . The Snell Bill appropriates \$1,000,000 a year for fire protection in cooperation with States and through them with private agencies. In the Pacific Northwest there are some thirty organizations of timber owners cooperating with each other and with the State and Federal Governments in fire protection. . . . The Snell Bill also appropriates \$10,000,000 a year for five years for acquiring National forests which . . . [in] 1920 aggregated 156,032,053 acres and which are intended to be conservation areas as well as a protection for waterheads. . . . Among the States, New York leads in reforestation. . . . From 1908 to 1920 [inclusive the state planted 68,000,000, while in 1920 private owners planted 3,000,000 trees on cut over land, or an approximate total of 71,000 acres]. . . . Massachusetts . . . [has] acquired 100,000 acres to be restocked. . . . [In Louisiana a] lumber . . . company has planted 3,000,000 trees. . . . Michigan planted 4,000,000 trees on State lands in 1920. [Thus it will be seen that the States as well as the Federal Government are waking up to the situation; but as yet attempts at reforestation have not been made on a scale large enough to be really effective.] . . . Kansas and Nebraska have done considerable planting to check drifting sands in the West and the work has been notably successful."—C. F. Carter, *Our reforestation activities* (*Scientific American*, Dec. 21, 1921, pp. 106, 107).

1917.—Ransdell-Humphreys Bill for control of Mississippi river. See MISSISSIPPI RIVER: 1917.

1918.—Government irrigation projects constructed or in process of construction.—"It is often difficult for eastern people to realize that nearly one half of the United States is dependent upon irrigation to mature crops. . . . The present [1918] proposed and completed projects of the Reclamation Service aggregate 3,117,862 acres or nearly 5,000 square miles. It is the policy of the

Reclamation Service to develop those projects which private capital cannot undertake and over thirty such projects are . . . in various stages of construction. One of the most unique projects of the Service is located in Western North Dakota, in the Valley of the Missouri River, and in the vicinity of the town of Williston . . . [where because of constant change in the river channel permanent structures were found to be impracticable. Therefore, at the suggestion of the engineers, coal is mined from beds of lignite found on public lands in the vicinity. A large power house was built and electrical pumps were placed on barges]. The water is delivered through pipes with flexible joints into reservoirs, and from these basins is led into canals which cover about 30,000 acres. . . . In the Lower Yellowstone Valley and embracing about 66,000 acres of land in Montana and North Dakota is the Lower Yellowstone project. . . . Up the Yellowstone about 200 miles is the Huntley project, which was completed in 1907. . . . [This project embraces 30,000 acres in Montana, having a general elevation of 3,000 feet above sea level. The first unit of the Sun River project was opened in 1908 near Great Falls, Montana, with the object of finally irrigating 174,000 acres. The Shoshone dam with its diversion dam, twelve miles below, provides water for 100,000 acres of choice land. The Pathfinder dam, below the confluence of the Sweetwater and the North Platte, waters many miles of country in Wyoming and Nebraska. The Belle Fourchette River has been dammed and turned into an inlet canal which carries the water to a natural depression between two hills.] This depression is blocked by one of the largest earthen embankments in the world, a structure more than a mile in length and 115 feet in maximum height and faced with concrete blocks. The reservoir formed has a storage capacity of 203,770 acre feet, and forms the largest lake in South Dakota. . . . In southern Colorado the most spectacular project of the government is nearly completed [1918]. In this region two streams, the Uncompahgre and the Gunnison, flow in nearly parallel courses about ten miles apart and separated by a mountain range 2,000 feet high. The Uncompahgre flows through a broad valley containing several hundred thousand acres of fertile land, but its volume is sufficient for the irrigation of only a small part of the irrigable area. On the other hand, the Gunnison River, a stream of much larger discharge, flows in a profound canyon, and in its valley there is no considerable area of land to be watered. To augment the insufficient flow of the first stream a tunnel six miles long has been constructed from the Gunnison River. . . . The history of this project is replete with danger, daring and heroism. . . . In 1904 an army of men blocked the Snake River in Southern Illinois with a huge dam; then they led the impounded waters into 130 miles of great canals and 100 miles of ditches and spread it over 120,000 acres of land. . . . The Minidoka project furnished indisputable evidence that a better investment was never made by a government since the world began than national irrigation. . . . Another important project in Idaho is located in Boise Valley, and includes about 255,000 acres of the richest land in the state. . . . The water supply [for the Umatilla project in northeastern Oregon] is the flood flow of the Umatilla River, which is carried in a large canal to a reservoir having a capacity of 50,000 acres, a foot deep. This reservoir was created by a dam 115 feet high. . . . On the eastern side of the Cascades, in Washington, are a succession of valleys in the drainage of the Yakima River. Comprehensive plans have been

worked out by the Reclamation Service, and construction is well under way for the reclamation of the largest project yet undertaken. The irrigable area is nearly a half million acres, and the cost will probably exceed \$25,000,000. The work is being taken up in divisions, each involving the irrigation of specified areas. . . . This system now [1918] supplies about 100,000 acres and the crops yield amounts to \$70 per acre. . . . On the western border of the Great interior Basin in the bed of ancient Lake Lahoton, in Nevada, an important work is now completed to irrigate 100,000 acres of land. This is the driest part of the United States except Death Valley, and was called "Forty Mile Desert" by the gold hunters. . . . The irrigation works in this valley in a way have changed the physical geography. The Truckee River is turned from its bed by a dam thirty feet high which diverts the water into a broad and deep canal thirty-one miles long and lined with cement. Truckee River is now flowing into Carson River. Another dam in Carson River directs the combined flow of both streams upon the desert. . . . The world is familiar with the catastrophe which threatened for a time to destroy a very large area in the lower valley [of the Colorado River] but few people appreciate the almost super-human engineering feat by which this powerful stream was forced back into its channel. . . . Since the river was controlled the government work at Yuma and above has progressed rapidly. The great weir at Laguna closes the river. Its length is 4,780 feet. The Suzana dam is interesting as it is the first structure of its kind to be erected in the United States. It is similar to several weirs built by the English engineers in Egypt and India. The project contemplates the reclamation of about 100,000 acres in Arizona and California. . . . In Southern New Mexico one of the largest reservoirs in the world has been created by the . . . construction of the Elephant-Butte dam. This dam stores the waters of the Rio Grande in a reservoir with a capacity exceeding 2,500,000 acre-feet."—*Universal Engineer*, Aug., 1918.

1920.—Conservation of fisheries.—Treaty with Canada. See U. S. A.: 1920 (July).

1921.—Caribou (California) power plant and irrigation canal. See ELECTRICAL DISCOVERY: Electric power: 1921.

1921.—State Forestry Services.—"The Forest Service, United States Department of Agriculture, reports that no less than thirty-three states have now provided for some sort of forestry activities and twenty-five of these share in the federal co-operative forest protection fund, allotted to states maintaining an effective fire detection and suppression system. Two others have applied recently for such assistance. Public backing of the movement to preserve the remaining forests from destruction by fire, and to put idle forest lands to work growing trees, is becoming widespread, and the effects of the popular demand for action is shown clearly in the state laws passed this year [1921]. Pennsylvania . . . leads all states in forest activities. The biennial appropriation passed by the legislature and approved by the governor carried \$1,870,000, an increase of \$863,000 over the appropriation of 1919; \$1,000,000 of the total . . . for fire protection. The legislature also passed an act empowering the federal government to acquire lands on the watersheds of navigable streams within the state, by purchase or condemnation, and to control and regulate such reserves. . . . [In Minnesota] a total of \$275,500 for general forestry

work was appropriated for . . . [1922, 1923] of which \$125,000 a year is for fire protection. The last named sum was augmented by an additional allotment of \$44,000 from the state board of relief. For the equipment of a flying field \$45,000 was voted. This provision was to meet the offer of the federal government to furnish the service of twelve planes if the necessary hangars and flying fields were provided. While the primary purpose of this agreement is to supply aerial mail communication, the planes will be able also to render effective service in discovering forest fires. In California . . . the legislature voted a substantial increase in appropriation for the state board of forestry, for the biennial period beginning July 1. For the prevention and suppression of fire \$75,000 was appropriated; for general administration, \$27,000 was appropriated; for a study of watershed areas, \$10,000, and to establish and maintain state forest nurseries, \$35,000. The legislature also voted \$300,000 for the purchase of redwood timber land for park purposes along the state highway in Mendocino and Humboldt counties, the area to be administered by the state board of forestry. . . . A new forest experiment station, the first in eastern states, has been established at Asheville, N. C., by the forest service of the United States Department of Agriculture. Steady depletion of the southern Appalachian timber supply has been responsible for the location of this station in the east; and the object of the work to be conducted will be to secure the information needed by foresters to determine the best methods of handling forest lands in the southern mountains."—*Science*, Sept. 2, 1921, pp. 188, 191.

CONSERVATIVE PARTY, England.—The name "Conservative," to replace that of Tory (see ENGLAND: 1680) as a party designation, was first introduced in 1831, by Mr. John Wilson Croker, in an article in the *Quarterly Review*. "It crept slowly into general favour, although some few there were who always held out against it, encouraged by the example of the late leader of the party, Lord Beaconsfield, who was not at all likely to extend a welcome to anything which came with Mr. Croker's mark upon it."—L. J. Jennings, *Croker papers*, v. 2, p. 198.—In the general election held August 19, 1837, "the Ministerialists fought the campaign on the strength of their record as reformers . . . the tories insisted on the danger to social order and the constitution from the subversive projects of the radical

wing of the whig party. Some of the opposition leaders described their own attitude as conservative, a word which was rapidly becoming current in political controversy. It had been used by Canning, at a city dinner, as far back as 1824, and was not, as is often said, first applied to the tories by Croker in the *Quarterly Review* in January, 1830. Macaulay in July, 1832, in his review of Dumont's *Mirabeau*, referred to it as a new cant word. Peel employed it in his address to the electors of Tamworth, and Russell in an election dinner at Stroud, described it as 'a mere change of name, a mere alias to persons who do not like to be known under their former designation'. The appellation, however, established itself, and largely, though never entirely, superseded that of tory while the whigs completely abandoned their old party name for that of liberals."—S. Low and L. C. Sanders, *Political history of England, 1837-1901*, pp. 5-6.

13th-18th centuries.—Origin and background.—**Conservatism in English political thought.—**Rise of the Tory party.—"It cannot, perhaps, be said that at any precise point in English History conservatism begins. . . . The claim of the barons against King John was that it was he that was the innovator who attacked the rights of his subjects, while Magna Charta merely formulated and affirmed the ancient laws and customs of the realm. [See ENGLAND: 1215.] This practice of representing constitutional change as though it were the reservation or restoration of some older and purer tradition has persisted right through our history and is to be observed in the controversies of the present time. . . . But if this sentiment is strong even now, it was overwhelming in mediæval times. Before the Reformation, therefore, it is impossible to distinguish conservatism in politics, not because there was none but because there was nothing else. . . . We begin to see conservatism as a distinct force when we approach the Reformation. As soon as the minds of men began to be affected by the movement they fell into categories which are familiar. . . . Puritanism overthrew both Church and Throne. But its success destroyed it; and Church and Throne came back together more closely united than ever, and supported by a well-marked body of opinion, which had grown up during the long contest in opposition to the reforming Puritans. This was the Church and King party or the 'Tories,' as twenty years after the Restoration they came to be called. Henceforth Toryism was one of the political forces at work, one of the streams of influence that are now joined in Conservatism. . . . Those influences, which in the more strict sense must be called conservative, meantime had played a different part in the struggles of the Reformation and the Rebellion. Conservatism was diffused rather than organised into any separate party during the sixteenth and seventeenth centuries. But Elizabeth herself, though her policy led to the development of Toryism, was rather a conservative than a Tory. [See ENGLAND: 1558-1588; 1559.] She had a dislike for innovation rather than a desire to exalt the Church. James I and Charles I on the other hand were Tories. They stood for the ascendancy of Church and King. [See ENGLAND: 1603; 1625; 1625-1628; 1628: Petition of Right; 1629-1640.] . . . The Restoration in 1660 was a triumph of conservatism. It was not more a restoration of the Monarchy than a general rejection of Puritanism and military tyranny, and all novelties in Church and State, in favour of the familiar forms of the ancient Constitution. [See ENGLAND: 1658-1660; 1661.] And it is not too much to say that from that time onwards until the French Revolution

introduced a new scene, conservatism was absolutely dominant in England."—H. Cecil, *Conservatism*, pp. 24-25, 29, 31-32.—See also ENGLAND: 1680; 1701; 1700; 1710-1712; 1714-1721.—"Parties had come to be divided more precisely, and more in accordance with their subsequent grouping, than had previously been the case. The original 'country party' had consisted of discontented cavaliers, alienated from the crown partly by personal dissatisfaction but mainly by distrust of Charles' ecclesiastical policy. But the union of the court with the advocates of religious toleration had been terminated by the dissolution of the Cabal, and Danby had succeeded in renewing the alliance between Crown and Church. The supporters of the non-resistance test were in the main the later Tories, its opponents were a few years later to develop into whigs."—R. Lodge, *History of England*, 1660-1702, p. 135.—"Both Tories and Whigs were . . . [at their lowest ebb, though in different senses and from different causes,] at the accession of George III. [See ENGLAND: 1760-1763.] George III has, perhaps, received too hard measure at the hands of historians. . . . If we are to do him justice we must compare him, not with William III nor with Queen Victoria, but with Sir Robert Peel or Lord Beaconsfield. He was a party leader, and like all party leaders by no means always successful. But if his whole career be viewed together it must be admitted to rank high in the annals of party leadership. He revived the Tory Party on what was essentially its old basis of defence of Church and King, although the emphasis was now rather on the King than on the Church. [See ENGLAND: 1762-1764; 1768-1774; U. S. A.: 1760-1775.] With a patience and dexterity which neither Peel nor Beaconsfield have surpassed, he raised the party to power, nominally under Lord North but really under himself. The disastrous failure in the American War overthrew him for the moment, but the coalition between Fox and North gave him a second opportunity, and by uniting himself with Pitt, whom we may call a dissentient Whig, he achieved a second and more lasting success. Only in this second period of power he was not the chief leader of the party. He submitted to the leadership of Pitt, although retaining a position of great influence and authority in the party councils."—H. Cecil, *Conservatism*, pp. 34-35.

1790-1900.—Imperialism.—Influence of the French Revolution.—Pitt and Burke.—Development of the new party.—"Apart from pure conservatism, and apart from Toryism, there is now a third influence in the Conservative Party which lacks a satisfactory name, but the power of which is matter of common remark. It is sometimes called Imperialism and sometimes Jingoism, or it is described by a periphrasis as 'support of a vigorous foreign policy' or as 'a strong interest in imperial affairs.' . . . Probably it is due to the rivalry of Pitt and Fox that imperialism has become part of the creed of the modern Conservative Party. . . . But what brought Conservatism into existence was the French Revolution. Natural conservatism, Toryism, imperialism, influenced particular statesmen or were diffused throughout the mind of the community, but until 1790 there was not a definite Conservative Party nor even anything resembling a consciously held body of Conservative doctrine. The name itself was not indeed invented till forty years later; but from 1790 the whole of English politics was cut in two by the influence of the French Revolution and its principles; and those who stood emphatically against the revolutionary movement made the

party in politics which we now call Conservative. Two men had a conspicuous influence in creating and leading the Conservative movement: one was Pitt and the other was Burke. Pitt was the practical leader who beaded the opposition to the French Revolution and behind whom the Toryism of George III, the natural conservatism of Burke, the zeal for the imperial greatness of the country, of which he himself was the best exponent, coalesced together and found their sphere of activity in resisting revolutionary France as the enemy of Church and King, the destroyer of all that was ordered and settled, the formidable enemy of the greatness and even the safety of England. And in Burke Conservatism found its first and perhaps its greatest teacher, who poured forth with extraordinary rhetorical power the language of an anti-revolutionary faith, and gave to the Conservative movement the dignity of a philosophical creed and the fervour of a religious crusade. . . . It would be possible to go further and say that Burke expressed the whole faith of modern Conservatism, if it were not that the imperialist side of Conservative policy finds no place in his writings. As already observed, Burke was always a conservative and became a Tory, but was not an imperialist. . . . But Pitt, becoming the Tory leader under the stress of the revolutionary struggle, carried his new party with him and made it, not for the time only but for the century that was to follow, an imperialist party. There was indeed a short period during which the Whigs took the lead in imperial policy under the leadership of Lord Palmerston. But the Conservative Party did not abandon its imperialist position under the stress of partisan sentiment. On the contrary, Palmerston drew a large measure of parliamentary support for his foreign policy from the Conservative side. And in the subsequent struggle between Disraeli and Gladstone, imperialism became almost wholly Conservative. . . . But after 1815, it was not till the last quarter of the nineteenth century that the imperialist controversy played much part in English politics."—*Ibid.*, pp. 36, 39-40, 61-63.—See also ENGLAND: 1782-1783; 1783-1787; 1793-1796; 1801-1806.

1815-1903.—Party conflicts.—Accomplishments.—"The early part of the century was occupied with conflicts in which conservative and Tory feeling were the dominant forces in Conservatism. It is most easy to review the party struggles of the last hundred years by noting that they hinge on six great events, five of them disastrous to the Conservative, and one to the Liberal Party. . . . [These included] the long controversy about Roman Catholic emancipation which ended in 1829; the passing of the Reform Bill in 1831-1832; the repeal of the Corn Laws in 1846 and the enacting of Household Suffrage in 1867. . . . The two last fall too near our own day to make it convenient to discuss them:—these are the Home Rule conflict of 1886-1895, the only great disaster to Liberalism, and the Fiscal controversy which began in 1903. . . . It is matter for regret that Pitt did not succeed in inspiring the Conservative Party (for so I will call it, though the name was not adopted till 1835), of which he was the first leader, not only with his imperialist but also with his reforming opinions. . . . Unfortunately the Conservative leaders who followed Pitt, with the exception of Canning [see ENGLAND: 1820-1827] were insensible to the necessity of 'changing order to preserve.'"—H. Cecil, *Conservatism*, pp. 63-64.—See also BIRMINGHAM, ENGLAND: 1832; BRISTOL: 1831; BRITISH EMPIRE: Colonial and imperial conferences: 1902, 1907; ENGLAND: 1558-1603; 1778-

1780; 1801-1806; 1806-1812; 1817-1848; 1830: Parliamentary representation before reform; 1830-1832; 1846: Vengeance of the Tory Protectionists; 1865-1868; 1872-1878; 1884-1885; 1885-1886: Gladstone's return to power; 1892-1893; 1894-1895 (March-September); 1903 (April-December); IRELAND: 1811-1820; 1885-1801; 1886; 1873-1879; 1895; LIBERAL PARTY: 1886-1905; SUFFRAGE, MANHOOD: British empire: 1295-1832; 1832-1885; TARIFF: 1836-1841; 1842; 1845-1846; ULSTER: 1892.—"In the history of political parties the period which followed the reform bill was one of a loosening of party ties and of unusual disorganization. A radical wing of the whig party had already formed and grew in strength. Sir Robert Peel's repeal of the corn laws split the tory party also, as the majority refused to follow him and the smaller body who did, known as Peelites, acted for some years by themselves. The disintegration of the older parties is shown also by the gradual disuse in this period of the names of whig and tory and the substitution for them of the new names liberal and conservative, with a restricted and special meaning attached to the still occasionally used terms of whig and tory."—G. B. Adams, *Constitutional history of England*, p. 458.

CONSERVATIVE PARTY, Netherlands. See NETHERLANDS: 1853-1867.

CONSERVATIVE PARTY, Spain. See SPAIN: 1900-1909; 1910-1920.

CONSERVATIVE PARTY, United States.—The name "Conservative" was applied from 1837 to 1840 to those Democrats who joined the Whigs in opposing the sub-treasury bill. In other matters the Conservatives as a rule followed their respective parties. "The most remarkable and exciting campaign our countrymen had yet witnessed was by this time drawing to a close [autumn of 1840]. The difficulty which troubled the Whigs at the outset was that of uniting the many factions, old and new, which divided their ranks and those of the Democrats. There were anti-renters, anti-slaverymen, and abolitionists; there were friends of Harrison, the friends of Webster, the friends of Clay; there were the Conservatives in New York bitterly opposed to Van Buren."—J. B. McMaster, *History of the people of the United States*, v. 6, p. 550.

CONSISTORY, Papal, advisory council. See CURIA, PAPAL; also VATICAN: Present-day papal administration.

CONSISTORY COURTS OF THE BISHOPS.—"The duties of the officials of these courts resembled in theory the duties of the cen-

sors under the Roman Republic. In the middle ages, a lofty effort had been made to overpass the common limitations of government, to introduce punishment for sins as well as crimes, and to visit with temporal penalties the breach of the moral law. . . . The administration of such a discipline fell as a matter of course, to the clergy. . . . Thus arose throughout Europe a system of spiritual surveillance over the habits and conduct of every man, extending from the cottage to the castle, taking note of all wrong dealing, of all oppression of man by man, of all licentiousness and profligacy, and representing upon earth, in the principles by which it was guided, the laws of the great tribunal of Almighty God. Such was the origin of the church courts, perhaps the greatest institutions yet devised by man. But to aim at these high ideals is as perilous as it is noble; and weapons which may be safely trusted in the hands of saints become fatal implements of mischief when saints have ceased to wield them. . . . The Consistory Courts had continued into the sixteenth century with unrestricted jurisdiction, although they had been for generations merely perennially flowing fountains, feeding the ecclesiastical exchequer. The moral conduct of every English man and woman remained subject to them. . . . But . . . the censures were no longer spiritual. They were commuted in various gradations for pecuniary fines, and each offence against morality was rated at its specific money value in the Episcopal tables. . . . The misdemeanours of which the courts took cognizance were 'offences against chastity,' 'heresy,' or 'matter sounding thereunto,' 'witchcraft,' 'drunkenness,' 'scandal,' 'defamation,' 'impatient words,' 'broken promises,' 'untruth,' 'absence from church,' 'speaking evil of saints,' 'non-payment of offerings,' and other delinquencies incapable of legal definition."—J. A. Froude, *History of England*, ch. 3.

CONSTABLE, John (1776-1837), English landscape painter. Became a student at the Royal Academy, 1799, and was elected a member in 1819; considered to be the originator of modern landscape painting; his most characteristic work was done between 1816 and 1826.—See also PAINTING: Europe (19th century).

CONSTABLE.—"The name is derived from the 'comes stabuli' of the Byzantine court, and appears in the west as early as the days of Gregory of Tours. The duties of the constables of France . . . and those of the constables of Naples . . . are not exactly parallel with [those of] the constables of England. In Naples the constable kept the king's sword, commanded the army, appointed the quarters, disciplined the troops and distributed the sentinels; the marshals and all other officers being his subordinates. The French office was nearly the same. In England, however, the marshal was not subordinate to the constable. Probably the English marshals fulfilled the duties which had been in Normandy discharged by the constables. The marshal is more distinctly an officer of the court, the constable one of the castle or army. . . . The constable . . . exercised the office of quartermaster-general of the court and army and succeeded to the duties of the Anglo-Saxon staller."—W. Stubbs, *Constitutional history of England*, ch. 11, sect. 122, and note.

CONSTABLE OF FRANCE.—"No other dignity in the world has been held by such a succession of great soldiers as the office of Constable of France. The Constable was originally a mere officer of the stables, but his power had increased by the suppression of the office of Grand Senechal, and by the time of Philip Augustus he exercised control over all the military forces of the crown. He was the general in chief of the army and the highest military authority in the kingdom. The constables had for four centuries been leaders in the wars of France, and they had experienced strange and varied fortunes. The office had been bestowed on the son of Simon de Montfort, and he for this honor had granted to the king of France his rights over those vast domains which had been given his father for his pious conquests. [See ALBIGENSES: 1217-1229.] It had been bestowed on Raoul de Nesle, who fell at Courtrai, where the French nobility suffered its first defeat from Flemish boors; on Bertrand de

Guesclin, the last of the great warriors, whose deeds were sung with those of the paladins of Charlemagne; on Clisson, the victor of Roosebeck [or Rosebecque]; on Armagnac, whose name has a bloody preeminence among the leaders of the fierce soldiery who ravaged France during the English wars; on Buchan, whose Scotch valor and fidelity gained him this great trust among a foreign people; on Richemont, the companion of Joan Darc; on Saint Pol, the ally of Charles the Bold, the betrayer and the victim of Louis XI.; on the Duke of Bourbon, who won the battle of Pavia against his sovereign, and led his soldiers to that sack of Rome which made the ravages of Genseric and Alaric seem mild; on Anne of Montmorenci, a prominent actor in every great event in France from the battle of Pavia against Charles V. to that of St. Denis, against Coligni; on his son, the companion of Henry IV. in his youth, and his trusted adviser in his age. . . . The sword borne by such men had been bestowed [1621] on Luines, the hero of an assassination, who could not drill a company of infantry; it was now [1622] given to the hero of many battles [the Duke of Lesdeguières], and the great office was to expire in the hands of a great soldier."—J. B. Perkins, *France under Mazarin*, v. 1, p. 94.—See also FRANCE: 1226-1270.

CONSTANCE, Council of (1414). See PACIFY: 1414-1418.

CONSTANCE, Peace of (1183). See ITALY: 1174-1183.

CONSTANS (c. 320-350), Roman emperor, son of Constantine I. See ROME: Empire: 323.

CONSTANT DE REBEQUE, Henri Benjamin (1767-1830), French writer, politician, and moderate revolutionist. Member of the tribunate, 1799-1802; banished by Napoleon; councilor of state during the Hundred Days; banished by Louis XVIII; member of Chamber of Deputies, 1819, until his death.

CONSTANTINA, or Constantine, a city of Algeria, on the site of the ancient Numidian city of Cirta. The ancient city was ruined in the war of Maxentius against Alexander, restored by Constantine in A. D. 313. It fell to the French in 1837. See BARBARY STATES: 1830-1846.

CONSTANTINE I, the Great (c. 288-337), Roman emperor, 306-337. He reunited the Roman empire, which had been divided for administrative purposes by Diocletian, overcame his rivals and became sole emperor. In his reign Christianity was made the state religion, and defined by the Nicene creed.—See also BRITAIN: 323-337; CHRISTIANITY: 312-337; CONSTANTINOPLE: 330; FRANKS: 306; PRETORIAN GUARDS: 312; ROME: Empire: 305-323; 313; 323.

Constantine II (317-340), Roman emperor, 337-340. See ROME: Empire: 323.

Constantine III (d. 641), Roman emperor, 641.

Constantine IV, Pogonatus, Roman emperor, 668-685.

Constantine V, Copronymus, Roman emperor, 740-775.

Constantine VI, Roman emperor, 780-797.

Constantine VII, Porphyrogenitus (905-959), Roman emperor, 945-959.

Constantine VIII, Roman emperor, 1025-1028.

Constantine IX, Monomachus, Roman emperor, 1042-1054.

Constantine X, Ducas, Roman emperor, 1059-1067. See BYZANTINE EMPIRE: 1057-1081.

Constantine XI, Palæologus (1304-1453), last emperor of Constantinople, 1394-1453, who was slain when the city fell to the Turks.

CONSTANTINE, king of Bulgaria, 1258-1277. See BULGARIA: 1258-1872.

CONSTANTINE I (†1868-), king of the Hellenes, 1913-1917. Married Sophie, sister of William II of Germany; was compelled to abdicate on June 12, 1917, when the Allies brought pressure to bear upon him because of his supposed interest in the German cause; withdrew to Switzerland, from which country after the death of his son and successor, Alexander, Oct. 20, 1920, the people of Greece recalled him to the throne by a plebiscite; entered Athens in triumph, Dec. 19, 1920. Abdicated in September, 1922, in favor of his son, the crown prince George.—See also BALKAN STATES: 1914; GREECE: 1913: Assassination of King George; 1914; 1915 (February-June); 1915 (June-November); 1916: Independent cabinet of Venizelos; 1920-1921; WORLD WAR: 1914: III. CONSTANTINE, the African (d. 1087), medical teacher of Salerno. See MEDICAL SCIENCE: Medieval: 10th-12th centuries.

CONSTANTINE, or Flavius Claudius Constantinus, usurper in Britain, 407-410. See BRITAIN: 407.

CONSTANTINE NICOLAIVICH (1827-1892), grand duke of Russia, appointed governor of Poland. See POLAND: 1863-1869.

CONSTANTINE PAVLOVICH (1779-1831), grand duke of Russia and ruler of Poland. See POLAND: 1830-1832.

CONSTANTINOPLE, capital of the Turkish empire. It is situated on seven hills at the southern extremity of the Bosphorus. It is famous as the capital of the Roman empire of the East from 330 to 1453, since which later date it has been the metropolis of Turkey. The church of St. Sophia, built by Justinian (532-538), is renowned for its beauty and its many historic associations. The city, formerly known as Byzantium, was the great center of Byzantine art and architecture. In modern times, the whole Eastern question, which has constantly agitated the diplomats of Europe, has centered largely in the problem of the disposition of this city, after the expected ultimate break-up of European Turkey. The modern city, called by the Turks Stamboul (from *eis tēn pōlin* "in the city") has an estimated population of about a million.—See also BOSPORUS: Ancient and medieval periods; BYZANTINE EMPIRE; BYZANTIUM; EASTERN QUESTION; EUROPE: Ancient Roman civilization: Fall of Rome.

330.—Transformation of Byzantium.—"Constantine had for some time contemplated the erection of a new capital. The experience of nearly half a century had confirmed the sagacity of Diocletian's selection of a site on the confines of Europe and Asia [Nicomedia] as the whereabouts in which the political centre of gravity of the Empire rested. At one time Constantine thought of adopting the site of ancient Troy, and is said to have actually commenced building a new city there. . . . More prosaic reasons ultimately prevailed. The practical genius of Constantine recognized in the town of Byzantium, on the European side of the border line between the two continents, the site best adapted for his new capital. All subsequent ages have applauded his discernment, for experience has endorsed the wisdom of the choice. By land, with its Asian suburb of Chrysopolis [modern Scutari], it practically spanned the narrow strait and joined Europe and Asia: by sea, it was open on one side to Spain, Italy, Greece, Africa, Egypt, Syria; on the other to the Euxine, and so by the Danube it had easy access to the whole of that important

frontier between the Empire and the barbarians; and round all the northern coasts of the sea it took the barbarians in flank. . . . The city was solemnly dedicated with religious ceremonies on the 11th of May, 330, and the occasion was celebrated, after the Roman fashion, by a great festival, largesses and games in the hippodrome, which lasted forty days. The Emperor gave to the city institutions modelled after those of the ancient Rome."—E. L. Cutts, *Constantine the Great*, ch. 29.—"The new walls of Constantine stretched from the port to the Propontis . . . at the distance of fifteen stadia from the ancient fortification, and, with the city of Byzantium, they enclosed five of the seven hills which, to the eyes of those who approach Constantinople, appear to rise above each other in beautiful order. About a century after the death of the founder, the new buildings . . . already covered the narrow ridge of the sixth and the broad summit of the seventh hill. . . . The buildings of the new city were executed by such artificers as the reign of Constantine could afford; but they were decorated by the hands of the most celebrated masters of the age of Pericles and Alexander. . . . By his commands the cities of Greece and Asia were despoiled of their most valuable ornaments."—E. Gibbon, *History of decline and fall of the Roman empire*, ch. 17.—"The new city was an exact copy of old Rome. . . . It was inhabited by senators from Rome. Wealthy individuals from the provinces were likewise compelled to keep up houses at Constantinople, pensions were conferred upon them, and a right to a certain amount of provisions from the public stores was annexed to these dwellings. Eighty thousand loaves of bread were distributed daily to the inhabitants of Constantinople. . . . The tribute of grain from Egypt was appropriated to supply Constantinople, and that of Africa was left for the consumption of Rome."—G. Finlay, *Greece under the Romans*, ch. 2.—See also LIBRARIES: Ancient: Constantinople.

511-512.—Tumults concerning the Trisagion.—During the reign of Anastasius, at Constantinople, the fierce controversy which had raged for many years throughout the empire, between the Monophysites (who maintained that the divine and the human natures in Christ were one), and the adherents of the Council of Chalcedon (which declared that Christ possessed two natures in one person), was embittered at the imperial capital by the hostility between the emperor, who favored the Monophysites, and the patriarch who was strict in Chalcedonian orthodoxy. In 511, and again in 512, it gave rise to two alarming riots at Constantinople. On the first occasion, a Monophysite or Eutychian party "burst into the Chapel of the Archangel in the Imperial Palace and dared to chant the Te Deum with the addition of the forbidden words, the war-cry of many an Eutychian mob, 'Who wast crucified for us.' The Trisagion, as it was called, the thrice-repeated cry to the Holy One, which Isaiah in his vision heard uttered by the seraphim, became, by the addition of these words, as emphatic a statement as the Monophysite party could desire of their

favourite tenet that God, not man, breathed out his soul unto death outside the gates of Jerusalem. . . . On the next Sunday the Monophysites sang the verse which was their war-cry in the great Basilica itself." The riot which ensued was quieted with difficulty by the patriarch, to whom the emperor humbled himself. But in the next year, on a fast-day (Nov. 6) the Monophysites gave a similar challenge, singing the Trisagion with the prohibited words added, and "again psalmody gave place to blows; men wounded and dying lay upon the floor of the church. . . . The orthodox mob streamed from all parts into the great forum. There they swarmed and swayed to and fro all that day and all that night, shouting forth, not the greatness of the Ephesian Diana, but 'Holy, Holy, Holy,' without the words 'Who wast crucified.' They hewed down the monks,—a minority of their class,—who were on the side of the imperial creed, and burned their monasteries with fire." After two days of riot, the aged emperor humbled himself to the mob, in the great Circus, offered to abdicate the throne and made peace by promises to respect the decrees of Chalcedon.—T. 668-675.—First siege by the Saracens.—"Forty-six years after the flight of Mahomet from Mecca his disciples appeared in arms under the walls of Constantinople. They were animated by a genuine or fictitious saying of the prophet, that, to the first army which besieged the city of the Cæsars, their sins were forgiven. . . . No sooner had the Caliph Moawiyah [the first of the Omniade caliphs, seated at Damascus] suppressed his rivals and established his throne, than he aspired to expiate the guilt of civil blood by the success of this holy expedition; his preparations by sea and land were adequate to the importance of the object; his standard was entrusted to Sophian, a veteran warrior. . . . The Greeks had little to hope, nor had their enemies any reasons of fear, from the courage and vigilance of the reigning Emperor, who disgraced the name of Constantine, and imitated only the inglorious years of his grandfather Heraclius. Without delay or opposition, the naval forces of the Saracens passed through the unguarded channel of the Hellespont, which even now, under the feeble and disorderly government of the Turks, is maintained as the natural bulwark of the capital. The Arabian fleet cast anchor and the troops were disembarked near the palace of Hebdomon, seven miles from the city. During many days, from the dawn of light to the evening, the line of assault was extended from the golden gate to the Eastern promontory. . . . But the besiegers had formed an insufficient estimate of the strength and resources of Constantinople. The solid and lofty walls were guarded by numbers and discipline; the spirit of the Romans were rekindled by the last danger of their religion and empire; the fugitives from the conquered provinces more successfully renewed the defence of Damascus and Alexandria; and the Saracens were dismayed by the strange and prodigious effects of artificial fire. This firm and

effectual resistance diverted their arms to the more easy attempts of plundering the European and Asiatic coasts of the Propontis; and, after keeping the sea from the month of April to that of September, on the approach of winter they retreated four score miles from the capital, to the isle of Cyzicus, in which they had established their magazine of spoil and provisions. So patient was their perseverance, or so languid were their operations, that they repeated in the six following summers the same attack and retreat, with a gradual abatement of hope and vigour, till the mischances of shipwreck and disease, of the sword and of fire, compelled them to relinquish the fruitless enterprise. They might bewail the loss, or commemorate the martyrdom, of 30,000 Moslems who fell in the siege of Constantinople. . . . The event of the siege revived, both in the East and West, the reputation of the Roman arms, and cast a momentary shade over the glories of the Saracens. . . . A peace, or truce of thirty years was ratified between the two Empires; and the stipulation of an annual tribute, fifty horses of a noble breed, fifty slaves, and 3,000 pieces of gold, degraded the majesty of the commander of the faithful."—E. Gibbon, *History of the decline and fall of the Roman empire*, ch. 52.

717-718.—Second siege by the Saracens.—"When Leo [the Isaurian] was raised to the [Byzantine] throne [717], the empire was threatened with immediate ruin. Six emperors had been dethroned within the space of twenty-one years. . . . The Bulgarians and Slavonians wasted Europe up to the walls of Constantinople; the Saracens ravaged the whole of Asia Minor to the shores of the Bosphorus. . . . The Caliph Suleiman, who had seen one private adventurer succeed the other in quick succession on the imperial throne, deemed the moment favourable for the final conquest of the Christians; and, reinforcing his brother's army [in Asia Minor], he ordered him to lay siege to Constantinople. The Saracen empire had now reached its greatest extent. From the banks of the Sihun and the Indus to the shores of the Atlantic in Mauretania and Spain, the order of Suleiman was implicitly obeyed. . . . The army Moslemah led against Constantinople was the best-appointed that had ever attacked the Christians: it consisted of 80,000 warriors. The Caliph announced his intention of taking the field in person with additional forces, should the capital of the Christians offer a protracted resistance to the arms of Islam. The whole expedition is said to have employed 180,000 men. . . . Moslemah, after capturing Pergamus, marched to Abydos, where he was joined by the Saracen fleet. He then transported his army across the Hellespont, and marching along the shore of the Propontis, invested Leo in his capital both by land and sea. The strong walls of Constantinople, the engines of defence with which Roman and Greek art had covered the ramparts, and the skill of the Byzantine engineers, rendered every attempt to carry the place by assault hopeless, so that the Saracens were compelled to trust to the effect of a strict blockade for gaining possession of the city. . . . The besiegers encamped before Constantinople on the 15th August 717. The Caliph Suleiman died before he was able to send any reinforcements to his brother. The winter proved unusually severe." Great numbers of the warriors from the south were destroyed

by the inclemency of a climate to which they had not become inured; many more died of famine in the Moslem camp, while the besieged city was plentifully supplied. The whole undertaking was disastrous from its beginning to its close, and, exactly one year from the pitching of his camp under the Byzantine walls, "on the 15th of August 718, Moslemah raised the siege, after ruining one of the finest armies the Saracens ever assembled. . . . Few military details concerning Leo's defence of Constantinople have been preserved, but there can be no doubt that it was one of the most brilliant exploits of a warlike age. . . . The vanity of Gallic writers has magnified the success of Charles Martel over a plundering expedition of the Spanish Arabs into a marvellous victory, and attributed the deliverance of Europe from the Saracen yoke to the valour of the Franks. A veil has been thrown over the talents and courage of Leo, a soldier of fortune, just seated on the imperial throne, who defeated the long-planned schemes of conquest of the Caliphs Welid and Suleiman. . . . The Saracens were gradually expelled from most of their conquests beyond Mount Taurus."—G. Finlay, *History of the Byzantine empire, from 716 to 1057, ch. 1.*

865.—First attack by the Russians.—"In the year 865, a nation hitherto unknown made its first appearance in the history of the world, where it was destined to act no unimportant part. Its entrance into the political system of the European nations was marked by an attempt to take Constantinople, a project which it has often revived. . . . In the year 862, Rurik, a Scandinavian or Varangian chief, arrived at Novgorod, and laid the first foundation of the state which has grown into the Russian empire. The Russian people, under Varangian domination, rapidly increased in power, and reduced many of their neighbours to submission. . . . From what particular circumstance the Russians were led to make their daring attack on Constantinople is not known. The Emperor Michael [III] had taken the command of an army to act against the Saracens, and Oryphas, admiral of the fleet, acted as governor of the capital during his absence. Before the Emperor had commenced his military operations, a fleet of 200 Russian vessels of small size, taking advantage of a favourable wind, suddenly passed through the Bosphorus, and anchored at the mouth of the Black River in the Propontis, about 18 miles from Constantinople. This Russian expedition had already plundered the shores of the Black Sea, and from its station within the Bosphorus it ravaged the country about Constantinople, and plundered the Prince's Islands, pillaging the monasteries and slaying the monks as well as the other inhabitants. The Emperor, informed by Oryphas of the attack on his capital, hastened to its defence. . . . It required no great exertions on the part of the imperial officers to equip a force sufficient to attack and put to flight these invaders; but the horrid cruelty of the barbarians, and the wild daring of their Varangian leaders, made a profound impression on the people of Constantinople."—G. Finlay, *History of the Byzantine empire, from 716 to 1057, bk. 1, ch. 3, sect. 3.*—See also RUSSIA: 865-941.

907-1043.—Repeated attacks by the Russians.—Notwithstanding an active and increasing commercial intercourse between the Greeks and the Russians, Constantinople was exposed, during the

tenth century and part of the eleventh, to repeated attacks from the masterful Varangians and their subjects. In the year 907, a fleet of 2,000 Russian vessels or boats swarmed into the Bosphorus, and laid waste the shores in the neighborhood of Constantinople. "It is not improbable that the expedition was undertaken to obtain indemnity for some commercial losses sustained by imperial negligence, monopoly or oppression. The subjects of the emperor were murdered, and the Russians amused themselves with torturing their captives in the most barbarous manner. At length Leo [VI] purchased their retreat by the payment of a large sum of money. . . . These hostilities were terminated by a commercial treaty in 912." There was peace under this treaty until 941, when a third attack on Constantinople was led by Igor, the son of Rurik. But it ended most disastrously for the Russians and Igor escaped with only a few boats. The result was another important treaty, negotiated in 945. In 970 the Byzantine empire was more seriously threatened by an attempt on the part of the Russians to subdue the kingdom of Bulgaria; which would have brought them into the same dangerous neighborhood to Constantinople that the Russia of our own day has labored so hard to reach. But the able soldier John Tzimisce happened to occupy the Byzantine throne; the Russian invasion of Bulgaria was repelled and Bulgaria, itself, was reannexed to the empire, which pushed its boundaries to the Danube, once more. For more than half a century, Constantinople was undisturbed by the covetous ambition of her Russian fellow Christians. Then they invaded the Bosphorus again with a formidable armament; but the expedition was wholly disastrous and they retreated with a loss of 15,000 men. "Three years elapsed before peace was re-established; but a treaty was then concluded and the trade at Constantinople placed on the old footing. From this period the alliance of the Russians with the Byzantine Empire was long uninterrupted; and as the Greeks became more deeply imbued with ecclesiastical prejudices, and more hostile to the Latin nations, the Eastern Church became, in their eyes, the symbol of their nationality, and the bigoted attachment of the Russians to the same religious formalities obtained for them from the Byzantine Greeks the appellation of the most Christian nation."—G. Finlay, *History of the Byzantine empire, from 716 to 1057, bk. 2, ch. 3, sect. 2.*—See also ACHRIDA, KINGDOM OF.

1081.—Sacked by the rebel army of Alexius Comnenus.—Alexius Comnenus, the emperor who occupied the Byzantine throne at the time of the first Crusade, and who became historically prominent in that connection, acquired his crown by a successful rebellion. He was collaterally of the family of Isaac Comnenus (Isaac I) who had reigned briefly in 1057-1059,—he, too, having been, in his imperial office, the product of a revolution. But the interval of twenty-two years had seen four emperors come and go—two to the grave and two into monastic seclusion. It was the last of these—Nicephorus III (Botaneites) that Alexius displaced, with the support of an army which he had previously commanded. One of the gates of the capital was betrayed to him by a German mercenary, and he gained the city almost without a blow. "The old Emperor consented to resign his crown and retire into a monastery. Alexius entered the imperial palace, and the rebel army commenced plundering every quarter of the city. Natives and mercenaries vied with one another in license and rapine. No class of society was sacred from their lust and avarice, and the inmates of

CONSTANTINOPLE ABOUT 1520

(From the original plan in the German National Museum at Nürnberg)

monasteries, churches, and palaces were alike plundered and insulted. This sack of Constantinople by the Sclavonians, Bulgarians, and Greeks in the service of the families of Comnenus, Ducas, and Paleologos, who crept treacherously into the city, was a fit prologue to its sufferings when it was stormed by the Crusaders in 1204. From this disgraceful conquest of Constantinople by Alexius Comnenus, we must date the decay of its wealth and civic supremacy, both as a capital and a commercial city. . . . The power which was thus established in rapine terminated about a century later in a bloody vengeance inflicted by an infuriated populace on the last Emperor of the Comnenian family, Andronicus I. Constantinople was taken on the 1st of April, 1081, and Alexius was crowned in St. Sophia's next day."—G. Finlay, *History of the Byzantine and Greek empires, from 716 to 1453, bk. 3, ch. 1.*

1261.—Great privileges conceded to Genoese.—Pera and its citadel Galata surrendered to them. See GENOA: 1261-1299.

1261-1453.—Restored Greek empire.—On July 25, 1261, Constantinople was surprised and the last Latin emperor expelled by the fortunate arms of Michael Palæologus, the Greek usurper at Nicæa. (See NICÆA: 1204-1261.) Twenty days later Michael made his triumphal entry into the ancient capital. "But after the first transport of devotion and pride, he sighed at the dreary prospect of solitude and ruin. The palace was defiled with smoke and dirt and the gross intemperance of the Franks; whole streets had been consumed by fire, or were decayed by the injuries of time; the sacred and profane edifices were stripped of their ornaments; and, as if they were conscious of their approaching exile, the industry of the Latins had been confined to the work of pillage and destruction. Trade had expired under the pressure of anarchy and distress, and the numbers of inhabitants had decreased with the opulence of the city. It was the first care of the Greek monarch to reinstate the nobles in the palaces of their fathers. . . . He re-peopled Constantinople by a liberal invitation to the provinces, and the brave 'volunteers' were seated in the capital which had been recovered by their arms. Instead of banishing the factories of the Pisans, Venetians, and Genoese, the prudent conqueror accepted their oaths of allegiance, encouraged their industry, confirmed their privileges and allowed them to live under the jurisdiction of their proper magistrates. Of these nations the Pisans and Venetians preserved their respective quarters in the city; but the services and power of the Genoese [who had assisted in the reconquest of Constantinople] deserved at the same time the gratitude and the jealousy of the Greeks. Their independent colony was first planted at the seaport town of Heraclea in Thrace. They were speedily recalled, and settled in the exclusive possession of the suburb of Galata, an advantageous post, in which they revived the commerce and insulted the majesty of the Byzantine Empire. The recovery of Constantinople was celebrated as the era of a new

Empire." The new empire thus established in the ancient Roman capital of the East made some show of vigor at first. Michael Palæologus "wrested from the Franks several of the noblest islands of the Archipelago—Lesbos, Chios, and Rhodes. His brother Constantine was sent to command in Malvasia and Sparta; and the Eastern side of the Morea, from Argos and Napoli to Cape Tænarus, was repossessed by the Greeks. . . . But in the prosecution of these Western conquests the countries beyond the Hellespont were left naked to the Turks; and their depredations verified the prophecy of a dying senator, that the recovery of Constantinople would be the ruin of Asia." Not only was Asia Minor abandoned to the new race of Turkish conquerors—the Ottomans—but those most aggressive of the proselytes of Islam were invited in the next generation to cross the Bosphorus, and to enter Thrace as partisans in a Greek civil war. Their footing in Europe once gained, they devoured the distracted and feeble empire piece by piece, until little remained of it beyond the capital itself. Long before the latter fell, the empire was a shadow and a name. In the very suburbs of Constantinople, the Genoese podesta, at Pera or Galata, had more power than the Greek emperor; and the rival Italian traders, of Genoa, Venice and Pisa, fought their battles under the eyes of the Byzantines with indifference, almost, to the will or wishes, the opposition or the help of the latter. "The weight of the Roman Empire was scarcely felt in the balance of these opulent and powerful republics. . . . The Roman Empire (I smile in transcribing the name) might soon have sunk into a province of Genoa, if the ambition of the republic had not been checked by the ruin of her freedom and naval power. A long contest of 130 years was determined by the triumph of Venice. . . . Yet the spirit of commerce survived that of conquest; and the colony of Pera still awed the capital and navigated the Euxine, till it was involved by the Turks in the final servitude of Constantinople itself."—E. Gibbon, *History of the decline and fall of the Roman empire, ch. 62-63.*—See also TURKEY: 1240-1326; 1326-1359; 1360-1389; 1389-1403.

ALSO IN: G. Finlay, *History of the Byzantine and Greek empires, from 716 to 1453, bk. 4, ch. 2.*

1348-1355.—War with the Genoese.—Alliance with Venice and Aragon.—John Cantacuzenos, who usurped the throne in 1347, "had not reigned a year before he was involved in hostilities with the Genoese colony of Galata, which had always contained many warm partisans of the house of Paleologos [displaced by Cantacuzenos]. This factory had grown into a flourishing town, and commanded a large portion of the Golden Horn. During the civil war, the Genoese capitalists had supplied the regency with money, and they now formed almost every branch of the revenue which the imperial government derived from the port. . . . The financial measures of the new emperor reduced their profits. . . . The increased industry of the Greeks, and the jealousy of the Genoese, led to open hostilities. The colonists of Galata commenced the war in a treacherous manner, without any authority from the republic of Genoa (1348). With a fleet of only eight large and some small galleys they attacked Constantinople while Cantacuzenos was absent from the capital, and burned several buildings and the greater part of the fleet he was then constructing. The Empress Irene, who administered the government in the absence of her husband, behaved with great prudence and courage and repulsed a bold attack of the Genoese. Cantacuzenos hastened to the capi-

tal. where he spent the winter in repairing the loss his fleet had sustained. As soon as it was ready for action, he engaged the Genoese in the port, where he hoped that their naval skill would be of no avail, and where the numerical superiority of his ships would insure him a victory. He expected, moreover, to gain possession of Galata itself by an attack on the land side while the Genoese were occupied at sea. The cowardly conduct of the Greeks, both by sea and land, rendered his plans abortive. The greater part of his ships were taken, and his army retreated without making a serious attack. Fortunately for Cantacuzenos, the colonists of Galata received an order from the Senate of Genoa to conclude peace. . . . Their victory enabled them to obtain favourable terms, and to keep possession of some land they had seized, and on which they soon completed the construction of a new citadel. The friendly disposition manifested by the government of Genoa induced Cantacuzenos to send ambassadors to the Senate to demand the restoration of the island of Chios, which had been conquered by a band of Genoese exiles in 1346. A treaty was concluded, by which the Genoese were to restore the island to the Emperor of Constantinople in ten years. . . . But this treaty was never carried into execution, for the exiles at Chios set both the republic of Genoa and the Greek Empire at defiance, and retained their conquest." The peace with Genoa was of short duration. Cantacuzenos was bent upon expelling the Genoese from Galata, and as they were now involved in the war with the Venetians which is known as the war of Caffa he hoped to accomplish his purpose by joining the latter. "The Genoese had drawn into their hands the greater part of the commerce of the Black Sea. The town of Tana or Azof was then a place of great commercial importance, as many of the productions of India and China found their way to western Europe from its warehouses. The Genoese, in consequence of a quarrel with the Tartars, had been compelled to suspend their intercourse with Tana, and the Venetians, availing themselves of the opportunity, had extended their trade and increased their profits. The envy of the Genoese led them to obstruct the Venetian trade and capture Venetian ships, until at length the disputes of the two republics broke out in open war in 1348. In the year 1351, Cantacuzenos entered into an alliance with Venice, and joined his forces to those of the Venetians, who had also concluded an alliance with Peter the Ceremonious, king of Aragon. Nicholas Pisani, one of the ablest admirals of the age, appeared before Constantinople with the Venetian fleet; but his ships had suffered severely from a storm, and his principal object was attained when he had convoyed the merchantmen of Venice safely into the Black Sea. Cantacuzenos, however, had no object but to take Galata; and, expecting to receive important aid from Pisani, he attacked the Genoese colony by sea and land. His assault was defeated in consequence of the weakness of the Greeks and the lukewarmness of the Venetians. Pisani retired to Negropont, to effect a junction with the Catalan fleet; and Pagano Doria, who had pursued him with a superior force, in returning to Galata to pass the winter, stormed the town of Heracleia on the Sea of Marmora, where Cantacuzenos had collected large magazines of provisions, and carried off a rich booty, with many wealthy Greeks, who were compelled to ransom themselves by paying large sums to these captors. Cantacuzenos was now besieged in Constantinople. . . . The Genoese, unable to make any impression on the city, indem-

nified themselves by ravaging the Greek territory on the Black Sea. . . . Early in the year 1352, Pisano returned to Constantinople with the Catalan fleet, under Ponzio da Santapace, and a great battle was fought between the allies and the Genoese, in full view of Constantinople and Galata. The scene of the combat was off the island of Prote, and it received the name of Vrachophagos from some sunken rocks, of which the Genoese availed themselves in their manœuvres. The honour of a doubtful and bloody day rested with the Genoese. . . . Pisani soon quitted the neighbourhood of Constantinople, and Cantacuzenos, having nothing more to hope from the Venetian alliance . . . concluded a peace with the republic of Genoa. In this war he had exposed the weakness of the Greek empire, and the decline of the maritime force of Greece, to all the states of Europe. The treaty confirmed all the previous privileges and encroachments of the colony of Galata and other Genoese establishments of the Empire."—C. Finlay, *History of the Byzantine and Greek empires*, 716-1453, bk. 4, ch. 2, sect. 4.—The retirement of the Greeks from the contest did not check the war between Genoa and Venice and the other allies of the latter, which was continued until 1355. The Genoese were defeated August 29, 1353, by the Venetians and Catalans, in a great battle fought near Lojera, on the northern coast of Sardinia, losing forty-one galleys and 4,500 or 5,000 men. They obtained their revenge the next year, on November 4, when Paganino Doria surprised the Venetian admiral, Pisani, at Portolongo, opposite the island of Sapienza, as he was preparing to go into winter-quarters. "The Venetians sustained not so much a defeat as a total discomfiture; 450 were killed; an enormous number of prisoners, loosely calculated at 6,000, and a highly valuable booty in prizes and stores, were taken." In June, 1355, the war was ended by a treaty which excluded Venice from all Black sea ports except Caffa.—W. C. Hazlitt, *History of the Venetian republic*, v. 3, ch. 18-19.

ALSO IN: F. A. Parker, *Fleets of the world*, pp. 88-94.

1453.—Conquest by the Turks.—Mohammed II, son of Amurath II, came to the Ottoman throne, at the age of twenty-one, in 1451. "The conquest of Constantinople was the first object on which his thoughts were fixed at the opening of his reign. The resolution with which he had formed this purpose expressed itself in his stern reply to the ambassadors of the Emperor, offering him tribute if he would renounce the project of building a fort on the European shore of the Bosphorus, which, at the distance of only five miles from the capital, would give him the command of the Black Sea. He ordered the envoys to retire, and threatened to flay alive any who should dare to bring him a similar message again. The fort was finished in three months and garrisoned with 400 janizaries; a tribute was exacted of all vessels that passed, and war was formally declared by the Sultan. Constantine [Constantine Palæologus, the last Greek emperor] made the best preparations in his power for defence; but he could muster only 600 Greek soldiers." In order to secure aid from the pope and the Italians, Constantine united himself with the Roman church. A few hundred troops were then sent to his assistance; but, at the most, he had only succeeded in manning the many miles of the city wall with 9,000 men, when, in April, 1453, the Sultan invested it. The Turkish army was said to number 250,000 men, and 420 vessels were counted in the accompanying fleet. A summons to surrender was answered with indignant

refusal by Constantine, "who had calmly resolved not to survive the fall of the city," and the final assault of the furious Turks was made on May 29, 1453. The heroic emperor was slain among the last defenders of the gate of St. Romanos, and the janizaries rode over his dead body as they charged into the streets of the fallen capital. "The despairing people—senators, priests, monks, nuns, husbands, wives and children—sought safety in the church of St. Sophia. A prophecy had been circulated that here the Turks would be arrested by an angel from heaven, with a drawn sword; and hither the miserable multitude crowded, in the expectation of supernatural help. The conquerors followed, sword in hand, slaughtering those whom they encountered in the street. They broke down the doors of the church with axes, and, rushing in, committed every act of atrocity that a frantic thirst for blood and the inflamed passions of demons could suggest. All the unhappy victims were divided as slaves among the soldiers, without regard to blood or rank, and hurried off to the camp; and the mighty cathedral, so long the glory of the Christian world, soon presented only traces of the orgies of hell. The other quarters of the city were plundered by other divisions of the army. . . . About noon the Sultan made his triumphal entry by the gate of St. Romanos, passing by the body of the Emperor, which lay concealed among the slain. Entering the church, he ordered a moolah to ascend the bema and announce to the Mussulmans that St. Sophia was now a mosque, consecrated to the prayers of the true believers. He ordered the body of the Emperor to be sought, his head to be exposed to the people, and afterwards to be sent as a trophy, to be seen by the Greeks, in the principal cities of the Ottoman Empire. For three days the city was given up to the indescribable horrors of pillage and the license of the Mussulman soldiery. Forty thousand perished during the sack of the city and fifty thousand were reduced to slavery."—C. C. Felton, *Greece, ancient and modern: Fourth course, lecture 6*.—See also CHRISTIANITY: 1453.

1453-1481.—City repopulated and rebuilt.—Creation of the Turkish Stamboul.—"It was necessary for Mohammed II to repopulate Constantinople, in order to render it the capital of the Ottoman Empire. The installation of an orthodox Patriarch calmed the minds of the Greeks, and many who had emigrated before the siege gradually returned, and were allowed to claim a portion of their property. But the slow increase of population, caused by a sense of security and the hope of gain, did not satisfy the Sultan, who was determined to see his capital one of the greatest cities of the East, and who knew that it had formerly exceeded Damascus, Bagdad and Cairo, in wealth, extent and population. From most of his subsequent conquests Mohammed compelled the wealthiest of the inhabitants to emigrate to Constantinople, where he granted them plots of land to build their houses. . . . Turks, Greeks, Servians, Bulgarians, Albanians, and Lazes, followed one another in quick succession, and long before the end of his reign Constantinople was crowded by a numerous and active population, and presented a more flourishing aspect than it had done during the preceding century. The embellishment of his capital was also the object of the Sultan's attention. . . . Mosques, minarets, fountains and tombs, the great objects of architectural magnificence

among the Mussulmans, were constructed in every quarter of the city. . . . The picturesque beauty of the Stamboul of the present day owes most of its artificial features to the Othoman conquest, and wears a Turkish aspect. The Constantinople of the Byzantine Empire disappeared with the last relics of the Greek Empire. The traveller who now desires to view the vestiges of a Byzantine capital, and examine the last relics of Byzantine architecture, must continue his travels eastward to Trebizond."—G. Finlay, *History of the Byzantine and Greek empires, from 716 to 1453, bk. 4, ch. 2, sect. 7*.

1920.—Age-long struggle for Constantinople.—Claims of the different nations and their diplomatic and military efforts to win the coveted prize.—Status by the Treaty of Sèvres.—"The continual loss of territory by Turkey has for years led to the discussion of the partition of the Empire. In this discussion the most important consideration has been the assignment of Constantinople. The heirs for this most valuable possession of the Sick Man of Europe have been many and their claims have been varied. 'The Sick Man is dying, what shall be done with his heritage?' was the absorbing question in every European chancellery. This question comes now acutely to the front demanding as one of the results of the war [World War] its settlement in a way that will secure Constantinople's future and remove it from the field of international disputes and aggression."—L. A. Springer, *Coveted city of Constantinople (Asia, Oct., 1917, p. 508)*.—"The scheme for the partition of the Turkish empire in Europe, which was sketched out by Napoleon in his interview with the Tsar Alexander I at Tilsit, was not more practical than such plans have been in later days. But, rough as it was, it still contained one or two pregnant suggestions, which even now are not without value in the discussion of the eastern question. Napoleon was willing to cede Bessarabia, Moldavia, Wallachia, and North Bulgaria to Russia, taking as his own share Albania, Thessaly as far as the gulf of Salonika, the Morea and Crete, while Austria was to be appeased with a part of Bosnia and Servia. The heir of Peter the Great and Catherine II was not, however, content with his portion of the spoils. He was willing to allow Napoleon to take, in addition to the already large French claims, the islands of the Archipelago, Syria, and Egypt, if Russia could have Roumelia and Constantinople. We have it on the authority of an eye-witness, the French Emperor's private secretary, that Napoleon replied by indignantly placing his finger on the spot on the map, which repre-

sented the Turkish capital, and exclaiming: 'Constantinople! Constantinople! never! for it is the empire of the world.' Subsequent events have perhaps diminished the strategic value of that marvellous site; but few will deny that it is still the goal of Russian ambition, though of all the Turkish provinces assigned to Russia at Tilsit, Bessarabia is the only one that she has definitely incorporated in her empire."—W. Miller, *Ottoman empire 1801-1913*, pp. 38-39.—See also BOSPORUS: Thracian Bosphorus.—"In the conflict of interests and the urgency of claimants the Greeks put forward the strongest case based upon purely historical rights. Constantinople, or rather ancient Byzantium, was a Greek settlement. For eleven hundred years after it was founded it was a Greek city and while under Turkish rule the largest element in its considerable Christian population has been Greek. The Greek war for independence was not merely an effort to free ancient classic Greece from the Turkish yoke but had for its broader purpose the revival of the Byzantine Empire. The Greeks . . . dreamt of a new Byzantium which would include their present kingdom and a strip of Turkey from the Adriatic to the Black Sea with a Greek Constantinople as their capital city. . . . Two Balkan nations have appeared as claimants for Constantinople, Serbia and Bulgaria. The Serbs have never reached the city as conquerors. Their great king Stefan Dushan in the height of his glory planned its conquest and collected a formidable force for that purpose. But his death occurred before he could carry out his designs. The Serbs as well as many western historians have held that had Dushan lived he would have driven the Turks from Europe. As it was the Serbs were defeated in the great battle of Kossovo, and completely subjugated. But with the revival of their nationality they have aspired to a South Slav state that would extend to the Bosphorus. In the Bulgars the Greeks meet their strongest rival claimant in southeastern Europe. Unlike the Greeks, the Bulgars have no historic claim to the coveted city. They have, however, always desired to possess it. They besieged it at the time of their first appearance in the Balkan peninsula and again in the eleventh century when at the height of their power. In the Balkan War of 1912 they advanced as far as Tchataldja, the outer defenses of Constantinople. . . . The basis of Bulgaria's claim seems really to be geographical. She already has an opening on the Black and Aegean seas and the European coast line seems a cut off from the Bulgarian line that breaks its continuity. . . . Russia's claims upon Constantinople are both practical and sentimental. They are based upon geographical, political and economic reasons, on the aspirations of her people and on historical traditions. The great traffic bearing rivers of southern Russia all flow into the Black Sea with the exception of the Volga which, however, is soon to be connected with it by a canal. The trade of this region, the oils and other products of the Caucasus, the immense export wheat of the Black Earth section, all must pass through the Bosphorus and Dardanelles, controlled by Turkey and guarded by Turkish guns before it can reach foreign markets. . . . The sentimental reasons are as appealing to the Russian people as are the economic. Their introduction to civilization and culture came from Constantinople as did also their religion and for years many of their clergy. When the Byzantine Empire fell into the Moslem power the Russians remained the only independent people of the Orthodox church. They came to look upon Mos-

cow as the third great religious capital of the world, the legitimate successor of Constantinople as Constantinople had been the successor of Rome. Ivan the Great married the Greek princess Sophia Paleologue, niece of the last Byzantine emperor, and gave the Byzantine double headed eagle the place that it has ever since occupied on the Russian standard. The Russians set themselves up as the protectors of Christian races under Ottoman rule. A Russian war against Turkey has been a religious crusade, the goal of which has always been to place the cross again on St. Sophia. Early in their history the Russians looked toward the south as the path to their destiny. Their warriors descended their rivers and fought the Greeks. One of their rulers established himself in the Balkans and was with difficulty dislodged by the Byzantine emperor who did not wish him as a neighbor. Peter the Great tried to gain access to the Black Sea by capturing Azof. He lost this stronghold to the Turks however and it was not until the reign of Catherine the Second that the Russians really found themselves established on this coast. In 1827 a Russian land force seriously threatened Constantinople, but it was not until 1878 that Russia actually approached the goal of her ambitions. Not until her soldiers were actually in sight of Constantinople did the Sultan accept the Czar's proffered terms of peace. A treaty was signed at San Stefano, but this proved so favorable to Russia that Lord Beaconsfield interfered, thereby committing England to a policy in which she so long persisted. It was this treaty which paved the way for the more famous treaty of Berlin signed in 1879, a treaty always regarded as a remarkable diplomatic document but one in which scarcely a single one of its well balanced provisions was effectually enforced. . . . The interest of Germany in Constantinople has developed in the last thirty years. Even at the time of the signing of the Berlin treaty Bismarck refused to take the Balkan situation as a matter of serious concern to Germany. "Not worth the blood of a single Pomeranian grenadier" was his comment. But Emperor William entirely changed this policy. For a quarter of a century he has planned the commercial penetration of Turkey and his schemes have been ably carried out by the astute von Bieberstein and his successors at Constantinople. The Emperor's visit to Constantinople and his theatrical entry into Jerusalem in 1868 were evidences of his determination to play a dominant part in the Near East situation. . . . Since then Germany has been making every effort to strengthen her hold commercially as well as politically upon the Ottoman Empire. Her most picturesque project was the Bagdad railway which was to start at the Bosphorus and extend eastward across Asia Minor and through the Mesopotamia Valley and which was to form a most important link in a Pan-Germanic union stretching from the North Sea to the Persian Gulf. It is very evident that Constantinople must play an important part in the realization of this dream. Should Russia gain the city and the Straits the great project would be shattered even if it had not already been doomed by the British capture of Bagdad. Should Germany occupy it or through a mastery of Turkey gain control of the coveted city and Straits, then Russia's situation would be the same as in the past except that Germany instead of Turkey would be the keeper to open or close the gates to her south bound commerce. . . . The plan of international control of Constantinople and the territory adjacent to the Straits has always appealed to students as the most attractive solution of the

Maps prepared specially for the NEW LARNED
under direction of the editors and publishers.

problem. The objections, however, have been many. It has been believed that the actual execution of such a scheme of control would be a difficult and delicate matter, that while it might be easily carried on in time of peace, it would present almost insurmountable difficulties in times of war and would result in making Constantinople a scene of widespread corruption and a hot-bed of intrigue between representatives of rival great powers, rival nationalities and rival financial interests. . . .

"A new and vivid interest in this question for Americans comes from the suggestion by Arnold Toynbee in his book *Nationality and War* of the administration of the Straits by the United States and of the support of this plan by Noel Buxton, M. P., one of the foremost students of the question. Mr. Buxton says that in all respects the United States is well fitted for the task, that she is one of the strongest powers in the world, and that while she has no private interests in the Straits she has links of friendship with the peoples in the territory through immigration to the United States, and through her educational missions represented by the two American institutions, Robert College and the American College for women. . . . But in the meantime Constantinople remains in the power of the Turks. They base their right of possession upon conquest and upon the fact that they have held it for 464 years. Often in that time has their hold upon it been imperiled. Frequently has diplomacy stepped in to save it to them. In the Crimean War when Russia menaced it and again when Turkish barbarities and atrocities shocked the civilized world, Great Britain, looking to the safety of her own interests, stood between the Turk and the rest of the world. In 1912 the Balkan allies after a series of amazing and dramatic victories swept over the plains of Thrace and attacked practically the last defense of the city. What the disorganized Turkish army would have done alone cannot be guessed, but they had their old ally, diplomacy, on their side as well as the dread cholera which attacked Bulgar and Turk alike. For days the people of Constantinople listened unperturbed to the roar of distant guns. The Grace of Allah prevailed. The enemy withdrew and the city was saved. The powerful defenses erected by political exigencies were swept away the day that Turkey entered the present war [World War] as an ally of the Central Powers. The balance of power that had always saved Constantinople no longer existed."—L. A. Springer, *Coveted city of Constantinople* (*Asia*, Oct., 1917, pp. 598-604).—The conclusion of peace with the Ottoman empire was a slow process. Diplomats were at odds to know what to do with the city. By the treaty of Sèvres between the Allies and Turkey, finally signed Aug. 10, 1920, Turkish rights and titles over Constantinople were to remain technically unaffected. In reality the allied powers maintained considerable control over Constantinople and the straits. (See SÈVRES, TREATY OF: 1920: Part III: Political clauses: Constantinople; Part XI: Ports, waterways, railways.)

1921.—Near East Conference. See TURKEY: 1921 (March-April): Secret treaties.

1922.—Nationalists take possession of government.—In November, Rafet Pasha, Nationalist representative in Constantinople, took possession of the government and deposed the sultan. Mohammed VI fled to Malta, and three days later Abdul Medjid Effendi was elected Caliph of the Moslems by the Grand Assembly at Angora, a ruler without temporal power, which was to remain vested in the Assembly.

CONSTITUTION ISLAND.—In the Hudson River opposite West Point lies Constitution Island. It is a wood-covered tract of nearly three hundred acres, and for many years it had been coveted by the authorities of the Military Academy and the War Department. Its owner, Miss Anna Bartlett Warner, was always willing to sell to the Government, but Congress could never be induced to make the necessary appropriation for its purchase. In 1908 Mrs. Russell Sage joined with Miss Warner in making a gift of the island to the Nation, to be used as a part of the military reservation at West Point.

CONSTITUTIONS.—The most interesting and important constitutions of the countries and states may be found in full after the historical article on the country. For example the constitutions of Argentina, Australia, Belgium, Brazil, Canada, Central America, Chile, China, Colombia, Czechoslovakia, Finland, France, Germany, Ireland, Italy, Japan, Korea, League of Nations, Norway, Panama, Persia, Poland, Prussia, Russia, South Africa, Sweden, Switzerland, United States, may thus be found after Argentina, Australia, etc. The principal provisions of the constitutions of other countries may be found after their respective articles. Owing to the peculiar construction of the English constitution, there is no large article on the subject, but there are, in addition to the descriptive material to be found after the article on England, various headings under which more detailed information will be obtained as, for instance, Parliament, Cabinet, Magna Carta, Crown, Imperial Federation, Privy Council, Bill of Rights, etc. No attempt has been made to print the text of the constitutions of the separate states of the United States, but some material on the history and contents of these documents may be found in the historical article on those states.—See also AMENDMENTS; DUE PROCESS OF LAW; LAW COURTS.

Definition and classification.—"A Constitution is the fundamental law according to which the government of a state is organized and the relations of individuals with society as a whole are regulated. It may be either a code, a well-defined text, or a collection of such texts promulgated at a certain time by a sovereign authority, or it may be the result, more or less definite, of a series of legislative acts, ordinances, judicial decisions, precedents, and traditions of dissimilar origin and unequal value. To the first class belong most of the constitutions of to-day. To the second belongs the oldest of them all, the one from which all the others are in a certain sense descended; namely, the English constitution. As the private law of the United Kingdom is uncodified, so also is her fundamental law unwritten. The vote of a parliamentary majority, the decision of a supreme court, may serve to expand or to contract it, and it is constantly in process of formation; it is a barrier, yielding indeed to the pressure of circumstances, when this pressure attains a certain degree of intensity, but never breaking; it is stable in spite of, or rather because of, its flexibility. We can study the growth of the English constitution, but we cannot properly speak of its adoption nor of its revision. The decrees of Parliament, that complex power wielded conjointly by the King, the Lords, and Commons, are sovereign, but Parliament does not create the constitution. It may enact statutes which became a part of the fundamental law, but does not itself either establish or systematically revise the constitution. This régime, the result of the political evolution of a feudal monarchy, the continuity of whose public law has never been permanently interrupted, commands admirers among liberals as well as among conservatives. Both—and the conservatives perhaps first,—will recognize its dangers, the further England advances in the direction of democracy. An unwritten constitution does not, as a whole, furnish innovators a definite, concrete point of attack. But, as it lies within the ordinary competence of Parliament to increase or diminish it by mere statutes, indirect blows may be dealt it, all the more dangerous because their aim is not immediately and generally apparent."—C. Borgeaud, *Adoption and amendment of constitutions in Europe and America*, pp. 15-16.—"The old-fashioned classification of Constitutions which has come down to our own times is based on the distinction of Written and Unwritten Law, itself an ill-expressed and rather confusing distinction, because *ius non scriptum* is intended to denote customs; and when customs have been recorded in writing, they can hardly continue to be called unwritten. This classification places in the category of Written Constitutions those which are expressly set forth in a specially important document or documents, and in the category of Unwritten those which began, not in formal agreements, but in usage, a usage which lives in men's collections, and which, even when it has been to a large extent defined, and secured against error, by being committed to writing, is recorded as embodying that which men have observed, and are deemed likely to continue to observe, not as that to which they have bound themselves formally by a law. These terms are, however, not happy terms, although the distinction they aim at expressing is a real distinction. . . . Unwritten Constitutions, though they began in custom, always include some statutes. Moreover, these names, while they dwell on a superficial distinction, ignore a more essential one to be presently mentioned. Let us therefore try to find a better classification. If we survey Constitutions generally,

in the past as well as in the present, we find them conforming to one or other of two leading types. Some are natural growths, unsymmetrical both in their form and in their contents. They consist of a variety of specific enactments or agreements of different dates; possibly proceeding from different sources, intermixed with customary rules which rest only on tradition or precedent, but are deemed of practically equal authority. Other Constitutions are works of conscious art, that is to say, they are the result of a deliberate effort on the part of the State to lay down once for all a body of coherent provisions under which its government shall be established and conducted. Such Constitutions are usually comprised in one instrument—possibly, however, in more than one—an instrument solemnly enacted whose form and title distinguish it from ordinary laws. We may provisionally call these two types the Old and the New, because all ancient and mediæval as well as some few recent Constitutions are of the former kind, while most modern ones belong to the latter. The distinction corresponds roughly to that drawn, in England and America, between common law and statute law, or to the Roman distinction between *ius* and *lex*, so that we might describe the types as Common Law Constitutions and Statutory Constitutions respectively. Yet the line of demarcation is not always a plain one. In countries with constitutions of the Common Law type, statutes are frequently passed, declaring or modifying or abolishing antecedent usage, which supersede and replace parts, possibly large parts, of the common law maxims, so that at last most of the leading rules can be found in a few great statutes. On the other hand, the Statutory Constitutions become developed by interpretation and fringed with decisions and enlarged or warped by custom, so that after a time the letter of their text no longer conveys their full effect. It is, therefore, desirable to have some more definite and characteristic test or criterion whereby to mark off the two types which have been just described in general terms. Such a criterion may be found in the relation which each Constitution bears to the ordinary laws of the State, and to the ordinary authority which enacts those laws. Some constitutions, including all that belong to the older or Common Law type, are on the level of the other laws of the country, whether those laws exist in the forms of statutes only, or also in the form of recorded decisions defining and confirming a custom. Such constitutions proceed from the same authorities which make the ordinary laws; and they are promulgated or repealed in the same way as ordinary laws. In such cases the term 'Constitution' denotes nothing more than such and so many of the statutes and customs of the country as determine the form and arrangements of its political system. And (as will presently appear) it is often difficult to say of any particular law whether it is or is not a part of the political Constitution. Other constitutions, most of them belonging to the newer or Statutory class, stand above the other laws of the country which they regulate. The instrument (or instruments) in which such a constitution is embodied proceeds from a source different from that whence spring the other laws, is repealable in a different way, exerts a superior force. It is enacted, not by the ordinary legislative authority, but by some higher or specially empowered person or body. If it is susceptible of change, it can be changed only by that authority or by that special person or body. When any of its provisions conflict with a provision of the ordinary law, it prevails, and the ordinary law must

give way. These are features, partly political, partly legal, which mark off the two types of Constitution from one another; and although it will appear that in some few cases the question to which type the Constitution of a particular State belongs may be a nice one, still the general legal criteria to be applied are clear and definite. In a State possessing a constitution of the former—the older—type, all laws (excluding of course by-laws, municipal regulations, and so forth) are of the same rank and exert the same force. There is, moreover, only one legislative authority competent to pass laws in all cases and for all purposes. But in a State whose Constitution belongs to the latter—the newer—type, there are two kinds of laws, one kind higher than the other, and more universally potent; and there are likewise two legislative authorities, one superior and capable of legislating for all purposes whatsoever, the other inferior and capable of legislating only so far as the superior authority has given it the right and function to do so.”—J. B. Bryce, *Constitutions*, pp. 5-9.

Function and purpose of a written constitution.—“The theory of democracy assumes that the multitude are both competent and interested; competent to understand the structure of their government and their own functions and duties as ultimately sovereign in it, interested as valuing those functions, and alive to the responsibility of those duties. A Constitution set out in black and white, contained in a concise document which can be expounded and remembered more easily than a Constitution growing out of a long series of controversies and compromises, seems specially fitted for a country where the multitude is called to rule. Only memory and common sense are needed to master it. It can lay down general principles in a series of broad, plain, authoritative propositions, while in the case of the ‘historical Constitution’ they have to be gathered from various sources, and expressed, if they are to be expressed correctly, in a guarded and qualified form. Now the average man, if intelligent enough to comprehend politics at all, likes general principles. Even if, as some think, he overvalues them, yet his capacity for absorbing them gives him a sort of comprehension of his government and attachment to it which are solid advantages in a large democracy. Constitutions of this type have usually arisen when the mass of the people were anxious to secure their rights against the invasions of power, and to construct a frame of government in which their voices should be sure to prevail. They furnish a valuable protection for minorities which, if not liable to be overborne by the tyranny of the mass, are at any rate liable to be disheartened into silence by superior numbers, and so need all the protection which legal safeguards can give them. Thus they have generally been accounted as institutions characteristic of democracy, though the cases of Germany and Japan show that this is not necessarily true. A change of view has, however, become noticeable within the last few years. In the new democracies of the United States and the British self-governing Colonies—and the same thing is true of popularly governed countries in Europe—the multitude no longer fears abuses of power by its rulers. It is itself the ruler, accustomed to be coaxed and flattered. It feels no need for the protection which Rigid Constitutions give. And in the United States it chafes under those restrictions on legislative power, embodied in the Federal Constitution or State Constitution (as the case may be), which have surrounded the rights of property and the obligation of sub-

sisting contracts with safeguards obnoxious, not only to the party called Socialist, but to reformers of other types. As these safeguards are sometimes thought to prevent the application of needed remedies and to secure impunity for abuses which have become entrenched behind them, the aforesaid constitutional provisions have incurred criticism and censure from various sections, and many attempts have been made by State legislatures, acting at the bidding of those who profess to control the votes of working men, to disregard or evade the restrictions. These attempts are usually defeated by the action of the Courts, whence it happens that both the Federal Constitution and the functions of the Judiciary are often attacked in the country which was so extravagantly proud of both institutions half a century ago. This strife between the Bench as the defender of old-fashioned doctrines (embodied in the provisions of a Rigid Constitution, Federal or State) and a State Legislature acting at the bidding of a large section of the voters is a remarkable feature of contemporary America.”—*Ibid.*, pp. 80-82.

Essentials of a written constitution.—Form and content.—Methods of expansion and revision.—“In its structure and content a written constitution differs in important particulars from a statute. It expresses the highest will of the sovereign and is or should be made up of very general prescriptions dealing with such matters as the structural organization of the government, the distribution of its powers among different organs, the mode and principles of its operation, the limitations upon its authority, the apparatus of checks and balances and the process by which the constitution itself may be altered. It is sometimes called the fundamental or organic law because it deals, or is supposed to deal, only with matters of a permanent and general character. [See also EMINENT DOMAIN: Definition.] It is also frequently spoken of as the supreme or paramount law because it usually, though not always, possesses a higher legal authority and overrides all conflicting provisions of statute law. Statutory law is of secondary rather than of primary importance and deals with matters which have more of a temporary than a permanent character. A typical written constitution contains three sets of provisions: first, a series of prescriptions setting forth the fundamental, civil, and political rights of the citizens, and imposing certain limitations on the power of the government as a means of securing the enjoyment of those rights; second, a series of provisions outlining the organization of the government, enumerating its powers, laying down certain rules relative to its administration and defining the electorate; and, third, a provision or provisions pointing out the mode of procedure in accordance with which formal changes in the fundamental law may be brought about. The first group of provisions collectively have been called by one writer the constitution of *liberty*; the second, the constitution of *government*; and the third, the constitution of *sovereignty*. The first group is commonly styled in republican states a ‘bill of rights’ or ‘declaration of rights.’ The people of the United States have always attached great importance to these declarations and have considered them a necessary part of their constitutions. Since 1780 every constitution adopted in the United States, with four exceptions, has given a prominent place to such declarations. In France, likewise, for a time after the Revolution, declarations of principles were considered a most essential part of their instruments of government. . . . The second group of provisions, as has been said, related to the

organization of the government in its widest sense, including the distribution of powers among the several departments, the organization of the particular agencies through which the state manifests itself, the extent and duration of their authority, the modes of appointment or election of public functionaries, and the constitution of the electorate. In some constitutions the provisions of this character are few in number and very general in character. The 'constitutional' laws of France, for example, contain no provisions governing the composition, mode of election, tenure, organization, or powers of the Chamber of Deputies, except the solitary provision that the Chamber shall be chosen by an electorate constituted on the basis of universal suffrage. [See also DEMOCRACY.] The constitution of the United States is in respect to its content and scope the model of written constitutions. Its provisions in regard to the frame of government are general in character, yet sufficiently detailed to embrace those matters which may be considered as essential and fundamental. . . . It is the constitutions of the individual states of the American federal union that violate most the canons laid down above in regard to the proper conception of the content and scope of the fundamental law. The first of these instruments of government, notably those adopted before the close of the eighteenth century, were remarkably brief and general in character. But those of each generation have grown in volume until some of those more recently adopted contain not only the fundamental public law, but a great deal that is not fundamental as well as a considerable amount of parliamentary law and ordinary private law. . . . The result of all this has been to change fundamentally the character of the American state constitutions. From instruments of fundamental public law they have become largely codes of ordinary statute law. . . . The development of a written constitution by judicial interpretation necessarily results from the ambiguities of language and the deficiencies of expression which abound in the most carefully framed instrument, from the appearance of new circumstances and conditions, and finally from the inevitable difference of opinion which arises concerning the meaning of its provisions. Under such circumstances nothing is more natural than for the judiciary to assume the responsibility of ascertaining not only the true meaning of that which is expressed in the constitution but also that which the framers intended to express; and to draw conclusions respecting its applicability to subjects which lie beyond the direct expressions of the text and which the framers would have dealt with had they been gifted with the power of foresight. Expansion by interpretation is especially potent in countries like the United States, where the judiciary plays an exceptionally important role, possessing as it does not only the power to interpret the meaning of the provisions of the constitution, but also to declare statutes which are in conflict with the supreme law to be of no force and effect. [See STATE GOVERNMENT: 1776-1800.] The most prolific source of constitutional expansion, particularly in republican states, is, of course, formal amendment of the written instrument in accordance with the method of procedure set forth in the fundamental law itself for making changes in its provisions. As has been said, provision for its own alteration has come to be regarded as an essential part of every written constitution. Some of the early American state constitutions (eight of them altogether and all belonging to the eighteenth century) contained no such provisions. Whether this

omission was due to oversight, or failure to appreciate the obvious advantages of expressly pointing out in the constitution itself the mode of procedure to be observed in altering its provisions; or whether it was due to the prevailing opinion, repeatedly asserted in their bills of rights, that the people have an inalienable right at all times to amend their constitutions and hence no necessity exists for limiting their right by self-imposed restrictions.—there is a difference of opinion. Whatever may have been the reason, the desirability, not to say necessity, of pointing out in the constitution a method of legal and orderly procedure for making alterations soon came to be appreciated; and all the American state constitutions framed since the beginning of the nineteenth century, with three exceptions, have contained amending provisions. No written constitution is complete without such a provision."—J. W. Garner, *Introduction to political science*, pp. 397-405.

Origin of the idea of written constitution.—Influence of the French Revolution.—"Lex regia" of medieval Roman emperors.—American colonial constitutions.—"The conception, which may properly be called French, of a codified public law, sharply differentiated from ordinary legislation, stands to-day at the base of the modern state; the exceptions of Great Britain and Hungary not invalidating the general rule. This conception was spread abroad throughout Europe by the French Revolution. It must not, however, be forgotten that the idea of a written constitution was entertained much earlier than 1789, and that it did not originate in France. In certain respects the idea may be traced back to the Middle Ages, and even to ancient law, to the famous *lex regia*, the source of the unlimited power of the Roman emperors. But this was only a formula expressing an unconditional delegation of sovereignty, a sort of general transfer of power, by which the prince was invested with the *imperium* and the *potestas*, without restrictions or limitations. The states of the Middle Ages were, indeed, familiar with charters by which liberties were confirmed, franchises granted, or privileges bestowed upon individuals, corporations, important vassals, orders, cities, communes, religious associations, mercantile companies, and industrial organizations, but they were not acquainted with constitutions of the type with which we are familiar, by which the rights of the individual are defined and the governing power is limited. The constitutions adopted by the American colonies after their emancipation from the English rule are the first which the history of modern public law records. Imitating them, the French National Assembly codified its decrees, and imposed them in this unified form upon the king, in the name of the sovereign nation."—C. Borgeaud, *Adoption and amendment of constitutions in Europe and America*, pp. 3-4.

1783-1848.—Influence of American constitutions in France.—European revolutions.—"In 1783, Franklin, at that time living in Passy, caused all the constitutions of America to be translated and published. This collection at once became famous. Everywhere the constitutions were warmly discussed,—in the salons, at the clubs, at court, in the city, in the country. Those who argued against them, in favour of the English form of liberty, a liberty obtained by the gradual evolution of customary law, met with some success among the privileged orders. Yet the nobility was itself divided for the younger nobles rallied gladly around Lafayette, Noailles, Lameth, and their colleagues in the War of Independence, popularly called 'the Americans.' Public opinion condemned England.

In 1787 the new Federal Constitution reached Paris, giving a new impetus to the dissertations of the philosophers, new life to the universal discussions. The French were already more jealous of popular liberties than was the Philadelphia Convention. They were troubled at not finding in the federal document drawn up by that body, a Declaration of the Rights of Man. [See also DEMOCRACY: Progress during 17th and 18th centuries.] In view of these facts, it would have been astonishing if these American ideas had not played a rôle, and an important one, in the cahiers of 1780. Those of the nobility and clergy admit, in general, that France already possesses a constitution, based upon the hereditary monarchy and the three orders. But those of the Third Estate, which 'is as yet *nothing* and is shortly to become *everything*,' demand almost unanimously that the coming Assembly, in which they wish to have the orders unite, shall adopt a declaration of rights and determine the basis of a written constitution, before granting any tax or enacting any legislation. . . . A fundamental law, made by the nation itself and intended to protect the State against the abuses of authority, this is indeed the definition of the modern democratic constitution. Sieyès thought himself the inventor of it. Lafayette protested, in favour of America, against a pretension historically so unwarranted. This idea, which the people's representatives swore in the Tennis Court they would realize, has remained, despite dictatorships, one of the dominant ideas of the French Revolution. The form of the government has experienced the most rapid and extraordinary changes, the conception of the rights of individuals has become alternately larger and smaller, but the principle of a fundamental written act, the formal expression of the national will, has remained the legal basis of all the régimes which have issued from 1789. [For the text of the French Declaration of the Rights of Man, see FRANCE: 1789 (August): Constitution-making and the rights of man.] When the Revolution spread throughout Europe, this idea sprang up everywhere in the wake of her victorious armies. In Holland, in Italy, in Switzerland, there arose upon the ruins of the ancient established orders constitutions similar to the one submitted by the Convention to the primary assemblies of the Year III."—*Ibid.*, pp. 21-23.—"While Great Britain worked out in comparative calm the adaptation of her political system to the needs of the nineteenth century, progress in the same direction in the rest of Europe was attended with a long series of convulsions. From the fall of Napoleon's empire for full two-thirds of a century agitation was continuous and wars were not infrequent for the realization on the continent of political ideas that had been made prominent by the French Revolution. Until the middle of the century the history of the period is punctuated with insurrections; after 1850, the type of disturbance changes to international war."—W. A. Dunning, *European theories of constitutional government after the Congress of Vienna* (*Political Science Quarterly*, Mar., 1919, p. 1).

1850-1880.—Demands for constitutions.—Rise of new forms and theories.—Adoption of written constitutions in European states.—"Despite the strong reactionary and obscurantist influence manifested in the Holy Alliance, the governments actually organized in the states whose monarchs were restored by the Congress of Vienna furnished abundant evidence that the ideas of the revolution had not lost all their force. Especially conspicuous was the idea that some kind of constitution—of fundamental law, written or unwritten—was of

the essence of a rational and workable system. Various practical conditions confirmed the old tendency to regard only a formal written document as a constitution in the full and precise sense. Hence the demand for some such well-defined legal basis for the government, whether monarchic, aristocratic or democratic, became the central feature in the program of the liberal party in every state. Concession to this demand went steadily on among the princes of the continent, strongly resisted only by Austria, Russia and Prussia. After the crises of 1848 the Hohenzollern and later the Hapsburger gave way, and by 1880 practically every Christian state of the continent save Russia was governed under a written constitution. During the agitations and conflicts that attended the progress to this end, theoretical debate developed new and striking doctrines only as to the content, not as to the desirability, of the written code. There was the greatest diversity among the actual constitutions in the organization and action of the governments. In every state there was continuous strife between parties demanding the application of liberal and conservative interpretations respectively to the fundamental law, or the expansion of that law in the sense of their particular interests. As to the essential requirements of constitutional government, theory was practically unanimous in holding that there must be, first, some guarantee of rights to the individual, and second, a separation of legislative, executive and judicial powers. It was further held by all but the ultra-conservatives that rational government required the participation of some form of deliberative assembly representing in some way the body of the population. All these requirements had been understood and met in France in 1789 and the following years, but the swift progress of those years into anarchy remained a potent warning to the liberals of the next generation and interposed a barrier for decades against every suggestion of republicanism. Hence the chief problem of those who speculated on the theory of constitutional government was to find a safe and useful niche in the system for the monarch. Thus until after 1848 the theories of the constitutional state, *Rechtsstaat*, as the Germans called it, were largely concerned with the effort to reconcile the functions of a representative assembly with those of a hereditary monarch, to insure the liberty of the subject individual against the historical and traditional omnipotence of the reigning individual, and to partition sovereignty neatly between the prince and the people or banish the troublesome concept from the ken of philosophy."—*Ibid.*, pp. 3-4.—See also DEMOCRACY: Progress following industrial revolution.

CONSTITUTIONS, Roman imperial. See **CORPUS JURIS CIVILIS**.

CONSTITUTIONS OF CLARENDON.—The "Constitutions of Clarendon" were a series of declarations drawn up by a council which King Henry II of England convened at Clarendon, near Winchester, in 1164, and which were intended to determine the law on various points in dispute between the crown and the laity, on one side, and the church on the other. The issues in question were those which brought Henry into collision with Thomas Becket, archbishop of Canterbury. The general provisions embodied in the Constitutions of Clarendon "would now be scarcely challenged in the most Catholic country in the world. 1. During the vacancy of any archbishopric, bishopric, abbey, or priory of royal foundation, the estates were to be in the custody of the Crown. Elections to these preferments were to be held in the royal chapel, with the assent of the king and council. 2. In every suit to which a clerk was a party, proceedings were to commence before the king's justices, and these justices were to decide whether the case was to be tried before a spiritual or a civil court. If it was referred to a spiritual court, a civil officer was to attend to watch the trial, and if a clerk was found guilty of felony the Church was to cease to protect him. 3. No tenant-in-chief of the king, or officer of his household, was to be excommunicated, or his lands laid under an interdict, until application had been first made to the king, or, in his absence, to the chief justice. 4. Laymen were not to be indicted in a bishop's court, either for perjury or other similar offence, except in the bishop's presence by a lawful prosecutor and with lawful witnesses. If the accused was of so high rank that no prosecutor would appear, the bishop might require the sheriff to call a jury to inquire into the case. 5. Archbishops, bishops, and other great persons were forbidden to leave the realm without the king's permission. 6. Appeals were to be from the archdeacon to the bishop, from the bishop to the archbishop, from the archbishop to the king, and no further; that, by the king's mandate, the case might be ended in the archbishop's court. The last article the king afterwards explained away. It was one of the most essential, but he was unable to maintain it; and he was rash, or he was ill-advised, in raising a second question, on which the pope would naturally be sensitive, before he had disposed of the first."—J. A. Froude, *Life and times of Becket*, pp. 31-32.—See also **CHURCH OF ENGLAND**: 1066-1534; **ENGLAND**: 1162-1170.

CONSUETUDO. See **CIVIL LAW**: B. C. 450-100.

CONSUL, First French. See **FRANCE**: 1799 (November-December).

CONSUL, Roman.—When the Romans had rid themselves of their kings and established a republic, or, rather, an aristocratic government, "the civil duties of the king were given to two magistrates, chosen for a year, who were at first called 'prætores' or generals, 'judices' or judges, or consules (cf. con 'together' and salio 'to leap') or 'colleagues.' In the matter of their power, no violent departure was made from the imperium of the king. The greatest limitation on the consuls was the short period for which they were at the head of the state; but even here they were thought of, by a fiction, as voluntarily abdicating at the expiration of their term, and as nominating their successors, although they were required to nomi-

nate the men who had already been selected in the 'comitia centuriata.' Another limitation was the result of the dual character of the magistracy. The imperium was not divided between the consuls, but each possessed it in full, as the king had before. When, therefore, they did not agree, the veto of the one prevailed over the proposal of the other, and there was no action."—A. Tighe, *Development of the Roman constitution*, ch. 4.—"As judges, the consuls occupied altogether the place of the kings. They decided the legal disputes of the citizens either personally or by deputy. Their criminal jurisdiction was probably limited to the most important cases. . . . In the warlike state of the Romans the military character of the consuls was no doubt most prominent and most important. When the consul led the army into the field he possessed the unlimited military power of the kings (the imperium). He was entrusted with the direction of the war, the distribution of the booty, and the first disposal of the conquered land. . . . The oldest designation for the consuls, therefore, was derived from their military quality, for they were called prætors, that is, commanders. It was, however, precisely in war that the division of power among two colleagues must often have proved prejudicial . . . and the necessity of unity in the direction of affairs was felt to be indispensable. The dictatorship served this purpose. By decree of the senate one of the consuls could be charged with naming a dictator for six months, and in this officer the full power of the king was revived for a limited period. The dictatorship was a formal suspension of the constitution of the republic. . . . Military was substituted for common law, and Rome, during the time of the dictatorship, was in a state of siege."—W. Ihne, *History of Rome*, bk. 2, ch. 1, and bk. 6, ch. 3-5.—In the later years of the Roman empire, "two consuls were created by the sovereigns of Rome and Constantinople for the sole purpose of giving a date to the year and a festival to the people. But the expenses of this festival, in which the wealthy and the vain aspired to surpass their predecessors, insensibly arose to the enormous sum of four score thousand pounds; the wisest senators declined a useless honour which involved the certain ruin of their families, and to this reluctance I should impute the frequent chasms in the last age of the consular Fasti. . . . The succession of consuls finally ceased in the thirteenth year of Justinian [541] whose despotic temper might be gratified by the final extinction of a title which admonished the Romans of their ancient freedom. Yet the annual consulship still lived in the minds of the people; they fondly expected its speedy restoration . . . and three centuries elapsed after the death of Justinian before that obsolete dignity, which had been suppressed by custom, could be abolished by law. The imperfect mode of distinguishing each year by the name of a magistrate was usefully supplied by the date of a permanent era."—E. Gibbon, *History of the decline and fall of the Roman empire*, ch. 40.—"There were no consuls in 531 and 532. The Emperor held the office alone in 533, and with a colleague in 534. Belisarius was sole consul in 535. The two following years, having no consuls of their own, were styled the First and Second after the Consulship of Belisarius. John of Cappadocia gave his name to the year 538, and the years 539 and 540 had again consuls, though one only for each year. In 541 Albinus Basilus sat in the curule chair, and he was practically the last of the long list of warriors, orators, demagogues, courtiers, which began (in the year 509 B.C.) with the names of

Lucius Junius Brutus and Lucius Tarquinius Collatinus. All the rest of the years of Justinian, twenty-four in number, were reckoned as Post Consulatum Basilii.—T. Hodgkin, *Italy and her invaders*, bk. 5, ch. 14.—See also **ROME**: Republic: B. C. 133.

CONSULAR SERVICE. See **DIPLOMATIC AND CONSULAR SERVICE.**

CONSULAR TRIBUNES, Roman.—The plebeians of Rome having demanded admission for their order to the consulship, a compromise was arranged, B. C. 444, which settled that, thereafter, "the people should be free to elect either consuls—that is, patricians according to the old law—or in their place other officers under the title of 'military tribunes with consular power,' consisting of patricians and plebeians. . . . It is not reported in what respect the official competency of the consular tribunes was to differ from that of the consuls. Still, so much is plain, that the difference consisted not alone in name. The number of the consular tribunes was in the beginning fixed at three."—W. Ihne, *History of Rome*, bk. 2, ch. 11.—See also **ROME**: Republic: B. C. 445-400.

CONSULTA, Papal, state council composed of laymen from the provinces of the papal territory. It was instituted by Pius IX in 1847 to allay the agitation for constitutional government.

CONSULTA, Senatus.—"A proposition sanctioned by a majority of the Senate, and not vetoed by one of the Tribunes of the Plebs, who might interrupt the proceedings at any stage, was called *Senatus-Consultum* or *Senatus-Decretum*, the only distinction between the terms being that the former was the more comprehensive, since a *Senatus-Consultum* might include several orders or *Decreta*. But if a Tribune of the Plebs put his veto on a proposition which a majority of the Senate had sanctioned, then the resolution of the Senate was called *Senatus Auctoritas*, and became a mere formal expression of opinion without legal efficacy. When a *Senatus-Consultum* had been passed, it was reduced to writing (*perscriptum est*). Those who had taken the greatest interest in the measure superintended this process (*scribendo adfuerunt*), and their names, styled *auctoritates perscriptae*, were included in the body of the document. In like manner a *Senatus Auctoritas* was frequently written out, serving as a sort of protest, and recording the names of those who had supported the motion as well as of the Tribune or Tribunes who had interceded. When one or more Tribunes had put their veto upon a measure approved of by a large majority, the Consuls were sometimes requested to remonstrate with the Tribunes (*agere cum Tribunis*), and to endeavour to induce them to withdraw their opposition. Sometimes, under similar circumstances, the Consuls proceeded immediately to consult the Senate upon the propriety of having recourse to strong measures, whether, for example, it might not be expedient to make an appeal to the people or to arm the Consuls with Dictatorial power. Not only a Tribune but one of the Consuls might interfere to prevent the passing of a *Senatus-Consultum*, such interference being termed *intercessio collegae*, or, generally, any magistrate possessed of authority equal to or greater than that of the magistrate who brought forward the proposition. Ordinary Senators, although they could not positively forbid the passing of a resolution, might in various ways impede, delay, and thus eventually frustrate it,—(1) By speaking against time.—(2) By demanding that each individual Senator should be called upon to speak (*ut singuli consulantur*).—(3) By requiring that each clause should be discussed separately

(*ut sententiae dividerentur*).—(4) By calling upon the president, again and again, to count the house (*Numerare Senatum*), in order to ascertain that there was a proper number present."—W. Ramsay, *Manual of Roman antiquities*, pp. 261-262.

CONTALMAISON, village in northeastern France, five miles northeast of Albert. On July 14, 1916, the British advanced from here in the second stage of the Battle of the Somme. See **WORLD WAR**: 1916: II. Western front: d, 6.

"**CONTEMPTIBLE LITTLE ARMY**," phrase said to have been used by the German emperor early in the World War in reference to the British regular army.

CONTINENTAL SYSTEM, a plan by which Napoleon hoped to undermine the strength of England by the destruction of her commerce through the organization, 1806-1814, of a blockade among the European nations. "It was at this juncture, as a direct result of his failure at Trafalgar and his great victories at Austerlitz and Jena, that Napoleon introduced the 'Continental System' by which he hoped to break the spirit of the British nation and place such a yoke upon the necks of the Continental powers as to keep them his humble and submissive servants. To accomplish this he issued the 'Berlin Decrees' in November, 1806. By these important enactments he declared the British Isles to be in a state of blockade. He gave to his subjects and those who were beneath his iron heel the right to confiscate all British merchandise, and threatened with displeasure all who traded with her. These decrees resulted in a counterblast from Great Britain in the 'Orders in Council' issued in the following year forbidding all trade between England and France or any ports dependent upon Napoleon, declaring the sale of ships by a belligerent to a neutral power void, and asserting the continuance of the right of search. Great Britain had no other alternative than this, but it was extremely unfortunate, as in 1812 it led to the war with the United States of America. . . . The Continental System, by which Napoleon attempted to execute his design, failed. By the Orders in Council the English government retaliated, and the mercantile marine of Europe was destroyed. The raw materials from the colonies beyond the seas reached England alone, and, at a time when the great mechanical inventions of the 18th century enabled her to take advantage of them, gave her manufactures a commanding superiority. Northern Europe suffered heavily by the loss of imported foodstuffs, and the Continental System helped to exasperate the population against Napoleon."—R. W. Jeffrey, *New Europe*, pp. 98-99, 84.—"His brother Louis having shown a reluctance to adhere to that system in Holland, where he was King, Napoleon had not only deposed him in July, 1810, but had

incorporated all the countries bordering on the North Sea as far as Elbe with his Empire. This Grand Empire was simply a coalition against England, but the foundations of that Empire were unsound. On December 31, 1810, Alexander [I., of Russia], irritated at Napoleon's seizure of Oldenburg, held by a Russian prince, declared that he had resolved to modify the strictness of the continental system. 'That,' said Napoleon, 'is the leak that is sinking the ship.' War with Russia was then determined upon. . . . Everything therefore hung upon the success of the Russian campaign."—A. Hassall, *France, medieval and modern*, p. 237.—See also FRANCE: 1801-1802; 1805 (March-December); 1806-1810; 1807-1808 (August-November).

CONTINUATION SCHOOLS. See EDUCATION: Modern developments: 20th century: Vocational education; Evening schools; EDUCATION, AGRICULTURAL.

CONTINUOUS VOYAGE: Definition.—Origin and application of doctrine.—Continuous voyage is a term applied to a principle of international maritime law. Sir William Scott, later Lord Stowell, formulated it in the course of the British prize court proceedings in the famous case of the *Maria* in the following words: "It is an inherent and settled principle in cases in which the same question can have come under discussion, that the mere touching at any port without importing the cargo into the common stock of the country, will not alter the nature of the voyage, which continues the same in all respects, and must be considered as a voyage to the country to which the vessel is actually going for the purpose of delivering the cargo at the ultimate port." The doctrine of continuous voyages was developed by the English courts to defeat the devices by which American merchantmen endeavored to avoid the rule denying neutrals in time of war the right to engage in a commerce from which they were excluded in time of peace. . . . In the closing years of the eighteenth century the British prize courts announced the general rule that a trade not open to neutrals in time of peace cannot be pursued by them in time of war, and asserted that the principle had been applied as the basis for the condemnation of the Dutch ships during the war of 1756. . . . [England] conceded to the neutral the right to import the products of the enemy's colonies into a neutral country and to export the goods of a neutral country other than contraband, to any port of the enemy which was not blockaded. The inevitable result of this condition was the importation of colonial goods into the country and their carriage from there to the belligerent. The law, according to the British view, contemplated two distinct voyages and the efforts of the American traders to engage in the forbidden commerce by means of alleged colorable importations into American ports was met by the assertion that where the importation into the neutral country was not in good faith the voyage from the colonial port to the belligerent was in law but one voyage and the ship was therefore subject to capture at any time after its departure from the neutral port. The voyage from the neutral port was not a new and distinct voyage but a continuation of the original voyage by which the goods had been imported and the entire voyage, although circuitous, was as illegal as if the neutral port had been entirely omitted. . . . The theory of continuous voyages was applied by Sir William Scott as early as the year 1800. It is interesting to note that it was first applied in favor of a neutral for the protection of a cargo which had gone from the neutral

port of Hamburg to the belligerent port of Bordeaux and from there to the French port of San Domingo. . . . The doctrine of continuous voyages was also recognized by the Supreme Court of the United States in a case which arose during the war between the United States and Mexico. . . . During the Crimean War, France applied the doctrine of continuous voyages to the carriage of contraband goods. . . . In considering the Civil War cases it must be remembered that the entire coast of the Confederacy was blockaded, and that both blockade running and the carriage of contraband goods was involved in every attempt to carry goods of a contraband nature to that coast. In order to restrict the danger area, ships engaged in the forbidden trade adopted the plan of clearing for neutral ports conveniently near the southern coast and there transshipping the goods to neutral vessels, especially adapted for the hazardous work of entering a Confederate port. . . . The *Dolphin* was the first of a series of cases in which the doctrine of continuous voyages was applied. She was a steamer of apparent British ownership which was captured near Porto Rico, while ostensibly on a voyage from Liverpool to Nassau with a cargo composed in part of goods contraband if destined for a belligerent country. Both ship and cargo were condemned by the district court. . . . 'The cutting up of the voyage into several parts,' said Judge Marvin, 'by the intervention or proposed intervention of several intermediate ports, may render it more difficult for cruisers or prize courts to determine where the ultimate terminus is intended to be, but it cannot make a voyage which in its nature is one, to become two or more voyages, nor make any of the parts of one entire voyage to become legal which would be illegal if not so divided.' . . . As was to be anticipated the decided weight of continental opinion as expressed by writers on international law was against the soundness and policy of the American decisions. . . . The reasonableness of the doctrine of continuous voyages as applied to modern conditions has [however] led to its general acceptance by maritime states and by writers of high authority, such as Bluntschli, Gessner, Kleen, Fiore, Calvo, Bonfils, Westlake, Oppenheim, and others. In its present form . . . [it] is applied to the continuous transportation of contraband goods over a previously determined route as well as to the continuous voyage of a ship. It seems to have been developed naturally and logically by the application of well settled rules of law to meet the difficulties arising out of new conditions."—C. B. Elliott, *Doctrine of continuous voyage (American Journal of International Law, Jan., 1907, pp. 61-104)*.—On the outbreak of the World War, the attempt on the part of the Allies to shut off Germany and Austria-Hungary from supplies coming from the neutral states led to diplomatic controversies with the United States of America. During the years 1915-1916, the doctrine of the continuous voyage was often invoked by Great Britain in order to justify her interference with American trade with Germany by way of the Netherlands and Scandinavia. In his reply to the American protest of April 2, 1915, Sir Edward Grey sets forth his defense of the Allied blockade methods as follows: "It may be noted in this connexion that at the time of the Civil War the United States found themselves under the necessity of declaring a blockade of some 3,000 miles of coastline, a military operation for which the number of vessels available was at first very small. It was vital to the cause of the United States in that great struggle that they should be able to

cut off the trade of the southern States. The Confederate armies were dependent on supplies from over-seas, and those supplies could not be obtained without exporting the cotton wherewith to pay for them; to cut off this trade the United States could only rely upon a blockade. The difficulties confronting the Federal Government were in part due to the fact that neighbouring neutral territory afforded convenient centres from which contraband could be introduced into the territory of their enemies and from which blockade running could be facilitated. Your Excellency will no doubt remember how, in order to meet this new difficulty, the old principles relating to contraband and blockade were developed and the doctrine of continuous voyage was applied and enforced, under which goods destined for the enemy territory were intercepted before they reached the neutral ports from which they were to be re-exported. The difficulties which imposed upon the United States the necessity of reshaping some of the old rules are somewhat akin to those with which the Allies are now faced in dealing with the trade of their enemy. Adjacent to Germany are various neutral countries which afford her convenient opportunities for carrying on her trade with foreign countries. Her own territories are covered by a network of railways and waterways, which enable her commerce to pass as conveniently through ports in such neutral countries as through her own. A blockade limited to enemy ports would leave open routes by which every kind of German commerce could pass almost as easily as through the ports in her own territory. Rotterdam is indeed the nearest outlet for some of the industrial districts of Germany. As a counterpoise to the freedom with which one belligerent may send his commerce across a neutral country without compromising its neutrality, the other belligerent may fairly claim to intercept such commerce before it has reached, or after it has left, the neutral State, provided, of course, that he can establish that the commerce with which he interferes is the commerce of his enemy and not commerce which is *bona fide* destined for, or proceeding from, the neutral State. It seems accordingly that, if it be recognized that a blockade is in certain cases the appropriate method of intercepting the trade of an enemy country, and if the blockade can only become effective by extending it to enemy commerce passing through neutral ports, such an extension is defensible and in accordance with principles which have met with general acceptance. To the contention that such action is not directly supported by written authority it may be replied that it is the business of writers on international law to formulate existing rules rather than to offer suggestions for their adaptation to altered circumstances, and your Excellency will remember the unmeasured terms in which a group of prominent international lawyers of all nations condemned the doctrine which had been laid down by the Supreme Court of the United States in the case of the *Springbok*—a doctrine upheld by the Claims Commission at Washington in 1873. But the United States and the British Government took a broader view, and looked below the surface at the underlying principles; and the Government of this country, whose nationals were the sufferers by the extension and development of the old methods of blockade made by the United States during the Civil War, abstained from all protest against the decisions by which the ships and their cargoes were condemned. What is really important in the general interest is that adaptations of the old rules should not be made unless

they are consistent with the general principles upon which an admitted belligerent right is based. It is also essential that all unnecessary injury to neutrals should be avoided. With these conditions it may be safely affirmed that the steps we are taking to intercept commodities on their way to and from Germany fully comply. We are interfering with no goods with which we should not be entitled to interfere by blockade if the geographical position and the conditions of Germany at present were such that her commerce passed through her own ports. We are taking the utmost possible care not to interfere with commerce genuinely destined for or proceeding from neutral countries. Furthermore, we have tempered the severity with which our measures might press upon neutrals by not applying the rule which was invariable in the old form of blockade, that ships and goods on their way to or from the blockaded area are liable to condemnation."—Sir Edward Grey, *Letter to Ambassador Page*, in J. Buchan, *Nelson's history of the war*, v. 8, pp. 197-199.—See also BLOCKADE: Meaning; CONTRABAND: Origin and meaning of; FREEDOM OF THE SEAS; LONDON, DECLARATION OF.

CONTIONES, or CONCIONES.—The contiones, or conciones, at Rome, were assemblies of the people, "less formal than the comitia," held for the mere purpose of discussing public questions, and incapable of passing any binding resolution. "They could not be called together by anybody except the magistrates, neither had every man the liberty of speaking in them, of making proposals or of declaring his opinion; . . . but even in this limited manner public questions could be discussed and the people could be enlightened. . . . The custom of discussing public questions in the contiones became general after the comitia of the tribes had obtained full legislative competency."—W. Ihne, *History of Rome*, bk. 6, ch. 1.—See also COMITIA CURIATA.

CONTRABAND: Origin and meaning of term.—"The term contraband derives from the Italian 'contrabbando,' which, itself deriving from the Latin 'contra' and 'bannum' or 'bandum,' means 'in defiance of an injunction.' Contraband of war is the designation of such goods as are interdicted by either belligerent to be carried to the enemy on the ground that they enable the latter to carry on the war with greater vigour. But this definition is only a formal one, as it does not say what kinds of goods belong to the class of contraband. This point is indeed, and always was, much controverted. The matter still stands as Grotius explained it. Although he does not employ the term contraband, he treats of the matter. He distinguishes three different kinds of articles. Firstly, those which, as arms for instance, can only be made use of in war, and which are, therefore, always contraband. Secondly, those, as articles of luxury, which can never be made use of in war and which, therefore, are never contraband. Thirdly, those which, as money, provisions, ships, and articles of naval equipment, may be made use of in war as well as in peace, and which are on account of their ancipitous use contraband or not according to the circumstances of the case. In spite of Bynkershoek's decided opposition to this distinction of Grotius, the practice of most belligerents has down to the present day been in conformity with it. A great many treaties have from the beginning of the sixteenth century been concluded between different States for the purpose of fixing what articles belonging to the class of ancipitous use should and what should not be regarded as contraband between the parties,

but all these treaties disagree with one another. And, as far as they are not bound by a treaty, belligerents always have exercised, and still exercise, their discretion in every war according to the special circumstances and articles of ancipitous use as contraband. The endeavour of the First and the Second Armed Neutrality of 1780 and 1800 to restrict once for all the number and kinds of articles that could be regarded as contraband failed, and the Declaration of Paris of 1856 uses the term contraband without any attempt to define it. . . . Articles which by their very character are primarily and ordinarily destined to be made use of in war are termed absolute contraband. . . . In this class are to be reckoned not only arms and ammunition, but also such articles of ancipitous use as military stores, naval stores, and the like. There are many articles which are not by their character destined to be made use of in war, but are nevertheless of great value to belligerents for the continuance of the war. Such articles are conditionally contraband, which means that they are contraband when it is clearly apparent that they are intended to be made use of for military or naval purposes. This intention becomes apparent on considering either the destination of the vessel carrying the articles concerned, or the consignee of the articles. If such destination is an enemy fleet, or an enemy port exclusively or mainly used for military or naval equipment, or if the consignee is a contractor for the enemy army and navy, it may justly be presumed that the goods are intended to be made use of for military or naval purposes. What articles belong to this class cannot be decisively laid down. Neither the practice of States nor the opinion of writers agrees upon the matter, and it is in especial controversy whether or not foodstuffs, horses and other beasts of burden, coal and other fuel, money and the like, and cotton can conditionally be declared contraband."—L. Oppenheim, *International law*, pp. 421-426.

In the World War.—The British orders in council of 1914 and 1915 dealing with this question, extended the lists of contraband, both absolute and conditional, applied the doctrine of continuous transport to conditional contraband as well as absolute, and took the unprecedented step (partly by way of reprisal) of declaring foodstuffs absolute contraband. Both the United States and Germany protested, but with little effect. Thus the laws of contraband, despite their long history, remain subject to the convenience or interest of belligerent nations.—See also ARMED NEUTRALITY; BLOCKADE; CONTINUOUS VOYAGE; ORIGIN; FREEDOM OF THE SEAS; U. S. A.: 1915 (February): Contraband of war; WORLD WAR: 1914: XII. Neutral nations: b.

CONVOCAATION.—The assemblies of the clergy in the two ecclesiastical provinces of England are called the Convocation of Canterbury and the Convocation of York. The former, which is the superior body, frequently receives the name of Convocation, simply. It is constituted upon the model of Parliament, and is, in fact, the parliament of the Church of England. It has two houses: the upper one consisting of the archbishop and his bishops; the lower one composed of deans, archdeacons and proctors, representing the inferior clergy. The Convocation of York has but one house. Since 1716 Convocation has possessed slight powers.

CONVULSIONISTS, sect of fanatics who appeared in France in the eighteenth century after the famous papal bull "Unigenitus," condemning one hundred and one propositions of Quesnel, had been issued as a result of the conflict between the Jesuits and the Jansenists. [See PORT ROYAL AND THE JANSENISTS: 1702-1715.] Those of the clergy who accepted the bull were called Acceptants and those who appealed to a general council against the pope were termed Appellants. "A young Jansenist clergyman, François de Pâris, had died in 1727 as a result of his ascetic practices, with his 'appeal' in his hand, and some miraculous cures performed at his grave were looked upon as a divine confirmation of the cause of the Appellants; even children fell into convulsions and trances on his grave, prophesying and testifying against the bull. Infidels were carried away by the fanaticism of the thousands who knelt at the grave of Pâris in the churchyard of St. Médard. In 1732 the king ordered the graveyard to be closed; but portions of earth which had been taken from the grave were equally efficacious, and the number of convulsionary prophets of coming ruin to Church and State continued to increase until the movement ended in strife, and sometimes in moral disorder, after giving occasion to the skeptics to draw conclusions unfavorable to the miracles of Christianity."—P. Tschackert, in *New Schaff-Herzog religious encyclopedia*, p. 98.

COÖPERATION: Early history.—"An interesting phase of labor enterprise within the past three-quarters of a century has been the growth

of the coöperative movement. Impelled by the waste of competition, the profits derived by middlemen, and the excessive cost of commodities, working-people in a number of countries have been influenced in recent generations to enter into combination for the purchase or the manufacture of products for their own use and to be sold to them directly."—F. A. Ogg, *Social progress in contemporary Europe*, p. 305.—"The co-operative idea as applied to industry existed in the latter part of the last [18th] century. Ambelakia was almost a co-operative town, as may be read in David Urquhart's 'Turkey and its Resources.' So vast a municipal partnership of industry has never existed since. The fishers on the Cornish coast carried out co-operation on the sea, and the miners of Cumberland dug ore on the principle of sharing the profits. The plan has been productive of contentment and advantage. Gruyère is a co-operative cheese, being formerly made in the Jura mountains, where the profits were equitably divided among the makers. In 1777, as Dr. Langford relates in his 'Century of Birmingham Life,' the tailors of that enterprising town set up a co-operative workshop, which is the earliest in English record. In France an attempt was made by Babœuf in 1796, to establish a despotism of justice and equality by violence, after the manner of Richelieu, whose policy taught the French revolutionists that force might be a remedy. . . . Contemporaneous with the French revolutionists we had Shute Barrington, Bishop of Durham, who surpassed all other bishops in human sympathy and social sagacity. He established at Mongewell, in Oxfordshire, the first known co-operative store; and he, Count Rumford, and Sir Thomas Bernard published in 1795, and for many years after, plans of co-operative and social life."—G. J. Holyoake, *Growth of co-operation in England* (*Fortnightly Review*, Aug., 1887).

Origin of modern coöperative movement.—Rochdale society in England.—Organizations on the Continent.—"The coöperative principle was first carried into successful execution in Great Britain, and to this day that country leads all others in the magnitude of its coöperative organizations. The parent coöperative enterprise in Great Britain was that undertaken in 1844 by the Rochdale Equitable Pioneers' Society. [See below: England.] . . . The success of coöperation in Great Britain has prompted numerous coöperative experiments on the continent, and some of these have achieved noteworthy results, although, on the whole, the working-people of continental countries have exhibited less capacity for peaceful, non-political organization than have their British contemporaries."—F. A. Ogg, *Social progress in contemporary Europe*, p. 305.

World movement.—"Every national coöperative movement acknowledges its indebtedness to the Rochdale Society. Its simple system seemed adapted to all those many environments. . . . Nearly all the European countries seem to have witnessed attempted organizations of consumers during the fifties, following the social unrest created by the revolutionary disturbances of 1848, a fact which may deserve special notice at this time, when the atmosphere is charged with labor unrest and Bolshevism. Naturally, there are no detailed records. . . . The first widespread knowledge of Rochdale seems to have been acquired in Europe during the early sixties. During that decade the system was adopted in practically all countries. By that time the by-laws of the Rochdale Society could be found in translation in all the languages of the Continent, and in some it was being spread broad-

cast to awaken a social consciousness among the people. The twenty-eight weavers, at least, had been fully conscious of a great ultimate aim, for in those by-laws there are suggestions of a wonderfully reconstructed society, as in 'that as soon as possible this society shall proceed to arrange the powers of production, distribution, education, and government, etc.' Everywhere this spirit was accepted with the method. Not even now has the name of Karl Marx acquired such universal significance among the masses of all lands as did the name of this grimy, English manufacturing town, the Mecca of coöperation, as a Belgian pilgrim termed it, on a visit to the famous store."

A. Sonnichsen, *Consumers' coöperation*, pp. 55-57.—"Coöperation in Germany dates from the middle of the nineteenth century. The earlier societies, organized for the purchase of raw materials of manufacture, were but indifferently successful, but the later distributive and agricultural associations flourished beyond expectation. . . . Coöperative distributive societies of the British type were developed in Switzerland at an earlier date than in any other continental country. . . . In Belgium, Holland, Denmark, Norway, and Sweden coöperation is widely practised. In Italy, Austria-Hungary, Spain, and even Russia, it is firmly entrenched. There is, indeed, no country of Europe in which the coöperative movement has not attained considerable proportions. The results are by no means confined to the lessening of expenditures, the increase of savings, and the amelioration of conditions of livelihood. The sense of social solidarity is perceptibly strengthened, and labor is brought to a realization of the highly important fact that the promotion of its essential interests may be attained by pacific and scientific means no less than by aggression and combat."—F. A. Ogg, *Social progress in contemporary Europe*, p. 307.—See also AGRICULTURE, INTERNATIONAL INSTITUTE OF.

Argentina: Coöperation in grain region.—Credit.—"The first steps towards co-operative organization were especially taken in what is called the grain region, which includes the richest and most fertile provinces of the Republic, Buenos-Aires, Cordoba, Santa Fé, etc. Here the population is densest, the settlements most numerous, communications most frequent, social relations easier. The first co-operative experiments for mixed objects (purchase and sale of food stuffs, agricultural implements, etc., credit, etc.), sometimes had serious difficulties to face in the implacable opposition of the middlemen and dealers, who saw in these advance posts of co-operation a menace to their interests, the want of experienced management, of firmness and constancy on the part of the organizers, and the want of preparation on the part of the members. 'The conditions under which Argentine agriculture is developing,' declares Lahitte, . . . of the Rural Economy Office, 'are almost all, whether economic or moral, opposed to the success of co-operative societies.' . . . The existing societies, for the most part, have been founded within the last two years [written 1913]. Generally, they have adopted the form of limited liability societies. The classic co-operative form of unlimited liability could not find a propitious soil in the agricultural conditions of Argentina. . . . As regards their objects, some are founded for many purposes: distribution, purchase of agricultural machinery and farm requisites and of land, sale of produce, credit, etc. In fact, they endeavour to provide for all the requirements of the farmer, to satisfy which he must generally submit to the usurious demands of the local *almacenero*."—*Argentina, Monthly bulletin of economic and social in-*

telligence (International Institute of Agriculture, Dec., 1913, pp. 19, 21).

Belgium: Catholic and Socialistic control.—Agricultural and industrial organizations.—"Belgium has an interesting and unique development. The first experiment there with Rochdale co-operation failed. Later Edouarde Anseele, the son of a poor shoemaker, started a modified form under which the dividends were not returned but used to form a fund for social activities for the members. The co-operative bakery he started in the early eighties in Ghent has grown into a mighty institution which includes three bakeries with an output of 110,000 loaves a week, a large department store, 21 groceries, 5 clothing and 6 shoe stores, a large brewery, one of the largest printing establishments in Belgium, a coal depot and a chain of drug stores. . . . Brussels has a like society equally large. The Catholic Church opposed the movement because of its socialistic affiliations and began organizing other co-operative societies and as a result co-operation in Belgium is mainly Catholic in the country and socialist in the towns. B. Seebohm Rowntree published the results of four years' studies of this remarkable co-operative development in agriculture and industry in his *Land and Labour*. He enumerates among others in 1910, 382 co-operative societies for improving the breed of cattle, 344 for that of goats, 24 for that of rabbits, 9 for that of pigs; he found 252 societies of beekeepers, 184 of horticulturists, 85 of poultry-keepers, 39 of hop-growers, 77 of beetroot cultivators; 497 co-operative dairies with 52,380 members and owning a fifth of all the cows in the kingdom, and in 1907 1,600 societies for the insurance of live stock, and all this in a population of less than a million agriculturalists. There is hardly a Belgian village without its co-operative society and hardly a society that does not contain a majority of the men eligible for membership and these societies are federated provincially and nationally. The largest of these provincial federations had a few years ago a membership of 40,000 and in one year bought for its members \$1,600,000 of manures, 100 tons of seeds, \$25,000 worth of machinery, managed 70 co-operative dairies, a number of flour mills and did banking through 300 credit associations of the Raiffeisen type. The best of recent figures shows 205 distributive societies in 1914 with 170,000 members. The war . . . [did not obliterate] co-operation even in the invaded land. The great 'Voorhuit' in Ghent gained 1,400 members in the first year of the war and opened its 26th branch store and had an turnover of 5,688,000 francs. The Belgian refugees started in one of the detention camps in Holland a co-operative society and in Brussels a great 'Co-operative Store for the Inhabitants of Brussels and District' [was] established for the duration of the war with a capital of four million francs to supply the populace with necessities."—E. P. Harris, *Co-operation, the hope of the consumer*, pp. 239-240.—See also WORLD WAR: Miscellaneous auxiliary services: XII. Reconstruction: b, 4.—"From Belgium comes news of the establishment of a flotilla of coöperative trawlers. 'The coöperative flotilla,' writes Victor Serwy, a prominent Belgian coöperative official, 'numbers today two units. It can, however, be asserted without fear that the flotilla will become a fleet, in view of the vast coöperative movement which is extending to all nations, which knows no frontiers, and which comprises more than 25,000,000 consumers in western Europe.' Sales of the Belgian Coöperative Society for the first six months of the past year [1921] are reported as

26,455,890 francs."—*Christian Science Monitor*, Feb. 16, 1922.

Canada: Genesis of coöperation in the West.—Influence.—Canadian Council of Agriculture.—Eastern coöperation.—Women's associations.—In Canada "It was the West which first grasped the essence of successful agricultural organization—co-operation for the advancement of the individual welfare of the farmer, [and it is in the farming communities, in the field of agricultural organizations that the success of coöperation in Canada is still found]. W. R. Motherwell, a pioneer who first conceived the idea of co-operative elevators in Canada, was instrumental in organizing, at Indian Head in Saskatchewan, a provisional committee for an association to be named the Territorial Grain Growers' Association. The meeting, which was held on December 18, 1902, was attended by seven farmers in addition to Motherwell, by Senator W. D. Perley and by the deputy commissioner of agriculture for the Territories both of whom addressed the meeting. From this small beginning in the early days of the present century large results have been attained. On February 1, 1903, within six weeks of the first meeting thirty-eight locals met in convention at Indian Head to perfect the organization of the new association. In 1905 it became the Saskatchewan Grain Growers' Association, and in 1910 had a membership of 33,445. The work of the Association in these years was remarkable and out of its activities . . . grew the Manitoba and Alberta bodies; in agricultural trading organizations it was largely responsible for the Grain Growers' Grain Co., the Saskatchewan Co-operative Elevator Co., the Municipal Hail Insurance Association, Regina, and, . . . the Co-operative Wholesale Department of its own Association; . . . it had grown from the original 38 . . . [branches] to over 1,500; the Society and its associated organizations taught Western farmers to realize that they could be . . . [an important] factor . . . in the affairs of the nation and helped them to . . . trust each other, and to act in common. . . . Farmers were made to believe that co-operation was the surest road to individual as well as collective success and that legislation was best secured by and through organization. . . . [In 1903 the first Manitoba association was formed at Virden, and the following March a convention of twenty-six locals, was held. The members of this association numbered 12,000 in 1910. The example of Saskatchewan and Manitoba was followed in 1906 by Alberta, where the Canadian Society of Equity was already in existence. The two associations united in 1908 to form the United Farmers of Alberta, a strong association which in 1918 had a membership of 17,000.] In 1908 the 'Grain Growers' Guide' was started as a monthly publication 'to aid in the discussion of economic and social problems,' and in a word to draw the farmers of the West into a strong unified political body, and to direct the opinions of that body when formed. This periodical 'exercised a strong influence in the succeeding discussions, and organization of the political movement.' Meantime the idea of a co-operative society had been broached, and after much missionary work had been done by the editor of the 'Guide,' the Grain Growers' Grain Co. was formed at Winnipeg in July, 1906. A seat on the Winnipeg Grain Exchange was bought, and before the close of the year 2,340,000 bushels of grain had been handled at a substantial profit for the association. The Manitoba organization achieved one of the first practical successes of the movement when, in 1910, it compelled the Manitoba Government, in re-

sponse to a persistent demand and agitation, to accept a policy of Government-owned interior elevators, and an Elevator Commission was appointed by the Government [to manage them]. . . . Afterwards, however, the Government took the control of affairs out of the hands of the Commission and purchased a large number of elevators, . . . (176 in number) [which were operated] for two years at a loss and then leased . . . (1912) to the Grain Growers' Grain Co. . . . Then came a period of struggle with the [Winnipeg] Grain Exchange, suspension . . . and enforced re-instatement by Government action; a period, also, in which the Directors had to give the Bank their own personal security for advances, [but, in spite of these adverse circumstances, it continued to prosper]. . . . Following its assumption of control over Manitoba elevators . . . [The Grain Growers' Grain Co.] branched out into Saskatchewan and, . . . in 1918, [had] a total of 199 under operation [in that Province]. In 1912, . . . in order to meet changing conditions in the grain trade, the Company [had] leased a 2,500,000-bushel terminal elevator at Fort William and operated it with yearly growing success. . . . In the same year it secured a 300,000,000 feet timber limit in Northern British Columbia . . . and, in 1917, commenced erection of a \$250,000 mill and plant at Hutton, B.C., . . . which came into operation in 1918. In 1912, also, the Company had opened a co-operative supply department which by 1917 had a turnover of \$3,000,000 yearly in farm . . . [supplies from machinery to flour]. . . . Export business was taken up in 1913 and, after some heavy losses incurred in learning a complicated system of operation, the Grain Growers' Export Co., Ltd., was established. . . . In 1913 the Company had also arranged for the carrying on of business as flour, feed and grain merchants at New Westminster and other Pacific Coast points. By 1917 . . . 'The Company had built up an enormous business and performed a very wide service to the grain growers of the prairies and had over 20,000 shareholders. The Company faced active competition of the keenest kind in every branch of this work. It charged competitive prices for all services rendered and made nearly \$2,000,000 in profits in 12 years. These profits were distributed in 10 per cent. dividends to the shareholders each year and also in very generous grants to the Provincial Associations in Manitoba, Saskatchewan and Alberta, and for educational work generally.' . . . [The Saskatchewan Coöperative Elevator Co. was formed in 1911, and by 1917 had 300 elevators in operation. The local association began to buy car lots of farm necessities, and household supplies, and in 1914 a Central Wholesale was organized by the provincial association. Alberta followed in 1913 with the Alberta Farmers' Coöperative Elevator Company].

"The mode of operation [in Alberta] was much the same as in Saskatchewan. . . . Under the Local Act the Provincial Government made a cash advance of 85 per cent. of the cost of each elevator built, or bought, by the Company but had no control over location, purchase, price, equipment or capacity. As security the Government took a first mortgage on the Elevator and other property of the Company at a given point, with loans repayable in 20 equal yearly installments. The Act called for 20 Locals to begin with and the Company started operations with 46 and the prompt construction of 42 elevators and purchase of 10 others. . . . [In 1915 this company put through its elevators a huge crop of over four and a quarter million bushels. It soon added trading

in live stock and also coöperative supply to its activities. In 1917, however, [the] association united (under act of Parliament) with the Manitoba association—the Grain Growers' Grain Co.—to form the United Grain Growers, Limited, with an authorized capital of \$5,000,000. After the amalgamation the united concern [The United Grain Growers, Ltd.] owned 206 elevators in the three Provinces and leased 137 in Manitoba; owned 223 flour warehouses in the three Provinces and leased 8 and owned, similarly, 181 coal sheds. It had branches of the Live-stock Department in Winnipeg, Calgary and Edmonton with seats upon the Stock Exchanges of Winnipeg, Calgary, Vancouver and Fort William. . . . The Company by this time controlled 6 subsidiary concerns—the Grain Growers' Export Co., Inc., New York; the Grain Growers' Export Company, Ltd., Winnipeg; Public Press, Limited; United Grain Growers (B. C.), Ltd.; U. G. G. Sawmills, Ltd.; United Grain Growers' Securities Co, Ltd.—and owned a number of shares in the Home Bank of Canada. . . . U. G. G. Securities, Ltd., was organized in 1917 for the sale of farm lands on commission and . . . about the same time the business of Hail Insurance, through general agencies, was added to the other interests of the Company.

"In 1909 the Canadian Council of Agriculture was formed to coördinate the work of the Grain Growers' Association, and promote organization in the East, where associations which were at least partly coöperative had already been formed. The United Farmers of Ontario had organized in February, 1914, the United Farmers of New Brunswick in May, 1918. In New Brunswick the United Farmers' Cooperative Co., Ltd., in 1919 had eight branch stores, a live-stock department and a commission department.

"All these societies have not only an economic, but also a political and a social aspect. The latter is perhaps more particularly stressed by the women's farm organizations which have risen out of the provincial coöperative association and hold annual conventions. A quotation from the constitution of the Women's Section of the Grain Growers' association gives some idea of the ideals of these associations of women. [The constitution gives as the chief aims of its existence]: 'Assisting the Association in providing training for leadership for the young people of the rural communities. Enrichment of rural life, socially and intellectually by study, discussion, social intercourse, and wholesome, well-balanced recreation. Education of women and girls for the responsibilities of community life and of democratic citizenship generally. Making more adequate the educational facilities of the rural boys and girls, and the securing of more intimate relationship between the school and the other units which make up the community. The safeguarding of the fundamental rights of women and children by more adequate and just legislation, both Dominion and Provincial. Better provision for the safeguarding of public health, especially of children, and the securing of more adequate medical and hospital facilities for rural districts. The maintenance and defence of the home as an institution. Coöperation, where possible, with all organized forces, spiritual or material, which are working for the greatest good of the country and its people. Larger emphasis upon the finer things of life—"the things that are more excellent."'—J. C. Hopkins, *The Canadian Review of Public Affairs*, 1919, pp. 354, 355, 357, 359, 360, 361, 362, 363, 371.—"The Coöperative Union now has in affiliation with it the United Grain Growers (Ltd.) a farmers'

organization engaged primarily in marketing grain and cattle, whose membership numbers 34,503. This organization does not operate on the patronage-dividend basis. The reason for this is not lack of knowledge or desire for a coöperative basis of operation on the part of members, but that in order to retain its seat on the Winnipeg Grain Exchange it was obliged to give up this feature to which it had originally adhered. . . . [In 1919 there were] between 300 and 400 coöperative shipping organizations [in Ontario]. Their central organization owns a seat on the Toronto Live Stock Exchange and during its first year of business shipped \$10,000,000 worth of stock. The wool growers of the Province also combined, and it is reported that 31 per cent. of all the wool clipped in Ontario . . . [in 1919] was sold through coöperative associations. Eggs and apples are other lines in which coöperative marketing has been successfully carried on. A large proportion of the agricultural coöperative work is carried on by unincorporated farmers' clubs, of which there are estimated to be between 1,200 and 1,300 in Ontario. The majority of these are affiliated with the United Farmers' Cooperative Co., which acts as their wholesale society and does an annual business of \$8,500,000. At the end of 1918 there were 271 agricultural societies registered in Quebec. Of the 112 societies which furnished reports 18 were engaged in the manufacture of butter and cheese, 2 in raising sheep, 2 in operating clover hullers, and 90 in purchase and sale of agricultural supplies and products. These 112 societies had a membership of 16,370, a trade of \$6,064,915, and a net surplus of \$75,593. The growth of the credit union in Canada is attributed largely to the work of Mr. Alphonse Desjardins, who was the founder of the original Canadian coöperative bank at Levis. It is reported that the province of Quebec . . . [in 1920 had] 167 local coöperative banks, whose membership . . . [exceeded] 60,000. . . . [with assets amounting] to \$10,000,000 and whose yearly business is over \$30,000,000. The average number of loans granted yearly by these banks is said to be 18,000."—*Monthly Labor Review*, Nov., 1920, pp. 122-123.

Czecho-Slovakia: Early societies.—Under the new republic.—**Types of organization.**—"The coöperative movement in Czecho-Slovakia dates back to about 1860, when a joint producers' and consumer's society was founded at Prague. This society had immediate success, which lasted for several years, during which time nearly 500 other coöperative societies were established throughout the country. Unfortunately, though the movement was thoroughly imbued with coöperative ideals, it was not very practical, and this, combined with unfavorable laws and the opposition of private dealers, caused its failure. From that time until 1905 little was attempted. In that year, however, a big society was organized at Prague, founded on strictly Rochdale principles, and thereafter many societies were formed. In 1908, 86 Czech societies withdrew from the Central Union of Austrian Distributive Societies and formed their own federation, called the Central Union of Czech Distributive, Productive, and Provident Societies, as well as their own wholesale society, at Prague. The federation has been very successful. With the establishment of the Czecho-Slovak Republic, a large number of societies which had remained in membership with the Central Union of Austrian Distributive Societies transferred their membership to the Czech Union."—*Ibid.*, pp. 123-124.—"The Tzecho-Slovak Republic . . . is successfully developing, both politically and economically, and

all the labor organizations, especially the Workmen's Coöperative Union, are consequently improving in strength. During the year 1920 it made very considerable progress, as its recently issued report shows. The membership of the Central Coöperative Union at Prague, in which are united all workmen's coöperative societies, was increased last year by many newly founded organizations. While the development in 1919 was greater than during the previous ten years, the progress in 1920 exceeded that of 1919. The membership of the Central Union increased by 419 societies and reached a total of 1117. In 1920 the Consumers Agricultural and Building Society recorded the largest increase, its total membership being 135,110, with 104 newly formed societies. The increase of the societies was accompanied by a corresponding improvement in their financial position. The great growth of share capital, for instance, from 13,915,656 crowns to 35,216,228 crowns in 1920, is due, not only to the foundation of new societies, but also to an energetic propaganda for the increase of share capital. The amount of trade transacted in 1920 amounted to 984,570,995 crowns, as compared with 307,397,747 crowns in 1919. The net profit rose from 5,340,316 crowns in 1919 to 13,510,581 crowns in 1920."—*Christian Science Monitor*, Feb. 16, 1922.—"Membership in the Czech Union is not confined to consumers' societies, but includes also a number of productive societies. . . . There are said to be about 500 other consumers' societies in Czecho-Slovakia not affiliated with the Coöperative Union, having 250,000 members and annual sales amounting to 100,000,000 crowns (\$20,300,000 par). Though the consumers' societies are the most numerous, there are other types of societies, such as workers', housing, credit, and agricultural societies. The workers' societies own a number of large establishments, such as bakeries, butcher shops, printing and book-binding establishments, tailor shops, shoe shops, etc. The members of these societies work in the shops and receive the savings. The housing societies undertake the construction both of tenements and small family dwellings, in which work they receive Government assistance in the form of a direct subsidy and a guaranty of up to 90 per cent. of the mortgage indebtedness. The farmers have about 3,000 credit societies organized on the Raiffeisen plan, having about 500,000 members. There are also about 1,000 Schulze-Delitzsch banks organized by business men. The farmers also organize for purposes of buying raw materials and of marketing their produce. It is estimated that nearly one-third of the total population of the country is interested in the coöperative movement."—*Monthly Labor Review*, Nov., 1920, pp. 124-125.

ALSO IN: *Coöperative Movement in Czecho-Slovakia* (*International Labor Review*, Oct. 21, p. 145).

Denmark: Development of organizations.—"In Denmark co-operation has been developed mainly in connection with the agricultural industry. . . . The first effort was the co-operative store. This store was founded by a Lutheran minister, who was inspired by the example of the Rochdale Pioneers, whose methods he adopted. A few years later the first attempts were made to organize the dairying industry on a co-operative basis and during the past forty years the co-operative movement has spread until the whole country is now covered by a network of co-operative societies of various types. After the first co-operative creameries had been established, Danish co-operators made it their business to organize the pig-

breeding and bacon-curing industries. Later they proceeded to organize the co-operative marketing and exporting of butter and other agricultural products, to form poultry-raising and egg-collecting societies, and to establish credit societies, electricity-supply societies, and other societies for co-operative production, distribution, and consumption."—*Co-operative Educator*, Apr., 1920.—"The first co-operative dairy was opened in Jutland in 1882, to be followed in but a few years by hundreds of others. To-day [written in 1915] there are 1,200 co-operative dairies, owning more than 1,000,000 cows, or 81 per cent. of the cows in Denmark. . . . To guard against the misuse of the co-operative system, and to avoid the grosser follies of ignorance, Scientific Control Associations have been formed, which send inspectors round the farms to inquire into their management. . . . The co-operative system has also been adopted in the meat trade. . . . The first co-operative slaughterhouse was opened in 1887, seven others followed in 1888, and now there are thirty-six of these institutions. The members are compelled to sell their meat there, even if they could obtain better prices elsewhere. . . . The great industry in eggs is also managed now on a basis of co-operation, although it was the last of the staple industries of Denmark to come under this beneficial influence. . . . Any account of the co-operative undertakings of the Danish farmers must include the General Supply Associations. . . . They have been founded by the farmers themselves [and] exist mostly in the country districts away from the large towns. . . . The prices charged are generally the same as those of the private tradesman but at the end of every year the surplus is divided in cash among the members of the association. . . . A few years ago the farmers formed associations for buying feeding-stuffs."—W. J. Harvey and C. Reppien, *Denmark and the Danes*, pp. 145, 146, 147, 150, 151, 152.—See also HOUSING: Denmark.—"The official censuses show that in . . . 1919 there was 1,690 . . . societies with a total membership of 317,000 and a turnover of \$41,666,665. . . . The Danish Wholesale Society, whose affiliated societies comprise seven-tenths of the distributive co-operation in Denmark, had in . . . 1919 . . . 1,604 affiliated societies, a collective membership of 250,224, and total sales of \$36,424,135. Productive enterprises operated by the Wholesale include hosiery, ready-made clothing, bicycles, soap, rope, margarine, mustard, chocolate and sweetmeat manufactures. The society also owns seed-testing and seed-growing grounds. The value of commodities from these productive operations in 1914 was \$4,905,945, while in 1919 it was \$7,672,070. The Danish Co-operative Bank operates as a central organisation for co-operative savings and loan banks in Denmark, of which there are about 70 with limited liability. The Bank has over 100 branches, and its total business increased from \$256,945,000 in 1915 to \$2,222,000,000 in 1919."—G. S. Watkins, *Coöperation* (*University of Illinois Bulletin*, v. 18, no. 28, Mar. 14, 1921, p. 68).

England: Robert Owen and the New Lanark mills.—Rochdale plan.—British Coöperative Union.—Increase in membership to 1921.—"The only apostle of the social state in England at the beginning of this [19th] century,' Harriet Martineau testifies, 'was Robert Owen,' and to him we owe the co-operation of to-day. With him it took the shape of a despotism of philanthropy. . . . The amazing arrangements Mr. Owen made at his New Lanark Mills for educating his workpeople, and the large amount of profit which he expended upon their personal comforts, have had

no imitators except Godin of Guise, whose palaces of industry are to-day the wonder of all visitors. Owen, like Godin, knew how to make manufacturing generosity pay. . . . It was here that Mr. Owen set up a co-operative store on the primitive plan of buying goods and provisions wholesale and selling them to the workmen's families at cost price, he giving storerooms and paying for the management, to the greater advantage of the industrial purchasers. The benefit which the Lanark weavers enjoyed in being able to buy retail at wholesale prices was soon noised abroad, and clever workmen elsewhere began to form stores to supply their families in the same way. The earliest instance of this is the Economical Society of Sheerness, commenced in 1816, and which is still doing business in the same premises and also in adjacent ones lately erected. . . . These practical co-operative societies with economical objects gradually extended themselves over the land, Mr. Owen with splendid generosity, giving costly publicity to his successes, that others might profit likewise according to their means. His remarkable manufacturing gains set workmen thinking that they might do something in the same way. . . . The co-operative stores now changed their plan. They sold retail at shop charges, and saved the difference between retail and cost price as a fund with which to commence co-operative workshops. In 1830 from 300 to 400 co-operative stores had been set up in England. There are records of 250 existing, cited in the 'History of Co-operation in England.'—G. J. Holyoake, *Growth of coöperation in England* (*Fortnightly Review*, Aug. 1, 1887).—The "Christian Socialism," which arose in England about 1850, under the influence of Frederick D. Maurice, Charles Kingsley, Thomas Hughes, identified itself practically with the coöperative movement.—R. T. Ely, *French and German socialism*, pp. 240-251.

"When, in 1844, twenty-eight old weavers in Rochdale, England, decided to join forces and start a store, they had very definite ends in view. About their first step was to study out a form of organization which would enable them to work together and attain those ends. By becoming their own merchants they sought to get only honest goods and to save for themselves such portion of the merchants' profits as was not necessary to pay out in actual expenses of handling the goods. They desired that each man should have and retain an equal voice in the control of the business even though some might contribute more capital than others. They did not wish to earn profits but to enable each to get his goods at the wholesale cost with nothing added except the necessary expense of handling them. At that time, however, there was no form of organization devised which would enable them to do these things, much less a law under which to incorporate. The following plan was worked out, and it has proved to be one of the most valuable social instruments ever invented. First, capital with which to do business was subscribed by consumer members, each taking one or more shares of stock as is the case with an ordinary joint-stock company. Second, in the control of the business of the company each stockholder of the society had but one vote for directors, etc., even though he might own more than one share of stock. Voting had to be in person, not by proxy. Third, the earnings of capital were limited to a rate equal to the prevailing rate of interest on money. Fourth, the selling prices of goods to individual members were made substantially equal to those prevailing in the community where the store was located. Fifth, the surplus above the cost of doing business was

used: first, to form suitable reserves; second, to pay dividends or interest on stock holdings; and, third, the balance was returned to members in proportion to their purchases. Sixth, cash sales only were permitted. Capital was recognized as a necessary servant, employed and paid wages, as such, but not treated as a master controlling the business by its vote and appropriating the profits. In fact, the use of Capital was treated as an expense except that as an expense it was discriminated against by not being allowed any interest if the returns from the business in any year were not sufficient to pay the interest—that is, the other expenses were met first. . . . Voting, the Rochdale pioneers thought, should be done by men and women, not by money as in the ordinary capitalist company. Moreover, the member must show his interest in the matter voted upon by coming to the meeting; this led to the rule of no proxy voting. To this was added the 'one man, one vote' rule which made it impossible for control of a society to become concentrated in few hands. . . . Goods were sold only for cash. We can imagine that the old mill hands must have had strong reasons for this rule for they themselves were doubtless sorely tempted. Their little capital of \$144 was scraped together a few pennies a week while some of them doubtless knew what unsatisfied hunger meant. But they had in mind both the good of the member and the success of the store. Among the worst evils of the time was buying on credit. It was bad for the consumer and bad for any store which did not heavily tax the consumer to make losses good. It did not treat members alike. It required extra expense to manage and keep accounts. . . . It is advantageous to obtain supplies for the stores in the largest possible quantities. For this reason the various local store societies unite to form wholesale societies to deal with original producers and production. The Co-operative Wholesale Society of Manchester, England [1863], and the Scotch Co-operative Wholesale Society of Glasgow [1868] were formed and are owned by the local stores. They are managed democratically as are the local societies. The local societies send delegates to meetings which elect directors to supervise these great institutions. The wholesale societies which do an enormous business in furnishing goods to local stores have depots for purchasing in various parts of the world. They also manufacture numerous lines of products. By reason of the completeness of its operation Lord Rosebery was moved to refer to the co-operative movement as 'a state within a state,' and the great Gladstone said, 'There has not been a better thing done in this country, in my opinion, than the establishment of co-operation.' Thus, the possibility and practicability of replacing the profit maker control of distribution by the consumer control has been demonstrated beyond the shadow of a doubt, and England's leading economist, Prof. Marshall, says that he regards co-operation as 'unique among all the achievements that have been wrought in the history of the world.'—E. P. Harris, *Coöperation, the hope of the consumer*, pp. 88-93.

"In 1851 there was a general convention of the Yorkshire and Lancastershire societies, held in Manchester, at which a committee was elected to prepare model rules for new coöperative societies. Nine years later these same societies organized a permanent Conference Association. Finally, in 1868, a national conference was held in London, to which all the societies in Great Britain were invited to send delegates. At this national convention a committee was elected, which made arrange-

ments for the first national coöperative congress, which was, accordingly, held next year, 1869. Since then the general British movement has held regular yearly congresses, each in a different locality. From the first congress sprang an 'executive board,' to carry out the orders of the congress during the year, being just what its name indicated. Within a short time this was expanded to a permanent Central Coöperative Board, in which the movement was represented in five sections, or districts. The organization later developed into the present British Coöperative Union. The Coöperative Union is, first of all, the educational body of the British Coöperative Movement. Each yearly congress decides what character this education, or propoganda, shall assume; what constitutes true coöperative principle and method. . . . Aside from carrying on a country-wide propoganda through lectures, pamphlets, books, and other publications, the Union acts as an advisory body to new societies, for whom it issues model rules, systems of bookkeeping, and other such practical literature. Sometimes it sends agitators into unorganized communities to encourage the formation of new societies, but this policy is no longer carried out as much as formerly, Great Britain being now practically covered from end to end by coöperative organization. The Union also maintains a parliamentary committee to guard its interests in Parliament; to see that the private traders do not succeed in passing adverse legislation against the movement, etc. That it accomplishes a great service for the local societies is obvious from the fact that practically all the British societies have joined the Union, the census figures of the government being very little larger than those reported by the Union at the yearly congress."—A. Sonnichsen, *Consumers' coöperation*, pp. 37-38.—See also LABOR ORGANIZATION: 1919: British labor movement.

"The British co-operative superstructure erected on the Rochdale foundation has now [1913] developed into what former British Premier Earl Rosebery once rather aptly described as 'a state within a state.' . . . Members are usually heads of families, and, if we take an average of four to each household, the co-operative population of Britain may . . . be said to be about . . . one-fourth of the inhabitants of the United Kingdom, and that the most industrious, intelligent and self-respecting of the working and lower middle class population. . . . Britain co-operators have used fifty million dollars of their funds to build houses for members, and in assisting members to build for themselves. This, of course, takes no account of the thousands of co-operators who have, from the financial resources, probably a much greater amount provided for them by the co-operative movement, but without borrowing from it, built their own homes. Many people have literally eaten and clothed themselves and their families into homes, that is to say, by allowing their purchase dividends to remain on deposit to be compounded at 5%, or thereabouts, and hypothecating what would otherwise be paid in rent to interest on mortgages, they have become possessed of homes without contributing one cent to the principal."—G. Keen, *Co-operative movement (Proceedings Minnesota Academy of Social Sciences, v. 7, no. 7, 1913, pp. 121, 122, 123)*.—"As the venture succeeded its scope was broadened. Members gain admission by the payment of a nominal fee, and the association has become in effect a vast company which owns buildings and grounds, employs buyers and clerks, and conducts a general mercantile business, the profits being distributed from

time to time among the members in accordance with the amount of monthly purchases made by each."—F. A. Ogg, *Social progress in contemporary Europe*, p. 307.

"There is something very impressive in the yearly totals of co-operative membership, which has for the past sixty years hardly ever failed to increase substantially year by year. The hundred thousand of 1863 became a million by 1891, two millions by 1904, three millions by 1914, and four millions by 1919. The number of separate societies in active existence rose slowly to its maximum in 1903, when there seem to have been as many as 1481 effectively in being; but by that time the aggregate membership had grown to nearly two millions. Since that date, whilst the aggregate membership has more than doubled, the number of separate societies has slowly but steadily fallen, until, in 1919, those known to be actively in existence were reckoned at no more than 1357. . . . The great majority of the societies of small membership are in villages or minor urban centres, where they often enrol as members a high percentage of all the families within their area, carry on the greater part of the retail trade, and engage in a considerable variety of enterprises for their members' convenience. . . . In contrast with the small society, usually working in a local centre of restricted and not rapidly increasing population, stand those societies of tens of thousands of members in densely populated cities, where the membership and trade have grown, mainly by a process of individual accretion, to such an extent as to constitute a powerful Co-operative organisation. The society may be one of old standing, like that of Leeds (established in 1847), in 1919 having 81,175 members, with a trade of £3,749,288; or . . . the Northern Society at Aberdeen, with 32,883 members and a trade of £1,554,348. Or the development may be of more recent date, as in the Birmingham Industrial Co-operative Society (established in 1881), which had, in 1919, 47,868 members and a trade of £1,621,113; or that of Liverpool, established in 1886, with 53,953 members and a trade of £1,682,525. . . .

