TO THE Most Illustrious THE ROYAL SOCIETY, The following CATALOGUE IS Moft Humbly PRESENTED By the Author NEHEMJAH GREW.

famili Roy Sioc

# 

- 11 N

## To his Honoured Friend

# Daniel Colwall Efq;

## Fellow of the ROYAL SOCIETY.

### SIR,

Othing can be more fit, than to dedicate a Catalogue of that Museum to your Self, of which you are the Founder. You having, in your Devotion to the *Royal Society*, offered

up to them That so noble an Hecatombe.

The truth is, I have herein profecuted, what the *Royal Society*, by their Order for the making and publifhing of this Catalogue, had begun: they having done the fame, as with regard to Common Ufe; fo to return that which is but Right to your Self, and that they might always wear this Catalogue, as the Miniature of your abundant Respects, near their Hearts.

Neither must your Voluntary Undertaking for the Engraving of the Plates for this Work, be unknown. You having done this, not only out of respect to my Self; but likewise in order to a Publique Good; whereby you are a Benefactor to all Ingenious Men.

Befides the particular regard you had to the *Royal* Society it Self; which feeming ( in the opinion of fome ) to look a little pale, you intended hereby,

A 3

to

# The Epistle Dedicatory.

to put some fresh Blood into their Cheeks; pouring out your Box of Oyntment, not in order to their Burial, but their Refurrection.

To conclude, I have made this Addrefs, not only to do You Right, but to do Right unto Virtue it felf; and that having proposed your exemplary prudence unto others; they may from you, learn, To use the redundant part of their Estates, either to a Charitable end, as this City will witness for your Self; or the Promotion of Masculine Studies, as in the present Case: or other laudable ways, so as with you, to merit a lasting esteem amongst the wifer and better part of Mankind.

> I am, Sir,

> > Your very bumble obliged Servant

> > > N. GREW.

THE

## THE

# PREFACE.

A S to the following Catalogue, I have fome things to fay, of the Order, Names, Descriptions, Figures, and Uses of Particulars, and the Quotations I have made therein.

As to the first, I like not the reason which Aldrovandus gives for his beginning the History of Quadrupeds with the Horse; Quod præcipuam nobis utilitatem præbeat. Being better placed according to the degrees of their Approximation, to Humane Shape, and one to another : and so other Things, according to their Nature. Much less should I choose, with Gesner, to go by the Alphabet. The very Scale of the Creatures, is a matter of high speculation.

As to the Names, where they were wanting, (which in our own Language were many ) I have taken leave to give them. But have generally reteind them, where I have found them all-ready given. Although, from fome distinguishing Note les convenient ; as the Colour is, than the Figure. And fometimes very Improper, as Concha Perfica, and the like, from the For it often falls out, that the fame Thing breeds in many Places. Place. But there is no Natural Reafon, why it should be called by one, rather than So that the Names of Things should be always taken from someanother. thing more observably declarative of their Form, or Nature. The doing of which would much facilitate and Improve the Knowledge of them many ways. For fo, every Name were a short Definition. Where as if Words are confus'd, little elfe can be distinctly learn'd. Yet I took it not to be my part, actually to reform this matter ; unlefs I had been writing an Universal History of Nature.

In the Descriptions, I have taken care; First, to rectifie the mistakes of fuch as are given us by other Hands. Secondly, not to Iranscribe any; as is too commonly done: but having noted something more especial therein, to refer to the Author. Thirdly, where there is no Description at all, or that is too short, or the faults therein many, to give one at large. For the doing of all which, what the trouble of comparing Books together hath been, I say with Sleydan in another Case, Post Deum Immortalem Ipse novi.

In the Descriptions given, I have observed, with the Figures of Things, also their Colours; so far as I could, unless I had view'd them Living, and Fresh. And have added their just Measures. Much neglected by Writers of Natural History.

If any object against their length: perhaps they have not so well considered the necessity hereof, for the cleer and evident distinction of the several Kinds and Species, in so great a variety of Things known in the World. And wherein also regard is to be had, to all that after Ages may discover, or have occasion to enquire after. The Curiosity and Diligence of Pliny, is highly to be commended. Tet he is so brief, that his Works are rather a Nomenclature, than a History: which perhaps might be more intelligible to the Age he lived in

## The Preface.

in, than the succeeding ones. But had He, and Others, been more particular in the Matters they treat of: their Commentators had engaged their own and their Readers Time much better, than in so many fruitles and endles Disquisitions and Gontests. It were certainly a Thing both in it self Destrable, and of much Consequences. To have such an Inventory of Nature, wherein, as on the one hand, nothing should be Wanting; so nothing Repeated or Confounded, on the other. For which, there is no way without a cleer and full Description of Things.

Belides, that in such Descriptions, many Particulars relating to the Nature and Use of Things; will occur to the Authors mind, which otherwise he would never have thought of. And may give occasion to his Readers, for the confideration of many more. And therefore it were alfovery proper. That not only Things strange and rare, but the most known and common amongst us, were thus describ'd. Not meerly, for that what is common in one Countrey, is rare in another : but because, likewise, it would yield a great aboundance of matter for any Man's Reason to work upon. He that notes, That a Grey hound hath pricked Ears, but that those of a Hound hang down ; may also the Reason of both: for that the former hunts with his Ears; the the latter, only with his Nofe: So that as a blind Man, minds nothing but what he Hears : so a Hound, having his Ears half Stop'd with the Flaps, minds nothing but what he Smells. He that skall observe, That a Horse, which ought to have many and strong Teeth, and large and thick Hoofes, hath no Horns: and that an Ox, with Horns, hath fewer Teeth, and weaker Hoofs : cannot but at the fame time fee the Providence of Nature, In disposing of the same Excrementitious parts of the Blood, either way, as is most suitable to the Animal. One that considers the Teeth of a Horse, sees the reason, why he hath so long an upper Lip; which is his Hand, and in Some fort answers to the Proboscis of an Elephant; whereby he nimbly winds the Graß in great quantities at once into his Mouth. So that for Nature to have made him a short Lip, had been to make a little Hopper, to a great Mill. The fame Animal having need of great Lungs, how necessary is it also for him to have a broad Breaft, well bowed Ribs, and wide Noftrils to give them play ? That being much pefter'd with Flys, he should have a long brush Tail to whish them off. Whereas the AS, which either for the hardness and dryness of his Skin, or other Cause, is less anoy'd with them, hath no need of such an one. That being keavy, he should not Tread or Leap stiff, as a Man; but have a Pastern made him, gradually and safely to break the force of his weight. By This, his Body hangs on the Hoof, as a Coach doth by the Leathers. Without this, the most thorow pas'd Horse, would tread so hard, that as it were impossible for any man to endure long upon his Back; so his Joynts would be much chafed, and he must needs presently tyre. Yet if it be too long, by yielding over much, it makes every step somewhat more laborious, and to loofe some ground. He that would have one for Carriage. will choose him short, and high Back'd. For Runing, long, and clean or slender Limb'd : another, were like a Man that should run a Race in his Boots. And a due length is as neceffary : which is, when the Measure beiween the Main and the Tail answers to the hight, or thereabout. If much under, his hinder Feet will want their full scope : if much over, there will be more weight to be moved with the same force, as if the weight were less. But he that would have one for Draught, looks not that the Limbs be slender, if they are strong; especially those behind. For though the fore Legs pull

# The Preface.

pull fometimes, most when they make an acute angle with the Belly; yet the greatest strefs usually lies upon the hinder; these being as the Centre of Gravity, and the Load, and Body of the Horfe, the two Counter Weights. And when he Goes without Drawing, his fore Feet only support him ; but his hinder, ferve alfo as Leavers to carry him on. And therefore when he walks, he always moves his hinder Foot first.

Together with such Notes as these, arising from the Description of the outward Parts ; how largely and ulefully might that of the Inner; his Generation, Breeding and the like, be also insisted on. And so the like of other Animals. Whereby a better Hiftory of them might be written in five years, than hath hitherto been done in two Thousand.

As for the Figures, I have given only those of such particulars, as are omitted by others. Saving one or two, found in some Authors less known, or common. Nor any, but what is also described : which makes any further Explication of these needles, belides what the Reader will find next before them.

After the Descriptions; instead of medling with Mystick, Mythologick, or Hieroglyphick matters; or relating Stories of Men who were great Riders, or Women that were bold and feared not Horses; as some others have thone : I thought it much more proper, To remarque some of the Uses and Reasons of Things. Where also for the sake of the English Reader, I have undergone the transcribing some particulars. More I could have done, with les trouble. These I hope will compensate the room, they take up. Amongst Medicines, I have thought fit to mention the Virtues of divers Exoticks. Becaufe the greatest Rarity, if once experienced to be of good use, will soon become common. The Jesuites Barque, of which, no Man yet hath well describ'd the Tree, and very few know precisely where it grows; yet what great quantity, doth the much use of it bring over to us? Unicorns Horns, upon the like motive of Trade, would be as plentiful as Elephants Teeth.

I have made the Quotations, not to prove things well known, to be true ; as one \* (and he too defervedly efteemed for his great Diligence and Curio- \* Aldrovandus. (ity) who very formally quotes Aristotle, to prove a Sheep to be amongst the Bisulca: Ovem, (inquit) ex genere esse Bisulcorum, non solum dom fa ipfa loquitur, fed Aristoteles etiam scripto publicavit, inquiens; as if Aristotle, must be brought to prove a Man hath ten Toes. But partly, To be my Warrant, in matters lefs credible. Partly, to give the Authors, that which is their due : not at all liking the Malignant-way of some, who never mention any, but to confute him. Yet withall, To rectifie his Mistakes where I found them. And to mind the Reader, Not to peruse the most Honeft, or Learned Author, without some caution.

A

## A Prospect of the whole WORK.

Of the MUSEUM.

PART. I.

Of Animals.

Sect. 1.

Of Humane Rarities.

Sect. 2.

Of Quadrupeds. CHap. 1. Of Viviparous; and particularly of Multifidous Quadrupeds. Chap. 2. Of Bifidous, and Solidipedous Quadrupeds. Appendix. Of certain Balls found in the Stomachs of divers Quadrupeds.

Chap. 3. Of Oviparous Quadrupeds.

Sect. 3.

Of Serpents.

Sect. 4.

Of Birds. Chap. 1. Of Land-Fowles. Chap. 2. Of Water-Fowles 5 particularly of the Cloven Footed. Chap. 3. Of Palmipeds or Web-Footed. Chap. 4. Of their Eggs and Nests.

Sect. 5.

Of Fishes. Chap. 1. Of Viviparous Fishes. Chap. 2. Of Oviparous Fishes; particularly such as are Not-Scal'd. Chap. 3. Of Scaled Fishes. Chap. 4. Of Exanguious Fishes.

Sect. 6.

Of Shells. Chap. 1. Of Shells Whirled and lingle.

Chap. 2. Of Shells Double and Multiple. To which are subjoyned 7. Schemes comprehending them all.

Sect. 7.

Of Infects. Chap. 1. Of Infects with Naked Wings. Chap. 2. Of Infects with Sheathed Wings. Chap. 3. Of Creeping Infects.

#### PART. II.

Of Plants.

Sect. 1.

Of Trees.

Chap. 1. Of Woods, Branches and Leaves.

Chap. 2. Of Fruits; particulary such as are of the Apple, Pear, and Plum Kinds.

Chap. 3. Of Calibashes 5 and some other like Fruits.

Chap. 4. Of Nuts, and divers other like Fruits.

Chap. 5. Of Berries, Cones, Lobes, and fome other Parts of Trees.

#### Sect. 2.

Of Shrubs and Arborescent Plants. Chap. 1. Of Shrubs, chiefly. Chap. 2. Of Arborescent Plants.

Sect. 3.

Of Herbs. Chap. 1. Of Stalks and Roots. Chap. 2. Of Fruits. Chap. 3. Of Seeds.

Sect. 4.

#### Sect. 4.

Of Moss, Mushrooms, &c. Togegether with some Appendents to Plants.

Sect. 5.

Of Sea Plants: Chap. 1. Of Sea Shrubs. Chap. 2. Of other Sea Plants; and Of Coyns, and other matters relating of Sponges.

#### PART. III.

#### Of Minerals.

#### Sect. I.

#### Of Stones.

Chap. 1. Of Animal Bodies petrified ; and such like. Chap. 2. Of Vegetable Bodies petrified ; and Stones like them. Chap. 3. Of Corals, and other like Marine Productions. Chap. 4. Of Gems. Chap. 5. Of other Stones Regular. Chap. 6. Of Stones Irregular.

#### Sect. 2.

Of Metalls. Chap. 1. Of Gold, Silver, and Copper. Chap. 2. Of Tin, Lead, and Iron. Chap. 3. Of Antimony, Mercury, and other Metallick Bodies.

Sect. 3.

Of Mineral Principles. Chap. 1. Of Salts. Chap. 2. Of Ambar and other sulphurs. Chap. 3. Of Earths.

#### PART. IV.

Of Artificial Matters.

Sect. 1.

Of things relating to Chymistry, and to other Parts of Natural Philosophy.

Sect. 2. Of things relating to Mathematicks z and some Mechanicks.

Sect. 3.

Chiefly, of Mechanicks.

Sect. 4.

to Antiquity.

Appendix. Of some Plants, and other Particulars.

> Index. Of some Medicines.

Lift. Of those who have contributed to this Mulæum.

Of the Anatomical Part.

- Chap. 1. Of the Stomachs and Guts of fix Carnivorous Quadrupeds, fc. a Weefle, Fitchet, Polecat, Cat, Dog, and Fox.
- Chap. 2. Of the Mole, which seems to feed on Infects, as also of the Urchan, Squiril, and Rat; chiefly frugivorous.
- Chap. 2. Of a Rabbit, Horfe, and Pig ; both frugivorous and graminivorous.
- Chap. 4. Of a Sheep, and Calf 3 chiefly graminivorous.

Chap. 5. Of the Uses of the Gulets of Quadrupeds.

- Chap. 6. Of the Uses of the Stomachs of Quadrupeds.
- Chap. 7. Of the Uses of the Guts of Quadrupeds.
- Chap. 8. Of the Stomachs and Guts of Birds.

Chap. 9. Of their Uses.

Chap. 10. Of the Stomachs and Guts of Fishes.

With a Short Explication of some of the Figures, next before them.

At a Meeting of the Council of the Royal Society, July 18th 1678.

Ordered,

THat Dr. Grew be defired, at his leafure, to Make a Catalogue and Description of the Rarities belonging to this Society.

Thom. Henshaw Vice-Prases R. S.

At a Meeting of the Council of the Royal Society, July 5th 1679.

Ordered,

THat a Book entitled, Museum Regalis Societatis, &c. By Dr. Nebemjab Grew, be Printed. Thom. Henshaw Vice-Præses R.S.

The Reader is defired to amend the following

# ERRATA.

# Gresham Colledge.

## PART I.

# OF ANIMALS.

# Sect. I.

## Of Humane Rarities.

A N ÆGYPTIAN MUMMY given by the Illustrious Prince *Henry* Duke of *Norfolk*. It is an entire one taken out of the Royal Pyramids. In length five feet and <sup>1</sup>, defended with feveral linnen Covers, all woven like ordinary Flaxen Cloth. But by the fpinning, diftinguished into three kinds. The utmost, is like Flaxen Cloth of two shillings an Ell: the inmost, of half a Crown: the middlemost, of three shillings, or thereabout.

The utmost Cover is divided into feveral pieces, each of doubled Linnen, and adapted in figure to the part it covers,

ąş

Of Humane Rarities.

as one on the Breaft, another on the Belly, and fo on all the principal Parts. On each of thefe pieces is laid a white Paint, of a kind of chalky or limy fubftance, of the thicknefs of a Hen-Egg-fhell. Upon this chalky ground are drawn the Hieroglyphick Figures of Men, Women and Birds; in Gold, yellow, red and blew. But with very rude fhapes, and the Colours no where mixed together. So very mean was the Art of Painting amongst the *Ægyptians* heretofore. For we have reafon to believe, that what was done for one of their Kings or Nobles, was done with their beft skill.

The middlemost Cover confisteth of one fingle and entire piece of Linnen, almost like a Winding-sheet. It is also tinged with some kind of Paint, but very lightly, and without any Figures.

The inmoft Covering is wrapped round about the Head, Trunk, each Arm, and each Leg apart, about thirty or forty times, like fo many fwathing Bands. About twenty of the utmoft of thefe folds are lightly tinged, all the other inmoft more fully, with a blackifh and gummous fubftance. But the Flefh fo fully, as it feems to be converted into a black Rofin; which being held to the flame of a Candle, is a little odorous and inflamable. The Bones alfo, are not only outwardly, but alfo quite through of a black colour, as if they were burnt.

From hence it is very probable, That the way of Embalming amongft the *Ægyptians*, was by boiling the Body (in a long Cauldron like a Fifh-kettle) in fome kind of liquid Balfome; fo long, till the aqueous parts of the flefh being evaporated, the oily and gummous parts of the Balfome did by degrees foak into it, and intimately incorporate therewith. Much after the fame manner, as the Sugar doth, in the conditing of Pears, Q linces, and the like.

'Tis alfo likely, that a better way might be taken, than this ufed by the *Ægyptians*. And that is, by boyling, or rather foaking the Body in fome white fort of Oyl, and fuch as will dry, (as that of Walnuts) made and kept fo hot, as to evaporate the watery parts by degrees, and to keep the flesh white, and not brittle, but limber and plient. Which, especially in the business of Anatomy, would be of good use: because, that all the Muscules of the Body, being being first parted one from another, might hereby be preferved found, clean, and limber upon the Bones; and fo all the motions of the parts be explicated with the greatest eafe, and without any offenfiveness.

Tis equally probable, that the whole Compages of the Muscules, as they lie upon the Bones, might with little trouble, and lefs charge than by the former way, be truly Tanned, or reduced to a limber fort of Leather; whereby alfo the weftage of the fibers, or other mechanisme of the Muscules might more easily and leifurely be observed. For the skins of Beafts, whereof Leather is daily made, are Muscular; and in mans body confisteth, for the most part, of the fame carneous fibers, as the Muscules, but more clofely woven or matted together.

Mummy, faith Wormius (a) (and fo most Writers here- (a) Museum of) is of great use against Contusions, clodded Blood, Hard num. Labour, &c. But let them fee to it, that dare trust to old Gums, which have long fince loft their virtue.

By fome Chymifts are alfo prepared Mummiæ Tinstura Quercetani; Mummiæ Extractum Crolly; Oleum Olivarum Mummiatum. (b) But the prudent Reader will take heed of (b) Schrod. Pharm. words.

A MALE HUMANE FOETUS. Given by Thomas Cox Efq; An Abortive of about the 4th Month. In length five inches. The Head, from the hinder part to the face, an Inch and . The Face, an Inch and . The Back, from shoulder to shoulder, an Inch and 3 broad. The Buttocks an Inch. The Arms and Thighs 1 Inch over. The Wrift and fmall of the Leg, ‡ of an Inch. The Navel-ftring ; of an Inch; twifted like a Rope; and cut off five Inches long. The Eyes shut. But the Mouth open. It hath neither Nails, nor Hair. The Skin white and fmooth, almost as in Children newly born. See Dr. W. Needham's curious Book de Fætu Formato. (c)

The largeness of the Head and Chest, with respect to the hokenus's other parts, is observable. The mouth being open, shews that Secundine the Fatus, even in the 4th Month, may that way take part of Humana. its Aliment. (d) The Skin hath been kept white and fmooth (d) See Harfor fo long a time, *fcil*. above fifteen years, by being in- vey de Generat. Anicluded with rectified spirit of Wine in a Cylindrical Glass; malium. to the middle of which the *Fatus* is poifed, by means of a Glafs

(c) And Ho-

3

B 2

Glass Buble of an Inch diametre, the Neck whereof is fastned to the Anus of the Fatus by a wyer.

The entire SKIN of a MOOR. Tis tanned with the Hair of the Head, and even the fmallest in all the other parts remaining on it.

Herein are observable, the Fibers in the skin of the Penis, which are very white, and exquifitely fmall, like the thread of a Spiders Web. Likewife the thinnefs of the true Cutis in the fole of the Foot; and on the contrary, the extraordinary thickness of the Cuticula, especially in the Heel, exceeding the fixth part of an Inch : which is about fifty times the thickness of that in the ball of the Hand. (a) Historiar. Bartholine (a) mentions a Farrier who had feveral Callofities on his Right-Hand Fingers, as big as Walnuts.

> The fame Author (b) flews the way of tanning a Hu-I believe it may be tann'd by all the ways mane Skin. which are us'd upon other Skins.

He faith, (c) That a Thong hereof ty'd about the middle, is of good use for facilitating the Birth; and especially against Mother-Fits. Whether any other way, if fo, than by raifing and fortifying the phancy (which will fometimes produce ftrange effects ) I leave to the Reader to judge.

All the Principal VEINS, ARTERIES, and NERVES, both of the Limbs and Viscera. The generous Gift of John Evelyn Efquire. He bought them at Padoa, where he faw them with great industry and exactnefs (according to the beft method then used) taken out of the body of a Man, and very curioufly fpread upon four large TABLES, whereon they are now preferved. The Work of Fabritius Bartoletus then Vestingius's Affistant there, and afterwards Phyfician to the King of Poland.

The Veins and Arteries are fo exceedingly well done, as to shew the most curious Schemes which Laurentius and other Physitians have given us of them, are real and not fictitious. But the *Nerves* have been much more truly and fully reprefented to us of late by Dr. Richard Lower, in (d) De Ner- Dr. Willis. (d) Especially as to their Plexus and Inofculations, vorum Defcript.& ufu. and their admirable Distributions to the Organs of the Senles, and the Viscera.

Aristotle (e) by the account he gives of the Doctrine (c) Hiftor. Anim. lib.3. of the Naturalists of his Time, and before him, feems to c. 3. have

Cent. 5.

(b) Hiftoriar. Cent. 3.

(c) Ibid.

#### Of Humane Rarities. PART I.

have been the first, who to any purpose, observed the Distribution of the Sanguineous Vellels. Yet he defcribes them only from the Heart upward. Nor makes he any diffinction betwixt the Vena Porta, and the Vena Cava. So that even here he comes far short of that exactness which Anatomists have fince arrived at; as appears, upon inspection, by the TABLES above mention'd.

The SCELETON of a Man. Wherein the number of Bones (about two hundred and fifty) together with their dimensions, figures, and articulations are all easily observable. Given by Thomas Povey Esquire.

The Hiftory of the Bones, as finished, is well perform'd by most Anatomists. But the manner, and order of their beginning and perfection, hath been given us, fo far as I know, by the diligent Observations of Kirckringius (a) (a) Kirckonly.

ringii Ofteologia.

Of all Humane Bones indifferently, as well as of the Skull, are prepared, Spiritus simplicior, Spiritus oleosus, Oleum rectificatum, & Magisterium. Amongst which, the spiritus oleofus, if well prepared, is of undoubted use against Hysterical Paffions; and in fome other Cafes, where the Nerves efpecially are affected.

The SCELETON of a Woman; of equal height with the former. By comparing thefe two together, it may be noted, That the Os Ilium is larger and more outward in the Female Sceleton, than in the Male ; fc. for the more eafie Labour, as *Bartholine* and others have alfo obferved by the like comparison. I add, That the fame Bone is alfo broader by ' an Inch in the Female Sceleton, than in the Male: *[c.* for the better fuftentation of the Fatus in the Womb. Again, That the Os Sacrum is half an Inch longer in the Female: both for the forementioned reason, and also the better proportion of the Parts. the contrary, That the Vertebra, especially of the Loyns, are much broader, thicker, and ftronger in the Male Sceleton, than in the Female; being hereby better fitted for the bearing of burthens. And, that as in the Male Sceleton there are 32 Teeth, as is usual, and in the Female but 28; So the nether Chap in the Male Sceleton is half an Inch broader than in the Female, as being made to accommodate a bigger Muscule for the motion of those Teeth.

### Of Humane Rarities.

And for the fame reafon, the Angles fubjected Teeth. to the Os Jugale are above i an Inch more distant; For that a Man being fitted, in other refpects, to undergo more labour; his Chaps alfo should be the better made to eat the more. Once more, That the Skull of the Male Sceleton, is much bigger, than of the Female; and fo capable of more Brains. Although a little Houfe may be well furnished, and look better than a great one that stands empty.

The SCELETON of an Abortive Humane Fatus. 'Tis not above two Inches long. The parts of the Head, Cheft, and Limbs are all entire, but not perfect. For the extremities of the Bones of the Arms and Leggs, are at both ends plainly cartilagineous. They are in thicknefs like a Taylors flitching Thread. Given by Thomas Povey Efq;. See Kirckringius de Fatûs Offibus.

It may poffibly be conceived by fome, That the Bones, at least fome of them, are hard at the first; as Salts and other like Cryftallizing Bodies are as hard upon the very first instant of their shooting, as they are when grown into great Crystals. But it is fo far evident, that all the Bones are foft at the first, that I am of opinion, That originally they are a Congeries of Fibers or fibrous Veffels, as true as any other in the Body; which by degrees harden into Bones: even as the inmost Veffels in a Plant, do in time harden into Wood. (a) And that as in a Plant, there are fucceffive additions of Rings or Tubes of Wood, made out of Veffels: So in an Animal, it feems plain, That there are additions fucceffively made to the Bones out of the Fibrous parts of the Mufcules; efpecially, those whitest Fibers which run transversly, and make the stamen or warp of every Muscule. So that as in the Barque of a Plant, part of the Veffels are fucceffively derived outward to the (b) See the Rind, and part inward to the Sap, which afterwards becomes hard wood. (b) So in the Flesh of an Animal, part tiveAnatomy of the white transverse Fibers are fuccessively derived to the Skin (of which this chiefly confifts) and part of them inwardly, making still new Periosteum's one after another, as the old ones become fo many additions to the Bones.

A HUMANE SKULL that was never buried. Whereof there are feveral Medicines prepar'd, (c) as Cranium

(a) See the Authors Anatomy of Plants.

Authors Comparaof Trunks.

(c) See Schrod. Pharm. and others.

PART I. Of Humane Rarities.

nium Humanum præparatum, Cranium Humanum Calcinatum. Cranii Humani Magisterium, Spiritus Essentificatus, Oleum, Sal Volatile, Tinctura, Galreda, i.e. Extractum Cranii Theophrasti. But the Cranium præparatum, and the spirit are most, and most deservedly, in use. 7

A HUMANE SKULL cover'd all over with Mofs, by the *Paracelfians* call'd *Ufnea*. This Mofs is by them commended for its peculiar Virtue in ftopping of bleeding at the Nofe.

Upon comparison it appears to me, to be the fame, *in specie*, with that defcribed by *Johannes Bauhinus* under the Title of *Muscus facie Abietis*. So that we may probably expect the fame advantage from the use of this, as of that which grows upon Skulls. For a Skull can have no further influence, than hath the alteration of the foil : which although it may produce fome differences, yet is feldom or never known to alter the specifick Virtue of a Plant.

A HUMANE SKULL cover'd all over with the Skin. Having been buried, as is probable, in fome Limy, or other like foil, by which it was tann'd or turn'd into a kind of Leather.

The GALL BLADDER, together with the VASA BILARIA, taken out of the Liver, and filled with foft red Wax. Performed, and given by Dr. Swammerdam.

The SPLEEN most curiously EXCARNATED, and the Vessel filled with wax : whereby its Fibers and Vesfels are very well seen. Performed, and given by the same Hand.

A Portion of the P E N I S and Urethra: wherein the *Corpora Nervofa* are most confpicuous. By the fame Hand.

A Portion of the INTESTINUM JEJUNUM: wherein the Valvulæ conniventes obferved by Rhuyfferius, delineated by Kirckringius, are well feen.

It is observed (a) by Dr. William Cole, That not only (a) Philothese Valves, but the Fibers of the inner Muscular Mem- $\frac{1}{N.125}$ . brane of the Guts are admirably continued in a spiral Line, all along from the Stomach to the very Anus.

The **PROPER VESSELS** of a HUMANE TESTICLE,

## Of Humane Rarities.

8

## PART I.

TESTICLE, feparated and expanded, from their moft clofe and numerous into wider folds, for the fpace of a foot in length, and half a foot in breadth. Performed by Dr. *Edmund King*.

It is taken for granted, I think almost by every body, That Van Horne and de Graaf were the first Observers of these Vessels. But that every one may have his due, it is worth the Readers notice, That ten years before de Graaf's Book concerning the same, a Description with Figures thereof, in the Testicles both of a Boar and of a Man, were first published by Vauclius Dathirius Bonglarus, sc. in the Year 1658. Whereof also Mr. Oldenburgh hath given an account in the Philosophical Transactions. N. 42.

The WOMB of a WOMAN, blown up and dried. Together with the Spermatick Vellels annexed; and the Arteries in the bottom of the Uterus, undulated like the Classers of a Vine; all filled up with foft Wax. Alfo the Membranous and Round Ligaments of the Womb, the Ureters, Bladder, Clitoris, Nymphæ, Hymen, Fallopian Tube, and the Ovarys, commonly called the Testicles; all made most curiously visibly, and given by Dr. Swammerdam. The Descriptions and Figures hereof may be seen in the fame Authors Book, printed at Leyden, 1672. and prefented to the Royal Society.

Of the Organs appropriated to Generation in both Sexes, fee alfo Van Hornes Prodromus, and Regnerus de Graaf.

Of the manner and use of filling the Vessels with Wax, or other like substancee, se the Honourable Mr. Boyle, in his First Part, Of the Usefulness of Natural Philosophy; who, I think, was the first that made mention of managing and representing them this way.

A TOOTH taken out of the Tefticle or Ovary of a Woman, and given by Dr. Edward Tyfon. Tis near  $\frac{1}{2}$  an Inch long, pointed like the Eye-Tooth of a Man, but more flender. As hard and white as any in the Head.

Here is alfo the Draught of another TOOTH, taken alfo out of the Ovary of a Woman, by the fame Hand, being fhaped pretty like one of the Grinders or great Teeth, and as big. It is as white and as hard as the former. The Womans Husband keeps the Tooth it felf by him.

Hair .

HAIR taken out of the *Ovary* of a Woman, and given by the fame Hand. It is fine, and most of it grey. The length of one Hair (longer than the rest) <sup>4</sup>/<sub>4</sub> of a yard.

HAIR found by the fame Perfon in the Ovary, and Hornes of the Womb of a Bitch: as alfo in the Omentum, Veins, and Heart. 'Tis all fhort, anfwerable in length to the Hair of a Dog; and of a brown colour.

The BONES of a Humane LEG and FOOT grown together, and in fome places rarified like a Sponge or Pumice-Stone. "Tis very probable, it was a Difeafe in the Bones fomewhat like to that which Chirurgions call an  $Exoft \omega fis$ ; and that they became fuch, by fome malignant and ftrumous Ulcer.

A piece of a BONE voided by Sir W. Throgmorton with his Urine. Given by Thomas Cox Efq;. 'Tis about the  $3^{d}$  of an Inch over, and almost fquare. Smooth on one fide, and spongy on the other, on the edges rugged. About the bigness of a little green Peas.

In the Philosophical Transactions (*Num.* 41.) there is a Relation of a BULLET that was voided by the *Penis* with the Urine. Communicated by Dr. *Nath. Fairfax*.

A STONE voided from the Penis or Urethra of a Man who lived at Exeter. Given by Dr. Cotton. It is of a whitish colour, and soft substance, almost like Chalk. In length two Inches and a quarter. Of a Pyramidal figure; with an obtufe Cone. Near the Bafe an Inch over. Where it hath a little Hole or Canale tending towards the Cone. When it first slipped out of the Bladder into the Penis, it was neither fo thick or big, nor fo hard, but that, as it feems, the Urine preffing forward, forced a hole for its paffage through the middle of it. Which being opened, the Stone continued fixed in the fame place, viz. about an Inch behind the Glans Penis, for the space of Thirteen Years. In which time, it gradually grew bigger, till it came to the bulk above mention'd. And the faid Hole or Canale being by the continual accretion of new matter, at last stop'd up, the Stone was then forced out of the end of the Penis.

This Man, in all this time, fcarce felt any great Pains; neither did he omit his ufual Recreations or his bufinefs. And once he took a Journey (*on Horfeback*) from *Exeter* 

C

to

## Of Quadrupede's.

### PART I.

to London, is about an hundred and thirty eight miles, without any trouble.

Bartholine (a) mentions a Stone as big as a Walnut, of an Ounce weight, which was voided at the upper end of the *Urethra*, through which it there forced its way.

Of Humane Stones bred either in the Kidneys or Bladder, are prepared, The Crystalline Salt, and the Elyxir. Medicines hardly to be got, and at laft, to little purpofe.

Of the Nature of the Stone, and of those Medicines which are most effectual to prevent the Generation of it, fee fome experiments of the Authors in his Book of the Luctation arifing from the mixture of Bodies.

#### SECT. II.

### Of Quadrupede's.

#### CHAP. I.

## Of Viviparous Quadruped's; particularly, fuch as are Multifidous.

MONKEY. Cercopithecus: qu. Simia caudata. See - the Defcriptions and Figures of feveral kinds in Aldrovandus, Marggravius, and others. Aldrovandus speaks of fome as big as a Mastiff, having Tails five Cubits long. In Brafile there is a fort of yellowish Monkey, which (b) Barl.Re- fmell like Musk. (b) In which place they are numerous, rum gest. in Bras. Hist. and in great variety. (c) As alfo in all the Mountanious places of the East Indies. (d) As they climb the Trees, if (c) Joh. de in danger of falling, they fave themfelves not only with their Feet, but their Tails, by wraping them round about the next Bough. The Zygantes in Africa effect them good meat. Re Cibariâ.

The SCELETON of a MONKEY. Wherein the diftance betwixt the Os facrum and the Ifchia, as it is much greater, than in the Sceleton of a Woman, is observable. Likely fo, in other Viviparous Quadrupede's: for

10

p. 223.

(d) Aldrovandus a

Monfet de

Laet.

## Of Quadrupede's:

for which caufe, partly, they have all more easie Labour than a Woman.

The THROTTLE BONE of a Male AQUI-QUI; which the People of *Brafile* call the *King-Monkey*; being far bigger than all the other kinds; defcribed by *J. de Laet*, (*a*) out of *Lerius*. 'Tis a Bone, fo called (*a*) Lib. 15. by the *Englifb*, with the help of which he makes a very <sup>C. 5.</sup> great noife. For 'tis hollow, and very hard. Exceeding thin, and fo half transparent. In length two Inches and <sup>1</sup>. In height an Inch and <sup>3</sup>. In breadth almost two Inches. At one end, hath an Aperture an Inch wide every way. On the top furrow'd, fo as to refemble a Puppies Skull.

I fuppofe it is placed in the Throat, or at the upper end of the Larynx, near the Epiglottis. Job. Lerius defcribing of it, (b) falfly calls it a Membrane.

The SLOATH. Ignavus five Pigritia. An Animal Laet. lib. 15. of fo flow a motion, that he will be three or four days, at leaft, in climbing up and coming down a Tree. (c) (c) Bartzeus And to go the length of fifty Paces on plain ground, requires a whole day. (d) The Natives of Brafile call him (d)Clufus. Haii, from his voice of a like found: which he commonly repeats about fix times together, defcending, as if one fhould fing, La, fol, fa, mi, re, ut. (e) Whatfoever he (e) Id. takes hold of, he doth it fo ftrongly (or rather flifly) as fometimes to fleep fecurely while he hangs at it. (f) See (f) Guliel. his Defcription in Clufius, Marggravius, Pifo, and others. Pifo. They all feem to omit the length of his fore feet, which is almoft double to that of his hinder.

From the fhag of his Body, the fhape of his Legs, his having little or no Tail, the flownefs of his gate, and his climbing up of Trees, as little *Bears* are us'd to do, he feems to come near the Bear-kind: from which he chiefly differs, In having but *three Claws* upon a foot. He breedeth principally in *Florida* and *Brafile*.

Two BLACK-BEAR CUBS. The Defcription of the Bear, fee in Aldrovandus, Gefner, & The Anatomy, in the Philofophical Tranfactions, N. 49. They breed moft in Nova Zembla, and other of the more Northerly Countries. In Norway they hunt him, and fo in Helvetia and Mufcovy, and if he be fat, they account him a delicate  $\binom{(g)}{de Re Ciba-}$ Tis feumWorm,

## Of Quadrupede's.

## PART I.

<sup>2</sup>Tis obferved by *Aldrovandus*, That a *Bear* hath Hair on both the Eye-lids, as a *Man*, which other *Quadrupedes* have not. *Natalis Comes* (cited by the fame Author) comparing his parts with those of a Man, reckons his *Claws* among them, which are much more like to those of a *Lion*. So easie it is, to drive on the comparison too far, to make it good.

(a) Quoted by Gefner. The FOOT of a white Groenland BEAR, which is *half a foot* broad. Vadianus (a) faw a Bear-skin five feet long, and broader than a Bulls Hide. The Bear to which this Foot did belong, might be as big.

A LEOPARDS SKIN. 'Tis a yard broad. From the Snout to the hinder end of the Tail near three yards. The Tail a yard. See the Defeription of the Animal in *Aldrovandus*, &c.

If they are well compar'd, he is every way, in fhape, like a *Cat*: his Head, Teeth, Tongue, Feet, Claws, Tail, all like a *Cats*. His actions alfo like a *Cats*; he boxes with his fore-feet, as a *Cat* doth her *Kitlins*; Leaps at the Prey, as a *Cat* at a *Moufe*; and will alfo fpit much after the fame manner. So that they feem to differ, just as a *Kite* doth from an *Eagle*.

The Leopard (and all of this kind) as he goes, always keeps the Clams of his fore-feet turned up from the ground, and fheath'd as it were in the Skin of his Toes, whereby he preferves them fharp for Rapine, extending them only, when he leaps at the Prey. See fomewhat to this purpofe in Gefner, out of Pliny.

(b) Aldrovandus.

(c) Gefner out of Paulus Venetus. He is begotten by a *Lion*, upon a *Panther*, (b) which hath her name from her being fo fierce. Yet in *Tartary* they keep Leopards tame, and breed them up for hunting of *Deer*, and other Beafts; efpecially for the *Great Cham's* ufe. (c) They are most numerous in *Africa* and *Syria*.

The SKULL of a young TIGER. Both as to the *Teeth*, and otherwife it well refembles that of a *Cat*. Except that in the room of the Transfvers *Suture* in a *Cat*, there is one in the figure of a great Y; fo wonderfully close and firm, as the Bones seem to be continuous. Except also the outward *Sinus*'s of the lower Jaw, where the *Musculi Temporales* and the *Mansorii primi* are inferted: as being, rateably, much deeper than in a *Cats*; and so better fitted to receive those *Muscules* which are here also much more robust.

Two CLAVICULAR Teeth or Tusks of a Tiger. A little crooked like those of a *Dog* or *Cat*. Their exerted part very white. By the bow, almost five Inches long. From the top of their Root, or from the feat of the Gooms, to their *apex* near two Inches. An Inch over, and two and  $\frac{1}{2}$  about. The Animal to which they belonged, was kill'd in *Java major*, and weighed 435 pounds. A great weight, confidering, that not feeding on Grafs, but Flesh only, they have no great Belly. *Aldrovandus* faith, He faw the Skin of one above five foot long, and therefore gueffes the Animal was almost as big as a Horfe. Which this alfo may well be thought to have match'd.