"The most important . . . federal bodies in the Co-operative Movement on its manufacturing, distributive, and financial sides are . . . the English and Scottish Co-operative Wholesale Societies, in which are united all but a tiny fraction of the thirteen hundred local consumers' societies, together with a hundred other Co-operative organisations. . . . These great business federations are based, like the individual stores, on government by and in the interests of the consumer; they are practically open only to Co-operative societies, which take shares in proportion to their membership, and share the 'profits' in proportion to their purchases. The two 'Wholesale' societies not only obtain for the stores, on the lowest possible terms, practically every article in which they deal direct from the English or foreign manufacturer or grower, but they have also . . . set themselves to manufacture, in their own productive departments, every commodity demanded by the stores which they can possibly produce to advantage. The English society sells annually, to its membership of twelve hundred societies, over a hundred and five millions' sterling worth of goods. . . . The two Wholesale societies employ over 36,000 operatives in what are classed as processes of production. Taking together the stores and the Wholesales, with the corn-milling and baking societies, the associations of consumers employ, in manufacturing processes of one sort or another, just upon 47,000 operatives. . . . One of the most important

developments of British Co-operation is the banking system that it has organised for itself. It is an incidental result of the device of 'dividend on purchases,' which those unfamiliar with the movement find it difficult to credit, that the Co-operative societies . . . have frequently had at their disposal more capital than they knew what to do with. They make it a rule to pay cash; and, vast as is their business, their bills are unknown in Lombard Street. In 1872 the C. W. S. started a 'Deposit and Loan Department' for the convenience of its constituent societies, and this, from 1876, has been termed the Banking Department. It now keeps the current accounts of over a thousand Co-operative societies; more than five thousand Trade Unions, Trade Union branches, and Friendly Societies, and over two thousand Working Men's Clubs and other mutual organizations (these latter, which have deposits of some four millions, began to be admitted as non-members from 1887), its total deposits and withdrawals now exceeding six hundred and forty-five million pounds a year. . . . Co-operative Insurance began in 1867, when the Co-operative Insurance Society was established to undertake the fire insurance of the different societies. Gradually all the other branches of insurance were added, including the life insurance of individual Co-operators; and in 1913 the whole concern was taken over jointly by the English and Scottish Wholesale Societies, and is now run—retaining its own name—by a joint committee. . . . The business is now increasing by leaps and bounds, the industrial premium income being, at the end of 1920, about £3000 per week. . . . On the establishment of the National Health Insurance scheme in 1912, the Co-operative Insurance Society started its Health Insurance Section, as an Approved Society under the Act, for the purpose of enabling Co-operators to insure in their own society. . . . An important step was taken in 1877 by the opening of a New York depot, to be followed by others at Rouen, Copenhagen, Aarhus, Odense, Denia, Esbjerg, Herning, and Montreal. . . . The acquisition of a tallow factory at Sydney (1901) was followed in 1902 by the purchase (jointly with the Scottish Society) of the first of a number of tea estates in Ceylon, later extended to Southern India; in 1917-1920, by the acquisition, similarly on joint account, of oil-yielding properties in West Africa. The Scottish C. W. S. had meanwhile been acquiring, on its own account, besides creameries and piggeries, in Ireland, a depot at Winnipeg (1906), various wheat elevators in Canada (from 1908), cocoa-yielding properties in West Africa (from 1914), and wheat farms in Canada (1916). . . . From 1904 onwards, but particularly since 1912, the English C. W. S. has been buying agricultural estates in England for the production of fruit for its jam factories, milk for its dairies and distributing depots, and wheat for its mills and bakeries, until it has come to own and administer no less than 33,232 acres. In 1917, notwithstanding a financially disastrous experience with a coal-mine in 1877-82, the Shilbottle Colliery was purchased; and this is now being worked to supply a small proportion of the very extensive business in coal."—S. and B. Webb, *The consumers' co-operative movement*, pp. 16, 19, 20, 95, 96, 98, 103, 105, 107, 108.

Also in: G. J. Holyoake, *History of co-operation in England*.—*Idem*, *History of the Rochdale Pioneers*.—B. Jones, *Co-operative production*.

Finland: Peasants' societies.—Syndicates.—Types of coöperative organizations.—"While

there was no co-operative law under which to form co-operative societies, co-operative effort took the shape mainly of the formation of peasants' societies resembling the French agricultural syndicates. Their object was quite as much to champion agricultural class interests as to organise common purchase. These societies as a rule confine their operations to their own particular parish, and the aim of their promoters was and still remains to have one in each parish. The following figures will show that we are getting nearer the realisation of that ideal. In 1899 there were only 60 such societies in the country. By 1901 their number had risen to 277, with 14,336 members among them, by 1902 to 347, with 20,200 members, and by 1903 to 362, with 22,000 members. The total number of our parishes is 474. The syndicates' trade has advanced in the same way. Their total sales in 1899 amounted to 128,000 frs., by 1901 the figure had grown to 880,000 frs., by 1902 to 1,468,000 frs., and by 1903 to 2,134,000 frs. Next in order to the syndicates follow the genuinely co-operative societies of various descriptions formed under the co-operative law of 1901. . . . The total number of members is not positively known, but is estimated at something like 26,000. The credit societies are all of them based upon unlimited liability. . . . Of the other societies, about half have limited personal liability, and the balance no liability at all. Our law permits these three kinds of organization. However, we are endeavouring to convert the societies without liability as much as possible into limited liability societies, and it looks as if we were to succeed. Among these various kinds of societies co-operative dairies appear to merit singling out for special comment. We have now 110 dairies, which are for the most part managed, as they have been formed, by peasants. Such an advance within two years is under our peculiar circumstances something to be thankful for. For our sparse population, scattered over a wide area, with immense forests separating village from village, as if they formed worlds apart, does not readily lend itself to united action. In addition, nine months of our year are winter. Nevertheless the movement has thriven. We have dairy societies with as many as 4,000 cows, but stretching out over an expanse the radius of which measures about six miles. Thanks to the grants in aid, repayable by easy instalments, given by the State for purposes of first installation, many of these societies are in an admirable condition. There are some in which large proprietors having 100 cows each stand shoulder to shoulder with small peasants having only three. . . . Our credit societies are all of the Raiffeisen type. Two among these are artisans' societies, the rest agricultural. The figures now available are only for six months, and therefore afford no test. Among societies of other kinds we have a great variety, such as for the common employment of agricultural machinery, for the cutting of peat for the use of members, building associations, working men's productive societies formed by tailors, stone cutters, tobacco workers, etc. Two particular varieties seem to deserve mention for their peculiarity. One is a students' co-operative temperance restaurant, the other an electrical supply society. The restaurant has about 200 student members. The manageress is a student herself, and at our last co-operative congress provided the banquet on behalf of her society. The electrical supply society has its home in a remote secluded village in the forest, employing a rapid in the river as motive force, and supplying both light and power. . . . The main central agency for

the purchase of agricultural requisites is the Commercial Information Department of the Society 'Pellervo.' Its business amounted in 1901-2 to £19,720, and in 1903 to £37,160. We hope to make this department our great central supply society of the future. The department just spoken of has served as model to two similar information departments recently formed in the province. Our distributive societies have this year [1904] taken steps towards forming a union of their own, which is to serve at once as an advisory body and as a wholesale society. A central committee has already been formed, and a permanent secretary, an instructor, and other officers have been appointed. Part of the expenses incurred are defrayed by the 'Pellervo.' In the last place, the co-operative dairies are preparing to combine to a great union, which is to manage their export trade. As a first step a local union has been formed."—H. Debbard, *Address before Sixth International Co-operative Congress, Sept., 5-8, 1904, pp. 538-542.*—"The General Cooperative Union of Finland had in 1919 567 societies with an aggregate membership of 201,307 and a total turnover of \$123,154,145. . . . [Between 1914 and 1919 the] Wholesale Society made remarkable progress despite the difficulties incident to civil war. The Wholesale in 1914 had 244 societies and a turnover of \$4,857,200, and in 1919 a total of 503 societies with a collective turnover of \$40,997,180. Besides several agricultural estates, the wholesale owns a match factory, a saw mill, a brick works, a tar distillery, a cooage, a coffee roasting establishment, and a fruit packing enterprise. The value of the total output of these productive works increased from \$135,545 in 1915, to \$1,037,395 in 1919. The Socialist Societies have seceded from the Central Cooperative Union (the neutral union) and have formed the Central Union of Consumers' Cooperative Societies, which embraces the minority of distributive societies in Finland. In 1919 the Central Union had 103 affiliated societies with a collective membership of 123,817, and total sales of about \$54,613,060. The Wholesale had 91 affiliated societies with a total membership of 119,615 and total sales of \$10,829,720."—G. S. Watkins, *Coöperation (University of Illinois Bulletin, v. 18, no. 28, Mar. 14, 1921, pp. 73, 74).*

France: Agricultural societies.—Consumers' societies.—"In general it may be said that agricultural co-operation has been further developed in France than in any European countries except Belgium, Denmark, and portions of Germany. Of co-operation in cultivation there is now very little, although prior to the Revolution such cultivation was practised by a large number of *sociétés taisebles*, organised by peasant communities. The sense of personal proprietorship is too strong to-day to permit any considerable extension of communistic methods of tillage. The co-operative societies, none the less, frequently make provision for the use in common of agricultural implements, and some exist solely for the purchase and collective utilisation of steam ploughs, of threshing machines, or of machinery in general. But it is the sale and the conversion, or manufacture, of agricultural products, rather than production, that most of the societies take as their province. . . . The number of societies existing for the sole purpose of co-operative sale and conversion of agricultural products is about 2,400; and in recent years there has been an attempt, as yet only moderately successful, to organise them in a *Fédération Nationale des Sociétés Co-opératives Agricoles*."—F. A. Ogg, *Economic development of modern Europe, pp. 198-199.*

—"In France the first consumers' societies of which

there are any record appeared in 1866. But in spite of an early start, progress here was slow. Until quite recently it remained one of the backward countries; for France was the original home of the self-governing workshop. Some hundreds of them were organized in Paris and its vicinity immediately after the revolution of 1848 and subsidized by the government with capital and work, or custom. Here, as in England, the upper classes became keenly interested in solving the troubles of the working people for them, and wherever that was the case natural evolution had a struggle with man-made theories and was often checked by them temporarily."—A. Sonnichsen, *Consumers' co-operation, pp. 57-58.*—"According to the 1920 Year-book of the French National Federation of Consumers' Cooperative Societies, there were in France on July 1, 1919, 3,724 cooperative societies. Of these, 2,352 reported a combined membership of 1,313,997; and 2,331 annual sales during 1918 of 636,399,319 francs (\$122,882,969, par). The French consumers' cooperative movement has a national federation formed by the amalgamation in 1912 of the Exchange of French Socialist Cooperative Societies and the Union of French Consumers' Cooperative Societies. This federation now has in membership nearly 2,000 societies, representing more than a million families. Delegates from the federated societies meet in annual congress, at which a central council of 18 members is elected to carry on the work of the federation. Besides a permanent secretariat and federal committees there are general offices of scientific research, investigation, and statistics. Since 1914 determined efforts have been made to modernize the shops, to stop the leaks, to establish proper systems of accounts, and to obtain greater patronage of the stores. Much has been done also in the amalgamation of small societies to form big ones. The Cooperative Union of Paris thus formed had at the beginning of 1920, 220 branches, 37,000 members, and an annual business of 37,000,000 francs (\$7,141,000, par)."—*Monthly Labor Review, Nov., 1920, p. 126.*

Germany: Schulze-Delitzsch founder of movement in Germany.—Loan and credit associations.—Lassalle.—Opposition and readjustment.—German wholesale.—"Hermann Schulze was born at Delitzsch, in Prussian Saxony, August 29th, 1808. He studied jurisprudence at Leipzig and Halle, and afterwards occupied judicial posts under the Government, becoming District Judge at Delitzsch in 1841, a position which he held until 1850. In 1848, he was elected to the Prussian National Assembly, and the following year he became a member of the Second Chamber, in which he sat as Schulze-Delitzsch, a name which has since adhered to him. Being a member of the Progressist party, he proved a thorn in the Government's flesh, and he was made District Judge at Wreschen, but he returned later to the Prussian Diet, and became also a member of the North German and German Reichstags. For more than thirty years Schulze headed the co-operative movement in Germany, but his self-sacrifice impoverished him, and although his motto as a social reformer had always been 'Self-help,' as opposed to Lassalle's 'State-help,' he was compelled in his declining years to accept a gift of £7,000 from his friends. Schulze died honoured if not famous on April 29th, 1883. Schulze-Delitzsch is the father of the co-operative movement in Germany. He had watched the development of this movement in England, and as early as 1848 he had lifted up his voice in espousal

of co-operative principles in his own country. Though a Radical, Schulze was no Socialist, and he believed co-operation to be a powerful weapon wherewith to withstand the steady advance of Socialistic doctrine in Germany. Besides carrying on agitation by means of platform-speaking, he published various works on the subject, the chief of which are: 'Die arbeitenden Klassen und das Associationswesen in Deutschland, als Programm zu einem deutschen Congress,' (Leipzig, 1858); 'Kapitel zu einem deutschen Arbeitercatechismus,' (Leipzig, 1863); 'Die Abschaffung des geschäftlichen Risiko durch Herrn Lassalle,' (Berlin, 1865); 'Die Entwicklung des Genossenschaften in einzelnen Gewerbszweigen,' (Leipzig, 1873). Schulze advocated the application of the co-operative principle to other organisations than the English stores, and especially to loan, raw material, and industrial associations. He made a practical beginning at his own home and the adjacent town of Eilenburg, where in 1849, he established two co-operative associations of shoemakers and joiners, the object of which was the purchase and supply to members of raw material at cost price. . . . For a long time Schulze had the field of agitation to himself, and the consequence was that the more intelligent sections of the working classes took to his proposals readily. Another reason for his success, however, was the fact that the movement was practical and entirely unpolitical. It was a movement from which the Socialistic element was absent, and one in which, therefore, the moneyed classes could safely co-operate. Schulze, in fact, sought to introduce reforms social rather than Socialistic. The fault of his scheme as a regenerative agency was that it did not affect the masses of the people, and thus the roots of the social question were not touched. Schulze could only look for any considerable support to small tradesmen and artisans, to those who were really able to help themselves if shown the way. But his motto of 'Self-help' was an unmeaning gospel to the vast class of people who were not in this happy position. . . . The movement neared a turning point in 1858. In that year Schulze identified himself with the capitalist party at a Congress of German economists, held at Gotha, and he soon began to lose favour with the popular classes. The high-water mark was reached in 1860, at which time the co-operative associations had a membership of 200,000, and the business done amounted to 40,000,000 thalers or about £6,000,000; the capital raised by contribution or loan approaching a third of this sum. In the year 1864 no fewer than 800 Loan and Credit Associations had been established, while in 1861 the number of Raw Material and Productive Associations was 172, and that of Co-operative Stores 66. Possibly the movement might have continued to prosper, even though Schulze was suspected of sympathy with the capitalists, had no rival appeared on the scene. But a rival did appear, and he was none other than Lassalle."—W. H. Dawson, *German socialism and Ferdinand Lassalle*, ch. 7.—"In 1850 Schulze-Delitzsch laid the foundation-stone of German co-operation by the establishment of the first credit bank [Vorschlussverein]. Co-operative credit came first because in 1850 Germany was still a 'Klein Industrie Staat' (Small Industry State) and the ranks of small independent producers cried for protection against Jews and usury. However, the revolutionary disturbances of 1848 frightened the Government and the wealthy class into the patronage of peaceful measures for the alleviation of social distress. The cheap supply of the necessaries of life was an obvious measure of peace; hence during 1850-70, the first store

period, they were semi-patronal institutions under the wing of the higher bourgeoisie. Neither Schulze-Delitzsch nor Lassalle, the two pioneers of industrial co-operation, appreciated the significance of the store. Lassalle, under the influence of the iron law of wages, repudiated the idea of organising poor consumers, on the ground that it contributed indirectly to the profit of the capitalists, and demanded State-organised associations in control of the instruments of production. Schulze-Delitzsch was firm to self-help, and supported the stores as one form of it. But he regarded them always as junior members of the co-operative family, and he never acknowledged any antagonism between the interests of the store and those of the shopkeepers and artisans who were members of his credit banks. The war of 1870, with its indemnity heritage of the 'Milliard-Segen,' launched Germany on her industrial revolution. The ablest of the bourgeoisie rose to be industrial leaders; but many of the small-scale producers either sank into the wage-earning classes or swelled the ranks of middlemen. Many, however, held their own with the help of the co-operative credit bank. The bourgeoisie, being themselves generally distressed, dropped their patronage of the stores. Hence the second period, 1870-89, was one of stagnation, in which many of the old stores disappeared, while the emerging working class, suspecting the store as a subterfuge of capitalist exploitation, had neither the confidence nor the strength to take up the flag. The law of 1878 against associations robbed the working classes of everything save their right to vote, but, like all persecution, it brought the oppressed to a consciousness of their powers. In opposition to the doctrine of Schulze-Delitzsch, the Co-operative Law of 1889 permitted limited liability. Thereupon the stores, their Magna Charta won, entered upon the third period of their history, a period of rapid growth. The working classes were now enthusiastic for the co-operative store. Between 1890 and 1902 the quarrel in the co-operative family came to a head. Within the Allgemeiner-Verband were two hostile forces: on the one side the banks controlling a number of the older-fashioned stores, on the other the working class stores, headed by the 'Vorwärts-Verband' of industrial Saxony. In 1898 the leaders of the Hamburg Wholesale, the recent creation of the working class stores, visited the co-operative establishments of Great Britain and carried back to Germany the reports of the wonders of Rochdale and Manchester. . . . In 1894 was established the . . . German Wholesale, the 'Grosseinkaufs Gesellschaft Deutscher Konsumvereine', with its seat at Hamburg. . . . In 1906 the position of the German Wholesale *itself* was as follows:—membership, 448 societies; trade, 46 million marks."—C. R. Fay, *Coöperation of home and abroad*, pp. 286-288.—"Unlike France, where many cooperative establishments were destroyed in the devastated areas of war, Germany suffered practically no setback in the cooperative movement except the loss of societies through the recent political readjustment of frontiers. The Central Union of German Distributive Societies (Zentralverbund deutscher Konsumvereine) is much stronger today than at any other time in its career, and is by far the most powerful organization among consumers' movements west of Russia. In 1914 the Union had 1,100 societies, of which 1,094 reported a total membership of 1,717,519 and collective sales of \$123,245,130. The data for 1918 show 1,090 societies, of which 1,078 reported a collective membership of 2,231,917, and total sales of \$167,688,285, while in 1919, 1,132 societies had a total

membership of 2,308,407 and a collective turnover of \$268,895,315. The German Cooperative Wholesale (*Grosssein kaufsgesellschaft deutscher Konsumvereine*) is a prosperous institution both in its distributive and productive departments. Its productive establishments now comprise three cigar factories, a tobacco factory, a match works, two soap works, a weaving shed, a clothing factory, a box factory, a sweetmeat and chocolate establishment, a mustard works, a spice mill, a brush works, a wood works, etc."—G. Watkins, *Coöperation* (*University of Illinois Bulletin*, Mar. 14, 1921, pp. 72-73).—See also GERMANY: 1919-1920: Question of socialization; RURAL CREDIT.

India: Rapid spread of coöperative societies.—"No phenomenon in the economic life of Modern India is more striking than the rapid growth of the co-operative movement. Introduced only eleven years ago [1905], it has spread and progressed until [in 1916 it] comprised 15,000 societies, with 744,000 members, and a total working capital of about £5,144,000. These are amazing figures to have rewarded so few years' work among a population to whom the ideas implied in the co-operative system were at first quite foreign. . . . The new societies have weathered local famines in Gujerat, the Deccan, and the United Provinces, and have passed almost unscathed through the financial crisis which brought down so many joint-stock banks in Bombay and the Punjab during 1913 and 1914. . . . The causes which led Government to introduce the movement into India deserve a brief notice. The past fifty years have witnessed a remarkable growth in the commerce and total wealth of India. In this general prosperity the peasant class has had little part. Far from decreasing, the burden of their indebtedness has probably increased. . . . The great mass of them still turn to the village money-lender for the capital necessary for carrying on their industry; and in a transaction in which their needs and ignorance are pitted against the greed and shrewdness of a hereditary class of financiers, they are usually overreached and have to pay far higher rates of interest than the security which they have to offer justifies. Agriculture can never be a lucrative occupation so long as the capital with which it is carried on is considered cheaply obtained at 20 or 30 per cent. This persistent indebtedness and stagnation amongst vast masses of the agricultural population is, perhaps, the greatest barrier in the way of progress that the Indian Government has to encounter. From time to time various remedies have been tried. . . . But no mere legislative fiat can control the working of economic law. The weaker class has continued to go to the wall, and their general condition to stagnate. . . .

"The idea of using co-operation as a means of combating the Indian rural problem was first conceived by the Government of Madras, which sent Sir Frederick Nicholson to Europe to study the theory and practice of agricultural banking and to suggest means by which a similar movement might be started in their Presidency. Between 1895 and 1897 he issued an exhaustive report, . . . and . . . summarised his conclusions in the words 'Find Raiffeisen.' By this he meant not only that the system of rural credit societies first invented by Raiffeisen should be given a trial, but that genuine enthusiasts were needed to launch the movement. To the honour of the Civil Service, such men were speedily forthcoming. . . . Lord Curzon, the Viceroy [1899-1905] was quick to realise that no great results could be expected from uncoordinated individual effort, and accordingly appointed a

Committee under Sir Edward Law. . . . The result of its enquiry was the Co-operative Credit Societies Act, which was passed into law in 1904. Societies were classified as rural and urban; and, while the latter were left a free choice, the former were bound to accept unlimited liability. Their area was closely restricted. Loans might be made only to members and on personal or real, but not ordinarily on chattel, security. An annual official audit was made compulsory. . . . The movement so far outran the dreams of its authors and ramified in so many new directions that in 1912 it became necessary to undertake fresh legislation. The new Act swept away the old distinction between rural and urban societies, and substituted a more scientific distinction based on the character of the members' liability. . . . Co-operative organisations with other objects besides that of furnishing credit were allowed. The exact form which these should take was not definitely laid down; and, pending fuller experience, Registrars were left a wide discretion. . . . In 1914 a Committee . . . was appointed to review the whole position and to advise the Government of India more particularly on the higher organisation of the co-operative movement and the financial connexion of the various parts of the system. Their report . . . is the first critical survey of the whole field of Indian co-operation by men of administrative experience in the East, and abounds in practical suggestions and cautions, which cannot fail to have a profound influence on future policy. . . .

"Owing to the special nature of the business done by co-operative credit societies, the extent to which they rely on personal credit, and the difficulty of keeping them under observation, Joint Stock Banks are reluctant to deal with them direct. It has therefore been found necessary to start special institutions, known as Central Banks, to supply them with funds. Of these there are 189 in British India, controlling a working capital of about £1,300,000, and using it almost exclusively in loans to societies. . . . The co-operative organisation of credit in India . . . follows in its main lines European precedents. But there are certain local conditions which, as time passes, are likely to distinguish it more and more widely from its model. The first is the wide margin of interest on which Indian societies are able to work. The current rate of interest charged on loans in the bazar is so high that societies are not only able without complaint to advance loans at rates well in excess of the rates which are payable on deposits, but are actually bound to do so in order that over-facile credit may not encourage reckless borrowing. As a result, societies can earn substantial profits and build up an owned capital in the form of reserve fund infinitely faster than in Europe, where the margin between the lending and the borrowing rate rarely exceeds 1 per cent. They are also in a better position to subscribe to shares in Central Banks and so secure control of them, and to contribute to the expenses of their own audit and supervision. . . .

"The ultimate goal to which co-operation is tending in India cannot yet be foreseen. Its first aim is to free the rural and industrial classes from the state of economic serfdom under which they now labour. There is every reason to suppose that in time it will accomplish this. With a peasantry emancipated from debt, many avenues of rural regeneration are opened up. Cheaper and more plentiful capital within easy reach will give the ryots a chance of improving their time-honoured methods of agriculture with an assurance that they will enjoy the fruits of their own enterprise. The

purchase of tools, manure, and so forth, and the disposal of produce, can be arranged in a more business-like way. A better use may be made of irrigation. Stock-breeding, dairy-farming, and scientific fodder storage will become feasible. Above all no result of co-operation is more certain and more dynamic than the impetus which it gives to education."—R. B. Ewbank, *Co-operative movement in India* (*Quarterly Review*, v. 225, no. 447, Apr., 1916, pp. 368-371, 376, 379, 380, 382).—"By midsummer 1920, which is the latest date for which we have figures, the new cause had enlisted over 1,500,000 active adherents, members of societies, distributed among nearly 39,000 societies, working with a collective capital of twelve and a half lakhs of rupees, say about £90,000, and doing an immense amount of good both economically and educationally, in a variety of ways—helping poor people, to all appearance hopelessly sunk in debt and misery, back into freedom, stimulating and improving alike agriculture, the great stand-by of the nation, and industry; and arousing a keen desire for education; . . . providing employment; imparting a notable impulse to thrift; cheapening money; tempting to some extent already the hidden treasures of earlier saving, unfruitfully buried in the ground, into productive employment, and opening to the enormous, feckless, and sullenly despondent population, because hopelessly indebted, a brighter prospect of a more satisfactory existence. . . . We have it from the lips of leading, responsible administrators, like Lord Meston and Sir Edward Maclagan, that the beneficent work done by co-operative societies, even in respect of credit only, has been found to extend far beyond the narrow limit of actual membership. . . . For the hire of money has been greatly lowered, and to some extent, at any rate, the iron rule of the thus far monopolising, despotic, usurious and bloodsucking moneylender has been broken. . . . That in itself, surely is a great boon gained for India."—*Co-operative movement and labour in India* (*International Labour Review*, v. 5, no. 2, Feb., 1922, pp. 229-230, 231).

Ireland: Agricultural coöperative movement.—**Irish Agricultural Organization Society.**—"In the year 1889 the pioneers of the agricultural co-operative movement [in Ireland] could be counted on the fingers of one hand. . . . The farms of Ireland being . . . [for the most part] small, intensive cultivation was indicated. But the economic trend was all in the direction of large-scale production and distribution. This is the paradox in its practical expression. Obviously, a very perfect organization of the small producers would be required in order to give the small man the advantage of the large-scale business. [To a few, the sole hope for the country lay in coöperation.] . . . The small group of Irishmen who took up the task of agricultural reform in Ireland were nearly

all students of cooperation in its technical sense. . . . They knew that it had not touched agriculture but they believed that its principles and methods could be applied to Irish agriculture, [and that it was] . . . only a question of pegging away to win out. . . .

"It was decided to restrict the new movement to the rural community and to concentrate upon the basic industry of agriculture. . . . The Irish movement was bitterly opposed by the country traders, who saw that joint purchase of agricultural requirements and joint sale of agricultural produce not only would deprive them of a considerable portion of their business but would throw light upon the quality of all articles of common consumption and the prices charged for them, and they had even more political influence in Ireland than their brethren possessed in England. . . . The new movement was cooperation and nothing else . . . but it was not long before the attack upon the divine right of middle profits was scented. The control of the political machine in advanced industrial communities by combines and trusts was never comparable to the influence upon Irish politics of the village traders. It is generally known how 'big business' has aroused the ire of progressive leaders in American politics, but the way in which little business retarded rural progress in Ireland for a quarter of a century has escaped notice. . . .

"Dairying was on the eve of its industrial revolution. It had always been a home industry, chiefly conducted by the women folk. Now new machinery had been invented chiefly in Scandinavia—which made factory production far more profitable than home production. The modern market was increasingly demanding that articles of common consumption should be consigned to it in bulk of uniform quality. . . . The Danes and the Swedes, who had adopted mass production, were already competing successfully with Irish butter in the British and even in the Irish market. . . . Before we took the field with our cooperative campaign, the substitution of the modern factory method for the immemorial domestic method of butter-making was well under way. Looking from the Rock of Casbel over the central plain of Ireland the white walls of new creameries could be seen breaking the monotony of green pastures in the rich dairying districts of Tipperary, Limerick and Cork. . . . The manufacturers of the new dairying machinery were willing to supply it to bodies of farmers upon credit. Of course the purchasers had to be incorporated in order to make their joint credit negotiable. We, too, wanted to get them incorporated in business associations. But the manufacturers had no patience with the theorists who were insisting upon the cooperative plan, then wholly unknown to our farmers. . . . Yet we had to insist upon the cooperative principle as being absolutely essential to success and . . . the conflict between the two methods of organizing farmers for factory dairying proved once for all to the quick intelligence of the Irish farmer that only by means of cooperation could he work out his economic salvation. . . .

"In the cooperative creameries the principle of one-man-one-vote prevails and all are equal upon questions of policy and management. Furthermore, the profit on shares is limited to a fixed rate of interest. . . . Any further net profit made is divided, not among the shareholders in proportion to their shares, but among the suppliers of milk in proportion to the quality and quantity of the milk supplied. In some creameries this net profit is also shared by the workers in the institution.

... Our first dairying society was started in the spring of 1891. . . . By the year 1899, however, we had 152 of these societies working, with a trade turnover of about \$2,500,000 worth of butter. Ten years later the number of dairying societies had risen to 380 with a membership of 44,213 and a turnover of some \$9,000,000. In 1910, after another decade of strenuous propaganda, the number of these societies was 439, the membership 53,240, and the turnover \$35,000,000. . . . A sufficient indication of the growth of the movement as a whole will be found in the following simple figures: In 1890 there were 424 societies of all kinds with a membership of 39,852 and a trade turnover of \$45,000,000. In the year 1910 societies numbered 1,028, members 135,369, and the trade turnover was \$55,000,000. The total trade turnover from the commencement of the movement down to the end of the year 1910 was \$350,000,000. . . . There is an immense amount of cooperation which does not admit of statistical display, such as the joint ownership of costly agricultural machinery and breeding stock. In Wexford a large meat-packing undertaking has been in existence for many years. . . .

"In the spring of 1894 a . . . meeting was held in Dublin to receive a report of the movement's achievement up to date and to consider the best means for its continuance and development. At this meeting was founded the Irish Agricultural Organization Society, . . . Ireland thus contributing to the agricultural economy of the English-speaking countries a new agency of social service. A few years later an English and a Scottish agricultural organization society were founded on the Irish model. The I. A. O. S. is governed by a committee, the majority of whom are representatives of the societies affiliated with the central body. Representation is also given to individual subscribers. The committee is presided over by a president and vice-president. . . . The staff . . . consists of five senior organizers, who cover all Ireland between them, holding meetings . . . preparatory to the formation of societies, see that the conditions pointing toward a successful society exist in the district and that all the necessary formalities are complied with. They are assisted by a staff of some half dozen men, chosen for their expert qualifications in dairying, the treatment of flax and general business. . . . An expert auditing staff gives accountancy inspection and advice. A bacteriological laboratory under a distinguished scientist supplies to dairying societies technical advice of too direct a commercial bearing for governmental concern. The secretariat and office staff complete the human equipment."—H. Plunkett, *Message of the farmers of Ireland* (*Survey Graphic*), Nov. 26, 1921, pp. 318-323.)

Italy: Consumers' coöperative societies.—After-war developments.—National Coöperative Credit Institute.—"In Italy consumers' societies were founded even before national unity had been attained, notably up in the northern provinces. By 1886 there were enough of them, based on the 'sistema de Rochdale,' to form a national union comprising 68 societies. By 1890 this number had dwindled to 24, but in 1893 there were 50; then, each year successively, the membership of this federation increased to 103, 131, 279, 398, until 1898, when they numbered 480. In that year there was a revolutionary disturbance in Milan, the center of the League, and many persons were arrested and imprisoned, among them the secretary of the League and many other coöperative leaders. All popular societies with a radical tendency were suppressed, among them many of the

coöperative societies, so that in 1899 there were only 300 members in the League. By 1901 the number was greater than ever; 586, and ever since there has been a continuous increase, the number being 1,933 in 1910. During this period these societies had held no less than nineteen national conventions, or congresses. Incidentally, it may be mentioned that one of the most energetic figures in promoting coöperation in Italy has been that prominent statesman, one time Prime Minister of Italy, Luigi Luzzatti."—A. Sonnichsen, *Consumers' coöperation*, p. 60.—"The co-operative movement in Italy underwent, in consequence of the war and of the events immediately following in it, a remarkable extension and development. In 1915 there were, it is estimated, 7,420 co-operative societies in Italy; there are now [1921], according to more recent data collected by the Ministry of Labour at my request, 15,510 such societies, and, as certain kinds of credit and agricultural co-operative societies are not included in this figure, the real total must, I think, be as high as 20,000. The number of societies has therefore almost trebled since the outbreak of the war, while membership, which is now estimated at almost three millions, has doubled. The share capital and the reserves of the co-operative societies have also increased and now amount to more than six hundred million lire. The National Co-operative societies have also increased. . . . The National Co-operative Credit Institute, which has a capital of two hundred and eighty million lire, and is the strongest co-operative bank in the world, paid out sums in 1920 amounting in all to more than six thousand million lire. . . . In Southern Italy . . . the need for public works is very great, particularly for hydraulic works, such as the construction of dams and irrigation canals. . . . Co-operative societies of all political views have united to form the Co-operative Institute for Public Works in Southern Italy, and this Institute is setting to work with energy. It will be no small triumph for the co-operative movement to demonstrate, here as elsewhere, to what extent it concerns itself with the vital problems on which national prosperity depends. . . . The war resulted in an enormous expansion of consumers' co-operation in Italy. In fact, there are nearly as many consumers' co-operative societies as there are communes, but their distribution is not uniform, and there are often several rival societies in the same district. There are some huge societies which will bear comparison with their prototypes in other countries. There are ten co-operative societies in large centres of population, each of which has sales amounting to more than ten million lire per annum. The foremost of these are the Military Society and the Milan Co-operative Society in each of which annual sales amount to more than one hundred million lire; these societies have a complex organisation of retail shops, factories, and other branches, including savings banks. There is, however, one serious defect in the consumers' co-operative movement in Italy. It has no wholesale society such as those founded in all other European countries on the model of the English wholesale societies. . . . This defect will have to be overcome; it illustrates the drawbacks of minute subdivision and specialisation already shown to be characteristic of the Italian co-operative movement."—M. Ruini, *Italian co-operative movement* (*International Labour Review*, v. 5, no. 1, Jan., 1922, pp. 13, 16, 24, 30, 31).

Jugo-Slavia: Coöperative society successor to the Zadruga.—Rochdale societies.—Between 1870 and 1890 attempts were made to establish co-

operation in Serbia, but without success. About 1905, however, "a co-operative society of supply was founded in Belgrade on the principle of Rochdale, and . . . [by 1908 possessed] two shops and [had met] with fair success. . . . The failure of co-operation in the towns makes all remarkable the success in the country districts. . . . The Zad-ruga [patriarchal communities] becomes more and more indefinite, but the Servian peasants have found in the co-operative idea a worthy successor. . . . The first agricultural co-operative society in Servia was founded in 1894. . . . Five years later . . . there already existed 100 such associations, and . . . a law was made to settle the basis upon which these societies were allowed to be formed and developed. . . . Co-operative societies for supply have existed . . . [since 1905] in the vil-lages. . . . These societies are constructed on the principles of Rochdale. . . . The prices are the same as on the market, only at the end of the year the profits realized are distributed amongst the members in proportion to their purchases. . . . [In addition there is the old time associative system called the 'Moba' by which the neighbors of an agriculturist came to his assistance. In 1909] about thirty of these co-operative societies [owned] co-operative granaries. The object is to come to the assistance of agriculturists who have been deprived by a bad year of means of livelihood, or means of sowing."—M. Avramovitch, *Rural co-operation, in Servia by the Servians* (A. Stead, ed.), pp. 268, 269, 272, 273.—See also RURAL CREDIT: Serbia.

Lithuania: Consumers' and producers' societies.—Jewish coöperative societies.—Jewish popular banks.—Coöperative societies have a strong influence on Lithuanian economic life.—"Before the war there were about 300 coöperative societies in Lithuania, all of which were suspended owing to the war. During their occupation the Germans established similar societies, but these institutions failed to win popular confidence. . . . With the establishment of the Lithuanian Government coöperative societies began to be organized again. . . . There are now throughout Lithuania some 400 coöperative societies. . . . The total membership . . . is about 120,000 Lithuanian citizens. . . . Coöperative societies are of two kinds—consumers' and producers' societies. The former have a very wide range of activity. Besides furnishing their members with articles of prime necessity, they also have the right to buy up products manufactured by their members. The consumers' societies serve chiefly the rural population. . . . The coöperative societies furnish the people with all indispensable articles, including agricultural implements for the rural population. They also engage in the sale of agricultural products. During March a congress of representatives from all the Lithuanian coöperative societies was held in Kovno. A resolution was adopted in favor of the union of all Lithuanian coöperative societies into a single league. It was also proposed to open a coöperative bank. . . . The Jewish coöperative movement, which up to 1914 had developed successfully, was almost wholly suspended through the war. Owing to the economic conditions under which the Lithuanian Jews live, credit coöperation has become most widely distributed and has assumed the specific form of the so-called Jewish popular banks. . . . Sixty-five newly created Jewish popular banks were registered in the Department of Commerce and Industry during six months. According to information in possession of the economic section of the Jewish National Council, 47 of these banks were recently operating with a capital of 1,731,160 marks. . . . The membership of these banks exceeds

3,700. . . . To finance all these Jewish banks and to regulate the monetary transactions of Lithuanian Jews abroad, a central bank has been established, called the Central Bank for the Support and Development of Jewish Coöperation in Lithuania."—U. S. Bureau of Foreign and Domestic Commerce, *Coöperative societies in Lithuania* (*Commerce Reports*, no. 244, Oct. 16, 1920, pp. 242, 243-244).

New Zealand: Farmers' commercial coöperation.—Farmers' Union Trading Co.—"The farmers of New Zealand began to organize for commercial purposes about 30 years ago [written in 1920], and have grown until to-day they are important factors in the commercial as well as in the agricultural life of the country. There are two exceptionally strong associations or companies, one at Christchurch in the South Island, and the other at Auckland in the North Island, as well as several smaller companies and associations throughout the dominion. The growth of these farmers' trading organizations has been very marked during the last few years, and especially is this true of the company at Auckland. The New Zealand Farmers' Coöperative Association of Canterbury (Ltd.) was organized in 1882 with a capital of £250,000 (\$1,216,625 at normal exchange). It now has a capital of £1,500,000 (\$7,299,750), did a business last year amounting to £5,501,325 (\$26,772,198), and has a membership of 9,818. The Farmers' Union Trading Co. at Auckland is only a few years old, but now has a capital of £1,000,000 (\$4,866,500), and is doing a monthly business of about \$600,000. Its membership is 11,800. These associations handle practically everything that farmers need from tractors, motor trucks, agricultural machinery, down to a paper of needles, as well as financing the farmers and handling their products to a large extent. They are heavy importers, importing a large portion of the goods handled. The Farmers' Union Trading Co. at Auckland is just opening an office in New York to look after their interests. They have sent out a practical man who has had extensive training in the business here."—A. A. Winslow, *Growth of farmers' trading companies in New Zealand* (U. S. Bureau of Foreign and Domestic Commerce, *Commerce Reports*, no. 305, Dec. 29, 1920, p. 1339).

Norway: Coöperative Union.—Wholesale societies.—Agricultural societies.—"The statistics of the Coöperative Union of Norway show that in 1914 there were 149 societies, a total membership of 31,000, and total sales of \$2,783,220, while in 1919 there were 204 societies, a total membership of 80,000, and a turnover of \$19,782,000. This indicates an increase of 97 per cent in the number of affiliated societies, and 158 per cent in the collective membership. Wholesale distributive operations increased from \$860,275 in 1914 to \$3,350,930 in 1919. The productive operations of the Wholesale comprise the manufacture of margarine and tobacco, and coffee roasting. The output of the tobacco factory in 1919 amounted to \$300,000, as compared with \$92,625 in 1918, while the production of the margarine factory increased 50 per cent in 1919."—G. S. Watkins, *Coöperation* (*University of Illinois Bulletin*, Mar., 14, 1921, p. 69).

"The Norwegian Union of Agricultural Societies has just celebrated its twenty-fifth anniversary. Today there are 1000 purchase societies, with a membership of 40,000, in this union, the turnover of which has increased from 243,610 crowns in 1897 to 36,451,662 crowns in 1920. The total turnover for the 25 years is 234,000,000 crowns, of which about 3,000,000 have been returned as dividend. The capital amounts to 2,000,000 crowns, and the transfers to 1,000,000. The union owns warehouses

in Christiania, which have direct access to the harbor and railway; it has a warehouse at Tonsberg, a steamer, a large mill and silos at Kambo. It has purchased productive works for the manufacture of agricultural machinery at Gjovik and Brumanddal, and on a plot acquired at Gworad a corn and seed separator is to be erected. In addition to all this it has its own banking establishment, known as the 'Bundeners Bank.'—*Christian Science Monitor*, Feb. 22, 1922.

Rumania: Coöperative societies.—In the old kingdom of Rumania, coöperative societies of all sorts have made an advance as in other countries. Sprung into existence in 1900, coöperative societies today may be found almost in every village of the kingdom. There are "credit coöperative societies" (or village banks) which rapidly supply those in need of money, without recourse to cities; "consumers' organizations" that have opened up stores with various merchandise for the people; "renting or leasing coöperative societies" that lease large farms to be worked for common profit; and "societies for cultivation" that exploit forests and work other enterprises. "The number of consumers' cooperative societies in Rumania on Dec. 31, 1920, was 383. Of these, 311 had submitted a report of their work for the year, as compared with 160 during the year 1919. The membership of the societies rose from 33,470 in 1919 to 96,515 in 1920. The value of the paid-up shares rose during the same period from 3,493,517 lei to 14,273,429 lei. The total turnover amounted to 111,481,565 lei in 1919."—*Christian Science Monitor*, Feb. 16, 1922.

Russia: Rapid spread of coöperation.—**Moscow Narodny Bank.**—Absorption of coöperative system into soviet organization.—There were in Russia, in 1919, "three general types of coöperative associations, namely, consumers' societies, producers' societies, and credit societies, each with a varied history of alternative encouragement and obstruction first under the czarist regime and later under the proletarian dictatorship of the Bolsheviki. These societies have surmounted all barriers of this kind and have developed from modest buying and selling groups until at present 'they extend into almost every phase of Russian rural life, which is 87 per cent of the whole, and include in their scope production, transportation, distribution, banking and credit, and foreign trade.' The origin of Russian coöperation dates back to 1865, when the Government approved the first consumers' society. Credit associations formed a union in 1901, were encouraged by legislation in 1905 which gave the Zemstvos power to open such institutions on their own authority, and by a new statute in 1911 which gave them banking privileges. The Moscow Narodny (People's) Bank, founded in 1912, is the great financial institution of the coöperatives. Between 1900 and 1905 agricultural coöperative associations commenced and have assumed an important position in Russian life. [See also RUSSIA: 1909-1914.] In 1918 the Russian coöperative unions had 20,000,000 individual members (heads of families) and comprised 80,000 local societies and 500 local unions. On the basis of five to a family this means that coöperative organizations represented 100,000,000 of the Russian population. The capital was 230,000,000 rubles, or \$117,300,000, if reckoned at par, the number of industrial plants owned by the unions numbered 5,000, and the number of employees 50,000. Of 80,000 societies on January 1, 1919, 26,500 were credit and loan savings associations; 40,000 were consumers' societies; 8,500 were agricultural societies; while 5,000 were peasant groups

or artels for making butter, etc. Much promise for Russian coöperation is found in the growth of regional unions of societies and the affiliation of these with the All-Russian Central Union of Consumers' Societies, the 'Centrosoyus,' whose total turnover at the end of 1918 was approximately \$500,000,000, and the value of whose productive output was about \$75,000,000. The incorporation of the coöperative system into the Soviet State organization is a step which has been bitterly opposed by coöperators. Whatever else one might say in eulogy of the Russian coöperative movement, it is unquestionably the brightest ray of hope in Russia's economic and political disruption."—G. S. Watkins, *Coöperation (University of Illinois, Bulletin, v. 18, no. 28, Mar. 14, 1921, pp. 75, 76)*.—In the middle of 1919 Russia contained approximately 25,000 distributive coöperative societies with a collective membership of nearly 12,000,000. "The main lines of the Decree of March 20th [ordering the absorption of the coöperative societies into the Soviet organization] can be summed up as follows:—In all towns and villages consumers' societies are to amalgamate to form a single organization of distribution—"the Consumers' Commune." The bases of the Commune are—in the towns and industrial centres, the workers' Co-operatives or, failing those, the general citizens' co-operative societies; in the villages, the rural distributive stores. The Consumers' Communes are to include the whole population of the locality, the duty of every citizen being to become a member of the Commune and to inscribe himself at one of the distributing centres. The affairs of the Commune are managed by a Board and a Controlling Council. The right to elect and be elected a member of all the administrative and controlling bodies of the Commune is based on the suffrage governing the election to the political institutions of Soviet Russia—that is to say, by a vote of all citizens who have attained eighteen years of age and support themselves by their labour. The task of distributing produce and articles of prime necessity passes to the Communes thus organised, which take over all existing co-operative stores of the Soviets, all depots and distributing centres and all productive enterprises belonging to the co-operative with all their assets and capital. The late members of the consumers' societies are paid back the value of their shares in strict conformity with the statutes of the respective societies."—*The Consumers' Commune (People's Year Book, 1921, p. 219)*.

Spain: Catalonia the seat of the coöperative movement.—Gains subsequent to World War.—"Co-operation in Spain—that is, mainly in Catalonia and the Balearic Isles—has made some progress. In 1900, when we held our first Congress, our Union consisted of only 44 societies. We then constituted our 'Regional Chamber of Co-operative Societies,' the organisation of which I explained in my last report. . . . To-day we have a round 100 societies, half of which, that is 50, have their seat in Barcelona itself. . . . Catalonia, which is really a country by itself, distinct in many things from the rest of Spain, is the most industrial part of the kingdom. . . . It comprises about the fifteenth part of Spanish territory, but the tenth part of Spanish population. Within it there are, apart from our 100, another 40 co-operative societies which have not yet joined our Union. Unfortunately the membership in our societies is generally speaking small. The 140 among them number only about 8,000 members, which gives an average of 57 to the society. There are some tolerably big societies, of course, several with 150

members a piece, and one, the *Protectora Civil* of Zarrasa, with 500. Accordingly, in many other societies the membership must be exceedingly small. The entire annual trade of the 140 societies figures at about 10,000,000 pesetas, that is about £400,000. Most of these societies are of the distributive form. Nevertheless we have some good productive societies. Thus, in Barcelona the brickmakers of the *Redentora*, . . . the upholsterers of *La Tapicería Artística*, the printers of *Las Artes Graficas*, and the shoemakers of *La Activa*, and in Roda the cotton spinners of *La Primera del Ter*."—J. S. Anton, *Address at sixth Congress of the International Coöperative alliance, Budapest, 1904*, pp. 549-550.—"Spain, which has hitherto been regarded in the international cooperative movement as one of the backward countries, has during and since the war shown signs of greater promise. Formerly, the distributive movement was confined to the industrial center of the country in the Province of Catalonia, but latterly the movement seems to have gained ground in other localities, and to such an extent that steps have been taken for the establishment of a national union. A particularly active group of young distributive societies have arisen in the north of the country, and a union of cooperative societies in the north of Spain (Union de Cooperatives del Norte de España) with headquarters at Bilbao, has been formed. The union has already undertaken wholesale purchase, and in this connection it did a trade of 5,089,460 pesetas in 1920, an increase on the turnover of 1919 by 2,034,251 pesetas. At the end of 1920 the number of affiliated societies was 35 with a total membership of 14,253, doing a trade of 16,042,265 pesetas. The union is aided financially by the leading banks in the Province. Its development, and that of the affiliated societies in northern Spain can therefore be looked forward to with confidence."—*Christian Science Monitor*, Feb. 16, 1922.

Sweden: Organization and growth of cooperative societies.—**Swedish Coöperative Union.**—**Wholesale society.**—The first attempts to establish cooperative societies in Sweden were made in 1860-1880, but failed, mainly because the promoters of the movement neglected to adopt the "Rochdale principles". . . In fact, it was not until the beginning of the twentieth century that a firm foundation for the cooperative movement was laid . . . by the adoption of the . . . Rochdale system. The Swedish Coöperative Union was founded in 1899, by thirty societies. These societies had but a very small membership. In the beginning the union was concerned only with questions relating to propoganda and organization, but in 1904 opened a wholesale trading department. "In 1913 the Swedish Coöperative Union, which is an association of four-fifths of the distributive cooperative societies in Sweden, had 560 affiliated societies, with a collective membership of 103,369 for 409 of these societies giving returns, and a total sales of \$9,086,340. In 1916 there were 785 affiliated societies, of which 737 reported a collective membership of 169,063 and a total turnover of \$22,683,835. The statistics for 1919 show 016 societies, of which 879 reported an aggregate membership of 225,423 and sales amounting to \$60,032,775. In addition to these distributive societies the Union comprises four insurance companies. Similar success has been achieved by the Union's Wholesale, which, in 1913, the end of the first decade of its existence, had total sales of \$2,117,030. In 1916 the total volume of sales was \$6,114,785, while in 1919 the total was \$19,208,230. The increase in the turnover for 1919 was 147 per cent over 1918. In addition

the society has established a margarine factory at Norrköping, at a cost of \$850,000, with a productive capacity of 140,000 to 160,000 pounds per day."—G. S. Watkins, *Coöperation (University of Illinois Bulletin, v. 18, no. 28, Mar. 14, 1921, p. 69)*.

Switzerland: General union of cooperative stores.—"In Switzerland the cooperative movement has been developed, unaided, by the people themselves. The greatest number of societies are agricultural societies, but very little published information is available concerning them. . . . The consumers' cooperative store movement in Switzerland dates from 1847 and has been successful from the first. In 1890 the General Union of Swiss Coöperative Stores (*Verband schweizerische Konsumentenvereine*) was founded. Up to 1902 the farmers' consumers' cooperative societies were affiliated with the general union through their Union of East Swiss Agricultural Coöperative Societies. In that year the country societies withdrew from the general union because of a difference in views. The union pursued a policy of favoring free trade, while the farmers' societies were protectionists. Though the union has had a definite economic policy, it has maintained an attitude of strict neutrality with regard to politics. The union carries on a wholesale business, the savings of which are used to create reserves and establish new business enterprises. Large sums are spent yearly for education and propoganda. The union, or the V. S. K., as it is called, now owns and operates a boot and shoe factory, two flour mills (one in German and one in French Switzerland), a printing establishment, an architect's office, a laboratory, a coffee-roasting department, and a dairy. It also owns about 900 acres of land. Since 1917 it has also issued life insurance through a special company organized for the purpose."—*Monthly Labor Review, Nov., 1920*.—It also includes a cooperative garden village for the housing of cooperative union employees.

United States: Consumers' societies.—**Manufacturing and agricultural organizations.**—"So far back as 1868, in Minneapolis, four journeymen coopers had formed a cooperative society, steadily enlarged as the milling interests increased. [See also MORMONISM: Cooperative polity since 1847; MINNESOTA: 1868.] In 1874, when the flour output was about 500,000 barrels a year, so many coopers had come to town that the Coöperative Barrel Manufacturing Company was formed and twelve years afterwards two-thirds of all barrels made in Minneapolis were made in cooperative shops. And then somehow the things began to decline. Of seven great cooperative shops existing in 1886 only three survive [in 1908]. . . . In other lines of productive effort Coöperation has often achieved notable success. The cooperative creamery, for instance, has been a boon to millions of farmers. . . . The idea is steadily gaining; it is very strong in all the Western States. . . . In the operation of these societies there has been almost uniform success. The farmers indeed have done far more than the workingmen to show the benefits of union. . . . Fruit growers' associations have been formed in nine states. . . . The Southern California Fruit Exchange, organized in 1891, handles more than half the orange business in California. . . . One third of all the fruit grown in California is now handled cooperatively. There are also cooperative bee keepers, cooperative sheep herders, cooperative poultry raisers, cattle breeders, wool growers, cotton growers and milk-dealers, and in six states are flourishing cooperative grain elevators. . . . Of cooperative

insurance companies we have mutual life, fire, hail and live-stock insurance. In Michigan, Iowa, Indiana, Kansas, Nebraska, Minnesota, Wisconsin, and the Dakotas farmers' coöperative telephone companies have had a phenomenal growth and have effected in some degree a transformation of rural life. . . . Coöperative distribution . . . has been revived in America through the well-considered efforts of the Coöperative Association of America, and the Golden Rule Fraternity. The Coöperative Association began in Lewiston, Me., in 1900, as 'A Trust for the People.' It has utilized the ordinary trust machinery towards communal good instead of personal profit. There is a holding company called the 'Co-Workers' Fraternity' and this [in 1906] owns a controlling interest in stock of the Coöperative Association of America, in the National Production Company of New Jersey, in the Massachusetts Coöperative Society. . . . The revived prospects of Coöperation in America are due chiefly to the altruistic efforts of a certain band of thoughtful men and women that believe this to be the first step towards a cure of the national evils."—C. E. Russell, *Uprising of the many*, pp. 30-37.

"I spent nearly four weeks, from March 3 to March 27, [1908] visiting a chain of co-operative stores, fifty-five in number, in the vicinity of Minneapolis, Minnesota. These stores are organized on the famous Rochdale plan, for the benefit of the consumer instead of the capitalist. The profits are divided in proportion to purchases, except that the general public who have not yet chosen to become members or shareholders receive only half-dividend or benefit. Goods are not sold cheaper; it is aimed to create capital by earning good profits. An accounting is had and the profits ascertained once in three or six or twelve months. These profits are then distributed between a surplus fund, an educational or propaganda fund, and dividend on purchases, which is paid in cash if the shareholder has paid in full, or credited on his share if only part paid. This is the nub of the Rochdale System, departures from which have been the cause of a long and almost unbroken line of failure in American attempts in co-operative stores. These Minnesota and Wisconsin stores have all been organized on a nearly uniform plan by a propaganda organization known as the Right Relationship League, consisting of three active officers, two additional directors, eight field organizers, and an associate membership of all the store shareholders who pay a fee of one dollar. The stores are incorporated by counties; when there are several stores in one county, they are 'departments' or branches. For example, the Polk County (Wisconsin) company has ten stores, the Pepin County company nine stores, and each has a general manager and a joint warehouse. Instead of starting a new store with a new manager and no established trade, the newly organized co-operative company buys out the best or next best general store in the town and continues the former owner as manager."—N. O. Nelson, *Co-operative movement in the United States* (*Outlook*, July 4, 1908).—In "Labor Problems," by T. S. Adams and Helen L. Sumner, a considerable number of successful undertakings in producers' coöperation in the United States are enumerated, including establishments operated by labor unions in the iron, glass, garment and cigar-making, box-workers, wood-workers, building trades, etc., east and west; besides coöperative laundries and restaurants. The most interesting of these organizations appears to be that of the Workers' Coöperative Association of Boston, formed in 1900 by members of the building trades.

"The history of Co-operation in the United States is a story of idealism, blasted by failures. . . . The spirit of individualism, the newness of the country, the mixture of races and nationalities, the presence of frontiers into which a fluid population could be kept moving, and the not hopeless possibilities of escape from poverty, all contributed to inhibit the growth of co-operation in the United States. . . . The new life came with aggregations of immigrant people from countries which had well established co-operative societies. The farmers of the western and northern states and the foreign industrial workers in all parts of the country during the past decade have been making more successful experiments in organization than had ever before been attained. But it has been especially since the year 1916 that the greatest impetus to the movement has been seen. . . . [The development of the movement] has been sporadic. . . . The agricultural people of the northern states have been among the first in this new era. The Co-operative League of America has knowledge of over 2,000 true consumers' co-operative societies conducting stores. In some locations the purchasing power of groups of societies has become so great that they have federated and organized wholesale societies. The Tri-state Co-operative Society is a federation of about 70 societies, mostly in Western Pennsylvania. These societies are constituted of many nationalities: Poles, Slovaks, Lithuanians, Ukrainians, Italians, and Bohemians. One of the typical successful organizations is that of Bentleyville, Penn. Here in a little mining town, it has crowded out private business, and handles groceries, meats, dry-goods, shoes, feed and automobile supplies to the amount of \$200,000 a year. The Tri-state Co-operative Society maintains a wholesale with a warehouse at Monessen, Pa., . . . [and] another warehouse at Pittsburgh. The Central States Co-operative Society is a federation of about 65 distributive societies. Its headquarters are in Springfield, Ill. It maintains a wholesale with a warehouse at East St. Louis. These societies are largely built up among the union locals of the United Mine Workers in Illinois. This is a group of about 80 of these societies. Their financial success enables many of them to return to their members a savings-return of from 6 to 12 per cent. quarterly on the cost of their purchases. The society at Witt, Illinois, may be taken as a typical example of this group. It has over 300 members. Its last quarterly report shows that for the three months they paid a cash savings-return to their members of 8 per cent. This society, like that at Danville, has an energetic committee on education and social features, and brings together the men, women, and children in its educational and recreational activities. The Staunton, Illinois, Society has nearly 400 members, declares a ten per cent. savings-return, does a quarterly business of \$36,376, and has resources amounting to \$35,000. Many of these societies own their own buildings. They sell groceries, meat, hardware, dry goods, and clothing. Some conduct their own coal yard. The Roseland, Illinois, society has 400 members, and is doing a business of \$130,000 a year. Here is a society with a large element of Scottish co-operators who learned co-operation in the old country. Their festivals and picnics, with their band of kilted musicians is a glory of the movement. . . . Strong groups of societies exist in Indiana, Ohio and Iowa. The Palatine Co-operative Society of Chicago, with 1,200 members, conducts a school with 400 Polish students. This society has a capital of \$500,000. The societies in the northern states are growing

up in the farmers' organisations. Their wealth, numbers, and the size of their membership is greater than in any other section of the country. These societies are largely connected with co-operative producers' organisations. Hundreds of them not only conduct stores where groceries, clothing, dry goods, and hardware are sold, but they do an enormous business in supplying seeds, fertilisers, and harvesting machinery to their members. These same organisations buy the farmers' products and dispose of them on a co-operative basis. Some of them own grain elevators, others are organized to sell live stock, and not a few conduct a meat-packing business. It is among these societies that the Co-operative Wholesale Society of America, the American Rochdale Union, the American Co-operative Association, the American Rochdale League, the American Co-operative Organisation Bureau, and a large number of organisation societies operate. . . . Wisconsin, Minnesota, the Dakotas, and Montana are, perhaps, more thoroughly permeated with the spirit of co-operation than any other section of the country. . . . The Non-Partisan League has given special attention to co-operative organisations and is promoting the movement, organising not only societies to run stores, but banks and community centres. The North-West has a vigorous movement around Puget Sound. The powerful organisations of Seattle have become interested in co-operation. Among the Seattle co-operatives are found a laundry, printing plant, milk condensary, several shingle mills, fish cannery, and recreation houses. Behind them is the support of the labor unions. The Puget Sound Co-operative Wholesale, a federation of the societies about Seattle was organised in 1918. In the winter of 1919, it fed the families of the striking shipyard workers. . . . An older co-operative movement is found in California. The Rochdale movement started there in 1000. It experienced many vicissitudes. A Wholesale was organised but it failed to give substantial help. Then the Pacific Co-operative League was incorporated in 1913 as a propaganda and sustaining organisation. This has given decided strength to the movement. In 1918, the California Union of Producers and Consumers was created. The three organisations which enter into its composition are the Farmers' Educational and Co-operative Union, the Pacific Co-operative League, and the California State Federation of Labor. . . . A group of people who have done more than any other nationality to promote co-operation in the United States are the Finns. . . . At Superior, Wis., they have a wholesale in the midst of a group of about fifty splendid societies. . . . In Western Massachusetts is another group of Finns. . . . In New York city they have co-operative apartment houses, restaurants, and club houses. Their central bank in Fitchburg, Mass., has a branch in New York. . . . From the Northern states to New England are chains of these Finnish societies. Their club houses, theatres, and amusement parks represent the best America has in these expressions of co-operation. Other national and racial groups which have made notable progress are the Russians, Italians, Germans, Poles, Slovaks, and Franco-Belgians. One of the most successful forms of consumers' co-operation in the United States is seen in Farmers' fire insurance. There are about 2,000 of these mutual fire insurance companies. They carry insurance exceeding \$5,250,000,000 on property valued at nearly 7 billion dollars. This insurance is carried on one-half the rate charged by the commercial companies. The insurance is cheaper because the expenses are less, and the moral hazard is largely

removed. The National Co-operative Convention at Springfield, Illinois, in 1918, under the auspices of the Co-operative League of America, was a significant event in the development of the American movement. . . . During the first six months after this event the League added the names of over 1,000 societies to its list. The co-operative movement in America has undergone a striking revival during the past few years. In 1916, the American Federation of Labor passed strong resolutions endorsing consumers' co-operation and provided for the promotion of true Rochdale methods.

"Fundamental Principles of the Co-operative Consumers' Movement.—(1) One vote only for each member. (2) Capital to receive interest at not more than the legal or minimum current rate. (3) Surplus savings (or 'profit') to be returned as savings-returns in proportion to the patronage of each individual, or to be employed for the general social good of the society. (4) Business to be done for cash or its equivalent. (5) Goods to be sold at current market price—not at cost. (6) Education in the principles and aims of co-operation, with the view of expansion into the larger fields, always to be carried on in connection with the enjoyment of the immediate economic advantages. (7) Federation as soon as possible with the nearest co-operative societies, with the ultimate purpose of national and world co-operation."—J. P. Warbasse, President, Co-operative League of America, Pamphlet.

"The Coöperative League of America has estimated that in 1920 there were about 3,000 consumers' societies in the United States, with a total membership of over 500,000, representing with their families 2,000,000 persons, and a combined purchasing power of \$200,000,000 annually. The total capital of these societies is estimated to be \$15,000,000. Adequate statistical data concerning the movement in America are not available, but there is every reason to believe that these estimates are approximately correct."—G. S. Watkins, *Coöperation* (*University of Illinois Bulletin*, v. 18, no. 28, Mar. 14, 1921, p. 50).—"Co-operative associations in New York City, exclusive of housing co-operatives, transacted more than \$1,600,000 worth of business during 1921, according to Louis Blachly, Director of the Co-operative Division of the State Department of Farms and Markets. Substantial progress was made during the year in co-operative work. . . . The failures, for the most part, were due, . . . either to poor business management and a lack of adequate survey in advance or to keen competition of the chain stores, this being especially true of the co-operative grocery stores. . . . The stronger associations grew stronger last year, while the weaker ones either became weaker or disappeared altogether. At least two of the larger co-operatives which paid no dividends in 1920 were able to make 6 per cent. returns to the stockholders last year. In the large associations, both the amount of business and membership increased. . . . The five principal co-operative associations in this city, . . . transacted a total business of \$1,079,000 last year. The largest organization is the Finnish Co-operative Trading Association, Inc."—*New York Times*, Mar. 5, 1922.

nology, p. 60.

COPENHAGEN (Danish Kjöbenhavn), capital
of Denmark, largest and most important city of the
country, is situated on the islands of Zealand and
Amager. It was only a fishing village until it came
into the possession of Bishop Absalon, who fortified
it, 1167, from which time it has grown steadily
in importance. It is almost entirely a commercial
rather than an industrial city, through which passes
over one-half of the commerce of Denmark. The
1920 census gives it, including the suburbs, a popu-
lation of 630,400.

1254.—First municipal privileges.—The city re-
ceived its first municipal rights from Bishop Er-
landsen.

1362.—Taken and pillaged by the Hanseatic
League. See SCANDINAVIAN STATES: 1018-1397.

1443.—Capital of the kingdom of Denmark.—
King Christopher, the Bavarian, chose it for the
capital of the kingdom.

1658-1659.—Besieged by Charles X, of Sweden.
See SWEDEN: 1644-1697.

1700.—Surrendered to Charles XII. See SWE-
DEN: 1697-1700.

1801.—Bombarded by the fleets of England,
Holland, and Sweden. See FRANCE: 1801-1802.

COPPAGE vs. KANSAS.—The facts of the
Coppage case are briefly as follows: In 1903 a
Kansas statute was passed making it a misde-
meanor for any employer to require a worker to
agree not to join a labor union or remain as a
member of such, as a condition of obtaining or

retaining a position. On July 1, 1911, T. B.
Coppage, superintendent of the St. Louis and
San Francisco Railway Company at Fort Scott,
Kansas, requested A. R. Hedges, a switchman, to
sign an agreement that he would withdraw from
the Switchmen's Union of America and remain out-
side of its ranks so long as he was employed by
the company. Hedges refused to comply and was
discharged. Legal proceedings followed. The case
finally reached the Kansas Supreme Court, where
the constitutionality of the statute was upheld.
On January 25 of this year [1915] the Kansas
judgment was reversed by the United States Su-
preme Court, Justice Pitney rendering the decision.
Justice Holmes dissented on the same grounds as
in the Adair case of 1908, and Justice Day issued
a separate dissenting opinion, concurred in by
Justice Hughes. Justice Pitney contended that the
statute in question constituted an interference with
liberty of contract guaranteed by the Fourteenth
Amendment, and thus must be deemed to be
arbitrary, 'unless it be supportable as a reasonable
exercise of the police power of the State.' A
statute, he declared, may be sustained as a legiti-
mate exercise of this police power if it is passed
to prevent coercion and to promote the public
health, safety, morals or general welfare of the
people. No coercion, however, here appears—the
plaintiff was absolutely free to choose whether he
wished to retain his membership in the trade union
or to keep his job. The act bears no possible rela-
tion to the public welfare, etc., 'beyond the sup-
posed desirability of leveling inequalities of fortune
by depriving one who has property of some part
of what is characterized as his "financial inde-
pendence." An endeavor so to level inequalities
would deny to citizens the right of private property
guaranteed by the Fourteenth Amendment, since
inequality is the inevitable result of a system of
private property. Justice Holmes . . . showed that
the statute, far from interfering with freedom of
contract, might be looked upon as actually pre-
paring the way for such freedom. He declared:
'In present conditions a workman may not un-
naturally believe that only by belonging to a union
can be secure a contract that shall be fair to him.
If that belief, whether right or wrong, may be
held by a reasonable man, it seems to me that it
may be enforced by law in order to establish the
equality of position between the parties in which
liberty of contract begins. Whether in the long
run it is wise for the workmen to enact legisla-
tion of this sort is not my concern, but I am
strongly of the opinion that there is nothing in the
constitution of the United States to prevent it.' . . .

"Justice Day, in opposing the majority view,
declared that the right of contract was not abso-
lute; that those who attack the legislation have
the burden of proving that it conflicts with some
constitutional restraint or that the public wel-
fare is not subserved by the legislation; that
the local legislature is itself a judge of the necessity
of such legislation, and that the legislature's en-
actments might be set aside only if they can be shown
to be arbitrary and capricious. Since this statute
simply protected the legal right of an employe to
join a union, its passage could not be considered
an abuse of legislative power. The Justice also
declared that the court had no right to inquire
into the motives of the legislature and that even
if the object of the statute was that of equalizing
the relative positions of contractual parties, and
of protecting 'those who might otherwise be unable
to protect themselves,' no substantial objection
could be raised. Justice Day scoffed at the asser-
tion that coercion is not present when an employe

forces an employe either to sign an agreement to leave a union or leave his job. 'In view of the relative position of employer and employed,' he declared, 'who is to deny that the stipulation here insisted upon and forbidden by the law is essentially coercive? No forms of words can strip it of its true character.' The Adair case was distinguished from the Kansas case on the ground that in the former, the statute in question prevented the employer from *discharging* a worker on account of his connection with organized labor. The Kansas statute prevented an employer from forcing an agreement that the worker *at no future time during his employment* shall join a union. Although a State might not be able to prevent an employer from discharging a worker because he resorted to the courts for redress, the justice held, it could prevent him from requiring his workers to agree never in the future to bring such an action to court. Justice Day was also of the opinion that the court would have decided otherwise than it did if a similar law had been passed to protect employers in their legal associations. He said: 'An analogous case, viewed from the employer's standpoint, would be: Can the State, in the exercise of its legislative power, reach concerted effort of employes intended to coerce the employer as a condition of hiring labor that he shall engage in writing to give up his privilege of association with other employers in legal organizations, corporate or otherwise, having for their object a united effort to promote by legal means that which employers believe to be for the best interests of their business?'—H. W. Laidler, *Kansas labor statute case and the Supreme Court (International Molders' Journal, May, 1915, pp. 332-333)*.

COPYRIGHT: Definition.—"Copyright (from the Latin *copia*, plenty) means, in general, the right to copy, to make plenty. In its specific application it means the right to multiply copies of those products of the human brain known as literature

and art. There is another legal sense of the word 'copyright' much emphasized by several English justices. Through the low Latin use of the word *copia*, our word 'copy' has a secondary and reversed meaning, as the pattern to be copied or made plenty, in which sense the schoolboy copies from the 'copy' set in his copy-book, and the modern printer calls for the author's 'copy.' Copyright, accordingly, may also mean the right in copy made (whether the original work or duplication of it), as well as the right to make copies, which by no means goes with the work or any duplicate of it. Blackstone in his Commentaries of 1767, in which the word copyright seems to have been first used, lays down the fundamental principles of copyright as follows: 'When a man, by the exertion of his rational powers, has produced an original work, he seems to have clearly a right to dispose of that identical work as he pleases, and any attempt to vary the disposition he has made of it appears to be an invasion of that right. Now the identity of a literary composition consists entirely in the sentiment and the language; the same conceptions, clothed in the same words, must necessarily be the same composition; and whatever method be taken of exhibiting that composition to the ear or the eye of another, by recital, by writing, or by printing, in any number of copies, or at any period of time, it is always the identical work of the author which so exhibited; and no other man (it hath been thought) can have a right to exhibit it, especially for profit, without the author's consent. This consent may, perhaps, be tacitly given to all mankind, when an author suffers his work to be published by another hand, without any claim or reserve of right, and without stamping on it any marks of ownership; it being then a present to the public, like building a church or bridge, or laying out a new highway."—R. R. Bowker, *Copyright—its history and its law*, pp. 1-3.

Early conceptions of authors' rights.—"Our traditions of the blind Homer, singing his Iliad in the multitudinous places of his protean nativity, do not vouchsafe us any information as to the *status* of authors in his day. There seems indeed to be no indication of author's rights or literary property in Greek or earlier literatures. But there is mention in Roman literature of the sale of playwright by the dramatic authors, as Terence; and Rome had booksellers who sold copies of poems written out by slaves, and who seem to have been protected by some kind of 'courtesy of the trade,' since Martial names certain booksellers who had specific poems of his for sale. . . . The Roman jurist Gaius, probably of the second century, held that where an artist had painted upon a *tabula*, his was the superior right. And this opinion was adopted by Tribonian, chief editor of the code of Justinian, in the sixth century, and was applied in a modern question in respect to John Leech's drawings upon wood. . . . The first record of a copyright case is that of *Finnian v. Columba* in 567, chronicled by Adamnan fifty years later and cited by Montalembert in 'The monks of the West.' St. Columba, in his presaintly days, surreptitiously made a copy of a psalter in possession of his teacher Finnian, and the copy was reclaimed, so the tradition relates, under the decision of King Dermott, in the Halls of Tara: 'To every cow her calf.' The authenticity of the tradition is questioned by other writers, but the phrase gives the pith of the common law doctrine of literary property and indicates that in those early centuries there was a sense of copyright. . . . Finally dif-

ferent texts of the same work were compared to obtain a certain or standard text, and the multiplication of such copies became the basis of a publishing and bookselling trade, in secular as well as sacerdotal hands, the development of which is traced in detail by George Haven Putnam in 'Books and their makers in the Middle Ages.' This development is illustrated in the statutes of 1223 of the University of Paris, providing that the 'booksellers of the University' should produce duplicate copies of the texts authorized for the use of the University, and there is indication that payment was made by the University to scholars for the annotation and proof-reading of such texts."—*Ibid.*, pp. 8-9.

1450-1793.—Invention of printing.—Effect on copying and selling rights.—Official control by church and state.—Grants and privileges.—Changes in author's copyright.—"All early copyright dealt with books. The political and economic results which can be and are worked by the printed word were recognized by governmental and ecclesiastical authority from the very first. It is a great mistake to deem that the multiplication of copies was coeval with the rise of printing. An enormous number of copyists or scribes were a feature not only of Roman but even more especially of late mediæval life. Printing, however, spelled cheapness and the means of communicating to the masses what had been a luxury for the relatively few learned and lettered classes. The spread of the invention of printing, the Reformation and the Renaissance were, more or less, contemporaneous. They found absolutism; both political and mental, universal. Governmental censorship of all printed matter was rigorously enforced. The author under such conditions was a very different creature from his modern successor. As has been wittily said in early days an author usually disappeared immediately after the publication of his work and if he reappeared at all, did so in the stocks or pillory."—A. W. Weil, *American copyright law*, p. 6.—"The invention of printing, prior to 1450, made protection of literary property a question of rapidly increasing importance. The new art raised, of course, many new questions wherever the guardians of the law were set to their chronic task of applying old ideas of right to new conditions. The earliest copyright certificate, if it may be so called, in a printed book was that in the re-issue of the tractate of Peter Nigrus printed in 1475, at Esslingen, in which the Bishop of Ratisbon certified the correctness of the copy and his approval. At first 'privileges' were granted chiefly to printers, for the reproduction of classic or patristic works, but possibly in some cases as the representatives of living writers; and there are early instances of direct grants to authors, the earliest known being in 1486 in Venice to Sabellico. In Germany, the cradle of the art of printing, whence come the earliest *incunabula* or cradle-books, printing privileges were developed some decades later than in Italy. Koberger, the early Nuremberg printer, whose imprint dates back to 1473, relied rather on the 'courtesy of the trade,' and indeed made an agreement in 1495 with Kessler of Basel to respect each other's rights. Yet a suit brought in 1480 by Schöffler, who with Fust had established the first publishing and bookselling business, brought in connection with Fust's heirs against Inkus of Frankfort for the infringement of property rights in certain books, and the issue of a preliminary injunction by a court at Basel, indicated some definite legal status. The first recorded privilege in Germany was issued by the imperial Aulic Council in 1501, to the Rhenish

Celtic Sodalitas for the printing of dramas of the nun-poet, Hroswitha, who had been dead for 600 years, as prepared by Celtes of Nuremberg. . . . Venice, among whose chief glories were to be the master printers Aldus, was the first and foremost of the Italian states to encourage the new art. The first privilege granted by her Senate, in 1469, indeed antedated the first in Germany by thirty-two years, the first in France by thirty-four years, and the first in England by forty-nine years. This was to John of Speyer, a German printer, for a monopoly for printing in Venice for five years, with prohibition of importation of works printed elsewhere, which he did not live to enjoy. The first known author's copyright was granted September 1, 1486, to Antonio Sabellico, historian to the Republic, of the sole right to publish or authorize the publication of his 'Decade of Venetian affairs,' not limited in time, with a penalty of five hundred ducats for infringement. . . . Florence was second only to Venice in the production of books and the protection of authors, and the records of Florentine printing show that in the sixteenth century international privileges were sought and obtained. Thus the printer of a Florentine edition of the Pandects, in 1553, obtained privileges also in Spain, France and the two Sicilies, possibly through a Papal grant. By 1515, under Leo X, patron of art and letters, the Holy See had asserted its jurisdiction over copyrights and privileges, not only in its own territory, but throughout Italy and Germany, and elsewhere, under pain of spiritual punishments. . . . In France, after the invention of printing, the functions of the *libraires jurés*, under the authority given by the King through the University of Paris, naturally came to include books, and this relation was continued until the Revolution of 1789. Copyrights throughout this period seem to have been in perpetuity. . . . Copyrights continued in perpetuity until all royal privileges were abolished in 1789 by the National Assembly, after which in July, 1793, a general copyright law was passed, granting copyright to an author for his life and to his heirs for ten years thereafter."—R. R. Bowker, *Copyright—its history and its law*, pp. 10-11, 13, 17-18.

1500-1710.—Governmental control in England.—Booksellers' monopolies.—Printing privileges.—Early legislation.—Statute of Anne.—"To talk about the natural rights of authors in Tudor or Stuart England, would have been farcical. The early history of copyright had nothing to do with the rights of the author. He was not allowed to publish his work save by governmental license. He had not the financial ability nor the mechanical facilities for printing his works. The urban booksellers constituted guilds, monopolistic survivals of mediævalism. In England, the London Stationers' Company, partly utilized as a regulatory governmental agency, was all powerful in the world of letters, prior to and well into the Eighteenth Century. The claims of its members to copyright rested not in the theory of creation but solely on that of purchase. Their theories were those of mediæval merchants and their conception of the rights of authors was limited to that obtaining in the market place. It was not until relative political liberty, the breaking down of the guild system, the rise of the fashionable author and the great changes of the late Seventeenth Century in England came into being that we find the first beginning of the now accepted modern theories of literary property. These first arose out of the economic struggles of booksellers. The resultant statutes, and the judicial opinions which are their

reflex, have mirrored the changes in scientific, æsthetic and metaphysical thought which have marked the progress of modern civilization and form frequently unrecognizable milestones in political development. Thus it is obvious that the views which now prevail as to the foundation of literary property are a relatively modern development. They date from a great opinion of Lord Mansfield more remarkable for its sense of natural justice and eloquence than logical legal accuracy."—A. W. Weil, *American copyright law*, p. 7.—"In England, a Royal Printer was appointed in 1504, and to his successor, Richard Pynson, in 1518, the first printing 'privilege' was issued, in the form of a prohibition for two years of the printing by any other person of a certain speech to which this first English copyright notice was appended. . . . An early enactment of Richard III, in 1483, had encouraged the circulation of books by exempting from certain restraints on aliens 'any artificer, or merchant stranger, of what nation or country he be, for bringing into this realm, or selling by retail or otherwise, any books written or printed, or for inhabiting within this said realm for the same intent, or any scrivener, alluminor, reader, or printer of such books.' But fifty years later, under Henry VIII, this exemption was repealed by an act, 'for printers and binders of books,' which provided that no person 'resident or inhabitant within this realm shall buy to sell again, any printed books brought from any parts out of the King's obeysance, ready bound in boards, leather, or parchment,' or buy 'of any stranger born out of the King's obedience, other than of denizens, any manner of printed books brought from any parties beyond the sea, except only by engros, and not by retail'—the buyer to be punished by a fine, of which a moiety was to go to the informer. The act also contained provisions to 'reform and redress,' through the Chancery judges with 'twelve honest and discreet persons,' 'too high and unreasonable prices.' [See COMMON LAW: 1499.] . . . Henry VIII granted many printing privileges, and in 1530 the first English copyright to an author was issued to John Palsgrave, who, having prepared a French grammar at his own expense, received a privilege for seven years."—R. R. Bowker, *Copyright—its history and its law*, pp. 0-21.—"Governmental regulation of printed matter, aside from monopolistic patents to the so-called Kings Printers and patents to the University of Cambridge first resided in the Court of Star Chamber. It dealt with unlicensed printers and writers whose works were obnoxious to Church or State in a drastic and summary fashion. No one appears to have been bold enough to assert a claim of common law copyright before it, judging from its reported proceedings. It issued decrees regulating the sale and printing of books from time to time and codified these in 1637 into a decree which formed the basis of the Licencing Act passed by a Parliament of Charles II. It provides,—so far as material,—that no book might be published in England, the exclusive right of printing which belonged to the Stationers' Company, or to any other person, as a result of Letters Patent, Order, entrance in the Register Books of that Company or otherwise. The Licencing Act expired in 1679. . . . After the expiration of the Licencing Acts, the members of the Stationers' Company made repeated applications to Parliament for a new Licencing Act. Their efforts finally, in 1710, resulted in the famous Statute of Anne. . . . The Statute of Anne dealt both with books which had been published and with new books and gave rights, limited in time, in connec-

tion with each."—A. W. Weil, *American copyright law*, pp. 9-10.

1766-1890.—Copyright cases in English law.—Statute of 1842.—Later legislation.—"After the expiration of the term prescribed by the Statute [of Anne], Scotch and country booksellers began to print copies of some of the old works in question. Early encounters in the Court of Chancery resulted in favor of the London booksellers, possibly, as Mr. Birrell suggests, because of the expense of defending actions under the early Chancery practice. . . . In 1766, a second action was brought, at law, *Millar v. Taylor*, involving Thompson's 'The Seasons.' It was argued twice before Lord Mansfield, Willes, Aston and Yates, JJ. The Court, in most elaborate opinions, held that the copyright in a book belonged to an author at common law, was perpetual and not taken away by the Statute of Anne. . . . Thereafter, a contest over the same work precipitated the famous suit of *Donaldson v. Becket*. The lower Court followed *Millar v. Taylor* but, on appeal, the House of Lords reversed the decision, holding that if there had been a perpetual common law copyright in a work after its publication, it was taken away by the Statute of Anne. This decision . . . forever ended perpetual copyright in published works in England. It was followed, and determined the fate of a similar claim, in the United States."—A. W. Weil, *American copyright law*, pp. 10-11.

"In the year 1775 the universities . . . obtained an Act granting them perpetual copyright in books given to them for the advancement of learning and education. In the year 1814 an Act was passed, which extended the periods of monopoly allowed by the Statute of Anne. It enacted, that authors should have the sole liberty of printing and reprinting their works for twenty-eight years to commence from the day of publication; and further, that if the author should be living at the expiration of that period, for the residue of his natural life. The year 1842 saw the Copyright Act passed, upon which the law of literary copyright now depends. For many reasons the time could not have been more propitious for extending the periods of copyright. Many of the members of Parliament were impressed by the petitions they had received. They naturally would think of Scott, who, just at the time when he was about to reap the reward of his early and most successful novels, died, leaving his family in great financial difficulty,—for his copyrights had expired. They would think of Wordsworth, who just at the time when his poems were becoming popular, found that they belonged to everyone, as well as to himself. They would think of Southey, who constantly found himself ill at ease in the presence of his creditors, and whose literary career was known to have been much altered by his pecuniary needs, which arose owing to the shortness of his copyrights. They would also, no doubt, bear in mind the petition of 'Thomas Carlyle, a writer of books,' who set before the House 'that your petitioner has written certain books, being incited thereto by certain innocent and laudable considerations; that his labours have found, hitherto, in money or money's worth, small recompense or none.' The time was ripe for legislative lenience. The Act said that Copyright should exist for 'forty-two years from publication, or until seven years from the death of the author, whichever shall be longest.' The gratitude of all authors is due to Mr. Serjeant Talfourd for his excellent enactment. At a time when it appeared that authors were to approach a little nearer to their just rewards,

when the future was about to become rosy with the hue of success, there sprung from the serried ranks of the opposition, in the debates upon this Bill, the great figure of Macaulay. By his unrelenting opposition to the extension of the period to sixty years' publication, he was eventually successful in moulding it to the shape which it came at last to assume upon the Statute book. It was said at the time that 'Literature's own familiar friend in whom she trusted, and who has eaten of her bread, has lifted up his heel against her.' The influence wielded by Macaulay justifies his biographer in saying that 'Never has any public man, unendowed with the authority of a minister, so easily moulded so important a piece of legislation into a shape, which so accurately accorded with his own views, as did Macaulay the Copyright Act of 1842.'"—W. F. W. Brown, *Origin and growth of copyright* (*Law Magazine and Review*, Nov., 1908, pp. 63-64).—"A . . . digest by Sir James Stephen, appended to the report [of the Royal Copyright Commission, 1878] is presented by the Commission as 'a correct statement of the law as it stands.' This digest is one of the most valuable contributions to the literature of copyright, but the frequency with which such phrases occur as 'it is probable but not certain.' . . . 'it seems' [etc.], . . . shows the state of the law, 'wholly destitute of any sort of arrangement, incomplete, often obscure. . . . This report and digest covered legislation through 1875, inclusive of the Canada act. [See EQUITY LAW: 1875.] They seem also to have regarded, though the act is not specified in the schedule, the consolidated customs act of 1876 (39 & 40 Victoria, c. 36), which incidentally contained the provisions for the prohibition of the importation of copyright books. Despite the recommendations of the Commission and several later endeavors to pass a comprehensive copyright act,—of which the most important was Lord Monkswell's bill introduced into Parliament on behalf of the British Society of Authors, November 16, 1890, and given in full with an analysis by Walter Besant in George Haven Putnam's 'Question of copyright'—later legislation in England has been confined practically to two topics, international copyright and the vexed question of musical compositions."—R. R. Bowker, *Copyright—its history and its law*, pp. 30-31.

1790-1909.—Copyright law in the United States.—"The first Federal Copyright Law was passed in 1790 (Act of May 31st). It was closely modeled upon the English statute. It provided 'for the encouragement of learning' by securing to the authors or proprietors of printed or published maps, charts, and books, if citizens of the United States or resident therein, copyright for the term of fourteen years. The right given was merely the sole right and liberty of printing, reprinting, publishing and vending the same. No performing right or right of translation was conferred. Printing and publishing were apparently used largely as synonyms in it. The Act provided a penalty, half to the author or proprietor of the copyrighted work, half to the United States, as to all copies of the work printed, reprinted, published, imported, sold or exposed for sale, without the prior consent in writing of the author or proprietor signed in the presence of two witnesses. . . . The provisions of this Act have been extended by frequent supplementary Acts passed in 1802, 1831, 1834, 1846, 1856, 1865. A complete revision was made in 1870 and amended three and four years later. From the year 1882 to the passage of the present Act, 1909, five Acts were passed. In fact, even the last Act has been slightly amended in

1912, 1913, 1914."—A. W. Weil, *American copyright law*, pp. 17-18.—"To the general surprise, the new copyright bill slipped through both houses of Congress . . . [March 3, 1909]. It consists of one complete and consistent copyright statute, in sixty-four sections. The term of copyright is lengthened. The bill leaves the present first term of twenty-eight years unchanged, but provides for a renewal term of twenty-eight years instead of fourteen, thus making possible a period of protection of fifty-six years from the publication of the work. The bill also provides for the extension of subsisting copyrights upon the same basis. Copyright may now be secured for all the 'writings' of an author, using the constitutional expression. In enumerating and classifying works protected by copyright, the bill is more explicit than the present statutes, and adds the following new designations: 'Lectures, sermons, and addresses, prepared for oral delivery'; 'dramatico-musical compositions'; 'plastic works of a scientific or technical character'; 'reproductions of a work of art,' and 'prints and pictorial illustrations,' in lieu of 'engravings,' 'cuts,' and 'chromos,' and 'works of art' instead of the . . . specific designations, 'painting,' 'drawings,' 'statue,' and 'statuary.' Express provision is made that compilations, abridgments, adaptations, arrangements, dramatizations, or translations and works republished with new matter shall be considered new works subject to copyright.

"As regards a musical work, the bill provides . . . that the author shall have the sole right to perform the work publicly for profit, but adds the sole right 'to make any arrangement or setting of it or of the melody of it in any system of notation or any form of record from which it may be read or reproduced.' The composer's control of the reproduction of his music by mechanical instruments is qualified as follows: (a) to cover only music published and copyrighted after the act goes into effect; (b) not to include music by a foreign author or composer unless the foreign state or nation of which he is a subject grants to citizens of the United States similar rights; (c) whenever the owner of a musical copyright has used or permitted or acquiesced in the use of his work upon parts of instruments serving to reproduce mechanically the musical work, any other person may make similar use of the work upon the payment of a royalty of two cents on each part manufactured, notice to be filed in the copyright office of such use or license to use by the copyright proprietor.

"American manufacture is required in the case of a book, not only as regards type-setting in the United States, but 'if the text be produced by lithographic or photo-engraving process, then by a process wholly performed within the limits of the United States.' The provision is also extended to illustrations within a book, and to separate lithographs and photo-engravings, 'except where in either case the subjects represented are located in a foreign country.' The printing and binding of the book must also be performed within the United States. Photographs are released from the present requirement that they 'shall be printed from negatives made within the United States or from transfers made therefrom.' The 'original text of a book of foreign origin in a language or languages other than English' is also excepted from the requirements of type-setting in the United States. A new *ad interim* protection is given books printed abroad in the English language. If one complete copy of such book is deposited in the copyright office not later than thirty days after publication abroad, copyright is granted for a

period of thirty days from the date of receipt of the copy. If an authorized edition of the book is produced from type set in the United States during this second thirty days, the full term of copyright is secured.

"The much discussed provisions prohibiting the importation of copyrighted books are considerably modified. The importation of *piratical* copies of any work copyrighted is prohibited, and the importation of any books, 'although authorized by the author or proprietor,' which have not been produced in accordance with the manufacturing provisions, is prohibited. The Act of 1801 permits importation of books in 'the case of persons purchasing for use and not for sale, who import, subject to the duty thereon, not more than two copies of such book at any one time.' The new law permits importation, 'not more than one copy at one time, for individual use, and not for sale,' and adds the proviso that 'such privilege of importation shall not extend to a foreign reprint of a book by an American author copyrighted in the United States.' The Act of 1801 allows importation in good faith for the use of societies incorporated or established for educational, philosophical, literary, or religious purposes, or for the encouragement of the fine arts, or for any college, academy, school, or seminary of learning. The new law confines the privilege to *incorporated* societies or institutions, but adds scientific societies and 'any State, school, college, university, or free public library'; but while the Act of 1801 permits 'two copies in any one invoice' to be so imported, the new law provides for 'not more than one copy of any such book in one invoice' when 'for use and not for sale.' In the case of infringement, an injunction may issue, as now, and damages be recovered as well as all the profits due to the infringement."—*New York Evening Post*, Mar. 4, 1909.

1909-1921.—Legislation in various countries.—National and international laws.—"The American copyright code of 1909, comprehensively replacing all previous laws, a gratifying advance in legislation, . . . places American copyright practice on a new basis. The new British code, brought before Parliament in 1910, and finally adopted in December, 1911, to be effective July 1, 1912, marks a like forward step for the British Empire [see BRITISH EMPIRE: Colonial and imperial conferences: 1910], enabling the mother country and its colonies to participate in the Berlin convention. Among the self-governing Dominions made free to accept the British code or legislate independently, Australia had already adopted in 1905 a complete new code, and Canada is following its example in the measure proposed in 1911. . . . Portugal has already in 1911 joined the family of nations by adherence to the Berlin convention. Russia has shaped . . . domestic legislation to the same end, and even China in 1910 decreed copyright protection throughout its vast empire of ancient and reviving letters. The Berlin convention of 1908 strengthened and broadened the bond of the International Copyright Union [an additional protocol was signed at Berne, March 20, 1914], and the Buenos Aires convention of 1910, which the United States has . . . ratified, made a new basis for copyright protection throughout the Pan-American Union, both freeing authors from formalities beyond those required in the country of origin. Thus the American dream of 1838 of 'a universal republic of letters whose foundation shall be one just law,' is well on the way toward realization."—R. R. Bowker, *Copyright—its history and its law*, p. v. (foreword).—An amendment to the

United States copyright law was approved December 18, 1910, to become effective March 3, 1921. Further amendments were passed in February, April and June of 1921. The present Australian and New Zealand copyright codes date from 1912 and 1913 respectively. Newfoundland and British India put into force the British Copyright Act of 1911 the following year. The German Copyright Acts of 1901 were amended in 1910, and those of France date from the latter year.

CORCYRA.—The Greek island now known as Corfu, separated from the coast of Epirus by a strait only two to seven miles in breadth, bore in ancient times the name of Korkyra, or, rather took that name from its ruling city (see GREECE: Map of ancient Greece). "Korkyra [the city] was founded by the Corinthians, at the same time (we are told) as Syracuse. . . . The island was generally conceived in antiquity as the residence of the Homeric Phæakians, and it is to this fact that Thucydides ascribes in part the eminence of the Korkyræan marine. According to another story, some Eretrians from Eubœa had settled there, and were compelled to retire. A third statement represents the Liburnians as the prior inhabitants,—and this perhaps is the most probable, since the Liburnians were an enterprising, maritime, piratical race, who long continued to occupy the more northerly islands in the Adriatic along the Illyrian and Dalmatian coast. . . . At the time when the Corinthians were about to colonize Sicily, it was natural that they should also wish to plant a settlement at Korkyra, which was a post of great importance for facilitating the voyage from Peloponnesus to Italy, and was further convenient for traffic with Epirus, at that period altogether non-Hellenic. Their choice of a site was fully justified by the prosperity and power of the colony, which, however, though sometimes in combination with the mother-city, was more frequently alienated from her and hostile, and continued so from an early period throughout most part of the three centuries from 700-400 B. C. . . . Notwithstanding the long-continued dissensions between Korkyra and Corinth, it appears that four considerable settlements on this same line of coast were formed by the joint enterprise of both,—Leukas and Anaktorium to the south of the mouth of the Ambrakiot Gulf—and Apollonia and Epidamnus [afterwards called Dyrrhachium], both in the territory of the Illyrians at some distance to the north of the Akrokeraunian promontory [modern Cape Glossa, on the Albanian coast]. . . . Leukas, Anaktorium and Ambrakia are all referred to the agency of Kypselus the Corinthian. . . . The six colonies just named—Korkyra, Ambrakia, Anaktorium, Leukas [near the modern St. Maura], Apollonia, and Epidamnus—form an aggregate lying apart from the rest of the Hellenic name, and connected with each other, though not always maintained in harmony, by analogy of race and position, as well as by their common origin from Corinth."—G. Grote, *History of Greece*, pt. 2, ch. 23.—See also IONIAN ISLANDS.

COREA. See KOREA.

CORELLI, Arcangelo (1653-1713), Italian violinist and composer, known as the father of modern violin playing. Studied with Bassani and Simonelli; settled in Rome before 1685; originated the form known as *concerto grosso*; laid the foundation for the development of superior violin technique; and started the line of great violinists.

CORFINIUM, a town in ancient Italy, captured by Cæsar. See ROME: Republic: B. C. 50-49.

CORFU, Greek island in the Ionian sea off the coast of Epirus, known in ancient times as Corcyra, or Korkyra.

Ancient. See CORCYRA; IONIAN ISLANDS.

1081.—Taken by Robert Guiscard. See BYZANTINE EMPIRE: 1081-1085.

1146.—Taken by Roger of Sicily. See BYZANTINE EMPIRE: 1146.

1216-1916.—Since the fall of the Greek empire.—Corfu was won by the Venetians in the early years of the Latin conquest of the Greek empire (1216), but was presently lost, to come back again into the possession of the republic 170 years later. "No part of Greece has been so often cut off from the Greek body. Under Pyrrhos and Agathoklès, no less than under Michael Angelos and Roger, it obeyed an Epeirot or Sicilian master. . . . At last, after yet another turn of Sicilian rule, it passed for 400 years [1386-1797] to the great commonwealth [of Venice]. In our own day Corfu was not added to free Greece till long after the de-

liverance of Attica and Peloponnèsos. But, under so many changes of foreign masters, the island has always remained part of Europe and of Christendom. Alone among the Greek lands, Corfu has never passed under barbarian rule. It has seen the Turk only, for one moment, as an invader [see TURKEY: 1714-1718], for another moment as a nominal overlord."—E. A. Freeman, *Historical geography of Europe*, p. 408. See IONIAN ISLANDS: To 1814.—Corfu was ceded to the French by the Treaty of Campo Formio Corfu, 1798, and held by them until expelled by the Russo-Turkish armament, 1799; and again replaced by French administration, 1807. The Treaty of Paris placed the Ionian Islands under the English protectorate in 1815; but in accordance with the wishes of the inhabitants the islands have formed a nomarchy of Greece since 1864. During the World War the remnants of the Serbian army were sent to the island of Corfu and the Serbian parliament assembled there, 1916. See WORLD WAR: 1916: V. Balkan theater: b, 1.

CORFU, Declaration of, the agreement signed, July 20, 1917, by Anton Trumbitch, leader of the southern Slavs of Austria-Hungary, and Nikola Pashitch, premier of Serbia; provided for the union of all the Jugo-Slavs in a single "Kingdom of the Serbs, Croats and Slovenes," with liberal institutions. See ADRIATIC QUESTION; JUGO-SLAVIA: 1868-1917; WORLD WAR: 1917: V. Balkan theater: e.

CORINIUM, Roman city in Britain, on the site of which is the modern city of Cirencester. Some of the richest mosaic pavements found in England have been uncovered there.—T. Wright, *Celt, Roman and Saxon*, ch. 5.

CORINTH.—Corinth, the chief city and state, in ancient times, of the narrow isthmus which connected Peloponnesus with northern Greece, "owed everything to her situation. The double sea by the isthmus, the confluence of the high road of the whole of Hellas, the rocky citadel towering aloft over land and sea, through which rushed—or around which flowed—an abundance of springs; all these formed so extraordinary a commixture of advantages, that, if the intercourse with other countries remained undisturbed, they could not but call forth an important city. As in Argolis, so on the isthmus also, other besides Dorian families had in the days of the migration helped to found the new state. . . . By the side of the Dorian, five non-Dorian tribes existed in Corinth, attesting the multitude and variety of population, which were kept together as one state by the royal power of the Heraclidæ, supported by the armed force of the Dorians. In the ninth century [B. C.] the royal power passed into the hands of a branch of the Heraclidæ deriving its descent from Bacchis [one of the earliest of the kings]; and it was in the extraordinary genius of this royal line that the greatness of the city originated. The Bacchiadæ opened the city to the immigration of the industrious settlers who hoped to make their fortunes more speedily than elsewhere at this meeting point of all Greek highroads of commerce. They cherished and advanced every invention of importance. . . . They took commerce into their own hands, and established the tramway on the isthmus, along which ships were, on rollers, transported from one gulf to the other. . . . They converted the gulf which had hitherto taken its name from Crisa into the Corinthian, and secured its narrow inlet by means of the fortified place of Molycria. . . . They continued their advance along the coast and occupied the most important points on the

Achelous."—E. Curtius, *History of Greece*, bk. 2, ch. 1.—See also COMMERCE: Ancient: B. C. 1000-200; GREECE: Migrations to Asia Minor and islands of the Ægean.

B. C. 745-725.—Constitutional revolution.—End of monarchy.—Prytanes.—Commercial progress.—A violent contention which arose between two branches of the Bacchiadæ "no doubt gave the nobles of Corinth power and opportunity to end the struggle by a change in the constitution, and by the discontinuance of the monarchy; this occurred in the year 745 B. C., after eight generations of kings. . . . Yet the place at the head of the commonwealth was not to be entirely taken away from the ancient royal house. A presiding chief (a prytanis), newly elected each year by the whole nobility from the members of the royal race, was henceforward to conduct the government [see PRYTANIS]. It was a peculiar arrangement which this change introduced into Corinth. We may assume that the sovereignty was transferred to the nobles collectively, or to their representative. This representation seems to have been so regulated that each of the eight tribes sent an equal number of members to the Gerousia, i. e., the council of elders [see GERUSIA]. . . . But the first of these eight tribes, to which belonged the royal family, was privileged. From it was chosen the head of the state, an office for which only a Bacchiad was eligible—that is, only a member of the old royal house, which took the foremost place in the first tribe. This clan of the Bacchiadæ is said to have contained 200 men. 'They were numerous and wealthy,' says Strabo. Accordingly the royal house did not exclusively retain the first rank in the state, but only in conjunction with the families connected with it by kindred and race. . . . The new constitution of Corinth, the government by nobles, under the dynastic presidency of one family, became a type for other cantons. It was a Corinthian of the Bacchiadæ who, twenty or thirty years after the introduction of the prytanes, regulated the oligarchy of the Thebans and gave them laws (about 725 B. C.). . . . The fall of the monarchy in Corinth at first brought with it disastrous consequences for the power and prestige of the commonwealth. The communities of the Megarians—either because the new government made increased demands upon them, or because they considered their allegiance had ceased with the cessation of monarchy, and thought the moment was favourable—deserted Corinth and asserted their freedom. The five communities on the isthmus united together around the territory of Megara, lying in the plain by the Saronic Gulf, where the majority of the Doric tribes had settled; the city of Megara, in the vicinity of two ancient fortresses . . . became the chief centre of the communities, now associated in one commonwealth. . . . The important progress of Corinth under the prytany [see PRYTANES] of the Bacchiadæ was not due to successes upon the mainland, but in another sphere. For navigation and commerce no canton in Hellas was more favourably situated. Lying on the neck of the isthmus, it extended from sea to sea, an advantageous position which had indeed first attracted the Phœnicians thither in ancient times. . . . Corinth, says Thucydides, was always from the first a centre of commerce, and abounded in wealth; for the population within and without the Peloponnesus communicated with each other more in ancient times by land across the isthmus than by sea. But when the Hellenes became more practised in navigation, the Corinthians with their ships put down piracy and established marts on both sides; and through this influx of

riches their city became very powerful."—M. Duncker, *History of Greece*, v. 2, bk. 3, ch. 3.

B. C. 44.—Restoration by Cæsar.—"In the desolate land of Greece, Cæsar, besides other plans, . . . busied himself above all with the restoration of Corinth. Not only was a considerable burgess-colony conducted thither, but a plan was projected for cutting through the isthmus, so as to avoid the dangerous circumnavigation of the Peloponnesus and to make the whole traffic between Italy and Asia pass through the Corintho-Saronic gulf."—T. Mommsen, *History of Rome*, bk. 5, ch. 11.—"Cæsar sent to Corinth a large number of freedmen, and other settlers were afterwards sent by Augustus; but it is certain that many Greeks came to live in the new Corinth, for it became a Greek town. Corinth was a mass of ruins when the new settlers came, and while they were removing the rubbish, they grubbed up the burial places, where they found a great number of earthen figures and bronze urns, which they sold at a high price and filled Rome with them."—G. Long, *Decline of the Roman republic*, v. 5, ch. 32.—"Corinth rapidly rose under these auspices, became a centre of commerce and art, and took the lead among the cities of European Hellas. Here was established the seat of the Roman government of Achaia, and its population, though the representations we have received of it are extravagant, undoubtedly exceeded that of any Grecian rival."—C. Merivale, *History of the Romans*, ch. 40.

1445.—**Destruction by Turks.**—The fortifications of the isthmus of Corinth were stormed and the Peloponnesus invaded by Amurath II in 1445. "Corinth itself, a city sanctified by its antiquity, by its gods, by its arts, by the beauty of its women, by its fountains, its cypresses, its very ruins themselves, whence its unrivalled situation had always restored it, fell anew, buried in its flames, by the hands of Tourakhan, that ancient and ambitious vizier of Amurath. Its flames were seen from Athens, from Ægina, from Lepanto, from Cytheron, from Pindus. The inhabitants, as also those of Patras, were led into slavery in Asia, to the number of 60,000."—A. Lamartine, *History of Turkey*, bk. 11, sect. 10.

CORK, capital of the county of Cork, Ireland, port, parliamentary borough and seat of an Anglican and Catholic bishop, lies on an island formed by the Lee. It was founded by St. Finn Barr about 600. During the ninth century it was devastated by the Danes, who later, during the early part of the eleventh century, built the city walls and made it a trading station. In 1172 Cork was surrendered to Henry II by the King of Munster, Desmond MacCarthy. On the royalist side during the civil war, it was taken by Cromwell in 1649. Marlborough besieged and took it in 1690. At present it ranks as the third city in Ireland. On Dec. 18, 1920, during the troubles in Ireland, there broke out in the city incendiary fires which destroyed the Carnegie Library, the City Hall, one side of Patrick Street and other sections. In 1922 the entire business district was burned down.

CORONATION.—"The royal consecration in its most perfect form included both coronation and unction. The wearing of a crown was a most ancient sign of royalty, into the origin of which it is useless now to inquire; but the solemn rite of crowning was borrowed from the Old Testament by the Byzantine Cæsars; the second Theodosius was the first emperor crowned with religious ceremonies in Christian times. The introduction

of the rite of anointing is less certainly ascertained. It did not always accompany coronation."—W. Stubbs, *Constitutional history of England*, ch. 6, sect. 60

CORPUS JURIS CIVILIS.—"The Corpus Juris Civilis represents the Roman law in the form which it assumed at the close of the ancient period (a thousand years after the decemviral legislation of the Twelve Tables), and through which mainly it has acted upon modern times. It was compiled in the Eastern Roman Empire (the Western ceased in 476) under the Emperor Justinian, . . . who reigned 527-565. The plan of the work, as laid out by [his great law-minister] Tribonian, included two principal parts, to be made from the constitutions of the Roman emperors, and from the treatises of the Roman lawyers. The 'constitutions' (law-utterances) of the emperors consisted of—1. 'Orationes,' proposals of law, submitted to and adopted by the Senate; 2. 'Edicta,' laws issued directly by the emperor as head of the state; 3. 'Mandata,' instructions addressed by the emperor to high officers of law and justice; 4. 'Decreta,' decisions given by the emperor in cases brought before him by appeal or otherwise; 5. 'Rescripta,' answers returned by the emperor when consulted on questions of law by parties in a suit or by magistrates. . . . Three or four collections had already been made, in which the most important constitutions were selected from the mass, presented in a condensed form, and arranged according to

their subjects. The last and most elaborate of these collections was the Theodosian Code, compiled about a century before the accession of Justinian; it is still in great part extant. . . . The new Codex Constitutionem, prepared in little more than a year, was published in April, 529. The next work was to digest the treatises of the most eminent law writers. Thirty-nine were selected, nearly all of whom lived between 100 B. C. and 250 A. D. Their books (2,000 in number) were divided among a body of collaborators (sixteen besides Tribonian), each of whom from the books assigned to him extracted what he thought proper . . . and putting the extracts (9,000 in all) under an arranged series of heads. . . . The Digest—or Pandects (all-receiving), as it is also called from the multiplicity of its sources—was issued with authority of law, in December, 533. . . . While the Digest or Pandects forms much the largest fraction of the Corpus Juris, its relative value and importance are far more than proportionate to its extent. The Digest is, in fact, the soul of the Corpus. . . . To bring the Codex Constitutionem into better conformity with the Digest, it was revised in 534 and issued as we now have it in November of that year. . . . The Corpus Juris includes also an elementary text-book, the Institutiones (founded on the 'institutiones' of Gaius, who flourished about 150). . . . The Institutes, Digest and Codex were given, as a complete body of law, to the law-schools at Constantinople, Rome, Berytus, Alexandria, Casarea, to be studied in their five years' curriculum. In the courts it was to supersede all earlier authorities. . . . Later statutes of Justinian, arranged in order of time, form the Novels ('novellae constitutione,' most of them in Greek), the last component of the Corpus Juris."—J. Hadley, *Introduction to Roman law*, lect. 1.—"This gigantic task was of service not alone to the age, but on this well-ordered foundation is based the law of half of modern Europe. For in the earliest dawn of the Renaissance this code, long neglected, was taken up and studied with energy, and helped to transform the . . . nations from feudal to modern conditions. Another instance is thus afforded of the way in which our modern world owes a vast debt to the Roman civilization. . . . In the United States is to be found a survival of this Roman law. For the legal system of the State of Louisiana, French in origin, is based upon the old French law, and that upon the Roman. Elsewhere in the English-speaking world the Roman law has not been so deeply formative, because of the early and entire separation of Britain from the empire."—C. Seignebos, *History of Roman people*, pp. 454, 456.—See also BOLOGNA: 11th century; CIVIL LAW; ECCLESIASTICAL LAW: Definition; ECONOMICS: Roman; EUROPE: Ancient: Roman civilization: Effect of imperial dominion.

CORRIDOR, a narrow strip of territory ceded to a country to afford political access to the sea, to a river, or to some other country, without putting too large an alien area under its rule. The Polish "corridor," for example, granted by the Treaty of Versailles, 1919, gives Poland access to the sea, also to the free city of Danzig, without the necessity of putting East Prussia under Polish rule. The "corridor," however, renders East Prussia non-contiguous with the rest of Germany.

CORRUPT AND ILLEGAL PRACTICES AT ELECTIONS: Great Britain.—Election evils before 1832.—Act of 1854.—Before the Reform Act of 1832, corruption was prevalent in Great Britain, but after that event there were additional inducements for the use of money to control elections. The larger electorate meant more votes for the aristocracy to buy if they wished to retain their power. Besides actual cash transactions, there was much indirect bribery through gifts (see **ENGLAND**: 1830: Reform movement). "It was the custom to distribute what was known as 'head-money' or 'basket-money,' which was simply the gift of one or two guineas to each voter by the candidate. As no bargain was made, it hardly came under the category of bribery, but it often proved quite as efficacious. The simplest method of indirect bribery was to hire electors to serve on sinecure committees, where they had no work to do, but would receive high wages. In some boroughs, practically all the voters were on the party committees and received five shillings or more a day, without doing any work. The position of messenger was a desirable one, for it brought in five shillings a day, and notwithstanding its title, did not mean that the bearer must run errands. When Gladstone stood for Newark, in 1832, a band composed of voters played without intermission for extravagant wages. All such methods were simply a cloak for covering up what was practically the purchase of a poor man's vote by the wealthy candidate. Almost invariably they were accompanied and complemented by an inordinate amount of treating to food and drink, the effect of which upon the general morality of the electorate was naturally degrading. In some boroughs, the poorer classes were in a state of intoxication during the entire polling, and the hospitals were filled with voters recovering from the effects of debauchery or drunken fights. . . . Purchase of votes, whether by cash or drink, was supplemented by the exercise of corrupt influence, of the kind which the wealthier classes can always bring to bear. The new voters in the boroughs were largely dependent upon the trade and custom of the upper classes, while the tenants in the counties ran the risk of eviction if they opposed the wishes of their landlords. The vote of the tenant was, in all cases, looked upon as the chattel of the landlord, in which he had the right to deal and of which he might dispose. . . . Many attempts were made by the House of Commons to put a stop to intimidation and corrupt practices

in general, but with slight success. In 1854 an Act was passed which defined bribery and other methods of electoral corruption, laid down stringent penalties, and enacted that all money expended by candidates in their electioneering campaigns should be strictly accounted for. But this legislation, while it may have mitigated some of the worst practices, failed to eliminate corrupt influence at elections. In some boroughs the system of corruption actually became better organized, and the office of election agent, whose business it was to win an election by fair means or foul, developed into a regular profession. Investigations in the sixties and early seventies showed that in certain quarters bribery was as bad as ever. In some boroughs the electoral agent was frankly known as bribe-agent, and gave up most of his time between elections to forming and maintaining a corrupt organization. In such boroughs the campaign began with the canvass, when the sub-agents went around among the voters to ask their political opinions; the electors were apt to demand and receive retaining-fees of a guinea or so to prove the candidate's good will. 'I asked for their votes,' said one canvasser, 'but you might as well ask for their lives, unless you had money to give them.' The popular candidate was the man who promised the largest bribe and was known as 'Mr. Most.' The bribe-agent was cashier and organizer when the election began. He would divide the constituency into districts over each of which he appointed a captain, who in turn appointed his sub-captains, who were to take charge of particular streets or families. There were also the assistants who mingled and drank with the voters. One party once had an official known as 'fuddler,' whose duty it was to keep his pockets filled with small change, to be used in buying drinks for voters whom he might meet on the street. Frequently the bribing was perfectly open, and the agents would go out into the market-place, where the voters were waiting for the highest bidder. Sometimes the agents of the two parties would enter into frank competition for the purchase of votes, and encounters and fisticuffs were by no means rare. In general, some sort of superficial concealment was attempted. A stranger from another constituency would be imported to play the part of what was known as 'the man in the moon,' and distribute the money bribes. The voters might receive their money in a darkened room, or through a broken window. On one occasion the electors, on being invited to breakfast on the morning of polling day, discovered thirty shillings under each coffee cup. Corruption of such a kind would have been impossible had it not been regarded as rather a trivial offense against morality, and it is surprising to see the good-nature with which it was winked at by individuals of all classes. The voters themselves did not, as a rule, consider it degrading to receive a bribe. They looked upon their suffrage as a marketable commodity, for which they were entitled to receive all that it was worth. They regarded it as an unmerited misfortune when there was no contest in an election which would force the candidates to bid against each other for the voters' favor."—C. Seymour and D. P. Frary, *How the world votes*, pp. 123-129.

United States: Corrupt ballots.—General tendencies toward eradication.—"Corruption in politics—however flagrant it may have been—has from time to time at least been partly eliminated. We have advanced and progressed. If we had stood still we know we should not have accomplished a tithe of what we have accomplished, and it is doubtful whether as a nation we would have been in existence. All kinds of accusations were made from time to time during the ante-Civil War period, it being often asserted when men were elected to office that ballots had been changed or substituted. However, it cannot be denied that since that period good laws have been passed by the United States and by the several States for the betterment of conditions—social and political—and especially for the better protection of the ballot. . . . Before the Civil War the ballot was corrupt. There were but few barriers against its being corrupt. The politician and seeker of office made his own combinations and in some States printed his own tickets. There were few if any registration laws. The test at election was to get the votes. The result of an election as a rule did not impress any great principle upon the country, but influence, promise of office, and expenditure of money often determined Presidential elections, as they determined elections in many of the States. Finally, registration laws were enacted. They did great good. Since the Civil War the Australian ballot, which had its origin in Australia, has become a great factor in many of the States of the Union. . . . No one today would do away with its provisions except him who would countenance corrupt elections and thereby defeat the will of the people. However, it has not entirely cured the evils which led to its adoption, and the question is being asked by reformers and others having the best interests of the State at heart, 'What more can be done to improve conditions?' In other words, the attainment of political preferment on an equality among all conditions of men who are worthy of such preferment. Men are often nominated for office by a party because they can control many men employed in their business, or because they may donate large sums of money, or are in such influential positions as to obtain large contributions of money from other people or certain special interests or corporations. This has led up to the question of the control of direct primaries so that a direct primary may be conducted with as much care and sacredness as the elections that elevate or defeat a candidate for office. . . . Every attempt upon the part of Congress to legislate for the general control of elections has been strenuously resisted, and the general government, up to this time, has gone but a short distance for the complete control of the election of President, Vice-President, and United States Senators and Representatives. The election laws of the individual States govern, with few limitations. The tendency, however, with the general government, as well as with the States today, is to purify elections, to limit the expenditures of money, and especially to give publicity to all contributions and expenditures used in the conduct of elections."—J. M. Carey, *State assumption of nomination and election expenses (Proceedings of the 6th Meeting of Governors, 1913, pp. 170-173)*.

United States: Laws for prevention of corrupt elections.—"As early as 1876 Congress framed a law forbidding the executive officers and employees from requesting, giving or receiving from any officer or employee of the government, any

money or thing of value for political purposes. Since that time several acts have been passed bearing upon the same subject; notably the law of Congress of January 6, 1910, regulating publicity of contributions, and so forth. Indeed, a great interest is being shown, both by Congress and by the legislatures of the several States, with the view of further protecting the ballot. President Roosevelt, as early as December 7, 1907, in an annual message, said: 'The need for collecting large campaign funds would vanish if Congress provided an appropriation for the proper and legitimate expenses of each of the great national parties, an appropriation ample enough to meet the necessity for thorough organization and machinery, which requires a large expenditure of money. Then the stipulation should be made that no party securing campaign funds from the treasury should accept more than a fixed amount from any individual subscriber or donor and the necessary publicity for receipts and expenditures could without difficulty be provided.' The purpose was ahead of the times; it was radical and was criticized favorably and unfavorably. A mere mention of the fact then has now become a living issue before the American people. President Taft in speaking on the question of publicity in his annual message on December 7, 1909, said: 'I urgently recommend to Congress the laws passed requiring the candidates in elections of members to the House of Representatives, that those in charge of their candidacy and campaign file in a proper office of the United States government a statement of the contributions received and expenditures incurred in a campaign, and that similar legislation be enacted with reference to all other elections within the control of Congress.' It appears, therefore, that both of the questions—publicity by the candidates and whether or not the expenses of primaries and elections should be borne by the government—are being earnestly considered. In the campaign of 1908 we recall that a great deal was said on the subject of publicity, and in the reports made—which were then voluntary—the Republican National Committee reported contributions of over one million of dollars, and it was also acknowledged that there were collected in the several States by finance committees of that same party and turned over to the committee, over \$600,000. The Democratic National Committee announced large contributions, but not so great as those of the Republican party. It has been claimed that far less money was expended at that election than was expended at either of the two previous ones. Whether this is true or not we do not know. It all led to the subsequent action taken by Congress requiring certain published statements by committees and by candidates for the office of United States Senator and Representative, giving the amount of contributions received and expended. At first the opposition to contributions seemed to be to those made by corporations, and on this subject, as early as 1894, Elihu Root, speaking before the New York Constitutional Convention, favored an amendment prohibiting contributions by corporations. He said: 'It strikes at a constantly growing evil which has done more to shake the confidence of the people of small means of this country in our political institutions than any other practice that has ever prevailed since the foundation of our government.' Certain States—notably Florida, Tennessee, Nebraska and Missouri—soon thereafter took up the matter and passed laws which absolutely forbade gifts from such sources for political purposes. These States have been followed by a number of others enacting laws on the same line."—J. M.

Carey, *State assumption of nomination and election expenses* (Proceedings of the 6th Meeting of Governors, 1913, pp. 176-178).—See also CIVIL SERVICE REFORM: United States: 1889; 1901; SHORT BALLOT: 1908-1921.

United States: Forms of corruption.—Methods employed.—"The most direct and effective form of fraud is bribery. There is a large class of voters whose votes are always for sale to the highest bidder, and who are dealt in wholesale, like other forms of merchandise. It was reported in 1916 that carloads of negroes had passed through Louisville, Kentucky, on their way to vote in the North. The adoption of the Australian ballot made control of purchased votes more difficult, but the ruse of the 'assisted vote' partly overcame the handicap, particularly in the South. If the voter is disabled or ignorant, most states allow him to be escorted into the voting booth by an assistant from each of the two leading parties. The assistant keeps tally on the delivery of bribed votes. In Baltimore it was once customary for him to slip a chestnut into the voter's pocket as a token to be redeemed by the Machine cashier. As it became noised about among the colored people that chestnuts were selling for ten dollars apiece, they determined to engage in this lucrative trade with chestnuts of their own. The first few who essayed to sell to the cashier were to their great astonishment hastily ejected, minus their chestnuts and without any money. They later discovered that the marketable chestnuts had been boiled! Other marks of identification have been a peculiar blackheaded pin, a distinctive celluloid button, or a tin tag stamped O. K. In past days party workers were commonly paid twenty or thirty dollars, if they could produce a score of votes. This money was disbursed, partly in direct bribes, partly in drinks and free rides to the lower class of voters. It was declared not long since that well-to-do farmers in Maryland sold their votes as regularly as they did their hay, while the negro population had been corrupted *en masse*. The campaign chest which provides the funds for buying votes, formerly contributed by a multitude of party members, is now raised from the party candidates and office holders, and from corporations financially concerned in the election. The sum must be large. It is necessary not simply to pay a man an excessive rate for his services; the reward must be so extravagant as to make the fires of party enthusiasm blaze inextinguishably. The cost of a mayoralty campaign in New York City before 1910 was about \$800,000. Before publication of campaign expenses Mr. F. A. Ogg estimated the cost of a presidential election to be \$15,000,000. Contributions to the party chest from candidates to show their interest in the fight are always 'appreciated' in the euphemistic phrase. They constitute a prior mortgage on the aspirant's official position with so demoralizing an effect that their payment has been somewhat abated by public opinion. Far more despicable are the tolls levied upon government officeholders—with an average annual wage of \$625. The law forbids one officeholder to demand campaign contributions from another and prohibits the asking for them in a Federal building, but these regulations are easily evaded. When the names of officials appear on the summons to stand and deliver, they are applied with a rubber stamp, so that the holders are immune. The request for money is couched in terms which assume a voluntary payment. It is an unjust imposition to extort seventy dollars, as in Kentucky, from rural free delivery clerks, whose salary is \$400. They are neither able nor in duty

bound to bear so large a proportion of campaign expenses which should fall on the rank and file of the party. . . . Another form of open-handed corruption is violence at the polls, a relic of the feudal period of American politics. During the Reconstruction period and after, in the South, terrorism was employed to keep the negroes from the polls. If threats did not suffice, tar and feathers, or a 'cow-hiding' were resorted to. To the present day the negroes are frequently bullied at the polls. In the North gangs of strong-fisted bullies move from ward to ward of a city to prevent interference with Machine-organized repeating or personation. An overzealous watcher for a Citizens' League may be blackjacked or arrested, and sometimes the furniture of the voting place is torn up and used in a general mêlée. Such strong-arm methods, however, are now generally used only in precincts where a low class of voters with many immigrants exists. More subtle have been the frauds perpetrated in connection with the ballot and with registration. So commonly were ballot boxes stuffed in advance of the polls, that in New York glass urns were formerly employed. It was customary to cast a 'tissue' or 'pudding' ballot of five or six ballots folded together as one. 'Marrow fat' fraud consists in the voter's putting in such a ballot, while the poll-clerk enrolls an equal number of fictitious names. No part of the election is more open to fraud than the count. Before the adoption of the Australian system, the judges often counted the votes during the poll, and perverted returns were common. Any falsification in the count is now punishable by an imprisonment of from five to ten years. The only fraud which flourishes practically unabated in spite of all efforts to check it, is the practice of repeating. The same man votes in district after district, sometimes casting ten or twelve votes in a day. So varied are the devices employed by these floaters, that even those who devote all their energies to curbing the evil are never sure when they have detected all. Over several precincts the Boss places a producer of repeating votes. For months he is busy creating as many lodgings as possible to substantiate the floaters' claims for registration. Janitors in apartment houses, lodging house keepers, even barbers, saloon keepers, and livery men are persuaded to tell inquirers that X, Y, and Z board at their establishments. The producer may thus acquire a hundred and fifty pseudo-residences. Other means are used to swell the number of names on the registry lists. The Tweed régime in New York City in one year with indecent haste increased the number of naturalizations from 9,200 to 41,000, and the practice still continues. Names of the thirty to forty-five per cent. of voters who move away between elections are kept on the rolls and count for an honest vote on election day. The same is done with the names of deceased persons, so that there was a modicum of truth in the remark of a Philadelphian, that they were still voting in his city the names of the signers of the Declaration of Independence. On registration day the producer takes his post in a basement near the polling place, where he is visited by a steerer, or 'guerilla,' who introduces two or three men at a time. They are given each a slip of paper with one of the 'doctored' addresses upon it, which they return after registration with the addition of the fictitious name under which they register. They are then paid one dollar apiece and pass on to the next producer. The slips of paper are kept until election day, when the producer again takes his seat in the basement. If in the meantime a champion of the honest bal-

lot has investigated at the lodging house, the janitor or the liveryman has removed his suspicions. The false addresses are again distributed to the same or other repeaters, who vote upon them unless challenged, when they usually waive examination and disappear. Repeating attains enormous proportions in large cities, where the election officers do not know more than fifteen per cent. of the voters in their districts. So efficient was the Tweed ring in New York City in 1868-1871, that the votes cast were eight per cent. in excess of the total voting population. In the New York City elections of 1910 it was conservatively estimated that the number of fraudulent registrations and votes prevented equaled the total number of votes cast. Various forms of legal repression have been essayed with indifferent success to end corruption in elections. The New York statutes may be taken as typical. The entertainment of voters is forbidden, and the use of money in campaigns is restricted to certain specified purposes, which include printing, fireworks, the renting of halls and offices, and reasonable expenses for the various political agents, etc., etc. It is a misdemeanor to assess any public official for the campaign chest. The whole amount which may be expended is limited, in the case of governor to \$10,000, in that of county and town offices to \$500. Both candidates and party committee must file statements after the election of their contributions and expenditures, an adaptation of the Corrupt Practices Acts of Great Britain and her colonies. Oregon establishes modified state control by means of a campaign booklet published under state auspices, space in which costs fifty dollars a page. Each party is limited to twenty-four pages. Thus for about \$100 per candidate a party can reach every voter in the state with a statement of its principles, and any other advertising matter it may wish to make public."—C. Seymour and D. P. CORSICA, island in the Mediterranean sea, north of Sardinia. See ROME: Map of ancient Italy.

Early history.—"The original inhabitants of Corsica are supposed to have been Ligurians, but at a very early period the people had commercial intercourse with Spain, Ionia and Tuscany. The island was subsequently occupied by the Carthaginians, who, however, were expelled by the Romans during the first Punic war. A few years later Corsica came under the dominion of Rome, and that sway was nominally maintained until the downfall of the Empire. It then fell under the dominion of the Vandals, and after their expulsion owned successively the rule of the Goths, the

Saracens and the Pisans, and finally of the Genoese. It came into the possession of the latter people in the year 1120. Pisa subsequently made several attempts to drive out her rivals, but they were in the end void of results. But in 1448, Genoa, having sustained great losses in the constant wars in which she was engaged, was induced to surrender the administration of Corsica and of her colonies in the Levant to a corporation known as the Bank of St. George. From that time the island was administered by governors appointed by the Bank of St. George, almost precisely in the manner in which, in England, up to 1859, the East Indies were administered by an 'imperium in imperio.'"—G. B. Malleson, *Studies from Genoese history*, ch. 3.

1558-1559.—Revolt against the Genoese rule, and resubjection. See GENOA: 1528-1559; FRANCE: 1547-1559.

1729-1769.—Struggle for independence.—Romance of King Theodore.—Paolis.—Cession to France.—The revolt of 1558 was renewed in 1564, but ended in 1567, upon the death of its leader, Sampiero. For the next century and a half, Corsica remained inactive; "depressed and miserable under renewed Genoese exactions and tyrannies, but too exhausted to resume hostilities. In 1720, however, fighting again broke out, suddenly roused by one of the many private wrongs then pressing upon the lower orders, and the rebellion soon spread over the whole island. It was well organized under two leaders of energy and ability, and was more determined in its measures than ever. . . . Genoa had recourse to the Emperor of Germany, from whom she bought several thousand mercenaries, who were sent across the sea to try their skill upon these unconquerable islanders. . . . The courage and chivalry of his insular foes . . . won for them the regard of the opposing General Wachtendonk; and, chiefly through his mediation, a treaty, supposed to be favourable to the islanders, was concluded between Genoa and the Corte legislative assembly in 1732. Wachtendonk remained in the island another year to see the treaty carried out, and in June, 1734, the German general returned to his own country. . . . But he had scarcely retired before the treaty was broken. Genoa began anew her system of illegal arrests and attempted assassinations; and, once more, the people arose under Hyacinth Paoli, an obscure native of the little village of Morosaglia, but a man of spirit and talent, and a scholar. Under the direction of this man, and of Giafferi, his colleague, a democratic constitution, in the highest degree prudent and practical, was framed for the Corsican people. . . . Early in the next year occurred a strange and romantic adventure in this adventurous country. A man, handsome and well-dressed, surrounded by obsequious courtiers, and attended by every luxury, landed in the island from a vessel well-furnished with gold, ammunition, and arms. This man was a German adventurer, Baron Theodore von Neuhoff, who, after a romantic youth, had suddenly conceived a desire to become king of Corsica. He was a man of great talent and personal fascination, of good judgment, and enthusiastic disposition. He had fallen in love with the bravery and determination of the Corsicans, and longed to head such a nation. He had put himself into communication with the leading islanders; and, having really some little influence at the continental courts, persuaded them that he had much more. He offered to obtain such assistance from foreign potentates, by his persuasions, as should effectually oust the Genoese; and, in return, requested the crown of Corsica. His

genius and his enthusiasm were so great, and his promises so dazzling, that, after some hesitation, the poor Corsicans, in their despair, seized upon this last straw; and in March, 1736, Theodore was crowned king. His exertions for the good of this country were untiring. He established manufactures and promoted with all his power art and commerce, at the same time that, with all the force of his genius, he endeavoured to persuade foreign powers to lend their assistance to his new subjects in the field. His style of living meanwhile was regal and sumptuous. . . . Towards the conclusion of his first year of sovereignty, Theodore left Corsica on a continental tour, with the avowed object of hastening the promised succour. In two years he returned, bringing with him three large and several smaller war vessels, handsomely laden with ammunition, which had actually been raised by means of his talents and persuasive faculties, chiefly amongst the Dutch. But, meanwhile, the Corsicans had had other affairs to which to attend. France had interfered at the request of Genoa; and negotiations were actively going on, which the arrival of the pseudo-king could only interrupt. Theodore, although now so well attended, found himself unheeded and disregarded; and after a few months was forced to leave his new kingdom to its fate, and to return to the continent. Five years later, in 1743, he again returned, again well equipped, this time with English vessels, but with the same ill success. Convinced now that his chance was over and his dream of royalty destroyed, Theodore returned to England with a sore heart, spending his remaining years in this asylum for dethroned kings and ruined adventurers. His tomb may be seen in Westminster Abbey. For the next five and twenty years the war continued between Corsica and Genoa, still fought out on the blood-deluged plains of the unhappy little island. But the republic of Genoa was now long past her prime, and her energies were fading into senility; and, had it not been for the ever-increasing assistance of France, her intrepid foes would long ere this have got the better of her. In May, 1768, a treaty was signed between Genoa and France, by which the republic ceded her now enfeebled claims on Corsica to her ally, and left her long-oppressed victim to fight the contest out with the French troops. During this time, first Gaffori, then Pasquale Paoli, were the leaders of the people. Gaffori, a man of refinement, and a hero of skill and intrepidity, was murdered in a vendetta in 1753, and in 1755 Pasquale, youngest son of the old patriot Hyacinth Paoli, left his position as officer in the Neapolitan service, and landed, by the general desire of his own people, at Aleria, to undertake the command of the Corsican army. . . . From 1764 to 1768 a truce was concluded between the foes. . . . In August, 1768, the truce was to expire; but, before the appointed day had arrived, an army of 20,000 French suddenly swooped down upon the luckless island. . . . It was a hopeless struggle for Corsica; but the heroism of the undaunted people moved all Europe to sympathy. . . . The Corsicans at first got the better of their formidable foe, at the Bridge of Golo, in the taking of Borgo, and in other lesser actions. . . . Meanwhile, the country was being destroyed, and the troops becoming exhausted. . . . The battle of Ponte Nuovo, on the 6th of May, 1769, at once and forever annihilated the Corsican cause. . . . After this victory, the French rapidly gained possession of the whole island, and shortly afterwards the struggle was abandoned. . . . In the same year, 1769, Napoleon Buonaparte was born in the house out of the Place du Marché at Ajaccio. 'I was

born,' he said himself in a letter to Paoli, 'the year my country died.'—G. Forde, *A Lady's tour in Corsica*, v. 2, ch. 18.

CORTES, name of the national assembly of representatives in Spain.

Early Spanish: Old monarchical constitutions of Castile and Aragon.—"The earliest instance on record of popular representation in Castile occurred at Burgos, in 1169; nearly a century antecedent to the celebrated Leicester parliament. Each city had but one vote, whatever might be the number of its representatives. A much greater irregularity, in regard to the number of cities required to send deputies to cortes [the name signifying 'court'] on different occasions, prevailed in Castile, than had ever existed in England; though, previously to the 15th century, this does not seem to have proceeded from any design of infringing on the liberties of the people. The nomination of these was originally vested in the householders at large, but was afterwards confined to the municipalities,—a most mischievous alteration, which subjected their election eventually to the corrupt influence of the crown. They assembled in the same chamber with the higher orders of the nobility and clergy, but on questions of moment, retired to deliberate by themselves. After the transaction of other business, their own petitions were presented to the sovereign, and his assent gave them the validity of laws. The Castilian commons, by neglecting to make their money grants depend on corresponding concessions from the crown, relinquished that powerful check on its operations so beneficially exerted in the British parliament, but in vain contended for even there till a much later period than that now under consideration. Whatever may have been the right of the nobility and clergy to attend in cortes, their sanction was not deemed essential to the validity of legislative acts; for their presence was not even required in many assemblies of the nation which

occurred in the 14th and 15th centuries. The extraordinary power thus committed to the commons was, on the whole, unfavorable to their liberties. It deprived them of the sympathy and cooperation of the great orders of the state, whose authority alone could have enabled them to withstand the encroachment of arbitrary power, and who, in fact, did eventually desert them in their utmost need. . . . The Aragonese cortes was composed of four branches, or arms; the ricos hombres, or great barons; the lesser nobles, comprehending the knights; the clergy; and the commons. The nobility of every denomination were entitled to a seat in the legislature. The ricos hombres were allowed to appear by proxy, and a similar privilege was enjoyed by baronial heiresses. The number of this body was very limited, twelve of them constituting a quorum. The arm of the ecclesiastics embraced an ample delegation from the inferior as well as higher clergy. It is affirmed not to have been a component of the national legislature until more than a century and a half after the admission of the commons. Indeed, the influence of the church was much less sensible in Aragon than in the other kingdoms of the Peninsula. . . . The commons enjoyed higher consideration and civil privileges. For this they were perhaps somewhat indebted to the example of their Catalan neighbors, the influence of whose democratic institutions naturally extended to other parts of the Aragonese monarchy. The charters of certain cities accorded to the inhabitants privileges of nobility, particularly that of immunity from taxation; while the magistrates of others were permitted to take their seats in the order of hidalgos. From a very early period we find them employed in offices of public trust, and on important missions. The epoch of their admission into the national assembly is traced as far back as 1133, several years earlier than the commencement of popular representation in Castile. Each city had the right of sending two or more deputies selected from persons eligible to its magistracy; but with the privilege of only one vote, whatever might be the number of its deputies. Any place which had been once represented in cortes might always claim to be so. By a statute of 1307, the convocation of the states, which had been annual, was declared biennial. The kings, however, paid little regard to this provision, rarely summoning them except for some specific necessity. The great officers of the crown, whatever might be their personal rank, were jealously excluded from their deliberations. . . . It was in the power of any member to defeat the passage of a bill, by opposing to it his veto or dissent, formally registered to that effect. He might even interpose his negative on the proceedings of the house, and thus put a stop to the prosecution of all further business during the session. This anomalous privilege, transcending even that claimed in the Polish diet, must have been too invidious in its exercise, and too pernicious in its consequences, to have been often resorted to. This may be inferred from the fact that it was not formally repealed until the reign of Philip II., in 1502. . . . The cortes exercised the highest functions, whether of a deliberative, legislative, or judicial nature. It had a right to be consulted on all matters of importance, especially on those of peace and war. No law was valid, no tax could be imposed, without its consent; and it carefully provided for the application of the revenue to its destined uses. It determined the succession to the crown, removed obnoxious ministers, reformed the household and domestic expenditure of the monarch, and exercised the power, in the most

unreserved manner, of withholding supplies, as well as of resisting what it regarded as an encroachment on the liberties of the nation. . . . The statute-book affords the most unequivocal evidence of the fidelity with which the guardians of the realm discharged the high trust reposed in them, in the numerous enactments it exhibits for the security both of person and property. Almost the first page which meets the eye in this venerable record contains the General Privilege, the Magna Charta, as it has been well denominated, of Aragon. It was granted by Peter the Great to the cortes at Saragossa, in 1283. It embraces a variety of provisions for the fair and open administration of justice; for ascertaining the legitimate powers intrusted to the cortes; for the security of property against exactions of the crown; and for the conservation of their legal immunities to the municipal corporations and the different orders of nobility. . . . The Aragonese, who rightly regarded the General Privilege as the broadest basis of their liberties, repeatedly procured its confirmation by succeeding sovereigns. . . . The judicial functions of the cortes have not been sufficiently noticed by writers. They were extensive in their operation, and gave it the name of the General Court."—W. H. Prescott, *History of the reign of Ferdinand and Isabella, introduction, sect. 1-2*.—A "high spirit of freedom had long animated the Aragonese. After several contests with the crown in the reign of James I., not to go back to earlier times, they compelled Peter III. in 1283 to grant a law called the General Privilege, the Magna Charta of Aragon, and perhaps a more full and satisfactory basis of civil liberty than our own." They further "established a positive right of maintaining their liberties by arms. This was contained in the Privilege of Union granted by Alfonso III. in 1287, after a violent conflict with his subjects; but which was afterwards so completely abolished, and even eradicated from the records of the kingdom, that its precise words have never been recovered. . . . That watchfulness over public liberty which originally belonged to the aristocracy of ricos hombres . . . and which was afterwards maintained by the dangerous Privilege of Union, became the duty of a civil magistrate whose office and functions are the most pleasing feature in the constitutional history of Aragon. The Justiza or Justiciary of Aragon has been treated by some writers as a sort of anomalous magistrate. . . . But I do not perceive that his functions were, in any essential respect, different from those of the chief justice of England, divided, from the time of Edward I., among the judges of the King's Bench. . . . All the royal as well as territorial judges were bound to apply for his opinion in case of legal difficulties arising in their courts, which he was to certify within eight days. By subsequent statutes of the same reign it was made penal for any one to obtain letters from the king, impeding the execution of the Justiza's process, and they were declared null. Inferior courts were forbidden to proceed in any business after his prohibition. . . . There are two parts of his remedial jurisdiction which deserve special notice. These are the processes of *juris firma*, or *firma del derecho*, and of *manifestation*. The former bears some analogy to the writs of 'pone' and 'certiorari' in England, through which the Court of King's Bench exercises its right of withdrawing a suit from the jurisdiction of inferior tribunals. But the Aragonese *juris firma* was of more extensive operation. . . . The process termed *manifestation* afforded as ample security for personal liberty as that of *juris firma* did for property."—H. Hallam, *Middle Ages, v. 2, ch. 4*.—The

old constitutional liberties of Aragon were lost under Charles V. See SPAIN: 1518-1522.—“The councils or meetings of the bishops after the reconquest, like the late Councils of Toledo, were always ‘jussu regis,’ and were attended by counts and magnates ‘ad videndum sine ad audiendum verbum Domini.’ But when the ecclesiastical business was ended, it was natural that the lay part of the assembly should discuss the affairs of the kingdom and of the people; and insensibly this afterpart of the proceedings grew as the first part diminished in importance. The exact date when the Council merged into the Curia or Cortes is difficult to determine; Señor Colmeiro takes the so-named Council of Leon in 1020 as the true starting-point of the latter. The early monarchy of Spain was elective, and the acclamation of the assembled people (plebs) was at least theoretically necessary to render the king’s election valid. The presence of the citizens at the Cortes or Zamora, though stated by Sandoval and Morales, is impugned by Señor Colmeiro; but at the Council of Oviedo in 1115 were present bishops of Spain and Portugal ‘cum principibus et plebe prae-dictae regionis,’ and these latter also subscribed the Acts. Still, though present and making their influence more and more felt, there is no record of a true representation of cities until Alfonso IX convoked the Cortes of Leon in 1188. . . . From this time the three estates—clergy, nobles, citizens—were always represented in the Cortes of Leon. Unfortunately, the political development of Castile did not synchronise with that of Leon. In general, that of Castile was fully half a century later. . . . It is not till the united Cortes of both kingdoms met at Seville in 1250, that we find true representation in Castile. Castile was always more feudal than Leon. It is in this want of simultaneous development, and in the presence of privileged classes, that we find the germ of the evils which eventually destroyed the liberties of Spain. Neither the number of deputies nor of the cities represented was ever fixed; at Burgos, in 1315, we find 200 deputies (procuradores) from 100 cities; gradually the number sank till seventeen, and finally twenty-two, cities alone were represented. The deputies were chosen from the municipality either by lot, by rotation, or by election; they were the mere spokesmen of the city councils, whose mandate was imperative. Their payment was at first by the cities, but, after 1422, by the king; and there are constant complaints that the salary was insufficient. The reign of Juan II. (1406-54) was fatal to the liberties of Castile; the answers to the demands and petitions of the deputies were deferred; and, in fact, if not in form, the law that no tax should be levied without consent of the Cortes was constantly violated. Still, but for the death of Prince Juan, in 1497, and the advent of the Austrian dynasty with the possession of the Low Countries, the old liberties might yet have been recovered. . . . With the Cortes of Toledo, in 1538, ended the meeting of the three estates. The nobility first, then the clergy, were eliminated from the Cortes, leaving only the proctors of the cities to become servile instruments for the purposes of taxation.”—W. Webster, *Review of Colmeiro’s “Cortes de los Antiguos Reinos de Leon y de Castilla”* (Academy, Aug. 16, 1884).—In Spain, the cortes, better organized [than most of the representative assemblies in Europe], revolted when the king touched their liberties; this was a pretext for taking them away. It is reported that Queen Isabella said: ‘I desire but one thing, that the people of Aragon revolt and give me the opportunity to attack them with arms and to change their constitution.’ In

Castile the towns revolted in 1523; the grandees, through jealousy, supported the king, and Charles V., after having executed the chiefs of the revolt, decided that in the future the cortes should vote the imposts before they presented their grievances, he forbade the deputies to have any understanding with each other outside of the sittings of the cortes, and sought to have his judges and his courtiers made deputies. From that time the cortes met every third year and voted for everything that the king demanded. At the end of the sixteenth century the holding of the cortes was nothing more than a comedy: the deputies came to the castle to kiss the hand of the king, the king came into the hall of the cortes and made known to them the amount of money which he desired; the cortes demanded time for reflection. At the second session they decided to petition the king to send away his secretaries from the seance. At the third session, the king not having sent away his secretaries, the cortes in their presence voted for the imposts; then the deputies went and announced it to the king, who gave them his hand to kiss, and each one brought his petition to the council of the king. In Aragon the people rebelled (1592) when the king ordered the Inquisition to arrest his former minister, Perez, who had taken refuge in the country. The king sent out the troops, who conquered the rebels, then he removed the head of the judiciary, appointed the lieutenants of justice and put a garrison in the country. The cortes continued to vote the tax, but from that time the king governed free from any control by the assembly.”—C. Seignobos, *History of mediæval and of modern civilization*, pp. 223-224.—See also SPAIN: 1813-1814 (December-May).

1876-1921.—Present status.—The constitution of Spain was proclaimed in 1876. Under its provisions the cortes is composed of two chambers, a Senate and Congress, equal in authority. The Senate is composed of three classes of senators: those by their own right; life senators; and those elected by the corporations of state. The Congress made up of deputies named in the electoral juntas on a proportional basis of one to every 50,000. The Congress selects its own officials, and has the right to impeach the ministers before the Senate. The cortes meets every year, and, together with the king, makes the laws. It must sanction the king’s marriage before he can contract it. The king has the power of summoning, suspending or dissolving the cortes. However, in the latter case a new cortes must be convened within three months. The Senate (elected Jan. 2, 1921) is composed of 90 Conservatives; 58 Liberals; 18 Independents; 6 Regionalists; 5 Catholics and Jaimistas; 2 Reformists; and 1 Republican. Congress, elected the same year, is made up of 223 Conservatives; 111 Liberals; 20 Regionalists; 16 Republicans; 11 Independents; 8 Catholics and Jaimistas; 8 Reformists; and 3 Socialists.

CORUPEDJON, Battle of (B. C. 281), battle fought in western Phrygia, in which Lysimachus, one of the disputants for Alexander’s empire, was defeated by Seleucus, and slain.—C. Thirlwall, *History of Greece*, ch. 60.

CORVEE.—One of the feudal rights possessed in France (under the old regime, before the revolution) “by the lord of the manor over his subjects, by means of which he could employ for his own profit a certain number of their days of labour, or of their oxen and horses. The ‘Corvée à volonté,’ that is to say, at the arbitrary will of the Seigneur, had been completely abolished [be-

fore the revolution]: forced labour had been for some time past confined to a certain number of days a year."—A. de Tocqueville, *On the state of society in France before 1789*, note 4 E, p. 499.—See also FRANCE: 1761-1773; TURGOT, ANNE ROBERT JACQUES.

CORVO ISLAND, smallest island of the Azores. See AZORES.

CORVUS, Marcus Valerius (370-270 B. C.), Roman general of the early republic.

CORVUS, Roman machine of war. See PUNIC WAR, FIRST.

COS.—One of the islands in the Ægean called the Sporades, near the Carian coast of Asia Minor. The island was sacred to Asclepius, or Æsculapeus, and was the birthplace of the celebrated physician Hippocrates, as well as of the painter Apelles. It was an Æolian colony, but joined the Dorian confederacy.—See also ATHENS: B. C. 378-357.

COSSACKS, name applied to a large portion of the frontier populations of southern Russia.

Origin.—Race of hardy plainmen.—"The origin of the Cossack tribes is lost in the obscurity of ages; and many celebrated historians are still divided in opinion as to whence the term Cossack, or rather Kosaque, is properly to be derived. This word, indeed, is susceptible of so many etymological explanations, as scarcely to offer for any one of them decided grounds of preference. Everything, however, would seem to favour the belief that the word Cossack, or Kosaque, was in much earlier use in the vicinity of the Caucasus than in the Ukraine. . . . Scherer, in his 'Annals of Russia Minor' (La petite Russie), traces back the origin of the Cossacks to the ninth century; but he does not support his assertion by any facts clothed with the dignity of historical truth. It appears certain, however, that the vast pasture lands between the Don and Dnieper, the country lying on the south of Kiow, and traversed by the Dnieper up to the Black sea, was the principal birthplace of the Cossacks."—H. Krasinski, *Cossacks of the Ukraine*, ch. 1.—"No problem of Russian history has given rise to more controversy than that of the origin of the Cossack race. It now appears established that the influence of the geographic and climatic conditions which exist on the steppes, modifying to a common type the characteristics of the peoples and tribes (often of wholly different origin) who in turn have inhabited the ancient lands of the Scythians—is the paramount factor in solving this problem. . . . The Russian word *Kasak*—of which 'Cossack' is the English equivalent—still signifies in several Tartar dialects a 'Horseman' or 'Rover.' By a not unnatural association of ideas this term has been adopted at different times and in widely separated localities as a tribal name by nomad peoples of the steppes. . . . It

was not until the latter half of the fifteenth century that the ebbing tide of Tartar invasion, which for nearly two centuries had submerged the richest lands of the great Russian plain, once more opened to settlement from the North the rich steppes of the 'Black Earth' district, and the scarcely less fertile lands to the South and East. . . . It would appear that about this time the term Cossack or *Kasak* was first used to describe a 'masterless man,' one who refused to identify himself with the *Krestianin* or ordinary agricultural laborer (a class about to fall wholly into the condition of serfdom). The same word may previously have been used by the Tartars after their conquest of Russia to denote tribesmen who, refusing to settle in towns or colonies, preferred to continue the nomad and adventurous life of their ancestors. The name also began to be applied to soldier-mercenaries from the steppe 'war bands,' who, while maintaining the warlike traditions of this wandering life, refused to become incorporated among the men-at-arms attached to the great *boyars* or to take permanent service in the paid militia formed by the Tsars after the reign of Ivan IV. . . . For thousands of years—until the coming of the railways in recent times—the problem of life on the Russian prairies must have presented themselves again and again under the same inevitable forms. The nations who established their permanent homes in this fertile 'smiling wilderness' were all endowed with similar characteristics. Their lives were passed on horseback and their existence depended on their skill as breeders of half-wild cattle and hunters of wary game. The Greek legend of the Centaurs was, in their case, scarcely an exaggeration. In plains so vast as to be almost without natural limits or defensible frontiers a necessary factor of effective occupation became the ability to defend a chosen area at any moment in hand to hand encounters with a mobile foe. . . . For this reason, the objects of steppe warfare were different from those of ordinary strategy. . . . It was upon the shores of the great river Dnieper, known to the ancients as the Borysthenes, that the first permanent Cossack communities established their settlements. By slow degrees, under the increasing influence of peasant immigration from the North (bringing with it the religion of Russia and such rude civilization as the northern woods had developed) the Asiatic and 'tribal' features of Cossack life began to disappear. During the early days of the XVth century they had so strengthened their hold upon the broad lands lying between the Dnieper and the Don, that we find the terms 'Free Cossacks of the Ukraine' and even 'The Republic of the Don' used to describe their settlements. . . . In the growing Cossack settlements or *slovods* only the sturdiest of the children were allowed to survive. As a preparation for a lifelong struggle with the forces of the steppes 'their mothers were wont to plunge them at birth either into a snowdrift or in a mixture of salt and water.' None of the scanty provisions of the tribe could be wasted upon weaklings or those of unpromising physique. When scarcely able to walk, the young Cossacks were placed on horseback and 'soon learned to swim wide rivers thus mounted.' At an early age they were only allowed food when by their unaided skill with bow and arrow they had brought down the wild game which supplied the family cook-pot. The clothing of the first Cossack tribesmen was contrived from sheepskins or the hides of wild beasts. Only the chieftains of the highest rank were able to afford garments of coarsely woven cloth dyed in brilliant colours. In case of sickness the Cossack remedy

was to mount on horseback and, after galloping across the plain until both steed and rider were exhausted, to open a small vein in the shoulder of their mount and drink the warm blood."—W. P. Cresson, *Cossacks, their history and country*, pp. 5-10, 13-15.

Government and organization under the empire.—Agriculture.—"The head of each 'army' preserves the ancient title of ataman (or hetman), an office usually uniting the military and civil duties of a governor-general. At the head of each *stanitza*—which usually comprises from one to four villages according to the size of their population—is placed a *stanitzi ataman*, who is responsible for the general order. Out of respect for Cossack particularism, each *stanitza* in theory became an administrative unit enjoying the fullest autonomy. The actual government in most of these communities is generally exercised by a council of Cossack elders, generally men past military age, whose patriarchal decisions are respected by all. The council or *shor* is responsible to a *stanitza* gathering in which all the Cossack heads of families are represented. In view, however, of the increasing population and the unwieldy proportions which these gatherings attained in many of the larger *stanitzi* the old principle of the *obshi kroug*, i.e., the 'Circle of All,' is generally limited to communities not exceeding twenty or thirty families. In the larger communities a representative system has been adopted based on the universal suffrage of men over twenty-five years of age. Decisions must be reached in all important affairs by the vote of at least a two-thirds majority. In the Cossack *stanitzi* non-Cossacks, or 'persons not of the military class' are permitted to live on payment of certain dues to the community, but without the right to vote or hold office. Jews were formerly rigorously excluded from this privilege. Cossacks have the same fondness for cattle raising and other pastoral pursuits noticeable in the inhabitants of nearly all new countries. Like the true 'cowboy' of the Far West—with whom he has much in common—the Cossack will only put his hand to the plow when driven to it by the sternest necessity. Although in many parts of the Cossack country the soil of the steppes is surpassingly rich, the rigours of a continental climate are felt with especial severity. In these vast almost treeless plains droughts, floods and other climate extremes are enemies of the Cossack husbandmen. Under the imperial government the breeding of horses and cattle was especially encouraged in order to furnish mounts for the cavalry, and to ensure the best results the Ministry of Agriculture provided the Cossack herders with blooded stock. Breeding farms are established for the direction and supervision of this industry at convenient points. Besides horses a great part of the wealth of the Cossack nations consists in their herds of cattle, sheep, swine, and camels. Indeed in many parts of the *stanitzi* the size of these herds forms the chief criterion of Cossack wealth and position, much in the same way that this standard is applied among nomad races. The old tradition that pictures the Cossack troops as a levy of wild horse-men, only useful for the purpose of partisan warfare, in no way represents the actual state of their military capabilities. Besides living from childhood in a military atmosphere their officers are drilled with especial severity for their long period of duty. Under the old regime, while special military institutions existed for Cossack officers, they were subjected to the same educational requirements as the cadets graduating from regular military schools. Moreover, no amount of training could take the

place of the marvellous *esprit de corps*—an almost instinctive 'clan' feeling—existing in every Cossack regiment. The introduction of universal military service in 1874, and the enactment of laws by which every male Russian was called upon to take up his share in the burden of state defence, removed many of the differences existing between the Cossacks and their peasant or *moujik* neighbours. But in spite of the important change thus realized the military traditions of the Cossack race remained unchanged and the imperial government continued to treat them as a distinct body in the community. Each Cossack was still required to furnish his own horses, uniform and weapons, and the only changes made in the old conditions of Cossack service had in view placing the Cossack armies in a position enabling them to co-operate with the regular troops of the Russian line."—W. P. Cresson, *Cossacks*, pp. 199-201.—See also MILITARY ORGANIZATION: 38.

COSTA, Afonso A. da, Portuguese statesman, representative at Versailles conference in 1919. See VERSAILLES, TREATY OF: Conditions of peace.

COSTA RICA: Area.—Resources.—Education.—Population.—Costa Rica is a Central American republic "which lies between the 8th and 11th parallels of north latitude, [and] constitutes a small section of Central America, a vast geographical entity, peculiarly distinguished for its geographical character, having its beginning in the Isthmus of Tehuantepec and ending in the Isthmus of Panama. Its area is estimated at fifty thousand square kilometers, bounded on the north by Nicaragua, on the south by Panama, on the northeast by the Caribbean Sea, and on the southeast by the Pacific Ocean. On the Pacific Coast are the Gulfs of Dulce and Nicoya, the latter of which enjoys the reputation of being one of the most beautiful spots in the world."—R. F. Guardia, *History of the discovery and conquest of Costa Rica*, p. 1.—"The topography of Costa Rica is similar to that of other Central American republics, inasmuch as the mountain range, which crosses its territory almost in its entirety, and which reaches considerable alti-

tude, is the predominant feature. This mountain range influences the climate, making it pleasant on the plateaus, and, at higher elevations, quite cold at certain times of the year. It is due to this diversity of climate that such a variety of products is to be found in Costa Rica, tobacco, cacao sugar, indigo, rice and coffee being successfully grown, while bananas form one of its principal products of export. India rubber and cocoanuts are also gathered in the forests."—*General descriptive data—Costa Rica (International Bureau of American Republics, J. Barrett, director, June, 1909).*—See also CENTRAL AMERICA; Map; LATIN AMERICA.