One of the fore-C L A W S of the fame T I G E R. Tis fomewhat white and half transparant, very flat, sharp pointed, and extreamly hooked; every way in colour and shape like the Claw of a *Cat*. At the *Basis*, 'tis an Inch broad, and measur'd by the bow, 'tis two Inches and  $\frac{1}{2}$ long. Note, That as the Bone, whereon the Claw is set, receives it into a little *Fovea* or Groove; fo is the Bone, again, by a double *Epipbysis*, inferted into the Claw : by which means it is more strongly and immovably contained in its place, for the furer grasping of the Prey.

Two other leffer CLAWS of a TIGER.

The Tiger excels in fwiftnefs; from whence he hath his Arabick Name, as well as the River call'd Tigris. As alfo in Fiercenefs: and yet in fondnefs and love to her *Cubs*; of which fee divers inftances in *Gefner*. An Impreffion which Nature hath ftampt upon all Creatures, to fecure the fucceffion of Generation. They abound in *Mexico, Brafile*, and in the *Eaft Indies*.

A Great STONE taken out of a *Dogs* Bladder. Given by the moft Reverend *Seth* Lord Bifhop of *Sarum*. The figure hereof is Oval, but flat on both fides. 'Tis above an Inch and  $\frac{1}{2}$  thick, two Inches and  $\frac{1}{2}$  over, and above three Inches long. Of a limy or chalky colour, and all over rough.

Note, that nitrous fpirits dropped here upon, fcarce produce any ebullition; although dropped on the redifh Stones, bred in a mans bladder, it produceth a great one. Of a like *Stone* bred in a *Dogs* bladder, fee a Relation in the *Phil. Tranf. N.* 84. Taken out of the *Roman Journal de Letterati.* The

# Of Quadrupede's.

#### PART I.

The GREAT TAMANDUA; by the People of Brafile, Tamandua-guacu; by the English, the Great Ant-Bear: Becaufe he feeds upon Ants, and is shagg'd, and hinderfooted almost like a Bear. He hath alfo a very long and fharp Snout, a flender Tongue, and extensible to a great length, alfo a long and brushy Tail: which are his principal Characters. See him described in John. de Laet, out of Lerius, in Guliel. Pifo, Marggravius, and others. Abba-(a) Lib. 16. villanus, quoted alfo by Joh. de Laet, (a) hath given a different Defcription; and probably a false one.

> He catcheth Ant's by fcratching open their fubterraneal Hives, and then thrufting his Tongue into them; which after a while, he draws back into his mouth laden with the Prey. (b) He useth his Tail for a Cover, which, like a Squirrel, he fometimes fpreads over his whole body. (c)

The SKULL of the RIVER-HORSE or HIP-POPOTAMUS. If we refpect his Figure, he were more properly called BUPOTAMUS, or RIVER-OXE. And accordingly the Germans rightly call him Walfer-Ocks; and the Italians at Constantinople BOMARIN. The fame Animal, which in the Book of 70b is called BEHEMOTH; as is folidly proved by Bochart, in his Hierozoicon. He is almost every where defcribed very Aristotle falfly gives him a Maine, like that of a falfly. Horfe : deluded, 'tis likely, by the Name. Kircher (d) falfly gives him all Horfe Teeth. In the Mulaum Romanum, he is defcribed with double Hoofs like an Ox, and pictured with four or five Claws like a Bear; neither truly. Bellonius, who faw one alive, but yet very young, was the first that hath given any tollerable Description of him. Yet as to the Teeth, he is miltaken, comparing them all to those of a Horse: probably because they were not yet grown. (e) But Columna, who alfo faw one, and that full grown, hath given a most accurate Description hereof, his principal Characters being thefe; Four yards and half long, about two yards high, a yard and half broad. Short leg'd. Cloven-hoofed; yet not with two, but four Hoofs. Tailed like a Tortoife. (Or like a Hog, (f) which he alfo twifts in the fame manner) Head almost like an Ox. His Chaps wide. His Eves fmall. His fore Teeth prodigioufly great, being fome of them <sup>‡</sup> a foot round about, above <sup>‡</sup> of

c. 15.

(b) Barlæi Res Brafil. p. 223. (c) Ibid.

(d) Chin. Illuftr.

(e) Fab.Colun. lib. de Aquat. & Terrest.

(f) Solinus and others queted by Bochart.

of a foot long; as is evident in the Skull here preferved; and other particulars mention'd by Columna in his copious Defcription hereof.

The great prominency of the Os Jugule is also obfervable; as being thereby fitted for the reception of marvelous great and strong Muscules for the drawing of his Chaps together.

Rings made of his Teeth, are believed to be very effectual against the Cramp. (a) Those that fell Artificial (a) Charl. Teeth, usually make them of the long Teeth of this Ani-On. Zoci. mal, as being supposed the best for this purpose.

His Teeth, fays Columna, are fo hard, that being ftruck against Steel, produce sparks of fire. And thence concludes it probable, That this Animal, by striking his Teeth one against another, in the night time, might produce the like, and fo feem, as it were, to vomit or breath out fire; a thing attributed to him by the Ancients. But the error of this Conjecture is double : First in his not confidering, That the fire (could any be produced by ftriking Steel againft thefe Teeth) would be ftruck not out of the Teeth, but out of the Steel. And next, In that, in truth, no fire can be produced by either friking of these Teeth one against another, or against Steel it felf; as I have try'd.

He is found in the Rivers Nile and Bamboth; (b) as alfo (b) Fab. Co-lum. out of near the Indian; and in Zaire, the great River of Congo. (c)

Several Teeth, both of the upper and nether Jaw of the Solinus. Hipopotamus. Some fo big, that they feem to have belonged tal. c. 29. & to a much bigger Skull, than this here.

A PISLE faid to be that of the HIPPOPOTAMUS. It feems to be only that part of the Pifle which he exerts. 'Tis in length, above a foot. The Glans even now it is dry, above feven Inches about. The other end very flender.

The fore-TOOTH of a BEVIR, fo called from FIBER, by a transposition of Letters. 'Tis three Inches and half long, with the Root, or that part which is fixed in the Chap. Near half Inch broad. A little crooked, and difforted or writhen. Triangular, the inner Angle more obtufe. Its end sharpen'd very obliquely, after the manner of a Chizel. So that these Teeth may properly be called DENTES SCALPRARII: wherewith this Animal, as with fo many ftrong Chizels, pairs off the Barques of Trees for his ufe. The

Strabo and (c) Muf.Sep-Linfchot.

204.

## Of Quadrupede's.

PART I.

The TAIL of a CASTOR or BEVIR. Of a peculiar shape, being very broad and flat, like an Apothecaries Spatula, but much bigger, being ten Inches long, and five broad. Almost bald, though the Beaft very hairy; and cancellated with fome refemblance to the Scales of Fifbes. Nature having hereby, as well as in other refpects, marked him for an Amphibious Animal. The Scythians (a) eat the Tail of a Caltor, as a dainty, being out of Pom-ponius Sabi- fometimes as fat as bacon.

(a) Gemer nus.

The PISLE-BONE of a CASTOR. So I find it infcrib'd. 'Tis very fmooth and folid. In length four Inches and <sup>1</sup>/<sub>4</sub>. Chonical, about <sup>1</sup>/<sub>4</sub> Inch over at one end, <sup>‡</sup> Inch at the other. At both ends inflected like the letter S.

See the Defcription of the Animal in Gefner, and others. His parts most remarkable, are those now described, and the Caftor-Bag. His Anatomy fee in the Philosophical Transactions, N. 49. Many strange Stories of his Ingenuity in Aldrovandus, Wormius, and others. He breeds in Italy, France, and other places: but our beft Caftor is from those of Russia. The great and principal use whereof inwardly, is in Hysterical and Comatofe Cafes.

An OTTER. Lutra. See him defcrib'd in Aldrovan-The Toes of his hinder feet, for the better fwimdus. Oc. ming, are joyn'd together with a Membrane, as in the From which he differs principally in his Teeth, Bevir. which are *canine*; and in his Tail, which is *feline*, or a So that he may not be unfitly called Putolong Taper. reus aquaticus, or the Water Polecat. He makes himfelf burrows on the water fide, as a Bevir. Is fometimes tamed, (b) and taught, by nimbly furrounding the Fifnes, to drive them into the Net. In Scandinaria they will bring the Fishes into the very Kitchen to the Cook. See fome Observations of this Animal in the Philos. Trans. N. 124. He breeds every where.

The QUILLS of a PORCUPINE. Tela Histricis. The Animal is defcribed by Aldrovandus, and others; but the Quills not fo fully. They are very fmooth, and thick as a Goofe-quill. With black and whitish portions alternately from end to end. Their Root i of an Inch long. Their Point not round, but flat and two-edg'd, like that of

(b) Gefner out of Olaus Magnus.

#### Of Quadrupede's. PART I.

of a Sword, or of fome Needles. So that they both bore with their Point, and cut with their edges at the fame inftant, whereby they wound the more furely.

The Porcupine crects his Quills, at his pleafure, as a Peacock doth his Tail. And, partly by ftretching his Skin, (a) (a) Gefner fhoots them at his purfuing Enemy. It may also be noted, out of Soli-That being rooted to little a way in the Skin (nothing near fo deeply as the Quills of Fowls) they are the more eafily ejaculated. They breed in India, Africa, and Ethiopia.

An HEDGHOG, or Urchan. Echinus, Herinaceus. See him defcrib'd in Aldrovandus. Anatomiz'd in Bartholine's Acta Medica. The Urchan, though a Viviparous Animal, yet hath his Tefficles lying within his Body, as in the Oviparous kind. (b) In the Ifland Maraguan, in the North (b) Arift. H. of Brafile, are fome Urchans very great, almost as big as Boars. (c) He makes his Bury with two Entries, to the (c) Joh. de North and South; and according to the weather and Laet. (out of feafon, keeps the one ftopt up, the other open. (d) The nus) lib. 16. Liver, Stomach, and fat of this Animal are fometimes me- c. 15. dically ufed.

The GREAT SHELL'D HEDGHOG. Bv the Natives of Brafile, called TATU; By the Spaniards, ARMADILLO; as Names common to the feveral (pecies. And by Latin Authors, Echinus Brasiliensis. This once belonged to the Duke of Holftein. See the Defcription of this Species in Clusius, and others.

Those Creatures which are cover'd with Feathers, Scales, or Shell, faith Aristotle, (e) have no Auricula or outward (e) Hiftor. Ear. So that he never faw this Animal; nor many others c, 11. now known, and fome which he ventures to defcribe; as appears by those general Affertions, whereof he is too often guilty.

He gathers himfelf up, Head, Feet and Tail, within his Shell, as round as a ball: as *Pifo* hath alfo pictur'd him. (f) And this he doth, not only when purfued, but alfo (f) Hift. 1. 3. when he fleeps. Unlefs he be ty'd, he will dig out his 5.3. way under the very walls of a house. (g) For it is his na- (g) Mus. ture to dig himfelf Buries, as the Coney doth; which he Septal. doth with very great celerity. (b) (b) Clufius.

For the tendernefs, whitenefs and delicacy of his Flefh, (i) Barlaus he is referved for Feafts; (i) and therein prefer'd before de Rebus either Braf. p. 222.

D

(d) Gefner,

out of Plutarch.

(a) Guil. Pifo.

Ximines.

either Conies or fucking-Pigs. (a) The Plates of his Shell being powder'd and given in a draught of the Decoction of Sage in the quantity of 3i, provoketh fweat; and are a fingular remedy against the Lues Venerea, faith Barlaus. (b) P. 369. (b) If it provoketh fweat, it may be used to good purpofes, whether it cureth that Difeafe, or no.

> The PIGHEADED ARMADILLO. Tatu Por-Nierembergius hath defcribed this Species, but yet cinus. The beft of any Wormius; who also omiteth imperfectly. fome particulars, and in others is miftaken.

> From his Snout-end to his Tail, about ten Inches and ; being younger and leffer than that of Wormius. His Body four Inches over. His Head an Inch and <sup>1</sup>/<sub>4</sub>, and three Incheslong. The end of his Nofe fcarce half an Inch over, fhaped like that of a Pig; from whence I have taken leave to name it. His Ears not above to f an Inch diftant one from the other. His fore-foot two Inches and ½ long, above 1 Inch over. On which he hath four Toes; the two foremost of which are an Inch long, the other two The hinder-foot of equal length, but thicker. an Inch. On which there are five Toes; the three foremost, and thickeft whereof are an Inch long, the other two <sup>1</sup>/<sub>2</sub> an Inch. His Tail about 11 Inches long, at the Buttocks an Inch and <sup>1</sup>/<sub>4</sub> over, at the end as finall as a Shoomakers waxed Thread.

> His Head, Back, Sides, Legs, and Tail, are all cover'd with a shelly Armour. His Head, with Shells, Scales for the most part, five and fix angled. His Shoulders, with round ones, and leffer, about # of an Inch over; betwixt which other leffer ones are interjected. The Back-piece confifteth of about ten shell Plates, joyned together by the mediation of as many parallel Skins. Every Plate is about ' Inch broad, curioufly composed of finall triangular or wedgelike pieces, indented one against another, and pounced or pricked all along their edges. His Buttocks adorned in the fame manner as his Shoulders. His Shell ending next his Tail, with an *Elipsi*. The fore-part of his Tail is encompass'd with shelly Rings, in number eleven; composed not of triangular, but fixangl'd and square pieces. The other half with Scales fet together, as on his Head. His nether Buttocks, Belly, Breaft, Neck, and Ears are all naked. His Eyes

# PART I. Of Quadrupede's.

Eyes black, round, and very little; refembling a black Bead of the bignefs of a Vetch. His Grinders in each Chap about twelve. More properly Tunfores; becaufe they are level and fmooth on the top. No thicker than a great Needle. Befides thefe Teeth, I find none.

By the help of the aforefaid *Plates*, and parallel *Skins* together with the Mufcules that lie under them, this Animal is able, like the Hedge-Hog, to gether up himfelf into a round ball. For the better performance of which action, Nature hath alfo left his Throath, Neck, Breaft and Belly naked. As alfo his Ears, that he may turn them more expeditely for the reception of founds from every quarter. His Eyes, like thofe of a Mole, very little, as most fuitable to a Creature living for the most part in the dark, and under ground. His hinder feet, like a Conies, more ftrong, for the better working of his Buries.

*Pifo* (*a*) maketh the action of conglobation peculiar to (*a*) Hift.1.3. this *fpecies*, but very falfly, as will appear by the following S.3. Defcription.

The WEESLE-HEADED ARMADILLO. *Tatu Mustelinus*. I find this *species* no where defcrib'd. For that Defcription of a third *species* in *Cluss*, was taken only from some Picture, no way answering to the Animal before us.

His Head in figure almost like a *Weefles*, whence I take leave for his Name. 'Tis three Inches and  $\frac{1}{2}$  long; his Forehead two Inches and  $\frac{1}{2}$  broad, and very flat; the end of his Nofe  $\frac{1}{2}$  Inch. His Eyes fmall,  $\frac{1}{4}$  of an Inch long. His Ears two Inches diftant one from another; an Inch long. His Body or Trunk 11 Inches long, about fix broad. His Tail  $5\frac{1}{2}$  long; near the Buttocks an Inch and  $\frac{1}{4}$  over, the extremity  $\frac{1}{2}$  of an Inch. His fore-Leg two Inches and  $\frac{1}{2}$  long,  $\frac{3}{4}$  broad. On which there are five Toes; whereof the three foremost are an Inch long, the other two half an Inch : all with Claws the  $\frac{1}{2}$  of an Inch. On his hinder foot (which is fomewhat bigger) he hath alfo five Toes, as in the foremost.

His Head, Back, Sides, Legs, and Tail are cover'd with a fhelly Armour. His Head-piece, as alfo the fhells on his Legs, are composed of roundifh Scals, a tof an Inch over. His Neck-piece is a fingle Plate, composed of little pieces, a total states and the states of th

D 2

of

PART I.

of an Inch fquare. His Shoulder-piece confifteth of feveral Ranks or Rows of fuch like fquare pieces, but not fet together by any Articulation, or movable Conjunction. His Back-piece, reaching alfo over his Buttocks to his Tail, is compofed of feveral Plates, in number eighteen, moveably joyned together by as many intermediate Skins. The foremoft and greateft of thefe Plates, confift of fquare pieces  $\ddagger$ Inch long, and a  $\ddagger$  broad. The hindermoft, of fquare and round ones together. The extream part of the Shell next the Tail, is Parabolick. The fore part of the Tail is furrounded with fix Rings; confifting of little fquare pieces. The other half with Scals. His Breaft, Belly, and Ears all naked; for the fame purpofes, as in the former.

This *Species*, by the greater number of Plates, feemeth able to draw, effectially his hinder parts, more roundly inward, than the other.

The FLYING SQUIREL, qu. Sciurel, from Sciurus. Not defcribed, unlefs by Scaliger. The colour of his Body a dark grey. Of his Tail, almost that of straw. Leffer than the common Squirel, not above five Inches and  $\frac{1}{2}$  from his Nofe end to his Buttocks. His Skin, from his Sides, Thighs and Legs (almost as the wings of a Bat) is stretched out about an Inch in breadth, or more or lefs at his pleafure: by means whereof he leaps further, and alights the more fafely; and is therefore called *The flying Squirel*. In other respects, like the *Europæan* kind. It was fent from *Virginia*, its breeding place.

He feems to be the fame Animal which Scaliger defcribes under the Name of the Flying Cat. Exercit. 217. S. 9.

The Squirel, when he hath a mind to crofs any water (a) Gefner, for a good Nut-Tree, picks out, and fits on fome light piece of Barque for a Boat, and erecting his Tail for a Sail, Author of the Book, de

CHAP.

### Of Quadruped's.

#### CHAP. II.

# Of VIVIPAROUS QUADRUPED'S, Particularly such as are BIFIDOUS, and SOLIDIPEDOUS.

The LEG of a GREENLAND STAG. It is fcarce four Inches long. Nor above <sup>1</sup>/<sub>3</sub> d of an Inch over. Cover'd all over with very fhort hair, of the ordinary ruffet or reddifh brown colour. The hoofs fomewhat black, <sup>1</sup>/<sub>2</sub> inch long, <sup>1</sup>/<sub>3</sub> broad, and <sup>1</sup>/<sub>4</sub> high. Given by Mr. Palmer.

The BONES of a STAGS heart. About an inch and  $\frac{1}{4}$  long, and  $\frac{1}{4}$  broad. Very thin, but yet hard and folid. They feem to be a help for the ftronger and more fteady motion of the Mufcules of the heart. Butchers often find the like in the heart of an Ox; which are eafily fubfituted for the former : and I would as foon truft the one, as the other.

A STAGS TEARS. A thicken'd Excretion from the inward Angle of his Eye. In colour and confiftence almost like to Mirrh; or Ear-wax that has been long harden'd in the Ear. Of a strong stinking smell, like that of the Animal's sweat. They are generally affirmed to be sudorifick, and of an Alexipharmick nature. And if they were as easile to be had, as some Womens, it were worth the trying.

They are quite a different thing from that little round and hard Bone, which *Scaliger* defcribes (*a*) by the Name <sup>(a)</sup> Exerc. of *Lachryma Cervina*, and which he affirms to grow in the great Corner of a Stags Eye to the Bone, after an hundred years old. I doubt a ftranger fight, than the *Ludus Secularis*; fuch as no man (but himfelf) ever faw, or fhall fee.

The MUSK DEER. Capreolus Moschi. Gesner reckoning up the Names, tells us, That the English call him a Musk Cat. But is better at other Languages. He breeds in China, and the East Indies. Not ill pictur'd in

### Of Quadruped's. PART I.

in Calceolarius's Mulaum. That in Kircher's China Illustrata faulty as to the Snout and Feet. That of Johnston ab-Almost every where worfe defcrib'd. That he is furd. a two-horn'd Animal, fays Aldrovandus, all agree, except Simeon Sethi, who faith he hath but one. Neither of which The Defcription likewife given by Scaliger, and is true. out of him by Chiocco in Calceolarius's Museum is false, and The best I find is amongst the German verv defective. To which I would have refer'd the Rea-Transactions. der, but that comparing it with That I had drawn up before I met with it, I fee fome differences.

From his Nofe end to his Tail, a yard and a foot long. His Head above a foot. His Neck of a yard. His Forehead three inches broad. His Nofe end fcarce <sup>3</sup> of an inch. being very fharp, like that of a Grey-Hound. His Ears like a *Coneys*, about three inches long, and erect. As alfo his Tail or Scut, which exceeds not two inches. His fore-Leg a foot and two inches long, taking in Foot and Thigh. Near an inch over: the Foot deeply cloven; with two. fore-Hoofs, an inch and ‡ long, each ‡ of an inch over; and two Heels, almost as big, and therefore conspicuous. His hinder feet are here wanting.

His hair on his Head and Legs about 1 inch long, and rateably fmall. On his Belly an inch and ½ long, and fomewhat thicker. On his Back and Buttocks three inches long : thicker in proportion, than in any other Animal, except perhaps fome of the Deer kind, *[c. three or four times as* thick as Hogs Briftles: confifting of brown and white portions alternately from the Root to the top. On the Head and Legs, brown; On the Belly and under the Skut, whitifh. As it were frizled, efpecially on the Back and Belly, by a kind of Softer than in most Animals, and exceeding undulation. For being fplit, and view'd with a Glafs, light and rare. they appear to be made up of little Bladders, like those in the Plume or Stalk of a Quill: fo that it is a thing betwixt a common Hair and a Quill. On each fide his lower Chap, almost under the corners of his mouth, there is a peculiar Tuft (about <sup>‡</sup> of an inch long) of fhort, thick and hard hairs, or rather Briftles, of equal length, as in a fcrubing-Brufh.

The Musk Bladder or Bag is about three inches long,

two

two over, and fwelling out from his Belly one and 1/2. Standing before his Groin about as much. I find it cut open, whereby the observation of its natural Aperture (which I fuppofe it hath as the Caftor-Bag) is prevented.

He hath 26 Teeth. In his lower Chap, fixteen; of which there are eight little Cuters before ; behind, four Grinders on each fide, rugged and continuous. As many like Grinders in the upper Jaw. About an inch and <sup>1</sup>/<sub>2</sub> from the Nofe end, in the fame Jaw, on each fide a Tusk, two inches and 1 long; hooked downward, and backward, and ending in a point. Not round, but flat, the breadth of an inch; thin, and having a sharp edge behind: fo as it may not unfitly be liken'd to a Sithe. There are no Horns.

The Hair of this Animal, by its foftnefs and rarity, are a fingular contrivance of Nature to keep him warm. For all Garments, the fofter and rarer they are, (cat. par.) they are the warmer. For the fame caufe, the Hair on his Back, is alfo the longeft; fc. for the better protection of the Spinalis Medulla, His two Tusks, by the Figure, appear to ferve for fighting partly, and partly for feeding; by the help whereof he is able either to ftub up edible Roots out of the ground, or to tear off the Barques, or break down the Boughs of Trees. By the help of his great Ears, he hears his approaching enemy the further off, to make his flight. So alfo the Hare, being a fearful Animal, hath the like. Nature hath furnished him with great heels, both to enable him to make the greater leaps, and to light alfo upon his Feet the more fafely, for by their means, the force of his weight is gradually broken.

Scaliger's mistakes (a) about this Animal, are principally (a) Exercithefe two; In faying his Tusks grow out of his nether Jaw; and in calling the Musk, A postemated Blood. For he might as well call Civet and Caftor the Blood of those Animals that yield them. And if it were apostemated, it would not be feparated from the Flesh, but contiguous to it: whereas it is plain, that the Musk was here inclosed on all fides, in an entire Cyftis or Bag made by nature for that purpose.

The VELVET HORNES of a Greenland Roe-Buck.

tat. 21.

### PART I.

They are a yard high, with numerous, and round Buck. Covered all over with an ashcolour'd hair, a Branches. <sup>4</sup> of an inch long, and ftanding upright, as the *Pile* of Velvet.

The HORNES of an Indian Roe-Buck; which the people of Brafile call Cuguacu-apara. See the Defcription of the Animal in Marggrarius. His Picture in Johnston; but under the name of the Capreolus Marinus.

The HORNES of a Roe-Deer of Greenland. Thev are very little more than an inch long, and half an inch They are pointed at the top, and knobed or tubeover. rous at the bottom.

Deer in New Mexico fo big, (a) that they breed them up the Obferva- to draw with, as we do with Oxen and Horfes. So ftrangely tion of Alfon- does the Climat alter the Bulk of fome Animals. Dear. and they only, may be fuppos'd to caft their horns, becaufe they have neither a long Tail, as Oxen; nor fo long hair as a Goat or a Ram; by either of which is made a continual confumption of the fame matter, which in Deer goes into the horns. The horns of Deer, are of all other the fulleft of Volatile Salt. Which may lead us to conjecture of the like nature of his flesh, and blood; and the caufe of his great falacity.

> The ROCK-DOE. Ibex famina. A kind of wild See the Defcription of Pliny, and Bellonius. She Goat. breeds chiefly upon the Alps. A Creature of admirable fwiftnefs. And may probably be that very Species mention'd in the Book of  $\overline{Job}$ . (b) Her horns grow fometimes fo far backward, as to reach over her Buttocks.

> HORNES of the WREATHED-Horn-The Goat, or Antilope of Barbary, called Capra Strepficerotes, and See the Defcription of the Animal in Wormius. Gazella. These Hornes are about a foot and # long. But in Septalius's Mulaum there is one pair faid to be above a yard in length. They are twifted into a kind of fpiral shape, but the Rings which feem to be fpiral, are really circular.

> The BONE of the ANTILOPES HORN; which is folid, and alfo fpiral or twifted, but without Rings. Given by Henry Whiftler Efq;.

> The HORNES of the SYRIAN GOAT; called Capra Mambrina I. Syriaca being. Mambre, a Mountain

(a) Joh. de Laet. from sus de Benavides.

(b) Chap. 39.

PART I. Of Qu

Of Quadruped's.

tain near *Hebron*; where about, chiefly, this Goat breeds: (a) See *Gefner's* Defcription of him. And compare it with in bis Parathe Picture he gives, which feemeth to be the truer, as to the lypom. hornes. His Ears are follong, (b) as to reach almost to the (b) Gefner ground. A fufficient fupplement for the fhortness of his ibid. hornes: being not above two inches and  $\frac{1}{2}$  long; and a little crooked backward, almost like a Dogs Tooth.

The HORNES of a DOG-GOAT. I find them inferibed, The hornes of a Dog. *Johnfton* giveth the figure of the Animal, without any Defeription. According to that figure, he is headed like a Dog, and of the bignefs of a Tumbler. But footed, and horned like a Goat. To whofe alfo the hornes here preferved are like in colour, and fomewhat near in fhape : but nothing near fo big; being not much above two inches long. Not only the hornes themfelves, but alfo the bones whereon they ftand, are hollow to the top. They were fent from a certain Kingdom near *China*.

The HORNES of a HARE; fo I find them infcribed. Although it is probable, that they are the hornes of a fmall kind of *German* Deer. Yet *Wormius* faith, There are horned-Hares in *Saxony*. See alfo *Gefner* of the fame. *Johnston* gives the Picture, without a Defcripton. This pair, once belonged to the Prince Elector of *Saxony*.

A pair of very great English Rams HORNES.

The HORNES of a Spanish-Ram. In length, <sup>3</sup>/<sub>4</sub> of a yard. The Tips a yard distant. Somewhat flat, wrinkled, and twisted, as those of an ordinary Ram.

The HORNES of a MUSCOVY-Ram. I meet no where with the Defcription of the Animal, or thefe Hornes. He feemeth to be of kin to the *Hircus Cotilardicus*, which *Johnfton* hath pictur'd. Thefe hornes are black : and fomewhat wrinkled. Confift of four Branches : The two greater whereof are a foot long, and as thick as an ordinary Rams, very ftrait, ftanding in the form of the letter V, or like the legs of a pair of Compaffes, and a little writhen. The two leffer are feven inches long, not fo thick, winding downward, and inward one towards another, in the form of two half Moons. The points of all four very blunt.

A very great HORN of the ROCK-BUCK, or E of

26

PART I.

of the *Ibexmas.* In fhape almost like a bended Crofsbow. By the ftring,  $\frac{3}{4}$  of a yard long; but by the bow, about an Eln. It was formerly tipp'd with filver, and kept in a Gentlemans house, and shew'd (to fome special Friends) for the Claw of a Griffin. See the figure hereof in Moscardus's Muscaum.

The HORNES of a WILD BULL; called Bubalus five Buffalus. They are broad at the Roots, but grow very fharp of a fudden; and bended inwards about the middle; fo that the Tips are not above two inches diftant. See the Animal defcrib'd in Bellonius, and others. He is much bigger than the Europæan Bull. This kind breeds moft in Afia. But they are alfo kept in Italy, in their Cities. In India they fell the Milk of the Female about the ftreets, as they do Cows Milk here. The Leather call'd Buff, is made of the Hyde. Thefe Hornes were brought from Africa.

The HORNES of the BUNCH-BAK'D BULL. Cornua Bisontis. This pair belongeth to that Species, which hath a great Maine. These, contrary to the former, stand wide, and especial upwards, their Tips being  $\frac{1}{2}$  an Eln distant. See the Description of the Animal in Aldrovandus, his Picture in Johnston. He is swifter than any other Bull, and untameable. He breeds in Lithuania. To the hornes is joyn'd the fore-part of the skull, together with the skin, which is very thick and tough. The skin of any Bulls Forehead, either for its toughness, or other cause, is the only part of the Hyde made use of by Horners, whereupon they shave their Hornes (which they take out of a Tub of warm water by them) to fit them for Lamphorns.

The TAIL of an Indian COW. The Male is call'd Bonasus. The hairs hereof are greyish. Above a yard and is long. Yet almost as soft and fine as a Womans. The Cow is faid to be worshipped by the people that live near the River Ganges.

A little STONE out of an Oxes Liver. Infcribed *Tetraedrum inventum in Hepate Bovis*. But I find it broken into feveral pieces. It is just of a liver-colour. And is compos'd, as the *Bezoar* Stone, of feveral crusts or foft shells one over or within another.

A MON-

A MONSTROUS CALF with two heads. Each head is a little lefs than ufual; the reft of the parts according to Nature.

The SKIN of a CALF with two heads, tann'd There is a very strange story of a Monwith the hair on. ftrous Calf in the Philof. Tranf. N. 1. & N. 2. compar'd together : communicated by the Honourable Mr. Boyle.

The TUSK of a Wild BOAR. It winds about almost into a perfect Ring or Hoop; only is a little writhen. In measuring by the ambit, 'tis long or round about a foot and two inches. Its bafis an inch over. Almost all the way triangular, efpecially towards the point.

Another BOAR-TUSK, fomewhat flenderer, and of a femiannular Figure.

The wild Boar breeds in Helvetia, especially near the Alps. In Barbados very great. Ligon (a) faith, he faw (a) History of Barbados. there one fo big, that when his head was off, and his entrails taken out, weighed 400 l. It was well observed by Aristotle (as to those Beasts which he had seen) that no one was horned and tusked too: (b) the fuperfluous parts of (b) Hiftor. the blood proper for their production, not being fufficient 2. c. 1. to feed them both.

The SKULL of the HORNED HOG. By the people of the Island Bouro, not far from Amboina, he is called Baby Rouffa. (c) See the Picture hereof in Bartholine, (c) Barthol. (d) taken in Java, from whence he received it. As alfo the  $\frac{\text{Hift. Cent.2.}}{(d) \text{ Ibid. 2.}}$ Defcription, though but imperfect. See likewife Guilielmus Pijo, (e) who gives a figure fomewhat different, (e) In Boutimaking him flenderer and shaped in Body like to a Deer. us's Hift. N. Ind. Orients But his Defcription feems to be taken out of Bartholine. 1.5. c. 9. His principal Characters are thefe, About as big as a Stag, fnouted and tailed like a Boar, footed like a Goat : befides what is observable in the skull, which I shall now particularly defcribe.

It is a foot long, feven Inches high, and about five over. The Snout scarce two. The Teeth are 32. In the upper Jaw, four Cuters; in the nether, fix. In each Jaw, ten Grin-In the lower Jaw, two Tusks, one on each fide, like ders. those of a Boar, standing outerly, an inch behind the Cuters; near their Root, tof an inch over, sharp-pointed, hooked very much backward; by the bow, four inches long. On

27

E 2

## PART I.

On his upper Jaw, he hath two Horns, of the fame hardnefs and fubstance with the two great Teeth now defcrib'd : and Bartholine (a) calls them Teeth. Yet are they not Teeth, but Horns; becaufe they are not, as all Teeth, even the Tusks of an *Elephant*, fixed in the Jaw with their Roots upward, but downward : and fo their Alveoli are not open downward within the Mouth, but upward upon the top of the fnout: where these Horn's bore or pierce the flesh and skin, as the Teeth do the Gooms. Yet being two, they stand not in the middle, as in the Rhinoceros, but on the fides of the fnout, fc. behind the Cuters about two inches. Near their Roots about half inch over, ending in a sharp point, bended upward and backward like a fifh-hook, by the bow about <sup>1</sup>/<sub>2</sub> a foot long.

(b) In Bont. Hift. N. Ind. Orient. 1.5. c. 9.

Pifo (b) defcribing of it, faith, That in his nether Jaw (his upper Jaw he defcribes after) there are two great Tusks which ftand upright, and bore through his fnout (Roftrúmq; perforantes ): which is a fenfeles mistake. Bartholine indeed faith of the Horns (which he calls the Teeth) of the upper Jaw, ---prodeunt ex superiori Maxilla carnem Rostri perforantes : which Pilo transcribing, mistakes, and feigns as great an absurdity, as if Nature had put a Padlock or Bolt upon the Creatures Mouth.

Aristotle, as was before noted, faid well, as to the Animals he had feen, That no one hath both Tusks and Horns. But of his fault in affirming too generally, this Animal is not the only inftance, by many. The reafon why this hath both, may be, becaufe neither of them are very great, and his Horns, proportionably to what they are in others, are Befides that he is cover'd with hair, and not, verv little. as the Boar, with Briftles, which probably fpend more upon the fame matter, which in other Creatures makes the For Briftles feem to be nothing elfe but a Horn Horns. (plit into a multitude of little ones.

#### (c) Pifo in Bont.

Laet, out of Lerius.

This Creature is faid (c) to breed only in the Island Bouro. Yet that which the Brafilians call the Tajacuguitas, (d) Joh. de (d) may be the fame. As alfo Pigafeta's Porcus Quadricornis. There are Swine, faith he, (e) in the Philippick Islands, (e) Cited by with two, three, and four Horns. He might mistake the Aldrovandus. two Tusks for Horns; and from those which he faith had but two or three, they might be violently broken off.

Another

#### 28

(a) Hiftor. Cent. 2.

# Of Quadruped's.

Another SKULL of the BABY ROUSSA. It is altogether like the former, faving that the Tusks and Horns are not fo crooked. So that one feems to be of the elder, or the Male, the other of the younger, or elfe the Female. Both the Natives, and others that live amongst them, efteem this Animal a delicate fort of Venifon. (a)

The SKIN of a young RHINOCEROS, compofed indifferently to the shape of the Animal. In the Defcription whereof Jacobus Bontius (b) comes the nearest (b) Histor. to the truth. Yet is he very short and defective. To Nat. Ind. whofe therefore, as far as may be by this Skin, I shall add a better.

'Tis a yard long, and almost a foot over; his head nine inches long, almost eight over at the top. His Snout broadifh, as in a Calf. His Eyes little, as those of a Hog, about <sup>2</sup> of an inch long. They stand low, not much more than three inches above his Nofe end. His Ears alfo like a Hogs. His Legs, as of the Hippopotamus, rateably thort; about ten inches long. His Tail, five and 1; flat, as that of the Caftor; but not fo broad, near the Buttocks an inch and  $\frac{1}{2}$ , at the end  $\frac{1}{2}$  an inch.

The faid Skin is every where thick, and very hard; excepting only his Ears which are fofter, and extream thin. It hath about ten Plice or Folds; two under the nether Jaw, one on the Breaft, in the figure of the letter V, on the Neck one on each fide, one between the Shoulders femicircular, on the Back two transversly extended to the bottom of the fides, with two more strait ones, carry'd obliquely on the Buttocks.

The lower part of the Forehead and Snout cover'd with a kind of hard Cruft. His Ears naked and fmooth. All the other parts rough with round fealy Crufts; on the Back, Sides, and Belly, leffer, near a ‡ of an inch over; on the nether Chap and Shoulders, bigger; on his Buttocks and Legs, the biggest, about i an inch over. His Hair is black, fhort, and fine. So few, that there are not many more than scales or shells ; growing for the most part, out of the centre of the shell; fo that he is almost naked. His Dock is also naked on both fides, but on the edges there grows a confiderable quantity of longer and thicker Hair. The Animal being very young, had no Horn, nor fo much as any fign of it. The

(a) Pifo in Bontius.

### PARTI

(a) Hiftor. Nat.

(b) Ibid.

The *Rhinoceros*, fays *Bontius*, (a) is near as big as an *Elephant*, faving that he is not fo tall. He will lick a Man to death, (b) by raking away the flefh to the Bone with his rough and fharp Tongue.

In *Piso's* Figure, which he hath added to *Bontius's* Defcription, and which, he faith, was taken from the life, the Eyes are placed very low, as they are alfo in this Skin. But the Cloven-Feet, in the fame Picture, I find not here: peradventure, the Skin not being well taken off the Feet.

In the time of *Domitian* the Emperour, there was one fo big, as to tofs not only a Bear, but a Bull upon his Horn. Epigr. 22. & (c) But what *Martial* means, fpeaking of the *Rhino*-Epigr. 9. ceros, lib. 1.

#### Namq; gravem gemino Cornu sic extulis Ursum, Gc.

I do not well underftand. The Figure given by *Pifo*, as above, reprefents but one Horn only. Neither doth *Bontius* (who faith he hath feen great numbers of them both in houfes and in the woods) defcribe or mention any more than one Horn, And thofe who do fpeak of another, yet make it a very fmall one, and not over againft the other, but on the forepart of his back, and fo in a place where it is immoveable, and can no way be made ufe of for the toffing up of any thing, as the other on his Nofe.

(*d*) Linfchot p. 88.

The *Rhinoceros* breeds not in *India*,(d) but in *Bengala* and *Patane*, where they much frequent the River *Ganges*.

A piece of a great RHINOCEROS-SKIN,tann'd. 'Tis wonderful hard, and thick, about inch; exceeding that of any Land Animal which I have feen.

The HORN of a RHINOCEROS. It once belonged to the Duke of *Holfteine*. Although *Bontius* defcribes the Animal the beft of any before him, yet neither he, nor others defcribe the Horn to any purpofe. 'Tis in colour and fmoothnefs like thofe of a Bull. Almoft a yard long. At the bafe, above half a foot over; and there furrounded with a Garland of black and ftubby Briftles. Sharp-pointed. A little crooked backwards, like a Cocks Spur. Quite through folid. An inftance contrary

30

# Of Quadruped's.

trary to that Affertion of Aristotle, (a) "E71 Ne rai néparce Si (a) De Partib. Animal. 1.3. c. 2.

Another HORN of a RHINOCEROS, as big as that now defcrib'd. Given by Sir *Robert Southwell*, prefent Embaffador to the Prince Elector of *Brandenburge*.

A THIRD, almost as big as the former.

A FOURTH, a little one, about a foot long.

The *Rhinoceros* fights the *Elephant* with his Horn, and fometimes overcomes him. In *Septalius's Muſæum* there are feveral Veſſels mention'd to be made out of this Horn, as well as divers others. The *Rhinocerous* Horn, in *India*, as alfo his Teeth, Claws, Fleſh, Skin, Blood, yea Dung and Piſs, are much eſteemed, and us'd againſt Poiſon, and many Diſeaſes; and ſold at great rates. (b) Yet ſome ſor p. 88. an hundred times as much,as others of the fame colour and bigneſs; for ſome diſſerence which the *Indians* (only) diſcern betwixt them. (c) (c) Ibid.

The TAIL of a great R HINOCEROS. Not well defcribed by *Bontius*. The Dock is about  $\frac{1}{2}$  inch thick, and two inches broad, like an *Apothecaries Spatule*. Of what length the whole, is uncertain, this being only part of it, though it looks as if cut off near the Buttock; 'tis about nine inches, black, and very rough. On the two edges, and there only, grow alfo very black and fhining hairs, a foot long, flubborn, and of the thicknefs of a fmaller *Shoomakers* Thread. Yet not round, as other hair, but rather flatifh; like fo many little pieces of Whale-Bone.

A SPIRAL or WREATHED TUSK of an ELEPHANT. Prefented from the Royal African-Company by Thomas Crifpe Efq;. 'Tis about an Ell long. At the bafe, a foot about. From the thin edges whereof, it is chonically hollow to the depth (or height) of near  $\ddagger$  a yard. It is twifted or wreathed from the bottom to the top with three Circumvolutions, ftanding between two ftrait lines. 'Tis alfo furrow'd by the length. Yet the furrows furround it not, as in the horn of the Sea-Unicorn; but run parallel therewith. Neither is it round, as the faid Horn, but fomewhat flat. The Top very blunt.

Paufanias (cited by Gefner) affirms, and feems to fpeak it as a thing well known, That the Tusks of Elephants, which he calls, and ufeth arguments to prove them Horns, may, by

3 I

# PART I.

by the help of fire, like Cows horns, be reduced to any shape. Whether this be naturally twifted, or by art, I will not determine. Terzagi in Septalius's Musaum mentions though not a Spiral, yet strait Tusk of an Elephant, two yards high, and 160 pounds in weight.

The LEG BONE of an ELEPHANT. It was brought out of Syria for the Thigh-Bone of a Giant. But the proportion which the thickness bears to the length of the Bone, shews it to be the Bone not of a Man, but an Elephant. For the Leg-Bone is usually about <sup>2</sup> of an inch over: and foits traverse Area contains about (49) square eighths of an inch. But this Bone is above four inches over, in the transverse Area whereof therefore, are contained about (1088) fquare eighths of an inch. Which number (1088)being divided by (49) gives (22) for the Quotient. So that it is two and twenty times as thick as the Leg-Bone of a Man: I mean, the transverse Area of the one containeth that of the other 22 times. Yet is it but three times as long; and therefore should contain the fame but about nine times, were it the Leg-Bone of a Man. Tis about a yard and 1 foot long, and above a foot about in the slenderest part. And the shape of it, shews it to have belonged to the Leg, and not the Thigh. The Elephant to which it did belong, might be about five yards high.

Another LEG-BONE of an ELEPHANT, fcarce fo long, but of equal thickness. Given by Sir Thomas Brown of Norwich.

Elephants are brought into Europe out of Ceylan, Sumatra, Cochin, Siam, Bontam, Melinda, Gc. But they breed most (a) Linchol. in the Kingdoms of Aracan and Pegu. (a) In the Island of Ceylon, most docile. The Æthiopians behind Mosambique eat them, and fell their Teeth. The Indians use them to draw, and thip their Goods. In Winter, when it begins to rain, they are altogether mad and ungovernable, and fo continue from April to September, chain'd to fome Tree; after that, they become tame and ferviceable again. (b) See more of the nature, and ingenuity; and of the way of hunting (c) East.Ind. and taming them, in *Linschotus* and *Tavernere*. (c)

> One of the GRINDERS of an ELEPHANT. He hath four of these Teeth in each Jaw, wherewith he grinds his meat. This here is above a foot long. But the

32

(b) Ibid.

p. 29. &c.

Voyage.

the exerted part, or that part which ftands above the Goomes, is but feven inches in length, and three in breadth. 'Tis not above  $\frac{1}{2}$  an inch above the Goomes, but faften'd within the Jaw  $\frac{1}{2}$  a foot, where deepeft. The faid exerted part looks like eight or nine Rows of Teeth, three, four, and five in a Row, all coalefcent. The fides all along waved. The furthermoft Roots like the folds of an old fet Ruff. It weighs above eleven pounds and  $\frac{1}{2}$  Haver-dupoy[e.

ANOTHER of the fame Teeth, fomewhat leffer.

A THIRD, having part of it broken off.

The *Elephant*, in my mind, hath fome affinity with the *Boar*. Both are Taper-Tail'd, hunch-back'd, little-Ey'd; arm'd with Tusks, have the nether Chap fharp before, and a moveable Snout; the *Elephants Probofcis* being but a long Snout, and the *Boars* Snout a fhort *Probofcis*.

The HOOF of a Solidungulous Animal. It was brought from Angola. Perhaps of a kind of Zebra there, anfwering to the Indian defcribed by Pigafeta. 'Tis much about the fhape of a Horfe's, but not fo big; two inches and  $\frac{1}{2}$  broad, two inches long, and as much in height. Somewhat thick and ftrong. For the greateft part, blackifh; but juft before yellowifh, and half transparent. Within this is contained another young one (together with its inclosed Bone) all over of a yellowifh colour. The Zebra, Indica, (a) is in all his parts like a Mule, faving that it is (a) Aldrovandus.

Another strange HOOF of a Solidungulous Animal. It is of a blackish brown and opacous colour. Very thin, like that of a Calf. But rateably much broader than in other Animals, being not much above an Inch over foreward, yet expanded fide-ways two inches and a  $\frac{1}{4}$ .

Another HOOF of the former kind, a little lefs, blacker, and altogether opacous.

#### APPENDIX

34

PART I.

# APPENDIX.

### Of certain BALLS found in the Stomachs of divers Beasts.

A NAKED and round HAIRY BALL; almost three Inches over, taken out of the Stomach of a Calf.

Another fomewhat Oval, and more compact.

Several other leffer ones, and with the hairs more loofely composed.

Another, with the outward parts of the hair not complicated, as in the former, but ftanding parallel, and fomewhat winding, as in the Crown of a Mans head.

Two HAIRY BALLS, SPHÆRICAL, and INCRUSTATED. About two inches Diametre, cover'd with a fmooth and very thin Cruft, of the colour of Occidental *Bezoar*, having neither taft or fmell, nor ftirring at all, upon the effusion of Acids.

A H A I R Y B A L L, incrustated, and F L A T. Taken out of the stomach of a Bull in *Brasile*. 'Tis very smooth, and of the colour of Oriental *Bezoar*. Figur'd just like a Bowl. Somewhat above two inches thick, and

(a) Lib. ult. three, over. Ferranti Imperato (a) hath another like it. If you fcrape a little of the Cruft off, and pour fpirit of

Nitre upon it, it makes a confpicuous bullition, as it doth (b) See the upon Bezoar. (b)

Author's Another BALL, in figure, colour, and fubstance, like Discourse of the Luctati- the former; but bigger, being above three inches Diametre. on arising from the It was taken out of the stomach of a Cow.

mixture of Another with the like Incrustation, but of an Oval Bodies. Figure.

> A FIBROUS BALL. Confifting, not of Hair, but for the most part of the fibers of Plants. Perfectly Sphærical. An inch and ± Diametre. Cover'd with a brown, and very rough Crust. The like substance being also mixed with the most intimate parts of the Ball.

Another like Ball, but fomewhat lefs.

Half a FIBROUS BALL taken out of the stomach

of

# PART I. Of Quadruped's.

of a Sheep. Two inches over, and a little flat: It confifteth of moft fine herby Threads or Fibers, fhort, and very clofely compacted. Cover'd with a black, fhining, and moft thin Cuticle. A piece hereof fired, burns like Match-cord, all away to afhes.

Thefe Balls, efpecially those of Hair, we may suppose to be made by the motion of the stomach, which in these Creatures is very strong, and srequent : by which motion the Hair is wrought and compacted together, as Wooll is, by the Workmans hand, in the making of a Hat.

#### CHAP. III.

# OF OVIPAROUS QUADRUPED'S.

A Femal LAND-TORTOIS. Teftudo terreftris famina. Ufually defcribed, but no where fully, nor without errors. This here is eight inches long, and five broad. The Head an inch and  $\frac{1}{2}$  long, almost as broad; in shape fomewhat like a Toads. The Orbits of the Eyes very large, almost  $\frac{1}{2}$  inch over; a  $\frac{1}{2}$  of an inch behind the Snout. The lower Chap is received by a groove into the upper. The Tail three inches long, and sharp-pointed. The Feet two inches and  $\frac{1}{4}$ , and above  $\frac{1}{2}$  inch over. The fore-Feet have five very short Toes, with Claws about  $\frac{1}{4}$ inch long. The hinder feet have but four Toes, with shorewhat bigger Claws.

The Head, Back and Belly, have all bony Covers, faced or over-laid with shells. The head and back-pieces blackish, with citrine or ftraw-colour'd fpecks fprinkled up and down upon them. The back-piece convex, and almost Oval. On the fides, for the length of two inches as it were doubled inwards, and joyned to the Belly-piece. 'Tis cancellated with little fquares on the Margin; on the top of the back, fexangularly; and with the largest Area's between. The Belly-piece is party-colour'd black and citrine, almost flat 3 but turned up a little at the ends. Cancellated in the middle with fquares, with triangles before, and behind with Hyperbolick lines. The Feet are cover'd with small round Scales, the Tail with square ones. He breeds in the Deferts of Africa. F 2 Three

36

PART I.

Three little LAND-TORTOISES of the fame kind.

Another little LAND-TORTOISE, of kin to the former. 'Tis fomewhat rounder.

A leffer LAND-TORTOISE, almost circular and ridged on the back.

A great CHEQUER D TORTOISE-SHELL. *Tefta Teftellata major.* It was fent from *Madagafcar.* I find the Animal no where defcrib'd or figur'd. It is above half oval; being of all that I ever faw, the most concave; a foot long, eight inches over, and almost fix inches high.

The Convex is curioufly wrought with black and whitifh pieces, alternately wedged in, one againft another, and notched, as it were, with transfvers Incisions. Those near the Margines and on the fides are composed into feveral Pyramidal *Area's*, or great Triangles, whose Bases are about two inches broad. On the Back, into fexangular ones, each of them convex. On the fides, and quite behind, the Shell is carry'd fomewhat inward. Before, and hinderly, the edges are toothed, and bended outward and upward. The inward edges are cover'd with shell Plates above an inch and'<sup>±</sup> broad.

The Concave is composed of fix and forty Bones. Along the middle of the Back, are twelve, all, except the foremost and the four last, almost square. Next to these, are eight on each fide, like to fo many contiguous Ribs; together with two leffer fquare Bones before : Next to thefe, eight more, as it were, under-Ribs, on each fide. To the twelve middlemost Bones, the Ribs are joyned by an alternate commiffure, fo as one of them answers to the halfs of two Ribs, & vice versa. To thefe, the under-Ribs, in a wonderful manner, *scil.* by a branched Suture or Inden-For the great Teeth of the under-Ribs, being first ture. inferted into those of the upper-Ribs; the Indenture is afterwards repeated, by leffer Teeth, out of the fides of the great ones. The Belly-piece is here wanting.

Befides the most elegant ordering of the Work in the Convex, there are three things chiefly observable, which ferve for the greater strength of the Shell. That is to fay, The *Convexity* of the several *Area's* on the Back, the *branched* 

Of Quadruped's. PART I.

branched Sutures, and the Alternate commissures of the Bones. Anfwerable to the Rule of Nature, in a Humane Skull: and of Art, in the laying of Stones in Buildings; and in covering of broader Vaults, not with one Arch, but feveral leffer ones, for the greater ftrength.

A leffer CHEQUER'D SHELL. Perhaps Stellata Wormii, (a) or a kin to it. The Convex work is compo- (a) See his fed of black and citrine pieces, cancellated, and transverily Museum. notched; ten, eleven, or twelve of them meeting in a fquare, and rugged centre; each looking like a Star furrounded with Rays. The feveral Area's rife up into a convexity fomewhat greater, than in the Shell above defcrib'd. Juft before the Tail, the edges are bended a little upward; over the Tail, downward. The Belly-piece is joyned to the Back-piece for the length of two inches and <sup>1</sup>/<sub>2</sub>, with the edges turned upward. The middle of it flat, ftreak'd, and cancellated; the hinder part endeth in a double broad point.

Two more CHEQUER'D SHELLS of the fame Species; faving, That here are not fo great a number of Rays to each Star.

Another of the fame; excepting, that the feveral arched pieces are not fo high, as in the former.

A CHEQUER'D-SHELL, from Suranam. I think no where defcrib'd, or figur'd, unless perhaps by Moschardus. The convex work is composed of black and citrine pieces, in the Margin, of a Pyramidal or wedged Figure, oppofitely fet, and with transverse Notches: amongst which there are alfo little fquare, rugged, and citrine pieces intermixed. All the reft, which are also black and citrine, are fix times as big, adorned not with transverse but paralell Notches. Neither are they Radiated, but feveral of the fame kind contiguous fide to fide. They are compos'd into Area's almost flat : the centres whereof are also rugged, but much bigger than in the Shell laft defcribed. The Belly-piece is alfo less convex.

Another of the fame Species.

Another CHEQUER'D SHELL from Suranam, of kin to the last describ'd. The edges of this are round about, excepting before, turn'd up outward. The Back alfo is lefs convex; the Belly, more deep.

Another

# PART

Another of the fame Species.

A CHEQUER'D SHELL from Virginia. 'Tis in figure somewhat like the femal Tortoise first describ'd. Saving that it is more convex, and divided into Area's alfo fomewhat convex, and with transvers Furrows or Notches. 'Tis also near the Tail, turned up outward; but the hindermost part bended inward.

Another Shell of the fame Species.

Another, like the first describ'd, excepting also, That it is more convex; and inftead of fpecks, hath long ftreaks, and great blotches.

A SCALY TORTOISE SHELL. It feems to be of the Lutarious kind. I find it not defcrib'd, or figur'd. Above a foot long, ten inches broad, convex to the height of 3 <sup>1</sup>/<sub>2</sub>. The convex, all along the middle, high ridg'd. Composed of Scales, very fmooth, particolour'd, of a brownish red and citrine; in the utmost edge leffer, and almost fquare, but with acute Angles prolonged towards the Tail, and towards the Head doubled downwards. The reft are five, fix, and eight times bigger, fet alternately, as the Scales in Fishes, or Slate-work upon a house. The Concave is ftrengthened with a Back-Bone, and eight Ribs, obliquely appendent, on each fide. The Belly-piece is here wanting.

Rariorum.

man. (c) Ibid.

(d) Joh. de Backs. (d)Laet.

A SEA-TORTOISE. Curioufly figur'd by Befler. (a) Fascicul. (a) Described by Aldrovandus and others. He differs from the Land-Tortoife, chiefly, in having a more rude, and fofter shell, and Feet rather like the Finns of a Fish, as proper to fwim with. As alfo in Bulk. In the Brafilian shore, faid to be big enough, for one sometimes to dine (b) Mus.Ro- fourfcore men. (b) In the Indian-Sea so big, (c) that the shells ferve the Natives for Boats. In the Island Cuba fo great, that they will creep along with five men upon their

He fquirts the water out at his Nostrils, in the fame (e) Rondelet manner as the Dolphin doth at his Spout. (e) In Generation, the embraces of the Male and Female continue for a (f) Trapwhole Lunary month. (f) They take them, by turning ham's Dife. of Jam. Cap. them on their Backs with staves, in which posture they  $\binom{1}{(g)}$  Lig. Hift. lie, till they are fetch'd away. (g) As they lie on their of Barbados. Backs, they will fometimes fetch deep fighs, and shed abundance

38

abundance of Tears. (a) They kill them, by laying them (a) Traon their backs, and fo ripping them up round about where fap. the Back and Belly-pieces meet. (b) They abound in the (b) Lig Hift. *Caribdy* and *Lucayick* Iflands, and in *Jamaica*, As alfo in the *Red-Sea*.

Of their Nature, Generation, and inward Parts, fee fome Obfervations in the *Philof*. Transactions. (c) The fielh N.36. hereof maketh a most pleasant jelly. (d) The *Callapee*, *i. e.* (d) Trapham's Dife. the Belly-part fo called, baked, is an excellent Dish. (e) of Jam.

The Legs, faith Schroder out of Solenander, applied to (e) Ibid. the part affected, are a most experienced Remedy in the Gout. In Turky, the Shells are used for Bucklers. In Tabrobana, to cover their houses. (f) In China, (g) to make  $\begin{pmatrix} f \end{pmatrix} \underset{(g) \ Mus}{\text{Rom.}}$ 

A LITTLE SEA-TORTOISE, taken out of the Egg. The SHELL of a Sea-Tortoife.

The HEAD of a SEA-TORTOISE. Tis large, and fo fhews the make of the Mouth the better : where the fharp and toothed edge of the nether Chap, ftrikes into a Canale cut into the Bone of the upper; and the toothed protuberance of the upper, into a Canale in the nether : by which means he eafily fheers the Grafs, or other Plants, whereon he feeds. Given by Mr. John Short.

The SKULL of a SEA-TORTOISE, Nine inches long. The head of a Sea-Tortoife a foot long, is but about two inches. Therefore the Tortoife to which this skull belong'd, was a yard and half in length.

Three other SKULS about the fame bignefs. One whereof, given by *Henry Whiftler* Efq;.

Two pieces of the SHELL of a very great TORTOISE, each with a Rib fixed in it. Given by Sir Robert Southwell.

The HEART of a SEA-TORTOISE. It is about as big as a Lambs. Herein both the fingle Ventricle, and two Auricles, are all plainly visible. The Hearts of all (b) De Part. great Animals, faith Aristotle, (b) have three Ventricles; of Anim. lib.2. leffer, two; of all, at least one. One would a little wonder, <sup>c. 4.</sup> how so observing a man, should discover so many mistakes, in so few words.

The PISLE of a SEA-TORTOISE. 'Tis fourteen inches long, and two and round about. In fubftance like a Bulls. There are three more about the fame bignefs. See

# PART I.

(a) Hift. of Barbad: p. 118,

See the great efficacy attributed hereto by Ligon, (a) in curing him of two Fits of the Stone.

An EGG of a SEA-TORTOISE. 'Tis very white, and Sphærical, which I find no Author diffinctly to fay, but only to be like the Eggs of Fowls. About the bignefs of an Hand-Ball. The shell rather thinner and softer than of a Hen's. She lays them in the fand, where they lie till they are hatch'd. Sometimes above a hundred at a breed.

The CHAMÆLEON. By Wormius well defcribed. Fohnston's Figure, especially as to the feet, very falfe. A most curious one in Calceolarius. As alfo in Besler, faving that his eyes are drawn fomewhat too little. Of the skin it may be noted, that 'tis every where rough, as it were, with little round blifters or knobs; on his Head and Back, greater; on his Legs, Sides and Belly, leffer; of the bignefs of Silkworms Eggs. As alfo, that his hinder Feet are thicker than the fore-Feet: and the Heels or hinder Toes as long again, as the other; whereas in the fore-Feet, they are all of a length. The shape of his hinder Feet is therefore the better fitted to affift him in the climbing of Trees; the Heels being like ftrong Leavers to hoift him up. And the make of his Skin, for the changeablenefs of his Colours; which feems to depend on the falling or fwelling of the faid Knobs; whereby the light, receiving different Reflections, produceth different Colours. Of his Colours, faith Sca-(b) Exercit. liger, (b) from the Observation of Joh. Landius, it is not 196. Sect. 4. fo properly faid, that they are chang'd, but only the feveral Species highten'd or deepen'd. He hath a long Tail, as a *Lizard*, but flenderer: which, (c) as he defeends from a Tree, he laps round about the Boughs, to keep himfelf from falling. His Feet alfo are all made where with to take faft hold.

> Of the inward Parts, fee the Philof. Trans. N. 49. But efpecially Dominicus Panarolus, who together with his Medicinal Obfervations, hath published the Description and Anatomy hereof. Amongst other particulars, the Mufcular Membrane of the Eye, by which fingly all those motions are perform'd, which in other Animals require fix, and in fome feven Muscules, is remarkable. As alfo the diftinct continuation of the Optique Nerves from their Original to each Eye; whereby the uniform or conjunct motion of both his Eyes is not neceffary; as in other Creatures;

(c) Panarolus.

Creatures; but he is able to move one upward or backward, and the other downward or forward, or any other way, at the fame time. No lefs the fabrick of his Tongue; which being hollow from end to end, with a ftring running through the hollow, faften'd behind to the *Os hyoides*, before to its extremity, it darts out and contracts it felf in an inftant : and with a Vifcous fubftance at the end, catches the Prey, which are Flys and other Infects, as we ufe to do Birds with Limetwigs. Thus far *Panarolus*.

In the *High-hoe*, and other Birds of this kind, there is a peculiar *Cyftis*, wherein a Vifcous matter, like that above mention'd, is flored, and a Pipe deriving it thence into the Mouth ; the Defcription whereof I may hereafter publifh. I fuppofe therefore, that upon further examination, the like Contrivance will be found in a *Chamæleon*.

It may be noted, That *Panarolus*, about the beginning of his Defcription, calls the *Chamæleon* a flow Creature : Yet faith afterwards, (towards the end) that he climbs Trees fo wonderfully fwift, as if he flew. He is not therefore fo properly flow, as perhaps fullen and humerous.

Bartholine (a) hath alfo the Anatomy of this Animal, but (a) Hifts transcribes it all out of *Panarolus*. In one particular much forgets himfelf, faying about the beginning of his Discourse, that the *Chamaleon* hath very great Lungs; and in the end, that they are but little.

A young brown CHAMÆLEON.

A third, with black, yellow, and ash-colour mixed together.

A CROCODILE, about two yards and  $\ddagger$  long. He differs not much from a *Lizard*; chiefly in his Bulk, and the hardnefs of his Skin, which on his Back hath Scales proportionably hard and thick. In *Paname* there are fome an hundred feet long; as is affirmed both by *Job. de Lopez*, (b) and *Job. de Leri*. (c) In the *Mufœum Romanum*, there (b)Hift.Ind. 1.6. c. I. is a Tragical Relation of a very great one that devoured a (c) Cap. 10. Virgin, *Cap. 6*. The fame Animal which in the Book of *Job* is called the *Leviathan*, and hath been commonly taken to be the *Whale*; but falfly, as *Bochart* hath demonftrated. He is tolerably well defcribed by moft; and curioufly figur'd by *Befler*. He breeds in divers places in both the *Indies*, as well as in *Egypt*.

G

Nature,

#### PART

Nature, faith Aristotle, hath denied a Tongue to this Which Sir Thomas Brown takes notice of as a Animal. On the hinder half of his Tail he hath firm Vulgar Error. leathern upright Finns, wherewith he governs himfelf, as a Fifh, in fwimming.

He is effeemed good meat, not only by the Natives in Brafile, but also by the Hollanders there. (a) He is taken thus; They fasten a thick long Rope to fome Tree by the Waterfide, and to the other end, a ftrong iron Hook, which they bait with a Weather. (b)

In Brafile, they hunt them much for the fake of their Fat, which they commonly and fucceffively apply to their

(c) Gul. Pifo. Wounds, when bitten by him. (c) As alfo for his Tefticles, which fmell like Oyntment, and which they fell very dear. (d) In New Spain, the Kernels under their Throat, fmell like Musk, and are a prefent Remedy against burning Fevers. (e) The Stomach dry'd in the Sun, powder'd, and taken to the quantity of 3i, is an admirable Diuretick, and brings away Stones from the Reins and Bladder. (f) The fame taken to the quantity of a spoonful in the Morning, after Dinner, and before Supper, or ,as often as the Patient can bear it, is an excellent Remedy for the Dropfie. (g)

A CROCODILE, which, with part of the Tail that is broken off, is about a yard long. Perhaps that leffer fort which breeds in Brafile, whereof Linschoten faith, That they will come into the Houfes, and let the Children play with them harmlefly.

Another young CROCODILE not a foot long.

The SKELETON of a CROCODILE. Given by Sir Robert Southwell; to whom it was fent from the *East-Indies.* 'Tis about four yards and three quarters long. The Neck, from the hinder The Head about two feet. part of the Head, almost a foot and 1. The Trunk, from the fore-Ribs to the Tail, four feet. The Tail, feven. From the top of the Back to the Breast, a foot and high.

The Orbites of the Eyes proportionably little; what ever Pifo faith of his great Eyes.

The Articulations of the lower Jaw with the upper; and of the Occiput with the foremost Vertebra of the Neck; are here both made in the fame manner, as in other Quadrupeds

(a) Gulielmus Pifo.

(b) Scal. Exer. 196. Sect. 5.

(d) Ibid.

(e) Joh. de Laet. 1. 5. c. 4. out of Franc. Ximenex.

(f) Ibid.

(g) Ibid.

42

peds: notwithstanding the Tradition of his moving the upper Jaw.

The Teeth are about threefcore, thirty in each Jaw. All of them *Claviculares*, or Peg-Teeth, not much unlike the Tusks of a Maftiff; and fcarce bigger: notwithftanding that *Ariftotle* calls them great Teeth,  $i\delta b/r\pi as \mu s_2 a/\lambda s_5$ . (a) (a) Hift Ari-And yet, whereas a Dog hath but four Tusks, or exerted Teeth, in this Animal being all of that figure, their fmallnefs, with refpect to fo great a Head, is fully compenfated by their number. For the most part, those that are new and not worn, are toothed, like a fmall Saw, on their fides.

The Vertebræ, in all, fixty. Those of the Neck, are seven, as in a Man. The first whereof, in a Man called the Atlas, hath a Processian in the figure of the Epiglottis. The other fix, have each one Processian or Prominent Part, which is long, broad, sharp, and upright: and two that are transverse, and short; to which are joyned, by a Cartilage, fo many Ossa mucronata, one shorter than another from the Head toward the Trunk. But the Vertebræ, one lesser than another, from the Trunk towards the Head.

The Vertebræ of the Back, nineteen; that is, three fevens running one into another. Each of which hath three *Prominent* Parts, which are fharp, broad, and long; one perpendicular, and two that are transferfe, or at right angles.

The Ribs 24, twelve on each fide. Seven of which, have each of them double *Cartilages*, that is, one after another, appendent to them.

The fore part of the Sternum is plainly bony. The hinder part, cartilaginous; shaped like the Os Hyoides in a Man.

The Vertebræ of the Tail, are 34; or (if you add the laft of the Trunk as common to both) 35; that is feven times feven. The first fourteen, have each three Prominent Parts, like those of the Vertebræ in the Back. The next nineteen, have only an upright Process. The last of all, hath none. The first 14, are double, in number to those of the Neck, the next 19, are equal to those of the Back; the last answers to the Head. To all the Vertebræ of the Tail, except the last, are also subjoyned for many G 2 O[fa

PART I.

Ossa Mucronata, directly opposite to the upright Processus.

The Shoulder-Blades are two on each fide; each  $\frac{1}{2}$  foot long.

The Bones of the fore-Foot, 27. The Thigh-Bone near a foot long; an inch and  $\ddagger$  over. The Leg-Bones, two; each a little above  $\ddagger$  a foot long; and of equal thicknefs, *fc.* about  $\ddagger$  of an inch over. The Foot ftrictly fo call'd, the length of the Thigh. The Bones of the *Pedium*, four. The Fingers or Toes, five. The inmost, the thickeft, like a Thumb. From thence, the third, the longeft. The Bones of the Thumb, three; of the next Finger, four; of the next, five; of the two outmost, four; in all 20. All armed with black Claws, a little crooked, and not much above an inch long.

The Hip-Bones are three; each of them <sup>1</sup>/<sub>2</sub> a foot long.

The Bones of the hinder Foot, 24. The Thigh-Bone above a foot long, and an inch and  $\frac{1}{2}$  over. The Leg Bones almost eight inches long. The inmost, above an inch over; the other, but  $\frac{1}{2}$  an inch. The Foot, fo called, the length of the Thigh. The Bones of the *Pedium*, four. The Toes, four; whereof the inmost, the greatest; the third, the longest. The Bones of the great Toe, three; of the next, four; of the third and fourth, five. The Claws fomewhat bigger than in the fore-Foot.

Amongst other things worthy of note, the sense feasible for the tradition of the *Crocodiles* moving his upper Jaw, is plain from the structure of the Bones, that is, the Articulation only of the *Occiput* with the Neck, and of the nether Jaw with the upper, as above faid.

The first Author of it was Aristotle, in his Fourth Book de Partibus Animalium, Cap. 11. And thus much is true, not only of this Creature, but of all others, which have a long Head, and a wide Rietus, that when they open their Mouths, they feem to move both Jaws; as both the Viper, and the Lizard. And for the fame reafon, Columna (a) might fay as much of the Hippopotamus, that he moves the upper Jaw, as the Crocodile. So all Birds, efpecially with long Bills, shew the contemporary motion of both the Mandibulæ; the Musculi splenii pulling back the Occiput, and fo a little raising the upper, while the Musculi Digastrici pull the

(a) Lib. de Aquatil.

#### 44

the other down. But that this motion was not meant by Ariftotle, appears in his Firft Book de Hift. Anim, c. 11. Or lib. 3. c. 7. where he faith more plainly, That of all other Animals, only the Crocodile moveth the upper Jaw. So that he fpeaks of it, as a motion ftrange and peculiar; as if the upper Mandible did make an Articulation with the Cranium: contrary to what is here feen. And if we will hear Pifo, who probably fpeaks Ariftotle's meaning, as plainly as he doth his own, he goes further, and faith, (a) That the Crocodile doth not only move his upper Jaw, (a)Hift. N. but that his nether Jaw is immoveable. Than which Af-lib. 5fertion, to one that hath any competent knowledge in Anatomy, and feeth the Head and lower Jaw of this Animal articulated in the fame way, as in other Animals, nothing can appear more ridiculous.

The WINDPIPE of a CROCODILE. It is almost an inch and  $\frac{1}{2}$  over. Composed of *Cartilaginous* Rings, not broken off, with a Membrane betwixt their ends, as in most *Quadrupedes*, but entire.

The GREEN LIZARD. It was brought from the West-Indies. See the Description hereof in Gesner, and others.

The SENEMBI, a Lizard fo called in Brafile. Alfo called Igvana. Curioufly figur'd by Befler. Well defcrib'd by Marggrarius, and after him, Wormius. Saving as to the odd ftructure of the hinder Foot. The inmost Toe is joyned to the next, by a Membrane, for the length of an inch and  $\ddagger$ . This to the third, by a like Membrane for the length of an inch. This again to the fourth, for the length of an inch and  $\ddagger$ . The fourth, almost loose from the last. The Picture alfo, commonly given, falfly reprefents the fore-Leg equal to the hinder, which is far longer and thicker.

Another SENEMBI leffer than the former.

The SWIFT, or SPOTTED LIZARD. Commonly called STELLIO, or the STARRY-LIZARD; but not properly, the Stars, in the Figure given by *Aldrovandus* and others, being feigned. For the Animal is not marked with Starry, but with round Spots. The leffer are fprinkled up and down. The greater composed into about 13 half Rings or Girdles. On the Back the fpots are

PART IS

are alfo more diffinct, than on the Tail. They breed in *Thracia*, *Syria*, and *Sicily*. The Powder hereof being taken, is believed by fome *plurimum ftimulare Venerem*.

The SWAPTAIL LIZARD. Uromaftix, vel Caudiverbera. Called alfo CORDILUS. In Calceolarius's Mufæum there is a curious Picture hereof, under the Name of CROCODILUS TERRESTRIS. As alfo in Befler. Gefner, from Thomas Eraftus, hath very copioufly defcrib'd him, efpecially his Tail.

The BUGELUGEY. Of kin to the former. Aldrovandus and Johnston give only his Figure, with the Name of Lacertus Indicus. He is distinguished from other Lizards, chiefly, by the Scales on his Belly, which, like those of a Crocodile, are very great; *fc.* five or fix times bigger than those on his back. It was brought from Africa. This Lizard, faith Wormius, moveth his upper Jaw, as the Crocodile. Which, in what fense it is false and absurd, I have above shew'd.

The SCALY-LIZARD. He is well pictur'd in Befler. As alfo in the Mufæum of Olearius. Aldrovandus gives only a rude half draught, and without any Defcription, as well as the former. Clufius only faith, He remembers that he had feen one of them. Bontius (a) hath his Picture, but a very bad one. Elfe-where I find it not. He hath alfo defcribed him, but very defectively, and with feveral miftakes.

He is a yard and  $\frac{1}{2}$  long. His Head from his Nofe-end to his fore-Feet not above three inches. He hath no Neck. His Trunk, from the fore-Legs to the hinder, not above ten inches and  $\frac{1}{2}$ . His Tail exceeding long, *fc*. a yard and half a quarter. His Head above two inches over. His Nofe near an Inch. His Trunk almost four. His Tail moderately taper'd, and ending obtufely. The under part of the Tail is plain or flat; the upper part, hyperbolick. His fore-Legs, contrary to what they are in other *Lizards*, are longer than the hinder; thefe, not above three inches and  $\frac{1}{2}$ ; those, above four. The Claws also of the fore-Feet are longer; the longest about an inch; those of the hinder, but  $\frac{1}{2}$  an inch. He hath only four Toes and a Heel, both before and behind.

He is all over, except his Throat, Belly, the lower part

of

(a) Hift. N. l. 5. c. 8.

# Of Quadruped's.

of his fore-Leg, and the inward part of his hinder, cover'd with Scales, very thick, and in hardnefs anfwering to the moft folid Bone. The bafis of each Scale (perhaps through age) of a 'blackifh yellow, the Cone betwixt yellow and ftraw-colour, or like old *Ivory*. Adorned with *Striæ* proceeding from the bafe to the Cone. Set together, with an alternate refpect, as the Scales of Fifhes. In the Trunk, there are 10 or 11 filed to each Rank. Towards the end of the Tail, but five. The greateft, near two inches broad; the leaft, a quarter of an inch. On his Forehead, Back, and fore part of his Tail, they are flat. But on the edges of the Tail, they are doubled into an acute Angle, the one half of each ftanding on the Convex, the other on the flat of the Tail.

He is faid to be a most tame and innocent Creature. Which is very likely; according to the way of Nature, which ufually leaveth dangerous Animals, as *Serpents*, and other hurtful *Lizards*, naked: but defendeth the Bodies of fearful and innocent Creatures, as the *Tortoife*, the *Tatu*, and the like, with Armor.

Johannes Lerus, quoted by Linschoten, mentions a white fcaly Lizard in Brasile, as thick as a Mans middle, and five or fix feet long. Perhaps a bigger of the same kind with this above described.

There is a fort of little *Lizard*, (a) which when he (a) Ligon's fwelleth with anger, like the *Chamæleon*, changeth his co-bad. p. 62. lour, from green to a kind of Hair-colour or Ruffet. The Eggs of fome, if not of most *Lizards*, eat very pleafantly. And in (b) Brafile there are a fort of Water-Lizards five feet (b) Linschots long, which being flay'd and fodden, for whiteness, fweet-Lib. 2. 248, ness, and tenderness, furpas all other meats.

A LAND-SALAMANDER. Defcribed by Aldrovandus, and others. Much like a Lizard; but his Mouth is fhorter, and broader, more like a Toads: and feldom exceedeth a foot in length.

Bartholine tells of one that was kept alive in a Glass nine Months without food. (c)

(c) Hift. 50,

The LITTLE COMMON EFT. He hath a Cent. 2. thicker Trunk, a blunt Oval Snout, his hinder feet are very diftant from the foremost.

The SLENDER EFT. His Head is rateably very great;

# PART I.

great; his Snout alfo longer and sharper than in the former. His Trunk flenderer and much lefs belly'd. His hinder Legs alfo ftand nearer to the foremoft.

The THICK-TAIL'D EFT. His Head is here wanting. His Tail is not fo flender or tapering as in both the former, but ends more obtufely. And his hinder feet ftand yet nearer to his foremost.

The SCINK. Defcribed by Wormius, and others. Curioufly pictur'd by Befler. Like a Lizard; faving that he hath a shorter Neck and Tail, short Legs, a flat and broad Foot like a Hand, with very short Toes, and without any Claws. The Powder hereof is faid, Potenter Venerem stimulare.

#### SECT. III.

#### OF SERPENTS.

SNAKE preferved in Spirit of Wine. In Barbados there are fome about a yard and half long, that (a) Ligon's (a) will flide up the perpendicular Wall of a Houfe out of Hift. of Bar- one Room into another. A greater agility without feet, than we fee in most Creatures that have four. Much helped, as it should feem, by their great length; whereby they can, in an inftant, reduce themfelves into fo many more undulations for their better affent. In Brafile, faith Joh. de Laet, (b) there are Snakes found fometimes 25 or 30 feet long. The Indians, in fome places, eat Snakes very greedily.

The greater SLOW-WORM; Cacilia. Called alfo the BLIND-WORM; fo commonly thought to be, because of the littleness of his Eyes. His Skin also is very fmooth and gliftering. His Teeth very fmall. Of a lighter colour than the Adder; which are his principal Notes. See the Descriptions of Gesner and Aldrovandus. The Female is Viviparous, as well as the Viper. Bellonius faith, that out of one, he hath taken above forty young ones.

The VIPER. Vipera, qu. Vivipera; becaufe the only among Serpents hath been thought to bring forth her young

bad. p. 61.

(b) Lib. 15. c. 14.

#### Of Serpents.

young Ones. All Animals, faith Ariftotle; (a) that bring (a) Hift. forth their young, have alfoexternal Ears: yet knew that c. 11. an Adder which hath no Auricle is Viviparous. And this, indeed, he obferves with a good Remark, which is, That the firft lays her Eggs within her Womb; (b) wherein they (b) Hiftor. are afterwards hatched. Which had been a fair Introduction to him, to have obferved, That all other Viviparous Animals are Oviparous within themfelves. And 'tis much, that the hint hath not been long fince taken from the Raya, and fome other Fifhes. The Viper, faith Sir Thomas (c) Brown, from the experience of credible Perfons, in (c) Pfeudod. Epidem. cafe of fear, receiveth her young Ones into her Mouth; which being over, they return thence again.

The chief use of Vipers is for the Medicine called *The*riaca Andromachi. But there are also divers Medicines made out of them: as

Oleum per Infusionem,	Sal Viperarum	Spiritus,
Oleum Stillatitium,	· Volatile,	Ēſſentia,
Vinum Viperinum,	Fixum,	Alcohol Burgravii, (d) (d) Schro-
	Theriacale,	Pulvis Viper': Germanus. (e) Pharmac.
		(e) Prævo-

Of the nature of the Viper, fee the Observations tius: of Bourdelot, Redi, & Charas. See also the Phil. Trans. N. 87.