"The bananas, of course, are produced on the Atlantic coastal lowlands, and the value of the annual export of these is now in the neighbourhood of a million pounds. The great majority of the bunches are shipped from Port Limon, but a certain proportion of those grown in the southern districts are sent to the Panamanian province of Bocas del Toro, and are shipped from there. About a third of the total quantity of bananas grown is exported to Great Britain; the rest is taken by the United States. It is difficult to estimate the actual area of land devoted to banana plantation, owing to the rapid spread of the industry; but in 1912 the extent of land thus employed was about one hundred thousand acres, and the increase since then has been considerable."—W. H. Koebel, *Central America, p. 229.*—In the trade of the world Costa Rica derives its importance almost exclusively from its coffee, which has been exported chiefly to Great Britain. The mining of gold and silver, on the Pacific slopes, is the second industry of importance; while in the interior are quantities of virgin timber, including rosewood and mahogany. "The boast of the country is that its school teachers exceed in number the army, and the Costa Rican points to numerous beautiful school buildings in all parts of the country as the reason for the superior quality of democratic life in this beautiful country. Nor is the boast an idle one, for while there is an army of soldiers and officers numbering about 500, there is an army of school teachers numbering about 1,000, with nearly 35,000 school children in the ranks. Educational training is the means that Costa Rica has adopted since early days for improving its governmental structure, for developing public institutions, for generating a spirit of justice and equality, and that policy has placed it among the progressive little countries of the world. The progress of a nation is said to vary in direct proportion to its educational opportunities and this truism finds expression in Costa Rica."—*Pan-American Union (Bulletin, May, 1916, pp. 607-608).*—"Although not so rapid as that of the other Spanish-American communities, the material progress of Costa Rica has at least been steady and regular. The population advanced from 80,000 in 1844 to 120,500 in 1864, and to over 182,000 in 1883, and was estimated at 220,000 in 1890. The number of immigrants is still very small, and of the 4,672 returned in 1883, nearly 2,000 were from the conterminous states of Nicaragua and Colombia."—E. Reclus, *Universal geography (Central America, v. 17, p. 308).*—In 1918 the estimated population was 459,423.

ALSO IN: W. H. Koebel, *Central America, pp. 227-228.*—C. R. Enock, *Republics of Central and South America, pp. 460-461.*

Origin of name.—"This term 'Rich Coast,' given formerly to the whole of the south-western shores of the Caribbean Sea, that is, to the Gulf of Colombia taken in its widest sense, was later re-

stricted mainly to the district of Veragua in Colombia, where gold had been discovered. But the present Costa Rica, at first known as Nueva Cartago, was found so little productive by its first white settlers, that, according to some writers, the name of 'Rich Coast' was retained by a sort of antiphrasis."—E. Reclus, *Universal geography (Central America, v. 17, p. 293).*—"Costa Rica was so named by the early Spanish settlers on account of its immense natural wealth, and it contains, in addition to its virgin forests, broad savannas and valuable vegetable fruit products, mineral deposits of great value. Many gold mines were worked by the early Spaniards, and recently some activity has been shown in exploiting this branch of industry, warranted by the richness of the mineral deposits in the extensive mining zones of the republic. The native Indians worked, in a crude way, the silver, gold, and copper mines of the land in olden times."—C. R. Enock, *Republics of Central and South America, p. 461.*

Aboriginal inhabitants.—"When Costa Rica was discovered by the Spanish in the beginning of the sixteenth century, her territory was inhabited by several thousand semi-barbarous Indians, distributed among the great forests by which it was covered. These Indians belonged to five distinct races called Corobici, Boruca (or Buinca), Chorotega, Nahua and Carib. There is reason to believe that the Corobicis were the most ancient; the Borucas probably migrated from the interior of Colombia about the year one thousand of the Christian era; the Chorotegas from Chiapas towards the fourteenth century; the Nahuas from Mexico fifty years later, and the Caribs from Venezuela in about the year 1400."—R. F. Guardia, *History of the discovery and conquest of Costa Rica, p. 3.*—See also INDIANS, AMERICAN; Cultural areas in Central America; Maya area.

1502.—Discovery by Columbus.—"On the 9th of May, 1502, the immortal Columbus left Cadiz upon his fourth and last voyage to the world he had discovered. . . . When near the Island of Santo Domingo, a tempest put them in imminent peril, and separated the five ships; but these coming together again at the west of the island, and having repaired their damages, they arrived on July 30th at La Guanaja, the first spot of Central America touched by Columbus. . . . Sunday, August 14th, he landed . . . in Caxinas (today Trujillo). . . . The 17th of the same August, Columbus, having entered the River Tinto in small boats, . . . took possession of the land in the name of the king of Castile. . . . They were continuing their journey southward, when a furious tempest rose, in which they nearly perished. . . . The 12th of September they doubled the Cape of Gracias a Dios, which the Admiral so named because of the calming of the tempest there; the ships were repaired and continuing their voyage, they arrived at last—October 5, 1502—at the region which today is the Republic of Costa Rica. It was the first spot in Central America where the Spaniards found the object of their solicitude—gold. The natives used it in different forms of ornaments. The illustrious Genoese discovered all the Atlantic Coast of Costa Rica, the Islands and Bay of Almirante, thus named in his honor; traversed the *terra firma* surrounding these islands, which he called *Vera Agua*, and returned to Spain, after having searched as far as Portobelo for the channel which he believed to exist between the two

oceans."—J. B. Calvo, *Republic of Costa Rica*, pp. 209-210.—See also AMERICA: 1498-1505.

ALSO IN: R. F. Guardia, *History of discovery and conquest of Costa Rica*, pp. 24-29.

1540-1639.—Established as a province.—Frontiers defined.—Appointment of military governor.—Brief period of prosperity.—"The Spanish crown in 1540 established the Province of Costa Rica; in 1560 and 1573 defined its frontiers; in 1562 appointed Juan Vasquez de Coronado military governor of Costa Rica and Veragua. The city of Cartago, until 1823 the capital, was founded by Coronado, but it was a city only in name. During the first century of the existence of the province no headway was made. The Indian tribes were the most intractable of their kind; white settlers were few. A brief period of comparative prosperity began when Capt.-Gen. Sandoval in 1638-39 made a new port at Matina and opened a road from it to the capital. The value of cocoa plantations near the road increased, and the eastern coast, as well as the Gulf of Nicoya, was visited by trading ships."—M. Wilcox, *Encyclopedia of Latin America*, p. 535.

1666-1727.—Decay of the province.—Raids of pirates.—"The Province had arrived at a satisfactory grade of prosperity, and although thus far the Spanish population was not large, its excellent climate and the richness of its soil should have attracted many colonies. Commerce was flourishing through the Ports of Matina, on the Atlantic, with Portobelo, Cartagena, and other places, and through the Port of Caldera, on the Pacific, with Panama, Peru, and other countries. . . . Unfortunately, from 1665 the depredations of pirates had caused great inquietude among the inhabitants, and the progress, hardly under way, met with great difficulties; it even went so far that the extreme measure of closing the ports to foreign commerce was reached. Little else was done during the government of Juan Lopez de la Flor than to defend the Province. The attempts of the corsairs did not amount merely to sacking and pillaging, but they had the idea of possessing themselves of the country and establishing communication from sea to sea. In this they were supported by the English Governor of Jamaica. With this motive the buccaneers Morgan and Mansfelt, in 1666, prepared a formal expedition; they arrived at Matina with 500 to 800 men, in fifteen ships, landed, and made their way to the interior as far as Turrialba. Warned in time, the Governor went forth to put them to rout, and to close the narrow pass at the opening of Quebrada Honda, where he arrived April 15th. . . . Mansfelt being apprised of the presence of the forces at Quebrada Honda, . . . of the distance to Cartago, and the kind of roads they would have to travel, decided to retreat. . . . The retreat was rapid . . . and [they] . . . gained the safety of their ships. . . . This was the most formidable attempt made by the corsairs to gain possession of Costa Rica, or to cross it and submit it to pillage. The constant alarms felt by the inhabitants caused such as did not emigrate to establish themselves in the interior, subject to a miserable Commerce with Nicaragua and Panama; their poverty augmented until they were reduced to a lamentable condition. . . . With this condition of affairs began the government of Don Juan Francisco Saenz Vasquez, inaugurated in 1674, who immediately began his efforts to lift Costa Rica out of his troubles. Saenz was enterprising, and desired the prosperity of the Province. . . . In June, 1676, the enemy, leaving its armada in Portete (Moin), entered by the Matina River in Piroques,

with 800 men, and took possession of the valley. The Governor . . . set forth with 500 soldiers and 200 Indian bowmen and forced the invaders to reëmbark. . . . Saenz was succeeded by Don Miguel Gomez de Lara, in 1681. The pirates continued marauding the coasts and attacking the settlements whenever they could. They landed in Caldera, attacked and took the City of Esparza, sacked and burned it. . . . In 1718 there was neither barber, surgeon, doctor, nor drug-store. There were no stores. Each inhabitant, including the Governor, had to plant for his own consumption. In the Capital meat was sold but twice a week. The civilized population was united almost exclusively in Cartago and Esparza, the number being few in the latter. Exportation was reduced to some quintals of cocoa and tallow, which were exchanged in Panama for cloths."—J. B. Calvo, *Costa Rica*, pp. 224-228.

1821-1848.—Independence of Spain.—Brief annexation to Mexico.—Civil war.—Joined republic of Central American states.—Became an independent republic.—Costa Rica formed a part of the audiencia and captain-generalcy of Guatemala until 1821, but "on the 15th of September . . . [of that year, it] revolted from Spanish authority and joined the Mexican empire. Union with Mexico was proclaimed formally in Costa Rica January 10, 1822, when it was declared that, the *pueblos* having decided for incorporation with the Empire of Iturbide, this Province should send a delegate or delegates, which they should designate, and be subject to the Constitution that the Congress of that country should dictate."—J. B. Calvo, *Costa Rica*, p. 250.—The subjection was never popular and in 1823 hostilities broke out between the Liberals, who wanted an independent republic, and Conservatives, who were in favor of the Mexican union. Civil war resulted. The Liberals were triumphant and the seat of government was transferred from Cartago, the old capital, to San José, the Liberal headquarters. This independence lasted until 1824, when Costa Rica joined the newly formed republic of Central American states, the union lasting until 1839. It was not until 1848, however, that an independent republic was proclaimed. See CENTRAL AMERICA: 1821-1871.

1850.—Clayton-Bulwer Treaty and the projected Nicaragua canal. See NICARAGUA: 1850.

1856-1860.—Involved in war with William Walker.—Costa Rican "troops were conspicuously successful against the filibuster from Nashville, Tenn., William Walker, who in 1855 forced the Nicaraguans to elect him to the presidency. This feat established Costa Rica as one of the controlling forces in a group of small states, but an aggressive policy was not adopted then, nor has it been subsequently adopted."—M. Wilcox, *Encyclopedia of Latin America*, p. 542.—See also CENTRAL AMERICA: 1821-1871.

1871.—Constitution proclaimed.—"Costa Rica is a republic, the government of which is representative, the representatives being classified so that one-half retires every two years. Since 1825 Costa Rica has had nine constitutions, the last one having been promulgated in 1871."—G. Niederlein, *Republic of Costa Rica*, p. 121.—"The present constitution of the Republic of Costa Rica was proclaimed on December 7, 1871, and has been in force ever since, some slight amendments being added from time to time. The Government is divided into the customary legislative, executive, and judicial branches with functions similar to those of the same branches in other American re-

publics. The Congress of the Republic is composed of one chamber, the Chamber of Deputies, elected by indirect vote of electors chosen by the people for the purpose. . . . The Deputies serve for a term of four years, but the Chamber is renewed by halves every two years. A permanent committee composed of five deputies represents Congress during its recess and assists the President of the Republic in the interpretation of laws. . . . The President of the Republic is elected in the same manner as the deputies, i. e., by an electoral college chosen by popular vote all citizens over twenty years of age being entitled to suffrage. The President's term of office is four years, and he may not be reelected for a second consecutive term. Three *designados*, known as first, second, and third, are named by Congress to represent the President in case of his death, absence from the country, resignation, or inability to exercise authority. . . . A Council of Government assists the President, composed of members of his cabinet, and such other citizens as the President may from time to time appoint. Four ministers or secretaries of State form the Cabinet. The judicial powers are vested in a National Supreme Court, two Courts of Appeals, several criminal and civil courts, as well as a number of district and municipal courts and justices of the peace. The territory of the Republic is divided politically into five provinces and two comarcas, which are again divided into cantons and these into districts and municipalities."—*General descriptive data—Costa Rica (International Bureau of American Republics, J. Barrett, director, June, 1909)*.

1871-1885.—Ascendancy of Barrios in Guatemala.—Efforts to reestablish a Central American union. See CENTRAL AMERICA: 1871-1885.

1886-1894.—Continued struggle for union.—Conflicts between president and legislature. See CENTRAL AMERICA: 1886-1894.

1890.—First International American Conference at Washington. See AMERICAN REPUBLICS, INTERNATIONAL UNION OF: 1890.

1897.—Boundary dispute with Nicaragua settled. See CENTRAL AMERICA: 1897.

1900.—Boundary with Panama (then province of Colombia) determined by arbitral award.—The frontier line with Colombia (Panama) was determined by the award of the president of France as arbitrator. The president's decision extended the Colombian frontier to Punta Carreta on the Caribbean coast, thus depriving Costa Rica of extensive territory to which she laid claim.

1901.—Second International American Conference at Mexico City.—Treaty of compulsory arbitration signed. See AMERICAN REPUBLICS, INTERNATIONAL UNION OF: 1901-1902; ARBITRATION, INTERNATIONAL: Modern: 1902.

1906.—Third International American Conference at Rio de Janeiro. See AMERICAN REPUBLICS, INTERNATIONAL UNION OF: 1906.

1907.—Washington Peace Conference.—Establishment of Central American Court of Justice.—"In 1907 Costa Rica and all the other Central American States sent delegates to a conference which was at Washington, D. C., from 14 November to 20 December. The conference decided, among other things, to establish a Central American Court of Justice and a Central American 'pedagogical institute,' both to be located in Costa Rica, and the delegates, expressing the opinion that each republic should have the right to maintain at the proposed normal college not more than 200 students of both sexes, agreed to send not less than 20 students of each sex."—M. Wilcox, *Ency-*

clopedia of Latin-America, p. 536.—See also CENTRAL AMERICA: 1907.

1910.—Protocol signed by Costa Rica and Panama.—Articles I and VII of the Porras-Anderson treaty of March 17, 1910, read as follows:

ARTICLE I. The Republic of Costa Rica and the Republic of Panama, although they consider that the boundary between their respective territories designated by the arbitral award of his Excellency, the President of the French Republic, the 11th September, 1900, is clear and indisputable in the region of the Pacific from Punta Burica to a point beyond Cerro Pando on the central Cordillera, near the ninth degree of north latitude, have not been able to reach an agreement in respect to the interpretation which ought to be given to the arbitral award as to the rest of the boundary line, and for the purpose of settling their said disagreement agreed to submit to the decision of the Honorable, the Chief Justice of the United States, who will determine, in the capacity of arbitrator the question: What is the boundary between Costa Rica and Panama under and most in accordance with the correct interpretation and true intention of the award of the President of the French Republic made the 11th of September, 1900? In order to decide this the arbitrator will take into account all the facts, circumstances and considerations which may have a bearing upon the case, as well as the limitation of the Loubet award expressed in the letter of his Excellency, M. Delcassé, Minister of Foreign Relations of France, to his Excellency, Señor Peralta, Minister of Costa Rica, in Paris, of the 23d November, 1900, that this boundary line must be drawn within the confines of the territory in dispute as determined by the Convention of Paris between the Republic of Costa Rica and the Republic of Colombia of the 20th January, 1886. . . .

ARTICLE VII. The award, whatever it be, shall be held as a perfect and compulsory treaty between the High Contracting Parties. Both High Contracting Parties bind themselves to the faithful execution of the award and waive all claims against it. The boundary line between the two republics as finally fixed by the arbitrator shall be deemed the true line, and his determination of the same shall be final, conclusive and without appeal. Thereupon a commission of delimitation shall be constituted in the same manner as provided in Article II, with respect to the commission of survey, and shall immediately thereafter proceed to mark and delimitate the boundary line, permanently, in accordance with such decision of the arbitrator. Such commission of delimitation shall act under the direction of the arbitrator, who shall settle and determine any dispute as to the same.

1910.—Fourth International American Conference at Buenos Aires. See AMERICAN REPUBLICS, INTERNATIONAL UNION OF: 1910.

1914-1917.—Attitude towards World War.—"The people of Costa Rica would seem to possess a proportion of white blood somewhat in excess of that of the average Central American State. They have proved themselves industrious agriculturists, and the inevitable Latin American rule has asserted itself once again here: that political tranquillity—comparative tranquillity, if you will—goes hand in hand with material prosperity. European and North American immigrants, moreover, are numerous in Costa Rica, and their influence has been not without its value upon the original inhabitants of the Republic."—W. H. Koebel, *Cen-*

tral America, p. 225.—See also CENTRAL AMERICA: 1911.—“Although little has been done to encourage it, European immigration has favored Costa Rica to quite a considerable extent. This fact may be attributed to the natural wealth of the country, to her geographical situation, to the delightful climate of the high plateaus, as much as to the internal peace which she has enjoyed for half a century, and to the hospitable character of the Costa Ricans. Spaniards and Italians are the most numerous of the entering nationalities, with Germans in third place. There are few English and less French. The number of the latter class has constantly diminished during the last twenty-five years and today they form only a very small group. The first news of the declaration of war caused stupor in Costa Rica. No one wished to believe it. We had an idea, almost universal, that a war between the great European Powers was no longer possible. . . . But it was necessary to bow before the terrible reality. . . . The violation of the neutrality of Belgium roused the greatest indignation, not only on account of the fact itself but also because of the extremely warm sympathy which we feel for this country. . . . Not much faith was placed in the first reports of the conduct of the German armies in Belgium. The stories told were so monstrous that one supposed them to be at least very much exaggerated. On the other hand the resident Germans protested with all their strength against the accusations launched concerning their compatriots. . . . On the outbreak of hostilities the press limited itself to the publications of despatches, almost without comment. . . . The greater part of the journals, putting a muzzle on their Francophile feelings, took up an attitude of neutrality for fear of wounding the feeling of the German colony. . . . During the first months of the war German propaganda flourished; there was nothing to counterbalance it. . . . This propaganda was chiefly directed against England. . . . The British blockade has completely killed the propaganda organized in Hamburg and nowadays it is from France that we receive special publications relative to the war.”—R. F. Guardia, *Costa Rica and the European War* (*Pan-American Magazine*, July, 1917, pp. 155-158).

1914-1917.—Presidency of Gonzalez.—Revolution under Tinoco.—“The recent revolt in Costa Rica, bloodless, effected without more than a few hours' excitement in the capital, and undoubtedly reflecting the wish of the majority of the Costa Ricans, is an example of the ancient truth that the most peace-loving people can be driven to revolt when they are sufficiently exasperated. Up to the morning of January 27, [1917] the President of the Republic of Costa Rica was Don Alfredo Gonzalez, a man of some forty years of age and without any record of distinction; he came into office in 1914 not by the votes of the people but by a political trick. There were three candidates at the Presidential election held in 1913: Dr. Duran was the representative of the National Union party; Don Rafael Yglesias was the representative of the Civil group, which is a split from the first party; and Don Maximo Fernandez was the candidate of the Republican party, which has existed only since 9001 and represents the more turbulent and less informed section in Costa Rica. As a result of this three-cornered election, Duran received 20,000 votes; Yglesias, 18,000, and Fernandez 26,000, and while these figures demonstrate that the Republicans were greatly in the minority, it was also impossible by Costa Rican law for anyone to claim election since a Presidential candidate to be

successful must receive one-half of all the votes cast, plus one or more. Under these circumstances the question had to go to the National Assembly, whose duty it was to decide between the two candidates receiving the larger number of votes at the polls. This situation had been already provided for as soon as it was plain that the evenly balanced three-cornered election would bring no one into power without a compromise, and this compromise was arranged for, before voting took place, the citizens who cast their votes for Duran understanding that these might be delivered to Yglesias, and vice-versa; in any case, the total of 38,000 votes was collectively against the Republican candidate. If this arrangement had been carried out, Dr. Duran would be President of Costa Rica, but a hastily concocted intrigue prevented this fortunate solution of the 1913 election. The National Assembly contained 18 National Unionists, 12 Civilists and 17 Republicans; the junction of the two first ranks would have given Duran a majority of 13 over the Republicans, but unluckily the Republicans were able to win over Yglesias, the Civilist candidate, to withhold his support, and, in their anxiety at all costs to defeat Duran, the Republicans offered to compromise with the Civilists on an entirely new choice—a citizen who should be elected by Congress as ‘Designate,’ an office equivalent to that of Vice-President under ordinary circumstances, who should exercise office during the 1914-1918 term. The name of Don Manuel Castro Quesada was first suggested, but that of Alfredo Gonzalez was finally agreed upon. Señor Gonzalez thus assumed the reins of office without having received a single vote from Costa Rican citizens, in violation of the agreement made between the two sections of the strongest political group in the country, and in disregard of the Constitutional law. Costa Rica was the most astonished republic in Central America when it discovered that it had for its Chief Magistrate a man for whom no votes had been cast and who was personally unknown; nevertheless, this is an extremely peace-loving country, and had Gonzalez done his duty he would undoubtedly have ended his term without public protest; if Costa Rica dismissed him it was only after serious and repeated cause had been given. The charges against him include that of illegally influencing the Congressional elections held in 1915; at that time the names of 2,000 voters in the capital alone (San José, a city of 40,000 inhabitants) were arbitrarily removed from the voting lists, while access to the polls of many citizens known to be opponents of the government was forcibly prevented by police armed with machetes and revolvers. Others were arrested and held in custody while voting took place. This outrage against public rights was the first act which aroused the general anger of Costa Rica, but it was not the only one; Gonzalez's disregard of the ideas of the best men in the country, men who had long been esteemed by a land which is never ungrateful to her worthy sons, was accompanied by his elevation of favorites of foreign birth. Another grievance was that of taxation; with the approval of men of both parties, a scheme was launched having as its aim the substitution of indirect for direct taxes; indirect taxes are in Costa Rica as in many parts of the Americas, including the United States, the great source of revenue, although the system is universally condemned as pernicious. The satisfaction felt in contemplation of readjustment was rudely dashed when President Gonzalez announced that both the old taxes and the new ones, which consist of a

very heavy land tax as well as an income tax, would be continued; at the same time it was announced that public expenditures would be increased by fifty per cent. Even this burden might not have roused Costa Rica to action had it not been made clear soon afterwards that Gonzalez proposed to secure another term of office. By Costa Rican law a President may not immediately succeed himself, but Gonzalez disposed of this objection by the assertion that he had never been elected president. This was too much; the country seethed with discontent, and it became plain to many lookers-on that if some bold stroke were not made there would undoubtedly break out a revolution with the disrupting qualities of social disorder and of bloodshed. Costa Rica has not seen blood shed in public anger for forty years, and there is no one among her friends who would not lament to see her record of peaceful progress thus broken. Such an occurrence was averted by the *coup d'etat* of January 27. On that morning President Gonzalez was quietly informed by a band of responsible citizens that his administration would be no longer recognized, the majority of the army declared their allegiance to a new order of affairs, and the deposed leader took refuge in the American Legation—a proceeding quite unnecessary in view of the peaceful nature of the movement. Not a single person was injured, and no one was even placed under arrest longer than twenty-four hours, before which time the degree of public excitement caused by the news had entirely subsided; as a matter of fact, the *fait accompli* was hailed with relief and content by the whole of Costa Rica with the possible exception of the immediate entourage of Gonzalez, and by ten o'clock in the morning the whole thing was over in the capital. The business of San José went on as if nothing had occurred. Stores and banks remained open and the theatres were full of gay crowds in the evening. The man to whom the conduct of the administration was entrusted by the citizens who brought about the *coup* was General Federico Tinoco, a member of a highly respected family, and leagued by his political affiliations to the newer Republican party. General Tinoco was at one time a friend and supporter of Gonzalez, had helped to make his assumption of power possible in the first instance, and only became associated with the movement of revolt when the situation grew intolerable. The deposition of Gonzalez was supported by all the people of standing in the country, and by the whole of the foreign diplomats with one possible exception. The constitution of the new administration is, however, a guarantee of the absolute respect which Costa Rica will continue to pay in the future as in the past to the rights as well as the privileges of foreigners. As an instance of the support of General Tinoco's administration by strong and able men, it is only necessary to say that all of the seven ex-Presidents of Costa Rica, all of whom live in the country, have given their help in the reorganization of public affairs. Don Bernardo Soto, Don Ascension Esquivel, Don Cleto Gonzalez Viquez, Dr. Duran and Don Rafael Yglesias are actively coöperating with General Tinoco as members of a commission appointed to prepare a reform platform, while Don José Rodriguez and Don Ricardo Jiménez are serving as counsellors."—*Revolution in Costa Rica* (*Pan-American Magazine*, Mar., 1917, pp. 235-237).

1921.—Boundary dispute between Costa Rica and Panama.—Note of Secretary Hughes.—In February, 1921, some desultory fighting took place on the disputed border between the Costa Ricans and the Panamans. United States marines and battleships were ordered to protect American property, particularly that of the United Fruit Company, in the disturbed area. This was tantamount to putting an end to active hostilities. On March 15, 1921, Secretary of State Hughes sent a note to the Panama government which reviewed the whole controversy as follows:

"It appears that the question which has been raised by the Government of Panama with respect to the boundary between Panama and Costa Rica has two aspects: (1) With respect to what may be termed the Pacific side of the Cordillera and (2) with respect to the Atlantic side. The Government of the United States deems it to be beyond controversy that the boundary line on the Pacific side was determined by the arbitral award of his Excellency the President of the French Republic on the 11th of September, 1900. The line on the Pacific side, as thus determined, was unequivocally accepted by both the Republic of Panama and the Republic of Costa Rica in the Porras-Anderson Treaty of March 17, 1919. In Article I. of that treaty it is stated that the Republic of Panama and the Republic of Costa Rica 'consider that the boundary between their respective territories designated by the arbitral award of his Excellency the President of the French Republic the 11th of September, 1900, is clear and indisputable in the region of the Pacific from Punta Burica to a point beyond Cerro Pando on the Central Cordillera, near the ninth degree of north latitude.' Notwithstanding this fact the Government of Panama apparently has taken no steps to fulfill its obligation to recognize the territory on the Costa Rican side of that line as subject to the jurisdiction to the Government of Costa Rica, but has continued to exercise jurisdiction over the territory beyond that boundary until the present time. It is to be observed that it is in that territory, belonging to Costa Rica, that Coto is situated. Because of the obligations and special interests of the Government of the United States, because of the obligations on the part of Panama, and because of the earnest desire of this Government that the Government of Panama shall maintain the most friendly relations with its neighbors in order that its own welfare and prosperity may be enhanced and that its territorial and political integrity may be free from attack, this Government considers it to be an unavoidable duty to request the Government of Panama at once to take steps to confirm the boundary line from Punta Burica to a point in the central Cordillera north of Cerro Pando, near the ninth degree of north latitude, by relinquishing its jurisdiction over the territory on the Costa Rican side of that line, as defined by the Loubet award, and by transferring such jurisdiction to the Government of Costa Rica in an orderly manner. The controversy which remained, after the award of his Excellency the President of the French Republic, over the remaining portion of the boundary line between Panama and Costa Rica, on the Atlantic side, was submitted to the arbitral decision of the Chief Justice of the United States by the two Governments concerned, under the provisions of the Porras-Anderson treaty of March 17, 1910. . . . The Chief Justice of the United States accordingly determined the boundary

lines between Costa Rica and Panama on the Atlantic side. His award was made in 1914. It gave to Costa Rica a portion of the territory claimed by Panama, and to Panama a portion of the territory claimed by Costa Rica. It would serve no useful purpose to enter into an extended discussion of the reasons which underlay the award of the Chief Justice of the United States, since these reasons are expressed with the utmost clearness in his decision. In an elaborate opinion, the Chief Justice of the United States dealt with the terms of submission, his jurisdiction as arbitrator under the submission, and with the line which should be drawn defining the boundary between Panama and Costa Rica from the Cordillera to the Atlantic. The award of the Chief Justice is definite and unmistakable. The Government of the United States had noted with deep concern the statement contained in the communication addressed by the Panaman Minister for Foreign Affairs to the American Legation on March 8 to the effect that the action taken by the Government of Panama in retiring its military forces from Coto 'should not be interpreted in any case as an implied recognition of the White award, which the executive power, the Legislative Assembly and the people of Panama have jointly refused to accept since 1914, the year in which it was rendered.' This Government understands that in refusing to accept the award of the Chief Justice of the United States the Government of Panama has urged that the Chief Justice exceeded his jurisdiction as arbitrator. This Government, mindful of its duty to examine this contention in order that it may fully discharge its obligation in the circumstances, and with the utmost regard for the interests of Panama and the earnest desire that her just rights should be maintained, has been unable to find any ground upon which this contention can be advanced. In dealing with the Loubet award, the Chief Justice of the United States, under the express terms of Article I. of the Porras-Anderson Treaty, had regard to the limitation expressed in the letter of his Excellency M. Delcasse of Nov. 23, 1900, to which Article I. refers, 'that this boundary line must be drawn within the confines of the territory in dispute as determined by the convention of Paris between the Republic of Costa Rica and the Republic of Colombia of Jan. 20, 1886.' Finding that 'the line of boundary of the previous award from Punta Mona to the Cordillera was not within the disputed territory' as determined by the convention of 1886, the arbitrator treated that line as non-existing, and it was then incumbent upon the arbitrator to substitute a line which was 'most in accordance with the correct interpretation and true intention of the former award.' This duty of the arbitrator arising from the treaty was fully recognized in the statement submitted to him on behalf of the Republic of Panama, and it is set forth by the arbitrator in his opinion that his power and duty in this respect were conceded by both parties. The Chief Justice explicitly adjudged that the boundary between the two countries 'most in accordance with the correct interpretation and true intention' of the former award was a line which he defined as starting at the mouth of the Sixaola River in the Atlantic and thence, as described, to the point near the ninth degree of north latitude, 'beyond Cerro Pando,' referred to in Article I. of the Porras-Anderson Treaty, and that line was decreed and established as the proper boundary between Panama and Costa Rica on the Atlantic side. This Government finds no basis for the contention that the arbitrator exceeded his

powers, and his award, according to the express terms of the Porras-Anderson Treaty, because 'a perfect and compulsory treaty between the high contracting parties' and both Panama and Costa Rica bound themselves to its faithful execution and waived all claims against it. They have agreed that 'the boundary line between the two republics as finally fixed by the arbitrator shall be deemed the true line and his determination of the same shall be final, conclusive and without appeal.' The Government of the United States therefore feels compelled to urge upon the Government of Panama in the most friendly, but most earnest manner, that it conclude, without delay, arrangements with the Government of Costa Rica for the appointment of the Commission of Engineers provided for by the terms of Article VII. of the Porras-Anderson treaty in order that the boundary line laid down by the decision of Chief Justice White may be physically laid down in a permanent manner and in accordance with the findings of the award."

1921.—Delegates at the Costa Rica conference sign pact to form a Central American Union.—Rejected by the National Assembly. See CENTRAL AMERICA: 1921; 1921 (October); also CENTRAL AMERICA, CONSTITUTION OF.

COSTANOAN FAMILY.—"Derivation: From the Spanish *costano*, 'coast-men.' Under this group name Latham included five tribes . . . which were under the supervision of the Mission Dolores. . . . The territory of the Costanoan family extends from the Golden Gate to a point near the southern end of Monterey Bay. . . . The surviving Indians of the once populous tribes of this family are now scattered over several counties and probably do not number, all told, over 30 individuals, as was ascertained by Mr. Henshaw in 1888. Most of these are to be found near the towns of Santa Cruz and Monterey."—J. W. Powell, *Seventh Annual Report, Bureau of Ethnology*, p. 71.

COSTS, term in law. See COMMON LAW: 1278.

COSTUME: Dominant factors in its origin and development.—Clothing is by no means coeval with man. And it seems to have been originated not so much for protection from the elements, or from a sense of modesty, as from a desire for ornamentation. In fact modesty may be said to be the result of clothes, and not clothes of modesty. In this as in other human arts, decoration has frequently been developed for its own sake until the structure on which it is based is lost sight of. Sometimes, as in the curious wasp-waists and flounced crinolines of the Cretans, and the very similar hooped silhouette of the sixteenth, seventeenth, eighteenth and nineteenth century Europeans, an actual modification of the human body has been attempted, presumably with much loss of comfort and even of health to the wearer. The powerful influence which causes people to strive for a particular decorative effect, more or less regardless of its aesthetic value, is termed fashion. "While this has doubtless greatly influenced architecture, furniture, manner of painting and of decoration, clothes have undoubtedly felt its power more quickly, more keenly and sometimes more fatally to the criterions of good sense and taste. . . . Sometimes it has been the whim to be modest, in affected humility; at other times it has pleased social fancy to seem to be 'old-fashioned' or mayhap classic in appearance. Either

through a desire for novelty or a wish to express new thoughts and emotions, an abnormal love for sumptuous display or an apparently unquenchable thirst for the foreign or the grotesque, has appeared with equal frequency."

Significance of clothes.—"As Montesquieu wrote a *Spirit of Laws*, observes our Professor, 'so could I write a *Spirit of Clothes*. . . For neither in tailoring nor in legislating does man proceed by mere Accident, but the hand is ever guided on by mysterious operations of the mind. In all his Modes, and habilitary endeavours, an Architectural Idea will be found lurking; his Body and the Cloth are the site and materials whereon and whereby his beautiful edifice, of a Person, is to be built. Whether he flow gracefully out in folded mantles, based on light sandals; tower up in high headgear, from amid peaks, spangles, and bell-girdles; swell out in starched ruffs, buckram stuffings, and monstrous tuberosities; or girth himself

EGYPTIAN COSTUMES (LATE PERIOD)

Lady and slave.

into separate sections, and front the world an Agglomeration of four limbs—will depend on the nature of such Architectural Idea: whether Grecian, Gothic, Later-Gothic, or altogether Modern, and Parisian or Anglo-Dandiical. Again what meaning lies in Colour! From the soberest drab to the high-flaming scarlet, spiritual idiosyncrasies unfold themselves in choice of Colour: If the Cut betoken Intellect and Talent, so does the Colour betoken Temper and Heart. In all which, among nations as among individuals, there is an incessant, indubitable, though infinitely complex working of Cause and Effect.'—T. Carlyle, *Sartor resartus*, pp. 45-46.—"Fashion's most powerful accomplice is now, and undoubtedly has always been, what we term the 'commercial interests.' . . . The influences of geography, time, social and ethical standards, and strong personalities, as well as principles of art, on the development of clothes, may perhaps be mentioned here, though they are too obvious to require prolonged discussion. Some dominant idea has been developed in every age and by every people. The results in costume, as in other mediums, are but a material record of the great

ideals that swayed the nations at the time of their creation."—F. A. Parsons, *Psychology of dress*, pp. xxii-xxiv.

Prehistoric. See EUROPE: Prehistoric period: Bronze Age.

Egyptian.—Babylonian.—Assyrian.—Hebrew.—Grecian.—Roman.—In the simplicity and utility of *Egyptian* dress are reflected not only the material environment of the race, but also the practical placid mind which evolved this earliest of civilizations. "The favourite stuff was pure fine white linen, and sometimes this was starched and gofered most elaborately. Although the dress of the men shows greater variety than the clothes of the women, a plain kilt seems to have been the most popular. This often had an embroidered end and a beautiful jewelled girdle. Sometimes the upper part of the body was bare, or a fine gauze vest was worn. A broad handsome necklace and bracelets completed the costume. The King's dress only differed in being either woven of, or embroidered with, gold, and the kilt was further adorned with a lion's tail! A loose robe with large sleeves was worn occasionally. Sometimes the kilt is quite long, more like a skirt, but the pictures suggest that this was worn over the kilt. The poor people wore short linen drawers or merely a fringed girdle. The women's dress consisted of a tight gown from the waist to the ankles; it was high waisted and kept in place by braces which passed over the shoulders. A loose cloak without sleeves is seen in some pictures; also sometimes an overdress, not so tight and with large sleeves, was worn. Every one went either barefoot or wore sandals, as they pleased. Some sandals are exquisitely embroidered. Others are very like modern shoes. The children very rarely wore any clothes—a most hygienic fashion for infancy in a hot climate! As they grew a little older they were promoted to a girdle, and after that they wore the ordinary dress of the period. The race had a passion for cleanliness; dirt of any kind was an abomination to the ancient Egyptian. This led them to shave both face and head; but as this last was very unbecoming, wigs were worn. Some of these are very elaborate, with curls to wear on festive occasions. The women seem to have adopted the custom also, but sometimes they wore their own hair curled and braided."—A. B. Gosse, *Civilization of the ancient Egyptians*, pp. 9-11.—The dress of the *Babylonians*, *Assyrians*, *Hebrews*, and related peoples, seems to have followed the familiar scheme of a close inner garment and a flowing outer wrap, with certain characteristic differences in materials, shape, and decoration. Trousers, however, were not unknown, and were an essential part of the dress of the Persians.

"It is worth noting that astonishingly little change of fashion occurred during long centuries of *Grecian* history. The practical Greek had discovered what costume suited his climate, and, being artistic as well as practical, he had settled upon one that did full justice to the scenic possibilities of the human form. . . . The Athenian male attire . . . consisted of but two articles, the tunic (*chiton*, q. v.) and the mantle (*himation*). Both of these were—to put it simply—oblongs or squares of material, mostly woollen, draped round the body. If the tunic was partly sewn to shape, that sewing was the minimum possible. . . . The tunic worn by a man of leisure had two armholes, but no sleeves. It fell to just above the knees and could be girdled. A workman's tunic had only a left armhole. . . .

EARLY GREEK COSTUMES

1. Ladies of Rank. 2. Warrior. 3. Olympic Singer. 4. Shepherd

The estimation of what we call good or bad 'cut' of our clothes corresponds to the estimation in which the Athenians held what was simply graceful or awkward adjustment of the mantle. . . . Both tunic and mantle were commonly white or nearly so, especially with staid or elderly citizens; nevertheless colours were not rare. . . . Purple, red, frog-green, and black were to be met with, but yellow was a colour for women only. . . . The female attire consisted ordinarily of two chief portions, the light underdress and the heavier mantle, both . . . bearing the same Greek names as those of the men. What in the case of the man is the tunic, is in the case of the woman both longer and fuller. The girdle also was wider and more important. The tunic may be sleeved or sleeveless, and its sleeves may be close or bell

shaped. Decorated with a border and itself most frequently of saffron colour, it served as the ordinary attire for the house. . . . For out of doors and visiting the upper garment was put on and carefully draped round the body, sometimes even being drawn over the head, if a separate head cover or veil was not employed."—T. G. Tucker, *Life in ancient Athens*, pp. 110-115, 168-169, 194-195.—See also CHLAMYS; CHITON; HIMATION.

"Roman attire consisted of two garments—the under garment, or *tunic*, and the outer garment, or *cloak*; the latter was known under the various names of *chlamys*, *toga*, and *pallium*, but, notwithstanding these several appellations, there was scarcely any appreciable distinction between them. The simple tunic with sleeves, which answered to our shirt, was like the modern blouse in shape,

COSTUMES OF THE ROMANS

1. Ladies of Rank. 2. Lictor. 3. Emperor. 4. Senator. 5. Legionary.

and was called by various names. . . . The *lacerna*, *læna*, *cucullus*, *chlamys*, *sagum*, *paludamentum*, were upper garments, more or less coarse, either full or scant, and usually short, and were analogous to our cloaks, mantles, etc., and were made both with and without hoods. There were many varieties of the tunic and cloak invented by female ingenuity, as well as of other articles of dress, which formed elegant accessories to the toilet, but there was no essential alteration in the national costume, nor was there any change in the shape of the numerous descriptions of shoes. The barbarian invasions brought about a revolution in the dress as well as in the social state of the people, and it is from the time of these invasions that we may date, properly speaking, the history of modern dress."—P. Lacroix, *Manners, customs and dress during the Middle Ages, and during the Renaissance period*, pp. 510-511.—See also CHLAMYS; HIMATION; PALLIUM; TOGA, ROMAN.

400-1000.—Early medieval.—This period is characterized by "the blending of the Roman with the barbaric costume—namely, the combination of

had long tight sleeves, and often over this a shorter tunic, reaching just below the knee, sometimes sleeveless, or with rather full sleeves tightening to the wrist. . . . The cloak was the 'grand garment,' heavily banded with ornament and fastened with a large clasp on one shoulder, or in the breast and centre. Long circular cloaks of varying lengths, put on over the head, were much favoured, and when caught up at the sides on either shoulder gave a fine draped effect."—T. Hughes, *Dress design*, pp. 49, 52, 54.—From a miniature of the ninth century "we discover that the female costume of the time consisted of two tunics, the under one being longer but less capacious than the other, the sleeves of the former coming down tight to the wrists, and being plaited in many folds, whilst those of the latter open out, and only reach to the elbow. The lower part, the neck, and the borders of the sleeves are trimmed with ornamented bands, the waist is encircled by a girdle just above the hips, and a long veil, finely worked, and fastened on the head, covers the shoulders and hangs down to the feet, completely hiding the hair. . . . Though we are able to form tolerably accurate notions relative to the dress of the upper classes during these remote periods, we do not possess any reliable information relative to that of the lower orders. . . . Nevertheless, we may suppose that the dress of the men in the lowest ranks of society has always been short and tight, consisting of *braies*, or tight drawers, mostly made of leather, of tight tunics, of *savons* or doublets, and of capes or cloaks of coarse brown woolen. We cannot find that any very decided change was made in dress before the end of the eleventh century. The ordinary dress made of thick cloths and of coarse woolen stuffs was very strong and durable, and not easily spoiled; and it was usual, as we still find in some provinces which adhere to old customs, for clothes, especially those worn on festive occasions and at ceremonials, to be handed down as heirlooms from father to son, to the third or fourth generation."—P. Lacroix, *Manners, customs and dress during the Middle Ages and during the Renaissance period*, pp. 518-523.

1000-1500.—Middle Ages.—Early Renaissance.—"From the 10th to the 15th century, we find costume developing rapidly into elaborate and interesting designs. . . . Rich velvets and brocades interwoven with gold enhanced the gorgeousness of attire, while the introduction of heraldic design brought in a very picturesque element. Hats and head-dresses began to become important features, enlarging to eccentric shapes and proportions, only equalled in the extravagant part of the 18th century. It may be noted that feminine fashion, as it assumes new characters and proportions, affects the style of the male clothes in the same way, as, when a high or pointed head-dress comes in, the male hat also increases its size; the same with curved or angular designs, full or tight sleeves."—T. Hughes, *Dress design*, p. 71.—"With the growth of modern nationalities, dress came to differ considerably in different countries, but there can be traced a certain general similarity. France and Italy were regarded as leaders of fashion. Theoretically the nobility monopolized fine garments, but in actual practice sumptuary laws could not be enforced, and sartorial splendor seems to have depended rather on means than on rank. A great variety of garments are mentioned, most of which cannot be identified with any certainty. Men continued to wear long tights or *braies* and hose, with tunics, usually belted, which might be long or short according to the age, occupation and tastes

GERMANIC COSTUMES

1. Bavarian. 2. Merovingian.

the long shapeless garment with that which was worn by the Germans, and which was accompanied by tight-fitting braies. . . . One great and characteristic difference between the Romans and the Franks should, however, be specially mentioned; namely, in the fashion of wearing the hair long, a fashion never adopted by the Romans, and which during the whole of the first dynasty, was a distinguishing mark of kings and nobles among the Franks."—P. Lacroix, *Manners, customs and dress during the Middle Ages and during the Renaissance period*, pp. 512-515.—"The male hair dressing . . . soon became well combed and trimmed square across the neck. . . . Small round tight caps of wool fur, or velvet, and rush or straw hats of a definite shape were in use to the 10th century. Tight caps, with lappets tied under the chin, and hoods appear on the short capes about the 8th century, or probably earlier. The garment was of the simplest form, cut like a plain square loose shirt to the middle of the thigh, and this was put on over the head. . . . The men of the ruling class from the 8th century were clothed in a long garment of simple shape, falling to the ankle, richly bordered at the hem and neck. This generally

of the wearer. The outer tunics of the women were made with long tight fitting waists, and were now called *cottes*. A garment introduced about 1200, which was popular for more than two centuries thereafter, was the close sleeveless overdress known as *surcot*, *cotte-hardie*, etc. The feminine version was long and often trained, sometimes with a low square neck-line, and curved openings at the sides like exaggerated armholes, showing the *cotte* and girdle. Close fur-trimmed jackets were also worn, their lines plainly suggested by those of the *surcot*. The masculine version varied more in shape and was worn both in civil dress and over armor. From 1350 or 1400 on, the young dandies affected an extremely short close style—much to the horror of their elders and the clergy, who dubbed it vain, extravagant, and immodest. Other objects of invective were the extremely long points on the shoes, the serrated (*dagged*) edges so popular in both masculine and feminine attire, and the fantastic headgear, chief of which was the *chaperon*, a hood with a short cape, and a long peak, called *tippet* or *livipipe*, which was wrapped around the neck or used to tie the cape portion into fantastic forms. In the 12th century women had dressed their hair rather soberly, with chin-band and veil, and a long braid or tress over either shoulder. Later these braids were looped up so as to cover the ears, or the hair built out in a wide square or heart-shaped effect and put into an elaborate net. About 1400 head-dresses grew in height, achieving a climax to the fad in the yard-high *hennins*. These were accompanied by a corresponding V-shaped neck-line in the robe or *houppelande* which now replaced the *surcot*, and by great attention to the size of the waist, and consequent lacing. During the last of the period, however, the wasp-waist and the *hennin* gave place to an easily fitting, full-skirted dress and a small close cap. Sleeves, which had been either wide and flowing, or closefitting, with perhaps a hanging oversleeve, now began to be puffed and slashed in what was called the Italian fashion. A similar change took place in male attire. Every article of dress, with the exception of the cloak, was slashed and puffed to the greatest extent; not only the pourpoint, but the hose, the shoes and even the boots and the bonnets. The latter were worn much on one side of the head, displaying a close cap beneath them. . . . The toes of the shoes and boots, which had previously been absurdly pointed were made so broad that an edict was issued to

limit their width instead of their length.”—J. R. Planché, *Cyclopædia of costume*, p. 137.

16th century.—Exaggerated silhouette.—“One of the characteristics of the Renaissance costume, a fondness for variety of color and richness of material, was not new but might be considered an outcome of the later fashions of the Middle Ages. The radical change in the costume came as the result of a desire to make the shape of the figure other than it really was. The desired shape was secured by the use of two garments, which were called the *basquine* and *vertugale*—the *basquine*, the corset; the *vertugale*, the hoopskirt or

ENGLISH LADY, 13TH CENTURY

crinoline. . . . As the sixteenth century neared its close, the silhouette became grotesque. The hoop, which had been funnel-shaped, was now made barrel or drum shaped, and both padding and plaits were frequently added at the hips to give more width. . . . To balance the size at the hips the sleeves were frequently made enormous.”—J. T. Fales, *Dressmaking*, pp. 18-22.—“During the sixteenth century, ladies wore the skirts of their dresses, which were tight at the waist and open in front, very wide, displaying the lower part of a very rich under petticoat, which reached to the ground, completely concealing the feet. This, like the sleeves with puffs, which fell in circles to the wrists, was altogether an Italian fashion. Frequently the hair was turned over in rolls, and adorned with precious stones, and was surmounted

LADIES' DRESS OF THE 15TH AND 16TH CENTURIES

by a small cap, coquettishly placed either on one side or on the top of the head, and ornamented with gold chains, jewels, and feathers. The body of the dress was always long, and pointed in front. Men wore their coats cut somewhat after the same shape: their trunk hose were tight, but round the waist they were puffed out. They wore a cloak, which only reached as far as the hips, and was always much ornamented; they carried a smooth

ribbon was used in all forms of decoration, as ornaments on sleeves, bodices, and skirts, in bows, streamers, latticework, etc. . . . These same general lines in costume prevailed throughout the century, but under the sway of Louis XIV (1643-1715) and his extravagant favorites it gradually lost much of its early grace and charm and became again heavy and stiff and more superb than elegant, . . . an exaggeration of fitted waists and elaborately puffed

BARRETS, OF THE EARLY 16TH CENTURY

CAPS OF THE EARLY 16TH CENTURY

or ribbed cap on one side of the head, and a small upright collar adorned the coat. This collar was replaced, after the first half of the sixteenth century, by the high, starched ruff, which was kept out by wires; ladies wore it still larger, when it had somewhat the appearance of an open fan at the back of the neck."—P. Lacroix, *Manners, customs and dress during the Middle Ages and during the Renaissance period*, pp. 548-549.

17th century.—Characteristics.—"In place of the barrel-shaped hoop and enormous skirts a close

and plaited overskirts, which were widely open to display the heavy, much-decorated underpetticoats."

—J. T. Fales, *Dressmaking*, pp. 24-28.—The male costume lost its stiffness but not its ornateness. The doublet became longer and looser, the breeches full and loose, tied with a ribbon just above or below the knee. Men seem to have been more vain and extravagant than women, and fully as fond of ribbons, lace, and lawn. In the latter half of the century, however, the flowing curls of the cavalier were replaced by the periwig, and a certain sobriety began to appear. "In an inventory of apparel of Charles II. in 1670 appears a suit of clothes of one material, and consisting of *coat*, waistcoat, and breeches. William III. is figured in 1604 in a long laced coat with enormous sleeve cuffs, the waistcoat almost as long as the coat, with large flaps and pockets richly laced, the nether garments being knee breeches and stockings with buckled shoes, the hat cocked according to the fancy of the wearer."—G. W. Rhead, *Chats on costume*, p. 130.

18th century.—Watteau.—Powdered head-dresses.—Embroidered coats and long waistcoats.—"The costume of the eighteenth century is considered by many to be, as a whole, more graceful than that of any preceding period. At the beginning of the century, about 1711, after an absence of a hundred years, the hoop [or panier] came once more into fashion, succeeding the puffings and paddings which had given size to the hips. . . . The heavy materials and elaborate decorations of the Louis XIV period were seldom used, and the paniers, probably somewhat on account of their size, were covered by rather plain, full skirts made of stuffs which were light in weight and brilliant in color. Later heavier materials appeared, and there was much decoration, but it was of a lighter, daintier, and more graceful kind. . . . The hair was done simply and often decorated with aigrettes of jewels, of flowers, and ribbon. About 1730 there appeared those graceful fashions

GERMAN, 17TH CENTURY

underpetticoat was worn with an overskirt which fell in graceful folds with its fulness arranged at the sides and the back. . . . The neck line of the bodice was more often round than square, as that shape was better suited for the arranging of the fichu, or collar, which replaced the ruff. . . . Mantles were large and full, and occasionally large hats were seen. On all garments a great profusion of

. . . referred to as Watteau. . . . There were many variations . . . but they were generally loose, flowing gowns without a defined waist line. The material was arranged in the back across the shoulders in wide box plaits, which fell unconfined to the floor and usually formed a train. The front was shaped to fit the figure somewhat to the waist line, and below that was cut sufficiently full to cover gracefully the large panier. . . . Throughout the entire period the paniers had been steadily in-

creasing in size, and were finished at the back with the black bag and bow, or in a tight pigtail. "In general we are told that gentlemen's coats grew fuller, until on the top it became a great spreading skirt just buttoned by one or two buttons at the waist. . . . These coats were embroidered all over or laced, had huge cuffs, then small ones, so that

FRENCH LADY, EARLY 18TH CENTURY

creasing in size, until at the end of the reign of Louis XV (1774) skirts were often six feet wide, from right to left, and eighteen feet in circumference."—J. T. Fales, *Dressmaking*, pp. 28-32.—"High head-dresses came into fashion again for a short time, during the reign of gigantic paniers, and were worn with powder. It took a whole day to complete one of those monuments of the capillary art, which were of such enormous size, that according to 'Le Mercure de France' of 1730, ladies could not sit in their coaches, but were

by the middle of the century fashion changed so rapidly that 'one knew the exact year of a coat he met in the street.' . . . Waistcoats were long, at one time nearly to the knees, fringed and flowered and open to show a velvet bow and lace cravat. Lace was worn at the wrists, and a snuff box in the hand was essential to perfect form. Every man of fashion carried a muff in winter, all sizes were worn from a huge one to a tiny one too small to be of any use."—F. A. Parsons, *Psychology of dress*, p. 256.

MEN'S DRESS, 18TH CENTURY

obliged to kneel. . . . Powder remained in vogue for more than half a century. No doubt the softness it conferred on the features, and the brilliancy it lent to the eyes, made it pleasing to everybody. It was still worn in 1760, and again in 1780, and after the Revolution it reappeared under the Directorie in 1795."—M. A. Challamel, *History of fashion in France*, pp. 158-159.—Wigs began to decrease

1795-1815.—Directorie and First Empire.—"The last act of the stupendous drama of eighteenth century French life began in the late autumn of 1795 with the installation of the Directorie. This final act was, however, played in several scenes, the last of which culminated with the overthrow of the empire in 1814. The period, therefore, may be said to be the first of the nine-

teenth century styles in Europe or elsewhere. . . . Perhaps the most noticeable characteristic of woman's apparel was the high waist line established by the Directoire and persisting through the Empire. . . . [Classic styles were imitated more or less accurately.] White gowns were the most fashionable, transparent ones universal. These were trimmed with ribbons and wreaths of flowers. The arms were bare except for long white gloves. Necklaces of pearls, hair in curls and roses on the head are often found in descriptions of the costumes of the day, as indeed are cap-bonnets trimmed with feathers and tied under the chin with silk strings. They wore velvet, cloth or merino coats with short waists but higher necks, for all gowns were 'indecently low.' . . . One very important and almost universal innovation was the Cashmere shawl."—F. A. Parsons, *Psychology of dress*, pp. 284, 292-293.—"Most men began to return to their own hair, and one might see many without long hair in the nineties. . . . A new type of coat made its appearance with a high turn-over collar and large lapels, and a sudden cut-in of the coat-front high in the waist, giving a very long-tailed effect to

EIGHTEENTH CENTURY DRESS

1. English, 1815. 2. English, 1850.

the skirt. . . . A greatcoat with one, two, or three capes was a picturesque garment. . . . Waistcoats, which had become much shorter, were now giving place to a type with a straight-across front and turned-back lapels at the neck. . . . Breeches became very tight, and trousers begin to appear after 1790."—T. Hughes, *Dress design*, pp. 231-234.

1815-1880.—Restoration and Second Empire (Victorian).—"The noble ladies who returned from emigration in 1815 could not reconcile themselves to the fashions of New France, and the shape of gowns and hats became almost an affair of state. The Legitimists, when once they had recrossed the frontier, endeavoured to repudiate whatever could remind them, nearly or remotely, of the Republic and the Empire."—M. A. Chalmel, *History of fashion in France*, p. 197.—Skirts grew fuller, waists longer, stays tighter, and sleeves became huge. The silhouette resembled that of the early Renaissance. The Romantic period of the forties (cf. the Romantic movement in literature, and the Gothic revival in architecture) simplified, but did not materially change the mode. Ornamentation was elaborate, and changed from season to season. Ready-made garments were first displayed for sale about 1850. "The increase in the size of the skirt brought about naturally, if slowly, a revival of

the wearing of crinoline or hoops. About 1854 crinolines, horse hair and wire hoops were all used. . . . There was constant opposition to the hoop, and in 1869 its shape was changed and a melon-shaped bustle was added. The skirts worn with it. . . . were narrow over the hips and were usually called Chinese skirts."—J. T. Fales, *Dressmaking*, pp. 46-47.—This period marks the adoption of side-whiskers and top-hats, the development of the frock-coat, and the displacement of knee breeches by trousers, at first tight and buttoned at the calf, later peg-top and strapped. Bright colors were gradually rejected, lingering longest in waistcoats. In the sixties a turn-down collar and bow replaced the stock collar. Evening dress had assumed almost exactly its present form, and the sack suit was not unknown.

1875-1920.—French and English influences.—American attempt at independence.—"With the growth and spread of Paris fashions since 1875 we are not concerned in detail, but to recognize her contributions to the nineteenth century is important, and to look somewhat into the cause and effect of her hectic political and social life during that century is to see again that these elements are always active in determining any style. . . . Notwithstanding this subjection to fashion our belief in our power to develop in six months, for our own salvation and incidentally for that of the world, an 'All American Art' containing no element or suggestion of the decadent past, is apparent; an art of a clarity, newness, and originality that shall answer the needs of the æsthetic sense, and the common sense, too, of all allied and associated peoples. Yet the spring fashions for women are all coming from Paris, and there are some men who have not yet abandoned conservative styles still dictated from London; in fact, the headlines of the leading papers tell us that conservatism in materials and cut is the vogue for men for the season of 1920. What at first may seem of minor importance is that there are yet alive some who can understand, appreciate, and use the art of the past intelligently, who can see it in relation to their own composite lives and in relation to the æsthetic quality which they know to be an essential of any object which will survive longer than the duration of a whim."—F. A. Parsons, *Psychology of dress* (illustrated), pp. 314-315, 331-332.

Oriental.—The world of clothes, not least of many spheres, reflects the new interest of the West in the East. It is now generally considered that in the artistic use of colors, and in excellence of textile and embroidery design the Orient is unsurpassed. The variations of dress, although as numerous as in the West, are not so much consecutive as simultaneous, and closely related to differences of rank, religious faith and race. The present forms have existed almost unchanged for centuries. Western dress is now being introduced, however, especially in official and military circles.

CHINA.—The dress of a Chinese is suited to the gravity of his demeanor. It consists in general of a long vest extending to the ankle, the sleeves. . . . covering the whole hand when it is not lifted up. No man of rank is allowed to appear in public without boots which are made of satin, silk, or calico. In full dress he wears a long silk gown, generally of a blue colour and heavily embroidered. . . . All colours are not suffered to be worn indiscriminately. The emperor and the princes of the blood only, are allowed to wear yellow. . . . The common people seldom wear other than blue or black, and white is universally adopted for mourning."—G. H. Mason, *Costume of China*, page facing Plate I.—It should be added that the long

coat or tunic is confined to the leisure classes. Laborers and artisans conform to the almost universal rule of utility, and wear a short loose tunic. There is also considerable difference in dress between the north and south of China. For instance the much emphasized use of trousers by the women is a northern custom. In the district near Canton, pleated skirts are always worn. "To the European man the fashion of a Chinese lady's dress seems unchanging—a beautifully embroidered loose jacket, with long pleated skirt and wide trousers, in strong crimson or yellow, or in delicate shades of all colors. . . . The general shape is unchanging, for in China it is considered indelicate for a woman to display her figure; but the Chinese milliner is as careful to change the fashion of the embroidery at short intervals as is the French modiste to change the form of the robe. . . . The most incomprehensible custom among Chinese women of family is that of footbinding. . . . Though several edicts have been issued forbidding it, the custom still continues."—H. A. Blake, *China*, pp. 109, 114.—This custom is now rapidly dying out.—See also CHINA: 1294-1736.

INDIA.—"It would appear that before the invasion of India by the Mahomedans, . . . sewing was not practised there. . . . Strict Hindus may yet be found to whom a garment composed of several pieces sewn together is an abomination and defilement. Throughout India generally, however, they have now begun to wear various made-up articles of dress such as were formerly used only by the Mahomedans. On the other hand the Mahomedans . . . frequently content themselves with the simpler covering which is more peculiarly the dress of the Hindu. [Of the loom-made garments (analogous to the Scotch plaid) the chief articles are the turban, lungi or loongee, and dhoti of the men, and the sari of the women.] The tribe or caste to which the wearer belongs frequently determines the size and shape of the turban, and there are numerous varieties which take special names from their forms or from the material of which they are made. . . . At the present time the usual dress of the poorer classes of Mahomedans and Hindus, whilst at home or at work, consists simply of the piece of cloth called a Dhotee wrapped round the loins. . . . The Loongee is worn over the shoulders in a variety of ways. . . . The same cloth, when of plain material, acts not only as a plaid during the day, but as a sheet at night. . . . The chief article of female attire in India consists of a long scarf, called a Saree, which both envelops the body and acts as a covering to the head. . . . As usually worn, one end is passed twice round the waist, the upper border tied in a strong knot, and allowed to fall in graceful folds to the ankle. . . . The other end is passed in front across the left arm and shoulder, one edge being brought over the head. It is then allowed to fall behind and over the right shoulder and arm. . . . [Of made-up garments there are a variety of jackets and long coats worn by men; and of trousers, both loose and tight, worn by men, and by the Mohammedan women.] We find that the petticoat or skirt though also of Mahomedan origin, is frequently worn along with the Saree. . . . A kind of bodice or close-fitting jacket, of varying dimensions, is now almost universally used by Hindu women."—J. F. Watson, *Textile manufactures and costumes of the people of India*, pp. 11, 13, 21, 22, 30, 57, 58.

JAPAN.—"A Study of the costume of Japan as it has existed with but slight changes through many centuries, will reveal a remarkable suitability to physical conditions as well as to climate and habits of life. . . . To allude merely to one small point,

the Japanese mode of sitting has in itself rendered comfortable and showy certain styles of attire which would have been cumbersome, inconvenient and ugly, therefore logically incorrect, if worn by people using chairs and couches. . . . Perhaps there is no country in the world, unless it be China, in which such great importance has been attached to the minutiae of dress. . . . From the time of the establishment of fixed ranks and rules of ceremonial, founded upon those of China, very few important modifications seem to have taken place. . . . There still remained plenty of room for variety and individuality in the variation of colours, patterns and modes of arrangement, such as the bow of the *obi*, the length of sleeves, and manner of hair-dressing. Within certain limits, however, such variations have been governed by social conventions seldom if ever violated. Each age in manhood and womanhood has its special distinctions in colour and arrangement, which habit and the fear of public ridicule prevents the most ambitious dandy or coquette from transgressing."—J. Conder, *History of Japanese costume*, pp. 335-337.

Survivals in costume.—Ecclesiastical garb.—Legal and academic gowns.—Peasant dress.—Royal robes.—Military uniforms.—In connection with this brief sketch it is interesting to note certain special costumes which are, in their origin, closely related to ordinary civil dress, although now strikingly different. "There is a point that may be borne in mind when seeking for curiosities of clothing, and it is that the more special or ceremonial the occasion, the more ancient or more primitive the costume which is worn. In this connection also it may be mentioned that the dress of the master of one generation may survive as that of the servant in another."—W. M. Webb, *Heritage of dress*, p. 5.

"The dress worn by clergy when conducting religious ceremonies offers many opportunities for studying the development of garments and illustrates at the same time how the dress used by a special class may evolve more slowly and on different lines from the same clothes that may be worn by the people at large. . . . It has been claimed that modern church vestments have been derived from those of the Levitical priesthood. . . . On the other hand, everything points to a more natural origin of the raiment concerned. Flowing garments give dignity, and we find that among the Romans such were used in dignified leisure or on occasions of state in contradistinction to the dress of active existence, which consisted of a short tunic or chiton. . . . It appears likely that those who ministered to the early Christian church would follow the general custom. . . . From this dress it is claimed, by those who have carefully gone into the question, that ecclesiastical vestments have been derived. . . . The albe takes its name from the *tunica alba*, which was used as a purely secular garment until the ninth century. . . . The surplice was derived from the albe. . . . The dalmatic was a wide gown or tunic with long full sleeves, which was derived apparently from the albe and used by persons in high secular positions before it was adopted by the church. . . . The outer door garment which replaced the toga took several forms. One form, called the *casula* is of interest to us because it is the forerunner of the chasuble. . . . [The archbishop's pall] is probably derived from the same ancestor as the stole, namely the *orarium*, which . . . was a favour of distinction granted by the Roman Emperor. . . . Of monastic habits the earliest is the Benedictine, consisting of a cassock, over which was worn the cowl—a large loose gown with hanging sleeves and a hood attached to it,

In the old times the costume of abbesses and nuns resembled the mourning habit of widows, who often retired to end their days in a convent. . . . We find in Henry II's reign the counterpart of the linen bands which surround the face and hide the hair."—*Ibid.*, pp. 184-201.

"Academical dress is in itself a survival, and the gay colours are almost enough to tell us this. Records show that in the fifteenth century they were already adopted by the graduates of our universities. The evidence . . . points to its having been derived from that of the clergy, but there are interesting connections with civil dress." The long hanging sleeve is similar to that worn during the later Middle Ages. "There is a likeness between the round hat of the doctor and the Tudor flat cap, and Fairholt would derive the mortar-board from the same head-dress. . . . 'Legal gowns have come down with very little change from the Middle Ages, and are doubtless derived from ecclesiastical through academical costume.' They were once bright coloured, but are now mostly black. 'The wigs themselves are an interesting survival' of the time when all gentlemen wore them."—*Ibid.*, pp. 208-215.

Planché doubtless indicates correctly the origin of peasant costumes when he terms them, "the relics of former fashions, retained until what was once general became characteristic of one locality only. . . . It is incontestable that what is popularly termed national costume, so far as the southwestern part of Europe is concerned, dates from the same epoch [seventeenth century] and has undergone little change until the last fifty years, during which . . . it has been slowly disappearing."—J. R. Planché, *Cyclopædia of costume*, v. 2, p. 300.—In other countries the peasants' dress is similarly derived, although not necessarily from the period mentioned. Perhaps the most primitive of all is the Scotch kilt which "is in fact a petticoat, and specially interesting, seeing that it is a survival of this type as man's garment."—W. M. Webb, *Heritage of dress*, pp. 76-77.

Of the king's crown it is said: "This symbol of sovereignty is coeval with the rank it denotes, and the varieties of its form are almost innumerable."—J. R. Planché, *Cyclopædia of costume*, v. 1, p. 149.—But with this exception the dress of kings has been distinguished rather by richness of material or ornament, than by distinctive style (cf. the gold cloth of the Egyptian king, the "purple" of the Roman emperor). Through the Middle Ages and the Renaissance, the robes of sovereigns differed from those of their subjects only in splendor. The present costume of the English court, which may be regarded as typical, shows many interesting survivals of former styles. "The English sovereigns are heads of the Church as well as the State . . . and the vestments used on the occasion [of coronation] agree almost entirely with those worn by a bishop at mass. . . . The imperial mantle . . . seems to have been originally a chasuble, but is now slit up the front. . . . The robe which the king wears at the opening of Parliament has a cape of ermine made up in miniver style, and it is lined throughout with the same fur. . . . The style of Court dress which may be worn today by civilians has become somewhat simpler. . . . The knee-breeches date from the time of William III and the coat in its original form dates back to Napoleon."—W. M. Webb, *Heritage of dress*, pp. 221-222, 226.

The use of special garb for warfare, both for defense and as decoration or means of identification, is common to primitive peoples. The equipment of the Greek may be regarded as typical of

bronze and early iron cultures. "He must possess a set of armor, which he supplies for himself, and which may differ a good deal from that of the next man in the ranks. This includes bronze greaves . . . a corselet of leather plated with bronze, a bronze shield, round or oval, and a bronze helmet with a plume or crest. From the waist a leather garment is worn, falling in a fringe of thongs to protect the lower portion of the body."

—T. G. Tucker, *Life in ancient Athens*, pp. 194-195.—See also MILITARY ORGANIZATION: 3.—Roman armor was similar in character, but was no longer subject to individual differences of taste. "There were in the Roman army three distinct orders or classes of soldiers: first . . . the *equities*, . . . second, the *legionarii*, . . . and third the *velites*, whose entire equipment was in exact conformity with their distinctive denomination."—M. P. Lacombe, *Arms and armour, in antiquity and the Middle Ages*, pp. 56-57.—See also MILITARY ORGANIZATION: 10.

The early Middle Ages are marked by the general adoption of coats of mail, composed first of small pieces of metal sewn upon a fabric, later of interlocking rings. "A crested helmet was generally worn but in actual warfare the visored basinet was used. A magnificent short close coat called a jupon, decorated with the arms of the wearer, and a gorgeous military belt formed the distinguishing garb of the period. By 1370 plated armour was general throughout the army, being adopted because it was of lighter weight than the chain mail armour of the preceding century."—F. A. Parsons, *Psychology of dress*, p. 19.—"The sixteenth century witnessed the commencement of the 'decline and fall' of armor." At the same time there begins to reappear something like the uniformity of equipment which had vanished with the Romans. "In the reign of Elizabeth, *anno* 1584, the soldiers raised in Lancashire for service in Ireland are directed to be furnished with 'convenient doublets and hose, and also a cassocke of motley or other sad (dark) grene collar or russet' . . . The regular uniforms of the British army were gradually adopted, as armour and buff-coats were discarded by the old regiments, or as the new were embodied; so that by the termination of the seventeenth century . . . nearly the whole of our land forces had their distinctive clothing of either scarlet or blue, varying only in the facings."—J. R. Planché, *Cyclopædia of costume*, v. 2, pp. 219, 281.—It is from this period that the modern dress uniform is derived. Within the last thirty years, however, these have been replaced, for all practical purposes, by a service uniform based on the principle of protective coloration. It is interesting to note that in the World War there was a revival of the use of armor, especially of steel helmets.—See also MILITARY ORGANIZATION: 1; 25; 41; 42.

COTARIUS, or cotter, in England a landholder of five acres. See LABOR REMUNERATION: Development of wage system; MANORS.

COTEREAUX, term for roaming soldiery in France during the 12th century. See WHITE HOODS OF FRANCE.

COTHON OF CARTHAGE.—"There were two hand-locked docks or harbours, opening the one into the other, and both, it would seem, the work of human hands. . . . The outer harbour was rectangular, about 1,400 feet long and 1,100 broad, and was appropriated to merchant vessels; the inner was circular like a drinking cup, whence it was called the Cothon, and was reserved for ships of war. It could not be approached except through the merchant harbour, and the entrance to this last was only 70 feet wide, and could be closed at any time by chains. The war harbour was entirely surrounded by quays, containing separate docks for 220 ships. In front of each dock were two Ionic pillars of marble, so that the whole must have presented the appearance of a splendid circular colonnade. Right in the centre of the harbour was an island, the head-quarters of the admiral."—R. B. Smith, *Carthage and the Carthaginians*, ch. 20.—See also **CARTHAGE**: Divisions.

COTTON, John (1585-1652), Puritan clergyman, sometimes called "The Patriarch of New England." The author of a number of books, among them the "Bloudy Tenent"; "Keys to the Kingdom of Heaven and the Power Thereof"; and the "Way of Congregational Churches Cleared." See **MASSACHUSETTS**: 1631-1636.

COTTON, Sir Robert Bruce (1571-1631), English antiquarian, founder of Cottonian library. See **LIBRARIES**: Modern: England.

COTTON: Introduction into Europe.—"Cotton had been used in the extreme East and in the extreme West from the earliest periods of which we have any record. The Spaniards, on their discovery of America, found the Mexicans clothed in cotton. . . . But though the use of cotton had been known from the earliest ages, both in India and America, no cotton goods were imported into Europe; and in the ancient world both rich and poor were clothed in silk, linen, and wool. The industrious Moors introduced cotton into Spain. Many centuries afterwards cotton was imported into Italy, Saxony and the Low Countries. Isolated from the rest of Europe, with little wealth, little industry, and no roads; rent by civil commotions; the English were the last people in Europe to introduce the manufacture of cotton goods into their own homes. Towards the close of the 16th century, indeed, cotton goods were occasionally mentioned in the Statute Book, and the manufacture of the cottons of Manchester was regulated by Acts passed in the reigns of Henry VIII., Edward VI., and Elizabeth. But there seem to be good reasons for concluding that Manchester cotton, in the time of the Tudors, were woollen goods, and did not consist of cotton at all. More than a century elapsed before any considerable trade in cotton attracted the attention of the legislature. The woollen manufacturers complained that people were dressing their children in printed cottons; and Parliament was actually persuaded to prohibit the introduction of Indian printed calicoes. Even an Act of Parliament, however, was unable to extinguish the growing taste for Indian cottons. . . . The taste for cotton led to the introduction of calico-printing in London; Parliament in order to encourage the new trade, was induced to sanction the importation of plain cotton cloths from India under a duty. The demand, which was thus created for calicoes, probably promoted their manufacture at home."—S. Walpole, *History of England from 1815*, v. 1, ch. 1.—See also **INDUSTRIAL REVOLUTION**: Mechanical and social phases.

COUCY-LE-CHÂTEAU, an ancient town in northern France, chiefly noted for the ruins of the thirteenth century fortress. This fortress, covering 10,000 square yards, was built by Enguerrand III, lord of Coucy; purchased by Louis d'Orléans, 1396; became crown property, 1498; dismantled by order of Cardinal Mazarin, 1652; and completely demolished by the Germans during the World War.

COUNCIL, Governor's.—"In all [the thirteen American] colonies there was a council whose authority came nominally from the same source as did that of the governor [that is, appointment by the Crown]; but, as a matter of fact, the councilors were ordinarily the leading men in the social colonies with a constantly growing proportion of royal officials. . . . After 1733 the Surveyors of the Customs in the Plantations were *ex officio* members of the Council. . . . The governors of the royal provinces originally were members of the Council; by 1725 their functions had become so differentiated that Mr. West, counsel for the Board of Trade, ruled that a governor could not act as a councilor when that body was exercising legislative functions."—E. Channing, *History of the United States*, v. 2, p. 245 and footnote.—"The councillor's oath, as formulated and administered in 1639, bound him to bear true faith to the proprietor and defend his rights, maintain the peace and welfare of the people, assist in the administration of Justice."—H. L. Osgood, *American colonies in the 17th century*, v. 2, p. 65.—The governor of the colony usually appointed the chief administrative officers upon the advice of his council. Except in Massachusetts the councilors could be removed by the governor. In addition to their function as the governor's advisors, the councilors formed the upper house of the legislature. They thus had a dual function—executive and legislative. In Massachusetts, Connecticut, and Rhode Island the council was elected by the assembly; in the provincial colonies it was chosen by the royal governor representing the king; in the proprietary colonies it was selected by the proprietor or his representative.

"The local administration of many of the British dependencies particularly the Crown colonies is carried on by the Governor and the Governor's councils. In all, the central figure is the Governor, who is not only, as in the self-governing dominions, the nominal head of the government and the authorized channel of communication with the for-

eign office, but is in fact as well in name the chief executive officer. . . . The ordinary and traditional constitution of a Crown colony consists of the Governor, an Executive Council, and a nominated Legislative Council, as in the Straits Settlements for instance, or the Gold Coast or Trinidad; but there are some Crown colonies which have no legislative council whatever. Gibraltar is one of them, and here all power, both executive and legislative, is vested in the Governor."—*Oxford survey of the British Empire, general survey, pp. 65, 66, 67.*—"In the crown colony [properly so called] there is not any pretension to the concession of civil privileges. The governor, appointed by the colonial office, is absolute; he is aided by a council of local residents selected by himself, or by the home authorities, but this body is simply advisory, for, if deemed wise, its suggestions can be totally rejected or disregarded."—H. C. Morris *History of colonization, v. 2, p. 231.*

COUNCIL OF FOUR, The Supreme Council, or The Big Four, the ruling body of the Peace Conference of Paris, 1919, composed of the chief delegates, one each, of the United States (President Wilson), of Great Britain (Lloyd George), of France (Clemenceau), and of Italy (Orlando). "It was early apparent that the Conference could not profitably meet and do business as a whole. Twenty-seven different states were represented, besides the five British dominions. There were seventy authorized delegates. Such a body would have become a debating society; it would still be in session, its labors scarcely begun. Some guiding or steering executive committee was obviously required, and it was early found in the delegates of the five chief powers: America, England, France, Italy, and Japan. . . . So there was early organized a Committee or Council of Ten, each state having two members, ordinarily the chief delegate and the foreign secretary; and this became the active agency of the conference. It had a secretariat; and expert advisers, civil or military, attended as they were needed. . . . Each special interest, each minor nationality, had a chance to come forward and state its case, usually at considerable length. Whatever was said in French was translated into English, and vice versa. The sessions grew long and tiresome, and progress was slow. More and more people were called in. . . . For its last two sessions the Council moved into the large room reserved for the plenary sessions of the Conference. One of these meetings was reported at length in the Paris papers, and it was alleged that undue publicity, as well as undue prolixity, was responsible for the sudden change on March 24. After that date the Council of Ten ceased to meet. . . . At times thereafter the foreign ministers met as a Council of

Five. But the real power rested with a new body, the Council of the four principal delegates of England, France, Italy, and the United States—Messrs. Lloyd George, Clemenceau, Orlando, and Wilson. The Council of Four left the spacious quarters of the Quai d'Orsay. Sometimes it met in M. Clemenceau's office at the Ministry of War, sometimes at Mr. Lloyd George's apartment, most frequently at President Wilson's residence, either in his study, or, when several outsiders were present, in the large drawing-room. The meetings in the study were not always 'private and unattended,' nor were the occasional conferences upstairs the confused gatherings which an infrequent spectator has pictured. Outsiders were called in as needed, but ordinarily the Four met by themselves, with a confidential interpreter, Captain Mantoux, very able and trustworthy. There was no stenographer, not even a secretary, though secretaries were usually outside the door to execute orders. The meetings were quite conversational, and the records necessarily fragmentary. But the Council at least worked rapidly, sometimes perforce too rapidly. Steadily the main lines of the treaty emerged. By March the expert work of the Conference had been largely organized into commissions, not systematically and at the outset, as the French had proposed in January, but haltingly and irregularly, as necessity compelled. . . . Some matters were never referred to commissions, delicate questions like Fiume and Dalmatia and the Rhine frontier being reserved for the exclusive consideration of the Four. . . . The reports of the commissions were, however, first made directly to the Ten or the Four or the Five, as the case might be. . . . Sometimes the report, presented in print, would be accepted without debate. Sometimes a particular question would be considered at length, perhaps with the result of recommitting the report. Unanimous reports were likely to go through rapidly. A session of the Council of Four might take an important report clause by clause, with explanations from the committee and suggestions from members of the Council, but without fundamental modifications. On the other hand important changes in one chapter of the treaty were made at the last moment by the Four without any consultation of the commission concerned. . . . The proceedings of the Council of Ten and the Council of Five were kept by a regular secretariat, those of the Council of Four less officially and systematically; these minutes were manifold but not printed."—C. COUNCILS OF THE CHURCH, General or Ecumenical.—There are seven councils admitted by both the Greek and Latin churches as œcumenical (or ecumenical)—that is, general, or universal. The Roman Catholics recognize thirteen more, making twenty in all—as follows:

Synod of apostles in Jerusalem (A. D. 49).

First council of Nicæa (325). See **NICÆA, COUNCIL OF**.

Second council of Constantinople (381).

First council of Ephesus (431). See **NESTORIAN AND MONOPHYSITE CONTROVERSY**.

Council of Chalcedon (451). See **CHRISTIANITY**: 312-337.

Fifth council of Constantinople (553). See **THREE CHAPTERS, DISPUTE OF**.

Sixth council of Constantinople (680-681). See **MONOTHELITE CONTROVERSY**.

Second council of Nicæa (787). See **IDOLATRY AND IMAGE WORSHIP**: 8th-9th centuries.

Eighth council of Constantinople (869).

First Lateran council (1123).

Second Lateran council (1139).

Third Lateran council (1179).

Fourth Lateran council (1215). See **WALDENSES**.

First ecumenical synod of Lyons (1245).

Second ecumenical synod of Lyons (1274).

Synod of Vienne in Gaul (1311-1312).

Council of Constance (1414). See **PAPACY**: 1414-1418.

Council of Basel (1431). See **PAPACY**: 1431-1448.

Council of Trent (1545). See **IDOLATRY AND IMAGE WORSHIP**: Practice and theory in Roman church; **PAPACY**: 1537-1563.

Council of the Vatican (1869). See **PAPACY**: 1869-1870.

Further important church councils are:

Council of Constantinople (842). See **IDOLATRY AND IMAGE WORSHIP**: 8th-9th centuries.

Council of Clermont (1095). See **CRUSADES**: 1095.

Council of Pisa (1409). See **PAPACY**: 1377-1417.

Synod of Dort (1619). See **NETHERLANDS**: 1603-1619.

Synod of Paris (825). See **IDOLATRY AND IMAGE WORSHIP**: Practice and theory in Roman church.

COUNT, Spanish. See **ADELANTADO**.

COUNT AND DUKE, Roman: Origin of the titles.—“The defence of the Roman empire was at length committed [under Constantine and his successors] to eight masters-general of the cavalry and infantry. Under their orders thirty-five military

commanders were stationed in the provinces—three in Britain, six in Gaul, one in Spain, one in Italy, five on the Upper and four on the Lower Danube, in Asia eight, three in Egypt, and four in Africa. The titles of Counts and Dukes, by which they were properly distinguished, have obtained in modern languages so very different a sense that the use of them may occasion some surprise. But it should be recollected that the second of those appellations is only a corruption of the Latin word which was indiscriminately applied to any military chief. All these provincial generals were therefore dukes; but no more than ten among them were dignified with the rank of counts or companions, a title of honour, or rather of favour, which had been recently invented in the court of Constantine. A gold belt was the ensign which distinguished the office of the counts and dukes.”—E. Gibbon, *History of the decline and fall of the Roman empire*, ch. 17.—“The Duke and the Count of modern Europe—what are they but the Generals and Companions (Duces and Comites) of a Roman province? Why or when they changed places, the Duke climbing up into such unquestioned pre-eminence over his former superior the Count, I know not, nor yet by what process it was discovered that the latter was the precise equivalent of the Scandinavian Jarl.”—T. Hodgkin, *Italy and her invaders*, bk. 1, ch. 3.

COUNT OF THE DOMESTICS.—In the organization of the imperial household, during the later period of the Roman empire, the officers called Counts of the Domestics “commanded the various divisions of the household troops, known by the names of Domestici and Protectores, and thus together replaced the Prætorian Prefect of the earlier days of the Empire. . . . Theoretically, their duties would not greatly differ from those of a Colonel in the Guards.”—T. Hodgkin, *Italy and her invaders*, bk. 1, ch. 3.

COUNT OF THE SACRED LARGESSES.—In the later Roman empire, “the Count who had charge of the Sacred (i. e. Imperial) Bounty, should have been by his title simply the Grand Almoner of the Empire. . . . In practice, however, the minister who took charge of the Imperial Largesses had to find ways and means for every other form of Imperial expenditure. . . . The Count of the Sacred Largesses was therefore in fact the Chancellor of the Exchequer of the Empire.”—T. Hodgkin, *Italy and her invaders*, bk. 1, ch. 3.

COURCI, or Courcy, John de (died c. 1219), Anglo-Norman conqueror of Ulster. See ULSTER: 1171-1186.

COUREURS DE BOIS, (hush-rangers or wood-rangers).—After the old fur-trading companies of New France had given way to the new company known as The Hundred Associates (formed 1627), large numbers of men began to frequent the forests, giving rise to a type known as the coureurs de bois. These men, half traders, half explorers, wholly bent on adventure were carried far and wide in their illicit fur-trading operations. Many of the military officers who came out with their regiments belonged to the noblesse of France; and as an inducement to stay in New France were given as seigniories large tracts of land. Owing to the difficulties of agricultural pursuits and the arbitrary official interference of every sort, the seignior was often quite as poor as his habitants. "To exist, the nobleman generally took kindly to the fur-trade, which meant a roving life, wherein much gayety was mingled with the roughest adventure, when unable or unwilling to secure a government license, he became a *coureur de bois*—a practice subjecting him to the penalty of outlawry; but the extreme punishment was seldom meted out. These gentlemen wanderers were of a hardy stock, took kindly to the wild, uncouth life of the forest, readily fraternized with the savages, whose dress and manners they often affected and, seldom possessing refined sentiments, frequently led Indian War-parties in bloody forays upon the frontiers of the . . . English, and outdoing their followers in cruelty. Each was an experienced partisan leader, with a small body of devoted retainers, who propelled his boats, kept his camp, defended his property and person, rallied around him in his

raids, and were as solicitous as he himself of the dignity of his caste. A full third of the population was engaged in the [illicit] fur-trade. From it the peasants, boatmen (*voyageurs*), trading-post clerks, and trappers won but the barest subsistence; many of the seigniors made heavy gains, although others . . . like La Salle and Vérendrye, were swamped by the enormous expense of the exploring expeditions which they undertook in the effort both to extend their own fields of operations and the sphere of French influence."—B. G. Thwaites, *France in America*, in *American Nation*, v. 7, pp. 133-134.—To keep control of the natives and win new trade was the settled policy of France. Thus the path-finding fur-trader became one of the instruments of interior expansion and the fur-trade a source of wealth. To wrest the fur-trade from the English was one of the main motives of the English policy. By the end of the 17th century several *coureurs de bois* had ascended the Ohio and Tennessee rivers and crossed the divide. Among these was Jean Couture, who, in 1693, deserted the French colony and made his way overland. In 1699, he led a party of traders up the Savannah and down the Tennessee in an effort to divert the trade from the Canadian English. With the capitulation of Montreal, 1760, British rule in Canada began; under the new régime the trade was supervised according to the principles of the Proclamation of 1763 which had created an Indian reserve and opened trade to all licensed subjects. The French Trading organization was ruined; but the *coureur de bois* became the backbone of the fur-gathering business for the English.

COURTRAI (Flemish Kortryk), an ancient and important town situated between Ghent and Lille, famous for its fine linen, lace and lace thread.

1302.—Battle of.—The battle of Courtrai (July 11, 1302), in which the barons and knights of France were slaughtered by the sturdy burghers of Flanders, was sometimes called the Day of the Spurs, on account of the great number of gilt spurs which was taken from the bodies of the dead.—See also FLANDERS: 1209-1304; FRANCE: 1285-1314.

1382.—Pillaged and burned by the French. See FLANDERS: 1382.

1385.—Rebuilt.—Three years after the destruction of the town Philip the Bold of Burgundy rebuilt it.

1667.—Taken by the French. See BELGIUM: 1667.

1679.—Restored to Spain. See NIMEGUEN, PEACE OF: 1678-1679.

COURTS.—A court in the legal sense, is a definite authority empowered to settle disputes between individuals (civil courts), or to try and punish members of the community charged with offence against the community itself or its government (criminal courts). Courts, in one form or another, have arisen among all peoples who have passed the savage stage. Authority may be vested in the recognized head of the community (chief, king, etc.), in the military leader, or in priests of religion. In some cases the king or chief may have powers definitely connected with religious beliefs and practices, or the priest may assume judicial authority distinctly civil (ecclesiastical courts). The settlement of disputes and punishment of offenders by court-martial applies to the army and navy only. From all these roots, however, have come judicial systems among Aryan peoples.

Athenian. See ATHENS: B. C. 461-431.

Roman.—Among ancient Romans criminal jurisdiction was exercised, directly or indirectly, by the King, although appeal from decisions was sometimes granted to the popular assembly. In the Republican period this appeal really constituted the trial itself. During the last century of the Republic the *questiones* gradually acquired the powers of jurisdiction formerly exercised by the assembly. The *questio* was a body of jurors with a special magistrate, usually a praetor. Roman kings often exercised civil as well as criminal jurisdiction, although apparently they did not themselves decide cases. The king heard the pleadings only and sent the parties in the controversy to a referee selected by themselves. Before the Republic these referees were probably usually priests; during the Republican period there was sometimes one *judex*, sometimes an election board of *judices* to decide the cases submitted. In the Republican period the fundamental underlying principle of judicial procedure was the separation of jurisdiction and judgment. In the Imperial period this system was gradually changed, and administration of justice was taken out of the people's hands and controlled by the Emperor.—See also CODES: Roman.

ALSO IN: F. A. Ramström, *De judiciis publicis apud Romanos-Upsaliae*, 1815, 1 p. l, 9 pp. 12°.

Early Teutonic or Hundred Court transferred to England.—**Jurisdiction.**—“In the free Townships the people held their periodic *gemôts* to elect their petty officers. . . . So they have to choose the four good men who with the head-men will represent them in the courts or meeting of the Hundred and Shire. In the manorial Township the head-man was the lord's *gerefa* (reeve, steward) nominated of course by him, but with the proper assent of the little community. Then again the townsmen pass by-laws regulating the course of their common husbandry, and execute orders transmitted to them from above in such matters as selecting and equipping men for the host, pursuit of criminals, tracking stolen cattle, and the like. . . . It does not appear, however, that the Township *gemôt* enjoyed any criminal jurisdiction. . . . Next in order above the meetings of the Township came those of the Hundred, or Wapentake, corresponding to the *pagus* of Tacitus, the *herred* of Scandinavia, the *huntari* or *gau* of Germany. As a social and judicial institution it was common to every branch of the Germanic race, a relic of their primitive organization. . . . The authority of the Hundred as a judicial court . . . [is] clearly noticed by Tacitus. . . . [who says] ‘And in fact they are called the Hundred among themselves, so that what was a mere number has become a name and title.’ . . . Describing the national assemblies or meetings of the whole tribe, the writer tells us that in them were appointed the *principes* or magistrates to administer justice throughout the *pagi* and *vici* (Hundreds and Townships); and then speaking of these magistrates he says: . . . ‘Each of these has a hundred free-men sitting beside him to advise and support him.’ Here however we should see not a delegation of a hundred assessors sitting beside a magistrate, but the actual Hundred court or meeting (*hundredes-gemôt*), consisting of the theoretic hundred free heads of households, assembled with a magistrate as chairman. This man in England would be the *hundredes-ealdor*, or Hundred-man, corresponding to the centenarius of Frankish law, originally elective but in later times appointed by the king, possibly by the caldorman of the shire. We also hear of the *gerefa*, reeve or sheriff, in connexion with the Hundred court. He was essentially a Royal officer, the steward of the King's rights, and never at any time elective. The sittings of the court or *gemôt* were held once a month, the judges were the whole body of freemen or suitors, who were bound to be present. In later times we find that the tenants of a manor in the absence of their lord might be represented by four good men and their reeve. But even then special meetings might be summoned twice a year, at which the whole male population would be requested to attend. The Hundred court enjoyed full civil and criminal jurisdiction: it attested wills and transfers of land. Suits could only be carried to the County Court or to the King's hearing by way of appeal from proceedings in the Hundred. It had a common purse to and from which payments were made: suitors attending the meetings were under special legal protection (*grith*), and persons neglecting to come when summoned were fired. Highest in the scale of popular assemblies came the county court (*scir-gemôt*) or folk-mote (*folc-gemôt*) in the fullest sense . . . and meeting twice a year. . . . The county court was attended by the same classes of persons as the Hundred court: it would decide questions between inhabitants of different Hundreds, and it would entertain appeals or quasi-appeals from the Hundreds. Again, reference to the King was not permitted till after application to the Shire as well as the Hundred. . . .

The establishment of shires in our sense followed on the break up of the tribal divisions, and indicated the adoption of a more uniform national system."—J. H. Ramsay, *Foundations of England*, v. 1. pp. 158, 160-162.—See also CRIMINAL LAW: 1066-1272; ECCLESIASTICAL LAW: 449-1066.

Medieval.—Throughout the Middle Ages there were ecclesiastical courts with jurisdiction over the clergy and many civil matters (such as marriage and the administration of estates), as well as those directly connected with the church. In these courts judicial organization and procedure followed the system of the late Roman Empire. There were also feudal courts and independent city courts for criminal and civil cases.—See also CRIMINAL LAW; ECCLESIASTICAL LAW: 449-1066; 1066-1087; 1100; 1135; 1160-1545; and below: England; France; Germany.

Modern jurisprudence.—Judges as lawgivers.—"As there was an old jurisprudence to preserve the rights and remedy the wrongs of the old social order and the old economic era, so there has come about a new jurisprudence to preserve the rights and remedy the wrongs not only of the old social order and the old economic era but also of the new social order and the new economic era, replacing in part and supplementing in large measure the old jurisprudence, and particularly in providing new remedies and instituting new tribunals of justice with large and ample remedial powers. The old social order centered about individual rights and subordinated the rights of the community to the rights of the individual. In the old economic era the production and distribution of wealth centered around the individual who engaged in commercial rivalry, strife, and competition, more or less in disregard of the rights and welfare of the community. The old jurisprudence was built up upon the predominant and underlying principle of individual rights; it recognized in its laws the individual rights of the individual member of society; the rights of the community were subordinated and submerged in the rights of the individual. The old jurisprudence gave no adequate remedies for the enforcement of the collective rights of the community. With the passing of the old social order and the old economic era and the coming of the new social order and the new economic era, the rights of the community are being made at least equal to the rights of the individual, are being worked out through the collective rights of the community and new remedies are being provided for the enforcement of the community rights, and thereby of the individual rights, which remedies did not exist under the old jurisprudence. . . . Under the old social order and the old economic era as well as under the new social order and the new economic era, a rate charged and collected by a common carrier of freight should be just and reasonable. Under the old economic order a shipper aggrieved by an unjust and unreasonable rate was compelled to sue at law with trial by jury and judgment by the court that the rate paid by him in the past was unjust and unreasonable, and the remedy was merely the collection of damages, if by any possibility there was any practical way of proving his case, the burden of proof so to do resting on him. Each shipment was a separate transaction pertaining to the past and not to the future. The machinery of justice was inadequate, the remedy was purely as of the past and did not pertain to the future. Under the old jurisprudence the right to a just and reasonable rate was just as emphatically declared by the law as it is to-day, but the machinery of justice was unfitted to ascertain the right and the remedies inade-

quate to rectify the wrong. The shipper's right was, in fact the community's right; his wrongs were not so much of the past as of the future. The new jurisprudence regards a just and reasonable rate not merely as an individual right to be vindicated by the individual, but a community right to be vindicated by the community, not for one individual but for all the individuals of the community; and, at least in interstate commerce and in some of the States, the laws have deprived the courts of their old jurisdiction under the old jurisprudence of passing on the question of fact involved and remitted it to a commission which is a new tribunal of justice, under the new jurisprudence, with new machinery, and new and adequate remedies to deal not merely with the past but with the future for the whole community affected and not merely for one member of that community. Under the old economic era individuals carried on business. Then there were evolved simple forms of business organization, such as partnerships, limited partnerships, and limited partnership associations wherein a restricted number of men joined hands in a common enterprise. Business organization became more complex in the form of corporations with their stockholders and bondholders. The industrial corporation became even more complex with its common stock, preferred stock, deferred stock, debentures, mortgage bonds, long-time notes and short-time notes, interlocking directors, and chairmen of boards of directors. These corporations gave great impetus to the new collectivism wherein the rights of the many individuals were merged in and asserted through the rights of the collective body. With these new complex organizations came trust agreements, and unreasonable restraint of trade, unfair methods of competition and monopoly of trade and business. The world did not realize that the old economic era of individualism had passed and that a new economic era was upon us. To the new evils and wrongs under the new economic era, legislative bodies sought to apply the old remedies for the rectification of the wrongs of individualism under the old economic era, such as the Sherman anti-trust law, with drastic criminal prosecutions in the hands of the Department of Justice and theoretical triple damages to the individual for past damages and inadequate injunctive remedies for future wrongs, with insufficient machinery for the enforcement of rights and inadequate remedies for the redress of wrongs. "Just as the new jurisprudence gave birth [in the United States] to the Interstate Commerce Commission and the various State commissions for the redress of the wrongs of the individuals through community rights, so has the law now provided the Federal Trade Commission as a new tribunal under the new jurisprudence with machinery for the ascertainment of the rights of the community and thereby of the wrongs suffered by the individuals constituting the community. Under the old social order the workman was regarded as a part of the industrial machine, and, if stricken down in the course of his employment, he or his survivors, both probably in need of immediate relief, were driven to a suit at law, with its costs, delays, and frequent denials of justice. Under the new social order injuries to workmen are regarded as part of the cost of production, and the community has a deep and lasting interest in the care of the injured workman and, in the case of his death, in the survivors who were dependent upon him. The old economic order and the old jurisprudence made no adequate provision for care for the situation, and the old jurisprudence furnished no adequate remedies for carrying out

of the new economic order. The new jurisprudence has created new remedies and new tribunals in the form of industrial commissions and workmen's compensation boards to levy a just and equitable contribution on all industry and to distribute the same equitably to the injured workman or dependants without cost, without delay, and without denial. . . . The law has substituted [in the United States] for the old economic order of purely individual action of purely individual national banks, collective action through a Federal reserve board, and the new jurisprudence has furnished a guide to the Federal reserve board and put in its hands remedies of prevention and aid in lieu of remedies of liquidation and bankruptcy under the old jurisprudence. Magna Charta declared that right and justice should neither be sold, delayed, nor denied. History tells us and experience teaches us that court costs only too often measure the price of justice; that delay of justice is much worse and more costly than its denial; that justice has too often been in fact denied by the inadequacy of the remedies provided. We do know that under the new jurisprudence the expense of administering collective rights is less per individual affected than the vindication of individual rights alone under the old jurisprudence. We do know that justice is administered more swiftly. We do know that there are fewer cases of denial of justice because of the more adequate remedies given under the new jurisprudence. . . . The new jurisprudence has most admirably supplemented, without destroying, the old jurisprudence, by providing in addition to the old remedies, new remedies more adequate and more complete and more certain and more swift than the old jurisprudence."—F. P. James, *New jurisprudence*, pp. 3-6.—"The conception that judges are also lawgivers and that their principal function is to review, and if necessary set aside, the actions of legislatures and executives is highly modern. There is not a single case of record in colonial or state courts declaring a statute void before 1780. Even the Supreme Court of the United States never disallowed an act of Congress (except in two cases on trifling issues relating to the jurisdiction of the court) until the Dred Scott decision of 1857. Abraham Lincoln and his supporters held that decision to be a scandalous interference with justice; and it was not until about 1865 that the Supreme Court began a regular system of reviewing and annulling acts of Congress. No other country in the world except Canada and Australia has ever adopted this American conception of the superior power and sanctity of the judiciary. When we speak of 'separation of powers' we mean that the courts are superior to the other two departments. When the French speak of 'Separation des Pouvoirs' they mean that the courts are not superior. The Swiss Constitution forbids the national courts to abrogate statutes. Whatever the merits of the American system, we have no right to assume that it is a world-wide system or that it could be applied either by or upon countries which know nothing of the doctrine of judicial supremacy."—A. B. Hart, *New York Times (Book Review and Magazine, Jan. 23, 1921)*.

Judicial organization.—"The organization of the judiciary differs essentially from either that of the executive or the legislative departments. The supreme executive power practically everywhere is vested in the hands of a single person, while the legislative power is intrusted to a more or less numerous assembly. The judicial power, on the other hand, is neither vested in a single person nor in an assembly, but in a number of magis-

trates, sometimes sitting singly and sometimes in bodies, constituting tribunals or benches, usually arranged in a hierarchical series one above the other. In some countries, of which the German Empire is [1910] a notable example, all the courts from the lowest to the highest are collegial in organization, that is, each is held by a bench of judges rather than by a single magistrate. In other countries only the highest courts, usually those having appellate jurisdiction, are organized on the collegial principle. Thus in the judicial organization of the United States, the district courts are held by a single judge, and the circuit courts may be, and frequently are, held by one judge. Among the individual states, generally, all the inferior courts are held by single judges, leaving only the highest courts to be constituted on the collegial principle. Usually standing at the top of the hierarchy is a supreme court which has jurisdiction over cases brought up from the lower courts by way of appeal or upon writs of error, and whose decision is final and conclusive. This court may be a tribunal of review, that is, with power to revise the decisions of the lower courts; or it may be simply a court of cassation, with power only to 'break' or quash the judgments of the lower courts; or it may be both. Sometimes instead of a single court of final authority there are several with equal and coördinate jurisdiction. This is the case, for example, in Italy, where there are five independent supreme courts of cassation, each having final and supreme authority within its own territorial jurisdiction. Between these courts the ordinary higher civil jurisdiction of the kingdom is divided; no appeal lies from one to another, and none of the five feels bound to accept the decisions of the others or follow them as precedents. This decentralization of the judicial system has proved to be a source of great weakness in the governmental system of Italy (Lowell, 'Government and Parties in Continental Europe,' v. 1, p. 170). On the continent of Europe the division of the judicial tribunals into chambers or senates for convenience of administration is a common practice. Thus in the German Empire all the courts except the lowest (the *Amtsgericht*) are divided into civil and criminal chambers; and the imperial court (the *Reichsgericht*) is similarly divided into criminal and civil 'senates,' there being four of the former and six of the latter. Likewise, the highest court of France, the tribunal of cassation, is divided into sections, three in number. In order to avoid conflicting decisions where the court with final authority is divided into chambers or sections, sessions *in plenum* are sometimes necessary. In the United States the practice of dividing the courts into sections or chambers has rarely been followed. In states having the federal system of government there are usually two separate and distinct series of judicial bodies, one to exercise the national or general jurisdiction of the whole union, the other the local jurisdiction of the component states. This is not necessarily so, however, as the organization of the German judicial system clearly shows. Instead of two separate and distinct systems, one to exercise the judicial power of the empire and the other that of each individual state, there is a single uniform system for the empire and the states alike, all being organized under imperial law and exercising their functions in accordance with an imperial code of procedure. Thus the entire judicial system of the country, from the bottom to the top, rests upon the same basis; the competency and procedure of all the courts are determined by imperial law, and they are held by judges whose qualifications and tenure are prescribed by the same

authority. There is no division of jurisdiction between the empire and the states; in short, the federal principle has no place in the judicial organization of that country. Nevertheless, with the exception of the *Reichsgericht*, the courts are all regarded as state tribunals rather than as imperial courts, the judges being appointed by the state governments and their compensation being determined and provided by the same authorities. Moreover, they exercise their jurisdiction in the name of the local governments and are subject to the oversight of the states in which they are situated. As there is one uniform judicial organization for all the German states, so there are common imperial codes of civil and criminal law and of procedure. Thus neither diversity in judicial organization nor of law exists in Germany, though the state is federal in its organization.

"In the United States there are as many systems of judicial organization and of law and procedure as there are states. Each individual commonwealth organizes its own judiciary and frames its own codes of law and procedure, according to its own notions and its own conception of its local needs and conditions. Nevertheless, there is in reality far more of resemblance than of diversity, owing to the common basis which is afforded by the common law, upon which the legal system of each of the states rests. There are, of course, variations, but in essentials there is remarkable similarity and uniformity. Only in a limited sense are the courts of one state regarded by those of another as foreign. The constitution of the United States requires that the courts of each state shall give full faith and credit to the records and judicial proceedings of the other states; and the spirit of judicial comity—the deference paid by the courts of one state to the decisions of the others—which characterizes interstate judicial relations constitutes a powerful unifying force. This rule of comity, together with the full faith and credit provision, makes possible the enforcement in one state of rights acquired in others and likewise contributes to the prevention by one of acts which would infringe on prohibitions created by others. Moreover, there are many points of connection between the national and state judiciaries. Thus every judicial officer of a state is required by the constitution of the United States to bind himself by oath to support its provisions and this obligation makes it incumbent upon him in his judicial capacity to respect the laws and treaties of the United States and in case of conflict between them and the laws of the state which he is commissioned to enforce, to uphold and give precedence to the former. Both the national and state courts are in a sense complementary parts of the same governmental system. Rights arising under the national constitution and laws may ordinarily be enforced by the state courts, though the federal government cannot compel them against their will to exercise the jurisdiction and discharge the duties which properly belong to the national courts. There are many cases which can be brought at the option of the plaintiff in either a federal or a state court, but in most instances if brought in the latter the defendant has the right of removing it to a federal court if he chooses. Furthermore, in any case tried in a state court, if the decision turns on a claim of right arising under the constitution or laws of the United States and if the decision is adverse to the claim, the losing party may appeal therefrom and have the decision of the state court reviewed by the highest federal court in the land."—J. W. Garner, *Introduction to political science*, pp. 580-585.

"The legislation of Congress has left the parties at liberty, with few exceptions, to bring their suits in the state courts, irrespective of the questions involved, but has made provision for protecting the federal authority by a transfer to the federal courts, either before or after judgment, of the cases to which the federal judicial power extends."—T. M. Cooley, *Principles of constitutional law*, p. 125. —"This is necessary, otherwise the constitution and laws of the United States would not be what they are declared to be, namely, the supreme law of the land."—J. W. Garner, *Introduction to political science*, p. 585.

England: Origin and development.—"The first step in the public enforcement of law is the constitution of some sort of a tribunal with something in the nature of a procedure for the punishment of offences. These rude tribunals we find established in the earliest history of England. . . . There was the Court of the Hundred, and the Court of the County [see above: Early Teutonic], and perhaps other petty tribunals. Of the precise origin of these courts we have no knowledge, and but little of their actual constitution and proceedings. We know of no legislation or other public act creating them. Certain persons, the sheriffs and other officials and the whole body of free landholders, were required to attend them, and were called the suitors. They constituted the judges. Over these tribunals the King exercised some supervision, exerted principally through the sheriffs, who were his officers. There was little of purely private litigation, for there was as yet but a feeble development of civil rights, and this little mainly arose out of disputes concerning the possession of land. Other business than that of a judicial nature was transacted at these courts, such as the making of transfers of land. There were no professed lawyers attending them, and their proceedings were extremely rude and simple. Besides these local tribunals, the King himself held a court. . . . The King's Court, as we first find it, was held at no particular place, but wherever he might be. It was held by the King himself, or by some high official deputed by him. It punished any crime committed in his presence or upon his lands, and it took cognisance of all controversies voluntarily submitted to him. The great nobles and landholders were not inclined to submit their disputes to the rude local tribunals held by ignorant men, but the King's Court possessed an authority and dignity which commanded their respect. No radical change in the constitution of these courts was effected at once by the Norman Conquest. The introduction of the feudal system brought with it the establishment of the baronial courts, [see also MANORS] and the privilege of holding these and courts of the manor was very often embraced in grants of land by the King, but the jurisdiction of these was confined to the particular manors or baronies, and to disputes between the tenants living upon them relating to the land and probably to some petty offences. . . . The next period . . . [embraces] the improvement and perfection of legal tribunals. . . . There were several modes in which these tribunals in England were improved and perfected. The improvement, of course, began at the top, and the impulses received there were communicated throughout the system. In the first place, itinerant justices came to be appointed by the King, who journeyed throughout the realm, and took cognisance of the proceedings in the courts and of the sheriffs and other officials. These judges were selected from the retinue of officials surrounding the King, and were often men of considerable

learning and skill. They compelled a better performance by the inferior courts of their functions, and served to give instruction to the judges holding them. In the next place, the King's Court itself, [the Curia Regis] held by the most learned men of the time, . . . continually enlarged its sphere of action . . . and developed into branches which eventually became the several courts known in later times as the Exchequer, King's Bench, and Common Pleas. Whatever was done in the King's Court was everywhere recognised, followed, and obeyed, and what was called the *custom of the King's Court* became everywhere accepted as law."—J. C. Carter, *Law: its origin, growth and function*, pp. 57-59, 62-63.—"Almost without interruption since the time of Henry II., royal officers have been commissioned to travel over the country holding court. In the course of time that duty became practically, although not formally, confined to the judges of the three courts, and a couple of those judges visited every part of England at least twice a year, to try, with the aid of local juries, civil and criminal cases that would otherwise come before the courts at Westminster. The judges in eyre [on circuit] were, in fact, the chief instrument in breaking down the old local courts. It was they who made possible the centralisation of justice in the royal courts, and the growth of a truly national jurisprudence—the English Common Law."—A. L. Lowell, *Government of England*, p. 442.

England: Origin of the court of equity.—Jurisdiction of ecclesiastical, probate, divorce and admiralty courts.—Reforms.—County courts.—"Before the end of the thirteenth century comes to a close we can see the three great Common Law Courts as they existed until the Judicature Act came into operation in 1875. The King's Bench dealt with all cases in which the King's interest or prerogative was concerned; the Common Bench with suits between subjects; the Exchequer with cases arising out of the collection of revenue . . . [and] all three Courts became, in the fourteenth century, for most purposes accessible to all. But by the side of these Courts arose a department of government which was hereafter to acquire important judicial functions. . . . When the three Common Law Courts had been developed out of the Curia there was still a residuary judicial power in the Crown. Those who were dissatisfied with the decisions of the Courts petitioned the Crown in Parliament, alleging error. Hence came the appellate jurisdiction of the House of Lords. But there were those who did not complain that the Courts were wrong, but that they could not afford the needed redress. Such complainants petitioned the Crown in person or the Crown in Council . . . [and] at an early date it became customary . . . to refer the matter to the Chancellor, . . . [who] did not meddle with the more remote remedy of damages: his procedure went directly to the root of the grievances complained of. The Common Law Courts could say, 'You shall pay or restore because of your wrongful act or omission.' The Chancellor could say, 'You shall carry out your undertaking—you shall refrain from your contemplated wrong.' Thus where it was desired to enforce the performance of a contract, or to . . . [overcome fraud to compel a trustee] to carry out the terms of his trust, the Chancery was the resort of the suitor. Thus arose equity, supplementing the common law, acting always in *personam*, not awarding damages, or touching property. . . . The Ecclesiastical Courts when severed from the secular courts carried with them some matters of a secular character—wills of personal

property, the administration of . . . estates [of intestates]. The jurisdiction in these matters was, in the year 1857, transferred to . . . the Probate Court and the Court for Divorce. . . . The Court of the Lord High Admiral or his deputy had a customary jurisdiction, defined in the reign of Richard II as relating to all manner of injuries committed at sea, not within the precincts of any county. [In 1701 under the Act of Settlement the judges who are appointed by the king were given life tenure on good behavior. They can only be removed on an address from both houses of parliament.] Each of the Common Law Courts, until the year 1830, consisted of four judges—a chief justice and three *puisne* judges in the King's Bench and Common Pleas; a chief baron and three barons of the Exchequer. In 1830 and 1868 the number of judges was increased. The Chancery, as a Court of justice, was manned, until the commencement of the present century, by the Chancellor and the Master of the Rolls, who, from being mainly concerned with the custody of documents, began in the time of Wolsey to discharge the functions of a judge, in aid of the Chancellor. . . . In 1813 it became necessary to create a new Court of first instance in Equity, that of the Vice-Chancellor of England. In 1841 the equitable jurisdiction of the Court of Exchequer was taken away, and two more Vice-Chancellors were appointed."—W. R. Anson, *Law and custom of constitution*, v. 2, pp. 254-257, 259.—"In 1832 civil procedure was slightly simplified and was made uniform in all three common law courts. . . . It is hardly possible to say that the reforms in the law and in judicial institutions which followed 1832 are of less value to the individual than those in local government, though they are less conspicuous. In 1836 changes were made in criminal trials by which the accused was given the right to counsel and to a more full knowledge of the evidence against him. . . . Following these acts a long series of statutes has been passed affecting both the content of the criminal law and procedure in trials in the interest of humanity and impartial justice."—G. B. Adams, *Constitutional history of England*, pp. 373-374.—"Before the creation of the county courts in 1846, civil justice at Common Law was highly centralised, and in Equity still more so; but criminal justice was administered by a large number of local tribunals, as well as by the judges on circuit. This was due not to the survival of early popular or feudal courts, for they had long faded into insignificance. It was due to the statutory authority of the justices of the peace . . . [on whom] powers were conferred, bit by bit, by a long series of statutes covering more than six centuries."—A. L. Lowell, *Government of England*, v. 2, pp. 448-449.—"Local justice in civil cases has also been provided for by a division of the country into districts grouped in circuits, first made in 1846, and called by the historical name of county courts, though they have no connection, historical or geographical, with the older system. From nearly all their judgments an appeal may be taken to the high court and carried on if desired to the house of lords. . . . In 1852 two statutes were adopted by which extensive changes were made in procedure and in the staffs of the common law courts. Serious reforms in the chancery system began about this time, consolidating the courts, simplifying procedure, and tending to do away with the conflict between equity and common law."—G. B. Adams, *Constitutional history of England*, p. 455.

England: Supreme Court of Judicature Act.—Justice courts Quarter Sessions.—Criminal court of appeal.—House of Lords.—The various

streams of reform culminated in the Supreme Court of Judicature Act, 1873, which reorganized the ancient courts. "All the high courts have been brought into one 'supreme court of judicature' which is generic in character, existing only in its two branches, the court of appeal and the high court of justice; the latter also exists only in its three 'divisions,' the king's bench, the chancery, and the probate, divorce and admiralty court. . . . A part of the business of the high court is also done in the assize courts on circuit, the modern form of the old itinerant justice system. The operation of the divisions of the high court has been made as uniform as possible both in procedure and remedies, common law and equity being fused, but in business they remain distinct."—G. B. Adams, *Constitutional history of England*, p. 456.—"The inferior criminal jurisdictions are those of the Justices of the Peace trying indictable offences at Quarter Sessions or exercising a summary jurisdiction. Every county has its commission of the peace. . . . On this commission are placed all the judges of the Supreme Court, all the members of the Privy Council, and such persons as the King, acting through the Lord Chancellor, may choose either on the recommendation of the Lord Lieutenant or after inquiries made independently. The Lord Lieutenant is, in practice, the chief of the justices, and keeper of the records of the county. . . . At Quarter Sessions, held four times a year, the justices of the peace form a court to try indictable offences with a jury, and to hear, without a jury, appeals from justices sitting as courts of summary jurisdiction. . . . The chairman, elected by the justices, takes the part of the judge at a criminal trial, but he is only the presiding officer and spokesman of the justices who form the court. The summary jurisdiction of magistrates rests entirely upon Statute, is exercised in petty sessional divisions, and must be exercised by two justices sitting together. . . . The High Court consists of three Divisions. . . . The Chancery Division consists of the Lord Chancellor, who presides, and five judges. The King's Bench Division contains the Lord Chief Justice of England, who presides, and fourteen judges. The Probate, Divorce and Admiralty Division has but two judges, the President and another. All these judges . . . are appointed to specific Divisions . . . but any one may sit for another in any divisional court, and the King may . . . transfer a judge permanently from one Division to another. The Court of Appeal is composed of the Master of the Rolls and five Lords Justices similarly appointed. . . . [After the enactment of the Judicature Act, it was still felt that injustice was done in not allowing appeal from the High Court, in criminal cases. A glaring case in which an innocent man was unable for years to obtain a revision of his case, and the feeling that a pardon could not remove the stigma of conviction for an uncommitted crime finally brought about the passage of an act, in 1907, to 'Establish a Court of Criminal Appeal.' This court is composed of eight judges of the King's Bench, appointed by the Lord Chief Justice, for such period of time as he may think fit.] There are certain offences which may be tried by summary jurisdiction, by two justices sitting without a jury at petty sessions. Others cannot be so tried, but may be tried at Quarter Sessions with a jury. Others again can only be tried by a Commissioner on circuit or judge of the High Court. . . . Some boroughs have no Commission of the Peace, . . . but fall under the jurisdiction of the shire. Some have no Quarter Sessions. Their justices then can only exercise a summary jurisdiction.

Some have a Court of Quarter Sessions, . . . [presided over by] a Recorder, a barrister of not less than five years' standing, who with the jury of the borough tries such cases as are not reserved for the superior Courts. The Stipendiary magistracy is an institution which took its rise in the metropolis, where a number of jurisdictions converged. . . . Other towns have stipendiary magistrates with like powers, but unlike the London police magistrates, who are paid partly by the County of Middlesex, partly by the nation, the local stipendiary is paid by the locality."—W. R. Anson, *Law and custom of the constitution*, v. 2, pp. 268, 271, 272, 273, 274.—"The Act which reorganised the courts in 1873 abolished the appellate jurisdiction of the House of Lords. . . . But before this went into effect there came a change of heart, and a determination . . . to strengthen . . . [the House of Lords as a court of law] by the addition of legal members. The Act of 1876, therefore, restored its appellate jurisdiction, and provided for the creation . . . of four, life peers, to be known as Lords of Appeal in Ordinary. The Act declared that an appeal should lie to the House of Lords from . . . the Court of Appeal in England, and those Scotch and Irish courts from which appeals had previously lain to the Lords. . . . Under the Act of 1876, no appeal shall be heard unless three Lords of Appeal are present, and it defines these as the Lord Chancellor, the Lords of Appeal in Ordinary, and any other peers who hold, or have held, high judicial office . . . in the Supreme Court of Judicature in England, in the [parallel] courts . . . in Scotland and Ireland, and in the Judicial Committee of the Privy Council. . . . During a dissolution the Lords of Appeal may sit and act in the name of the House. . . . The House of Lords is not the only court of last resort in England. There is another with much the same personnel, but quite a different jurisdiction. This is the Judicial Committee of the Privy Council, which hears appeals from the ecclesiastical courts, from the Channel Islands and the Isle of Man, from the [dominions] colonies and dependencies, and from English courts established by treaty in foreign lands."—A. L. Lowell, *Government of England*, v. 2, pp. 464, 465.

France: Lack of uniformity in early times.—Feudal courts.—The King's Court.—Origin of parlements.—French courts hereditary.—Prior to the revolution, France had not a uniform system of laws. In the first place, the early laws differed in accordance with the race which inhabited the part of the country in which they were in vogue. Thus the laws of Bretagne varied from those of the Isle of France. It is true that the Roman law prevailed for a time after the disappearance of the Romans themselves, and that the Carolingian kings imposed capitularies or decrees upon all their subjects (see CAPITULARIES); but both Roman law and capitularies were supplanted in sections of the country by local customs which grew to have the force of laws. Moreover, "from the beginning of feudalism the great nobles or seigneurs administered justice in their own names; . . . the landowner judged the men of his domain; the seignior [had] . . . the administration of justice over his vassals, . . . the successors of

the Carolingian officers, . . . who administered justice in the name of their sovereign, converted right to their own use. . . . Among the seigniors some had superior jurisdiction [high justice] . . . they exercised civil and criminal jurisdiction without restriction, [could take a man's life, or torture him, or only fine or imprison him] others had only inferior jurisdiction [low justice], limited . . . to police offences (punishable by a fine of ten sous) and to civil cases (involving sixty sous). A vassal could claim to be tried by his peers; but the serf had no such safeguard. His lord was both his owner and judge. . . . In addition to these seignioral courts there were also the courts set up by the communes, and also the ecclesiastical courts. . . . Furthermore the tribunals of the kings claimed from an early time . . . the exclusive jurisdiction of certain causes called *royal cases*. There had never been a definite list of these, a fact which permitted their multiplication as the authority of the king increased. At first the theory applied only to . . . *crimen majestatis* [crimes against the king, highway crimes, or violations of the public peace—the king's peace]. Gradually—during the 1300s and 1400s most serious crimes came to be included. . . . By this means [and also by the increase of the king's power as a seignioral lord] the royal courts continually encroached upon the seignioral courts. . . . [Another important change also took place during this time. In early days the seignior acted as judge. The king himself, as in England, tried important cases in his *curia*, the high court, composed of his council, over which he presided himself. Gradually] a complete change took place . . . the seigniorial tribunals [as also the tribunals of the king] were composed of men learned in the law. . . . The change had its causes in the progress of the law and of judicial procedure under the influence of the revival of Roman law."—J. Brissaud, *History of French public law*.—"A tendency to substitute clerks as judges in the place of nobles was encouraged by kings who, like Philip Augustus, St. Louis, and Philip the Fair, sought the extension of a centralized royal authority. Alike from their studies and their desire for promotion, the legists were eager to lay down rules which increased the authority of the king; and the principles of Roman law, established under the empire, were the grounds for claiming powers for the king like those of the emperors. The confusion and uncertainty of local customs and the caprices of the feudal tribunals were distasteful to a body of men who were taught that the law should be uniform and exact. The principal courts of the king soon came to be composed entirely of those educated in the law and receiving their appointments from the king. . . . As the king constantly increased his power over the great feudatories and added new territory to the kingdom of France, his courts extended their authority over a larger field and more numerous questions. They encroached upon innumerable feudal jurisdictions, until either they usurped their places or claimed a right to review their decisions. It was a change made easier by the approval of litigants. The people welcomed the change from the uncertain decisions of the feudal courts, from the necessity for bribery, the probability of injustice, and the possibility of wild and bloody vagaries of punishment, to the more orderly and legal judgments of the courts of the king. Before, the end of the fourteenth century the administration of justice was chiefly vested in a body of men forming part of the central government. In this system the most important place was held by the Parlement of Paris, which may be regarded as the successor to

the king's council. Some of the judicial powers of the royal council were by Philip Augustus vested in a court of peers, composed of six lay and six ecclesiastical lords. . . . St. Louis proceeded much further with the organization of this court. Under him came the first division into sections, with regular sessions at Paris. The name of Parlement insensibly came into use, . . . but coming in France to signify a place where were talked matters of law instead of matters of state."—J. B. Perkins, *France under Mazarin*, v. 1, pp. 381-382.—"It was divided into several chambers: the Chamber of Inquiries, the Chamber of Bequests, the Great Chamber, and the Chamber of the Tournelle or Criminal Chamber. At the outset there was only one parliament; that of Paris. But little by little provincial parliaments were constituted, and these, too, were destined to become courts of appeal. Parliaments were created at Toulouse, Grenoble, Bordeaux, Dijon, Rouen, Aix, Pau, Metz, Douai, Nancy, and in Brittany and Franche-Comté. . . . (See also PARLEMENT OF PARIS.) In the royal courts positions were at first temporary, or at least for a time. Presently they became assignable for a sum of money, despite the vehement and reiterated protests of the States-General of the fourteenth and sixteenth centuries. . . . Sometimes judicial offices were sold by the holders to their successors; sometimes, if death rendered them vacant, it was the King himself who profited thereby. Then, by exceptional measures of favour which gradually became more and more general, the King granted the councillors of the parliaments, bailiffs, and provosts, the 'survival' of their charges to the profit of their heirs, and heredity was added to venality."—R. Poincaré, *How France is governed* (tr. by B. Miall), pp. 232-233.—Thus it was that the hereditary "nobles of the robe" came into being.—See also BASOCHE.

ALSO IN: J. Brisseaud, *History of French public law*.

France: Continued lack of uniformity in the 18th century.—Changes made by revolution.—Judiciary elective and permanent.—Council of state.—Tribunal of conflicts.—"The courts . . . did not at the end of the eighteenth century occupy the same position that they had in England. In the first place, there was no common universal, uniform law. In the second place, the judicial system was not centralized, inasmuch as there were, for example, in France, thirteen supreme courts of equal power. In the third place the Crown had succeeded in taking out of the jurisdiction of the ordinary courts, which were independent of the royal influence, many cases involving the relations of the Crown and individuals. These cases were thus those in which the powers of government officers and the rights of individuals over against the government were concerned. The Crown had put the decision of these cases in the hands of special courts whose judges were dependent upon it, and might be dismissed from office at any time. Such were the conditions in France when the French Revolution broke out in 1789. Those who were called upon to frame the new constitutions of France, of which there were so many between 1789 and 1814, regarded Montesquieu's theory of the separation of powers with somewhat the same approval as did the constitution-makers of the United States. But they assigned quite a different meaning to it. It was not to be expected of them that they should lay the same emphasis upon the independence of the judiciary as had been laid by the English-speaking peoples. For the judges of the ordinary courts had for a long time been independent of the Crown, as a result of the fact

that judicial office was property of which the holder of the office might not be deprived. Moreover, the conduct of certain of the French courts had been such as to cause the people of France to regard them as the protectors of privileges rather than as the defenders of private rights. For in the attack made on feudal privilege, which was attempted by the French king just before the French Revolution, some of the French courts whose judges were conservative in their feelings had attempted to oppose the Crown. The French constitution-makers of the revolutionary period, therefore, adopted the view that the principle of the separation of powers was opposed to a judicial control over the Crown in the exercise of the powers of government; and that the function of the courts, that is the judicial power, was to decide merely questions involving the relations of private individuals one with another. The constitution of 1791, thus, after stating that the judicial power was delegated to judges to be elected by the people, and that the judicial power should in no case be exercised by the legislative body nor by the King, provided that the courts might not interfere with the exercise of legislative power nor suspend the execution of the laws, nor undertake the discharge of administrative functions, nor, finally, summon before them administrative officers because of their performance of their duties. The immediate effect of the French Revolution was not, therefore, to cause any important change in the position of the courts as the protectors of individual rights against executive encroachment. But in the course of the century and more which has followed the adoption of the first written French constitution, the French have gradually developed a system for the judicial protection of individual rights through the organization of what have come to be known as administrative tribunals. At the head of this system is a body called the Council of State, which has gradually taken on most of the characteristics of a court, and is at the present time exercising a tremendous influence on the French law of private rights. The members of the Council of State are appointed by the executive, and may theoretically be removed by him, but as a matter of fact their tenure of office is as permanent as is that of the ordinary judges, and may be said to be absolutely secure. The result is that the French have secured in a way quite different from that provided by the Anglo-American law an effective method for the protection against encroachment by the executive of the legal rights of individuals. But the fundamental principle is the same. This is the establishment of a judicial body whose members are independent of the executive, which shall have jurisdiction over all actions to which government officers and private individuals are parties, and in which the rights given by law to those individuals are involved. Furthermore, it is to be noticed that the law has been made uniform for all of France. The constitution of 1791 contained a provision to the effect that 'there should be made a code of civil law uniform for the entire kingdom.' This injunction was subsequently obeyed through the drawing up of the famous civil code and other codes until at the present time there is a common law for all Frenchmen. The application of these codes is intrusted to a system of courts acting under one supreme court, the Court of Cassation. [See also FRANCE: 1801-1800.] The tenure of the judges of the courts is permanent and independent of the executive, though not of the legislature. The principles of . . . the administrative law have been made uniform throughout France, but they have not been codified. The

application and development of this law in concrete cases are intrusted to a special set of courts acting under the control of one supreme court—*viz.*, the Council of State. This method of disposing of the subject has, it is believed by many, been followed by great advantage. The special character of the courts, their devotion of their entire time to similar classes of questions, have enabled them to elaborate in their decisions a legal system for the regulation of the relations between governmental officers and private individuals, which is surpassed by none in its success both in protecting individual rights and in promoting government efficiency. . . . Provision has had to be made for what is called a 'Tribunal of Conflicts,' which determines whether in a given case it is the ordinary courts or the administrative tribunals which have jurisdiction. The anxiety exhibited in the French law to prevent the ordinary courts from exercising a control over administrative officers has had the result of providing for the Tribunal of Conflicts, an organization of such a character as to give a majority of its members to those interested in the maintenance of administrative independence. For the court consists of members selected in equal numbers from the supreme ordinary court, the Court of Cassation, and the supreme administrative court—the Council of State. As it is presided over by an administrative officer, the Minister of Justice, the administrative members are in control."—F. Goodnow, *Principles of constitutional government*, pp. 234-236, 240.—See also FRANCE: 1792 (August-September); (September).

France: Modern courts.—Duties of judges in criminal cases.—At the present day (1920) in France the lowest court is that of the *juge de paix* (justice of the peace) in which trivial cases, small disputes, violations of police regulations and like matters are tried. It has also something of the nature of a court of arbitration, where the magistrate seeks to effect a reconciliation between the parties to a civil suit, and even between divided members of a family. This attempt at conciliation which is obligatory is called the preliminary of conciliation. Above the court of the *juge de paix* comes the Court of First Instance, presided over by three judges, in which are heard cases which have been appealed from the *juges de paix*, civil cases which are too important for the magistrate's court, and misdemeanors, or offenses against the criminal law which fall short of assassination or murder. A court of First Instance is situated in each *arrondissement*. Next comes the Court of Appeal, which must have five members in session, the president and four councillors. In each court of appeal, beside one or more civil chambers, there is a chamber of correctionary appeal, which is entrusted with the judgment, on appeal of the condemned, or the public ministry, of those accused who have already appeared before the court. In each court also sits a chamber of indictment, which decides appeals against a decision of no cause for prosecution. Here also persons accused of crime are indicted, and sent to the Court of Assizes. The Court of Assizes, the criminal court of France, is presided over by three judges or councillors of the Court of Appeal, who impose the penalty after a verdict of "guilty" has been returned by the majority of the jury. From this court there is no appeal, except on a technicality. Even then the case is not heard on appeal. An entirely new trial is opened before another Court of Assizes, which proceeds as if no prior trial had been held. In the Assize Court, the witnesses appear in order fixed by the prosecutor;

consequently the jury does not know which side has called them. A witness tells his story, without interruption, whether of what he knows as an eye witness, or of what he has heard; or of his own opinion as to guilt or innocence of the accused; the president of the court alone having the right to reject or admit the testimony, and he alone has the right to question witnesses, although counsel on either side, or the jury, may ask that questions be put. When two witnesses contradict each other, they are placed on the stand together and allowed to argue the point.—This is called "Confrontation of Witnesses." "The President of the Court plays a very active rôle. He questions the witnesses; he determines the relevancy of evidence. Immediately after the opening address of the prosecutor comes the judicial interrogation of the accused. The president conducts the interrogation very thoroughly and does not hesitate to use methods that to us seem unbecoming to a judge."—E. McC. Sait, *Government and politics of France*, pp. 416, 417.—The Court of Cassation, the highest court in France, determines the effect of the law. It is not in reality a direct court of appeal. It examines only the facts and circumstances, and decides whether the proceedings were regular, and if the judges were impartial and respected the law. This court, which was created in 1790, sits in Paris. It has three chambers, the Chamber of Request, Civil Chamber and Criminal Chamber. It does not, however, try the case itself, nor inflict a penalty. It simply "states the law." If irregularity has been found, the decision in question is quashed, and the case sent back to be re-tried. The functions of the court, however, are not confined to the consideration of mere errors of law or even the interpretation of the law, which is one of its important duties. If it is found that an apparent error in judgment has been made, or if evidence appears of the condemnation of an innocent person, it is the province of the Court of Cassation to hold an enquiry and revise an unjust sentence.

Germany: Feudal system.—Emperor's court.—During the hundred years which elapsed between the reigns of Charlemagne and Otto I (the Great) the feudal system had developed in Germany, bringing with it three new groups of customary, or unwritten law. Consequently, when we consider the provincial customs (*Landrecht*), which already had gained the force of law, and the municipal law which had grown in the towns out of long established customs and charters, we are faced by no less than five different kinds of law administered by five different types of courts:—the feudal law, made by the feudal lord, and his noble vassals, and administered in his court; the ministerial court which doled out rough justice to the unfree; the manor court, where the law or custom of the manor was administered; the provincial or land law, by the public court of the land; the town law by the court of the town. Moreover, this confusion is enhanced by the weakness of the *Curia Regis*, the king's court. In England this court, developed naturally into the Parliament, the source not only of justice but of law. But in England the king had become the strong central power, and his court the center from which emanated law and justice. In Germany this was not the case. It is true that the emperor moved rapidly about, being now in one place, now in another. "Royal justice was the justice of the king. . . . But the task of seeing that every man got his rights was . . . a work of enormous difficulty. . . . It required a strong, central permanent court; with a professional hand of

royal judges. Such a court was never formed." Moreover, there was another reason why the king's court, the *Curia Regis*, played but a small part in the development of German law and courts when it traveled, "it changed color with the surface over which it traveled. When the king came into Saxon territory, Saxon litigants would flock to his court . . . which would be composed of Saxon nobles and princes. The law administered would be Saxon law, the judgments would be found by Saxons. . . . In Swabia the court would be mainly Swabian; in Bavaria, it would be mainly Bavarian." The law by which he judged was therefore not the king's law but the law or custom under which the man on trial lived. Furthermore, it was long before the king's court developed. It was not until 1235 that a professional judge was appointed by Frederick II, and then he had to promise that cases which concerned the property or inheritance of princes or other great nobles, their persons, rights, fiefs or honor should not be heard by the judge, but by the king himself in person. "In the fifteenth century, however, it was decided that a doctor of laws was a noble and as such a judge was competent to try, and to sentence others of the same class. . . . This judge was directed to record the proceedings of the court which had hitherto not been reduced to writing."—H. Fisher, *Medieval empire*, pp. 169, 171, 230.—In "Germany . . . the jurisdiction of the emperor was exercised chiefly through the tribunal of the palace ('Reichshofgericht') presided over by the prince, or after 1235, by a 'justitiarius curiæ regiæ.' The jurisdiction of this functionary, which extended to all affairs submitted to the emperor, except the 'causæ majores' which were taken before a 'Reichstag' or a 'Hoftag,' lost its importance in consequence of special grants to the privileged classes ('*de non evocando, de non appellando*') and of the quashing of its decrees. In 1450, the 'Reichshofgericht' ceased to sit. It had already been supplanted by the emperor himself, who exercised personal justice with his councilors. From this originated, in 1495, the Imperial Chamber of Justice, the 'Reichskammergericht,' with a fixed seat (Frankfort, 1495; Wetzlar, 1693-1806) composed of judges appointed in part by the emperor, in part by electors and the estates. It had jurisdiction of violations of the public peace, of suits in fiscal matters, of suits of those seigniors who held immediately of the Empire, and, finally, appeals and cases involving denials of justice. The 'Reichstag' had the right to revise the decisions of this chamber (only a suspensive effect after 1555). The institution of the Imperial Chamber did not take away from the emperor his personal right of administering justice; he exercised it with his council, which ended by being divided into a political body, the privy council ('Geh. Rath'), and a judicial body, the aulic council ('Reichshof-rath'); after having commenced by preparing the cases which had to be submitted to the decision of the emperor, it became a tribunal independent of him, at least in a certain measure, for it was always possible to defer the judgment to the emperor ('*votum et imperatorem*'). The members of the privy council were excluded from it. The emperor could be asked to revise his decisions. The competence of this tribunal was twofold; it had jurisdiction of the same cases as the Imperial Chamber; and it determined exclusively feudal questions, criminal actions against the seigniors who held immediately of the empire and cases involving imperial privileges.—Concerning the putting under the ban of the empire, cf. Schröder, p. 816."—J. Brissaud (tr. by J. W. Garner), *How France is*

governed, p. 436, footnote.—“Justice was rendered by attorneys of the Empire (*Reichsvogt*, *Landvogt*) assisted by officers (*Schultheissen*) and by ‘ministeriales’; these judges were appointed by the emperor who often sent to them appeals addressed to him. Their competence was limited in the 1400s and little by little they lost all importance. For a long time Westphalia had ‘Freigerichte,’ tribunals for free men (*Vehmgerichte*) the judges of which were appointed by the archbishop of Cologne; in the 1200s and 1300s, they assured public security; in decadence after the 1400s, they were transformed into seigniorial courts.”—*Ibid.*, p. 453, footnote.—See also *VEHMGERICHTS*.

Germany: Modern courts under imperial constitution.—“The first question the [modern German] judge asks himself is, ‘What does the Code say?’ For the law—criminal, civil and commercial—has been codified, and crimes and illegalities, with their respective punishments, are laid down in black and white with absolute precision, but giving a maximum and minimum within which the court must limit itself. All judgments must be written, giving the articles of the Code on which they are based, and in every case the parties have the right to appeal. It must be understood that in all criminal cases the State is a party, for, according to German law, not only does a person by an illegal act injure the person who has been affected by that act, but also at the same time the State itself, and therefore the State, in the person of the representative of the Minister of Justice, appears as complainant, conducts the case, and demands punishment of the offence. Only rarely, and then in simple cases of insult and assault, may a private person prosecute alone. . . . There is a large number of courts with differing jurisdictions, [all of which are state courts, with the sole exception of the *Reichsgericht*]. Police officers, in the first case, have the right to inflict fines definitely stated in the police orders for certain minor misdemeanours. The parties in such a case, however, have the right to ask to be sent before the *Amtsgericht*, or court of first instance. These courts, of which there are 1,944, try petty criminal cases and civil cases involving sums up to £15. They are presided over by a professional judge, who may call in two lay assessors to assist him. The *Schöffengericht* (with a bench consisting of three professional judges and two laymen, something like grand jurymen) has jurisdiction in criminal cases with power to inflict imprisonment up to three months and in civil cases involving sums up to £30. Then follows the *Landgericht* (a provincial or county court), of which there are 176, composed usually of three judges in civil cases and five in criminal cases, which hears appeals from the *Amtsgericht* and also possesses original jurisdiction in more important civil and criminal cases and in divorce suits. A further step is the *Oberlandgericht* (superior provincial court), with seven judges, who hear further appeals and also try serious civil and criminal cases. The *Schwurgericht* (a court of assizes with three professional judges and a jury) tries cases of felony. Above all of these is the Imperial Supreme Court, which tries treason cases, and to which a final appeal in any case may go and whose decision cannot be reversed. In Bavaria, however, there is a Supreme Provincial Court, which possesses virtually the same powers as the Imperial Supreme Court. . . . As soon as a criminal case is started, all the documents are placed in the hands of the Crown counsel, who opens an investigation. He has at his disposal all the police and legal authorities of the Empire. On the result of his inquiry depends whether the charge shall be carried into

court or allowed to lapse for lack of proof. Should the case go into court, the Crown counsel watches the action until the end, and in most cases calls for judgment, suggesting to the judge the sentence he thinks is called for. It is customary to consider an accused person as guilty until he proves himself innocent, and this gives rise to a great amount of criticism, for it has happened frequently that an innocent person has been detained many months on suspicion of an offence which he has not committed. The preliminary investigation of a crime often lasts nine or ten months, and it is a great hardship on the accused to be detained so long if there is no direct proof of his guilt and he himself is not in a position to bring evidence of his innocence. It must be added, however, that in most cases an accused person is set free while awaiting trial, unless the crime is a serious one and circumstantial evidence is very strong, or the authorities suspect the accused of the intention of fleeing from justice. Persons without a domicile, those refusing information about themselves, foreigners, and people who are suspected of attempting to destroy evidence or to suborn witnesses are all liable to detention under the Code while awaiting trial.”—R. M. Berry, *Germany of the Germans*, pp. 104-107.—See also *GERMANY*: 1885.

ALSO IN: B. E. Howard, *German empire*.

Germany: Commercial courts under code of 1905.—“When the State Administration holds a need to exist, Chambers for Commercial Matters may be erected in connection with the *Landgericht* for the whole district covered by the *Landgericht* or for limited portions of the same. . . . The activity of the Chamber for Commercial Matters is *always the exception*. It arises only when, in regular procedure before the Civil Chamber of the *Landgericht*, a motion is made by one of the parties to refer the case to the Chamber for Commercial Matters. . . . Competence extends to those civil suits at law assigned to the *Landgericht* as court of first instance, in which complaint is made against a merchant . . . with respect to transactions which are commercial transactions for both parties; suits arising out of matters of exchange; . . . suits based on certain legal relations in commercial matters; and suits over the rebate of dues collected by reason of the Imperial Stamp Tax Law. . . . The Chamber for Commercial Matters is composed of a presiding judge, appointed from the *Landgericht*, and two laymen, known as *Handelsrichter* or commercial judges.”—B. E. Howard, *German empire*, pp. 180-182.

Germany: Under Republican constitution.—High Court of Justice.—“In Germany justice, particularly such as is regulated by the laws on the organization of justice, the Code of Civil Procedure, the Code of Criminal Procedure, is administered by the tribunals of the states. The Reich had only one judicial organism, the *Reichsgericht*, whose powers are in principle similar to those of the *Cour de Cassation* (the highest court of appeal in France). The new Constitution has changed nothing in this system. . . . Now as before the sole authority of the Reich in this domain lies in the *Reichsgericht*. But the Constitution has introduced a new judicial organism whose authority extends over all important cases of a national scope, and constitutes thereby a powerful element in centralization: that is the High Court of Justice. The task of organizing this Court is left by the Constitution to a special law. Until this law enters into effect the powers of this Court are entrusted

to a senate of seven members, of which four are nominated by the Reichstag and two by the Reichsgericht. The authority of the High Court of Justice is regulated by the Constitution. It is this Court that passes on the difficulties that may arise between states in the cases of division of patrimony where changes or separations of territories are involved. It is this Court also that decides constitutional difficulties within a state when there is no competent tribunal within the state to deal with such a question. It is this Court that adjudicates disputes as to public rights that arise between different states or between a state and the Reich, when there is no other tribunal of the Reich that has jurisdiction over such a dispute. This Court in addition presides over actions instituted by the Reichstag against the President, the Chancellor and the Ministers of the Reich for culpable violation of the Constitution or the laws of the Reich."—R. Brunet, *New German constitution*, pp. 68-69.

Japan: Modern courts.—In Japan, under the constitution, "public trial and the inviolability of judges are guaranteed. A 'Court of Administrative Litigation,' a feature unknown to English and American jurisprudence, is provided for cases where it is claimed that the executive authorities have infringed upon the rights of the subject. The underlying idea seems to be that a court of law might be incapable of deciding upon questions of administrative expediency, and would also be disinclined to sacrifice the individual for the public benefit. . . . The Civil Code was built upon a German model, but as regards Family Law and the law of succession Japanese customs and usage were adhered to. . . . A feature of the Japanese judicial system which will especially strike Englishmen and Americans is the absence of juries and the appointment of judges and public prosecutors after examination. The Courts of Justice are classed as District Courts, Local Courts, Courts of Appeal, and the Court of Cassation. Each court has its public procurator after the continental fashion. The District or lower court of first instance is presided over by a single judge who has jurisdiction in small civil and criminal cases. He also has other duties such as supervising guardians and registration. The Local Court is divided into sections presided over by three judges. It acts as a court of first instance in civil and criminal cases not within the jurisdiction of the District Courts and also hears appeals from the latter. The Court of Appeal is a tribunal of second instance and hears appeals from the local court. The supreme court of Japan is the Court of Cassation. Each of its sections is composed of seven judges. It is both a court of appeal from the lower courts and of first and final instance in certain offences against or involving members of the Imperial family."—R. P. Porter, *Japan the new world-power*, pp. 567, 568, 569-570.—"To every Court is attached a Procurator, who is charged with the entire conduct of every criminal prosecution throughout all its stages, to whom a written statement of the circumstances of the offence is handed by the police immediately an arrest has taken place, and whose functions in capital offences only end when he has witnessed the execution of the condemned. It is he who decides whether a charge is to be formulated and its precise nature; whether its nature permits of it being tried in the first instance in a magistracy or a district court, or whether its gravity renders it advisable that it should be at once remitted to the Court of Appeal which, notwithstanding its name, exercises an original criminal jurisdiction; whether bail should be granted pending trial; and when the trial takes place he conducts the prose-

cution in court, so that he unites in himself all the functions of Grand Jury, public prosecutor and sheriff. As public prosecutor, his duties considerably exceed those of his compeer in England. Once the prisoner has been committed for trial, it is his business to procure a conviction, and in addressing the court, both on law and fact, he suggests both the clause of the code under which the accused should be convicted and the exact sentence which should be passed under it. The judges, as a rule, follow his suggestions, though there is no specific obligation on them to do so, and if they err, there is a very wide right of appeal not only on law but on fact."—J. H. Longford, *Japan of the Japanese*, pp. 193-195.

United States: Organization of the federal courts.—"By the revised judicial code of 1911 the judicial power of the United States is vested in a series of three courts—the District Court, the Circuit Court of Appeals, and the Supreme Court (see also SUPREME COURT)—and in three special courts—the Court of Claims, the Court of Customs Appeals, and the Commerce Court, which was abolished in 1913. . . . The lowest court in the series is the District Court. For this purpose the United States is divided into eighty-one districts, each state containing at least one, and the larger states several. To each district there is appointed by the president, with the advice and consent of the Senate, a district judge. There is also appointed a district attorney, or prosecuting officer, with such assistants as may be necessary, who act under the direction of the Attorney-General of the United States. A United States marshal, with such assistant marshals as are necessary, acts as the executive officer of the court, and may call upon the military force of the United States, if necessary, to aid him in the performance of his duties. To this District Court is given all the original jurisdiction of the United States, with a few exceptions. . . . Thus the District Court has all the criminal jurisdiction arising under the federal laws of Congress, and all cases in admiralty and maritime jurisdiction now extending to all inland waters which in any way may be utilized for interstate commerce. And perhaps even more far-reaching than the above, in the District Court originate all cases to which citizens of different states are parties. Moreover, a suit already begun in the state courts may be transferred to the District Court, if it can be shown that it is one in which the District Court could gain jurisdiction. It is further to be noted that the courts of the United States, and thus the District Court, act not merely as courts of law but as courts of equity, and have power to issue the writ of injunction and to punish for refusal to obey by means of proceedings for contempt of court. By the first judiciary act of 1789 a Circuit Court was established to hear cases of appeal from the District Court and to take cognizance of more important cases than were given to the District Court. The justices of the Supreme Court were assigned to this, and each was required to hold two circuits a year in each district of his circuit. The justices complained of this double service, and in 1801 a distinct class of circuit justices was created. This act was repealed in the following year, and the justices of the Supreme Court went on circuit until 1860 when the country was divided into nine circuits, and nine circuit justices were appointed. In 1801 it was found that the Supreme Court was nearly four years behind its docket, and a new court was created to relieve the Supreme Court of its burden of cases. This was called the Circuit

Court of Appeals. With the establishment of the Circuit Court of Appeals and the increase of the number of cases which might be brought before the District Court the importance of the Circuit Court declined. Therefore, by the judiciary act of 1911 [which codified the acts relating to the Federal judiciary], the Circuit Court was abolished, and the jurisdiction of the cases which came before it was given to the District Court. Thus the District Court has become the most important court of first instance in the United States, replacing the old Circuit Court. The act establishing the Circuit Court of Appeals as amended by the act of 1911 groups the states into nine circuits. For three of these circuits four circuit judges are appointed; for one circuit, two; and for the remaining circuits, three. These circuit judges, together with the justices of the Supreme Court, and the judges of the District Court, which is included in the circuit, form the Circuit Court of Appeals. Any two of the judges may sit—in practice the justices of the Supreme Court never attend—and take cognizance of appeals from the District Court. The court has no original jurisdiction but very wide appellate power. All cases decided by the District Court are reviewable by the Circuit Court of Appeals upon writ of error, except certain classes of cases which are carried directly to the Supreme Court. In addition, it hears appeals in cases of bankruptcy and in injunction proceedings, and appeals from the territorial court of Alaska. More important, however, than its wide appellate jurisdiction is the fact that its judgment is final in a large number of cases. In all cases in which the jurisdiction of the United States courts was obtained on the ground of diverse citizenship, and in cases arising from patent, copyright, or revenue laws, and in all cases in admiralty, except prize cases, the jurisdiction of the Circuit Court of Appeals is final. But the Supreme Court may, upon petition of either party, if it thinks advisable, cause any case in which the judgment of the Circuit Court of Appeals is final to be brought before it, there to be reviewed and determined.”—E. Kimball, *National government of the United States*, pp. 383-385.—The “Court of Customs Appeals is composed of a presiding judge and four associates. . . . The court sits in any of the judicial circuits and has exclusive jurisdiction over appeals from the Board of General Appraisers of the Treasury Board as to the value of imported goods and the rate of duty imposed thereon.”—J. T. Young, *New American government and its work*, p. 280.—“In addition, the United States has created several special courts, of which the most important is the Court of Claims in Washington, composed of five justices. . . . It has power to try cases of claims against the United States; if it finds money due, it certifies the amount to Congress, which appropriates for the purpose; it has no power to enforce a judgment against the United States. By an act of March 3, 1891, a Court of Private Land Claims was created, with five justices, their jurisdiction extending only to claims arising from or under the treaties of territorial cession by Mexico in 1848 and 1853. Entirely outside of the judicial system are several national tribunals for federal matters. Such are the courts created by Congress in the District of Columbia, in the territories, among the Indians, and in the dependencies, under the special powers of the United States over the seat of government and the ‘territory or other property’ of the United States. Such are the military and naval courts martial provided under the general authority of the United States to raise and govern armies and

to make war. Such are the administrative tribunals attached to several of the executive departments: the commissioners of public lands and of patents render elaborate decisions, which are printed in regular series of *Reports of Cases*; the Treasury Department makes rulings on contested questions within its field of administration. So far as such decisions involve questions of property and of individual rights, they are appealable to the regular judicial courts.”—A. B. Hart, *Actual government*, 4th ed., pp. 303-304.—See also CRIMINAL LAW: 1893; 1921.

United States: State courts.—Terms of judges.—Appeals to federal courts.—Right of federal courts to veto state statutes.—Relative status of state and federal courts.—Use of jury system.—“State judges are organized into courts arranged in a progressive series. In Massachusetts, for instance, there is a system of police and municipal courts in large cities, with additional justices and two special justices, each sitting in a separate place; in each county there is also a probate court, in charge of wills and inheritances; . . . a district court, with a district attorney, and the judges are assigned according to the needs of the service; above this is a superior court, the eighteen judges of which have a salary of \$6,500 each; above this is a supreme judicial court, with seven judges, at a salary of \$8,000 each. The chief justice in each of the two systems has \$500 extra salary. Appeals may in general be brought from district courts to the superior court, and from the superior court to the Supreme Court; they may also be brought from the probate court to the Supreme Court. Under this system, small cases usually fall first to a lower court; then, if appealed, to the middle jurisdiction, whatever it may be; and thence to the highest state court. The result is unification of decisions throughout the state; and the Supreme Court takes pains, so far as possible, to follow its own precedents, so that there may be a traditional unity. The details of organization and administration, the methods of appeal, the kinds of question which may be brought in original suit before a lower and a higher court, the relations of the general system of state courts to municipal courts,—all these questions are subject to great variations from state to state. Everywhere the principle is the same: that questions of law shall be transferred from court to court, up to the highest state court; and especially that questions of personal rights and other constitutional privileges shall be eventually settled only by the highest court. In addition to the regular courts, there are in most states justices of the peace, with jurisdiction over small offences and suits; these may be considered, perhaps, as a fourth system of inferior courts. In some states there is a provision for courts of conciliation, or for tribunals of arbitration; but these are rather a means for umpiring disputes than for settling them under the principles of law. Probate courts act with little formality where there is no opposition; but in hotly-contested will cases they may spend days in hearing testimony and arguments, and make decisions on questions of law, subject to examination by a higher court. . . . The municipal and police courts have to do almost solely with petty crimes,—drunkenness, fighting, destruction of property, and the like; and they have a summary process with very speedy examination of witnesses, so that a trial often occupies only three or four minutes, and the penalty is at once fixed and the punishment begins. In most of such cases the guilt is obvious, or the prisoners are too ignorant of the laws to protract the matter; yet on questions

of law, appeal practically always lies from the municipal court to some higher court. The middle courts of the regular state series commonly take cognizance of the most serious crimes. Here, as cases may involve life and death, trials are sometimes long and searching, and may last two months or more. The highest courts seldom examine into the facts in criminal cases, but pass on questions of law which may be appealed to them."—A. B. Hart, *Actual government*, 4th ed., pp. 154-156.—"The federal courts have an immense power over the state governments, through their right to declare state statutes void. . . . The principle involved is not the right to call up a state statute and annul it, but simply that a state statute contrary to the federal constitution or statutes cannot possibly come into being; that from the moment of its passage it has no life or force; and that therefore the court may leave it out of account in making up its mind. . . . Certain cases from their nature go to the federal courts, whether they occur within or without the special federal jurisdiction; such are maritime cases, seizures under United States laws, and offences against federal laws,—as for instance, discriminating in interstate commerce or robbing the mails."—A. B. Hart, *Actual government*, 4th ed., pp. 316, 358.—"There is an impression in the popular mind that all state courts are subordinate to all federal courts, that the lowest court in the federal system is superior to the highest state court. . . . Such impression is altogether wrong. Each set of courts . . . has its own field of jurisdiction and within that field cannot be interfered with by the other. Most cases which originate in the state courts reach their final determination there. Not one in a thousand among them ever reaches the federal Supreme Court. Whether a case is brought before a state or a federal court in the first instance depends wholly upon the nature of the case itself. If it concerns matters or persons within state jurisdiction, the state courts handle it; if it concerns matters or persons within federal authority, it goes before the federal courts. If the suit is commenced in either, and in the course of the trial it becomes apparent that it should have been entered in the other, it can be removed to the latter. But if a controversy is properly within the jurisdiction of the state courts it can go no farther than the highest state tribunal unless the Supreme Court of the United States obtains appellate cognizance of it by writ of error. . . . The term for which judges are chosen varies from life to a few years. In Massachusetts, for example, judges of all courts, whether higher or lower, are appointed by the governor with the consent of his council and hold office until they die or resign. In Pennsylvania the judges of the Supreme Court are elected by the people for twenty-one years, in New York for fourteen years, and in Illinois for six years. In Vermont they are chosen by the legislature for two years only. Many states make a distinction between the judges of the higher and the lower courts, giving the former longer terms."—W. B. Munro, *Government of the United States*, pp. 402, 404.—"In the system of criminal jurisprudence are deeply imbedded the principles of indictment and trial by jury. Indictment is the process of preliminary examination, usually by a grand jury, of the evidence against a man charged with crime; if the jury sees reason to send the case to trial, it 'finds a true bill,' and the prosecutor must bring the matter to trial. In justice courts and municipal courts the jury is usually dispensed with, although in most states it must be had if the prisoner demands it. The more serious crimes are

always tried by a 'petty' [or petit] jury, the common rule being that there must be twelve jurors and a unanimous verdict; but several of the far Western states allow a decision by ten, or even fewer, jurors out of the twelve. In most states a jury trial may be waived if the prisoner so desires. . . . The methods of civil court business are much like those in criminal law: jury trials are very common on questions of property, and especially on questions of personal damage. . . . When the testimony is all in, the lawyer on each side argues the case; and then, if it is a jury trial, the court sums up the evidence in a 'charge,' in which it informs the jury what the law is and summarizes the evidence. In some states the jury insists also on deciding for itself what the law is."—A. B. Hart, *Actual government*, 4th ed., pp. 156, 159-160.—See also CRIME AND CRIMINOLOGY; DUE PROCESS OF LAW; DETROIT: 1920: Reform in judicial procedure; CALIFORNIA: 1900-1909; LOUISIANA: 1921.