The SLOUGH of an ENGLISH VIPER. That is, the *Cuticula*. They caft it off twice every year, *fc*. at Spring and Fall. The feparation begins at the Head; and is finish'd in the space of 24 hours. From all parts so entire, that the very *Tunica Adnata*, or outward Skin of the Eye it felf is here plainly to be seen.

A Gelly made hereof, is order'd to be used for the making up of the compounded Powder of Crabs Claws into Balls. Which way of prefervation, were no lefs proper for divers other Cordial Powders; especially such as are *Aromatick*, and whose Virtue lies in parts that are of themselves volatile and easily evaporable. Of which kind, there are none in this Powder.

The SKIN of a BOIGUACU; a Serpent fo called, by the Natives of *Brafile*. As far as can now be feen, its mixed of afh-colour with cancellated work of brown;

H

fome-

# Of Serpents.

PART I.

fomewhat after the manner, as in divers other Indian Ser-Towards the Head it is fomewhat flenderer, than pents. about the middle; where it is in compass, half a yard. 'Tis almost feven yards long. See the Description of the He is of all other kinds the greatest. But Serpent in Pilo. not fo venimous, as are many others. I have now at home, faith Bontius, the Skin of a Serpent (of this kind) twelve yards long, which I kill'd in a Wood in Java. And, that in that Kindgom, was one taken thirteen yards and long, with a Boar in her Belly; of which, being boyl'd, (a) Hift. Nat. the general D. Petrus, and others did eat a part. (a) And Joh. de Laet. reports, (b) That in Rio de la Plata, a Province of the West-Indies, there are fome quatuor Orgyas longi, and fo big, as to fwallow a Stagg whole, horns and all. Of fuch kind of Serpents, fee alfo Marcus Paulus Venetus, and Athan. Kircher. (c)

> This Serpent, fays Pilo, will thruft his Tail up a Mans Fundament, and gird him about the middle till he kills

(d) Hift. N. him. (d) Yet is it probable, that they communicate no Venime by their Tail, but only are fo cunning as to use that way, whereby to take the fafter hold. Not only the Natives, but the Hollanders that live amongst them, make them part of their food. (e)

The SKIN of the IBIBABOCA. Another Serpent of Brafile, fo called by the people there. 'Tis a foot round about, and almost three yards and half long. His (f) Joh. de colours, originally, are white, black, and red. (f) Of all Laet. from J. the binds of Someone his Dita is the most permissions wat the kinds of Serpents, his Bite is the most pernicious, yet worketh the floweft. (g) 'Tis healed by a Cataplasme made of the Head of the Serpent. (b)

Two SKINS of the fame kind, about eight feet long; and with their colours elegantly chequer'd, as in the former.

The SKIN of a RATTLE-SNAKE; a Serpent fo called, from the Rattle at the end of his Tail. By the Natives of Brasile, BOICININGA. Well described by Franciscus Ximenez; and from him by Joh. de Laet. But his Rattle is no where well pictur'd. Neither doth Ximenez, or any other Author observe the true structure of it.

It is composed of about 8, 10, or 12, some times, as this

1. 5. c. 3. (b) Lib. 14. C. I.

(c) China Illustrata.

(e) Ibid.

Lerius. (g) Ibid. (b) Pifo.

50

# Of Serpents.

PART I.

this before us, of fixteen white Bones, but very hollow, thin, hard, and dry, and therefore brittle, almost like Glass, and very fonorous. They are alfo all very near of the fame bulk; and of the felf fame Figure, almost like the Os Sacrum in a Man. For although the laft of all only, feems, to have a kind of a Ridged Tail or Epiphysis adjoyned to it, yet have every one of them the like; fo, as the Tail of every uppermost Bone, runs within two of the Bones be-By which Artifice, they have not only a moveable low it. coherence, but also make a more multiplied found, each Bone hitting against two others at the fame time.

By this Rattle, those that travel through the Fields, or along the High-ways, are warned to avoid coming near fo noxious a Creature. For those that are bitten with him, fometimes die miferably in 24 hours; their whole body cleaving into chops. (a) They commonly bury the Limb Ximenez that is bitten, and fo keep it, till the pain wears off. (b) quoted by Joh. de Laet. By thrufting the end of his Tail, faith *Pifo*, up into a Mans 1. 5. c. 15. Fundament, he kills him immediately. But he feems here (b) Bontius. falfly to attribute that to this Serpent, which he doth much more probably to the BOIGUACU. For this is but a leffer fort, feldom exceeding a yard and +, and therefore cannot do it by girding a Man about. And for there being any Venime in the Rattle, it was, I believe, hardly ever imagin'd by any other man. Their progressive motion, , faith Joh. Lerius, is fo fwift, that they feem to fly. Which makes the Rattle to be fo much the more ufeful, in giving timely notice of their approach. Some of the largest are in Panuco, a Province of Mexico. 'Tis faid, that the fmell of **Dittany** kills him. (c)

It is affirmed by Marggrarius and others, that as many N.3. & N.4. years old as the Serpent is, the Rattle hath fo many joynts. Which if it be true, then they will live at least fixteen years, fome Rattles (as this here) confifting of fixteen joynts. Which makes the Tradition very fufpicious.

About fourteen more SKINS of the RATTLE-SNAKE. Some of them are all over of a dark-brown. Others chequer'd with a brown, upon afh-colour.

Several RATTLES of the fame Serpent; most of them composed of above ten joynts.

A POWDER faid to be taken out of a Serpents  $H_2$ Head.

(a) Franc.

(c) See the Phil. Tranf.

#### Of Serpents.

### PART I.

SECT.

Head. 'Tis as white as Starch, and taftlefs. Makes a noife between the Teeth, like that Mineral called *Agaricus Mineralis*. Acid, and efpecially Nitrous Spirits dropped upon it, produceth a confiderable effervefcence.

The SERPENT-STONE. Said by fome, to be factitious, By others, to be a Natural Animal Stone. Particularly by Sir *Philiberto Vernatti*, an obferving Perfon, to be taken out of the Head of a Serpent in *Java*, from whence it was fent by him hither. It feems to be that called *Bulgolda*, which *Boetius*, out of *Ferdinando Lopez*, faics is taken out of the Head of an Animal, which the *Indians* call *Bulgoldalf*. Whether it be natural or artificial, I shall here defcribe it.

'Tis about ‡ of an inch long, above ‡ over, and ‡ thick ; flat and almoft orbicular, like a Cowflip-Cake, or other like Confection. All round about very fmooth, and fhining, for the greater part, black ; but with fome afh-colour intermixed; fo as to look like a River-pebble. But of a fubftance foft and friable, like the Oriental *Bezoar*. And in like manner, as the fame Stone, is eafily diffolved with any Nitrous Spirit dropped upon it, but not with other Acids. Which is to me an argument that it grows within fome Animal: it being the nature of moft Animal-Stones, to be diffoluble only by Nitrous Spirits.

(a) Philofoph. Tranf. N. 6.

\*

Sir *Philiberto* (*a*) amongft other paffages of this Stone, faith, That if it be laid to a Wound, made by any Venimous Creature, it is faid to flick to it, and fo to draw away all the Venime. And the like I have heard affirmed of the fame Stone by a Phyfitian of Note in this City.

52

Of Birds.

53

## SECT. IV.

#### OF BIRDS.

## CHAP. L

## Of Land-Fowls, and of their Parts.

Great BAT or FLITTER-MOUSE of the WEST-INDIES. Vefpertilio Americ. The Bat ftands in the Rear of Beafts, and in the Front of Birds. I meet with no full Defeription of this kind. From his Nofe-end to his Anus almost a foot. His Body almost three inches over. His Head two inches and ½ long, one and ½ over. His Nofe like a Dogs, the end about ½ inch broad. His Ears extream thin, about 4 of an inch long, and as broad; an inch and ½ afunder. His Eyes ⅓ of an inch long. He hath fix and thirty Teeth. In each Chap before, are four little ones, roundifh, blunt, and almost flat-ended; rather *Tunfores*, than *Incifores*. The next are large, fhaped like the Tusks of a Dog, two in each Chap. Next to thefe, two more of the first kind in each Chap. And last of all twenty Grinders.

The Wings ftretched out, are two or three inches above a yard wide from end to end. The upper part of the Arm that governs them, about four inches long, and flefhy, *fc*. an inch over. The next, or the *Cubitus* alfo four inches long, tendinous, and flender, not above ‡ of an inch thick. The Fingers are five, or four and a Thumb. Each hath three Bones. The firft Bone of the fore-Finger or Thumb, is above ½ an inch long; the middlemoft, an inch and ½; the laft very fhort, fheathed within a fharp and crooked Claw, ¾ of an inch long, almoft like that of a Hawk. The firft Bone of the next Finger, is above three inches long ; the middlemoft, but ‡ of an inch ; the laft, about ½ an inch; having a very little Claw. The firft Bone of the third or middle Finger, is four inches long ; the middlemoft,

moft, three ; the laft, three and <sup>‡</sup>. The first of the fourth, is alfo four inches long ; the middlemost, two and <sup>‡</sup>; the laft, as much. The first of the fifth or utmost Finger, is alfo four inches long ; the middlemost, two; the last, as many.

His Thigh an inch and  $\frac{1}{2}$  long, and flefhy, yet not much above  $\frac{1}{2}$  inch over. His Leg two-inches long, tendinous, and about  $\frac{1}{2}$  of an inch thick. The *Pedium*, above  $\frac{1}{2}$  inch long. The Toes, five; each of them about an inch and  $\frac{1}{2}$ long; and each having a Claw, like that on his Thumb. The two inmoft, have each two Bones; the other have three.

The Membrane which makes the Wings, excepting only his Head, Neck, two joynts of his Thumb and the bottom of his Feet, is fpread from the top of his Back, over all his Parts.

He hath no Tail.

The fhape and number of his Teeth, fhew him to be a Voracious Creature. The Claws of his Thumb and Feet, that he is alfo Rapacious. The ftructure of his Wings is admirable. For were they to be always ftretched out, they were (as to the length of the Bones) the moft irregular and ill contrived of any thing that ever was feen. But being made to open and fhut, fhew the greater *Artifice*, in having the Bones of fuch a length, as might ferve for all the Pofitions betwixt being quite open and quite clofe. The particular explication whereof, notwithftanding, cannot be made, without examining the feveral Mufcules, by which all the faid pofitions are determin'd.

Another WEST-INDIAN BAT of the fame kind. There are many of them in *Brafile*. The *Chine-fes* efteem of them as a delicate fort of meat. (a) *Barlæus* uftr. mentions a Water-Bat, which the Natives of *Brafile* call
Bra-Guacucua. (b) In the fame Ifland, there is a fort of great
4. Bat, that as Men lie afleep with their Legs naked, will fuck their blood at a Wound fo gently made, as not to awake them: whereby they are oftentimes in danger of bleeding to death. (c)

The HEAD of an OSTRICH. Caput Struthiocameli. He is accurately defcribed in Mr. Willughby's Ornithologia. His Head, like that of a Goofe; he hath great

(a) Kirch. Chin. Illuftr. (b) Res Brafil. p. 224.

(c) Pifo's Hift, N.

## Of Birds.

great thick black Hairs on his upper Eye-lid, as in Quadrupedes; his Tail standing in a Bunch, and not expanded, as in other Birds; his Wings very fhort and little; and his Foot not divided into three or four Toes, as in other Birds, but into two only; which are his principal Characters.

The Offrich is the greateft of Birds; when he holds up his Head and Neck, near two Ells high. (a) In the King- (a) Willugh: dom of Abafia, they are as big as Affes. (b) The American, (b) Gefner are leffer than those of Africa. (c)

out of Pau-

He flys not, because his Wings are short. But with their lus Ven. help, is able to out-run a Horfe. (d) He is a gregarious (d) Gefner Bird. His Feathers are made use of for the adorning of out of Pliny. Hats, Caps, &c. for making of Womens Fans, and the like. (e) The Stomach of an Oftrich, faith Schroder, taken (e) Willugh in power, wonderfully diffolves the Stone.. (f) 'Tis probable (f) Pharmace it may bring away Gravel.

The Legof an OSTRICH. 'Tis near half a yard long without the Foot. The Foot, no lefs than ten inches, as long as of most men. The Leg-Bone in the smallest part four inches about, and in the Joynt nine inches: which is thicker than in most men. It hath but one triangular Claw; of that fubstance, as to look liker a little Hoof, and feems rather harder than that of a Horfe.

The CASSOWARY. Emen. Accurately defcribed by Cluss, and pictur'd in Willughby's Ornithologia. His Bill, almost like that of a Gooses, but not so broad. Next to the Oftrich, he is the greatest of Birds; and in Bulk little inferior, but not near fo tall. On the top of his Head, hath a horny Crown, which falls off when he moulters, and grows again with the Feathers. His Wings extream fmall. The plumage of his Feathers fo little, that he feems at a diftance to be hairy. Hath three Toes without a Heel, as the Buftard. Hath no Tail: which are his chief Margues. He is brought from Tabrobana, the Molucca Islands, and others of the East-Indies.

The HEAD of a CASSOWARY. The Bill is longer, but not fo broad, and fo the mouth not fo wide, as of an Oftrich.

The LEG of a CASSOWARY. 'Tis almost as long, and as thick, as that of an Offrich.

The

PART I.

The HEAD of the SEA-EAGLE or OSPREY. Caput Haljaêti.

The CLAWS of the fame BIRD. See the full Defcription of the Bird in Willughby's Ornithologia.

The Eagle breeds abundantly on the Mountains Taurus Not only comes into England, (a) but is and Caucalus. faid to build yearly on the Rocks of Snowdon in North-Wales. In (b) the Year 1668. on the Peke in Darbysbire, was found an Eagles Neft, flat or level, and about two Ells fquare; together with a young one in it.

The BIRD of PARADISE. By the Natives of the Molucca Islands (where they breed, and by whom they are worshipped,) called MANUCODIATA, i.e. The Bird of God. Becaufe they know not from whence they come; and for their beauty. From his fwift flight to and again, the Indians, in their Language, call him a Swallow. Marggravius reckons up feveral forts of them, and defcribes them all. The leaft kind, Clusius calls the King. Becaufe (as he faith, from the report of the Dutch Mariners) as they fly together, about 30 or 40 in a flock, he always keeps higher than the reft.) Befides the fmallnefs of his Body, in refpect to what his copious Plumes fhew him; the long Feathers which grow upon his fides under his Wings, and are extended thence a great way beyond his Tail; and the two long Strings or Quills which grow upon his Rump, do most remarkably diftinguish him from all other Birds. He is elegantly figur'd in Calceolarius's Musaum, with the Title of Chamaleon aereus.

erc. 228. S. 2.

Antonius Pigafeta was the first that brought this Bird, or (c) Clusius, any certain knowledge of him into Europe. (c) Before which, he was believed, not only by the Vulgar, but by Na-(d) See Ex- turalists, (amongst whom Scaliger (d) was one) that they had no Legs, but always flew up and down fufpended in the Air, by the help of their Wings and Tail spread all abroad. According to which filly fancy, he is also pictur'd in Gesner.

Agreeable to this conceit, it is likewife commonly thought, and by Georgius de sepibus, who describes the Mulaum Romanum, is affirmed, that those two long Quills that grow upon the top of this Birds Rump, being at his pleasure twined or wrapped round about the boughs of Trees.

(a) Wil-lugh. Ornithol. (b) Ibid.

56

# Of Birds.

Trees, ferve quietly to fuspend him. Whereas, as Mr. Wray hath alfo rightly observed, (a) not being Muscular, it is im (a) Wilpossible they should be of any such use. His hooked Claws loughb. Orthew him to be a Bird of Prey; and he ordinarily flys at Green-Finches, and other little Birds, and feeds on them. (b)  $^{(b)}_{H N.1.5}$ The Tarnacenses shoot them down with Darts. (c)

Two more MANUCODIATA'S of the fame Species.

The GREAT RED and BLEW PARROT. Pfittacus Erythrocyaneus. All the great kind called alfo MACCAW and Cockatoone. It was fent hither from Java. See his Defcription in Willoughby's Ornithologia. There are of these greater, the middlemost called Popinjayes, and the leffer called *Perroqueets*, in all above twenty forts. Their more remarkable Parts, are their hooked Bills, whereby they catch hold of Boughs, and help to raife themselves up in the climbing of Trees. Their broad, thick, and muscular Tongues, for which they are called aνθρωπόγλωfor, and by which they are the better enabled to fpeak, and to rowl their meat from fide to fide under the edges of their Bills: and their Feet, which, like those of the Woodpecker, have two Toes before and two behind, with which they bring their meat to their mouths; and that after an odd way, fc. by turning their foot outward. (d)(d) Wil-

The Parret only, faith Scaliger, (e) with the Crocodile, loughb. Ormoves the upper Jaw : Yet the fame is affirmed of the (e) Exercit: Hippopotamus, by Columna; of the Lizard, by Wormius; 236. S. 1. and of the Phænicopter, by Cardan. Which confirms what I have faid under the Defcription of the Skeleton of a 'Crocodile, and in what fenfe it is abfurdly faid of them all. In their Cheeks, faith *Pifo*, (f) in each Noftril, and  $\binom{f}{N. I. Occid.}$ on the top of their Heads, in a certain Tumor, there lies; about August, a thick Worm; all which, in a little time, fall out of their own accord, without any fign left of their ever being there. They are a gregarious fort of Birds.  $(g)^{(g)}_{art}$  Bart They breed very numeroufly in both the Indies. In Barbados, fly in flocks like Clouds. In Calechut they are forced to fet people to watch their Rice-Fields, least they should (b) Gefner fpoil them. (b) The flesh of their Chickens eats just like a out of Ludov. Romanus. Pigeon. (i) er. per a le man an an (i) Pifo. The Ţ

57

(c) Ibid.

58

#### PART I.

The BILL of a BIRD, by the people of Brafile, called COA. It is of a blackish-brown mixed with ash-colour. In shape, and bigness, very like that of the least fort of Parret called Perroqueets. He is faid to feed upon all manner of venimous things : and to be himfelf a Cordial. Which, if true, yet is it not to be much admir'd. For if by venimous things, be meant Animals that have a venimous bite; Do we not know that the flesh of fuch Animals. as of Vipers, is effected a Cordial? Or is it understood of things that are Tota fubstantia Venimous, or at least malignant to humane Bodies, do not Ducks feed on living Toads? Again, what is a Cordial? are not many things to call'd meerly from their collateral effect ? Carduus Benedictus it felf, and other things given as fuch, Nature doth certainly abhor: but being able to caft them off, by Vomit or Sweat, and fo perhaps fomething elfe that offends her together with them, they are therefore called Cordials.

A young LINET which being first embowel'd, hath been preferved found and entire, in rectified Spirit of Wine, for the space of 17 years. Given by the Honourable Mr. Boyl. Who, so far as I know, was the first that made trial of preferving Animals this way. An Experiment of much use. As for the preferving of all forts of Worms, Caterpillars, and other soft Infects in their natural bulk and shape, which otherwise shrink up, so as nothing can be observed of their parts after they are dead. So also to keep the Guts, or other soft parts of Animals, fit for often repeated Inspections. And had the Kings or Physitians of Egypt thought on't, in my Opinion, it had been a much better way of making an everlasting Mummy.

A young CHICKEN emboweled and put into rectified Oil of Turpentine, at the fame time, with the *Linet*, and preferved found; Only there is a little fedement at the bottom of the Glafs.

The HEAD of the HUMGUM, or Horned-Crow; called RHINOCEROS Avis. It was brought from the *Eaft Indies*. 'Tis of kin to that defcribed by *Bontius*. Mr. Willoughby gives the Picture, but no Defcription. It hath a Crown on the top of the Bill, of the fame colour and fubftance therewith, and prolonged in the fhape of a Horn,

PART I.

Horn, to the length of 2 of a foot. Yet not bended upward, as in that of Bontius, but standing horizontal. It is fpongy behind, and hollow before; fo that it is very light, although to big. The Bird defcribed by Bontius, and probably this alfo, breeds in Bantam and Molucca.

The nether BEAK of the RHINOCEROS Bird. If we believe, faith Georg. de Sepibus, (a) the Reverend Fa-(a) Musethers, which are us'd to go to the Indies; the Bill of this um Roman: Bird is a most precious Antidote against all manner of For which caufe alfo, the Indian Kings pre-Poifons. ferve it as a great Treasure, and account it a Royal Prefent.

The HEAD of the CROWNED CROW Mr. Willughby pictures it. But I meet with the Defcription hereof no where. 'Tis almost a foot long. The Skull not above two inches and 1 long, above two broad, and as high. The Bill likewife as broad. The nether Beak an inch and # high, one forked Bone, in the shape of the Os Hyoides in a Bird, hooked or bended downward, the edges indented like a Saw; but with the points of the Teeth directed forward. The upper Beak an inch and high, confifteth of one concamerated Bone, bended downwards, and Toothed as the other. To this and the Skull, grows a fquare horny-Crown, about fix inches long, three and <sup>1</sup> over, and one and high, fpongy behind, and hollow before. The Nostrils, which are about ‡ of an inch wide, open between the Eye and the top of the Bill.

The Teeth of the Bill, not being made to point inward, but forward or outward, plainly shews, that they ferve not, as they do in fome other Birds, to hold fast the Prey; but rather, for some purpose or other, to perform the use of a Saw.

The HEAD of the TOUCAN, fo called by the Indians. From the noife he makes, Aracari. (b) And Pica Brafilien- (b) Pifer fis, for the likenefs of both their Tails. (c) In the  $Mu \int \alpha um$  (c) Will. Romanum, this and the Rhinoceros Avis, are confounded. Orn. They breed not only in Brafile, but alfo in Guajana, and other places. This Bill was fent from Peru. See the Defcription of the Bird in Mr. Willughby's Ornithologia. That which is most remarkable of him, is, that his Bill is almost as big as his Body, which is not much bigger than that

**5**9

I 2

that of a *Black-Bird*. The Bill and Head I shall describe more fully.

They are in length eight inches. The Skull but a little above an inch and  $\frac{1}{2}$  fquare. The upper Beak, which is prominent above the Skull near  $\frac{1}{2}$  an inch, is almost two inches high, and an inch and  $\frac{1}{2}$  over; confisting of one not hollow, but very spongy Bone, as the Crown of the *Indian* Crow, or rather more; with a ridge all along the top, which is blunt behind, and very sharp before; the end or point hooked down like that of an *Eagle*; and both the edges Toothed, as in the *Indian Crow*. The nether Beak near an inch and  $\frac{1}{2}$  over, one and  $\frac{1}{2}$  high, hollowed, ridged underneath, and Toothed as the upper.

The Noftrils ftand ftrangely, in a place altogether unufual, *fc.* on the top of the Head, behind the top of the Bill. The Teeth ferve, doubtlefs, for the fame purpofe, as in the *Humgum*, and the *Indian Crow*.

(a) Lib. 3. Sect. 2.

60

Within his Bill, faith Pifo, (a) in the place of the Tongue, is contained a moveable Feather or black Quill. Were it really fuch, it were most absurd to think it any other, than one there by chance. But if a Tongue, or natural Part, it might have fome fuch odd figure, as to have fome refemblance to the stump of a Feather.

The BILL of the FLEMING of Suranam. Very like to that of a Toucan, faving, that it is not fo fharp-ridged; neither is it fpongy within, but perfectly hollow. So that the Bird feems to be an other Species of the Toucan kind.

The LEG of a DODO. Called Cygnus Cucullatus, by Nierembergius; by Clusius, Gallus Gallinaceus Peregrinus; by Bontius called Dronte; who faith, That by fome it is called (in Dutch) Dod-aers. Largely deferibed in Mr. Willughby's Ornithol. out of Clusius and others. He is more especially diftinguished from other Birds by the Membranous Hood on his Head, the greatness and strength of his Bill, the littleness of his Wings, his bunchy Tail, and the shortness of his Legs. Abating his Head and Legs, he feems to be much like an Oftrich; to which also he comes near, as to the bigness of his Body. He breeds in Mauris's Island. The Leg here preferved is cover'd with

## Of Birds.

with a reddifh yellow Scale. Not much above four inches long; yet above five in thickness, or round about the Joynts: wherein, though it be inferior to that of an Oftrich or a Calfoary, yet joyned with its shortness, may render it of almost equal strength.

The LEG, as it feems, of a certain MONSTROUS BIRD. 'Tis half a foot long. Two inches and # about. The fecond from the inmost, the longest. Hath five Toes. The fourth, the shortest. The fifth or utmost the thickest. It hath a very great black Spur, yet not crooked as a Cocks, but strait, and sharp-pointed, two inches long, and next the Leg an inch and <sup>1</sup>/<sub>4</sub> about.

A KING-FISHER, Ifpida. Defcribed by Mr. Willughby and others.

Two HEADS of the GROSSBEAK called Coccothrauftes. See the Defcription of the Bird in Mr. Willughby's Ornith. There is a most curious Picture hereof in Dr. Charlton's Onomasticon Zoic. They breed in Germany and Italy: but rarely, and not except in Winter, feen in England. They will crack Cherry-ftones, and Olive-ftones too (which are as hard again) very eafily; (a) his Bill and Temporal (a) Wil-lughb. Or Muscules are fo strong.

nith. The HUMING BIRD. By the Brafilians, called Guanumbi. By Clusius, Ourissia, i.e. a Sun-beam; because of By the Spaniards, Tomineius; behis radiant-colours. caufe (b) one of them with its Neaft, weights but two (b) J. de

*Tomino's*, a weight fo called by the *Spaniards*, confifting c. 7. out of of 12 Grains. *Marggravius* reckons up and defcribes nine J. Lerius, as be from Oviforts of them.

Yet whether he hath taken in this amongst them, feems doubtful It is of the greater kind. From the point of his Bill to the end of his Tail above four inches and 1 long; His Bill black, almost an inch and 1 long, as thick as a Shoomakers waxed Thread; sharp-pointed, and crooked all along like a Sithe, or exactly as the Bill of the Guara or Indian Cur*lew.* His Head the third of an inch long, and as broad. His Neck two thirds. His Trunk an inch. His Tail an inch and <sup>1</sup>. In which there are ten black Rudder-Quills <sup>‡</sup> of an inch broad. Each Wing is two inches and <sup>‡</sup> long. Wherein there are fixteen Oar-Quills, of a blackifh-brown or Eagle-colour, a little more than <sup>‡</sup> of an inch broad. Of

edus.

PART

Of which colour are the reft of the Feathers, and no where radiant, as of the other Species. His Thigh, # inch long. His Leg, . On which are four Toes, above i of an inch long, and thick as a Taylors Stitching-Thread. His Claws near ‡ of an inch long.

The Leffer HUMING BIRD. His Head is loft. From the top of his Breaft, to the end of his Tail he is two inches long. But his Trunk or Body alone, is not above # of an inch in length. The other Parts are answerable. His colour various: on his Wings and Tail, a dark-brown; on his Belly, a yellowish-Red; on his Breast, White; on his Back, Green, mixed with glorious golden Rays.

The Huming-Bird is every where ill pictur'd : even in Mr. Willughby, for want of the Bird it felf. But all those Birds, at least, whereof he had the fight, are most curioufly and exactly reprefented. He is faid to have a loud, or shrill and fweet Note, emulous of that of a Nightingale. (a) He moves his Wings fwiftly and continually, whether flying, or fitting on a Flower. (b) He feeds, by thrusting his Bill into a Flower, like a Bee. (c) For which (b) Lig. Hift. purpose Joh. de Laet, describing this Bird, (whether out of Oviedus or Lerius is not plain) faith, That his Tongue is twice as long as his Bill. Which Clufius hath omitted; becaufe he took his Defcription from the Picture only. Gulielmus Pifo observeth alfo the fame. And it is very likely to be fo, as a Part more apt, by its length, and flexibility, to thrust and wind it felf to the bottoms of the deepest, and most crooked Flowers: in which, and not the upper and open parts of Flowers, it is, that the Honey-Dew which thefe Birds, as well as Bees, do fuck, is ufually lodg'd. Embron Downord

His Feathers are fet in Gold by the former, and fold at a great rate. (d) The Indians make of them very artificial Images. (e) They take them by mazing them with Sand fhot at them out of a Gun. (f)

Pifo relates, (g) as a thing known to himfelf, and many (g) Hift. N. curious and credible men with him in Brafile, That there are there a fort both of Caterpillars and of Butter flys, which are transform'd into this Bird: and that in the time of Transformation, there is plainly to be feen half a Caterpillar or half a Butterfly, and half a Bird, both together.

Yet

## PART I. Of Water-Fowles.

Yet the fame Author faith, That this Bird buildeth her Neft of Cotton-Wooll, and layeth Eggs. That a *Caterpiller* fhould produce a Bird; and a *Butter fly* too, the like; and yet this Bird lay Eggs to produce its own kind, are three greater wonders than any thing that hath been faid of the *Barnacle*. But we will rather fuppofe thefe men were themfelves deceived, than that they defigned to deceive others.

#### CHAP. II.

## Of WATER-FOWLES, particularly, of the Cloven-Footed.

The HEAD of the JABIRU. The Bird is defcribed by Marggravius, Pifo, and Willoughby. He is bigger than a Swan. I will take leave to defcribe the Bill a little more fully.

'Tis above a foot and  $\frac{1}{2}$  long; The Skull about three inches, and two broad. The Bill black, 13 inches long, an inch and  $\frac{1}{2}$  broad underneath. Both the Beaks are bended upwards and crooked all along. The upper, an inch and  $\frac{1}{2}$  high, confifting of one triangular Bone, having a fharp Ridge on the top, and is fharp-pointed. Its hinder edges are carved with oblique Furrows or Grooves. The Noftrils  $\frac{1}{2}$  an inch long, an inch and  $\frac{1}{2}$  before the eyes. The nether Beak an inch high, and concave, but one Bone, or if you pleafe, two joyned together for the length of half a foot from the point.

The oblique Furrows in the Margins of the upper Beak, are a fingular Contrivance of Nature, not only here, but in many other Birds, for the more fafe reception of the nether Beak; vidt. least it should go awry either within or without the upper, as often as it is forceably pull'd to it, and fo cause a diflocation, or a strain.

Another HEAD of the fame kind and bignefs.

The HEAD of an INDIAN HERON. I meet neither with the Animal nor with the Head any where defcribed, or figur'd. The Skull is about three inches fquare. The

## Of Water-Fowles.

64

PART I.

The Bill above  $\frac{1}{2}$  of a foot long. The upper Beak from edge to edge near two inches over. Confifts of one Bone, Triangular or Ridged at the top, a little crooked downward, Concave, and fharp-pointed. Its hinder *Margins* are obliquely furrow'd, as in the *Jabiru*. The nether Beak underneath two inches and  $\frac{1}{2}$  over. Confifteth of two Bones, joyned together for the length of not above an inch and  $\frac{1}{2}$  from the point, which is not above a fourth part of the length of Conjunction in the *Jabiru*. The edges of both the Beaks run along in a ftrait line.

Of the ufe of the oblique Furrows, before. According to the length of the faid Conjuction of the bones of the nether Beak from the point, the Bird may be conjectur'd more or lefs voraceous. For by how much this is the fhorter, by fo much more may the Skin of the Beak be dilated for the comprehending of the greater Prey : as is more remarkable in the *Pelecan*.

The HEAD of an INDIAN STORK. I find not the Bird, nor the Head, any where defcrib'd, or figur'd. The Skull is four inches high, and almost fquare. The Skin of the Neck, as it is stuff'd up and stretched out with Wooll, is a foot about; standing out with a bunch in the usual place of the Crop. The Bill it felf is above a foot long : and three inches and ‡ high. The upper Beak, from edge to edge, two inches over; is one triangular, and sharp-pointed Bone, ridged at the top, and a little crooked downward; but with strait Margins, and obliquely furrow'd behind, as in the Jabiru. The Nostrils ? of an inch long, and two inches before the Eyes. The nether Beak confifteth of two Bones joyned together for the length of three inches from the point; the edges whereof are a little crooked upwards. Underneath, above two inches over. The edges of both the Beaks are made rough, like a Saw, with numerous fmall and oblique Incifions directed backward, or looking towards the Throat.

The fame oblique and fmall Incifions are visible in the Bills of divers other Birds of the Rapacious kind; in all made for the more fecure retention of the Prey.

Of our Europæan Storks, feveral of the Parts are ufed in Medicine, at least put into the Materia Medica; as the Stomach, Gall, Fat, and Dung. Of the fame alfo are

prc-

#### Of Water-Fowles. PART I.

prepared Oleum Stillatitium, Sal volatile, Aqua Antepileptica, &c. Vulgus, si decipi vult, decipiatur.

They fometimes (faith Mr. Willughby (a) of the Storke) (a) Ornith. devour Snakes and other Serpents: which when they begin to creep out at their Breeches, they will prefently clap them close to a Wall to keep them in.

65

A BUNCH of black FEATHERS, of the Creft that grows on the Head of the leffer afh-colour'd or grey Heron. The length of those whereof Mr. Willughby makes mention, was five inches; but of thefe, above eight. The Turks value thefe Feathers at a great Rate. It is reported, faies Wormius, That in England it is death, to kill a Heron. But our Lawyers know of no fuch Law.

The BALEARICK CRANE. He differs, as to his outward shape, but little from the European : faving that on his Head he hath a Crown of thick Hairs or Briftles very full and fpreading. See the Defcription and Picture of the Bird in Willughby's Ornithologia.

I once diffected this Bird, but found not the fame kind of Windpipe (with curious flexures) as is defcribed by Barthol. (b) and Mr. Willughby, and by them observed in the (b) Hift, European Crane. They are therefore fo far two different Cent. 4. Species.

The HORN of the UNICORNE BIRD; In Brafile called ANHIMA. Defcribed by Marggravius, and Willughby, out of him. His principal marks are thefe; Headed and Footed like the Dunghill Cock, Tail'd like a Goose, Horned on his Forehead (with fome likenefs) as the Unicorne is pictur'd; Spurd on his Wings; Bigger than a Swan. The Male, fay Marggravius and Pifo, as big again.

The HORN was given by Father Hieronymus Lobus. In the Bird which Marggravius defcribes, the Horn was but a little above two inches long. But this is above three, and about as thick as a Bodkin. The top alfo of this is not fharp, as figur'd (and I doubt feigned) by the fame Author, but blunt; and, contrary to what is feen in Horns, rather thicker than toward the bottom. It is but of a foftish and brittle substance, inferior to the softest fort of Horns. Confidering which, and the bluntnefs of it, as well as fmallnefs, compared with the Bird, it cannot be thought

Κ

## Of Water-Fowles.

PART I.

thought to be defensive or offensive, as a true Horn, but must have some other use.

Being taken in any convenient Liquor, faith *Pifo*, to the quantity of about 3<sup>ii</sup>, it is often fuccefsful in Malignant Fevers, and againft Poyfon, by provoking fweat.

The SPUR of the UNICORNE BIRD. It grows as is above faid, on the fore-Joynt of the Wings. Triangular, fharp-pointed, and an inch and ½ long. Said by Marggravius, miftakingly, to be ftrait; it being crooked (a little upwards) as a Cocks Spur; and thereby fit more effectually to wound.

The HEAD of the SHOVLER or SPOONBILL. The former Name the more proper, the end of the Bill being broad like a Shovel, but not Concave like a Spoon, but perfectly flat. The extremity of each Beak is a little hooked downward. And they are both made very rough within with numerous and crooked *Striæ*. A device of Nature, for the better holding of the Prey.

This Bird is of affinity with the *Heron*-kind, from which he fcarce differs in any Part, faving the Bill. He feeds on Shell-fifh. Wherewith having fill'd his Crop, he lets them lie there, till the heat of it makes them open: whereupon difgorging them, he picks the meat out of the Shells. Related by *Gefner* out of *Ariftotle*, *Ælian*, and (a) Lib.2.de Cicero. (a)

Nat. Deorum.

66

The SEA-CURLEW. By the people of *Brafile*, called *Guara*. By *Clufius* and other *Latin* Authors, *Numenius Indicus*, and *Arcuata Coccinea*. Given by Dr. *Walter Charl-ton*. See the Defcription hereof in *Willughby's Ornithologia*. About as big as a *Shoveler*, long Leg'd, fhort Tail'd, with a Bill flender, long, and crooked like a Sithe. But that which is moft remarkable, is the alteration of his colours, being at first black, then afh-colour'd; next white, after that fcarlet, and last of all crimfon, which grows the richer die, the longer he lives. (*b*)

(b) Joh. de Laet lib.15. c.13. & Wil. Oxnith.

The BRASILIAN MOOR-HEN, called Jacana. Given by Dr. Richard Lower. See Marggravius's Defcription hereof. The Colours not the fame in all parts, as in that of Marggravius; the hinder part of the Back and Tail being here of a bright Bay or Cheftnut, inclining to red: in his, only black and green mixed. Perhaps depending

Of Palmipede's

depending on the difference of Ages as in the Guara. The Membrane wherewith he faith the Head is cover'd, in this, growing on the Bill, is extended only over the Forehead like an inverted Peak. He faith, that on all the four Toes there grows a Claw, i an inch long : whereas the Claw of the hinder Toe or Heel is at least an inch and <sup>1</sup>/<sub>2</sub> long. On the fore Joynt of each Wing, grows a Spur, as in the Anhima; but not above id of an inch long, round, and exceeding fharp. Which is omitted alfo by Marggravius, but mention'd by Pifo. She is remarkably diffinguished from all other Birds, by the flenderness of her Legs and Toes.

#### CHAP. III.

## Of PALMIPEDE'S, or WEBFOOTED FOWLES.

THE PHÆNICOPTER; So called from the fcarlet-colour of his Wings. By the French, Flammant, for the fame reason. Given by Thomas Povey Esq. There are an abundance of them in Peru. (a) In Winter they (a) Joh. de feed in France. See Willughby's Defcription. His Neck Laet. and Legs are exceeding long. When Scaliger therefore faith, (b) That he hath the shortest Legs of any Animal (b) Exercit. yet known; he would have faid, the longest. But that 233. S. 2. wherein he is most remarkable, is his Bill. Which I shall describe more particularly.

The Figure of each Beak, is truly Hyperbolical. The upper is ridged behind; before, plain or flat, pointed like a Sword, and with the extremity bended a little down. Within, it hath an Angle or tharp Ridge which runs all along the middle. At the top of the Hyperbole, not above i of an inch high. The lower Beak, in the fame place, above an inch high; hollow, and the Margins Itrangely expanded inward for the breadth of above  $\frac{1}{4}$  of an inch, and fomewhat convexly. They are both furnished with black Teeth (as I call them from their use) K 2 of

67

## Of Palmipede's. PART I.

of an unufual figure, sc. flender, numerous and parallel, as in Ivory-Combs; but also very short, scarce the eighth of an inch deep. An admirable invention of Nature, by the help of which, and of the sharp Ridge above mention'd. this Bird holds his flippery Prey the faster.

What Cardane affirmeth of the Phanicopter, That he moves the upper Jaw or Beak, I have observed, faith Wor-(a) Lib. de mius, to be true. Menippus the Philosopher also, (a) cited by Rondeletius, faith the fame. But Wormius adds, That the cause is not fo manifest, as in the Crocodile : vet shews not, in what respect. Hereof seed. 2. Chap. 3.

> As for the Phanicopter, it must needs be faid, That the shape and bigness of the upper Beak (which here, contrary to what it is in all other Birds that I have feen, is thinner and far lefs than the nether) fpeaks it to be the more fit for motion, or to make the appulse, and the nether to receive it. But there can be no determination of these matters, without Infpection into the Muscules and the Articulation of the Bones.