United States: Right of courts to issue injunctions.—Question of injunctions in labor disputes.—"A writ of injunction may be defined as a judicial process, operating *in personam*, and requiring the person to whom it is directed to do or to refrain from doing a particular thing."—J. L. High, *Treatise on the law of injunctions*, v. 1, p. 2.—"The use of the injunction to restrain waste, nuisances, continued trespasses, boycotts, etc., is a common feature of modern practice. The jurisdiction of equity to restrain waste, by injunction was well recognized in the early part of the seventeenth century. This remedy has now virtually superseded the Common Law action of waste, and taken the place of an action on the case for damages. In cases of nuisance and trespass it was long the practice to await the determination of the question of legal right before granting equitable relief. . . . The advantages of this procedure, where available, are obvious. The preliminary injunction is quickly obtained, often *ex parte*; the remedy in case of contempt is summary and effectual; and there is no trial by jury. No wonder that efforts are made to extend the jurisdiction to its utmost limits. Some of these attempts have been resolutely resisted by the courts, but many have been successful."—G. D. Watrous, *Torts in Two centuries of growth, of American law*, p. 112.—"The jurisdiction of equity to interfere by injunction to some extent in labor disputes cannot be seriously questioned at the present day [1910]. In issuing its restraining process in proper cases, the court exerts its authority, which is as old as the chancery itself, to prohibit those wrongful acts which will work irreparable injury to property rights for which the courts administering the common law can afford no adequate remedy. To the exercise of this power every member of the community is subject; and there is no reason why persons engaged in labor disputes should be granted immunity from it. In so far, therefore, as the courts restrain the performance by employer and workman alike of those acts only which plainly infringe upon the property rights of another person, to his immediate and irremediable damage, their action is clearly beyond the reach of legitimate criticism. American labor leaders, however, protest with great energy against the use of the injunction to forbid acts that render the doer liable to criminal prosecution, upon the ground that since a violation of the injunction subjects the offender to punishment by fine and imprisonment for contempt of court, after a summary trial conducted by the equity judge alone, the effect is to deny him his constitutional right to be tried by a jury before he can

be made to suffer criminal penalties. This argument, in so far as it is grounded upon existing law, was finally and conclusively refuted by the Supreme Court of the United States in the celebrated Debs case (158 U. S. 564, 594), decided May 27, 1893. It was there pointed out that the power of equity to restrain the commission of acts destructive of property had never been regarded as in any degree curtailed by the fact that these same acts might also amount to offenses against the criminal law. The injunction is solely in aid of the civil liability of the wrongdoer in favor of the person directly injured; and this is not affected by the existence of a concurrent criminal liability; wherefore it follows that the power of the court to issue the injunction being thus established, the power of the same court to punish violations of it in its own peculiar fashion is the same in nature and extent as in the case of any other lawful order of the court. Since, then, the punishment for contempt is not for a violation of the criminal law, but for disobedience to a lawful mandate of the court protecting certain civil rights, there is no violation of the offender's right to a jury trial in criminal prosecutions. The labor unions charge that this distinction is purely verbal. Its substantial effect, they say, is to subject persons to penalties identical with those imposed by the criminal courts, without the protection of a jury trial, and with a very limited right of appeal. And if the law is as stated, it ought to be changed, either by forbidding the issue of injunctions at all against criminal acts, or else—what amounts to the same thing—by allowing a jury trial to persons accused of violating such an injunction, thus rendering a proceeding for contempt practically indistinguishable from an ordinary criminal prosecution.—J. W. Bryan, *Proper bounds of the use of the injunction in labor disputes* (reprinted from the *Annals of the American Academy of Political and Social Science*, Sept., 1910, pp. 288-289).—The question of the issuance of writs of injunction by the courts in connection with labor disputes came much into discussion during the canvass preliminary to the American presidential election of 1908, and was a prominent subject of declaration in the platforms of the political parties (see U. S. A: 1908 [April-November]). Subsequently, President Taft, in his first annual message to Congress, cited the pronouncement of the Republican party on this question, and said: "I recommend that in compliance with the promise thus made, appropriate legislation be adopted. The ends of justice will best be met and the chief cause of complaint against ill-considered injunctions without notice will be removed by the enactment of a statute forbidding hereafter the issuing of any injunction or restraining order, whether temporary or permanent, by any Federal court, without previous notice and a reasonable opportunity to be heard on behalf of the parties to be enjoined; unless it shall appear to the satisfaction of the court that the delay necessary to give such notice and hearing would result in irreparable injury to the complainant and unless also the court shall from the evidence make a written finding, which shall be spread upon the court minutes, that immediate and irreparable injury is likely to ensue to the complainant, and shall define the injury, state why it is irreparable, and shall also endorse on the order issued the date and the hour of the issuance of the order. Moreover, every such injunction or restraining order issued without previous notice and opportunity by the defendant to be heard should by force of the statute expire and be of no effect after seven days from the issuance thereof, or within any time less

than that period which the court may fix, unless within such seven days or such less period, the injunction or order is extended or renewed after previous notice and opportunity to be heard."

United States: President Taft's recommendations for expediting procedure.—The following is from President Taft's first annual message to Congress, December, 1909: "The deplorable delays in the administration of civil and criminal law have received the attention of committees of the American Bar Association and of many State Bar Associations, as well as the considered thought of judges and jurists. In my judgment, a change in judicial procedure, with a view to reducing its expense to private litigants in civil cases and facilitating the dispatch of business and final decision in both civil and criminal cases, constitutes the greatest need in our American institutions. I do not doubt for one moment that much of the lawless violence and cruelty exhibited in lynchings is directly due to the uncertainties and injustice growing out of the delays in trials, judgments, and the executions thereof by our courts. Of course, these remarks apply quite as well to the administration of justice in State courts as to that in Federal courts, and without making invidious distinction, it is, perhaps, not too much to say that, speaking generally, the defects are less in the Federal courts than in the State courts. But they are very great in the Federal courts. The expedition with which business is disposed of both on the civil and the criminal side of English courts, under modern rules of procedure, makes the delays in our courts seem archaic and barbarous.

"The procedure in the Federal courts should furnish an example for the State courts. I presume it is impossible, without an amendment to the Constitution, to unite under one form of action the proceedings at common law and proceedings in equity in the Federal courts, but it is certainly not impossible by a statute to simplify and make short and direct the procedure both at law and in equity in those courts. It is not impossible to cut down still more than it is cut down the jurisdiction of the Supreme Court so as to confine it almost wholly to statutory and constitutional questions. Under the present statutes, the equity and admiralty procedure in the Federal courts is under the control of the Supreme Court, but in the pressure of business to which that court is subjected, it is impossible to hope that a radical and proper reform of the Federal equity procedure can be brought about. I therefore recommend legislation providing for the appointment by the President of a commission with authority to examine the law and equity procedure of the Federal courts of first instance, the law of appeals from those courts to the courts of appeals and to the Supreme Court, and the costs imposed in such procedure upon the private litigants and upon the public treasury, and make recommendation with a view to simplifying and expediting the procedure as far as possible, and making it as inexpensive as may be to the litigant of little means."

United States: Lack of uniformity of decisions in state courts.—"Commerce has long since wiped out the imaginary lines that mark the political boundaries between the states. Obviously the State courts must keep pace with it in interstate relations in order to usefully perform their manifest functions. Otherwise, they will retard instead of aiding and will confuse instead of clarifying social and commercial relations. The courts are to the government and to commerce what the locomotives are to the railroads and to commerce. The railroads cannot be conducted without locomotives

and governments cannot be conducted without courts. . . . The State governments may provide the most perfect laws and entertain the best intention toward the splendid interstate commerce that the best interests of all government require shall be fostered and encouraged, yet the potency and dignity of those laws are measured exactly as they are administered to the people through the agency of the courts. If these State decisions lack uniformity and their diverse procedure and practice burden and hamper business projected or invited into or through a State, or if justice is interrupted by local traditions or influences or technicality or subtlety in any State, a feeling of hostility towards the courts of that State will surely follow and they cannot be of the greatest service. . . . It was nearly a quarter of a century ago that certain unselfish and thoughtful lawyers saw the necessity of harmonizing conflicting State Statutes that were vexing and retarding interstate commerce and organized the Conference of Commissioners on Uniform State Laws for that purpose. They have lived to see their uniform negotiable instrument law adopted in forty-one States, and many other uniform statutes well on the way to universal popularity. The Warehouse Receipt Act is in effect in twenty-two states and the 'Sales Act' in ten. Within a decade every law affecting interstate relations will probably be made uniform in all the States, for interstate commerce is militantly supporting these lawyers. We have come to accept their work as a matter of fact, but it is difficult to measure the obligation of commerce and the country to these great jurists and public spirited men, and the ideal inspiring them. But, the thing that interests us is that there is a completed and earnest organization that is always at work. These things evidence the passing of the days of investigation and education, for the Conference of Commissioners are preparing the legislation. . . . But, there is another and equally unreasonable impediment to fixed interstate judicial relations. It is a diversified court procedure. The same system of pleading and procedure is not in vogue in any two States. As a matter of fact it is just as reasonable for the States to adopt differing languages as to adopt differing court procedure, and I challenge any sensible reason to the contrary. . . . But, . . . after the Legislatures had adopted the letter of the uniform Statutes, many State Courts failed to live up to their wholesome spirit, and destroyed the intent of uniformity by engrafting upon them uncertain local policies, ancient customs and State traditions that had proved a source of costly annoyance and that were sought to be avoided. These jurists made a striking picture of antiquity clinging to modernity. They seemed unable to grasp the need of the great commerce of their States, that confined itself to no political boundary and which ought not to be perplexed by diversified interpretations of an identical statute, even if there were any possible reason for it. The only remedy for this blighting evil was a personal and intimate exchange of ideas and views in friendly debates between the members of different State Appellate courts, a sort of friendly talk over the back fences, as it were. By some manner of means, other than by law, conflict of interpretation must cease. . . . A conference of state judges was, then, the only hope. . . . [A] historic meeting [was held] at Montreal on August 30, 1913, the first conference of judges ever held in the history of the United States, and with which every man should become familiar. It means, in plain language, that the Chief Justice of the Supreme Appellate Courts and the Senior Circuit Judges of the Federal Circuits

or their alternates, did enter a conference to which they were invited, . . . and there followed and grew out of it a permanent organization, officially known as the 'Judicial Section' of the American Bar Association."—T. W. Shelton, *Fixed interstate judicial relations* (Pamphlet, 1914, pp. 10-15).

COURTS, Administrative.—Administrative courts, which are unknown in the United States and the British empire, occupy an important place in continental Europe, and in Japan. These courts which are French in origin, regulate the relations of the government and private individuals. "Nevertheless, both in England and America, there are numerous boards, commissions, and authorities which possess what may not improperly be described as administrative jurisdiction. They are, in fact, often referred to as administrative tribunals; they possess the power of adjudication and determination in many cases, and not infrequently their decisions are conclusive, and hence not subject to review by the courts. Although they are not a part of the judicial system, their procedure when hearing and determining controversies is often characterized by the formalism of the courts of justice. A regular system of appeal is often allowed from one to another, and in some cases their decisions are published and cited as precedents. In England examples of authorities which exercise a limited administrative jurisdiction are the Railway Commission, the Local Government Board, the Board of Trade, the Board of Education, and the Board of Agriculture. In the United States similar bodies are the Interstate Commerce Commission, whose powers have been described as 'quasi administrative, quasi judicial'; the Pension Office, the Patent Office, the Land Office, the Bureau of Immigration, the office of Comptroller of the Treasury, the General Board of Customs Appraisers, the United States Customs Court, and the Court of Claims."—J. W. Garner, *Introduction to political science*, pp. 592-593.—"The French method of providing a special law for the regulation of the relations of the government and the individual has had great influence on the Continent. In most continental countries [which regulate the relations of the government and private individuals] what is known as an administrative law, is distinguished from the ordinary law, regulating the relations of individuals one with another. Like the French law, its provisions are somewhat different from the provisions of the ordinary law in similar relationships. Thus contracts with the government must be made in particular ways, in order that they may be enforceable. Thus again the personal liability of officers for the damages they cause by their illegal acts is somewhat different from that of ordinary individuals, where they have been guilty of illegal acts. The rules of law governing the actions of administrative officers are grouped together in the French legal classification, which is commonly adopted on the Continent under the name of administrative law, whether they are applied by special courts or not. In England and the United States, where perhaps they resemble more closely the ordinary rules of law governing private legal relationships, and where they are in all cases applied, certainly in last instance, by the highest of the ordinary courts, they have not thus been called by any special name. But while many countries have followed the French example in the formal recognition of an administrative law, there are comparatively few which have adopted the French idea

of administrative courts. Most have preferred to intrust the administration of the administrative law to the ordinary courts. Of those countries outside of France which have established administrative courts, the German state, Prussia, is the most important. The judges of the Prussian administrative courts are, however, in law, as well as in fact, independent in tenure of the executive. Furthermore, in Prussia the Judges of the lower administrative courts are for the most part not learned in the law, they are elected by the people of the localities over which they have jurisdiction, and in other capacities are engaged in the active work of administration. We may say, then, that one of the fundamental principles of constitutional government as seen in the law of modern European states, is: First—the existence of judicial bodies independent in tenure of the executive; which shall, Second—apply the law regulating the relations of individuals one with another—usually called the private law—by deciding the cases brought before them; and, Third—shall apply in the same manner the law regulating the relations between officers of the government and private individuals—usually called the public or administrative law. Whether a formal distinction is made between the private and the administrative law, and whether these two functions are discharged by the same courts, are matters of comparatively little importance. The important thing is that the courts which have these powers shall be independent of the executive. Without such independence it may be said that constitutional government is impossible. The independence of the judges over against the executive which, we have seen, would appear to be so necessary to the existence of constitutional government, has been ordinarily secured by providing in the law that, while they may be appointed by the executive, they may not be removed except through the concurrent action of the executive and the legislature, or by something in the nature of a formal trial, like an impeachment proceeding, in which both houses of the legislature participate. Some countries have gone even further in their desire to secure what they regarded as the necessary degree of independence. Thus in France no judge of the ordinary courts may be removed from office without the consent of the supreme ordinary court, the Court of Cassation. In Germany also the judges both of the ordinary courts and of the highest administrative court are appointed for life. The German judiciary act provides that 'no judge shall against his will be permanently or temporarily removed from office, transferred to another place, or retired, except by judicial decision and on grounds and according to forms prescribed by law.' Apart from the case of the lay judges of the lower administrative courts in Prussia, the principle of the popular election of judges adopted in the French constitution of 1791 has not been followed except in a number of the states of the United States. Opinions in that country differ as to the success of the elective principle as applied to judges. It must be admitted, however, that there is no immediate prospect of the abandonment in the United States of the principle in those cases in which it has been adopted."—J. F. Goodnow, *Principles of constitutional government*, pp. 240, 242-244.

CRACOW, or Krakow, a city in Poland, situated on the Vistula in the southwest of Galicia; an important town, of great strategic value, the ancient capital of Poland, said to have been founded in 700 A. D. The town is the distributing center for coal and zinc mines, and close by are the Kreszowice sulphur baths and the famous Wieliczka salt mines. The university (Jagellonian), the second oldest in Europe, is famous for its library. Two interesting monuments are the Krakus hill, on the opposite side of the river, and the Kosciuszko hill, large mounds of earth thrown up in memory of Krakus the mythical founder of the city, and of Kosciuszko the hero of Poland, the latter in 1820-1823, the former in the ninth century.

1257.—Civic constitution.—"Magdeburg rights." See **POLAND**: 14th century.

1290-1587.—Vicissitudes.—The city changed hands frequently. In 1290 Wenceslaus II of Bohemia captured it, and in 1305 it was recaptured by Ladislaus Lokietek, king of Poland. In 1587 it ceased to be the capital.

1702.—Taken by Charles XII of Sweden. See **SWEDEN**: 1701-1707.

1793-1794.—Occupied by Russia. See **POLAND**: 1793-1796.

1795.—Seized by Austria. See **POLAND**: 1793-1796.

1809.—Incorporated by Napoleon I in duchy of Warsaw. See **GERMANY**: 1809 (July-September).

1815.—Free city.—Cracow was made a "free,

independent, and strictly neutral city, by the Congress of Vienna, under the protection of Russia, Austria and Prussia." See **AUSTRIA**: 1815-1846; **VIENNA**, CONGRESS OF.

1831-1846.—Occupation by Austrians, Russians and Prussians. See **AUSTRIA**: 1815-1846.

1846.—Seizure by Austria.—An insurrection broke out in the town as a result of which it was seized by Austria, and made part of the Austrian dominions.

1914-1915.—Threatened by the Russians. See **WORLD WAR**: 1914: II. Eastern front: d, 3.

1919.—Restored to Poland.—Cracow was made part of restored Polish state by treaty of Saint Germain.

CRÉDIT MOBILIER, French, great banking corporation formed in France in 1852, which caused a disastrous inflation of credits.

CREDIT MOBILIER SCANDAL.—On the meeting of the Congress of the United States in December, 1872, attention was called by the Speaker to charges made in the preceding canvass "that the Vice-President, the Vice-President elect, the Secretary of the Treasury, several Senators, the Speaker of the House, and a large number of Representatives had been bribed, during the years 1867 and 1868, by presents of stock in a corporation known as the Credit Mobilier [organized to contract for building the Union Pacific Railroad] to vote and act for the benefit of the Union Pacific Railroad Company. On his motion, an investigating committee was appointed, L. P. Poland, of Vermont, being chairman. The Poland Committee reported February 18th, 1873, recommending the expulsion of Oakes Ames, of Massachusetts, for 'selling to members of Congress shares of the stock of the Credit Mobilier below their real value, with intent thereby to influence the votes of such members,' and of James Brooks, of New York, for receiving such stock. The House modified the proposed expulsion into an 'absolute condemnation' of the conduct of both members."—A. Johnston, *History of American politics*, pp. 219-220.—*Report of Select Committee (42d Congress, 3d session, House of Representative report no. 77).*

CREOLE.—"In Europe it is very common to attach to the term creole the idea of a particular complexion. This is a mistake. The designation creole [in Spanish American regions] properly belongs to all the natives of America born of parents who have emigrated from the Old World, be those parents Europeans or Africans. There are, therefore, white as well as black Creoles. . . . The term Creole is a corruption of the Spanish word 'criollo,' which is derived from 'criar,' to create or to foster. The Spaniards apply the term 'criollo' not merely to the human race, but also to animals propagated in the colonies, but of pure European blood: thus they have creole horses, bullocks, poultry, &c."—J. J. von Tschudi, *Travels in Peru, ch. 5, and foot-note.*—"The term Creole is commonly applied in books to the native of a Spanish colony descended from European ancestors, while often the popular acceptance conveys the idea of an origin partly African. In fact, its meaning varies in different times and regions, and in Louisiana alone has, and has had, its broad and its close, its earlier and its later, significance. For instance, it did not here first belong to the descendants of Spanish, but of French settlers. But such a meaning implied a certain excellence of origin, and so came early to include any native of French or Spanish descent by either parent, whose pure non-mixture with the slave race entitled him to social rank. Much later the term was adopted by, not

conceded to, the natives of European-African, or Creole-African blood, and is still so used among themselves. At length the spirit of commerce availed itself of the money value of so honored a title, and broadened its meaning to take in any creature or thing of variety or manufacture peculiar to Louisiana, that might become an object of sale, as Creole ponies, chickens, cows, shoes, eggs, wagons, baskets, cabbages, etc. . . . There are no English, Scotch, Irish, Western, or Yankee Creoles, these all being included under the distinctive term 'Americans.' . . . There seems to be no more serviceable definition of the Creoles of Louisiana or of New Orleans than to say they are the French-speaking, native, ruling class."—G. E. Waring, Jr., and G. W. Cable, *History and present condition of New Orleans (Tenth Census of the United States, v. 19, p. 218)*.—See also LOUISIANA: 1766-1768; 1769.

CRETAN LABYRINTH. See ÆGEAN CIVILIZATION: Excavations and antiquities: Cretan area.

CRETE, one of the largest islands in the Mediterranean, south of the Ægean sea or archipelago. (See GREECE: Map of ancient Greece.) Recent archaeological researches (see ÆGEAN CIVILIZATION: Excavations and antiquities: Cretan area) have proved beyond a doubt that Crete was, during the third and second millenniums B. C., the center of a civilization which, as regards both its antiquity and its artistic and scientific achievements, rivalled the great civilizations of the Nile and the Euphrates valleys.

Effect of position and physical features upon Cretan civilization.—"The most important remains of ancient Ægean civilization have been found in the island of Crete, and there the whole story of this civilization can be studied from its beginning to its end. Crete was the main focus of the Ægean culture. It came to the mainland of Greece from Crete, and in Greece was really, if not exactly a foreign, at any rate a non-indigenous culture. . . . A great civilization sprang up in the Ægean Isles, and it was natural that in the largest and most fertile island of all its growth should have been most marked, and that the fully developed culture which evolved itself in Crete should have absorbed the less developed culture of the smaller isles, and eventually have forced its way on to the mainland. Crete was a favoured land for the development of the civilization whose seeds had been planted in it in the Stone Age. 'Crete,' says Mr. Hogarth, 'is large enough to be a little world in

itself, compounded of mountain and plain, high-land and lowland slopes. With its high relief arresting the burden of the sea-breezes from south and west, and preserving snow far into the spring, it is a land that flows, at such times as man will suffer it to flow, with wine and oil. . . . Man has done much to destroy the gifts of the south wind, but he cannot harm the carpet of flowery vegetation which comes up on the land, as the snows melt, and survives the year through in the higher valleys. A serrated and shaggy wall, rising from a wind-tormented, inhospitable sea, and interrupted by three main depressions, of which two are low; little locked pans and verdant valleys, hidden inland behind spurs; spontaneous vegetation where ever the north wind is shut away—such is the impression left by Crete.' Crete is the wall of the Ægean, which shuts off the territory of the Ægean civilization from the South, but this wall is not entirely without sally-ports on the outer side, the bay of the Messará, the beach of Hierapetra, the coves of the eastern butt-end. And these were probably the landing-places of the first inhabitants. Westward the wall becomes tremendous at Sphakiá, and forbids all landing, and to this fact may be due the circumstance that the Cretan civilization seems to have grown up entirely in the central and eastern parts of the island; it grew up in the lands which the first-comers had occupied, which they reached at once from the possible landing-places on the south coast. We have no proof yet of culture in Western Crete even in the most palmy days of the Minoan culture, and it may be that the Sphakian and even the Khanian region on the north coast behind it remained always in a lower state of civilization. The fact, too, that the two chief mountain-seats of Cretan religion, Ida and Dikté (Lasithi) are situated in the centre and east of the island, while the White Mountains of the west have no part in Minoan religion seemingly, and certainly none in Greek legend, to which Ida and Dikté were almost as familiar as Olympus, points in the same direction. Ida and Dikté bound on either side the great central plain of the Messará, which the first colonists would immediately occupy after their arrival on the shores of the best landing-place on the southern coast; they became naturally the homes of their gods. The White Mountains, behind the impassable wall of Sphakiá, had none to venerate them. It is in the Messará that we must place the beginnings of Cretan and Ægean culture. Eastward, expansion was easy past the slopes of Dikté, and subsidiary swarms no doubt reached the isthmus-gate of Hierapetra also. . . . The isles of the Cyclades led the Cretans in later days by easy stages to Greece, and there the plains of Argolis, of Messene, and Lakonia, of Bœotia, and eventually of Thessaly, saw the development of the Mycenaean-Minoan culture of the mainland."—H. R. Hall, *Ægean archaeology*, pp. 255-258.—"These are the natural conditions in which a Minoan world grew up; easy livelihood from small secluded corn-lands, and abundant culture of fruit-bearing trees; supplemented by upland pasturage, and the harvest of the sea. Easy intercourse with many similar lands, or coast plains of the same land, identical in natural economy, almost infinitely various in mineral resources and in artistic and industrial dialect. Intercourse less easy, but within the power of moderate seamanship, in the sailing season, with a venerable centre of art and luxury, like Egypt. Above all, a landscape of exceptional beauty, of brilliant atmosphere; grandly contrasted profile of ridge and promontory; infinitely various form and colouring of spring flowers and sponge-

diver's trophies, seaweed, shells, and sea-anemones. It is not surprising, then, that it is here that man first achieved an artistic style which was naturalist and idealist in one; acutely observant of the form and habit of living things, sensitive to the qualities and potentialities of raw material, wonderfully skilled in the art of the potter, painter, gem-engraver, and gold-smith; and above all, able to draw inspiration from other styles and methods, without losing the sureness of its own touch, or the power to impress its own strong character on its works of art."—J. L. Myres, *Dawn of history*, pp. 180-181.

Language and literature. See **ÆGEAN CIVILIZATION**: Excavations and antiquities: Cretan area.

Government and social organization.—"The language of the script is not yet deciphered, but from the form of the written documents, which Arthur Evans has found in very large numbers in the palace archives of Cnossus, and other explorers in smaller quantity at Phaestos and Agia Triadha, it is possible to learn something of Minoan government and organization. Most of the tablets are inventories of treasure and stores, and receipts for chariots, armour, metal vessels, ingots of copper such as have been found in store at Agia Triadha, and singly in Cyprus and Sardinia; and smaller quantities of unworked gold by weight. Other tablets contain lists of persons, male and female; perhaps tribute paid in slaves, or in person, as in the Greek legend of the Minotaur. Clearly we have to do with the details of a vast and exact administration, far more extensive than Cnossus itself would justify; and the comparative insignificance of other Cretan towns during the great 'Palace Period' ('Late-Minoan 2'), the temporary extinction of some of them, and the traces of a system of highly engineered roads and forts over the mountain passes, confirm the impression that the later Greeks were right in the main, in regarding Minos of Cnossus as a monarch who ruled the seas and terrorized the land, absolute and ruthless, if only because inflexibly just."—J. S. Myres, *Dawn of history*, pp. 183-184.—"In Crete, as in Laconia, Dorians were the ruling people, who had subdued the old inhabitants of the island and placed them in a position of subordination. . . . It is, however, beyond doubt that settlements were made in Crete by the Phoenicians, and that a large portion of the island was subject to them. In the historical period, it is true, we no longer find them here; we find, on the contrary, only a number of Greek states, all moreover Dorian. Each of these consisted of a city with its surrounding district, in which no doubt also smaller cities in their turn were found standing in a relation of subordination to the principal city. For that each city of the 'ninety-cities' or 'hundred-cities' isle, as Homer calls it, formed also an independent state, will probably not be supposed. As independent states our authorities give us reason to recognize about seventeen. The most important of these were in earlier times Cnossus, Gortyn and Cydonia."—G. Schömann, *Antiquities of Greece: the state*, pt. 3, ch. 2.—See also **ASIA MINOR**: B. C. 1100.—"The settlers in Crete had betrayed a true Dorian incapacity for assimilating the conquered nationalities; and each city is a miniature Sparta in relation to its immediate neighbours. . . . The members of the serf population were not assigned wholly to the use of individual citizens as at Sparta, and the chief sign of that more rigorous communism which distinguished the Cretan cities was the existence of a class of slaves working for the state and helping to support all the citizens by their collective labour. . . . The

other class of private serfs . . . exhibit the mildest form of slavery in Greece. They were householders with property of their own, they could apparently intermarry with free women, and they had a subsidiary right of inheritance to their masters' estates. They possessed, however, no legal personality of their own, and before a court and in other legal acts were represented by their masters. . . . [See **SERFDOM**: Heroic Age.] Lastly we have the privileged class of freemen . . . divided into the Dorian tribes of the Hylleis, Pamphyli, and Dymanes. Within this class the noble clans . . . were distinguished from the commons by certain special political privileges. . . . The military character of this ruling class, necessitated by the smallness of its numbers, was strongly marked, and a Cretan city has been compared, with as much justice as Sparta, to a camp. The citizens met at public meals, which were supported directly or indirectly by the state; for even where as at Lyctus, each member paid a tithe of his produce, he was at least partly reimbursed by receipts from the public revenues. The common tables, to which the young were admitted, had by no means merely a social character, for their organisation was directed to military training and to education of a general kind. Associations were encouraged of a military, political, and exclusive character. The young formed themselves into bands . . . for hunting and mimic combat, the older men into clubs . . . which dined together at the public tables, possibly fought together in the field, formed the same party in the state, and doubtless fostered the factious life characteristic of the Cretan cities. A union of these clubs was often sufficiently powerful to impair the constitution, as is shown by the occasional abolition of the highest magistracy by the nobles who would not submit to justice."—A. H. J. Greenidge, *Handbook of Greek constitutional history*, pp. 116-118.—See also **ÆGEAN CIVILIZATION**: Minoan Age: B. C. 1600-1200; **EUROPE**: Ancient: Greek civilization: Its heritage.

B. C. 68-66.—Roman conquest.—The Romans came into collision with the Cretans during their conflict with the Cilician pirates. The Cretans, degenerate and half-piratical themselves, had formed an alliance with the professional buccaneers, and defeated, off Cydonia, a Roman fleet that had been sent against the latter, 71 B. C. They soon repented of the provocation they had offered and sent envoys to Rome to buy peace by heavy bribes; but neither the penitence nor the bribes prevailed. Three years passed, however, before the proconsul, Quintus Metellus, appeared in Crete 68 B. C. to exact satisfaction, and two years more were spent in overcoming the stubborn resistance of the islanders. The taking of Cydonia cost Metellus a bloody battle and a prolonged siege. Cnossus and other towns held out with equal courage. In the end, however, Crete was added to the conquered dominions of Rome. At the last of the struggle there occurred a conflict of jurisdiction between Metellus and Pompey, and their respective forces fought with one another on the Cretan soil.—T. Mommsen, *History of Rome*, bk. 5, ch. 4.

823.—Conquest by the Saracens.—"The reign of Al Hakem, the Omniade Caliph of Spain, was disturbed by continual troubles; and some theological disputes having created a violent insurrection in the suburbs of Cordova, about 15,000 Spanish Arabs were compelled to emigrate in the year 815. The greater part of these desperadoes established themselves at Alexandria, where they soon took an active part in the civil wars of Egypt. The rebellion of Thomas [an officer who disputed

the Byzantine throne with Michael III, and the absence of the naval forces of the Byzantine Empire from the Archipelago, left the island of Crete unprotected. The Andalusian Arabs of Alexandria availed themselves of this circumstance to invade the island, and establish a settlement on it, in the year 823. Michael was unable to take any measures for expelling the invaders, and an event soon happened in Egypt which added greatly to the strength of this Saracen colony. The victories of the lieutenants of the Caliph Almamon compelled the remainder of the Andalusian Arabs to quit Alexandria; so that Abou Hafs, called by the Greeks Apochaps, joined his countrymen in Crete with forty ships, determined to make the new settlement their permanent home. It is said by the Byzantine writers that they commenced their conquest of the island by destroying their fleet, and constructing a strong fortified camp, surrounded by an immense ditch, from which it received the name of Chandak, now corrupted by the western nations into Candia. . . . The Saracens retained possession of Crete for 135 years."—G. Finlay, *History of the Byzantine empire, from 716 to 1057, bk. 1, ch. 3*.—During the stay of these piratical Andalusian Arabs at Alexandria, "they cut in pieces both friends and foes, pillaged the churches and mosques, sold above 6,000 Christian captives, and maintained their station in the capital of Egypt till they were oppressed by the forces and presence of Almamon himself."—E. Gibbon, *History of the decline and fall of the Roman empire, ch. 52*.

961-963.—**Recovery from the Saracens.**—"In the subordinate station of great domestic, or general of the East, he [Nicephorus Phocas, afterwards emperor, on the Byzantine throne], reduced the island of Crete, and extirpated the nest of pirates who had so long defied, with impunity, the majesty of the Empire. . . . Seven months were consumed in the siege of Candia; the despair of the native Cretans was stimulated by the frequent aid of their brethren of Africa and Spain; and, after the massy wall and double ditch had been stormed by the Greeks, a hopeless conflict was still maintained in the streets and houses of the city. The whole island was subdued in the capital, and a submissive people accepted, without resistance, the baptism of the conqueror."—E. Gibbon, *History of the decline and fall of the Roman empire, ch. 52*.

1800-1913.—**Summary of chief events.**—"At the opening of the nineteenth century the island of Crete was a Turkish vilayet or province. Two circumstances then embittered the lot of the island. First of all, the Orthodox Christians who constituted a majority of the population were almost continually oppressed by their Mohammedan rulers and were periodically engaged in bloody conflict with their Mohammedan neighbors. Secondly, while Crete was a separate Turkish vilayet, the Cretans, both Mohammedan and Christian, spoke the Greek language and were bound to Greece by a sense of common nationality. From these two circumstances resulted a long series of disastrous insurrections and massacres. Oddly enough, the Powers of Europe throughout the century persistently added to the confusion by coming to the aid of the Mohammedans as against the Christians,

and by supporting the sultan's sovereignty as against the nationalist aspirations of the Cretan Hellenes. When in 1821 the Greeks on the mainland revolted, the Greeks in Crete joined in the insurrection. But at the end of the war, the Powers decided that Crete should be left in the Ottoman Empire, instead of being joined to the new kingdom of Greece. For a time Crete was quiet, under the beneficent rule of an exceptionally statesmanlike governor, Mustafa Pasha (1832-1852), but he had hardly left the island when Crete again fell into anarchy. The Congress of Berlin (1878) vainly attempted to settle the question by establishing in Crete a sort of constitutional government, which had been promised by the sultan in the 'Organic Statute' of 1868. The sultan, however, intended nothing of the kind, and in 1889 he placed Crete again under the despotic rule of a Mohammedan *vah* or governor. In 1896 a new insurrection compelled the sultan to promise reforms, but within a few months the insincerity of his promises became apparent, and again civil war was the order of the day. This time the kingdom of Greece intervened, sending warships and an army to assist the Cretan insurgents (1897). On the mainland the Greeks were defeated by the Turks and compelled to abandon their enterprise. And the Powers, stubbornly and blindly, as ever, stepped in to declare that Greece must not annex Crete, that Crete must remain under the sultan's suzerainty. The Powers were willing, however, that the Cretans should have self-government in local affairs, and proclaimed the autonomy of Crete (December, 1897). Not yet were the Cretans satisfied. In 1905 insurgents led by Eleutherios Venizelos declared the union of their island with Greece, and the Cretan assembly assented, but the Powers again intervened to uphold the sultan's sovereignty. This time they conceded that, while Crete should remain an autonomous part of the Ottoman Empire, the king of Greece should appoint a high commissioner (1906) to rule the island, and Greek officers should drill the Cretan *gendarmierie* and militia. The desire of the Cretans for union with Greece was now irresistibly aroused. In 1908 they again voted union; but the question was left unsettled until in 1912 Cretan deputies were admitted to the parliament at Athens, the Turkish flag at Canea (in Crete) was hauled down, and [as a result of the Balkan War of 1912] by the treaty of London, 30 May, 1913, Turkey renounced all sovereignty over Crete. The national aspirations of Crete were at last satisfied when in December, 1913, Constantine, king of the Hellenes, took possession of the island at Canea and solemnly hoisted the flag of the Hellenic kingdom."—C. "CRIME AGAINST KANSAS." See U. S. A.: 1856: Senator Sumner's speech on "The crime against Kansas."

CRIME AND CRIMINOLOGY: Nature of crimes.—"Crime is a variable quantity. It is the product of the aggregate social condition and tendencies of a people at a given moment in its history. Actions which in one age are regarded as heroic, and which have elevated their authors to the rank of the gods, in another bring the same daring spirits to a dungeon or the gibbet. The connection between law and ethics is not nearly so close as is commonly imagined. In law nothing is wrong which the law itself does not forbid. Precedent and prejudice wage perpetual war with progress. The conservative instincts of the race, which are allied to authority in Church and State, in the form of established governmental institutions, oppose the radical and revolutionary tendencies of the political and social innovators whose respect for the past is limited by the tenacity of their aspirations for the future. That which is

ENLARGEMENT OF A FINGER PRINT

permanent and abiding in human nature constitutes its larger part; but there is enough that is evanescent to impart a transitory character to many alleged crimes and many forms of punishment. Progress has been attended by one constant effort to throw off oppression—religious, political, legal, and military; to find room for the exercise and development of individual tastes and capacities. The determination to conquer personal freedom has been indomitable, and it has furnished many martyrs, whom tyrants have branded as criminals. These observations have a distinct bearing upon the question whether crime is a disease. Since what is crime in one age is no crime in another, then, if crime is a disease, disease in one age may be health in another. Where heresy is regarded as a crime, the heretic must, upon that theory, be a person whose physical and mental constitution are more or less abnormal. Christians might be regarded as suffering from disease, or at least as constituting an anthropological type, in Arabia; and Mussulmans must be similarly regarded throughout Christendom. . . . Crime is not a character which attaches to an individual. It is not a simple phenomenon of ethical aberration from a standard type. It is rather a complex relation, which the law creates between itself and the law-breaker. The law creates crime. It therefore creates the criminal, because crime cannot be said to exist apart from the criminal. The criminal is

a man who puts himself in an attitude of antagonism to the law."—F. H. Wines, *Punishment and reformation*, pp. 23-25.

Outline of criminological theories.—"Among primitive people, such as the Hebrews of the Psalms, mankind are sharply divided into the good and the bad, the righteous and the unrighteous, the sheep and the goats. In this estimation the unrighteous, or, as we now call them, the criminals, are those whose acts and omissions are such as to incur the wrath and vengeance of the tribal god—a wrath and vengeance that are utterly indiscriminating, and fall alike upon the just and upon the unjust, upon the righteous and the unrighteous, the tribe being regarded by its deity as a whole, just as the family is regarded by the rest of the tribe as a whole. For any transgression by one member of the tribe the whole tribe is punished by its god, and for any transgression by one member of a family the whole family is punished by the tribe. . . . This view . . . was gradually superseded by a doctrine which regarded him [the criminal] as one of the generality of an undivided mankind, but one who had succumbed under stress of temptation, and was not otherwise distinguished. This way of regarding the criminal was strongly supported by Beccaria and Bentham, who made it the basis of their schemes of treating criminals. They contended that, since criminals are normal persons resembling the rest of the human race in all material respects, they are swayed by the same motives; but since the motives that restrain other people from committing crime are not in criminals strong enough to restrain them from committing crime, an additional motive, in the shape of fear of punishment, should be provided to reinforce the insufficient motives and render them effectual. Punishment of the criminal is no longer to be vindictive, nor is it to be propitiatory of the anger of God, as primitive punishments are, for the criminal is to be regarded, for the purpose of human justice, no longer as a sinner against God, but solely as an offender against the laws of society. The function of punishment is solely deterrent. Its only purpose is to deter a would-be criminal from committing crime, and this it can do only if the criminal is an ordinary normal person, swayed, like the rest of mankind, by fear of punishment among other motives. A subsequent school looked more closely into the matter, and, while not departing in principle from the doctrine that criminals are normal persons who have yielded to temptation, yet observed that there were differences among criminals, and that to treat them alike and in the mass must necessarily perpetrate injustice, which it was one purpose of Beccaria's and Bentham's systems to avoid. The doctrine that all criminals are normal persons swayed by the same motives as the rest of mankind is clearly untrue, so these reformers discerned, of those criminals who are lunatics also, and for criminal lunatics justice demands special treatment. Young persons also are on a footing different from adults, and for them also different treatment is required. Another profound difference between the newer and the older schools was that, while the latter punished only to deter, the former placed reform also as one of the purposes of punishment. Both alike, however, postulated that the sane adult criminal is a normal, ordinary person who has yielded to a temptation that the non-criminal has not succumbed to, either because he was better founded in morality, or perchance because the temptation never came his way.

"The fourth mode of regarding the criminal was that identified with the name of Cesare Lombroso,

and called sometimes the anthropological, sometimes the positive doctrine. This differed from the view of Beccaria and his successors, and reverted to the original doctrine that the criminal is specifically distinct from the person who does not commit crime. The old view was, as we have seen, that the criminal or sinner was distinct from the righteous man, and separated from him by an impassable gulf. This was Lombroso's doctrine also; but whereas the primitive doctrine discerned no difference between criminal and non-criminal except that the one was wicked and the other good, Lombroso professed to discern between them innumerable differences of physique, of mind, and of habits, which marked criminals off as a separate race, as distinct from the rest of the community as, for instance, the Semitic Jews are distinct from Aryan Christians among whom they live, and, like the Jews, easily distinguished by the discerning eye of the anthropological positivist. . . . The method of the anthropological criminologist is, or was, to examine each criminal with respect to his physical and mental qualities, his habits, conduct, and so forth; and whatever quality the criminologist found that departed from an imaginary standard that he fixed in his mind as the normal, he put down as a 'stigma' of criminality, marking the criminal off as belonging to the criminal race or pathological variety of human kind, and distinguishing him from the non-criminal man. . . . The school of Lombroso taught that criminality is derived from heredity alone; and the doctrine led to such patent absurdities that its opponents flew to the opposite extreme, and asserted that criminality is the product of environment alone. . . . Criminals, according to this school, are not born criminals, but made criminals; and their criminality is due to poverty, to their being brought up in bad homes by drunken and criminal parents, to lack of education, to drunkenness, either of their parents or of themselves, and so forth. It did not appear to these doctrinaires, any more than to their opponents, that either proof or evidence of their assertions was needed. It seemed to them likely, *a priori*, that such circumstances would tend to criminality.

"A passing notice must be paid to a school that has never had much influence or many followers, which regards the criminal as the product of disease—of a disease allied to, if not identical with, madness. In the opinion of coroners' juries, almost every suicide was *ipso facto* mad when and at the time the murder is committed. For the coroners' jurors there is some excuse. They wish to save the feelings and minimize the distress of the relatives of the dead. . . . A coroner's verdict of *felo de se* carried with it terrible consequences. The felon of himself was (and still is) denied Christian burial, a deprivation that caused in former times much more distress than it does now to the surviving relatives. . . . Besides this, his lands and goods were forfeited; and it was to prevent this as well as the other consequences of a verdict of *felo de se* that coroners' juries took to violating their oaths, and finding, in the teeth of the evidence, that the suicide was mad when he took his life. . . . The conclusion arrived at by Dr. Goring from his most painstaking and laborious survey of data furnished by several thousand inmates of English convict prisons is discrepant from all those that have been described, and is this: the criminal men—by which he means men who have been convicted of crime sufficiently serious to be tried in a superior court, that is to say, at assizes or quarter sessions—do differ appreciably, and even conspicuously, from the mean of Englishmen at

large. The difference is not the difference between disease and health; still less is it a difference that can be termed in biological language a 'sport,' such as albinism or the possession of a sixth finger or toe on one extremity; still less is it a racial peculiarity inherent in a criminal stock and descending by inheritance, as the Jewish or Japanese. According to Dr. Goring, criminals, in the restricted sense in which he uses the word, do as a class differ in both physical and mental characters from the rest of the population; but they differ, not specifically, but selectively. They differ in possessing, in a rather higher degree than the average or the mean, certain qualities that all men possess in some degree. . . . They are a separate class, but a selected class, and are different solely because they are selected."—C. A. Mercier, *Crime and criminals*, pp. 203-215.

Social regulation of crime.—Outlawry.—Minor breaches of the peace.—Fine system.—Methods of trial.—Crimes against property.—As the primary function of the state is the pro-

CESARE LOMBROSO

tection of the lives and property of the community through war, it is not strange that a similar function in internal affairs should develop. . . . Long before the state existed men had protected themselves and still felt abundantly able to do so in ordinary emergencies. In all civilizations, groups of men are found united in bonds of real or fictitious kinship for purposes of joint protection. How natural this has become is seen at a glance by observing the numerous fraternal orders of developed civilization. These groups in early civilization were united for purposes of blood revenge, fine payments, and mutual responsibility. The patriarchal family at a later stage answered the same purpose. The loosening of patriarchal family ties through commerce and industry brought about in city life the development of the guild, the guild for social and religious purposes, the trades guild, the merchant guild, and akin to these the orders of knighthood and the brotherhoods of the church. Such associations, found in all civilizations and in all times and places, devoted themselves to the preservation of the peace by restraints placed on individual members, by dis-

cipline inflicted on disturbers of the peace, and by presenting a united front against aggressions of unruly members of the community. But besides associations for the preservation of the peace there were others organized for opposite purposes, associations composed of outlaws, robbers, criminals who had fled from home, men owning no master, worthless fellows for whom no one would be responsible. Against such the united strength of the entire community was necessary. The state therefore developed the function of unifying the force of the community against armed associations of lawless men within its own borders. Similarly, armed resistance to the laws of the community in the form of rebellions, insurrections, and riots, was suppressed through the power and strength of the state. In this way developed the right of the state to suppress such disturbances with a strong

in retaliation. This *lex talionis*, or principle of eye for eye, tooth for tooth had one extremely inconvenient consequence; it was likely to develop into a blood feud. Blood feuds kept the whole community in turmoil, besides robbing the state of many of its best fighting men. Under such conditions the state assumed the office of umpire, examined the facts in the case, turned over the guilty person to his prosecutors for punishment, and forbade the friends of the convicted person to carry the matter further. These, debarred from the privilege of avenging their kinsman, sought the privilege of redeeming his life by payments. Such a compromise in most cases proved eminently satisfactory to all parties. Better pay a fine than lose a friend, and on the other hand a fine received is some compensation for the loss of a friend, and perhaps more satisfactory than blood revenge. The

EXPERT COMPARING FINGER PRINTS

hand, if necessary suspending civil law for the time and exercising arbitrary war powers. Ordinary breaches of the peace long remained outside the jurisdiction of the state, and even now some offenses against the peace are popularly considered matters to be settled personally, such as offenses against honor, chastity, reputation, and the person. Certain social associations or institutions are still accustomed to exercise slight powers of discipline over their membership, as, for instance, the family, the school, and the church. There are many survivals of private vengeance such as the fisticuff brawl of humble life, the well-nigh obsolete duel of socially higher classes, the use of lynch law administered by outraged individuals of communities, Ku-Klux organizations, and the feuds still so common in backward countries or semipatriarchal communities. All such offenses were once legally avenged by the persons offended, supported by the kinsmen of the fraternity or family. If one slew another, the friends of the murdered man slew the murderer or one of his kin. If injury less than life was inflicted, similar injuries were given

state was also satisfied, by this arrangement, because men that kill in fight make good soldiers in war, and war material of that sort was too valuable to waste through useless bloodshedding in private feuds. In some such way developed a system of fines graded for almost every possible offense against the person, from a life to a tooth or a lock of hair, and varying in amount with the social standing of the person assaulted. These fines were paid to the injured person, or to his kin or fraternity, but the state reserved a fraction of the fine for its services as umpire. The income from such fines proved so remunerative to the state that there was a constant tendency to usurp the function of the prosecutor, whose business it was to present the criminal for trial, and to claim an increasing share of the fines. The matter was settled at last by the state's assumption of the entire matter. When a crime takes place, the state arrests the accused, makes all investigations, prosecutes the case, inflicts the punishment, and collects the whole of the fine. The early pecuniary motive of the state has, however, overreached itself, for,

in the development of punitive law, other forms of punishment, such as imprisonment, have been substituted for fines in many offenses, and the income of the state has correspondingly diminished, while the expense of administering punishment has enormously increased. Neither the injured person nor his kin now share in the fine, but merely have the doubtful satisfaction of seeing punishment inflicted on the offender. By theory a civil process for damages is possible, but in practice, useless. There are movements in some countries looking to the enactment of a law requiring the state to indemnify the injured person or his kin, on the theory that the state agrees to preserve the peace, and if it fails to do so in any case, it should pay a penalty for its neglect. The state in the development of its functions of arbitration and punishment, has tried many curious experiments. The city of refuge represents an attempt to distinguish be-

retaliation. The injured party would naturally seek to recover from the offender or his kin more than he had lost, so as to recompense him for his trouble. This brought about bad feeling, fighting, and occasional loss of life. As in the case of personal violence, the state at first acted as umpire and settled guilt and damages, taking its share of the latter. It then gradually assumed entire responsibility in the matter, and now merely returns to the robbed person his property if recovered. The modern state in exercising its jurisdiction over crime of all sorts is not satisfied merely to detect and punish the offender, but seeks to prevent the commission of crime (1) by carefully framing and publishing the penal law, in order that no one may plead as an excuse ignorance of the law, and (2) by the use of a permanent police force, which systematically patrols the community and seeks to prevent disorder and crime. Even more is ac-

ALPHONSE BERTILLON

Illustrating the famous system of identification of which he was the founder

tween intentional and unintentional murder. The use of the sanctuary is a device for the prevention of punishment inflicted without proper consideration and trial. The ordeal and the judicial combat endeavored to throw the responsibility for the decision on God. The system of compurgation allowed the state to decide prudently on the side that could present more able-bodied men ready to swear to anything to help out a friend (a system not unknown at this day). Torture was regularly applied on the theory that a man in great pain will tell the truth. Finally, excessively cruel and hideous forms of death were inflicted on the guilty under the theory that others would be deterred from similar offenses. Such systems of punishment now survive only in uncivilized communities, and the modern theory of penology is founded on humane principles. [See also CRIMINAL LAW: 1600.] A similar development of state authority took place in respect to offenses against property. For a long period theft was considered to be purely a private matter and was settled by methods of

complished in this direction by wise systems of education and economic regulations and well-being."—J. Q. Dealey, *State and government*, pp. 77-81.

Methods of identifying criminals.—"When the criminal or person accused of the crime has been captured, it becomes necessary to identify him. For this purpose various methods of identification have been devised, such as the anthropometric [or Bertillon] and the dactyloscopic or finger-print methods. The fingerprint method is rapidly becoming the principal means of identification because of its accuracy and the ease with which it can be applied."—M. F. Parmelee, *Criminology*, p. 340.—"The measurements taken of the bony skeleton—the height, length of the extended arms, of the limbs and their component parts separately (including the fingers and the feet), and dimensions of the skull and chest—do not precisely correspond in any two human beings, in their totality. Dr. Alphonse Bertillon, of Paris, has grasped this thought, and he has devised a set of instruments

for taking these measurements, and a system of recording them upon cards and arranging the cards systematically, so that, under the classification which he has invented, they can be consulted with as much ease as a dictionary, or the card catalogue of a library. His card catalogue of convicts is the best conceivable form of a universal criminal register, upon many accounts; not only because it is practical, accurate, and adequate; but because the habitual convict whose criminal record is needed for any legitimate purpose can be unmistakably identified thereby, without any knowledge of his name; while the accidental or occasional criminal who does not relapse into crime, and is not again arrested, is therein buried out of sight as irrecoverably as if the record had been destroyed in the central fires of the earth."—F. H. Wines, *Punishment and reformation*, pp. 248-249.

CRIMINAL LAW.—"Acts of violence and theft . . . were long considered to be private matters, of no concern to the state, and were settled in accordance with the social customs of the community. Regulation, therefore, was social, domestic, religious, but not political [see CRIME AND CRIMINOLOGY]. As the state began to enlarge its importance and to regulate all disputes that tended to disturb the peace of the community, necessarily it had to adopt a system of law as the basal principles for decisions. The customs of the community based on primitive customs and prohibitions (the tabu) supplied such a system subject to such modifications as from time to time became necessary. In this way developed ordinary criminal law, which names the various prohibitions enforced by the state, and specifies the penalties to be inflicted in case of violation of the law."—J. Q. Dealey, *State and government*, pp. 275-276.

1066-1272.—Ordinary criminal courts.—"In a very few words the history of the ordinary courts is as follows: Before the Conquest the ordinary criminal court was the County or Hundred Court, but it was subject to the general supervision and concurrent jurisdiction of the King's Court. The Conqueror and his sons did not alter this state of things, but the supervision of the King's Court and the exercise of his concurrent jurisdiction were much increased both in stringency and in frequency, and as time went on narrowed the jurisdiction and diminished the importance of the local court. In process of time the King's Court developed itself into the Court of King's Bench and the Courts of the Justices of Assize, Oyer and Terminer and Gaol Delivery, or to use the common expression, the Assize Courts; and the County Court, so far as its criminal jurisdiction was concerned, lost the greater part of its importance. These changes took place by degrees during the reigns which followed the Conquest, and were complete at the accession of Edward I. In the reign of Edward III. the Justices of the Peace were instituted, and they, in course of time, were authorized to hold Courts for the trial of offenders, which are the Courts of Quarter Sessions. The County Court, however, still retained a separate existence, till the beginning of the reign of Edward IV. when it was virtually, though not absolutely, abolished. A vestige of its existence is still to be traced in Courts Leet."—J. F. Stephen, *History of the criminal law of England*, v. 1, pp. 75-76.

12th-14th centuries: Courts in feudal France. See COURTS: France: Lack of uniformity.

1166.—Disappearance of compurgation in criminal cases.—"In criminal cases in the king's courts, compurgation is thought to have disappeared in consequence of what has been called 'the implied prohibition' of the Assize of Clarendon, in 1166. But it remained long in the local and ecclesiastical courts. Palgrave preserves as the latest instances of compurgation in criminal cases that can be traced, some cases as late as 1440-1, in the Hundred Court of Winchelsea in Sussex. They are cases of felony, and the compurgation is with thirty-six neighbors. They show a mingling of

the old and the new procedure."—J. B. Thayer, *Older modes of trial* (*Harvard Law Review*, v. 5, p. 59).

1166-1215.—Jury in criminal cases.—"It seems to have been possible, even before the decree of the Fourth Lateran Council, in . . . 1215, to apply the jury to criminal cases whenever the accused asked for it. . . . The Assize of Clarendon, in 1166, with its apparatus of an accusing jury and a trial by ordeal is thought to have done away in the king's courts with compurgation as a mode of trial for crime; and now the Lateran Council, in forbidding ecclesiastics to take part in trial by ordeal, was deemed to have forbidden that mode of trial."—J. B. Thayer, *Jury and its development* (*Harvard Law Review*, v. 5, p. 265).

1176 (circa).—"Eyres," and criminal jurisdiction.—"It is enough for me to point out that, on the circuits instituted by Henry II, and commonly distinguished as 'eyres' by way of pre-eminence, the administration of criminal justice, was treated, not as a thing by itself, but as one part, perhaps the most prominent and important part, of the general administration of the country, which was put to a considerable extent under the superintendence of the justices in eyre. Nor is this surprising when we consider that fines, amercements, and forfeitures of all sorts were items of great importance in the royal revenue. The rigorous enforcement of all the proprietary and other profitable rights of the Crown which the articles of eyre confided to the justices was naturally associated with their duties as administrators of the criminal law, in which the king was deeply interested, not only because it protected the life and property of his subjects, but also because it contributed to his revenue."—J. F. Stephen, *History of the criminal law of England*, v. 1, p. 102.

1198-1199.—Trial by ordeal.—"The earliest instance of the ordeal [see ORDEAL] in our printed judicial records occurs in 1198-9, on an appeal of death, by a maimed person, where two of the defendants are adjudged to purge themselves by the hot iron. But within twenty years or so this mode of trial came to a sudden end in England, through the powerful agency of the Church,—an event which was the more remarkable because Henry II., in the Assize of Clarendon (1166) and again in that of Northampton (1176), providing a public mode of accusation in the case of the larger crimes, had fixed the ordeal as the mode of trial. The old form of trial by oath was no longer recognized in such cases in the king's courts. It was the stranger, therefore, that such quick operation should have been allowed in England to the decree, in November, 1215, of the Fourth Lateran Council at Rome. That this was recognized and accepted within about three years (1218-19) by the English crown is shown by the well-known writs of Henry III. to the judges, dealing with the puzzling question of what to do for a mode of trial, 'cum prohibuit sit per Ecclesiam Romanam iudicium ignis et aquae.' I find no case of trial by ordeal in our printed records later than Trinity Term of the 15 John (1213)."—J. B. Thayer, *Older modes of trial* (*Harvard Law Review*, v. 5, p. 64-65).

13th-14th centuries.—Trial by combat, England, France. See WAGER OF BATTLE.

13th-14th centuries.—Holy brotherhood, or Hermandad, Spain. See HOLY BROTHERHOOD, or HERMANDAD.

1215.—Two juries in criminal cases.—"The ordeal was strictly a mode of trial. What may clearly bring this home to one of the present day is the well-known fact that it gave place, not long after the Assize of Clarendon, to the petit jury,

when Henry III. bowed to the decree of the fourth Lateran Council (1215) abolishing the ordeal. It was at this point that our cumbrous, inherited system of two juries in criminal cases had its origin."—J. B. Thayer, *Presumptions and the law of evidence* (*Harvard Law Review*, v. 3, p. 159, note).

1215.—Coroners and common law power as to fires.—"Although Magna Charta took away the power of the Coroner of holding Pleas of the Crown, that is of trying the more important crimes, there was nothing to forbid him from continuing to receive accusations against all offenders. This he did, and continues to do to the present day, without challenge, in cases of sudden or unexplained deaths. Nor is it denied that he has done so and may do so in other matters, such as in treasure trove, wreck of the sea and deodands. The difficulty, of course, is to know whether the Coroner was or was not in the habit of holding inquests on fires. There is no evidence that he had not the power to do so. On the contrary, we think the extracts from the ancient writers which we have before quoted, are on the whole in favour of his having that power. Before Magna Charta he had the power to try all serious crimes; arson would unquestionably be one of them. Magna Charta only took away his power of trying them, not of making a preliminary investigation, otherwise an inquest."—S. Baker, *Law Magazine & Review* (London, 1886-7), 4th series, v. 12, p. 268.

1272-1875.—King's Bench.—Supreme criminal court.—"From the reign of Edward I, to the year 1875 it [the court of King's Bench] continued to be the Supreme Criminal Court of the Realm, with no alterations in its powers or constitution of sufficient importance to be mentioned except that during the Commonwealth it was called the Upper Bench."—J. F. Stephen, *History of the criminal law of England*, v. 1, p. 94.

1276.—Coroner's jury.—"The earliest instance that occurs of any sort of preliminary inquiry into crimes with a view to subsequent proceedings is the case of the coroner's inquest. Coroners, according to Mr. Stubbs, originated in the year 1104, but the first authority of importance about their duties is to be found in Bracton. He gives an account of their duties so full as to imply that in his day their office was comparatively modern. The Statute de Officio Coronatoris (4 Edward I., st. 2, A. D. 1276) is almost a transcript of the passage in Bracton. It gives the coroner's duty very fully, and is, to this day, the foundation of the law on the subject."—J. F. Stephen, *History of the criminal law of England*, v. 1, p. 217.

Also in: W. Forsyth, *Trial by jury*, p. 187.

1285.—Courts of oyer and terminer.—"The first express mention of them with which I am acquainted is in the statute 13 Edw. I, c. 29 (1285), which taken in connection with some subsequent authorities throws considerable light on their nature. They were either general or special. General when they were issued to commissioners whose duty it was to hear and determine all matters of a criminal nature within certain local limits, special when the commission was confined to particular cases. Such special commissions were frequently granted at the prayer of particular individuals. They differed from commissions of gaol delivery principally in the circumstance that the commission of Oyer and Terminer was 'ad inquirendum, audiendum, et terminandum,' whereas that of gaol delivery is 'ad gaolam nostram castri nostri de C. de prisonibus in ea existentibus hac vice deliberandum,' the interpretation put upon which was that justices of Oyer and Terminer could proceed only upon indictments taken before themselves, whereas

justices of gaol delivery had to try every one found in the prison which they were to deliver. On the other hand, a prisoner on bail could not be tried before a justice of gaol delivery, because he would not be in the gaol, whereas if he appeared before justices of Oyer and Terminer he might be both indicted and tried."—J. F. Stephen, *History of the criminal law of England*, v. 1, p. 106.

1305.—Challenging jury for cause.—"The prisoner was allowed to challenge peremptorily, i.e. without showing cause, any number of jurors less than thirty-five, or three whole juries. When or why he acquired this right it is difficult to say. Neither Bracton nor Britton mention it, and it is hard to reconcile it with the fact that the jurors were witnesses. A man who might challenge peremptorily thirty-five witnesses could always secure impunity. It probably arose at a period when the separation between the duties of the jury and the witnesses was coming to be recognized. The earliest statute on the subject, 33 Edw. I, st. 4 (A. D. 1305), enacts 'that from henceforth, notwithstanding it be alleged by them that sue for the king that the jurors of those inquests, or some of them, be not indifferent for the king, yet such inquests shall not remain untaken for that cause, but if they that sue for the king will challenge any of those jurors, they shall assign of the challenge a cause certain.'"—J. F. Stephen, *History of the criminal law of England*, v. 1, pp. 301-302.

1344.—Justices of the peace.—"In 1344 (18 Edw. III, st. 2, c. 2) it was enacted that 'two or three of the best of reputation in the counties shall be assigned keepers of the peace by the King's Commission, . . . to hear and determine felonies and trespasses done against the peace in the same counties, and to inflict punishment reasonably.' This was the first act by which the Conservators of the Peace obtained judicial power."—J. F. Stephen, *History of the criminal law of England*, v. 1, p. 113.

1351.—Treason Act, England. See TREASON: English law.

1459.—Bill of Attainder first passed, England. See ATTAINDER, BILL OF ATTAINDER.

1506.—Insanity as a defence.—The earliest adjudication upon the legal responsibility of an insane person occurred in the Year Book of the 21 Henry VII.—*American Law Review*, v. 15, p. 717.

1547.—Two lawful witnesses required to convict.—"In all cases of treason and misprison of treason,—by statutes 1 Edw. VI. c. 12; 5 & 6 Edw. VI. c. 11, and 7 & 8 Will. III. c. 3,—two lawful witnesses are required to convict a prisoner; unless he shall willingly and without violence confess the same. And, by the last-mentioned statute, it is declared, that both of such witnesses must be to the same overt act of treason; or one to one overt act, and the other to another overt act of the same species of treason, and not of distinct heads or kinds: and that no evidence shall be admitted to prove any overt act, not expressly laid in the indictment."—J. F. Stephen, *Commentaries*, v. 4, p. 425 (8th ed.).

1592.—Criminal trials under Elizabeth.—"In prosecutions by the State, every barrier which the law has ever attempted to erect for the protection of innocence was ruthlessly cast down. Men were arrested without the order of a magistrate, on the mere warrant of a secretary of state or privy councillor, and thrown into prison at the pleasure of the minister. In confinement they were subjected to torture, for the rack rarely stood idle while Elizabeth was on the throne. If brought to trial, they were denied the aid of a counsel and the evidence of witnesses in their behalf. Nor were they

confronted with the witnesses against them, but written depositions, taken out of court and in the absence of the prisoner, were read to the jury, or rather such portions of them as the prosecution considered advantageous to its side. On the bench sat a judge holding office at the pleasure of the crown, and in the jury-box twelve men, picked out by the sheriff, who themselves were punished if they gave a verdict of acquittal."—D. Campbell, *Puritan in Holland, England and America*, v. 1, p. 367.

1600 (circa).—Capital punishment.—"Sir James Fitz James Stephen, in his *History of Criminal Law*, estimates that at the end of the sixteenth century there were about 800 executions per year in England (v. 1, 468). Another sentence in vogue in England before that time was to be hanged, to have the bowels burned, and to be quartered. Beccaria describes the scene where 'amid clouds of writhing smoke the groans of human victims, the crackling of their bones, and the flying of their still panting bowels were a pleasing spectacle and agreeable harmony to the frantic multitude.' (Ch. 39.) As late as the reign of Elizabeth, . . . the sentence of death in England was to be hung, drawn and quartered. Campian, the Jesuit, was tortured before trial until his limbs were dislocated on the rack, and was carried helpless into Westminster Hall for trial before the Chief Justice of England, unable to raise an arm in order to plead not guilty. He was sentenced to be hung, drawn and quartered, which meant legally, that upon being hung he was to be cut down while yet living, and dragged at the tail of a horse, and then before death should release him, to be hewn in pieces, which were to be sent dispersed to the places where the offense was committed or known, to be exhibited in attestation of the punishment, the head being displayed in the most important place, as the chief object of interest. In the process of hanging, drawing and quartering, Froude says that due precautions were taken to prolong the agony. Campian's case is specially interesting, as showing the intervention of a more humane spirit to mitigate the barbarity of the law. As they were about to cut him down alive from the gibbet, the voice of some one in authority cried out: 'Hold, till the man is dead.' This innovation was the precursor of the change in the law so as to require the sentence to be that he be hanged by the neck until he is dead. It is not generally known that the words 'until he is dead' are words of mercy inserted to protect the victim from the torture and mutilation which the public had gathered to enjoy."—A. Abbott, *Address before New York Society of Medical Jurisprudence (Advocate, Minnesota, 1880)*, v. 1, p. 71).

1641-1662.—No man shall be compelled to incriminate himself.—"What . . . is the history of this rule? . . . Briefly, these things appear: 1st. That it is not a common law rule at all, but is wholly statutory in its authority. 2d. That the object of the rule, until a comparatively late period of its existence, was not to protect from answers in the king's court of justice, but to prevent a usurpation of jurisdiction on the part of the Court Christian (or ecclesiastical tribunals). 3d. That even as thus enforced the rule was but partial and limited in its application. 4th. That by gradual perversion of function the rule assumed its present form, but not earlier than the latter half of the seventeenth century. . . . But nothing can be clearer than that it was a statutory rule. . . . The first of these were 16 Car. I., c. 2 (1641) and provided that no one should impose any penalty in ecclesiastical matters, nor should 'tender . . .

to any . . . person whatsoever any corporal oath whereby he shall be obliged to confess or accuse himself of any crime or any . . . thing whereby he shall be exposed to any censure or penalty whatever.' This probably applied to ecclesiastical courts alone. The second (13 Car. II., c. 12, 1662) is more general, providing that 'no one shall administer to any person whatsoever the oath usually called *ex officio*, or any other oath, whereby such persons may be charged or compelled to confess any criminal matter.' . . . The Statute of 13 Car. II. is cited in *Scurr's Case*, but otherwise neither of them seems to have been mentioned; nor do the text-books, as a rule, take any notice of them. Henceforward, however, no question arises in the courts as to the validity of the privilege against self-crimination, and the statutory exemption is recognized as applying in common-law courts as well as in others. . . . This maxim, or rather the abuse of it in the ecclesiastical courts, helps in part to explain the shape which the general privilege now has taken. . . . We notice that most of the church's religious investigations, . . . were conducted by means of commissions or inquisitions, not by ordinary trials upon proper presentment; and thus the very rule of the canon law itself was continually broken, and persons unsuspected and unbetrayed '*per famam*' were compelled, '*seipsum prodere*,' to become their own accusers. This, for a time, was the burden of the complaint. . . . Furthermore, in rebelling against this abuse of the canon-law rule, men were obliged to formulate their reasons for objecting to answer the articles of inquisitions. . . . They professed to be willing to answer ordinary questions, but not to betray themselves to disgrace and ruin, especially as where the crimes charged were, as a rule, religious offences and not those which men generally regard as offences against social order. In this way the rule began to be formulated and limited, as applying to the disclosure of forfeitures and penal offences. In the course of the struggle the aid of the civil courts was invoked; . . . and towards the end of the seventeenth century, . . . it found a lodgment in the practice of the Exchequer, of Chancery, and of the other courts. There had never been in the civil courts any complaint based on the same lines, or any demand for such a privilege. . . . But the momentum of this right, wrested from the ecclesiastical courts after a century of continual struggle, fairly carried it over and fixed it firmly in the common-law practice also."—J. H. Wigmore, *Nemo tenetur seipsum prodere* (*Harvard Law Review*, v. 5, pp. 71-88).

1660-1820.—One hundred and eighty-seven capital offenses added to criminal code in England.—"From the Restoration to the death of George III.,—a period of 160 years,—no less than 187 capital offenses were added to the criminal code. The legislature was able, every year, to discover more than one heinous crime deserving of death. In the reign of George II. thirty-three Acts were passed creating capital offenses; in the first fifty years of George III., no less than sixty-three. In such a multiplication of offenses all principle was ignored; offenses wholly different in character and degree were confounded in the indiscriminating penalty of death. Whenever an offense was found to be increasing, some busy senator called for new rigor, until murder became in the eye of the law no greater crime than picking a pocket, purloining a ribbon from a shop, or pilfering a pewter-pot. Such lawmakers were as ignorant as they were cruel. . . . Dr. Johnson,—no squeamish moralist,—exposed them; Sir W. Blackstone, in whom admiration of our jurisprudence was almost a foible, de-

nounced them. Beccaria, Montesquieu, and Bentham demonstrated that certainty of punishment was more effectual in the repression of crime, than severity; but law-givers were still inexorable."—T. E. May, *Constitutional history of England* (*Widdleton's ed.*), v. 2, pp. 553-554.

1679.—Habeas Corpus Act passed, to insure fair trial. See ENGLAND: 1679 (May).

1695.—Counsel allowed to persons indicted for high treason.—"Holland, following the early example of Spain, always permitted a prisoner the services of a counsel; and if he was too poor to defray the cost, one was furnished at the public charge. In England, until after the fall of the Stuarts, this right, except for the purposes of arguing mere questions of law, was denied to every one placed on trial for his life. In 1695, it was finally accorded to persons indicted for high treason. Even then it is doubtful, says Lord Campbell, whether a bill for this purpose would have passed if Lord Ashley, afterwards Earl of Shaftesbury and author of the '*Characteristics*,' had not broken down while delivering in the House of Commons a set speech upon it, and, being called upon to go on, had not electrified the House by observing: 'If I, sir, who rise only to give my opinion upon a bill now pending, in the fate of which I have no personal interest, am so confounded that I am unable to express the least of what I propose to say, what must the condition of that man be, who, without any assistance, is called to plead for his life, his honor, and for his posterity?'"—D. Campbell, *Puritan in Holland, England and America*, v. 2, p. 446.

1708.—Torture.—The fact that judicial torture, though not a common law power of the courts, was used in England by command of Mary, Elizabeth, James I and Charles I, is familiar to all. It was sanctioned by Lord Coke and Lord Bacon, and Coke himself conducted examinations by it. It was first made illegal in Scotland in 1708; in Bavaria and Württemberg in 1806; in Baden in 1831.—A. Abbott, *Address before New York Society of Medical Jurisprudence* (*Advocate*, Minnesota, 1889, v. 1, p. 71).

1725.—Knowledge of right and wrong test of responsibility.—The case of Edward Arnold, in 1725, who was indicted for shooting at Lord Onslow, seems to be the earliest case in which the knowledge of right and wrong becomes the test of responsibility.—*American Law Review*, v. 15, pp. 720-722.

1770.—Criminal law of libel.—"In this case [Case of the North Briton Junius' Letter to the King, tried before Lord Mansfield and a special jury on the 2nd June 1770] two doctrines were maintained which excepted libels from the general principles of the Criminal Law—firstly, that a publisher was criminally responsible for the acts of his servants, unless he was proved to be neither privy nor to have assented to the publication of a libel; secondly, that it was the province of the Court alone to judge of the criminality of the publication complained of. The first rule was rigidly observed in the Courts until the passing of Lord Campbell's Libel Act in 1843 (6 and 7 Vict., c. 96). The second prevailed only until 1792, when Fox's Libel Act (32 Geo. III, c. 60) declared it to be contrary to the Law of England. . . . A century's experience has proved that the law, as declared by the Legislature in 1792, has worked well, falsifying the forebodings of the Judges of the period, who predicted 'the confusion and destruction of the Law of England' as the result of a change which they regarded as the subversion of a fundamental and important principle of English

Jurisprudence. Fox's Libel Act did not complete the emancipation of the Press. Liberty of discussion continued to be restrained by merciless persecution. The case of Sir Francis Burdett, in 1820, deserves notice. Sir Francis had written, on the subject of the 'Peterloo Massacre' in Manchester, a letter which was published in a London newspaper. He was fined £2,000 and sentenced to imprisonment for three months. The proceedings on a motion for a new trial are of importance because of the Judicial interpretation of the Libel Act of 1792. The view was then stated by Best, J. (afterwards Lord Wynford), and was adopted unanimously by the Court, that the statute of George III. had not made the question of libel one of fact. If it had, instead of removing an anomaly, it would have created one. Libel, said Best, J., is a question of law, and the judge is the judge of the law in libel as in all other cases, the jury having the power of acting agreeably to his statement of the law or not. All that the statute does is to prevent the question from being left to the jury in the narrow way in which it was left before that time. The jury were then only to find the fact of the publication and the truth of the innuendoes, for the judges used to tell them that the intent was an inference of law to be drawn from the paper, with which the jury had nothing to do. The legislature have said that this is not so, but that the whole case is for the jury (4 B. and A. 95). The law relating to Political Libel has not been developed or altered in any way since the case of *R. v. Burdett*. If it should ever be revived, which does not at present appear probable, it will be found, says Sir James Stephen, to have been insensibly modified by the law as to defamatory libels on private persons, which has been the subject of a great number of highly important judicial decisions. The effect of these is, amongst other things, to give a right to everyone to criticise fairly—that is, honestly, even if mistakenly—the public conduct of public men, and to comment honestly, even if mistakenly, upon the proceedings of Parliament and the Courts of Justice. (History of the Criminal Law, II., 376.) The unsuccessful prosecution of Cobbett for an article in the 'Political Register,' in 1831, nearly brought to a close the long series of contests between the Executive and the Press. From the period of the Reform Act of 1832, the utmost latitude has been permitted to public writings, and Press prosecutions for political libels, like the Censorship, have lapsed."—J. W. R. Brown, in *Law Magazine & Review*, 4th series, v. 17, p. 197.

1781.—Bill of Attainder forbidden by United States constitution. See *ATTAINDER, BILL OF ATTAINDER*.

1791.—Criminals allowed counsel.—"When the American States adopted their first constitutions, five of them contained a provision that every person accused of crime was to be allowed counsel for his defence. The same right was, in 1791, granted for all America in the first amendments to the Constitution of the United States. This would seem to be an elementary principle of justice, but it was not adopted in England until nearly half a century later, and then only after a bitter struggle."—D. Campbell, *Puritan in Holland, England and America*, v. 1, p. 70.

1818.—Last trial by battle.—"The last appeal of murder brought in England was the case of *Ashford v. Thornton* in 1818. In that case, after Thornton had been tried and acquitted of the murder of Mary Ashford at the Warwick Assizes her brother charged him in the court of king's bench with her murder, according to the forms of the

ancient procedure. The court admitted the legality of the proceedings, and recognized the appellee's right to wage his body; but as the appellant was not prepared to fight, the case ended upon a plea of *autrefois acquit* interposed by Thornton when arraigned on the appeal. This proceeding led to the statute of 59 Geo. III., c. 46, by which all appeals in criminal cases were finally abolished."—H. Taylor, *Origin and growth of the English constitution*, pt. 1, p. 311.—See also *WAGER OF BATTLE*.

1819.—Severity of the former criminal law of England.—"Sir James Mackintosh in 1819, in moving in Parliament for a committee to inquire into the conditions of the criminal law, stated that there were then 'two hundred capital felonies on the statute book.' Undoubtedly this apparent severity, for the reasons stated by Sir James Stephen, is greater than the real severity, since many of the offenses made capital were of infrequent occurrence; and juries, moreover, often refused to convict, and persons capitally convicted for offenses of minor degrees of guilt were usually pardoned on condition of transportation to the American and afterwards to the Australian colonies. But this learned author admits that, 'after making all deductions on these grounds there can be no doubt that the legislation of the eighteenth century in criminal matters was severe to the highest degree, and destitute of any sort of principle or system.'"—J. F. Dillon, *Laws and jurisprudence of England and America*, p. 366.

1825.—"Ticket-of-leave" system established.—"The 'ticket-of-leave' system [was] established under the English laws of penal servitude. It originated under the authority of the governors of the penal colonies, and was the first sanctioned by Parliament, so far as the committee are aware, by an Act 5 Geo. IV., chap. 34. Subsequently, when transportation for crime was abolished by the Acts 16, 17 Vict., chap. 99 (A. D. 1853) and 20, 21 Vict., chap. 3, and system of home prisons established, the 'license' or ticket-of-leave system was adopted by Parliament, in those acts, as a method of rewarding convicts for good conduct during imprisonment. By further acts passed in 1864, 1871 and 1879, the system has been brought gradually into its present efficacy."—*Report of committee on judicial administration, and remedial procedure (9 American Bar Association Report, p. 317)*.

1832-1860.—Revision of criminal code in England.—"With the reform period commenced a new era in criminal legislation. Ministers and law officers now vied with philanthropists, in undoing the unbalanced work of many generations. In 1832, Lord Auckland, Master of the Mint, secured the abolition of capital punishment for offences connected with coinage; Mr. Attorney-general Denman exempted forgery from the same penalty in all but two cases, to which the Lords would not assent; and Mr. Ewart obtained the like remission for sheep-stealing, and other similar offences. In 1833, the Criminal Law Commission was appointed, to revise the entire code. . . . The commissioners recommended numerous other remissions, which were promptly carried into effect by Lord John Russell in 1837. Even these remissions, however, fell short of public opinion, which found expression in an amendment of Mr. Ewart, for limiting the punishment of death to the single crime of murder. This proposal was then lost by a majority of one; but has since, by successive measures, been accepted by the legislature;—murder alone, and the exceptional crime of treason, having been reserved for the last penalty of the law. Great indeed, and rapid, was this reformation of the criminal

code. It was computed that, from 1810 to 1845, upwards of 1,400 persons had suffered death for crimes, which had since ceased to be capital.—T. E. May, *Constitutional history of England* (Widdleton's ed.), v. 2, pp. 557-558.

1843.—Lord Campbell's Libel Act, and publisher's liability.—"In the 'Morning Advertiser' of the 19th of December, 1769, appeared Junius's celebrated letter to the king. Inflammatory and seditious, it could not be overlooked; and as the author was unknown, informations were immediately filed against the printers and publishers of the letter. But before they were brought to trial, Almon, the bookseller, was tried for selling the 'London Museum,' in which the libel was reprinted. His connection with the publication proved to be so slight that he escaped with a nominal punishment. Two doctrines, however, were maintained in this case, which excepted libels from the general principles of the criminal law. By the first, a publisher was held criminally answerable for the acts of his servants, unless proved to be neither privy nor assenting to the publication of a libel. So long as exculpatory evidence was admitted, this doctrine was defensible; but judges afterwards refused to admit such evidence, holding that the publication of a libel by a publisher's servant was proof of his criminality. And this monstrous rule of law prevailed until 1843, when it was condemned by Lord Campbell's Libel Act."—T. E. May, *Constitutional history of England* (Widdleton's ed.), v. 2, pp. 113-114.—"And be it enacted, that whensoever, upon the trial of any indictment or information for the publication of a libel, under the plea of not guilty, evidence shall have been given which shall establish a presumptive case of publication against the defendant by the act of any other person by his authority, it shall be competent to such defendant to prove that such publication was made without his authority, consent, or knowledge, and that the said publication did not arise from want of due care or caution on his part."—*Statute 6 & 7 Vic., c. 96, s. 7.*

1848.—English court of criminal appeal.—"England has not yet got her court of Criminal Appeal, although the Council of Judges, in their belated scheme of legal reform, recommend the legislature to create one. Questions whether an action should be dismissed as 'frivolous or vexatious,' disputes about 'security for costs,' and the 'sufficiency of interrogatories' or 'particulars,' and all manner of trivial causes affecting property or status, are deemed by the law of England sufficiently important to entitle the parties to them, if dissatisfied with the finding of a court of first instance, to submit it to the touchstone of an appeal. But the lives and liberties of British subjects charged with the commission of criminal offences are in general disposed of irrevocably by the verdict of a jury, guided by the directions of a trial judge. To this rule, however, there are two leading exceptions. In the first place, any convicted prisoner may petition the sovereign for a pardon, or for the commutation of his sentence; and the royal prerogative of mercy is exercised through, and on the advice of the Secretary of State for the Home Department. In the second place, the English machine juridical notwithstanding its lack of a properly constituted Court of Criminal Appeal, is furnished with a kind of 'mechanical equivalent' therefor, in the 'Court for Crown Cases Reserved,' which was established by act of Parliament in 1848 (11 & 12 Vic. c. 78)." —*English court of criminal appeal* (Green Bag, v. 5, p. 345).

1854.—Conflict between United States consti-

tution and a treaty.—"About 1854, M. Dillon, French consul at San Francisco, refused to appear and testify in a criminal case. The Constitution of the United States (Amendment VI.), in criminal cases grants accused persons compulsory process for obtaining witnesses, while our treaties of 1853, with France (Art. II.) says that consuls 'shall never be compelled to appear as witnesses before the courts.' Thus there was a conflict between the Constitution and the treaty, and it was held that the treaty was void. After a long correspondence the French Consuls were directed to obey a subpoena in future."—T. D. Woolsey, *Introduction to the study of international law* (6th ed.), p. 157, note.

1877.—"Indeterminate sentences."—"This practice, so far as the committee can ascertain, has been adopted in the states of New York and Ohio only. . . . The Ohio statute has been taken mainly from that which was adopted in New York, April 12, 1877."—*Report of committee on judicial administrations, and remedial procedure* (9 American Bar Association Report, p. 313).

1877.—Prison reform law. See PRISON REFORM: England.

1880.—New criminal laws, New York state. See CODES: 1848-1880.

1887.—Amendment Bill, Ireland. See IRELAND: 1885-1891.

1890.—Law for minors, Italy. See CHILD WELFARE LEGISLATION: 1889-1900.

1893.—Criminal jurisdiction of federal courts.—"The Supreme Court of the U. S., in *United States v. Rodgers*, . . . 150 U. S., . . . in declaring that the term 'high seas' in the criminal law of the United States is applicable as well to the open waters of the great lakes as to the open waters of the ocean, may be said, in a just sense, not to have changed the law, but to have asserted the law to be in force upon a vast domain over which its jurisdiction was heretofore in doubt. The opinion of Justice Field will take its place in our jurisprudence in company with the great cases of the Genesee Chief, 12 How. (U. S.), 443, and its successors, and with them marks the self adapting capacity of the judicial power to meet the great exigencies of justice and good government."—*University Law Review*, v. 1, p. 2.

1899-1916.—Indeterminate sentence and parole system, New York state. See PRISON REFORM: United States: Indeterminate sentence and parole system of New York state.

1906.—English Prevention of Corruption Act.—The object of the English Prevention of Corruption Act, passed in 1906, is to check the practice of giving and taking secret commissions, which, as the late Lord Russell of Killowen caused the country to realize, was widely prevalent in commercial and professional circles, as well as in the humbler sphere of the "servants' hall." Before the passing of the Act, of course, it was illegal to give and receive secret commissions. After the Act came into force, it became criminal. The provisions of the measure make it a misdemeanour, punishable, on summary conviction or on indictment, with fine or imprisonment—

(1) For any agent corruptly to receive any gift or consideration for doing or not doing any act, or showing or not showing favour or disfavour, in relation to his principal's affairs;

(2) For any person corruptly to offer such gift or consideration to any agent;

(3) For any person to give to an agent, or for any agent to use, any false or defective receipt or other business document with intent to deceive the principal.

Two years after the Act came into force its effects were discussed by a writer in the *London Times*, who said: "The circumstances that the *fiat* of the Attorney-General must be obtained before any prosecution can be instituted under the Act, and that, until recently, there was no organization qualified to take active steps to prevent the Act from becoming a dead letter, account for the comparatively small number of cases in which proceedings have been taken under the Act during the past two years. Fifteen prosecutions have been authorized by the Attorney-General. In 12 cases there have been convictions, one case has been abandoned, and two are still pending. These figures show, at any rate, that prosecutions are not lightly instituted, and that the charges which have been preferred against offenders have been, as a rule, well founded.

"It is undoubtedly true, in this matter as in others, that 'everybody's business is nobody's.' Soon after the passing of the Act it was realized that, if it was to prove effective 'for the better prevention of corruption,' some organization must be formed to give effect to the measure—to furnish information in respect to its provisions, to investigate complaints, and, if necessary, to institute prosecutions. A society was formed, therefore, with the title of 'The Secret Commissions and Bribery Prevention League,' to work on lines similar to those of the societies which strengthen the arm of the law so effectively in respect of cruelty to children and cruelty to animals. . . . The committee have investigated a large number of cases which have been brought to their knowledge, they have given advice freely to members and others interested in the working of the Act, they have issued thousands of circulars and letters, as well as occasional 'news sheets,' they have made representations to the War Office and other public bodies as opportunities occurred, and have summoned various trade conferences for the consideration of points of importance arising out of the Act. The value of the League's work is emphasized by the fact that the members include many important limited liability companies and trade associations, and that the League is becoming in a special sense representative of the commercial community as a whole."

1913.—Law for juvenile offenders, Italy. See CHILD WELFARE LEGISLATION: 1902-1920.

1921.—Federal criminal procedure.—Criminal law administration.—The courts of the United States derive their criminal jurisdiction from the statute law of Congress solely. Criminal cases in the federal courts are governed and controlled by federal statutes and state statutes and decisions under state statutes are inapplicable, except in so far as such statutes or decisions may be persuasive. In the absence of federal law the courts of the United States are governed in the administration of criminal law by the rules of the common law rather than state laws so that, for instance, the rules of evidence in the federal courts are those which were in force at common law in the state at the time, the federal court therein was created, as amended thereafter by Congress, but unaffected by subsequent state statutes.—Based on J. E.

Byrne, *Federal criminal procedure*, p. 1.—William H. Taft, reviewing Raymond Fosdick's book on the "American Police Systems," drew attention to specific defects in American criminal law administration: "All crime cannot be prevented, nor indeed can all crime be punished. The excellence or failure of a government in this regard is to be judged by comparison with the efficiency of other governments in this respect. Exact comparison between the amount of crime in this country [United States] and in other countries is not easy, because one incidental defect in our system is the absence of satisfactory statistics of all the crimes committed, prosecuted and punished in the various States of this country. This incidental defect is a symptom of the principal disease. Had we an efficient machine for the prevention of crime and for the arrest, prosecution and conviction of the criminal, we should have complete statistics; but so slipshod and ineffective is our whole machinery that little effort is made by the authorities to secure accurate and detailed reports and to tabulate them in an intelligible way for public information. One reason for this, we may infer, is that such statistics, if complete, would reflect no credit on the particular State or county government, and it is thought wiser not to bring too clearly to the public knowledge the disgraceful failure of the present system.

"Mr. Fosdick has not been able to give us full statistics the country over, but by dint of special local investigations, of fugitive reports, of the consultation of court records, of such reports as those of Dr. Hoffman, the learned vice president of the Prudential Life Insurance Company, the helpful series of articles of the *Chicago Tribune* on the number of homicides committed for certain periods and other reliable sources of statistical information he has shown a distressing amount of all kinds of crime, but especially of homicides, burglaries and highway robberies in the cities of the United States as compared with cities of the same population in England, France, Italy and Germany before the war. Statistics as to the continental countries during the war do not offer a proper basis for comparison, but those of England do, and the contrast between the numbers of such crimes in England and in the various cities of the United States is startling and discouraging. Even more humiliating for Americans is the comparison between the percentage of crimes committed with those punished in the United States and in these European countries. Let us take Chicago, which is one-third the size of London and one-fifteenths of the whole of England and Wales in population. Murders in England and Wales in 1914 were 92, and those in Chicago were 87. . . . And this difference is continued in the other cities. New York City in 1916 had six times the number of homicides—that is, murder and manslaughter—that London had for the same year, and only 10 less homicides than all of England and Wales. . . . In 1918 New York had again six times more homicides than London and exceeded the total homicides of England and Wales by 67. In 1915 New York City had eight times as many burglaries as London, and nearly twice the number of burglaries reported in all England and Wales. In 1917 New York had four times as many burglaries as London and approximately the same number occurred in England and Wales. Chicago in 1916 had 532 more burglaries than London. . . . In 1916 New York had 886 such crimes to London's 10, and to 227 of England, Wales and Scotland together. In 1918 New York City had 840, while London had 63, and England and Wales had 100. And the same contrast exists with respect to the other cities of

this country. Equally unsatisfactory is the contrast with reference to prosecutions and convictions. In a single year in Oregon—and this can be duplicated almost everywhere—there occurred 56 homicides. Forty-six of the offenders were arrested, 10 committed suicide and 36 were held for trial. Of the 36 only three were convicted at all, and of these only one for murder in the first degree. . . .

"The calculations of the *Chicago Tribune* show that in the year 1916 there were 8,372 culpable homicides and 115 legal executions in the United States. In 1917 there were 7,803 and 85 legal executions. . . . In London in 1917 there were 19 premeditated murders; three remained unsolved, five perpetrators committed suicide, 11 were arrested, and out of these there were eight convictions. In the whole of England and Wales for 1916 there were 85 murders committed, and 59 persons arrested in connection therewith were committed for trial. Fifty-three trials resulted in the year, and of these 12 were found insane and were confined, 16 were found guilty, but were adjudged insane and confined, 10 were acquitted and 15 were sentenced to death. Mr. Fosdick . . . [considers] the reasons for this contrast. The first reason for it he finds in the large alien population in all our great cities. In European cities the percentage of alien residents is very small indeed. In the American cities it reaches 30 and 40 percent, and includes a large number of residents who do not speak the English language, who do not know our laws, who preserve their native customs in grouped settlements and offer immense difficulties to the police authorities in dealing with their ignorance and lack of sense of responsibility and respect for authority. In addition to the presence of aliens, there are congested centers of the colored race in our large cities, and the racial prejudices that are often excited produce additional breaches of the law and add to the record of crime. Mr. Fosdick points out, however, that if the offenses of our foreign and colored races were stricken from calculation our crime would still greatly exceed the record of western Europe. He says that in spite of all its kindness and good nature, the temper of our communities contains a strong strain of violence. 'We condone violence and shirk its punishment. We lack a high instinct for order. We lack a sense of the dignity of obedience to restraint which is demanded for the common good. We lack a certain respect for our own security and the terms upon which civilized communities keep the peace.' He quotes from the *Chicago Tribune* the following: 'There is probably more undisciplined, egotistic, mischievous force in the United States than in any country of first rank in the world.'

"A second cause for failure to enforce the law against crimes he finds in the injection of politics into the police forces of the cities. A third cause, he points out, is the apparently irrepressible desire of misguided enthusiasts to attempt to elevate the morals of the community by regulations directed against acts which most of the community are inclined to, and which are lawful except for such regulations. The impossibility of enforcing these with spasmodic efforts to do so demoralizes enforcement of all law and inevitably puts a choice of laws to be enforced in the police authorities. This is a fruitful source of favoritism, corruption and is a motive for political control. Another great cause for this humiliating record of unpunished crime he finds in the machinery for prosecuting crime in the courts after the police have made the arrests. He says that the police are often unjustly charged with responsibilities for a failure

to punish crime in many instances where the blame for it should rest with the courts and their machinery for prosecution and convictions. He gives instances of ridiculous technicalities upon which men who have been convicted by juries have escaped in courts of review ultimate punishment. Here the fault is due partly to the failure of the Legislature to enact statutes forbidding the setting aside of judgments by courts of review except for errors substantially affecting the result in the court below and partly by the disposition of narrow judges to mouse through records to find technicalities upon which to release the prisoner. Perhaps the capital reason for the disgraceful failure in the administration of justice in State courts is the delay in bringing cases to trial. All crimes but murder and treason are bailable before conviction, and if the defendant in the prosecution for bailable offenses has friends or money he can secure bondsmen, and he is released. Men without friends or money who are accused must stay in jail. The humane desire of the courts to grant the release of innocent men detained in jail on charges naturally leads them to direct the trial of the defendants in jail before the trial of the defendants out on bail. In few cities, if any, in the United States, are there courts enough and prosecuting officers enough promptly to dispose of all the cases before the courts. The result of it is that the preference of 'jail' cases, so called, to 'bail' cases for early trial postpones the bail cases until the case becomes so old that the witnesses have left the jurisdiction or disappeared beyond the control of the subpoena of the court. More than this, after months or years, the memory of the witnesses is much more indefinite and much easier to impeach on cross-examination. Delay is the great hope of the guilty criminal, and it is by delay that the criminals with money secure immunity."—W. H. Taft, *Administration of criminal law in the United States* (*Brooklyn Eagle*, Feb. 13, 1921).

CRISES, Financial. See PANIC.

CRISPI, Francesco (1810-1901), Italian statesman; leader of Sicilian revolution of 1848, active in "Expedition of the Thousand," and in Sicilian government under Garibaldi's dictatorship in the island; 1864, opposed invasion of Papal states; 1867, engineered the Lobbia affair; 1876, elected president of the Chamber; 1877, minister of the interior; 1879, retired from office; 1887, again minister of the interior and premier, and secured various reforms. In January, 1891, his government was overturned; December, 1893, he again returned to power, suppressed disorder, and held office until the defeats in Abyssinia brought about his resignation. An attack upon him in 1897, by the radical leader Cavalotti, resulted in a parliamentary investigation into his conduct, and a vote of censure by the Chamber, for his irregular method of restoring the depleted secret service fund.—See also ITALY: 1870-1901; 1895-1896; 1898.

CRISSA, Crisa, or Krissa, ancient town of Greece in Phocis, near Delphi. See DELPHI.

CRISTOFAR, Bartolommeo (1655-1731), Italian inventor of the pianoforte. See INVENTIONS: 18th century: Piano.

CRITTENDEN, John Jordan (1787-1863), American statesman, four times United States senator; governor of Kentucky, 1848-1850; attorney-general under President Fillmore; author of Crittenden Compromise. See U. S. A.: 1860 (December): Vain concessions and humiliations.

CRITTENDEN COMPROMISE, measure proposed by Senator Crittenden to prevent secession of Southern states. See U. S. A.: 1860 (December): Vain concessions and humiliations.

CROATANS, Indian tribe. See AMERICA: 1587-1590.

CROATIA, in the Balkan peninsula, a region of Jugo-Slavia, lying between Carniola on the north, and Bosnia on the south, with a coast line from Fiume to the Dalmatian frontier; formerly a Hungarian possession. The population is composed almost entirely of Croats and Serbs, both of whom belong to the Serbo-Croatian branch of the Slavonic race. Agriculture is the chief industry.

Early peoples. See SLAVS: Origin.

Language. See PHILOLOGY: 22.

7th century.—Slavonic occupation and settlement. See BALKAN STATES: Races existing.

910-1091.—Independent kingdom established.—During the tenth and eleventh centuries Croatia, which had for a time been a part of the empire of the western Franks, and then subdued by the Byzantine emperor, gained its independence and established a kingdom. A vigorous, aggressive people, with a special aptitude for maritime affairs, the Croats contrived to make themselves uncomfortable but respected neighbors of the western kingdoms, especially of Italy, and for a time even exacted tribute from Venice.—See also BYZANTINE EMPIRE: 1081-1085.

1090.—Subjection and annexation to Hungary. See HUNGARY: 972-1116.

1299-1322.—Supremacy in Bosnia. See BOSNIA: 1250-1322.

1353-1393.—Ruled over by Turks of Bosnia. See BOSNIA: 1376-1391.

1576.—Transferred to the duke of Styria.—Military colonization. See HUNGARY: 1567-1604.

1526-1718.—Turkish conquests.—Austrian possession.—During the sixteenth and seventeenth centuries, Croatia passed under the control of the Ottoman empire. The Turks never attempted to colonize the Croatsians, nor even to make them good Mohammedans—being too busy with wars of conquest. By the peace of Carlowitz in 1699 and by the treaty of Passarowitz in 1718 the greater part of Croatia, along with Hungary, came under the control of Austria. A part of Croatia known as Turkish Croatia was retained by the Turks.

1809-1814.—Conquest by Napoleon.—For a few years, during the height of Napoleon's power, Croatia was under the French flag, joined to the Illyrian provinces, and almost all Croats of military age served in the Napoleonic army.—See also GERMANY: 1809 (July-September).

1814-1848.—Appanage of Hungarian crown.—Croatia, as an appanage of the Hungarian crown, became something between a subject province and an allied kingdom in the Austro-Hungarian monarchy. See AUSTRIA: Map showing Hapsburg possessions.

1848.—Part in Hungarian revolution.—The reactionary Austrian government used race prejudices of Croats against Magyars to subdue the great Hungarian uprising. Jellachich, Ban of Croatia,

was merely a tool of the Hapsburgs. See HUNGARY: 1847-1849; JUGO-SLAVIA: 1848-1867.

1858-1918.—Reincorporation in Hungary.—A compromise treaty made Croatia once more a part of Hungary, and gave the Croats representation in the Hungarian Diet. Hungary, however, immediately annexed Fiume, and the Croats, dissatisfied with the compromise, began the agitation for autonomy which continued until the close of the World War. A succession of riots, especially those of 1883 and 1903, emphasized nationalist demands. See AUSTRIA: 1866-1867; HUNGARY: 1856-1868.

1897.—Beginning of Serbo-Croat coalition. See SERBIA: 1885-1903.

1909.—Question of Triple Monarchy. See AUSTRIA-HUNGARY: 1909 (December).

1914.—Attitude towards World War. See AUSTRIA-HUNGARY: 1914-1915.

1915.—Promises of Adriatic territory by Treaty of London. See LONDON, TREATY OR PACT OF.

1917-1918.—Desire for union with Jugo-Slavs. See JUGO-SLAVIA: 1914-1918.

1918.—Independence.—Part of Jugo-Slavia. See AUSTRIA-HUNGARY: 1918; HUNGARY: 1918: End of the World War; JUGO-SLAVIA: 1918: Formation of the Serb-Croat-Slovene kingdom.

1919.—Attempt to take Fiume for Jugo-Slavia. See FRUME: 1919: Italians and Jugo-Slavs claim city.

1921.—United with Serbs and Slovenes in Jugo-Slavia. See BALKAN STATES: 1921: Jugo-Slavia.

CROATS, early inhabitants of Balkan regions. See JUGO-SLAVIA: Jugo-Slav peoples; SERBIA: c. 650-1168; also CROATIA.

CROCE, Benedetto (1866-), Italian politician and philosopher; minister of public instruction in the Giolitti ministry, 1920-1921; author of the "Æsthetic." See ART: Definitions and theories.

CRÆSUS, last king of Lydia (c. B. C. 560-546). His name has become proverbial for immense wealth. He was overthrown by Cyrus the Great in 546 B. C. See ASIA MINOR: B. C. 724-539; GREECE: B. C. 500-493: Rising of Ionians of Asia Minor against Persians.

CROFTERS ACT (1886). See SCOTLAND: 1730-1921.

CROIA, town in Albania. In 1477 it was besieged by Turks and surrendered to them. See GREECE: 1454-1479.

CROISILLES, village of northern France, southeast of Arras occupied by Germans during World War. See WORLD WAR: 1918: II. Western front: c, 6; d, 2.

CROKER, Richard (1841-1922), politician in New York City. See NEW YORK CITY: 1894-1895; 1897.

CRO-MAGNON, prehistoric race in Europe. See ANTHROPOLOGY: Physical; FRANCE: The people; EUROPE: Prehistoric period: Earliest remains, etc.: Cro-Magnon man; also Palœolithic art, etc.

CROMER, Evelyn Baring, 1st Earl of (1841-1917), British statesman and colonial administrator. Investigated repressive measures of Governor Eyre in Jamaica, 1865; private secretary to Lord Northbrook, viceroy of India, 1872-1876. The great work of his life was the rehabilitation of Egyptian financial conditions as British agent in 1877 and as consul-general in Egypt, 1883-1907. He acted as chairman of commission of inquiry on the Dardanelles, 1916. See BELGIAN CONGO: 1903-1905;

EGYPT: 1883-1907; 1899-1900; 1906-1907; SUDAN: 1914.

CROMLECHS, rude stone monuments found in many parts of the British Isles, France, and elsewhere, usually formed by three or more huge, rough, upright stones, with a still larger stone lying flatly upon them. In France these are called Dolmens. They were formerly thought to be "Druids altars," to which notion they owe the name Cromlechs; but it is now very generally concluded by archaeologists that they were constructed for burial chambers, and that originally, in most cases, they were covered with mounds of earth, forming the well known barrows, or grave mounds, or tumuli.—L. Jewett, *Grave mounds*.—See also AMORITES.

ALSO IN: T. Wright, *Celt, the Roman and the Saxon*.—J. Lubbock, *Prehistoric times*, ch. 5.

CROMWELL, Oliver (1599-1658), Lord Protector of England, was first returned to Parliament in 1628, but showed none of his great powers at that time. In 1631, he sold his property with the intention of emigrating to the Puritan colonies; but for some reason changed his mind, though it is not now generally believed that he was stopped by an order in council. Meantime he had gone through the experience of conversion, and a period of extreme depression and doubt from which he emerged with a religious fervor and indomitable faith, which made him invincible. In 1640 he was again elected to Parliament for Cambridge, at once began to take an active interest in public affairs, which he chiefly displayed in opposition to measures dictated by the king, and to church government. In 1641 he began to assume leadership of the Root and Branch party, to which he belonged. In 1642 he was at Edgehill with a company of sixty horse, raised by himself, was the moving spirit in the "Eastern Association" which united Cambridgeshire, Essex, Hertfordshire, Norfolk and Suffolk against the king and at once advanced to the position of leader, while his troop of horse became the nucleus of the famous "Iron-sides." From this time onward his life became a part of the history of England.—See also BORDEAUX: 1652-1653; ENGLAND: 1643 (May) to 1658; INSTRUMENT OF GOVERNMENT; IRELAND: 1649-1650; 1653; JAMAICA: 1655-1796; MILITARY ORGANIZATION: 30; SCOTLAND: 1650 (September); 1651 (August); VIRGINIA: 1650-1660; WALDENSES: 1655.

Statue of.—A proposal in the English House of Commons, in 1895, to vote £500 for a statue of Cromwell was so violently opposed by the Irish members that the government was compelled to withdraw the item from the estimates. The statue was erected in Westminster (London) in 1899.

CROMWELL, Richard (1626-1712), Lord Protector of England; succeeded his father the great Oliver Cromwell in September, 1658, but in May of the following year was dismissed by the army, and retired to private life. He lived on the Continent for some years, but in 1680 returned to England and lived at Cheshunt until his death.—See also ENGLAND: 1658-1660.

CROMWELL, Thomas, Earl of Essex (c. 1485-1540), said to have been steward to the estate of archbishop of York about 1520; 1523, member of parliament; 1524, became confidential adviser to Cardinal Wolsey. After Wolsey's fall, he became parliamentary agent of Henry VIII; 1531, he became a member of the privy council; 1533, chancellor of the exchequer; 1534, secretary of the privy council; 1535, chancellor of Cambridge university and visitor, or inspector-general of the monasteries and becoming the chief agent in their suppression; 1536, became Baron Cromwell, and

the king's vicar-general; 1540, was created Earl of Essex.

CRONJE, Pietrus Arnoldus (1840-1911), Boer general in South African War. See SOUTH AFRICA, UNION OF: 1899 (October-December); 1900 (January-February).

CRUSADES.—"The Crusades were expeditions undertaken, in fulfilment of a solemn vow, to deliver the Holy Places from Mohammedan tyranny.

The origin of the word may be traced to the cross made of cloth and worn as a badge on the outer garment of those who took part in these enterprises. . . . Since the Middle Ages the meaning of the word crusade has been extended to include all wars undertaken in pursuance of a vow, and directed against Mohammedans, pagans, heretics, or those under the ban of excommunication."—L. Brehier, *Crusades (Catholic Encyclopedia, v. 4, p. 543)*.—"In their widest aspect the crusades may be regarded as a renewal of the age-long contest between East and West, in which the struggle of Greeks and Persians and of Romans and Carthaginians formed the earlier episodes. The contest assumed a new character when Europe had become Christian and Asia Mohammedan. It was not only two contrasting types of civilization but also two rival world religions which in the eighth century faced each other under the walls of Constantinople and on the battlefield of Tours. Now, during the twelfth and thirteenth centuries, they were to meet again. Seven or eight chief crusades are usually enumerated. To number them, however, obscures the fact that for nearly two hundred years Europe and Asia were engaged in almost constant warfare. Throughout this period there was a continuous movement of crusaders to and from the Moslem possessions in Asia Minor, Syria and Egypt."—H. Webster, *Early European history, pt. 2, p. 466*.

Causes and introductory events.—"Like all the great movements of mankind, the Crusades must be traced to the coincidence of many causes which influenced men of various nations and discordant feelings, at the same period of time, to pursue one common end with their whole heart. Religious zeal, the fashion of pilgrimages, the spirit of social development, the energies that lead to colonisation or conquest, and commercial relations, only lately extended so widely as to influence public opinion, all suddenly received a deep wound. Every class of society felt injured and insulted, and unity of action was created as if by a divine impulse. The movement was facilitated by the circumstance that Europe began to adopt habits of order just at the time when Asia was thrown into a state of anarchy by the invasions of the Seljouk Turks. Great numbers of pilgrims had always passed through the Byzantine empire to visit the holy places in Palestine. . . . Though the disturbed and impoverished state of Europe, after the fall of the Western Empire, diminished the number of pilgrims, still, even in times of the greatest anarchy, many passed annually through the Eastern Empire to Palestine. The improvement which dawned on the western nations during the eleventh century, and the augmented commerce of the Italians, gave additional importance to the pilgrimage to the East. About the year 1064, during the reign of Constantine X., an army or caravan of seven thousand pilgrims passed through Constantinople, led by the Archbishop of Mentz and four bishops. They made their way through Asia Minor, which was then under the Byzantine government; but in the neighbourhood of Jerusalem they were attacked by the Bedouins, and only saved from destruction by the Saracen emir of Ramla, who hastened to their assistance. These pilgrims are reported to have lost 3,000 of their number, without being able to visit either the Jordan or the Dead Sea. The invasions of the Seljouks [see TURKEY 1073-1092] increased the disorders in Palestine. . . . In the year 1076 the Seljouk Turks took possession of Jerusalem, and immediately commenced harassing the pilgrims with unheard-of exactions. The Saracens had in general viewed the pilgrims with favour,

as men engaged in fulfilling a pious duty, or pursuing lawful gain with praiseworthy industry, and they had levied only a reasonable toll on the pilgrims, and a moderate duty on their merchandise; while in consideration of these imposts, they had established guards to protect them on the roads by which they approached the holy places. The Turks, on the contrary, acting like mere nomads, uncertain of retaining possession of the city, thought only of gratifying their avarice. They plundered the rich pilgrims, and insulted the poor. The religious feelings of the Christians were irritated, and their commerce ruined; a cry for vengeance arose throughout all Europe, and men's minds were fully prepared for an attempt to conquer Palestine, when Peter the Hermit began to preach that it was a sacred duty to deliver the tomb of Christ from the hands of the Infidels."—G. Finlay, *History of the Byzantine and Greek empires, bk. 3, ch. 2, sect. 1*.

1095.—Council of Clermont.—Pope Urban II, one of two rival pontiffs then contending for recognition by the church, entered with great eagerness into the movement stirred by Peter the Hermit, and gave it a powerful impulse through his support, while obtaining for himself, at the same time, a decisive advantage over his competitor, by the popularity of the agitation. A great council was convened at Piacenza, 1095, and a second at Clermont, in the autumn of the same year, to deliberate upon the action to be taken. The city of Clermont could not contain the vast multitude of bishops, clergy and laity which assembled, and an army of many thousands was tented in the surrounding country. To that excited congregation, at a meeting in the great square of Clermont, Pope Urban addressed a speech which is one of the notable utterances of history. "He began by detailing the miseries endured by their brethren in the Holy Land; how the plains of Palestine were desolated by the outrageous heathen, who with the sword and the firebrand carried wailing into the dwellings and flames into the possessions of the faithful; how Christian wives and daughters were defiled by pagan lust; how the altars of the true God were desecrated, and the relics of the saints trodden under foot. 'You,' continued the eloquent pontiff (and Urban II. was one of the most eloquent men of the day), 'you, who hear me, and who have received the true faith, and been endowed by God with power, and strength, and greatness of soul,—whose ancestors have been the prop of Christendom, and whose kings have put a barrier against the progress of the infidel,—I call upon you to wipe off these impurities from the face of the earth, and lift your oppressed fellow-Christians from the depths into which they have been trampled.' . . . The warmth of the pontiff communicated itself to the crowd, and the enthusiasm of the people broke out several times ere he concluded his address. He went on to portray, not only the spiritual but the temporal advantages that would accrue to those who took up arms in the service of the cross. Palestine was, he said, a land flowing with milk and honey, and precious in the sight of God, as the scene of the grand events which had saved mankind. That land, he promised, should be divided among them. Moreover, they should have full pardon for all their offences, either against God or man. 'Go, then,' he added, 'in expiation of your sins; and go assured, that after this world shall have passed away, imperishable glory shall be yours in the world which is to come.' The enthusiasm was no longer to be restrained, and loud shouts interrupted the speaker; the people exclaiming as if with one voice, 'Dieu le veult! Dieu le veult!' . . . The news of this council

spread to the remotest parts of Europe in an incredibly short space of time. Long before the fleetest horseman could have brought the intelligence, it was known by the people in distant provinces; a fact which was considered as nothing less than supernatural. But the subject was in everybody's mouth, and the minds of men were prepared for the result. The enthusiastic merely asserted what they wished, and the event tallied with their prediction."—C. Mackay, *Memoirs of extraordinary popular delusions: the Crusades*, v. 2.

1095-1096.—Peter the Hermit and his appeal.—"About twenty years after the conquest of Jerusalem by the Turks, the holy sepulchre was visited by an hermit of the name of Peter, a native of Amiens, in the province of Picardy in France. His resentment and sympathy were excited by his own injuries, and the oppression of the Christian name; he mingled his tears with those of the patriarch, and earnestly inquired, if no hopes of relief could be entertained from the Greek emperors of the East. The patriarch exposed the vices and weakness of the successors of Constantine. 'I will rouse,' exclaimed the hermit, 'the martial nations of Europe in your cause'; and Europe was obedient to the call of the hermit. The astonished patriarch dismissed him with epistles of credit and complaint, and no sooner did he land at Bari, than Peter hastened to kiss the feet of the Roman pontiff. His stature was small, his appearance contemptible; but his eye was keen and lively, and he possessed that vehemence of speech which seldom fails to impart the persuasion of the soul. He was born of a gentleman's family (for we must now adopt a modern idiom), and his military service was under the neighbouring counts of Boulogne, the heroes of the first crusade. Invigorated by the approbation of the pontiff, this zealous missionary traversed, with speed and success, the provinces of Italy and France. His diet was abstemious, his prayers long and fervent, and the alms which he received with one hand, he distributed with the other; his head was bare, his feet naked, his meagre body was wrapt in a coarse garment; he bore and displayed a weighty crucifix; and the ass on which he rode was sanctified in the public eye by the service of the man of God. He preached to innumerable crowds in the churches, the streets, and the highways. . . . When he painted the sufferings of the natives and pilgrims of Palestine, every heart was melted to compassion; every breast glowed with indignation, when he challenged the warriors of the age to defend their brethren and rescue their Saviour: his ignorance of art and language was compensated by sighs and tears, and ejaculations; and Peter supplied the deficiency of reason by loud and frequent appeals to Christ and his Mother, to the saints and angels of paradise, with whom he had personally conversed. The most perfect orator of Athens might have envied the success of his eloquence; the rustic enthusiast inspired the passions which he felt, and Christendom expected with impatience the counsels and decrees of the supreme pontiff."—E. Gibbon, *History of the decline and fall of the Roman empire*, ch. 58.

ALSO IN: J. C. Robertson, *History of the Christian church*, v. 4, bk. 6, ch. 4.

1096-1099.—First great movement.—The first army of Crusaders to set out on the long march to Jerusalem was a mob of men, women and children which had not patience to wait for the organized movement of the military leaders. They gathered in vast numbers on the banks of the Moselle and the Meuse, in the spring of 1096,

with Peter the Hermit for their chosen chief. There were nine knights, only, in the swarm, and but few who had horses to ride, or efficient arms to bear, or provisions to feed upon. Knowing nothing, and therefore fearing nothing, they marched away, through France, Germany, Hungary and beyond, begging food where they could and subsisting by pillage when necessary. A knight called Walter the Penniless led the van, and Peter followed, with his second division, by a somewhat different route. Walter escaped serious trouble until he reached the country of the savage Bulgarians. Peter's senseless mob provoked the just wrath of the Hungarians by storming the small city of Semlin and slaying 4,000 of its inhabitants. The route of both was lined with the bones of thousands who perished of hunger, of exposure, of disease, and by the swords of Hungarians and Bulgarians. A third and a fourth host of like kind followed in their wake, led by a monk, Gotschalk, a priest named Volkmar, and a Count Ermican. These terrorized even more all the countries through which they passed,—especially where Jews were to be hunted and killed,—and were destroyed in Hungary to almost the last man. Peter and Walter reached Constantinople with 100,000 followers, it is said, even yet, after all who had fallen by the way. Still refusing to wait for the better appointed expeditions that were in progress, and still appalling eastern Christendom by their lawless barbarities, they passed into Asia Minor, and their miserable career soon came to an end. Attacking the Turks in the city of Nicaea,—which had become the capital of the Seljouk sultan of Roum,—they were beaten, routed, scattered, slaughtered, until barely 3,000 of the great host escaped. "Of the first Crusaders," says Gibbon, "300,000 had already perished before a single city was rescued from the infidels,—before their graver and more noble brethren had completed the preparations of their enterprise." Meantime the knights and princes of the crusade had gathered their armies and were now (in the summer of 1096) beginning to move eastward, by different routes. Not one of the greater sovereigns of Europe had enlisted in the undertaking. The chiefs of one armament were Godfrey de Bouillon, duke of the Lower Lorraine, or Brabant; his brothers, Eustace, count of Boulogne, and Baldwin; his cousin, Baldwin de Bourg, with Baldwin, count of Hainaut, Dudo de Contz, and other knights celebrated in the "Jerusalem Delivered" of Tasso. This expedition followed nearly the route of Peter the Hermit, through Hungary and Bulgaria, giving hostages for its orderly conduct and winning the good-will of those countries, even maddened as they were by the foregoing mobs. Another larger following from France was led by Hugh, count of Vermandois, brother of the king of France; Robert, duke of Normandy, eldest son of William the Conqueror; Stephen, count of Blois, the Conqueror's son-in-law, and Robert, count of Flanders. These took the road into Italy, and to Bari, whence, after spending the winter, waiting for favorable weather, they were transported by ships to Greece, and pursued their march to Constantinople. They were followed by a contingent from southern Italy, under Bohemond, the Norman prince of Tarentum, son of Robert Guiscard, and his knightly cousin, Tancred. A fourth army, gathered in southern France by count Raymond of Toulouse and Bishop Adhemar, the appointed legate and representative of the pope, chose still another route, through Lombardy, Dalmatia and Macedonia, into Thrace. On passing through the territories of the Byzantine emperor (Alexius I), all the crusaders experienced his

distrust, his duplicity, and his cautious ill-will—which, under the circumstances were natural enough. Alexius managed so well that he extorted from each of the princes an acknowledgment of his rights of sovereignty over the region of their expected conquests, with an oath of fealty and homage, and he pushed them across the Bosphorus so adroitly that no two had the opportunity to unite their forces under the walls of Constantinople. Their first undertaking in Asia (May and June, 1097) was the siege of Nicæa, and they beleaguered it with an army which Gibbon believes to have been never exceeded within the compass of a single camp. Here, again, they were mastered by the cunning diplomacy of the Greek emperor. When the sultan of Roum yielded his capital, he was persuaded to surrender it to Alexius, and the imperial banner protected it from the rage of the discomfited crusaders. But they revenged themselves on the Turk at Dorylæum, where he attacked them during their subsequent march, and where he suffered a defeat which ended all fighting in Asia Minor. Baldwin, brother of Godfrey, now improved his opportunities by stealing away from the army, with a few hundred knights and men, to make conquests on his own account; with such success that he won the city of Edessa, with a sweep of country around it, and founded a principality which subsisted for half a century. (See *EDESSA*: 1097-1144). The rest fared on, meeting no opposition from infidel swords, but sickening and dying by thousands, from heat and from want of water and food, until they came to Antioch. There, the Turkish emir in command, with a stout garrison of horse and foot, had prepared for a stubborn defence, and he held the besiegers at bay for seven months, while they starved in their ill-supplied camps. The city was delivered to them by a traitor, at length, but prince Bohemond, the crafty Norman, secured the benefit of the treason to himself, and forced his compatriots to concede to him the sovereignty of Antioch. The sufferings of the crusaders did not end with the taking of the city. They brought famine and pestilence upon themselves anew by their greedy and sensual indulgence, and they were soon under siege in their own turn, by a great army which the Turks had brought against them. Death and desertion were in rivalry to thin their wasted ranks. The survivors were in gloom and despair, when an opportune miracle occurred to excite them afresh. A lance, which visions and apparitions certified to be the very spear that pierced the Redeemer's side, was found buried in a church at Antioch. Under the stimulus of this amazing discovery they sallied from the town and dispersed the great army of the Turks in utter rout. Still the quarrels of the leaders went on, and ten months more were consumed before the remains of the Latin army advanced to Jerusalem. It was June, 1099, when they saw the Holy City and assailed its formidable walls. Their number was now reduced to 40,000, but their devotion and their ardor rose to frenzy, and after a siege of little more than a month they forced an entrance by storm. Then they spared neither age nor sex until they had killed all who denied the Saviour of mankind—the Prince of Peace.—Based on E. Gibbon, *History of the decline and fall of the Roman empire*, ch. 58.—See also *JERUSALEM*: 1099.

1101-1102.—After-wave of the first movement.—“The tales of victory brought home by the pilgrims excited the most extravagant expectations in the minds of their auditors, and nothing was deemed capable of resisting European valour. The pope called upon all who had taken the cross to perform their vow, the emperor Henry IV. had the crusade preached, in order to gain favour with the clergy and laity. Many princes now resolved to visit in person the new empire founded in the East. Three great armies assembled: the first in Italy under the archbishop of Milan, and the two counts of Blandrate; the second in France under Hugh the Great and Stephen of Blois [who had deserted their comrades of the first expedition at Antioch, and] whom shame and remorse urged to perform their vow, William, duke of Guienne and count of Poitou, who mortgaged his territory to William Rufus of England to procure funds, the count of Nevers, the duke of Burgundy, the bishops of Laon and Soissons; the third in Germany, under the bishop of Saltzburg, the aged duke Welf of Bavaria, Conrad the master of the horse to the emperor, and many other knights and nobles. Ida also, the margravine of Austria, declared her resolution to share the toils and dangers of the way, and pay her vows at the tomb of Christ. Vast numbers of women of all ranks accompanied all these armies,—nay, in that of the duke of Guienne, who was inferior to none in valour, but united to it the qualities of a troubadour and glee-man, there appeared whole troops of young women. The Italian pilgrims were the first to arrive at Constantinople. They set out early in the spring, and took their way through Carinthia, Hungary, and Bulgaria. Though the excesses committed by them were great, the emperor gave them a kind reception, and the most prudent and friendly advice respecting their future progress. While they abode at Constantinople, Conrad and the count of Blois, and the duke of Burgundy, arrived, and at Whitsuntide they all passed over, and encamped at Nicomedia.” With ignorant fatuity, and against all experienced advice, the new Crusaders resolved to direct their march to Bagdad and to overthrow the caliphate. The first body which advanced was cut to pieces by the Turks on the banks of the Halys, and only a few thousands, out of more than one hundred thousand, are said to have made their escape by desperate flight. The second and third armies were met successively by the victorious Moslems, before they had advanced so far, and were even more completely annihilated. The latter body contained, according to the chroniclers of the time, 150,000 pilgrims, of whom scarcely one thousand were saved from slavery or death. The men fell under the swords of the Turks; the women and girls, in great numbers, finished out their days in the harems of the East. Out of the wreck of the three vast armaments a slender column of 10,000 men was got together after some weeks at Antioch and led to Jerusalem (A. D. 1102). Most of these perished in subsequent battles, and very few ever saw Europe again. “Such was the fruitless termination of this second great movement of the West, in which perhaps a third of a million of pilgrims left their homes, never to revisit them.”—T. Keightley, *The Crusaders*, ch. 2.

ALSO IN: J. F. Michaud, *History of the Crusades*, bk. 4.

1104-1111.—Conquest of maritime cities of Syria and Palestine.—Destruction of the library of Tripoli.—“The prosperity and the safety of Jerusalem appeared closely connected with the

conquest of the maritime cities of Syria and Palestine; it being by them alone that it could receive succour, or establish prompt and easy communications with the West. The maritime nations of Europe were interested in seconding, in this instance, the enterprises of the king of Jerusalem. . . . From the period of the first crusades, the Pisans and the Genoese had constantly sent vessels to the seas of the East; and their fleets had aided the Christians in several expeditions against the Mussulmans. A Genoese fleet had just arrived in the seas of Syria when Baldwin undertook the siege of Ptolemais [Acre]. The Genoese were invited to assist in this conquest; but as religion was not the principle to bring them into action, they required, in return for their assistance and their labour, that they should have a third of the booty; they likewise stipulated to have a separate church for themselves, and a national factory and tribunal in the conquered city. Ptolemais was besieged by land and sea, and after a bloody resistance of twenty days, the inhabitants and the garrison proposed to surrender, and implored the clemency of the conquerors. The city opened its gates to the Christians, and the inhabitants prepared to depart, taking with them whatever they deemed most valuable; but the Genoese, at the sight of such rich booty, paid no respect to the capitulation, and massacred without pity a disarmed and defenceless people. . . . In consequence of this victory, several places which the Egyptians still held on the coasts of Syria fell into the hands of the Christians." Among those was the city of Tripoli. "Raymond, Count de St. Gilles and of Thoulouse, one of the companions of Godfrey, after having wandered for a long time about Asia, had died before this place, of which he had commenced the siege. In memory of his exploits in the first crusade, the rich territory of Tripoli was created a county, and became the inheritance of his family. This territory was celebrated for its productions. . . . A library established in this city, and celebrated through all the East, contained the monuments of the ancient literature of the Persians, the Arabians, the Egyptians, and the Greeks. A hundred copyists were there constantly employed in transcribing manuscripts. . . . After the taking of the city, a priest attached to Count Bernard de St. Gilles, entered the room in which were collected a vast number of copies of the Koran, and as he declared the library of Tripoli contained only the impious books of Mahomet, it was given up to the flames. . . . Bibles, situated on the smiling and fertile shores of Phoenicia, Sarepta, where St. Jerome saw still in his day the tower of Isaiah; and Berytus, famous in the early days of the church for its school of eloquence, shared the fate of Tripoli, and became baronies bestowed upon Christian knights. After these conquests, the Pisans, the Genoese, and several warriors who had followed Baldwin in his expeditions, returned into Europe; and the king of Jerusalem, abandoned by these useful allies, was obliged to employ the forces which remained in repulsing the invasions of the Saracens."—J. F. Michaud, *History of the Crusades*, v. 1, bk. 5.

1124.—Siege of Tyre. See TYRE: 1124.

1146.—Eastern empire invaded by Roger of Sicily. See BYZANTINE EMPIRE: 1146.

1147-1149.—Second great movement.—During the reign of Fulk, the fourth king of Jerusalem, the Latin power in Palestine and its neighboring territories began to be seriously shaken by a vigorous Turkish prince named Zenghi, on whom the sultan Mahmoud had conferred the government of all the country west of the Tigris. It was the first time since the coming of the Christians of the

West that the whole strength of Islam in that region had been so nearly gathered into one strong hand, to be used against them, and they felt the effect speedily, being themselves weakened by many quarrels. In 1143 King Fulk died, leaving the crown to a young son, Baldwin III,—a boy of thirteen, whose mother governed in his name. The next year Zenghi captured the important city of Edessa, and consternation was produced by his successes. Europe was then appealed to for help against the advancing Turk, and the call from Jerusalem was taken up by St. Bernard of Clairvaux, the irresistible enthusiast, whose influence accomplished, in his time, whatever he willed to have done. Just half a century after Peter the Hermit, St. Bernard preached a second Crusade, and with almost equal effect, notwithstanding the better knowledge now possessed of all the hardships and perils of the expedition. This time, royalty took the lead. King Conrad of Germany commanded a great army from that country, and another host followed King Louis VII from France. "Both armies marched down the Danube, to Constantinople, in the summer of 1147. At the same moment King Roger [of Naples], with his fleet, attacked, not the Turks, but the Greek seaport towns of the Morea. Manuel [the Byzantine emperor] thereupon, convinced that the large armies were designed for the destruction of his empire in the first place, with the greatest exertions, got together troops from all his provinces, and entered into a half-alliance with the Turks of Asia Minor. The mischief and ill-feeling was increased by the lawless conduct of the German hordes; the Greek troops attacked them more than once; whereupon numerous voices were raised in Louis's headquarters to demand open war against the faithless Greeks. The kings were fully agreed not to permit this, but on arriving in Constantinople they completely fell out, for, while Louis made no secret of his warm friendship for Roger, Conrad promised the Emperor of Constantinople to attack the Normans as soon as the Crusade should be ended. This was a bad beginning for a united campaign in the East, and moreover, at every step eastward, new difficulties arose. The German army, broken up into several detachments, and led without ability or prudence, was attacked in Asia Minor by the Emir of Iconium, and cut to pieces, all but a few hundred men. The French, though better appointed, also suffered severe losses in that country, but contrived nevertheless, to reach Antioch with a very considerable force, and from thence might have carried the project which the second Baldwin had conceived in vain, namely, the defence of the northeastern frontier, upon which, especially since Zenki [Zenghi] had made his appearance, the life or death of the Christian states depended. But in vain did Prince Raymond of Antioch try to prevail upon King Louis to take this view, and to attack without delay the most formidable of all their adversaries, Nouredin [son of Zenghi, now dead]. Louis would not hear or do anything till he had seen Jerusalem and prayed at the Holy Sepulchre. . . . In Jerusalem he [King Louis] was welcomed by Queen Melisende (now regent, during her son's minority, after Fulco's death), with praise and gratitude, because he had not taken part in the distant wars of the Prince of Antioch, but had reserved his forces for the defence of the holy city of Jerusalem. It was now resolved to lead the army against Damascus, the only Turkish town whose Emir had always refused to submit to either Zenki or Nouredin. Nevertheless Nouredin instantly collected all his available forces, to succour the besieged town." But he was spared

further exertion by the jealous disagreement of the Christians, who began to take thought as to what should be done with Damascus when they took it. The Syrian barons concluded that they would prefer to leave the city in Turkish hands, and by treacherous manœuvres they forced king Louis to raise the siege. "The German king, long since tired of his powerless position, returned home in the autumn of 1148, and Louis, after much

an eye-witness, the cities and castles were empty, and scarcely one man was left to seven women; and now it was known that the fathers, the husbands, the sons, or the brothers of these miserable women would see their earthly homes no more. The cry of anguish charged Bernard with the crime of sending them forth on an errand in which they had done absolutely nothing and had reaped only wretchedness and disgrace. For a time Bernard

THE CRUSADERS REPULSED IN THE SECOND ASSAULT ON JERUSALEM

(From a drawing by Doré)

pressing, stayed a few months longer, and reached Europe in the following spring. The whole expedition . . . had been wrecked, without honour and without result, by the most wretched personal passions, and the most narrow and selfish policy."—H. Von Sybel, *History and literature of the Crusades*, ch. 3.—"So ended in utter shame and ignominy the Second Crusade. The event seemed to give the lie to the glowing promises and prophecies of St. Bernard. So vast had been the drain of population to feed this holy war that, in the phrase of

himself was struck dumb: but he soon remembered that he had spoken with the authority of God and his vicegerent, and that the guilt or failure must lie at the door of the pilgrims."—G. W. Cox, *The Crusades*, ch. 5.

1187.—Loss of Jerusalem. See JERUSALEM: 1144-1187.

1188-1192.—Third great movement.—When the news reached Europe that Saladin, the redoubtable new champion of Islam had expelled the Christians and the Cross from Jerusalem, polluting once more

the precincts of the Holy Sepulchre, the effect produced was something not easily understood at the present day. If we may believe historians of the time, the pope (Urban III.) died of grief; "Christians forgot all the ills of their own country to weep over Jerusalem. . . . Luxury was banished from cities; injuries were forgotten and alms were given abundantly. Christians slept upon ashes, clothed themselves in haircloth, and expiated their disorderly lives by fasting and mortification. The clergy set the example; the morals of the cloister were reformed, and cardinals, condemning themselves to poverty, promised to repair to the Holy Land, supported on charity by the way. These pious reformations did not last long; but men's minds were not the less prepared for a new crusade by them, and all Europe was soon roused by the voice of Gregory VIII., who exhorted the faithful to assume the cross and take up arms."—J. F. Michaud, *History of the Crusades*, bk. 7.—"The emperor Frederic Barbarossa and the kings of France and England [see ENGLAND: 1189-1199] assumed the cross; and the tardy magnitude of their armaments was anticipated by the maritime states of the Mediterranean and the ocean. The skilful and provident Italians first embarked in the ships of Genoa, Pisa, and Venice. They were speedily followed by the most eager pilgrims of France, Normandy and the Western Isles. The powerful succour of Flanders, Frise, and Denmark filled near a hundred vessels; and the northern warriors were distinguished in the field by a lofty stature and a ponderous battle-axe. Their increasing multitudes could no longer be confined within the walls of Tyre [which the Latins still held], or remain obedient to the voice of Conrad [marquis of Montferrat, who had taken command of the place and repelled the attacks of Saladin]. They pitied the misfortunes and revered the dignity of Lusignan [the nominal king of Jerusalem, lately captive in Saladin's hands], who was released from prison, perhaps to divide the army of the Franks. He proposed the recovery of Ptolemais, or Acre, thirty miles to the south of Tyre; and the place was first invested [July, 1189] by 2,000 horse and 30,000 foot under his nominal command. I shall not expatiate on the story of this memorable siege, which lasted near two years, and consumed, in a narrow space, the forces of Europe and Asia. . . . At the sound of the holy trumpet the Moslems of Egypt, Syria, Arabia, and the Oriental provinces assembled under the servant of the prophet: his camp was pitched and removed within a few miles of Acre; and he laboured, night and day, for the relief of his brethren and the annoyance of the Franks. . . . In the spring of the second year, the royal fleets of France and England cast anchor in the bay of Acre, and the siege was more vigorously prosecuted by the youthful emulation of the two kings, Philip Augustus and Richard Plantagenet. After every resource had been tried, and every hope was exhausted, the defenders of Acre submitted to their fate. . . . By the conquest of Acre the Latin powers acquired a strong town and a convenient harbour; but the advantage was most dearly purchased. The minister and historian of Saladin computes, from the report of the enemy, that their numbers, at different periods, amounted to 500,000 or 600,000; that more than 100,000 Christians were slain; that a far greater number was lost by disease or shipwreck." On the reduction of Acre, king Philip Augustus returned to France, leaving only 500 knights and 10,000 men behind him. Meantime, the old emperor, Frederick Barbarossa, coming by the landward route, through the country of the Greeks and Asia Minor,

with a well-trained army of 20,000 knights and 50,000 men on foot, had perished by the way, drowned in a little Cilician torrent, and only 5,000 of his troops had reached the camp at Acre. Old as he was, (he was seventy when he took the cross) Barbarossa might have changed the event of the Crusade if he had reached the scene of conflict; for he had brims with his valor and character with his ferocity, which Richard Cœur de Lion had not. The latter remained another year in the Holy Land; recovered Cæsarea and Jaffa; threatened Saladin in Jerusalem seriously, but to no avail; and stirred up more and fiercer quarrels among the Christians than had been customary, even on the soil which was sacred to them. In the end, a treaty was arranged which displeased the more devout on both sides. "It was stipulated that Jerusalem and the holy sepulchre should be open, without tribute or vexation, to the pilgrimage of the Latin Christians; that, after the demolition of Ascalon, they should inclusively possess the sea-coast from Jaffa to Tyre; that the count of Tripoli and the prince of Antioch should be comprised in the truce; and that, during three years and three months, all hostilities should cease. . . . Richard embarked for Europe, to seek a long captivity and a premature grave; and the space of a few months concluded the life and glories of Saladin."—E. Gibbon, *History of the decline and fall of the Roman empire*, ch. 50.—"A halo of false glory surrounds the Third Crusade from the associations which connect it with the lion-hearted king of England. The exploits of Richard I. have stirred to enthusiasm the dullest of chroniclers, have furnished themes for jubilant eulogies, and have shed over his life that glamour which cheats even sober-minded men when they read the story of his prototype Achilles in the tale of Troy. . . . When we turn from the picture to the reality, we shall see in this Third Crusade an enterprise in which the fiery zeal which does something towards redeeming the savage brutalities of Godfrey and the first crusaders is displaced by base and sordid greed, by intrigues utterly of the earth earthy, by wanton crimes from which we might well suppose that the sun would hide away its face; and in the leaders of this enterprise we shall see men in whom morally there is scarcely a single quality to relieve the monotonous blackness of their infamy; in whom, strategically, a very little generalship comes to the aid of a blind brute force."—G. W. Cox, *The Crusades*, ch. 7.

1196-1197.—Fourth expedition.—A crusading expedition of German barons and their followers, which went to the Holy Land, by way of Italy, in 1196, is generally counted as the fourth Crusade, though some writers look upon it as a movement supplementary to the third Crusade. The Germans, who numbered some 40,000, do not seem to have been welcomed by the Christians of Palestine. The latter preferred to maintain the state of peace then prevailing; but the new crusaders forced hostilities at once. Saladin was dead; his brother Saphadin accepted the challenge to war with prompt vigor and struck the first hard blow, taking Jaffa, with great slaughter, and demolishing its fortifications. But Saphadin was presently defeated in a battle fought between Tyre and Sidon, and Jaffa was recovered, together with other towns and most of the coast. But, a little later, the Germans suffered, in their turn, a most demoralizing reverse at the castle of Thoron, which they besieged, and were further disturbed, in the midst

of their depression, by news of the death of their emperor, Henry VI. A great part of them, thereupon, returned home. Those who remained, or many of them, occupied Jaffa, where they were attacked, a few months later, and cut to pieces.—G. W. Cox, *The Crusades*, ch. 8.

1201-1203.—Fifth movement.—Treachery of the Venetians.—Conquest of Constantinople.—“Every traveller returning from Syria brought a prayer for immediate help from the survivors of the Third Crusade. It was necessary to act at once if any portion even of the wreck of the kingdom of Jerusalem were to be saved. Innocent the Third, and some, at least, of the statesmen of the West were fully alive to the progress which Islam had made since the departure of the Western kings. In 1197, however, after five years of weary waiting, the time seemed opportune for striking a new blow for Christendom. Saladin, the great Sultan, had died in 1193, and his two sons were already quarreling about the partition of his empire. The contending divisions of the Arab Moslems were at this moment each bidding for the support of the Christians of Syria. The other great race of Mahometans which had threatened Europe, the Seljukian Turks, had made a halt in their progress through Asia Minor. . . . Other special circumstances which rendered the moment favourable for a new crusade, combined with the profound conviction of the statesmen of the West of the danger to Christendom from the progress of Islam, urged Western Europe to take part in the new enterprise. The reigning Pope, Innocent III, was the great moving spirit of the Fourth Crusade.” The popular preacher of the Crusade was found in an ignorant priest named Fulk, of Neuilly, whose success in kindling public enthusiasm was almost equal to that of Peter the Hermit. Vast numbers took the cross, with Theobald, count of Champagne, Louis, count of Blois and Chartres, Simon de Montfort, Walter of Brienne, Baldwin, count of Flanders, Hugh of St. Pol, Geoffrey de Villehardouin, marshal of Champagne and future historian of the Crusade, and many other prominent knights and princes among the leaders. The young count of Champagne was the chosen chief; but he sickened and died and his place was taken by Boniface, marquis of Montferrat. It was the decision of the leaders that the expedition should be directed in the first instance against the Moslem power in Egypt, and that it should be conveyed to the attack of Egypt by sea. Venice, alone, seemed to be able to furnish ships, sailors and supplies for so great a movement, and a contract with Venice for the service was concluded in the spring of 1201. But Venice was mercenary, unscrupulous and treacherous, caring for nothing but commercial gains. Before the crusaders could gather at her port for embarkation, she had betrayed them to the Moslems. By a secret treaty with the sultan of Egypt, the fact of which is coming more and more conclusively to light, she had undertaken to frustrate the Crusade, and to receive important commercial privileges at Alexandria as compensation for her treachery. When, therefore, in the early summer of 1202, the army of the Crusade was collected at Venice to take ship, it encountered difficulties, discouragements and ill-treatments which thickened daily. The number assembled was not equal to expectation. Some had gone by sea from Flanders; some by other routes. But Venice had provided transport for the whole, and inflexibly demanded pay for the whole. The money in hand was not equal to this claim. The summer was lost in disputes and attempted compromises. Many of the crusaders

withdrew in disgust and went home. At length, in defiance of the censures of the pope and of the bitter opposition of many leaders and followers of the expedition, there was a bargain struck, by the terms of which the crusaders were to assist the Venetians in taking and plundering the Christian city of Zara, a dreaded commercial rival on the Dalmatian coast of the Adriatic, belonging to the king of Hungary, himself one of the promoters of the very crusade which was now to be turned against him. The infamous compact was carried out. Zara was taken, and in the end it was totally destroyed by the Venetians. In the meantime, the doomed city was occupied by the crusading army through the winter, while a still more perfidious plot was being formed. Old Dandolo, the blind doge of Venice, was the master spirit of it. He was helped by the influence of Philip, one of the two rivals then fighting for the imperial crown in Germany and Italy. Philip had married a daughter of Isaac II (Angelos), made emperor at Constantinople on the fall of the dynasty of Comnenus, and that feeble prince had lately been dethroned by his brother. The son and heir of Isaac, named Alexius, had escaped from Constantinople and had made his way to Philip imploring help. Either Philip conceived the idea, or it was suggested to him, that the armament of the Crusade might be employed to place the young Alexius on the throne of his father. To the Venetians the scheme was more than acceptable. It would frustrate the Crusade, which they had pledged themselves to the sultan of Egypt to accomplish; it would satisfy their ill-will towards the Byzantines, and, more important than all else, it would give them an opportunity to secure immeasurable advantages over their rivals in the great trade which Constantinople held at command. The marquis of Montferrat, commander of the Crusade, had some grievances of his own and some ambitions of his own, which made him favorable to the new project, and he was easily won to it. The three influences thus combined—those of Philip, of Dandolo, and of Montferrat—overcame all opposition. Some who opposed were bribed, some were intimidated, some were deluded by promises, some deserted the ranks. Pope Innocent remonstrated, appealed and threatened in vain. The pilgrim host, “changed from a crusading army into a filibustering expedition,” set sail from Zara in the spring of the year 1203, and was landed, the following June, not on the shores of Egypt or Syria, but under the walls of Constantinople. Its conquest, pillage and brutally destructive treatment of the great city are described in another place.—E. Pears, *Fall of Constantinople*, ch. 8-13.—See also BYZANTINE EMPIRE: 1203-1204; 1204-1205.

1212.—Children's Crusade.—“The so-called Children's Crusade illustrates at once the religious enthusiasm and misdirected zeal which marked the whole crusading movement. During the year 1212 thousands of French children assembled in bands and marched through the towns and villages, carrying banners, candles, and crosses and singing, ‘Lord

God, exalt Christianity. Lord God, restore to us the true cross.' The children could not be restrained at first, but finally hunger compelled them to return home. In Germany, during the same year, a lad named Nicholas really did succeed in launching a crusade. He led a mixed multitude of men and women, boys and girls over the Alps into Italy, where they expected to take ship for Palestine."—H. Webster, *Early European history*, pt. 2, p. 478.—They crossed the Alps and reached Genoa on August 25, 1012, to the number of 7,000 "men, women, boys and girls." "On the following Sunday they left the city; but many men, women, boys and girls of their number remained at Genoa.' Some are said to have gone to Marseilles, others to 'Vineiam,' which is a city near the sea, and there some were taken on board vessels to be sold to the Saracens.' Still others went on to Brindisi where 'the bishops, detecting the plot, did not permit them to embark; for they had been sold to the heathen by the father of Nicholas.' Evidently from these accounts the band was breaking up and seeking at various ports to cross over to the Holy Land and Jerusalem. Finally all seem to have become discouraged; . . . many perished, . . . many were despoiled by the Lombards; many were sold into slavery in divers places. Some at length . . . went to Rome, where the children and old people were released from their vow to go on a crusade. . . . The few who returned home, went back ignominiously, singly or in little groups, silently and sadly. . . . It is recorded that Nicholas afterwards fought bravely at Acre and in the siege of Damietta and returned unharmed. . . . Röhrich [a German writer] connects the tale of the Pied Piper of Hamelin with the children's crusade. He states that the original of the tale is dated in 1284 [and] . . . thinks it significant that the legend . . . makes [the children] . . . reappear on the Road of Charles the Great, the traditional route of Crusaders on their way to the Holy Land. . . . While this crusading movement is of comparatively little importance, it is of great interest for the light which it throws upon the mental attitude of the contemporaries. . . . It must also be remembered that somewhat similar undertakings by children are recorded in 1234 and 1458."—D. C. Munro, *Children's Crusade* (*American Historical Review*, v. 1, Apr., 1914, p. 516).—"These children," Pope Innocent III declared, "put us to shame; while we sleep they rush to recover the Holy Land."

1216-1229.—Sixth movement.—Frederic II in Jerusalem.—For six years after the betrayal of the vows of the crusaders of 1202-1204—who sacked Constantinople instead of rescuing Jerusalem—the Christians of Palestine were protected by a truce with Saphadin, the brother of Saladin, who had succeeded the latter in power. Hostilities were then rashly provoked by the always foolish Latins, and they soon found themselves reduced to sore straits, calling upon Europe for fresh help. Pope Innocent III did not scruple to second their appeal. A new crusade was preached with great earnestness, and a general council of the church—the fourth of Lateran—was convened for the stimulation of it. "The Fifth Crusade [or the Sixth, as more commonly numbered], the result of this resolution, was divided in the sequel into three maritime expeditions: the first [1216] consisting principally of Hungarians under their king, Andrew; the second [1218] composed of Germans, Italians, French and English nobles and their followers; and the third [1228] led by the Emperor Frederic II in person. . . . Though the King of

Hungary was attended by the flower of a nation which, before its conversion to Christianity, had been the scourge and terror of Western Europe, the arms of that monarch, even aided by the junction of numerous German crusaders under the dukes of Austria and Bavaria, performed nothing worthy of notice: and after a single campaign in Palestine, in which the Mussulman territories were ineffectually ravaged, the fickle Andrew deserted the cause and returned with his forces to Europe. His defection did not prevent the duke of Austria, with the German crusaders, from remaining, in concert with the King of Jerusalem, his barons, and the knights of the three religious orders, for the defence of Palestine; and, in the following year, the constancy of these faithful champions of the Cross was rewarded by the arrival of numerous reinforcements from Germany. . . . It was resolved to change the scene of warfare from the narrow limits of the Syrian shore to the coast of Egypt, . . . and the situation of Damietta, at the mouth of the Nile, pointed out that city as the first object of attack." After a siege of seventeen months, during which both the besieged and the besiegers suffered horribly, from famine and from pestilence, Damietta was taken (1219). Nine-tenths of its population of 80,000 had perished. "Both during the siege and after the capture of Damietta, the invasion of Egypt had filled the infidels with consternation; and the alarm which was betrayed in their counsels proved that the crusaders, in choosing that country for the theatre of operations, had assailed the Mussulman power in its most vital and vulnerable point. Of the two sons of Saphadin, Coradinus and Camel, who were now uneasily seated on the thrones of Damascus and Cairo, the former, in despair of preserving Jerusalem, had already demolished its fortifications; and the brothers agreed in repeatedly offering the cession of the holy city and of all Palestine to the Christians, upon the single condition of their evacuating Egypt. Every object which had been ineffectually proposed in repeated Crusades, since the fatal battle of Tiberias, might now have been gloriously obtained by the acceptance of these terms, and the King of Jerusalem, the French and English leaders, and the Teutonic knights, all eagerly desired to embrace the offer of the Sultans. But the obstinate ambition and cupidity of the surviving papal legate, Cardinal Pelagius, of the Italian chieftains, and of the knights of the other two religious orders, by holding out the rich prospect of the conquest and plunder of Egypt, overruled every wise and temperate argument in the Christian councils, and produced a rejection of all compromise with the infidels. After a winter of luxurious inaction, the legate led the crusading host from Damietta toward Cairo (1220)." The expedition was as disastrous in its result as it was imbecile in its leadership. The whole army, caught by the rising of the Nile, was placed in so helpless a situation that it was glad to purchase escape by the surrender of Damietta and the evacuation of Egypt. The retreat of the greater part of these crusaders did not end until they had reached home. Pope Honorius III (who had succeeded Innocent III in 1216) strove to shift responsibility for the failure from his wretched legate to the emperor Frederic II, who had thus far evaded the fulfilment of his crusading promises and vows, being occupied in struggles with the papacy. At length, in 1228 (see ITALY; 1183-1250), Frederic embarked for Palestine with a small force, pursued by the maledictions of the pope, who denounced him for daring to assume the cross while under the ban of the church, as much as he had denounced him before for neglect-

ing it. But the free-thinking Hohenstauffen cared little, apparently, and went his way, shunned scrupulously by all pious souls, including the knights of Palestine, except those of the Teutonic order. With the help of the latter he occupied and re fortified Jaffa and succeeded in concluding a treaty with the Sultan which restored Jerusalem to the Christians, reserving certain rights to the

he crowned himself its king [see JERUSALEM]. The patriarch, the Templars and the Hospitallers refused to take part in the ceremony; the pope denounced Frederic's advantageous treaty as soon as he had news of it, and all that it gained for the Christians of Palestine was thrown away by them as speedily as possible.—Major Procter, *History of the Crusades*, ch. 5, sect. 2.—“No Crusader, since

SAINT FRANCIS OF ASSISI PREACHING THE GOSPEL TO MALIK AL-KAMIL

(From a drawing by Doré)

Mohammedans; giving up likewise Bethlehem, Nazareth and some other places to the Christians, and securing peace for ten years. Frederic had married, a few years before, for his second empress, Yolande, daughter and heiress of the titular king of Jerusalem, John de Brienne. With the hand of this princess, he received from her father a solemn transfer of all his rights to that shadowy throne. He now claimed those rights, and, entering Jerusalem, with the Teutonic knights (1229),

Godfrey de Bouillon, had effected so much as Frederick the Second. What would he not have obtained, had the Pope, the Patriarch and the Orders given him their hearty coöperation?"—T. L. Kingston, *History of Frederick II*, ch. 8.—See also GERMANY: 1197-1250.

1244.—Invasion of Palestine by the Khwarizmians. See JERUSALEM: 1244.

1248-1254.—Seventh movement.—Expedition of St. Louis to Egypt.—The seventh Crusade was

undertaken, with little aid from other countries, by the devout and wonderfully Christian-like young king of France, Louis IX, afterwards canonized, and known in history as St. Louis. "He carried it out with a picked army, furnished by the feudal chivalry and by the religious and military orders dedicated to the service of the Holy Land. The Isle of Cyprus was the trysting-place appointed for all the forces of the expedition.

out of his design. . . . He did not succeed in winning a majority in the council of chiefs over to his opinion as to the necessity for a speedy departure for Egypt; it was decided to pass the winter in Cyprus. . . . At last a start was made from Cyprus in May, 1249, and, in spite of violent gales of wind which dispersed a large number of vessels, they arrived on the 4th of June before Damietta. . . . Having become masters of Damietta, St. Louis and

SAINT LOUIS ARRIVING BEFORE DAMIETTA
(After Doré)

Louis arrived there on the 12th of September, 1248, and reckoned upon remaining there only a few days; for it was Egypt that he was in a hurry to reach. The Christian world was at that time of opinion that, to deliver the Holy Land, it was necessary first of all to strike a blow at Islamism in Egypt, wherein its chief strength resided. But scarcely had the crusaders formed a junction in Cyprus, when the vices of the expedition and the weaknesses of its chief began to be manifest. Louis, unshakable in his religious zeal, was wanting in clear ideas and fixed resolves as to the carrying

the crusaders committed the same fault there as in the Isle of Cyprus: they halted there for an indefinite time. They were expecting fresh crusaders; and they spent the time of expectation in quarreling over the partition of the booty taken in the city. They made away with it, they wasted it blindly. . . . Louis saw and deplored these irregularities, without being in a condition to stop them. At length, on the 20th of November, 1249, after more than five months' inactivity at Damietta, the crusaders put themselves once more in motion, with the determination of marching upon Babylon,

that outskirts of Cairo, now called Old Cairo, which the greater part of them, in their ignorance, mistook for the real Babylon, and where they flattered themselves they would find immense riches, and avenge the olden sufferings of the Hebrew captives. The Mussulmans had found time to recover from their first fright, and to organize, at all points, a vigorous resistance. On the 8th of February, 1250, a battle took place twenty leagues from Damietta, at Mansourah ('the city of victory'), on the right bank of the Nile. . . . The battle-field was left that day to the crusaders; but they were not allowed to occupy it as conquerors, for, three days afterwards, on the 11th of February, 1250, the camp of St. Louis was assailed by clouds of Saracens, horse and foot, Mamelukes and Bedouins. All surprise had vanished, the Mussulmans measured at a glance the numbers of the Christians, and attacked them in full assurance of success, whatever heroism they might display; and the crusaders themselves indulged in no more self-illusion, and thought only of defending themselves. Lack of provisions and sickness soon rendered defence almost as impossible as attack; every day saw the Christian camp more and more encumbered with the famine-stricken, the dying, and the dead; and the necessity for retreating became evident." An attempt to negotiate with the enemy failed, because they insisted on the surrender of the king as hostage,—which none would concede. "On the 5th of April, 1250, the crusaders decided upon retreating. This was the most deplorable scene of a deplorable drama; and at the same time it was, for the king, an occasion for displaying, in their most sublime and attractive traits, all the virtues of the Christian. Whilst sickness and famine were devastating the camp, Louis made himself visitor, physician and comforter; and his presence and his words exercised upon the worst cases a searching influence. . . . When the 5th of April, the day fixed for the retreat, had come, Louis himself was ill and much enfeebled. He was urged to go aboard one of the vessels which were to descend the Nile, carrying the wounded and the most suffering; but he refused absolutely, saying, 'I don't separate from my people in the hour of danger.' He remained on land, and when he had to move forward he fainted away. When he came to himself, he was amongst the last to leave the camp. . . . At four leagues distance from the camp it had just left, the rear-guard of the crusaders, harassed by clouds of Saracens, was obliged to halt. Louis could no longer keep on his horse. 'He was put up at a house,' says Joinville, 'and laid, almost dead, upon the lap of a tradeswoman from Paris; and it was believed that he would not last till evening.'" The king, in this condition, with the whole wreck of his army,—only 10,000 in number remaining to him,—were taken prisoners. Their release from captivity was purchased a month later by the surrender of Damietta and a ransom-payment of 500,000 livres. They made their way to St. Jean d' Acre, in Palestine, whence many of them returned home. But King Louis, with some of his knights and men-at-arms—how many is not known—stayed yet in the Holy Land for four years, striving and hoping against hope to accomplish something for the deliverance of Jerusalem, and expending "in small works of piety, sympathy, protection, and care for the future of the Christian population in Asia, his time, his strength, his pecuniary resources, and the ardor of a soul which could not remain idly abandoned to sorrowing over great desires unsatisfied." The good and pious but ill-guided king returned to France in the summer of 1254, and was received with great joy.—

F. P. Guizot, *Popular history of France*, ch. 17.

1252.—Movement of "the Pastors."—On the arrival in France of the news of the disastrous failure of St. Louis's expedition to Egypt, there occurred an outbreak of fanaticism as insensate as that of the children's crusade of forty years before. It was said to have originated with a Hungarian named Jacob, who began to proclaim that Christ rejected the great ones of the earth from His service, and that the deliverance of the Holy City must be accomplished by the poor and humble. "Shepherds left their flocks, labourers laid down the plough, to follow his footsteps. . . . The name of Pastors was given to these village crusaders. . . . At length, assembled to the number of more than 100,000, these redoubtable pilgrims left Paris and divided themselves into several troops, to repair to the coast, whence they were to embark for the East. The city of Orleans, which happened to be in their passage, became the theatre of frightful disorders. The progress of their enormities at length created serious alarm in the government and the magistracy; orders were sent to the provinces to pursue and disperse these turbulent and seditious bands. The most numerous assemblage of the Pastors was fixed to take place at Bourges, where the 'master of Hungary' [Jacob] was to perform miracles and communicate the will of Heaven. Their arrival in that city was the signal for murder, fire and pillage. The irritated people took up arms and marched against these disturbers of the public peace; they overtook them between Mortemer and Villeneuve-sur-le-Cher, where, in spite of their numbers, they were routed, and received the punishment due to their brigandages. Jacob had his head cut off by the blow of an axe; many of his companions and disciples met with death on the field of battle, or were consigned to punishment; the remainder took to flight."—J. F. Michaud, *History of the Crusades*, bk. 14.

1256-1259.—Against Eccelino di Romano. See VERONA: 1236-1250.

1270-1271.—Last undertakings.—St. Louis at Tunis.—Prince Edward in Palestine.—"For seven years after his return to France, from 1254 to 1261, Louis seemed to think no more about them [the crusades], and there is nothing to show that he spoke of them even to his most intimate confidants; but, in spite of his apparent calmness, he was living, so far as they were concerned, in a continual ferment of imagination and internal fever, even flattering himself that some favorable circumstance would call him back to his interrupted work. . . . In 1261, Louis held, at Paris, a Parliament, at which, without any talk of a new crusade, measures were taken which revealed an idea of it. . . . In 1263 the crusade was openly preached. . . . All objections, all warnings, all anxieties came to nothing in the face of Louis's fixed idea and pious passion. He started from Paris on the 16th of March, 1270, a sick man almost already, but with soul content, and probably the only one without misgiving in the midst of all his comrades. It was once more at Aigues-Mortes that he went to embark. All was as yet dark and undecided as to the plan of the expedition. . . . Steps were taken at hap-hazard with full trust in Providence and utter forgetfulness that Providence does not absolve men from foresight. . . . It was only in Sardinia, after four days' halt at Cagliari, that Louis announced to the chiefs of the crusade, assembled aboard his ship,

the 'Mountjoy,' that he was making for Tunis, and that their Christian work would commence there. The king of Tunis (as he was then called), Mohammed Mostanser, had for some time been talking of his desire to become a Christian, if he could be efficiently protected against the seditious of his subjects. Louis welcomed with transport the prospect of Mussulman conversions. . . . But on the 17th of July, when the fleet arrived before Tunis, the admiral, Florent de Varennes, probably without the king's orders, and with that want of reflection which was conspicuous at each step of the enterprise, immediately took possession of the harbor and of some Tunisian vessels as prize, and sent word to the king 'that he had only to support him and that the disembarkation of the troops might be effected with perfect safety.' Thus war was commenced at the very first moment against the Mussulman prince whom there had been promise of seeing before long a Christian. At the end of a fortnight, after some fight between the Tunisians and the crusaders, so much political and military blindness produced its natural consequences. The re-enforcements promised to Louis by his brother Charles of Anjou, king of Sicily, had not arrived; provisions were falling short; and the heats of an African summer were working havoc amongst the army with such rapidity that before long there was no time to bury the dead; but they were cast pell-mell into the ditch which surrounded the camp, and the air was tainted thereby. On the 3d of August Louis was attacked by the epidemic fever." On August 25 he died. His son and successor, Philip III, held his ground before Tunis until November, when he gladly accepted a payment of money from the Tunisian prince for withdrawing his army. Disaster followed him. A storm destroyed part of his fleet, with 4,000 or 5,000 men, and sunk all the treasure he had received from the Moslems. On the journey home through Italy his wife met with an accident which ended her life and that of her prematurely born child. The young king arrived at Paris, May, 1271, bringing the remains of five of his family for burial at St. Denis: his wife, his son, his father, his brother, and his brother-in-law,—all victims of the fatal crusade. While France was thus burying the last of her crusaders, Prince Edward (afterwards King Edward I) of England, landed in Syria at the head of a few hundred knights and men at arms. Joined by the Templars and Hospitalers, he had an army of 6,000 or 7,000 men, with which he took Nazareth and made there a bloody sacrifice to the memory of the gentle Nazarene. He did nothing more. Being wounded by an assassin, he arranged a truce with the sultan of Egypt and returned home. His expedition was the last from Europe which strove with the Moslems for the Holy Land. The Christians of Palestine, who still held Acre and Tyre, Sidon and a few other coast cities, were soon afterwards overwhelmed, and the dominion of the Crescent in Syria was undisputed any more by force of arms, though many voices cried vainly against it. The spirit of the Crusades had expired.—F. P. Guizot, *Popular history of France*, ch. 17.

1299.—Last campaign of the Templars.—"After the fall of Acre [1291] the headquarters of the Templars were established at Limisso in the island of Cyprus, and urgent letters were sent to Europe for succour." In 1295, James de Molay, the head of the English province, became grand master, and

soon after his arrival in Palestine he entered into an alliance with Ghazan Khan, the Mongol ruler of Persia, who had married a Christian princess of Armenia and was not unfriendly to the Christians, as against the Mamelukes of Egypt, with whom he was at war. The Mongol Khan invited the Templars to join him in an expedition against the sultan of Egypt, and they did so in the spring of 1299, at Antioch. "An army of 30,000 men was placed by the Mogul emperor under the command of the Grand Master, and the combined forces moved up the valley of the Orontes towards Damascus. In a great battle fought at Hems, the troops of the sultans of Damascus and Egypt were entirely defeated and pursued with great slaughter until nightfall. Aleppo, Hems, Damascus, and all the principal cities, surrendered to the victorious arms of the Moguls, and the Templars once again entered Jerusalem in triumph, visited the Holy Sepulchre and celebrated Easter on Mount Zion." The khan sent ambassadors to Europe, offering the possession of Palestine to the Christian powers if they would give him their alliance and support, but none responded to the call. Ghazan Khan fell ill and withdrew from Syria; the Templars retreated to Cyprus once more and their military career, as the champions of the Cross, was at an end.—C. G. Addison, *Knights Templars*, ch. 6.

Military aspect of the Crusades.—"Free from external dangers for the first time since the days of Charles the Great, the European nations were themselves able to think of taking the offensive. The two all-important data which governed their enterprises, were, firstly, that a free land route down the Danube to the borders of the Byzantine Empire had become available since the conversion of the Magyars; secondly, that the Italian states of Venice, Genoa and Pisa had lately developed war-navies strong enough to guarantee a free passage for expeditions aiming at the Levant. Down to the year 1000 the only naval powers in the Mediterranean had been the Byzantines and the Moslems. The whole face of affairs was changed by the appearance of the Italian republics as a third party in the strife for supremacy at sea. Even before the preaching of the first Crusade there were signs that Western Christendom was about to bestir itself and take the offensive. The steady advance of the Germans against the Slavs of the East, the attacks of the Genoese and the Sicilian Normans on Africa, were signs of the coming movement. But no one could have foreseen the shape which the advance of the European nations was to take. Swayed by a sudden religious impulse, they threw themselves upon the Levant, and began the long struggle for the dominion of the Eastern Mediterranean which was not to end till the fall of Acre in 1291. With the causes of the Crusades we are not concerned; nor are their religious, social, or commercial aspects our province. It is with their military side alone that we have to deal—a subject sufficiently vast and varied to fill many

volumes if we had space to descend into detail. Stated broadly, the problem which was started in 1096, and lasted till 1201, was whether feudal Europe . . . would prove strong enough to make a permanent lodgment, in the East, or perchance to make good the whole of the ancient losses which Christendom had suffered at the hands of the Saracens and Turk from the days of Heraclius to those of Romanus Diogenes. The state of the Moslem powers of the Levant in 1096 was on the whole favourable for the assailants who were about to throw themselves upon Syria and Asia Minor. It had seemed in the early days of the Turkish invasion, and soon after the fatal day of Manzikert, that a single great empire might establish itself in Western Asia under the house of Alp Arslan. But no such result had followed the conquests of the Seljouks. At the moment when the first Crusaders crossed the Bosphorus, the Sultanate of Roum had separated itself from the main body of the Turkish Empire, petty princes governed Aleppo, Antioch, Damascus, and Mesopotamia, and the Fatimite sovereigns of Egypt were still clinging to the southern parts of Palestine. The political situation was most favourable for the assailants; a few years earlier they would have found their task far harder, and the heroic courage which habitually saved them from the consequences of their incredible lack of strategy and discipline might have failed to accomplish the conquest of Western Syria. Fighting against jealous and divided enemies, they only just succeeded in conquering Jerusalem and Antioch. Opposed by a single monarch wielding all the resources of Asia Minor and the Levant, they would probably have failed on the threshold, and never have seen the Taurus or the Orontes. The first crusading armies displayed all the faults of the feudal host in their highest development. They were led by no single chief of a rank sufficient to command the obedience of his companions. Neither emperor nor king took the cross, and the crowd of counts and dukes, vassals of different suzerains, had no single leader to whom obedience was due. If a mediæval king found it a hard matter to rule his own feudal levies, and could never count on unquestioning obedience from his barons, what sort of discipline or subordination could be expected from a host drawn together from all the ends of Europe? It is perhaps more astonishing that the Crusaders accomplished anything, than that they did not accomplish more than their actual achievements. When we realise the nature of the numerous and unruly councils of war which directed the army that took Jerusalem, we are only surprised that it did not meet with more disasters and fewer successes. Yet this host was superior to most of the other crusading expeditions in the efficiency of its fighting men, the high character of its leaders, and the care that had been devoted to its organisation. To understand the general aspect of the crusading armies, we must remember all the unfortunate hordes that perished obscurely in the uplands of Asia Minor and left no trace behind. . . . The Crusades, as a whole, may be said to have had two main objects. The first was to relieve the pressure of the Turks on Constantinople, which had been so dangerous ever since the day of Manzikert. The second was to conquer the Holy Land and restore its shrines to the custody of Christendom. Both of these purposes were to a certain extent accomplished: the Turkish frontier in Asia Minor was thrust back many scores of miles, and nearly two centuries elapsed before the Seljouk Sultans were able to recover their lost ground. Jerusalem was stormed, and for ninety years remained in the hands of the

Franks. But these ends were achieved in the most wasteful manner, by the most blundering methods, and at the maximum cost of life and material. One of the main causes of the disasters of all the crusading armies was a complete lack of geographical knowledge. A cursory glance at the itineraries of the various expeditions shows that the majority of them were chosen on the most unhappy principles, and were bound to lead those who adopted them into grave peril, if not to utter destruction. We must not blame the men of the eleventh and twelfth centuries overmuch for their errors: to a great extent they were inevitable in face of their utter want of geographical information concerning the countries of the Levant. Any misdirection was possible in days when the whole available stock of information in the West consisted of garbled fragments of the ancient Roman geographers, reinforced by a certain amount of oral information gathered from merchants and pilgrims. The Franks could hardly be expected to have any knowledge concerning the Eastern waters: the Byzantines and Saracens had for many centuries divided the control of the seas beyond Sicily, and the navies of the Italian republics were but just beginning to trespass on them: beyond Constantinople there was no accurate knowledge available. The land routes were even more uncertain than those of the sea. The road to the Bosphorus across Hungary and Servia had only become practicable after the conversion of the Magyars to Christianity (1000-61). It had not yet been adopted as a channel for commerce or a route for pilgrimages. Beyond Constantinople there was only such information to be obtained as the Greeks could give. This information was not always honestly purveyed: the Byzantine emperors had purposes of their own to serve, and often sent the pilgrim hosts on itineraries which suited themselves rather than those which were best adapted for the purposes which the Franks had in view. We need not believe the constant complaints of the Western chroniclers that the Comneni deliberately guided the pilgrims to destruction, out of jealousy and treachery. But Alexius and Manuel, if not John, were quite capable of serving their own ends by despatching the invaders of Asia Minor on routes which were not the best available. When the Crusaders had gone on their way and beaten off the Turks, the emperor followed behind, somewhat after the manner of the jackal, and seized what he could. The recovery of Lydia and Mysia was undoubtedly due to the first Crusade, and that of Northern Phrygia and Galatia to the Crusade of 1101.

"It is only fair, however, to notice that in the case where deliberate misdirection by the Greeks seems on the face of things most probable, a deeper inquiry shows that the Crusaders themselves were to blame. When, in 1101, Raymond of Toulouse and the Lombards marched by the incredibly round-about way of Ancyra-Gangra-Amasia, we might have suspected that Alexius had recommended it to them in order that he might follow in their rear and reoccupy Galatia, as indeed he did. But both Raymond d'Agiles on the side of the Franks, and Anna Comnena on that of the Byzantines, assert that the unhappy choice was made by the Crusaders themselves. Anna adds that her father pointed out to them the madness of their attempt to march on Bagdad through the mountains of Armenia, and that they utterly refused to listen to him. It was not his fault if, after recovering Ancyra for the empire, they were starved and harassed in the trackless lands beyond the Halys, so that only a few thousands of them finally struggled back to Sinope. It must also be

remembered that the Byzantines themselves, though they had all the old Roman road-books, and elaborate data for the distances in their own lost 'themes' in Asia Minor, were not able to give accurate information concerning the present condition of the land. The Turks had wrought so much damage in the last twenty years, burning towns, filling up cisterns, and extirpating the population of whole districts, that the old information concerning the interior had no longer its full value. Routes easy and practicable before 1070 were broken and desolate by 1097. The many perils which the Comneni suffered in their own campaigns in inner Asia Minor are sufficient proof that their informations as to the land was no longer reliable. It would be unfair, therefore, to attribute to wilful misdirection on the part of the Greeks the whole of the misadventures of the Crusaders in Asia Minor. The larger part of their troubles were of their own creation, and came from carelessness, presumption, improvidence, and selfishness. Even when put upon the right road, they were apt to go astray from blind conceit or want of discipline. This comes out most clearly from the fact that many crusading expeditions miscarried in Hungary or the Slavonic lands just to the south of the Danube, before they ever reached Constantinople. For an elaborate example of a wrong-headed choice of route, nothing can be more striking than that which Raymond of Toulouse and the Provençals selected in 1096. In all South-Eastern Europe there is no district more destitute of roads and more inhospitable than the Illyrian coastline. But Raymond chose to march from Istria to Durazzo through the stony valleys and pathless hills of Dalmatia, Montenegro, and Northern Albania, among the wild Croats and Morlaciabians. It is surprising that he was able to bring half his following to Durazzo: he must have failed altogether had not his expedition been by far the best equipped and the most carefully provisioned of all those which set out for the first Crusade.

"For the pilgrimage to Syria there were two great alternatives open—the land voyage by Constantinople and the sea voyage direct to the Levant. The latter was in every way preferable when once the sea routes had been surveyed. But at the time of the first Crusade it was practically unknown: only the adventurous sailors of Venice, Pisa, and Genoa attempted it: the French, Burgundians, Provençals, Germans, and Lombards all preferred the longer road by Constantinople. Even in later times the landmen's horror of the water drove a majority of the Crusaders to shun the voyage by sea: all the greater chiefs of the second Crusade, and Frederic Barbarossa among the leaders of the third, persisted in taking the land route. The first great expeditions made by sea by any save the Italian powers were those of Philip Augustus and Richard of England in 1190. But from that time onward the advantages of the direct voyage to Palestine seem to have been recognised, and all the later Crusaders preferred it. It was obviously better to arrive fresh and unwearied at Acre or Tyre, rather than to run the thousand risks from Hungarian, Greek, and Turk which threatened all who marched by land. . . . The union of Syria, Mesopotamia, and Egypt ought to have brought about the instant ruin of the kingdom of Jerusalem. That the state survived for nearly twenty years more was due to a lucky chance. Yussuf Salah-ed-din (Saladin), who succeeded his uncle Shirkuh as the lieutenant of Nur-ed-din in Egypt, proved a disloyal vassal, and did not combine his power effectively with that of his master. He did not openly break with the Syrian

prince, but played his own game, and not that of his suzerain. Hence it was only when Nur-ed-din had died (1172) and Saladin had overrun and annexed the dominions of his late master's sons (1170-83), that all the Moslem states from the Tigris to the Nile were really united under a single ruler. The day of doom for the kingdom of Jerusalem was now at hand. Saladin's realm surrounded the crusading states on all sides, and when he threw himself upon them their fall was sudden and disastrous. At the great battle of Tiberias (Hattin) in 1187, the Frankish host was exterminated; Jerusalem fell in a few months, and after its fall fortress after fortress dropped into Saladin's hands, till little remained to the Crusaders save Tyre, Tripoli, and Antioch. That these small remnants of the Christian states escaped him was due to the third Crusade. Richard of England and Philip of France failed to retake Jerusalem, but they recovered Acre and most of the coast-towns of Palestine. Richard inflicted a crushing blow on Saladin at the battle of Arsouf (1191), and shortly after the Franks and Moslems came to an agreement, which saved for Christendom a wreck of the kingdom of Jerusalem. The inland was lost, but the long narrow coast-slip from Antioch to Jaffa was preserved. Saladin died shortly afterwards (1192), and his dominions broke up; his sons and his brother El-Adel each kept a portion. This disruption of the Ayubite realm was the salvation of the Syrian Franks; their hold on the coast-region of the Levant was to endure for yet another hundred years. But the kingdom of Jerusalem (it might more appropriately have been called the kingdom of Acre) was now a mere survival without strength to recover itself. It might have been stamped out at any moment, if a leader of genius had arisen among the Mohammedans and united again all the resources which had been in Saladin's hands. But the unending civil wars of the Ayubites gave a long lease of life to the decrepit Frankish realm. Strange as it may appear, the Christians were even able to recover the Holy City itself for a moment. Jerusalem was twice in their hands for a short space—once in 1229, when the Emperor Frederick II. got possession of it—once in 1244. On each occasion the reconquest was ephemeral—it marked the weakness of the Saracen, not the recovered strength of the Frank. But along the coast the thin line of ports was firmly held; strengthened by all the resources of the scientific combination of Eastern and Western fortification, they long proved impregnable. The sea was always open to bring them food and reinforcements; the Italian maritime powers were keenly interested in their survival for commercial reasons. Hence it was that the banner of the Cross still waved on every headland from Laodicea to Jaffa till the thirteenth century was far spent and the house of the Ayubites had vanished. The end of the kingdom of Jerusalem only drew near when the new and vigorous dynasty of the Bahri Mamelukes had once more united Egypt and Syria. Then at last came the doom of the Frankish realm, and one after another the ports of the Levant yielded before the arms of the great Sultans, Bibars, Kelaun, and Malik-el-Ashraf. Acre—the last surviving stronghold—fell after a two months' siege in May, 1291. The only wonder is that it had survived so long; had Saladin's life been protracted for ten years, the end would have come nearly a century earlier. But in the thirteenth as in the twelfth century the dissensions of the Mohammedans were the salvation of the Franks. . . . Egypt was a tempting prey—rich above other lands, peopled by an

unwarlike race, and ruled by a monarch depending for his military resources not on his born subjects, but on mercenary bands of Turks, Kurds, Syrians, and Arabs. Egypt and Syria, too, were divided between different branches of the Ayubite house in 1219: El-Kamil reigned at Cairo, El-Muazzam at Damascus; and though they were not unfriendly to each other, yet two rulers can seldom combine their efforts to act like one. The conquest of Egypt, regarded as an enterprise wholly independent on the defence of Palestine, presented both in 1219 and in 1249 many attractions. A commander of genius might probably have accomplished it with the forces led by either John or Louis. It is more doubtful whether the land could have been held when once subdued; but, at least, the experiment was worth making. But if the problem was not an impossible one, it was one which required to be solved according to the general rules of strategy. Egypt must always be 'grasped by the throat' by a bold march on Cairo, and for a march on Cairo there are only two practicable routes. It is absolutely necessary to avoid getting entangled in the countless canals and waterways of the Delta. The first of the two alternative routes is to land near Alexandria, to keep west of the westernmost branch of the Nile, as did Bonaparte in 1798, and to march by Damanhour and Gizeh. The drawbacks of this route are that its first two or three stages are through desert, and that it brings the invader opposite to Cairo, with the Nile still interposed between him and his goal.

"The crossing of the main stream in face of the enemy, when the army has pushed so far inland, might prove very perilous. The second and far preferable route is to start near the ancient Pelusium and march by Salabieh and Belbeis on Cairo, keeping east of the easternmost branch of the Nile. This brings the invader directly on to the capital; he has no canals or waterways to cross, and the distance he has to cover is no more than a hundred miles. Here also the main difficulty to be faced is that the first two stages are through desert country. Egypt has always been invaded by this line; it was followed by Cambyses, Alexander the Great, Antiochus Epiphanes, Amru, and Selim I. Lord Wolsey only diverged from it in 1882 because he was able to utilize the Suez Canal, and so shorten his land march by forty miles. This route was well known to the Franks; Amaury had used it in 1168, taking Belbeis, and actually laying siege to Cairo, which he might have captured if he had not allowed himself to be bought off by an enormous war-indemnity. It is therefore most astonishing that both John de Brienne and St. Louis neglected this obvious and easy line, and chose instead to land at Damietta. The road from that place to Cairo leads through the very midst of the Delta, over countless canals and four considerable branches of the Nile. Across it lie a dozen strong positions for the defending army. It is not too much to say that the invasion of Egypt by this line is bound to fail, if the masters of the country show ordinary vigour and intelligence. The fates of the two Frankish expeditions are a sufficient commentary on the wisdom of their leaders. John de Brienne only took Damietta after a siege of eight months; his troops were already much exhausted when he advanced into the Delta; they were brought to a stand by the line of the Ashmoun Canal, behind which lay the army of the Sultan El-Kamil. They made several unsuccessful attempts to break through and were already despairing of success when they learned that the land between them and their base at

Damietta had been inundated; the Nile was rising, and the Egyptians had cut the dikes. They hastily retreated towards Damietta; but the waters were out everywhere, the Sultan followed hard behind them, and, to save themselves from starvation or drowning, the Crusaders had to come to terms. El-Kamil granted them a free departure, on condition that they should evacuate Damietta (August, 1221).

"Far worse was the fate of St. Louis when he tried the same route in 1249. Considering how John de Brienne had fared, we can only marvel that he ventured to choose the same road. He started with somewhat better fortune than his predecessor, for Damietta fell into his hands after a very slight engagement with the Moslems. But he then wasted no less than six months in waiting for stores and reinforcements; all this time was employed by the Sultan in increasing his army and in preparing obstacles for the march of the French. When, in November, 1249, King Louis did at last begin his advance, he was promptly checked by the same bar which had ruined John de Brienne, the impassable Ashmoun Canal, defended by the Egyptian army. Time after time the bridges and causeways which he strove to construct were swept away by the military machines of the enemy. At last Louis got across by night with his cavalry at a deep ford practicable only for the horsemen; the infantry could not follow. The Egyptians were for a moment surprised, but the king's brother, Robert of Artois, threw away all chance of a victory by charging rashly into the streets of Mansourah with the van long ere the king and the main body had come upon the field. He and the whole of his division were cut to pieces, and when Louis arrived he only succeeded in forcing his way to the neighbourhood of Mansourah at the cost of half his knights. At last, however, he worked his way to the bank opposite his own camp, and his infantry were able to finish the causeway at which they had long been labouring, and so to join him. The French thus obtained a lodgment beyond the Ashmoun, but the success had cost them so dear that they could advance no farther. They lingered near Mansourah for some months, unable to move forward and unwilling to turn back, till at last famine and pestilence broke out, and compelled them to abandon the invasion. But the Egyptians had broken the road between them and Damietta, and as they straggled northward they were cut to pieces in detail in a long running fight extending over several days. At last the king was surrounded and taken prisoner, and soon after the few surviving wrecks of the army laid down their arms. They could not even make terms for themselves, as John de Brienne had done in 1221, and the greater part of the captives were put to death in cold blood by the Egyptians."—C. Oman, *History of the art of war*, pp. 230, 236, 261-266.—See also MILITARY ORGANIZATION: 15.

Effects and consequences of the crusades in Europe.—"The principle of the crusades was a savage fanaticism; and the most important effects were analogous to the cause. Each pilgrim was ambitious to return with his sacred spoils, the preceded and followed by a train of miracles and visions. The belief of the Catholics was corrupted by new legends, their practice by new superstitions; and the establishment of the inquisition, the mendicant orders of monks and friars, the last abuse of indulgences, and the final progress of idolatry, flowed from the haleful fountain of the holy war. The active spirit of the Latins preyed on the vitals of their reason and religion; and if the ninth and tenth centuries were the times of

darkness, the thirteenth and fourteenth were the age of absurdity and fable. . . . Some philosophers have applauded the propitious influence of these holy wars, which appear to me to have checked rather than forwarded the maturity of Europe."—E. Gibbon, *History of the decline and fall of the Roman empire*, ch. 61.—"The crusades may be considered as material pilgrimages on an enormous scale, and their influence upon general morality seems to have been altogether pernicious. Those who served under the cross would not indeed have lived very virtuously at home; but the confidence in their own merits which the principle of such expeditions inspired must have aggravated the ferocity and dissoluteness of their ancient habits. Several historians attest the depravation of morals which existed, both among the crusaders and in the states formed out of their conquests."—H. Hallam, *Middle ages*, ch. 9, pt. 1.—"It was not possible for the crusaders to travel through so many countries, and to behold their various customs and institutions, without acquiring information and improvement. Their views enlarged; their prejudices wore off; new ideas crowded into their minds; and they must have been sensible, on many occasions, of the rusticity of their own manners when compared with those of a more polished people. . . . Accordingly, we discover, soon after the commencement of the crusades, greater splendour in the courts of princes, greater pomp in public ceremonies, a more refined taste in pleasure and amusements, together with a more romantic spirit of enterprise spreading gradually over Europe; and to these wild expeditions, the effect of superstition and folly, we owe the first gleams of light which tended to dispel barbarism and ignorance. But the beneficial consequences of the crusades took place slowly; their influence upon the state of property, and, consequently, of power, in the different kingdoms of Europe, was more immediate as well as discernible."—W. Robertson, *View of the progress of society in Europe*, sect. 1.—"The crusades are not, in my mind, either the popular delusions that our cheap literature has determined them to be, nor papal conspiracies against kings and peoples, as they appear to the Protestant controversialist; nor the savage outbreaks of expiring barbarism, thirsting for blood and plunder, nor volcanic explosions of religious intolerance. I believe them to have been, in their deep sources, and in the minds of their best champions, and in the main tendency of their results, capable of ample justification. They were the first great effort of mediæval life to go beyond the pursuit of selfish and isolated ambitions; they were the trial-feat of the young world, essaying to use, to the glory of God and the benefit of man, the arms of its new knighthood. . . . That in the end they were a benefit to the world no one who reads can doubt; and that in their course they brought out a love for all that is heroic in human nature, the love of freedom, the honour of prowess, sympathy with sorrow, perseverance to the last and patient endurance without hope, the chronicles of the age abundantly prove; proving, moreover, that it was by the experience of those times that the forms of those virtues were realized and presented to posterity."—W. Stubbs, *Seventeen lectures on the study of mediæval and modern history*, lect. 8.—"Though begun under the name and influence of religious belief, the crusades deprived religious ideas, I shall not say of their legitimate share of influence, but of their exclusive and despotic possession of the human mind. This result, though undoubtedly unforeseen, arose from various causes. The first

was evidently the novelty, extent, and variety of the scene which displayed itself to the crusaders; what generally happens to travellers happened to them. It is mere common-place to say, that travelling gives freedom to the mind; that the habit of observing different nations, different manners and different opinions, enlarges the ideas, and disengages the judgment from old prejudices. The same thing happened to those nations of travellers who have been called the crusaders; their minds were opened and raised by having seen a multitude of different things, by having become acquainted with other manners than their own. They found themselves also placed in connexion with two states of civilization, not only different from their own, but more advanced—the Greek state of society on the one hand, and the Mussulman on the other. . . . It is curious to observe in the chronicles the impression made by the crusaders on the Mussulmans, who regarded them at first as the most brutal, ferocious, and stupid barbarians they had ever seen. The crusaders, on their part, were struck with the riches and elegance of manners which they observed among the Mussulmans. These first impressions were succeeded by frequent relations between the Mussulmans and Christians. These became more extensive and important than is commonly believed. . . . There is another circumstance which is worthy of notice. Down to the time of the crusades, the court of Rome, the centre of the Church, had been very little in communication with the laity, unless through the medium of ecclesiastics; either legates sent by the court of Rome, or the whole body of the bishops and clergy. There were always some laymen in direct relation with Rome; but upon the whole, it was by means of churchmen that Rome had any communication with the people of different countries. During the crusades, on the contrary, Rome became a halting-place for a great portion of the crusaders, either in going or returning. A multitude of laymen were spectators of its policy and its manners, and were able to discover the share which personal interest had in religious disputes. There is no doubt that this newly-acquired knowledge inspired many minds with a boldness hitherto unknown. When we consider the state of the general mind at the termination of the crusades, especially in regard to ecclesiastical matters, we cannot fail to be struck with a singular fact: religious notions underwent no change, and were not replaced by contrary or even different opinions. Thought, notwithstanding, had become more free; religious creeds were not the only subject on which the human mind exercised its faculties; without abandoning them, it began occasionally to wander from them, and to take other directions. . . . The social state of society had undergone an analogous change. . . . Without entering into the details . . . we may collect into a few general facts the influence of the crusades on the social state of Europe. They greatly diminished the number of petty fiefs, petty domains, and petty proprietors; they concentrated property and power in a smaller number of hands. It is from the time of the crusades that we may observe the formation and growth of great fiefs—the existence of feudal power on a large scale. . . . This was one of the most important results of the crusades. Even in those cases where small proprietors preserved their fiefs, they did not live upon them in such an insulated state as formerly. The possessors of great fiefs became so many centres around which the smaller ones were gathered, and near which they came to live. During the crusades, small proprietors found it necessary

to place themselves in the train of some rich and powerful chief, from whom they received assistance and support. They lived with him, shared his fortune, and passed through the same adventures that he did. When the crusaders returned home, this social spirit, this habit of living in intercourse with superiors continued to subsist, and had its influence on the manners of the age. . . . The extension of the great fiefs, and the creation of a number of central points in society, in place of the general dispersion which previously existed, were the two principal effects of the crusades, considered with respect to their influence upon feudalism. As to the inhabitants of the towns, a result of the same nature may easily be perceived. The crusades created great civic communities. Petty commerce and petty industry were not sufficient to give rise to communities such as the great cities of Italy and Flanders. It was commerce on a great scale—maritime commerce, and, especially, the commerce of the East and West, which gave them birth; now it was the crusades which gave to the maritime commerce the greatest impulse it had yet received. On the whole, when we survey the state of society at the end of the crusades, we find that the movement tending to dissolution and dispersion, the movement of universal localization (if I may be allowed such an expression), had ceased, and had been succeeded by a movement in the contrary direction, a movement of centralization. All things tended to mutual approximation; small things were absorbed in great ones, or gathered round them. Such was the direction then taken by the progress of society."—F. Guizot, *History of civilization*, v. 1, lect. 8.—See also CHRISTIANITY: 11th-13th centuries: Period of the Crusades; COMMERCE: Medieval: 11th-16th centuries; EASTERN QUESTION; EUROPE: Middle Ages: Crusades and their results.

CTESIAS, Greek historian, a contemporary of Xenophon. See BABYLONIA: Historical sources.

CTESIPHON.—"The Parthian monarchs, like the Mogul sovereigns of Hindostan, delighted in the pastoral life of their Scythian ancestors, and the imperial camp was frequently pitched in the plain of Ctesiphon, on the eastern banks of the Tigris, at the distance of only three miles from Seleucia. The innumerable attendants on luxury and despotism resorted to the court, and the little village of Ctesiphon insensibly swelled into a great city. Under the reign of Marcus, the Roman generals penetrated as far as Ctesiphon and Seleucia. They were received as friends by the Greek colony; they attacked as enemies the seat of the Parthian kings; yet both cities experienced the same treatment. The sack and conflagration of Seleucia, with the massacre of 300,000 of the inhabitants, tarnished the glory of the Roman triumph. Seleucia, already exhausted by the neighborhood of a too powerful rival, sunk under the fatal blow; but Ctesiphon, in about thirty-three years, had sufficiently recovered its strength to maintain an obstinate siege against the emperor Severus. The city was, however, taken by assault; the king, who defended it in person, escaped with precipitation;

100,000 captives and a rich booty rewarded the fatigues of the Roman soldiers. Notwithstanding these misfortunes, Ctesiphon succeeded to Babylon and to Seleucia as one of the great capitals of the East."—E. Gibbon, *History of the decline and fall of the Roman empire*, ch. 8.—In 637 Ctesiphon passed into the possession of the Saracens. See CALIPHATE: 632-651.

ALSO IN: G. Rawlinson, *Sixth great oriental monarchy*, ch. 6.

1915-1917.—On November 22, 1915, the British forces in Mesopotamia unsuccessfully attacked Ctesiphon. On March 6, 1917, the British passed the town, then deserted by the Turks, and five days later entered Bagdad. See WORLD WAR: 1915: VI. Turkey: c, 4.

CUATOS, a tribe of American aborigines. See PAMPAS TRIBES.

CUBA: Geographic description.—Resources.—Cuba is a Latin-American republic in the West Indies comprising the island of Cuba, the Isle of Pines and small adjacent islands. "Cuba, the largest and richest of the West Indian islands, lies just within the tropics; its most northerly point is within 100 miles of Key West, its most southerly within 100 miles of Jamaica. The island is 720 miles long, and from twenty-five to 100 miles wide. Its area including 1,300 keys (cays) or islets, is 45,000 square miles. . . . Cuba has three natural divisions, the eastern mountains, the central plains with occasional hills, and the western central axial mountains bordered by sloping valleys."—H. R. Mill, *International geography*, p. 793.—"The position of the island is remarkable. It stretches away in a sort of crescent from east to west, throwing its western end with a curve, as if to form an impregnable barrier to the outlet of the Gulf of Mexico, as though it, at some ancient period, had formed a part of the American continent, and had been severed on its north side from the Florida peninsula, by the wearing of the Gulf stream, and from Yucatan, on its southeastern point, by a current setting into the gulf."—A. Jones, *Cuba in 1850*, p. 8.—"The shore line of Cuba is very broken and irregular, with numberless bays, lagoons and coves and with over 600 small islets or 'cays' off the north shore and over 700 off the south shore. While these islands render the navigation of Cuban waters dangerous and difficult yet at the same time they serve to break the force of wind and waves and Cuba has more good ports, for a place of its size, than any other island in the world. In fact, one of the Island's nicknames is the 'Isle of One Hundred Harbours,' more than fifty of the harbours being ports of entry and practically landlocked. Flowing across the broad and fertile plains from the distant mountains and emptying their waters into the Caribbean and the Atlantic, are numerous rivers, many of them broad and beautiful, but only one—the Cauto, near the eastern end of the Island—being navigable for any great distance. In many places near the coasts, and particularly in the south-central district, are large swamps, while in the eastern provinces are extensive forests and in the mountains are rich mineral deposits. With its varied surface, its tropical climate and its rich soil, Cuba offers ideal conditions for rich and luxuriant vegetation and the flora comprises over 3,000 species, while the forests contain such valuable woods as mahogany, lignum-vitæ, granadilla, sweet cedar, logwood, sandal wood, red sanders, etc.; the forest area covering nearly fifty per cent. of the Island's surface, more than 1,200,000 acres being government land. In addition, every tropical fruit, flower, plant, and product thrives luxuriously in Cuba, while in the moun-

tains and high interior plains many temperate products may be raised."—A. H. Verrill, *Cuba, past and present*, pp. 12-14.—Cuba's staple products are coffee, fruits, rum, honey, and sugar; and the mineral resources, found chiefly in the district of Santiago de Cuba, are iron, asphalt and manganese.

Sugar industry.—"Cuba produces considerably more than one-fourth of the entire cane sugar of the world, devoting two million acres to the crop. More than four-fifths of this area is in the provinces of Santa Clara, Matanzas and Oriente. The Island's output in recent years has been more than 1,000,000 tons of refined sugar [a year]. Enormous as is this production, it falls far short of the quantity that could be produced if larger areas of the available suitable land were put under cultivation and if such scientific and intensive methods as prevail in some other countries were employed. Sugar cane was probably first grown in Cuba some time about the middle of the sixteenth century [c. 1523], under the encouragement of a royal bounty. The industry made but slow progress during the next two and a half centuries. In 1850, the sugar production of the Island had reached approximately 300,000 tons. Since then it has steadily increased, the million mark having been attained in 1894. During the latter half of the nineteenth century a tendency to centralization set in. Previous to that period the crop had been raised on a large number of small plantations, each working entirely independently. In 1880 began the movement toward the establishment of 'centrals' for the performance of the extractive operations. There are now nearly two hundred of these buildings in the Island. At the same time the combination of small plantations resulted in a decrease in numbers with an increase in average size. The million ton mark gained in 1894 was upheld in the following year, but in 1896 [due to the war] . . . the year's output was barely more than 225,000 tons. During . . . [this war] the sugar plantations throughout Cuba were either utterly ruined, or severely damaged. Since the war, the industry has been resuscitated by the investment of vast amounts of money, the erection of modern buildings, and the installation of the latest types of machinery. As a considerable proportion of this investment was American money, American methods have been extensively introduced. The result of all this is a complete reformation of the industry in all its branches. There is, nevertheless, room for further improvement, especially in the field. A better quality of cane might be secured by intelligent selection, and the invention of a harvester would result in a great economy. The latter-day sugar plantation is a very extensive establishment and costs from five hundred thousand dollars to several millions. One of the largest and most complete in Cuba is that called the Central Preston, belonging to the Nipe Bay Company, and situated on Nipe Bay. The factory, according to the latest method, is erected close to the wharves at Punta Tabaco. Thence the cane lands extend inland and along the shore for twenty-five miles. . . . So great is Cuba's reliance upon her sugar industry that a rise or falling off in it means depression or elation in every part of the Island. In 1906, the United States paid to Cuba \$72,650,000 for 1,092,180 tons of sugar, and the prices ranged from 3½ cents to 5¼ cents per pound. The result was general prosperity and contentment. Since then the prices have risen and fallen through frequent changes and a wide range, and they are once more high enough to make the planter and manufacturer happy. But the average price and

profit for any series of recent years have not been such as to encourage investment in the industry, and those engaged in it are only too conscious of the fact that their prosperity rests upon a very unstable basis. There are those who look for relief of Cuba's difficulties in the cessation of the European bounties, and a complete solution of them in annexation to the United States, but either contingency is a slender dependence."—F. Lindsay, *Cuba and her people today*, pp. 169-184.—The sugar crop of Cuba for 1919-1920 amounted to 3,730,077 tons, whereas the grand total of cane and beet sugar for the entire world was only 15,310,824 tons.—See also FOOD REGULATION: 1917-1918: Food control in the United States; LATIN AMERICA: Agriculture.

Origin of name.—"The various names given to the island during the first years of the discovery—Juana, Fernandina, Santiago, Ave Maria, Alfa y Omega—have all been forgotten, and Cubanacan, the native name of a part of the central region near the present district of the 'Five Towns,' has survived under the mutilated Spanish form of Cuba, the Coube of the French buccaneers."—E. Reclus, *Universal geography*, v. 17, pp. 354-355.

Aborigines.—Present races.—Population.—"At the time of the discovery Cuba is known to have been fairly well peopled by thirty distinct tribes, whose names and territories have been carefully preserved by the early writers. The Cibunys, as they were collectively called, were, like the Lucayans of the neighbouring Bahama Archipelago, a branch of the widely-diffused Arawak race. They occupied the whole island except a small tract at its western extremity, which was held by the fierce Guanahacabibes of Carib stock and speech. But all alike, estimated at about one million, had disappeared long before the close of the sixteenth century, victims of the first European planters. When all were gone they had to be replaced by other aborigines brought by the slave raiders from the surrounding mainlands and islands."—Stanford's *Compendium of geography*, v. 2, p. 297.—"Of the inhabitants of Cuba, as found by the Spaniards, comparatively little is recorded. They seem to have been a somewhat negative people, generally described as docile, gentle, generous, and indolent. Their garments were quite limited, and their customs altogether primitive. They disappear from Cuba's story in its earliest chapters. Very little is known of their numbers. Some historians state that, in the days of Columbus, the island had a million inhabitants, but this is obviously little if anything more than a rough guess."—A. G. Robinson, *Cuba, old and new*, p. 14.

ALSO IN: I. A. Wright, *Earliest history of Cuba*, pp. 9-16.

"The people of Cuba may be classified into five distinct groups, as follows: white Cubans, black Cubans, colored Cubans, Spaniards . . . and foreigners other than Spanish. The white Cubans are the owners of the soil; the black and colored form the laboring classes; . . . the Spanish, . . . the commercial class; while the other foreigners are birds of passage whose interests in the island are purely financial. It is difficult to ascertain or even estimate the numerical proportion of these classes to one another. The entire foreign element, exclusive of about thirty thousand Chinese males and the army, probably does not exceed one hundred thousand people. The civilian foreigners, in most cases, are estimable people, the better class of whom are engaged in banking, trade, and sugar-planting. They have no other interest in the welfare of the country than gain of wealth, and have no intention of permanent residence. Hence they

should not be considered in any manner as representative of the Cuban people, although their voice has, in recent political events, almost drowned that of the true inhabitants. . . . The lower classes of the Spanish male population of Havana—porters, draymen, and clerks—are organized into a dangerous and oftentimes uncontrollable military force, known as the Volunteers, who, while never having been known to take the field, are a serious menace to the peace of the city, being feared equally by the authorities, over whose heads they hold the threat of mutiny, and by the resident and unarmed Cubans, over whom they hold the threat of massacre. Up to date the record of this organized mob has been a series of horrible crimes. . . . Although of Spanish blood, the Cubans, through adaptation to environment, have become a different class from the people of the mother-country, just as the American stock has become differentiated from the English. Under the influence of their surroundings, they have developed into a gentle, industrious, and normally peaceable race, not to be judged by the combativeness which they have developed under a tyranny such as has never been imposed upon any other people. The better class of *Camagueynos*, as the natives of the interior are fond of calling themselves, aside from the customary number of idlers and spoiled sons of wealthy parents one sees in Havana, are certainly the finest . . . men of the island.”—R. T. Hill, *Cuba and Porto Rico*, pp. 99-100.—In 1921, the estimated population was 2,900,000.

Education.—By the law of 1880, which went into effect 1899 primary education was made free and compulsory. “There are nearly five thousand schools in Cuba, Education providing one of the most remarkable reforms achieved by the Republic. There are five times the number of pupils now under instruction than during the old regime. Primary free schools are established in all rural districts, and the secondary schools have been greatly improved. A novel system of travelling teachers also has been instituted for higher grade schools in country districts and small towns where a permanent staff for advanced subjects could not be maintained. Circuits are arranged over which first-class instructors follow each other in succession for subjects which include Anatomy, Physiology, Hygiene, Agriculture, Natural History, Psychology, Music, and Manual Training. In the lower grades a modern system of kindergarten is proving successful. Domestic economy, deportment and English are special features of Cuban education. There are Normal Colleges in each province, and a special department in the University for training teachers of both sexes. Advanced and University Education for poor but brilliant students is provided by municipal and national scholarships, which are also given to enable pupils of special promise to finish abroad. Veterinary students are sent to take courses in England, architects and artists are assisted to finish in Rome or Paris, engineers and dentists to the United States, and medical students to the best centres for the study of the branches in which they specialize. The School of Applied Arts and Crafts in Havana turns out a creditable list of engineers, chemists and architects. There are the National Conservatory of Music, the Military Academy, the School of Painting and Sculpture, and many other important institutions in Havana. There is also the English College, with a staff drawn from the leading public schools here after which the establishment is modelled. The National University is composed of three faculties—Science and Literature, Law, Surgery and Medicine. Very low fees are asked

from poor students of exceptional ability. There are nearly two thousand under-graduates enrolled.”—G. C. Musgrave, *Cuba, the land of opportunity*, pp. 62-64.

1492-1493.—Discovery by Columbus.—“Christopher Columbus’ diary shows that while exploring the Bahamas, immediately after . . . he had found a New World for Castile and for Leon, the Admiral had news from the natives of those keys of another island he seems at first to have thought they called Colba. He presently understood the word aright, to be Cuba. He heard at the same time of Bosio or Bobio, which he thought was a separate island, whereas it may have been the eastern end of Cuba as distinguished from the rest and identified with Hayti especially in the more bellicose character of its inhabitants. Columbus believed that Cuba was Cipango [Japan], that half or wholly mythical land of gold and pearls, precious stones and spices, which Marco Polo in describing it located some fifteen hundred miles off the continent of India. Therefore he readily interpreted the natives of the Bahaman keys to say that in Cuba there were numerous great merchants and navigators and a commerce commensurate with the magnificence of populous cities of a large and oriental state. He bent his course southwestward and on October 28, 1492, having lain off shore all night in a rain, he landed in Cuba which he christened Juana for the prince Don Juan, son of Isabella of Castile, Columbus’ patron, and of her husband Ferdinand of Aragon.”—I. A. Wright, *Early history of Cuba*, pp. 5-6.—See also AMERICA: 1492; 1493-1496.

ALSO IN: A. G. Robinson, *Cuba*, pp. 1-8.

1511.—Spanish conquest and occupation.—“Of the islands, Cuba was the second discovered; but no attempt had been made to plant a colony there during the lifetime of Columbus; who, indeed, after skirting the whole extent of its southern coast, died in the conviction that it was part of the continent. At length, in 1511, Diego, the son and successor of the ‘admiral,’ who still maintained the seat of government in Hispaniola, finding the mines much exhausted there, proposed to occupy the neighbouring island of Cuba, or Fernandina, as it is called, in compliment to the Spanish monarch. He prepared a small force for the conquest, which he placed under the command of Don Diego Velasquez. . . . Velasquez, or rather his lieutenant Narvaez, who took the office on himself of scouring the country, met with no serious opposition from the inhabitants, who were of the same family with the effeminate natives of Hispaniola.” After the conquest, Velasquez was appointed governor, and established his seat of government at St. Jago, on the southeast corner of the island.—W. H. Prescott, *Conquest of Mexico*, bk. 2, ch. 1.

ALSO IN: A. Helps, *Spanish conquest in America*, bk. 7.

1514-1762.—Slow development of the island.—Velasquez and Cortés.—De Soto.—Las Casas.—Raids on the island.—“Velasquez founded many of the towns of the island, the first of which was Baracoa, then Bayamo, and in 1514 Trinidad, Santo Espirito, Puerto Principe; next, in 1515, Santiago de Cuba, as also, in the same year, the town of Habana. . . . This period (1511-1607) is particularly interesting to the general reader from the fact that in it the explorations of Hernandez de Cadoba and Grijalva to Darien, Yucatan, etc., were inaugurated,—events which had so much to do with the spread of Spanish rule and discovery, paving the way as they did for the exploration of Mexico under Hernando Cortés, who, in the early history of Cuba, figures largely as the lieutenant

of the Governor Velasquez. [See also MEXICO: 1519-1520.] . . . In 1524, Diego Velasquez died,—his death hastened, it is said, by the troubles brought upon him by his disputes with his insubordinate lieutenant, Cortés. . . . In the history of the improvement of the island, his government will bear favorable comparison with many of the later governments; and while that great evil, slavery, was introduced into the island in his time [about 1523], so also was the sugar cane. . . . Up to 1538, there seems to be nothing specially striking in the general history of the island, if we except the constant attacks with fire and sword of the 'filibusteros,' or pirates of all nations, from which most all the sea-coast towns suffered more or less; but in that year there arrived at Santiago de Cuba a man destined to play an important part in the history and discovery of the new world, and named as Provincial Governor of Florida as well as of Cuba,—I allude to Hernando de Soto, who brought with him 10 large vessels, prepared and fitted out expressly for the conquest of the new Spanish territory of Florida. After much care and preparation, this expedition started out from the city of Habana, the 12th of May [see FLORIDA: 1528-1542] . . . In this period, also, was promulgated that order, secured, it is believed, by the noble efforts of Padre Las Casas, prohibiting the enslaving of the aborigines; while, also, such had become its importance as a town, all vessels directed to and from Mexico were ordered to stop at Havana. In the period of years that elapsed from 1607 to 1762, the island seems to have been in a perfect state of lethargy, except the usual changes of its many Governors, and the raids made upon it by pirates, or by more legalized enemies in the form of French and English men-of-war."—S. Hazard, *Cuba with pen and pencil*, pp. 547-550.—During this period the administration of Cuba by the Spanish government was unorganized and violent, filled with bitter quarrels among both the ecclesiastical and civil authorities.

1762-1763.—Capture of Havana by the English.—British occupation.—Returned to Spain by the treaty of Paris (1763).—"On the 6th of June, 1762, there arrived off the port of Havana an English squadron of 32 ships and frigates, with some 200 transports, bringing with them a force of nearly 20,000 men of all arms, under command of the Duke of Albemarle. This formidable armament, the largest that America had ever seen, laid siege to the city of Havana, whose garrison consisted at that time of only about 2,700 regulars and the volunteers that took up arms immediately for the defense of the place. . . . The garrison, however, made a very gallant and prolonged defense, notwithstanding the smallness of their numbers, and finally, surrendering, were permitted to march out with the honors of war, the English thus coming into possession of the most important defences on the coast, and, subsequently, taking possession of the town of Matanzas. Remaining in possession of this portion of the Island of Cuba for many months (until July 6, 1763), the English, by importing negro labor to cultivate the large tracts of wild land, and by shipping large quantities of European merchandize, gave a start to the trade and traffic of the island that pushed it far on its way to the state of prosperity it has now reached; but by the treaty of peace, at Paris, in February, 1763 [see SEVEN YEARS' WAR: Treaties which ended the war], was restored to Spain the portion of the island wrested from her by the English."—S. Hazard, *Cuba with pen and pencil*, pp. 547-550.

1763-1861.—Temporary liberal policy of the Spanish government.—Increase in prosperity.—

Period of conspiracies (1820-1830) and discontent with Spanish rule.—"When the English captured Havana in 1762 they opened the port to all English ships. The possibilities of Cuban commerce were immediately revealed, for in the short period they held the city—less than a year—seven hundred and twenty-seven merchant vessels entered the harbor. The enlightened Charles III. of Spain, profiting by this example, opened the trade of the islands in 1765 . . . to eight Spanish ports besides Cadiz, and relaxed many of the regulations that had hampered the merchants. The prosperity of Cuba dates from the English capture of Havana. . . . In 1775 the number of slaves in Cuba was about forty-six thousand and the number of free colored about thirty thousand. With the relaxation of the trade laws the economic development of Cuba went forward by leaps, and the average importation of slaves for the ten years, 1790-1799, was over five thousand."—E. G. Bourne, *Spain in America*, pp. 279, 296-297.—From 1790-1820 European wars left Cuba independent of Spain. Free commerce was further legalized and the island enjoyed the rule of a series of liberal governors, among the most notable of whom was Louis de las Casas.—"In this period (1762-1801) the island made rapid advances in improvement and civilization, many of the Captains-General of this period doing much to improve the towns and the people, beautifying the streets, erecting buildings, etc. In 1763, a large emigration took place from Florida [and the island of Jamaica] and in 1795 the French emigrants from Santo Domingo came on to the island in large numbers. . . . From 1801, rapid increase in the prosperity of the island has taken place. . . . At various times insurrections, some of them quite serious in their nature, have shown what the natural desire of the native population is for greater privileges and freedom. . . . In 1823, there was a society of 'soles,' as it was called, formed for the purpose of freeing the island, having at its head young D. Francisco Lemus, and having for its pretext that the island was about to be sold to England. In 1820, there was discovered the conspiracy of the Black Eagle, as it was called (Aguila Negra), an attempt on the part of the population to obtain their freedom, some of the Mexican settlers in the island being prominent in it. The insurrection, or attempt at one, by the blacks in 1844, was remarkable for its widespread ramifications among the slaves of the island, as well as its thorough organization,—the intention being to murder all the whites on the island. Other minor insurrections there were, but it remained for Narciso Lopez, with a force of some 300 men, to make the most important attempt [1851], in which he lost his life, to free the island."—S. Hazard, *Cuba with pen and pencil*, pp. 547-550.

1827-1840.—Effect of Monroe doctrine on Cuba. See MONROE DOCTRINE: 1827-1867.

1845-1860.—Acquisition coveted by the slave-power in the United States.—Attempted purchase.—Filibustering schemes.—Ostend manifesto.—"When the Spanish colonies in America became independent, they abolished slavery. Apprehensive that the republics of Mexico and Colombia would be anxious to wrest Cuba and Porto Rico from Spain, secure their independence, and introduce into those islands the idea, if they did not establish the fact, of freedom, the slave-masters [of the United States] at once sought to guard

against what they deemed so calamitous an event. . . . But after the annexation of Texas, there was a change of feeling and purpose, and Cuba, from being an object of dread, became an object of vehement desire. The propagandists, strengthened and emboldened by that signal triumph, now turned their eyes towards this beautiful 'isle of the sea,' as the theatre of new exploits; and they determined to secure the 'gem of the Antilles' for the coronet of their great and growing power. During Mr. Polk's administration an attempt was made to purchase it, and the sum of \$100,000,000 was offered therefor. But the offer was promptly declined. What, however, could not be bought it was determined to steal, and filibustering movements and expeditions became the order of the day. For no sooner was President Taylor inaugurated than he found movements on foot in that direction; and, in August, 1849, he issued a proclamation, affirming his belief that an 'armed expedition' was being fitted out 'against Cuba or some of the provinces of Mexico,' and calling upon all good citizens 'to discountenance and prevent any such enterprise.' In 1851 an expedition, consisting of some 500 men sailed from New Orleans under Lopez, a Cuban adventurer. But though it effected a landing, it was easily defeated, and its leader and a few of his followers were executed. Soon afterward, a secret association, styling itself the Order of the Lone Star, was formed in several of the Southern cities, having a similar object in view; but it attracted little notice and accomplished nothing. . . . In August, 1854, President Pierce instructed Mr. Marcy, his Secretary of State, to direct Buchanan, Mason and Soulé, ministers respectively at the courts of London, Paris and Madrid, to convene in some European city and confer with each other in regard to the matter of gaining Cuba to the United States. They met accordingly, in October, at Ostend. The results of their deliberations were published in a manifesto, in which the reasons are set forth for the acquisition; and the declaration was made that the Union could never enjoy repose and security 'as long as Cuba is not embraced within its boundaries.' But the great source of anxiety, the controlling motive, was the apprehension that, unless so annexed, she would 'be Africanized and become a second San Domingo,' thus 'seriously to endanger' the Union. This paper attracted great attention and caused much astonishment. It was at first received with incredulity, as if there had been some mistake or imposition practised. . . . But there was no mistake. . . . It was the deliberate utterance of the conference, and it received the indorsement of Mr. Pierce and his administration. The Democratic national conventions of 1856 and of 1860 were quite as explicit as were the authors of the Ostend manifesto 'in favor of the acquisition of Cuba.'—H. Wilson, *History of the rise and fall of the slave power in America*, v. 2, ch. 47.

1854.—Case of the *Black Warrior*.—One of the irritations that excited feeling in the United States against the Spanish authorities in Cuba was caused, in 1854, by the seizure, at Havana, on purely technical grounds, of the steamer *Black Warrior*, which touched at the port for passengers and mail. Her cargo was confiscated and a heavy fine levied on the ship. "The circumstances of the seizure were certainly provoking, and it is impossible to avoid belief that they were deliberately intended to be so. The vessel had long been making regular and entirely legitimate trips to that port. But on the latest of them she was arbitrarily seized and her cargo condemned; not for filibustering or illicit trade, but for alleged disregard of some obsolete

port regulations which had long been ignored. . . . The president reported the incident to Congress, and stated that a demand for redress and indemnity was being made. Some violent speeches were made in Congress by Southern members, and there were even demands for war and the conquest of Cuba. [W. L.] Marcy [secretary of state] . . . kept his head and instructed [Pierre] Soulé [minister to Spain] to demand an indemnity of \$300,000, and to express the hope that the Cuban authorities would be appropriately rebuked for an act which it was confidently assumed the Spanish government could not approve. . . . The case was aggravated by the fact that it occurred in Holy Week, when it was not customary at Madrid to transact business which could possibly be postponed. Calderon, however, . . . replied within twenty-four hours that the matter would be most carefully considered at the earliest possible moment."—W. F. Johnson, *America's foreign relations*, v. 1, pp. 543-544.—Indemnity for the wrong to the owners was only obtained, however, after five years of controversy.

1865.—Situation of the Cubans under Spanish rule.—In his book, "The West Indies and the Spanish Main," published in 1859, Anthony Trollope described the situation of the Cubans under Spanish rule by saying: "At present they have no national privilege except that of undergoing taxation. Every office is held by a Spaniard." Of course, there was deep-seated discontent, and many insurrectionary attempts; but "it was not till the end of 1865, and after protracted efforts on the part of the colonists, that they succeeded in obtaining the appointment of a commission to inquire into the causes of their discontent." Nothing came of it; and the Cubans then "set themselves to devise plans for freeing their island from the crushing dominion of Spain."—*Edinburgh Review*, Oct., 1873.

1868-1895.—Declaration of Independence.—Ten years of insurrection.—United States and Spain.—Affair of the *Virginus*.—End of slavery.—Increased dissatisfaction of the Cubans.—"Cuban independence was proclaimed on October 10, 1868, at the Yara plantation. That was the natal date and that was the natal place of the Republic of Cuba. The event was made known to the world in a Declaration of Independence, which was issued at Manzanillo, and which was as follows: 'In arming ourselves against the tyrannical Government of Spain we must, according to precedent in all civilized countries, proclaim before the world the cause that impels us to take this step, which though liable to entail considerable disturbance upon the present, will insure the happiness of the future. It is well known that Spain governs the Island of Cuba with an iron and blood-stained hand. The former holds the latter deprived of political, civil, and religious liberty. Hence, the unfortunate Cubans being illegally prosecuted and thrown into exile or executed by military commissions in times of peace. Hence, their being kept from public meetings, and forbidden to speak or write on affairs of state; hence, their remonstrances against the evils that afflict them being looked upon as the proceedings of rebels, from the fact that they are bound to keep silence and obey. Hence, the never-ending plague of hungry officials from Spain to devour the product of their industry and labor. Hence, their exclusion from public stations and want of opportunity to skill themselves in the art of government. Hence, the restrictions to which public instructions with them is subjected, in order to keep them so ignorant as not to be able to know and enforce their rights in any shape or form whatever. Hence, the navy and standing army, which are kept upon their country at an

enormous expenditure from their own wealth to make them bend their knees and submit their necks to the iron yoke that disgraces them. Hence, the grinding taxation under which they labor, and which would make them all perish in misery but for the marvelous fertility of the soil. On the other hand, Cuba cannot prosper as she ought to, because white immigration that suits her best is artfully kept from her shores by the Spanish Government, and as Spain has many a time promised us Cubans to respect our rights without having hitherto fulfilled her promise, as she continues to tax us heavily and by so doing is likely to destroy our wealth; as we are in danger of losing our property, our lives, and our honor under further Spanish domination; as we have reached a depth of degradation utterly revolting to manhood; as great nations have sprung from revolt against a similar disgrace, after exhausted pleadings for relief, as we despair of justice from Spain through reasoning and cannot longer live deprived of the rights which other people enjoy, we are constrained to appeal to arms and to assert our rights in the battle-field, cherishing the hope that our grievances will be a sufficient excuse for this last resort to redress them and to secure our future welfare. To the God of our conscience, and to all civilized nations, we submit the sincerity of our purpose. Vengeance does not mislead us, nor is ambition our guide. We only want to be free and to see all men with us equally free, as the Creator intended all mankind to be. Our earnest belief is that all men are brethren. Hence our love of toleration, order and justice in every respect. We desire the gradual abolition of slavery, with indemnification; we admire universal suffrage, as it insures the sovereignty of the people; we demand a religious regard for the inalienable rights of men as the basis of freedom and nation greatness.' Following the Declaration of Independence, the provisional government of the Republic of Cuba was organized at Bayamo. The most prominent figure in the organization of the Cuban revolutionists and the first really constructive leader of the Cuban insurrection was Carlos Manuel Cespedes, a native of Bayamo. . . . Cespedes's only expressed zeal for the emancipation of the oppressed Cubans, and the earnest efforts which he had long exerted in their behalf, had won for him such widespread recognition as a patriot that he was, without a dissenting voice, chosen for the head of the provisional government."—W. F. Johnson, *History of Cuba*, v. 3, pp. 155-157.—"In 1868 [the popular party in favor of independence] began a war for freedom. Their most important leader was Quesada, a man of great devotion and much ability. He realized that his followers could not cope with the great army sent against them and resorted to guerilla warfare. He divided his forces into small mounted bands, badly armed but strong in the predatory instinct. They burned property, ravaged the crops, and took life relentlessly, making themselves terrors to all who did not support their cause. The Spanish army was strong in infantry and weak in cavalry, and it could only extend its garrisons in the infected districts and wait for time to wear out the revolutionists. By 1878 this was accomplished, and resistance ceased when concessions were promised [amnesty for the war; liberty to the slaves; reforms in government and colonial autonomy]. But the ten years' war left the country a waste. It also led to unpleasant relations between the United States and Spain. An insurgent junta in New Orleans and in New York sent powerful aid to the revolt in the form of arms and supplies, and many Cubans escaping to

our shores took oaths of American citizenship and returned to the island to serve under the revolutionists. This naturally enraged the Spanish governor of Cuba, but the orders he issued in opposition to it went beyond the bounds of international comity. Vessels taking recruits and supplies to the insurgents, he declared, should be considered piratical, 'and all persons captured in such vessels,' he added, 'without regard to their number will be immediately executed.' The United States protested against the decree, and it was withdrawn some time after it was promulgated. . . . The local Spanish officials resented the repeal of the order . . . , and they met the desperate methods of the insurgents with the most cruel decrees. . . . In 1873 the *Virginus*, a well-known filibustering ship, was taken on the high seas, and carried into Santiago harbor. The crew of 52 and the 103 passengers, among them 8 American, several British, and one French subjects, were sent before a summary court martial, and within five days 53 of them, including the captain, an American citizen, were shot as pirates, spite of the protest of the American, British, and French consuls. The Spanish officer in command declared that he obeyed the orders of his superiors. The proceedings were not known in Madrid until it was too late to stop them. The ministry there, as soon as it knew of the capture, sent orders that no sentences be carried out without permission from that quarter. The despatch reached Havana in time to save some of the victims. . . . The affair brought the two nations to the verge of war. . . . Spain declared that the *Virginus* was not an American ship and promised reparation in a month if investigation showed the contrary. . . . The investigation showed she had no right to carry the United States flag, and that her American registry was fraudulent. . . . In 1875 she [Spain] contributed \$80,000 to be distributed among the relatives of the Americans shot at Santiago."—J. S. Bassett, *Short history of the United States*, pp. 782-784.—"By gradual emancipation, slavery ceased to exist in the island in 1885. The powers of the captain-general, the most objectionable feature of Spanish rule, continued uncurtailed."—J. H. Latané, *Diplomatic relations of the U. S. and Spanish America*, ch. 3.—Between 1878 and 1895 the growth of political parties was stimulated. Dissatisfaction with the policies of the Spanish government increased when colonial autonomy promised by the convention of Zanjón (1878) failed to be carried out. The cessation of reciprocity with the United States (in force from 1891 to 1894) added to the general disaffection.

1895-1898.—Insurrection renewed.—General Campos unsuccessful in quelling rebellion.—Succeeded by General Weyler.—Concentration order and other edicts.—Weyler succeeded by General Blanco.—Attitude of the United States.—Teller resolution.—"The revolution of 1895 falls naturally into three periods: First, that of Captain-General Martinez Campos, whose fair fighting failed to prevent the spread of the revolutionary movement from the eastern to the western provinces; second, that of Captain-General Weyler, who inaugurated the shameful policy of reconcentration; third, that of Captain-General Blanco—including the events from Weyler's recall to the destruction of the *Maine*. [See also SPAIN: 1885-1896.] Fighting fairly and like a gentleman, Campos was fairly beaten by men who developed positive genius in guerrilla warfare—Gomez and Antonio Maceo, who knew how to win by skilful evasion, by opportune attack, and, above all, by making an ally of every peasant and living on the country. Maceo crossed both trochas [a kind of

entrenchment], and reached Pinar del Rio province, thus carrying revolt from one end of the island to the other. Among the hills of the Sierra de los Organos he maintained his band of followers and defied all efforts to dislodge him up to the close of the year 1806. Then he risked his life once too often, and was killed. Campos failing to check the insurrection, Weyler was sent to crush it [February, 1806]. The reasoning of the latter was strictly logical. He learned that Cuban peasants supplied the rebels with food, with information in regard to the movements of the Spanish columns, and with ammunition—bought, stolen, or brought to the coast by filibusters; he did not shrink, then, from the extreme cruelty involved in the removal of the country folk from their homes to garrisoned cities, where, as 'reconcentrados' they should become quite harmless."—M. Wilcox, *Encyclopedia of Latin America*, pp. 628-629.

ALSO IN: *United States Senate Document, No. 166, 54th Congress, 1st session.*

On October 21, 1896, Weyler made his infamous proclamation the text of which is as follows:

ARTICLE 1. All inhabitants of the district of Sancti Spiritus and the provinces of Puerto Principe and Santiago de Cuba will have to concentrate in places which are the headquarters of a division, a brigade, a column, or a troop, and will have to be provided with documentary proof of identity, within eight days of the publication of this proclamation in the municipalities.

ART. 2. To travel in the country in the radius covered by the columns in operation, it is absolutely indispensable to have a pass from the mayor, military commandants, or chiefs of detachments. Any one lacking this will be detained and sent to headquarters of divisions or brigades, and thence to Havana, at my disposition, by the first possible means. Even if a pass is exhibited, which is suspected to be not authentic or granted by authority to person with known sympathy toward the rebellion, or who show favor thereto, rigorous measures will result to those responsible.

ART. 3. All owners of commercial establishments in the country districts will vacate them, and the chiefs of columns will take such measures as the success of their operations dictates regarding such places which, while useless for the country's wealth, serve the enemy as hiding places in the woods and in the interior.

ART. 4. All passes hitherto issued hereby become null and void.

Thousands of Cuban families were pent in towns or zones under surveillance of a Spanish garrison, and as time went on they died of starvation and fever. "Torn from their homes, with foul earth, foul air, foul water, and foul food or none, what wonder that one-half have died and that one-quarter of the living are so diseased that they cannot be saved? . . . Deaths in the streets have not been uncommon. I was told by one of our consuls that they have been found dead about the markets in the morning, where they had crawled, hoping to get some stray bits of food from the early hucksters, and that there had been cases where they had dropped dead inside the market surrounded by food. These people were independent and self-supporting before Weyler's order. . . . I went to Cuba with a strong conviction that the picture had been overdrawn; that a few cases of starvation and suffering had inspired and stimulated the press correspondents, and that they had given free play to a strong, natural, and highly cultivated imagination. . . . I could not believe that,

out of a population of 1,600,000, 200,000 had died within these Spanish forts, practically prison walls, within a few months past from actual starvation and diseases caused by insufficient and improper food. My inquiries were entirely outside of sensational sources. They were made of our medical officers, of our consuls, of city alcaldes (mayors), of relief committees, of leading merchants and bankers, physicians, and lawyers. Several of my informants were Spanish born, but every time the answer was that the case had not been overstated. What I saw I cannot tell so that others can see it. It must be seen with one's own eyes to be realized."—*Congressional Record, Mar. 17, 1898.*

—"When Spain's prime minister, Señor Cánovas del Castillo, was assassinated, 8 Aug., 1897, the prop of Weyler's Cuban policy was withdrawn. [See SPAIN: 1897 (August-October).] His successor, General Blanco, took to Cuba a policy of compromise. Autonomy was offered; [Constitution establishing self-government in the islands of Cuba and Porto Rico was promulgated by royal decree at Madrid on Nov. 25, 1897] and, for the rescue of the reconcentrados, the suggestion was made that charitable people in the United States might forward supplies to be distributed by the American consuls in Cuba. The proposal of autonomy was rejected with emphasis: General Blanco's emissary who brought the message was shot by an insurgent commander."—M. Wilcox, *Encyclopedia of Latin America*, p. 629.—"The dividing lines between parties are the most straight and clear cut that have ever come to my knowledge. The division in our war was by no means so clearly defined. It is Cuban against Spaniard. It is practically the entire Cuban population on one side and the Spanish army and Spanish citizens on the other. I do not count the autonomists in this division, as they are so far too inconsiderable in numbers to be worth counting. General Blanco filled the civil offices with men who had been autonomists and were still classed as such. But the march of events had satisfied most of them that the chance for autonomy came too late. . . . There is no doubt that General Blanco is acting in entire good faith; that he desires to give the Cubans a fair measure of autonomy, as Campos did at the close of the ten-year war. He has, of course, a few personal followers, but the army and the Spanish citizens do not want genuine autonomy, for that means government by the Cuban people. And it is not strange that the Cubans say it comes too late."—*Congressional Record, Mar. 17, 1898.*

"And when it became known that an appeal for contributions to feed starving Cuba had been made in the United States, formidable riots in Havana expressed resentment of the proffered relief, which was regarded as the entering wedge of the dreaded intervention. For the protection of American interests the Atlantic squadron was ordered to make its headquarters at the Dry Tortugas, within six hours' sail from the Cuban capital; and on 25 January the battleship *Maine* was sent to Havana harbor. The Spanish government sent the cruiser *Viscaya* to New York harbor soon afterwards. On 9 Feb., 1898, a letter addressed to Señor Canelejas by Señor Dupuy de Lome, Spanish minister to the United States, was published in the newspapers of the latter country. Its cynical tone and insulting characterization of President McKinley were resented and Señor de Lome resigned his office. One week later the *Maine* was destroyed [see U. S. A.: 1898 (February-March)]. . . . The courts [of inquiry] was unable to obtain evidence fixing the responsibility upon any person or persons; before the official investigation was made, however, public

opinion in the United States had rightly or wrongly assigned the responsibility, and war with Spain seemed inevitable. On 8 March, the House of Representatives passed a bill appropriating \$50,000,000 for national defense. . . . Diplomatic representatives of the six great European powers called at the White House 7 April to present a joint note, a 'pressing appeal' for 'the maintenance of peace.' President McKinley's reply was conciliatory, but the resolve he had formed was expressed in his message of 11 April. 'In the name of humanity, in the name of civilization, in behalf of endangered American interests, which give us the right and the duty to speak and act, the war in Cuba must stop.' The war in Cuba had, indeed, stopped or halted. [See U. S. A.: 1898 (March-April).] The

resolutions with effect,' concluded with the words [Teller resolution or amendment]: 'the United States hereby declaim any disposition or intention to exercise sovereignty, jurisdiction, or control over said island, except for the pacification thereof, and asserts its determination when that is accomplished to leave the government and control of the island to its people.'—M. Wilcox, *Encyclopedia of Latin America*, pp. 629-631.—See also COLUMBIA: 1898-1902; FLORIDA: 1898.

MORRO CASTLE, CUBA

queen regent of Spain had directed General Blanco to proclaim a suspension of hostilities. . . . It was asserted that the reconcentrados were to be permitted to return to their homes, that the sum of \$600,000 had been voted for their relief, and that public works had been undertaken for the purpose of giving employment to the poor. Spain had offered to submit to arbitration the disputes which might arise in the matter of the *Maine*. President McKinley called attention to all these things, and requested that they should be given full weight in the deliberations of Congress. . . . The famous joint resolutions of 19 April [see U. S. A.: 1898 (April)], recognizing 'the independence of the people of Cuba, demanding that the government of Spain relinquish the authority and government in the island of Cuba, and withdraw its land and naval forces from Cuba and Cuban waters, and directing the President of the United States to use the land and naval forces of the United States to carry these

1898 (December).—Removal of the remains of Columbus to Spain.—The remains of Columbus were taken from the cathedral in Havana, on December 12, for transfer to the cathedral at Seville, in Spain.

1898-1899 (December-January).—Treaty of peace signed Dec. 10, 1898.—United States in possession.—'The treaty of peace was signed, in Paris, on December 10, 1898, duly ratified by both parties in the following months, and was finally proclaimed on April 11, 1899, . . . the anniversary of the issuance of President McKinley's war message. On January 1, 1899, the American flag was hoisted throughout the island, as a signal of full authority, but subject to the provisions of the Teller Amendment.'—A. G. Robinson, *Cuba, old and new*, p. 182.

1898-1899 (December-October).—Organization of military government under United States authority.—Report of the military governor, on

conditions prevailing, measures adopted, and results obtained.—On December 13, 1898, the following general order was issued by the secretary of war of the United States: "By direction of the President, a division to be known as the Division of Cuba, consisting of the geographical departments and provinces of the island of Cuba, with headquarters in the city of Habana, is hereby created, under command of Maj. Gen. John R. Brooke, U. S. A., who, in addition to command of the troops in the division, will exercise the authority of military governor of the island. Maj. Gen. Fitzhugh Lee, U. S. V., commanding the Seventh Army Corps, is assigned to the immediate command of all the troops in the province of Habana. Maj. Gen. William Ludlow, U. S. V., is designated as the military governor of the city of Habana, and will report direct to the division commander. He is charged with all that relates to collection and disbursement of revenues of the port and city, and its police, sanitation, and general government, under such regulations as may be prescribed by the President."

General Brooke arrived at Havana on December 28, and assumed the command of the troops and the military governorship of the island. In his subsequent report (October 1, 1899) of conditions then existing, proceedings taken, events occurring and results attained, he wrote: "It was found that considerable confusion incident to the withdrawal of the Spanish troops and replacing them with the United States troops existed, but no untoward event occurred, however, as every precaution was taken to maintain order. The gradual withdrawal of the Spanish troops and the advance of the United States troops continued, until the morning of the 1st of January, 1899, found but few Spanish troops in the city, and these went on board transports, which movement was completed about 12.30 p. m. Outside of the principal towns the retiring Spanish army was closely followed by the Cuban army, which took charge of the towns and country, maintaining order, and generally, performing police duty. This state of affairs continued, substantially, until the final disbandment of that army. The disbandment of the Cuban army was commenced in November, 1898. . . . A large part of the [Cuban] army was held together on various pretexts until the distribution of the \$3,000,000 [allotted for distribution to the Cuban army, to enable the soldiers to return to their homes], and the giving up of their arms effected a final disbandment. During the time the army was held together as an organized body the police duties performed seemed to be well done and order was preserved. The spectacle of an army of, according to the rolls, 48,000 men being peacefully dispersed among the people has for its prototype the disappearance of the great volunteer army of the United States in 1865. In neither case has there been any great disturbance, as was feared in both cases, and particularly so as regards the Cuban army. The small attempts at brigandage were quickly suppressed, the lawbreakers placed in prison, and the courts are now hearing their cases.

"On January 1, 1899, a division of the Seventh Army Corps, [U. S. Army] . . . was brought to the city, and, with the regiments on duty, in Habana under the command of Gen. William Ludlow, were so placed as to insure good order during the ceremonies of the relinquishment of sovereignty by Spain, which occurred in the Governor-General's palace at 12 o'clock noon. . . . A large number of the people were found to be actually starving. Efforts were immediately made to supply food, which the War Department sent, all told, 5,493,500

Cuban rations, in addition to the 1,000,000 rations distributed by Mr. Gould. . . . The result of this action was the immediate lowering of the death rate, the restoration to health of the sick, and a general change for the better was soon apparent. Medicines were also supplied for the sick with most beneficial results. Employment was given to those who could work, and they were paid weekly, so that they might have money to buy food. . . . A great part of the improvement dates from the month of May, when the muster out of the Cuban army removed a great source of distrust. The extent to which have been carried the cultivation of the fields, the reconstruction of homes, the re-establishment of order and public service, especially in the matter of hygiene in the towns, is something wonderful. . . . The question of finance, as relates to the restoration of crippled and destroyed agricultural industries, is one which has occupied a great deal of attention on the part of this government. Planters and small farmers in the tobacco growing districts are rapidly recovering from their forlorn condition. The quick growing crop and the remunerative prices have enabled them to restore, in a measure, the lost cattle, mules, and implements necessary to the farmers. There is, also, a desire to use labor-saving devices, which are now being slowly introduced. . . . The quiet severance of church and state has been effected by the fact of the Government of the United States being in control. Certain changes have already been made in the laws, and others will follow in due course; this without violating the legal rights of the Roman Catholic Church, which was the only religious denomination tolerated in the island, except a small body of Baptists. The important subject of schools is now approaching a solution."—Gen. J. R. Brooke, *Civil report, Oct. 1, 1899 (Message and documents: Abridgment, 1899-1900, v. 2, pp. 1266-76)*.

General Fitzhugh Lee reported, September 19, 1899, on the state of things in the province of Havana, as follows: "I assumed command of the department of the province of Habana January 1, 1899, and of the province of Pinar del Rio April 19, 1899. The deplorable condition of the island after it was evacuated by the Spanish is well known. Business of all sorts was suspended. Agricultural operations had ceased; large sugar estates, with their enormous and expensive machinery, were destroyed; houses burned; stock driven off for consumption by the Spanish troops, or killed. There was scarcely an ox left to pull a plow, had there been a plow left. . . . Miles and miles of country uninhabited either by the human race or domestic animals was visible to the eye on every side. The great fertile island of Cuba in some places resembled an ash pile; in others, the dreary desert. The wheels of the former government had ceased to revolve. Chaos, confusion, doubt, and uncertainty filled with apprehension the minds of the Cubans, who, for the first time, had been relieved of the cruel care of those who for centuries controlled their country and their destiny. . . . The railroads on the island were in bad order, having been used to the extent of their endurance conveying Spanish troops and Spanish supplies over them, while the great calzadas or turnpikes were filled with holes, for the war prevented repairs to either railroads or roads. Municipalities were all greatly in debt. None of the civil officers had been paid, and school-teachers had large amounts of back salary due. Judicial officers were discharging their duties as far as they could—for there was really no law in the island except the mandate of the Captain-General—without pay, and many months of back

pay was due to the professors in the colleges of the largest cities. The whole framework of the government had to be rebuilt, and its machinery carefully and gradually reconstructed. Important government problems had to be promptly solved, which involved social, economic, commercial, agricultural, public instruction, support of eleemosynary institutions of all kinds, means of communications, reorganization of municipalities, with the necessary town and city police, including a mounted force to patrol the adjoining rural districts within the limits, and subject to the authorities of the mayors and council of their respective municipalities; the appointment of new alcaldes and other officers to replace those left in authority by the Spanish Government, and who would be more in accord with the inhabitants whose local affairs they directed. Many trying and troublesome questions arose, and many difficulties environed on either side of the situation.

"Of the Cuban rural population, less than 20 per cent. of them were able to read and write, resembling children awaking the first time to the realities of life. They were in the main obedient, docile, quiet, and inoffensive, and anxious to adapt themselves as soon as possible to the new conditions which confronted them. The Cuban soldiers, black and white, who had been in the fields and woods for four years defying the Spanish banner, still kept their guns, and were massing around the cities and towns, producing more or less unrest in the public mind with the fear that many of them, unaccustomed to work so long, would be transformed into brigands, and not become peaceful, law-abiding citizens. In eight months wonderful progress has been made. The arms of the Cuban soldiers have been stacked, and they have quietly resumed peaceful vocations. Brigandage, which partially flourished for a time, has been stamped out, tillage everywhere has greatly increased, many houses rebuilt, many huts constructed, fences are being built, and more and more farming lands are gradually being taken up, and municipalities reorganized with new officers representing the wishes of the majority of the inhabitants. Municipal police have been appointed who are uniformed and under the charge of, in most cases, efficient officers."—Gen. F. Lee, *Report*, Sept. 19, 1899.

1899 (October).—Census of the island.—Statistics of population, nativity, illiteracy, etc.—"The total population of Cuba on October 16, 1899, determined by the census taken [under the direction of the war department of the United States] as of that date, was 1,572,797. . . . The latest census taken under Spanish authority was in 1887. The total population as returned by that census was 1,631,687. . . . Whether that census was correct may be a matter of discussion, but if incorrect, the number of inhabitants was certainly not overstated. Comparing the total population at these two censuses, it is seen that the loss in the 12 years amounted to 58,890, or 3.6 per cent of the population in 1887. This loss is attributable to the recent civil war and the reconcentration policy accompanying it, but the figures express only a part of the loss from this cause. Judging from the earlier history of the island and the excess of births over deaths, as shown by the registration records, however imperfect they may be, the population probably increased from 1887 up to the beginning of the war and at the latter epoch reached a total of little less than 1,800,000. It is probable, therefore, that the direct and indirect losses by the war and the reconcentration policy, including a decrease of births and of immigration and an increase of deaths and of emigration reached a total of approximately

200,000. . . . The area of Cuba is approximately 44,000 square miles, and the average number of inhabitants per square mile 35.7. . . . Habana, with the densest population, is as thickly populated as the State of Connecticut, and Puerto Principe, the most sparsely populated. . . .

"The total number of males of voting age in Cuba was 417,993, or 26 per cent of the total population. This is a little less than the proportion, in 1890, in the United States, where it was 27 per cent. . . . Classifying the potential voters of Cuba by birthplace and race, it is seen that 44.9 per cent were whites, born in Cuba; that 30.5 per cent were colored, and as nearly all the colored were born in the island it is seen that fully seven-tenths of the potential voters of Cuba were native born, 23 per cent were born in Spain, and 1.6 per cent in other countries. Classifying the whole number of potential voters by citizenship it is seen that 70 per cent were Cuban citizens, 2 per cent were Spanish citizens, 18 per cent were holding their citizenship in suspense, and 10 per cent were citizens of other countries, or their citizenship was unknown. . . . The Cuban citizens, numbering 290,905, were composed almost entirely of persons born in Cuba, there being among them but 220 white persons, and probably not more colored, of alien birth. The white Cuban citizens, who were natives of the island, numbered 184,471, and of these 94,301, or 51 per cent, were unable to read. The colored Cuban citizens numbered 106,214, of which not less than 78,279, or 74 per cent, were unable to read. The people of Cuba who claimed Spanish citizenship numbered 9,500, and of these nearly all were born in Spain, there being but 150 born elsewhere. Those whose citizenship was in suspense numbered 76,669. These also were nearly all of Spanish birth, the number born elsewhere being but 1,420. The number of persons of other or unknown citizenship was 40,919. Of these fully one-half were colored, most of them being Chinese, and much the larger proportion of the remaining half were of Spanish birth. Summing up the situation, it appears that the total number of males of voting age who could read was 200,631, a little less than half the total number of males of voting age. Of these 22,629 were of Spanish or other foreign citizenship or unknown citizenship. The number whose citizenship was in suspense was 50,724, and the number of Cuban citizens able to read was 118,278, or 59 per cent of all Cuban citizens of voting age."—*Census of Cuba, Bulletins Nos. I and III*.

1899 (December).—Appointment of Gen. Leonard Wood to the military command and governorship.—On December 6, Gen. Leonard Wood was commissioned major-general of volunteers, and was assigned to command of the Division of Cuba, relieving General Brooke as division commander and military governor of Cuba. On the 30th, Governor Wood announced the appointment of the following Cuban ministers, to form his cabinet: Secretary of state and government, Diego Tamayo; secretary of justice, Luis Estevez; secretary of education, Juan Bautista Hernandez; secretary of finance, Enrique Varona; secretary of public works, José Ramon Villalon; secretary of agriculture, industry, and commerce, Rius Rivera.

1900 (June-November).—Municipal elections and election of a constitutional convention.—Meeting of the convention.—Statement of the military governor.—"The census having been completed and the period given for Spanish residents to make their election as to citizenship having expired on the 11th of April, 1900, steps were immediately taken for the election of municipal govern-

ments by the people. In view of the fact that 66 per cent of the people could not read and write, it was not deemed advisable that absolutely unrestricted suffrage should be established, and, after very full conference with leading Cubans, including all the heads of the great departments of state, a general agreement was reached upon a basis of suffrage, which provided that every native male Cuban or Spaniard who had elected to take Cuban citizenship, of full age, might vote if he either could read and write, or owned real estate or personal property to the value of \$250, or had served in and been honorably discharged from the Cuban army; thus according a voice in the government of the country to every one who had the intelligence to acquire the rudiments of learning, the thrift to accumulate property, or the patriotism to fight for his country. On the 18th of April an election law . . . was promulgated for the guidance of the proposed election. On the 16th of June an election was held throughout the island in which the people of Cuba in all the municipalities, elected all their municipal officers. The boards of registration and election were composed of Cubans selected by the Cubans themselves. . . . There was no disturbance. After the newly elected municipal officers had been installed and commenced the performance of their duties an order was made enlarging the powers of the municipal governments and putting into their hands as much of the government of the people as was practicable. As soon as the new municipal governments were fairly established the following call for a constitutional convention was issued: 'Habana, July 25, 1900. The military governor of Cuba directs the publication of the following instructions: Whereas the Congress of the United States by its joint resolution of April 20, 1808, declared That the people of the island of Cuba are, and of right ought to be, free and independent; That the United States hereby disclaims any disposition or intention to exercise sovereignty, jurisdiction, or control over said island except for the pacification thereof, and asserts its determination, when that is accomplished, to leave the government and control of the island to its people; And whereas the people of Cuba have established municipal governments, deriving their authority from the suffrages of the people given under just and equal laws, and are now ready, in like manner, to proceed to the establishment of a general government which shall assume and exercise sovereignty, jurisdiction, and control over the island: Therefore

"It is ordered, That a general election be held in the island of Cuba on the third Saturday of September, in the year nineteen hundred, to elect delegates to a convention to meet in the city of Habana, at twelve o'clock noon on the first Monday of November, in the year nineteen hundred, to frame and adopt a constitution for the people of Cuba, and, as a part thereof, to provide for and agree with the Government of the United States upon the relations to exist between that Government and the Government of Cuba, and to provide for the election by the people of officers under such constitution and the transfer of government to the officers so elected.

"The election will be held in the several voting precincts of the island under and pursuant to the provisions of the electoral law of April 18, 1900, and the amendments thereof. The people of the several provinces will elect delegates in number proportionate to their populations as determined by the census, viz: The people of the province of Pinar del Rio will elect three (3) delegates. The people of the province of Habana will elect eight (8) delegates. The people of the province of

Matanzas will elect four (4) delegates. The people of the province of Santa Clara will elect seven (7) delegates. The people of the province of Puerto Principe will elect two (2) delegates. The people of the province of Santiago de Cuba will elect seven (7) delegates.' Under this call a second election was held on the 15th of September, under the same law, with some slight amendments, and under the same conditions as the municipal elections. . . . The thirty-one members of the constitutional convention were elected, and they convened at Habana at the appointed time. The sessions of the convention were opened in the city of Habana on the 5th of November by the military governor, with the following statement: 'To the delegates of the Constitutional Convention of Cuba. Gentlemen: As military governor of the island, representing the President of the United States, I call this convention to order. It will be your duty, first, to frame and adopt a constitution for Cuba, and, when that has been done, to formulate what, in your opinion, ought to be the relations between Cuba and the United States. The constitution must be adequate to secure a stable, orderly, and free government.

"When you have formulated the relations which, in your opinion, ought to exist between Cuba and the United States, the Government of the United States will doubtless take such action on its part as shall lead to a final and authoritative agreement between the people of the two countries for the promotion of their common interests.'"—*United States secretary of war, annual report, Nov. 30, 1900, pp. 24-32.*

1900-1901.—Frauds by American officials in the Havana post office.—Question of the extradition of C. F. W. Neely.—Decision of the Supreme Court of the United States as to the independent status of Cuba in its relations to the United States.—In the spring of 1900 a discovery was made of extensive frauds committed by American officials who had been placed, by U. S. military authority, in the post office at Havana. One of the persons accused, named C. F. W. Neely, having returned to the United States, his extradition, for trial in Cuba, was demanded, and a question thereon arose as to the status of the island of Cuba in its relations to the United States. The case (Neely vs. Henkel) was taken on appeal to the Supreme Court of the United States, and Neely was subject to extradition by the decision of that tribunal, rendered in January, 1901. The status of Cuba, as an independent foreign territory, was thus defined in the opinion of the Court:

"The legislative and executive branches of the Government, by the joint resolution of April 20, 1808, expressly disclaimed any purpose to exercise sovereignty, jurisdiction, or control over Cuba, 'except for the pacification thereof,' and asserted the determination of the United States, that object being accomplished, to leave the government and control of Cuba to its own people. All that has been done in relation to Cuba has had that end in view, and so far as the court is informed by the public history of the relations of this country with that island, nothing has been done inconsistent with the declared object of the war with Spain. Cuba is none the less foreign territory, within the meaning of the act of Congress, because it is under a military governor appointed by and representing the President in the work of assisting the inhabitants of that island to establish a government of their own, under which, as a free and independent people, they may control their own affairs without interference by other nations. The occupancy of the island by troops of the United States was the

necessary result of the war. That result could not have been avoided by the United States consistently with the principles of international law or with its obligations to the people of Cuba. It is true that as between Spain and the United States—indeed, as between the United States and all foreign nations—Cuba, upon the cessation of hostilities with Spain and after the treaty of Paris, was to be treated as if it were conquered territory. But—as between the United States and Cuba, that island is territory held in trust for the inhabitants of Cuba, to whom it rightfully belongs and to whose exclusive control it will be surrendered when a stable government shall have been established by their voluntary action.”

1901 (January).—Draft of constitution reported to the convention by its central committee.—Public sessions of the Constitutional Convention were not opened until the middle of January, 1901, when the draft of a constitution was reported by its central committee, and the text given to the press. By subsequent action of the convention, various amendments were made. . . . The preamble is in these words: “We, the delegates of the Cuban people, having met in assembly for the purpose of agreeing upon the adoption of a fundamental law, which, at the same time that it provides for the constitution into a sovereign and independent nation of the people of Cuba, establishes a solid and permanent form of government, capable of complying with its international obligations, insuring domestic tranquillity, establishing justice, promoting the general welfare, and securing the blessings of liberty to the inhabitants, we do agree upon and adopt the following constitution, in pursuance of the said purpose, invoking the protection of the Almighty, and prompted by the dictates of our conscience.” The form of government is declared to be republican. The guarantees of the constitution, defined with precision and at length, include “equal rights under the law,” protection from arbitrary arrest and imprisonment, freedom of thought, speech, writing and publication, freedom of worship, freedom of association and meeting, freedom of teaching, freedom of travel, inviolability of private dwellings and private papers, “except by order of a competent authority and with the formalities prescribed by the laws.” Legislative powers are to be exercised by two elective bodies, to be named House of Representatives and Senate, and conjointly known as Congress. The Senate to be composed of six senators elected from each of the six departments of the republic; the boundaries and names of the departments to be those of the present provinces “as long as not modified by the laws.” The terms of the senators to be six years, one third of their number to be elected every two years. The House of Representatives to be composed of “one representative for every 25,000 inhabitants or fraction of more than 12,000, elected for a period of four years, by direct vote, and in the manner prescribed by law”; one half to be elected every two years. Representatives and Senators not to be held responsible for opinions expressed in the exercise of their duties, and not to be arrested nor tried without the consent of the body to which they belong, “except in case of being discovered in the act of committing some crime.” Congress to meet in regular session every year on the first Monday in November, and to remain in session for at least ninety consecutive days, excepting holidays and Sundays. Its powers to be substantially the same as those exercised by the Congress of the United States. The executive power to be exercised by the president of the republic, who “shall be elected by direct votes,

and an absolute majority thereof, cast on one single day, in accordance with the provisions of the law.” The term of the president to be four years, and none to be elected for three consecutive terms. A vice-president to be elected “in the same manner as the president, conjointly with the latter and for a like term.”

The judicial power to be “exercised by the Supreme Court of Justice and such other courts as may be established by law.” The supreme court, like that of the United States, “to decide as to the constitutionality of legislative acts that may have been objected to as unconstitutional,” and to have an appellate jurisdiction corresponding to that of the Supreme Court of the United States. Over each of the six departments or provinces it is provided that there shall be a governor, “elected by a direct vote for a period of three years,” and a departmental assembly, “to consist of not less than eight or more than twenty, elected by direct vote for a like period of three years.” The departmental assemblies to “have the right of independent action in all things not antagonistic to the constitution, to the general laws nor to international treaties, nor to that which pertains to the inherent rights of the municipalities, which may concern the department, such as the establishment and maintenance of institutions of public education, public charities, public departmental roads, means of communication by water or sea, the preparation of their budgets, and the appointment and removal of their employes.” The “municipal terminos” are to be governed by “Ayuntamientos,” composed of councilmen elected by a direct vote in the manner prescribed by law, and by a mayor, elected in like manner. The Ayuntamientos to be self-governing, free to “take action on all matters that solely and exclusively concern their municipal termino, such as appointment and removal of employes, preparation of their budgets, freely establishing the means of income to meet them without any other limitation than that of making them compatible with the general system of taxation of the republic.” The provision for amendment of the constitution is as follows: “The constitution cannot be changed in whole or part except by two-thirds vote of both legislative bodies. Six months after deciding on the reform, a Constitutional Assembly shall be elected, which shall confine itself to the approval or disapproval of the reform voted by the legislative bodies. These will continue in their functions independently of the Constitutional Assembly. The members in this Assembly shall be equal to the number of the members in the two legislative bodies together.”

1901 (February - March).—Conditions prescribed for independent government.—Platt amendment.—In the call for a Constitutional Convention issued by the military governor on July 25, 1900, it was set forth that the duty of the convention would be “to frame and adopt a constitution for the people of Cuba, and, as a part thereof, to provide for and agree with the government of the United States upon the relations to exist between that government and the government of Cuba.” This intimated an intention on the part of the government of the United States to attach conditions to its recognition of the independent government for which the Convention was expected to provide. The convention, however, gave no sign of a disposition to act as desired by the government of the United States, and seemed likely to finish its work, either without touching the subject of relations between the Cuban and American republics, or else offering proposals that would not meet the wishes of the latter. The day on

which the session of Congress would expire drew near, and still nothing came from the Cubans, who seem to have understood that they were exempted from such dictation by the resolution which Congress adopted on April 18, 1898, when it took up the Cuban cause (see U. S. A.: 1898 [April]), declaring that "the United States hereby disclaims any disposition or intention to exercise sovereignty, jurisdiction, or control over said island [of Cuba], except for the pacification thereof, and asserts its determination when that is accomplished to leave the government and control of the island to its people." Unwilling to be left to deal, alone, with the question thus arising between the Cubans and their liberators, President McKinley caused it to be understood that he would call an extra session of Congress, if no congressional action on the subject of Cuban relations was found practicable before March 4. This stimulated the expiring Congress, and the Army Appropriation Bill, then pending in the Senate, was made the vehicle of legislation on the subject, by the hasty insertion therein of the following amendment, offered by Senator Platt, of Connecticut:

"In fulfillment of the declaration contained in the joint resolution approved April 20, 1898, entitled 'For the recognition of the independence of the people of Cuba, demanding that the Government of Spain relinquish its authority and government in the island of Cuba, and to withdraw its land and naval forces from Cuba and Cuban waters, and directing the President of the United States to use the land and naval forces of the United States to carry these resolutions into effect,' the President is hereby authorized to 'leave the government and control of the island of Cuba to its people,' so soon as a government shall have been established in said island under a constitution which, either as a part thereof or in an ordinance appended thereto, shall define the future relations of the United States with Cuba, substantially as follows:

I.

"That the government of Cuba shall never enter into any treaty or other compact with any foreign power or powers which will impair or tend to impair the independence of Cuba, nor in any manner authorize or permit any foreign power or powers to obtain by colonization or for military or naval purposes or otherwise, lodgment in or control over any portion of said island.

II.

"That said government shall not assume or contract any public debt, to pay the interest upon which, and to make reasonable sinking fund provision for the ultimate discharge of which, the ordinary revenues of the island, after defraying the current expenses of government, shall be inadequate.

III.

"That the government of Cuba consents that the United States may exercise the right to intervene for the preservation of Cuban independence, the maintenance of a government adequate for the protection of life, property, and individual liberty, and for discharging the obligations with respect to Cuba imposed by the treaty of Paris on the United States, now to be assumed and undertaken by the government of Cuba.

IV.

"That all acts of the United States in Cuba during its military occupancy thereof are ratified

and validated, and all lawful rights acquired thereunder shall be maintained and protected.

V.

"That the government of Cuba will execute, and as far as necessary extend, the plans already devised or other plans to be mutually agreed upon, for the sanitation of the cities of the island, to the end that a recurrence of epidemic and infectious diseases may be prevented, thereby assuring protection to the people and commerce of Cuba, as well as to the commerce of the Southern ports of the United States and the people residing therein.

VI.

"That the Isle of Pines shall be omitted from the proposed constitutional boundaries of Cuba, the title thereto being left to future adjustment by treaty.

VII.

"That to enable the United States to maintain the independence of Cuba, and to protect the people thereof, as well as for its own defence, the government of Cuba will sell or lease to the United States lands necessary for coaling or naval stations at certain specified points, to be agreed upon with the President of the United States.

VIII.

"That by way of further assurance the government of Cuba will embody the foregoing provisions in a permanent treaty with the United States."

The Platt amendment, as it is known, was adopted by the Senate on February 27 (yeas 43, nays 20, not voting 25), and concurred in by the House on March 1 (yeas 161, nays 136, not voting 56).

1901-1902.—Organization of free government under a republican constitution.—Transfer of executive authority from the provisional military governor to the president-elect.—Official correspondence of the occasion.—The Platt Amendment was approved by President McKinley on March 2, 1901, and communicated, through the provisional military governor of the island, Gen. Leonard Wood, to the Cuban Constitutional Convention. On June 12, 1901, the convention adopted an ordinance making provisions identical with those of the Platt amendment, a part of the constitution of Cuba.

"On October 1, 1901, the convention performed its remaining duty by adopting an electoral law providing for a general election throughout the island, to be held on December 31, 1901, to choose governors of provinces, provincial councilors, members of the house of representatives, and presidential and senatorial electors. The law also provided that on February 24, 1902, the several bodies of electors thus chosen should meet and elect a president, vice-president and senators. The elections were to be held under the direct supervision of a central board of scrutiny, composed of the president of the convention and four other members selected for that purpose. The law was promulgated by a general order of the military governor on October 14, 1901. The constitution thus adopted and perfected was treated by the United States as an acceptable basis for the formation of the new government to which, when organized and installed, the control of the island was to be transferred.

"In conformity to the Cuban constitution and electoral law, elections were held by the Cuban people on December 31, 1901, and by the electoral college on February 24, 1902, when a president

[T. Estrada Palma], vice-president, senate, and house of representatives were chosen. The situation at this important juncture in the affairs of Cuba is described by Secretary Root in his annual report for 1902 as follows:

"The whole governmental situation in Cuba was quite unprecedented, with its curious device of a suspended sovereignty given up by Spain, but not in terms vested in anybody else, and if vested remaining dormant, while a practical working government of military occupation in time of peace, deriving its authority from the sovereignty of another country, claimed temporary allegiance, made and enforced laws, and developed a political organization of the Cuban people to take and exercise the suspended or dormant sovereignty. It was important that in inaugurating the new government there should be no break in the continuity of legal obligation, of rights of property and contract, of jurisdiction, or of administrative action. It would not do to wait for the new government to pass laws or to create offices and appoint administrative officers and vest them with powers, for the instant that the new government was created the intervening government ceased, and the period of waiting would be a period of anarchy.

"It was necessary, therefore, to take such steps that the new Government should be created as a going concern, every officer of which should be able to go on with his part of the business of governing under the new sovereignty without waiting for any new authority. That everything necessary to this end should be done, and that it should be done according to a consistent and maintainable legal theory, caused the Department a good deal of solicitude. It is gratifying to report that it was done, and that the Government which, until noon of May 20, was proceeding under the authority of the President of the United States, went on in the afternoon of that day and has ever since continued under the sovereignty which had been abandoned by Spain in April, 1899, without any more break or confusion than accompanies the inauguration of a new President in the United States. This could not have been done without the most perfect good understanding, mutual confidence, and sympathetic cooperation on the part of our officers who were about to retire, and the newly elected officers of Cuba, who were about to take the reins of government."—*Establishment of free government in Cuba* (Bureau of Insular Affairs, U. S. War Department, Document no. 312 in v. 7 of Senate Documents, 58th Congress, 2d Session).—"At twelve o'clock, noon, on the 20th of May, 1902, there was gathered in the State Apartment of the Palace occupied by many Spanish Governors-General, the officials of the new Cuban Republic, and a limited number of guests. In that same apartment, General Castellanos signed the abdication of Spanish authority. In its turn, pursuant to its pledges, the United States transferred authority to the President of the Cuban Republic. Four centuries of subjection, and a century of protest and struggle, were there and then ended, and Cuba joined the sisterhood of independent nations."—A. G. Robinson, *Cuba, old and new*, p. 183.

1902.—Tomas Estrada Palma, first president of the Cuban republic.—"There was such manifest propriety in the selection of Gen. Estrada Palma to be the first president of the Cuban Republic that the attempt to bring forward another candidate was unavailing. There was no excitement at the popular election, and the voting was light, because the result was a foregone conclusion. The two most important men in the last struggle for

Cuban freedom were Gen. Maximo Gomez and Gen. Estrada Palma. Gomez commanded the armies in the field, and employed methods which, as we have repeatedly said, entitle him to rank as one of the greatest of all modern commanders. Palma was the agent of the Cuban patriots in the United States, and he, more than any other man, is to be credited with having kept alive the military movement in Cuba by means of material aid and assistance sent from the outside. Most important of all, he addressed himself with success to bringing about that awakening of public opinion in the United States which finally took the form of an irresistible moral crusade on behalf of Cuban freedom. If these two men had died, or were otherwise ineligible, Cuba would not, indeed, have been left without trained and patriotic sons who could have filled the presidential office with ability and success. But since Gomez and Palma were both alive, and available in every sense, they were the two men to whom Cuba might naturally turn, rather than to any others, as candidates for the presidency. The military hero is always the man to be first considered, and Gomez for a time was the candidate whose name was upon all lips. But he declared that he had no ambition for political office, and in due time it appeared that Gomez was shaping things in Cuba for the nomination of Palma. . . .

"Tomas Estrada Palma is sixty-six years of age. . . . His patriotic sympathies led him to active service in the ten years' struggle for independence which began in 1868 and ended in 1878, and early in that period he became a general in the insurgent army. Toward the end of the war, he became the president of the provisional government, a position which at least indicated the confidence in which he was held by the Cuban people. He was made a prisoner, taken to Spain, at the risk of his life refused to swear allegiance, witnessed, in consequence, the confiscation of his estates, and some time after the final termination of the struggle regained his personal liberty, at the loss, however, of his Cuban property and home. After his release, at the end of the Ten Years' War, Palma traveled in Spanish-American countries, and settled in Honduras, where he married the daughter of the president of that republic and became post-master-general. Subsequently he came with his wife and one little child to New York."—*American Review of Reviews*, Feb., 1902.

1903.—Lease of coaling and naval stations to the United States.—Reciprocity with the United States.—Cession of the Isle of Pines.—In consonance with article seven of the so-called Platt amendment, which became an appendix to the constitution of the republic of Cuba, an agreement between the United States and Cuba for the lease to the former, in Guantanamo and Bahia Honda, of lands for coaling and naval stations, was signed in February, 1903. The consequent lease was signed and ratifications exchanged in the following July and October. According to the terms of the agreement "while, on the one hand, the United States recognizes the continuance of the ultimate sovereignty of the Republic of Cuba over the above described areas of land and water, on the other hand the Republic of Cuba consents that during the period of the occupation by the United States of said areas under the terms of this agreement the United States shall exercise complete jurisdiction and control over and within said areas with the right to acquire (under conditions to be hereafter agreed upon by the two Governments) for the public purposes of the United States any land or other property therein by pur-

chase or by exercise of eminent domain with full compensation to the owners thereof." The yearly rental to be paid for the use of the lands defined in the Agreement is \$2000. An arrangement of reciprocity between Cuba and the United States, conceding to Cuban sugar a rebate of 20 per cent. from the Dingley tariff rate, and giving 20 to 40 per cent. of reduction in Cuba on American goods, was ratified by the United States Senate in December.

1904.—Treaty with the United States.—In April, 1904, an extradition treaty was concluded with the United States.

1906.—Represented at third international conference of American republics. See AMERICAN REPUBLICS, INTERNATIONAL UNION OF: 1906.

1906.—Gains to Spain from loss of Cuba. See SPAIN: 1898-1906.

1906 (August-October).—Outbreak of insurrection.—Appeal of President Palma for American intervention.—Republic practically without a government.—Secretary Taft, sent to the island, establishes a provisional government.—Governor Magoon.—"The Cuban Republic seemed fairly established on solid foundations, and the United States felt a reasonable pride in its work; but it soon developed that the Cubans had not learned the primary lesson of democracy—submission to the will of the majority. Towards the latter part of August, 1906, following the reelection of President Palma, an insurrectionary movement began which had for its object the overthrow of his government. About the middle of September, President Roosevelt decided to send Secretary Taft and Assistant Secretary of State Bacon to Havana for the purpose of reconciling the contending factions; and at the same time he addressed a letter to Mr. Quesada, Cuban minister to the United States, in which he said: 'Our intervention in Cuban affairs will only come if Cuba herself shows that she has fallen into the insurrectionary habit, that she lacks the self-restraint necessary to secure peaceful self-government, and that her contending factions have plunged the country into anarchy.' Secretary Taft's efforts proving unavailing, President Palma resigned. When the time for the assembling of the Cuban congress, which had been convened, arrived, it was found to be impossible to command a quorum. President Palma having refused to withdraw his resignation, and there being no congress to adopt other measures for continuing the government, Secretary Taft assumed control September 20, and proclaimed a provisional government for the restoration of order and the protection of life and property. This action was taken under authority of President Roosevelt, in accordance with the provisions of the Platt amendment. Secretary Taft stated in his proclamation that 'the provisional government hereby established will be maintained only long enough to restore order, peace, and public confidence, by direction of and in the name of the President of the United States, and then to hold such elections as may be necessary to determine on those persons upon whom the permanent government of the republics should devolve.' A body of United States troops was sent to Cuba under command of Brigadier-General Franklin Bell. October 3, 1906, Secretary Taft was relieved of the duties of provisional governor in order that he might resume his labors in Washington, and Charles E. Magoon was appointed to take his place at Havana."—J. H. Latané, *America as a world power*, pp. 190-191.

message to Congress (1906).—*Papers relating to the foreign relations of the United States, 1906, Pt. I.*

1906-1909.—Under the provisional American government.—Election of a new Congress and a new president.—Restoration of the republic.—In his message to Congress, December, 1907, President Roosevelt described the conditions that had prevailed in the island for two years under the provisional government, instituted by Secretary Taft and over which Governor Magoon had presided, in a few words, as follows: "Absolute quiet and prosperity have returned to the island because of this action. We are now taking steps to provide for elections in the island and our expectation is within the coming year to be able to turn the island over again to a government chosen by the people thereof. Cuba is at our doors. It is not possible that this Nation should permit Cuba again to sink into the condition from which we rescued it. All that we ask of the Cuban people is that they be prosperous, that they govern themselves so as to bring content, order and progress to their island, the Queen of the Antilles; and our only interference has been and will be to help them achieve these results." Provincial elections held in the following August went generally in favor of the Conservative party, and that party was accordingly expected to win the presidential election, appointed to occur in November, 1908; but such was not the result. Three parties were in the field, Conservatives, Miguelistas, and Zayistas. The Miguelistas were political followers of Gen. José Miguel Gomez, whose middle name they took for their party designation; the Zayistas were partisans of Dr. Alfredo Zayas; the Conservatives were reputed to be substantially identical with the party known as Moderates in the politics of the first republic. Their leader was General Menocal. The Liberals of former contests were now divided between Miguelistas and Zayistas. They were reunited in the national election of November, and swept the Moderates into the background, electing both their leaders, Gomez and Zayas, the one to be president, the other to be vice-president, of the reconstituted republic; electing, at the same time, an effective majority in the Congress for their support. January 28, 1909, was the day fixed for dissolving the provisional government and reinvesting the Cubans with political independence; but the Congress was organized and held its initial session on the 13th. The president and vice-president elect were inaugurated with simple ceremonies on the 23th. Governor Magoon, in his brief address, surrendered the reins of government to President Gomez. President Gomez replied:

"We receive from you the government of Cuba which you turn over to us in compliance with the instructions of the President of the United States. All acquired rights shall be respected in harmony with the principles of international law, the principles of our constitution and the provisions of the appendix of the constitution. The constitution shall be upheld in all its integrity because our chief concern will be to preserve it inviolate.

"We are indebted to your nation for its generous aid in the maintenance of our institutions and the cordial relations existing will never grow less through any act of ours. Once again we are masters of our fate and there is not a Cuban heart but swears to maintain for all time the newly-acquired integrity of the nation, and who does not at the same time feel the profoundest gratitude towards those who, after governing them, have faithfully performed their agreement and now leave us in the full enjoyment of our sovereignty." According to newspaper reports, however, popular

sentiments were not as warm as those expressed by the president. Governor Magoon and his associates sailed for home immediately. About 3000 American troops remained on the island, under command of Maj. Gen. Thomas L. Barry, until April following.

1907.—Status of population.—Remarkable increase in eight years.—By the census returns of 1907, the population of Cuba was 2,048,980, an increase of 30 per cent. over the population in 1899, which was estimated at 1,572,797. As reported from Washington, 57 per cent. of the population above ten years of age could read and 33½ per cent. of the children were attending school.

1907 (April).—Controversy over the Isle of Pines.—American settlement.—Decision of Supreme Court of the United States.—“In 1898 the signing of the Treaty of Paris put an end to the Spanish-American War. Immediately, certain alert Americans, presuming that the Isle of Pines had become American territory by virtue of Article II, in that treaty, ceding to the United States ‘Porto Rico and all other islands now under Spanish sovereignty in the West Indies,’ began an American occupation of the Isle. They bought great tracts of land from Cuban and Spanish owners, which areas they at once laid out in smaller parcels and resold to settlers whom they assured that it was American soil. Yet in 1902, when the American Military Government of Cuba withdrew leaving the first Republic of Cuba constituted, the Isle of Pines found itself still administered as a part of Havana province, just as it had always been. Protests were made to Washington. On one occasion Havana was startled to learn that the Isle of Pines had seceded, organized a territorial government of its own, on an original interpretation of the usual American plan, and was demanding entrance into the American Union. Despite some irritation, both in the United States and Cuba, aroused by this picturesque procedure, no final recognition of the Isle as American territory was obtained; on the contrary, Secretary Root called attention to the fact that it has always been an integral part of Cuba, adding that in his judgment the United States has no substantial claim to it. But the Platt Amendment provides (1901) that title to the Isle shall be left to future adjustment by treaty between the United States and Cuba. Two treaties relinquishing it to Cuba having failed of ratification, the door is still open to that ‘future adjustment.’ In the interim, the Isle remains *de facto* Cuban, pending definite action by the political departments of the two governments concerned. Meanwhile, American residents there have made the Isle of Pines an American community in all save political status. . . . Americans are in the majority of the population; American money is not only the official but the actual currency of trade; the prevailing architecture outside of towns is American; American ministers preach from Protestant pulpits; American teachers preside over schools where American children congregate, and these schools are conducted in English, as Americans use that language. American spring wagons and automobiles have replaced the clumsy ox-cart and the picturesque coach, and they travel over the best of roads—wide, smooth highways, which facilitate shipments of fruits from orchards and gardens owned by Americans, producing for American markets. It is literally true that Americans own the Isle of Pines. Not two per cent. of its area is the property of persons of other nationality.”—J. A. Wright, *Isle of Pines*, pp. 40-42.—A decision by the Supreme Court of the United States, rendered on April 8, 1907, determined that

the Isle of Pines is foreign territory, in the view of the United States customs laws, and, inferentially, that the United States has practically no title to the island.

1909-1911.—Material prosperity.—Financial difficulties.—Navy.—Although the sugar crop was estimated at a million and a half tons for 1909, the Cuban government had difficulty in meeting the increased expenses of the Republic. President Gomez was accused of corruption by the followers of Acevedo, who attempted in 1910 to stir up a revolt, demanding the resignation of the president. The authorities were able to quell the uprising and order was restored. In July, 1910, the revenue-cutter service became the navy. Contracts were given out for two cruisers in the United States and two small cruisers in England.

1910.—Represented at fourth International American Congress. See AMERICAN REPUBLICS, INTERNATIONAL UNION OF: 1910.

1911-1912.—Wreck of the U. S. battleship *Maine* raised in Havana harbor.—Official report.—*Maine* resunk at sea.—The wreck of the United States battleship *Maine* was raised in Havana harbor. The secretary of the navy in an official statement issued on December 8, [1911] said: “The board [composed of army and navy officers] finds that the injuries to the bottom of the *Maine* were caused by the explosion of a charge of a low form of explosive exterior to the ship. . . . This resulted in igniting and exploding the contents of the six-inch reserve magazine, . . . said contents including a large quantity of black powder. The more or less complete explosion of the contents of the remaining forward magazine followed. The magazine explosions resulted in the destruction of the vessel. The United States battleship *Maine*, raised after fourteen years’ immersion in Havana harbour, was towed out and sunk in deep water on March 17 [1912]. . . . The remains of the men who went down on her were embarked with due honours on an American cruiser for interment at the National Cemetery at Arlington, Va.”—*Annual Register*, 1912, p. 469.

1912-1914.—Internal disorders cause United States to threaten intervention.—Gen. Mario G. Menocal elected president.—Coinage system.—“In Cuba the effervescence of 1911 continued and in January the United States Government had to warn President Gomez that it might have to intervene. The Veterans’ Association urged that all who had fought for Spain during the revolutions preceding 1898 should be excluded from the public service, but President Gomez succeeded in inducing the party leaders to check the agitation, and Mr. Knox, who visited the island on April 11, denied the rumours of impending intervention. At the end of May, the negroes of the eastern districts rose under General Estenoz, ostensibly to effect the repeal of the law prohibiting the formation of racial parties; his forces captured Lanaya, near Santiago, and American battleships were sent to Key West and Guantanamo; but the aim was only to protect United States citizens and their property, and the rising failed. In November [1912] General Menocal, the Conservative candidate for president, defeated Dr. Zayas (Liberal), the actual vice-president. Serious rioting had preceded the election, but it was conducted peacefully, and intervention proved unnecessary.”—*Annual Register*, 1912, pp. 468-469.—Gen. Menocal was inaugurated May 20, 1913. On November 7, 1914, a law was published authorising a new coinage issue in Cuba with a gold peso of 1.6718 grammes as the monetary unit. The coinage of gold is unlimited, but silver must not be minted to the value of more

than 12,000,000 pesos. The extent of the nickel coinage is to be determined by the national executive. The United States coinage still remains legal tender.

1914-1918.—Effect of opening of Panama Canal.—Cuban exports and imports.—“The opening of the Panama canal was bound to increase the value of Cuba’s seaports. It also attracted thousands of American and Canadian tourists who flocked to the Island for a respite from a northern winter, and to visit the Canal Zone. . . . The British steamers engaged in the Caribbean trade which had been sold to Germany, now became nucleus for the large tourist traffic and carrying trade between the United States, the West Indies, and Central America, which the great Hamburg and Bremen companies built up so rapidly. . . . American companies also soon had large fleets of ships engaged in the tourist traffic and fruit trade with Cuba. Ere long the entries and sailings from Havana exceeded those of all American ports except New York, and all other Cuban harbours became prosperous. . . . Until the war [World War], in charters for loading and shipping Cuban products, especially from the smaller ports, British cargo boats maintained a leading place. . . . Since the war the United States has gained an enormous lead in Cuban shipping, and Scandinavian vessels are filling the charters for special cargoes. In 1917 and 1918 more Norwegian than British ships entered Cuban harbours. The cream of the defunct German trade has gone to the United States. [The staple products of Cuba are sugar and tobacco, but considerable trade is carried on in coffee, cocoa, fruits and minerals.] In 1918 Cuba’s imports were \$297,622,215. Her exports \$413,325,251, a further substantial increase, with a large trade balance in her favour. At one period of the old régime exports from the United States, Spain and the United Kingdom were nearly equal. When the real race opened twenty years ago, just as Cuba’s foreign trade started its amazing record of increase, exports there from the British Isles were £1,795,568. By 1912 these figures were a million pounds more, and the figures receded again in 1913. . . . Orders for sugar machinery, formerly [a British] speciality, [went] to Americans. [In 1916] German trade was . . . dead, and the United States’ exports were leaping up by millions a year. Taking official Cuba figures for 1917 and 1918, the largest shares in imports were:—

	1917	1918
United States.....	\$206,353,087	\$222,262,276
United Kingdom.....	15,377,328	9,154,567
Spain	15,651,998	10,392,529
France	6,289,418	7,044,221

. . . On the other side of the balance-sheet Cuba has been building up a magnificent export trade for her own products, for which the United States has always been a ready customer, while British imports from the Island have been enormously fostered by the war and . . . crying need for sugar [in England]. The figures are:—

	1917	1918
United States.....	\$257,446,699	\$293,997,619
United Kingdom.....	73,563,756	95,817,266
Spain	13,546,199	6,775,875
France	11,616,630	5,656,957

1917 (April).—Declaration of war on Germany.—“Cuba’s share in the Great War was not insignificant. The island republic was first among

the Latin-American nations to follow the lead of the United States in declaring war upon Germany. On April 6, 1917, President Menocal sent a message to the Cuban Congress asking for a declaration of war as a protest against the inhuman submarine campaign and to preserve the ideals of American solidarity, honor and justice. It was a popular move and on the following day the resolution declaring a state of war was unanimously adopted. Almost immediately the German and Austrian merchant steamers which remained war-bound in various Cuban ports were seized and handed over to the United States government for the transportation of troops, munitions and food to Europe. The tonnage amounted to 200,000 tons—a valuable acquisition in view of the critical shortage of ships. The Cuban Congress proceeded to pass several laws concerning espionage, aliens and their property, and other important matters relating to the national defence. Compulsory military service was also adopted, and Cuba offered to send an army corps to France, fully trained and equipped provided the United States would allocate the ships necessary to transport it. This generous offer could not be accepted because of the difficulties involved in sending the American troops overseas, nevertheless Cuba went ahead with the drafting of men for army service and was engaged with this task when the armistice was granted to Germany. A number of Cubans, however, entered the service of the Allies as volunteers, and several of them achieved distinction in the French air force. Cuba also organized a small fleet to patrol the Gulf of Mexico and the Caribbean Sea in co-operation with the American warships, while counter-espionage operations were conducted at Havana, which was a way station for travellers bound to Mexico, where Germany expected to stir up trouble against the United States with the hope of forcing the American government to keep a large detachment of troops on the Mexican border. The Cuban people subscribed heavily to the American war loans, their banks took a share in the French loans, and the Cuban Congress voted \$2,500,000 in aid of the victims of war in France, Italy, Serbia and other countries. Moreover, the Cubans gave generous support to the Red Cross and other relief agencies.”—A. H. Verrill, *Cuba, past and present*, pp. 236-238.

1918.—Effect of the World War.—“Like every other nation Cuba suffered economic disturbance by reason of the war. Before the conflict the republic carried on a large trade with Germany and Austria, which purchased quantities of Cuban tobacco and were at the same time strong competitors in the sugar market. The Cubans also found themselves handicapped by the withdrawal of ships for war purposes, while their tourist trade suffered a decline similar to that experienced by the other West Indian winter resorts. Before the war Cuba was wonderfully well supplied with steamship service between the island and American and European ports, and there is little doubt that in future years the republic’s maritime communications will far exceed those existing prior to the world conflict. The prosperity of the country and its manifold attractions will assuredly bring about this result. Politically and socially Cuba experienced the same conflicts of policies and ideals which touched other nations as they surged through the world. The republic met its troublesome problems successfully, and faced the period of reconstruction with a firm resolve to profit by the lessons ac-

quired during the period of the Great War."—E. Lindsay, *Cuba and her people to-day*, p. 240.—See also LATIN AMERICA: 1914.

1919.—Represented at Paris conference.—Treaty of Versailles. See PARIS, CONFERENCE OF: Outline of work; VERSAILLES, TREATY OF: Conditions of peace.

1920-1921 (October-March).—Moratorium.—Financial crisis.—Following a conference, of the bankers and government officials, on the financial crisis, President Menocal issued a proclamation of a fifty-day moratorium effective until Dec. 1, 1920. "The necessity which forced the declaration of a moratorium was not brought on solely by speculation in sugar, but by a number of circumstances. . . . While speculation in sugar may have been a contributory cause to the crisis . . . there were other influences of equal or perhaps, even greater importance. For one thing, there was an over extension in business due to the wave of prosperity which Cuban merchants, like merchants in other countries, had been riding for more than two years. Another cause may be laid to foreign exporters who, to take advantage of rising markets in their own country, delayed deliveries of goods which Cuban merchants had ordered. When the goods did not come, the Cuban buyer, in many instances, placed a duplicate order with another house. . . . Eventually the market broke. Prices tumbled here in the United States and elsewhere. Then the foreign exporters began sending the long-delayed shipments to Cuba. As a result, some of the Cuban merchants received, and at top prices, three or four times the amount of goods they normally . . . put in stock. This rush of shipments caused congestion in Havana harbor. The warehouses became filled to capacity. . . . There was a jam in the customs house. . . . The action which precipitated [the crisis] was the reduction of credits by American banks to Cuban banks and merchants. . . . It was made necessary by world conditions. . . . Rumors of all kinds spread and finally runs started on three of the large Havana banks. . . . The whole financial structure of Cuba became endangered. There was almost a panic. President Menocal, acting on the advice of bankers, decreed a moratorium for fifty days which has been extended until the present time [March, 1921]. Now conditions are much improved. . . . Up to the end of the year [1920], because of political reasons, it was impossible to get the Cuban Congress together with a quorum to enact needed legislation. . . . Since the arrival of General Crowder on January 6, to confer with President Menocal, a measure has passed the Cuban Senate providing for the final extension of the moratorium in a modified form."—J. H. Edwards, *Cuba's commercial condition* (*Pan-American Magazine*, v. 32, Nov. 4, 1921, pp. 213).—See also LATIN AMERICA: 1918-1921: Effect of natural resources.

1920-1921 (November-January).—Electoral crisis.—Major General Crowder's advisory mission.—The uncertain results of the Cuban elections held Nov. 1, 1920, was one of the contributing causes in the island's crisis. On the face of the returns, Dr. Alfredo Zayas, the coalition candidate, was elected; but the supporters of Gen. José Miguel Gomez, the Liberal candidate, charged intimidation of voters, fraud at the polls, and suppression of returns favourable to the Liberal Party. The Liberal Party petitioned President Wilson to hold an investigation. On Jan. 3, 1921, Joseph Tumulty, secretary to President Wilson, issued the press notice: "Upon instructions of the President, Major General Enoch Crowder, has sailed for Havana, Cuba. . . . General Crowder goes to Cuba

to confer with President Menocal regarding conditions in Cuba. The moratorium and financial crisis in Cuba continue, the solution of which appears more difficult on account of the unsettled Presidential election. A continuation of the present situation would prove most detrimental to the prosperity of Cuba and harmful to the relations between the United States and Cuba.' The 'special relations' to which President Wilson's announcement refers are covered in the so-called Platt Amendment to the act of March 2, 1901, defining the future relations of the two countries. [See above: 1901 (February-March)]. . . . This section of the Platt Amendment also constitutes Article III of the Treaty of July 2, 1904, between this country and Cuba, into which it was incorporated textually. . . . On the face of the returns Dr. Alfredo Zayas, candidate of a coalition of conservatives and other elements, has been elected President, but enough votes were missing to furnish the possibility of throwing the victory to his opponent, José Miguel Gomez, candidate of the Liberals. The Cuban courts have found some ballots to have been fraudulent and thrown them out, but the legal processes are not expeditious and certain by-elections have to be held to determine the result."—*New York Times*, Jan. 3, 1921.

1921 (January-March).—President Menocal's letter to the Electoral Board.—Results of the by-elections.—To end the long drawn out presidential campaign, President Menocal wrote the Central Board as follows: "The electoral boards and tribunals not having announced within the time prescribed the results of the elections held Nov. 1, 1920, the municipal administration has become a provisional administration in the majority of the municipal districts. If the definite results are not proclaimed by the board and the courts by Feb. 24 of this year, the administrations of the six provinces will become also on this date provisional administrations. If the decisions are not reached and results proclaimed by the first Monday of the coming April the date on which the members of Congress elected at the last election should take possession of their posts, the offices of half of the Congress will become vacant and the total paralysis of the legislative power will follow, and if on May 20, the date on which the President and Vice-President of the Republic should be inaugurated, the national administration will also become provisional unless prior to that date the electoral colleges of the six provinces have met and have counted the votes and proclaimed the candidates elected. This situation alone is sufficiently grave, and considered in relation with the present financial crisis constitutes a menace to the national life which calls for extraordinary measures."—The presidential campaign ended, at the partial elections (March 16, 1921), by the choosing of Dr. Alfredo Layas as president of Cuba and "the United States, through Minister Long, on April 17, formally recognized Dr. Zayas, candidate of the Coalition Party, as the duly elected President of the Cuban Republic. This decision determined General Gomez to give up the contest, and he so formally announced as soon as he learned of Minister Long's statement."—*New York Times Current History*, XIV, No. 2, May, 1921, p. 339.

1922 (May).—Financial status.—Fire in cane sugar districts.—The financial situation of Cuba is still grave. H. Upmann and Co., a German bank in Havana, suspended payments on May 1, 1922. President Zayas, to alleviate conditions and to prevent United States intervention, decreed a reduction of \$2,000,000 in the army budget. Following the rejection of the proposal, by the sugar interests

of Denver, to limit the Cuban cane sugar crop, fires broke out in the cane sugar districts destroying a million tons of cane.

1922 (September).—Passage of Crowder's reform measures.—By September 10th the House of Representatives had passed all but the last and the Senate the first two of the reform measures suggested by General Crowder. The measures are as follows: (1) modification of the civil service law, (2) improvement in the system of accounting, (3) provision for the investigation of the floating debt, (4) methods of facilitating the removal of judges, (5) means of providing for the contraction of the foreign loan.

CUBIT, an ancient term of measurement. "The length of the Egyptian foot is . . . shown to be equal to 1.013 English foot, or 12.16 inches (0.3086 metre) and the cubit to 18.24 English inches, or 0.463 metre. This cubit was identical with the Phœnician or Olympic cubit, afterwards adopted in Greece. . . . The second of the two Egyptian cubits was the royal cubit, or cubit of Memphis, of seven palms or twenty-eight digits. . . . The mean length of the Egyptian royal cubit, is . . . ascertained to be 20.67 English inches, or 525 mm. . . . The fact that Moses always mentions the Egyptian measures . . . as well as the Egyptian weights . . . proves that the Hebrews originally brought their weights and measures from Egypt. . . . In his dissertation on cubits, Sir Isaac Newton states grounds for his opinion that the sacred cubit of the Jews was equal to 24.7 of our inches, and that the royal cubit of Memphis was equivalent to five-sixths of this sacred Jewish cubit, or 20.6 inches."—H. W. Chisholm, *On the science of weighing and measuring*, ch. 2.—See also INVENTIONS: Ancient and medieval: Measurements: Time and space.

CUI, César Antonovitch (1835-1918), Russian composer and military engineer. Studied music with Moniuszko and Balakireff; became musical critic for the *St. Petersburg Gazette*; championed the theories of the Young Russian school; earned an enviable reputation as a critic; talent best shown in his songs and chorals.

CUICIDH, a province formed of several Mortnath. See TUATH.

CUITLAHUATZIN (c. 1470-1520), Mexican war-chief elected to succeed Montezuma after his death. See MEXICO: 1520-1521.

CULDEES.—It used to be set forth by religious historians that the Culdees were an ancient religious fraternity in Scotland, probably founded by Columba, the saintly Irish missionary of the sixth century, and having its principal seat in Iona; that they "were the lights of Scotland in a dark and superstitious age"; that they struggled for several centuries against the errors and the oppressive pretensions of Rome. The facts gathered by Dean Reeves and published in 1864, in his work on the "Culdees of the British Islands," supported by the more recent studies of Mr. W. F. Skene, are now generally accepted. Says Mr. Skene (*Celtic Scotland*, bk. 2, ch. 6): "It is not till after the expulsion of the Columban monks from the kingdom of the Picts, in the beginning of the eighth century, that the name of Culdee appears." Mr. Skene's conclusion is that the Culdees sprang from an ascetic order called Deicolæ or God-worshippers; that in Irish the name became Ceile De, thence corrupted into Culdee; that they were hermits, who became in time associated in communities, and were finally brought under the canonical rule of the Roman church, along with the secular clergy.

CUMÆ, **CUMÆAN SIBYL**.—"Earlier than 735 B. C., . . . though we do not know the precise era of its commencement, there existed one solitary Grecian establishment in the Tyrrhenian Sea,—the Campanian Cumæ, near Cape Misenum; which the more common opinion of chronologists supposed to have been founded in 1050 B. C. and which has even been carried back by some authors to 1139 B. C. . . . Cumæ, situated on the neck of the peninsula which terminates in Cape Misenum, occupied a lofty and rocky hill overhanging the sea and difficult of access on the land side. . . . In the hollow rock under the very walls of the town was situated the cavern of the prophetic Sibyl,—a parallel and reproduction of the Gergithian Sibyl, near Kyme in Æolis: in the immediate neighborhood, too, stood the wild woods and dark lake of Avernus, consecrated to the subterranean gods, and offering an establishment of priests, with ceremonies evoking the dead, for purposes of prophecy or for solving doubts and mysteries. It was here that Grecian imagination localized the Cimmerians and the fable of Odysseus."—G. Grote, *History of Greece*, pt. 2, ch. 22.—See also SIBYLS.

CUMANS, **Komans**, **Comans**, or **Kumani**, an eastern tribe occupying Moldavia and adjacent regions during the Middle Ages. See KIPCHAKS; PATCHINACKS; COSSACKS; HUNGARY: 1114-1301.

CUMBERLAND, William Augustus, duke of (1721-1765), English general in the War of the Austrian Succession, and the Jacobite rising in Scotland, figuring in the battles of Dettingen

(1743), Fontenoy (1745), at the siege of Tournay (1745), at Culloeden (1746), Lawfield (1747) and Hastenbeck. See BELGIUM: 1745.

CUMBERLAND, a border county of England, bounded on the north by Scotland, on the west by the Irish Sea and Solway Firth, on the east by Northumberland, and south by Lancashire and Westmoreland. Area, 1520 square miles. The county is rich in relics of the Roman occupation of Britain, while during later centuries it was the theater of considerable border warfare until Scotland and England were united. Cumberland is famous for magnificent scenery in the so-called "Lake District."

CUMBERLAND, or "NATIONAL", ROAD.—"Though completed as a government project only from Cumberland, Maryland, to Wheeling (then Virginia, now West Virginia), the old National Road, was connected up with the earlier pikes from Baltimore, Frederick and Hagerstown, and subsequently with the newer lines west of the Ohio River, making the shortest and most natural way for road travel from tidewater at Chesapeake Bay to the junction of the Mississippi and Missouri rivers at St. Louis, Missouri. It follows as direct a course across the Alleghany Mountains as the nature of the country in western Maryland and southwestern Pennsylvania would permit; it is a wonderfully scenic route, and has a historic background beyond comparison with any of its rivals. This National Road has been from the first an unique American institution, and was for many years a vital factor in the life, politics and industry of the country. . . . Between Cumberland and Wheeling, the names 'National Pike' and 'Cumberland Road' are interchangeable, both having been used indiscriminately by the Secretary of War, chief engineer and the field forces in their extensive correspondence during the progress of the work. So carefully was the route originally laid out that the loss of distance in the mountains between Clear Spring, Maryland, and Uniontown, Pa., is remarkably small, the road seeming always to find the shortest and easiest way across from one summit to another—usually by running down along the side of one ridge to the foot; and then, perhaps at once, but more often after a restful stretch of level road, making the corresponding ascent on the other side. Generally, too, there is a broad sweep to the curves, and a fair margin of safety to the traveler, in pleasing contrast to the narrow roads and sharp curves often found in equally hilly sections. Many times between Baltimore and Uniontown, and occasionally beyond, even close to the Ohio River, the motorist beginning one long descent may look ahead, perhaps three or four miles, across the intervening valley and see an automobile, or even a shadowy motorcycle, starting down the opposite grade. Let them 'sight' each other, as over an imaginary rifle barrel, and often the first apparent variation of either from the perfectly straight line will be at a point where each swerves enough from the center of the road to avoid a collision as they pass. Riding by night on these stretches, a star will often hang persistently in the same general position mile after mile.

"Except on the mountains, where long straightways are unusual, as many as four or five ascents and descents can sometimes be seen ahead or behind—usually all in a straight line. . . . Recalling that the traveler of a century or more ago experienced the full physical proportions of every mile, it is easier to understand the enormous advantages to the emigrant, stage coach patron, and freight wagon driver, of the shortest distance between strategic points on highway and waterway, which

lends special interest to some comparisons of distance greatly favorable to the Old National Road. From Baltimore through Cumberland to Wheeling is under 300 miles, somewhat less than the distance from Albany to Buffalo, N. Y. But the latter is only a fraction of the road mileage from New York City or New England by the northern route to the Ohio River, by which a great part of the central West was settled long before the route through New York State and along the Great Lakes was opened up. . . .

"It is fairly well established that to George Washington was due the original conception of a trans-Alleghany road; and he also foresaw the commercial importance of the Hudson River-Mohawk Valley-Great Lakes route between the East and the central West. As a young man he made two round trips between Virginia and Fort Duquesne through a considerable part of which territory the National Road was afterward built, and became well acquainted with the topography of the Hudson River and the Mohawk Valley during the Revolutionary War. The 'Father of his Country' did not live to see the great project undertaken, but the idea found valiant champions in Albert Gallatin, Henry Clay, Thomas Jefferson and others, so that in 1802 (only three years after the death of Washington), Congress took it up along with a bill to admit Ohio into the Union; and afterwards arranged for financing it through sales of public lands in the new states it would principally benefit. On March 20, 1806, President Jefferson signed a bill appropriating \$30,000 for a preliminary survey from Cumberland, head of a navigation on the Potomac, through the Cumberland Narrows and across the mountains to the Ohio River at Wheeling. Construction (supported by appropriations made as needed) followed as soon as practicable thereafter, but was nearly stopped by the war of 1812. Work was resumed on a larger scale in 1816, and continued despite some interruptions through western Maryland, southwestern Pennsylvania, and across a corner of what is now upper West Virginia to the Ohio River, so that it was opened to Wheeling in 1818, having been built that far during the administrations of Jefferson, Madison and Monroe. One result of this was to make Wheeling, settled as far back as 1760, a very important point of embarkation, for the bulk of emigration that started west over the National Road preferred to float from the Ohio River toward the present sites of Marietta, Cincinnati and Louisville, rather than to strike through the little-known wilderness more directly west. Sixty or seventy flat-boats, loaded with emigrants and their belongings, frequently passed a certain point in a single day; these were not all brought to the great river by the National Road, for some came from the partly-settled valleys of the Alleghany and Monongahela to Pittsburgh or Brownsville, without the necessity of crossing the mountains, but the old road was undoubtedly the more important factor of the two. The original statute under which construction had been carried to the Ohio River provided for nothing west of Wheeling; but so great use was made of the completed portion, and so insistent became the demand for its extension, especially across central Ohio and Indiana, that on May 15, 1820, Congress appropriated \$10,000 for a new survey from Wheeling to the Mississippi River opposite St. Louis—the act calling specifically for a 'straight line, eighty feet wide.' This was followed by liberal appropriations from 1820 to 1838, during which time a vast amount of work was done in Ohio and Indiana; but toward the last Congress seemed to lose interest in the project, and voted

funds only for grading and bridging that part of it in southern Illinois. Such work as was done along the route in that state was not of a substantial or permanent character; so the National Road never became, as Clay and Gallatin had expected it would, an improved thoroughfare from east of the Alleghanies all the way to the Mississippi River valley. Meanwhile, the country was at the beginning of a great railway era, and rumblings of an impending civil war began to be heard. The costs of repairs on the completed portions had been greatly underestimated, and one by one the states of Ohio, Maryland, Virginia and Pennsylvania in the order named, accepted the offer of Congress to take over and maintain that part of the road within their borders.

"Except for short pieces of road in national cemeteries, army posts, national parks, irrigation districts and the like, the Federal government then gave up all highway construction, and has never resumed it in exactly the same way on this continent. The final appropriation was on June 17, 1844, when a supplementary bill was passed carrying \$1,350.81 for 'arrears'; and the accounts for the National Road were closed, after a total expenditure of \$6,824,919.33, a large sum in those days. But without question, for every dollar spent in the building and maintenance of this road, ten dollars were added to the wealth of the territory it traversed, and thereby to the nation.

"Coaches carrying passengers and the mails, and freight wagons in large numbers, continued to use the National Road until the winter of 1852-53, when the completion of the Baltimore & Ohio Railroad made the general use of the highway no longer profitable. There was nothing at that time to take the place of the traffic that was shifted to the railroad, and no real incentive to keep it in good condition. The modern idea of touring over the roads as a means of pleasure and recreation was unthought of, and the opportunities for its enjoyment would have been small at best, as the crowded, lumbering coaches afforded no comfort at the ordinary speed of ten or twelve miles per hour; and no long trip was without its dangers, as the records of the stage companies and occasional letters from travelers abundantly prove.

"What may be called the modern history of the National Highway dates back to its transfer (during 1831 and 1832) from Federal to an individual State control, followed by a long period of neglect, during which time the old Pike fell from its once-proud estate, largely because when government interest and supervision ceased, the original commanding purpose was lost, and the project was never carried through to its logical conclusions by the states concerned—Maryland, Pennsylvania, West Virginia, Ohio, Indiana and Illinois. Perhaps this was only natural, as they never had any uniform or united plan for its repair and maintenance; and until comparatively recent years lacked the machinery to do this in an effective way. But since both Maryland and Pennsylvania have made great and permanent improvements over the mountain divisions, it has been fully restored to through travel, and has become the eastern section of the National Old Trails Ocean-to-Ocean Highway, one of the most important transcontinental routes. . .

"Aside from carrying the mails, the greatest usefulness of the National Road was in breaking a way through the Appalachian Mountains, enabling thousands of emigrants to pass through to the West by the shortest overland route from the Potomac to the Ohio. The influence of the Great Lakes on the course of travel between the East and the cen-

tral West came later, for Marietta, Cincinnati and Louisville were settled long in advance of Cleveland, Toledo, Indianapolis and Chicago, all located in sections of country which had no such feeders as the National Road and the Ohio River."—R. Bruce, *National road*.—See also U. S. A.: 1806-1812.

CUMBERLAND GAP, a pass through the Cumberland mountains in southern Virginia, an important position in the Civil War. See U. S. A.: 1863 (August-September: Tennessee).

CUMBERLAND REGION, name applied to the valley of the Cumberland river in north central Tennessee. See TENNESSEE: 1770-1780.

CUMBRIA: Early British kingdom.—"The Britons of Cumbria occupy a tolerably large space on the map, but a very small one in history;—their annals have entirely perished;—and nothing authentic remains concerning them, except a few passages. . . Romance would furnish more; for it was in Cumbria that Rhyderc, or Roderic the magnificent, is therein represented to have reigned, and Merlin to have prophesied. Arthur held his court in merry Carlisle; and Peredur, the Prince of Sunshine, whose name we find amongst the princes of Strathclyde, is one of the great heroes of the 'Mabinogion,' or tales of youth, long preserved by tradition amongst the Cymri. These fantastic personages, however, are of importance in one point of view, because they show, what we might otherwise forget—that from the Ribble in Lancashire, or thereabouts, up to the Clyde, there existed a dense population composed of Britons, who preserved their national language and customs, agreeing in all respects with the Welsh of the present day. So that even in the tenth century, the ancient Britons still inhabited the greater part of the western coast of the island, however much they had been compelled to yield to the political supremacy of the Saxon invaders. The 'Regnum Cumbrense' comprehended many districts, probably governed by petty princes or Reguli, in subordination to a chief monarch or Pendragon. Reged appears to have been somewhere in the vicinity of Annandale, Strathclyde is of course the district or vale of Clydesdale. In this district, or state, was situated Alclyd, or Dunbritton, now Dumbarton, where the British kings usually resided; and the whole Cumbrian kingdom was not infrequently called Strathclyde, from the ruling or principal state."—F. Palgrave, *History of the Anglo-Saxons*, ch 11.—Cumbria and Cambria (Wales), the two states long maintained by the Britons, against the Angles and Saxons, bore, in reality, the same name, Cumbria being the more correct form of it. The earliest development of the so-called Welsh poetry seems to have been in Cumbria rather than in Wales. Taliesin and Aneurin were Cumbrian bards, and Arthur, if any historical personage stands behind his kingly shadow, was probably a Cumbrian hero.—J. Rhys, *Celtic Britain*.—See also **ALCLYDE**; **BRITAIN**: 6th century; **KYMRY**; **SCOTLAND**: 10th-11th centuries.

CUNDIMARCAS, aboriginal tribe of the Andes. See CHIBCHAS.

CUNEIFORM INSCRIPTION.—The characters employed for the written languages of ancient Babylonia and Assyria have been called cuneiform, from the Latin *cuneus*, a wedge, because the marks composing them are wedge-shaped. All knowledge of those characters and of the languages expressed in them had been lost for many centuries, and its recent recovery is one of the most marvelous achievements of our age. "Travelers had discovered inscriptions engraved in cuneiform, or, as they were also termed, arrowheaded characters, on the ruined monuments of Persepolis and other ancient sites in Persia. . . . The inscriptions were in three different systems of cuneiform writing; and since the three kinds of inscriptions were always placed side by side, it was evident that they represented different versions of the same text. . . . The clue to the decipherment of the inscriptions was first discovered by the successful guess of a German scholar, Grotefend. Grotefend noticed that the inscriptions generally began with three or four words, one of which varied, while the others remained unchanged. The variable word had three forms, though the same form always appeared on the same monument. Grotefend, therefore, conjectured that this word represented the name of a king, the words which followed it being royal titles." Working on this conjecture, he identified the three names with Darius, Xerxes and Artaxerxes, and one of the supposed titles with a Zend word for "king," which gave him a considerable part of the cuneiform alphabet. He was followed in the work by Burouf, Lassen and Sir Henry Rawlinson, until, finally, Assyrian inscriptions were read with "almost as much certainty as a page of the Old Testament."—A. H. Sayce, *Fresh light from the ancient monuments*, ch. 1.—See also ÆGEAN CIVILIZATION: Minoan Age: B. CUPHARAS, Bulgarian monk. See CHRISTIANITY: 9th century: Bulgarian church.

CUP-THEGN, in Alfred the Great's time, one of the four heads of the royal household. See STALLER AND HOROERE.

CURACA, or Cacicue.—"Cacicue, lord of vassals, was the name by which the natives of Cuba designated their chiefs. Learning this, the conquerors applied the name generally to the rulers of wild tribes, although in none of the dialects of the continent is the word found."—H. H. Bancroft, *History of the Pacific states*, v. 1, p. 210, *foot-note*.—The same name was also applied to the chiefs of the Mexican Indians and those of Peru and Central America.

CURAÇAO, Colony and island of.—"The Netherlands colony of Curaçao consists of six islands in the Caribbean Sea, north of South America. They are divided into two groups, viz: Curaçao, Bonaire and Aruba which lie in the neighborhood of Venezuela and Saint Eustache, Saba and Saint Martin (the last being partly Netherlands, partly French territory) forming part of the Leeward Islands or Lesser Antilles. Of these islands Curaçao is the most important, chiefly because . . . [it] still possesses a position of importance in the world's shipping-traffic . . . [and because of its] favorably situated harbor, [Saint Anna, the harbor of Willemstad]."—*Netherlands colony of Curaçao, Netherlands commission in Curaçao (Panama Pacific International Exposition, San Francisco, 1915)*.—The island was settled by the Spaniards in 1527 and by the Dutch in 1634. It is now administered by a governor, appointed by the ruler of the Netherlands, supported by a colonial council.—See also WEST INDIES.

"CURB MARKET".—The "curb market," as its name indicates, was located at the curb, outside the New York Stock Exchange on Broad Street. It was frequented by small stock brokers and young men who had no seat in the Stock Exchange, and who received reports from the latter and carried on a business by a system of signals with employees inside the exchange. In 1921, however, a building was erected for the curb brokers and they have since carried on their business there, the "curb market" being discontinued at its former location.—See also STOCK EXCHANGE: 1909.

CURFEW-BELL.—"Except from its influence upon the imagination, it would be hardly worth while to notice the legend of the curfew-bell, so commonly supposed to have been imposed by William [the Conqueror] upon the English, as a token of degradation and slavery; but the 'squilla di lontano, che paja il giorno pianger che si muore,' was a universal custom of police throughout the whole of mediæval Europe, not unconnected with devotional feeling."—F. Palgrave, *History of Normandy and England*, v. 3, p. 627.—"In the year [1061] after King Henry's death [Henry I of France], in a Synod held at Caen by the Duke's authority [Duke William of Normandy, who became in 1066 the Conqueror and king of England], and attended by Bishops, Abbots, and Barons, it was ordered that a bell should be rung every evening, at hearing of which prayer should be offered, and all people should get within their houses and sbut their doors. This odd mixture of

piety and police seems to be the origin of the famous and misrepresented Curfew. Whatever was its object, it was at least not ordained as any special hardship on William's English subjects."—E. A. Freeman, *History of the Norman conquest of England*, v. 3, ch. 12, sect. 3.

CURFEW BILL (1846). See ENGLAND: 1846.

CURIA, Ancient Roman, political unit. See COMMITIA CURIATA, ROME: Ancient kingdom: Early character and civilization; Genesis of the people.

CURIA, Austria, one of the four divisions of the electorate in the former Austrian empire. See AUSTRIA: 1906-1909.

CURIA, Municipal, of the later Roman empire: *Decuriones*.—"It is only necessary in this work to describe the general type of the municipal organization which existed in the provinces of the Roman Empire after the time of Constantine. . . . The proprietors of land in the Roman provinces generally dwelt in towns and cities, as a protection against brigands and manstealers. Every town had an agricultural district which formed its territory, and the landed proprietors constituted the municipality. The whole local authority was vested in an oligarchical senate called the Curia, consisting probably of one hundred of the wealthiest landed proprietors in the city or township. This body elected the municipal authorities and officers, and filled up vacancies in its own body. It was therefore independent of the proprietors from among whom it was taken, and whose interests it ought to have represented. The Curia—not the body of landed proprietors—formed therefore the Roman municipality. The Curia was used by the imperial government as an instrument of fiscal extortion."—G. Finlay, *Greece under the Romans*, ch. 2, sect. 1.—"When the progress of fiscal tyranny had almost sapped the vigor of society, the *decuriones* [members of the municipal curiæ, called also *curiales*] . . . being held jointly responsible for the taxation, became the veriest slaves of the empire. Responsible jointly for the taxes, they were, by the same token, responsible for their colleagues and their successors; their estates were made the securities of the imperial dues; and if any estate was abandoned by its proprietor, they were compelled to occupy it and meet the imposts exigible from it. Yet they could not relinquish their offices; they could not leave the city except by stealth; they could not enter the army, or the priesthood, or any office which might relieve them from municipal functions. . . . Even the children of the Curial were ascribed to his functions, and could engage in no course of life inconsistent with the onerous and intolerable duty. In short, this dignity was so much abhorred that the lowest plebeian shunned admission to it, the members of it made themselves bondmen, married slave-women, or joined the barbaric hordes in order to escape it; and malefactors, Jews and heretics were sometimes condemned to it, as an appropriate penalty for their offenses."—P. Godwin, *History of France: Ancient Gaul*, bk. 2, ch. 8.—See also EDUCATION: Modern: 1540-1756; ROME: Empire: 363-379.

CURIA, Papal: College of cardinals.—Consistory.—"The Court of Rome, commonly called the Roman Curia, consisted of a number of dignified ecclesiastics who assisted the Pope in the executive administration. The Pontiff's more intimate advisers, or, as we should say, his private council, were the College of Cardinals [see PAPACY: 1050; VATICAN: Present-day papal administration], con-

sisting of a certain number of cardinal bishops, cardinal priests, and cardinal deacons. The cardinal deacons, at first seven and afterwards fourteen in number, were originally ecclesiastics appointed as overseers and guardians of the sick and poor in the different districts of Rome. Equal to them in rank were the fifty cardinal priests, as the chief priests of the principal Roman churches were called; who, with the cardinal deacons, formed, in very early times, the presbytery, or senate of the Bishop of Rome. . . . According to some authorities, cardinal bishops were instituted in the 9th century; according to others not till the 11th, when seven bishops of the dioceses nearest to Rome—Ostia, Porto, Velitrae, Tusculum, Præneste, Tibur, and the Sabines—were adopted by the Pope partly as his assistants in the service of the Lateran, and partly in the general administration of the Church. In process of time, the appointment of such cardinal bishops was extended not only to the rest of Italy but also to foreign countries. Though the youngest of the cardinals in point of time, cardinal bishops were the highest in rank, and enjoyed the preëminence in the College. Their titles were derived from their dioceses. . . . But they were also called by their own names. The number of the cardinals was indefinite and varying. The Council of Basle endeavoured to restrict it to 24. But this was not carried out, and Pope Sixtus V. at length fixed the number at 70. The Council called the Consistory, which advised with the Pope both in temporal and ecclesiastical matters, was ordinarily private, and confined to the cardinals alone; though on extraordinary occasions, and for solemn purposes of state, as in the audiences of foreign ambassadors, &c., other prelates, and even distinguished laymen, might appear in it."—T. H. Dyer, *History of modern Europe*, v. 1, p. 38.—See also PAPACY: 1537-1563; 1908.

CURIA REGIS: England.—"The Anglo-Norman central council or curia regis . . . in form and appearance, and in the main in the functions it performed . . . seemed . . . identical with the Saxon national assembly that had preceded it. It was like that an assembly of the great men in church and state, of the household officers of the king, and in exceptional cases of any whom he might wish to summon. But in reality the Norman Conquest had introduced into the assembly a new controlling principle of composition which makes a decided institutional change and compels us to find its true ancestor in the Frankish, not in the Saxon state. That new principle of composition was feudal. The great council was feudalized, not in function, but in structure. The great men in church and state in attending it performed a duty which they owed no longer to the state, nor to the king as sovereign, but to the king personally as lord of vassals, just as their own vassals attended their exactly similar councils."—G. B. Adams, *Constitutional history of England*, p. 60.—See also COURTS: Germany: Feudal system.—"What was the *Curia Regis* of the twelfth and thirteenth centuries? . . . The view is at least tenable that [it] . . . meant nothing more than the royal presence actual or implied. . . . *Curia regis* is the mediæval latin for what we call the Crown. This theoretical presence pervades every court throughout the British empire at the present time and it is an attribute of the modern sovereignty of the crown except its representatives and delegates [see ENGLAND: 1100-1135]. . . . We look in vain for any definite organization of the original *curia regis*; it kept no rolls [records] until Henry II had made it a court of law. . . . That the main function of Edward I's parliaments is to continue and expand the work of Henry II's *curia regis* will appear from the briefest indication of

their procedure. The first step towards the holding of a parliament after its summons had been decided, the writs issued, and the representatives, if any, elected, was to make public proclamation in the great hall of Westminster Palace, in the chancery, in the court of common pleas, in the exchequer, in the guildhall, and in Westcheap that all who wished to present petitions at the approaching parliament should hand them in by a certain date. Thereupon, . . . the chancellor, the treasurer, and the justices of either bench were ordered to draw up in writing a brief statement of the suits pending before it which could not be determined out of parliament, so that right might be done therein. . . . The several courts of the *curia regis* were in a sense its committees: in parliament the judges and [the king's] council sat [together] in common or joint session and there decided cases reported to them; the whole was held to be greater than the part, in authority and legal wisdom as well as in size."—A. F. Pollard, *Evolution of Parliament*, pp. 25-26, 36, 40, 41, 43.