> Another PHÆNICOPTER. The Tongue of this Bird, as Apicius faith, was a delicious Morfel amongst the Romans.

> The GREATEST LOON. Colymbus maximus five Arcticus Clussi. Given by Mr. Houghton an Apothecary in London. Defcribed by Mr. Willighby. (b) This is as big as a Goofe : of a dark colour, dapled with white Spots on the Neck, Back, and Wings; each Feather marked near the point with two Spots. They breed in Farr Island.

> The GREAT SPECKLED LOON of NORWAY. By the people there called LUMME. Defcribed by Wormius, and out of him by Mr. Willughby. In the former, the Spots are fewer on the Neck, more on the Back: In this, more on the Neck, and fewer on the Back. There. each Feather hath two Spots; here, but one, near the point.

The Legs, both of these and the other Species of the Loon kind, are broad and flat, by which they are diffinguished from all other Birds. (c) Their Claws are alfo (c) Willughb. Orbroad, in shape almost like a mans Nail; as Mr. Willughby nith. p. 256. alfo observes. (d) They are called Colymbi, because they are great

(b) Ornithologiz, p. 259.

(d) Ibid.

Homine.

Of Palmipede's.

PART I.

great Divers. Their Legs are joyned to the Loins near their Rump; That they may both fwim and dive with the greatest swiftness and ease. (a) And their Bodies being (a) Ibid. hereby extended fo much the farther from the centre of gravity, it becomes the more laborious to them to walk, and fo inclines them to keep more on the water, as their fitteft place; (b) as the fame Author much to this purpofe. (b) P. 258. The Skin of this Bird is fometimes worn on the Head and & 259.

Breaft to keep them warm; and preferred before the Swans.

The BILL of the GREATEST LOON. It belongs to the first Species, but the Bird was of leffer growth.

The two FEET of the GREAT NORWEGIAN LOON. (c)(c) Will.

The FOOT of the LESSER LOON, called the DIDAP-Om. PER or DOBCHICK. See the Defcription of the Bird in Mr. Willughby. All the Loons breed in Mona, Farra, and other Scotifb Islands.

The FOOT of the SHAG, called Graculus Palmipes. See the Bird in Mr. Willughby. He is a little bigger than a Tame Drake. His Foot stands more floaping than in the Loon; the inmost Toe being the longest. It is observable, that of all Web-footed Fowl or Palmipede's, only the Shag and the Cormorant, are known to fit and build their Nefts in Trees. (d)

The PELECANE. Onocrotalus, from the noife he makes lugh.Omith. like an Ass. See the Description hereof in Aldrovandus, Willughby, and others. I add, That the shortness of his Trunk or Body, in respect to the other Parts, is observable; not being a foot long: whereas from the end of his Bill to his Rump, he's near an Eln long : and to the end of his Toes, he's above a yard and half. I shall defcribe his Bill a little more particularly.

The upper Beak, from the bottom of his Forehead, is fourteen inches long; behind an inch over, and convex or ridged; before, an inch and half over, and almost flat. It is composed of three Bones; the end of the middlemost is hooked like a Hawks Bill; the edges of the two utmost are sharp, and bended downwards; all made rough within with five or fix edged-lines running through the length of the Beak: thus well contriv'd for the holding the most flippery Prey. The end of the nether Beak, is almost like the

(d) Wil-

69

## Of Palmipede's.

PART I.

the Poop of a Ship. 'Tis in length fixteen inches, being extended (Ithink further than in all other Birds) an inch beyond the Eye: whereas the ufual Picture, makes it to end as much before, or on this fide it. Partly by this unufual production; the fwallow is the greater, as fit for fo voraceous a Bird. It confifteth of two Bones, united together only at the end. To which, and part of his Neck, is fubjoyned a Membrane vaftly expanfible; as appears in the Bird here preferv'd, capable of above two gallons of Water, and which *Francifcus Stellutus*, quoted by Mr. *Willughby* out of *Joh. Faber*, faith, he lets hang down and contracts again at his pleafure. It may not be improperly called the Crop, which in other Birds lies under the Neck, but in this is extended to the very end of his Bill.

Tis probable, that the ufe of this Bag is not only for the reception, but alfo the maceration of his Meat. And that having taken his opportunity to fill it, by contracting it, preffes the meat down into his Ventricle and Guts, by degrees, as they are able to fubdue it. Befides the luxury of the Taft, which perhaps he enjoys all the while it lies in his Throat. 'Tis alfo probable, that the meat being herein warm'd, and made a little tenderer, the Female doth difgorge part of it, wherewith to feed her Young. And might occafion the Fiction, of this Birds feeding her Young, with her own Blood.

The HEAD of a PELECANE. Another of the fame. Alfo the nether Beak of another.

The SOLUND GOOSE. Anfer Baffanus. See the Defcription hereof in Gefner and Willughby. He is in bignefs and Feather very like a tame Goofe. But his Bill longer, and fomewhat pointed, more like that of the Guilemot. His Wings alfo much longer, being two yards over. Near Collbill in Warwick-fbire there was one found, Nov. 1669. (by fome means fall'n on the ground) alive, not able to raife her felf up again for the length of her Wings. (a) But they fcarce breed any where except on the Rocks of the Ifland Bafs in Scotland, (b) from whence the Name.

She hath this ftrange property, that she will swallow and difgorge again a great many Fishes, one after another; and at last, return with one (in her Crop) to her young

(a) Will.Orn.(b) Ibid.

## Of Palmipede's.

young Ones : related by Gesner from an observing Scot. It feems probable, that the trys which, of many will beft agree with her own ftomach, and when she finds one more delicate than the reft, she carries that to her Young. When they come to build, they bring fo great a quantity of broken Wood with them, that the People there fupply themfelves from thence with as much as ferves them for firing all the year. (a)

They are extraordinary fat. Out of their Fat the Scots Boethius. make a most excellent Oil to be used in the Gout, and other Cafes: Not inferior to that Oleum Comagenum, fo much celebrated by Pliny. (b) The young Goflins are by (b) Gemer them alfo accounted a great Dainty. (c)

em alfo accounted a great Dainty. (c) The PENGUIN. So called from his extraordinary fat- (c) Wil.Orn. nefs. For though he be no higher than a large Goofe, yet he weighs fometimes, faith Clusius, fixteen pounds. His Wings are extream short and little, altogether unuseful for flight, but by the help whereof he fwims very fwiftly. See his Defcription at large in the fame Author; as alfo in Wormius, and Willughby out of both. I shall give a more full Description of the Bill.

'Tis black; from the corners of his Mouth four inches and 1 long. But the Horns, or horny portions, whereof it chiefly confifts, are fhorter; in the upper Beak, a little more than three inches long; in the nether, two. Again, in the upper, it is obliquely prolonged from the Margins to the Forehead; contrariwife, in the nether, it is obliquely shorten'd from the Margins to that part under the Tongue. The upper Beak is an inch high, between the corners of the Mouth as wide, but prefently rifes up into a sharp Ridge. Its Edges about the middle, a little convex; about the end, concave and fharp. They are double Grooved, *[c.* before and behind. In the end, 'tis crooked. The nether Beak behind as much over, as the upper; towards the end, more compressed. Hollow like a Trough. Its edges sharp, and convex before; behind, they are groov'd. In the middle, it bunches out underneath. The upper Beak, is cut with feven or eight oblique and crooked Notches; the nether, with as many strait ones.

The height of the upper Beak; the sharpness, and the extuberance of the lower; together with the grooved Edges

(a) Gefner

## Of Palmipede's.

PART I.

Edges of both, do all give the Bill a fure hold, and wonderful strength. The three Grooves, as fo many Joynts, keep the Beaks from diffortion, when in cafe of milling the Prey, they are fwifty and forceably clapt together. The sharp Edges of the nether Beak, ferve instead of Teeth. The Bunch underneath, anfwers in fome measure, to the ftrength of an Arch. The hight of the upper Beak, to that of a Board, when fet upon its Edge.

The Penguin breeds in Canada, in the Island called Newland, in those of Fero, and of the Magellanick-Sea, and is therefore by Clusus called the Magellanick-Goofe. Thev work themfelves, as the Coney, deep Buries by the Sea-(a) Wormi-fide. (a)

The AUK, RASOR-BILL, or MURRE. Alka Hoiari. See the Defcription in the forementioned Authors. She breeds on the Rocks of the Island Mona in Scotland. As alfo in those of Fero. Scarce fo big as a tame Duck. His Bill is like that of the Penguin. But the upper Beak is sharper Ridg'd : and the Horny part of it shorter. The nether hath a leffer Bunch. The Notches also on both are fewer: whereof one or more of them are white, as Mr. Willughby rightly observes.

The HEAD of an AUK.

The GUILLEMOT, fo called efpecially in Northumberland; in Wales, the Guillem; in York-fbire, the Skout; in Cornwall, the Kiddaw. (b). LOMWIA HOIARI. He's like the Auk, but bigger. See the Defcription hereof in Willughby; as alfo in Wormius. They build in Norway and Island. As alfo in Farra an Island in Scotland.

The HEAD of the GUILLEMOT.

The PUFFIN; called alfo Bottlenofe, Coulterneb, Mullet, and Pope. Anas Arctica Clusii. Hereof fee Clusius, Wormius, and Willughby. They are lefs than a tame Duck. Their Bill is much like to that of a Penguin, faving that the Horn of the nether Beak is not shorten'd, as there, but contrariwife obliquely prolonged from the Margins. alfo fhorter, and anfwerably higher, and therefore rather ftronger. When they fight, they will hold by their Bills fo hard, as fometimes to break one anothers necks, be-(c) Willugh. fore they'l part. Whatever (c) they eat in the day, they difgorge a good part of it in the night into the mouths

(b) Wil-lugh. Ornithol.

Orn.

us.

of

## Of Palmipede's.

of their Pullen. They breed in Island, in the Isle of Mona in Scotland, in those of Fero and the Syllies; also in Ireland, and other places; laying their Eggs under ground.

The Puffin, Penguin, and Guillemot, all want the Heel or hinder Toe. Have all black Backs, but their Bellies, which are much under water, are White. All lay but one Egg at a fitting : proper perhaps to other Birds of this kind. (a)

The HEAD of a PUFFIN.

The HEAD of the MAN of WAR; called alfo Al-Supposed by some to be the Head of a Dodo. bitrolle. But it feems doubtful. That there is a Bird called The Man of War, is commonly known to our Sea-men; and feveral of them who have feen the Head here preferved, do affirm it to be the Head of that Bird; which they defcribe to be a very great one, the Wings whereof are eight And Ligon, (b) fpeaking of him, faith, That (b) Hift. of feet over. Barbad.p.61: he will commonly fly out to Sea, to fee what Ships are coming to Land, and fo return. Whereas the Dodo is hardly a Volatile Bird, having little or no Wings, except fuch as those of the Cassoary and the Ostrich. Besides, although the upper Beak of this Bill, doth much refemble that of the Dodo; yet the nether is of a quite different shape. So that either this is not the Head of a Dodo, or elfe we have no where a true figure of it. I shall describe it as follows.

The SKULL is four inches long; the Bill, feven; two and high; one and broad. The upper Beak is hollow. Is composed of fix Bones. The uppermost whereof is four inches and long, above linch high, and convex. The middlemost on each fide, also four inches long, and about to of an inch high or thick. The lowermost, above five inches long, and i high. Their Edges are furrow'd with oblique and deep Grooves both before and behind. All these five Bones are refimated or bended upward, with fome refemblance to a Saddle. The fixth, at the end of the Beak, is a wonderful strong Bone, crooked exactly like the Bill of a *Parret*, and hollow; by the bow, almost three inches, and near an inch over. Its Edges are very keen, and standing out with two sharp or pointed Angles. The Noftrils are <sup>‡</sup> of an inch long, and almost two inches before

(a) Willugh; Ornith.

73

L

## Of Palmipede's.

PART I.

before the Eyes. The nether Beak is composed of three Bones. The two hinder, four inches long, near an inch high, and bended answerably to those of the upper Beak. Their Edges are cut with deep Furrows. The third, at the end of the Beak, is hollow, above an inch long, near as high. Its Edges very sharp, and hard, and exceedingly convex or bended downward. Underneath, a round and sharp Pin grows out from it in a level towards the Skull, near an inch and  $\frac{1}{2}$  long. It was brought from the *Indies*.

The fhape of this Bill flews it to belong to a Bird of Prey, and as is most likely, fome great Sea-Fowl; which I will venture to call *The Great Indian Gull*. The ftrength of the end of the upper Beak is remarkable : as alfo are the fharp and hard Edges of the nether; and the Grooved Edges of both; the ufe whereof fee in the Defcription of fome other Birds, as of the *Jabiru* and the *Penguin*. The upper Beak feemeth to be composed of fo many Bones, partly, that if a Fracture flould happen to one, it might there terminate, and the reft be fecur'd.

The GREAT GREY GULL, or the Herring-Gull. Larus grifeus maximus. Perfpicuoufly defcribed by Mr. Willughby. Who only omits to fay, that the upper Beak is bended upwards, as in the Bill above defcribed; and (which is obfervable) that the Edges of the nether are not fharp, as is ufual, but broad or expanded inward (and almost contiguous) as in the Phænicopter. They (a) are very numerous near Gravefend.

Another GREY GULL, whereof the Rump, Tail, and upper part of the Wings are very white. Given by *Henry Whiftler* Efq;.

The TROPICK BIRD. So called, becaufe faid never to be feen but between the *Tropicks. Avis Tropicorum*. Well defcribed by Mr. *Willughby*. He only omits the Denticulation of the edges of his Bill, or those fmall oblique Incifions, which, from their inward respect, are plainly made for the better retention of the Prey. Besides fome very short Feathers on his Tail, he hath two Quills above half a yard long.

Another TROPICK BIRD like the former.

Another all over WHITE, except the fore part of

(a) Will. Orn.

# PART I. Of the Eggs and Nests of Birds.

of the Wings. Both given by the forementioned Perfon.

The HEAD of the TROPICK BIRD. The two Tail-Quills of the fame.

#### CHAP. IV.

## Of the EGGS and NESTS of BIRDS.

OF EGGS, there is here a confiderable number: which therefore I thought fit to put altogether in this Chapter. Their Figures, as they ftand together, appear the more various. For fome are almost Sphærical or Round as a Ball: others, as the most, are more oblong. Of these, fome few are perfectly Oval, *i.e.* with both the ends defined with two equal *Ellips*: but most are Conical, or with one end sharper than the other. Of these again, most have their smaller end but Blunt; fome few, very sharp. Lastly, almost all both Blunt and Sharp are Convexly Conical, *i.e.* they are all along Convex, not only *per ambitum*, but between both ends: whereas fome few are Plano-Conical, whose Superfice is in part level between both ends.

Their Colours are alfo various; as White, Pale, Livid, Afh-colour, Blew, Brown, Green. Their Spots, and Speckles, are alfo Iron-colour'd, Red, Bay, Musk-colour, Black, &cc. the Caufes of all which, both Figures and Colours, were no unfit fubject of enquiry. But here I can do little more than fhew, to what Eggs in particular any of them do belong.

The EGG of an OSTRICH. 'Tis very fmooth, and white; all over prict as it were with extream fmall brown Specks. Almoft of a Sphærical Figure. About half a foot,by its *Axis*, from end to end. Round about, by the breadth, fixteen inches, *i. e.* near five inches and  $\frac{1}{2}$  ftrait over. Both the ends of an equal Convexity. Sometimes fo big, faith Mr. *Willughby*, as to weigh fifteen pounds. The Shell is of anfwerable thicknefs, in regard to its bignefs, to that of other Birds Eggs. They are fometimes fet in Silver, and ufed as Cups.

L 2

Another

## Of the Eggs and Nefts of Birds. PART I.

Another white EGG, almost Sphærical. 'Tis scarce fo long as a Hens Egg, yet is as thick, as that of a Goose.

76

A third white EGG, almost Sphærical. 'Tis scarce bigger than a little Nutmeg.

The EGG of a CASSOARY. The Shell underneath or within is white : without, it is all over rough-caft with a Teftaceous Cruft of a pale Green colour. It is of an exact Oval Figure, or with both ends equally Convex. In length, by its Axis, five inches, round about the breadth, eleven; *i. e.* a little above three and  $\frac{1}{2}$  ftrait over.

Another EGG of a CASSOWARY, like the former.

Another EGG perfectly Oval, or with both ends equally Convex. Exceeding white, as big as a *Pigeons* Egg.

Another EGG perfectly Oval, but fomewhat leffer, and of a light Afh-colour.

Another EGG exactly Oval, and alfo of a light Afhcolour, but no bigger than a Nutmeg.

The EGG, as I take it, of the leffer DIVER or LOON. In bignefs equal to a Hens. Of a pale wan colour. Obtufely Conical, fo as to come very near to an exact Oval.

The EGG, I think, of the WIGEON. It is of the fame Colour and Figure as the laft defcribed : but fome-what leffer.

Another EGG like the two former, but a little leffer. Inferibed, Arts: perhaps of the Anas Arctica or Puffin.

The Egg, as it feems, of the AUK or RAZOR-BILL. Of a pale and livid colour, with Iron-colour'd Spots fprinkled all over it. Obtufely Conical. In bignefs, between those of a *Turkey* and a *Hen*.

The EGG, perhaps, of the biggeft Arctick Loon. It is of a dark Green colour, befprinkled all over with Spots of a fad Bay. Both in figure, and bignefs, like that of a *Goofe*.

The EGG of a CROW. Of a Blew colour, befprinkled all over very full with dark brown Spots. Obtufely Conical. As big as a *Pigeons*.

The EGG of a GOLDFINCH. Of a whitish Ash-colour, befprinkled with dark brown spots. Yet not every where, but only on the thicker end. It comes near to an exact Oval. The The EGG, I fuppofe, of a HOOP. It is longer than a large *Damascene Plum*. Obtufely Conical. Of an Ashcolour, stained with spots of a fad or deep Bay, and of a dark Brown.

The EGG of the KITTY. In Colour, Figure, and Bignefs, not much unlike the laft defcribed : yet fomewhat leffer, and almost exactly Oval.

The EGG of the CADEY. Perhaps the *Jackdaw*, by fome alfo called the *Caddo*. It is of a pale Blew, befprinkled with dark Spots.

An ash-colour'd EGG, speckled with Spots of a fad Red. Obtufely Conical; and as big as that of a *Pigeon*.

The EGG of the SEA-MOIT. In colour, almost like the last described. In bigness like to that of the Hoop.

An EGG in shape and bigness, like a *Damastene Plum*. Dyed with a full Blew, and sprinkled here and there with a few spots of a fad Bay.

The EGG of a REDSTART. Of a whitish Ash-colour. Speckled on the thicker end only, with a few spots of a fad Bay. In figure and bigness almost like an ordinary Acorne.

A pale wan coloured EGG, in bignefs not much unlike the former.

The EGG of a WAGTAILE. Of the fame bignefs with the laft, but more Conical. Of a white colour befprinkled with very finall and numerous fpecks of a blackifh tincture.

An EGG of the fame colour with that of the *Redftart*, but more Conical.

The EGG of a THROSTLE. Of a pale Blew, and fpeckled with a few fpots of a fad Bay. As big as a leffer *Damascene Plum*. But with one end sharp.

The EGG of a STONERUNNER. Of an Ash-colour, befprinkled with fad Bay spots. Conical, and sharp. Of the bigness of a little Walnut. Here are four of them.

The EGG of a ROOK. Painted all over with Green and dark Brown fpots. Conical, and fharp. Somewhat lefs than a *Crow's*.

An Afh-colour'd EGG, befprinkled with fad Bay fpots. Conical, and fharp. Almoft as big as a *Pullets*.

The EGG of the SEAMEW; perhaps, of the leffer GULL.

GULL. Of an Afh-colour tinged with blackifh fpots. In bignefs equal to that of a *Hen*. But acutely Conical.

78

An EGG of a kind of Greenish Ash-colour. In bigness, and in shape like that of a *Stonerunner*. Here are two of these.

The EGG of the HORNPIE; perhaps, the SEAPIE. Of an Afh-colour mixed with a kind of *Citrine*, and ftained with blackifh fpots. Almost as big as that of a *Hen*.

The EGG of a RED-SHANK. Of a kind of Straw colour, tinged with fad Bay fpots. Most acutely Conical, or with one very sharp end. In bigness like to that of a *Rook*; but a little shorter.

The EGG, as I take it of the GUILLEMOT. Of a Green colour, ftained with Black fpots. Acutely Conical; and alfo, in part, level between both ends or Plano-conical. Somewhat bigger than that of a *Turkey*.

The EGG of a LAPWING. Of a kind of Citrine colour, ftained with large black fpots. Sharp, and Plano-conical. A little bigger than that of a *Redfbank*.

The EGG of the SEACOB; a kind of GULL. Of an Ash-colour, besprinkled with little black specks. In shape very like to that of a *Lapwing*. But not above half as big.

The EGG of a HEN, with a thick knob fo growing on its greater end, as to appear to have been originally liquid.

The EGG of a SWAN with another within it. Given by Sir *Thomas Brown* of *Norwich*. Who hath alfo obferved the like both in *Hens* and *Turkeys*. The utmost feemeth to be a little bigger than ordinary, *fc.* near five inches long by its *Axis*, and ten round about, or three and  $\ddagger$  ftrait over. In fhape like a *Turkeys*. The other which is included sticks fast to the fide of the greater; whether it did fo originally, as also whether both of them contained White and Yelk, is uncertain. It is of the fame figure, about four inches long, bigger than the biggest *Hens* Egg. The Shell of the fame hardness and thickness as that of the greater.

'Tis plain, that the leffer Egg was first perfectly form'd.

But

# PART I. Of the Eggs and Nefts of Birds.

But not being big enough to provoke the *Uterus* to exclufion, new matter gather'd round about it for another Egg: and was the more eafily fupplied, becaufe fo little fpent upon the former. And it may be noted, That Nature is fo intent upon finishing her Work, that she may be observed much oftener to over do, than under do i you shall find twenty Eggs with two Yelks, or hear of twenty Animals with two Heads, for one that hath none.

From the Egg with the Lump at the greater end, it feems alfo plain, That the Shells of Eggs, although as hard as any Animal Stones, yet are not bred, as those, out of ftony Parts visibly præexistent in liquor, and so cluster'd together : but out of a liquid substance, not much unlike to that which is separated by the Reins of Birds.

Of the figure of the Egg, it is obfervable, That it ufually anfwers to that of the Body or Trunk of the Bird to which it belongs: as the Fruit is longer or broader, anfwerable to a tall or fpreading Tree. And as it is a Tranfcript from the Original; fo it felf an Original for the next Copy. So those Birds that have a Rump and hinder Parts more Oval and fpreading, as the *Duck*; or more Conical, as the *Dunghill-Hen*; breed, and are bred of Eggs alike fhaped, *viz*. That fo there may be fufficient, yet no fuperfluous Room, or Matter, for the *Chick*.

Of the Number of Eggs laid at one Breed, it is alfo worth the noting, That Land-Fowl, and of thefe efpecially, fuch as are Domeftick, and whereof there is continually great deftruction made, for the moft part lay a confiderable number of Eggs for one fitting. Whereas fome Sea-Fowls, (as Mr. *Willughby* obferves of the *Penguin*, and fome others) lay but one. Becaufe building upon the Rocks, where they are feldomer deftroy'd, were they greater Breeders, there would not be room enough for the reception of the hundredth part of them.

The NEST of a little Bird of CHINA. Almost of a Semilunar Figure, and about two inches and  $\ddagger$  broad. Of a white fubstance, becoming fost, being moistened, and transparent like a Gelly; whereinto it seems to be convetrible, in part, being boiled: and by the Gentry of *China* is esteemed a delicate fort of meat; although, like that of *Harts-Horn*, it hath no Tast. Outwardly, it is more Of the Eggs and Nefts of Birds. PART I.

more clofe and folid; within, confifting of parts loofly Netted together, as those in the middle of Harts-Horns, or fome fpongy Bones. See also a short Description hereof in Wormius.

The Birds breed in Coromandel, and build their Nefts (a) Gulielm. (as is supposed of the Sperm of Fishes) (a) on the fides of the high Rocks; from whence the Natives fetch them, and fell them to the Chinefes at a great rate. (b)

The TREBLE NEST of an Indian Bird, made to hang down from the Bough of a Tree, with three Venters or Bellies, and three Necks all open one into another. See the Picture of fuch a like one in Willughby's Ornithologia.

The NEST of another East-Indian Bird, which, to avoid the rapine of Apes and Monkey's, the hangs down from the Bough of a Tree, by a very long Neck. See the figure hereof alfo in Mr. Willughby.

The NEST of a little BIRD of BRASILE, which the hangs also on a Tree out of the reach of Serpents. About ten inches in length. The Structure admirable. The upper part by which it hangs to the Tree is a flat Label, about four inches long, and three over. To this the other two Parts, *c*. the Neck and Belly of the Neft, are fufpended. The Neck is five inches long; below, an inch and zover; above, a little straiter. The Belly is likewife about the fame length as the Neck, of an Oval figure, in the middle two inches and <sup>±</sup>over. The Neck is open, not above, but below, at the very end: for this and the Belly hang at the Label, as you would imagine a Sack of Corn hung up by the middle, quite double. So that the Bird first ascends by the Neck, and then defcends into the Belly of the Neft. It is composed of Reeds and other parts of Plants curiously woven together, like a piece of Hair-Cloath.

A GREAT NEST of an other West-Indian Bird. Above three quarters of a yard long, befides part of it broken off. Where broadest, near a foot over, and almost flat. Narrowed from the bottom all the way to the top. It hath two Apertures. Above, about a foot from the top of the intire Nest, one larger and longer; below, sc. a foot above the bottom, another perfectly round, and three inches over. It confisteth of the parts of Plants fomewhat loofely woven together. The Invention feemeth very

Pifo.

80

(b) Muf. Worm.

# Of Fishes.

very fubtile. The entry above, for the Bird her felf; her Eggs and Chicks hanging fafe at fo great a depth; the lower, till thefe are fleg'd, being in the mean time ftop'd up with Feathers, Mofs, or other like materials: but afterwards laid open for them, that cannot reach the top, to fly out at below.

#### SECT. V.

#### OF FISHES.

#### CHAP. I.

#### OF VIVIPEROUS FISHES.

The RIB of a TRITON or MAREMAN. About the fame length with that of a Mans, but thicker and ftronger; and nothing near fo much bended. The Fifth to which it belonged, was taken near *Brafile*. Of this kind, *Wormius*, in his *Museum*, gives us divers Relations, together with the Defcriptions of feveral Species. See alfo Job. de Laet. (a) of the fame. And *Barlæus*, who faith, (a) L. 15. That in *Brafile* he is called *Tpupiapra*.

A BONE faid to be taken out of a MAREMAIDS HEAD. It is in bignefs and shape not much unlike that called *Lapis Manați*; but the knobs and hollows thereof are somewhat different.

One JOYNT of the NACK-BONE of a WHALE. By Anatomists called a Vertebra. The one of those Parts or Joynts which answers to one fingle Rib on each fide. It weigheth Thirty pounds Haverdupois. In length, *i.e.* by the length of the Back-Bone, near  $\frac{1}{2}$  of a foot; above a foot high; and three quarters of a yard broad, *i. e.* by the bredth of the Whale. The Hole in the middle of it, which the Marrow of the Back passet through, near half a foot over. All its Knobs, are much alike those in Quadrupedes.

of fina

The

Of Fishes.

The PISLE of a WHALE. In length, above a yard. Near the Root  $\frac{1}{2}$  a foot round about, notwithstanding its being now dry and much shrunk. From thence it tapers to the very end, which is scarce one inch about. 'Tis now as hard as a Horn.

Part of the EAR-BONE of a WHALE. 'Tis as hard, and heavy for its bulk, as any Bone whatfoever. As big as a labouring mans Fift: The fame Bone which in an Ox, is little bigger than a Nutmeg.

Part of a BONE faid to be taken out of the Brain of a *Whale*, taken near the *Bermudas*. Given by Dr. John Wilkins, the late Bifhop of *Chefter*, to whom it was fent from thence. It feems to be part of the Brain-Pan, that was broken off and ftruck into the Brain, when the *Whale* was taken.

A ROUND BONE of a WHALE. Given by Dr. Walter Pope. 'Tis almost a foot Diametre, and in the middle about five inches thick. 'Tis rounded on the Edges, and thinner than at the middle, refembling a thick Holland Cheefe.

Three more Round BONES of a WHALE; all of them leffer, and one ratably thicker than the former; the other thinner, like a white penny Loaf. The third the thinneft, almost like a Tanfey.

Wormius (a) makes mention of a Manuscript, entituled, Speculum Regale: but written in the ancient Danisb-Tongue, as he faith is fuppofed, by King Suerron; in which are reckon'd up two and twenty kinds of Whales: of all which he gives a brief account in his Muscum. Of which, the last fave one, is faid to be fometimes almost an hundred and thirty Elns long. The last of all, liker a little Island, than an Animal.

(b) Hift. Cent. 4.

(a) Mufæ-

um.

Bartholine (b) alfor reckons up the fame number; but with fome different Names, and a different Account; which he gives from a Manufcript Hiftory of the Fifhes of *Iceland*: which, faith he, a curious and obferving Shepherd of *Iceland* fent to *Wormius* fome years before his death, with all their Figures. But how thefe two accounts agree, I fee not. I would not think, That *Wormius* did here put in the King, and leave out the Shepherd, to make the ftory better.

82

Of Fishes.

On the Snout of one of these Whales, called Hoddunesur; grow about five hundred horny flat pieces, which Taylors in Denmark use in making of Cloaths. (a) The fame in (a) Ibid. fubitance, with that we call Whale-Bone, belonging to the Finns. In Island they are fo commonly taken, That the hard Bones are there used for the impaling of Houses and Gardens. (b) (b) Muss

83

The HORN of the SEA-UNICORNE. Given by Rom. Sir Joseph Williamson now Prefident of the Royal-Society. It is an entire one, eight feet long, or about two yards and three quarters. Very beautiful in length, straitness, whiteness, and its spiral Furrows bigger and less, making about seven Rounds from the bottom to the top, or point. At the Basis or bottom, about seven inches round. From thence, for about a foot, it swells a little, and then again grows slenderer, all the way, and so ends in a sharp point. 'Tis also conically hollow at the Basis, for near three quarters of a foot deep.

The fame Horn (together with the Fifh it felf, fometimes above 30 Elns long,) is defcribed by *Wormius*. (c) (c) Mufeut<sup>H</sup> But I cannot, with him, call it a Tooth. In that, it performeth not the office of a Tooth, but of a Horn. Neither doth it ftand as a Tooth, but horizontally. Nor is it fixed in the Mouth, where all Teeth ftand, but in the Snout. The reafon why he calls it fo, is, becaufe it is faftened in the Snout, as Teeth are in the Jaw. See alfo the Defcription hereof in *Bartholine*. (d) But in that he makes it to be (d) Hifts *Gyris Intortum*, is not (at leaft as to this Horn) fo clearly Cent. 4expressed: the Horn it felf being ftrait, and not writhen, but only furrounded with fpiral Furrows. The fame is alfo transfcribed by *Terzagi* out of *Wormius*, into *Septalius*'s *Mulæum*.

Of the Virtue hereof, *Wormius* mentions two Experiments. The one, upon its being given to a Dog, after a Dofe of *Arfenick*: but he expressed the quantity of neither. The other, upon twelve Grains hereof given after a Drachm of *Nux Vomica*. Both the Dogs lived; whereas two other Dogs having the same Dofes, without the Horn, died. Both experiments are attested by feveral Physitians of Note.

The credit of these Persons is not doubted. But the question

#### Of Fishes.

PART I.

question is, Whether these Dogs might not have liv'd without the Horn. As fome Dogs that have been bitten by an Adder, have been obferv'd to get over their Convulfions, and recover. It is alfo faid in one of the Experiments, that the Dog which liv'd, vomited : and in the other, there is nothing faid to the contrary. The queftion therefore is, Whether many other things, which will caufe vomiting, may not do as well, as this fo much celebrated Horn?

Whatever it may perform against Poifon, it hath, faith Bartholine, been very fuccefsfully used by Phyfitians in Malignant Fevers. As in that, which at Coppenhagen in the years 1652, and 1653. was very brief : and which it (a) Barthol. carr'd off with very great Sweats. (a) It was used alfo by Hift. Cent.4. Albertus Kyperus at Leyden in the Year 1655. in the like Cafe, and with the like fuccess. (b) And that the fweating proceeded not meerly from Natures own ftrength over the Difeafe, but as the was helped by the use of the Horn; feems probable from what Bartholine further faith, (c) That a scruple or 3ß hereof being given in Carduus-Water, or other convenient Liquor, caufeth a free and copious fweating, even in those that are not used to sweat, except with much difficulty.

> Heretofore, the chief Bishops in Denmark, used to make their Episcopal Staffs of these Horns. (d) The Natives of Groenland, and other Places where the Sea-Unicorne is taken, arm the sharp ends of the thickest and longest of these Horns with Iron Beards, and fo use them for the wounding and taking of Whales.

The Sea-Unicorne is it felf a leffer Whale, and is that Species which the People of Island, where there are many, call Narwhal. The figure which Olaus Magnus gives of the Head, is fictitious.

A PIECE of the SEA-UNICORNS HORN.

The SAW-FISH. Pristis. Johnston hath given a good figure (e) hereof, but without either Name or Description. And that of Wormius is defective, and in fome particulars, out.

This here is a young One; from the end of the Saw. to the end of the Tail, four feet. The Saw it self above a foot; near its Basis, two inches broad; at the fore-end,

one

(d) Ibid.

(b) Ibid.

(c) Ibid.

(e) Tab. 4. N. I.

84

one. Armed, on each fide, with feven and twenty Spikes, each  $\frac{1}{2}$  an inch long, bended a little backward, and with two fharp edges behind, as the Spur of the *Unicorne* Bird hath above.

His Head very flat, about three inches long; behind, almoft four inches broad; before, two. His Eyes an inch long, as much behind the Snout, two inches diftant. Above i an inch behind his Eyes he hath two Spouts, about i of an inch wide, by both which (as fome Fifhes by a fingle one) he cafts out the Water, which in taking the Prey, or otherwife, he receives into his mouth. Beneath, clofe by the Root of the Saw, are two oblique Noftrils, an inch diftant, figur'd like the letter S. An inch behind thefe, his Mouth, two inches and i over. His Lips are rugged with extream fmall round knobs. He hath no Teeth.

The Apertures of his Gills are five; placed obliquely, not on his fides, but his Breaft, about four inches behind his Mouth.

His Trunk or Body prefently behind his Head, becomes fives inches broad, and about three high; from whence it is again extenuated all the way to the end of his Tail.

He hath feven triangular Finns. On the bottom of his fides, two Gill-Finns, not behind the Gills, as in moft Fifhes, but for a good part before them; near eight inches long, above three broad, and almost horizontal. Three inches behind these, two Belly-Finns, two inches broad, five long, and as much distant. Directly over these, on the Back a fifth, four inches long, above three high. On the Back also, but near the Tail, a fixth, four inches long, and as high. The Tail-Finn, as it were half a Finn, being  $\frac{1}{2}$  a foot high, but underneath level with the Tail.

Cover'd all over with a tough and dark-colour'd Skin, fomewhat rough, as you draw your hand forward: from the Belly-Finns to the end of the Tail, as it were pinched together into a little Ridge on each fide. There are many of them in the *Indian*-Sea.

The reafon why he hath two Spouts, feemeth to be the flatnefs and breadth of his Head or Mouth; in which the Water lying more fpread, could not fo expeditely be carri'd off by a fingle one in the middle, as by one on each fide.

He

## Of Fishes.

PART I.

He is faid to defend himfelf from the Whale with his Saw. Wherewith, by its ftructure, 'tis plain, that he fetches his ftroak backward or fide-ways, the Spikes being bended, pointed, and edged, and fo made to prick and cut, that way.

The SAW or SPIKED SNOUT of the SAWFISH. 'Tis a very large one, four feet long, or above an El'n by three inches. Its Basis, excluding the Spikes, feven inches broad. On each fide are feventeen Spikes, most of them two inches and 1 long, and figur'd as above defcribed.

The length of the Fish before described, from end to end. if compar'd with the Saw is as four to one. Therefore the Fish, to which this Saw belong'd, was near five yards and half long. Again, the number of Spikes in the Saw of the Fish now defcrib'd, compared with those in this great Saw, is fomewhat more than as three to two. Therefore had the faid Fish liv'd to the Age of this to which the great Saw belonged, it would have been eight yards in length.

Five more fuch like SAWS, fomewhat lefs.

The HEAD of the RAPIER-FISH; called Xiphias. By the Brasilians, Araguagua. He is pretty well described by Rondeletius. Grows fometimes to the length of five vards. The Sword, which grows level from the Snout of the Fish, is here about a yard long, at the Basis four inches over, two edged, and pointed exactly like a Rapier. He preys on Fishes, having first stab'd them with this Sword. (a) The Whale, faith Ligon, to shake off the Sword-Onom. Zoic. Fish and Theshall, his two mortal enemies, leaps fometimes more than his own length above water. (b) He is taken frequently in the German Ocean; as alfo in the Black-Sea; and fometimes in the Danuby.

> The HEAD of the TUCK-FISH. Of the Sword-fifth kind, but a different Species from the former. Whether it be any where defcrib'd, feems doubtful. The hinder parts of the Head are here broken off. The Snout is not fo flat as in the Rapier-fish, but thicker and rounder, more like a Tuck, from whence I take leave to name it. 'Tis half a yard long; near the Head, two inches over; about the one. Not with a flat point, but one perfectly The upper part hereof is fmooth, the nether middle, one. round. rough,

(a) Charl. (b) Hift. of

86

Barb. p. 6.

## Of Fishes.

87

rough, the fmooth and rough parts continu'd obliquely from the Point to the Root. Both the Chaps are alfo rough in the fame manner, in the place of the Teeth, which this Fifh hath not. The nether Chap hath alfo a different fhape from that of the Rapier-Fifh : this being not above four inches over, that half a foot; yet both are a foot long. It is composed of two Bones, so joyned together, for the space only of an inch and half, as to make a fharp point.

Marggravius and Pifo (and out of these Johnston) defcribe an American-Fish by the name of GUEBUCU, of kin to this, the Head whereof is here describ'd. But cannot be the fame, unless both the Pictures which they give, and Marggravius's Description (who particularly faith, That the Snout is fixteen inches long, the nether Chap, ten) be false. For in this Head, the nether Chap is broader, and comparatively not near so long.

The HEAD of the UNDER-SWORD-FISH. It is defcribed by no Author that I have perus'd. The Fifh feems to be a fmaller kind. The Head is of a triangular figure, having one acute Angle below, and a blunt one on each fide. An inch and quarter high; the Forehead an inch over, flat, and fcaly. In length 'tis about two inches and a quarter. The Eyes, proportionably, exceeding great, *fc*. three quarters of an inch over. The Snout half an inch broad, not above ‡ of an inch long, a little ridged in the middle. The Chaps, inftead of Teeth, are rough with many little Afperities, almost as the skin of a *Scate*.