CURIE, Marie Skłodowska (1867-), Polish scientist, wife of Pierre Curie, who collaborated with her in the discovery of radium (1898) and its properties. This work she carried on alone after his death in 1906. In 1921 she made a lecture tour of the United States and received a gift of radium from the women of the United States. She was elected full member of the French Academy of Medicine in February, 1922. See CHEMISTRY: Radio-activity: Radium; MEDICAL SCIENCE: Modern: 20th century: Study and modern treatment of cancer; NOBEL PRIZES: Physics; 1903; Chemistry: 1911.

CURIE, Pierre (1859-1906), French scientist, professor of physics at the Sorbonne in Paris; best known for his work on radium, and discoveries in radioactivity, in which he collaborated with his wife, Marie Skłodowska Curie. See NOBEL PRIZES: Physics: 1903.

CURIO, Gaius Scribonius (d. about B. C. 49), Roman general, statesman and orator. See UTICA: Curio's defeat.

CURRAGH INCIDENT.—"On March 20th [1914] it was announced that a grave crisis had arisen in connection with the troops in Ireland; that in consequence of orders to move troops into Ulster, and the sending of a warship to Belfast, many officers of the Curragh garrison [twenty-seven miles southwest of Dublin] had tendered their resignations. Mr. Asquith issued on Mar. 22nd, through the *Times*, an official statement that the movement of the troops in Ireland was purely precautionary, that no further movement was contemplated, that there was no truth in the supposition that warrants had been issued for the Ulster leaders, and that no inquisition had been made into the intention of officers in the event of their being asked to take up arms against Ulster. There had, however, been an 'honest misunderstanding.' On Mar. 24th it became known that Col. Seely (Minister for War), Sir John French (Inspector-General), and Sir J. S. Ewart (Quartermaster-General) had initialled a memorandum, given to Brig.-General H. P. Gough, commanding the cavalry on the Curragh, pointing out that it was the duty of all soldiers to obey lawful commands, but concluding: 'But they (the Cabinet) have no intention whatever of taking advantage of this right to crush political

opposition to the policy or principles of the Home Rule Bill.' The publication of this last clause caused a political sensation. On March 25th Col. Seely apologised in the House of Commons for having amplified the memorandum to Gen. Gough, after the text had been approved by the Cabinet. He tendered his resignation, which was not then accepted. A White Paper was issued, showing that on Mar. 14th the War Office had warned Gen. Sir A. Paget, commanding in Ireland, to ensure protection to stores in Ulster, and that Gen. Paget reported on Mar. 20th that Gen. Gough and 57 officers of the 3rd Cavalry Brigade preferred dismissal from the Army to going north. These officers were suspended, but afterwards reinstated. On March 26th Sir John French and Sir J. S. Ewart tendered their resignations in consequence of the Government disavowal of the final clause of the memorandum they had initialled, and although great pressure was put on them to remain, their decision, in which they were finally joined by Col. Seely, could not be shaken."—*Hazell's Annual*, 1915, pp. 352-353.

CYCLADES, SPORADES.—"Among the Ionic portion of Hellas are to be reckoned (besides Athens) Eubœa, and the numerous group of islands included between the southernmost Eubœan promontory, the eastern coast of Peloponnesus, and the northwestern coast of Krête. Of these islands some are to be considered as outlying prolongations, in a southeasterly direction, of the mountain-system of Attica; others of that of Eubœa; while a certain number of them lie apart from either system, and seem referable to a volcanic origin. To the first class belong Keôs, Kythnos, Seriphus, Pholegandrus, Sikinos, Gyarus, Sýra, Paros, and Antiparos; to the second class Andros, Tênos, Mykonos, Dêlos, Naxos, Amorgos; to the third class Kimôlus, Mêlos, Thêra. These islands passed amongst the ancients by the general name of the Cyclades and the Sporades; the former denomination being commonly understood to comprise those which immediately surrounded the sacred island of Dêlos, —the latter being given to those which lay more scattered and apart. But the names are not applied with uniformity or steadiness even in ancient times; at present the whole group are usually known by the title of Cyclades."—G. Grote, *History of Greece*, pt. 2, ch. 12.—See also DELOS.

CYNOSARGES, in ancient times it was a celebrated gymnasium in Athens, connected with a sanctuary of Heracles. Here Antisthenes, a Greek philosopher, founded the school known as the Cynics. See GYMNASIA, Greek.

CYNOSCEPHALÆ, Battle of (B. C. 364). —The battle in which Pelopidas, the Theban pa-

triot, friend and colleague of Epaminondas, was slain. It was fought 364 B. C. in Thessaly, near Pharsalus, on the heights called Cynoscephalæ, or the Dog's Heads, and delivered the Thessalian cities from the encroachments of the tyrant of Pberæ.—C. Thirlwall, *History of Greece*, ch. 40.

Second battle of (B. C. 197). See GREECE: B. C. 214-146; ÆTOLIA; ROME: Republic: B. C. 215-106.

CYNOSSEMA, Naval battle of.—Two successive naval battles fought, one in July and the second in October, 411 B. C., between the Athenians and the Peloponnesian allies, in the Hellespont, are jointly called the battle of Cynossema. The name was taken from the headland called Cynossema, or the "Dog's Tomb," "ennobled by the legend and the chapel of the Trojan queen Hecuba." The Athenians had the advantage in both encounters, especially in the latter one, when they were joined by Alcibiades, with reinforcements, just in time to decide the doubtful fortunes of the day.—E. Curtius, *History of Greece*, bk. 4, ch. 5.—See also GREECE: B. C. 411-407.

CYPRIAN, Plague of. See PLAGUE: 78-266.

CYPRUS, large island in the eastern part of the Mediterranean, forty miles from the coast of Asia Minor, sixty-five miles from the coast of Syria, with an area of 3,584 square miles. (See TURKEY: Map of Asia Minor.) The population of 274,108 (1911) is composed almost wholly of Greeks and Turks, who are engaged chiefly in agriculture. (See BRITISH EMPIRE: Extent.) The chief exports are wheat, barley, pomegranates, raisins, wine, carole, fruit, cotton. The island is a British possession, governed by a High Commissioner, with an executive council, and a legislature of six officials and twelve elected members, three of whom are minority representatives elected by Mohammedans.

Origin of name.—"The Greek name of the island was derived from the abundance in which it produced the beautiful plant ("Copper") which furnishes the 'al-henna,' coveted throughout the East for the yellow dye which it communicates to the nails. It was rich in mines of copper, which has obtained for it the name by which it is known in the modern languages of the West."—J. Kenrick, *Phœnicia*, ch. 4.

Early history.—"The first authentic record with regard to Cyprus is an inscription on an Egyptian tombstone of the 17th century B. C., from which it appears that the island was conquered by Thothmes III. of Egypt, in whose reign the exodus of the Children of Israel is supposed to have taken place. This was no doubt anterior to the establishment of any Greek colonies, and probably, also, before the Phœnicians had settled in the island. [See PHŒNICIANS: Origin.] . . . As appears from various inscriptions and other records, Cyprus became subject successively to Egypt, as just mentioned, to Assyria, to Egypt again in 568 B. C., when it was conquered by Amasis, and in 525 B. C. to Persia. Meanwhile the power of the Greeks had been increasing. . . . The civilization of the West was about to assert itself at Marathon and Salamis; and Cyprus, being midway between East and West, could not fail to be involved in the coming conflict. On the occasion of the Ionic revolt [see PERSIA: B. C. 521-493] the Greek element in Cyprus showed its strength; and in 502 B. C. the whole island, with the single exception of the Phœnician town of Amathus, took part with the Ionians in renouncing the authority of the Persian king." But in the war which followed, the Persians, aided by the Phœnicians of

the mainland, reconquered Cyprus, and the Cyprian Greeks were long disheartened. They recovered their courage, however, about 410 B. C. when Evagoras, a Greek of the royal house of Teucer, made himself master of Salamis, and finally established a general sovereignty over the island—even extending his power to the mainland and subjugating Tyre. "The reign of Evagoras is perhaps the most brilliant period in the history of Cyprus. Before his death, which took place in 374 B. C., he had raised the island from the position of a mere dependency of one or other of the great Eastern monarchies, had gained for it a place among the leading states of Greece, and had solved the question as to which division of the ancient world the Cyprian people should be assigned. Consequently when, some forty years later, the power of Persia was shattered by Alexander the Great at the battle of Issus, the kings of the island hastened to offer him their submission as the leader of the Greek race, and sent 120 ships to assist him in the siege of Tyre." After Alexander's death, Cyprus was disputed between Antigonus and Ptolemy. (See MACEDONIA: B. C. 310-301.) The king of Egypt secured the prize, and the island remained under the Greek-Egyptian crown, until it passed, with the rest of the heritage of the Ptolemys, to the Romans (see also EGYPT: B. C. 323-30). "When the [Roman] empire was divided, on the death of Constantine the Great, Cyprus, like Malta, passed into the hands of the Byzantine Emperors. Like Malta, also it was exposed to frequent attacks from the Arabs; but, although they several times occupied the island and once held it for no less than 160 years, they were always expelled again by the Byzantine Emperors, and never established themselves there as firmly as they did in Malta. The crusades first brought Cyprus into contact with the western nations of modern Europe."—C. P. Lucas, *Historical geography of British colonies*, sect. 1, ch. 2.—See also ÆGEAN CIVILIZATION: Excavations and antiquities: Cretan area.

B. C. 58.—Annexed to Roman dominions.—"The annexation of Cyprus was decreed in 606 [58 B. C.] by the people [of Rome], that is, by the leaders of the democracy, the support given to piracy by the Cypriots being alleged as the official reason why that course should now be adopted. Marcus Cato, intrusted by his opponents with the execution of this measure, came to the island without an army; but he had no need of one. The king [a brother of the king of Egypt] took poison; the inhabitants submitted without offering resistance to their inevitable fate, and were placed under the governor of Cilicia."—T. Mommsen, *History of Rome*, bk. 5, ch. 4.

A. D. 47.—Visited by Paul and Barnabas. See CHRISTIANITY: A. D. 33-52.

117.—Jewish insurrection.—"This rich and pleasant territory [the island of Cyprus] had afforded a refuge to the Jews of the continent through three generations of disturbance and alarm, and the Hebrew race was now [117] probably not inferior there in number to the native Syrians or Greeks. On the first outburst of a Jewish revolt [against the Roman domination, in the last year of the reign of Trajan] the whole island fell into the hands of the insurgents, and became an arsenal and rallying point for the insurrection, which soon spread over Egypt, Cyrene and Mesopotamia. The leader of the revolt in Cyprus bore the name of Artemion, but we know no particulars of the war in this quarter, except that 240,000 of the

native population is said to have fallen victims to the exterminating fury of the insurgents. When the rebellion was at last extinguished in blood, the Jews were forbidden thenceforth to set foot on the island; and even if driven thither by stress of weather, the penalty of death was mercilessly enforced. . . . The Jewish population of Cyrenaica outnumbered the natives. . . . The hostility of the Jews in these parts was less directed against the central government and the Roman residents than the native race. . . . Of these 220,000 are said to have perished."—C. Merivale, *History of the Romans*, ch. 65.

1191.—Conquest by Richard Cœur de Lion.—Founding of Latin kingdom.—During the civil strife and confusion of the last years of the Comnenian dynasty of emperors at Constantinople, one of the members of the family, Isaac Comnenos, secured the sovereignty of Cyprus and assumed the title of emperor. With the alliance of the king of Sicily, he defeated the Byzantine forces sent against him, and was planted securely, to all appearance, on his newly built throne at the time of the third Crusade. Circumstances at that time (1191) gave him a fatal opportunity to provoke the English crusaders. First, he seized the property and imprisoned the crews of three English ships that were wrecked on the Cyprian coast. Not satisfied with that violence, he refused shelter from the storm to a vessel which bore Berengaria of Navarre, the intended wife of King Richard. "The king of England immediately sailed to Cyprus; and when Isaac refused to deliver up the shipwrecked crusaders, and to restore their property, Richard landed his army and commenced a series of operations, which ended in his conquering the whole island, in which he abolished the administrative institutions of the Eastern Empire, enslaving the Greek race, introducing the feudal system, by which he riveted the chains of a foreign domination, and then gave it as a present to Guy of Lusignan, the titular king of Jerusalem, who became the founder of a dynasty of Frank kings in Cyprus."—G. Finlay, *History of the Byzantine and Greek empires, from 716 to 1453*, bk. 3, ch. 3, sect. 1.—Before giving Cyprus to Guy of Lusignan, Richard had sold the island to the Templars, and Guy had to pay the knights heavily for the extinguishment of their rights. Richard, therefore, was rather a negotiator than a giver in the transaction.—W. Stubbs, *Seventeen lectures on the study of mediæval and modern history*, lect. 8.

1192-1489.—Kingdom under house of Lusignan.—"The house of Lusignan maintained itself in Cyprus for nearly three centuries, during which, although fallen somewhat from the blessedness which had been broken up by Isaac Comnenus, the island seems to have retained so much fertility and prosperity as to make its later history very dark by contrast. . . . Guy, we are told, received Cyprus for life only, and did homage for the island to Richard. As he already bore the title of king, the question whether he should hold Cyprus as a kingdom does not seem to have arisen. . . . On his death, in April, 1194, Richard putting in no claim for the reversion, his brother, Amalric of Lusignan, constable of Palestine, entered on the possession as his heir. . . . Amalric succeeded to the crown of Jerusalem; the crown of Jerusalem, which, after the year 1269, became permanently united with that of Cyprus, was an independent crown, and the king of Jerusalem an anointed king: the union of the crowns therefore seems to have precluded any question as to the tenure by which the kingdom of Cyprus should be held. . . . The homage then due to Richard, or to the crown of

England, ceased at the death of Guy."—W. Stubbs, *Seventeen lectures on the study of mediæval and modern history*, lect. 8.—See also JERUSALEM: 1187-1229.

1489-1570.—Venetian dependency.—The last reigning king of Cyprus was James II, a bastard brother of Queen Charlotte, whom he drove from the Cypriot throne in 1464. This king married a Venetian lady, Caterina Cornaro, in 1471 and was declared to be "the son-in-law of the Republic." The unscrupulous republic is said to have poisoned its son-in-law in order to secure the succession. He died in 1473, and a son, born after his death, lived but two years. Cyprus was then ruled by the Venetians for fifteen years in the name of Caterina, who finally renounced her rights wholly in favor of the republic. After 1489, until its conquest by the Turks, Cyprus was a Venetian dependency, in form as well as in fact, but tributary to the sultan of Egypt.—W. Stubbs, *Seventeen lectures on the study of mediæval and modern history*, lect. 8.

1570-1571.—Conquest by the Turks. See TURKEY: 1566-1571.

CYRANO DE BERGERAC, Savinien (1620-1655), French dramatist and novelist. See FRENCH LITERATURE: 1600-1630.

CYRENAICA, Cyrene, or Kyrene, a city, growing into a kingdom, which was founded at an early day by the Greeks, on that projecting part of the coast of Libya, or northern Africa, which lies opposite to Greece. The first settlers were said to have been from the little island of Thera, whose people were bold and enterprising. The site they chose "was of an unusual nature, especially for islanders, and lay several miles away from the sea, the shores of which were devoid of natural bays for anchorage. But, with this exception, every advantage was at hand: instead of the narrow stony soil of their native land, they found the most fertile corn-fields, a broad table-land with a healthy atmosphere and watered by fresh springs; a well-wooded coast-land, unusually well adapted for all the natural products which the Hellenes deemed essential; while in the background spread mysteriously the desert, a world passing the comprehension of the Hellenes, out of which the Libyan tribes came to the shore with horses and camels, with black slaves, with apes, parrots and other wonderful animals, with dates and rare fruits. . . . An abundant spring of water above the shore was the natural point at which the brown men of the deserts and the mariners assembled. Here regular meetings became customary. The bazaar became a permanent market, and the market a city which arose on a grand scale, broad and lofty, on two

rocky heights, which jut out towards the sea from the plateau of the desert. This city was called Cyrene. . . . Large numbers of population immigrated from Crete, the islands and Peloponnesus. A large amount of new land was parcelled out, the Libyans were driven back, the landing-place became the port of Apollonia, and the territory occupied by the city itself was largely extended. Cyrene became, like Massalia, the starting point of a group of settlements, the centre of a small Greece: Barca and Hesperides [afterwards called Berenice] were her daughters. Gradually a nation grew up, which extended itself and its agriculture, and contrived to cover a large division of African land with Hellenic culture. This was the new era which commenced for Cyrene with the reign of the third king, the Battus who, on account of the marvellously rapid rise of his kingdom, was celebrated as 'the fortunate' in all Hellas. The Battiadæ [the family or dynasty of Battus] were soon regarded as a great power."—E. Curtius, *History of Greece*, bk. 2, ch. 3.—Cyrenaica became subject to Egypt under the Ptolemys, and was then usually called Pentapolis, from the five cities of Cyrene, Apollonia, Arsinoë (formerly Teuchira), Berenice (formerly Hesperis, or Hesperides) and Ptolemais (the port of Barca). Later it became a province of the Roman empire, and finally, passing under Mohammedan rule, sank to its present state, as a district, called Barca, of the kingdom of Tripoli.—Cyrene was especially famous for the production of a plant called silphium—supposed to be assafœtida—on which the ancients seem to have set an extraordinary value. This was one of the principal sources of the wealth of Cyrene.—E. H. Bunbury, *History of ancient geography*, ch. 8, sect. 1, and ch. 12, sect. 2.—See also GREECE: Migrations to Asia Minor and islands of the Ægean.

B. C. 322.—Absorbed in the kingdom of Egypt by Ptolemy Lagus. See EGYPT: B. C. 323-30.

B. C. 97.—Transferred to the Romans by will.—"In the middle of this region [of Ptolemy, called Lathyrus, king of Egypt] died Ptolemy Apion, king of Cyrene. He was the half-brother of Lathyrus and Alexander, and having been made king of Cyrene by his father Euergetes II, he had there reigned quietly for twenty years. Being between Egypt and Carthage, then called the Roman province of Africa, and having no army which he could lead against the Roman legions, he had placed himself under the guardianship of Rome; he had bought a truce during his lifetime, by making the Roman people his heirs in his will, so that on his death they were to have his kingdom. Cyrene had been part of Egypt for above two hundred years, and was usually governed by a younger son or brother of the king. But on the death of Ptolemy Apion, the Roman senate, who had latterly been grasping at everything within their reach, claimed his kingdom as their inheritance, and in the flattering language of their decree by which the country was enslaved, they declared Cyrene free."—S. Sharpe, *History of Egypt*, ch. 11.

CYRUS THE GREAT (c. B. C. 600-529), founder of the Persian Empire. He secured Persian independence from Median overlordship about 550 B. C., at the same time, totally overthrowing the Median empire. He conquered Lydia in 546 and captured Babylon in 539. In following up his conquests, he was magnanimous, merciful and liberal, and established a firm and just system of government. The Jews, released by him from their captivity in Babylon, were permitted to return home and rebuild their temple. He was killed in warfare against one of the barbarous tribes east of Persia.—See also ASIA MINOR: B. C. 724-539; BABYLONIA: Invasion by Cyrus; BACTRIA; GREECE: B. C. 500-493; Rising of Ionians of Asia Minor against Persians; JEWS: B. C. 604-536; 537; MILITARY ORGANIZATION: 2; PERSIA: B. C. 540-521.

CYRUS THE YOUNGER (d. B. C. 401), second son of Darius Nothus. He sought to deprive his elder brother Artaxerxes of the throne, and was killed in the Battle of Cunaxa. Xenophon's Anabasis recounts the adventures of the Greek auxiliaries of his army in their retreat to the sea, after the death of Cyrus. See PERSIA: B. C. 401-400.

CYZICUS, an ancient town in Asia Minor, now the ruins of Bal-Kiz, on the peninsula of Kapu Dagh, stretching into the sea of Marmora. See GREECE: Map of ancient Greece.

B. C. 411-410.—Battles at. See GREECE: B. C. 411-407.

B. C. 74.—Siege by Mithradates.—Cyzicus, which had then become one of the largest and wealthiest cities of Asia Minor, was besieged for an entire year (74-73 B. C.) by Mithradates in the third Mithradatic War. The Roman consul Lucullus came to the relief of the city and succeeded in gaining a position which blocked the besiegers and cut off their supplies. In the end, Mithradates retreated with a small remnant only, of his great armament, and never recovered from the disaster.—G. Long, *Decline of the Roman republic*, v. 3, ch. 1.

CZECHO-SLOVAKIA: Territory. — Geographical position.—Physical features.—"The Republic of Czecho-Slovakia [with an area of about 55,000 sq. miles] is comprised of the former Austrian Crown Lands of Bohemia, Moravia, and Silesia, . . . a large part of former Northern Hungary, . . . known as Slovakia, . . . and the western part of the Teschen district. . . . [The demarcation of its] boundaries gives Czecho-Slovakia the most central position in Europe. . . . On the north and west the country borders on Germany, on the south the boundary is contiguous with that of Austria and of Hungary, on the north-east with Poland, and for a short distance in the extreme east with Roumania. [Its length is about 600

miles, and the greatest breadth 185 miles.]—*Weekly Bulletin, Department of Trade and Commerce, Canada, No. 875, excerpts, pp. 1323-1324.*—“This extensive region . . . is, as a whole, mountainous, except for the Danube plain, and is richly endowed with forest.”—*Geographical Review, July, 1919.*—“Based upon Bohemia and Moravia, the new state also includes the hill countries of Slovak speech to the east as well as the northern strip formerly known as Austrian Silesia and a portion of Dečín [Teschen] with a coalfield. Its southern boundaries were difficult to settle. Linguistic frontiers are rarely linear, because of the tendency of the hill people to learn the speech of the market towns on the edges of the plains, and, besides, a frontier along foot-hills is unsatisfactory to the strategist. The plain south-west of the Tatra has, therefore, been given to Czechoslovakia, which thus has at Bratislava (Pressburg), an old Hungarian capital, a Danube port of great value.”—H. J. Fleure, *Treaty settlement of Europe, p. 68.*—See

transport facilities. . . . The Elbe [now internationalized] affords easy communication with Germany and the North Sea, the Danube with the countries of South-east Europe and the pass of the Oder river in Silesia gives an outlet to Poland and Russia. Czecho-Slovakia is therefore an industrial country, situated in the heart of Europe and surrounded on three sides by agricultural states. This gives the country a strategic position for the trade with the markets of Eastern and Southern Europe, which are large purchasers of manufactured goods. . . . Czecho-Slovakia is well supplied with railway facilities. . . . Nearly all the important (Austrian and Hungarian) lines are under the management of the Czecho-Slovak State Railways, the system of which extends over all parts of the country.”—*Weekly Bulletin, Department of Trade and Commerce, Canada, No. 875, excerpts pp. 1323-1328.*—“Agriculture in the Czecho-Slovakia Republic is highly developed and compares . . . favorably with that of the other most progressive European

CZECHO-SLOVAKIA

(Showing territory acquired from the adjoining states)

Natural resources.—**Industries.**—**Trade.**—**Transport facilities.**—**Agriculture.**—“The new Republic of Czecho-Slovakia is one of the most [nearly] self-supporting countries of Europe. It possesses many important manufacturing industries and is rich in coal and other minerals. It is estimated that about 80 per cent of the mines and industrial enterprises of the former Austro-Hungarian Empire are now located within the boundaries of the Czecho-Slovak Republic. The country has also abundant supplies of timber and extensive tracts of agricultural land. [See CONSERVATION OF NATURAL RESOURCES: Czecho-Slovakia.] . . . The trade of Czecho-Slovakia is that of an industrial country importing chiefly raw materials and food-stuffs and exporting finished manufactured products. . . . The industrial centers are nearly all located in Bohemia, Moravia and Silesia, and this explains the greater relative density of the population of these provinces as compared with that of Slovakia. . . . After natural resources, the most important factor in the economic development of Czecho-Slovakia has been the unrivalled

states; 41 per cent of the population are engaged in agriculture. The fact that half of the total area of the republic consists of arable land and that only 4 per cent is non-productive, shows the intensity with which cultivation is carried on. The chief crops, wheat and barley, account for 25 per cent of the arable land. In respect to the yield per acre, Czecho-Slovakia is surpassed only by Germany and Great Britain.”—B. Stepanek, *Social and economic problems [in Czecho-Slovakia] (Survey, June 11, 1921, p. 348).*

Language. See PHILOLOGY: 21.

Racial characteristics.—**Population.**—“The Czechs and the Slovaks were included . . . [in] the migration of Slav races, who in the early centuries of the Christian era crossed the Carpathians from the Russian steppes in search of warmer climates and owing to the pressure of Mongol hordes coming from the East. It is certain that the Czechs established themselves as early as the eighth century in what is now Bohemia, Moravia and Silesia, where they have maintained themselves in a compact block ever since. . . . The Slovaks first settled on the plains of Hungary, but with the coming of the Magyars they retired to the foothill valleys of

the Carpathians. . . . The Slovaks are closely allied to the Czechs and there are only minor differences in the dialects spoken by these two branches of the Slav race. There are, however, important fundamental differences in character, which arise probably from a different historical development. The Czechs are an aggressive, energetic and efficient race, while the Slovaks are a peaceful agricultural people with more of the true Slav characteristics than have the Czechs."—*Weekly Bulletin, Department of Trade and Commerce, Canada, No. 876, pp. 1412-1413.*—Of the 13,595,818 (1921) inhabitants, the majority are Czechs and Slovaks. "In the extreme east of Slovakia, in the territory known as sub-Carpathian Russia, there dwell Ruthenians or little Russians, also of Slav race. . . . The principal non-Slav elements in the population of Czecho-Slovakia are the Germans, Hungarians or Magyars and the Jews. . . . The Czechs claim that the non-Slav minority number altogether about three millions."—*Ibid., p. 1413.*—See also BOHEMIA: Its people and their early history; SLAVS; and BALKAN STATES: Map showing distribution of nationalities; CZECHS.

15th-20th centuries.—Brief history of revolutionary movement for independence up to the World War.—"For a long period Bohemia was an independent kingdom with varying fortunes, the boundaries at one time extending from the Adriatic to the Baltic. In the fifteenth century a series of bitter religious wars commenced, which culminated in 1620 in the defeat of the Bohemians, who had espoused the Protestant cause. The Czechs thus came completely under Austrian domination. Conditioned by their geographical position, the Slovaks have . . . been more under Magyar domination rather than under German, to which the Czechs have been subjected. The Czechs and Slovaks availed themselves of the opportunity presented by the Great War to achieve their independence, and the movement which had been growing throughout the war finally culminated in the revolution of October 28, 1918, when the formation of Czecho-Slovakia as an independent state was proclaimed."—*Weekly Bulletin, Department of Trade and Commerce, Canada, No. 876, p. 1413.*—See also BOHEMIA; AUSTRIA: 1898; 1899-1900; 1900 (February); 1900; AUSTRIA-HUNGARY: 1904.

1914-1918.—Political conditions during the World War.—Declaration of independence (1918).—With the outbreak of the war the situation in Bohemia had grown more and more intolerable until at last it fell little short of a reign of terror. Espionage and censorship were so complete, that it was dangerous to make any public comment upon current affairs. Political life had from the first been entirely suspended. As neither the Austrian Parliament nor the provincial diets had been allowed to meet, there was no parliamentary immunity. On November 24, 1915, a decree of the Minister of the Interior announced the dissolution of the Bohemian Sokols [see SOKOLS] and of the inter-Slavonic Federation of Sokols of which Prague has always been the centre. A deadly blow was thus struck at one of the most characteristic features of Czech national life; for the 953 Sokol societies of Bohemia counted no fewer than 110,000 members, and may without exaggeration be described as the backbone of the nation. Only ten days later all the remaining Slav associations of Prague were dissolved. Germanizing tendencies became more and more marked, and on January 15, 1916, in defiance of all existing laws, German was proclaimed by the Governor as the official language of political administration throughout Bohemia. The archbishop of Prague

was transferred to the see of Olmutz and replaced by a German prelate. On May 23rd, the Young Czech leader, Dr. Kramar, and another deputy, Dr. Scheiner, the president of the famous Bohemian Sokols, had been placed under arrest, at the express orders of the military authorities and of the Archduke Frederick himself, who in a private report to Vienna charged the entire Czech nation with Russophil sentiments. In the first months of the war great efforts were made to induce the Czech parties to publish a manifesto in favour of Austria, but entirely without success. All remained ominously silent. In April, 1915, one of the Clerical leaders was persuaded to take the initiative in reviving the proposal, but he found himself entirely isolated and had to abandon the attempt.—Based upon R. W. Seton-Watson, *German, Slav, and Magyar, pp. 165-168.*—"The whole Czecho-Slovak nation aligned itself against Austria-Hungary and Germany on the side of the Allies. The movement was

THOMAS G. MASARYK
(President of Czecho-Slovakia)

spontaneous and general. . . . An open opposition to the war and to Austria was begun by the Czecho-Slovak soldiers. They refused to fight, surrendered to the enemy *en masse*, and soon formed Czecho-Slovak legions in the Allied armies. . . . The national movement was very strong. The most cruel terrorism, . . . the hangings and shootings at home, the confiscation of property and the jailing of citizens were of no avail."—*Nation, Oct. 5, 1918.*—"According to statistics published by the *Neues Wiener Tageblatt*, 720 civilians had been executed in Bohemia between August, 1914, and January, 1916, and during the same period 245 in Moravia. By the end of May the total had risen to 1,200."—R. W. Seton-Watson, *German, Slav, and Magyar, p. 169.*—When force and suppression failed Emperor Charles resorted to promises of coronation, federalization and autonomy, but too late. The Bohemian cause had gained too great a momentum to be arrested by promises. Thomas G. Masaryk had left Czecho-Slovakia December, 1914, and on July 6, 1915, the anniversary day of John Hus, he declared Bohemia's allegiance to the Allied cause. In November of the same year, the Czecho-Slovak National Council at Paris, formed with the unanimous consent of the people at home, declared the Hapsburgs deposed from the throne of

Bohemia. In addition to the National Council at Paris the Czecho-Slovaks formed one at Prague in July, 1918, and in August Great Britain recognized Czecho-Slovakia as an Allied nation. On October 28, the council took over Bohemia, Moravia, Silesia, and Slovakia and administered the government of these countries. The government was formed outside of Bohemia, and Masaryk returned to Prague in triumph, December 21, 1918, as the president of the newly formed republic.—See also AUSTRIA-HUNGARY: 1914-1915; 1917-1918.

On November 14, 1918, the following Declaration of Independence was issued:

At this grave moment, when the Hohenzollerns are offering peace in order to stop the victorious advance of the allied armies and to prevent the dismemberment of Austria-Hungary and Turkey, and when the Hapsburgs are promising the federalization of the empire and autonomy to the dissatisfied nationalities committed to their rule, [see WORLD WAR: 1918: X. Statement of war aims: k] we, the Czecho-Slovak National Council, recognized by the Allied and American Governments as the Provisional Government of the Czecho-Slovak State and Nation, in complete accord with the declaration of the Czech Deputies made in Prague on January 6, 1918, and realizing that federalization and still more autonomy, means nothing under a Hapsburg dynasty, do hereby make and declare this our Declaration of Independence. We do this because of our belief that no people should be forced to live under a sovereignty they do not recognize, and because of our knowledge and firm conviction that our nation cannot freely develop in a Hapsburg mock federation, which is only a new form of the denationalizing oppression under which we have suffered for the last 300 years. We consider freedom to be the first prerequisite for federalization, and believe that the free nations of Central and Eastern Europe may easily federate should they find it necessary. We make this declaration on the basis of our historic and natural right. We have been an independent State since the seventh century, and in 1526, as an independent State, consisting of Bohemia, Moravia, and Silesia, we joined with Austria and Hungary in a defensive union against the Turkish danger. We have never voluntarily surrendered our rights as an independent State in this confederation. The Hapsburgs broke their compact with our nation by illegally transgressing our rights and violating the Constitution of our State, which they had pledged themselves to uphold, and we therefore refuse longer to remain a part of Austria-Hungary in any form. We claim the right of Bohemia to be reunited with her Slovak brethren of Slovakia, once a part of our national State, later torn from our national body, and fifty years ago incorporated in the Hungarian State of the Magyars, who, by their unspeakable violence and ruthless oppression of their subject races have lost all moral and human right to rule anybody but themselves. The world knows the history of our struggle against the Hapsburg oppression, intensified and systematized by the Austro-Hungarian dualistic compromise of 1867. This dualism is only a shameless organization of brute force and exploitation of the majority by the minority; it is a political conspiracy of the Germans and Magyars against our own as well as the other Slav and the Latin nations of the monarchy. The world knows the justice of our claims, which the Hapsburgs themselves dared not deny. Francis Joseph in the most solemn manner repeatedly recognized the sovereign rights of our nation. The Germans and Magyars opposed this recognition, and Austria-Hungary, bowing before the Pan-Germans, became

a colony of Germany, and, as her vanguard to the East, provoked the last Balkan conflict, as well as the present world war, which was begun by the Hapsburgs alone without the consent of the representatives of the people. . . . We reject the sacrilegious assertion that the power of the Hapsburg and the Hohenzollern dynasties is of divine origin; we refuse to recognize the divine right of Kings. Our nation elected the Hapsburgs to the throne of Bohemia of its own free will, and by the same right deposes them. We hereby declare the Hapsburg dynasty unworthy of leading our nation, and deny all of the claims to rule in the Czecho-Slovak Land, which we here and now declare shall henceforth be a free and independent people and nation. We accept and shall adhere to the ideals of modern democracy, as they have been the ideals of our nation for centuries. We accept the American principles as laid down by President Wilson; the principles of liberated mankind—of the actual equality of nations—and of Governments deriving all their just power from the consent of the governed. We, the nation of Comenius, cannot but accept these principles expressed in the American Declaration of Independence, the principles of Lincoln, and of the declaration of the rights of man and of the citizen. For these principles our nation shed its blood in the memorable Hussite wars 500 years ago; for these same principles, beside her allies, our nation is shedding its blood today in Russia, Italy, and France." The rest of the document outlines the constitution and form of government to be adopted, reforms planned, and the internal and external policy of the future state.—See also AUSTRIA-HUNGARY: 1918; HUNGARY: 1918: End of the World War; EUROPE: Modern period: New balance of powers.

1918.—Adoption of a new flag. See FLAGS: Czecho-Slovakia.

1918-1920.—Military organization.—Campaign against Bolshevik Russia.—During the World War a Czecho-Slovak army was formed of prisoners of war, set free by the Russian government. It was recognized by France, Italy, Great Britain, and the United States as an Allied regular force, and fought on the fronts of France, Italy, and Russia. See RUSSIA: 1918-1920: Anti-Bolshevik movement; WORLD WAR: 1918: III. Russia: a; c; e; e, 1; f; V. Balkan theater: a.

1918-1920.—Provisional constitution.—New constitution.—National Assembly.—Main parties in Parliament.—"The provisional government of the Czechoslovak Republic at Prague was established by virtue of a law of November 13, 1918, on a provisional constitution. . . . The provisional constitution is an interesting document. It bestows upon the national assembly the legislative power and the power to supervise the executive until the time when a constitutionally elected assembly shall meet. . . . Thus it makes the president a figurehead and gives the national assembly the sovereign power. It had been in use only a few months before it became the subject of a great deal of discussion."—*American Political Science Review*, Nov., 1919.—It was amended on March 22, 1919, and on February 29, 1920, another constitution was adopted. "The new Constitution, adopted in February, proclaims the state to be a democratic republic with a president at its head, elected by the legislature for a term of seven years. It provides for a bicameral parliament, a senate of 150 members above twenty-six years of age elected

for eight years by universal suffrage, and a chamber of deputies of 300 chosen for six years, for which all men and women who have attained the age of twenty-one may vote. Power is really lodged in the lower house, the senate being merely a revising body. The president is bound to summon both branches to ordinary sessions each year. The president may prorogue the legislature but not for longer than one month, and only once a year; he also has the right to dissolve it. The ministers are responsible to the chamber and must resign if that body expresses lack of confidence. The Constitution contains a bill of rights modeled after that of the United States. The Czecho-Slovak language is the official language of the republic, but in all districts in which any racial minority numbers more than twenty per cent, the minority may use their own language in public offices and courts and may have their own schools. Minority representation is provided for, and voting is by districts and party lists.—*Political Science Quarterly, Supplement, Sept. 1920*.—"The national assembly was an expansion . . . of the national council at Prague . . . which was dissolved during the war . . . [and] was reorganized under the Presidency of Dr. Kramar. . . . It was this institution which assumed charge in Czechoslovakia when the revolution broke out on October 28, 1918."—*American Political Science Review, Nov., 1919*.—"On April 15 [1919] the National Constituent Assembly, having completed its work, dissolved, and the Tusar ministry resigned. New elections were held for the Chamber of Deputies on April 18 and for the senate on the 26th."—*Political Science Quarterly, Supplement, Sept., 1920*.—According to the universal political methods of European countries, the main parties in Czecho-Slovakia are the Social Democrats, the People's party, the Agrarians, the Czech Socialists, the National Democrats and the Peasants' party.

"The Parliament is composed of 209 Slovak and Tzech members who make use of the Tzechish idiom, as against 81 members who are Germans, Hungarians and Ruthenians, who, at least in Parliament, speak German. These same elements are represented in the Senate in the proportion of 101 to 40. From among the German members of Parliament hardly one-eighth understand the Tzech language tolerably. As for the Magyars and the Ruthenians, in the matter of foreign languages, with very few exceptions, they know no other but German, the language they make use of in the parliamentary debates. It is worthy of remark that under the former Austrian régime at the Diet of Prague . . . and that of Brunn, . . . all the communications, verbal and written, from the President and from the government were made in both languages—German and Tzech. The present Parliament of Prague on the contrary is monolingual—that is to say—that all official communications are made exclusively in the Tzech language. It is the same with the reports of parliamentary commissions, which have to be drawn up and read exclusively in Tzech. From all this it results that for the almost total number of the non-Tzech members, the parliamentary work remains a dead letter; while on the other side, the members of the Tzech majority only lend a negligent ear to the German speeches of the minority, which they treat with disdain. To insist upon the use of Tzechish as the exclusive language of Parliament is equivalent to shutting the door of the House to some of the most worthy representatives of the minority of the nation."—*Christian Science Monitor, June 2, 1921*.

1918-1920.—**Financial, economic, and industrial conditions.**—"The formation of Czecho-Slovakia as an independent state found the trade and industries confronted with very great difficulties. The break-up of the Austro-Hungarian Empire brought about a serious financial and currency crisis. The transport services were disorganized, and as a result of over four years of war and blockade the industries of the country were paralyzed for lack of raw materials. Decreased agricultural production owing to lack of fertilizers and other reasons had, moreover, caused a severe food shortage. The low exchange value of the crown prevented the country from importing necessary supplies of raw materials and foodstuffs. . . . The deficiency of transport facilities . . . [was] a serious handicap to the economic reconstruction of Czecho-Slovakia. There [was] . . . a shortage of locomotives and cars for the use of the Slovak railways. . . . Besides the deficiency of rolling stock the trade and industry of Czechoslovakia [was] hampered by the incompleteness of the railway system, which [resulted] . . . from the new delimitation of boundaries. . . . The railways formerly comprised part of the Austrian or Hungarian systems and the main lines extended north to south in the direction of Vienna or Budapest."—*Weekly Bulletin, Department of Trade and Commerce, Canada, No. 876, excerpts pp. 1414-1416*.—"The home industries were also greatly handicapped through lack of fuel, and many factories were not in a position to continue work.—Based upon *Review of the Foreign Press (Economic Review, June 2, 1920, quoting Narodni Listy, May 9, 1920)*.

The food shortage caused considerable labor unrest in 1920. The reduction of the bread ration in Czecho-Slovakia by one-half, as well as the incessant increase in the cost of living, led on May 11, 1920, to a large labor demonstration in Prague, accompanied by the closing of all businesses and most of the shops.—*Ibid., June 2, 1920*.—A general famine strike was . . . declared in the district round Carlsbad, which was to last until the bread supply was assured. The population had received no bread for seven weeks and no flour for five.—*Ibid., June 30, 1920*.—A general strike in the Reichenberg district caused full rations of bread and flour to be distributed, but in the Zwickau districts the total lack of bread, flour, and pulse threatened serious disturbances. In the district round Pressburg, formerly Hungarian territory, disturbances which threatened the harvest caused the proclamation of martial law.—*Ibid., Aug. 13, 1920*.—The annual report for 1919, issued by the central board of the Czecho-Slovak trade associations, shows a great increase in the strength of the trade union movement in that country.

1918-1920.—**Government activities in work of reconstruction.**—"The first problem confronting the Government was . . . the unification of the currency and the stabilization of the financial position of the country."—*Weekly Bulletin, Department of Trade and Commerce, Canada, Nov. 15, 1920*.—"With regard to currency, Czechoslovakia . . . definitely separated itself from the old Austro-Hungarian currency, . . . stamped its notes and called many of them in. The imposition of new taxes is another method of combating inflation."—*Review of the Foreign Press (Economic Review, Oct. 15, 1920)*.—According to an announcement of the minister of finance, "the system of taxation would be revised so as to impose the heaviest taxes on the rich. The Government's proposals . . . [included] new succession duties, new duties on water

power, increased salaries for civil servants, . . . heavy taxation of export profits, and the revision of municipal finances."—*Ibid.*, Dec. 3, 1920, quoting *Gazette de Prague*, Nov. 6.—"Its internal programme also . . . [included] reduction of the coal tax, regulation of the coal trade, and, if possible, the cheapening of coal; restraint of profiteering, housing, unemployment, improvement of the condition of Government officials; support of schools of all nationalities, socialisation of certain industries, land reform, and, finally, the strengthening of national defence. Great stress . . . [was] laid on the necessity of giving effect with all speed to the Army Act, which . . . [would put] the army in a condition to meet all contingencies."—*Ibid.*, Oct. 8, 1920.

1919.—Labor legislation.—"A law providing for a general eight hour day, applying with some modifications to agriculture and even to domestic service, came into operation in January. This is one of the most ambitious pieces of legislation on hours of labor which any State has yet attempted."—*Living Age*, July 19, 1919.

1919.—Treaty of St. Germain.—Provisions. See ST. GERMAIN, TREATY OF: Part III: Section III.

1919.—Hungarian invasion.—In June, the Magyars invaded the Czech territory in Hungary and Slovakia, causing the Czechoslovaks to lose considerable ground, which was, however, recovered when, under the pressure of the Allies, the Hungarians withdrew about the middle of July.—See also HUNGARY: 1919 (March).

1919-1920.—New land laws.—"A law of the Czechoslovakian republic of 16th April 1919 orders the expropriation of large landed estates and entrusts the work to a special land office. A large landed estate is defined as an estate belonging to one person exceeding 150 hectares of farm land or 250 hectares of land of any other sort. The expropriated land belongs to the State which, by means of the above office, must take possession of it and divide it up. The compensation to be paid will be settled by another special law; the present law, however, lays down the rule that compensation shall be paid in all cases, except those specially mentioned in the law."—(*International Yearbook of Agricultural Legislation*, v. 9, 1919, *Introduction*, p. liv.)—"The legislative provisions passed on this matter in the Czechoslovakian republic can be classed in two groups, of which the first contains the laws directly regarding land reform, and the other group contains the laws destined to regulate the concession to small farmers of land obtained by means of expropriating large estates. The first group includes the laws of 16th April 1919 and 19th February 1920 which provide for and regulate the expropriation of large estates, and the law of April 1920 arranges the mode of procedure and the payment of indemnity. The first of these laws (16th April 1919) provides that in order to carry out land reform the State has power to expropriate large landed properties, over 150 hectares if of agricultural land, and 250 if other

lands. The law confides the execution of this land reform to a special body to which is given the name of land office. The second law (12th February 1920) deals with the management of landed property in the time elapsing between the day of expropriation and that on which the State takes possession for division. During this period the management of the expropriated land is confided to experts who have to exercise the greatest care in carrying out this trust in order to keep up the expropriated land and make it produce the greatest possible amount of agricultural produce. The law determines the duties of these persons in the utmost detail, and sets up a special service of supervision charged with the assiduous inspection of such lands. The third law (8th April 1920) contains in the first part rules of procedure prescribed for taking possession of expropriated lands. In the second part the law deals with the indemnity to be paid to the owners of expropriated lands. The indemnity will be commensurate with the average price paid during the course of the years 1913 and 1915 for the purchase of lands of more than 100 hectares similar in point of agriculture, in land registration and in topography to those in question. In dealing with estates of more than 1,000 hectares in the first place the price should be established according to the foregoing indications; this price should then be reduced in proportion varying from 5% minimum for land extending over from one to two thousand hectares, up to a maximum of 40% on land which is more than 50,000 hectares in extent. The State expropriating the land has the right to exact from the owner a proportion of the live stock and equipment actually on the land. This right should be exercised by the State within one month of the taking possession of the estate; the price to be paid is the current rate at the moment when the estate is taken over; and if it is not possible to agree on the matter, the price will be decided by legal experts. From the moment of the liquidation of the indemnity to be paid to the owner for the expropriation of his land, there exists in favour of the owner and at the charge of the State a credit for the amount of the said indemnity; from that moment the interest on said sum commences, which the State may pay in cash or in instalments. Finally the law deals with the position of employees on the expropriated land. The law recognises their right to a State pension and they must also be preferred when other employees are to be nominated for the management of the State lands, and they also have a right of precedence in the division of the expropriated land. The second group of laws includes a law of the 27th May 1919 and two amending laws of 6th April and 15th April 1920. These laws provide that a renter can ask the State to permit him to purchase the estate he is cultivating whether the land in question belongs to the State or has been expropriated. In order that this application may have effect, however, it is necessary that the farmer or his family shall have farmed the land in question without interruption from 1st October 1901, either personally or by his family. The applicant for possession of the land farmed by him must pay an indemnity to be decided by suitable judges who will make their valuation on the basis of the price current in the year 1913. The price may be paid at choice of the applicant either in one lot or in instalments, of which the first two must be paid before the assignment of the land is definitely made, and the other eight in the succeeding eight years. The applicant is forbidden to transfer the land for a period of ten years from the date of

purchase. Exceptions to this rule may be made with the consent of the land office."—*Introduction (International Yearbook of Agricultural Legislation, v. 10, 1920, pp. xliii-xliv)*.

1920.—Union of Slovakia and Bohemia. See TRIANON, TREATY OF (1920).

1920.—Race antagonism.—In 1920 "relations between Czechs and Germans . . . [were] strained. By way of protest against the arbitrary closing of 100 German schools, the remainder . . . closed voluntarily. The German members of the National Assembly . . . brought an interpellation setting forth the grievances of the German minority. They complained that the promises made to them by the Government, of the protection of the minority which had induced them to join the Assembly had not been fulfilled, that they had been excluded from participation in the labours of the Assembly, and that their position had become worse under the present Government."—*Review of the Foreign Press (Economic Review, Nov. 5, 1920)*.—The end of the year 1920 was "marked by a violent outbreak of race feeling between Czechs and Germans. Each party . . . [accused] the other of unprovoked aggression and of refusing to cooperate in the common weal. The removal in Eger, by Czech soldiers, of the statue of the obnoxious Joseph II, stung the German population to reprisals. Such is the German account, but according to the official report of the commander of garrison, the statue was thrown down by some soldiers who broke out of barracks, through irritation at hostile demonstrations by the population. . . . The Czech school in Eger was destroyed and Czech women, girls, and soldiers were maltreated. These proceedings provoked counter-demonstrations in Prague, Pilsen, and Brünn involving in the first-named, destruction of German property, seizure by closing of German theatres and social institutions, closing of German schools, and the raiding and wrecking of the offices of the *Prager Tageblatt* and of the President's organ *Tribuna*. Angry protests . . . [were] made to the Premier and President by German members of Parliament. Collisions between Czech soldiers and Germans in Asch . . . resulted in loss of life."—*Ibid.*, Dec. 10, 1920.—See also HUNGARY: 1920-1921.

1920.—Schism in the church. See PAPAČY: 1920: Schism in Czecho-Slovakia.

1920 (August).—Little Entente.—"The declaration of neutrality in the Russo-Polish war . . . was followed by an act of foreign policy even more momentous, the conclusion on Czechoslovak initiative, of the Central European Triple Entente, also called 'the Little Entente.' Negotiations to bring about this alignment of the three main 'succession states,' Czechoslovakia, Jugoslavia and Rumania, were conducted by the foreign minister, Dr. Edward Benes, who left Prague for Belgrade on Aug. 19, and afterward visited Bucharest. [According to the official declaration], this entente is aimed not merely against all attempts against reaction which might menace the new states, it is not merely a defensive alliance assuring integrity and independence to the three states concerned, but is, above all, a positive agreement to facilitate a return to normal economic conditions to regularize the exchanges between these countries . . . and to establish a new order of things in accordance with the new political constitution in Central Europe. . . . The united power of Czechoslovakia,

Jugoslavia and Rumania is so considerable that no state in Central or Eastern Europe would venture to attack this alliance."—*Current History Magazine, Oct., 1920, p. 80*.—See also JUGO-SLAVIA: 1920.

1920 (December).—Hungarian plot.—Financial status.—A Hungarian plot to raid Pressburg on the night of Dec. 27, 1920, was frustrated by the watchfulness of the Czecho-Slovakian authorities. "At the end of 1920, the foreign debt was three and a half billion francs, the internal debt, twenty-five billion Czecho-Slovak crowns. The wealth of Czecho-Slovakia may be estimated as some two hundred billion Czecho-Slovak crowns."—B. Stepanek, *Social and economic problems (Survey, June 11, 1921, p. 349)*.

1920.—Coöperation movement. See COÖPERATION: Czecho-Slovakia.

1921.—Navigation of the Danube.—Danube-Oder and Elbe-Danube canals. See DANUBE: 1921.

1921.—New cabinet.—On Sept. 26 a new ministry was appointed with Eduard Benes as prime minister and minister of foreign affairs.

1921.—Represented at Portorosa conference. See PORTOROSA CONFERENCE (1921).

1922 (August-September).—Treaty with Ukraine.—Sound financial status.—A commercial and economic treaty with the Ukraine was ratified in August. It provides for a re-establishment of diplomatic relations, and in case of war between either country and a third party, the other will remain neutral. The financial situation in Czecho-Slovakia is exceptionally good. The country has been able to right itself after the World War without resorting to fiat money.

1922.—Represented at Genoa economic and financial conference. See GENOA CONFERENCE (1922).

Educational status. See EDUCATION: Modern developments: 20th century: General education: Bohemia.

Georges-Picot, *La politique extérieure de la république tchécoslovaque (Revue Science Politique, April-June, 1921)*.

CZECHO-SLOVAKIA, Constitution of.—This constitution was formally adopted by the constituent assembly at Prague on Feb. 29, 1920, and was approved by President Masaryk on March 5. The main features follow those of the constitution of France. The president is elected for seven years and may hold office for two consecutive terms. The legislative body is bi-cameral, consisting of a House of Deputies and a Senate. The House of Deputies is made up of 300 members, elected for six years, and the Senate is made up of 150 members, elected for eight years. The House of Deputies is the more powerful chamber, for a majority vote of this body can overrule the president's veto, and its vote of a lack of confidence can overthrow the ministry. The system of elections is based on proportional representation. The franchise for the House of Deputies is open to all citizens of either sex over 21 years of age and for the Senate to those over 26 years of age. The full text is as follows:

Preamble

We, the Czecho-Slovak Nation, in order to form a more perfect union of the nation, establish jus-

justice and order in the republic, insure tranquil development of the Czecho-Slovak homeland, promote the general welfare of all the citizens of this State and secure the blessings of liberty to future generations, have adopted in our National Assembly on the 20th day of February, 1920, a Constitution for the Czecho-Slovak Republic, the text of which follows. On this occasion, we, the Czecho-Slovak Nation, declare that we shall endeavor to have this Constitution and all laws of our land carried out in the spirit of our history and also in the spirit of modern principles contained in the word self-determination; for we desire to join the society of nations as an enlightened, peaceful, democratic and progressive member.

Enabling Provisions

I. Laws in conflict with the Constitution, the fundamental laws which are a part of it, and laws which may supplement or amend it are void.

The Constitution and the fundamental laws which are a part of it may be changed or supplemented only by laws designated as constitutional laws.

II. The Constitutional Court decides whether laws of the Czecho-Slovak Republic and laws of the Diet of Carpathian Russia comply with Article I.

III. The Constitutional Court consists of seven members. The Supreme Administrative Court and the Supreme Court each designate two members. The remaining two members, together with the President of the Court, are appointed by the President of the republic.

Regulation of the manner in which the two above-mentioned courts select members of the Constitutional Court, its functioning, rules of procedure and effects of its judgments is determined by law.

IV. The existing National Assembly shall remain in session until the Chamber of Deputies and the Senate are constituted.

Laws adopted by this National Assembly, but not proclaimed on the day when the Chamber of Deputies and the Senate are constituted, may not go into effect if returned by the President of the republic to the National Assembly.

As to the term set by the Provisional Constitution for the exercise of the right of the President of the republic according to Section 11 and for the duty to proclaim the adopted law, the laws passed by the existing National Assembly shall be governed by the Provisional Constitution.

V. The present President remains in office until a new election has taken place. From the day on which this Constitution goes into effect he shall possess the rights herein granted.

VI. Until there is elected the full number of members of the Chamber of Deputies and the Senate provided for in the Constitution the number of members actually elected shall be applied to determine the quorum of Deputies and Senators required by the Constitution.

VII. Provisions of Articles I, II, and III. (Paragraph 1) form a part of the Constitution in accordance with Section 33 of this instrument.

Enabling laws referred to in the Constitution are not a part of this instrument within the scope of Section 1 unless otherwise expressly stated by the Constitution.

VIII. The Constitution hereto attached goes into effect on the day of its proclamation.

Section 20 of the Constitution does not apply to members of the existing National Assembly.

IX. On the day stated in Paragraph 1 of Section 8 all ordinances in conflict with the Constitution

and the republican form of government, as well as all former constitutional laws, even though some of their provisions may not be in conflict with the fundamental laws of the Czecho-Slovak Republic, become void.

X. This law goes into effect simultaneously with the Constitution, and the Government is charged with carrying out this law and the Constitution.

I. General Provisions of the Constitution

1. The people are the only source of all State authority in the Czecho-Slovak Republic.

The Constitution determines through what organs the sovereign people adopt laws, carry them out and find justice. The Constitution also sets the limits which these organs may not exceed, so that the constitutionally guaranteed rights of citizens may be protected.

2. The Czecho-Slovak State is a democratic republic, at the head of which is an elected President.

3. The territory of the Czecho-Slovak Republic forms a unitary and indivisible whole, the frontiers of which may be changed only by fundamental law.

An indivisible part of this whole, on the basis of voluntary union in accordance with the treaty between the allied and associated powers and the Czecho-Slovak Republic in Saint-Germain-en-Laye Sept. 10, 1919, is the autonomous territory of Carpathian Russia, which will receive the widest autonomy compatible with the unity of the Czecho-Slovak Republic.

Carpathian Russia has its own Diet, which elects its own officers.

The Diet of Carpathian Russia is competent to make laws in matters of language, instruction, religion, local administration, as well as in other matters which may be assigned to it by the laws of the Czecho-Slovak Republic. Laws adopted by the Diet of Carpathian Russia and signed by the President of the Republic are proclaimed in a separate series and shall also be signed by the Governor.

Carpathian Russia shall be represented in the National Assembly of the Czecho-Slovak Republic by the proper number of Deputies and Senators in accordance with Czecho-Slovak election laws.

At the head of Carpathian Russia stands a Governor appointed by the President of the Czecho-Slovak Republic upon nomination by the Government; he shall be responsible also to the Diet of Carpathian Russia.

Public servants of Carpathian Russia shall as far as possible be taken from its own population.

Details, especially the right to vote and to be elected to the Diet, are regulated by special enactments.

The law of the National Assembly, determining the boundaries of Carpathian Russia, shall form a part of the Constitution.

4. Citizenship of the Czecho-Slovak Republic is one and unitary.

Rules governing the acquiring of citizenship, its effects and its loss are determined by law.

A citizen or subject of a foreign State may not at the same time be a citizen of the Czecho-Slovak Republic.

5. Prague is the capital of the Czecho-Slovak Republic.

The colors of the republic are white, red and blue.

Coat of arms and flags are prescribed by laws.

II. Legislative Authority

6. Legislative authority for the entire territory of the Czecho-Slovak Republic is exercised by the

National Assembly, which consists of two houses: Chamber of Deputies and Senate.

Both houses meet regularly in Prague. In cases of absolute necessity they may be called to meet temporarily in some other place in the Czecho-Slovak Republic.

7. Legislative and administrative power of land Diets is abolished.

Unless a law adopted by the National Assembly provides otherwise, it applies to the entire territory of the Czecho-Slovak Republic.

8. The Chamber of Deputies consists of 300 members, elected by general, equal, direct and secret franchise in accordance with the principle of proportionate representation. Elections take place on Sundays.

9. The right to vote for members of the Chamber of Deputies belongs to all citizens of the Czecho-Slovak Republic without distinction of sex who are 21 years of age and comply with other requirements of the fundamental law governing elections to the Chamber of Deputies.

10. All citizens of the Czecho-Slovak Republic, without distinction of sex, who are 30 years of age and comply with other requirements of the fundamental law, are eligible to election to the Chamber of Deputies.

12. Details of the exercise of right to vote and election rules are contained in the law governing elections to Chamber of Deputies.

13. The Senate consists of 150 members, elected by general, equal, direct and secret franchise in accordance with the principle of proportionate representation. Elections take place on Sundays.

14. The right to vote for members of the Senate belongs to all citizens of the Czecho-Slovak Republic without distinction of sex who are 26 years of age and comply with other requirements of the fundamental law as to the composition and jurisdiction of the Senate.

15. Eligible are those citizens of the Czecho-Slovak Republic, without distinction of sex, who have reached 45 years of age and comply with other requirements of the fundamental law as to the composition and jurisdiction of the Senate.

16. The term for which Senators are elected is eight years.

17. Details of the exercise of right to vote and election rules are contained in the law as to the composition and jurisdiction of the Senate.

18. No one may be a member of both houses.

19. Contested elections to the Chamber of Deputies and the Senate are passed upon by the electoral court. Details are regulated by law.

20. An employe of the State who is elected to the National Assembly and qualifies as member receives a leave of absence for the duration of his term and is entitled to his regular salary, not including therein local or active supplement of the same, as well as to seniority promotion. University professors are entitled to leave of absence; if they make use of this right, the same provisions apply to them as to other State servants.

Other public servants are entitled to leave of absence while they are members of the National Assembly.

Members of the National Assembly may receive a salaried State appointment only after the expiration of one year from the time they cease to be members of the National Assembly.

This provision does not apply to Ministers. The time limit of one year, contained in the previous paragraph, does not apply to Deputies and Senators who were in the service of the State before their election to the National Assembly, if they remain in the same department of service.

Members of county assemblies and county and district chiefs may not be members of the National Assembly. Judges of the Constitutional Court and associate Judges of the Electoral Court may not at the same time sit in the National Assembly.

21. Members of either house may resign at any time.

22. Members of the National Assembly carry out their mandates in person; they may not receive orders from any one.

They may not intervene with public authorities in party interests. This prohibition does not apply to members of the National Assembly in so far as intervention with authorities is a part of their regular duties.

In the first meeting of the House which they attend they shall make the following pledge: "I promise that I will be faithful to the Czecho-Slovak Republic, that I will observe the laws and execute my trust according to my best knowledge and conscience." Refusal of the pledge or pledge with reservation carries with it automatic loss of mandate.

23. Members of the National Assembly cannot be molested by reason of their vote in the House or committees. For anything they may say in the exercise of their mandate they are subject only to the disciplinary power of the House.

24. Before a member of the National Assembly may be prosecuted or disciplined for other acts or omissions, the consent of the proper House must be obtained. If the House refuses its consent, prosecution is dropped permanently.

These provisions do not apply to criminal liability which a member of the National Assembly may incur as responsible editor.

25. If a member of either House is arrested in the commission of a criminal offense, the court or other proper authority shall inform the President of the House at once of the arrest. Unless the House, or during the adjournment of the National Assembly the commission elected in accordance with Section 54, signifies within fourteen days its consent to further imprisonment, imprisonment ceases. Should the commission give its consent, the House itself shall decide the question of further imprisonment within fourteen days of its convening.

26. Members of both houses may refuse to testify as to matters which were confided to them as members of the House, even after they have ceased to be members. This does not apply to charges of seducing a member of either House to abuse his trust.

27. Members of both houses shall receive compensation provided by law.

28. The President of the republic shall call both houses into two regular sessions annually, in Spring and Fall. The Spring session commences in March, the Fall session in October.

He may also call the houses into special sessions according to need. If a majority of either House makes a demand for special session on the President of the Government, stating the nature of special business, the President shall cause the houses to meet within fourteen days from the date of demand. In case of his failure to act the houses shall convene simultaneously within the following fourteen days at the call of their Presidents.

When more than four months have elapsed since the last regular session, the President of the republic shall at the request of at least two-fifths of either House call the houses to meet within fourteen days of the date of the request. In case of his failure to act the houses shall meet within

the following fourteen days at the call of their Presidents.

29. Sessions of both houses open and close at the same time.

30. The President of the republic declares the session closed.

He may prorogue the houses for no longer than one month and not oftener than once a year.

31. The President of the republic may dissolve the houses. He may not exercise this right within the last six months of his term of office. At the expiration of the term of either House or at the dissolution of either House new elections shall take place within sixty days.

Dissolution of the Senate does not stay criminal proceedings that may be pending before the Senate in accordance with Sections 67 and 79.

32. The quorum of either House, except where otherwise provided for herein, is one-third of entire membership; all acts to be valid must receive a majority vote of those present.

33. Declaration of war, amendment of the Constitution and the fundamental laws which are a part thereof may be done only by affirmative vote of three-fifths of all members of both houses.

34. The Chamber of Deputies may impeach the President of the republic, the President of the Government and members of Government by a two-thirds majority in the presence of two-thirds of the membership.

Proceedings before the Senate as a high court are regulated by law.

35. Each House elects its own President, officers and functionaries.

36. Sessions of the Chamber of Deputies and the Senate are public. Executive sessions may be held only in cases enumerated in the rules of proceeding.

37. The fundamental principles of the relations of both houses to each other, to the Government and to all outside them are regulated by special law within the limits set by constitutional provisions. For the transaction of its business each House adopts its own rules.

Until the House of Deputies and the Senate adopt their own rules, the rules of the existing National Assembly shall apply.

38. When both houses meet as National Assembly the rules of the House of Deputies apply.

Such a joint session is called by the President of the Government and presided over by the President of the Chamber of Deputies.

His alternate is President of the Senate.

39. Ministers may participate at any time in the meetings of either House and of all committees. They shall be given the floor whenever they desire to speak.

40. At the request of either House or its committee the Minister shall attend its meeting.

Otherwise the Minister may be represented by officials of his department.

41. Bills may be submitted either by the Government or by either House.

A bill submitted by members of either House shall be accompanied by a statement of expenses involved in the bill and by a recommendation as to how they shall be defrayed.

Government proposals for financial and army bills shall be laid first before the Chamber of Deputies.

42. Changes in fundamental laws shall be concurred in by both houses. This applies also to other laws, except as otherwise provided in Sections 43, 44 and 48.

43. The Senate shall take action on a bill passed by the House of Deputies within six weeks; on financial and army bills within one month. The

House of Deputies shall take action on a bill adopted by the Senate within three months.

These time limits run from the day when the printed act of one House is delivered to the other House; by consent of both houses these time limits may be extended or shortened. The limit of one month within which the Senate shall take action on financial and army bills cannot be extended.

If during the limit the term of the House which is to take action on the bill of the other expires or the House is dissolved, prorogued or its session closed, the limit begins to run anew from its next meeting.

If the second House takes no action within the above time limits, the failure is considered equivalent to approval of the decision of the first House.

44. A measure passed by the Chamber of Deputies shall become law in spite of the dissent of the Senate if the Chamber of Deputies by a vote of the majority of the entire membership reaffirms its original vote. If the Senate rejects by a three-fourths majority of the entire membership a bill which was passed by the Chamber of Deputies the bill becomes law only if repassed by the Chamber of Deputies by a majority of three-fifths of the entire membership.

Proposals of the Senate are submitted to the Chamber of Deputies. If the latter rejects the Senate bill and the Senate reaffirms its original vote by a majority vote of the entire membership, the bill is submitted once more to the Chamber of Deputies. If the Chamber of Deputies rejects the Senate bill by a majority vote of the entire membership the bill fails.

Bills which thus fail cannot be resubmitted in either House before the expiration of one year.

Amendment of a bill passed by one House in the other House is equivalent to rejection.

45. If either House has to consider for the second time a bill which it once voted or consider again a bill passed by the other House, and should the House be dissolved or its term expire before reconsideration, the action of the new House on the matter shall be considered to be its second action in the sense of Section 44.

46. If the National Assembly rejects a Government bill, the Government may order a popular vote to be taken on the question, whether the bill shall become law. Such a decision of the Government must be unanimous.

The right of vote belongs to all who are entitled to vote for members of the Chamber of Deputies.

Details are regulated by law.

Popular vote does not apply to governmental proposals changing or amending the Constitution and the fundamental laws which are a part of it.

47. The President of the republic may return with his objections a law passed by the National Assembly within one month from the day on which it was delivered to the Government.

48. If both houses in a roll call reaffirm their vote by a majority of the entire membership, the measure shall be proclaimed law.

If such a concurrent majority of both houses is not reached, the measure will nevertheless become law, if in a new roll call the Chamber of Deputies votes for it by three-fifths of the entire membership.

If the measure in question is one which requires the larger quorum and higher majority, the returned measure must be adopted in the presence of this quorum by the specified majority.

The provisions of Section 45 apply here also.

49. A law does not go into effect until it is proclaimed in the manner prescribed by law.

Laws are proclaimed by this clause: "The Na-

tional Assembly of the Czecho-Slovak Republic adopted the following law."

Laws shall be proclaimed within eight days, not including Sundays, from the limit set in Section 47. If the President of the republic makes use of his right there referred to, the law shall be proclaimed within eight days, not including Sundays, from the day when re-enactment by the National Assembly is communicated to the Government.

50. Every law must state which member of the Government is charged with its execution.

51. The law shall be signed by the President of the republic, the President of the Government and the Minister charged to execute the law. If the President is disabled or ill and has no Deputy, the President of the Government signs on his behalf.

The President of the Government may be represented in the signing of laws in the manner provided for in Section 71.

52. Each House has the right to interpellate the President and members of the Government on all matters within their jurisdiction, inquire into administrative acts of the Government, appoint committees to which the Ministers shall submit information, adopt addresses and resolutions.

The President and members of the Government shall answer the interpellations of the members of the houses.

53. The manner in which State financial economy and State debt is controlled is regulated by law.

54. (1) In the period between the dissolution of either House or the expiration of its term and the next convening of both houses, and also during the time when the session of the two houses is prorogued or closed, a commission of twenty-four members may enact urgent measures which have the force of law. The Chamber of Deputies elects sixteen members with sixteen alternates, and the Senate elects eight members and eight alternates for the term of one year. Each alternate takes the place of a definite member.

(2) First elections take place as soon as the two houses are organized. Presidents and Vice Presidents of both houses take part in voting. When a new House has been elected it selects new members of the commission, even though the one-year term of sitting members has not expired.

(3) The principle of proportionate representation shall be applied in these elections. Parties may combine. If all parties agree, members of the commission may be selected from the body of the House. This may be done if objectors do not exceed twenty Deputies or ten Senators.

(4) Members of the commission remain in office until their successors are elected. Alternates take the place of members who permanently or temporarily are unable to perform their duties. If there is a vacancy in the office of either member or alternate, supplementary election is had for the balance of the term. A newly elected member must belong to the same group as the former member unless the group in question should fail to nominate a candidate or refuse to participate in electing.

(5) A member of the Government may not be member of commission or his alternate.

(6) As soon as the commission is elected it shall organize itself by electing a President and Second Vice President out of members of the House of Deputies, and First Vice President out of Senate members.

(7) Sections 23 to 27 of the Constitution apply to members of the commission.

(8) The commission may act in all matters that come within the legislative and administrative jurisdiction of the National Assembly, but it cannot

(a) elect the President of the republic or his Deputy;

(b) amend fundamental laws or change jurisdiction of public authorities, except that it may add new duties to existing authorities;

(c) impose by its measures upon citizens new and lasting financial duties, increase military obligation, burden permanently the State finances or alienate State property;

(d) give its consent to declaration of war.

(9) A measure which is to have the effect of law or which authorizes expenditures not provided for in the budget must be approved by a majority of the entire membership.

(10) In all other cases the commission may act in the presence of one-half of its membership by a majority vote of those present. The President votes only to break the tie.

(11) Emergency measures which are in the nature of law may be adopted only upon recommendation of the Government approved by the President of the republic.

(12) Acts of the commission referred to in the preceding section have temporarily the effect of law; they are proclaimed, with a reference to Section 54, in the series of laws and ordinances, and they are signed by the President of the republic, President of the Government or his Deputy, and at least one-half of the Ministers. Acts which are not signed by the President of the republic may not be proclaimed.

(13) The jurisdiction of the Constitutional Court extends to measures which are in the nature of law; they shall be submitted to the court by the Government at the time of their proclamation in the series of laws and ordinances. The Constitutional Court decides whether measures submitted to it comply with Paragraph 8 b.

(14) President of the commission and Vice President submit a report of the actions of the commission in the first sessions of the Chamber of Deputies and the Senate, even though they may have ceased to be members.

(15) Measures which are not approved by both houses within two months of their convening are thereafter void.

III. Governing and Executive Power

55. Ordinances may be issued only for the purpose of carrying out a definite law and within its terms.

56. The President of the republic is elected by the National Assembly.

He shall be a citizen of the Czecho-Slovak Republic, qualified to be member of the Chamber of Deputies and 35 years of age.

57. Election is held in the presence of the majority of the total membership of both houses, and a vote of three-fifths of those present is necessary.

If two ballots result in no choice, the next balloting is limited to the highest candidates; he who receives a plurality of votes is elected. In case of tie the decision is made by lot.

Details are governed by law.

58. The term of office commences on the day when the newly elected President makes the promise, as provided in Section 65.

The term of office is seven years.

Election is held within the last four weeks of an expiring term.

No one may be elected for more than two successive terms. A person who has served as President for two successive terms cannot be elected again until seven years shall have elapsed from the expiration of his last term. This provision

does not apply to the first President of the Czecho-Slovak Republic.

The former President continues in office until the new President is elected.

59. Should the President die or resign during his term of office, a new election is held in accordance with provisions of Sections 56 and 57 for a term of seven years. The National Assembly shall be convened for that purpose within fourteen days.

60. Until the new President is elected (Section 59), or if the President is prevented by ill-health or other cause from performing his office, his authority is exercised by the Government, which may entrust definite functions to its own President.

61. If the President is incapacitated or ill for more than six months (Section 60), and if the Government so decides in the presence of three-quarters of its members, the National Assembly will elect an acting President who will serve as such, until the impediment is removed.

During the period for which a person is not eligible to be President in accordance with Section 58 he cannot be acting President.

62. The election of acting President is governed by rules applying to the election of President.

63. The President of the republic may not be at the same time member of the National Assembly. If a member of the National Assembly is elected acting President, he cannot execute his mandate in the National Assembly while he is exercising the office of President.

64. The President of the republic:

(1) Represents the State in its foreign relations. He negotiates and ratifies international treaties, commercial treaties, treaties which impose upon the State or the citizens burdens of a financial or personal nature, especially military, and treaties which change the boundaries of the State, need the consent of the National Assembly. In the case of changes of boundaries the consent of the National Assembly must take the form of a constitutional law (Article I. of the enabling laws);

(2) Receives and accredits diplomatic representatives;

(3) Proclaims state of war to exist, declares war after first obtaining the consent of the National Assembly, and lays before it the negotiated treaty of peace for its approval;

(4) Convenes, prorogues and dissolves the National Assembly (Sections 28 to 31) and declares the session of the houses closed;

(5) May return bills with his objections (Section 47) and signs laws of the National Assembly (Section 51), of the Diet of Carpathian Russia (Section 3), and ordinances of the commission (Section 54);

(6) Gives to the National Assembly oral or written information of the state of the republic and recommends to their consideration such measures as he may deem necessary and expedient;

(7) Appoints and dismisses Ministers and determines their number;

(8) Appoints all professors of universities, and all Judges, civil officials and army officers of the sixth or higher rank;

(9) Grants gifts and pensions in special cases upon motion of the Government;

(10) Is Commander in Chief of all armed forces;

(11) Grants pardons in accordance with Section 103.

All governing and executive power, in so far as the Constitution and laws of the Czecho-Slovak Republic, adopted after Nov. 15, 1918, do not expressly reserve it to the President of the republic, shall be exercised by the Government (Section 70).

65. The President of the republic promises before

the National Assembly (Section 58) upon his honor and conscience that he will study the welfare of the republic and the people and that he will observe constitutional and other laws.

66. The President of the republic is not responsible for the execution of his office. For his utterances, connected with the office of the President, the Government is responsible.

67. He may be criminally prosecuted only for high treason before the Senate upon impeachment by the Chamber of Deputies (Section 34). The punishment may extend only to the loss of his office and disqualification ever to hold it again.

Details are determined by law.

68. Every act of the President in the exercise of his governing or executive power is valid only when countersigned by a responsible member of the Government.

69. Provisions applying to the President of the republic apply also to the acting President (Section 61).

70. The President and members of the Government (Ministers) are appointed and dismissed by the President of the republic.

The ordinary seat of the Government is Prague (Section 6).

71. The Government elects from its membership the President's Deputy, who may take his place. If the Deputy is unable to act, the oldest member of the Government in years acts as President.

72. The President of the republic decides over which department each Minister shall preside.

73. Members of the Government promise to the President of the republic, upon their honor and conscience, that they will conscientiously and impartially perform their duties and observe constitutional and other laws.

74. No member of the Government may sit on the Board of Directors or act as representative of a stock company or a firm which is engaged in business for profit.

75. The Government is responsible to the Chamber of Deputies, which may declare its lack of confidence in the Government. This shall be done in the presence of the majority of the entire membership by a majority vote upon a roll call.

76. Motion to declare lack of a confidence shall be signed by at least one hundred Deputies and shall be referred to committee which will submit its report within eight days.

77. The Government may ask the Chamber of Deputies to vote its confidence. This motion shall be acted upon without reference to committee.

78. If the Chamber of Deputies declares lack of confidence in the Government or if it rejects the motion of Government for a vote of confidence, the Government shall hand its resignation to the President of the republic, who will select the persons who are to carry on the affairs of state until a new Government is formed.

If the Government resigns at a time when there is neither President nor acting President, the commission provided for in Section 54 accepts the resignation and takes steps to have the administration carried on.

79. If the President or members of the Government violate fundamental or other laws by their official acts either intentionally or from gross negligence, they are responsible criminally.

Right to impeach belongs to the Chamber of Deputies, and the trial is held before the Senate.

Details are regulated by law.

80. The Government acts as a college which is competent to take action only in the presence of the President or acting President and a majority of the Ministers.

81. The Government decides corporatively in particular:

(a) Government measures for the National Assembly, Government ordinances (Section 84) and recommendations to the President of the republic to make use of the power given him by Section 74;

(b) all matters of a political nature;

(c) appointment of Judges and civil officials of the eighth and higher ranks, as far as this appertains to the central authorities, and nominations of functionaries who are appointed by the President of the republic (Section 64, Paragraph 8).

82. The President of the republic may attend and preside over the meetings of the Government; he may require of the Government and its members written opinion of any matter relating to the duties of their office.

83. The President of the republic may invite the Government or its members for consultation.

84. Every Government ordinance shall be signed by the President of the Government or the acting President, and also by Ministers charged with its execution and in no case less than half the Ministers.

85. The jurisdiction of the Ministries is regulated by law.

86. In the lower State administrative offices the citizen element shall be, as far as possible, represented, and the protection of the rights and interests of the citizens (administrative judicature) shall be effectively provided.

87. No one may be at the same time an elected member of an inferior administrative organ and also of an organ that is superior or exercises supervision over the former.

Exceptions may be made by law.

88. Judicial protection against administrative organs shall be provided by the Supreme Administrative Court, composed of independent Judges, with jurisdiction over the territory of the entire republic.

Details are regulated by law.

89. The nature and authority of the inferior organs of State administration is settled in principle by law which may leave details to Government ordinances.

90. State organs which are entrusted with economic functions only, without exercising the sovereign authority of the State, are created and organized by ordinances.

91. The nature and authority of the autonomous organ are regulated by special law.

92. The law determines to what extent the State shall be responsible for illegal execution of governmental authority.

93. Public employes shall in their official acts observe fundamental and other laws. This applies also to citizen members of administrative colleges.

IV. Judicial Power

94. The judicial power is exercised by State courts; the law prescribes their organization, their jurisdiction and their procedure.

No one may be sent before any other Judge but the one who has jurisdiction by law.

Only in criminal matters extraordinary courts may be introduced, and then in cases prescribed by law in advance and for a limited period.

95. Judicial power in civil cases belongs to civil courts, either regular or special and arbitration courts; judicial power in criminal matters belongs to regular criminal courts, in so far as it is not assigned to military criminal courts, and except as such matters may, in accordance with general ordinances, be dealt with by police or financial punitive procedure.

For the entire territory of the Czecho-Slovak Republic there shall be one Supreme Court.

The place of juries in judicial procedure is regulated by special laws.

Jury trials may be temporarily suspended in cases provided for by law.

The jurisdiction of court-martial may be extended to civil population in accordance with the provisions of law only in time of war and for acts done during the war.

96. Judicial power is in all instances separated from administration.

Conflicts of jurisdiction between courts and administrative organs are regulated by law.

97. Qualifications of professional Judges are determined by law.

Judges shall take an oath of office that they will observe the laws.

The status of Judges in the service of State is regulated by special law.

98. All Judges shall execute their office independently of all considerations except only the law.

99. Professional Judges are appointed permanently; they may not be transferred, demoted or pensioned against their will, except should there be a new organization of courts and then only during the period provided for by the law, or by virtue of a proper disciplinary finding; they may be pensioned also by a proper finding when they reach the legal retirement age. Details are regulated by law which also prescribes under what conditions Judges may be suspended from office.

Judicial Senates in courts of first and second instance are in session all year; exceptions are made by law.

100. Judgments are pronounced in the name of the republic.

Sessions of court are oral and public; judgments in criminal cases are declared in public; the public may be excluded from court sessions only in cases enumerated by law.

In trials of criminal cases the principle of accusation applies.

101. Professional Judges may not hold any other paid position, permanent or temporary, except as otherwise provided by law.

102. Judges in passing upon a legal question may examine the validity of an ordinance; as to law they may only inquire whether it was properly promulgated (Section 51).

103. The President of the republic shall have power to declare amnesty, grant pardons or commute punishments, restore lost civil rights, in particular the right to vote for National Assembly and other elected bodies, and with the exception of criminal proceedings where an individual is complainant, suspend all criminal prosecution.

This power of the President of the republic does not apply to members of the Government, impeached or condemned in accordance with Section 79.

104. Liability of the State and Judges for damages caused by illegal execution of official authority is determined by law.

105. In all cases in which an administrative organ in accordance with particular laws passes upon claims for compensation the party affected may, after exhausting his remedies with higher authorities, apply for relief to courts.

Details are regulated by law.

V. Rights and Privileges, as Well as Duties of Citizens

106. Privileges due to sex, birth and calling are not recognized.

All inhabitants of the Czecho-Slovak Republic enjoy, equally with the citizens of the republic, in its territory full and complete protection of race or religion. Exceptions to this principle are admissible only as far as is compatible with international law.

Titles may be conferred only when they refer to office or occupation; this does not apply to academic degrees.

107. Personal liberty is guaranteed. Details are regulated by a law which is a part of this Constitution.

Personal liberty may be restricted or taken away only in conformity with law; likewise public authorities may compel a citizen to perform personal acts only in conformity with law.

108. Every Czecho-Slovak citizen may settle in any part of the Czecho-Slovak Republic, acquire real property there and engage in a gainful occupation, within the limits of general legal provisions.

This right may be restricted only in the public interest by law.

109. Private ownership may only be restricted by law.

Expropriation may be accomplished only in compliance with law and compensation shall be paid, except where the law specifically provides that compensation shall not be paid.

110. The right to emigrate may only be limited by law.

111. Taxes and public burdens may be imposed only in conformity with law.

Likewise threats and imposition of punishments shall be made only in conformity with law.

112. The rights of home shall not be violated.

Details are regulated by a law which is a part of this Constitution.

113. Liberty of press and the right to assemble peacefully and without arms, and to form associations is guaranteed. It is therefore illegal as a matter of principle to subject the press to censoring before publication. The manner in which the right of assembly and association shall be exercised is determined by laws.

An association may be dissolved only when its activity violates the criminal law or public peace and order.

The law may impose restrictions upon assemblies in places serving public traffic, upon the establishment of associations for profit and upon the participation of foreigners in political societies. In the same manner restrictions may be imposed upon the preceding guarantees in time of war or of domestic disorders which may menace substantially the republican form of government, the Constitution or public peace and order.

114. The right to associate for the protection and improvement of conditions of employment and economic interests is guaranteed.

All acts of individuals or associations which seem to amount to intentional violation of this right are prohibited.

115. The right of petition is inherent; legal persons and associations may exercise it only within their scope of action.

116. Secrecy of mails is guaranteed.

Details are regulated by law.

117. Every person may, within the limits of law, express his opinions by word, writing, press, picture, &c.

This applies to legal persons within their scope of action.

The exercise of this right shall not prejudice any one in his relations as employe of another.

118. Scientific investigation and publication of

its results, as well as art, is untrammelled as long as it does not violate criminal law.

119. Public instruction shall be so conducted as not to be in conflict with the results of scientific investigation.

120. Establishment of private schools is permitted only within the limits of laws.

The State administration shall have the supreme conduct and oversight of all instruction and education.

121. Liberty of conscience and profession is guaranteed.

122. No one may be compelled directly or indirectly to participate in any religious act; this does not apply to the authority of father or guardian.

All inhabitants of the Czecho-Slovak Republic have equally with citizens of the Czecho-Slovak Republic the right to practice in public or private any confession, religion or faith, as long as the practice is not in conflict with public order or good morals.

123. All religious confessions are equal before the law.

124. The performance of definite religious acts may be forbidden if they violate good order or public morality.

125. The marriage relation, family and motherhood, are under the special protection of the laws.

126. Every physically fit citizen of the Czecho-Slovak Republic shall submit to military training and obey the call to defend the State.

Details are regulated by law.

VI. Protection of National, Religious and Racial Minorities

127. All citizens of the Czecho-Slovak Republic are fully equal before the law and enjoy civil and political rights, regardless of race, language or religion.

Difference of religion, faith, confession and language shall not be a handicap to any citizen of the Czecho-Slovak Republic within the limits of general laws, in particular with reference to access to employment by the State, to offices and dignities, or the pursuit of any occupation or profession.

Citizens of the Czecho-Slovak Republic may, within the limits of general laws, freely employ any language in private or commercial relations, in matters relating to religion, in press or any publications, or in public assemblies of the people.

This shall not affect rights which belong to the organs of the State in accordance with any present or future laws based on considerations of public order, safety of the State and efficient control.

128. The right to use a definite language in public offices is regulated by special law which forms a part of this Constitution.

129. In so far as citizens may, in compliance with general laws, establish, direct and administer at their own expense charitable, religious and social institutions, schools and educational institutions, all citizens, regardless of nationality, language, religion and race, shall be equal and may in such institutions freely employ their own language and practice their religion.

130. In cities and districts in which there lives a considerable fraction of Czecho-Slovak citizens of other than Czecho-Slovak language, children of such Czecho-Slovak citizens shall receive in public schools, within the limits of the general law governing education, suitable opportunity to be taught in their own tongue; but instruction in the Czecho-Slovak language may be made obligatory.

131. Wherever in cities and districts in which there lives a considerable fraction of Czecho-Slovak

citizens, belonging to religious, national and language minorities, definite sums are to be expended on education, religion or charity from public funds on the basis of State, municipal or other public budgets, such minorities are hereby guaranteed, within the limits of general regulations applicable to public administration, a proportionate share in the expenditure of such funds.

132. Principles set forth in Sections 130 and 131, especially the definition of the expression "considerable fraction," shall be carried out by special laws.

133. Every form of forcible denationalization is forbidden. Violation of this principle may be declared criminal by law.

CZECHS: Derivation of name.—Racial characteristics.—"The great struggle known as the migration of nations, forced the Slavs to imitate their neighbours by strengthening their organization. The Slavs of Bohemia were, at a time which it is difficult to determine, divided into tribes, each of which was ruled over by a chief named, voyvode. The voyvode of the most important of these tribes, the Cechs, a name which was gradually extended to all the Slavonic tribes in Bohemia—appears to have exercised a certain supremacy over the other voyvodes, and to have been known as the knez (prince). When some of the tribes increased in number, the voyvodes divided them into several zupa (districts), over each of which they appointed a zupan (chief). The voyvodes, as well as the supreme voyvode or knez, were elected by the members of their tribe; but this selection soon tended to become merely nominal, as it became established that the choice should be limited to members of certain powerful families. The knez or prince, as well as the voyvodes and zupans, seem to have united all civil and military authority in their persons. The prince was judge over the whole people, and the voyvodes and zupans acted in the same capacity with regard to their tribe or district. These same chiefs were also leaders in time of war."—F. Lutzow, *Bohemia, an historical sketch*, pp. 7-8.—"The Czechs are the westernmost branch of the Slavs, their name being derived, according to tradition, from that of a noted ancestral chief. . . . The advent is lost in antiquity; it is known, however, that they cremated their dead, and cremation burials in northeastern Bohemia and in Moravia antedate 500 B. C. Their invasions or spread southwestward, so far as recorded in tradition or history, were of a peaceful nature. . . . Notwithstanding the most bitter struggle for every right of their own, the Czechs have

extended a helpful hand to all other branches of the Slavs, in whose intellectual advance and solidarity they see the best guarantee of a peaceful future. They have extended their great organization Sokol, which stands for national discipline, with physical and mental soundness, among all Slav nations and they are sending freely their teachers over the Slav world. . . . The Czech of to-day is not wholly the Czech of the fifteenth century, and to a casual observer may appear to differ but little from his neighbors. Yet he differs, and under modern polish and the more or less perceptible effects of centuries of oppression, is still in a large measure the Czech of the old. He is kind and with a stock of native humor. He is musical, loves songs, poetry, art, nature, and fellowship. He is an intent thinker and restless seeker of truth, of learning, but no apt schemer. He is ambitious, and covetous of freedom in the broadest sense, but tendencies to domineering, oppression, power by force over others, are foreign to his nature."—A. Hrdlicka, *Bohemia and the Czechs* (*National Geographic Magazine*, Feb., 1917).—See also BOHEMIA: Its people and their early history; and CZECHO-SLOVAKIA.

DABISA OF BOSNIA. See STEPHEN II, king of Bosnia.

DACHTELFELD. See SAXONS: 772-804.

DACIA, DACIANS.—Ancient Dacia embraced the district north of the Danube between the Theiss and the Dneister. "The Dacians [at the time of Augustus, in the last half century B. C.] occupied the whole of what now forms the southern part of Hungary, the Banat and Transylvania. . . . The more prominent part which they henceforth assumed in Roman history was probably owing principally to the immediate proximity in which they now found themselves to the Roman frontier. [See also RUMANIA: B. C. 5th century-A. D. 1241.] The question of the relation in which the Dacians stood to the Getæ, whom we find in possession of these

same countries at an earlier period, was one on which there existed considerable difference of opinion among ancient writers; but the prevailing conclusion was that they were only different names applied to the same people. Even Strabo, who describes them as distinct, though cognate tribes, states that they spoke the same language. According to his distinction the Getæ occupied the more easterly regions, adjoining the Euxine, and the Dacians the western, bordering on the Germans."—E. H. Bunbury, *History of ancient geography*, ch. 20, sect. 1.

102-106.—Trajan's conquest.—At the beginning of the second century, when Trajan conquered the Dacians and added their country to the Roman empire, "they may be considered as occupying the

broad block of land bounded by the Theiss, the Carpathians, the lower Danube or Ister, and the Pruth." In his first campaign, 102, Trajan penetrated the country to the heart of modern Transylvania, and forced the Dacians to give him battle at a place called Tapæ, the site of which is not known. He routed them with much slaughter, as they had been routed at the same place, Tapæ, sixteen years before, in one of the ineffectual campaigns directed by Domitian. They submitted, and Trajan established strong Roman posts in the country; but he had scarcely reached Rome and celebrated his triumph there, before the Dacians were again in arms. In the spring of the year 104, Trajan repaired to the lower Danube in person, once more, and entered the Dacian country with an overwhelming force. This time the subjugation was complete, and the Romans established their occupation of the country by the founding of colonies and the building of roads. Dacia was now made a Roman province, and "the language of the Empire became, and to this day substantially remains, the national tongue of the inhabitants. . . . Of the Dacian province, the last acquired and the first to be surrendered of the Roman possessions, if we except some transient occupations, soon to be commemorated, in the East, not many traces now exist; but even these may suffice to mark the moulding power of Roman civilization. . . . The accents of the Roman tongue still echo in the valleys of Hungary and Wallachia; the descendants of the Dacians at the present day repudiate the appellation of Wallachs, or strangers, and still claim the name of Romûni."—C. Merivale, *History of the Romans*, ch. 63.

DACIA, merchant ship sold in December, 1914, by the Hamburg-American Line to an American citizen; was transferred to American registry, loaded with cotton and dispatched to Bremen; on February 27, 1915, was captured by the French, who declared the transfer illegal and held the ship as a prize.

DACOITS, armed bodies of robbers in India and Burma. The Dacoits of India, who were suppressed soon after the Thugs, were "robbers by profession, and even by birth." Dacoity "was established upon a broad basis of hereditary caste, and was for the most part an organic state of society. 'I have always followed the trade of my ancestors, Dakoitee,' said Lukha, a noted Dakoite, who subsequently became approver." The hunting down of the Dacoits was begun in 1838, under the direction of Colonel Sleeman, who had already hunted down the Thugs.—J. W. Kaye, *Administration of the East India Company*, pt. 3, ch. 3.—To be convicted of the crime of dacoity the band must consist of a membership of five or more criminals. In Burma the term was applied also to armed groups which maintained a guerilla warfare against England for some years after the defeat of the Burman army.

DAIMBERT, or **Dagobert** (d. 1107), archbishop of Pisa. In 1099 he was made patriarch of Jerusalem. See **JERUSALEM**: 1099-1131.

DAIMLER, Gottlieb (1834-1899), German inventor of internal combustion engine for motor vehicles. See **AUTOMOBILES**: 1885-1894.

DAIMYO, name given to territorial feudal lords in Japan. These noblemen were amalgamated with

other classes of the nobility on the abolition of feudalism in 1868. See JAPAN: 1641-1853.

DAIREN, Tairen, Taliwan, or Dalny, Manchurian port on the southern extremity of the Liao-tung peninsula, about twenty miles north of Port Arthur. (See JAPAN: Map.) At the conclusion of the Russo-Japanese War in 1895, Japan succeeded to the rights of Russia. Dairen is the customs port for all the leased territory held by Japan on the peninsula. The original name, Taliwan, was changed by the Russians to Dalny, and again, by the Japanese, to Dairen or Tairen, after the treaty of Portsmouth. "The city of Dairen had been laid out by the Russians, who invested many millions of roubles in town and harbor construction. The Japanese have continued to build upon the foundations laid by the Russians. Dairen now stands a beautiful and substantial city beside a thoroughly equipped harbor. Though a shipping and railway point, it has the appearance of neither. The port lies away from the city proper beyond a low promontory. The railway yards lie in a deep cut spanned by a handsome stone viaduct. The harbor is sheltered, and the docks have complete modern facilities. Vessels berth alongside granite docks, and railway trains run on the docks. Ample warehouses have been provided, and the bean mills are near at hand. The railway has extensive shops and has built a model town—a little apart from the city—for employees. The Chinese residential quarter is also away from the main city. There is an efficient tram system with more than twenty-five miles of track; and electric lights, water-works, sewers, etc., have been installed as a matter of course."—S. K. Hornbeck, *Contemporary politics in the Far East*, p. 276.—According to the Japanese census the population was 97,231 in 1918.

1898.—Lease to Russia. See CHINA: 1898 (March-July).

1899.—Declared a free port. See CHINA: 1899 (August).

1904.—Russian evacuation. See JAPAN: 1902-1905.

1915.—Japan desires further lease on Dairen. See CHINA: 1915.

1922.—Conference between Japan and the Far Eastern Republic.—Development work by Japanese continued.—"Japan asked the Far Eastern Republic to open negotiations at Dairen . . . to determine future relations and settle outstanding disputes between Japan and the Far Eastern republics. . . . The negotiations at Dairen dragged on with reports emanating from Japan from time to time that they were making progress, until the Washington Conference closed and Japan had ascertained the intentions of the Genoa Conference. Then they came to a deadlock, and the Dairen conference also adjourned."—C. R. Smith (*Asia*, August, 1922, p. 640).—"There is nothing in the recent development at Dairen which would indicate that the Japanese intend to evacuate the territory at the expiration of the Russian lease (in 1923). In 1915 they showed very plainly that they did not intend to evacuate. . . . Japan continues her development work at Dairen wholly regardless of the terms of the Russian lease."—H. K. Norton, *Far Eastern reflections* (*Contemporary Review*, Sept., 1922, pp. 308-309).

DAJJAL. See AMAIYA.

DAKAR, fortified seaport town of Senegal (see AFRICA: Map), seat of the Government General of French West Africa. It is connected by submarine cable with Brest, in France. Situated in the Gulf of Goree on the peninsula of Cape Verde, and directly opposite the islands of that name, Dakar occupies, as a naval station, an important strategic

position on the ship routes between Europe and South Africa and South America. Since 1862—the year of its foundation—the town has grown into a prosperous rail and shipping center; in 1887 it was created a French *commune*.

DAKOITEE. See DACOITS.

DAKOTA TERRITORY.—The name Dakota, derived from an Indian word meaning "allied," was first used to designate a group of tribes inhabiting the northern reaches of the Mississippi and the Missouri basins. Rather loosely used at first to designate the whole of the Northwest, it was ultimately narrowed down to the territory which became the states of North and South Dakota. Since the earlier history of these two states is a unit, and their later courses, in many respects parallel, the whole region is best considered under one heading.

Aboriginal inhabitants. See HIDAATA.

1800-1805.—Exploration by Lewis and Clark. See U. S. A.: 1804-1805.

1803.—Embraced in Louisiana Purchase. See LOUISIANA: 1798-1803.

1806-1833.—Opening up of territory by fur-trappers and traders.—American Fur Trading Company.—"Soon after the explorations of Lewis and Clark, American traders and adventurers became induced to penetrate the wilderness and establish their posts to traffic in furs with the Indians. All their goods for the trade with the Dakota tribes were transported up the river in open boats, propelled by oars and wind, and 'cordalled' over the bars by means of long tow-ropes attached to the boats and drawn by men walking along the shore. . . . Pierre Choteau [of the American Fur Company] appears to have been the first man who ever ran a steamboat up the Missouri River into Dakota Territory, and under his pilotship the steamers *Antelope* and *Yellowstone*, in 1832 and 1833, were the first to plow Dakota's waters, and startle the tribes of the wilderness with the scream of civilization."—M. K. Armstrong, *Centennial address on Dakota territory*, pp. 4-5.

1834-1838.—Part joined successively to Michigan, Wisconsin, and Iowa territories. See WISCONSIN: 1805-1848.

1851-1859.—First treaties with the Indians and earliest permanent settlements.—Earliest pioneers west of Mississippi.—Surrender of Sioux lands.—First permanent settlements within limits of modern Dakota states.—"In the year 1851, the memorable treaty at Traverse-de-Sioux, Minnesota, between the United States and the upper bands of Dakota Indians, was consummated, by the provisions of which the Government became possessed of the first acre of land in Dakota, to which the Indians had relinquished their title. It embraced a strip of land in the upper valley of the Big Sioux River, covering the present towns of Sioux Falls, Flandreau, and Medary. In 1857, the Dakota Land Company, of St. Paul, Minnesota, and the Western Town Company, of Dubuque, Iowa, both established themselves at points on the newly-ceded lands in the Sioux River valley. At Sioux Falls a saw-mill was started, the first in the Territory, and in the following winter was published, at the same place, the first newspaper in Dakota. In 1858 the first house was built, on the present site of the city of Yankton. . . . In the fall of the same year a small band of pioneers from Minnesota located near Bon Homme Island, on the Missouri River. During the same season the town of Medary, on the Big Sioux River, was

burned by the Indians, and the place abandoned. In 1858, treaties were formed with the Yankton and Ponka Indians, by the provisions of which those two tribes ceded to the United States about sixteen million acres of land lying in the southern part of the Territory, and watered by the Big Sioux, Dakota, Vermillion, and Niobrara Rivers. For these lands, which comprised the choicest region owned by the Sioux nation of Indians, the United States stipulated to pay two million dollars in annual installments for fifty years. In July, 1859, the Yankton tribe of Sioux Indians commenced to abandon these lands, and to remove to their new reservation of four hundred thousand acres, opposite Fort Randall, on the east bank of the Missouri. Here begins the date of permanent settlement in Dakota, . . . and here we commence the history of Dakota's white race. Scarcely had the Indians removed from their old hunting-grounds before the white settlers began to enter the Territory and erect their western cabins for future homes. In 1859 the first white families settled in the present counties of Union, Clay, and Yankton." In 1859-60 the United States mail service was extended from Sioux City, Iowa, to Yankton, a distance of sixty miles, once a week.—M. K. Armstrong, *Centennial address on Dakota territory*, pp. 5-7.

1859-1862.—Organization of Dakota territory.—Petitions of inhabitants for territorial organization.—Establishment of territorial government.—Boundaries.—Early politics.—Services in Civil War.—Floods and prairie fires.—Economic progress.—“The pioneers of the Territory soon began to take steps to secure a Territorial form of government, and on the 8th of November, 1859, the first convention of citizens assembled at Yankton to petition Congress for a Territorial organization. . . . [It was not, however, until 1861 that a bill was passed. On March 2 of that year] President Buchanan approved the organic law giving to Dakota a Territorial government. The Territory being at that time so far removed from railroads and telegraphs, the news did not reach Yankton until eleven days after the passage of the law. Under its legally defined boundaries the new Territory of Dakota . . . thus established . . . extended from Iowa and Minnesota on the east to the summit of the Rocky Mountains on the west, and from the British possessions on the north to the Territory of Nebraska on the south. In the month of June, the Federal officers of the Territory arrived, and entered upon the discharge of their duties. . . . Politics now, for the first time, began to bewilder the brains of Dakota pioneers. Captain J. B. S. Todd had already published himself as an independent candidate for Delegate in Congress; and by a convention which assembled at Vermillion on the 1st of June, A. J. Bell had been put in nomination by the so-called Union party; but not until C. P. Booge had declared himself the people's candidate may Dakota be said to have embarked in the race for Congress. . . . Election came and passed; five hundred and eighty-five votes were cast in the Territory, of which Todd received three hundred and ninety-seven, Booge one hundred and ten, and Bell seventy-eight. The Board of Territorial Canvassers therefore issued to Todd the certificate of election as first Delegate to Congress from Dakota. The Legislature, which had been chosen at the same election, consisting of nine members of the Council and thirteen members of the lower House, was convened by the Governor at Yankton, March 17, 1862, and perfected its organization by the selection of J. H. Shober, President, and James Tufts, Secretary of the Council;

and George M. Pinney, Speaker, and J. R. Hanson, Chief Clerk of the House. A creditable code of laws for the Territory was enacted, the capital located by law at Yankton, and the Pembina Settlement given a representation of three legislators. The contest over the location of the capital grew so threatening that the Governor ordered a squad of armed United States soldiers into the House to prevent violence to Speaker Pinney. Pinney next day resigned, and J. L. Tiernon was chosen Speaker. During the winter of 1861-62, in the midst of the rebellion, the Secretary of War authorized the enlistment of Company A, Dakota Cavalry, which organization, consisting of ninety-six men, was mustered into the United States service, April 19, 1862, with Nelson Miner as captain; and in the following winter, Company B, Dakota Cavalry, consisting of eighty-eight men, was mustered into the United States service, with William Tripp as captain. In March, 1862, during the breaking up of the Missouri River, that great stream became gorged with ice below the mouth of Dakota River, and the waters were thrown over the banks, covering nearly the whole valley for sixty miles to Sioux City. The settlers were driven from their homes by the floods, and were obliged to flee to the high lands, with their families and herds, for safety. The preceding winter had been one of terrible storms and drifting snows, causing much suffering in the poorly-constructed houses of the pioneers, and in some cases death from freezing; while the great prairie fires of the previous autumn had brought much disaster to property and danger to life. The season of 1862 following, however, proved to be one of comparative prosperity to the husbandman; the harvests were bountiful, the immigration increased, and towns and villages sprang to view along the wooded streams. . . . During the fall of 1862, the first United States Land Office in the Territory was opened at Vermillion. Additional surveys of lands were made by the Government in Southern Dakota, and many new homesteads were made in the Territory.”—*Ibid.*, pp. 7-10.—The Homestead Act, passed in the same year, still further assisted in the settlement of the new country.

1862-1865.—Indian wars.—Uprisings of Sioux Indians.—Measures of defense among settlers.—Appearance of federal troops.—New settlers.—Dark prospects.—Return of peace and prosperity.—“On the 30th day of August, 1862, the inhabitants were startled by the alarming news that the Sioux Indians in the adjoining State of Minnesota had broken out in bloody war against the whites. . . . The Governor immediately issued a proclamation calling into armed service all citizens of the Territory subject to military duty, to protect the frontier homes and families against the expected attack of the red man's knife and tomahawk. The town of Sioux Falls was attacked by a war-party of Indians, two citizens murdered near the village, and the inhabitants driven from the place, and most of the buildings afterwards burned to ashes. Some four hundred citizens of the Territory responded to the proclamation of the Governor, and immediately . . . formed themselves into hastily-organized militia companies, furnishing their own firearms, subsistence, and clothing. Fortifications were speedily thrown up for protection of families in the principal towns, and all the farming settlements on the Missouri slope were quickly abandoned, some sending their women and children to the neighboring States for safety, while others took refuge in the stockades at the towns, to unite with the villagers in mutual protection. . . . At Yankton all inhabitants in the

surrounding country had assembled for defence within the barracks of the town. Within these rude walls the citizens remained under arms day and night until United States troops began to arrive, and the Indians had retreated. . . . The farmers then ventured back to their devastated homes, to gather a winter's subsistence from their damaged harvests and scattered herds. . . . [Two companies of] United States Cavalry were stationed for the winter among the settlements. . . . On the 3d of March, 1863, Congress erected the new Territory of Idaho out of the western portion of Dakota, comprising that region of the Rocky Mountains in which discoveries of gold had been made in the year previous, . . . and in May, 1864, the Territory of Montana was created out of Eastern Idaho and Western Dakota. . . . Thus in two years Dakota lost its richest mines and most populous sections, which were set off into Idaho and Montana. In Southern Dakota the spring of 1863 had opened with discouraging prospects to the settlers. The fear of a long and harassing Indian war was prevalent among the people. The settlements were again almost unguarded and defenceless; no military protection was afforded by the commander of the district until a daring murder was committed by a war-party of Indians on a public highway within three miles of the capital of the Territory, and whole settlements . . . had abandoned the Territory. . . . In June, 1863, the Government dispatched to the Territory two thousand mounted United States troops, under General Sully, who pursued and punished the Indians at the battle of Whitestone Hills, and afterwards returned to garrison the frontier settlements for the winter. Fort Sully was built and garrisoned as the most frontier military post in the Territory. During the same season the Santee and Winnebago tribes of Indians were removed from Minnesota and located in reservations in Dakota. . . . In June [1864] General Sully led his second military expedition through the Territory to punish the tribes which were still on the war-path. One of his steamers made the first trip up the Yellowstone River to near the mouth of the Big Horn, carrying supplies for the troops. His command consisted of about twenty-five hundred men, and, notwithstanding the fact that small detachments of troops were left in his rear . . . the United States mail stage was attacked upon the public highways, and a murder committed almost within signal-shot of a garrisoned station. A whole family of innocent and defenceless children were horribly butchered by the Indians at St. Helena, twelve miles below Yankton. The season of 1864 was a sad one for the settlements of the Territory. Not only did lurking bands of Indians hang upon the border for rapine and murder, but unremitting drouth and clouds of grasshoppers swept [away] the bloom of the fields and the verdure of the plains, and with the approach of autumn the despondent farmers repaired with their teams to the neighboring States, to bring in a supply to subsist their families until another harvest-time. The prospects for the future were truly discouraging, and many of the earliest settlers abandoned the Territory for the purpose of making homes elsewhere. . . . The spring of 1865 gave promise of a more prosperous year. The season proved a more favorable one for farmers, and their fields yielded remunerative harvests. Schools were established throughout the settled counties, and the erection of church buildings commenced in the principal towns. The Government [improved and opened] . . . wagon roads through the Territory to the mountains, and the first permanent bridges were built over the Big

Sioux, Vermillion, and Dakota Rivers. In June, General Sully led his third military expedition up the Missouri into the Indian country, and peace and safety generally prevailed throughout the inhabited counties of the Territory."—*Ibid.*, pp. 10-13.

1866-1870.—Peace with the Indians.—Congressional elections.—Immigration and economic development.—"With the opening of spring in 1866, the three-years' war with the Indians was declared at an end, and a Board of Peace Commissioners was sent out by the Government to form treaties of perpetual peace and friendship with the wild tribes of Sioux on the Missouri River. Governor Edmunds, of Dakota, was one of the Commissioners, and M. K. Armstrong, Secretary. The Commission left Yankton . . . in May, . . . [ascended the Missouri River and] spent nearly four months in holding councils and making treaties with . . . the wild tribes on the upper river. No serious Indian disturbances occurred in the Territory during the summer, and the inhabitants of the settled counties were generally favored with peace and prosperity. . . . During the years 1867 and 1868 . . . by steady and unceasing growth, new counties were organized, towns and villages took courage, immigration was renewed, the land surveys were extended into the Red River valley, and the Territory, . . . commenced its career of permanent and unmistakable progress. The first railroad to Sioux City, Iowa, was completed in 1868, near the eastern line of Dakota. The Union Pacific Railroad was also completed through Southwestern Dakota and the Territory of Wyoming, created therefrom by an act of Congress. Prior, however, to the separation of Wyoming from Dakota, the fifth Congressional election had been held in the autumn of 1868, whereat the united vote of the two Territories was four thousand six hundred and eighty-one. . . . The annual message of Governor Faulk to the Legislature that winter revealed a very satisfactory condition of the growth, prospects, and finances of the Territory. The Great Sioux Indian Treaty had been made, and the Black Hill country in Dakota set apart as a permanent reservation for the various tribes of Sioux. . . . The white population of Southern Dakota had increased forty-two per cent. Over one thousand farms had been located by immigrants under the homestead and pre-emption laws. The husbandman was rewarded with bountiful harvests, which found a ready market by the constant demand to supply the new Indian agencies and military posts on the upper river. . . . At the close of the year, the population of the Territory was estimated at twelve thousand inhabitants. With the opening of the season of 1869, immigration again commenced to fill up the southern counties and to locate upon the newly-surveyed lands. . . . Merchants and mechanics prospered, and the farmers were favored with abundant harvests, although in some localities the great prairie fires of autumn laid waste much valuable property in the way of unprotected homes and grain stacks. During the years 1869 and 1870 several attempts were made to secure the building of a railroad along the Missouri valley through the counties of Union, Clay, and Yankton. The line of road had been surveyed, and a mile or two graded near Elk Point, but no aid being given by Congress, the project was for the time abandoned. The first telegraph line in the Territory was built in the fall of 1870, leading from Sioux City, Iowa, to Yankton. Seven newspapers were published in the Territory, each Republican in politics. In October, 1870, came the sixth Congressional election [and M. K. Armstrong was elected delegate to Congress]. . . . The na-

tional census of 1870 showed the population of Dakota to be fourteen thousand one hundred and eighty."—*Ibid.*, pp. 13-15.

1871-1876.—Building of first railroads.—Economic development.—Immigration.—Survey of territory in 1876 showing growth and prosperity.—“During the succeeding years of 1871 and 1872 renewed endeavors were made to secure the building of a railroad from Sioux City to Yankton, and two hundred and fifteen thousand dollars, in eight per cent. twenty-year bonds, were voted as a gift to any corporation that would complete the road within twelve months. The Dakota Southern Railroad Company accepted the proposition, and before the close of the year 1872 the road was completed to Vermillion, and within two months thereafter, in the dead of winter, the iron rail was laid into Yankton, and the first train of cars rolled into the capital city, eleven years after the organization of the Territory. The Northern Pacific Railroad had also, during the same season, been pushed across the Red River of the North, and constructed one hundred and thirty miles into Dakota, and along its line the sites of the present towns of Fargo, Jamestown, and Bismarck were located. Much immigration had penetrated into the rich valleys of Northern Dakota in anticipation of the road. In Southern Dakota new settlements were continually spreading out up the valleys of the Sioux, the Vermillion, and the Dakota Rivers. The Winona and St. Peter's branch of the Chicago and Northwestern Railroad was constructed forty miles into Dakota, to the head-waters of the Sioux River. Over two hundred miles of railroad were built in the Territory during the year 1872. . . . With the opening of the year 1873 everything bid fair for a prosperous era in Dakota. The railroad to the capital had been completed, and with spring navigation the Government freights for the upper military posts and Indian agencies were shipped by rail to Yankton, and there transferred to steamboats to be transported up the river. . . . The season was propitious to the husbandman, and the yield of wheat and other grains was so large that, for the first time in the history of the Territory, considerable shipments were made to Eastern markets. In fact, during the two years of 1873 and 1874 grain-raising in Dakota was inaugurated as the principal feature of farming, and additional flourishing mills were erected in different parts of the Territory. With the gathering of the harvests of 1874 it became demonstrated that the soil and climate of Dakota rendered it one of the finest wheat-growing regions of the whole West, and the grain was eagerly sought in the Eastern markets. Immigration increased, the villages prospered, and schools and churches were numerous established in the newer counties of the Territory. The new forest-culture law of Congress had done much toward settling up the prairie counties, while the reliable discoveries of gold in the Black Hills by General Custer's army had attracted large numbers of miners into Western Dakota. In October came the seventh Congressional election in the Territory. Judge J. P. Kidder was nominated by the Republicans, and M. P. Armstrong was again run by the Democrats. There were nine thousand five hundred and eighteen votes returned, indicating a population of nearly fifty thousand people. . . . [In] 1876 we find Dakota emerging from her past chequered history of frontier wars and pioneer settlement, possessing a population of fifty thousand inhabitants, with a taxable wealth of twelve and a half million dollars, aside from a rich domain of ninety-two million acres of unoccupied lands and twenty-five thousand Indians. . . . Only three years ago

the first train of cars steamed into the Territory of Dakota; now there are three hundred and one miles of running railroad in the Territory, connecting with more than one thousand miles of navigable river. There are also six hundred and forty miles of telegraph line in operation, and two thousand four hundred and fifty miles of running mail routes, supplying one hundred and fifty-two post-offices."—*Ibid.*, pp. 15-17.

1876.—Great Sioux War. See U. S. A.: 1866-1876.

1882-1889.—Movement toward statehood and division of the territory.—Early proposals to divide the territory.—Division as a national issue.—North and South Dakota as states.—Difference in their character and economic interests.—“The fight for the division of the big territory into two began practically in 1871. The building of the Northern Pacific railroad had led to rapid settlement of North Dakota. In 1882 a mass meeting held at Fargo elected twenty-two delegates to proceed to Washington and urge upon Congress the importance and necessity for the division of the territory. Judge A. H. Barnes headed the delegation. The North Dakotans were defeated in their efforts at Washington by a delegation of South Dakotans who feared the division of the territory would delay statehood. The men from North Dakota returned home vowing that when South Dakota became a state, North Dakota would be her twin sister. The vow was fulfilled when the statehood bill was approved on Washington's birthday, 1889.”—Z. I. Trinka, *Out where the West begins*, p. 191.—See also U. S. A.: 1889-1890.—“The Democratic leaders declared for admission of Dakota territory as a whole, and the federal government used its influence to oppose the division movement in Dakota; therefore, a considerable party grew up in Dakota in opposition to division, but at every test the people pronounced strongly for two states. The population of Dakota was increasing rapidly, there were nearly six hundred thousand white citizens in the territory, and, under the territorial form of government, they were denied many of the privileges of citizenship. Yet year after year passed without action for their relief. The Republican national convention of 1888 made the division and admission of North and South Dakota a national issue and it was discussed from every platform in America. The Republican party prevailed in that election, and, before the close of the Congress then in existence, the bill for the division of Dakota territory and the admission of North and South Dakota was passed on St. Valentine's Day and approved on Washington's Birthday, 1889, and that bill provided that no acre of school land in South Dakota or North Dakota should ever be sold for less than the sum of ten dollars. A new constitutional convention met at Sioux Falls on July 4 of that year, with power only to amend and resubmit the constitution of 1885. The constitution was submitted to the people at an election on the first day of October. They approved it, and on the second day of November, 1889, President Harrison issued his proclamation, admitting South Dakota as a state in the Union. North Dakota was admitted as another state by the same proclamation. Statehood was welcomed by the people with real rejoicing. As a territory the people had no part in the election of a President, nor in the legislation by Congress, and all of the conditions of territorial life tended to make a people dependent rather than self-reliant. The chief concern of the people of Dakota, however, during

the ten years' fight for statehood, had been for the division of the territory into two states. In this they were moved by motives of the highest patriotism. The leaders of that period believed that it would be a crime for them to sit idly by and permit the great territory to become one state, with but two members of the United States Senate, thus entailing to posterity forever a sort of political vassalage to the small states of the eastern seaboard. Besides this there was at that period an inherent difference between the people of South Dakota and those of the North. South Dakota was chiefly occupied by homesteaders, who brought with them the conservative notions of small farmers, about public and private economy, morality, and education. On the other hand North Dakota was in the beginning chiefly settled by bonanza farmers, captains of industry, who came with large means, buying great areas of land and farming upon extensive lines. They and their camp followers were adventurous men whose traditions were entirely at variance with those of the homesteaders of the South, and the result was constant friction between the two elements. The progress of time, and new immigration to the western portion of North Dakota, has materially modified conditions there."—D. Robinson, *Brief history of South Dakota*, pp. 170-172.—See also NORTH DAKOTA; SOUTH DAKOTA.

DALLAS, Alexander James (1750-1817), American Secretary of the Treasury appointed by President Madison. See TARIFF: 1808-1824.

DALLAS, George Mifflin (1792-1864), American official and diplomat. Member of the Senate, 1831-1833; attorney-general of Pennsylvania, 1833-1835; minister at St. Petersburg, 1837-1839; vice-president of the United States, 1845-1849; minister at the Court of St. James's, 1856-1861.

DALMATIA.—A narrow strip of land running southward on the eastern side of the Adriatic, along the western coast of the Balkan peninsula, deeply indented by bays and including a number of small islands. For the most part the country is mountainous. The chief industries are fishing, wine growing, olive culture. Agriculture is still of the most primitive kind. The country is a treasure-house of Roman and medieval and Renaissance architecture especially at Nona, Sebenico, and the ruins of Salona, and Spalato where Diocletian built the great palace in which he spent his last years. Some three thousand people live within its walls to-day. The Duomo, once either a temple or a tomb, is said to be, next to the Pantheon at Rome, the best and most interesting example of a Roman temple in existence. "Dalmatia is a border country in the historical as well as the geographical sense. It once separated Greek and Latin, just as it subsequently divided Venetian and Magyar, Venetian and Turk, and in our own day Slav and Italian. Its eastern neighbours in the nature of things cannot but cast longing eyes towards its seaboard; yet no Power seeking supremacy in the Adriatic is easily disposed to forgo its possession."—*Dalmatia Handbook, Historical Section (British) Foreign Office*, p. 21.—See also BALKAN STATES: Geographical position.—"According to the 1910 census, out of a total population of 645,666, the Catholics in Dalmatia number 539,074 (538,101 Roman; 973 Greek); the Orthodox Church has 105,338 members; the Evangelical Churches (Lutheran and Calvinist) 322 and 253 respectively. About 80 per cent. of the Serbo-Croat population is said to be Catholic and 16 per cent. Orthodox."—*Ibid.*, p. 29.—See also BALKAN STATES: Map showing distribution of nationalities.

B. C. 1st century-A. D. 6th century.—Roman supremacy.—Attached to Eastern empire.—"The Romans brought the province of Dalmatia into being about 34 B. C., having gradually torn it from a shadowy kingdom of Illyria, whose inhabitants are said to have left descendants amongst the Albanian tribes; they planted it with colonies, of which Zara and Salona were the principal. In the dispositions of Diocletian and Constantine it formed a province of the diocese of Illyricum [see also ILLYRICUM OF THE ROMANS], and was subsequently, between A. D. 379 and 395, definitely attached to the Western Empire as part of West Illyria. With the break-up of the Western Empire it passed through the hands of Odoacer and the Goths, and was presently annexed by the Emperor Justinian to the Eastern Empire."—*Ibid.*, p. 21.—See also BATONIAN WAR; SALONA.

7th century.—Slavonic invasion.—"The Slavonic migrations of the seventh century created the problem which remains to this day. The Italian population fled to the seaport towns; and the eastern coast of the Adriatic became, in Freeman's phrase, 'a Slavonic land with an Italian fringe.' The fringe was not, however, continuous; at points the Serbo-Croats broke through to the sea. Not

only was the country subject to a dual political attraction—eastwards and westwards—but the barrier of the Dinaric Alps impeded her intercourse in the one direction in the same degree as did the Adriatic in the other. These facts dominated the vicissitudes of her subsequent history.”—*Ibid.*, p. 22.—See also SLAVS: 6th-7th centuries.

803.—Supremacy of Eastern empire over maritime parts of Dalmatia declared by treaty of Aix-la-Chapelle. See VENICE: 607-810.

9th-14th centuries.—From Charlemagne to rise of the Serbs.—Charlemagne, who received the submission of Dalmatia in 805, arranged by an agreement with the Emperor Michael in 812 that the coast towns should be subject to the Eastern Emperor, while the interior region was included in the Holy Roman Empire. Again, at the next stage, when the inland districts, after a brief subjection to Croatia (825-’30), had passed under Hungarian control and the seaboard had been brought within Venetian protection (994-’8) [see also BYZANTINE EMPIRE: 1081-1085; VENICE: 810-961], a fresh opposition arose between the Hungarian kingdom and the Venetian Republic, the one engaging the sympathies of the farmers and the inland merchants, and the other that of the seafaring folk of the coast. The contest continued with various fortune from the year 1102 [see also HUNGARY: 972-1116], when Coloman of Hungary is alleged to have been crowned King of Croatia and Dalmatia at Zara, to the fifteenth century, and was complicated by the rise of Serbia under Stephen Nemanja, who conquered southern Dalmatia in 1169, and the rise of Bosnia [see also BOSNIA: 1376-1391], under Stephen Tvrtko, who in 1389 established a fleeting dominion over Dalmatia, including the littoral between Fiume and Cattaro.”—*Dalmatia Handbook, Historical Section (British) Foreign Office, p. 22.*—See also HUNGARY: 1301-1442.

1420-1699.—Opening of Venetian period.—Extent of Venetian dominion.—Coming of the Turks.—“By 1420, however, thanks to the pressure of the Turks upon the Hungarians, the field was clear for Venice. How far the Republic extended her actual control is disputable; Prezzolini estimates that it did not reach beyond 50 kilometres from the coast, and this not uninterruptedly. Ragusa remained independent, and became . . . a centre of Dalmatian civilization, in which both the Italian and Slavonic elements participated. Then came the time, after Hungary had been finally disposed of at Mohács (1526), when Venice had herself to face the onslaught of Islam. Once more the division between the ‘mountain’ and the ‘shore’ asserted itself, the Turks being generally masters of the inland districts and the Venetians fairly secure in the possession of the greater cities of the coast. Strategic requirements drew Venice increasingly into the interior between 1647 and 1699.”—*Ibid.*, p. 22.—“The Treaty of Carlowitz (1699) gave her the ‘*novo acquisto*,’ the so-called ‘Mocenigo’ line—which ran through Knin, Vrljika, Sinj, Clissa, Vrgorac, Castelnuovo to Cattaro, but fell short of the Dinaric Alps.”—*Ibid.*, p. 23.—See also HUNGARY: 1683-1699; TURKEY: 1684-1696; USCOCKS.

1787-1797.—Treaty of Passarowitz.—Venetian rule.—“That farther frontier—the ‘Grimani’ line—which forms the boundary to-day, was obtained by the Treaty of Passarowitz (1718) and passed under the name of the ‘*novissimo acquisto*.’ It was, therefore, only between 1718 and 1797 that the whole province was in Venetian possession. . . . The province was ruled from Zara by a governor-general, who bore the title of *Provveditore Generale*. The ‘*Rettore*’ of Cattaro held the office of *Provveditore Straordinario*. ‘Count Veneti,’ as they

were called, who were directly dependent on the *Provveditore*, presided over the local magistracies.”—*Ibid.*, p. 24.

1797-1814.—Napoleonic episode.—Growth of nationality.—Transfer to Italy by Peace of Pressburg.—Illyrian Provinces.—“In 1797 Bonaparte extinguished the Venetian Republic. [See FRANCE: 1796-1797 (October-April); 1797 (May-October).] . . . The principle of nationality which the French Revolution had engendered was, however, struggling to life . . . and, after a fresh rupture with Austria had occurred, Napoleon, at the Peace of Pressburg in December, 1805, threw Dalmatia into a transitory kingdom of Italy, of which he was himself the sovereign. [See also GERMANY: 1805-1806.] His designs at this time included the possession of Cattaro, through which he hoped to acquire an influence upon the Porte. Austria consented to surrender it; but, before the surrender took effect, Russian troops from Corfu had occupied it. Pressure from Austria failed to dislodge them; and Napoleon consequently extinguished the Republic of Ragusa and seized the town as a substitute. The subsequent disasters of Austria . . . resulted in a new organization of the conquered territory. Dalmatia was incorporated in the ‘Illyrian Provinces.’ [See also GERMANY: 1809 (July-September).] This transitory creation consisted, besides Dalmatia, of Croatia, military and civil, Carniola, Istria, and Ragusa, and was placed under the government of Marmont, who showed great administrative energy. The coast-road from Zara to Spalato was made under his direction; brigands were suppressed; schools, primary, secondary, and technical, were established; and the civilizing activities of the Franciscan clergy received State countenance. The changes involved expenses and hardship, but were probably in the long run beneficial. The ‘Illyrian Provinces’ were, however, swept away in 1814. Under the pressure of British and Austrian forces the French were expelled from Dalmatia; and Austria recovered all, and more than all, that she had lost by the French Revolution.”—*Ibid.*, pp. 24-25.—See also WORLD WAR: Causes; Indirect; b, 1.

1807.—Boundary question settled by treaty of Fontainebleau. See FRANCE: 1807-1808 (August-November).

1814-1862.—Austrian restoration.—Education.—“The administration was reorganized in 1822, when the political privileges of the Dalmatian nobility were suppressed in favour of a bureaucracy. The mayors were appointed by the Austrian Minister of the Interior or the Emperor; and the communal councillors and delegates by the Prefect, or at his pleasure by a restricted body of electors. . . . Education, owing to the teachers’ college being Italian, remained until 1864 almost entirely Italian in character, though in 1862 twenty-three Slav primary schools existed, and in the 125 mixed schools religious, but no form of secular, instruction was given in Serbo-Croatian.”—*Ibid.*, p. 25.—See also AUSTRIA: Map showing Hapsburg possessions.

ALSO IN: E. A. Freeman, *Subject and neighbour lands of Venice*.—T. G. Jackson, *Dalmatia, the Quarnero and Istria*, ch. 1-2.—M. M. Holbach, *Dalmatia*.—G. Drage, *Austria-Hungary*.

1861-1914.—Constitution and its effects.—Growth of Slav education.—Jugo-Slav movement.—Effect of First Balkan War.—“In 1861, under the new federal Constitution, the Dalmatian Diet was organized on a curial basis—the electors, that is to say, were groups representing (1) land-owners; (2) chambers of commerce; (3) rural communes; (4) towns. The growing sense of na-

tionality probably rendered it impossible that this arrangement, even if it had been administered by the most honest Government, should have satisfied the parties interested. Italian sentiment was approaching maturity; Slav sentiment had come to birth. Present-day Italians and Slavs alike judge the Constitution by the effect it had upon their respective national prospects. . . . The Italians complain that they lost immediately the very substantial majority (30 out of 43) which they had possessed in the Dalmatian Diet, and subsequently predominance in the municipalities, so that at the present time Zara alone is controlled by an Italian corporation. The Serbo-Croats, on the other hand, point out how insufficient was the representation they obtained in 1861 to satisfy the democratic theories of 1914. They have a more impressive grievance in the fact that the project of union . . . was rejected by the Dalmatian Diet, packed, as they allege, by the Governor Mamula, a Croat from the Military Frontier Province acting under the instructions of the Imperial Government. Nor was the project put into effect in the Ausgleich settlements of 1867-8. [See also JUGO-SLAVIA: 1848-1867.] Hungary, which, under the provisions of 65 of the Nagonda (i.e., the Compromise of 1868 between Hungary and Croatia), had undertaken to promote the union of Croatia and Dalmatia, left the promise unfulfilled. . . . Meanwhile, increasing, if tardy, consideration was being given to the Serbo-Croats of Dalmatia. In 1866 some knowledge of the so-called 'Illyrian' language began to be required of Dalmatian officials; and in 1869 Dalmatian was permitted in the communications addressed by the communes to the administrative authorities, and in the conduct of criminal charges. In 1883 this privilege was extended to civil charges. In 1887 the obligation to use Serbo-Croatian was laid upon administrative authorities in their correspondence with Serbo-Croatian communes. Finally, in 1909, Serbo-Croatian was put on an equality with Italian; and the party which had initiated a cause gained the right of prescribing the language in which it should be conducted.

"The events of 1878, when Bosnia and Herzegovina were occupied, and of 1909, when they were annexed by Austria, affected the interests of Dalmatia. These provinces . . . formed the head without which Dalmatia was only a face; and their inclusion in Austria seemed calculated to strengthen . . . the link between Dalmatia and the Austrian Empire. [See also AUSTRIA-HUNGARY: 1909 (December).] But the Jugo-Slav Nationalist movement had, meanwhile, outstripped the concessions and manœuvres of the Imperial Government. The resistance of the Young Jugo-Slavs of Croatia to the Kuen-Hederváry régime had evoked sympathy in Dalmatia; and Dalmatian deputies to the Reichsrat were associated with deputies from Croatia and Istria in the Conference of Fiume in October, 1905. The question of the union of Dalmatia with Croatia was the pretext of the Conference and a principal feature of its conclusions, in which it was made a condition of the support to be given by the Croats to the Magyar Opposition. . . . A majority of the Dalmatian deputies to the Reichsrat, however, remained Austrophil. In 1907 the passage of the Austrian Universal Suffrage Act altered the system of representation in a democratic direction. A continued policy of repression in Croatia . . . produced another sympathetic agitation in Dalmatia in 1912, which was greatly stimulated by the victory of the Serbs at Kumanovo in the First Balkan War. These demonstrations were at first tolerated by the Government; but ultimately repressive measures, particularly in regard to the

press, were resorted to, and at Spalato and Sebenico the town councils were dissolved. M. Katalinić, the Mayor of Spalato, was tried for using treasonable expressions in a public speech, not in a Dalmatian court but at Klagenfurt, in spite of which circumstance he was acquitted. The fear that Austria would enter into hostilities with Serbia produced a protest on the part of all the Serbo-Croat party leaders at Zara against the alleged 'attempt of the Government to involve our people in a civil war'; and this temper of mind was widely diffused, notably among the students. It had not had time to subside when the European War broke out."—*Dalmatia Handbook, Historical Section (British Foreign Office, pp. 25-28.*—See also ADRIATIC QUESTION; BALKAN STATES.

1920.—Ceded to Jugo-Slavia by Treaty of Rapallo. See BALKAN STATES: 1921: Jugo-Slavia; RAPALLO, TREATY OF (1920).

DALNY, former name of Dairen or Tairen, a Manchurian seaport. See DAIREN.

DALRIADA.—"A district forming the northeast corner of Ireland and comprising the north half of the county of Antrim, was called Dalriada. It appears to have been one of the earliest settlements of the Scots among the Picts of Ulster and to have derived its name from its supposed founder Cairbre, surnamed Righfhada or Riada. It lay exactly opposite the peninsula of Kintyre; and from this Irish district the colony of Scots, which was already Christian [fifth century] passed over and settled in Kintyre and in the island of Isla, [establishing a Scottish Dalriada]."—W. F. Skene, *Celtic Scotland*, bk. 1, ch. 3.—See also SCOTLAND: 7th century.

DAMASCUS, chief town of Syria, capital of the vilayet of Syria, beautifully situated on a plain east of the Anti-Lebanon and southeast of Beirut. "No Scripture site is more surely identified than that of the ancient Damascus; and few possess a greater interest for the theologian, the historian, or the antiquary. It is unquestionably one of the oldest cities in the world, and is in many respects one of the most remarkable. It has outlived generations of cities, and has been a witness of the stir-

ring events of full four thousand years. It has in succession formed an important part of the most powerful empires of the world. The monarchs of Nineveh, Babylon, Persia, Greece, and Rome, have conquered it; and it has prospered under every dynasty, and outlived them all. No city in Syria, none perhaps in Western Asia, possesses such advantages in respect to situation as Damascus. At the eastern base of Antilibanus lies a plain having an elevation of about 2200 feet above the sea. The lowest ridge of the mountain-chain, a barren

its base on the south side being about twenty-eight miles long; its perpendicular on the east seventeen; and its hypotenuse, along the foot of Antilibanus, thirty-three. Its area is thus about *two hundred and thirty-six* square geographical miles.—J. S. Porter, *Five years in Damascus*, pp. 26-27.—See also CHRISTIANITY: Map of Palestine in the time of Christ.—The kingdom of Damascus, or "Aram of Damascus" as it was entitled, was formed soon after that Syrian region threw off the yoke of dependence which David and Solomon had imposed

DAMASCUS

© Underwood & Underwood

Showing the iron roof of the Bazar Hamidieh, which extends almost a mile through the city

line of chalky hills, runs from the foot of Hermon in a direction north-east by east, forming the north-western boundary of the plain. On its south side are two low ridges of hills called *Jebel el-Aswad* and *Jebel Maniā*, and in a narrow vale between them flows the river 'Awaj, the ancient *Pharpar*. Far away to the east may be seen a little group of conical hills, called the *Tellul*. If a line be drawn through these, north and south, till it meet the other sides, forming with them a triangle, the plain of Damascus will be circumscribed. That portion of it, however, which alone is inhabited and in part cultivated, is bounded on the east by the three lakes into which the 'rivers of Damascus' empty themselves. In form it is a rectangular triangle,

upon it. (See also JERUSALEM: B. C. 1400-700.) "Rezon, the outlaw, was its founder. Hader, or Hadad, and Rimmon, were the chief divinities of the race, and from them the line of its kings derived their names,—Hadad, Ben-hadad, Hadad-czer, Tabrimmon."—A. P. Stanley, *Lectures on the history of the Jewish church*, lect. 33.—"Though frequently captured and plundered in succeeding centuries by Egypt and Assyria, neither of those nations was able to hold it long in subjection because of the other. It was probably a temporary repulse of the Assyrians, under Shalmaneser II., by the Damascene general Naaman to which reference is made in 2 Kings v. 1: 'by him the Lord had given deliverance unto Syria.' . . . After the

great conquerors of Egypt and Asia, each in his day, had captured and plundered Damascus, it was taken without resistance by Parmenio for Alexander the Great [333 B.C.]. In it Pompey spent the proudest year of his life, 64 B.C., distributing at his pleasure the thrones of the East to the vassals of Rome. Cleopatra had received the city as a love-gift from Mark Antony, and Tiberius had bestowed it upon Herod the Great, before Aretas of Petra, the father of the princess whom Herod Antipas divorced for Herodias' sake, and the ruler whose officers watched the city to prevent the escape of Paul, made it, we know not how, a part of his dominions."—W. B. Wright, *Ancient cities*, ch. 7. —"At times before and after the commencement of Christianity it was occupied by Nabataean rulers, some of whom are known to us by inscriptions in Arabia. Christianity appears to have made way in the city at an early date, and probably long subsisted by the side of a mixture of Greek and Nabataean cults. A fresh era in its history was constituted by the Mohammedan conquest, especially when the founder of the Umayyad dynasty (661-750) made it the capital of an empire that steadily grew in extent. [See CALIPHATE: 632-639; 661; 763.] Since the termination of that period it has not been a metropolis, for even such sovereigns as Nur al-din acknowledged the suzerainty of the Caliph of Baghdad, while other rulers have been commissioned by the Sultans reigning in Cairo and Constantinople. Numerous rebellions have indeed been commenced at the Syrian capital, but their success has usually been temporary, and the independence of Syria rarely their ultimate object."—D. S. Margoliouth, *Cairo, Jerusalem and Damascus*, pp. 249-250.—See also BYZANTINE EMPIRE: 963-1025; COMMERCE: Medieval: 5th-8th centuries.

In the twelfth century Damascus was attacked and besieged by the Crusaders (see CRUSADES: 1147-1149), but was taken by Nureddin in 1154, and afterward passed into the hands of Saladin (see SALADIN, EMPIRE OF). It was his headquarters in the wars with the Franks. In 1401, when the Egyptians were vanquished by Tamerlane, the city was ruled by the Mongol conqueror, who killed most of its citizens, and burned and sacked the town. (See TIMUR.) Rebuilt, Damascus was taken from Egypt by the Turks in 1516, retaken by the Egyptians under Ibrahim Pasha in 1832, and, with all of Syria, restored to Turkey by the allied powers in 1840. (See TURKEY: 1831-1840; also Map of Asia Minor.) In 1860 occurred an uprising of Moslems against Christians, with the massacre of more than 5000 Christian people. During the World War Damascus again became the scene of military activity. In May, 1916, Damascus was declared independent by the Sykes Picot agreement (later abrogated) with French and English spheres of influence. (See SYRIA: 1908-1921.) The city was entered by Australian mounted troops on the night of Sept. 30, 1918, and next morning was occupied by British and Arab troops. It was handed over for administration to the king of the Hejaz.—See also WORLD WAR: 1918: VI. Turkish theater: c, 13; c, 21.

DAMIANISTS, followers of Damian, the Monophysite patriarch of Alexandria in the sixth

century. The theory of the Damianists was similar to that of Sabellius, who held that God is One Person, but at the same time distinguished three different phases of His Being according to His "energies or modes." While this doctrine aimed to refute the Tritheists, it really led to the conclusion that there are four Gods and won for the Damianists the name of Tetratheites.

DAMIANUS (d. 303), patriarch of Alexandria, the founder of the Damianists. See DAMIANISTS.

DAMIETTA, town of Egypt. See CRUSADES: Map of Mediterranean lands after 1204.

1219-1220.—Siege, capture and surrender by the Crusaders. See CRUSADES: 1216-1220.

1249-1250.—Capture and loss by Saint Louis. See CRUSADES: 1248-1254.

1252.—Destruction by the Mamelukes.—"Two years after the deliverance of the king [Saint Louis], and whilst he was still in Palestine, the Mamelukes, fearing a fresh invasion of the Franks, in order to prevent their enemies from taking Damietta and fortifying themselves in that city, entirely destroyed it. Some years after, as their fears were not yet removed, and the second crusade of Louis IX. spread fresh alarms throughout the East, the Egyptians caused immense heaps of stone to be cast into the mouth of the Nile, in order that the Christian fleets might not be able to sail up the river. Since that period a new Damietta has been built at a small distance from the site of the former city."—J. F. Michaud, *History of the Crusades*, bk. 14.

DAMLOUP, redoubt and village on east bank of Meuse, near Verdun, France; during the World War, it was captured, in June, 1916, by the Germans, immediately recovered and again captured; but held by the French in November, 1916. See WORLD WAR: 1916: II. Western front: b, 15.

DAMNONII, or Damni. See DUMNONII.

DAMOISEL, damoiselle, or Donzello.—"In mediæval Latin 'domicella' is used for the unmarried daughter of a prince or noble, and 'domicellus,' contracted from 'domnicellus,' the diminutive of 'dominus,' for the son. These words are the forerunners of the old French 'damoisel' in the masculine, and 'damoiselle' in the feminine gender. Froissart calls Richard, prince of Wales, son of Edward: 'le jeune damoisil Richart.' In Romance the word is indifferently 'damoiseil' and 'danzel,' in Italian 'donzello.' All of these are evidently titles under the same notion as that of child and 'enfant,' of which the idea belongs to the knights of an earlier period."—R. T. Hampson, *Origines patricie*, p. 328.

DANCING: Its relation to music. See **MUSIC:** Primitive.

DANCING MANIA.—"The effects of the Black Death had not yet subsided, and the graves of millions of its victims were scarcely closed, when a strange delusion arose in Germany. . . . It was a convulsion which in the most extraordinary manner infuriated the human frame, and excited the astonishment of contemporaries for more than two centuries, since which time it has never reappeared. It was called the dance of St. John or of St. Vitus, on account of the Bacchantic leaps by which it was characterized, and which gave to those affected, whilst performing their wild dance, and screaming and foaming with fury, all the appearance of persons possessed. It did not remain confined to particular localities, but was propagated by the sight of the sufferers, like a demoniacal epidemic, over the whole of Germany and the neighboring countries to the north-west, which were already prepared for its reception by the prevailing opinions of the times. So early as the year 1374, assemblages of men and women were seen at Aix-la-Chapelle who had come out of Germany, and who, united by one common delusion, exhibited to the public both in the streets and in the churches the following strange spectacle. They formed circles hand in hand, and appearing to have lost all control over their senses, continued dancing, regardless of the bystanders, for hours together in wild delirium, until at length they fell to the ground in a state of exhaustion. They then complained of extreme oppression, and groaned as if in the agonies of death, until they were swathed in cloths, bound tightly round their waists, upon which they again recovered, and remained free from complaint until the next attack. This practice of swathing was resorted to on account of the tympany which followed these spasmodic ravings, but the by-standers frequently relieved patients in a less artificial manner, by thumping and trampling upon the parts affected. While dancing they neither saw nor heard, being insensible to external impressions through the senses, but were haunted by visions, their fancies conjuring up spirits whose names they shrieked out; and some of them afterwards asserted that they felt as if they had been immersed in a stream of blood, which obliged them to leap so high. . . . Where the disease was completely developed, the attack commenced with epileptic convulsions. Those affected fell to the ground senseless, panting and labouring for breath. They foamed at the mouth, and suddenly springing up began their dance amidst strange contortions. Yet the malady doubtless made its appearance very variously, and was modified by temporary or local circumstances. . . . It was but a few months ere this demoniacal disease had spread from Aix-la-Chapelle, where it appeared in July, over the neighboring Netherlands. In Liege, Utrecht, Tongres, and many other towns of Belgium, the dancers appeared with garlands in their hair, and their waists girt with cloths, that they might, as soon as the paroxysm was over, receive immediate relief on the attack of the tympany. This bandage was, by the insertion of a stick, easily twisted tight; many, however, obtained more relief from kicks and blows, which they found numbers of persons ready to administer. . . . A few months after this dancing malady had made its appearance at Aix-la-

Chapelle, it broke out at Cologne, where the number of those possessed amounted to more than five hundred, and about the same time at Metz, the streets of which place are said to have been filled with eleven hundred dancers. Peasants left their ploughs, mechanics their workshops, housewives domestic duties, to join the wild revels, and this rich commercial city became the scene of the most ruinous disorder. . . . The dancing mania of the year 1374 was, in fact, no new disease, but a phenomenon well known in the middle ages, of which many wondrous stories were traditionally current among the people."—J. F. C. Hecker, *Epidemics of the Middle Ages: dancing mania*, ch. 1.

DANTZIC, or Dantzig. See DANZIG.

DANUBE (Latin *Danubius*; German *Donau*; Slav *Dunai*; Magyar *Duna*), the second great river (after the Volga) in Europe, rises in the Black Forest in Baden and describes a serpentine course of 1740 miles through Germany, Austria, Hungary, Serbia, Bulgaria and Rumania into the Black Sea. See AUSTRIA: Geography.

B. C. 5th-A. D. 15th centuries.—First mention in history.—Early settlers.—Important medieval trade route.—Under Turkish rule.—"Herodotus (484-424 B. C.), the father of history, is the first authentic writer who makes mention of the Danube. In part IV ('Melpomene') of his history under the heading 'Dareios and Skythika' he writes as follows: 'The country of the Scythians is a flat plain, covered with grass, and well watered. It is crossed by rivers, as numerous as the graves in Egypt. I shall enumerate the most important of them, those which are directly accessible from the Pontus Euxinus [Black Sea]. First comes the Istros (Danube) with its five mouths. As far as I know, the Istros is the largest of all rivers, and is equally high both in Summer and in Winter. It is the greatest river in the country of the Scythians; it has numerous tributaries: Pyretos (Pruth), Tiarantos (Aluta), Araros ('Sereth'), Napolis (Jalomitza) and Ordessos (Ardjis) in Scythia; Maris (Maros) in the country of the Agathyrsiens; Atlas, Auras and Tibisis (Theiss) in the mountains of Hâmos (Balkan); Athyris, Noes and Artanes in Thrace; Kios in the mountain of Rhodope; in Illyria Brongos, and Karpis in the country of the Ombrikens. The Istros flows through the whole of Europe, from the country of the Celts, the most distant people in Europe.' . . . As we see, Herodotus is not quite true to fact with regard to the source of the river and its tributaries. . . . The Greek name Istros, probably comes from the colony Istros founded by the Greek state Miletos on the right bank of the Danube about the year 650 B. C. . . . Another Greek writer Strabo, in the year 25 A. D., mentions the Lower Danube as a waterway, and says that trade was carried on 'on one of the seven mouths of the Danube.' The Roman Emperor Trajan, by reason of his victories in Dacia [modern Rumania] . . . in 107 B. C. came into possession of the whole river, the upper part of which was called the 'Danube,' even before the Roman conquest of that territory. 'Danuvius' was called the God of this river, and there were found in Donaueschingen and in Aquincum (near Budapest) inscriptions, which prove the truth of this story. The Romans first of all used the Danube for strategical purposes. The region round about the source of the Danube was called 'Mons Abnoba' and there are authentic proofs in Tacitus' 'Germania' that the source of the river was well known to the Romans. The ruins of the Trajan high-road are still to be seen on the left bank of the Danube at the Iron Gates, between Bâziás and Orsova, as are also the remains of a Trajan slab in the Kazan-Pass, opposite Ogradena. Roman historians give Carnuntum, a town of considerable strategic importance near Vienna, as the centre of the Danube flotilla. . . . Both the history of international law and the history of navigation are unknown in the nomadic periods, following the overthrow of the Roman Empire. [During the first decade of our era the Danube had become throughout its entire length the northern boundary of that empire.] The first people to establish themselves on the banks of the Danube after the disorders caused by the nomadic wanderings, were the Avars, who were

driven out by Charlemagne in the 9th century. The Avars were succeeded by the Bulgarians who came from the banks of the Volga. They lived on friendly terms with Charlemagne, the Emperor of Franconia, and used the Danube as a commercial way, from the mouth of the Theiss to the Black Sea, until they were conquered by the Emperor Basilus II of Byzanz [Byzantium]. The greater part of the territory occupied by them was afterwards taken by the Hungarians, the last of the nomadic races in Europe. . . . Not only did they do nothing to hamper navigation on the Danube, but they even took part in it themselves. . . . That also German merchants devoted themselves to commerce in the 12th century, can be seen from coins bearing on this period, which have, at different times, been dug out of the earth. . . . As at that time the sea-way to India had not yet been discovered, the Danube played a great part in the world's trade, as it formed a connecting link with the Crimea. The historian Rogerius, who was secretary to the Hungarian King, Béla, when speaking of Pest, calls it the 'Portus Danubii,' as early as the 12th century. In the following century it received a staple-right. . . . To illustrate the state of civilization at that time it may be mentioned that the principal part of the profits was derived from the export of female-slaves to Turkey, while the trade in male slaves had been stopped in the 10th century. There were boatmen guilds also along the banks of the Danube; historical documents of such guilds in Pest are still extant. We have authentic proof that trade on the Bavarian and Austrian parts of the river was monopolized by guilds, just as on the Rhine, at that time. But it was not so on the lower Danube, where each Riparian State did the trade on its own part. (The Greeks were also privileged to trade on the Lower Danube.) . . . From the 13th to the 15th century trade on the Lower Danube and at its mouths was mostly in the hands of the Genoese, who were principally engaged in the export of grain from Moldavia. Caffa was their principal port. Nicephorus Gregoras narrates that the Genoese merchants allowed no one to trade there who was not in possession of a Genoese passport. . . . The Turks, having taken Constantinople [in 1453], were now threatening the riparian states of the Upper Danube, and all trade was at a standstill (the Genoese historian, Foliato, tells how the Genoese were driven away from the Danube by the Turks. Caffa was captured in 1476)."—H. Hajnal, *The Danube*, pp. 107-113.

17th - 19th centuries. — Navigation. — First steamship on the river.—"At the end of the 17th century, when the Turks had been driven back, trade on the Danube began to flourish anew. In 1671 the Levant Trading Co. was founded for the purpose of trading between Ulm and the East. The treaties of Carlowitz, Posarowitz [Passarowitz] and Belgrade changed the situation completely, and made the Danube free. It may be mentioned that the rapidity with which Prince Eugen brought his reinforcements down the Danube, was, in no small measure, the cause of the overwhelming defeat of the Turks. In this he was materially helped by foreign powers. Herr C. V. Suppan, one of the present [1920] directors of the Austrian Danube Steam Navigation Company, says that, in 1692, the French Admiral François Joseph de Fleury took part in the construction of war-ships in the Austrian capital. Baron Schweiger-Lerchenfeld also reports that in 1715, the English ship-builder, Daniel Davids, was invited to come to Vienna for the same purpose. According to B. Gonda the Hungarians, smarting no longer under the Turkish

yoke, used their part of the Danube for commercial purposes. They traded in rock-salt found in the mountains of Marmaros. It is not till the end of the 17th century that we read of regular passenger traffic on the Upper Danube. The ships used for this purpose were called 'Ordinärsschiffe' and conveyed passengers from Ulm to Pressburg. The voyage from Ulm to Vienna took about 10 days; and that from Vienna to Pressburg 8 hours. There were faster-sailing ships from Ratisbon to Vienna, but they were much dearer, costing 180 Florins. As it was much safer for people to travel by water than by land, these ships were greatly preferred, just as was the case with the 'Diligences' on the Rhine. We can easily understand that there was no up-passenger-traffic, because ships took six weeks from Vienna to Ratisbon. The Empress Maria Theresa (1740-1780) like her father, Charles, was an energetic patron both of sea and river navigation. She was instrumental in abolishing all illegal river duties in Hungary. . . . The son and successor of Maria Theresa, the Emperor Joseph II. (1780-1790), encouraged navigation, not only by statutes, but also by subsidies. His object was to capture the Wallachian and Moldavian trade, and in this he was greatly helped by his chancellor Kaunitz, who was in permanent correspondence with Baron Herbert Batheal in Pera [Constantinople] . . . for the purpose of developing the export of goods to the Orient through the Danube-Delta. . . . Joseph's foresight bore good fruit, for, after the Peace-Treaty of Sistow [Sistova, 1791], in 1796 the first Navigation Company in Hungary was formed by Royal Patent. Napoleon, realising the importance of the Danube, called it the 'King of Rivers,' and so aroused in the people the enthusiasm necessary for the further development of river trade. Besides having a map of the river drawn, he also established a flotilla on the Danube, which attracted universal attention. The first Insurance Company for Shipping was founded in 1807, in Pest. This company was, at the same time, a shipping concern, having its own ships. On the Lower Danube both rowing-boats and sailing vessels took part in the trade, whereas from the Iron Gates upwards only rowing-boats could be used. . . . It was decided to acquire a ship-building yard on the bank of the Danube in Erdberg (near Vienna) and to build a steam-ship of 60 H.P. under the superintendence of Messrs. Andrews and Prichard [a British firm], and to hire this ship, which was to be named after the Emperor Francis I., to Messrs. Andrews and Prichard. The company was called: 'First Austrian Danube Steam-Navigation Company' ('Erste österreichische Donau Dampfschiffabrt's Gesellschaft'). The privilege given to Messrs. Andrews and Prichard on the 1st of September, 1829, was transferred to the Company on the 17th of September, 1830, for Austrian waters, and, on the 22nd of April, 1831, for Hungarian waters. The trial trip of the Francis I. took place on the 17th of September, 1830. The secretary of the Company in his annual report to the shareholders covering the year 1830, speaks in glowing terms of the success of the trial trip: 'What we have seen with our own eyes, together with the opinion of the experts, confirms us in our belief that no vessel could be better constructed. The trip from Vienna to Pest in 14 and a half hours, and the return trip in 48 hours 20 minutes, a distance of nearly 500 kilometres (each way) is a proof both of the rapidity of the river and of the excellence of the vessel. . . .' Although the trial trip took place in September, 1830, a regular service of steamers was not introduced till February, 1831, and then only with one ship, Francis I. . . . An

energetic patron of the Danube trade appeared in 1832 in the person of Count Stephen Széchenyi. Széchenyi, the creator of the Academy of Science at Pest, the builder of the first permanent bridge between Buda and Pest, the pioneer of civilization in Hungary, the 'greatest Hungarian,' as he is called by his grateful posterity, was, at the beginning, an apathetic onlooker, but afterwards became a whole-hearted supporter of the movement. He was a great believer in British culture; he visited France, Belgium and Great Britain several times, and employed mostly British firms and British experts in carrying out his plans. His talents and achievements were acknowledged also by his government, which appointed him royal commissioner for navigation on the Danube."—H. Hajnal, *The Danube*, pp. 114-118, 124-127.—See also HUNGARY: 1825-1844.

1850-1916.—*Danube Commission (1856)*.—Later commissions.—"Before the Crimean War the commerce of the Lower Danube was greatly hampered by the quarantine regulations imposed by Russia, which since 1829 had practically usurped control of the river mouths by establishing a series of quarantine stations. Besides these restrictions, there were natural obstacles which hindered the trade of the Danubian states. Complaints were made, chiefly by Austria at first, but by others after the adoption of free trade by Great Britain stimulated grain shipments from the Danube, that Russia was not only doing nothing to dredge the silted channel, but that she was, on the contrary, aggravating the already bad conditions for the very purpose of hindering commerce on the Danube and increasing that of Odessa. Grain ships and other cargoes were continually shoaling on the river bed, which ever shifted with flood and drought. This meant lighterage, and gave a profitable business to river barges, manned chiefly by Greeks, who were regarded and denounced as pirates, and were charged with being in collusion with river pilots to run ships aground, and with stealing freely from the cargoes. But no redress could be had, and recrimination waxed ever more bitter until the Crimean War led to an adjustment.

"The suggestion to establish an international commission to free the river from impediments seems to have originated with Charles Cunningham, British vice-consul at Galatz, who in a report of September 30, 1850, proposed as one of several methods 'that the different nations interested in the navigation of the Danube should name Commissioners (as seems to be done on the Rhine), and the Commission to attend to the duties of clearing the Sulina,' a branch of the Danube delta. This suggestion was elaborated in a memorandum of the plenipotentiaries of Austria, France and Great Britain, addressed to Prince Gortchakoff of Russia, setting down certain fundamental principles. The second principle was thus stated: 'To give the freedom of navigation of the Danube all the development possible, it appears desirable that the course of the Lower Danube, from the point where it becomes common to two riverain states, should be withdrawn from the existing territorial jurisdiction. . . . In any case the free navigation of the river cannot be assured unless it is placed under the control of a syndical authority invested with the powers necessary to remove the now existing obstacles at the outlets of the stream, or which may form there later.'

"In the conferences to discuss these principles, Baron Prokesch-Osten, one of Austria's delegates, read a statement giving his views as to the best procedure. He proposed among other measures that the principles for international rivers de-

veloped at the Congress of Vienna be applied to the Danube from the point where the river becomes common to the two states, Austria and Turkey. . . . The agreements arrived at in the various sessions of the plenipotentiaries were embodied in a memorandum which, with some changes, became the basis of the article incorporated in the Peace of Paris [1856] at the close of the Crimean War."—E. Krehbiel, *European commission of the Danube (International Conciliation, Oct., 1918)*.—"The immediate problem in 1856 was to open, and to keep open, this great highway of commerce, and the most obvious difficulty lay in the fact that, whereas the upper waters flowed through the territories of three civilised European States, Würtemberg, Bavaria, and Austria-Hungary, fate and history had allowed an Asiatic Power, the 'malignant and turban'd' Turk, to bestride the lower river from the Iron Gates to the Black Sea. It is true that Russia, by seizing Bessarabia, had penetrated to one bank of the delta, and it is true that already in 1856 the Danubian empire of Turkey was breaking up into autonomous principalities, embryos of Roumania and the Balkan States. But the oriental administration of Turkey, and the deliberate policy of Russia, had combined to make the Lower Danube impassable for commerce, and the statesmen at Paris in 1856 knew well that no treaty would secure freedom of navigation below the Iron Gates if the execution of its terms were credulously entrusted to the riparian states. This was the immediate problem which the statesmen of Europe set themselves to solve in the Treaty of Paris, and, though the future dealt somewhat ironically with their solution, their outlook coloured the whole subsequent history of the Danube and even faintly colours some of the clauses of the treaties of 1919. They began by declaring that the principles of the Treaty of Vienna [1815] should in future apply to the Danube and its mouths, and that 'the navigation of the Danube shall not be subjected to any impediment or charge not expressly provided for by the stipulations contained in the following articles.' They then immediately applied themselves to the problem of opening the mouth of the river, and for this purpose they constituted an international body, the European Commission, consisting of representatives of Austria, France, Britain, Prussia, Russia, and Sardinia, to which they entrusted the duty of executing 'the works necessary, below Isaccea, to clear the mouths of the Danube.' This Commission was to be temporary, and a permanent Commission, composed of representatives of the riparian states (the Riparian Commission), was to prepare regulations for the navigation and police of the whole river, to cause necessary works to be executed in order to keep the river open to navigation, and to take over the mouth of the river after the dissolution of the European Commission. Such was the first attempt to solve internationally this problem; time has dealt ironically with the attempt, partly because the problem itself has become more and more complicated internationally."—L. Woolf, *Problem of the Danube (New Europe, Feb. 5, 1920, pp. 86-87)*.—"The passages in the Peace of Paris relating to the new joint agent may be summarized as follows: The European nations declare that the arrangement respecting the Lower Danube 'henceforth forms a part of the public law of Europe,' and is placed under their guarantee. The regulations of police and quarantine shall rest upon the basis of facilitating as much as possible the passage of vessels, and with the exception of these regulations no obstacle whatever shall be opposed to free navigation of the river by any of the nations concerned. The European Commission was

established by Article XVI: 'With a view to carry out the arrangements of the preceding Article, a Commission, in which Great Britain, Austria, France, Prussia, Russia, Sardinia, and Turkey, shall each be represented by one delegate, shall be charged to designate and to cause to be executed the Works necessary. . . . In order to cover the Expenses of such Works, as well as of the establishments intended to secure and to facilitate the Navigation at the Mouths of the Danube, fixed Duties, or a suitable rate, settled by the Commission by a majority of votes, may be levied, on the express condition that, in this respect as in every other, the Flags of all Nations shall be treated on the footing of perfect equality.'

"The Riverain Commission was created by Article XVII: 'A Commission shall be established, and shall be composed of delegates of Austria, Bavaria, the Sublime Porte, and Württemberg (one for each of these Powers), to whom shall be added Commissioners from the Three Danubian Principalities whose nomination shall have been approved by the Porte. This Commission, which shall be permanent: 1. Shall prepare Regulations of Navigation and River Police; 2. Shall remove the impediments, of whatever nature they may be, which still prevent the application to the Danube of the arrangements of the Treaty of Vienna; 3. Shall order and cause to be executed the necessary Works throughout the whole course of the River; and 4. Shall, after the dissolution of the European Commission, see to maintaining the Mouths of the Danube and the neighboring parts of the Sea in navigable state.'

"Article XVIII: It is understood that the European Commission shall have completed its task, and that the River Commission shall have finished the Works described in the preceding Articles, Nos. 1 and 2, within the period of two years. The signing Powers assembled in Conference having been informed of that fact, shall, after having placed it on record, pronounce the Dissolution of the European Commission, and from that time the permanent River Commission shall enjoy the same powers as those with which the European Commission shall have until then been invested.'

"As the subsequent relations of the European and the Riverain Commission are complex and confusing, it is worth while giving a summary at this point. The European Commission, consisting of representatives of the greater nations, was appointed for two years and was to install the works for opening the river. It was then to turn the management over to the Riverain Commission, composed of delegates of the states bordering on the river. The riverain states were eager to get the control of the river into their own hands, and the non-riverain states, loath to lose control, sought to keep the European Commission alive. In this they were successful, and despite strong insistence from the riverain states the Riverain Commission never came into power, and was presently wholly abandoned.

"The European Commission of the Danube, created by the treaty, and consisting of seven delegates, met and organized on November 4, 1856. It fixed its headquarters at Galatz, and appointed Charles Hartley chief engineer. Its position was as follows: It depended for funds on Turkey, which had agreed to advance them and had declined the participation of other nations; it had no basis for an opinion as to the best way to attack the river problem; it found river traffic paralyzed; it was expected to complete the opening of the stream in two years. . . . A comprehensive report of the chief engineer made on October 17, 1857, cleared up many . . . points, but not before objections were heard.

The technical advisers of the British government declared that the provisional works on the Sulina were merely money thrown into the sea, and the government twice telegraphed its commissioner to cause the work to be suspended. Having voted with his colleagues, these instructions placed the commissioner in a quandary between his national and his international duty. Legally he was clearly bound to execute . . . the mandate of his nation; morally he—and his nation—were bound by his vote as a commissioner. It later developed that three other governments had sent similar instructions to their delegates. Thus four out of seven sovereign nations had given an order to stop work, but the work went on by reason of the existence of the commission. The incident is a poignant illustration of the tendency of a joint agent of nations to determine the action of its constituents. Meanwhile, prolonged discussion on the branch to be developed went on without producing any agreement; and, the two years ending, it became necessary to refer the matter to the powers. In the conferences held by them, a sharp clash arose over the continuance of the European Commission beyond the period of two years provided by the treaty, Austria and Turkey, both riverain states spiritedly opposed lengthening its life. Long and heated discussion brought no agreement, and the five non-riverain Powers—finally supported by Turkey—resolved that the European Commission should finish the work it had begun. Austria entered reservation, but was helpless by virtue of the treaty stipulation that the European Commission could be dissolved by unanimous consent only. It is another illustration of the compelling force of an international joint agent that Austria did not exercise the right she undoubtedly possessed to withdraw from the whole affair.

"The conferences of the Powers on the opening of the river continued into 1860, when work was temporarily suspended because a railway from Tchernavoda to Constanza, begun with British capital, threatened to compete with river trade. The unexpectedly satisfactory results yielded in the interval by the provisional works on the Sulina led to a decision to make those works permanent. Accordingly the seven powers through their plenipotentiaries issued the Public Act of November 2, 1865. By this the European Commission of the Danube was charged, to the exclusion of any interference, with administering, maintaining and developing the works on the river, and was given power to settle the question of the channels to be chosen. In ratifying this convention the Powers proposed to extend the life of the European Commission for an additional five years. This was eventually approved, Russia, in accepting, stating that this period should be the outside limit not to be exceeded in any case. In 1871, at the expiration of the five years, the Powers, viewing the circumstance that the commission had contracted loans for the period, lengthened its life for twelve years, or to April 24, 1883. In 1878, the Treaty of Berlin gave Rumania representation on the commission, and extended the jurisdiction of the body to Galatz. When the twelve years expired in 1883, a European conference continued the Danube Commission for a period of twenty-one years from April 24, 1883, and provided for an automatic renewal after that for periods of three years, subject to denunciation with a year's notice, at the expiration of any triennium. The jurisdiction of the commission was extended from Galatz to Braila. The Riverain Commission was not again brought into the discussion. Conformably to the terms of this arrangement, the commission has since 1904

been renewed by three-year periods. It outlasted the first years of the Great War, as is indicated by the appointment of a new commissioner by France in 1916 to succeed a deceased member."—E. Krehbiel, *European commission of the Danube (International Conciliation, Oct., 1918)*.

1856-1919.—International position of the Danube.—Reorganized by World War peace treaties.—"Article CIX of the Treaty of Vienna [1815] contains the Magna Charta of the freedom of international rivers; but it was not until forty years later in the Treaty of Paris [1856] that the Powers attempted to apply it to what is now, perhaps, the most important of international rivers, the Danube. The [World] war has once more raised, and changed, this old question of the international position of the Danube. Articles 346-53 of the Treaty of Versailles [1919] with Germany, and Articles 301-8 of the Treaty of Saint-Germain with Austria [1919], contain the skeleton of the solution adopted by the Paris Conference for this problem, but it is not possible either to understand or to explain the significance of this solution without some reference to the past. The international situation on the Danube and the international régime created by the Paris Conference [1919] are both new, but both have their roots in old treaties and in ancient history. People often speak of the 'internationalisation of the Danube' as the most successful experiment in international control. It is true that the Treaty of Paris created an international body, the European Commission of the Danube, which eventually established and maintained with great success a species of international government over a part of the river, but the whole river was never successfully internationalised and never subjected to international control. Article CIX. of the Treaty of Vienna, to which we have already referred, proclaimed that the navigation of international rivers 'along their whole course, from the point where each of them becomes navigable, to its mouth, shall be entirely free, and shall not, in respect to commerce, be prohibited to anyone'; but the Great Powers never succeeded in arriving at an agreement upon the method by which they might, upon the Danube, entrust the full carrying out of this principle to an international body, and one of the most important features of the new régime is that, if carried out, it will for the first time place the whole Danube under international control. The fact is that statesmen, though occasionally they embody general principles in the clause of a treaty, rarely act upon them; like most men and animals, they are content to take each difficulty as it comes and meet it empirically by the divine method known as 'trial and error.' That certainly is what they did with the difficulty of the Danube between 1856 and 1914. . . . Before 1856 there were only four riparian states whose commerce looked for its outlet to the Danube. In 1878 [Berlin Congress], when the next great international overhauling of eastern Europe took place, three new states, Roumania, Serbia, Bulgaria, whose economic and political life was intimately bound up with the river, had emerged, or were about to emerge, from that limbo of infant states, the Ottoman Empire. In 1919 the break-up of that other limbo, the Austrian Empire, has again added two new independent states—Hungary and Czechoslovakia—to the international complication of the problem. . . . The problem of the Danube still remained unsolved when the expert commission of the Paris Conference sat down to discuss it in 1919. And the war had made that problem both more acute and more complicated. The greater the number of independent states whose economic

life depends upon an international river, the greater is the necessity to ensure real freedom of navigation, and the greater is the difficulty of composing divergent interests and of eliminating irrelevant jealousies and hostilities. In the valley of the Danube an equitable and permanent settlement is peculiarly urgent, because the river is the great artery of the economic life of a vast region, and it is of the first importance that, in the conditions created by the war and the break-up of Austria-Hungary, it may not be used to constrict or kill the economic life of any particular state, but may be used as the chief instrument in reconstructing the international economic life of all the new states. The Paris Conference and treaties do not pretend to have arrived at a permanent settlement of the problem, but they have adopted a provisional arrangement which has some interesting features. The statesmen of 1919 return once more to the principle of 1815 and 1856, for they proclaim the Danube to be an international river from Ulm to the sea, and they therefore re-establish a principle which was certainly emasculated in 1878 and 1883. While they reduce the number and complication of the régimes applied to the river, they have not followed what might seem to be the logical course of applying to the whole river a single international régime. Their outlook is, as we said, still slightly coloured by the geographical and political conditions of 1856; they reconstitute the European Commission with jurisdiction up to Braila, and then, abolishing Austria-Hungary's special régime and rights at the Iron Gates, place the whole Danube between Braila and Ulm under the administration of an International Commission which is to consist of two representatives of German riparian states, one representative of each other riparian state and one representative of each non-riparian state represented in future on the European Commission. It should also be noted that 'as a provisional measure,' the European Commission is to consist only of representatives of Britain, France, Italy, and Roumania. This arrangement has the merit of at least simplifying the problem; the river is now subjected to two régimes only, and both of them recognize the international principle."—L. Woolf, *Problem of the Danube (New Europe, Feb. 5, 1920)*.—See also VERSAILLES, TREATY OF: Part XII: Sect. II: ch. 3.

1921.—Internationalization convention signed.—Danube Navigation Company.—British interests.—"The International Danube Conference appointed in accordance with the Peace Treaty to draw up the final regulations governing navigation on the Danube has concluded its labors. The Convention, which was signed at 4 o'clock to-day (July 23) at the Ministry of Foreign Affairs, provides for the institution for the Upper and Middle Danube of a commission which will examine the programme of works to be carried out on the river with a view to assuring uniformity of police regulations, and to fixing the taxes to be levied and the creation of a body destined to develop to the utmost the resources of the river. . . . Great Britain has already, in the Danube Navigation Company, a powerful grip upon the Danube, which will grow even stronger now that this company's vessels are running as far as Belgrade, while by the formation recently of a subsidiary Anglo-Rumanian enterprise the company can deal with traffic from Passau to the mouths of the Danube—from the Black Forest to the Black Sea. The fact that this company, which has absorbed the previous German, Austrian, and Hungarian companies, is under predominantly British control should be of great advantage to British commercial relations with all the Danubian

States, and should, if this advantage is properly realized, help British traders to resist the relentless striving of Germany to regain and even increase her old economic hegemony over these markets. These incorporated companies operate at the present day [1921] some 55 passenger steamers, 88 tug-boats, 19 ferry steamers, and 626 barges. In addition to controlling this formidable river armada the Danube Navigation Company has acquired a coal mine at Pecs—on the Hungarian-Yugoslav border—with an annual output of 650,000 tons, the Mohacs-Pecs railway, shipbuilding and repairing yards at Obuda, Korneuburg, Komarom, Orsova, and Ujpest, as well as a number of cranes, warehouses, and other plant. These figures alone suffice to show that a wonderful prize has fallen into British hands—a prize which, it may be said by one who followed the negotiations with some attention, was largely acquired owing to the desire of these riparian States to do business with Great Britain, and owing to the commercial prestige of this country. Not, of course, that the British company is going to enjoy a monopoly on the stately waters of the Danube. The Czecho-Slovaks themselves are determined to run vessels under their own flag. A certain number of such vessels are already in operation; more are on order, and more again will come into operation as soon as Mr. Hines, the American arbitrator, shall have finally divided up among the various Succession States the considerable flotilla which has survived from the days of the Dual Monarchy. There is nothing disquieting in such rivalry from friendly and allied peoples. The stream of the Danube is broad enough to bear many argosies, and when once the Danube Commission . . . shall have really got into its stride there is every prospect that the Danube, instead of being eagerly seized upon by the different States on the most flimsy pretext as a form of heaven-sent *chantage*, will become one of the very first commercial waterways of Europe. . . . This is not the place to go into all the many plans for exploiting the waterways of Central Europe, but a reference should certainly be made not only to the Danube-Oder Canal, the completion of which will be one of the duties of the Czecho-Slovak Government during the next few years, but also to the scheme for linking up the Elbe and the Danube. If this plan is realized it will be of supreme importance, not only to Czecho-Slovakia but to the whole of Central Europe, as it will bring about a system of direct transport from the North Sea and the Baltic to the Black Sea. All the preparations are now completed and certain sections of the route have already been finished. The last stages of this undertaking will not be complete for many years, but it is worth noting here that Bratislava [Pressburg] will be at one end of this gigantic link, since the Pardubice-Prerov canal connecting the Elbe and the Morava will join up with the Prerov-Bratislava canal. And thus one sees, in a general way, why the Danube Commission should have chosen Bratislava in preference to either Vienna or Budapest, as its home, and why the determination to make Bratislava a new Nijni Novgorod, an emporium for the wares of the Baltic and the Adriatic, for the products of Great Britain and Rumania, is no Utopian dream, but the practical scheme of an industrious, energetic, and far-sighted people."—*Times (London)*, July 25, 1921, p. 15

DARA, Battle of (529). See PERSIA: 226-627.

DARBAR. See DURBAR.

DARDANELLES: Situation.—Difficulty of navigation in ancient times.—Historical and commercial importance.—Dardanelles (the ancient Hellespont), the deep narrow strait whose surface current, flowing from the sea of Marmora southwestwardly into the Ægean sea, separates the small, hilly, barren peninsula of Gallipoli in Europe, from the historic, picturesque, fertile slope of the Troad, part of Turkish Brussa, in Asia Minor. With the sea of Marmora and the Bosphorous, or Strait of Constantinople, it connects the Black sea and its extensive Bulgarian, Rumanian and Russian hinterland, and its Caucasian and Anatolian littorals, with the great Mediterranean, and constitutes one of the most important channels of trade in the civilized world; it was long the sole

sea route linking Asia to the West.—(See also CONSTANTINOPLE: Map of the Dardanelles, etc.)—In former times “The Dardanelles and the Bosphorus were even more difficult to navigate than the straits of Gibraltar. Down both there flows a strong current accompanied generally by a high wind. In the Dardanelles or Hellespont, which is considerably broader and a little deeper than the Bosphorus, the current attains an average speed of nearly two miles an hour and a maximum of six; when Byron swam across at the narrowest point he covered four miles to make one. In the Bosphorus the average is as high as three. In the Hellespont the main difficulty was to pass the first corner by Cape Sigeum which Pisistratus occupied for Athens at the very beginning of her sea power; for here the current rushes out along the Asiatic shore with great velocity. . . . When boats were small they did not attempt to round the Cape, but disembarked in the small bay opposite the island of Tenedos and carried their goods over by land to the bay just round the corner. The hill of Troy is so placed as to command this land route, and its chieftains kept up the road and levied toll on all who used it. Once inside the strait modern sailing ships ‘work up in the eddy, taking care to tack short of the main current, which may be distinctly seen’, and, after the narrows, hugging the European shore to avoid the prevalent north wind, right up to Byzantium. Ancient ships did the same, except for the tacking, for they suffered from the additional inconvenience of not being able to sail in the wind.”—H. Zimmern, *Greek commonwealth*, p. 24.—Readers of Herodotus may recall that he concludes his history with the occupation of Abydos and the reduction of Cestos by the Athenians in 479 B. C., after the precipitate retreat of Xerxes across his celebrated bridge of boats with which he spanned the Hellespont. (See also BOSPORUS.) Since the Persian invasions of Greece and the invasion of Asia by Alexander the Great a century and a half later, through the long periods of Roman, Byzantine and Turkish history, the Hellespont occupied a most important strategic position in world affairs and may to-day even be said to rival the Suez and Panama canals, in commercial importance. The historic waterway forms the approach to Constantinople, the Golden Horn, the Bosphorus, and to the Russian and Turkish Black Sea ports; some 12,000 merchant ships pass through in the course of the year, carrying to and from the Turkish capital, Sevastopol and Odessa, Batum and Trebizond, the mouths of the Danube, the Dniester, the Dnieper and the Don. “When the Black Sea was Turkish entirely and no other nation possessed any part of its shore, when, indeed, it was a ‘closed sea’ in the view of international law; then, of course, the Straits were Turkish, even after the Black Sea was no longer a ‘closed sea’; and navigation through the Bosphorus was forbidden to foreign ships of war and merchantmen equally, and through the Dardanelles as well, by the Turkish government. By various treaties since 1774 Turkey . . . [however] agreed to the free navigation of the Dardanelles by merchant vessels.”—C. H. Stockton, *Outlines of international law*, p. 131-132.

1833-1914.—Turkish jurisdiction modified by Treaties.—“By the Treaty of Unkiar Skelessi, July 8, 1833 . . . Russia became the paramount power at Constantinople. Article I of this remarkable treaty enacted a defensive alliance between Russia and Turkey . . . [and a secret article added that] the Tsar ‘will not ask for that aid if circumstances should place the Sublime Porte under the obligation of furnishing it’. Instead, ‘the Sublime Ottoman Porte, in place of the aid which it is bound

to furnish [Russia] in case of need, according to the principle of reciprocity of the Patent Treaty, shall confine its action in favour of the Imperial Court of Russia to closing the Strait of the Dardanelles, that is to say, to not allowing any Foreign Vessels of War to enter therein under any pretext whatsoever’. This simply meant that if Russia was at war with any of the European Powers, the Dardanelles would be closed to all their war-ships, but that the Russian Fleet could pass freely to and from the Mediterranean.”—A. H. Oakes and R. B. Mowat, *Great European treaties of the nineteenth century*, pp. 166-167.—See also BOSPORUS: 1832-1878.—“By treaty with the principal European powers, in 1841, Turkey declared the maintenance of its old doctrine by which the entrance of foreign men-of-war into the Dardanelles and the Bosphorus was prohibited. This was agreed to by the participating powers, as was also the declaration of the Sultan that he reserves to himself the right to deliver firmans of passage for small vessels of war to be employed as stationary vessels for the various missions of foreign powers at Constantinople. He has also, as a matter of fact, given firmans of passage to vessels carrying crowned heads, and in one case to the [American] flag-ship with Admiral Farragut on board. By the treaty of London of 1871 the right of exclusion of men-of-war from the Dardanelles and the Bosphorus was again upheld, and at the same time the right of free navigation for merchantmen of all nations was confirmed. The United States was not a participating power in this case, but, without agreeing to the validity of the arrangement, it is respected by it. An additional power was given to the Sultan by the same treaty of London to open the strait in time of peace to vessels of war of friendly and allied powers, in case he should consider it necessary in order to secure the execution of the treaty of Paris of 1856 which closed the Crimean War. . . . Finally, it cannot be said that the straits leading to the Black Sea from the Mediterranean are closed to men-of-war, as a matter of legal principle, but specifically by the free determination of the European powers to continue to that extent the ancient state of things, as an engagement with the Sultan.”—C. H. Stockton, *Outlines of international law*, pp. 132-133.—The sultan has been successively bolstered up by Russia, by England and by Germany, and by the mutual jealousy of the European powers. (See also GERMANY: 1887.) The Dardanelles is defended by forts and mines and in modern warfare can easily be held against the most formidable fleets, as was shown in the Turco-Italian and Balkan wars, when the Italian fleet under Admiral Viale bombarded the outer forts in April, 1912, and the Greek naval force of Admiral Coundouriotis blocked the channel in October, 1913, but neither penetrated the strait. “In April and May, 1912, the Turks temporarily closed the Dardanelles. One of the largest markets in the world was thus shut off from the activities of the British shipowner. The grain of Russia was left to rot in the bins of the wharves of the Black Sea, and her loss amounted to millions of pounds. England lost £15,000 to £20,000 per day; Rumania, Bulgaria, Greece as much. British steamers, headed for the Black Sea, had to be diverted through the Suez Canal towards Indian markets, with the result of depressing freights from the East, and with a consequent further loss to the shipowner. The world was thus provided with a singularly clear and instructive object-lesson in International Political Economy. The Turk had sealed the straits and he awaited the result, while the nations looked helplessly on. . . . Lord Lansdowne, as one of the

trained observers who witnessed the plight of the 185 vessels anchored east and west of Constantinople on May 2, 1912, lost no time in deploring the financial losses involved. He remarked quietly to his colleagues in the House of Lords that 'sooner or later' the nations would have to decide to what extent a belligerent Power, controlling narrow waters which form a great trade avenue for the commerce of the world, was justified in entirely closing such an avenue in order to facilitate the hostile operations in which that Power might find itself involved. And, enlarging the inquiry to all its philosophic bearings, he observed: 'Just as public opinion in any country would be slow to tolerate arrangements under which a local trade dispute might have the effect of paralysing the whole industrial life of the country, so public opinion amongst the Great Nations would be slow to tolerate a state of things under which a local conflict involving only two Powers would be allowed to create such serious detriment and disturbance to the whole trading community of the world.' Thus, in Lord Lansdowne's view, the lesson taught by the Dardanelles experiment was that perhaps, after all, the life and death interests even of two nations must, in certain circumstances, be sacrificed to the interests of 'the trading community of the world.'—W. M. Fullerton, *Problems of power*, pp. 9-10.

1915.—Military operations in World War.—“In November, 1914, Turkey had entered the war on the side of Germany and Austria. . . . It almost completely cut off Russia from her western partners, making it very difficult for them to obtain her wheat, which they badly needed, and just as hard for her to receive from them the war supplies without which she could not long do much. [See WORLD WAR: 1914: IV. Turkey: c.] It was of the greatest importance that communications be opened up again by forcing the Dardanelles and afterward taking Constantinople. Moreover, this would not only assist Russia, but it would be a momentous success in itself, and bring to an end, perhaps, the German dream of mastery in the Balkans, and Asiatic Turkey. Therefore, in February, 1915, British and French warships attempted to force the Strait of the Dardanelles. [See WORLD WAR: 1914: IV. Turkey: j.] After severe losses they desisted, though it is said that victory was within reach if they had attacked again the next day. A great expedition [under Sir Ian Hamilton] was now sent out to take the positions which guarded the entrance, and in April a landing was effected on the Gallipoli Peninsula.”—E. R. Turner, *Europe, 1780-1920*, p. 552.

“The failure of the purely naval attack on the Dardanelles on March 18th (1915) had been followed by the military preparations and landing on April 25th, and the subsequent great military offensive on the heights of Gallipoli based on the port of Mudros, in Lemnos, forty miles away. [See also WORLD WAR: 1915: VI. Turkey: a.] By the end of July that offensive had failed. At this point in the development of events—at the end of July—Mr. Lloyd George now definitely again urged on his colleagues in the [British] Government to consider once more the plan of going to the assistance of Serbia as alternative to going further forward with the Gallipoli attack. At this time he was very busy with his munition campaign in the country. But on the few occasions when he was able to take part in the deliberations of the Dardanelles Committee his attitude always was—the Germans are going to break through Serbia as soon as they can; so either make certain of getting to Constantinople quickly, or consider whether you ought not to go to the assistance of Serbia with

all the strength you can command. The forces on Gallipoli were obviously the nearest available for such a rescue.”—H. Spender, *The prime minister, a life of Lloyd George*, p. 202.—“Athens [had] offered the whole Greek fleet and one Greek division for co-operation in the attack on the Dardanelles. But already the curt refusal of the previous overtures [in January] had driven the Allies to other designs; and the pro-Bulgarian influences in Russia were now very strong. Bulgaria was now astutely offering to lend her armies for an attack on Constantinople from the north-west while the fleets were hammering at the Straits. The old Russian Court Government, always fearful of Greek designs on Constantinople, leaned towards Bulgaria, and, now that a choice seemed possible, preferred Bulgarian help to Greek. . . . Bulgaria was, in fact, during that time making offers to both sides; she was, in vulgar language, waiting to see 'how the cat jumped.' For the moment, therefore, she became 'pro-Entente.' But immediately that the failure of the Dardanelles attack became apparent she swung back into the Teutonic orbit. The diplomatic situation was, as Lord Grey fairly claimed, 'overshadowed by the military.' . . . [But] a renewed attack on Gallipoli by way of Suvla Bay in August only resulted in a more tragic and wasteful failure. . . . The very enterprise which had already taken the place of the Serbian expedition became futile from the moment of the Serbian disaster. In the beginning of October the Turks had been running so seriously short of ammunition that success for our arms seemed near at hand. By the end of the month they were fully replenished. The enterprise became plainly impossible from the moment that Germany, having now, by the conquest of Serbia and the coming in of Bulgaria, achieved a direct route to Constantinople, could pour through as much ammunition and as many big guns as the Turks required for their defence. On December 10th began the withdrawal from that fatal peninsula, and on January 8th of the following year not a single British soldier remained on those blood-stained shores.”—*Ibid.*, pp. 191, 204-205.—“In all the war there was no more glorious and disastrous enterprise than this attempt to scale the barren, rocky mountains that guarded the strait. Even the drinking water had to be brought from a long distance, and numbers went insane from thirst. Many a heroic attempt was made, and the fighting went on all through the time when the Russians were being defeated to the north. One day Allied soldiers won to the top of the mountains and saw the blue waters of Marmora in the distance; but they were soon driven out. The Turks fought with stubborn courage until the Germans, having put Russia out of the way and destroyed Serbia, were coming to relieve them. Gallipoli was evacuated, and the troops thus withdrawn were taken to the Greek city of Salonica.”—E. R. Turner, *Europe, 1780-1920*, pp. 552-553.—A commission which was appointed to inquire into the cause of the failure of the operations issued an interim report in February, 1917, followed by a final report in November, 1919:—“The final report of the Dardanelles Commission was published on Tuesday. It deals in detail with the history of the campaign after March, 1915, and briefly summarizes Lord Cromer's interim report, which dealt with the origins and early actions of the expedition and which was published in February, 1917. The Commission finds that the government did not sufficiently consider the measures which were necessary to the success of such an expedition, especially in the matter of naval co-operation, and that they greatly under-estimated the difficulties of the enter-

prise, that having decided to undertake the expedition, the government found that an adequate concentration of troops and material would involve a limitation of our efforts on the Western Front; that after the first failure there was undue delay in deciding upon future action; that the plan of attack from Anzac and Suvla was open to criticism, and that the Suvla attack should have been more vigorously pressed. The commissioners commend Sir Ian Hamilton's gallantry, but they consider that he ought to have shown a more critical spirit after the first landing. . . . The commission says that partial failure of the water supply and of the medical services was due to the breakdown of the military plan. The final decision to evacuate was a right one."—*Spectator*, London, Nov. 22, 1919.—See also BOSPORUS: 1914-1918; WORLD WAR: 1915: VI. Turkey: a.

1920.—Provisions of the Turkish peace treaty.—"The navigation of the Straits, including the Dardanelles, the Sea-of Marmora, and the Bosphorus, is to be open in future both in peace and war to every vessel of commerce or of war and to military and commercial aircraft without distinction of flag. These waters are not to be subject to blockade, and no belligerent right is to be exercised nor any act of hostility committed within them unless in pursuance of a decision of the Council of the League of Nations. A 'Commission of the Straits' is established with control over these waters, to which both the Turkish and Greek Governments delegate the necessary powers. The commission is composed of representatives appointed respectively by the United States of America (if and when that Government is willing to participate), the British Empire, France, Italy, Japan, Russia (if and when Russia becomes a member of the League of Nations), Greece, Rumania and Bulgaria (if and when Bulgaria becomes a member of the League of Nations). Each power is to appoint one representative, but the representatives of the United States, the British Empire, France, Italy, Japan and Russia have two votes each, and the representatives of the other three powers one vote each. The commission exercises its authority in complete independence of the local authority, with its own flag, budget and separate organization. The commission is charged with the execution of any works necessary for the improvement of the channels or the approaches to harbors, lighting and buoying, the control of pilotage and towage, the control of anchorages, the control necessary to assure the execution in the ports of Constantinople and Haidar Pasha of the régime laid down in that part of the treaty relating to ports, waterways and railways and the control of all matters relating to wrecks and salvage and lighterage. In the case of threats to the freedom of passage of the Straits, special provision is made for appeal by the commission to the representatives at Constantinople of Great Britain, France and Italy, which powers, under the military provisions of the treaty, provide forces for the occupation of the zone of the Straits. These representatives will concert with the naval and military commanders of the allied forces the necessary measures, whether the threat comes from within or without the zone of the Straits. . . . For the purpose of guaranteeing the freedom of the

Straits all works, fortifications and batteries are to be demolished within a zone extending 20 kilometers inland from the coasts of the Sea of Marmora and of the Straits and comprising the islands of Lemnos, Imbros, Samothrace, Tenedos and Mitylene. The construction of similar works or of roads or railways suitable for the rapid transport of mobile batteries is forbidden; France, Great Britain and Italy have the right to prepare for demolition any existing roads and railways which might be utilized to this end, and to maintain such military forces within the zone as they may consider necessary; otherwise the zone is not to be used for military purposes. This provision does not exclude the employment of forces of Greek and Turkish gendarmerie which will be under the interallied command of the forces of occupation, nor the presence of the Sultan's bodyguard. Provision is also made for the acquisition of property or permanent works by the commission, the raising of loans, the levying of dues on shipping in the Straits, the transfer to the commission of the functions exercised within the waters of the Straits by the Constantinople Superior Council of Health, the Turkish Sanitary Administration and the National Life Boat Service of the Bosphorus."—*New York Times Current History*, July, 1920, pp. 717, 721.—The Turkish Peace Treaty was not handed to the Turkish delegates at Paris until May 11, 1920. As two governments were set up over the Turks, that of Mohammed VI at Constantinople under the control of the Allies, and that of the Nationalists, headed by Mustapha Kemal Pasha, at Angora, the original terms of the Treaty of Sèvres, though signed August 10, 1920, have been modified in an effort to reconcile the two factions, at the Near East Conference, held at London, February 21 to March 12, 1921, as follows:

"The Dardanelles and Bosphorus.—Further, in regard to the Straits, the Allies have in mind considerably to reduce the demilitarized zone, which would be limited:—(1) To the Peninsula of Gallipoli and the Marmora coast up to Rodosto; (2) On the Asiatic coast of the Dardanelles, from Tenedos to Karabigha; (3) On the two shores of the Bosphorus to a depth of 20 or 25 kilometers [12½ or 16 miles]; (4) To the islands commanding the Dardanelles, in the Ægean and the Marmora.

"Constantinople.—The Allies might also consent to the rapid evacuation of Constantinople, of the Ismid Peninsula, and to limit the allied occupation to Gallipoli and Chanak. They would also in these circumstances assent to the maintenance by Turkey of troops in Constantinople and to a Turkish right of free passage between Asia and Europe in the demilitarized zone of the Bosphorus."—*Ibid.*, May, 1921, p. 348.—Greece, however, contended for the original terms of the Treaty and waged war with Turkey, while the other powers apparently stood aside. Rumania asked for certain modifications in view of the action of the Near East Conference.—See also SÈVRES, TREATY OF: 1920: Part 3: Political clauses: The Straits.

DARDANI, an ancient tribe dwelling in Asia Minor. See TROY; ASIA MINOR: Greek colonies; AMORITES.

DAR EL BAIDA. See CASABLANCA.

DAR-ES-SALAAM (Harbor of Peace), "on the coast [of Africa] about 40 miles southwest of Zanzibar, is the principal commercial center, and the chief port of entry [of Tanganyika Territory, formerly German East Africa]. It is built on the northern shore of the landlocked bay, which forms a deep harbor nearly 5 miles long, with accommodations for at least a dozen large steamers. In many ways the town is modeled after a German city, and its most prominent features are its cleanliness and the orderly manner in which it is laid out."—*United States Consular Report*, 1914.—Dar-es-Salaam is the terminus of an important caravan route, and has a population of 21,000. During the World War it was bombarded by the British and surrendered to them on Sept. 3, 1916.—See also WORLD WAR: 1916: VII. African theater: a, 17, 18.

DARFUR, a country in East Central Africa, lying between Kordofan and Wadai. Has an area of 150,000 square miles, of which a great part is plateau 2000 or 3000 feet above the sea level. The chief towns are El-Fasher and Kober. For 400 years this country was ruled by a line of absolute sovereigns, the last of whom was defeated by the Egyptian army of conquest in 1874 and was made a part of the Anglo-Egyptian Sudan in 1875. In 1915 the British occupied El-Fasher and annexed the country to the Sudan. See SUDAN: 1914-1920.

DARIEN, a name formerly applied to the entire Isthmus of Panama, discovered by Columbus during his fourth and last voyage to the New World, 1502-1504 (see AMERICA: 1509-1511), but now confined to the forest-clad hill country lying between the Gulf of Uraba (also known as the Gulf of Darien) on the north and San Miguel on the south. (See also TIERRA FIRME.) Sir Francis Drake attacked the Spanish settlement here in 1572. In 1605 the Scottish parliament granted a charter to William Patterson to found a Scottish "Colony of Darien" on the isthmus; the venture proved a failure, and the settlement was abandoned in 1700. See also SCOTLAND: 1695-1699.

DARINI. See IRELAND: Tribes of early Celtic inhabitants.

DARIUS, Family of. See ACHÆMENIOS.

DARIUS I, the Great, king of Persia, 558-486 B. C., following a successful revolt by the nobility against the usurping Magian, Gaumata, who had seized the throne after the death of Cambyses. His reign was long and generally prosperous. He died while preparing a new expedition against Greece to revenge the defeat of his army at Marathon.—See also GREECE: B. C. 500-493; Rising of Ionians of Asia Minor against Persians; B. C. 402-401; and B. C. 490; B. C. 480; Persian Wars: Thermopylæ; PERSIA: B. DARLING DOWNS. See AUSTRALIA: 1787-1840.

DARMSTADT, city in Germany, located between the Rhine and the Main, northwest of the Odenwald and 17 miles south of Frankfort-on-the-Main. It was in existence in the 11th century. In the 14th century it was still a village and in the possession of the counts of Katzenelnbogen. In 1479 it passed into the possession of the House of Hesse. In the Schmalkaldic War it was captured by the imperial army. At the death of Philip the Magnanimous, it was given to his youngest son, George, who made it his residence (1567). He was the founder of the Hesse-Darmstadt line. Darmstadt is the capital of the grand duchy of Hesse, and consists of an old and a new town. It has a library of 600,000 volumes and 40,000 manuscripts, a museum of Egyptian and German antiquities, and a picture gallery which has in its possession the "Madonna of the Burgomaster Meyer" by Holbein the Younger.—See also HESSE.

DARNLEY, Henry Stewart, or Stuart, Lord (1545-1567), second husband of Mary, Queen of Scots. See SCOTLAND: 1561-1568.

DARTMOOR PRISON, near Princetown in Devonshire, England, was erected in 1809 for the accommodation of French prisoners. In 1850 it was opened as a convict prison.

DARTMOUTH, a famous seaport and municipal borough of South Devon, England. Richard I, Cœur-de-lion, embarked here with his Crusaders for the Holy Land.

DARTMOUTH COLLEGE, Hanover, New Hampshire. See UNIVERSITIES AND COLLEGES: 1754-1769.

DAR-UL-HARB. See DAR-UL-ISLAM.

DAR-UL-ISLAM and DAR-UL-HARB.—"The Koran divides the world into two portions, the House of Islam, Dar-ul-Islam, and the House of War, Dar-ul-harb. It was generally been represented by Western writers on the institutes of Mahometanism and on the habits of Mahometan nations, that the Dar-ul-harb, the House of War, comprises all lands of the misbelievers. . . . There is even a widely-spread idea among superficial talkers and writers that the holy hostility, the Jehad [or Dhihad] of Mussulmans against non-Mussulmans is not limited to warfare between nation and nation; but that 'it is a part of the religion of every Mahometan to kill as many Christians as possible, and that by counting up a certain number killed, they think themselves secure of heaven.' But careful historical investigators, and statesmen long practically conversant with Mahometan populations have exposed the fallacy of such charges against those who hold the creed of Islam. . . . A country which is under Christian rulers, but in which Mahometans are allowed free profession of their faith, and peaceable exercise of

their ritual, is not a portion of the House of War, of the Dar-ul-harb; and there is no religious duty of warfare, no Jihad, on the part of true Mussulmans against such a state. This has been of late years formally determined by the chief authorities in Mahometan law with respect to British India."—E. S. Creasy, *History of the Ottoman Turks*, ch. 6.

DARWIN, Charles (1809-1882), English naturalist. First came into prominence from his voyage on board the *Beagle* which from 1831-1836 engaged in a survey of the South American coasts, and important Atlantic and Pacific islands; 1839, published his "Journal of Researches"; 1840-1843, edited the Journal of the "Voyage of H. M. S. *Beagle*"; 1842, he advanced his theory of the origin of coral reefs, which is now generally held; 1858, he read two papers before the Linnæan Society, one by himself, the other by A. R. Wallace, both dealing with the theory of evolution, on which Darwin had been working for years; 1859, appeared "The Origin of Species by Means of Natural Selection or the Preservation of Favored Races in the Struggle of Life." This monumental work, and his "Descent of Man and Selection in Relation to Sex," which appeared in 1871, made such a profound impression that they may be said to have completely changed the trend of thought with relation to natural science and kindred subjects.—See also AGNOSTICISM; ENGLISH LITERATURE: 1832-1800; EVOLUTION: Historical development of the idea; and Darwin's theory of natural selection; Classification of theories.

DARWIN, Erasmus (1731-1802), English man of science and poet; grandfather of Charles Darwin. He was a keen observer of nature, and rendered many of his observations in verse; the principal of these is his "Botanic Garden" (1789); his most important scientific work is his "Zoonomia (1794-1796) in prose. In his "Origin of Species" Charles Darwin wrote of this work that "it is curious how largely my grandfather anticipated the views and erroneous grounds of opinion of Lamarck." His last work was "Phytologia or the Philosophy of Agriculture and Gardening" (1799), in which he expresses his belief that plants have sensation and volition.—See also EVOLUTION: Classification of theories.

DASTAGERD.—The favorite residence of the last great Persian king and conqueror, Chosroes (590-628), was fixed at Dastagerd, or Artemita, sixty miles north of Ctesiphon, and east of the Tigris. His palaces and pleasure grounds were of extraordinary magnificence.—E. Gibbon, *History of the decline and fall of the Roman empire*, ch. 46.

DAUN, Wierich Philip Lorenz, Count von, Austrian general. See ROME: Modern city: 1707.

DAUPHIN, an ancient title borne by the sovereigns of Vienne and of Auvergne. From this title was derived the name of the province of Dauphiné. This province finally became the possession of the dauphins of the Viennois, who carried three dolphins in their crests. In 1340 Humbert II, the last independent dauphin of the Viennois, sold the province to Philip VI of France, by whom it was transferred to Charles of Valois, his grandson and heir to the throne of France. The latter assumed the title of dauphin, and when in 1364 he ascended the throne as Charles V, he gave Dauphiné to his eldest son, who thereafter bore the title of dauphin, as did all succeeding eldest sons of the rulers of France. (See also DAUPHINÉ: 1340.) By extension the title was later conferred also upon the eldest sons of dauphins. The crown princes, or dauphins de France, were: Charles V; Charles VI; Charles de France (died 1386) and his brothers; Charles (died 1400); Louis (died 1415); Jean (died 1416); and Charles VII; Louis XI, and his son Joachim, who died in infancy; Charles VIII and two of his sons, both named Charles. Louis XII became king without having been a dauphin, while his two sons, who died in childhood, each bore the title, which passed next to the son of François I, also named François. Then followed as dauphins: Henri II, François II. Henri IV did not carry the title. Next came Louis XIII, Louis XIV, Louis (the *grand Dauphin*), who died 1711; Louis, duke of Burgundy (died 1712); his son, Louis, duke of Brittany, who died in the same year; Louis XV and his son Louis (died 1765); Louis XVI and his son Louis Joseph (died 1789); Louis Charles, duke of Normandy, known as Louis XVII; and finally, Louis Antoine, duc d'Angoulême, son of Charles X. The name of *false dauphins* is applied to several pretenders who represented themselves as the surviving son of Louis XVI, which son had died in 1705.

DAUPHINE (English spelling Dauphiny), old province of France. As early as the year 500 it was a part of the Burgundian domain. See BURGUNDY: 500.

877.—Part of the kingdom of Lothaire. See BURGUNDY: 843-933.

1032.—Part of the German empire. See BURGUNDY: 1032.

1349.—Acquired by Philip VI of France.—In 1349, Philip VI, or Philip de Valois, of France,

acquired by purchase from Humbert II, count of Vienne, the sovereignty of the province of Dauphiné. This principality became from that time the appanage of the eldest sons of the kings of France.—See also BURGUNDY: 1127-1378; FRANCE: Maps of medieval period: 1154-1360; and DAUPHIN.

Also in: E. Smedley, *History of France*, pt. 1, ch. 9.

DAVENANT, or D'Avenant, Sir William (1606-1668), English poet and dramatist. See DRAMA: 1660-1800.

DAVENPORT, John (1507-1670), Puritan clergyman, one of the founders of the New Haven colony, Connecticut. See CONNECTICUT: 1638; 1639.

DAVID, second king of Israel, according to traditional computation, ruled about 1055-1015 B. C.; according to some authorities his reign of forty years fell between 1033-903 B. C. or of thirty-two years between 1010-978 B. C. He was the youngest son of Jesse of Bethlehem, of the tribe of Judah. David is stated to have been thirty years old when he ascended the throne.—See also JERUSALEM: B. C. 2100-1400; 1400-700; JEWS: Kingdoms of Israel and Judah; ADULLAM.

DAVID I (1084-1153), king of Scotland, 1124-1153. See SCOTLAND: 1093-1153.

David II (1324-1371), king of Scotland, 1329-1371; son of Robert Bruce. See SCOTLAND: 1333-1370.

DAVID, Jacques Louis (1748-1825), French painter, foremost of the Classical school; studied in Rome at the height of the classical revival; painted many contemporary scenes and portraits, and also classical subjects (*Oath of the Horatii*, *Leonidas*); an active supporter of the Revolution and of Napoleon, he was exiled in 1815.—See also PAINTING: Europe (19th century).

DAVIDISTS, followers of David Joris, a Dutch ultra-enthusiast and Anabaptist of the Reformation period. Joris, who claimed to have visions, was hailed as a prophet in Oldenburg, eastern Friesland and the Netherlands, where after 1538 many of the Davidists were executed. The remarkable escapes of their leader gave rise to the belief that he could make himself invisible. His last years were passed at Basel where, under the name of John of Bruges, he lived as a respected citizen and apparently an orthodox churchman. It was not until 1559, three years after his death, that the deception was discovered. Joris was condemned as a heretic by the University of Basel, his body was exhumed and burned and his Basel adherents were forced to recant. Heresy trials of the Davidists in Holland and Hölstein, however, were not unknown late in the sixteenth century. The members of one or two other Christian sects were also called Davidists.

DAVIDSON, John (1857-1900), English poet, playwright and novelist. See ENGLISH LITERATURE: 1880-1920.

DAVIDSON, Thomas (1840-1900), member of the Fabian society. See SOCIALISM: 1883-1884.

DAVIGNON, Henri (1879-), Belgian foreign minister at the outbreak of the World War. See BELGIUM: 1914; World War; WORLD WAR: Diplomatic background: 24; 52; 61.

DAVILA, Enrico Caterino (1576-1631), Italian historian. See HISTORY: 24.

DAVILA, Miguel R., President of Honduras, 1908-1911. See CENTRAL AMERICA: 1911; HONDURAS: 1900-1915.

DAVILA, Pedrarias (1460-1530), Spanish governor of South America. See AMERICA: 1524-1528; COLOMBIA: 1499-1536.

DA VINCI, Leonardo. See VINCI, LEONARDO DA.

DAVIS, David (1815-1886), American jurist. Member of Illinois legislature and of state constitutional convention of 1847; judge of state circuit court, 1848-1862; justice United States Supreme court, 1862-1877; nominated for president on National Labor Reform ticket in 1872, but withdrew; member of the United States Senate, 1877-1883; president of the Senate in place of Chester A. Arthur, 1881-1883.

DAVIS, George Breckenridge (1847-1914), commissioner plenipotentiary to the second peace conference. See HAGUE CONFERENCES: 1907.

DAVIS, George Whitefield (1830-), military governor of Porto Rico. See PORTO RICO: 1808-1809 (October-October).

Report on civil government of Porto Rico. See PORTO RICO: 1808-1809 (August-July).

DAVIS, Henry Gassaway (1823-1916), American politician, delegate to second international conference of American Republics; Democratic candidate for vice-president of the United States in 1904. See AMERICAN REPUBLICS, INTERNATIONAL UNION OF: 1001-1902; U. S. A.: 1904 (May-November).

DAVIS, Isaac (1745-1775), American patriot. See U. S. A.: 1775 (April).

DAVIS, James John, appointed United States secretary of labor, 1921. See U. S. A.: 1921 (March): President Harding's Cabinet.

DAVIS, Jefferson (1808-1889), American statesman. Served in the Black Hawk War; member of Congress, 1845-1846; served with distinction in the Mexican War; member of the United States Senate, 1847-1851; 1857-1861; secretary of war under President Pierce, 1853-1857; president of the Confederacy, 1861-1865 (see U. S. A.: 1861 [February]: Adoption of a constitution; [April-May]; and [October: Virginia]); confined in Fortress Monroe, 1865-1867 (see U. S. A.: 1865 [April-May]); indicted for treason, 1866, but released in 1867.

DAVIS, John (1550-1605), English explorer. See ARCTIC EXPLORATION: 1527-1773.

DAVIS, John William (1873-), American diplomat and public official. Assistant professor of law at Washington and Lee University, 1896-1897; member West Virginia house of delegates, 1899; member United States Congress, 1911-1913; counselor American Red Cross, 1913-1918; solicitor-general of United States, 1913-1918; ambassador to Great Britain, 1918-1921.

DAVITT, Michael (1846-1906), Irish nationalist, the founder of the Irish Land League. See IRELAND: 1873-1879.

DAVOUT, Louis Nicolas, Duc d'Auerstädt and Prince d'Eckmühl (1770-1823), one of Napoleon's leading marshals. He took an active and successful part in many campaigns, including the victories from which his titles were derived; administered Poland (the grand duchy of Warsaw), 1807-1818; minister of war during the Hundred Days. See GERMANY: 1806 (October); 1806-1807; 1807; (February-June); 1812-1813; FRANCE: 1805 (March-December); also RUSSIA: 1812 (June-September); (September).

DAVY, Sir Humphry (1778-1829), English chemist. See CHEMISTRY: Modern: Lavoisier, etc.; CHEMISTRY, AGRICULTURAL; ELECTRICAL DISCOVERY: Electric lighting: 1810-1876; INVENTIONS: 19th century: Artificial light; and Liquefaction of gases; MEDICAL SCIENCE: Modern: 19th century: Discovery of anesthetics.

DAVY, Richard (fl. 1400-1402), English organist, composer, wrote the first *Passion* music.

DAWES, Charles Gates (1865-), American financier. Comptroller of the currency, 1897-

1902; director of the budget, June, 1921-June, 1922. See U. S. A.: 1921 (June); 1922 (June).

DAWES, Henry Laurens (1816-1903), American lawyer and politician. He was a member of the Massachusetts house of representatives, 1848-1849; member of the Massachusetts constitutional convention, 1853; member of United States House of Representatives, 1857-1875; and United States Senator, 1875-1893. From 1893 until his death in 1903, he was chairman of the Dawes' Indian Commission to the five civilized tribes. See INDIANS, AMERICAN: 1893-1899; OKLAHOMA: 1885-1887; 1893-1903.

DAWES, Thomas (1731-1809), American patriot, with Paul Revere from Lexington to Concord. See U. S. A.: 1775 (April).

DAWN MAN. See EUROPE: Prehistoric period: Earliest remains: Piltown man.

DAWSON AGREEMENT. See NICARAGUA: 1905-1911.

DAY, William Rufus (1849-), secretary of state during President McKinley's administration. (See U. S. A.: 1898 [April].) A prominent figure in the Spanish-American war; head of the American delegation at the peace conference which ended the war, justice of the Supreme Court of the United States since 1903; appointed commissioner for America on Claims Commission, 1922. See COPPAGE vs. KANSAS; U. S. A.: 1898 (July-December); GERMANY: 1922 (July-August).

DAY IN COURT.—This means the right of every natural or corporate person to be heard in court and have his case decided. The federal courts have declared some state laws void because they provided that corporations could not contest these laws in court without thereby forfeiting their charters.

DAY OF BARRICADES. See FRANCE: 1584-1589.

DAY OF DUPES. See FRANCE: 1630-1632.

DAY OF THE SECTIONS. See FRANCE: 1795 (October-December).

DAY OF THE SPURS. See COURTRAI, BATTLE OF.

DAYAKS, or Dyaks, wild tribes inhabiting Borneo. See BORNEO: 1865-1890.

DAYLIGHT SAVING MOVEMENT: Origin.—What is known as the daylight saving movement is said to have been first mooted by a builder in London, Mr. Willet, who suggested the possibility of securing a most important general advantage to the whole community by establishing a legal difference between summer and winter in the numbering of the hours. The proposition was to retain the standard clock time for all the year except between a given date in April and a given date in September, within which period the clocks should be set forward one hour, making six o'clock in the morning, for example, become seven. At first the proposition excited little but laughter; but the more it was considered the more advocacy it won. A bill to realize it was twice before Parliament (before 1914), failing to be passed, but gaining votes.

1916.—Adopted first in Germany.—Tried in other European countries.—Endorsed in United States.—“The ‘Daylight Saving’ plan, namely, of turning the clock forward an hour during the five summer months from the last Sunday in April to the last Sunday in September was first put into effect by Germany in the spring of 1916 as an emergency war measure. Immediately all of the other leading warring nations, except Russia, adopted the plan, as well as Norway, Sweden, Holland [Switzerland, Spain] and Denmark, on account of its great economic and other advantages.

. . . Trial [in 1916] in all of these countries resulted in such material benefits that not only all of the countries mentioned, but also Portugal, Australia, Iceland and Bermuda . . . enacted it for 1917. To ascertain the exact results of the trial, the British Parliament, the German Reichstag and the legislative body of Holland appointed investigating committees—each of which reported favorable results and recommended its permanent adoption. . . Early in May, 1916, after the adoption of the plan in Germany and other European countries, [Marcus M. Marks] organized the New York daylight saving committee, consisting of about two hundred leading men and women of New York city, to bring the movement to the attention of people throughout the country. Shortly thereafter, the plan was taken under consideration by many of the leading chambers of commerce throughout the country and its approval spread rapidly.”—M. M. Marks, *Daylight saving* (*National Municipal Review*, July, 1917).

1918.—Calder Daylight Saving Act.—Opposition.—The Calder Daylight Saving Act was passed by the Congress of the United States on March 21, 1918. It advanced standard time one hour between the last Sunday in March and the last Sunday in October. “The farmers of the United States are opposed in general and in a large majority to the daylight-saving plan tried out [during the] . . . summer [of 1918] and so generally approved in cities and towns. . . . The farmer objects to doing his early ‘chores’ in the dark. . . . Moreover, the plan throws his whole day more or less out of adjustment, for the farmer lives and works by the sun. Some rural workers have disregarded the time-change altogether and some report that they care very little for artificial time-standards, as they regulate their lives altogether by astronomical happenings. These, of course, do not strenuously object to the plan; they rather look upon it with indifference.”—*Literary Digest*, Feb. 1, 1919.

1919.—Repeal of national law in the United States.—During the summer of 1919 a rider was attached to the agricultural appropriation bill, repealing the daylight saving law. The president vetoed the bill. On July 14, the House voted, 243 to 135, to pass the bill over the president's veto. As this was not the requisite two-thirds vote, the attempt failed. In August, of the same year, the law was finally repealed over the president's veto by a vote of 223 to 101 in the House, and 57 to 19 in the Senate. “There are practically no opponents of daylight saving among the residents of municipalities. The opposition that caused Congress to repeal this health-giving measure over the President's veto was largely representative of rural districts.”—S. A. Weldon, *Let us have daylight saving* (*American City*, Nov., 1919.)

1921.—France and England.—“Clocks with three hands to show official time and the sun's time are the remedy suggested by former Premier Paul Painlevé for complaints which are growing in volume against the use of ‘Summer time’ in France. The fight is, as everywhere, between country and town. When ‘Summer time’ came into operation again some weeks ago, the clocks were all advanced one hour. Paris rejoiced in longer daylight and the economy of gas and electric light. But the complaints of the country grow in volume, and for next year there is promised the full strength resistance in the Chamber, led by Deputies from the agricultural and seaport constituencies. . . . While the country complains, it should be added that the towns of France and official departments would not give up Summer time without a struggle. Summer time will become effective in Great Britain

at 2 o'clock Sunday morning, when all the clocks in the United Kingdom will be set forward an hour. This will be the sixth year that the daylight saving schedule for the Summer months has prevailed in England."—*New York Times*, April 3, 1921.

DAYS OF WEEK: Origin of names. See MYTHOLOGY: Germanic: Identification of Germanic Gods, etc.

DAYTON, city and county seat of Montgomery county, Ohio, situated on the banks of the Miami River. The site was purchased by a party of Revolutionary soldiers in 1795 and laid out as a town the following year. It was incorporated in 1805 and named in honor of Jonathan Dayton (1760-1824), an American soldier and legislator. In 1841 it received a city charter. A disastrous flood occurred in the city on March 25, 1913. The following year Dayton adopted the city manager plan of municipal government.—See also CITY MANAGER PLAN OF MUNICIPAL GOVERNMENT: Dayton, Ohio; OHIO: 1913.

DEAD MAN'S HILL (Le Mort Homme), one of the hills west of the river Meuse in northeastern France. During the World War it was the object of a prolonged German attack in the spring of 1916, figuring in the battle of Verdun; was captured by the Germans on May 29 of that year and recaptured by the French on August 20, 1917. See WORLD WAR: 1916: II. Western front: b, 9; b, 14; 1917: II. Western front: f, 1; f, 2.

DEAD SEA, salt lake in Palestine, southeast of Jerusalem. Its principal tributary is the Jordan. It is forty-seven miles long, six to nine and a half miles wide, has no outlet and its surface lies 1292 feet below the level of the Mediterranean sea.—See also PALESTINE: Land.

DEADLOCKS.—"Deadlocks" were of frequent occurrence . . . [in the United States] legislatures. One of the most famous occurred in the Pennsylvania legislature in 1899, when on January 17, it began balloting for the purpose of selecting a successor to Senator Quay, cast daily ballots until April 19, and then adjourned the following day without having effected an election. A still longer and more notorious contest was waged in Delaware by Mr. J. E. Addicks, whose fight [for the United States senatorship] in the legislature lasted, with intermissions, from 1895 to 1903."—C. A. Beard, *American government and politics*, pp. 241-242.—In his first fight (1805) for the senatorship Addicks prevented H. A. Dupont's election. Three years later the fight between the two factions, the Addicks and the Dupont, was renewed and caused a deadlock in the Delaware legislature. Because of this the state was unrepresented in the Senate in 1808 and again in 1901 when Addicks caused another deadlock. "Deadlocks between the two houses of a state legislature are not uncommon, and sometimes last for several weeks. A frequent result of a deadlock over a bill is that it fails for lack of agreement; but a common way out is the appointment of a committee of conference from the two houses, which recommends some form of compromise."—A. B. Hart, *Actual government as applied under American conditions*, p. 132.

DEAF, Education for. See EDUCATION: Mod-

ern developments; 20th century: Education for the deaf, blind and feeble-minded: Deaf-mutes.

DEAK, Ferenz (Francis) (1803-1876), Hungarian statesman. See AUSTRIA: 1856-1868; 1866-1867; 1868.

DEAKIN, Alfred (1856-), Australian statesman, leader of the federal opposition, 1910-1913. Attorney-general in first commonwealth ministry, 1901-1903; prime minister, 1905-1908; 1909-1910; representative at the Imperial conference, 1907. See AUSTRALIA: 1903-1904; 1905-1906; 1908; 1909 (May-June); BRITISH EMPIRE: Colonial and Imperial conferences: 1907.

DE AMICIS, Edmondo (1846-1908), Italian writer. See ITALIAN LITERATURE: 1860-1914.

DEAN FOREST.—The "Royal Forest of Dean," situated in the southwestern angle of the county of Gloucester, England, between the Severn and the Wye, is still so extensive that it covers some 23,000 acres, though much reduced from its original dimensions. Its oaks and its iron mines have played important parts in British history. The latter were worked by the Romans and still give employment to a large number of miners. The former were thought to be so essential to the naval power of England that the destruction of the forest is said to have been one of the special duties prescribed to the Spanish Armada.—J. C. Brown, *Forests of England*.

DEANE, Richard (1610-1653), British general, admiral and regicide. Was an important military and naval officer of Cromwell, and signed the death warrant of Charles I.

DEANE, Silas (1737-1789), American ambassador at the French court. See U. S. A.: 1776-1778.

DEARBORN, Henry (1751-1829), American general. Secretary of war at the outbreak of the War of 1812. See U. S. A.: 1800-1801; 1812 (June-October); 1812 (September-November); 1813 (April-July).

DEARBORN, Fort, early frontier fort built on the site of Chicago in 1804-1805. The garrison and settlers were attacked in 1812 by the Indians and most of their number massacred, while the fort was destroyed. The fort was rebuilt in 1817 and finally demolished in 1856. See CHICAGO: 1812-1837.

DEATH, Brethren of, an order of black robed hermits in the thirteenth century. Their salutation to each other was, "Remember that you must die."

DEATH DUTY, or Inheritance taxes.—"Inheritance taxes, or 'death duties,' as they are called in England, also form a part of the fiscal system . . . [where the tax has been imposed since 1780]. Amendments have been made [in the laws] until the tax takes three forms: one on the general estate, one on the personal property, and one on real estate. The amounts are graduated and taxed at a progressive rate, ranging from 1 to 23 per cent. . . . The Australasian and Canadian provinces have followed the lead of the mother country, and are making extensive use of the tax with steeply progressive rates."—M. H. Hunter, *Outlines of public finance*, pp. 141, 333-334.—See also TAXATION: Local taxation in the United States.

Defeated proposal in Germany. See GERMANY: 1908-1909.

1918. See **WORLD WAR**: 1918: II. Western front: c, 33.

DEBORAH, prophetess and judge of Israel. See **Jews**: Israel under the judges.

DEBRECZIN, city of Hungary, referred to as "Protestant Rome." It was the scene of a battle in 1849. See **AUSTRIA**: 1848-1849; **HUNGARY**: 1847-1849.

DEBS, Eugene Victor (1855-), American social agitator. Member of Indiana legislature, 1885; president of American Railway Union, 1893-1897; imprisoned for contempt of court on a charge of violating an injunction, 1894; candidate for President of the United States on Social Democratic ticket, 1900; candidate for President on Socialist party ticket, 1904, 1908, 1912, 1920; convicted for violation of Espionage Act, 1918, and sentenced to ten years' imprisonment. Pardoned in 1921 by President Harding. See **ESPIONAGE ACT**: Trials; **LABOR STRIKES AND BOYCOTTS**: 1880-1900; **SOCIALISM**: 1874-1901; 1918-1919; Debs' trial; **U. S. A.**: 1894; Strike at Pullman; 1900 (May-November).

DEBT, Laws concerning: **Ancient Greek**.—At Athens, in the time of Solon (sixth century, B. C.) the Thetes—"the cultivating tenants, metayers and small proprietors of the country . . . are exhibited as weighed down by debts and dependence, and driven in large numbers out of a state of freedom into slavery—the whole mass of them (we are told) being in debt to the rich, who were proprietors of the greater part of the soil. They had either borrowed money for their own necessities, or they tilled the lands of the rich as dependent tenants, paying a stipulated portion of the produce, and in this capacity they were largely in arrear. All the calamitous effects were here seen of the old harsh law of debtor and creditor—once prevalent in Greece, Italy, Asia, and a large portion of the world—combined with the recognition of slavery as a legitimate status, and of the right of one man to sell himself as well as that of another man to buy him. Every debtor unable to fulfil his contract was liable to be adjudged as the slave of his creditor, until he could find means either of paying it or working it out; and not only he himself, but his minor sons and unmarried daughters and sisters also, whom the law gave him the power of selling. The poor man thus borrowed upon the security of his body (to translate literally the Greek phrase) and upon that of the persons in his family. So severely had these oppressive contracts been enforced, that many debtors had been reduced from freedom to slavery in Attica itself,—many others had been sold for exportation,—and some had only hitherto preserved their own freedom by selling their children. . . . To their relief Solon's first measure, the memorable *Seisachtheia*, shaking off of burthens, was directed. The relief which it afforded was complete and immediate. It cancelled at once all those contracts in which the debtor had borrowed on the security either of his person or of his land; it forbade all future loans or contracts in which the person of the debtor was pledged as security: it deprived the creditor in future of all power to imprison, or enslave, or extort work from, his debtor, and confined him to an effective judgment at law authorizing the seizure of the property of the latter. It swept off all the numerous mortgage pillars from the landed properties in Attica, leaving the land free from all past claims. It liberated and restored to their full rights all debtors actually in slavery under previous legal adjudication; and it even provided the means (we do not know how) of re-purchasing in foreign lands, and bringing back to a renewed life of liberty in Attica,

many insolvents who had been sold for exportation. And while Solon forbade every Athenian to pledge or sell his own person into slavery, he took a step farther in the same direction by forbidding him to pledge or sell his son, his daughter, or an unmarried sister under his tutelage—excepting only the case in which either of the latter might be detected in unchastity. . . . One thing is never to be forgotten in regard to this measure, combined with the concurrent amendments introduced by Solon in the law—it settled finally the question to which it referred. Never again do we hear of the law of debtor and creditor as disturbing Athenian tranquillity. The general sentiment which grew up at Athens, under the Solonian money-law and under the democratical government, was one of high respect for the sanctity of contracts. . . . There can be little doubt that under the Solonian law, which enabled the creditor to seize the property of his debtor, but gave him no power over the person, the system of money-lending assumed a more beneficial character."—G. Grote, *History of Greece*, v. 3, pt. 2, ch. 11.

Ancient Roman.—"The hold of the creditor was on the person of the debtor. The obligation of a debt was a tying up or binding, or bondage, of the person: the payment was a solution, a loosing or release of the person from that bondage. The property of the debtor was not a pledge for the debt. It could be made so by special agreement, though in the earliest law only by transferring it at once to the ownership of the creditor. Without such special agreement, the creditor whose debtor failed to pay could not touch his property. Even when the debtor had been prosecuted and condemned to pay, if he still failed, the creditor could not touch his property. He could seize his person—I speak now of the early law, in the first centuries of the republic—and after holding him in rigorous confinement for sixty days, with opportunities, however, either to pay himself or get somebody to pay for him, if payment still failed, he could sell him as a slave, or put him to death; if there were several creditors, they could cut his body into pieces and divide it among them. This extreme severity was afterward softened; but the principle remained long unchanged, that the hold of the creditor was on the person of the debtor. If the debtor obstinately and to the last refused to surrender his property, the creditor could not touch it."—J. Hadley, *Introduction to Roman law*, lect. 10.—"During the first half of the Samnite war [326-304 B. C.], but in what year is uncertain, there was passed that famous law [Poetilian law] which prohibited personal slavery for debt. No creditor might for the future attach the person of his debtor, but he might only seize his property; and all those whose personal freedom was pledged for their debts (*nexi*), were released from their liability, if they could swear that they had property enough to meet their creditor's demands. It does not appear that this great alteration in the law was the work of any tribune, or that it arose out of any general or deliberate desire to soften the severity of the ancient practice. It was occasioned, we are told, by one scandalous instance of abuse of power on the part of a creditor. . . . But although personal slavery for debt was thus done away with, yet the consequences of insolvency were much more serious at Rome than they are in modern Europe. He whose property had once been made over to his creditors by the prætor's sentence, became: *ipso facto*, infamous; he lost his tribe, and with it all his political rights; and the forfeiture was irrevocable, even though he might afterwards pay his debts to the full; nor was it even in the power

of the censors to replace him on the roll of citizens. So sacred a thing did credit appear in the eyes of the Romans."—T. Arnold, *History of Rome*, v. 2, ch. 32.

In England.—"Debt has been regarded as a crime by primitive society in every part of the world. In Palestine, as in Rome, the creditor had power over the person of the debtor, and misfortune was commonly treated with a severity which was not always awarded to crime [Levit. 25: 39-41, and 2 Kings 4: 1]. In this country [England] the same system was gradually introduced in Plantagenet times. The creditor, who had been previously entitled to seize the goods, or even the land of the debtor, was at last authorised to seize his person. In one sense, indeed, the English law was, in this respect, more irrational than the cruel code of the Jews, or the awful punishment [death and dismemberment or slavery—Gibbon, ch. 44] which the law of the Twelve Tables [Roman Law] reserved for debtors. In Palestine the creditor was, at least, entitled to the service of the debtor or of his children, and the slave had the prospect of an Insolvent Debtor's Relief Act in the Sabbatical year. Even the law of the Twelve Tables allowed the creditors to sell the debtor into slavery, instead of resorting to the horrible alternative of partitioning his body. But in England the creditors had no such choice. They had nothing to do but to throw the debtor into prison; and by his imprisonment deprive themselves of the only chance of his earning money to pay their debts. [See also COMMON LAW: 1285; 1657.] A law of this kind was intolerable to a commercial people. The debtor languished in gaol, the creditor failed to obtain payment of his debt. When trade increased in Tudor times, the wits of legislators were exercised in devising some expedient for satisfying the creditor without imprisoning the debtor. The Chancellor was authorised to appoint commissioners empowered to divide the debtor's property among the creditors. By an Act of Anne the debtor who complied with the law was released from further liability, and was practically enabled to commence life anew. In 1826, a debtor was allowed to procure his own bankruptcy [See also COMMON LAW: 1828]; while in 1831, commissioners were appointed to carry out the arrangements which had been previously conducted under the Court of Chancery. The law of bankruptcy which was thus gradually developed by the legislation of three centuries only applied to persons in trade. No one who was not a trader could become a bankrupt; the ordinary debtor became as a matter of course an insolvent, and passed under the insolvent laws. The statutes, moreover, omitted to give any very plain definition of a trader. The distinction between trader and non-trader which had been gradually drawn by the Courts was not based on any very clear principle. A person who made bricks on his own estate of his own clay was not a trader; but a person who bought the clay and then made the bricks was a trader. Farmers, again, were exempt from the bankruptcy law; but farmers who purchased cattle for sale at a profit were liable to it. The possibility, moreover, of a trader being made a bankrupt depended on the size of his business. A petitioning creditor in bankruptcy was required to be a person to whom at least £100 was due; if two persons petitioned, their debts were required to amount to £150; if more than two persons petitioned, to £200. A small shopkeeper, therefore, who could not hope to obtain credit for £200, £150, or £100, could not become a bankrupt; he was forced to become an insolvent. The treatment of the insolvent was wholly different from that of the bankrupt. The

bankruptcy law was founded on the principle that the goods and not the person of the debtor should be liable for the debt; the insolvency law enabled the person of the debtor to be seized, but provided no machinery for obtaining his goods. . . . Up to 1838 the first step in insolvency was the arrest of the debtor. Any person who made a deposition on oath that some other person was in debt to him, could obtain his arrest on what was known as 'mesne process.' The oath might possibly be untrue; the debt might not be due; the warrant issued on the sworn deposition as a matter of course. But, in addition to the imprisonment on mesne process, the insolvent could be imprisoned for a further period on what was known as 'final process.' Imprisonment on mesne process was the course which the creditor took to prevent the flight of the debtor; imprisonment on final process was the punishment which the Court awarded to the crime of debt. Such a system would have been bad enough if the debtor's prisons had been well managed. The actual condition of these prisons almost exceeds belief. Dickens, indeed, has made the story of a debtor's imprisonment in the Marshalsea ['Little Dorrit'] familiar to a world of readers. [See also COMMON LAW: 1838.] . . . The Act of 1813 had done something to mitigate the misery which the law occasioned. The Court which was constituted by it released 50,000 debtors in 13 years. [See also COMMON LAW: 1813-1843.] But large numbers of persons were still detained in prison for debt. In 1827 nearly 6,000 persons were committed in London alone for debt. The Common Law Commissioners, reporting in 1830, declared that the loud and general complaints of the law of insolvency were well founded; and Cottenham, in 1838, introduced a bill to abolish imprisonment for debt in all cases. The Lords were not prepared for so complete a remedy; they declined to abolish imprisonment on final process, or to exempt from imprisonment on mesne process, persons who owed more than £20, and who were about to leave the country. Cottenham, disappointed at these amendments, decided on strengthening his own hands by instituting a fresh inquiry. He appointed a commission in 1839, which reported in 1840, and which recommended the abolition of imprisonment on final process, and the union of bankruptcy and insolvency. In 1841, in 1842, in 1843, and in 1844 Cottenham introduced bills to carry out this report. The bills of 1841, 1842, and 1843 were lost. The bill of 1844 was not much more successful. Brougham declared that debtors who refused to disclose their property, who refused to answer questions about it, who refused to give it up, or who fraudulently made away with it, as well as debtors who had been guilty of gross extravagance, deserved imprisonment. He introduced an alternative bill giving the Court discretionary power to imprison them. The Lords, bewildered by the contrary counsels of two such great lawyers as Cottenham and Brougham, decided on referring both bills to one Select Committee. The Committee preferred Brougham's bill, amended it, and returned it to the House. This bill became ultimately law. It enabled both private debtors and traders whose debts amounted to less than the sums named in the Bankruptcy Acts to become bankrupts; and it abolished imprisonment in all cases where the debt did not exceed £20."—S. Walpole, *History of England from 1815*, v. 4, ch. 17.—In 1869 a new court of bankruptcy was established and imprisonment for debt abolished except in certain rare cases. The Bankruptcy Act of 1883 transferred the administrative functions of the court to the Board of Trade. The act was amended in 1890. In 1906 a committee

was appointed by the Board of Trade to investigate conditions of bankruptcy and debt. The committee found no dissatisfaction with the main features of the existing law, but recommended some minor changes.—See also BANKRUPTCY: Early development and general principles; and English bankruptcy.

In the United States.—"In New York, by the act of April 26, 1831, and which went into operation on March 1st, 1832, arrest and imprisonment on civil process at law, and on execution in equity founded upon contract, were abolished. The provision under the act was not to apply to any person who should have been a non-resident of the state for a month preceding (and even this exception was abolished by the act of April 25th, 1840); nor to proceedings as for a contempt to enforce civil remedies; nor to actions for fines and penalties; nor to suits founded in torts . . . nor on promises to marry; or for moneys collected by any public officer; or for misconduct or neglect in office, or in any professional employment. The plaintiff, however, in any suit, or upon any judgment or decree, may apply to a judge for a warrant to arrest the defendant, upon affidavit stating a debt or demand due, to more than \$50; and that the defendant is about to remove property out of the jurisdiction of the court, with intent to defraud his creditors; or that he has property or rights in action which he fraudulently conceals; or public or corporate stock, money, or evidences of debt, which he unjustly refuses to apply to the payment of the judgment or decree in favor of the plaintiff; or that he has assigned, or is about to assign or dispose of his property, with intent to defraud his creditors; or has fraudulently contracted the debt, or incurred the obligation respecting which the suit is brought. If the judge shall be satisfied, on due examination, of the truth of the charge, he is to commit the debtor to jail, unless he complies with certain prescribed conditions or some one of them, and which are calculated for the security of the plaintiff's claim. Nor is any execution against the body to be issued on justices' judgments, except in cases essentially the same with those above stated. . . . By the New York act of 1846, c. 150, the defendant is liable for imprisonment as in actions for wrong, if he be sued and judgment pass against him in actions on contracts for moneys received by him (and it applies to all male persons) in a fiduciary character. The legislature of Massachusetts, in 1834 and 1842, essentially abolished arrest and imprisonment for debt, unless on proof that the debtor was about to abscond. As early as 1790, the constitution of Pennsylvania established, as a fundamental principle, that debtors should not be continued in prison after surrender of their estates in the mode to be prescribed by law, unless in cases of a strong presumption of fraud. In February, 1819, the legislature of that state exempted women from arrest and imprisonment for debt; and this provision as to women was afterwards applied in New York to all civil actions founded upon contract. . . . Females were first exempted from imprisonment for debt in Louisiana and Mississippi; and imprisonment for debt, in all cases free from fraud, is now abolished in each of those states. The commissioners in Pennsylvania, in their report on the Civil Code, in January, 1835, recommended that there be no arrest of the body of the debtor on mesne process, without an affidavit of the debt, and that the defendant was a non-resident, or about to depart without leaving sufficient property except in cases of force, fraud, or deceit, verified by affidavit. This suggestion was carried into effect by the act of the legislature of Pennsylvania

of July 12th, 1842, entitled 'An Act to abolish imprisonment for debt, and to punish fraudulent debtors.' In New Hampshire, imprisonment on mesne process and execution for debt existed under certain qualifications, until December 23, 1840, when it was abolished by statute, in cases of contract and debts accruing after the first of March, 1841. In Vermont, imprisonment for debt, on contracts made after first January, 1839, is abolished, as to resident citizens, unless there be evidence that they are about to abscond with their property; so, also, the exception in Mississippi applies to cases of torts, frauds, and meditated concealment, or fraudulent disposition of property."—J. Kent, *Commentaries on American law*, v. 2 (O. W. Holmes, Jr., ed.).—"In many states the Constitution provides (A) that there shall be no imprisonment for debt: Ind. C. 1, 22; Minn. C. 1, 12; Kan. C. B. Rts. 16; Md. C. 3, 38; N. C. C. 1, 16; Mo. C. 2, 16; Tex. C. 1, 18; Ore. C. 1, 19; Nev. C. 1, 14; S. C. C. 1, 20; Ga. C. 1, 1, 21; Ala. C. 1, 21; Miss. C. 1, 11; Fla. C. Decl'n Rts. 15. (B) That there shall be no imprisonment for debt (1) in any civil action on mesne or final process, in seven states: O. C. 1, 15; Io. C. 1, 19; Neb. C. 1, 20; Tenn. C. 1, 18; Ark. C. 2, 16; Cal. C. 1, 15; Ore. C. 1, 15; Ariz. B. Rts. 18. (2) In any action or judgment founded upon contract, in three states: N. J. C. 1, 17; Mich. C. 6, 33; Wis. C. 1, 16. (C) In six, that there shall be no person imprisoned for debt in any civil action when he has delivered up his property for the benefit of his creditors in the manner prescribed by law: Vt. C. 2, 33; R. I. C. 1, 11; Pa. C. 1, 16; Ill. C. 2, 12; Ky. C. 13, 19; Col. C. 2, 12. . . . But the above principles are subject to the following exceptions in the several states respectively: (1) a debtor may be imprisoned in criminal actions: Tenn. So (2) for the non-payment of fines or penalties imposed by law: Mo. So (3) generally, in civil or criminal actions, for fraud: Vt., R. I., N. J., Pa., O., Ind., Ill., Mich., Io., Minn., Kan., Neb., N. C., Ky., Ark., Cal., Ore., Nev., Col., S. C., Fla., Ariz. And so, in two, the legislature has power to provide for the punishment of fraud and for reaching property of the debtor concealed from his creditors: Ga. C. 1, 2, 6; La. C. 223. So (4) absconding debtors may be imprisoned: Ore. Or debtors (5) in cases of libel or slander: Nev. (6) In civil cases of tort generally: Cal., Col. (7) In cases of malicious mischief: Cal. (8) Or of breach of trust: Mich., Ariz. (9) Or of moneys collected by public officers, or in any professional employment: Mich., Ariz."—F. J. Stimson, *American statute law: Digest of constitutions and civil public statutes of all the states and territories relating to persons and property, in force Jan. 1, 1886, art. 8.*—In 1913 a statute of Kansas (Ch. 170) provides for small debtor's courts in cities. An alleged debtor can be called before these courts by mail, by telephone or orally. The case may be "tried considerably and summarily" and no costs are charged to either party. In 1917 it was held by court decisions that constitutional prohibitions of imprisonment for debt do not forbid imprisonment for refusal to pay the amount due a prisoner's wife for her support or for the non-payment of a tax debt. The prohibitions are held to apply to imprisonment for contract debt. (State vs. Wideman, 112 Miss. 1; State vs. Latham, 137 Tenn. 391).

"Where any state law conflicts with a provision of the National Bankruptcy Act, [of 1898] the former becomes inoperative. [See U. S. A.: 1898 (July).] The present national law [1898, amended in 1903] provides for both voluntary and involuntary petitions in bankruptcy. In the former cases the in-

solvent himself files a petition in a federal district court and officials are appointed by the court or elected by his creditors to take over his assets; in the case of involuntary petitions the application is made by one or more of the insolvent's creditors. After the assets have been liquidated the insolvent may under certain conditions obtain from the court a discharge from bankruptcy which relieves him of further legal liability with respect to all debts unpaid at the time of filing the petition."—W. B. Munro, *Government of the United States*, pp. 277-278.—See also BANKRUPTCY: Early development and general principles; and American bankruptcy; COURTS: United States; LOUISIANA: 1843-1853; PEONAGE: In the United States; TENNESSEE: 1870-1884.

DEBTS, Public: Ancient and medieval.—"The development of public indebtedness accompanied the decline of the older system of treasures. In its present form it is essentially a creation of the last two centuries, and even within the last fifty years [written in 1892] it has gained more ground than in all preceding periods. The causes of its rise and immense expansion must be sought in the special circumstances, both political and social, of the time. . . . The Middle Ages show little advance on—in some respects they fall below—the economic position of the Roman Empire. . . . The King borrows on his personal credit, or on his domain, which he even gives in pledge as a security for payment. These loans were usually obtained from the Church, or from foreign bankers. . . . Both in England and France, these borrowings grew more common as wealth and the cost of government increased. Francis I obtained various sums through the city of Paris, which kept a list of the creditors and distributed the interest. Appeals to Parliament in connexion with loans occur as early as the reign of Richard II. Forced loans were tried by Edward IV, and by the Tudors in the sixteenth century. The pledging of taxes as security is the last step in the older forms of borrowing. A more advanced position is found in the loans of the Italian cities, especially Genoa and Venice, which raised money through the agency of banks established for the purpose. . . . The commercial revolution of the fifteenth and sixteenth centuries which depressed the Italian towns brought those of the Low Countries into prominence. The system of state-borrowing and of lending to foreign countries was engaged in by the Dutch. . . . Imitation of the Dutch methods of commerce and Finance . . . was a principal cause of the creation and advance of the English funded debt, which has in its turn been an example to other States. . . . It is thus plain that neither ancient nor medieval Finance possessed the modern public debt system."—C. F. Bastable, *Public finance*, pp. 543-545.

France before the World War.—"The national debt of France dates from the Revolution of 1789, when the debts accumulated by the old monarchy disappeared in the overthrow of society. The public credit of France was necessarily at this time at very low ebb and remained so for some years. The years 1793 saw the appearance of the public debt in its modern form. By the law of August 24, 1793, Cambon proposed the creation of a 'Grand livre de la dette publique' in which all the existing debt forms were to be entered as a unified 5 per cent. debt. The annuities were afterwards added. The book entries were treated as conclusive evidence of the claim. After this reorganization the capital value of the debt in 1793 was nearly 3,500,000,000 francs, and the interest charge 174,000,000 francs, of which only one-quarter 1797, due to the depreciation of the assignats and general derangement

of the finances, the Government 'paid off' two-thirds of the debt in bonds exchangeable for land. In short, the debt was reduced to one-third of its original value, and after some further confiscations amounted at the end of the 18th Century to 800,000,000 francs calling for an annual charge of 40,000,000 francs. Then came the rule of Napoleon ending in 1814. He and his finance ministers believed in making war 'pay its way.' They were opposed to the use of inconvertible currency and to raising money by loans. This policy involved heavy taxation and also heavy annual burdens on the conquered countries. The total addition to the debt charge after 14 years of costly war was only 23,000,000 francs. Of this amount 6,000,000 were on account of the debts of countries taken over by France, 10,000,000 were obligations incurred by the Directory, and only 7,000,000 were chargeable to the Empire. The restored House of Bourbon, however, had to pay a heavy war indemnity imposed by the allies, it had to compensate the emigrants, and to take up large unpaid balances of the imperial expenditure. By 1815 the principal of debt had risen to about 1,280,000,000 francs. From 1815 to 1818 loans were issued at prices varying from 52.50 to 67.60 for the 5% Rente. In 1819 a law was passed creating auxiliary 'grands livres' in every department. This gave to the provincials an opportunity to invest in the rentes. From this time the credit of the nation steadily rose. This was due to a policy of debt redemption and budget surpluses. In 1830, 80,000,000 4% rentes were sold by the government at a premium. Immediately thereafter the July revolution brought about a heavy fall in quotations, so that when in 1831 the Orleanist Government offered 120,000,000 5 per cents. they could obtain for them only 84. The credit of the nation then improved again so that in 1845 the 5 per cent. rentes sold as high as 122.85, 4 per cents. at 110.5 and 3 per cents. at 86.4. At the close of Louis-Philippe's reign in 1848 the debt charge was 177,000,000 francs, equivalent on a 5% basis to a capital sum of 3,540,000,000 francs. Then followed three years of grave financial disorder. As a result of the February revolution the 3 per cents. fell to 32.50 against 86.4 in 1845. During the Second Republic the debt charge rose to 231,000,000 francs, making the capital of the debt in 1852 on a 5% basis 4,620,000,000 francs. During the Second Empire (1852-1870) the government of Napoleon Third issued in all eight loans, most of them at 3 per cent. They were sold at a heavy discount. The loans were generally much over subscribed by speculators. This policy had the effect of widely distributing rentes among the French people. In 1830 the number of rentiers was 125,000; in 1869 it had risen to 1,254,000, and in 1881 to 4,000,000—these figures do not allow for duplicates. The extravagance of the Second Empire, which brought about budget deficits, the cost of the Crimean, Mexican and Italian Wars and the undertaking of huge public works, resulted in increasing the debt charge by 129,000,000 francs. Therefore at the opening of the Franco-Prussian War the debt charge amounted to about 500,000,000 francs, or at 4% to a principal sum of about 12,500,000,000 francs. From 1870 to 1872 France endured a strain of war finance unexampled in European history. Then followed the adjustments made necessary in the repayment and funding of war obligations. These involved the payment of losses incurred by the railroads, towns and individuals, the payment of the German indemnity and the funding of the debt incurred to the Bank of France. The remarkable latent resources of France have been shown by the man-

ner in which the French people have increased their investments in rentes since 1870. The annual charge increased from 511,000,000 francs in 1870 to 1,286,000,000 francs in 1892, an increase of 775,000,000. This represented an increase in the capital of the debt of over 18,000,000,000 francs, or to a maximum of 31,000,000,000 francs. The total increase in public revenue in the same period was 1,082,000,000, so that 71 per cent. was absorbed in the debt service. Since this date until the beginning of the present war the debt of France has been practically stationary. Two refunding operations have been carried through. These resulted in placing all of the debt on a 3 per cent. basis. On January 1, 1914, the grand total of the debt of France, according to the Statesman's Year Book for 1915, was 32,888,809,509 francs, calling for an annual charge of 1,306,585,021 francs. Reduced to dollars this represents a total debt of \$6,577,761,001—and the annual charge in dollars was \$261,317,000. This was the largest public debt of any of the nations.”—Harvey Fisk & Sons, *Government Bonds, England and France* (Harvey Fisk & Sons Bond Books, pp. 35-39).

Germany before the World War.—“Till the outbreak of the Franco-Prussian war in the summer of 1870, the North German Confederation, itself only in existence since 1866-67, had made but modest demands upon the State credit—grants amounting to 17 million thalers (51 million marks) only having been obtained for naval and coast defence purposes. This sum, however, was never entirely placed, nor was it strictly speaking a loan; but it was raised by the issue of Treasury Bonds to the amount of 13.45 million thalers (40.35 million marks). A considerable quantity of these bonds were several times repaid and re-issued for small amounts, but they were finally paid off in 1872. The expenses of the war of 1870 were borne by the North German Confederation and each of the South German States on its own separate account. The new loans raised for this purpose by the North German Confederation were partly in the form of a five per cent. Consolidated Loan of 120 million thalers (360 million marks) in July, 1870, of which, however, only 113.37 million thalers were issued; partly by the issue, from time to time, of Treasury Bonds at short dates, which were soon called in; and partly by the issue of Treasury Bonds, running for five years. Thus, by the end of 1871, there was a new North German Confederation Debt of 220,020,801 thalers. However, the successful issue of the war and France's war indemnity of five milliard francs enabled the Confederation to repay these loans in full in 1872, so that only a few unredeemed bonds still exist. A small portion of the debt (17,000 marks) is still [1902] outstanding. . . . By 1873, therefore, the German Empire, in its character of legal successor to the North German Confederation, actually had no State Debt. The debt came into existence again in 1875, when the French War Indemnity had been absorbed in the costs of the war, the repayment of loans, joint Imperial expenditure, the creation of Imperial Funds, and in distribution among the separate States. . . . During the last few years [written in 1902], both the navy and the foreign policy have contributed towards the augmentation of the German Debt in a considerable degree; for some time past the loans raised have been principally for military and naval expenses. In the Budget Act of 1900, a sum of 80,477,000 marks was devoted to paying off loans; together with the loan for the China Expedition, it amounted to 233,304,000 marks, making altogether 436.5 millions. Moreover, the grants allowed by law in the Budget towards

the diminution of the national debt were reduced in 1900 to 2,291,000 marks, and altogether cancelled in 1901, in order that they should be employed to meet special expenses, and so lessen the amount of new loans to be raised. [In 1907 the German debt amounted to \$4,220,000,000.] But the revenues of the Empire, which have been hitherto steadily increasing, especially of late years, have on the other hand contributed to the maintenance of prosperous financial conditions. Only quite recently have signs of a decrease in the revenues appeared, in consequence of the general financial crisis. . . . While in the National Debt of the German Empire can only be reckoned such loans as were and still are raised for defraying the expenses of army, navy, Imperial Post, and the above mentioned railway, those dating from 1866 (in North Germany) and 1871 (South Germany), as also the debts incurred for the construction of State railways and the purchase of private lines, must be reckoned in the State debt of each separate State concerned. In the Budget of the various States the gross receipts of the railways come under State Revenue, their working expenses under State Outlay, the net profits furnishing not only the interest, and eventually the means for the repayment of the loans originally raised for this purpose, but, particularly in Prussia, a surplus over and above which goes to cover other public expenditure.”—A. Wagner, *National debt of the German Empire* (North American Review, v. 174, no. 6, June, 1902, pp. 845-846, 848-849, 856).

Great Britain before the World War.—“Prior to William's reign, [1689-1702] English sovereigns had frequently to have recourse to the goldsmiths—the moneylenders and bankers of their day—for the means of carrying on their wars or maintaining their courts. . . . In earlier and more turbulent times, before Parliament had acquired any restraining influence over the actions of the sovereign, the repayment of such debts was a fruitful source of trouble to the people who had to supply the means wherewith to meet the demands of the moneylenders together with the exactions extorted from them by the rapacity of the Revenue farmers' agents. In these days England had its own anti-semitic question,—for the despised, downtrodden Jew was frequently the lender direct or indirect,—and settled the question in a more or less mediæval fashion. . . . What really dates from his reign is not the system of borrowing but the system of funding. From a period of immemorial antiquity it had been the practice of every English government to contract debts. What the Revolution introduced was the practice of honestly paying them.' The only debt which was in existence before the Revolution, and which ultimately became incorporated with the other national funds, was the 'Bankers' Debt.' In 1672, under the influence of the Cabal Ministry, the Exchequer had been closed, and £1,328,526 advanced on the credit of supplies voted by the House of Commons had practically been confiscated. Letters Patent were issued in 1677 to Sir Robert Viner, Bt., and the other creditors for the amount due to them, and in July, 1678, a Bill was introduced into the House of Lords to confirm these Letters Patent, and was passed, but Parliament was dissolved without the bill being submitted to the House of Commons. Interest at 6 per cent. per annum was paid at irregular intervals for some years; the last payment being made in the reign of James II. by tallies for three quarters' interest up to Lady-day, 1683. The closing of the Exchequer brought financial ruin to many of the goldsmiths and their clients, and was probably one of the causes why, when the Revolution did take place, the merchants of the

City of London were as a whole in favour of the change."—J. Y. Watt, *When England defaulted* (*Journal of finance*, Nov., 1898, p. 980).—"At the peace of Ryswick in 1697 the debt had risen to £21,515,000. During the period of peace which followed a reduction took place of £5,121,000. During Queen Anne's war the sum of £35,750,000 was added to the debt, so that at the peace of Utrecht in 1713 the debt amounted to £52,145,000 bearing interest varying from 8% on the older issues down to 6% on the later issues. In the subsequent 26 years of peace the sum of £4,190,000 was paid off and refunding operations carried through which reduced the interest rate to 4%. The wars with Spain and France which followed added £31,339,000 to the debt, but such was the confidence in the public credit that the Government raised the greater part of the large amounts required at from 3% to 4%. Again the debt decreased nearly £5,000,000 and by refunding operations the interest rate fell to 3%. The debt as thus refunded was known as 'the 3% reduced annuities' and 'the 3% Consolidated annuities' or briefly as 'reduced threes' and 'Consols.' Thus we have the beginning of the familiar term British Consols for the bonds which have been called and quite justly 'the premier security of the world.' Then began the 7-years war which added to the debt £64,533,000 bringing it up to £138,865,000 in 1763 at the peace of Paris. A large part of the money cost 4%. During the subsequent peace £10,281,000 were paid off. Therefore at the beginning of the American war in 1775 the debt of England stood at £128,583,000 calling for an annual charge of £4,471,000. During the war with her American Colonies . . . the debt of England nearly doubled and the debt charge more than doubled. Then, as usual during periods of peace, there was a small reduction in the debt and Consols which had fallen to 54 in 1782 reacted to 96 in 1792. After this for 22 years England was almost continuously at war, chiefly with France. By 1814 when Napoleon had apparently been conquered the debt had reached the great sum of £742,615,000 and the debt charge was £26,647,000. Then came the return of Napoleon from Elba. Finally in 1815 the battle of Waterloo was fought and won. When the cost was reckoned it was found that the nation was facing a debt funded and unfunded of about £885,000,000. Naturally the rate of interest had risen. In 1816 the interest charge on Great Britain's debt equalled 11% of the total income of the country. The national income was estimated to be about £300,000,000. The total annual expenditure of the government equalled over 20% of the nation's entire income. In 1822 Vansittart introduced a scheme which led to the conversion of the 5 per cents., with a large saving of interest, and also provided for the establishment of a true sinking fund. By 1855 over £80,000,000 of the debt had been paid off and the price of 3% Consols had risen to par. Then came the Crimean War which added £33,000,000 by 1857. More than twice this amount, viz. £70,000,000, was paid off in the following 20 years. During all this period Consols fluctuated between 84 and 97. In the following 23 years the debt steadily decreased until in 1899 it stood at £635,000,000, some £210,000,000 less than in 1857. Meanwhile an important refunding operation had been carried through in 1889 and the interest rate reduced thereby to 2¾ per cent. subject to a further reduction in 1903 to 2½ per cent. In three consecutive years 1896, 1897 and 1898 the 2¾ per cent. Consols sold as high as 113, a 2.41 per cent. basis of yield. Then came the mutterings of the Boer war and as the danger of war became apparent Consols fell to an average

price of 103 in October, 1899, when the war broke out. As a direct result of this war the funded debt mounted to £770,778,762 in 1904. The total debt funded and unfunded amounted to about £798,000,000. By determined efforts the debt had been reduced to about £706,000,000 at the beginning of the present war, August 1, 1914."—*Government Bonds, England and France* (Harvey Fisk & Sons Bond Books, pp. 10-13).

Italy before the World War.—"The whole system of Public Debt in Italy rests on the Act of Parliament of July 10th, 1861, by which the so-called *Gran Libro*, or 'Great Book of the Public Debt,' was instituted. Practically, the Great Book represents the amount of the national debt, which is by law inscribed in it, under the guarantees and the privileges which the law provides. These guarantees have their first foundation in the *Statuto*, or Constitution, which King Charles Albert granted to Piedmont in 1848, and which became lately, without any change, the Constitution of the Kingdom of Italy. Clause 31 of the Constitution provides that: 'The Public Debt is guaranteed. Any engagement of the State towards its creditors is inviolable.' The present Kingdom of Italy, with an area of 110,646 square miles and a population of about thirty-three millions, is the result of the union and amalgamation of all the old petty States into which the peninsula was divided. It is obvious, therefore, that the present [1902] amount of the Italian Public Debt must be traced to the following sources: (1) The unification of old debts inherited by the small States which existed before national unity. (2) War debts, chiefly contracted in order to carry on the great national wars of 1859 and 1866. (3) Debts incurred for the purpose of consolidating and improving the new kingdom, both by making up the deficit of the annual Budget and by developing public works, railways and the economical resources of the country. . . . The great mass of Italian Public Debts is of an international character; it can be and it is, in fact, negotiated at the exchanges of different countries, especially in Paris, Berlin and London. The coupon is paid in gold in foreign cities; it is paid in inconvertible paper currency at home. . . . As soon as the inconvertible paper currency was introduced in the year 1866, there appeared, as its natural outcome, the gold premium. The history of Italian finance for the last quarter of a century is but a continuous though ineffectual effort to redeem the country from the bane of the gold premium and from its deleterious consequences. In the history of inconvertible paper currency in Italy, four distinct periods may be traced: (1) From the war of the year 1866 up to the Banking Act of April 30th, 1874, by which some order was introduced into the paper currency of the country; (2) From the Banking Act of 1874 to the Act of April 7th, 1881, for the resumption of specie payment; (3) From the Act of the year 1881 to the new Banking Act of August 10th, 1893, which, after the failure of the Banca Romana, and the union with the Banca d'Italia of the two Tuscan banks, reduced to three the number of the Banks of Issue, viz., the Banca d'Italia, Banca di Napoli, and Banco di Sicilia. (4) From the Act of the year 1893 up to the present date. . . . In the first period (1866-1874), besides complete disorder in the issue of paper money, national finance, owing to the campaigns of the years 1866 and 1870, was in a very bad condition. The deficit in the State Budget reached \$144,000,000 in the year 1866, during the war with Austria, and gradually fell to almost \$2,000,000 in the year 1874, chiefly owing

to the noble efforts of Sella and Minghetti, the two leaders of the Conservative party then in power. The second period (1874-1881) gave hopes of a rapid improvement in the economic conditions of the country. The Budget presented an increasing surplus, which reached almost \$11,000,000 in the year 1881. . . . No sooner had this period of growing prosperity set in, than the government and the country lost sight of every principle of wise economy. Public expenditure increased continuously, so that the unprecedented surplus of almost \$11,000,000 in the year 1881 soon converted itself into a small deficit in the year 1884, which increased up to \$47,000,000 in the year 1889-90! The State construction of new railways proceeded so rapidly that large loans were issued every year in order to pay for them, up to the amount of nearly \$60,000,000, in the single year 1887-88. Exchange speculation, unsound joint-stock companies, over-building in large towns, especially in Rome and Naples, grew to such an extent, as to induce both the government and the Banks of Issue to make an illegal over-issue of paper money. Under such conditions, the resumption of gold payments soon became a failure; the gold premium reappeared; consols fell; banks failed or were utterly crippled; and there ensued a protracted financial and economical depression. This crisis reached its climax in the years 1889-1892. When Crispi's cabinet was formed in the year 1893, the financial situation of the country was most serious. Especially through Signor Sonnino's endeavors, there began a new period of financial retrenchment and of economical reconstruction. Unfortunately, the war with Abyssinia broke out, and the country again passed through a short period of depression. That war, though most unfortunate, did not cost the country more than \$30,000,000, which were added to the Public Debt. But, the Di Rudini cabinet soon began to restore order to the public finances, and by the year 1896-97, the surplus of effective income over expenditure reappeared. This surplus has been increasing from year to year. . . . It is often affirmed, chiefly by foreign writers on Italian finance, that the country is crushed by the amount of her Public Debt. There is much exaggeration in this statement, though it may have an apparent foundation in the fact that out of a total annual revenue of \$346,000,000, the Budget is charged with \$137,000,000 of interest in Public Debts of various descriptions, besides civil and military pensions to the amount of \$16,000,000. This apparent proportion of 40 per cent. between the interest on Public Debt and the total revenue is rather an unfavorable one. But it must be mentioned that, on a large portion of the interest on Public Debts, there is a taxation of 20 per cent., so that the net payments are reduced to about \$120,000,000. Moreover, more than a third of the Public Debt was contracted in order to construct or purchase railways, which yield about \$20,000,000 net revenue to the State, so that the annual burden to the Treasury is scarcely more than \$100,000,000. The proportion, though a heavy one, does not justify the pessimistic views which have frequently prevailed in some quarters. Italy was gradually progressing between 1870 and 1880, when a period of unprecedented financial and economic folly set in, in the years 1881-1893. But the inevitable reaction soon began: two different Ministers of Finance, Lauzzatti in 1891 and Sonnino in 1894, began a sound policy of retrenchment and laid the foundation of the present improved financial situation."—M. Ferraris, *Public debt of Italy* (*North American Review*, Sept., 1902, pp. 423-429, 431-432).—In 1906 Italy's debt was \$2,604,400,000.

America.—Drago doctrine.—Failure of certain

Central American countries to pay their debts has led to threats of war in several instances. One of the most notable was the case of Venezuela. "It will be remembered that during the second session of the [1902] Congress Great Britain, Germany, and Italy formed an alliance for the purpose of blockading the ports of Venezuela and using such other means of pressure as would secure a settlement of claims due, as they alleged, to certain of their subjects. Their employment of force for the collection of these claims was terminated by an agreement brought about through the offices of the diplomatic representatives of the United States at Caracas and the Government at Washington. . . . Under this agreement Venezuela agreed to set apart a certain percentage of the customs receipts of two of her ports to be applied to the payment of whatever obligations might be ascertained by mixed commissions appointed for that purpose to be due from her, not only to the three powers already mentioned . . . but also to the United States, France, [etc.] . . . who had not employed force for the collection of the claims alleged to be due to certain of their citizens."—T. Roosevelt, *Annual message to Congress*, Dec. 7, 1903.—This dispute with Venezuela led to the pronouncement of the so-called Drago doctrine, namely that there should be no use of force against an American state for the recovery of debts unless arbitration is impossible. (See DRAGO DOCTRINE.) A companion to this doctrine was that of Calvo, who said that every state would realize that honesty is the best policy, and that there should never, under any circumstances, be any use of force against an American debtor state for the collection of pecuniary claims. At the Hague Conference in 1907 the Drago doctrine was accepted by the adoption of a convention for the restriction of force in the recovery of contract debts. One of the provisions of the Platt amendment, which defined the relation of Cuba to the United States, limited the public debt of Cuba to the amount for which her ordinary revenues could provide. See CUBA: 1901 (February-March).

Russia before the World War.—"At the beginning of the reign of Catherine II, . . . the Russian Government really made its first appeals to public credit. The means employed were such as the age admitted—issues of assignats (inconvertible currency) and the placing abroad of loans of small amount repayable at short term—four, at the most, eight, years. . . . At the death of the great empress, the amount outstanding did not exceed £6,000,000. . . . The wars of Napoleon caused a new deluge of paper money. . . . The loans issued between 1817 and 1822, for the withdrawal of part of these assignats, gave birth to the debt payable to silver roubles. This debt existed undoubtedly before 1817, but the elements of which it was formed were not in general anything other than: (a) funds delivered in exchange for property acquired by the State, and (b) what long constituted a flaw in the financial organization of Russia—securities placed at the disposition of the public services and furnishing them, in the form of interest received on bonds every year, the equivalent of incompressible (but dilatable) budgetary grants. The withdrawals of the period 1818-1823 reduced the remainder of assignats issued to 595,776,310 roubles, a figure which was not subject to any modification during the twenty years following. On January 1, 1824, the national debt of Russia (exclusive of Poland) could be valued at a little over £60,000,000. . . . Two wars, the one with Persia (1826), the other with Turkey (1827-1829), and the Polish insurrection (1831) resulted in the addition of nearly £20,000,000 to the debt of the

Empire, which, in 1837, presented a total of £80,000,000. In 1842 began the first railway loans (the St. Petersburg Moscow line). The credit of Russia attains a level—if not a depth—which it was not destined to surpass till forty-eight years later (during the ministry of M. Vyshnegradski, 1887-1892). . . . One year after (June, 1848), the French five per cent. *Rente* was at fifty per cent. (owing to *ateliers nationaux*, etc.). In 1849, Russian troops were pacifying Hungary. And yet Russia was able, in the beginning of 1850, to issue in London, at an actual rate of interest of five per cent. a loan, of £5,500,000 (the so-called first four and one-half per cent. loan, the remainder of which was redeemed in 1891). . . . On the eve of the Crimean War, Russia as yet possessed but 621 miles of railways open to traffic, and her debt funded and unfunded, including the excess of the note issues over the total bullion, was near £144,000,000. After the liquidation of the expenses of the Crimean War, of those of the final pacification of the Caucasus and of those of the second Polish insurrection, that is about January 1, 1864, the Russian railway system—for the most part concessions—as yet reckoned but 2,175 miles fully open to traffic, and the operation of the redemption connected with the emancipation of the serfs was only just beginning. The incorporation of the Polish debt in the Russian budget, the completion of the emancipation operation (for which purpose securities to the amount of 600,000,000 roubles were issued, the balance of which was converted in 1891-1894), the Russo-Turkish War of 1877-1879, the pacification of Central Asia and the vigorous impulse given to the construction of the railway system from 1867 to 1886, brought the net total of the national debt on January 1, 1887, to £524,000,000. At that time, the net revenue of the total Russian railway system had never reached, for any one financial year, £0,500,000. . . . On January 1, 1900, the consolidated debt of Russia amounted to £656,000,000. . . . On January 1, 1901, the remainder of the Russian loans entering into the Public Debt reached the general total of £656,547,764."—*National debt of Russia (Bankers' Magazine, April, 1901, pp. 580-583)*.—In 1907 Russia's debt reached a total of \$4,591,400,000.

United States before the World War.—"The colonies often borrowed money of their own citizens in order to fit out military expeditions. The states did the same in the Revolution, and in 1789 over \$18,000,000 of state debt was outstanding. This sum was assumed by the United States, and for about thirty years thereafter the states had little or no debt. Then came the great era of canal-building, which involved all the states from New York to Virginia, and westward to Illinois. A little later, in the thirties and forties, came the building of railroads with state aid, causing an immediate use for millions of dollars; and at the same time a new supply of loans became available, because foreign capitalists were willing to advance large sums on the credit of the states. Matters went on flourishingly until the great panic of 1837, which instantly cut down the state revenues and for the time stopped the development of the West. Many of the states defaulted on their bonds, among them Pennsylvania, a fact which led Sidney Smith, a holder of some of the bonds, to say that he never saw a Pennsylvanian without a desire to strip him of his coat and boots. Pennsylvania eventually paid up, but other states repudiated principal and interest. The whole transaction was much confused because in some cases the state issued bonds through railroad and banking corporations, which returned only a part of the proceeds: about \$14-

000,000, which had been lent the states in good faith, was an absolute loss to the capitalists. A second period of repudiation came during and after the Civil War. By the Fourteenth Amendment it was expressly declared that no state should pay any debt incurred in aid of rebellion against the United States; hence all the loans of the eleven seceded states incurred during the war became void. The ante-bellum debts were still valid, and the reconstructed governments of the Southern states at once proceeded to make new debts. In South Carolina the accounts were so loose that nobody ever knew whether the issue of bonds was \$25,000,000 or \$35,000,000; but \$6,000,000 are known to have been put on the market without any authority of law. The debt of the state, which in 1861 was \$4,000,000, in 1871 was stated at \$29,000,000, of which about \$18,000,000 was soon after repudiated. The state of Virginia was divided during the Civil War, and therefore the reconstructed state refused to hold itself responsible for more than one-half the outstanding debt; and of the remainder a considerable part was scaled. The Southern states, together with two Northern states, between 1865 and 1885 repudiated about \$160,000,000, much of which had been contracted by state governments which did not really represent the tax-payers."—*Ibid.*, pp. 410-420.—See also SOUTH CAROLINA: 1868-1872.—"The total outstanding debt of all the commonwealths in 1870 was \$325,866,898; in 1800, \$223,107,883, and in 1902 the total debt of the states and territories was only \$234,908,873."—C. A. Beard, *American government and politics*, p. 707.—"Naturally there is a great variation in the amounts of indebtedness which the several states are carrying. . . . No one of the forty-eight states is entirely without debt, although a few of them have no net debt; in other words, their sinking-fund assets are sufficient to cover all obligations as they mature. . . . The net debt of New York state is more than one hundred and twenty-five millions. Massachusetts and California come next, with less than a quarter of that sum. . . . The states borrow money, when they have occasion to do so, by the issue of bonds. . . . In recent years it has become the practice, although there are still many departures from it, to provide a sinking-fund whenever an issue of bonds is made. This is a fund into which is paid every year out of current income a sum sufficient to enable the bonds to be redeemed when they mature. . . . A better plan of borrowing is to serialize the dates of maturity in such way that one or more bonds will come due for payment each year. . . . A definite proportion of the debt is regularly extinguished each year by applying from current revenue what would go into the sinking-fund, more or less. Many cities now use the serial plan, and a few of the states have adopted it with highly satisfactory results."—W. B. Munro, *Government of the United States*, pp. 470-472.

National debt of the United States dates from the Revolution. The United States borrowed extensively from foreign nations to pay off the revolutionary debt. "Nevertheless, in 1790 we still owed \$1,640,071 foreign interest. The domestic continental loans of the war amounted to \$13,030,168. . . . In 1835 the last of the national debt was paid [except for about \$37,000]."—J. S. Bassett, *Short history of the United States*, pp. 222, 422.—After 1835 the national debt rose to \$63,452,774 in 1850 and \$2,331,160,956 in 1870. "After the Civil War there was a fear in financial circles that some portion of the national debt might be repudiated. To allay these misgivings the Fourteenth Amendment provided in 1868 that 'the validity of the

DEBTS, PUBLIC

Status After
World War

DEBTS, PUBLIC

public debt of the United States . . . shall not be questioned.' It was furthermore stipulated that neither the United States nor any state of the Union should assume or pay any debt . . . incurred in aid of insurrection . . . against the United States. . . Debts incurred by the Confederacy or by any state of the Confederacy in connection with the Civil War were thus nullified by constitutional provision."—W. B. Munro, *Government of the United States*, p. 243.—"At the time of the declaration of war with Spain [1898] the finances of the Government were in excellent condition and the taxing machinery was in good working operation. Congress for the first time planned for war expenses on a really scientific basis by providing for an adequate scheme of taxation in connection with an issue of bonds. As far as taxes were concerned, reliance was placed almost wholly upon new internal revenue duties. An issue of \$200,000,000 3% ten-twenty year bonds was authorized. These bonds were sold at par and almost immediately thereafter were quoted at a premium. Upon the cessation of the war with Spain the Government found itself embarrassed by large surplus revenues and the process of debt paying began again. As there were no bonds subject to call, it was necessary for the Secretary of the Treasury to endeavor to buy bonds. He therefore in November, 1899, offered to purchase \$25,000,000 4s of 1907 or 5s of 1904, but succeeded in obtaining something less than \$20,000,000 bonds."—H. E. Fisk, *Our public debt*, p. 53.—Just before the World War the public debt of the United States had reached, in round numbers, \$1,000,000,000.

European debts before the World War.—In 1887 the combined debt of all civilized countries was estimated at \$27,000,000,000. Before the World War, France had the largest public debt of any country in the world—\$6,346,129,000. Germany's was comparatively small—\$1,177,418,000—in 1914. (This refers to the German empire. The combined indebtedness of the individual states was \$3,735,902,000.) Italy's debt the same year was \$2,852,148,000; Russia's was \$4,537,861,000. The national debt of Spain, in 1913, was \$1,814,270,000. That of the United Kingdom was \$3,485,818,000. Before the World War the aggregate national debt of about sixty nations of the world was \$43,200,031,000.—See also AUSTRIA-HUNGARY: 1907; HAGUE CONFERENCES: 1907.

ALSO IN: H. C. Adams, *Public debts*.—H. Secrist, *Economic analysis of constitutional restrictions upon public indebtedness in the United States*.—W. A. Scott, *Reputation of state debts*.—J. Zorn, *Thoughts on a capital levy*, pp. 3-9, 14-20, 22-31, 36-50.—G. W. Gough, *National debt*.—W. H. Dawson, *Evolution of modern Germany*, pp. 404-407.

World War and after.—During the World War the Allies borrowed from the American treasury approximately \$9,600,000,000. The aggregate debt of the sixty nations above referred to was, after the war, \$279,014,908,000.

"The amount of our [Great Britain] aggregate liabilities on March 31 next [1917] is expected to be £3,755,000,000; and, although probably nearly a thousand millions thereof represent money lent to our Dominions and Allies, the whole sum has nevertheless to be treated as a liability, and interest upon it, whether for a longer or shorter term, will have to be paid. Presumably the borrowers of the thousand millions aforesaid will pay interest for it at stated times, so what this country will actually have to find will be the interest on a net debt of £2,955,000,000. On March 31, 1914, the National liabilities amounted to £707,654,000. During 1914-15 a sum of £458,000,000 was added;

and during 1915-16 a sum of £1,031,637,000 (after allowing for the effect of conversion). Thus, on March 31, 1916, there was already a total of £2,197,500,000; and the estimated addition for the current year, together with unforeseen expenditure, will bring up the figure on March 31, 1917, to £3,755,064,000 gross, without reckoning the Japanese loan."

—H. J. Jennings, *Our national debt* (*Quarterly Review*, Jan., 1917).—"If the pre-war National Debt [of Great Britain] be added to the net amount of cash borrowed we get a total of £7,567,000,000 while actually the nominal amount on March 31st, 1919, was £7,435,000,000 but this is on the assumption that National War Bonds and War Savings certificates were taken at their issue price, and not their price of redemption."—H. G. Williams, *Britain's financial and economic position* (*British Commonwealth Union pamphlet*, no. 6, p. 8).—"Since the beginning of the war the debt [of the United States] has increased in the sum of about \$23,000,000,000 so that the debt to-day is about twenty-four times the amount at which it stood before we began to take an active part in the world war about two years ago [written in 1919]. We may assume, when adjustments and settlements have all been made, that the maximum debt for the present war may reach about \$30,000,000,000. However, against this total should be placed an asset of around ten billion dollars of interest-bearing obligations of foreign governments representing some eight and a half billion of loans made to our Allies during the progress of the war, together with another contemplated billion and a half of similar loans."—H. E. Fisk, *Our public debt*, p. 62.—"The gross debt of the United States on June 30 [1922] amounted to \$22,963,000,000 as compared with \$23,138,000,000 on May 31, with \$23,977,000,000 on June 30, 1921, and with \$26,596,000,000 on Aug. 31, 1919, when the war debt was at its peak."—*New York Times Current History*, Aug., 1922, p. 737.

"World national debts in 1921 are nearly ten times as much as at the beginning of the war. . . . The totals when transformed into United States dollars at the par value of [one hundred principal countries] . . . advanced from forty-three billion dollars in 1913 to 205 billions in 1918, the closing year of the war; 205 billions in 1919, the first full peace year; and 383 billions at the latest date for which figures available; indicating that the total of national indebtedness at the close of 1921 will approximate and perhaps exceed 400 billion dollars against the 43 billions of 1913. All debt figures given below [of the principal warring nations] have been transformed into United States currency at the pre-war normal value—the par of exchange.

	1913	1921
1. Australia	81,000,000	1,956,000,000
2. Austria	2,152,000,000	15,834
3. Belgium	722,000,000	4,670,000,000
4. Canada	483,000,000	2,345,000,000
5. Czecho-Slovakia		9,135,000,000
6. France	6,346,000,000	51,000,000,000
7. Germany	1,194,000,000	71,000,000,000
8. Hungary [including share of Austrian debt]	1,731,000,000	14,200,000,000
9. Italy	2,921,000,000	18,650,000,000
10. Japan	1,242,000,000	1,713,000,000
11. Jugo-Slavia	174,000,000	705,000,000
	[Serbian debt]	
12. New Zealand	438,000,000	978,000,000
13. Rumania	317,000,000	5,270,000,000
14. Russia	4,538,000,000	22,774,000,000

Austin, *World national debts in 1921* (*National City Bank*).—See also ENGLAND: 1914-1918: Taxation policy; RUSSIA: 1917-1920: Bolshevik finances; SOUTH AFRICA, UNION OF: Constitution; SWITZERLAND: 1921; VERSAILLES, TREATY OF: Part X. Sect. III; WORLD WAR: Miscellaneous auxiliary services: XIV. Cost of the war: a.

Problem of paying World War debts.—"Yesterday's [Oct. 4, 1922] speech to the Bankers' Convention by Mr. Reginald McKenna, Chairman of the London City and Midland Bank and formerly Chancellor of the British Exchequer, was in some respects the clearest statement that has yet been made of the practical economic problem involved in the German reparations and the inter-allied debts. It ought to receive the most careful consideration. . . . He begins by saying that 'England has the ability to pay,' that he 'can unhesitatingly assert her determination to honor her bond in full,' and that he believes himself justified 'in asking you to treat England's debt to the United States as certain to be provided for.' Mr. McKenna holds that Germany has not the means of making the foreign payments imposed by the Versailles Treaty. He distinguishes between Germany's 'capacity to produce' and her 'capacity to pay foreign debt,' and it is, in his view, the failure of the Versailles experts to draw that distinction which led to what he deems their error of calculation. Briefly, his statement of the case is that before the war Germany's yearly export surplus from sale of produce or payment for foreign services did not exceed \$100,000,000. She also had, it is true, the interest on her foreign investments, which Mr. McKenna estimates to have amounted to \$5,500,000,000. But his contention is that most of these prewar foreign securities are gone, either through sale in wartime, or through seizure of enemy property, or through loss of value as in the case of Russian holdings. His conclusion is that Germany's total exportable surplus was never sufficient to enable her to make through it the annual payment stipulated at Versailles, and that it is wholly out of the question that she should do so today. On the other hand, Mr. McKenna frankly recognizes the magnitude of the balances held for account of private German citizens in foreign countries, an outcome largely of sale of German paper marks to foreigners. His estimate of these balances is \$1,000,000,000, and he believes that they could be recoverable by the German Government for the purpose of making foreign reparations payments. [See also GERMANY: 1922 (July-August).] . . .

"In the case of the inter-governmental debt owed by the Continental Entente Allies, Mr. McKenna holds a view somewhat similar to that which he takes of the German reparations. France, for example, 'has no trade surplus or reserves of accumulated or exportable wealth to enable her to meet her present external liabilities.' A debtor nation 'may, in certain circumstances, pay off its foreign debt with remarkable ease and rapidity, but the indispensable condition for such rapid repayment is that there should be an extraordinary demand for its goods, a demand which is a natural accompaniment of war, but does not exist in peace.' Aside from England, he concludes, the other countries indebted to our Treasury 'are none of them in a position to meet more than a small part of their external liabilities, and in the existing condi-

tion of Europe a definite postponement of any payment by them is desirable in the interests of all parties.' His conviction that 'an attempt to influence payment beyond a debtor's ability is injurious to the international trade of the world, lowers wages, reduces profits and is a direct cause of unemployment' he describes very fairly as uninfluenced by political considerations, or by the strictly moral obligations of the debtor States."—*New York Times*, Oct. 5, 1922.—See also EUROPE: Modern: Far-reaching effects of the World War; FRANCE: 1922 (April-July); GENOA CONFERENCE (1922); HAGUE (ALLIED) CONFERENCE (1922); ENGLAND: 1922 (July-September).

DEBUSSY, Claude Achille (1862-1918), French composer and leader of the new French school. Educated at Paris Conservatoire under Marmentel, Lavignac, Massenet and Guiraud; gained many prizes, among them, the coveted Grand Prix de Rome; enriched and widened the field of harmony by the conscious employment of overtones combined with the old church modes, and the whole tone scale; reached the climax of his creative career in the masterpiece "Pelléas et Mélisande." DECORATION DAY, holiday, also known as Memorial Day, set apart for the decoration of graves of those who were killed in the American Civil War. The date of May 30th was designated for this observance by General John A. Logan in 1868. It is a legal holiday in all the northern states, and in Virginia, Kentucky, and Missouri. The celebration generally includes parades of veterans, ending in a visit to the cemetery "for the purpose of strewing with flowers, or otherwise decorating the graves of comrades who died in defense of their country."—J. A. Logan, Commander-in-Chief of the Grand Army of the Republic, *General order of May 5*, 1868.—In recent years, especially since the World War, Decoration Day has ceased to be a day for remembering soldiers of the Civil War only and has come to include all those who died in any of America's wars.—See also GRAND ARMY OF THE REPUBLIC.

DE DONIS CONDITIONALIBUS, article in the second Statute of Westminster enacted by Edward I, 1285. "The Statute of Westminster the Second, or 13 Edward I, is . . . the basis of many important points in Real Property Law. Like the Statute of Westminster the First 'it is a Code in itself.' . . . But the great section of the Act is the first, 'De Donis Conditionalibus,' on which the law of 'entail' to this day rests. By a judicial finesse the old power of protecting landed property from alienation had, in great measure, been swept away. The grant of land to 'A. B. and the heirs of his body' had come to be construed, not as conferring an estate strictly limited to pass from A. B. to his

descendants as long as any such existed, but as giving an estate to A. B. upon condition of having issue; so that if A. B. fulfilled the condition, by having issue born alive, he had it in his power, by taking certain steps, to bar his issue, and all others interested in reversion or remainder, so as to acquire the fee simple absolute. The Act forbids this interpretation for the future, requiring such gifts to be construed 'according to the intention of the grantor, as expressed in the words of the deed.' From this time onwards therefore a conveyance to a man and the heirs of his body was no longer construed as conferring 'a fee simple conditional,' but 'an estate tail,' 'feodum talliatum,' that is a 'bound,' or 'tied down,' or 'settled' fee, one that the holder could not alienate beyond the term of his own life."—J. DE HERETICO COMBURENDO, ecclesiastical statute authorizing the burning of heretics,

issued in 1401 under Henry IV of England. The immediate occasion was the rising of the Lollards, followers of John Wycliffe, but later the measure was enforced against all Protestants. After numerous repeals and revivals it was finally abolished by Charles II in 1678. The writ *de heretico comburendo* provided "that none should presume to preach openly or privately without the licence of the diocesan except curates in their own churches, and that none should teach heresy, hold conventicles or favor the new doctrines: if any should offend, the diocesan of the place should cause him to be arrested and detained in his prisons till canonical purgation or abjuration, proceedings for which should take place within three months of the arrest: if he were convicted he should be imprisoned by the diocesan according to the measure of his default, and fined proportionably; but if he should refuse to abjure, or relapse after abjuration, so that according to the canons he ought to be left to the secular court, he should be given up to the sheriff or other local magistrate and be publicly burned. By this act then, the bishop had authority to arrest, imprison, and try the criminal within three months, to detain him in his own court and to call in the sheriff to burn him. . . . By the laws and customs of foreign states burning was the regular form of execution for such an offense; in England it was the recognized punishment due for heresy in common with arson and other heinous crimes; and there was nothing apparently in its enforcement here that shocked the feelings of the age."—W. DEIR, or Deir Ez-Zor, town of eastern Syria, situated on the Euphrates not far above the confluence of the Khabur. It is the capital of the Zor sanjak formed in 1857. See SYRIA: 1908-1921.

DEIRA, Kingdom of. One of the kingdoms of the Angles, covering what is now called the East Riding of Yorkshire, with some territory beyond it. Sometimes it was united with the kingdom of Bernicia, north of it, to form the greater kingdom of Northumbria.—See also ENGLAND: 547-633.

DEISM (Latin *Deus*, god), a term which in its strict sense denotes the belief in a supreme deity as opposed to atheism and pantheism. It is, however, usually accepted as referring to a certain tendency or school of rationalistic theological thought which manifested itself, more particularly in England, in the late seventeenth and early eighteenth centuries. "The name of Deists, as applied to those who are no friends to revealed religion, is said to have been first assumed about the middle of the sixteenth century, by some Gentlemen in France and Italy, who were willing to cover their opposition to the Christian revelation by a more honourable name than that of Atheists. One of the first authors, as far as I can find, that makes express mention of them is *Viret*, a divine of

great eminence among the first Reformers; who . . . in 1563, speaks of some persons in that time who called themselves by a new name, that of Deists. These, he tells us, professed to believe in a God, but showed no regard to Jesus Christ and considered the doctrine of the apostles and evangelists as fables and dreams. . . . Some of them, as he observed, professed to believe the immortality of the soul; others were of the Epicurean opinion in this point as well as about the providence of God with respect to mankind, as if he did not concern himself in the government of human affairs."—J. Leland, *Deistical writers*, v. 1, p. 2.

English deism.—Late 17th and early 18th centuries.—Origin and precursors of the movement.—"The same tendencies which produced the Latitudinarian movement led, in minds of a different cast and training, to the development of Deism, and gave rise to the Deistic controversy. There were minds less appreciative of the need and the nature of Christianity. There were special co-operative influences, among which was the effect of the Copernican discovery upon the views taken of Scripture, and its effect, along with that of the philosophy of Bacon, and of the new studies in natural science, upon the general mood of feeling. This new mood may be described, for the lack of a better term, as rationalistic. Deism in its English type did not, like the Epicurean theory, deny the Providence of the Deity. It cast aside the belief in a special revelation, and of course the reality of denied miracles. The Latitudinarians sought for the basis of the religious creed in the truths held in common by the various contending Christian, or, at least, Protestant bodies. The deists did the same in reference to the different forms of religion, including the Christian. The value of the Bible is made to consist in its republication, but without supernatural sanction of the principles of natural religion, ascertainable and ascertained by 'the light of nature.'"—G. P. Fisher, *History of Christian doctrine*, pp. 371-372.—"In England the first deist was Herbert of Cherbury (1581-1648), with his 'five fundamental propositions of religion.' The body of English deists, however, got their cue from Locke's identification of the moral law with the law of nature; but Locke himself was not a deist. The literature of deism coincides for the most part with the English moral philosophy of the period, but usually the group of English deists is supposed to include only Toland, Chubb, Tindal, Collins, Morgan, and Bolingbroke. These men lived in the first half of the Enlightenment. They were much despised by the scholars of the time as being mere dabblers in letters."—H. E. Cushman, *Beginner's history of philosophy*, v. 2, p. 175.—"It is doubtful whether Hobbes, whom Leland and other eighteenth-century writers ranked as the chief writer of the Deistic School, really went so far as Deism in his philosophy, though a superficial perusal of the *Leviathan* is apt to give the impression that he was a deist. The name of atheist, which was bestowed on him as on most of the English freethinkers who followed him, certainly did him less injustice than any of them. . . . But that Hobbes, whatever his own philosophy amounted to, by the immensely strong influence he exerted in the direction of discrediting orthodoxy and prompting free thought, was the most powerful force which operated in the birth of the Deistic school proper at the end of the century is undeniable. No writer has poured more contempt on the authority of revelation than he in his famous *reductio ad absurdum* in the *Leviathan*: 'To say God hath spoken to him in a

dream is no more than to say he dreamed that God spoke to him. To say he hath seen a vision, or heard a voice, is to say that he has dreamed between sleeping and waking. To say he speaks by supernatural inspiration is to say he finds an ardent desire to speak, or some strong opinion of himself for which he cannot allege any sufficient and natural reason.' . . . The Deistic link between Hobbes and Toland is found by Leland, the last century historian and critic of the movement, in Blount, who began his literary career in 1679" and who later wrote *The Oracles of Reason*, "the most characteristically Deistic of all Blount's writings, made up largely of a strong attack on the mediatorial scheme of Christian theology. . . . The posthumous works of Blount were followed a year later by the initial work of Toland, the first of the famous trio completed by Collins and Tindal."—J. M. Attenborough, *Eighteenth century deists* (*Westminster Review*, Dec., 1901, pp. 622-624).

"John Toland (1669-1722) was the author of *Christianity Not Mysterious* (1696). He went beyond the assertion of Hobbes and Locke, that there is nothing contrary to reason in Christianity, by maintaining that there is nothing above reason in it; that everything is plain to reason, asserting that there is no profit in anything not intelligible. In primitive Christianity there were no unsearchable mysteries, but these have been introduced, in the course of time, partly in accommodation to Judaism with its levitical rites, and Heathenism with its mysteries, and partly by the mixture of philosophy."—G. P. Fisher, *History of Christian doctrine*, p. 375.—"His enemies called him a Jesuit, a Socinian, a Nonconformist; adding that they had never read his book, and by the grace of God they never would read it. At length it was brought before Parliament. Toland wished to be present to defend himself, but this was not granted. The House agreed that the book was heretical . . . and *Christianity Not Mysterious* was burned before the gate of the House of Parliament in the august presence of the sheriffs and constables of the city of Dublin. Toland escaped from Ireland and did not give his countrymen the opportunity of taking him into custody."—J. Hunt, *Religious thought in England*, v. 2, p. 244.—"It appears that the 'deistic movement,' commonly assigned to the eighteenth century, had been abundantly prepared for in the seventeenth, which in turn was but developing ideas current in the sixteenth. When in 1696 John Toland published his *Christianity Not Mysterious*, the sensation it made was due not so much to any unheard-of boldness in its thought as to the simple fact that deistic ideas had thus found their way into print. So far the deistic position was represented in English literature only by the works of Herbert, Hobbes, and Blount; and of these only the first (who wrote in Latin) and the third had put the case at any length. Against the deists or atheists of the school of Hobbes, and the Scriptural Unitarians who thought with Newton and Locke, there stood arrayed the great mass of orthodox intolerance which clamoured for the violent suppression of every sort of 'infidelity.' It was this feeling, of which the army of ignorant rural clergy were the spokesmen, that found vent in the Blasphemy Act of 1697. The new literary growth from the time of Toland is the evidence of the richness of the rationalistic soil already created. Thinking that men craved a new atmosphere, Locke's *Reasonableness of Christianity* is an unsuccessful compromise; Toland's book begins a new propaganda era."—J. M. Robertson, *Short history of freethought*, v. 2, p. 126.

"The *Earl of Shaftesbury*, author of the *Characteristics*, is generally reckoned among the Deists. He did not admit that the term was applicable to him in any other sense than that of Theist. A Deist, he said, is not the opposite of a Christian, but of an Atheist. He had written a preface to Whichcot's sermons, and did not seem to object to be considered a rational Christian, but his opposition to enthusiasm, fanaticism, and superstition, is often expressed as if under these he included Christianity. . . . Shaftesbury's Deism is founded on a few passages which look like an application of his own doctrine of 'good humor.' 'Do not imagine,' he says in the character of a speaker in a dialogue, 'that I dare aspire so high as to defend revealed religion or the holy mysteries of the Christian faith. I am unworthy of such a task, and should profane the subject. It is of mere philosophy I speak.' . . . He was sure that if he were to exercise himself in such speculations, the further he inquired the less satisfaction he would find, for 'inquiry was the sure road to heterodoxy.' This was a mode of writing common with the Deists."—J. Hunt, *Religious thought in England*, v. 2, pp. 342-343, 357-358.

"Anthony Collins, whose first important work appeared in the year after Shaftesbury's death, had, like him, the advantage, in attempting to undermine the current theology, of starting the campaign with a good and unsuspected religious character. He was well born and had gained the friendship and warm admiration of Locke. . . . The *Discourse on Freethinking* did not any more than Shaftesbury's *Characteristics*, openly question the current theological beliefs or declare that they were unable to bear the examination of free reason. Its chief offense was that it advocated a free criticism of the Scriptures and insinuated that they were of uncertain authority, owing to the probability of corruption by the Fathers and from the many different readings in the text just collected and published by Dr. Mills. . . . The essay, though it was immediately driven into contempt by Bentley's famous reply, is really an exceedingly clever and forcible piece of writing. . . . Collins followed up the impression which the last work had made by a blow at the very root of all theologies, the doctrine of the freedom of the will. In his *Philosophic Enquiry concerning Human Liberty*, a work which deserves to give him a recognised position among English philosophical writers, he contended, in the now familiar manner, that all phenomena of volition are the results of a mechanical battle of motives, the mind being invincibly determined by its predominant motive, and entirely without liberty of choice. This work is the only one of Collins', and almost the only one which the theological controversy of the first half of the eighteenth century produced, worth perusal today. . . . Among the most resolute of Collins' numerous opponents was the profound *Samuel Clarke*. . . . Collins died in 1720. His character was universally admitted to be of great uprightness and nobility, and his bitterest enemies never dared to attack him as a man."—J. M. Attenborough, *Eighteenth century deists* (*Westminster Review*, Dec., 1901, pp. 630-633).

"The way had been prepared for this minimising of current Christian doctrine by the two treatises of the unfortunate *Thomas Woolston*, the most vigorous and effective of all the lesser Deistic writers. . . . In his two Discourses on the Gospel Miracles, without any of Tindal's regard for the feelings of orthodox believers, he treats the Gospel narrative in the most contemptuous manner and pours liberal abuse on all the orthodox champions,

. . . Woolston paid dearly for his boldness in putting his name to such open attacks on the current creed. He was heavily fined, and being, like most of his Deistic comrades, extremely impecunious, was thrown into prison, where he lingered until his death in 1733. . . . *Thomas Morgan*, a poor farmer's son, who had been charitably educated for the Nonconformist ministry, published in 1737 *The Moral Philosopher*, in which he denied quaintly that the Deity 'had ever communicated His mind by revelation' and maintained that all miracles, wherever related, were 'tricks of imposture.' The work was in the dialogue form, then so much affected, the debaters being styled a 'Christian Deist' and a 'Christian Jew.' Morgan seems to have escaped punishment by the secular arm though he naturally lost his living in the Nonconformist ministry. Another smaller writer, Annet, who dared to attempt a refutation of the replies to Woolston, was less fortunate, being pilloried and thrown into Bridewell prison."—*Ibid.*, pp. 633-635.—*Thomas Chubb*, an energetic tallow-chandler of Salisbury (d. 1747), in a multitude of tracts brought an ethical 'Christian rationalism' within the range of the unscholarly many."—J. M. Robertson, *Short history of freethought*, v. 2, p. 146.

"Tindal, the third member of the famous Deistic trio, though born earlier than either of the others, was the last to make his mark as a Deistic writer. His great work *Christianity as Old as Creation*, the last he wrote, appeared the year after the death of Toland and Collins. . . . *Christianity as Old as Creation* may be said to have raised the Deistic movement to its high water mark. It became immediately popular, and its effects on the religious thought of the country seem for a time to have been immense. Nearly a hundred and fifty replies have been enumerated, all the leading theologians deeming it their duty to make an effort to crush the book."—J. M. Attenborough, *Eighteenth century deists* (*Westminster Review*, Dec., 1901, p. 635).

"Bolingbroke (1678-1751), in writings left to be published after his death, assumes that Monotheism was the primitive religion, and argues for it on the ground of the consent of all tradition that the world had a beginning. Almost everything not contained in the creed of nature is ascribed to the shrewd invention of rulers, who, in order to keep the people in subjection, have played on their fears."—G. P. Fisher, *History of Christian doctrine*, p. 378.—"Lord Bolingbroke, who albeit more of a debater than a thinker, debated with masterly power, in a style unmatched for harmony and energetic grace. . . . His influence commonly belittled, was much greater than writers like Johnson would admit; and it went deep."—J. M. Robertson, *Short history of freethought*, v. 2, p. 170.

"The English deists passed from view at the end of the first half of the eighteenth century, crushed by the weight of the attack upon them. The more powerful orthodoxy, with its greater talent, was itself rationalistic, and could beat them on their own ground. The Churchmen showed that the objections against the God of revelation would be equally effective against the deistic God of nature. The classic argument along this line against the deists is Bishop Butler's *Analogy of Religion*. The battle was unequal, and the character of the books published during the controversy reveals the inequality of the contest. The deistic publications were small and shabby octavos, and were published anonymously. The orthodox publications were solid octavos and quartos in handsome bindings, with the credentials of powerful signatures. Even if the orthodoxy had not employed the arm

of the law against the deists, the deists would have been broken by the intellectual force against them."—H. E. Cashman, *Beginner's history of philosophy*, v. 2, pp. 175-176.—Leslie Stephen, considered by many historians of a recent date unfair in his treatment of the deists, nevertheless mirrors the spirit of the eighteenth and indeed of the nineteenth centuries in his contemptuous description of the despised school, especially where he compares them with their orthodox opponents: "On the side of Christianity, indeed, appeared all that was intellectually venerable in England. Amongst the champions of the faith might be reckoned Bentley, incomparably the first critic of the day; Locke, the intellectual ruler of the eighteenth century; Berkeley, acutest of English metaphysicians and most graceful of philosophic writers; Clarke, whom we may still respect as a vigorous gladiator, and then enjoying the reputation of a great master of philosophic thought; Butler, the most patient, original, and candid of philosophical theologians; Waterland, the most learned of contemporary divines; and Warburton, the rather knock-kneed giant of theology, whose swashing blows, if too apt to fall upon his allies, represented at least a rough intellectual vigour. Around those great names gathered the dignitaries of the Church, and those who aspired to church dignity, for the dissection of a deist was a recognized title to obtaining preferment. . . . The names indeed of the despised deists make but a poor showing when compared with this imposing list. They are but a ragged regiment, whose whole ammunition of learning was a trifle when compared with the abundant stores of a single light of orthodoxy; whilst in speculative ability they were children by the side of some of their antagonists. Swift's sneers seem to be generally justified; and their literary power would hardly have attracted attention if employed upon any other topic. Two of the deists, indeed, claimed respect as men of rank and of considerable pretensions to taste. But Shaftesbury, though a man of real power, attacked orthodoxy in the most oblique fashion; and Bolingbroke's 'blunderbuss' missed fire, because discharged when the controversy was nearly extinct. Mandeville, perhaps the acutest of the deists made like Shaftesbury, an indirect and covert assault. Collins, a respectable country gentleman, showed considerable acuteness; Toland, a poor denizen of Grub Street, and Tindal, a Fellow of All Souls, made a certain display of learning, and succeeded in planting some effective arguments. Below them we must make a rapid descent to find fitting places for poor mad Woolston, most scandalous of the deists, and Chubb, the good Salisbury tallow-chandler, who ingeniously confesses, whilst criticising the Scriptures, that he knows no language but his own. Morgan, and two or three anonymous writers, do little more than reflect the arguments of Tindal and Toland, and Annet, a broken-down schoolmaster, is a rather disreputable link between Woolston and Tom Paine. At the end of the deist controversy, indeed, there appeared two remarkable writers. Hume, the profoundest as well as the clearest of English philosophers of the century, struck a blow of which the echo is still vibrating; but Hume can scarcely be reckoned amongst the deists. He is already emerging into a higher atmosphere. Conyers Middleton, whose attack upon miracles eclipsed for a time that of his contemporary, was a formidable though covert ally of Deism, but belongs to the transition to a later period. The deists suffered from another disadvantage besides their intellectual infirmity. They had to fight in fetters. . . . The Church of

England could no longer persecute but it was still privileged. A dissenter was disqualified from office, though not regarded as a criminal. . . . The infidel was a degree lower. He was still liable to persecution, though seldom persecuted in practice. . . . It was perfectly safe and in some classes fashionable to express sceptical opinions in conversation, but it was clearly disreputable, and not quite safe to publish them. If the governing classes hated priestcraft, and cared little for Christianity, they had a great value for decorum. . . . The deist books were occasionally burnt by the hangman, which probably served as an advertisement. Collins at one time thought it necessary to retire to Holland; . . . Woolston was fined and imprisoned for language more significant of insanity than of intentional profanity; and at a later period Annet was pilloried and imprisoned. . . . But as a rule, the deists escaped without injury; their creed exposed them to much obloquy, but little danger; and they were forced, not to conceal their opinions, but to cover them with a veil of decent ambiguity."—L. Stephen, *History of English thought in the eighteenth century*, v. 1, pp. 86-89.—See also CHURCH OF ENGLAND: 18th century.

France: Influence of deism.—Voltaire.—Development into atheism.—The eighteenth century "witnessed in France the spread of deism, which took its rise in England, and with deism the advocacy and spread of a materialistic atheism. Voltaire (1694-1778), whose sway in the domain of letters surpassed that of any other author since Erasmus, defended deism, as verified both on moral grounds and by scientific proof. . . . The deism of Voltaire was followed by the materialism and atheism of the 'Encyclopaedists,'—so called from the title of the copious work of Diderot and D'Alembert, the *Encyclopédie*, which was sympathetic with the extremes of infidelity. . . . Against these debasing opinions Rousseau protested in the *Savoyard Vicar's Profession of Faith* (contained in *Emile*). . . . When we examine the evidences of Christianity, we are left in doubts and difficulties. Reasons on one side are balanced by reasons on the other. But the heart speaks with a convincing voice, affirming the inspiration of the Scriptures and that Jesus is more than man. . . . Despite oscillation and an excess of sentiment in his utterances respecting religion, Rousseau anticipates in a more indefinite way the ideas of Kant in his *Practical Reason*."—G. P. Fisher, *History of Christian doctrine*, pp. 492-493.—"What was the cause why English deists wrote and taught their creed in vain, were despised while living and consigned to oblivion when dead, refrained almost entirely from political intermeddling, and left the church in England unhurt by the struggle; while on the other hand deism in France became omnipotent, absorbed the intellect of the country, swept away the church, and remodelled the state? . . . It is a phenomenon political rather than intellectual. It depended upon the soil in which the seed was sown, not on the inherent qualities of the seed itself. . . . In the state and church all was authority; all was of the past: in the world of literature and philosophy all was criticism, activity, hope in the future. Into a soil thus prepared the seeds of unbelief on the subject of religion were introduced. We cannot deny that they were imported mainly from England. Doubt had indeed not been wholly wanting in France. In the preceding centuries Montaigne and Charron, and at the commencement of the one of which we speak, Bayle and Fontenelle were probably harassed with disbelief. . . . And free thought in the form of literary criticism of the scriptures had brought

down the denunciation of the French church on Richard Simon. But undoubtedly the direct parent of the French unbelief was English deism. . . . Voltaire spent three years of exile in England, at the time when the ferment existed concerning Woolston's attack on miracles, and both knew Bolingbroke personally, and translated his writings. . . ." Of the two periods into which the history of French doubt in the eighteenth century may be divided "the early doubters and Voltaire mark the former. . . . Diderot and the French encyclopaedists with the ramification of their school at the court of Frederick II. of Prussia, form the point of transition: Rousseau marks the opening of the second period, when unbelief was attempting to reconstruct society and remodel education. The selfish philosophy of Helvetius and his friends then carries on the course of the history of unbelief, until in the storm of the revolution it shows itself in the teaching of Volney, and the absurd acts of the theo-philanthropists."—A. S. Farrar, *Critical history of free thought*, pp. 230, 235-238.

Germany: Deistic thought.—In Germany "the first era of Rationalism was the period when the Anglo-French deism was dominant. It was the age of Frederick the Great. . . . It was the period of 'illumination' in Europe. . . . The period of 'illumination' in Biblical and historical criticism, although it had its forerunner in the Socinian and Arminian scholars, was opened by Semler (1725-91), a contemporary of Lessing. . . . Zeal for exploration in all these directions was kindled in all the German universities. Among the critics, Eichorn (1752-1827), for fifty-two years a teacher at Jena and Göttingen, brought forward suggestions and problems without number which stimulated thought and demanded solution. . . . It was inevitable that a powerful influence on the course of theology . . . should be exerted by the foremost philosopher of modern days, Immanuel Kant (1722-1804). He began as an adherent of the philosophy of Leibnitz in the form in which it was cast by Wolf. The speculations of Hume awoke him from his 'dogmatic slumber,' and compelled him to inquire for a basis of knowledge not resting on unverified assumptions, or leading to universal skepticism. . . . The teaching of Kant on the moral side was a most healthful rebuke to the lax tone and low ideals of the deistic illumination. . . . But it brought in a type of rationalism in which the distinctively religious character of Christianity was eclipsed or subordinated to an ethical legalism. . . . Thenceforward, there appear two streams in the field of German thought, a believing Christian theology, founded on the recognition of a 'consciousness of God,' indigenous in the soul, and a speculative Pantheism, the fruit of a modification, in this direction, of Kant's philosophy."—G. P. Fisher, *History of Christian doctrine*, pp. 494, 497, 499-501.

American deists.—"Perhaps the most signal of all the proofs of the change wrought in the opinions of the civilized world in the eighteenth century is the fact that at the time of the War of Independence the leading statesmen of the American colonies were deists. Such were Benjamin Franklin, the diplomatist of the Revolution; Thomas Paine, its prophet and inspirer; Washington, its commander; and Jefferson, its typical legislator. . . . It is still one of the stock doctrines of religious Sociology in England and America that deism, mis-called atheism, wrought the reign of Terror in the French Revolution; when as a matter of fact the same deism was at the head of affairs in the American."—J. M. Robertson, *Short history of freethought*, v. 2, p. 317.—See also THEISM.

DELAGO BAY ARBITRATION.—"On December 11th, 1875, Portugal concluded a treaty with the Transvaal Government under which the latter Government bound itself to continue the line of railway—which the Portuguese Government proposed to build from Lourenço-Marques to the Transvaal frontier—up to a centre of production and consumption which should insure the traffic of the line and the development of international commerce. The Portuguese Government then began to look about for a concessionaire and contractor for this line, and after some research, eventually came to terms with one Colonel Edward McMurdo, a citizen of the United States of America, who undertook to build the line without any Government subvention,—a matter of some importance to the Portuguese Government,—but upon certain conditions, of which the most important was that the concessionaire should have the right to fix the tariffs without any State interference. A contract . . . was drawn up and executed in Lisbon on December 14th, 1883." The government bound itself to grant no concession for a rival railway from the coast to the Transvaal boundary, and gave the contractor certain valuable mining rights and grants of land. On his part he was to complete the road within three years. He formed a Portuguese company for the purpose, and seems to have been prepared for success in his undertaking, when rumors began to circulate that the Transvaal government had secured from that of Portugal the right to build a steam tramway from the eastern terminus of its own line to the coast. These rumors were contradicted by the Portuguese government, but are said to have been eventually confirmed. Five months after the signing of the contract with Colonel McMurdo, the Portuguese authorities, it seems, had actually violated it in the manner described. Henceforth the contractor appears to have had every possible embarrassment thrown in his way by combined action of the Portuguese and Boer governments. His Portuguese company was broken down, but he organized another in England, which struggled on with the enterprise until 1889, when a decree from Lisbon rescinded the concession, declared the railway forfeited, and ordered military possession of it to be taken. The sufferers in the matter, being British and American citizens, appealed then to their respective governments, and both intervened in their behalf. The result was a reference of the matter to the arbitration of Switzerland. So much was settled in June, 1891; but it was not until March, 1900, that the judgment of the arbitrators was pronounced. They awarded to the Delagoa Bay Company, as its due on the railway, 13,980,000

francs. "To this is added a sum of fr. 2,000,000 as an indemnity for the land grant, which brings the total award (less £28,000 paid by Portugal on account in 1890) to fr. 15,314,000 (or about £612,500), with interest at 5 per cent. from June 25th, 1889, to the date of payment. The amount of this award came as a considerable shock to the claimants, as well it might. It was insufficient to pay even the bonds in full (including interest at 7 per cent.), and left nothing whatever for the shareholders, while even the expenses are to be borne by each party equally."—M. DELATION, DELATORS.—Under the empire, there was soon bred at Rome an infamous class of men who bore a certain resemblance—with significant contrasts likewise—to the sycophants of Athens. They were known as delators, and their occupation was delation. "The delator was properly one who gave notice to the fiscal officers of moneys that had become due to the treasury of the state, or more strictly to the emperor's fiscus." But the title was extended to informers generally, who dragged their fellow-citizens before the tribunals for alleged violations of law. Augustus made delation a profession by attaching rewards to the information given against transgressors of his marriage laws. Under the successor of Augustus, the sullen and suspicious Tiberius, delation received its greatest encouragement and development. "According to the spirit of Roman criminal procedure, the informer and the pleader were one and the same person. There was no public accuser, . . . but the spy who discovered the delinquency was himself the man to demand of the senate, the praetor or the judge, an opportunity of proving it by his own eloquence and ingenuity. The odium of prosecution was thus removed from the government to the private delator."—C. Merivale, *History of the Romans*, ch. 44.

DELAWARE: Area.—Population.—Resources.—Delaware is the southernmost of the Middle Atlantic states and one of the thirteen original states of the Union. It has an area of 2,370 square miles of which 405 are water, and a popula-

tion of 223,003. It is mainly agricultural. In 1920 there were 10,140 farms occupying 85 per cent of the land. The principal products are maize, wheat, fruit and tomatoes. In the output of tomatoes it is the second state in the Union. Its oyster and other fisheries are gaining in importance. The mineral resources of the state are not extensive.

1606-1620.—Included in James' grants to the London and Plymouth companies. See AMERICA: Map of King James' grants.

1629-1631.—Dutch occupancy and first settlement.—The first attempt at settlement on the Delaware was made by the Dutch, who claimed the country in right of Hudson's discovery and Mey's exploration of the bay, notwithstanding the broad English claim, which covered the whole of it as part of an indefinite Virginia. In 1629, pursuant to the patent ordinance of the Dutch West India Company, which opened New Netherland territory to private purchasers, "Samuel Godyn and Samuel Blommaert, both directors of the Amsterdam Chamber, bargained with the natives for the soil from Cape Henlopen to the mouth of Delaware river; in July, 1630, this purchase of an estate more than thirty miles long was ratified at Fort Amsterdam by Minuit [then Governor of New Netherland] and his council. It is the oldest deed for land in Delaware, and comprises the water-line of the two southern counties of that state. . . . A company was soon formed to colonize the tract acquired by Godyn and Blommaert. The first settlement in Delaware, older than any in Pennsylvania, was undertaken by a company, of which Godyn, Van Rensselaer, Blommaert, the historian De Laet, and a new partner, David Petersen de Vries, were members. By joint enterprise, in December, 1630, a ship of 18 guns, commanded by Pieter Heyes, and laden with emigrants, store of seeds, cattle and agricultural implements, embarked from the Texel, partly to cover the southern shore of Delaware Bay with fields of wheat and tobacco, and partly for a whale fishery on the coast. . . . Early in the spring of 1631, the . . . vessel reached its destination, and just within Cape Henlopen, on Lewes Creek, planted a colony of more than thirty souls. The superintendence of the settlement was intrusted to Gillis Hosset. A little fort was built and well beset with palisades: the arms of Holland were affixed to a pillar; the country received the name *Swaanendael*; the water that of Godyn's Bay. The voyage of Heyes was the cradling of a state. That Delaware exists as a separate commonwealth is due to this colony. According to English rule, occupancy was necessary to complete a title to the wilderness; and the Dutch now occupied Delaware. On the 5th of May, Heyes and Hosset, in behalf of Godyn and Blommaert, made a further purchase from Indian chiefs of the opposite coast of Cape May, for twelve miles on the bay, on the sea, and in the interior; and, in June, this sale of a tract twelve miles square was formally attested at Manhattan. Animated by the courage of Godyn, the patroons of *Swaanendael* fitted out a second expedition under the command of De Vries. But, before he set sail, news was received of the destruction of the fort, and the murder of its people. Hosset, the commandant, had caused the death of an Indian chief; and the revenge of the savages was not appeased till not one of the emigrants remained alive. De Vries, on his arrival, found only the ruins of the house and its palisades, half consumed by fire, and here and there the bones of the colonists."—G. 1638-1640.—Planting of the Swedish colony.—"William Usselinx, a distinguished merchant in Stockholm, was the first to propose to the Swedish government a scheme for planting a colony in America. He was a native of Antwerp, and had resided in Spain, Portugal and the Azores, at a time when the spirit of foreign adventure pervaded every class of society. . . . In the year 1624 he proposed to the Swedish monarch, Gustavus Adolphus, a plan for the organization of a trading company, to extend its operations to Asia, Africa, America and Terra Magellanica. . . . Whether Usselinx had ever been in America is uncertain, but he had, soon after the organization of the Dutch West India Company, some connection with it, and by this and other means was able to give ample information in relation to the country bordering on the Delaware, its soil, climate, and productions. . . . His plan and contract were translated into the Swedish language by Schrader, the royal interpreter, and published to the nation, with an address strongly appealing both to their piety and their love of gain. The king recommended it to the States, and an edict dated at Stockholm, July 2d, 1626, was issued by royal authority, in which people of all ranks were invited to encourage the project and support the Company. Books were opened for subscription to the stock. . . . Gustavus pledged the royal treasure for its support to the amount of 400,000 dollars. . . . The work was ripe for execution, when the German war [the Thirty Years War], and afterwards the king's death, prevented it, and rendered the fair prospect fruitless. . . . The next attempt on the part of the Swedes to plant a colony in America was more successful. But there has been much difference among historians in relation to the period when that settlement was made. . . . It is owing to the preservation, among the Dutch records at Albany, of an official protest issued by Kieft, the Governor at New Amsterdam, that we do certainly know the Swedes were here in the spring of 1638. Peter Minuit, who conducted to our shore the first Swedish colony, had been Commercial Agent, and Director General of the Dutch West India Company, and Governor of the New Netherlands. . . . At this time Christina, the infant daughter of Gustavus Adolphus, had ascended the throne of Sweden. . . . Under the direction of Oxenstiern, the celebrated chancellor of Sweden, whose wisdom and virtue have shed a glory on the age in which he lived, the patent which had been granted in the reign of Gustavus to the company formed under the influence of Usselinx was renewed, and its privileges extended to the citizens of Germany. Minuit, being now out of employment, and probably deeming himself injured by the conduct of the Dutch Company [which had displaced him from the governorship of the New Netherlands, through the influence of the patroons, and appointed Wouter Van Twiller, a clerk, to succeed him], had determined to offer his services to the crown of Sweden. . . . Minuit laid before the chancellor a plan of procedure, urged a settlement on the Delaware, and offered to conduct the enterprise. Oxenstiern represented the case to the queen. . . . and Minuit was commissioned to command and direct the expedition."—B. Ferris, *History of the original settlements on the Delaware*, pt. 1, ch. 2-3.—"With two ships laden with pro-

visions and other supplies requisite for the settlement of emigrants in a new country, and with fifty colonists, Minuit sailed from Sweden late in 1637, and entered Delaware Bay in April, 1638. He found the country as he had left it, without white inhabitants. Minqua Kill, now Wilmington, was selected as the place for the first settlement, where he bought a few acres of land of the natives, landed his colonists and stores, erected a fort, and began a small plantation. He had conducted his enterprise with some secrecy, that he might avoid collision with the Dutch; but the watchful eyes of their agents soon discovered him, and reported his presence to the director at New Amsterdam. Kieft [successor to Van Twiller] had just arrived, and it became one of his first duties to notify a man who had preceded him in office that he was a trespasser and warn him off. Minuit, knowing that Kieft was powerless to enforce his protest, being without troops or money, paid no attention to his mis- sive, and kept on with his work. . . . He erected a fort of considerable strength, named Christina, for the Swedish queen, and garrisoned it with 24 soldiers. Understanding the character of the Indians, he conciliated their sachems by liberal presents and secured the trade. In a few months he was enabled to load his ships with peltries and despatch them to his patrons. . . . The colony had to all appearance a promising future. . . . Within two years, however, their prospects were clouded. The Company had failed to send out another ship with supplies and merchandise for the Indian trade. Provisions failed, trade fell off, and sickness began to prevail. . . . They resolved to remove to Manhattan, where they could at least have 'enough to eat.' On the eve of 'breaking up' to carry their resolution into effect, succor came from an unexpected quarter. The fame of New Sweden, as the colony was called, of its fertile lands and profitable trade, had reached other nations of Europe. In Holland itself a company was formed to establish a settlement under the patronage of the Swedish Company." This Dutch company "freighted a ship with colonists and supplies, which fortunately arrived when the Swedish colony was about to be broken up and the country abandoned. The spirits of the Swedes were revived. . . . Their projected removal was indefinitely deferred and they continued their work with fresh vigor. The Dutch colonists were located in a settlement by themselves, only a few miles from Fort Christina. They were loyal to the Swedes. . . . In the autumn of the same year, 1640, Peter Hollaendare, who had been appointed deputy governor of the colony, and Moens Kling, arrived from Sweden with three ships laden with provisions and merchandise for the straitened colonists. They also brought out a considerable company of new emigrants. New Sweden was now well established and prosperous. More lands were bought, and new settlements were made. Peter Minuit died the following year."—G. W. Schuyler, *Colonial New York*, v. 1, *introd.*, sect. 2.