The Sword grows in a level, not from the upper but the under Jaw, from whence we may give the Fifh his Name. In length three inches; near the Jaw half an inch over, from whence growing narrow all the way, it endeth in a Point like that of a Sword. It is not round, but flat, as that of the Rapier-Fifh, and in like manner two-edged. It feemeth to be compofed of two Bones, but very firmly coherent edge to edge all the way. Whether this Fifh be Viviperous, is uncertain; yet being of the Sworded-kind, I have ventur'd here to defcribe the Head.

A pair of the MANATEE-STONE'S. Taken out of the Head of the SEA-COW, by the *Indians* called *Manati*. Bigger than the biggeft fort of Walnuts; with feveral knobs

## Of Fishes.

PART I.

knobs and hollows, like as in the Ear-Bone, but much It is faid by Joh. de Laet to be much comgreater. mended against the Stone. There are two of them in every Head.

The Head of the Manati is like that of an Ox or Cow, from whence the English Name; his Eyes little; his Body long, like that of an Otter; his two Feet like an Elephants. Sometimes he is about thirty five feet or twelve yards long, and four broad. (a) He feeds not on Fishes, but the Grass out of Hic- on the banks of the Creeks and Bays. (b) Calves and ron. Benzon. fuckles her Young (as fome other Fishes) with two Duggs. (c) A certain Indian King kept and fed one of them with Bread fix and twenty years in a Lake near his Houfe, which grew tame, beyond all that the Antients have written of Dolphins : He would fometimes carry ten On Zoic. out of Petr. Mar- people on his Back, with eafe, a crofs the Lake. (d) They breed in Hispaniola, Jamaica, Brasile, and other places.

The BALANCE-FISH. Zygana Libella. Curioufly pictur'd in Salvian. Where also fee the Description. He hath his Name not unaptly from the shape of his Head, very different from that of all other Fishes, being spread out horizontally, like the Beam of a Balance; his eyes ftanding at the two extremes, as the iron Hooks do at the end of the Beam. He grows fometimes to the length of four or five yards: but this is a young one. They breed in the Mediterranian, especially, faith Bellonius, near Smyrna.

The HEAD of a great BALANCE-FISH. It is two feet vover, or from eye to eye. The Head of the leffer now mention'd, is five inches over, the Fish, 20 inches long. That therefore to which this great Head belong'd, was ten foot long.

The SKULL of the MORSE : fo called by the Muscovites; by the Danes, Rofmarus. He hath four feet, and his Body shapen not much unlike the SEA-CALF. But groweth fometimes to be bigger than an Ox. In his upper Jaw, he hath two remarguakble TUSKS, bended a little inward. In this Skull, the exerted part is five inches long, and four round about at the Root. His other Teeth are undefcrib'd. They are fixteen, eight on each Jaw. Not Grinders but Punchers, or fomewhat answerable

# Of Fishes.

able in shape to the Tusks of a Dog. In the upper Jaw, the longest; standing on each fide, two or three of them, within fide of the Tusks. They have a small flat on their infides, against which the Teeth of the under Jaw work; which are much smaller, and flat-fided. The shape of thefe Teeth feems no way fitted, and their ftrength very fuperfluous, for the eating of green Leaves at the bottom of the Sea, as this Animal is supposed to do.

The Figure which Olaus Magnus gives of this Animal, is fictitious. But that in Joh. de Laet (as to the Head at least) is a very good one: from whom Wormius borrows One of the Cubs is accurately defcribed by Everh. his. Vorstius, quoted by John de Laet, by Wormius, and by Terzagi in Septalius's Musaum. This Animal, when he goes, drags his hinder part after him, as the Seal. They always, faith Scaliger, (a) come on Land in Companies; and when (a) Exer. they fleep, one of them, as among Cranes, is fet to watch. 218.S. 4. They climb upon the Rocks on the Sea-fide by the help of their great Tusks, wherewith, as with two Hooks, they hold themfelves from fliping. They breed numeroufly near St. Lawrence Ifle.

Their Tusks are used by the Turks and Tartars for the making of Sword-Handles. (b) I have a Girdle, faith Wor- (b) Mulz-um Wormimius, (c) composed of Plates made of these Tusks; which anum. being worn, is an infallible Remedy against the Cramp : (c) Ibid. à Spasmo proculdubio immunes reddit.

A piece of a MORSE-HIDE. Than which, faith Wormius, I believe there is no Animal hath one more clofe and folid. I add, nor perhaps any that hath a thicker, being above half an inch thick.

A PISLE, faid to be that of the MORSE. 'Tis above a foot long, and feems to be only the exerted Part. At the Glans, half a foot about, now it is dry. The Muscovites, faith Vorstius; (d) take the Powder hereof to bring away the (d) Quoted by Laet, 1. 20 Stone.

The MALE or WHITE SHARK. Canis Carcharias See the Description hereof in Rondeletius. This is mas: about two yards long, and near \$ of a yard over, where thickeft. But they are found fometimes feven or eight yards in length, and more. One hath been taken, faith Gefner, from an other perfon, near four thoufand pounds weight.

N

### PART I.

weight. The fharpnefs and multitude of his Teeth effecially, and the widnefs of his Mouth, are remarkable. They will often bite off the Legs or Arms of those that venture into the Sea in a Calm; and fometimes fwallow them (a) Ligon's up whole. (a)

Hift. of Barb.

Their Teeth generally ftand in a fix-fold Row; but Bellonius obferves one with four Rows only. There are fome other Fifhes which have as many, and the Scate hath more: but take their Number and Bignefs together, and they are more confiderable. In Septalius's Museum, there is one, faith Terzagi, (in words at length) with a thoufand and two hundred Teeth. But neither hath this here, nor had any other that I ever read of, near half fo many.

Of his Optique Nerves, *Rondeletius* observes, That they are not, as in other Animals, but plainly *Cartilaginous*.

The Goldsmiths in France, faith the fame Author, fet the Teeth of the Shark (which there they call Serpents Teeth) in filver-Cafes; and the Women hang them about their Childrens Necks, to make them breed their Teeth the better. The Brain of the Shark, faith Wormius, (b) is highly commended by fome for the Stone. The people of Island, faith the fame Authour, boil them for Lamp-Oil. They are found fometimes upon our own Coaft, near Cornmall.

The LONG-SNOUTED SHARK. So I call it, becaufe it is much longer, than in the above-mentioned; fo as to be as it were the beginning of a Horn. The Body of this likewife, in proportion, is much fhorter and thicker. *Rondeletius* feems to give the Figure of this particular *Species*.

(c) Hift. An. 1.2. c. 1. near the end.

(b) Out of

Laet.

There is no fort of Animal, faith *Ariftotle*, (c) about us, which hath a double Row of Teeth. So that he never faw a *Shark*, nor divers other Fifhes that are commonly known, and fuch as are not unlikely to breed about *Greece*. That he includes Fifhes, is plain by the Context.

The GILL-FIN of the long-fnouted Shark.

The JAWS of a SHARK. There are fix or feven pair of these here preserved. Terzagi mentions one pair

in

## Of Fishes.

in Septalius's Museum, that were wide enough to have fwallowed any Man.

Two great TEETH of a SHARK. They are both curioufly indented, like a Saw, on each edge: as alfo the Teeth are in younger *Sharks*, but not fo vifibly. One of thefe is above an inch and half long. But one of thofe in a *Shark* of above two yards in length, is not half an inch. The *Shark* therefore, to which This belonged, was about eight yards long.

What the Teeth of a *Shark* wants in thicknefs, they have in breadth, whereby they are the more terrible; both pricking with their Points, and cutting with their Edges at the fame ftroak.

Part of the BACK-BONE of a SHARK.

The TOOTH of a PICKED-DOG. Not much unlike that of a *Shark*. The difference is, That the exerted part of this is bended, not inwards, but fide-ways.

The SPOTED HOUNDFISH or SEA-PANTHER; Galeus Afterias; becaufe of the Stars or Spots upon his Skin. But the radiation of the Spots in the Figure commonly given, is fictitious. See *Rondeletius*'s Defcription. He hath a rough Skin, as have all of this kind. Yet this Author faith, he hath a fmoother Skin, than the *Galeus lævis*: which, however comparatively taken, it may be true, is not well expressed of either. The faid Roughness is caused by an infinite number of most hard and sharp Prickles, composed in the fame manner as the Scales of Fishes.

The Female brings forth often times twice in one month, and fo is faid to Superfatate: which, faith Ariftotle, (a)  $_{lib.6.c.11}^{(a)}$  Hift. Anfeems rather to be, becaufe her Eggs are hatched (in her & 1.5.c.10. Womb) one after another.

The PICKED-DOG. Galeus Acanthias. Becaufe he hath two ftrong and fharp Spikes growing on his Back, behind the two Finns, and pointing towards his Tail. See the Defcription in Salvianus and Rondeletius. Befides the two Finns which grow on each fide the Anus, the Males, faith Salvian, (b) have alfo two Appendices, one on each fide (b) Hift.42. the Anus. But betwixt the Anus and the Tail there is no under-Finn; by which he differs from the reft of the Dogkind. He is faid fcarce to grow fo big, as to exceed twenty pounds in weight. His Skin is rough with the like Prickles,

N 2

as

PART I.

as in the former; fo finall, as fcarcely visible without a *Microscope*. But easily felt by drawing your hand towards the head. The shape also of the Teeth is odd and unufual, being armed with little sharp Hooks on each edge. They are taken sometimes upon our *English* Coast.

The Anatomy of the Galeus (the Male) is given us by Sir George Ent, in Dr. Charleton's Onomaftic. Zoic. Some of the most observable Remarks, are the peculiar shape of the Pancreas, and especially the Spleen, having a Label produced from one side, above twice its own length. Likewise the Purse at the farther end of the Duodenum, into which it opens only by a very small round Hole, not so wide as to receive the end of ones little spleen: all which are defcribed and figur'd. He hath also growing on the lower Eye-lid, a thick and firm Membrane, wherewith he often winkles or covers his whole Eye: the fame with that called the Periophthalmium, common to very many Birds.

The Defcription of the Viviparous Eggs in the Female; which are not unlike to those of the *Raya*, is given by *Rondeletius*. *Bellonius* hath seen an indifferent One, to bring forth thirteen young ones at a Birth. So so foon as ever she hath brought them forth, they swim along with her, and if any of them are assorid of any thing, it runs immediately into the Mouth, say fome, into the Womb of the Dam: when the fear is over, returns again, as if by a second Birth.

The Skin is used for the polishing of Wooden and Ivory Works.

The HEAD of a DOLPHIN, about a foot and  $\ddagger$  long. The *Dolphin* therefore to which it belong'd, was above two yards and half long. In the Skin, 'tis hard to find any paffage of found for Hearing. And *Ariftotle* denies that the *Dolphin* hears. But *Rondeletius* truly faith, that he doth, and that the whole ftructure of the Internal Ear may be feen in the Skull. See *Bettonius*'s Defcription and Figure of the Dam and her *Fatus*.

The HEAD of a DOLPHIN, leffer than the former.

The TAIL of the DOLPHIN. It is expanded (as alfo in the *Porpefs*) in a way peculiar, not uprightly, as in other Fifhes, but horizontally: by the help of which, he makes his Gamboles above the Water. And at the fame time

(F

time takes his Breath: as Mr. *Ray* hath well observed of the fame use in the *Porpess*. It is also of use to cash him forward by strong and repeated jirks, whereby he is so admirably swift, as it's faid, above all other Fishes. (a) There (a) Phil. is also another *Dolphins* Tail here preferved of the fame  $p_{p, 2275}$ . bigness.

The SKELETON of a PORPESS, or Sea-Hog. (b) The <sup>(b)</sup> Turfio Defcription and Anatomy of the Animal is given us by cana Ron-Bartholine (Hift. Cent. 2.) By Mr. Ray (Phil. Tranf. N.76.) deletii. By Dan. Major (Mifcel. Curiof. German. An. 4.) And lately more largely by Dr. Edward Tyfon. Some of the particulars more remarkable are, That the Fat, which is an inch thick, encompaffeth the whole Body, as in a Hog. That the Fibers which run through the Fat from the Membrana Carnofa to the Skin, do obliquely decuffate one another like a Lattice. And I may here obferve, That the like Decuffation is made betwixt the white and red Fibers of all Mulcules.

Tis further noted, That the Fat is nothing elfe but Oil contained in a great number of little Bladders. I add, That all these Bladders are the continuation of the Fibers which decussate, in a finer Work. And that there is no difference betwixt the faid Fibers and those of the Membrana Carnofa, faving their Relaxation, (as when a Spung swells with water) by the interposition of Oil.

The Stomach remarkable, confifting of three Bags. The Guts eleven times the length of the Fifh. The Glands of the Kidneys fo diftinct, that each having a white fubftance in its centre, and out of that its *Papilla*, feemed to be another little Kidney, about the bignefs of a large Peas. And I shall here take notice, That the whitish fubftance within every Gland, and the fame which is in the Kidneys of other Animals, is truly Carneous or *Muscular*, by which the conveyance of the Urinous parts of the Blood into the *Pelvis* is promoted.

The Paps are placed one on each fide the *Pudendum*. The *Ovaria* (it being a young Fifh) not above an inch long, and thick as a Goofe-Quill. The Diaphragme, without the ufual Tendon in the centre. The Heart, with two Ventricles and two Auricles. The Foramen Ovale, clofed. The Lungs confifting of two great Lobes. The *Larnyx* very

PART I.

very prominent, oddly shaped, like an old fashion'd Ewer. The Spout with strong Muscules; and Papillæ for the issuing of Snot. The Eye with the Musculus Suspensorius, as in Bruits. The Brain large, weighed above the *averdupois*, the Fish there's. The Musculus Ploas, and two others on the Back, very large and strong.

The Teeth (96 in all) fo placed, that those of one Jaw, are received into the diffances of the other. Stand not in diffinct Sockets, but all in one common Furrow. The Ear-Bone is oddly feated in a hollow, and encompassed with Muscules. The Drum well braced, but no Incus stapes & Malleolus to be seen. The Brain-Pan five inches broad, and but three long; the Brain answerable. The Back-Bone is composed of fixty Vertebræ. The fame number, as is before observed to be in that of a Crocodile. The Bones of the Fore-Finns, refemble those of an Arm with Hand and Fingers. Of the Tail, like those of two feet joyned together.

From the Nofe to the Tail-end about an Ell long, and roundifh, the Eyes and the Gape of the Mouth finall, the Back and upper parts black, the Belly white, the Tail horizontal : much like a *Dolphin*, faving that fhe is fhorter fnouted.

The SEA-CALF or SEAL. Phoca. Vitulus Marinus; From the noife he makes like a Calf. See Rondeletius's Defcription. His Head comparatively not big; shaped rather like an Otters; with Teeth like a Dogs; and Mustaches like those of a Cat. His Body long, and all over His fore-Feet, with Fingers clawd, but not divided ; hairy. yet fit for going. His hinder Feet, more properly Finns, and fitter for fwimming, as being an Amphibious Animal. The Female gives fuck, as the Porpels and other Vivipa-This here is about a yard long. But fomerous Fishes. times they are as big, faith Mr. Ray, as a Heifer of two years.

The Skin of this Fish is commonly used for the covering of Trunks. They are innumerable in the Atlantick-Sea; especially the Bay there called The Seal-Bay. (a) Our Mariners and Fishermen often take them in the Isle of Wight, as they lie asleep upon the Shore. (b) As also about Cornwall.

Another SEAL like the former, only fomewhat thicker. Given by Mr. 7. Houghton, Ph. L. The

(a) Laet. 1. 13.

(b) Charl. Onomast. Zoic.

# Of Fifbes.

The LONG-NECK'D SEAL. I find him no where diffinctly mention'd. He is much flenderer than either of the former. But that wherein he principally differs, is the length of his Neck. For from his Nofe-end to his fore-Feet, and from thence to his Tail, are the fame measure. As alfo in that inftead of fore-Feet, he hath rather Finns; not having any Claws thereon, as have the other kinds.

The SKULL of a SEAL. Given by *Henry Whiftler* Efq; The Teeth are fhaped fomewhat like a *Dogs*. The tops of them all are flat, being doubtlefs filed off. The *proceffus* of the *Os Frontis* which makes up the Orbit of the Eye in Land-Animals, is here wanting; and the faid Bone pinched up much more narrowly: Both to make room, as it fhould feem, for a very large Eye. The paffage into the Ears ftands very oddly. In *Dogs*, *Cats*, and most other Land-Animals, forward and outwardly. But here it ftands just oppositely, *fc*. behind and inwardly.

The FORE-FOOT of a very great SEAL.

The VIVIPAROUS EEL-POUT. Mustela marina vivipara. (the Male, Lupus marinus Schonfeldii.) 'Tis well pictur'd by Adam Oleareus, (a) who calls it a (a) Tab. 27. Sea-Wolf (Ein See-Wolf). As alfo by Johnston; but not defcribed. But in Gesner's Paralypomena 'tis both figur'd and defcribed by Ge. Fabritius under the Name of Klipsisch (*i.e.* Rock-Fish,) fo called by the people near the Baltick (where he breeds.) Fabritius is particular only as to the Teeth, and is alfo mistaken in fome things. I shall therefore add the Defcription I drew up before I met with his.

Tis a yard long. The Head  $\frac{1}{2}$  a foot long, and almost as high; being compressed on the fides, three inches and **3** over underneath, her Forehead but a little above two. Her Snout a little Convex. The Eyes very high, an inch long. The Nostrils before the Eyes  $\frac{3}{4}$  of an inch. Both the Chaps blunt-angled before, from the Corners of the Mouth three inches long, between the Corners, as much.

The Teeth all very thick, like those of *Quadrupedes*; both in figure and fcituation, very unufual. In the upper Jaw, five before; not Incifors, or Cutters, but thick Punchers. To the Roots of which, within fide, grow as it were nine little Teeth. Behind, are three Grinders; one of

of which, on each fide, is faften'd obliquely inwards, half an inch broad, and above an inch long. The third, and the greateft, ftands betwixt them in the middle of the Palate. Each of thefe having deep Incifions, feem, as it were, eight or ten Teeth. In the under Jaw, are two Punchers or Claviculars, each of them having two fharp Proceffes within fide. Behind, there feems to be only one Grinder on each fide, half an inch broad, and above two inches long, arched inward, and with fixteen or eighteen Incifions looking like fo many Teeth.

Her Gills open almost from the top of her Head to her Throat. The Fins are four. The Gill-Fins about five inches long, and as broad, placed fo low, as to meet in the Breast, and fo to supply the Breast-Fins. The Back-Fin is extended from Head to Tail; before, an inch high; behind, above two. The Belly-Fin reaches from the *Anus* (which opens a foot behind the Head) to the Tail, about an inch deep. The Body, where highest, above a foot, the Back a little convex, grows stender all the way to the Tail, the extremity whereof is here wanting. She is cover'd with a tough Skin, now of an Iron-colour, besprinkled all over with round spots.

That which is most remarkable in this Fish, are his Teeth: which are so made, as to be fit either for Ravine, or for the eating of Grass and other Herbs on the Rocks, and under Water. They seem also to be made for the Cracking of Shell-Fish. As likewise for Rumination: which may as well be afcrib'd to this Fish, as to the Scarus.

This Fish is one, amongst divers other instances of Aristotle's error, where he faith, O. Ne iχθύες παν Jes είσι παρχαρόδου Jes, πλην το ένδε το παλεμένο Σχάρο. (a)

The tops of this Fishes Grinders are commonly fold for *Toadstones*. As Dr. Christopher Merret hath also observed in his Pinax.

The SCATE, or Angel-Fish. Squatina, five Angelus Marinus. The figure in Johnston is tollerable. But the Defcription very short and imperfect. That of Rondeletius is better, yet not full. And either the Fish he describes is a different Species, or his Description of the Teeth is not true.

This is above an Ell long. His Head about ‡ of a yard long,

(a) DePart. Anim. 1. 3. C. 1.

## Of Fishes.

97

long, and near as much over, (here) with feveral Angles or Ridges: His Mouth five inches over, his Lips almost Semilunar.

Each of his Jaws are armed with about fix and thirty Rows of most sharp Teeth, and in every Row there are four Teeth. So that in all they are about two hundred fourfcore and eight, all couched a little inward.

About three inches behind his Nofe-end ftand his Eves, as it were on the top of his Head, and three inches and distant. Proportionably very fmall, sc. not above an inch over. About an inch and quarter behind his Eyes, and a little lower, he hath two Spouts, one on each fide, above an inch long, and convex before. His Neck <sup>1</sup>/<sub>2</sub> a foot over. His Back before, three inches above a foot, expanded (here) on both fides, as if it were shoulder'd. His Middle or Wast about eight inches. The lower part of his Back, ten inches, fpread like a pair of Buttocks. From his Shoulders to the bottom of his Buttocks about a foot and <sup>1</sup>. The length of his Tail, as much: the forepart whereof above four inches over, growing flenderer all the way to the end.

He hath feven Fins. His Shoulder-Fins with Cartilaginous Rays, expanded ' a foot out like a pair of Wings, and almost square. His Buttock-Fins prolonged hinderly 1 a foot, stand continguous to the Tail on both fides. On the top of his Tail, two leffer; three inches high, and couched backward. At the end a forked one i a foot long, and almost as high. From hence half a foot forward, the Skin is as it were pinched up into a little Ridge or Doublet on each fide.

Above he is very rough with innumerable fmall Prickles, efpecially felt upon drawing your hand forward. And the edges of the four fide-Fins are all thorny. But underneath the Skin is fo thick or clofely cover'd with little hard round knobs, as it feems almost fmooth.

This Fish hath two Spouts, like the Saw-Fish, because of the breadth of his Head. His Teeth admirable for taking fure hold of the most slippery Prey. Those Doublets on the fides of his Tail, feem to add strength to the Muscules which move the Tail-Fins. And fo in fome other Fishes. By the posture of the Fins he seems to make at the Prey, not by a forward stroke, but by afcending as a Dog to his Meat.

Meat, or defcending as a Hawk when the ftoops. With the broad Fore-Fins, faith *Oppian*, the Female thelters her Young, as a Hen her Chickens with her Wings. But *Ariftotle* affirms, That the gives them protection as doth the Dogfith, by receiving them into her mouth. He alfo faith, That of the Cartilaginous kind the *Scate* only beareth twice in a year, *[c. Spring and Fall.* 

(a) Hiftor. 50.

98

Salvianus (a) faith, That the Skin of his Back is fmooth; deceived by the Authorities of Aristotle, Epicarmus, Athenaeus, and Pliny: witneffes enough to prove an Error. The Skin of this Fish is used for the polishing of Wooden and Ivory Works. He is taken, faith Mr. Ray, fometimes near Cornwall.

Another SCATE. 'Tis a young one, but in fhape altogether like the former, faving that the Shoulder-Fins are here produced, more like a Wing, into a fharp Angle before.

The HEAD of a SCATE, about the bignefs of that above defcribed. Sometimes they grow to the weight of a hundred and fixty pounds.

The HEAD of the GREAT MAID. Caput Rajæ Oxyrrhynchæ majoris. See the Defcription of this and the other Kinds in Rondeletius, and Bellonius. They all differ from other Fishes, in having a broad and fquat Body, with a long flender Tail appendent, but not fo flender, as in the Cat-Fish. The end of the Snout in this, is all befet with little sharp Hooks pointing backward. And with the same Hooks, both the Jaws: but far bigger, and standing in feveral Rows, eight, ten, or twelve in a Row.

The Skin of the *Raja*, being artificially reduced to a monftrous shape, is by some shewed, and is commonly taken, for a *Basilisk*.

The EGG of a THORNBACK. Ovum Rajæ Clavatæ. Or rather the Bag or Cafe of the Egg. Hereof fee Rondeletius. 'Tis very fmooth, and (now) black and horny. Seven inches long, and four over. From each of the four Corners is ftretched a sharpe ended Membrane two inches long. In the middle it swelleth up on both sides: fo that in shape 'tis just like a Pulpit-Cushion. There are some other lesser ones of the same shape and colour.

In the upper part of the Womb, faith Rondeletius, are a great number of Eggs of feveral fizes, confifting only

of

Of Fishes.

of a Yelk, as in the *Ovary* of a Hen. These fucceflively ripening, are found in the lower part, confisting of Yelk and White, and cover'd with the faid horny Case. Out of every one of these mature Eggs, another *Fatus* is also fucceffively generated. Whereby it is intelligible, How this Fish produceth but one at once, and yet fo numerous a breed.

The SKREW-GUT of the RAJA, defcribed by *Steno's* Son. Sent by Dr. *Swammerdam* with fome other particulars mention'd in the first Section. It winds between parallel lines like a Screw or Stair-cafe.

The knobed TAIL of a THORNBACK. Of an aftrcolour, and about a yard long.

The fpiked TAIL of a THORNBACK, almost black. The knobs of both are fo hard, that they will file Iron or Brass. The Skin of this Fish is used for Knife-hafts, &c.

The fmooth CAT-Fifh. *Paftinaca marina lævis*. *Fabius Columna*, (*a*) hath defcribed two Species of this kind: but (*a*) Lib. de both of them feem to be different from the Fifh here. It is Aq. & Terfomewhat phantaftically ftuffed; yet I fhall give the Defcription as well as it will admit.

From the tip of his Snout, to his Tail, a foot and three inches, about a foot over, and  $\frac{1}{2}$  a foot (being, I fuppofe, thruft out fomewhat more than the natural dimension by the fluffing) in height. His Eyes  $\frac{1}{2}$  an inch long, two and  $\frac{1}{2}$ inches diftant, three and  $\frac{1}{2}$  behind his Nofe-end. Juft behind his Eyes, and a little more diftant, he hath two Spouts; one way, an inch and  $\frac{1}{2}$  over. His Snout prolonged forward an inch and  $\frac{1}{2}$  with an Obtufe Angle ; and extended towards the fide-Fins, wherewith it is alfo joyned by the mediation of a Skiny-Border  $\frac{1}{2}$  an inch broad. His Mouth very little, not an inch and  $\frac{1}{2}$  over ; curioufly rough-caft like a file, underneath, and behind his Snout-end two inches and  $\frac{1}{2}$ . Over his upper Chap hang two little Labels above  $\frac{1}{2}$ inch long.

His Gills are five on each fide, but towards the middle of his Belly. He hath four fide-Fins. His fore-Fins are ftretched out two inches in breadth, extended in length towards the Tail, almost a foot. The hinder-Fins are almost two inches broad, and above an inch and  $\frac{1}{2}$ long.

O 2

The

PART I.

The Tail a foot and two inches long, at the Root about an inch and  $\frac{1}{2}$  over, the extremity very fmall like a *Shoomakers* Thread. The Skin not very thick, nor ftubborn, (now) of a yellow colour on the back, on the Belly ftrawcolour'd: every where very fmooth, excepting on his Tail, where there are fome few very fhort prickles.

Whether this be not a young Fifh, and upon that account only wanteth the *Radius* (as the fharp Saw upon the Tail is called ) to me is uncertain. With this *Radius* he is faid to ftrike and kill his Prey, for which he lies as it were dormant, till it fwims within his reach. *Ælian*, cited by *Rondeletius*, faith, That he fometimes flies. Which that he may do a little above the water, as the flying Fifhes, feems poffible by the horizontal production of all his Fins, and their extension all along his fides.

The Chineses and Moors eat this Fish greedily.

The nether LIP of the fmooth CAT-FISH, two inches long.

The BRASILIAN FROG-FISH. Rana Pifcatrix minor. In Brafile, GUACUACUYA. The figure which Johnston gives is tolerable; but his Defcription very defective. The length of this is eight inches. His Mouth open makes a Circle<sup>‡</sup> of an inch over. His Lips, in the ufual place of Teeth, are rough; as alfo is his Tongue. He hath a black Horn on his Forehead, ftooped forwards, round, an inch and  $\frac{1}{2}$  long, one third over at the bottom, pointed, and having little Spikes round about it. What Johnston means by the Cuteus Nervus, appears not. At the top of his Head, juft under the Horn, ftand his Eyes a  $\frac{1}{2}$  of an inch over, and (here) no more diftant. The Noftrils a little before the Horn.

His Body two inches and  $\frac{1}{2}$  long, and four broad; before, Semilunar. His Back convex, his Belly flat; with a Border or Fin all along each fide  $\frac{1}{2}$  an inch broad. Behind are fubjoyned a pair of Fins almost two inches long, and an inch and  $\frac{1}{2}$  wide. In the middle of his Belly are two other leffer close together, above an inch long, but not more than  $\frac{1}{2}$  broad.

The length of the Tail four inches and ½. At the root 'tis round, and an inch over; at the end, with the fides compreffed, and ½ an inch high. The Tail-Fins three, one above,

above, another just under it, the third at the end much bigger. The Skin of his Belly and Tail underneath, whitish, thin, and rough. Of his Backfide, Fins, and Tail above, black, thick and set with short spikes arising from a round Base radiated like a Star. He seems, by his shape, to be near of kin to the *Thornback*; and therefore to be less appofitely Nam'd.

A leffer Brasilian Frogfish of the same kind.

The TRUMPET-FISH. So called from the figure of his Bill, which is an entire Pipe, fhaped almost like that of the Snipe-Fish. Acus Aristotelis. Well defcribed by Rondeletius; faving, that he defcribes the Body to be Sexangular all along. Whereas from the Head to the Anus it is Septangular. The Scales are also engraven with finall lines almost of an Elliptick figure. Salvianus errs in faying he is not fcaly. Another also of the fame Species.

The Female, faith *Rondeletius*, hath a *Canale* extended from her *Anus*, in which the Eggs are hatched into young Ones. Of the use of the Bill, see the *Snip-Fish*.

The leffer TRUMPET-FISH, or Viviparous Needle-Fifh.

The HORSE-FISH. *Hippocampus*. A finall Fifh. So called, becaufe his Head is fhaped like a Horfes, and his Tail divided by feveral Incifures, fomewhat like thofe of *Caterpillars*, called *usuma*. Given by Mr. Scotto a London Merchant. It hath the fame number of Fins, and in the fame place, the fame kind of Bill, the fore-Body Septangular, and the Tail fquare, as the Trumpet-Fifb. And is, therefore probably, alfo Viviparous : and fo I have ventur'd to place it here.

Another HIPPOCAMPUS taken in the *Mediterranean*.

A STURGEON. Acipenfer. Sturio, becaufe one of the greateft of edible Fifhes; for Stur, in the Danifb-Tongue, fignifies Great. (a) See Wormius his Defcription. Efpecially (a) Worthat of Salvianus, with his curious figure. The like in <sup>mius.</sup> Befler. The parts by which he is beft diftinguifhed, are his very long and fharp Snout, his little Mouth, to be feen only when he lies on his back, and his thick and bony Scales; which ftand in Rows fo, as to make the Fifh almoft Pentangular. The figure of moft of the fide Scales

PART Í.

(a) L. de Re is Rhomboidal. It is affirmed by Moufet, (a) That the Scales of a Sturgeon turn towards the Head; borrowing his Cibaria. Error herein of Pliny.

> Lately, a piece of a Sturgeons Gut was shewed me by Dr. Edward Tylon, which he had cut off of a great One fent to my Lord Major. It is very thick, ftrong and Mufcular. And the inner Coat made of Fibers, fo loofely woven together, as to look like a Net; and that above the eighth of an inch in thickness. In which a plenteous Chyle is conveniently lodged, and thence gradually tranfmitted to the Lacteal Veins.

> Scaliger faith (b) of the Guts of a Sturgeon, that being taken out and cut all to pieces, those pieces will still move. Which may partly depend upon their great thickness and muscularity; the like being observable in cutting the Heart and other Mulcular parts of divers Animals.

The Sturgeon is taken in most great Rivers, as well as in the Sea. He hath fometimes been feen, faith Bellonius, fix yards long. The bigger he is, as all other Fish, the The Italians (c) prefer the Belly before the better meat. Jole. His Liver very delicate. At Hamburge and Dantfick. they eat (or did in Moufet's time, who reports it, eat) Sturgeon roafted. In the fame Author, fee a most excellent Pickle for this Fish. The Eggs being falted and made up into a Mass, were first brought from Constantinople by the Italians, and called Caveare. Of the way of making it, see Gesner. The pickled pieces made of the Chine, are by (d) Salvian. fome called Schinalia. Of the long Bag(d) which grows next the Chine, the people that live near Tanais make Glew.

The HEAD of a great STURGEON.

MOON-FISH. Mola Salviani Luna; Becaufe the Tail-Fin is shaped like a Half-Moon, By which, and his odd truffed shape, looking as if he were only the Head of some great Fish cut off from his Trunk, he is fufficiently diftinguished from all others. Well defcribed by Rondeletius and Salvian; and by this latter, very curioufly pictur'd. The Gill-Fins, as he observes, are so postur'd, as not to move from Head to Tail, or vice versa, but from Back to Belly,

(b) Exerc. 182. S. 2.

(c) Salvian.

Of Fishes.

Belly, & e contra. The ufc whereof feems to be, To enable him to make a more direct and fudden defcent; that fo when any Ravenous Fifh makes full fpeed at him, he may in an inftant ftrike himfelf under his way, and fo efcape him. It may alfo be noted, That being a tall Fifh, and with his fides much comprefied, he hath a long Fin upon his Back, and another anfwering to it on his Belly: by which he is the better kept upright, or from fwaging on his fides.

Another MOON-FISH of the fame Species, but fomewhat leffer. Neither of thefe is above  $\frac{1}{2}$  a yard long. But that which *Salvian* defcribes, was above an hundred pounds weight. They are taken, as Mr. *Ray* faith, about St. *Ives* and *Penfans* in *Cornwall*.

### CHAP. II.

### OF OVIPEROUS FISHES, particularly such as are NOT-SCALED.

THe HEAD of the RIVER-WHALE. Caput Siluri. Johnston gives the figure of this Fish, but without a Description. That of Rondeletius is not full. This Head is is a foot long, as broad, and half as high. The Snout flat. Both the Chaps before of a Semilunar figure. Armed with an innumerable company of prickly Teeth, standing like those in a Card wherewith Women Comb Wooll. The nether Chap stands out above an inch before the upper. The Eyes round, and for fuch a Head, very fmall, fcarce the third of an inch over. Diftant three inches and 1. An inch above the corners of his Mouth, he hath two ftrings, fmooth and round, here (for they are broken) <sup>±</sup>/<sub>3</sub> a foot long, about the thickness of an Earth-Worm, taper'd and bended backward; outwardly nervous, inwardly Cartilat ginous or Grifly. His Gills defcending almost from the top of his Head, meet under his Throat.

What may be the use of these strings is uncertain, and to be collected only from observing their communication with other parts, and the manners of the Fish. But the intent

intent of their ftructure is lefs obfcure; the Nervous part ferving to draw it too and fro; the Cartilage, as the fpring in a *Pendulum* Watch, to ftint the motion and make it more fteady. And being flexible, it does the fame as a joynted Series of many little Bones.

The little SEA-UNICORNE. Monoceros minor. It was fent from Brafile, I find it not defcribed nor pictur'd in any Author. Nor is it certain whether it be Oviparous. Yet I have ventur'd to place, and shall defcribe it here.

'T is 'a yard long, almost 'a high, with its fides very much compressed, being not above two inches and a 'a over. High-Bac'd, like a *Perch*. And also (which is unufual) bow-Belli'd. His Head hath some refemblance to that of a *Baboone*; from the top to the bottom sour inches and 'a His Mouth, which stands below, not much above an inch over. His Teeth, in both Chaps, the thickness of a midling Needle, the eight of an inch long. His Gills subtended to his Eyes and Mouth like the segment of a Circle. His Eyes stand near the top of his Head; and are an inch over.

From the top is prolonged a fmooth (now) blackifh, round, taper'd, ftrait Horn, couched a little down below the level, two inches round about the Root, and three inches long. It feemeth not to have any Bone within it; nor is it inferted into any, as in the *Unicorne* of the Cetaceous kind before defcribed; but is the Skin it felf prolonged and hardened (as the *Cuticula* turns to *Cornes*) into a kind of horn.

The Fins are feven. The Gill-Fins two inches long, and one broad. The Back-Fin is extended from Head to Tail, above an inch and  $\frac{1}{2}$  high. The Breaft-Fins  $\frac{3}{4}$  of an inch before the *Anus*, near two inches long. The Belly-Fin, like that of the Back, and extended from the *Anus* to the end of the Tail. That at the end of the Tail *triangular*, two inches and  $\frac{1}{2}$  long, three high. The *Anus*, if you meafure by a perpendicular from the Gills, opens, oddly, not above an inch and  $\frac{1}{2}$  behind them. He is cover'd with a (now) blackifh, thick and tough Skin, and when you draw your hand forward, alfo rough.

The SHIPHALTER. Echeneis. Remora. Johnston hath

#### PART I. Of Fishes.

given an indifferent figure of it. But I meet with no tolerable Defcription any where.

'Tis about i of a yard long. His Body before, three inches and **fover**; thence tapering to the Tail-end. His Mouth two inches and <sup>1</sup>/<sub>2</sub> over. His Chaps ending fomewhat angularly. The nether a little broader, and produced forward near an inch more than the upper. His Lips rough with a great number of little prickles. His Eyes round, <sup>‡</sup> of an inch over, an inch behind his Mouth.

His Head fquat, adorned with a kind of Oval Coronet, fomewhat Concave, five inches and ' long, above two broad, cut traverfly with three and twenty Incifions or long Apertures, making fo many diffinct Membranes, with rough edges, joyned altogether with a Ligament running through the middle of the Coronet, and perforated on each fide the Ligament.

The Gills wind from an inch and <sup>1</sup>/<sub>2</sub> behind the Eyes down to the Throat. The Fins feven. The Gill-Fins above four inches long; The Breaft-Fins as long. About a tof a yard behind the Coronet a fifth extended on the Back above <sup>‡</sup> of a yard. A fixth like it on the Belly. The Tail-end, like a Spear, a little compressed. The Tail-Fin three inches and i long. The Anus open about the middle of the Fifh. His Skin is (now) brown, fmooth, and tough, or like tan'd Leather.

Perhaps the fame Fifh, which Ligon (a) faith, always (a) Hift. of Barbadoes. fwims along with the Shark, and frequently flicks to fome part about his Head. At least, it is very probable, that this Fish is able to fasten himself to any great Fish, Boat, or Ship, with the help of the Coronet or Sucker on his Head; which feems to be most fitly contrived for that purpose. In fome fort answerable to the Tail of a Leech, whereby fhe flicks her felf fast to the smoothest Glass. Or to those round Leathers, wherewith Boys are us'd to play, called Suckers, one of which, not above an inch and i diametre, being well foaked in water, will flick fo faft to a Stone, as to pluck one of twelve or fourteen pounds up from the ground.

Of the stupendious power which this Fish is supposed to have, there are many concur in the ftory; as that he is able to ftop a Ship in its career under full Sail : and what not? P and

106

PART I.

and great pains is taken to affign the Caufe; and to prove, That though the *Moon* be made of a *Green Cheefe*, yet is not the only Neft of *Maggots*. *Rondeletius* alone, in afcribing it to this eafily altering the polition of the Helm, and fo the motion of the Ship, coming near to good fenfe: efpecially if he had proved, That the Name of the Fifh, and the Story, were not Things much older than the Helm of a Ship.

'Tis plain, that the Tradition had a very early beginning, when little light Boats were the Ships which people us'd. To the fide whereof, this Fifh faftening her felf, might eafily make it fwag, as the leaft preponderance on either fide will do, and fo retard its Courfe. And the Story once begot upon a Boat, might ftill, like the Fifh it felf, flick to it, though turn'd to a Ship. Affigning as great a power to this *Neptune* in the Sea, as the Poets have done to *Apollo* the God of Life in the Heavens; who yet appears by the beft accounts of him put together, to have been at firft no better than a Crafty *Mountebank*.

The TOBACCOPIPE-FISH. By the People of Brafile, and by Marggravius who defcribes it, called Petimbuaba. He hath only omitted the Line, which, like a very fmall Chain, runs along both fides, as in the Sea-Scorpion, from Head to Tail : Both the Body and Snout are long and flender, from whence its Name. 'Tis alfo pictur'd, and in fome fort defcribed by Pifo.

The PRICKLED TURBUT. Rhombus aculeatus. So called from his figure and the prickles on his Back or brown fide. Defcribed by *Rondeletius*. The two ftrings that hang at the nether Chap, are here wanting. He is faid, having hid himfelf in Mud, with thefe, to Prey upon little Fifh, which feeing them rigle, make at them, fuppofing them to be Weeds.

The little GLOB-FISH. Orbis minor. So called from his Orbicular figure. Defcribed in moft *Mufæums*. Moft curioufly figur'd in that of *Calceolarius*. He is armed with long, round, hard, and fharp Spikes or Needles all round about, almoft like those of a *Hedg-Hog*; and is a fort of *Porcupine-Fifb*.

'Tis probable, That the Fish swims with these Needles all closely couched down round about, for that otherwise

they

# Of Fishes.

they would hinder her fwimming. But if at any time fhe is purfu'd, fhe immediately advances her Pikes, and bids the enemy come at his peril.

This and the other kinds are found, efpecially, in the River *Nile*.

The SEA-PORCUPINE. *Hiftrix Pifcis*. *Johnfton* hath figur'd it (*Tab.* 45.) but not well. Neither do I find any tolerable Defcription of it.

This here is above a foot long, near half a foot over, and as high, round, and almost of an Ovale figure. His Chaps about  $\frac{1}{2}$  an inch long, shaped fomewhat like the Bill of a *Sparrow*, each of them one some fingle Bone, without any Teeth, but sharp-edged; at the corners of the Mouth an inch over. His Eyes  $\frac{1}{2}$  an inch over, an inch behind his Mouth, and two and  $\frac{1}{2}$  distant.

The Gills but  $\frac{1}{2}$  of an inch long, Convex before, very high, viz. in the fame level with the Eye. As alfo the Gill-Fins, which are about two inches long, and three broad. Two inches and  $\frac{1}{2}$  before the end of the Tail, a third an inch and  $\frac{1}{2}$  broad and two inches long. An inch and  $\frac{1}{2}$  before the end of the Tail underneath, a fourth fomewhat lefs. The Tail-Fin above two inches long, an inch and  $\frac{1}{2}$  high, with its extream edge Convex.

He is cover'd with a Skin on the Back (now) of a brownifh yellow, on the Belly whitifh. Armed all round about, excepting his Tail, with round, hard, and moft fharp Needles, about an inch and  $\ddagger$  long,  $\ddagger$  an inch diftant one from another, each having three Roots (now) visibly fpread under the Skin, one on each fide, and a third before.

'Tis most probable, That to these Roots are fasten'd fo many *Muscules*, whereby these little Pikes are govern'd in their motion, and kept steady in their posture of defence.

Another SEA-PORCUPINE like the former.

The FROG-GLO B-FISH. Orbis Batrachoides. Figur'd by Johnston under the Title of Gestachelt. meer Taube, Tab. 24. But I find it not described to any purpose.

This is feven inches long, three broad, and as high. His Forehead above an inch and <sup>1</sup>/<sub>2</sub> over, by the eminency

P 2

of

of his Eye-Brows a little hollow. His Eyes round, above  $\frac{1}{2}$  an inch over. His Mouth very broad and femilunar, like that of a *Frog*; from whence I take leave for his Name. His nether Chap a little broad and more forward than the upper. Without any Teeth, but rough like a File. The Gills  $\frac{1}{2}$  an inch long, an inch and  $\frac{1}{2}$  behind the Eyes. The Fins are five. The Gill-Fins above an inch long, almost as broad. Before the end of the Tail, one above about an inch long, that underneath broken off. The Tail-Fin above  $\frac{1}{2}$  an inch long, near as high. The Anus opens an inch and quarter before the Tail-end.

Of Fishes.

He is cover'd all over with a very hard and tough Skin, (now) of a yellowish straw-colour. Armed round about with strong Spikes about  $\ddagger$  of an inch long, couched backward, and fixed with three Roots, as in the former. But not, as those, round, but flat with two edges like the point of a Sword.

It may further be noted of these Spikes, That being fixed in the Skin, both here and in the other kinds, so as to couch and point backward, the fish needs not to tack about, but is at the fame time in a posture of defence, and of flight, for its furer escape.

The EGYPTIAN GLOB-FISH. It differs from the reft, efpecially by the fmallnefs of its Prickles, which are rather like the little Thorns on a young *Rasperry-Bufb*. He is not armed with them, as *Rondeletius* faith, all over; the Skin behind the Gills for the length of  $\frac{3}{4}$  of an inch, and on the lower part of the Tail, being bald.

The HARE-GLOB-FISH. Orbis Lagocephalus. I find it not any where pictur'd or defcrib'd. 'Tis above a foot long,  $\frac{1}{2}$  a foot high, almoft five over. His Head almoft like a *Hares*, from whence I have Nam'd him. His Forehead plain and almoft fquare, an inch and  $\frac{1}{2}$  broad. His Eyes round, above  $\frac{3}{2}$  of an inch over, and ftand high. Three quarters of an inch before the Eyes, two holes like Noftrils. From thence to the Nofe-end a little above an inch. The end above  $\frac{1}{2}$  an inch over, and round. His upper Lip ftretched thence to the breadth of  $\frac{1}{2}$  an inch. Each Chap as it were divided into two great Teeth  $\frac{3}{2}$  of an inch broad.

The Gills an inch and ‡ long, behind the Eyes an inch,

below

below them ‡ an inch. The Fins are five. The Gill-Fins ftand obliquely between the Back and the Breaft, an inch and ‡ long, and three broad. Three inches before the Tailend, a third almost two inches long and one broad. Underneath, a fourth fomewhat lefs. This, which may be noted, being couched backward, the other foreward. The Tail-Fin two inches and ‡ long, and as high, with its utmost edge Convex.

His Skin Membranous and limber, on the top of his Head, Back, upper Sides and Breaft, and round about his Tail, fmooth and bald. On his Belly and lower part of his Sides and Breaft, armed with little fhort Prickles, about the third of an inch diftant, and fixed with little Roots, as in the former.

From the Crown of his Head are drawn two Lines almost to those holes like Nostrils. From the hinder part of the Head, two more all along the Back and Tail, in the figure of the Letter *f*. And two others from the Gill-Fins towards the *Anus*, and from thence to the end of the Tail. By these Lines, were there no other marks, it is easie to distinguish him from all the other *Species*.

An OVAL COMPAGES of BONES, faid to be the Sceleton of a Globe-Fifb.

The RED-GOURNET. *Pavo Salviani. Cuculus*, from the noife he makes like a *Cuckow* when he is taken. Well defcribed by *Rondeletius*. But his figure, efpecially in making him with a long Snout, anfwers not, unlefs it be of another *Species*. For the Forehead of this is fquare, and the Head almost cubical, like that of the *Scorpion-Fifb*. From which this chiefly differs in not having the Fins of the Back prickly or fpiked, and having a Line running from the top of the Back on each fide the Back-Fin to the Tail, like a finall linked Chain.

The LONG-SNOUTED GOURNET. *Cuculus Rondeletii*. By which Author 'tis well defcribed. It differs from the former *Species*, chiefly, in having a much longer head, and a faddle-Nofe.

The STAR-GAZER. Uranofcopus. Becaufe he looks directly against the Sky : whereas, as Rondeletius observes, the Ray and several other fishes, although they have their Eyes standing on the top of their Heads, yet the Pupils of their

### PARTI.

their Eyes are not directed upwards, but fide-ways. The Fifh is accurately defcribed by the fame Author. Saving, that he hath omitted the arching or bowing of his Body with the Head and Tail upwards : unlefs both the fhape of the Fifh here be forced, and his own figure thereof falfe.

This Fifh, when alive, hath a flender Membranous ftring, which he projects and draws in, at pleafure, as a Serpent doth his Tongue. With this he duckoys little fifhes, and then preys upon them. For plunging himfelf in Mud (Rondeletius faith, he hath feen him) and then lifting up his head a little, he cafts out the faid ftring; which the little fifhes taking for a Worm, and nibling at it, he immediately plucks them both in together.

The SQUAR-FISH. *Pifcis quadrangularis*. I think it is not defcribed or figur'd by any. There are two fquare fifthes defcribed by *Wormius*, the former of which he fuppofeth to be made fo, not bred. But neither is this, as that is, fpiked behind; nor as the other, horned before, befides other differences: 'Twas fent from the *Eaft-Indies*.

<sup>°</sup>Tis about fifteen inches long, four high, in the middle three and <sup>±</sup> over. His Forehead fquare, by the eminency of the Eye-brows, a little hollow; two inches and <sup>±</sup> over. His Eyes near an inch. His Nofe blunt, not very fteep, an inch and <sup>±</sup> long. Two fmall holes in the place of Noftrils. His Mouth exceeding little, <sup>±</sup> an inch over. His Teeth alfo very fmall.

The Gills are ftrait, an inch and  $\ddagger \log$ . His back a little Convex; towards his Tail, and on his fides blunt angled. So alfo his Belly, but plain or flat; and confiderably rifing up towards his Tail. He hath five Fins. The Gill-Fins are two inches in length, and two in breadth. They ftand a little obliquely. Like thefe, a little before the Tail, one above, another under. The Tail-Fin three inches long, and three and  $\ddagger$  high.

Some part of both the Chaps and of the Tail are cover'd only with a Skin. The reft of the fifh with a kind of Cruft: yet not altogether fo hard as in the Cruftaceous kind. This Cruft is all over adorned with innumerable little round knobs reduced, for the most part, into hexagonal figures, fubdivided into equilateral Triangles. *Wormius* 

PART I.

*Wormius* calls this Cruft a Leathery Skin: but not rightly; as any one that compares it with the true Skin upon his Chaps and Tail, whereof he takes no notice, may eafily judge. That it may be bent, proves it not a Skin; for fo may the Cruft of a *Lobfter*. To which this feemeth to ftand in the next degree, as that doth to a fhell. Or to fpeak properly, it feems neither a Skin, nor a Cruft alone, but a Medly of both together, or a Cruft upon a Skin: Nature having here, as in many other examples, united two extreams by a third Thing in the middle.

Another SQUARE FISH ftained with black Spots. Given by Mr. John Short.

The CONEY-FISH. *Pifcis Triangularis*. Deferibed by *Marggravius*. *Wormius* alfo fuppofeth his firft *Square-Fifb* to be the fame. But neither of them are particular enough.

Tis above  $\frac{1}{2}$  a yard long, above  $\frac{1}{2}$  a foot high, the Belly flat, and almost  $\frac{1}{2}$  a foot over. From whence his fides rife up into a sharp Angle. His Head somewhat like that of a *Coney*; from whence his Name. His Eyes great, *fc.* an inch and  $\frac{1}{2}$  long; and stand high. His Forehead almost square, and by the eminency of the Eye-brows a little hollow; an inch and  $\frac{1}{2}$  broad. Half an inch before the Eyes two little holes like Nostrils. His Nose defending almost perpendicularly, three inches deep, and blunt-ended. His Mouth not above an inch over. The Teeth  $\frac{1}{2}$  of an inch long, and sharp: ten in the lower Chap, in the upper twelve. His Back arched between the Head and Tail, and, as is faid, very sharp. On each fide his Belly he hath a strong stoward his Tail.

His Gills are ftrait, above an inch long, and parallel to his Nofe. The Fins five. The Gill-Fins here broken off. A little before his Tail, one above, another below, both two inches long, an inch and  $\frac{1}{2}$  broad. The Tail-Fin three inches long, and two and  $\frac{1}{2}$  high. Excepting his Chaps and Tail, which are naked, he is cover'd all over with the like Cruft, as the former. On the upper part of the Tail, alfo grows a diffinct Cruft, of an Oval figure.

The Chaps and Tail of this Fish, and the rest of the kind, are both left naked, for the more easie and convenient motion

PART I.

motion of the one in eating, and of the other in fwimming. And for the fame reafon, the Gill-Fins do alfo ftand upon a naked Membrane.

The Female-CONEY-FISH. The Nofe here defcendeth not fo fteeply. The Belly not fo broad. The Cruft every where, except the middle of the Belly, ftained with a great number of round black Spots. Hath not many of the triangular fubdivisions. Nor the Oval Cruft upon the Tail.

Another of the fame Species, with that now defcribed.

The HORNED CONEY-FISH. *Pifcis triangularis* (a) Tab. 45. cornutus. Johnston hath figur'd it. (a) But without either Defcription or Name. It differs from the fish last defcribed chiefly by its Horns, which he hath upon the top of his Forehead,  $\ddagger$  an inch long, near an inch about the bottom, and pointed; almost like an Horse Ears when he pricks them forward. His Teeth are also fimaller, his Mouth leffer, and more naked. His Belly narrower, and fo his fides more compressed. The Tail-Fin longer. And the Oval Cruft on the Tail, not above but beneath.

ANOTHER of the fame Species, with two Oval-Crufts, one on the top of the Tail, the other underneath.

A THIRD, without the faid Oval-Cruft, and the triangular fubdivisions.

Two more HORNED CONEY-FISHES. All five of one unmixed alh-colour.

#### CHAP. III.

### OF SCALED-FISHES.

The HEAD of the CUCUPU-GUACU; fo called by the people of *Brafile*, where it breeds. Defcribed by *Marggravius*. Who faith it is fometimes two yards long, and a yard and half about. The Mouth of this Head ftanding quite open, makes a circle of a yard in compafs. So that, probably, 'tis the biggeft of *Scaled-Fifbes*, excepting

# Of Fishes:

excepting the Sturgeon. Of all our European Fishes, it feems to come nearest to the Cole-Fish or Black-Cod.

The SCALES (perhaps) of the fame Fifh. They are almost circular, above three inches in Diameter, and anfwerably thick. Like other Scales, they are horny, tranfparent, and elastick or fpringy. That part of their edge which is inferted into the Skin; bluntly Toothed. They have a great many exceeding finall *Striæ*, hardly visible, but by holding them up against the light.

The FILE-FISH. CAPRISCUS. It was fent from the *Bermudas*. Curioufly pictur'd and defcribed by *Salvian*. (a) (a) Hift. 71. I call it the *File-Fifb*, from the likenefs which the foremost Bone upon his Back hath to a file. There are three of them: which, faith *Salvian*, he raifes and depresses at his pleasure; yet fo, as not one alone, but altogether. And although you press the foremost, and greatest never fo hard, it will not ftir: but if you depress the last and least of all never fo foftly, the other two immediately fall down with it: just as when a *Crofs-Bow* is let off by pulling down the Tricker. For which reason also the fish is called, at *Rome*, *Pefce Balestra*.

Another thing peculiar to this fifth is, that his Scales (as *Salvian* calls them) are feparated by cancellated lines, or Lattice-wife. I add, and that they are all incruftated, and rough-caft with little round knobs. So that the cover of this fifth, is near a kin to that of the *Square-Fifb*; that being only one entire Cruft, this divided into many little ones.

It may be noted, That where *Salvian* defcribeth this fifth to be *compreffum*  $\circlearrowright$  *latum*, *atq*; *fere orbicularem*, he hath not properly expressed his shape. For he is not *Broad*, but *Tall*; and much nearer to a *Rhombus* or Diamondfquare.

This fifth feems to be the fame which the People of Brafile call GUAPERUA; defcribed and pictur'd by Marggravius and Pifo, and out of them by Johnston. (b)

The TALLEST FILE-FISH. This feems to be that *Species* particularly defcribed by *Salvianus*. It differs from the foregoing only in being taller and narrower: and in having the Tail-Fin with longer horns.

The PRICKLE or longest FILE-FISH. It is a young One.

(b) Tab. 34.

#### 114

## Of Fishes.

One. Differs from that of *Salvian*. In that on the fides hinderly, grows a little fhort Prickle upon the centre of every Scale, pointing backward. It is alfo ratably much longer and lower, his Nofe a great deal fhorter, and lefs fteep, and his Tail-Fin lefs fpread.

Another LONG-FILE-FISH of the fame Species, and about a foot in length. But the Prickles above-faid are here worn off.

The STREAKED FILE-FISH. *Caprifcus striatus*. This differs from the last, In that its Scales are not prickled, but streaked with many small Lines; forward, entire; but hinderly composed of many little knobs.

The SNIPE-FISH. Scolopax. It was taken in the Baltick-Sea. I find it no where well defcribed.

It is a little fifh, when at full growth, as *Rondeletius*, who had feen three of them all finall, and full of Eggs, well obferves. This here, about three inches and  $\frac{1}{2}$  long,  $\frac{2}{3}$  of an inch high, the fides much compressed, being not  $\frac{1}{3}$  of an inch thick. The *Orbits* of his Eyes very great, *fc*. a  $\frac{1}{3}$  of an inch over. His Forehead as much.

He hath a tubular or pipe-like Snout, refembling that of the *Hippocampus*, or the *Horfe-Fifb*. It confifteth of only one hollow Bone, ftrait, and from his Eyes above an inch long, or one third of his whole length. At the root, above 4 of an inch high; at the extremity, in. Where he hath an exceeding little Mouth; which openeth not before, but above.

His Gills large, behind the Eyes  $\ddagger$  of an inch, from whence carry'd to his Snout or Bill, they defcribe  $\ddagger$  of a circle. The Fins four. The Gill-Fins almost  $\ddagger$  an inch long, in the fame level with his Mouth and the bottom of the Eye. The Tail-Fin as long,  $\ddagger$  of an inch high. Before and above the Tail a fourth, a  $\ddagger$  of an inch long,  $\ddagger$ broad.

A little before this Fin, ftands a white and very fharp Spike, or Sam, above an inch long, couched a little backward, and armed with a double row of fmall fharp Teeth, all pointing upward. To this great One, are fubjoyned two lefter, by one common Membrane, as in the File-Fifb.

His Skin grey with fome few rays of red; poffibly more

m

### Of Fishes:

in the living fifth. He is fcaly, and rough with a fingle Row of very fmall Prickles near his Eyes, with a treble one on his Belly and Sides; hardly visible without a Glass.

By the great length and ftructure of this Fifhes Bill, he fhould feem, upon dilating his Throat at his pleafure, to fuck in his food, and fo to ufe it as a *Sirynge*. Withall, his Mouth not being open before, but on the top of his Bill-end, like a Gutter-Trough, doth much promote the current, of all that comes in at it, to his Throat. And fo in the *Trumpet-Fifb*.

The three Spikes on his Back (whereof *Rondeletius* and others only obferve the greateft) being affociated in the fame manner, and having the like mutual proportion, as in the *File-Fifb*; it may reafonably be fuppofed, that they have alfo the fame Motions, depreffions and erections, as, in fpeaking of the faid fifh, hath been defcribed. And that therefore, while the fifh fwims fecure, they are all couched down clofe to his Back, that they may not hinder his courfe: but that when ever he is purfued, he ftrait erects them all, and by the help of the leffer, keeps the great one tite up againft his Enemy.

The SQUARE ACARAUNA; by Mariners, *The Old Wife.* It hath fome marks of kindred with the tall *Acarauna*, deferibed and pictur'd in *Marggravius* and *Pifo.* But hath alfo divers others of diftinction from it; as the different polition of the *Spurs*, the different shape both of Head, Body and Tail, &c. as may be observed by comparing the Deferiptions and Figures of both together. The tall *Acarauna* is figured alfo by *Johnston*, (*a*) out of *Marggravius*; (*a*) Tab. 32. but without any Infeription of Number or Title.

This here was brought from *Suranam*. Eight inches long and  $\frac{1}{2}$ , above three high, about one and  $\frac{3}{2}$  over. His fore parts and Tail are (now) of a pale ftraw-colour; all the reft are of a blackifh brown. He is cover'd all over with Scales engraven with finall parallel Lines: except on his Forehead and Chaps before, where his Skin is only ruged as you draw your Finger downward.

The Crown of his Head rifes up into a blunt Angle, his Forehead flat, above i an inch broad. His Eyes round, i an inch over, and ftand high. A little before them, two fmall holes like Noftrils. His Mouth alfo ftands high, and

Q 2

is extreme fmall, fcarce <sup>1</sup> of an inch over. His Teeth contiguous, like fmall Needles.

On his upper Jaw grow four little Prickles on each fide. On each fide his nether, two great *Spikes* or *Spurs*, hard, and very fharp, about an inch long, pointing obliquely downward, and bended a little like a *Cocks* Spur. From the Root of these feveral little fhort Prickles run in a strait Row to the Eyes.

The Gills behind make a ftrait Line, and an Angle, from whence they are produced forward. The Fins feven. The Gill-Fins hang under the *Spurs*, an inch and ½ long near an inch broad. The Breaft-Fins alfo an inch and ½ long, ½broad. The Back-Fin from the top of his Head, the Belly-Fin from his *Anus* are carry'd to the Tail-Fin, fo as to ftand betwixt two parallel lines, making the fifh almost fquare; from whence I have Nam'd it. They are both ftretched out beyond their roots with two fharp Angles. The Tail-Fin an inch and ½ long, and higher, with its utmost edge Convex.

The Spur above defcrib'd, is a dangerous, and as it feems, a malicious Weapon; wherewith the fifh ftrikes fide-ways, and as it were under-hand, not fuffering, in its doged humor, any other fifh to confort with it.

The SWALLOW-FISH. So called from the length of his Gill-Fins, which reach to the end of his Tail, like a pair of very long Wings. By fome, the *Flying-Herring*, from a likenefs in the fhape of their Body. Perhaps *Rondeletius's Mugilis Alatus*. But by *Salvian* called *Hirundo*, by whom it is well deferibed. (*a*) That Line (faith he) which in other fifthes goes either from the Head or *Branchiæ* by the fides to the Tail; here runs from the Belly-Fins along the Belly to the Tail. *Johnfton* alfo deferibes it out of *Aldrovandus*, but omits the juft number of feven Fins. In the figure alfo which he gives, the Belly-Fins are wanting. And the *Orbits* of the Eyes, which are extraordinary great, he reprefenteth little.

His Gill-Fins he ufeth as Wings, wherewith he flyeth, for efcape, above the water, when purfu'd by another fifh; efpecially, as *Pifo* faith, by the *Dolphin*. But as they fly (as the fame Author) they often become a prey to *Water*-*Fowl*. Hundreds of them are fometimes feen above the Water

(a) Hiftor. 62.

Water at once. When they fly, they make a kind of Stridor, as fome Fowls with their Wings.

KITE-FISH. So called alfo from his Wings or Gill-Fins, which, what they want in length, they have in breadth and ftrength. Figur'd by *Rondeletius*, and accurately defcribed. Saving, that he mentions but feven of his eight Fins.

This fifth feems to be the fame with that which Marggravius defcribes by the Name of PIRAPEBE.

Another KITE-FISH of the fame Species. Figur'd by Johnston, Tab. 17. N.9.

Of the GILL-FINS of the FLYING-FISH, it is further obfervable, That they are fastened very high near their Backs; that fo at the fame time their Bodies may be in fome part fustained by the Water, and their Wings have a little fcope to play above it, for their easier advance into the Air.

The BEARDED-LOACH or GROUNDLING. Gobites Barbatula. It is a fmall fifh about five inches long, bearded with fix finall Threads, three on each fide. Yet Bellonius mentions but four. Nor doth Gefner picture more in his corrected figure. See them both.

The MAILED-FISH. CataphraEtus Schonveldii. It was brought from Guiny. But is alfo often taken in the Mouth of the Elb. It is well defcribed by the Author of the Name. And by Johnston well figur'd, Tab. 46. But in Tab. 24. but fcurvily, unlefs it be another Species. It is a fmall fish about five or fix inches long, with a broad fquat head, and thence taper'd to the end of the Tail. His Scales are as it were doubled, by which he becomes of an angular figure, with about eight Angles before, and fix behind. His Nofe-end armed with two Prickles standing together in a femilunar figure; supposed to be venemous.

The TAMOATA pictur'd and defcribed by *Pifo*, feems to be the fame with this fifh.

Another MAILED-FISH of the fame Species.

The MAILED-FISH of *Brafile*. It hath a near refemblance to the former; from whence I have Nam'd it. I find it no where defcrib'd. 'Tis  $\frac{1}{2}$  a foot long. His Headan inch and  $\frac{3}{4}$  long, and near as broad. On the hinder part of his Head he hath three Angles, one on each fide, and

and a third in the middle. The Forehead almost flat. His upper Chap Elliptick. The *Orbits* of his Eyes round,  $\ddagger$  of an inch over, an inch behind his Nofe-end;  $\ddagger$  diftant. A little before the Eyes, two large holes like Nostrils. His Mouth a little prominent, near  $\ddagger$  an inch over. His Lips in the place of Teeth, only rough. His lower Jaw and Belly flat. His Body before, an inch and  $\ddagger$  broad, an inch and  $\ddagger$  high, his Back round, the Sides ending in two Angles. His Tail taper'd, and with the Sides a little flat.

One half of the Gills opens on the fides, the other underneath in the Breaft. The Fins are eight. The Gill-Fins of an unufual ftructure, having their utmost Spine or Bone very rough, thick and strong, above an inch and  $\frac{1}{2}$  long, flat and crooked, almost like a *Reaping-Hook*, seven or eight times as big as any of the rest of the Fin-Bones. The Belly-Fins much less, and above an inch behind. Just over these the Back-Fin. On the Tail one above, underneath, and at the end: But the two first are here broken off.

His Head is cover'd with a brown and rough bony Helmet. His Back, Sides and Tail with Scales of the fame colour, but a little lighter, rough, engraven with fmall parallel Lines, and of a Rhomboidal figure. His Breaft and Belly only with a thin limber Skin.

The BRASILIAN NEEDLE-FISH; by the People of *Brafile* called TIMUCU. *Acus Brafilienfis. Marggravius* hath defcribed and figur'd it well. 'Tis a long flender fifh, from whence its Name. It hath alfo a pair of Chaps like a long Bill. He only omits the two fcaly Lines which run along the Belly and Tail of the Fifh, which every where elfe hath a naked Skin.

The CHAPS (perhaps) of the GREENLAND NEEDLE-FISH. The Teeth which ftand in fingle Rows on the Edges of the Chaps are thick and ftrong, yet very fharp. In the lower Chap, near the two edges, are two furrows, into which the Teeth of the upper Chap ftrike. The two Bones which compose the Chap, are joyned together by an indented Suture, most curious to look upon. The fish feems next a kin to the common great *Needle-Fifb*, or the *Girrock*, which is defcribed by *Rondeletius*, *Aldrovandus*, and others, and pictur'd by *Johnston*, *Tab.* 15.

(a) Hift. Anim. lib. 2. It is an Obfervation of Ariftotles, (a) That most fishes c. 17.

Of Fishes:

having no Gullet, but their Stomachs standing just behind their Mouths; it often comes to pass, that while the greater pursue the lesser, acontina in 2012/a eis to 50/4000, their Stomachs come out into their very Mouths. Some refemblance whereof, in a low degree, may be felt by those that with an eager Appetite first begin to cat; the Gula rising up a little as it were to meet the meat half way; which, upon its retreat, it sucks in after it. Which hath happened in some with that violence, as to have endanger'd their being choaked.

### CHAP. IV.

# OF EXANGUIOUS FISHES.

The Rough HORNED-LOBSTER. Given by Dr. Thomas Allen. I call it fo, from the many pointed knobs which he hath all over his Back. Squilla Crangone. Deferibed by Rondeletius. See alfo the figure hereof in Gefner, p. 1099.

This fifh, inftead of the Plates on the Tail of a common *Lobster*, hath fo many Fins, which for the far greater part of them are naked, or without a Crust upon them.

All Lobsters use their Tails, as Fins, wherewith they commonly fwim backward by Jirks or Springs; reaching fometimes ten yards at a Spring. For which purpose, whereas the Gill-Fins of other fishes, which are their Oars, are a little Concave backward; these have the Plates of their Tails when they bend them down, as they use to do, a little Concave forwards.

Another HORNED-LOBSTER with a fmoother Back. These fishes are the most pleasant meat of all the Crustacious kind; except perhaps the Punger.

A CLAW of the GREAT LOBSTER. Aftacus Leo. Tis above a foot long, and a foot and three inches round the middle. So that, ratably, the Lobster it felf must have been about a yard in length.

TWO more of the fame, a little leffer.

The CLAW perhaps of a rare fort of CAMARUS, with the inner Joynt forked. The

The MOLUCCA-CRAB. Cancer Molucenfis. The beft figure hereof is given by Befler, who alone shews the Eyes; yet not fo clearly as could be wifhed. Not ill defcribed by Joh. de Laet. That which Clusius makes to be the fore part, he makes the hinder: and Wormius doth the like; and faith, it is plain, from the polition of the Legs; With both whom I agree. And to what Wormius faith, I alfo add, the position of the Eyes; for from Clusies Defcription, it would follow, that they flood in the hinder part of the Crab. Here are eight or nine of them; the entireft and largest, given by Henry Whistler Efg.

The Eye of this *Crab*, hath a horny Cover. But stands almost flat, or in the same plain with the rest of the shell. 'Tis pleafant to look on, being latticed like the Eye of a Butter fly. The latticed-work is differnable to a naked Eye, but much better through a Glass.

The People (a) that live near the River Chovacoèl in Nova Francia, pile their Shafts with the Tails of this Crab, which breeds there abundantly.

The CLAW of the PUNGER, or the VELVET-CRAB, It is one of the biggeft fort; and the beft called *Pagurus*. meat of any. Linschoten reports, That some (but he faith not of what kind) in India, have been found fo big, that whenfoever they got any man with in their Claws, it coft him his life.

The PRICKLED-CRAB. Hippocarcinus, or Cancer asper, because of the Spikes that grow upon his Back. They breed near Norway.

Another with a great number of Center-shells growing upon its Back.

It is noted by Aristotle, (b) That all Lobsters and Crabs Anim. lib. 4. have their Right Claw, the greater and stronger. Crabs have no Tail, nor need it, faith the fame Author, (c) as Lobsters do to fwim with; because they live much upon the Land.

> CRABS-EYES. Oculi Cancrorum. A Crustaceous-stone fo called, growing as is commonly (but I doubt falfly) faid, in River Crabs. Especially, faith Cerutus, (d) in the Female, at that time, when the new shell begins to grow.

> Both the Powder and the Magistery of Crabs-Eyes; and the Claws, and Distilled-Water of Crabs, are all used in Medicine. The

(a) J. de Lact. l. 2.

(d) Muf. Calceol. Sect.1.

(b) De Part.

c. 8.

(c) Ibid.

Of Fishes.

The NAKED-SHRIMP, commonly called *The Souldier-Crab. Cancellus.* Here are two of them houfed ; one in a *Sea-Snail-Ibell*; the other in that of a common *Wilk.* It is accurately defcribed by *Ariftotle.* (a) His fore part is armed (a) Hift. An. iib. 4. c. 4. with cruftaceous Plates, as the *LobIter*, but rather refembles the *Shrimp.* His hinder part is naked, or without a Cruft : from whence I take leave for the Name : Neither the ufual *Englifb* Name, nor the *Greek*, *Maprimov* (according to which the *Latin*) being futable to the fhape of this Animal, a quite different kind from a *Crab.* 

Two NAKED-SHRIMPS unhoufed, or without a fhell.

This Animal, becaufe his hinder part is naked, always houfes himfelf in fome empty shell, or other capable Body. When he hath filled one shell with Excrements, faith *Bellonius*, or grows too big for it, faith *Aristotle*, he transplants himfelf to another. Those that house themselves in the shell of the little long *Wilk*, or the *Purple-Wilk*, are called *Little Souldier-Crabs*, those in the great *Wilk-shell*, the *Great Souldier-Crabs*: and so, if in other shells of like bigness.

The INMATE-CRAB. *Pinnophylax*. Becaufe it is faid to watch for the Prey, and to give notice to the *Pinna* when to apprehend it. 'Tis fhaped like a *Crab*; but feldom grows bigger than a *Chefnut*. They are of a lovely white, and fome with rays of a light Red or Pinck-colour. One difference betwixt the *Cancellus* and this, is, That *that* always choofes an empty fhell,*this* hofpitates with the living Animal in the fame fhell. He cohabits not only with the *Pinna*, but alfo the *Mufcle*, *Oyfter*, and *Scallop*.

The PREKE or POULPS. *Polypus*. See the Defcription in *Rondeletius* and others. 'Tis a *Naked-Fifb*, having eight Fingers or Arms fpread out almost like the Rays of a *Star-Fifb*, and the Mouth in a manner in the middle of them. Their Arms ferve them both to fwim with, and to Attaque the Prey. When they are purfu'd by a fifh, they prefently cast forth a black Liquor, which they have always ready in a Bag, and wherewith they darken the water, and fo make their escape. Being boiled with Wine and Spices, they are, faith *Moufet*, (b) a very excellent meat. The SMOOTH STAR-FISH or SEA-PAD. Stella

(b) Lib. de Stella Re Cibariâ. marina

R

PART L.

*marina lævior.* It was fent from the *Eaft-Indies.* I find it not defcribed. When alive, it is of a flefh-colour. It hath five Arms or Rays, each an inch broad, and proportionably very long, *fc.* above five inches; the Trunk being not above an inch and ½ Diameter. The upper or convex fide is wrought all over with very little lenticular knobs, almoft like a *Chamæleon*'s Skin; with finall Concavities interjected, like thofe in *Poppy-feed.* Underneath, each Arm is furrow'd, the Margins of the Furrows being fet with a kind of curious Fring. The Margins of the Arms wrought with Lenticular eminencies fet in a ftraight Row, and befprinkled as it were with little *Century-feed.* 

Of Fishes.

All Stars have their Mouths in the middle underneath, as the Sea-Urchin. They feed upon Shell-fifh. And feem, faith Rondeletius, to have no other paffage for their Excrements, but their Mouths. Whereof I much doubt. They take the Prey, as the Polypus, and fwim very fwiftly, by ftretching out or contracting their Arms at their pleafure.

The BRANCHED STAR-FISH. Stella marina arborefcens. A rare kind. It was taken in the Bay of Maſtachuſet in New-England. See the Deſcriſption hereof in Rondeletius, and out of him in Wormius. As alfo in the Philofophical (a) Num.57. Tranf. (a) under the Title of Piſcis Echinoſtellaris Viſciformis. Before I had peruſed theſe, I had drawn up a Deſcription of my own, which I will take leave to ſubjoyn. It is above a foot Diametre. The Mouth, in the middle, is divided into five Lips. The figure both of this and of the Trunk or Body is pentangular. The Diametre of the Trunk almoſt three inches. The fides grow thin from the Mouth to their Edges, which are fo many exact Hyperbola's.

> From the five Corners of the Trunk, as many Branches being produced, are prefently each divided into two others, about an inch in compafs; round, but by a double Row of little knobs, feeming to be fquare. Each of thefe, are again fubdivided into leffer and leffer Branches. The laft whereof, are fcarce thicker than a Horfe-Hair. In number, by a moderate effimate, above a Thoufand.

> As he fwims, he fpreads and stretches out all his Branches to their full length; but so soon as he perceives the Prey

within

# Of Fishes.

within his reach, he hooks them all in, and fo takes it as it were in a Net.

The PRICKLED STAR-FISH. Stella marina hirfuta. Perhaps Rondeletius's Petinata prima. It hath five Arms, each Arm pointed, and alfo flender or narrowed next the Trunk, but fpread in the middle. Two inches and  $\ddagger$  long; the Trunk it felf not above  $\ddagger$  an inch Diametre. The upper part hath a rough fhag of fhort Prickles; the other, of longer : where alfo the Arms are furrow'd. Thefe innumerable Prickles upon their Arms, are all movable, as in the Sea-Hedg-Hog.

Three more PRICKLED STAR-FISHES; which indifferently answer the second, third, and sourth of *Ron*deletius.

The CROWN'D-STAR-FISH. Stella marina Coronalis. It was taken in the Danish-Sea. I meet not with the Defcription any where. 'Tis a little One. It hath five short Arms, bluntly pointed, about two inches long. The Trunk two inches and i over, the five Sides whereof are Hyperbolick. The upper part rifes up like a Crown, adorned with round Knobs of the bigness of a green Peas, with other little ones, on both fides like Pins heads, ranged into five even Rows from the ends of the Arms to the top of the Star; in some fort, as precious Stones are set upon a Royal Crown: from whence I have named it. The fpaces also between them are befet with little knobs. The edges of the Arms and Sides are in like manner fet round about with leffer upon greater. Underneath, the furrows of the five Arms meet in the middle, paved with little Stones almost like Teeth; the broad Margins, with other round knobs or stones.

These Stones, are in colour, substance, and nature congenerous, with those which are commonly called Crabs-Eyes.

The HIGH-CROWN'D STAR-FISH. It differs from the former, in being much taller, and in having no Knobs, but only Spikes, the one half whereof are ranged into certain correspondent Orders.

A FLAT SPIKED STAR-FISH, taken in the German Ocean.

Little STAR-FISHES with five Arms, taken in the British Seas. R 2 A

## Of Shells.

PART I.

A STAR-FISH with fix Rays or Arms. They are almost like those of the fmooth *Star-Fish*; excepting, that two of them are as short again as the rest. Whether a monstrous Production, or a distinct *Species*, I cannot fay.

A STAR-FISH with TWELVE RAYS; by fome called *Sun-Fifb.* 'Twas taken in the *British-Sea.* The *Basis* of each Ray is much flenderer than by the figure in *Johnston* is represented. Neither is it shag'd only on the edges, as in the fame figure, but all over.

### SECT. VI.

### OF SHELLS.

### CHAP. I.

### Of whirled and fingle SHELLS.

There is a large Treasure of Shells in this Museum: in all, great and small, about fix hundred. The Reduction of all which to the Order of Nature, whoever shall go about, will find to be no little Task. Nor can it be perfectly done here, because as yet the Collection it felf is not perfect. According to the best Method I can at present think of, I shall here place them. And that it may be the better judged, how far it is natural, or not, I shall afterwards digest them into Schemes. Most of them are Strangers in England and the British-Seas, and therefore I must be allowed a little more than ordinary liberty for the English Names.

Note, That when I fpeak of the Right or Left Lip of a Shell, I mean, as it is held with the Mouth downwards.

The FROG-WILK. Murex Coracoides. Defcribed and pictur'd by Johnston out of others. As are also most of those that follow, which are only named. It hath three Appendices on each fide, like fingers or feet, and one at the end. The

## Of Shells.

The BROAD-LIPP'D WILK. Aporrhais. The Lips of this are pale and even. Of this kind, three great Ones are here preferved, one of them above a foot in length.

The BROAD-LIP'D WILK, with wrinkled Lips, and dyed with a deep purple. See a curious figure of this in *Calceolarius's Museum*, (a) under the Title of *Conchilium* (a) Sect. 1. *Muricatum*. This Shell, faith *Cerutus*, (b) the *Indians* ufe (b) Ibid. as a Trumpet, both in their Wars, and in Hunting.