1640-1656.—Struggle between the Swedes and the Dutch and the final victory of the latter.—"The [Swedish] colony grew to such importance

that John Printz, a lieutenant-colonel of cavalry, was sent out in 1642 as governor, with orders for developing industry and trade. He took pains to command the mouth of the river, although the Dutch had established Fort Nassau on its eastern bank, and the Swedish settlements were on the western bank exclusively. Collisions arose between the Dutch and the Swedes, and when the former put up the arms of the States General on the completion of a purchase of lands from the Indians, Printz in a passion ordered them to be torn down. The Swedes gained in strength while the Dutch lost ground in the vicinity. In 1648 the Dutch attempted to build a trading post on the Schuylkill, when they were repulsed by force by the Swedes. Individuals seeking to erect houses were treated in the same way. The Swedes in turn set up a stockade on the disputed ground. Director Stuyvesant found it necessary in 1651 to go to confer with Printz with a view to holding the country against the aggressive English. The Indians were called into council and confirmed the Dutch title, allowing the Swedes little more than the site of Fort Christina. Fort Casimir was erected lower down the river, to protect Dutch interests. The two rulers agreed to be friends and allies, and so continued for three years. The distress of the Swedish colony led to appeals for aid from the home country whither Governor Printz had returned. In 1654 help was given, and a new governor, John Claude Rysingh, marked his coming by the capture of Fort Casimir, pretending that the Dutch West India Company authorized the act. The only revenge the Dutch could take was the seizure of a Swedish vessel which by mistake ran into Manhattan Bay. But the next year orders came from Holland exposing the fraud of Rysingh, and directing the expulsion of the Swedes from the South River. A fleet was organized and Director Stuyvesant recovered Fort Casimir without firing a gun. After some parley Fort Christina was also surrendered. Such Swedes as would not take the oath of allegiance to the Dutch authorities were sent to the home country. Only twenty persons accepted the oath, and of three clergymen two were expelled, and the third escaped like treatment by the sudden outbreak of Indian troubles. In 1656 the States General and Sweden made these transactions matter of international discussion. The Swedes presented a protest against the action of the Dutch, and it was talked over, but the matter was finally dropped. In the same year the West India Company sold its interests on the South River to the city of Amsterdam, and the colony of New Amstel was erected, so that the authority of New Netherland was extinguished."—E. H. Roberts, *New York*, v. 1, ch. 7.

1664.—Conquest by the English, and annexation to New York.—"Five days after the capitulation of New Amsterdam [surrendered by the Dutch to the English, Aug. 20, 1664. See NEW YORK: 1664] Nicolls, with Cartwright and Maverick . . . commissioned their colleague, Sir Robert Carr, to go," with three ships and an adequate military force, "and reduce the Delaware settlements. Carr was instructed to promise the Dutch the possession of all their property and all their present privileges,

'only that they change their masters.' To the Swedes he was to 'remonstrate their happy return under a monarchical government, and his majesty's good inclination to that nation.' To Lord Baltimore's officers in Maryland, he was to declare that their proprietor's pretended right to the Delaware being 'a doubtful case,' possession would be kept for the king 'till his majesty is informed and satisfied otherwise.' . . . The Swedes were soon made friends," but the Dutch attempted [October] some resistance, and yielded only after a couple of broadsides from the ships had killed three and wounded ten of their garrison. "Carr now landed . . . and claimed the pillage for himself as 'won by the sword.' Assuming an authority independent of Nicolls, he claimed to be the 'sole and chief commander and disposer' of all affairs on the Delaware." His acts of rapacity and violence, when reported to his fellow commissioners, at New York, were condemned and repudiated, and Nicolls, the presiding commissioner, went to the Delaware in person to displace him. "Carr was severely rebuked, and obliged to give up much of his ill-gotten spoil. Nevertheless, he could not be persuaded to leave the place for some time. The name of New Amstel was now changed to New Castle, and an infantry garrison established there. . . . Captain John Carr was appointed commander of the Delaware, in subordination to the government of New York, to which it was annexed 'as an appendage'; and thus affairs remained for several years."—J. R. Brodhead, *History of the state of New York*, v. 2, ch. 2.

1673.—Dutch reconquest. See NEW YORK: 1673.

1674.—Final recovery by the English. See NETHERLANDS: 1674.

1674-1760.—In dispute between the duke of York and the proprietary of Maryland.—Grant by the duke to William Penn. See PENNSYLVANIA: 1682; 1685; 1760-1767.

1691-1702.—Practical independence of Penn's "lower counties" acquired.—"In April, 1691, with the reluctant consent of William Penn, the 'territories,' or 'lower counties,' now known as the State of Delaware, became for two years a government by themselves under Markham. . . . The disturbance by Keith [see PENNSYLVANIA: 1692-1696] creating questions as to the administration of justice, confirmed the disposition of the English government to subject Pennsylvania to a royal commission; and in April 1693, Benjamin Fletcher, appointed governor by William and Mary, once more united Delaware to Pennsylvania." But Penn, restored to his authority in 1694, could not resist the jealousies which tended so strongly to divide the Delaware territories from Pennsylvania proper. "In 1702, Pennsylvania convened its legislature apart, and the two colonies were never again united. [See also PENNSYLVANIA: 1701-1718.] The lower counties became almost an independent republic; for, as they were not included in the charter, the authority of the proprietary over them was by sufferance only, and the executive power intrusted to the governor of Pennsylvania was too feeble to restrain the power of their people. The legislature, the tribunals, the subordinate executive officers of Delaware knew little of external control."—G. Bancroft, *History of the United States (author's last revision)*, v. 2, pt. 3, ch. 2.—The question of jurisdiction over Delaware was involved throughout in the boundary dispute between the proprietaries of Pennsylvania and Maryland. See PENNSYLVANIA: 1685; 1760-1767.

1700-1776.—Suffrage qualifications. See SUFFRAGE, MANHOOD: United States: 1621-1776.

1760-1766.—Question of taxation by Parliament.—Stamp Act and its repeal.—Declaratory Act. See U. S. A.: 1760-1775; 1763-1764; 1765; and 1766: Repeal of Stamp Act.

1766-1774.—Opening events of the American Revolution.—First Continental Congress. See U. S. A.: 1766-1767 to 1774; BOSTON: 1768 to 1773.

1776.—Framing of Delaware bill of rights. See U. S. A.: 1776-1779.

1787.—Ratification of Federal constitution. See U. S. A.: 1787; 1787-1789.

1787-1864.—Suffrage qualifications. See SUFFRAGE, MANHOOD: United States: 1787-1800; 1800-1864.

1861.—Governor Burton's reply to Lincoln's call to arms. See U. S. A.: 1861: President Lincoln's call to arms.

1865.—Struggle between Republican and Democratic parties.—Democrats against negro suffrage.—"After the close of the civil war there existed for many years a feeling of great bitterness between the political parties in the state [of Delaware]. The war had created fierce antagonisms, and the feeling thus engendered could only be allayed by the lapse of time. At the State election held in November, 1865, a bitter struggle ensued between the two parties for control of the State. The Democratic nominee was Gove Saulsbury, who had succeeded as Speaker of the Senate to the governorship by reason of the death of Governor Cannon. The Republicans nominated James Riddle, a New Castle County man, and a manufacturer on the Brandywine near Wilmington. . . . It resulted in the complete success of the Democratic party. . . . The Democratic majority in the General Assembly, by a strict party vote, placed itself on record as being opposed to negro suffrage, the question coming before the body on a series of resolutions which were introduced touching the matter of the recent passage by Congress of a bill granting suffrage to negroes in the District of Columbia."—H. C. Conrad, *History of the state of Delaware*, v. 1, pp. 220, 221.

1868-1869.—Extension of railways.—"About this time [1868] much activity was shown in the extension of railroad facilities in the State. The main line of the Delaware Railroad which had been in operation for several years was supplemented by several branches connected therewith. One branch extended from Clayton to Easton, Md., and was known as the Maryland & Delaware Railroad; another from Seaford to Cambridge called the Dorchester & Delaware Railroad; a third from Townsend to Centreville and a fourth branch from Harrington by way of Milford and Georgetown, to Lewes, and called the Junction & Breakwater Railroad. A new line of railroad called the Wilmington & Reading was completed in 1860 connecting the City of Wilmington with Coatesville in Chester County, Pennsylvania."—*Ibid.*, v. 1, p. 223.

1883.—Delaware fruit exchange.—This exchange was chartered for the more efficient marketing of fruit, especially peaches. It was the purpose of the plan to centralize the handling so that buyers and sellers might meet at one place. This principle of marketing has been widely adopted in fruit raising sections.

1897.—New constitution.—A new constitution for the state of Delaware, which went into effect June 10, 1897, provided that after January 1, 1900,

no citizen should vote who could not write his name and read the constitution in the English language. It also provided a registration fee of one dollar as a qualification to vote. The constitution also has a special provision for its amendment. See AMENDMENTS TO THE CONSTITUTION: United States: Other methods, etc.

1898.—Special session of the general assembly.—Contribution to Spanish-American war.—“A special session of the General Assembly convened in January, 1898, the main purpose of its meeting being to pass such laws as were necessary to carry into effect the provisions of the new constitution. The most important enactment of the session was a General Incorporation law which contained very liberal provisions for the formation of corporations and which was designed to bring a large revenue to the State. . . . On the breaking out of the Spanish-American war in April, 1898, and the issuing of the call by President McKinley for volunteers, the General Assembly of Delaware, then in session, by joint resolution appropriated \$30,000 for mobilizing, arming and equipping her national guard, and giving to the members of the guard the necessary field training that had been neglected for several years.”—H. C. Conrad, *History of the state of Delaware*, v. 1, pp. 244, 245.

1901-1903.—Representation in the United States Senate interrupted by party disruption.—The domination of J. Edward Addicks in state politics from 1893 to 1906 is unique among the states. The Addicks faction was strong in the rural sections. Wilmington with one-third the population of the state had only one-fifteenth of the representation in the legislature.—See also DEADLOCKS.

1911.—Agricultural Extension Act, and appropriations.—By the Agricultural Extension Act a division of Agricultural Extension was established as a part of Delaware College to conduct coöperative experiments; conduct Boys' corn growing contests and otherwise “interest the youth of the State in agriculture,” make farm surveys, aid individual farmers in the study of their soil and crops and “do all that it can . . . to further the Agricultural interests of the State.” \$15,000 for necessary buildings and grounds for Delaware College, and \$4,500 for the purposes of the Agricultural Extension Act, were appropriated in 1911, and at the same time an amending act was passed providing for Farmers' Institutes with a proviso that the “State Board of Agriculture may appoint a director for the State.”

1917.—Income tax law passed.—Mothers' pensions.—Workmen's compensation laws.—Other progressive legislation under Governor Townsend.—By a law passed in 1917 a tax of one per cent was levied on net incomes of natural persons having gross incomes of \$1000 or more. The state mothers' pension commission was created in that year, to consist of three women from each of the three counties of the state. Widowed or abandoned mothers of children under fourteen years may receive aid not to exceed \$8 a month for the first child and \$4 a month for each additional child. Mothers whose husbands are physically or mentally incapacitated may receive the same aid. The state bears the expense of administration and gives half the aid. An elective workmen's compensation law was passed in 1917. Some of the other laws passed during the administration of Governor J. G. Townsend (1917-1921) were the Child Labor law (1917), laws for regulating the hours of labor for women (1917) and the Inheritance Tax law (1917).

1918-1919.—Eighteenth amendment ratified.—

Men furnished in World War.—Field investigations.—Recommendations for legislative action.—Progressive legislation.—New School Code (1919).—Delaware was the ninth state to ratify the eighteenth, or prohibition, amendment, that action taking place March 18. The state provided 7,484 soldiers or 0.2 per cent of the total.

“Field studies and investigations in Delaware were begun in September, 1918, the state and county survey being the first work undertaken. . . . Field investigations in the city of Wilmington were begun late in December, 1918, and continued through the following January and part of February. The report was delivered about the middle of March [1919]. . . . The state government was found to possess 117 administrative agencies—6 elected by the people, 83 appointed by the governor (usually with the consent of the state senate), 2 appointed by the judges of the superior court, 12 appointed by boards or administrative agencies other than the governor, and 14 acting *ex-officio*. . . . The counties, it was found, have from 25 to 50 administrative agencies each, which not only are independent of one another but also are independent of any central directing and controlling authority. . . . Friction, duplication, inefficiency, and extravagance abound. . . . there are 40 distinct and detached organization units with virtually no attempt to correlate them functionally. Eight of them are responsible to the voters of the city, 8 are responsible to the mayor and council jointly, 11 are responsible to the council alone, 5 are responsible to the governor of the state, 4 are responsible to the associate judge of the superior court residing in New Castle county, 3 are *ex-officio*, and 1 is responsible to persons entirely outside of the government. . . . For the state it was suggested that the present system be supplanted by a very simple organization consisting of 9 executive departments directly responsible to the governor. These 9 departments, it was shown, could easily transact the duties now reposed in the multifarious boards, commissions, and independent officers. For the counties reorganization along the lines of the commission-manager or the commission plan was advised. . . . For the city of Wilmington simplification according to the principles of the manager plan or the independent mayor plan was recommended. . . . It was also recommended that rural New Castle county and the city of Wilmington be divorced, and that a consolidated city-county government be set up in Wilmington. Another important recommendation was that of a grant of larger powers of self-government to Wilmington, which are urgently needed because the experience of the city under the tutelage of the state legislature has been notably unhappy. . . . The reports have been laid before the general assembly of the state and Governor Townsend has requested the creation of a reconstruction commission to go over the reports and use them as the basis of recommendations for concrete legislative action. . . . Since this article was written [May, 1919] a bill creating the reconstruction commission desired by the governor has passed the Delaware General Assembly.”—C. C. Maxey, *Delaware survey (National Municipal Review, May, 1919, pp. 223, 224, 225)*.—During the same year an act was passed creating a state banking department, and a revision of the school laws took place resulting in the New School Code (1919).

1918-1921.—Service citizens of Delaware.—“A number of men and women, quickened into new hope and faith and courage by the war, all residents of Delaware, all anxious to serve the people of their State, organized the Service Citizens July

23rd, 1918. Their general purpose and aim was to do what they could to make Delaware the ideal state in all such vital matters as public health, education, Americanization, community development. They were men and women of many and varied religious affiliations; they belonged to different political parties; they hailed from the city, the town, the village and the open country; they represented scores of occupations—lawyers, clergymen, doctors, manufacturers, merchants, skilled mechanics, farmers, and so forth. They were not bent upon advancing the interests of any political party or clique, they had no thought of proselytising in the name of church or creed; they sought no financial gain for themselves or their friends—they came together to help make Delaware a healthier, happier, sweeter and more prosperous place in which to live.”—*Service citizens of Delaware*, July 29, 1919, pp. 5-6.—In furtherance of its aims, up to May 6, 1921, among other activities, the association had carried on the reference bureau begun by the general service board, established a Public Health Bureau, organized a traveling dental outfit to care for the teeth of school children, augmented the funds provided by the State for Americanization, established a pedagogic branch of the Women's College of Delaware, established thirty scholarships of \$150 a year each for two years, for the teachers' training course, provided over \$60,000 to cover school board deficits throughout the State, and had erected twenty-four new school buildings and begun the construction of fifteen more.

1920.—Population returns show continued inequality of representation.—Presidential vote.—The census of 1920 indicated that the state's population was 223,003, while that of the single city of Wilmington was 110,168, or almost half as much. By the constitution of 1831 the three counties of Delaware had equal representation in the legislature, but since New Castle county, containing Wilmington, had, after 1870, a larger population than the other two together, discontent increased until the constitution of 1897 gave New Castle county fifteen representatives and Essex and Sussex each ten (each of the three counties having seven senators). Nevertheless the representation under the constitution of 1897 continues to be disproportionate. Delaware in 1920 distributed its presidential vote as follows: Republican, 52,858; Democratic, 39,898; Socialist, 1,002; Prohibition, 998.

1921-1922.—Extension of state highways.—During this period considerable work was done under the state highway commission in carrying out their tremendous projects. Parts of Delaware's magnificent road system have been the gifts of public spirited citizens. General Coleman T. du Pont gave the state a 20 mile highway in 1921 running from Shelbyville to Georgetown.

Hase, *Index of economic material in documents of the states of the United States, Delaware, 1789-1904*.

DELAWARE, Service Citizens of. See DELAWARE: 1918-1921.

DELAWARE BAY, situated between the states of Delaware and New Jersey, on the Atlantic coast of the United States.

1609.—Discovered by Henry Hudson. See AMERICA: 1609.

Error perpetuated in its name.—“Almost every writer on American history that I have met with appears to have taken pains to perpetuate the

stereotyped error that ‘Lord Delawarr touched at this bay in his passage to Virginia in 1610.’ . . . Lord Delawarr himself, in his letter of the 7th of July, 1610, giving an account of his voyage to Virginia, not only makes no mention of that bay, or of his approaching it, but expressly speaks of his first reaching the American coast on the 6th of June, at what time we made land to the southward of our harbor, the Chesioptock Bay.’ The first European who is really known to have entered the bay, after Hudson, was Capt. Samuel Argall [July, 1616]. . . . The name of Lord Delawarr, however, seems to have been given to the bay soon afterwards by the Virginians.”—J. R. Brodhead, *History of the state of New York*, v. 1, app., note D.

DELAWARE RIVER, Washington's passage of (1777). See U. S. A.: 1776-1777: Washington's retreat.

DELAWARES, or Lenape. —“The proper name of the Delaware Indians was and is Lenapé (â as in father, é as a in mate). . . . The Lenape were divided into three sub-tribes:—1. The Minsi, Monseys, Montheys, Munsees, or Minisinks. 2. The Unami or Wonameys. 3. The Unalachtigo. No explanation of these designations will be found in Heckewelder or the older writers. From investigations among living Delawares, carried out at my request by Mr. Horatio Hale, it is evident that they are wholly geographical, and refer to the location of these subtribes on the Delaware river. . . . The Minsi lived in the mountainous region at the head waters of the Delaware, above the Forks or junction of the Lehigh river. . . . The Unamis' territory on the right bank of the Delaware river extended from the Lehigh Valley southward. It was with them and their southern neighbors, the Unalachtigos, that Penn dealt for the land ceded to him in the Indian deed of 1682. The Minsis did not take part in the transaction, and it was not until 1737 that the Colonial authorities treated directly with the latter for the cession of their territory. The Unalachtigo or Turkey totem had its principal seat on the affluents of the Delaware near where Wilmington now stands.”—D. G. Brinton, *Lenape and their legends*, ch. 3.—“At the . . . time when William Penn landed in Pennsylvania, the Delawares had been subjugated and made women by the Five Nations. It is well known that, according to that Indian mode of expression, the Delawares were henceforth prohibited from making war, and placed under the sovereignty of the conquerors, who did not even allow sales of land, in the actual possession of the Delawares, to be valid without their approbation. William Penn, his descendants, and the State of Pennsylvania, accordingly, always purchased the right of possession from the Delawares, and that of Sovereignty from the Five Nations. . . . The use of arms, though from very different causes, was equally prohibited to the Delawares and to the Quakers. Thus the colonization of Pennsylvania and of West New Jersey by the British, commenced under the most favorable auspices. Peace and the utmost harmony prevailed for more than sixty years between the whites and the Indians; for these were for the first time treated, not only justly, but kindly, by the colonists. But, however gradually and peaceably their lands might have been purchased, the Delawares found themselves at last in the same situation as all the other Indians, without lands of their own, and therefore without means of subsistence. They were compelled to seek refuge on the waters of the Susquehanna, as tenants at will, on lands belonging to their hated conquerors, the Five Nations. Even there and on the Juniata they were en-

croached upon. . . Under those circumstances, many of the Delawares determined to remove west of the Alleghany Mountains, and, about the year 1740-50, obtained from their ancient allies and uncles, the Wyandots, the grant of a derelict tract of land lying principally on the Muskingum. The great body of the nation was still attached to Pennsylvania. But the grounds of complaint increased. The Delawares were encouraged by the western tribes, and by the French, to shake off the yoke of the Six Nations, and to join in the war [1754-1703] against their allies, the British. The frontier settlements of Pennsylvania were accordingly attacked both by the Delawares and the Shawnees. And, although peace was made with them at Easton in 1758, and the conquest of Canada put an end to the general war, both the Shawnees and Delawares removed altogether in 1768 beyond the Alleghany Mountains. . . The years 1765-1795 are the true period of the power and importance of the Delawares. United with the Shawnees, who were settled on the Scioto, they sustained during the Seven Years' War the declining power of France, and arrested for some years the progress of the British and American arms. Although a portion of the nation adhered to the Americans during the War of Independence, the main body, together with all the western nations made common cause with the British. And, after the short truce which followed the treaty of 1783, they were again at the head of the western confederacy in their last struggle for independence. Placed by their geographical situation in the front of battle, they were, during those three wars, the aggressors, and, to the last moment, the most active and formidable enemies of America. The decisive victory of General Wayne (1794), dissolved the confederacy; and the Delawares were the greatest sufferers by the treaty of Greenville of 1795." After this, the greater part of the Delawares were settled on White River, Indiana, "till the year 1819, when they finally ceded their claim to the United States. Those residing there were then reduced to about 800 souls. A number . . . had previously removed to Canada; and it is difficult to ascertain the situation or numbers of the residue at this time [1836]. Those who have lately removed west of the Mississippi are, in an estimate of the War Department, computed at 400 souls. Former emigrations to that quarter had however taken place, and several small dispersed bands are, it is believed, united with the Senecas and some other tribes."—A. Gallatin, *Synopsis of the Indian tribes (Archæologia Americana, v. 2), introd., sect. 2.*—See also ALGONQUIAN FAMILY; ALLEGHANS; CHEROKEES; INDIANS, AMERICAN: Cultural areas in North America: Eastern Woodlands area; IROQUOIS CONFEDERACY; MORAVIAN OR BOHEMIAN BRETHERN: In Saxony and America; OHIO: 1774; SHAWANESE; U. S. A.: 1765-1768.

DE LA WARR, or Delaware, Lord (Thomas West). See DELAWARE, LORD.

DELBRÜCK, Clemens (1856-), German statesman. Burgomaster of Danzig, 1806; governor of West Prussia, 1902; minister of commerce and industry, 1905. In 1909 he was appointed minister of the interior. See GERMANY: 1916; Change of government and army personnel; WORLD WAR: Diplomatic background: 78.

DELCASSÉ, Théophile (1852-), French statesman. Elected to the chamber of Deputies, 1889; was connected with the French colonial office, 1893-1895; minister of foreign affairs, 1898-1905, during which period he worked to isolate Germany and did much to strengthen friendly relations of France with other European powers. In

1905 he resigned in order to relieve the tenseness of the Moroccan situation, and avoid war. Re-elected to Chamber of Deputies in 1906; minister of marine, 1911-1912; minister of foreign affairs, 1912. In August, 1914, he became a member of Viviani's nonpartisan war cabinet; resigned in 1915 as a protest against the sending of an expeditionary force to Serbia. See FRANCE: 1915 (October); WORLD WAR: Causes: Indirect: f.

DELFT, small city in South Holland between Rotterdam and The Hague, founded in 1071 by Gottfried, duke of Lorraine.

1584.—Assassination of the Prince of Orange. See NETHERLANDS: 1581-1584.

1813.—Revolt against the French. See NETHERLANDS: 1813.

DELHI, capital of British India since 1912. It is situated in what was formerly the southeastern corner of the province of Punjab; but by a proclamation issued Oct. 1, 1912, the city and its surroundings now constitute a separate province. (See INDIA: Map.) It is a very ancient city and was formerly the capital of the Mogul empire (1605). It was rebuilt in 1638-1648 by Shah Jahan, who gave to it the title Shah-Jahanbad. Based on the census of 1911 the population of the new city is about 413,000 and the area 573 square miles.

11th century.—Capture by Mahmud of Gazna. See TURKEY: 999-1183.

1192-1290.—Capital of the Mameluke or Slave dynasty. See INDIA: 977-1290.

1316-1339.—Under Tughlak sultans. See INDIA: 1290-1308.

1399.—Sack and massacre by Timur. See TIMUR.

1526-1605.—Founding of Mogul empire by Babar and Akbar. See INDIA: 1399-1605.

1739.—Sack and massacre by Nadir Shah. See INDIA: 1662-1748.

1760-1761.—Taken and plundered by the Maharrattas, then by the Afghans.—Collapse of the Mogul empire. See INDIA: 1747-1761.

1803.—Captured by Lake. See INDIA: 1798-1805.

1857.—Sepoy mutiny.—Massacre of Europeans.—Explosion of the magazine.—English siege and capture of the city. See INDIA: 1857 (May); (May-August); (June-September).

1903.—Great durbar. See INDIA: 1903 (January).

1911.—Durbar.—Personal attendance of the king-emperor of India.—Made the capital of India instead of Calcutta.—"The great event [December 12] of the year 1911, perhaps the greatest in modern Indian history, is over, leaving a pleasant memory of how the King-Emperor of India came from a distant land and in words full of graceful condescension announced the solemnity of his coronation to a loyal and loving people of diverse races, creeds and colours. No prince or potentate had, up to this time, done so. . . . The chief event of the Coronation was the transfer of the capital of the Empire from Calcutta to Delhi, an event which was never expected. . . . The wholesale trade of Calcutta is not likely to suffer much by this change. A few European houses may be losers of custom, but the great seaborne trade of the place will remain as it is."—B. Nath, *Delhi: ancient and modern (East and West, Feb., 1912, pp. 105, 106).*—"One of the reasons why Lord Hardinge was attracted to Delhi as his capital and why in the building of the new Imperial city he urged plans and expenditure on what seemed to be a scale of only too characteristically oriental extravagance, was that he might be nearer to the

Native States and thus be more frequently in their minds, and that the seat of government might appeal to them as truly Indian in its grandeur. One has only to look at a political map of India to see how Delhi lies in the midst of what is still native in India, and that when the British Government went there it seemed to cut itself off from the alien settlements of British race and merge itself in the dreams, in the ruins, in the traditions that to the great mass of the people are India."—J. R. Macdonald, *Government of India*, pp. 117, 118.—"Wherever the merit or demerit of that decision [to change the capital of India from Calcutta to Delhi] lies, it cannot be attributed to Lord Hardinge personally. Lord Hardinge reached India towards the end of 1910. The mind of the Government of India must have been made up early in the following summer, for the despatch which asked for the sanction of the Secretary of State not only to the exchange of capitals, but to the abandonment of the lately instituted Province of Eastern Bengal and the creation of another new Province out of Behar and Orissa, was dated Aug. 25, 1911; and it is patent that so big a scheme could not have been worked out in a night. But in August, 1911, Lord Hardinge, if he had seen Delhi at all, can only have been there on a flying visit to inspect the ground-breaking for the Royal Durbar. . . . The adoption of Delhi was only one part of a many-sided scheme which had several purposes; and the Government, in their despatch, frankly stated that an ideal capital would be hard to find. Some of the hopes with which the scheme was adopted have turned out better than expectation; in other respects the results are less satisfactory."—*India under Lord Hardinge* (*Quarterly Review*, July, 1916, p. 100).—"Very rarely since the sixteenth century, when Akbar laid the foundations of Fatehpur-Sikri and of the modern city of Agra, has there been any city-building project of so much interest and importance, not only for India, but for the whole Western world, as the building of the new capital for the Government of India at Delhi. [See CITY PLANNING: India]."—E. B. Havell, *Building of the new Delhi* (*Asiatic Quarterly*, Jan., 1913, p. 87).

1916-1921.—Viceroy.—Lord Hardinge was succeeded in 1916 by Lord Chelmsford, who was in turn followed in 1921 by Lord Reading.

1918.—War conference. See INDIA: 1914-1918.

1919.—Riots.—In March, 1919, the unrest prevalent in various parts of India during that year took the form of street riots in Delhi. Six were reported killed and seventeen wounded by the troops which fired upon the mob.—See also INDIA: 1919.

1921.—First session of Indian parliament.—"The great hall of audience of the Mogul Emperors on Feb. 8 witnessed one of the most beautiful and impressive ceremonies it ever beheld. . . . For the first time in their history the Princes and ruling chiefs of India met as a consultative body. . . . Sir A. B. Wood, Joint Foreign Secretary, read the proclamation of the British Emperor, which made the Chamber of Princes an auxiliary and guide at the side of the Government of India, to advance the interests common to their territories and to British India. . . . The first meeting of the new Council of State was held on Feb. 14. The session was mainly devoted to a resolution proposing a committee to consider the repealing or modifying of 'repressive laws.'"—*New York Times Current History*, April, 1921, pp. 137, 138, 139.

DELIUM, Battle of (424 B. C.).—"A serious defeat suffered by the Athenians in the Peloponnesian War, 424 B. C., at the hands of the Thebans and other Boeotians. It was consequent upon the seizure by the Athenians of the Boeotian temple of Delium—a temple of Apollo—on the sea-coast, about five miles from Tanagra, which they fortified and intended to hold. After the defeat of the army which was returning from this exploit, the garrison left at Delium was besieged and mostly captured. Among the hoplites who fought at Delium was the philosopher Socrates. The commander Hippocrates was slain."—Thucydides, *History*, bk. 4, sect. 89-100.—See also GREECE: B. C. 424-421.

DELLA TORRE FAMILY. See MILAN: 1277-1447.

DE LONG, George Washington (1844-1881), American Arctic explorer. See ARCTIC EXPLORATION: 1867-1901; Chronological summary: 1879-1882; and Map of Arctic regions.

DE L'ORME, Philibert (c. 1510-1570), French architect; studied in Italy, where he was employed by Pope Paul III; in France he was made architect to Francis I (1545), and favored by Henry II and Charles IX; principal work, Château d'Anet (destroyed), parts of Chenonceaux and Tuileries, tomb of Francis I at St. Denis.

DELOS, the smallest island of the group called the Cyclades, but the most important in the eyes of the Ionian Greeks, being their sacred isle, the fabled birthplace of Apollo and long the chief seat and center of his worship. "The Homeric Hymn to Apollo presents to us the island of Dêlos as the centre of a great periodical festival in honour of Apollo, celebrated by all the cities, insular and continental, of the Ionic name. What the date of this hymn is, we have no means of determining: Thucydides quotes it, without hesitation, as the production of Homer, and, doubtless, it was in his time universally accepted as such,—though modern critics concur in regarding both that and the other hymns as much later than the Iliad and Odyssey. It cannot probably be later than 600 B. C. The description of the Ionic visitors presented to us in this hymn is splendid and imposing; the number of their ships, the display of their finery, the beauty of their women, the athletic exhibitions as well as the matches of song and dance,—all these are represented as making an ineffaceable impression on the spectator: 'the assembled Ionians look as if they were beyond the reach of old age or death.' Such was the magnificence of which Dêlos was the periodical theatre, and which called forth the voices and poetical genius not merely of itinerant bards, but also of the Delian maidens in the temple of Apollo, during the century preceding 560 B. C. At that time it was the great central festival of the Ionians in Asia and Europe."—G. Grote, *History of Greece*, pt. 2, ch. 12.—During the war with Persia, Delos was made the common treasury of the Greeks; but Athens subsequently took the custody and management of the treasury to herself and reduced Delos to a dependency. The island was long the seat of an extensive commerce, and Delian bronze was of note in the arts.

B. C. 490.—Spared by the Persians. See GREECE: B. C. 490.

B. C. 477.—Delian confederacy. See ATHENS: B. C. 477; GREECE: B. C. 478-477.

B. C. 454.—Removal of the confederate treasury to Athens. See ATHENS: B. C. 466-454.

B. C. 425-422.—Purifications.—“In the midst of the losses and turmoil of the [Peloponnesian] war it had been determined [at Athens] to offer a solemn testimony of homage to Apollo on Delos, 425 B. C.—a homage doubtless connected with the complete cessation of the pestilence, which had lasted as long as the fifth year of the war. The solemnity consisted in the renewed consecration of the entire island to the divine Giver of grace; all the coffins containing human remains being removed from Delos, and Rhenea appointed to be henceforth the sole burial-place. This solemnity supplemented the act formerly performed by the orders of Pisistratus, and it was doubtless in the present instance also intended, by means of a brilliant renewal of the Delian celebration, to strengthen the power of Athens in the island sea, to give a festive centre to the Ionic world. . . . But the main purpose was clearly one of morality and religion. It was intended to calm and edify the minds of the citizens.”—E. Curtius, *History of Greece*, bk. 4, ch. 2.—Three years later (422 B. C.) the Athenians found some reason for another purification of Delos which was more radical, consisting in the expulsion of all the inhabitants from the island. The unfortunate Delians found an asylum at Adramyttium in Asia, until they were restored to their homes next year, through the influence of the Delphic oracle.—Thucydides, *History*, bk. 5, sect. 1.

B. C. 88.—Pontic massacre.—Early in the first war of Mithradates with the Romans (88 B. C.), Delos, which had been made a free port and had become the emporium of Roman commerce in the east, was seized by a Pontic fleet, and pillaged, 20,000 Italians being massacred on the island. The treasures of Delos were sent to Athens and the island restored to the Athenian control.—W. Ihne, *History of Rome*, bk. 7, ch. 17.

B. C. 69.—Ravaged by pirates.—“Almost under the eyes of the fleet of Lucullus, the pirate Athenodorus surprised in 685 [60 B. C.] the island of Delos, destroyed its far-famed shrines and temples, and carried off the whole population into slavery.”—T. Mommsen, *History of Rome*, bk. 5, ch. 2.

Slave trade under the Romans.—“Thrace and Sarmatia were the Guinea Coast of the Romans. The entrepôt of this trade was Delos, which had been made a free port by Rome after the conquest of Macedonia. Strabo tells us that in one day 10,000 slaves were sold there in open market. Such were the vile uses to which was put the Sacred Island, once the treasury of Greece.”—H. G. Liddell, *History of Rome*, bk. 5, ch. 48.

DELPHI, CRISSA, KIRRHA.—“In those early times when the Homeric Hymn to Apollo was composed the town of Krissa [in Phocis, near Delphi] appears to have been great and powerful, possessing all the broad plain between Parnassus, Kirphis, and the gulf, to which latter it gave its name,—and possessing also, what was a property not less valuable, the adjoining sanctuary of Pytho itself, which the Hymn identifies with Krissa, not indicating Delphi as a separate place. The Krissæans, doubtless, derived great profits from the number of visitors who came to visit Delphi, both by land and by sea, and Kirrha was originally only the name for their seaport. Gradually, however, the port appears have grown in importance at

the expense of the town; . . . while at the same time the sanctuary of Pytho with its administrators expanded into the town of Delphi, and came to claim an independent existence of its own. . . . In addition to the above facts, already sufficient in themselves as seeds of quarrel, we are told that the Kirrhæans abused their position as masters of the avenue to the temple by sea, and levied exorbitant tolls on the visitors who landed there. . . . Besides such offence against the general Grecian public, they had also incurred the enmity of their Phocian neighbours by outrages upon women, Phocian as well as Argeian, who were returning from the temple. Thus stood the case, apparently, about 595 B. C., when the Amphiktyonic meeting interfered . . . to punish the Kirrhæans. After a war of ten years, the first Sacred War in Greece, this object was completely accomplished, by a joint force of Thesalians under Eurylochus, Sikyonians under Kleisthenes, and Athenians under Alkmæon; the Athenian Solon being the person who originated and enforced, in the Amphiktyonic council, the proposition of interference. Kirrha . . . was destroyed, or left to subsist merely as a landing place; and the whole adjoining plain was consecrated to the Delphian god, whose domains thus touched the sea. . . . The fate of Kirrha in this war is ascertained: that of Krissa is not so clear, nor do we know whether it was destroyed, or left subsisting in a position of inferiority with regard to Delphi. From this time forward, the Delphian community appears as substantive and autonomous, exercising in their own right the management of the temple; though we shall find, on more than one occasion, that the Phocians contest this right. . . . The spoils of Kirrha were employed by the victorious allies in founding the Pythian Games. The octennial festival hitherto celebrated at Delphi in honour of the god, including no other competition except in the harp and the pæan, was expanded into comprehensive games on the model of the Olympic, with matches not only of music, but also of gymnastics and chariots,—celebrated, not at Delphi itself, but on the maritime plain near the ruined Kirrha,—and under the direct superintendence of the Amphiktyons themselves. . . . They were celebrated in the latter half of summer, or first half of every third Olympic year. . . . Nothing was conferred but wreaths of laurel.”—G. Grote, *History of Greece*, pt. 2, ch. 28.—See also AMPHIKTYONIC COUNCIL; GREECE: B. C. 357-336; ORACLES; PYTHO.

DEMIURGE, or Demiurgus, name given by Gnostics to the creator of spirit and matter, who is differentiated from the supreme God. See **GNOSTICS**.

DEMIURGI, COSMOS, TAGOS (or Tagus).—Of the less common titles applied among the ancient Greeks to their supreme magistrates, are "Cosmos, or Cosmos, and Tagos (signifying Arranger and Commander), the former of which we find in Crete, the latter in the Thessalian cities. With the former we may compare the title of Cosmopolis, which was in use among the Epizephyrian Locrians. A more frequent title is that of Demiurgi, a name which seems to imply a constitution no longer oligarchical, but which bestowed certain rights on the Demos. In the time of the Peloponnesian war magistrates of this kind existed in Elis and in the Arcadian Mantinea. . . . The title is declared by Grammaticus to have been commonly used among the Dorians. . . . A similar title is that of Demuchus, which the supreme magistrates of Thespiæ in Bœotia seem to have borne. . . . The Artyni at Ætina and Argos we have already mentioned."—G. Schömann, *Antiquities of Greece: The state*, pt. 2, ch. 5.

DEFINITION.—"What do we mean by democracy? . . . There is no word in the English language now more misused and misunderstood than this much-abused word, 'democracy.' Born in ancient Greece, it has come down through the ages as a shibboleth of the age-long and irresistible struggle of humanity toward what we might call civilization."—E. N. Dingley, *What is democracy?* (pamphlet, p. 3).—"Neither De Tocqueville nor Bryce, neither Mill nor Sumner Maine, has satisfactorily described either liberty or democracy. . . . Democracy is nowhere truthfully portrayed because no writer ever views it comprehensively. Democracy is more than a form of government; it is more than universal suffrage; it is more, even, than popular power. . . . Scientifically democracy must be defined as a form of society, or as a combination of the three. As a form of government, democracy consists in the actual administration of political affairs through universal suffrage. Democracy as a form of government cannot coexist with representative institutions; it admits executive and judicial offices only

of the most restricted ministerial type; it demands the decision of every question of legal and executive detail, no less than of every fundamental principle of right and of policy, by a direct popular vote. There is no such thing as a democratic government on a large scale. Democracy as a form of the state is popular sovereignty,—that is, a popular distribution of formal political power. It signifies the right of the masses of the people to participate in the creation of the government or machinery of administration. It may act through representative institutions, as well as directly. . . . Democracy as a form of society is not so often or quite so easily discriminated. It is a democratic organization and control of the non-political forms of association. It is also something besides. In a perfectly democratic society the masses would possess that indefinite, unformed, but actual political power which lies back of the formal power that registers its decisions through the act of voting. In the poorer ranks of the population there would be a volume of feeling, opinion, and will, that might at any moment assume a political form, either legal or revolutionary. In Professor Burgess's nomenclature, democracy as a form of society is popular sovereignty behind the constitution, as distinguished from popular sovereignty in the constitution. In the language of Professor Dicey, it is popular political sovereignty as distinguished from popular legal sovereignty."—F. H. Giddings, *Democracy and empire*, pp. 199-200, 203.—See also **CONSTITUTIONS**: Functions and purpose.—"I refrained . . . from attempting to lay down an inclusive definition. Such a course appeared necessary, if I would not attribute to American democracy of the past all that we now find to be theoretically involved in the action and character of thoroughly democratic people. If we analyze the subject, we shall see that we now find implied in it much that men would not have seen or not accepted in most of the decades of the past. Inasmuch as a democratic society includes naturally within itself the character, the aspirations, and the qualities of the main body of the people, we must expect, as the years go by, that some of the characteristics of democracy, portions at least of its visible significance, will vary. Successive experiences and developing social needs recreate, modify, and enlarge the scope and content of democratic responsibility."—A. C. McLaughlin, *Steps in the development of American democracy*, pp. 168-169.—"Democracies are absolutely dependent for their existence upon the preservation of law. Autocracies can give commands and enforce them. Rules of action are a convenience, not a necessity for them. On the other hand, the only atmosphere in which a democracy can live between the danger of autocracy on one side and the danger of anarchy on the other is the atmosphere of law. . . . The conception of an international law binding upon the governments of the world is, therefore, natural to the people of a democracy, and any violation of that law which they themselves have joined in prescribing is received with disapproval, if not with resentment."—E. Root, *Effect of democracy on international law* (*American Society International Law, Proceedings*, 1917, pp. 7-8).—See also below: Basis and value.

In primitive society.—"Critical ethnologists have come into essential agreement that the earliest type of social organization among primitive men was that of the *local group* organized about the institutions of the family and the village, and characterized by the absence of any elaborate kinship organization. It is in these small social groupings that the nearest approach is found to the so-called 'primitive democracy.' Here one finds small groups

on a basis of intimate association . . . and the component individuals participate in the whole culture of the group to a degree unknown in modern society."—H. E. Barnes, *Outline of the history of democracy*, p. 1.—See also CLANS.

In early political society.—The political state was the result of the amalgamation of warring groups for mutual protection. In this "nation making age," as Walter Bagehot calls it, there was a complete absence of democracy. The only form of government was absolute despotism.

ALSO IN: F. S. Marvin, *Living past*, ch. 3.

During the classical period.—"The democracy of ancient Hellas was a reaction against barbarism and a step made necessary to secure national safety and defence. Solon first tore the shackles of tyranny and aristocracy from the wrists of the wretched weaklings of ancient Athens. . . . But Solon's democracy was a failure, ending after thirty years of strife in a tyranny more pronounced than ever."—E. M. Dingley, *What is democracy?* (pamphlet, p. 3).—See also ATHENS: B. C. 504; GREECE: B. C. 8th-5th centuries: Political evolution of the leading states; HELLEA.—"The eccentricities of modern education make us dependent for a number of our primary political terms upon those used by the thinkers of the small Greek republics of ancient times before those petty states collapsed, through sheer political ineptitude, before the Macedonians. They thought in terms of states so small that it was possible to gather all the citizens together for the purposes of legislation. These states were scarcely more than what we English might call sovereign urban districts. Fast communications were made by runners; even the policeman with a bicycle of the modern urban district was beyond the scope of the Greek imagination. There were no railways, telegraphs, telephones, books or newspapers, there was no need for the state to maintain a system of education, and the affairs of the state were so simple that they could be discussed and decided by the human voice and open voting in an assembly of all the citizens. That is what democracy meant."—H. G. Wells, *In the fourth year*, pp. 112-113.—There was no real democracy either in Greece or Rome. Both countries, however, made valuable contributions to the theory of democracy. The "Politics" and "Ethics" of Aristotle have had a great influence on modern history, especially in England. "The curriculum of the oldest and most important branch of studies in Oxford finds in the *Republic* of Plato and the *Ethics* of Aristotle its central texts; and truths drawn from Greek thought have been learned in Oxford, and enforced in the world, not only by the thinkers, but also by the men of action, who have been trained in this curriculum. Generations of students have learned from Plato and Aristotle the lessons that 'man by the law of his being is a member of a political community'; that the true State is a 'partnership in a life of virtue'; that law is the expression of pure and passionless reason; that righteousness consists for each man in the fulfilment of his appointed function in the life and action of the community. These lessons have not been forgotten. 'If you take English political thought and action, from Pitt and Fox onwards,' writes Prof. Murray, 'it seems to me that you will always find present . . . strands of feeling which are due—of course among many other causes—to this germination of Greek influence; and unquestioning respect for freedom of life and thought, a mistrust of passion . . . a sure consciousness that the poor are the fellow citizens of the rich, and that statesmen must as a matter of fact consider the welfare of the whole State.'

The ultimate basis of the idealist philosophy of the State is thus to be found in the writings of Plato and Aristotle, and in a steady tradition of study and teaching of the *Republic* and the *Ethics*."—E. Barker, *Political thought in England*, pp. 24-25.—Aristotle's and Plato's theory of the state was that the "intelligent and capable" should rule. "We must consider . . . whether we establish guardians with this view, that they may enjoy the greatest happiness,—or, looking to the entire state, we regard whether it is to be found therein; and we must compel these allies and guardians to do this, and persuade them to become the best performers of their own particular work, and act also towards all others in the same manner; and thus, as the whole city becomes prosperous, and well constituted, we must permit the several classes to share in that degree of happiness which their nature admits. . . . By this smallest class [the guardians] and portion of the state then, and by the science that presides over and governs it, is the whole city wisely established on natural principles. . . . A democracy . . . arises when the poor prevailing over the rich, kill some, and banish others, and share the state-offices and magistracies equally among the remainder . . . and it seems to be a pleasant sort of government, both anarchical and variegated, distributing a certain equality to all alike, both equals and unequals. . . . The same malady . . . that existed in an oligarchy destroys this form likewise. . . . For excessive liberty seems only to degenerate into excessive slavery. . . . Probably then, tyranny is established out of no other form than democracy."—Plato, *Republic* (trans. by H. Davis), bk. 4, ch. 1, 7, bk. 8, ch. 10-11, 15.—The idea of a governmental compact originated with the Greeks. The great contribution of Rome to the history of democracy was the theory that the consent of the people was the foundation of the ruler's authority.—See also ACHÆAN LEAGUE; ATHENS: B. C. 508; 472-462; 461-431: Periclean democracy; 413-411; 336-322; GREECE: B. C. 4th century: General conditions; EUROPE: Ancient: Greek civilization: Political development.

In the Middle Ages.—"Lassalle traces the course of social evolution from the Middle Ages, to discover in what way social classes have been marked off from each other, in what way power and privilege have been distributed among them, and by what conditions their relations to one another have been determined; the retrospect disclosing a progressive broadening of the basis of power and privilege, accompanied by moral not less than material gains. Going back to the Middle Ages, Lassalle finds the same social grades as now, but not well developed or defined, and one grade and one element—the landed interest—dominating all the others. The cause—a simple one—he discovers in the economic conditions of the time. Agricultural produce was the staple wealth. Trade was but slightly developed, manufacturing still less, and movable possessions were so little thought of in comparison with possession of the soil that chattels were alienable without the consent of heirs, while property in land was not. Four highly important social consequences resulted from this predominance of the landed interest. First, a vast development of the feudal system, with its obligations of service in the field; second, the limitation of the right of representation to the owners of real estate; third, the exemption of landed proprietors from taxation, on the principle that a ruling, privileged class, invariably seeks to throw the burden of maintaining the existence of the state on the oppressed classes that have no property; fourth, the contempt

with which every labour or profession not connected with the land was socially regarded."—F. H. Giddings, *Democracy and empire*, pp. 100-101. —"The political conditions of the Middle Ages were unfavourable to the growth of republican sentiment. War was chronic, communication difficult, and social inequality ingrained in the necessary institution of feudalism. The countries which were best ordered were those the extent of whose territory did not exceed the powers of a medieval monarchy to control, such as Aragon, Sicily, England; and the advance of monarchy was a sure indication of national progress. Clerk and burgess looked to the King for protection against the rapacity of the noble, and the whole influence of the Roman Church was enlisted in the support of an institution from which she received and expected material benefits, and which she believed to be founded on the impregnable rock of Scripture. The political theory of the early Middle Ages, forged in the stress of the conflict between the Empire and the Papacy, bears witness to this general belief in the necessity and divinity of Kingship. The Papalist controversialists of the twelfth century contested not the God-ordained character of the Roman Empire nor questioned its duration. Still less did they propound republican ideals. It was a sufficient step for them to assert that monarchy was an office founded upon a contract, and that if the contract were violated by the sovereign he could be lawfully deposed. In England, constitutional growth was sure and wholesome, and though the Barons' War was stoutly contested, the song of Lewes which proclaims the theory of the opposition to the Crown does not belong to the category of democratic documents. It proclaims no republic, sketches no scheme of natural rights. The remedy for the ills of the harassed nation is that Henry III., whose 'gentle soul' flits through Dante's 'Purgatory,' should govern with the consent of his baronage. . . . The greatest of the Gentile philosophers supported a tenet which was believed to be a part of the divine providence by the doctors of the Catholic Church. Aristotle maintained that of all forms of government the most perfect was the rule of one good man, and the Christian teacher saw in the government of God both the pattern of the perfect monarchy and the exemplar expressly divined for the imitation of His human subjects. A curious instance of the power of this belief is afforded by Savonarola's 'Treatise upon the rule and government of States,' written in 1494 for the guidance of the city of Florence. It was the object of this remarkable discourse to explain that the people of Florence, being at once the most intellectual and spirited community in Italy, were unsuited to a monarchical or aristocratical government. A monarchy might do well enough for the Northern races, who were robust but unintellectual, or again it might be adapted to Orientals, whose activity of mind was balanced by physical languor; but wherever intellect and high spirit were combined, some form of popular government (*Governo civile*) must be established. Yet this conclusion is prefaced by an elaborate profession of belief in monarchy as the ideal form of government, not only because concentrated power was stronger than dispersed power, but also because monarchy was more like God. . . . It is true that from time to time the physical miseries of an uncomfortable age produced a crop of speculations which went far beyond the orbit of respectable thought. The right of the Church to possess wealth, or of the State to exercise coercive power, was questioned in the thirteenth century by the sectaries of Southern France, for whose chastisement was invented the

terrible weapon of the Inquisition. But such anti-social vagaries were rigidly suppressed. The heresies of the early Middle Ages contained a mixture of wild fancy and obdurate realism, exactly calculated to secure the discomfiture of those who held them. They were in the main the beliefs of the poor and oppressed, of men who felt the full force of the ironic contrast between the promises of the gospel and the performance of the world; who questioned doctrine where it seemed to conflict with the patent evidence of the senses; and finding the world full of evils, cried out against the fundamental principles upon which it was arranged. Such a spirit of wholesale revolt is common to every age and clime. In the Middle Ages, when the State was loosely jointed, and the dominant evil was to be found rather in the deficiency than in the excess of governance, the spirit of democratic protest was sporadic and unorganized. No comprehensive political programmes were drawn up; no revolutionary philosophy of the State was formulated."—H. A. L. Fisher, *Republican tradition in Europe*, pp. 8-9, 11-13.—See EUROPE: Middle Ages.—The only sign of democracy at this period was the equality which existed in the monasteries. Christianity introduced into the world the idea of the "brotherhood of man," although church organization was more autocratic than democratic. When the phrase "the people" was used during the Middle Ages it meant only the first three estates. The peasantry, by far the most numerous class of the population, was not included.

Progress in 17th and 18th centuries.—English revolutions.—American revolution.—Effects of the American revolution.—The revolution of 1649 in England was an important landmark in the history of democracy. [See ENGLAND: 1649 (February).] The continental countries at this time were establishing a new system, but it had little relation to democracy. "The new system was based on one fundamental idea, the supremacy of the state, an idea that dominated the public law of the seventeenth and eighteenth centuries. But the embodiment of the state was not the nation, it was the prince, . . . the prince, autocrat, suzerain, and chosen of God. To this conception of the state the tendencies of fourteen centuries had been contributing: the Roman law and institutions, the feudal law and customs, the Christian doctrine regarding the divinity of kings had tended to advance the interests of the prince rather than those of the people, to encourage not the liberty of man but the authority of the state."—C. M. Andrews, *Historical development of modern Europe* (*Students' ed.*, p. 2).—"The Whig Revolution of 1689 [see ENGLAND: 1688 (November-December); 1689 (January-February); (April-August)] and even the Puritan Rebellion of 1642 [see ENGLAND: 1642 (January); (January-August)], were from one point of view conservative movements. Their aim was to preserve the law of the land from either innovations or improvements introduced by arbitrary power. Coke was the legal hero of the Puritans, and Coke was the stiffest of formalists. A devotee of the common law, he detested the reforming ideas of Bacon fully as much as the despotic arbitrariness of James. The Revolution of 1689 was conducted under the guidance of Whig lawyers; they unwittingly laid the foundations of a modern constitutional monarchy, but their intention was to reaffirm in the Bill of Rights and in the Act of Settlement, not the innate rights of man but the inherited and immemorial liberties of Englishmen. This is the basis of truth which underlies the paradox exaggerated by the rhetoric of Burke that the statesmen who carried through the Revo-

lution of 1689 were not revolutionists. They assuredly believed that the liberties of Englishmen were bound up with the maintenance of the common law. The conservatism then of the English Revolution found its natural representatives in English lawyers."—A. V. Dicey, *Relation between law and public opinion in England during the 19th century*, p. 82.—"We do not understand the long quarrel about the stamp tax, the writs of assistance, and the precious tea, if we do not see that there had arisen in England, mainly in London, an oligarchy of wealthy traders who had managed to get within their grasp practically all the powers of the British commonwealth. The directors of the India and the fur companies—merchant princes and owners of the vast fleets that carried the commerce of the world—were as much the enemies of the British people as they were of the Southern tobacco growers or the New England rum traders. It was against this and not against the ancient and beloved constitution that the Americans fought. On this side of the Atlantic, wealth was far more equitably distributed; every man who would might acquire property enough to vote, and representation was not wholly unequal. In the wilderness of North America, the principles of the British constitution prevailed, and it was to preserve the ancient and substantial equality of men that Sam Adams and Franklin and Jefferson led the way to war. The best men in England saw that the colonists were fighting for the best interests of the British people, although neither Burke, nor Camden, nor Chatham had any zeal for or faith in that democracy which nerved the arms of the Americans. . . . Perhaps American democrats did as much for the English-speaking peoples of the world in that cruel war of revolution as British swords and ships a little later did for the world in breaking the power of Napoleon."—W. E. Dodd, *Converging democracies* (*Yale Review*, Apr., 1919, pp. 451-452).—See also U. S. A.: 1764.—"The foundation of the United States of America was a fact the magnitude and import of which was at once perceived in Europe. It proved that a great modern State could adopt the republican form; it showed that a pure democracy was capable of avoiding the follies and dangers which were considered to be peculiar to democratic government. The example given by the New World might be copied in the obsolescent States of Europe. In the New World, a whole continent, stretching from the Atlantic to the shore of the Pacific, would in the inevitable march of time be brought into one great democratic federation. A whole continent would be rescued from the barbarism of dynastic wars by the simple expedient of having no dynasties. The principle which in America secured the everlasting peace of a great section of the globe, by establishing a system of federated republics, might eventually be extended to Europe. If kings could be made to vanish, with their absurd family ambitions, their costly armies, and their intriguing diplomats; if every State in Europe could be governed by the popular voice, it was reasonable to expect that the gravest obstacles to international union would disappear. It was argued that states with homogeneous constitutions must themselves be homogeneous; that the interests of democracies are essentially identical; and that communities regulated upon the principles of natural justice would find their ethical satisfaction in the sentiment of human fraternity. No country in Europe was so quick as France in appropriating morals from the American Revolution. The war of American independence had been waged against England, the enemy of many centuries, and seemed in

the eyes of patriotic Frenchmen to be the retribution of Providence for the British conquest of Canada, and a triumph of natural right over force and fraud. A French army had helped to procure the American triumph, and returned to its native land saturated with republican spirit. The French navy had recaptured some of its lost prestige. By an ironic coincidence the last military triumph of the old dynasty was combined with the first practical demonstration of those principles of natural right which, passing from the writings of the French philosophers into the common mind of France, with all the splendid corroboration of the Peace of Versailles and the American Constitution, helped to undermine the fabric of the monarchy."—H. A. L. Fisher, *Republican tradition in Europe*, pp. 67-69.—See also FRANCE: 1789; Survey of France on the eve of the revolution: *Résumé* of causes.

Enlightened despotism in Europe. See EUROPE: Modern: Era of benevolent despots.

Genesis of modern democracy in the industrial and French revolutions.—Views of Locke and Blackstone.—Utopian socialism contained a germ of democracy, though the philanthropic attitude of most of the Utopian socialist leaders prevented it from developing into real democracy or even real socialism. The cause of the workingman was upheld by the great Utopians Fournier, Saint-Simon, and Owen, during the early stages of the industrial revolution. These Utopians advocated a society organized in the form of ideal communities, where the members worked on equal terms and shared the profits. Their doctrines were distinctly socialistic, but so different from those of later schools that the adjective "Utopian" has been necessary to describe them. (See SOCIALISM: Utopias; 1800-1824; 1805-1827; 1817-1825; 1832-1847).

The election of the deputies of the Third Estate to the meeting of the States-General in 1789 . . . definitely began the era of modern democracy on the continent of Europe. "In convoking the States-General France solemnly confessed the impotence of the old institutions. With this gathering of the representatives of the estates all those ideas and principles that had been agitating France for half a century were called into action. The men of the Third Estate, who constituted a majority of the Constituent Assembly, were dominated by the democratic idea. . . . Under the spell of the ideal, they sought to destroy the old and build up the new."—C. M. Andrews, *Historical development of modern Europe*, p. 11.—"On September 14, 1791, after a fortnight's consideration, Louis accepted the Constitution and solemnly swore to uphold it. . . . With the first session of the National Legislative Assembly, October 1, 1791, France began to live under its new constitution. Could Louis have been induced to reign as a constitutional king . . . something like quiet might have returned. But . . . the entire nation was almost immediately convinced that the court was plotting against the new order of things and invoking foreign aid to help punish the patriots. This suspicion, apparently justified by so many acts of Louis, made even a constitutional monarchy . . . no longer possible. . . . In the first session of the Convention (September 21, 1792) all parties united in abolishing monarchy and in declaring France a republic, and in due time a committee was appointed to draw up a new constitution."—S. Mathews, *French Revolution*, pp. 180, 182, 215.—See also FRANCE: 1789 (May); 1791 (June); (July-September); 1792 (September-November).—The "social contract" theory, first advanced by Æneas Sylvius,

was well expressed by Rousseau. "What is the government?" he asked. "An intermediate body established between the subjects and the sovereign for their mutual correspondence, charged with the execution of the laws and with the maintenance of liberty, both civic and political."—J. J. Rousseau, *Social contract*, bk. 3, ch. 1.—"Locke was Rousseau's most immediate inspirer. . . . The philosopher of the Revolution of 1688 probably carried its principles further than most of those who helped in the Revolution had any intention to carry them, when he said [in his essay on 'Civil government'] that 'the legislature being only a fiduciary power to act for certain ends, there remains still in the people a supreme power to remove or alter the legislative.' . . . Again, besides the principles of popular sovereignty, Locke most likely gave to Rousseau the idea of the origin of this sovereignty in the Civil state in a pact or contract."—J. Morley, *Rousseau*, v. 2, pp. 149-150.—The doctrine of "natural rights" also appeared at this time. "The rights of man are not founded upon history: they are rooted in his nature," writes Turgot in a letter to Mlle. Lespinasse (1770). "Property, security, and liberty constitutes the whole of the social order."—M. De la Rivière, *L'ordre naturel et essentiel des sociétés politiques*, v. 2, p. 615 (quoted in C. Gide and C. Rist, *History of economic doctrines*, p. 7).—"Natural right is indeterminate in a state of nature. The right only appears when justice and labour have been established."—F. Quesnay, *Tableau économique*, p. 43.

"[John Locke] proclaims essentially democratic doctrines—freedom, equality, self-government: 'Men being by nature of all free, equal, and independent, no one can be put out of this estate and subjected to the political power of another without his own consent.' Men form governments, he continues, by agreeing with others to join and unite into a community. They make a compact or contract. The purpose of this is the 'preservation of their lives, liberties, and estates.' If governments act contrary to the trust that is placed in them the right of the rulers is forfeited: 'The people have a right to act as supreme and continue the legislative in themselves or place it in a new form, or new hands as they think good.' Finally we may mention among the philosophers, who did much to express the conviction of freedom and liberty, Blackstone, the famous author of the 'Commentaries on the Laws of England,' which were published in 1765. He has been studied by practically all English and American lawyers since his day. We might say that his writings have seemed almost sacred to them. When we remember that in America our legislatures are very largely made up of lawyers, so that our laws are made as well as applied by Blackstone's disciples, we can appreciate what a great influence he has exerted. In the first chapter of his book he speaks of the rights of men as 'absolute.' He means by this that they come before all laws and all society. It is the same theory which Locke has in mind, but it is stated even more emphatically: 'For the principal aim of society is to protect individuals in the enjoyment of those absolute rights, which were vested in them by the immutable laws of nature, but which could not be preserved in peace without that mutual assistance and intercourse which is gained by the institution of friendly and social communities. Hence it follows, that the first and primary end of human laws is to maintain and regulate those absolute rights of individuals.' What, now, are these absolute or natural rights of man? 'The absolute rights of man—are usually summed up in one general appellation and denominated the natu-

ral liberty of mankind. This natural liberty consists properly in a power of acting as one thinks fit, without any restraint or control, unless by the law of nature; being a right inherent in us by birth and one of the gifts of God to man at his creation when he endued him with the faculty of free-will."—J. H. Tufts, *Our democracy*, pp. 132-134.—Another doctrine which Locke proclaimed was the legal supremacy of the legislative branch of the government. This was of importance as being the only sure way for the people to control the policy of their government. When the legislature is subordinate to the executive, as it was in Germany until 1919, it matters little how democratic a government is in other respects. That government is not a democracy.

Influence of Rousseau.—Intellectual development in Europe. See EUROPE: Modern: Revolutionary period; Intellectual development.

Progress following the industrial revolution.—Trend in England and France.—"There were three stages in the democratic movement of the period following the industrial revolution, (1) an elimination of the vestiges of the old régime; (2) the liberal rule of the 'benevolent bourgeoisie'; (3) attack upon the supremacy of the bourgeoisie by the proletariat. All of these movements were started by the industrial revolution. 'Does not the advance of democracy afford the clue to the development of English law since 1800?' This inquiry is suggested by some indisputable facts. In England, as in other European countries, society has, during the last century, advanced in a democratic direction. The most ordinary knowledge of the commonest events shows us that in 1800 the government of England was essentially aristocratic, and that the class which, though never despotic, was decidedly dominant, was the class of landowners and of large merchants; and that social conditions, the feelings and convictions of Englishmen in 1800, were even more aristocratic than were English political institutions. No one, again, can doubt that by 1900, and indeed, considerably before 1900, the English constitution had been transformed into something like a democracy. The supremacy of the landowners had passed away. . . . The electorate, which had in the main represented the landed interest, was extended in 1832 so as to give predominant power to the middle classes and to the manufacturers. [See ENGLAND: 1830: Reform movement; 1830-1832.] In 1867 the artisans of the towns acquired the parliamentary suffrage. [See ENGLAND: 1865-1868.] Subsequent legislation, ending with the Reform Acts of 1884-1885, admitted householders in counties to the same rights as the artisans, and finally established the system of so-called household suffrage, under which England is, in theory at least, governed by a democracy of householders. [See ENGLAND: 1884-1885; SUFFRAGE, MANHOOD: British empire: 1832-1885.] Of the real extent and the true nature of this advance towards democracy it is hardly necessary here to speak. All that need be noted is that alterations in parliamentary and other institutions have corresponded with an even more remarkable change, in a democratic direction, of public sentiment. . . . [In 1918 another parliamentary reform bill was passed, and, to-day, both men and women enjoy full suffrage rights (see SUFFRAGE, WOMAN: England; 1860-1905; 1916-1918).]—"The bill for the reform of Municipal Corporations [see MUNICIPAL GOVERNMENT: Development of the city, etc.] was carried before the close of the session [1836]. It abolished much confusion and corruption, establishing in each corporate town a mayor, annually elected, and a town council for the management of

borough funds."—H. D. Traill, *Social England*, v. 6, p. 114.—This, according to A. V. Dicey, was a step in the development of Benthamism, and secured democratic management of city government. At the same time this reform of local government took no thought of country laborers, and county administration was left to appointed magistrates. It did, however, improve the social condition of laborers and place poor relief under the supervision of the state.

"It was a natural, if not an inevitable step for the Bordeaux assembly to place the extreme executive power in the hands of Thiers. He was the only statesman who commanded the confidence of the whole nation. . . . The task which lay before him was to make peace with Prussia, to repair the havoc of war, and to give France a constitution; with a true instinct for a delicate and complex situation, he saw that the first two objects should be patiently and immediately pursued to their solution, the last should be left to ripen in the dark. The *de facto* government was republican. The peace was made in the name of the Republic. . . . The armies obeyed the Republic. The civil servants were appointed and dismissed by the government of the Republic. . . . Thiers saw that France must eventually come to the Republic, for, as he said, 'It is the form of government which divides us least,' . . . and he took a decision of critical importance when he implored the Assembly to devote itself to the reconstruction of France, and gave a pledge that he would in no way seek to prejudice the constitutional issue. . . . In the autumn of 1873 every political club and salon in Versailles and Paris was agog with speculation. . . . The fate of France, however, was not destined to be decided by a trial of parliamentary strength. The Comte de Chambord, the Bourbon candidate for a monarchy, refused to accept the tricolor as his flag. . . . This refusal meant the Republic. In one of the early debates . . . a deputy expressed the wish that the Republic would not come in *par la petite porte*. The phrase is happy, but the hope was disappointed. The third Republic came in surreptitiously by the postern gate. The constitution was built up piecemeal by an Assembly [which was half monarchist], which did not wish to build it at all, and neither in its successive parts, nor in its entirety, was it ever submitted to a *plébiscite* of the French nation. There was none of the old rapture as at the discovery of a new world of happiness. The Republic was accepted *faute de mieux*. . . . On January 30, 1875, it was carried in the Assembly by a single vote. The character of the new Republic can find no better expression than in the speeches of Gambetta. . . . He believed in it, he preached it up and down the country, he made it his mission to define republican ideas and to spread an enthusiasm for republican institutions. As Gambetta conceived of the Third Republic, so has the Third Republic substantially become. His appetites and repulsions, his enthusiasms and recoils are the appetites and repulsions, the enthusiasms and recoils of the political class which carries on the government of France, and of which he was a type. . . . He represented the bourgeoisie of France, the small proprietors, tradesmen and professional men . . . who make the backbone of the community; he knew the arguments which would go home to them, and the kind of polity adapted to their needs."—H. A. L. Fisher, *Republican traditions in Europe* (*Lowell lectures*, 1910, pp. 289, 293-294, 296).—See also FRANCE: 1871-1876.

Tendencies of the 19th century.—Growth of political democracy.—*Laissez-faire* followed by

state activity.—General public education.—Economic features.—Labor unions and social reform.—Corporations.—Democracy in politics.—Politically, democracy made great strides in Europe during the nineteenth century. "With the departure of Napoleon to Elba and the return of the Bourbons, France to all outward appearance was approaching the position she had occupied before the Revolution. . . . But it needs only a brief examination to show that such an appearance was only on the surface and that Europe had passed through a period in which an organic change had taken place both in the social structure and in the ideas and expectations of the people at large. War had diverted . . . the progressive tendencies of the period before 1789, but it had in no sense destroyed them. . . . It is only in the history of the next fifty years that we can find the demonstration of propositions laid down by the Constituent Assembly. National unity and individual liberty constitutionally defined are the terms that indicate the forces that the Revolution set loose. . . . That which effected the overthrow of Metternich's supremacy . . . was the Greek revolution [1827]. [See GREECE: 1821-1829.] . . . So effectual was the check given to the reactionary policy in the matter of the Greek revolution that almost no attempt was made to apply . . . the principle of intervention as a European policy when the next occasion for its maintenance arrived. In 1830, immediately after the revolution which overthrew the Bourbons in France, Belgium rose in revolt against the house of Orange, and determined to undo the work of the congress of Vienna by gaining independence as had Greece. [See BELGIUM: 1830-1832.] . . . At the congress . . . of London, December, 1830, to which all the five Powers sent representatives, the policy of Troppau and Verona was reversed; Belgium was declared independent, and a new law governing the European state system was proclaimed. In this congress the more liberal and progressive notion of non-intervention supported by France and England won its first great victory over the reactionary ideas of Austria and Prussia. . . . [See also EUROPE: Modern period; Revolutionary movement for self-government.] The revolution of 1848 in its inception and in the sequel followed the lines of that of 1789; . . . that of 1848 was an attempt to realise social and economic liberty by a similar application of principles for which the opportunity had been furnished by a revolution. . . . On April 23d France experimented with a suffrage 'the most radically universal,' says Barrot, 'that had ever been recognised or practised in the world.' Eight million electors, under a system of direct and universal suffrage for all persons over twenty-one years of age, voted according to the *scrutin de liste* by a secret ballot."—C. M. Andrews, *Historical development of modern Europe*, v. 1, pp. 86-87, 125, 128-129, 362, 352.—See also FRANCE: 1842-1848; 1848 (April-December); EUROPE: Modern; Political revolution of 1848.—In 1870 the third French republic was proclaimed, after the empire of Napoleon III had collapsed, in a revolution that was comparatively quiet, although followed by the bloody days of the Commune. [See FRANCE: 1870 (September), and after.] In 1875 the organic laws were passed which compose the present constitution of France. (See FRANCE, CONSTITUTION OF.) "From 1848 to 1880 the general tendency is towards individualism. The policy of *laissez-faire* finds general acceptance. *Laissez-faire* means on the one hand, and in domestic politics, a restriction of governmental activity to the bare minimum: on the other hand, and in foreign affairs,

a policy of free trade and of friendship between nations. [See **TARIFF**: 18th century.] . . . By 1880 the doctrine of *laissez-faire*—the preaching of non-intervention as the supreme duty of the State, internally as well as externally—seems to have passed. It had not only been undermined by the literary prophets: facts themselves were against it. Since 1870 the State had been concerning itself seriously with education; and still further extensions of its powers were being made inevitable by the crying needs of the time. . . . Legislation, according to Prof. Dicey, had become perceptibly 'collectivist' about 1870, when Mr. Forster passed the first Education Act.—E. Barker, *Political thought in England*, pp. 19-20, 204.—A second education act was passed in 1902 and the latest in 1918. "Every public educational system of our day, broadly speaking, is the child of the nineteenth century. The educational system of Germany, which in its results has been of hardly less value to mankind than to Germany itself, dates from the reconstitution of the German universities after the battle of Jena. Whatever system France may have had before the Revolution went down in the cataclysm that destroyed the ancient régime, so that the educational system of France also dates from the Napoleonic period. In the United States, while the seeds of the public school system may have been planted in the eighteenth, or perhaps even in the seventeenth century, it has only been in the nineteenth century, with the development of the country, that our public school system has grown into what we now see; while in England, the system of national education, in a democratic sense, must be dated from 1870. . . . Out of the growth of the democratic principle has come the belief that it is worth while to educate all the children of the state; and out of the scientific method, which has led to the general acceptance of the evolutionary theory, has been developed the advance in educational method which is so marked a feature of the last decades of the century."—S. Low, *Trend of the century* (*Atlantic Monthly*, Aug., 1898).—See also **EDUCATION**: Modern: 19th century.—The "mid-century period of English history . . . [is] seen to be highly significant in the economic sphere. It was the period in which trade-unionism grew rapidly, solidified itself, perfected its machinery, and discussed and clarified the demands of the laboring class. The effect of this preliminary work was apparent later. Workmen were receiving in their unions a kind of education in politics and management. . . . The Combination Act of 1800 which, in connection with the law of conspiracy then in force, made a trade union an unlawful association, was repealed in 1824. Since then such organizations have not been illegal. They have grown greatly and now enjoy strong legal protection."—C. D. Hazen, *Europe since 1815*, p. 457, and footnote.—"It was not until after 1850, however, that trade-unionism got a firm hold on British industries: first, by the organization of local unions of workmen in the various trades, such as the machinists, the iron and steel workers, the miners, the bricklayers, the spinners; then, by a national amalgamation of the local unions; and finally by a general federation of all the trades and the organization of a trades congress. In the seventies this powerful organization was able to force Parliament to repeal many of the old laws limiting the action of organized labor, and to give to the trade unions the right of bringing their influence to bear upon non-union working men, without being liable, as they formerly had been, to prosecution under the conspiracy laws."—J. H. Robinson

and C. A. Beard, *Development of modern Europe*, v. 2, pp. 389-390.—See also **LABOR ORGANIZATION**: 1843-1894.—In Germany "in regard to the right to combine for the defense of economic interests a valuable safeguard is secured to the majority of wage earners . . . by Section 152 of the Industrial Code [1869] which declares that 'All prohibitions . . . against industrial employers, industrial assistants . . . or factory operatives regarding agreements and combinations for the purpose of obtaining more favourable conditions of wages and of work, particularly by means of the suspension of work . . . are repealed.' The provision constitutes a defence of strikes and lock-outs. [See **LABOR ORGANIZATION**: 1848-1918.] . . . On the whole [however, under the Empire], it may be said that the law of combination [was] . . . more liberal than its interpretation by the courts and the police."—W. H. Dawson, *Evolution of modern Germany*, pp. 107-108.—Germany has excelled in state insurance in the interest of the working classes. The chief laws are those of 1885 and 1889. [See **SOCIAL INSURANCE**: Details for various countries: Germany.] These cannot be classed as democratic legislation, however, for their main purpose, as admitted by Bismarck, was to combat socialism. France had already legalized strikes in 1864. Russia was behind all the other great countries, economically, as well as politically. Serfdom, which had disappeared centuries before in England, had ended in France with the Revolution, and had been abolished between 1808-1811 in Prussia, still existed in Russia as late as 1861. In that year, Alexander II. issued the edict of emancipation, freeing about twenty-three million men. (See **RUSSIA**: 1861-1864).

"Democracy, as a political theory, emphasizes the equality of men and the equal rights and privileges of all men before the law. The tendency of it has been, in this country [the U. S.], to develop in multitudes of men great individuality and self-reliance. Side by side with this tendency, however, we see the corporation supplanting the individual capitalist, and the trade union obliterating the individual laborer, as direct agents in the work of the world. Strange as this contrast is, both tendencies must be consistent with democracy, for the corporation and the trade union flourish most where democracy is most developed. Indeed, they seem to be successful and powerful just because democracy pours into them both its vital strength. . . .

"The tendency to democracy in politics is unquestionably the dominant political fact of the [19th century] century. . . . Outside of Russia, and possibly even there, monarchical government in Europe is obliged to depend for its support upon the great body of the nation, instead of upon the power of the great and the noble. . . . In the United States, the century, though it began with a limited suffrage, ends with universal manhood suffrage, and even with woman suffrage in some of the Western States."—S. Low, *Trend of the century* (*Atlantic Monthly*, Aug., 1898).

Progress in the early part of the 20th century.—In England, fifty labor representatives were returned to Parliament in 1906. The Liberal cabinets of Campbell-Bannermann and Asquith contained one Labor member. "The ministers succeeded . . . in passing many important acts, including measures to compensate workmen for injuries received as a result of their employment, and to allow old age pensions to persons over seventy not in receipt of parish relief. The hours for work in coal-mines were fixed by law not to exceed eight hours; an act was passed for the

protection of children, called the *Châdren's Act* [see CHILD WELFARE LEGISLATION: 1903-1920] and two new universities were set up in Ireland. . . . In 1909 the great measure was the budget of Lloyd George [see ENGLAND: 1909 (April-December)]."—T. F. Tout, *Advanced history of Great Britain*, pp. 737-738.—National insurance against unemployment, sickness, accident, and old age is another great advance in the history of democracy. "The outstanding example of this system is compulsory nation-wide insurance in Great Britain. Beginning there in 1912 with 2,500,000 workers so protected, the plan, as a result of eight years of practical experience, was extended in 1920 to cover twelve million workers or two-thirds of all employed persons—nearly one-fourth of the entire population."—J. B. Andrews, *Unemployment prevention and insurance (American Labor Legislation Review, Dec., 1920, pp. 236-237)*.—France passed state insurance laws in 1905 and 1906, and Italy followed suit in 1908 and 1912.—See also SOCIAL INSURANCE: Details for various countries; Great Britain: 1911-1913; 1916-1920; also FRANCE; ITALY.—The tsar of Russia promised in 1905 to summon a *duma* or council, which should represent all Russia. [See RUSSIA: 1905 (October).] This *duma*, elected by approximate universal suffrage, met on May 10, 1906. It seemed that Russia had at least a semblance of parliamentary government. After two months, however, the tsar dissolved the *duma*. [See RUSSIA: 1906.] The same thing happened to the second *duma*. New election regulations radically reduced the number of workingmen and peasants in the *duma* of November, 1907. Autocracy and oppression continued. (See also RUSSIA: 1916: Russian absolutism.) Universal suffrage was established in Italy in 1912. Of all the countries in the world up to the outbreak of the World War, Australia and New Zealand were the most advanced. "Two of the characteristic features of extreme democracy in a new country have been very well marked in some of the Australian colonies,—the tendency towards strict forms of protection in commerce, and the desire to thrust all duties and responsibilities on the Government till State socialism is almost in view. Legislation to prevent the accumulation of large properties, by heavy progressive taxation, has also been heard of. Victoria has always been in the van in such democratic ideas. . . . New Zealand . . . is in sentiment the most democratic of all the Australasian colonies, and has gone further even than Victoria on the road towards placing all social enterprise, industry, and commerce under State control."—C. W. Oman, *England in the nineteenth century*, pp. 243-245.—"Of France one may, as Lord Bryce shows, draw as depressing a picture as one pleases, and then find that one has misjudged a great people and its institutions. Before the World War 'observers thought they saw in France a people torn by internal dissensions, religious and political, a legislature changeful and discredited, a large part of the people indifferent to politics, only a small fraction of the finest intellect of the country taking part in its politics. They remembered the Panama scandals, the *affaire Dreyfus*; they naturally concluded that France was a decadent country; in which the flame of national life was flickering low. Then came a war more terrible than any known before. Political dissensions continued. . . . But the nation rose to confront the peril that threatened its existence.' One may find as many detestable details in French political life as one pleases. The group-system in the legislature, with its constant atmosphere of intrigue and its ever-shifting ministers; the atmosphere of petty jobbing in pre-

ferences and committee rooms; the rancorous intolerance in religious matters with secret *dossiers* that it involved down to the outbreak of the war in 1914; the inequalities of the *droit administratif*—these are things on which Lord Bryce has had to expatiate, as in duty bound. Yet is the Republic responsible? 'Class hatred, religious intolerance, deficient respect for personal liberty, were not brought into France by democracy. They were matters of long standing, heritages of the *ancien régime*, for which the Republic is responsible only so far as it has not succeeded in eliminating them. It is the misfortune, not the fault of the Republic that antagonisms are stronger than affinities.' And in the world crisis of 1914-1918 public opinion proved sound; the diseases were on the surface of the body; they did not affect the heart."—C. Oman, *Review on Bryce's Modern democracies (Quarterly Review, July, 1921, pp. 135, 136)*.—"Though social as well as political equality reigns in France, there are still differences of rank, more significant in their disabling than in their recommending effect. Very few deputies come from the ancient nobility, or from the large land-owners. . . . 'Big business' has few representatives, and among these, extremely few persons of great wealth. The largest element consists of professional men, lawyers, physicians, journalists, retired functionaries, and professors or school teachers, this last class being the fewest."—J. Bryce, *Modern democracies*, v. 1, p. 278.

"The annals of Switzerland, the nearest approach to an ideal republic that the world can show, are edifying in the highest degree, but dull beyond compare. Happy, as the cynic said, is the land that has no history—and from the point of view of the writer of drum-and-trumpet chronicles, Switzerland has had no history since the Sonderbund War of 1848. Her citizens, intelligent, public-spirited, progressive, yet cautious have managed her affairs with the minimum of friction. The constitutional-specialist knows her mainly as the motherland of those two modern democratic experiments, the 'Referendum,' and the so-called 'Initiative,' viz. the right of a prescribed number of citizens to propose the passing of an enactment by popular vote. In Switzerland herself these devices have been worked with the moderation and good sense that characterize Swiss politics. They are used sparingly, they generally deal with questions in which all voters take a genuine and intelligent interest, and are decidedly popular institutions. It may seem strange to learn that they have reduced rather than intensified party feeling. . . . Happy are the Swiss who have no 'bosses,' no wealthy and corrupt party machine, very few cranks, and an admirable tradition of honest politics and 'playing the game.' With them a political life is not in the pecuniary sense a profession; it is hardly even a career. . . . Representatives do not inveigh against their colleagues, but take it for granted that they are acting according to their lights. There is an atmosphere of reciprocal respect, and the soundness of public life is secured by the existence of a vigilant and patriotic public opinion."—C. Oman, *Review on Bryce's Modern democracies (Quarterly Review, July, 1921, pp. 135, 136)*.—"The United States [has] "certainly . . . the most rigid Government among the great free peoples. It is in some respects so inflexible as to inhibit for long periods the operation of the public will. It would not, of course, be made so irresponsible to the final authority by any creative act of today. We seem, however, in this respect to have so strong a prejudice in favor of the form that we do not see that we lose the substance. In this we are not free but bound."—W. C. Redfield, *Democracy and the human equa-*

VOTING RING IN SWITZERLAND

Session of a Landsgemeinde where voting for officers and legislative measures is done by acclamation. The whole citizen body of the community makes up this assembly.

tion (*New York Times Book Review and Magazine*, Jan. 30, 1921, p. 11).—"Within recent years there has been much dissatisfaction with various hindrances to self-government. In some cases, this dissatisfaction has been because the representatives in legislatures have not passed laws which the people have desired. In other cases, mayors of cities or other administrative officers have failed to carry out laws which have been passed. In still a third type of cases, judges have declared laws unconstitutional which have been adopted by legislatures, or have decided cases in a way which was opposed to the general view, although it may have been in accordance with the law as the judge understood it. To meet these difficulties, methods called the 'Initiative, the Referendum, and the Recall' have been proposed, and, in some states, adopted."—J. H. Tufts, *Our democracy*, p. 250.—See INITIATIVE AND REFERENDUM: Criticism.

World War and democracy.—Modern democratic tendencies.—It is too soon to estimate the full effect of the World War upon democracy. The revolutions in Russia (see RUSSIA: 1917 [March 8-15], and after) and Germany (see GERMANY: 1918 [November], and after), however, were important steps in democratic history, though Russia has since abandoned democracy for Bolshevism. Germany, in her new constitution of 1919, adopted universal suffrage for men and women. "Prediction is hazardous; but it would seem that the Great War has carried most European countries beyond the reasonable hope of solving the industrial problem by a mere extension of governmental intervention and the elaboration of bureaucratic supervision. To-day, at all events, the insurgent cry for the right of 'life, liberty, and the pursuit of happiness' calls for something more than a little humanitarian mitigation of the present order. The trend of thought and action in Europe reveals little disposition to magnify the state or to increase the powers of government. The significance of the present movement in the labor world, such as the activities of the 'triple alliance' in England or of the railroad brotherhoods in the United States, the significance of the soviet idea in all its varied forms, is that these are attempts to get the 'will' of real economic groups 'represented' in government; and in so far they imply a modification of the system of representation on the basis of territorial areas. . . . The concentration of economic power in the hands of a class, the more or less effective control of the state by this class, the rationalization of the state so controlled on some foundation of divine right or of papal or popular infallibility—these are indeed old enemies of human welfare. They have appeared in every stage of history, and the latter-day result of the political and industrial revolutions of the last two centuries have been chiefly to present them in new forms. That these old enemies have taken on the protective coloring of democracy makes them no less real, but only more insidious. To mistake the form for the substance of democracy, to assume with complacency that institutions under which liberties were once won will always guarantee them—this will be, for any people in the twentieth century, to court disaster. It is perhaps the peculiar danger of the United States."—C. Becker, *United States—an experiment in democracy*, pp. 331-333.—See also EUROPE: Modern period: Far-reaching effects of the World War.

Basis and value of.—"Democracy rests upon education. Of course it is conceivable that in a perfectly simple state with narrow limits you might have democracy without very much intelligence,

but in the complexity of modern life it is utterly impossible to carry forward the affairs of popular government without wide and sound education. We sometimes wonder, not so much whether men are morally capable of living up to their responsibilities, as whether the human intellect is capable of actually solving the problems of modern life and managing public affairs for the common good. Society has become so intricate, there are so many interrelations and interdependencies, that we are sometimes staggered at the very prospect and shrink from the attempt to find intellectual solutions for our problems. . . . But when I have said that democracy rests on education, and prompts wealthy men to endow schools and colleges, and leads the public to pour out its money in educational undertakings, I have been dwelling only on education in the very formal, though more ordinary sense of the word. The more important truth is that democracy is itself educating. The duties to which men are called, the matters which each individual man is asked to consider, in themselves demand thought. Any social or political system which asks the individual man to think is in the highest degree education. Progress must come from human effort, and, above all, from the effort to think. 'In the free state,' said the French philosopher, Montesquieu, 'it does not make so very much difference whether men think things out correctly or incorrectly. The important thing is that they think at all.' At times in the course of heated elections, when complicated questions of state are involved, we doubt whether the untrained public is capable of understanding the actual issues. The truth simply is that in a free state it does not make such a tremendous amount of difference whether a question is thought out correctly or not, if men by their responsibilities are tempted to think about things which otherwise they would have no thought about. The educational and uplifting force comes from reaching out for ideas and logical principles just a little bit beyond our reach; and it is this reaching, this effort to do what one has not done before, this attempt to grasp what is perhaps unattainable, that is most desirable. It is better that men should reach and fail to grasp than never to have reached at all."—A. C. McLaughlin, *Steps in the development of American democracy*, pp. 185-189.—"Democracy is well enough, if you do not expect too much of it. It works no miracle. . . . It does not alter nature. Selfishness, short-sightedness, callousness remain what they were and play their part. In particular that 'great heart of the people' beats but feebly. For, at bottom, the main defect of democracy is the comparative indifference of the majority to public interests. They will not take the trouble. They will not give sustained continuous attention. There is much that in any case they cannot judge, for instance, the characters of men not known to them personally, complicated financial issues, or the bearing of a move in the diplomatic game. Nor are we to suppose that 'pure art's birth is still the Republic's. Art and letters flourish, or decay, under all manner of institutions, under Louis XIV as under Pericles. Democracy neither destroys nor creates them. What is more serious, it has not reconciled peoples nor classes. It has given something of liberty, and equality, but not fraternity. But after all was it reasonable to suppose that it should do these things? Why should it be supposed that the ordinary feelings of mankind will be materially lessened by the form of government any man lives under? . . . Democracy has shown itself capable of performing the main functions of government,

defence, order, justice, a competent executive. Not that it has always done so equally well. . . Democracies have often so far misunderstood the meaning of equality as to suppose one man can manage affairs as well as another. Hence they have refused sufficient payment for judges and civil servants, and have got inefficient administration and defective justice in consequence. . . Democracy, however, has not shown itself incompetent in politics. On the contrary, the great catastrophes have come from and through military autocracies and oligarchies, and in Lord Bryce's book on Modern Democracies a succession of burning topics of the last century is set out in which the 'masses' were nearer to the side of right than the 'classes'! On the whole then democracy has given the world as good a government as its competitors. Has it improved them? If it has not brought all the blessings that were expected, it has in some countries destroyed, in others materially diminished, many of the cruelties and terrors, injustices and oppressions that had darkened the souls of men for many generations."—L. T. Hobhouse, *Democracy and civilization* (an essay on Bryce's "Modern democracies," *Sociological Review*, July, 1921, pp. 126-127).—See also SUFFRAGE; BOSS: In politics; Bossism and democracy; PROLETARIAN DICTATORSHIP.

"DEMOCRATIC DONKEY".—The use of the donkey as the symbol of the Democratic party is said to have originated in a cartoon by Thomas Nast, January 15, 1870. The cartoon portrayed the Democratic press attacking Edwin M. Stanton after his death, and was entitled: "A live jackass kicking a dead lion." Though the point of the cartoon has no present significance; the use of the donkey to represent the Democratic party has remained to this day.

DEMOCRATIC PARTY, United States, term first applied in American politics in the years 1789-92 to the Anti-Federalists, and for the next thirty years to the party then known as Republican because of the latter's adoption of French principles of government. At the disappearance of the Federalist party (1816) there remained the Republican party, made up of two groups, the National Republicans and the Democratic Republicans. It is this latter group that Jackson organized into the present Democratic party in 1828. Its first national convention was held at Baltimore, May 21, 1832. See U. S. A.: 1789-1792; 1825-1828; 1845-1846; 1864 (May-November); 1896: Party platforms and nominations; 1900 (May-November); 1904 (May-November); 1908 (April-November); 1912: Woodrow Wilson and the election; 1912-1916; 1914 (November); 1918 (November); 1920 (May-November); CAUCUS: United States: 1895-1910; 1910-1915; CONSERVATIVE PARTY: United States: ALABAMA: 1848: Alabama platform; LOUISIANA: 1874-1877; MISSOURI: 1874-1920; NEW YORK: 1823; 1863-1871; OREGON: 1856-1859; 1876-1898; TENNESSEE: 1834-1856; WISCONSIN: 1856-1893.

DEMOCRITUS (c. B. C. 460-357), Greek philosopher. See MILETUS; EUROPE: Ancient: Greek civilization: Philosophy.

DEMOS, citizen body of the ancient Greek city-states. See SUFFRAGE, MANHOOD: B. C. 5th century.

DEMOSTHENES (d. 413 B. C.), Athenian general. Defended Pylos from the Spartans, 425 B. C., though the credit was given to Cleon; commander under Nicias in the expedition against Syracuse, 413 B. C. See GREECE: B. C. 425; SYRACUSE: B. C. 415-413.

DEMOSTHENES (c. 384-322 B. C.), Greek orator and patriot. His aim, in all his orations, was to form a united Greece, under Athenian leadership. His hatred for Philip of Macedon (who he felt was slowly crushing Greek freedom) was made famous by his orations, the Philipics. Gained for Athens the alliance of Byzantium and assisted Thebes against Philip; was the greatest power in the city government of Athens, 338-322 B. C. After the Grecian defeat in the Lamian War, which he sponsored, he was condemned to death, and fled to Calauria where, on the point of capture, he took poison. See ATHENS: B. C. 359-338; 336-322; GREECE: B. C. 357-336; 351-348; 323-322; GREEK LITERATURE: Oratory as literature.

DENMARK: Territory and physical features.—**Population**.—**Agriculture**.—**Scientific dairying**.—**Industrial coöperation**.—"Denmark consists of three large and some smaller islands, and a large promontory from North Germany. The large islands are Sjoelland, Fuhnen and Lolland, and the promontory is Jutland. [The total area, according to the census of 1921 is 16,609 square miles, and the population 3,267,831.] Copenhagen, the capital, is situated on Sjoelland, often called Sealand. . . . Only the small island of Bornholm . . . to the south-east, and far out in the Baltic, contains any really rugged scenery. The rest of Denmark is for the most part quietly rural in character. . . . The country abounds in small lakes and meres, generally overhung by dense beechwoods. . . . The coasts of Denmark are in the main low and sandy. . . . There are no large rivers in Denmark. The Gudenaä is the longest. . . . Of forests, Denmark boasts but few. Only 8.3 per cent of the area is covered with trees."—W. J. Harvey and C. Reppien, *Denmark and the Danes*, pp. 18-21.—"Denmark relies principally on its agriculture [which occupies about two-fifths of the population], its fisheries, and its shipping to sustain the credit side of its foreign trade balance. Its other industries, in the main, produce only enough, or not quite enough, for home consumption."—*Supplement to Commerce Reports*, Oct. 11, 1920.—The state maintains large porcelain works at Copenhagen, where there are also a number of distilleries. Sugar is produced from beets, which are largely grown.—"Less than a hundred years ago agriculture in Denmark was no whit more developed than in any other country in Europe. To-day the Danish farmer takes his place as one of the most scientific farmers of the age, while Denmark is, *pro-rata* to its area and population, almost the greatest grower of farm produce that history has seen. . . . The cumulative effect of the succeeding land laws has been to make Denmark a land of small and medium properties. One half of the area is appropriated to farms of between 38 and 150 acres. . . . Until the close of the eighteenth century the land remained in the absolute possession of a minority of large landowners, who let it, in most cases on unconscionable terms, to the small-farmer class. The properties of these latter were so split up that a system termed 'community of ownership' had to be devised as the only means whereby a living could be made. This system provided that, when within a given area

one tenant farmer desired to sow corn all the other farmers in the same area must likewise do the same, and on the same day, it not being practicable for one man to grow rye on his small patch while his neighbour produced barley or wheat. Moreover, at this time the small properties were burdened with villenage to the greater, the tenant of the former paying in labour for the use of his land. . . . Finally, there were the ecclesiastical tithes, from which the land is not yet quite free, although they are now being converted under the following generous State scheme. An Act of Parliament provides the payment of a capital sum amounting to twenty-five times the average of the tithes for the previous ten years. Of this the Government is paying seven twenty-fifths and the farmers themselves eighteen twenty-fifths, which the State will loan to them. . . . In the nineteenth century great strides were made in the direction of altering the system of land tenure, of abolishing villenage, and of converting the tithes aforementioned. Proprietors of entailed estates were allowed by law, and even encouraged, to sell portions of their lands to their tenants, while the State did all in its power to assist the latter with their purchases. . . . And in this manner it has come about that the Denmark of to-day is largely a country of small peasant proprietors. In the last fifty years some 10,000 farms have become the absolute property of their holders, and at the present time only 27 per cent. of the area of Denmark is burdened with rent."—W. J. Harvey and C. Reppien, *Denmark and the Danes*, pp. 103-115.—A "Danish farm is a scientific machine as nearly perfect as it is humanly possible to be, a machine in which the possibility of error is all but eliminated. . . . For such a small country the Danish farmers employ an inordinate number of farming machines. . . . No opportunity is lost of obtaining the latest farming devices, and the young farmers particularly show great originality in overcoming the difficulties which face them. . . . Much of the success of Danish farming can be directly traced to two scientists, N. J. Fjord and T. R. Segelecke, both professors at the High School of Agriculture. These gentlemen in the seventies directed their energies towards farm work and agrarian questions in general, though more particularly in the direction of devising methods for increasing the production of milk and the manufacture of pure butter [of which large quantities are exported, principally to London]. One important feature of their earlier work was the instruction of the peasants in modern and scientific methods, and proving to them the value of co-operation."—W. J. Harvey and C. Reppien, *Denmark and the Danes*, pp. 134-145.

Survey of history.—"Danish history first emerges from obscurity and tradition into something resembling fact and record about the year 800 A.D. Before this time it is difficult, if not altogether impossible, to disentangle the Danish elements from the vast fabric of the general Norse myth and legend. One fact can be stated with certainty. From the earliest times the Northmen had been quick and daring pirates, a race of freebooters and sea robbers, a violent people who loved fighting. . . . For seven or eight hundred years the Vikings pursued unchecked their career of slaughter and violence. Then in 826 the German monk

Ansgar travelled into Denmark, and set the first seeds of Christianity in the heart of this untamed and barbaric people. [See also MYTHOLOGY: Norse Mythology: Relation to the whole body of Germanic mythology.] . . . At length, however, weary of fighting with each other, the Northmen launched their galleys into the farthest waters of the then known world. To England they came, driven and buffeted by wind and wave, to Scotland and Iceland, to France and the fair countries of the South, until the Northern barbarians were the terror of civilized Europe. [In Denmark, as in England, before the year 800, the country was divided into several trihal kingdoms, of which those of the Sealanders and the Jutes were the strongest and the most feared.] The history of Denmark between the years of 800 and 1042 is so interwoven with that of England that it cannot easily be written apart. The Danes in the reign of Ecgberht swept up the Thames to London, and although in succeeding reigns they were repeatedly repulsed and driven back, they continued to arrive in England in greater and greater numbers. Alfred the Great and his sons succeeded in temporarily destroying their power, but under Swain the Two-bearded they renewed their supremacy. [One of their mightiest kings, who ruled in the middle of the twelfth century, was Valdemar the Great. He united under his scepter Jutland, Sealand and the South Swedish provinces, and subjugated the Wends, by whom the kingdom had been persistently harassed.] It was in the following reign, however, that of Valdemar the Victorious, that Denmark advanced to the proudest position in its history. This truly great monarch continued . . . the conquest of Northern Germany, until . . . he . . . ruled from Lund to Hamburg and Lubeck. . . . The Baltic had become a Danish Mediterranean. . . . The King devoted his declining years to internal administration. His legal code was used in Sleswick until the year 1000. The century following Valdemar was the darkest in Danish history. [The country became impoverished, owing to internal strife, caused by the subdivision of the kingdom among the younger sons of the kings. Moreover most of the territory was mortgaged to the counts of Holstein, and they virtually ruled Denmark. It recuperated, however, under Valdemar Atterdag.] When he died in 1375, Denmark was again a power in the North. [His daughter Margaret, widow of the king of Norway, brought about the first union of the three Scandinavian countries.] In the year 1396 the so-called Kalmar Union was devised, a constitution which had for its object the perpetual union of Scandinavia, while according local autonomy to the separate countries. [After the disruption of the Union in 1412, Sweden and Denmark were again united under Hans, son of Christian I, who was the first king of the Oldenburg family which ruled in Denmark for more than four hundred years (1448-1863). The fifteenth century is characterized by wars with Sweden and fights between the Catholic and Protestant parties; which ended with the abolition in Denmark of the Catholic church in 1536.—See also SCANDINAVIAN STATES: 1018-1397; 1397-1527.]

"The history of Denmark in the sixteenth, seventeenth and eighteenth centuries is the history of a rapidly declining power. Since the separation from Sweden in 1520 the relations between the two countries had been constantly strained. From 1563 to 1570 they were at war. [Under Christian IV (1588-1648) Denmark became embroiled in the Thirty Years' War. The events up to 1659 caused general discontent, and the power was withdrawn

from the nobles and entrusted entirely in the hands of the king. The towns were, however, granted extensive powers in local matters.] An age of absolutism followed for a century and three quarters. This period, although it added no new possessions to the Danish crown, was productive of much lasting good to the Danish people. Education became more general. Trade and industry revived. The old code of Valdemar was carefully revised and adapted to the altered conditions. Important reforms in the system of land tenure were instituted. The peasants, however, still had much ground for complaint. [In 1701, a law was passed attaching them to the land from their fourteenth to their thirty-fifth year, and later to their fifty-fifth year.] During the era of absolutism Danish mercantile trade commenced, and was fostered by the foundation of many companies designed expressly for foreign trade and exploitation. . . . The long peace which Denmark enjoyed from 1720 until the Napoleonic era was a period of internal development, but not external expansion. At the beginning of the nineteenth century this beneficent peace was rudely shattered, and Denmark was plunged into wars with both England and Sweden. . . . The war dragged desultorily on until . . . the Danes were compelled to sue for peace. The terms were the surrender of Norway to Sweden and of Heligoland to England. This was in 1814. The Dano-Norwegian Union had then lasted for more than four hundred years. Denmark had now been shorn of all her foreign possessions in Europe with the sole exception of Holstein. There followed a period of internal reconstruction. In 1813 the State had verged on bankruptcy, owing to the heavy expenses entailed by the war. Trade and commerce had been crippled. . . . The recuperative decade was rudely broken in 1848, the year of the revolts in Paris and Berlin. The German-speaking population of the provinces of Holstein and Sleswick rose against the Danish rule."—M. T. Harvey and C. Reppien, *Denmark and the Danes*, pp. 65-83.

1839-1848.—Royal succession growth of political feeling.—Frederick VI was succeeded in 1839 by Christian VIII, whose nine-year reign witnessed renewed demands for a popular constitution; he was succeeded in 1848 by Frederick VII.

1848-1862.—Schleswig-Holstein question.—First war with Prussia.—“The two Duchies of Schleswig and Holstein lie to the south of modern Denmark. Holstein, the more southern of the two, is exclusively German in its population. Schleswig, the more northern, contains a mixed population of Danes and Germans. In the course of the 14th century Schleswig was conquered by Denmark, but ceded to Count Gerard of Holstein—the Constitution of Waldemar providing that the two Duchies should be under one Lord, but that they should never be united to Denmark. This is the first fact to realise in the complex history of the Schleswig-Holstein question. The line of Gerard of Holstein expired in 1375. It was succeeded by a branch of the house of Oldenburg. In 1448 a member of this house, the nephew of the reigning Duke, was elected to the throne of Denmark. The reigning Duke procured in that year a confirmation of the compact that Schleswig should never be united with Denmark. Dying without issue in 1450, the Duke was succeeded, by the election of the Estates, by his nephew Christian I. of Denmark. In electing Christian, however, the Estates compelled him in 1460 to renew the compact confirmed in 1448. And, though Duchies and Crown were thenceforward united, the only link between them was the sovereign. Even this link could possibly be severed. For the succession in the Duchy was secured to the male heir in direct contradiction of the law of Denmark. . . . It would complicate this narrative if stress were laid on the various changes in the relations between Kingdom and Duchies which were consequent on the unsettled state of Europe during the three succeeding centuries. It is sufficient to say that, by a treaty made in 1773, the arrangements concluded more than 300 years before were confirmed. Schleswig-Holstein reverted once more to the King of Denmark under exactly the same conditions as in the time of Christian I., who had expressly recognised that he governed them as Duke, that is, by virtue of their own law of succession. Such an arrangement was not likely to be respected amidst the convulsions which affected Europe in the commencement of the present century. In 1806 Christian VII. took advantage of the disruption of the German Empire formally to incorporate the Duchies into his Kingdom. No one was in a position to dispute the act of the monarch. In 1815, however, the King of Denmark, by virtue of his rights in Holstein and Lauenburg, joined the Confederation of the Rhine; and the nobility of Holstein, brought in this way into fresh connection with Germany, appealed to the German Diet. But the Diet, in the first quarter of the 19th century, was subject to influences opposed to the rights of nationalities. It declined to interfere, and the union of Duchies and Kingdom was maintained. Christian VII. was succeeded in 1808 by his son Frederick VI., who was followed in 1839 by his cousin Christian VIII. The latter monarch had only one son, afterwards

Frederick VII., who, though twice married, had no children. On his death, if no alteration had been made, the crown of Denmark would have passed to the female line—the present reigning dynasty—while the Duchies, by the old undisputed law, would have reverted to a younger branch, which descended through males to the house of Augustenburg. With this prospect before them it became very desirable for the Danes to amalgamate the Duchies; and in the year 1844 the Danish Estates almost unanimously adopted a motion that the King should proclaim Denmark, Schleswig, Holstein, and Lauenburg one indivisible State. In 1846 the King put forth a declaration that there was no doubt that the Danish law of succession prevailed in Schleswig. He admitted that there was more doubt respecting Holstein. But he promised to use his endeavours to obtain the recognition of the integrity of Denmark as a collective State. Powerless alone against the Danes and their sovereign, Holstein appealed to the Diet; and the Diet took up the quarrel, and reserved the right of enforcing its legitimate authority in case of need. Christian VIII. died in January, 1848. His son, Frederick VII., the last of his line, grasped the tiller of the State at a critical moment. Crowns, before a month was over, were tumbling off the heads of half the sovereigns of Europe; and Denmark, shaken by these events, felt the full force of the revolutionary movement. Face to face with revolution at home and Germany across the frontier, the new King tried to cut instead of untying the Gordian knot. He separated Holstein from Schleswig, incorporating the latter in Denmark but allowing the former under its own constitution to form part of the German Confederation. Frederick VII. probably hoped that the German Diet would be content with the half-loaf which he offered it. The Diet, however, replied to the challenge by formally incorporating Schleswig in Germany, and by committing to Prussia the office of mediation [see GERMANY: 1848 (March-September)]. War broke out, but the arms of Prussia were crippled by the revolution which shook her throne. The sword of Denmark, under these circumstances, proved victorious; and the Duchies were ultimately compelled to submit to the decision which force had pronounced. These events gave rise to the famous protocol which was signed in London, in August, 1850, by England, France, Austria, Russia, Sweden, and Denmark. This document settled the question, so far as diplomacy could determine it, in the interests of Denmark. The unity of Denmark, Schleswig, Holstein and Lauenburg was secured by a uniform law of succession, and their internal affairs were placed, as far as practicable, under a common administration. The protocol of 1850 was signed by Lord Palmerston [for Great Britain] during the Russell Administration. It was succeeded by the treaty of 1852, which was concluded by Lord Malmesbury. This treaty, to which all the great powers were parties, was the logical consequence of the protocol. Under it the succession to Kingdom and Duchies was assigned to Prince Christian of Glücksburg, the present reigning King of Denmark. The integrity of the whole Danish Monarchy was declared permanent; but the rights of the German Confederation with respect to Holstein and Schleswig were reserved. The declaration was made in accordance with the views of Russia, England, and France; the reservation was inserted in the interests of the German powers; and in a manifesto, which was communicated to the German Courts, the King of Denmark laid down elaborate rules for the treatment and government of the Duchies. Thus, while the succession to the

Danish throne and the integrity of Denmark had been secured by the protocol of 1850 and the treaty of 1852, the elaborate promises of the Danish King, formally communicated to the German powers, had given the latter a pretext for contending that these pledges were at least as sacred as the treaty. And the next ten years made the pretext much more formidable than it seemed in 1852. . . . The Danes endeavoured to extricate themselves from a constantly growing embarrassment by repeating the policy of 1848, by granting, under what was known as the Constitution of 1855, autonomous institutions to Holstein, by consolidating the purely Danish portions of the Monarchy, and by incorporating Schleswig, which was partly Danish and partly German, in Denmark. But the German inhabitants of Schleswig resented this arrangement. They complained of the suppression of their language and the employment of Danish functionaries, and they argued that, under the engagements which had been contracted between 1851 and 1852, Holstein had a voice in constitutional changes of this character. This argument added heat to a dispute already acute. For it was now plain that, while the German Diet claimed the right to interfere in Holstein, Holstein asserted her claim to be heard on the affairs of the entire Kingdom."—S. Walpole, *Life of Lord John Russell*, v. 2, ch. 30.—In the first period of the war of 1848-9, the only important battle was fought at Duppeln, June 5, 1848. The Prussians were superior in land forces, but the Danes were able to make use of a flotilla of gunboats in defending their strong position. "After a useless slaughter, both parties remained nearly in the same position as they had occupied at the commencement of the conflict." The war was suspended in August by an armistice—that of Malmö—but was renewed in the April following. "On the 20th April [1849] the Prussians invaded Jutland with 48 battalions, 48 guns, and 2,000 horse; and the Danish generals, unable to make head against such a crusade, retired through the town of Kolding, which was fortified and commanded an important bridge that was abandoned to the invaders. The Danes, however, returned, and after a bloody combat dislodged the Prussians, but were finally obliged to evacuate it by the fire of the German mortars, which reduced the town to ashes. On the 3d May the Danes had their revenge, in the defeat of a large body of the Schleswig insurgents by a Danish corps near the fortress of Fredericia, with the loss of 340 men. A more important advantage was gained by them on the 6th July," over the Germans who were besieging Fredericia. "The loss of the Germans in this disastrous affair was 96 officers and 3,250 men killed and wounded, with their whole siege-artillery and stores. . . . This brilliant victory was immediately followed by the retreat of the Germans from nearly the whole of Jutland. A convention was soon after concluded at Berlin, which established an armistice for six months," and which was followed by the negotiations and treaties described above. But hostilities were not yet at an end; for the insurgents of Schleswig and Holstein remained in arms, and were said to receive almost open encouragement and aid from Prussia. Their army, 32,000 strong, occupied Idstedt and Wedelspang. They were attacked at the former place, on the 25th of July, 1850, by the Danes, and defeated after a bloody conflict. "The loss on both sides amounted to nearly 8,000 men, or about one in eight of the troops engaged; a prodigious slaughter, unexampled in European war since the battle of Waterloo. Of these, nearly 3,000, including 85 officers, were killed or wounded on the side of the Danes, and 5,000 on that of the

insurgents, whose loss in officers was peculiarly severe."—A. Alison, *History of Europe*, 1815-1852, ch. 53.—From 1855 to 1862 the history of Denmark was uneventful. But in the next year King Frederick VII. died, and the Treaty of London, which had settled the succession upon Prince Christian of Glücksburg, failed to prevent the reopening of the Schleswig-Holstein question.

1849-1874.—Danish constitution.—Relations of Iceland to Denmark.—"Denmark became a constitutional monarchy in 1849. The principal provisions of the Constitution are these: Every king of Denmark, before he can assume the government of the monarchy, must deliver a written oath that he will observe the constitution. He alone is invested with the executive power, but the legislative he exercises conjointly with the Assembly (Rigsdag). He can declare war and make peace, enter and renounce alliances. But he cannot, without the consent of the Assembly, sign away any of the possessions of the kingdom or encumber it with any State obligations. . . . The king's person is sacred and inviolable; he is exempt from all responsibility. The ministers form the Council of State, of which the king is the president, and where, by right, the heir-apparent has a seat. The king has an absolute veto. The Rigsdag (Assembly) meets every year, and cannot be prorogued till the session has lasted for two months at least. It consists of two Chambers—the Upper Chamber, 'Landsting,' and the Lower Chamber, 'Folketing.' The Upper Chamber consists of 66 members, twelve of which are Crown-elects for life, seven chosen by Copenhagen, and one by the so-called Lagting of Farø. The 46 remaining members are voted in by ten electoral districts, each of which comprises from one to three Amts, or rural governorships, with the towns situated within each of them included. The elections are arranged on the proportional or minority system. In Copenhagen and in the other towns one moiety of electors is chosen out of those who possess the franchise for the Lower House, the other moiety is selected from among those who pay the highest municipal rates. In every rural commune one elector is chosen by all the enfranchised members of the community. . . . The Lower House is elected for three years, and consists of 102 members; consequently there are 102 electorates or electoral districts. . . . The Lower House is elected by manhood suffrage. Every man thirty years old has a vote, provided there be no stain on his character, and that he possesses the birthright of a citizen within his district, and has been domiciled for a year within it before exercising his right of voting, and does not stand in such a subordinate relation of service to private persons as not to have a home of his own. . . . The two Chambers of the Rigsdag stand, as legislative bodies, on an equal footing, both having the right to propose and to alter laws. . . . At present [1891] this very Liberal Constitution is not working smoothly. As was to be expected, two parties have gradually come into existence—a Conservative and a Liberal, or, as they are termed after French fashion, the Right and the Left. The country is governed at present arbitrarily against an opposition in overwhelming majority in the Lower House. The dispute between the Left and the Ministry does not really turn so much upon conflicting views with regard to great public interests, as upon the question whether Denmark has, or has not, to have parliamentary government.

. . . The Right represents chiefly the educated and the wealthy classes; the Left the mass of the people, and is looked down upon by the Right. In 1800 the old Althing (All Men's Assembly, General Diet), which had existed from 930, came to an end. Forty-five years later it was re-established by King Christian VIII. in the character of a consultative assembly. . . . The Althing at once began to direct its attention to the question—What Iceland's proper position should be in the Danish monarchy when eventually its anticipated constitution should be carried out. The country had always been governed by its special laws; it had a code of laws of its own, and it had never been ruled, in administrative sense, as a province of Denmark. Every successive king had, on his accession to the throne, issued a proclamation guaranteeing to Iceland due observance of the country's laws and traditional privileges. Hence it was found entirely impracticable to include Iceland under the provisions of the charter for Denmark; and a royal rescript of September 23, 1848, announced that with regard to Iceland no measures for settling the constitutional relation of that part of the monarchy would be adopted until a constitutive assembly in the country itself 'had been heard' on the subject. Unfortunately, the revolt of the duchies intervened between this declaration and the date of the constitutive assembly which was fixed for 1851. The Government took fright, being unfortunately quite in the dark about the real state of public opinion in the distant dependency. . . . The Icelanders only wanted to abide by their laws, and to have the management of their own home affairs, but the so-called National-Liberal Government wanted to incorporate the country as a province in the kingdom of Denmark proper. This idea the Icelanders really never could understand as seriously meant. . . . The constitutive assembly was brusquely dissolved by the Royal Commissary when he saw that it meant to insist on autonomy for the Icelanders in their own home affairs. And from 1851 to 1874 every successive Althing (but one) persisted in calling on the Government to fulfil the royal promise of 1848. It was no doubt due to the very loyal, quiet, and able manner in which the Icelanders pursued their case, under the leadership of the trusted patriot, Jon Sigurdsson, that in 1874 the Government at last agreed to give Iceland the constitution it demanded. But instead of frankly meeting the Icelandic demands in full, they were only partially complied with, and from the first the charter met with but scanty popularity."—E. Magnusson, *Denmark and Iceland (National life and thought*, ch. 12).—See also ICELAND: 1830-1854.

1873.—Adoption of gold standard for inter-

national exchange. See MONEY AND BANKING: Modern: 1867-1893.

1875-1901.—Struggle between the two houses of Parliament.—“For nineteen years (1875-94) J. B. S. Estrup governed Denmark against the will of the majority of the Folkething, supported by the King and the Landsting. He tried to establish the complete equality of the two Houses, and he fortified Copenhagen with money which had been, not voted but refused, by Parliament. All legislation was paralysed and at a standstill and provisional financial decrees took the place of budgets rejected by the Folkething, more than four-fifths of which were in opposition to him in 1884 and subsequent years. There was talk of a revolution, and some people refused to pay taxes which had not been granted by Parliament; an unsuccessful attempt was made on the life of the Premier. Finally, in 1894, the Opposition made a compromise with Estrup. He was to retire, but the illegal use of money to fortify Copenhagen, and the provisional financial decrees, were to be regularized. One Conservative Ministry succeeded the other in 1894-1901, and the struggle between the two Houses continued. While the ‘Rights’ (Conservative) party disintegrated more and more, the ‘Left’ grew stronger in the country at every election. At last Christian IX consented to ask Deuntzer to form a Ministry of the ‘Left,’ the first parliamentary Cabinet in Denmark.”—J. Stefansson, *Denmark and Sweden*, pp. 150-151.

1899.—Complaints from Danish Schleswig of German treatment.—The strictness with which the German government was enforcing its regulation prohibiting the use of the Danish language except in religious instruction aroused general discontent in Schleswig and caused a storm of protest. See GERMANY: 1899.

1899.—Representation in the Peace Conference at the Hague. See HAGUE CONFERENCES: 1899: Constitution.

20th century.—Status of education.—Workers’ education. See EDUCATION: Modern developments; 20th century: General education: Denmark; also Workers’ education: Denmark.

1901.—Democratic victory.—Landlordism in Denmark, entrenched in the upper house of Parliament, was dislodged from the control of the government by the Democratic party, in the elections of April, 1901, after a struggle of thirty years. “Out of 114 members in the lower house only 5 were won by the Conservatives, with small majorities, and even the strong Conservative majority in the upper house was reduced to one vote through the rebellion of the Conservatives. The Danes are now a thoroughly radical and democratic people, with a more perfect system of self-government in politics and business than perhaps any other nation. . . . The victory of April 3, . . . [1901] was as complete over the Moderates as over the Government. Before the poll the Moderates were twenty-two strong, but Mr. Bojesen, the evil genius of the democracy, withdrew his candidature. . . . [The] constituency, which he had represented since 1869, was taken by the Radicals, and the Moderates, now reduced to twelve or thirteen . . . lost all their former importance. . . . Mr. Jens Christian Christensen [was] . . . the most important member of the new cabinet. . . . Of late years, [he had] practically ruled the country in his capacity of president of the finance committee of the Folkething. . . . [A few months prior to the election he had been elected] a ‘revisor of the state’. . . . [After the election he became] minister of religion and education.”—*American Review of Reviews*, October, 1901.

1902-1909.—Fortification and naval defense question in Danish politics.—Formation of the Zahle ministry.—“A commission which was appointed in 1902 to decide by which means Denmark could best defend her neutrality, reported in 1908. [Premier] Neergaard laid a defence bill before Parliament, but he soon resigned and a Cabinet formed expressly for the purpose by Count Holstein-Ledreborg carried the Defence Bill through both Houses in 1909. Copenhagen was to be strongly fortified on the sea side and detached advance forts were to be built ashore in support, but the old illegal land fortifications erected by Estrup were to be left standing till 1922, when it is to be decided by a referendum of the people whether they shall be demolished or not. Stress was to be laid on torpedoes and coast defence by the Navy, which was to have a fortified *point d'appui* in the Great Belt. New taxation, confined to the well-to-do classes, was introduced to meet the increase in military expenditure.”—J. Stefansson, *Denmark and Sweden with Iceland and Finland*, pp. 152-153.—The question of defense, between land fortification and naval development, was for some time a very live one in Danish politics. Politically, the controversy was curiously altered in February, 1909, by a sudden change of front on the part of the Premier, M. Neergaard. In the Cabinet, which was formed upon Neergaard’s resignation, Christensen was included as minister of defence. The appointment of the latter was offensive to a large part of the public. An immense popular demonstration against the obnoxious minister of defence was carried out at Copenhagen on August 29; but he stayed in office some weeks longer, until a scheme of defence had been agreed upon between ex-Premier Neergaard and himself, and carried through parliament, September 24. The scheme provided for strong sea fortifications for Copenhagen, while the land defences of the eighties were to be maintained and somewhat strengthened by two new forts, which were, however, officially characterized as sea forts. Three weeks after the passage of the Defence Act Christensen resigned, and was followed out of office by the whole Holstein-Ledreborg Ministry before the end of October. For the first time in Denmark a Radical Ministry was then formed, under Zahle.

1903.—Power of Socialist party. See SOCIALISM: 1899-1908.

1906.—Death of King Christian IX.—Succession of Frederick VIII.—Gains by Social Democrats in the spring elections.—Visit from the Icelandic parliament.—On January 29, 1906, King Christian IX died, at the age of eighty-eight. He was succeeded by his son, Frederick VIII, who is said to have inherited his father’s character and ability in a marked degree. He had already reached the age of sixty-three when he came to the throne. When his accession was proclaimed he spoke from the balcony of the palace at Copenhagen to the multitude of people assembled in these words: “Our old King, my dearly beloved father, has closed his eyes. He fell asleep peacefully and calmly, having faithfully discharged his royal duties to the last. In taking over the heavy heritage placed on my shoulders, I cherish the confident hope, and offer a sincere prayer, that the Almighty may grant me strength and happiness to carry on the government in the spirit of my dearly beloved father, and that I may have the good fortune to reach an understanding with the people and their chosen representatives on all that tends to the good of the people and the happiness of our beloved fatherland. Let us join in the cry, ‘Long live the fatherland!’” In September, on the invitation of King

Frederick, the members of the Icelandic parliament visited Denmark.

1907.—Second Hague Conference. See HAGUE CONFERENCE: 1907.

1908.—Treaty for the maintenance of the status quo on the North Sea.—The governments of Denmark, France, Germany, the Netherlands and Sweden entered an agreement to "preserve intact and mutually to respect" their sovereign rights, and to act in concert in case their territorial status quo is threatened. See NORTH SEA: 1908.

1909 (June).—Murder of General Beckman.—In June, 1909, during a visit of the Tsar of Russia to the Danish Court, at Copenhagen, a Swedish anarchist, Adolf Vang, who had planned an attempt at the murder of the Russian sovereign, and was enraged on being baffled by the police, fired at two officers whom he met, provoked by nothing but their uniforms, and slew one, General Beckman.

1915.—Revision of the constitution.—"By far the most important event of the year . . . was the inauguration of the third Danish Constitution, which gave the vote to all men and all women who had reached the age of twenty-five years. Under the second constitution of 1866, the suffrage for the Folkething was limited to honest and independent men aged thirty or upward; and the effect of the new Bill was to include women and servants. The new Constitution provided also for the election on a basis of proportional representation of a number of new members to the Folkething in addition to the 114 returned by the existing constituencies. The change affected also the Constitution of the Landsthing; its numbers were raised from 66 to 72. Of these 18 were to be nominated by the old Landsthing before its extinction; while the remaining 54 were to be returned on a thoroughly democratic system of proportional representation. Nomination of members by the king was altogether abolished; and women were empowered not only to vote in the elections both to the Landsthing and the Folkething, but also became eligible to sit in both Houses. Moreover the old differentiation between electors, which gave the most representation to the landowners and highly taxed voters, was done away with. [See also SUFFRAGE, MANHOOD: Denmark: 1849-1921.] . . . The new scheme, however, was not to come in force until 1916 and the extension of the suffrage

was to take place gradually, not being finally completed for some years. The new constitution was voted on April 23 and again by a new Parliament on June 5, the anniversary of the first Danish Constitution of 1849. On the same day it was signed by the king, in whose honor a large procession of women filed past the royal palace. . . . The adoption of the new Constitution marked the triumph after fifteen years' struggle over the opposition of the Right, and was in the main the result of a compromise between that party and the Radicals and Socialists of the Left, under the immediate influence of the king."—*Annual Register*, 1915, pp. 277-278.

1917.—Sale of the Danish West Indies to the United States.—By a treaty signed on August 4 by the Danish minister to the United States, and ratified by the Folkething and the Landsting in December, the Danish West Indies (the Virgin Islands) were sold to the United States for \$25,000,000. The sale was at first opposed by both houses of the Rigsdag, and after a protracted fight, the question was settled by a plebiscite, held on December 14.—See also U. S. A.: Historical geography; 1917 (March); VIRGIN ISLANDS: United States purchase of the Islands.

1917-1920.—Economic and industrial conditions.—Industrial enterprises: electric power stations.—"Although the country was . . . free from serious political troubles, the [World] War had adverse economic effects upon the people. . . . The Danes suffered incidentally from the British blockade. No serious privations arose from this cause up to the end of 1916, but during 1917 the agricultural interests of Denmark undoubtedly suffered somewhat severely. . . . Compulsory rationing of sugar and bread was adopted."—*Annual Register*, 1917, pp. 277-278.—"The steady depreciation of the currency [1920] is causing quite a panic in the stock market. . . . *Politiken* censures the government for the inaction which has brought the country to such a pass, and urges the necessity of a stringent policy of stabilization. . . . Lively discussions are proceeding in the Rigsdag on the subject of the new Corn Laws, which will necessitate a further rise in the price of bread."—*Economic Review*, Sept. 10, 1920.—A "review of industrial conditions emphasizes the lack of sufficient fuel in Denmark and the general need of a future reliable market for coal."—*Supplement to Commerce Reports*, Oct. 11, 1920.—To remedy the coal shortage, Denmark planned to convey electric power from the funnels of the Skien and Rjukan Falls, in Southern Norway, either by means of an underwater cable across the Skagerrak to Jutland, or by means of an air line via Sweden.

1918.—Act conferring on Iceland the status of a sovereign state. See ICELAND: 1918.

1919.—Represented at Conference for international union of academies. See INTERNATIONAL UNION OF ACADEMIES: Conference called by French Academy.

1919.—Land reform law.—"A Danish law of 4th October, 1919, enacts that parochial lands, which owing to their nature and situation are capable of being cultivated shall be expropriated as the opportunity arises so as to create small holdings for the benefit of agricultural wage workers. To obtain a small holding under the present law, the applicant must give proof of his capacity to work it, of his possessing sufficient monetary resources, and also of his sobriety and honesty. The law then establishes rules for settling the price and regulates the way in which it shall be paid. Another Danish law of 4th October, 1919, decrees the division of all public lands suitable for

cultivation and the cession of single lots to farm workers. Another Danish law of 4th October, 1919, deals with all fiefs, trusts and entails; it enacts that the property in question shall remain free of all servitudes in the possession of the present holders who shall pay a certain proportion of its value and hand over a portion of land to the State. The lands which the State thus acquires must be allotted or ceded in accordance with the provisions of the above laws."—*Introduction (International Yearbook of Agricultural Legislation, v. 6, 1919, p. li.*—By a law of the same year entitled *property became freehold*, and one-third of the area of such estates became subject to expropriation for small holdings. Also, the state became entitled to a part of the capital value of the estate. Another law decreed that land held under lease should become freehold. All this important legislation is part of the general movement, in Europe, to divide up the large estates which have descended from feudal times.

1919.—German boundary line. See VERSAILLES, TREATY OF: Part II.

1919.—Trade union statistics. See LABOR ORGANIZATION: 1910-1919.

1919-1920.—Provisions for Schleswig under the Versailles treaty.—Holding of the plebiscites.—"The chief attention of the country was . . . directed towards the question of Schleswig, rather than towards any problem of internal politics. It will be remembered that in the original draft of the Treaty of Versailles, Schleswig had been divided into three zones—northern, middle, and southern—in all of which plebiscites were to be held to decide whether the several zones should be Danish or German [see VERSAILLES, TREATY OF: Part III: Sect. XII]. At the express wish of the Danish Government, however, the third (southern) zone had been subsequently excluded from the scheme altogether, since it was now thoroughly Germanised, and had, indeed, been largely Germanised even before 1864. The two other plebiscites were, however, to be held as soon as the Treaty of Peace had duly come into force. After the final ratification of the treaty in Paris on January 10, [1920], no time was lost in making preparations for the polls. . . . The population of the first zone was in the main Danish speaking; and it was foreseen that it would vote by a large majority for reunion with Denmark. The second zone was smaller than the first, but was nevertheless of great importance because it included the port of Flensburg, a town with a population of over 70,000 persons, which, if it were reunited to Denmark, would be the second city of that country. The voting in the first zone took place on February 10, as arranged. The total number of persons entitled to vote was 111,191. The total of the votes cast for Denmark was 75,431. . . . The result was naturally greeted with great enthusiasm in Denmark. There was great excitement both in Denmark and in Flensburg when the date of the polling in the second zone approached. The plebiscite was fixed for March 14. From a linguistic point of view the second zone was very mixed. . . . The second zone voted German by a large majority. The result of the poll in the second zone was one of the contributory causes which led to the remarkable political crisis which occurred at the end of March."—*Annual Register, 1920, pp. 262-263.*—On July 7, 1920, the international commission which had been in charge of North Schleswig from January 10, handed over the administration to the Danish authorities.

1919-1920.—Food regulation. See FOOD REGULATION: 1918-1920.

1920.—Dismissal of the Zahle ministry.—"Easter crisis."—Formation of a coalition government.—New election law.—Composition of the new Folkething.—Neergaard appointed prime minister.—Incorporation of northern Schleswig.—Constitutional amendment.—"The first intimation that all was not well with the state of Denmark came with the news of King Christian's sudden dismissal of the Zahle Ministry. This took place on the morning of 29 March. The explosion merely represented the climax of strained relations that had existed between the King and his Cabinet for some time, and which had been brought to a head by the announcement of the result of the Slesvig plebiscite. The existing Zahle Ministry, which had been criticised by the parties of the Right for its attitude towards the German question, announced its intention of adhering absolutely to the decision in zone 2, which went in favour of Germany by a three to one majority. The king, on the other hand, took a stiffer line. His personal and dynastic feelings were engaged in recovering Slesvig for the Kingdom, and he was enabled to take a bold stand in view of the fact that he had behind him an undoubtedly large body of support. Opinion indeed was inflamed, and resolved itself into two sharply divided camps. The Government's following consisted of the Social Democrats and the Radical Left; the Opposition's, of the Moderate Left and the Conservatives. The King therefore sought to take advantage of the nationalist feeling which had been aroused in the parties of the Right to get rid of a Government which was distasteful to him. . . . Although the Danish Constitution . . . in Article 13 expressly invests the King with the power of electing and dismissing the Ministers, the literal exercise of this prerogative caused a great sensation."—*New Europe, Apr. 15, 1920.*—"A storm of protest arose and, under threat of proclaiming a republic, Progressives throughout the country demanded the reinstatement of the dismissed cabinet ["Easter crisis"]. M. Neergaard failing to command a majority, the King appealed to M. Liebe to form a non-political government whose chief function would be to order new elections for the lower house (Folkething). Faced by a general strike, the Liebe government resigned after four days' tenure of office, and a provisional cabinet, opposed to the King's action in dissolving the Zahle government, was assembled by M. Fries, former Director of the Ministry of Justice."—*Political Science Quarterly, Supplement, 1920, pp. 140-141.*—Following the election experiment in 1918, a new election law, conforming with the amended constitution of 1915, was passed on April 11, 1920. In accordance with it the members of the Folkething, whose number is fixed at 140, are elected by a dual method, combining both the proportional representation method and the single-member district method, employed in the United States. "The main point of the electoral bill is the lowering of the age for the vote. The old electoral law gave the vote only to persons over 30, although a later modification aimed at gradually lowering this limit till it reached 25. The new bill, introduced by the Radical Left and the Social Democrats, will give the vote to every man and woman over 21. The main accretion of votes anticipated by the Left as a result of this measure is expected to come from the farm labourers and their women folk."—*New Europe, Apr. 15, 1920.*—As a result of the elections, held April 25, 1920, the new Folkething was composed of fifty-nine members representing the former Government parties, i.e., the Radical Left and the Social Democratic parties, and eighty

members representing the former opposition parties, i.e., the Left, the Conservative People's Parties and the Conservative Tradesmen's Party. The Liberal leader, Niels Neergaard, headed the new Cabinet as Prime Minister and Minister of Finance.

"After he came into office, Mr. Neergaard made it clear that he could not support the agitation of the extreme Danish Nationalists; but he was ready to endeavor to obtain guarantees for the just treatment of the Danish minority in Middle Schleswig. . . . A treaty between the Principal Allied Powers (Great Britain, France, Italy, and Japan) and Denmark was drawn up, the agreement being necessary for the transfer of Northern Schleswig to Denmark. The treaty was duly signed in Paris on July 5. At about the same time a 'North Schleswig Reunion Act' was passed through the Danish Parliament and was signed by the King on July 9. . . . After the Bill incorporating Northern Schleswig had been passed by the Rigsdag, Parliament was immediately dissolved in order to give the people an opportunity of expressing their opinion on the measures which had been approved. The second General Election was held on July 6. . . . The Bill incorporating the territory was passed by the new Parliament and was then finally submitted to a plebiscite at the beginning of September. The plebiscite resulted in the Bill being approved."—*Annual Register, 1920, pp. 264-265.*—The expansion of Danish territory resulting from the incorporation of northern Schleswig necessitated a constitutional amendment to allow the people of Schleswig to take part in the fall elections. This amendment was duly passed September 10th, and the elections were held on the 21st with the people of Schleswig voting. At this election the voting age was twenty-five for the first time.

"A new political party, the *South Jutland Left*, [was] formed at Aabenraa (Apenrade) with the object of promoting the amalgamation of the restored territory with the kingdom of Denmark in a peaceful and liberal manner, and with the shortest possible period of transition."—*Economic Review, Aug. 6, 1920.*—See also EUROPE: Modern: Political map.

1920.—*Social Aid League organized to break strikes.*—"The Social Aid League, which came into public notice during . . . [a] strike of transport workers and seamen in Denmark in April, is stated to be a non-political body organised in February of this year with the object of affording voluntary labour and assistance to the State in cases where labour disputes bring about the stoppage of activities vital to the life of the community. It is designed to give temporary assistance to the community—not to support or weaken either party to an industrial dispute. The League was organised by a group of men which included two advocates, a consul, an engineer, two merchants, two professors and a captain. In the middle of April the membership was stated to number a thousand, including engineers, doctors, architects, professors, students and tradesmen; it was believed that none came from the working class."—*Labour overseas (Ministry of Labour, London, Apr.-June, 1920, p. 02).*

1921.—*Administration of Neergaard.*—*Reorganization of Foreign Office.*—*Negotiations with Germany.*—*Labor conditions.*—*Financial status.*—The administration of Neergaard was concerned with the task of solving those problems, in particular, which arose from the international after-effects of the war. "In recognition of the fact that something more than purely economic measures would be required to obviate international difficulties, the Government realised that its

first duty was to reorganise the Foreign Office with special regard to modern commercial policy. With this object in view the Foreign Secretary on February 3, 1921, introduced into the Rigsdag a Bill which after some opposition was passed early in May. The fundamental principle of the project is to coördinate under a single head political as well as economic questions, formerly dealt with by separate departments. This unification is further symbolised by the fact that the general direction is to be placed in the hands of a permanent Director who is now M. O. C. Scavenius. In April [1921] it was decided to initiate direct negotiations with Germany in order to settle certain practical questions arising out of the restoration of South Jutland to Denmark. They were begun in May and concluded in December, when an agreement was reached in regard to water courses, fisheries, and local economic problems.

DANISH TERRITORY RECOVERED FROM GERMANY BY THE PLEBISCITE HELD ACCORDING TO THE TERMS OF THE VERSAILLES TREATY

. . . The Great Northern Telegraph Company has resumed its old activities in transmitting the world's telegraphic messages to the East across Russia. In March a Danish-Dutch Union and a Danish Czecho-Slovakian Chamber of Commerce were formed. In the autumn a concession for the exploitations of 65,000 hectares of forest were obtained from the Latvian Government. Further, a Danish-Australian Chamber of Commerce was created. The work in progress with a view to the development of Danish colonial enterprise in Greenland is of preponderating interest, and this work is especially marked by new administrative proposals, put forward in December, 1920. . . . Labour conditions in Denmark assumed a serious complexion during the spring in consequence of friction within several trades. On March 18 a lockout was declared, and was met with strikes comprising about 100,000 workers. Towards the middle of the following month the Government's arbitrator succeeded in bringing about a reconcilia-

tion involving amongst other things certain minute reductions in wages. Unemployment, which kept pace with the depression in trade, industry, and shipping, continued till the end of the year, and involved at its close approximately 80,000 workers. Shortly after the reopening of the Rigsdag in October the Minister of the Interior brought forward a proposal for the alteration of the terms on which maintenance and work should be given to the unemployed. But as the proposal implied a stricter control in granting allowances and at the same time aimed at reducing their amount, it was fiercely opposed by the Labour Party. Certain changes, intended to meet the objections of Labour, having been introduced, the proposal was passed with the consent of all parties and took effect as from January 1, 1922. During the Autumn session the attention of the Rigsdag was concentrated on the great fiscal reforms foreshadowed by the Government. . . . At the end of 1921 the general financial depression which weighed heavily on most European countries, did not affect Denmark severely. . . . At the close of the year 1921, Denmark can boast of a balanced Budget, favourable trade returns, a firm exchange which perceptibly improved during 1921 and was nearing par as the year ended, a discount rate of 5½ per cent., and a much reduced circulation of paper currency."—*Annual Register*, 1921, pp. 251, 252, 253, 254.

DENMARK, Constitution of: Principal provisions.—The "Grundlov," or charter, of June 5, 1849, first introduced a constitution into Denmark. The constitution was revised in 1866 and called the second constitution. This was followed by a revised or third constitution in 1915, amended September 10, 1920. See DENMARK: 1849-1872; 1915; 1920.

The principal provisions of the third constitution are as follows: The executive power is vested in the king who rules through his ministers; the king cannot declare war or sign a peace without the consent of the Rigsdag, and he must be a member of the Evangelical-Lutheran church, the State church; the legislative power is vested in the king and the Rigsdag jointly. The Rigsdag is composed of two houses: the Folkething (lower house) and the Landsting (upper house or Senate). Suffrage is enjoyed by all men and women of 25 years of age and with a fixed abode. The Folkething is composed of 149 members, 117 of which are elected by proportional representation; the term is four years but the king can dissolve it before that time. To this body the government must submit all money bills. The Landsting is composed of 56 members elected indirectly by voters of 35 years of age. The term is eight years, but elections are held every four for one half the body. Ministers may speak in either assembly, but can vote only

in the body of which they are members. The Landsting appoints from its own members, judges who together with others form the Rigsret, a body which tries parliamentary impeachments. The Rigsdag meets annually on the first Tuesday in October.

D'ENTRECASTEAUX ISLANDS, group of small islands east of New Guinea; used by the Australians in the World War in their operations against German New Guinea.

DENVER, city of the United States, capital of the State of Colorado and county seat of Denver county, is situated at the junction of the South Platte river and Cherry creek. An important railroad center, the city lies 2,025 miles from New York and 1,457 miles from San Francisco. It covers an area of sixty square miles and is regularly laid out in straight lines with geometrical precision; it contains a large number of fine public buildings, the State capitol, numerous parks, recreation and playgrounds. Denver University was created in 1880; within its buildings is housed the famous Chamberlain Observatory. Beginning as a mining settlement in 1858, Denver received its city charter in 1859 and was named after the then governor of Kansas, General J. W. Denver. It was reincorporated by the first Territorial Legislature in 1861 and became the capital of the territory in 1867. Population, 1920, 256,491.—See also COLORADO: 1776-1858.

DEORHAM, Battle of (577).—Fought near Bath, England, between the invading West Saxons and the Britons.—J. R. Green, *Making of England*, pp. 125-131.

DEPARTMENT, word applied in the United States to the ten chief divisions of the executive branch of the government. The department heads comprise the cabinet. In Great Britain it is applied to the subordinate divisions only of great offices, corresponding to the American use of the word bureau. In France it denotes a territorial division of the country. "The old thirty-two provinces were abolished and France was divided into eighty-three departments of nearly uniform size. The departments were divided into *arrondissements*, these into *cantons*, and these into municipalities or *communes*. These are terms which have ever since been in vogue. . . . Whereas formerly the central government had been represented in each province by its own agents or office-holders, the intendants and their subordinates, in the departments of the future the central government was to have no representatives."—C. D. Hazen, *Modern Europe*, p. 146.—"On February 17th, 1800, the law was proclaimed which forms to-day the basis of French administrative apparatus. According to its provisions in every 'department' the chief administrative officer is a prefect, in every 'Arrondissement' a sub-prefect, in every 'Commune' a mayor,

—all three classes being appointed by the Chief Magistrate and subordinated to the Minister of the Interior.”—A. Fournier, *Napoleon the First*, p. 223. —The French departments now number ninety-three, three in Algeria since 1881, and three of Alsace-Lorraine since 1918, being treated as parts of France.—See also ARRONDISSEMENT; COLONIZATION: French; FRANCE: 1801-1800.

DEPOSIT, Right of.—This expression referred to the right asserted by the United States about 1795-1800 to unload goods in Spanish Louisiana and reload them on ocean-going craft. This was claimed as a right included in that of free navigation of the Mississippi river. The withdrawal of this privilege by Spain before transferring Louisiana to France led President Jefferson to seek the purchase of territory at the mouth of the river and resulted in the purchase of Louisiana.

DE PRES, Després, or Desprez, Josquin (c. 1445-1521), celebrated French composer. Chapel master at St. Quentin; pupil of Okeghem; chorister in Sistine Chapel, 1471-1484; in papal choir again, 1486. Attached at various times to courts of Hercules in Ferrara, Lorenzo in Florence and Louis XII in Paris. Baini calls him the “idol of Europe,” until it was only Josquin in Italy; only “Josquin in France; in Germany, in Flanders, in Bohemia, in Spain, only Josquin.” Prolific composer of church music in forms perfected by Okeghem.

DEPRETIS, Agostino (1813-1887), Italian statesman. Took an active part in the Mazzinian conspiracies; was appointed governor of Brescia, 1850; went to Sicily to try to reconcile the policy of Cavour with that of Garibaldi, 1860; appointed pro-dictator of Sicily by Garibaldi, 1860; Premier of Italy, 1876-1879, 1881-1887.—See also ITALY: 1870-1901.

“DER TAG” (The day), for some years previous to the World War, said to have been a popular toast in the German navy, signifying the day on which the Germans should meet the British fleet in combat.

DERAA, or Ed Deraah, about thirty miles east of the River Jordan. See WORLD WAR: 1918: VI. Turkish theater: c, 12; c, 21.

DERBENT, or Derbend, town in the province of Daghestan, Caucasia, a port on the Caspian sea. It was conquered by the Arabs in the seventh century, by the Mongols in 1220, by the Russians in 1722. According to a treaty signed in 1723 the town was ceded to the Persians. In 1796 it was

once more besieged by the Russians and formally annexed in 1813.—See also JUROPACH.

DERBY, Edward Geoffrey Smith Stanley, Earl of (1789-1869), English statesman. Member of the House of Commons, 1820-1851, when his father's death raised him to the peerage; 1830, was made chief secretary for Ireland, opposed O'Connell, carried the Coercion Bill, and also introduced and carried the Irish Education Act; 1833, appointed secretary for the colonies and carried the Emancipation Act; 1852, he was called upon to form an administration, but was not upheld by the country; 1858, premier for a year; 1866, formed the ministry which carried the Reform Bill; 1867, resigned office and the leadership of the conservative party in favor of Disraeli.—See also ENGLAND: 1851-1852; 1858-1859; 1865-1868; 1868-1870.

DERBY, Edward George Villiers Stanley, Earl of (1865-), British statesman, soldier and diplomat; served in South African War; financial secretary to the war office in 1900, and in 1903 was made post-master general; 1915, was created director general of recruiting, and “conducted a final three-months' campaign for soldier volunteers throughout the length and breadth of the British Isles”; 1916-1918, secretary of state for war; 1918-1920, ambassador to Paris.—See also ENGLAND: 1915 (October 21).

DERBY, Edward Henry Stanley, Earl of (1826-1893), English statesman; 1858, secretary for the colonies; 1858-1859, secretary of state for India after he had successfully carried the India Bill through the House of Commons; 1866 and 1874, foreign secretary associated with Disraeli in the purchase of the Suez canal shares. In 1880 went over to the Liberal party; was secretary for the colonies under Gladstone, 1882 to 1885; led the Liberal Unionists in the House of Lords, 1886-1891.—See also ENGLAND: 1873-1880.

DERBY, Henry, Earl of (1367-1413), son of John of Gaunt, and afterwards Henry IV of England. See ENGLAND: 1399-1413.

DERBY, James Stanley, 7th earl of (1607-1651). Sided with Charles I in the civil war, and after Charles' failure retired to the Isle of Man, where he ruled with a strong hand, and provided a refuge for royalists. He assisted Charles II in the abortive attempt made in 1651 to secure the crown, and escaped with Charles from Worcester, but was captured, sentenced to death and executed at Bolton in October, 1651.—See also ENGLAND: 1642-1651.

DERBY, Thomas Stanley, Earl of (1435-1504). As Baron Stanley he was made Lord of the Isle of Man by Henry IV; made chief justice by Edward IV, 1461; an executor of Edward IV; made constable of England by Richard III; present at Bosworth in 1485 but took no part in the fight which made his stepson, Henry Richmond, king; 1485, created earl of Derby by his step-son, Henry VII.

DERBY, The.—A celebrated horse-race held each year on Epsom Downs, fifteen miles from London, “was instituted by the 12th Earl of Derby in 1780. A year earlier the same racing peer had started the Oaks, named after his place at Banstead Downs—the Valley of Lambert's Oaks. Lord Derby won his own race in 1787 with Sir Peter Teazle. . . Little could Lord Derby have imagined that by the time of his grandson—the Prime Minister of the early part of Queen Victoria's reign—the Derby would be the occasion of a national festival. . . How soon Derby Day became a national fête day cannot be said, but it was a great holiday in the early part of the last century. On

May 18, 1847. Lord George Bentinck—a real power in the political and racing world of those days—moved the adjournment of the House of Commons over Derby Day. This motion was moved each year by a private member, until in 1860 Lord Palmerston moved it as a Government measure 'as a part of the unwritten law of Parliament.' Sir Stafford Northcote abandoned the motion as a Government motion in 1879, and on the proposal of Lord Wolmer it was rejected in 1892. The House, therefore, did not adjourn in that year, but it was so empty that it could not transact any important business. . . . The adjournment was proposed this year [1921] by Mr. Bottomley, but not carried! . . . The Derby was run without a break from 1780 until 1914, and in 1915 the Epsom stands and course were put to other even more important uses. A substitute Derby which cannot count was run at Newmarket in 1915, 1916, 1917, and 1918.

"As an instance of the importance attached to the Derby, the following extract from the biography of Lord George Bentinck by Lord Beaconsfield is not without interest. Lord George had sold his whole stud at the Goodwood Meeting of 1846 to Mr. Mostyn for £10,000. Among the stud was Surplice, winner of the Derby of 1848:—

"A few days before—it was the day after the Derby, May 25, 1848—the writer met Lord George Bentinck in the Library of the House of Commons. He was standing before the bookshelves, with a volume in his hand, and his countenance was much disturbed. His resolutions in favour of the colonial interests, after all his labours, had been negated by the Committee on the 22nd and 24th; his horse Surplice, whom he had parted with among the rest of his stud, solely that he might pursue, without distraction, his labours on behalf of the great interests of the country, had won that paramount and Olympic stake, to gain which had been the object of his life. He had nothing to console him and nothing to sustain him, except his pride. Even that deserted him before a heart, which he knew at least could yield him sympathy. He gave a sort of superb groan.

"All my life I have been trying for this, and for what have I sacrificed it?' he murmured.

"It was in vain to offer solace.

"You do not know what the Derby is,' he moaned out.

"Yes, I do, it is the *Blue Riband of the Turf*."

"It is the Blue Riband of the Turf,' he slowly repeated to himself, and sitting down at a table he buried himself in a folio of statistics.

"There have been foreign attacks on the Derby, and strong forces have been landed on Epsom Downs on many occasions. In 1865 Gladiateur came from France and won, from which country Durbar II., the property of an American, also came. Kisber, who won in 1876, was a Hungarian, and Iroquois, who won in 1881, came from America."—*The Times (London) Weekly Edition, June 6, 1921.*

DERBY - DISRAELI MINISTRIES. See ENGLAND: 1851-1852; 1858-1859; 1865-1868; 1868-1870.

DERCETO - APHRODITE, Cult of. See SYRIA: B. C. 64-63.

DE RE DIPLOMATICA, treatise on the science of diplomatics written in the seventeenth century by the great French scholar, Mabillon. See HISTORY: 25.

DE RETZ FACTION, name given to the followers of the Cardinal de Retz in his struggle against Mazarin and the court during the war of the Fronde. See FRANCE: 1650-1651.

DERFFLINGER, German battle cruiser; took part in the action off Dogger Bank, January 24, 1915, and in the Battle of Jutland, May 31, 1916.

DERNA, town on northern coast of Africa in the province of Barca. In 1803 it was besieged by the United States. See BARBARY STATES: 1803-1805.

DERNA INCIDENT. See ITALY: 1911-1913.

DERNANCOURT, village in France, department of the Somme, sur l'Ancre. See WORLD WAR: 1918: II. Western front: c, 30.

DE ROBECK, Sir John Michael (1862-), British vice-admiral. In 1915 during the World War commanded naval forces at the Dardanelles; covered the landing of troops on the Gallipoli peninsula. See WORLD WAR: 1915: VI. Turkey: a; a, 1 and 3.

DÉROULEDE, Paul (1864-1914), French poet and politician. Founder of the Ligue des Patriotes, which was designed to invigorate the feeling of *revanche* against Germany; was tried and convicted of treasonable conspiracy in 1900 (see FRANCE: 1899 [February-June]; 1899-1900 [August-January]) for the political part taken by him after the death of President Faure; sentenced to ten years' exile; 1905, permitted to return to France after the passage of the law of amnesty.

DERRY, old name for Londonderry. See LONDONDERRY.

DE RUSSY, Fort: Capture of. See U.S.A.: 1864 (March-May: Louisiana).

DE RUYTER, Michael Adrianzoon (1607-1676), Dutch admiral. See ENGLAND: 1652-1654; NETHERLANDS: 1672-1674.

DERVISHES, members of religious brotherhoods or orders in Mohammedan countries resembling in many ways the monks of Christendom. The meaning of the name is probably "a poor fellow who goes from door to door for assistance." "The doctrines of the darwesh orders are those of the Sufi mystics, and their religious ceremonies consist of exercises called *zikrs* or 'recitals.' . . . It was about A. H. 49 (A. D. 766) that the Shaikh Alwan, a mystic renowned for his religious fervor, founded the first regular order of faqirs, now known as the *Alwaniyah* with its special rules and religious exercises, although similar associations of men without strict rules had existed from the days of Abu Bakr, the first Khalifah. And although there is the formal declaration of Mubammad, 'Let there be no monasticism in Islam,' still the inclinations of Eastern races to a solitary and a contemplative life carried it even against the positive opposition of orthodox Islam, and now there is scarcely a . . . learned man in Islam who is not a member of some religious order. Each century gave birth to new orders. . . . M. D'Obsson . . . gives a list of thirty-two orders, but it is by no means comprehensive. Three of these orders, the Bastamiyah, the Naqshbandiyah, and the Bakhtashiyah, descend from the original order established by the first Khalifah, Abu Bakr. The fourth Khalifah, 'Ali, gave birth to all the others. Each order has its *silsilah*, or chain of succession from one of these two great founders. . . . The Maulawiyah are the most popular religious order in the Turkish empire. They are called by Europeans, who witness their *zikrs* and various religious performances at Constantinople and Cairo, the 'dancing,' or 'whirling' darweshes. . . . They have service at their *takyah* or 'convent' every Wednesday and Sunday at two o'clock. There are about twenty performers, with high round felt caps and brown mantles. At a given signal they all fall flat on their faces, and rise and walk slowly round and round with their arms folded, bowing and turning slowly several times. They then cast off

their mantles and appear in long bell shaped petticoats and jackets, and then begin to spin, revolving and turning with extraordinary velocity. . . . The most popular order in India is that of the Murdariyah. . . . From these have sprung the Malang faqirs who crowd the bazaars of India. They wear their hair matted and tied in a knot. The Rufaiyah order is also a numerous one in some parts of India. They practise the most severe discipline, and mortify themselves by beating their bodies. They are known in Turkey and Egypt as the 'Howling Darweshes'. Another well-known order of darweshes is the *Qalandariyah* or 'Wandering Darweshes'.—T. P. Hughes, *Dictionary of Islam, article Faqir*, pp. 116-119.—The fanaticism of the dervishes has often made them dangerous political factors and has led to serious disturbances in Egypt and other parts of the Mohammedan East.—See also EGYPT: 1885-1896; 1897-1898; 1899-1900.

DE SANCTIS, Francesco (1817-1883), Italian critic. See ITALIAN LITERATURE: 1860-1914.