The MARBLE WILK. *Murex marmoreus*, from its mixed colours, which make it look like fpoted Marble. Of thefe, here are five.

The ORIENTAL WILK. Murex Orientalis. The right Lip of this is even. Here are four great Shells of this fort, near a foot in length.

Another ORIENTAL WILK, with the right Lip undulated.

Betwixt the three forts of Shells above mentioned, there is this difference, That the right Lip of that commonly call'd *The Oriental*, is only expanded; that of the marbled, expanded or fpread, and turned outward; of the *Broad-Lip'd*, fpread outward, and as it were Finger'd.

A SHELL like the ORIENTAL, with a KNOBED Turban or Whirle.

Another of the fame fort with an EVEN Whirle. It is a fmall fhell, not above an inch and <sup>‡</sup> long. Forward, fomewhat flat, and white as Milk. Hinderly, ftained with tauny fpots. The left Lip is turned or fpread out. The right, at the bottom wrinkled, and ftained with a light purple. Towards the Cone or fore Corner, is gather'd into an open Angle. The *Whirle* is fmooth, not very high, maketh fix Rounds.

The LONG-MOUTH'D WILK. Murex Labris parallelis. Both the Lips of this are plain or even on the Surface. I call it Long-Mouth'd, becaufe the Mouths of all that have been nam'd before, are very wide.

The LONG-MOUTH'D WILK, with oblique furrows on the left Lip. Here are four of this fort : whereof one is near i a foot long. Each of the inner Rounds of the *Whirle* or *Turban*, is one third part leffer than that next without it.

The SPIKED-WILK. Murex Aculeatus. This, of all the

#### 126

f. 5.

### Of Shells.

## PART I.

the reft, hath the Name, Murex, most properly given it; from the spiked Instrument used in War, so called. The Spikes of this are round. Here are three of these Shells, one (a) Tab. 32. of which is \$ of a foot long. Well figur'd by Olearius. (a) And better by Befler.

The SPIKED-WILK, with doubled or PLAITED Spikes. Here are two of this fort, one of them near <sup>1</sup>/<sub>2</sub> a foot long. Both the Lips are a little drawn outward, and fo the Mouth almost Oval, both the corners thereof pretty long, the left Lip fpread outward, the right wrinkled; the main Body fomewhat Conical, the Whirle low, confifting of fix Rounds; both striated, and armed with plated Spikes standing in a fpiral Order.

The BOSSED or KNOBED-WILK. In the place of spikes it hath round knobs. Here are five or fix, all leffer ones, about the length of a Katharine-Pear; fo that 'tis probable they grow not much bigger.

The CONICK SNAIL. Cochlea Cylindrica; fo it is commonly called by Zoographers, but very improperly, the figure hereof being Conical. Here are about fourteen of this fort. Whereof fome have a plain, others a knobed Some are all over white, or yellowifh, others are Turban. ftained white and black, or blackifh-bay, white and brown, or white and yellowish. In some the colours are laid in fpots, in others undulated, and in fome others Lattice-wife. Rondeletius faies, That this Shell feldom exceeds the thickness of the Thumb. Yet one of thefe is above i a foot long, and the Bafe above three inches over. The reft are fmall, all of them plain Cylinders. Not unelegantly express'd in fome variety of figures by Olearius, Tab. 31. and Fig. 3. of Tab. 32.

The Whirle maketh nine or ten Rounds: which hold the fame proportion one to another, as in the Long-Mouth'd In the Kingdom of Congi, and fome other places in Wilk. the East-Indies, these Shells go for Money.

The CONICK SNAIL a little convex, and with the Rounds of the Turban alfo convex.

Another Convex Conick Snail, with the Rounds of the Turban Concave.

The GREAT PERSIAN WILK. Concha Persica major. Of this fort there are four here preferved, of which, two This are above <sup>1</sup>/<sub>2</sub> a foot long.

# Of Shells.

This *Wilk* yields a purple juyce, anciently ufed for deying. The Cover of this Shell is called *Onyx* or *Unguis*, becaufe in fhape like the Claw of a Carniverous Bird. The beft of thefe *Opercula* or Covers are found in and brought from the *Red-Sea*.

The leffer PERSIAN WILK, with furrow'd Lips. Of this fort there are five here preferved of a middle fize. The *Great Perfian Wilk* is knobed, and hath only one Series of wrinckles. This even, and with a double Series of wrinckles a crofs one to the other. Each of the outer Rounds of the *Whirle* is double the thicknefs of the next within it.

The leffer PERSIAN WILK with even Lips. 'Tis a fmall fhell, fcarce bigger than the Kernel of a *Filbert*. The Mouth is almost Oval, each Corner ending in a fmall Channel. Both the Lips are turned outwards fideways, and as far as the end of the *Turban*. The Back is fpeckled with white, red, and blew. The *Turban* not high, nor hath more than three Rounds.

The PERSIAN WILK, with the Rounds of the Whirle plated and interrupted; fo as the Plates of the feveral rounds do anticipate one another. Of these here are three.

The FLAT-LIP'D SNAIL. Cochlea finiftri Labri angulo duplici. Not defcribed. In a manner half a long Oval. The left Lip is flat, whereby it hath a double edge. Deep within, 'tis flained with a fhining Bay. The left Lip near the *Turban* almoft an inch broad ; before, it ends fharp. The *Turban* maketh but about two Rounds. Both this and the Body are befet with knobs in a fpiral order, and are cover'd over with a pale purple Cruft.

The fhort FLAT-LIP'D SNAIL. 'Tis white within; yet the left Lip is ftained with two Bay fpots. The Back of a light afh-colour. The Knobs of this have no Incrustation. The Rounds of the *Turban* are three.

The WRINKLED-SNAIL. Cochlea rugofa. Here are two of thefe, whereof one is near  $\frac{1}{2}$  a foot long. Each of the outer Rounds of the *Turban* is twice as big as the next within it. One of thefe is curioufly figur'd by *Befler*.

The HOOK-NOS'D SNAIL. Cochlea Roftro recurvo. So I call

PART I.

I call it, though it is not properly the Nofe or Beak of the *Snail*, but of its shell. The *Turban* is pretty high. Both this and the Body are wrought with knobs and lines in an oblique and spiral Order.

(a) In his Purpura. But better in his Book de Aquat. & Terreftr. The SNAIL with the SPIKED TURBAN. Cochlea Turbine aculeato. This fhell is defcribed and figur'd by Fabius Columna. (a) Yet in fome things he hardly reaches it. The Mouth is a kind of long Oval. The right Lip is fpread, and as it were doubled outward. The Back faced with fmooth Plates like fo many more lips, carry'd obliquely from the left Lip to the Turban, and there fet with fhort but very fharp Spikes. The fpaces betwixt thefe are  $\frac{1}{2}$  an inch broad, wrinkled with very fmall furrows, and curioufly ftained with pillars of white and brown lines meeting together in feveral Arches, as if it had been done by a Painter.

The SHORT-NOS'D SNAIL, with a low and plain or even Turban.

The DIPING-SNAIL. Cochlea Immerfo Turbine. Not defcribed. In other Snails the Rounds of the Whirle ftand either in or elfe above a plain; here, they dip or run down within the fhell. Here are divers of them; all very fmooth, and of an Oval figure. One of a white colour, befprinkled with an innumerable company of fmall brown fpecks; about the bignefs of a little Horfe-Plum. The reft are fmaller.

The LONG-MOUTH'D SNAIL. Cochlea Labris parallelis, f. Cylindrovalis. The figure hereof is betwixt Cylindrical and Oval. One half only of the left Lip is turned outward, and uneven with oblique furrows. The right Lip plain. The fore-angle of the Mouth crooked. The Rounds of the *Turban* furrow'd, not high, four or five in number. The Back is painted with a mixture of yellow, bay, blew and black fpecks. It is about two inches long. There are fome more of the fame Species that are lefs.

The NAVLE-SNAIL. Cochlea Umbilicalis. The Turban of this is fmooth. The end of the inmost Round is produced like a Navle, whence its Name.

Another fort of NAVLE-SNAIL. The *Turban* of this is fet with fhort doubled or plated Spikes. It is almost a foot in length. The

### Of Shells.

The OVAL LONG-MOUTH'D SNAIL. Scarce bigger than a Filbert Kernel. The Lips are parallel. The right turned or doubled outward. The left uneven with three The Back fpeckled with white and red. oblique furrows. The Whirle hath four Rounds pretty high.

The PURPLE-WILK with folid Spikes. Purpura aculeis folidis. This and the other kinds commonly found in the Dead-Sea.

The PURPLE-WILK with long plated Spikes. Purpura Aculeis plicatis longi fimis. By Ferranto Imperato, called Echinata. Olearius gives a good Figure, (a) Fab. Columna (a) Tab. 296 the Description, with the Title of Purpura muricata five Murex Rostratus parous. I will add my own a little fuller. The main Body is not much bigger than a good big But hath a Horn no lefs than two inches and Nutmeg. 1 long, hear the Mouth 4 of an inch over, and sharp-pointed. Almost a Pipe, but a little open underneath by the length. Along the right Lip and the Turban it felf, in three Rows, stand feveral long sharp plated or gutter'd Spikes triangularly. But on the Turban they a little anticipate each other. As alfo do the Plates of the feveral Rounds. The right Lip is in fome fort toothed, the left turned outward.

The PURPLE with REDOUBLED SPIKES, i. e. with the greater doubled Spikes collaterally fubdivided into leffer. Of these there are four. Two of them white, defcribed by Columna with the Name of Purpura five Murex Pelagius marmoreus. Another, ash-colour'd; and a fourth, brown.

All Purples have a Canale or Gutter'd Horn long or fhort, in which is lodged that part which is called the Tongue; but performs the fame Office as the Gills in other Fishes. (b) The Animal creeps and directs its own way (b) Fab. with its Horns, like a Snail: yet hath it not four, but two Column. Purpura. only. (c)(c) Mart.

The Purple Tincture it yields, is contained betwixt that Lyster de part which is called the *Papaver* and the Neck. (d) It is of  $\binom{\text{Cochl.}}{(d) \text{ Ariftot.}}$ a different degree; in fome, more upon the Red, like that Hift. Anim. of Cochinele; in others, more upon the Blew, like that of lib. 5. c. 15. Violets. It was anciently (preffed out of the living (e) (e) Museum Animal, and) used especially for the deying of Silks. But Worm. is now grown out of use, as is likely, from the great abundance

S

at

abundance of a fort of Fucus, which the Italians call Roccella, wherewith Silk-Dyers do now make very rich Purples, (a) Fab.Co- of all varieties, with lefs labour and charge. (a)

lum. Pur-That little Shell called Blatta Byzantia, is the Operculum or Lid of the Purple.

The SQUARE-WILK. Buccina Rhomboidea, i. e. It hath in a fort four equal fides, with unequal Angles. I find it not defcrib'd. The Mouth almost Oval, both the Corners a little gutter'd. The right Lip is first turned outward, and then doubled or returned back again inward; and the edge a little toothed. Just opposite to this Lip, is laid upon the shell a kind of *lift*, and doubled down in the fame manner. Upon every Round of the Turban alfo are certain edged pieces in two opposite Rows. By thefe and the *lift* above faid the shell is made fquare. Both the main Body and the Turban are wrought over with knobs great and fmall standing in oblique and spiral Orders.

All WILKS that have the Rounds of the *Turban* thus edged, are betwixt a Purple and a common Wilk.

The LONG SQUARE WILK. Neither do I find this defcribed or figur'd. Both the doubling of the right Lip, and the opposite Lift, are lefs close, than in the former. Neither hath it any of the larger knobs.

The LONG THICK-LIP'D WILK. The right Lip of this is fwoln or flands thick outwardly; and on the Rounds of the Turban are many edged pieces.

The fame fort of WILK, with few edged pieces on the Turban.

The fore Corner of this The THIN-LIP'D WILK. ends in a gutter'd-Horn. Columna defcribes and pictures it with the Name of Bucciunm Rostratum. (b)

The GREAT THIN-LIP'D WILK. Strombus magnus. This fort hath edged pieces on the Rounds of the Turban. The biggeft of turbinated-shells : this here is almost = a yard long, and above ½ a yard round about.

The TRIANGULAR WILK. No where defcrib'd that The Mouth almost Oval. The fore Corner hereof I find. ends in a gutter'd-Horn bended a little upward. The left Lip only turned outward. The right is first bended outward, and then doubled or returned inward. From thence

(b) Lib. de Aquatil. & Terrest.

pura.

at the diftance of <sup>1</sup>/<sub>3</sub> d of the circuit of the shell, is laid a a Lift, in shape imitating the faid right Lip. At the fame distance, a pretty broad-pointed knob. By both these and the right Lip the shell is made Triangular. The knobs on the right Lip and Lift, are white, theother parts tawny, and as it were wrinkled. The Turban, which hath fix rounds, is alfo a little angular.

The COMMON WILK. This fort is fhort-fnouted, or hath no horn. Of this fort are feveral here preferv'd.

It is affirm'd by Aristotle, (a) That you may know how (a) Hift. An. lib. 5. c. 15. many years a Wilk is of, by the number of Rounds in the Of the manner of laying their Eggs, fee Bello-Turban. nius. They are defired by fome, as a rare fort of Meat. The best are in clean Creeks. That which Mr. Lyster defcribes, (b) by the Name of Buccinum maximum, is filhed out (b) De of the Sea at Scarbrough. Tit. 1.

A Wilk, faith Nicolaus Myrepfius; being burnt, powdered, and mixed with old Oil to the confiftence of Glew, and fo the Head, first shaved and rub'd, anointed therewith, is an admirable Remedy against Baldness and Morph of long standing. 'Tis usual to give Drink to Children that have the Chin-Cough, out of a Wilk-Shell; and it is observed, faith Wormius, (c) to do them good.

The WILK-SNAIL. Buccicochlea. So I call it becaufe, in Figure, it approaches to the Wilk; to the Common Snail, in the thinners of its shell. Columna (d) describes (d) Lib. de and figures this with the Title of Buccinum exoticum variegatum.

The WILK-SNAIL winding, from the Mouth, towards the right Hand; whereas almost all other shells wind the contrary way. The Mouth is white as Milk, and almost The left Lip spread and turned outward. Oval. The Rounds are Convex, as in the Wilk. In number fix, fpeckled with yellow Bay and blew fpots. The shell is as thin as that of common Land-Snails. Of kin to that shell described by Mr. Lyster under Tit. 1. lib. de Cochl. Mar.

The BELLY'D-LONG WHIRLE. Turbo Ventricofus, This shell runs all into a Whirle or Turban. It is also belly'd, *i.e.* fwells out a little betwixt the Mouth and the Cone. And the left Lip is uneven with oblique Furrows.

Cochl. Mar.

(c) Mulæum.

The

S 2

#### 132

Of Shells.

PART I.

The WHIRLE-SNAIL. *Turbocochlea*. The rounds of this fort wind from the Mouth to the right Hand, and that very obliquely, in number fix, fpeckled with *Cheftnut* fpots in Rows. The Mouth very long, and one Lip ridged. 'Tis thin like a common *Snail-fhell*. *Columna* (*a*) defcribes and figures one pretty like this by the Name of *Turbo alter minor*.

The SMALL WHIRL-SNAIL, with numerous rounds, and alfo winding from the Mouth toward the right Hand. There are about fifty of them in a Bottle. They are of a brown colour; and thin as the fhell of the common *Snail*. Their Mouth almost round. The right Lip hath a little Angle. It hath nine rounds with very finall *transvers Striæ*. *Columna* defcribes and figures one like this with the Title of *Turbo Terrestris non defcriptus*. Mr. *Lyster* (b) calls it *Buccinum pullum*; and very aptly compares it, both as to shape and bignefs, to an *Oat*. He faith it is found in *England* in the Cracks of *old Trees*, and in *Garden-walls*.

The BELLY'D-LONG WHIRLE, with fmall fpiral Furrows.

Another BELLY'D-LONG WHIRLE, with little knobs in fpiral Orders.

The LEVEL-WHIRLE, or the SPIRE. Turbo planus five verè Conicus. The rounds are all knobed, and the right Lip gather'd into fmall wrinkles.

Another KNOBED SPIRE, with the right Lip plain or even. Here are feveral little Ones of this fort.

The SMOOTH SPIRE, with high or fwelling rounds. Here are two forts of thefe; one with oblique, the other with fpiral fmall Furrows. This fhell is defcribed by Mr. Lyfter. (c)

The SMOOTH SPIRE, with flat rounds. Here are alfo two forts of these; the one furrow'd, the other not, described and figur'd by *Columna* under the title of *Buccinum Persicum eburneum nitidum maculosum*. Of all these here are several finall Ones.

The Natives of *Brafile* make a fort of Mufical Inftru-(d) Joh. de ments with thefe kind of fhells. (d)

The LOOSE WHIRLE. *Penicillus*. The one half of it windeth loofely like a *Worme*; the other is a fmall long *Turban*.

(a) Lib. de Aquat. & Terrest.

(b) Lib. de Cochl.

(c) Lib. de Cochl. Mar.

Laet.

The

## Of Shells.

The SHORT WHIRLE. Trochus. This is fomewhat more prolonged than fome others of this kind, the Bafe broader, and the Rounds in a level. Of this fort here are two great Ones, curioufly ftained with Crimfon waves from the Bafe (which is about four inches over) to the Cone. It is of kin to that which by Columna is called Turbo Perficus maximus.

Another level SHORT WHIRLE, alfo fomewhat longer than the reft, and with the *Rounds* in a level, but the *Bafe* narrow.

A thin level SHORT WHIRLE, fhorter than the former, and with flat rounds. Here are two forts of this; the one with fmooth, the other with ruged or knobed rounds.

A fourth WHIRLE of the fame kind, with high rounds. Here are alfo two forts of this; the one fmooth, the other ruged.

The BELLY'D SHORT WHIRLE with fpiked rounds. 'Tis no where defcribed that I find. The *Bafe* two inches broad, the *Cone* as high. The Mouth almoft round, and within of a *Pearl* colour. The whole fhell without whitifh. The *Bafe* all over wrought with round, and obliquely radiated wrinkles. The rounds are knobed, and the under edges of every round with flat doubled Spikes. Here are two more of the fame fort, with the Spikes ground off.

Another BELLY'D SHORT WHIRLE, almost fmooth, having only very fmall wrinkles, without any Spikes.

The CONCAVE SHORT WHIRLE. Trochus centro latè concavo. Hitherto undefcrib'd. 'Tis two inches broad, an inch an i high, being Belly'd, and having the Cone much depreffed. As alfo the Mouth, which is therefore a flattifh fquare. Both the Bafe and the Rounds are wrought with fmall fpiral and radiated wrinkles running acrofs. It hath five or fix rounds, fomewhat fwelling. Not, as in moft other fhells, contiguous in the centre, but thence receding, leave a wide fpace in the middle of the fhell, reprefenting in fome fort a pair of Winding-Stairs. The ridges alfo of the rounds are wrought with Tooth-Work, anfwering to the Sculpture on the edges of a Stair-Cafe.

There are feveral forts of short *Whirles* or *Trochi*, faies Mr. Lyster, (a) found in England, as at the Mouth of <sup>(a)</sup> Lib. de *Umber*, and in *Lincoln-shire* by the Sea-stide. The

### PART I.

The LITTLE ROUGH WILK. Nerites Turbine rugofo.

The LITTLE KNOBED WILK. Nerites Turbine tuberato.

The GREAT ROUND-MOUTH'D SNAIL, with a Pearl colour. *Cochlea cælata*. Here are three of thefe; of which two, are each above <sup>1</sup>/<sub>2</sub> a foot wide. Their pearly glofs,on the outfide is artificial; within, natural. The natural colour without is fometimes green, with white and bay fpots.

One way whereby it receives a bright pearl colour, is by being fteeped in *Vinegar*; which eats away the rough and duller furface.

The GREAT NAVLE-SHELL. Umbilicus marinus Indicus major. It is the lid of the Cochlea Cælata; and hath its Name from its fhape. Very well defcribed by Wormius.

The LITTLE NAVLE-SHELL, with wrinkled edges.

A SECOND, with the Convex fide more plainly winding like a *Navle*.

A THIRD, with the fame fide befprinkled with a great company of fmall round knobs.

The little *Navle-Shell* is well expressed by *Olearius*, *Tab.*33. *Fig.* 7. Here are feveral of them kept in a Glass.

Not only this, but other turbinated shells have their lid. Which, as Mr. Lyster well observes, is as it were another Value.

Spirit of Nitre droped upon this Shell, rifeth up with a ftrong efferrescence. The admirable Virtue of this Shell is (a) Museum experienced, faith Wormius, (a) by men of very good note, in stainching of Blood; the stat side hereof being only applied, with Spittle, to the Forehead. 'Tis usual to lay a cold Key or Stone in the Neck. But if the same, especially a good big Pebble with one side stat, like a Painters Mullet, were apply'd to the Forehead, I should expect as good advantage from that, as from the application of this shell.

(b) Lib. de Gem. & Lapid.

134

The Women in France, faith Boetius, (b) nimio Menfium fluore laborantes, commonly take this shell reduced to a fine powder, which they find to be a very good remedy, and keep it as a Secret.

The LESSER ROUND-MOUTH'D SNAIL, with a fhorter knobed Turban.

The

The SPIKED or TOOTHED SNAIL. Cochlea Echinophera five Echinis plicatis. Of an afh-colour. The Mouth round. The Turban fhort, having only three rounds almost flat. The Base wrought with circular wrinkles. The utmost round, as it were toothed with short flat-doubled Spikes.

'The FINGER'D SNAIL. Cochlea Dactylata. Not yet defcribed. The Spikes of this are doubled and redoubled, yet not flat, but thick and round, fo as to refemble fo many little Fingers. Without, it is of a fad brown. Within, of a Pearl colour. The Mouth round. The Turban low, making only three rounds, which fo recede from the centre, as to leave an empty fpace in the middle of the fhell. 'Tis all over rough with finall plated Spikes, and pointed wrinkles in a fpiral Order.

The HIGH-CROWN'D SNAIL, with a femicircular Mouth.

The LOW-CROWN'D SNAIL, with a femicircular Mouth.

The HALF-LIP'D SNAIL. So I call it, becaufe one half of the inner Lip being fpread outward, the other half feems as if it were clip'd off. Of this here are two forts; one with the upper, the other with the nether half deficient.

Another SNAIL like the former, faving that the inner Lip is whole, and the *Turban* fomewhat higher.

Another SNAIL with the *Turban* fomewhat lower. Of this here are two forts; one with the rounds of the *Turban* even or fmooth; the other, wrinkled.

The SEMICIRCULAR MOUTH, TOOTHED on both fides. The Teeth of the outer Lip are the leffer; they ftand not on the edge of the Lip, but deep in the Mouth, juft over against the inner Lip: where the white parts of the shell on both fides are defined or circumscribed by a Circle, whose centre is at the edge of the inner Lip. Outwardly, the shell is speckled with white, red, and black Spots, and ruged with spiral wrinkles. One like to this is described by *Columna* with the Name of *Cochlea marina marmorea*.

The BLOBBER-LIP'D SNAIL. Cochlea Labrofa. The Mouth of this is alfo Semicircular, the outer Lip being round

n

round and fpread out a little; the inner ftrait, like white *Marble*, its inner edge toothed, and fpread outward almoft as far as the *Navle* of the fhell; from whence I have nam'd it. The *Turban* is low and almost flat. It maketh fcarce more than two rounds, which therefore immediately run from great to fmall. On the outfide 'tis ruged with transfer wrinkles, and fpeckled with red and black fpots upon white.

Of Shells.

The toothed Lips of both these last Shells, most probably, ferve as Joynts to hold their lids, fo much the more close and steady.

The FORE-WHIRED SNAIL. Cochlea Turbine antico. This is no where defcribed. 'Tis fmooth, of an afh-colour. The outer Lip is fpread a little backward; and toothed within: as is alfo the edge of the inner Lip. Both the corners of the Mouth are placed on the circumference of the utmoft round. Whereby, contrary to all other shells I ever yet faw, it hath the *Turban* or *Whirle* made before. 'Tis much depressed, confisting of five flat rounds. The affertion of *Aristotle*, (a) That the *Turban* always stands behind, is here proved false.

The FLAT-WHIRLE. This Snail is a perfect Helix, all the shell lying as it were between two levels. Of this kind Mr. Lyster(b) defcribeth three forts. Of which he obferves, That upon the sprinkling a little Salt or Pepper, or the like, into their Mouths, they yield a Crimfon liquor.

The fame Author (c) hath observed fome particulars of the parts of *Snails*; as their Horns, Eyes, (as he suppose the them) Teeth, *Anus*, Lungs, milkly Veins (which are all they have) parts of Generation, &c. Which last, faith he, are so like, as to make it feem very probable, That they are *Hermaphrodites*. In the time of Coition, they strike a fort of similar testaceous Needles (*Spicula testacea*) into one an others Necks. For what cause, or in what manner, he could not fo well observe.

No Shell with a *Turban*, hath lefs than two rounds, nor hath any, faith the fame Author, (d) of *Englifb* Shells, above ten.

on the Back, and black on the Belly. Curioufly figur'd both.

(a) Hift. Anim. lib. 4. c. 4.

(b) Lib. de Cochleis. Tit. 26.

(c) Ibid. p.1.

(d) Ibid.

## Of Shells.

in Calceolarius's Musaum, and by Besler. Here are two of them, whereof one is near 4 of a yard long.

One half of the fame fort of shell cut down the middle. By which it appears to be divided by about 40 oblique transverse Partitions.

The Animal is of kin to the Polypus. Famous for the Art of Navigation. He rifes to the top of the Water with his Shell inverted; and being there, returns it. Then having a thin Membrance fpread against the Wind for a Sail, two Feet for the Rudder, and two for the Helm, he fails along. If any fear arifes, he pulls all in, and filling his shell with Water, immediately finks himfelf to the bottom of the Sea. (a)

(a) Arift.

The PEARLY SAILER, 'Tis both within and without 1. 9. c. 37. of the colour of the best Oriental Pearl. This fort is Scal. exercit. brought from India and the Perfian-Gulf. Hereof Neck-Rondeletius laces are fometimes made. As alfo Images and Beads used nus. Bellonius. And at Devotions. out of binz

The SPIKED SAILER. The Back and Belly of this Septalius's are flat with two ridges, and on each ridge grows a row of Mulaum. fhort Spikes.

The MAILED SAILER. Nauticlus Laminatus. I meet with it no where. Both within, and efpecially without, of the colour of the richeft Pearl. It is composed of a confiderable number of Plates, as if in Armor. Yet the Plates continuous; furrow'd along the middle, and produced with a blunt Angle, almost like a Widows-Peak. From under each of which, emergeth a kind of little Tongue, like that of a Shoo-Buckle.

VENUS-SHELL. Concha Veneris. Because beautiful. Or elfe, faith Terzagi, quòd partem Veneris Imperio subditam referat. The first I shall name is that with Blobbed-lips, or having as it were a white thick Facing. They are alfo furrow'd, and stained with Chestnut Spots. But the Back with a Purple.

VENUS SHELL, with the right Lip furrow'd, but neither of them faced or turned out.

A SECOND of this kind with the left Lip furrow'd.

A THIRD, with both Lips furrow'd.

The HIGH-BACK'D VENUS-SHELL. Of this kind, here are three of a Chestnut or Bay-colour; one stained with

Т

with Green, another with Brown, a third with white And a fourth, white, speckled with yellow, red, and foots. purple.

The NAVLED VENUS-SHELL. 'Tis also fomewhat high-back'd, and with each Lip furrow'd. On the thicker end, it hath fome refemblance of a little Turban or Naule.

The LONG-VENUS-SHELL. Of this fort here is one ftained with white fpots upon a Bay ground. The reft of the fame Figure, are fomewhat rough, having, as 'tis likely, been steeped in Vinegar, or some other ways corroded.

The BUNCH-BACK'D VENUS-SHELL. Deferibed and figur'd by Columna under the Name of Concha utrog; latere fe colligens. It hath a transvers Angle or Ridge in the middle. Where alfo, there is a diffinct piece, most closely inlaid into the Back of the Shell. The Lips also are both even.

The VENUS-SHEL with fmooth or even Lips, and without any ridge on the Back. The little white Ones of this kind, are those which are particularly called ENTALIA. With thefe, faith Rondeletius, the French adorn their Horfes Bridles, and other parts of Equipage. Of these and Jet mixed together, they also make Bracelets, and other Ornaments, for Widows in Half-Mourning. Many of this fort, striated, are found, faith Mr. Lyster, near Hartle-pool in the County of Durham, where the People call them Nuns.

Divers other leffer VENUS-SHELLS of feveral kinds. and stained with feveral colours, are here collected.

us.

(c) Rondeletius.

The Italians use this Shell for the polishing of Paper, (a) Wormi- and other things. (a) The people living near the Red-Sea gather them in abundance, and fell them to those that trade to Memphis; for with these the Egyptians smooth (b) Bellonius their Linnen Cloth. (b) Goldsmiths cut them in two, and make Spoons of them. They are commended against those Vlcers in the great Corner of the Eye, which usually turn to Fistula's, because of their admirable drying qua-lity without heat. (c) Yet we have no reason but to believe, that most other shells may be of equal Virtue. But if we observe, it is usual for people to have a high efteem of those things, even as to their Medicinal Virtue, that look prettily, or that are rarely to be had. Whereas, it is plain,

# Of Shells.

plain, that Nature generally supplyeth us with the greatest plenty of those things, which are the most useful.

The round SEA-URCHIN or BUTTON-FISH. Echinus orbicularis. Here are feveral Species hereof. The first I shall name is the Edible Button-Fish. These have very great Prickles, with Seats or Bases proportionable, in five double Orders. And the shells are orbicular. See the full Defcription in Rondeletius.

They were anciently eaten raw before Supper, as Oyfters are now, and as much efteemed.

The ROUND BUTTON-FISH, with ten Orders of midling Prickles. Of thefe Prickles it hath five Orders of bigger, and five of lefs, all Conical at each end, and bounded by ten more. Of this kind, here are fome more, others lefs round. Some alfo that are White, and others Redilb.

The ROUND BUTTON-FISH, with the leaft fort of Prickles, and difposed into ten Orders. Of this fort here are White, Brown, and Green. Thefe, Mr. Lyster faith, are found in the English-Seas.

The GREAT OVAL SEA-UR CHIN. Echinometra Aristotelis. See the Description hereof in Calceolarius's Mulaum. The greatest, and so as it were the Mother of all the other kinds; from whence its Name. This here is near i a foot long. Its Figure is not orbicular, but comes near an oval or flatish Heart.

The MARE-MAIDS-HEAD, or leffer Oval SEA-URCHIN. Echinus Spatagus. This differs from the former, only or principally in being much lefs; feldom exceeding the bignefs of a Hens Egg. These are shells rarely found.

The Sea-Urchin maketh its progreffive motion with its Prickles which it useth instead of Feet. (a) And it is affirm- (a) Arist. H. Anim. lib. 4. ed, by Moufet, particularly of the Great Oval, that it moveth c. 5. in a spiral line.

The SEA-EAR. Auris marina. It hath its Name from its Figure, fomewhat like a Mans ear. The infide is of a Pearl-colour, the outfide brown and ruged with many fmall radiated and fpiral wrinkles running acrofs. There are feveral Holes on one fide it, through which the Animal admits and expels the water at pleafure. Here are three

Τ2

of

# Of Shells.

of them, whereof two, are each about five inches long. This (a) Lyft. lib. fhell is found in abundance near *Garnfey Ifland*.(a) The *Gold*de Cochl. (b) Bellonius finiths in France (b) fplit them into thin Plates, wherewith they beautifie *Cabinets*, and other Works.

The VAULTED-LIMPET. Patella concamerata. No where defcribed, that I know off. It feems to be of the *Limpet*-kind, or to ftand betwix this and the Sea-Ear. It is in a manner a half Oval fplit by the length, which is an inch and half. It hath a Navle, as the Sea-Ear, winding to one fide. The Back is rough, and of a whitifh afh-colour. Within, very fmooth and of a pale purpleifh white. The hinder half is vaulted with a most white Plate, joyned to the fides  $\ddagger$  of an inch below the edges.

The EVEN OVAL LIMPET. See the figure hereof in Johnston. That part which may be called the Navle, stands a little above the convexity of the shell. The Seat of the Animal is shaped so, as in some fort to refemble the Stag-Beetle. The edges thereof curiously angul'd, particolour'd white and bay. The edge of the shell is perfectly Oval, and the inner Margin of a pale blew. Here are two fair Ones of this fort, about three inches long.

The PEARLY OVAL LIMPET. The infide hereof is of a curious pearl colour, with fome rays of purple. It hath a greater convexity than the former, and is waved all round about.

The OVAL LIMPET, with very deep furrows round about. Whereby the edges alfo are very angular. The Sear of the Animal white. Columna (c) feems to have deferibed this by the Name of Lepas five Patella maxima ftriata.

The LEVEL-LIMPET. *Patella Plano-convexa*. The fides of this lie level betwixt the edges and the top. 'Tis alfo furrowed, but not deeply. Yet the edges are more angular than of the former. The *Seat* of the Animal is white, furrounded with a kind of double Glory. The outer Margins are of a blackish shining Bay. There are several shall ones of this fort, having the inner side streaked with black and yellow.

The CONICK-LIMPET, with the top high, and the fides and edges level round about.

The CONICK-LIMPET, with part of the edge raifed toward

(c) Lib. de Aquat. & Terr. c. 50.

Of Shells.

toward the top or *Navle* of the shell. This fort I meet with no where. Without of an ash-colour, rough with wrinkles in rays, and waved Circles. Within smooth, the Margin white, about ‡ of an inch broad; the *Seat* of the Animal yellow spread out both ways.

The Animal it felf is headed and horned like a *Snail*. See *Bellonius*'s Defcription. Our *Fifbermen* ufe the ordinary kinds to bait with, who find them every where in our Seas on the Rocks near the *fbore*. (*a*) If they feel themfelves <sup>(a)</sup> Lyftri touched, they flick fo very faft to the Rock, that they can Cochl. hardly be loofened thence without a Knife. (*b*)

#### CHAP. II.

#### Of SHELLS Double and Multiple.

Note, That when I fpeak of the *Bafe*, I mean, that part on which the Teeth, Joynts or Hinges ftand. When of the *Navle*, the peeked end of the fhell, which for the most part stands behind the *Bafe*; as also that part which answers to it, where it doth not. When of the fides, not the Concave and Convex, but the edges produced from the *Navle* on the right and left.

The SEA-WING. Pinna. Each Value is very like in fhape to the Wing of a large Fowl, from whence I name it. Where broadeft, near  $\ddagger$  of a yard over. In length two feet: being the largeft and longeft of all the fhells that I know. The two Values are naturally ty'd together with a fort of Tom; whereby they are also fastened to fome Stone or other Body under Water. The Animal is very good meat.

The SEA-OYSTER; in diffinction from the common, which may be called the *Shore-Oyster*. Oftrea Pelagia. Here are feveral of this fort, all of them but small. Rondeletius faith, that in *India* they are fometimes a foot long.

The CHESTNUT-OYSTER. I meet with it no where defcribed or figur'd. It is near two inches and  $\frac{1}{2}$  long, of an Oval Figure, and fomewhat writhen. The outfide is of a dark-brown, very uneven with large Oval Furrows. The infide

# PART I.

infide of a dark-Bay; from whence I name it. Held up against the light, it looks like a deep Tincture of Safforn or The Seat of the Animal is rough with fmall Myrrh. frizled or undulated Wrinkles, furrounded with a fmooth Margin, on one fide above <sup>1</sup>/<sub>2</sub> an inch broad, after an odd fashion turn'd or spread outward, Convex inward, and entirely encompaffing the Navle of the shell. Here are three or four fmaller Ones of the fame Species.

A SHELL with the Bafe a little cover'd. Oftrea Bafi Cooperta. I find it not defcribed. It's fomewhat doubtful whether a Limpet or an Oyftershell. I think the latter. The Navle stands obliquely. But the fides make equal or fimilar lines from the Bale. Somewhat above an inch in length, very Convex, the Margin oval. The Bafe is as it were shaded with a transverse Plate <sup>1</sup>/<sub>4</sub> th of an inch broad. The infide, blew; the outfide fpeckled below with tawny and black fpots, above with white and purple, with very fmall lines running acrofs or Net-wife.

The PLAIN ROUND ESCALLOP. Pecten Valuis rotundis & aqualibus.

The ROUND FURROW'D ESCALLOP, with fmooth Shells or Values.

Another of the fame fort, with rough shells.

The LONG ESCALLOP. Thefe and the other kinds feldom exceed the bigness of the palm of the Hand. But Linscholen (a) faith, That by Malacca are shells found like Scallops, fo big, that two ftrong men can hardly draw one of them, with a leaver, after them. Scallops will move fo strongly, as oftentimes to leap out of the Catcher wherein (b) Arift. H. they are taken. (b) Their way of leaping or raifing up A. lib. 4. c.4. themfelves, is, by forcing their under Value against the Body whereon they lie. (c) They are taken amongst other.

(e) Scal. ex- places, near Portland, and at Purbec and Selfey, where they erc. 219. S.1. are excellent good. Rondeletius prefers them, for Meat, before Oysters.

> COKLE. Pectunculus. Here are of thefe, both White, Red, and fpeckled with various Colours.

> The CORALLINE SCALLOP. Concha Corallina. 1 call it a Scallop, becaufe it feems to be but another fort without ears. This is only waved. See Rondeletius's De-He faith 'tis rarely found, and feldom, except fcription. ın

(a) P. 90.

## Of Shells.

in the Dog-days, after long Southern Winds, caft on the thore.

The CORALLINE-SCALLOP both waved and wrinkled; the Wrinkles and Waves standing not across, but the fame way.

The long GAPING COCKLE. Chama. 'Tis thiner and more eafily broken than most other shells. The Values are feldom or never close shut. The sides are produced , from the Bafe by fimilar lines, as in the Cockle, and the figure of the shell oblong : from whence I have taken leave for its Name. Whether the Anatomy of the Animal would fuggest a better, I know not. This here is about an inch and 1 long; and of an afh-colour.

Of this, and probably all the other Species, it is omitted by those that describe them, that from each of the two Joynts at the Base, is produced a kind of bony Epiphysis, about i of an inch long, thin, sharp and flexible : whereupon some of the muscular parts of the Animal seem to be fastened, for the restraining the opening of the shell from any inconvenient degree.

The BLACK GAPING COCKLE. This is fomewhat leffer than the former, and of a rounder Figure, radiated, and the edges way'd. As thin as the former, and hath the like Epiphyfes.

This fort, when the South-Wind blows, rife up to the top of the Water, and fetting their two shells wide open; with the one under them, as a Boat; and the other, on one fide as a Sail, they four along. (a) (a) Bellon.

The Broath of this Shell-Fish is affirmed by Dioscorides H. Anim. lib. to be both Laxative and Diuretick. They have a kind of biting taft, like Pepper; and are therefore called, by the French, Des Flammes : and the Italians, for the fame reafon, call them, Peverazas. (b) (b) Bellonius

The SHEATH-FISH; commonly fo called from its fimilitude to the sheath of a Knife. Solen. Unguis. As the Sea-Wing is the longest, fo this is the most expanded of all Shells; though ufually call'd A long Shell, but impro-For it may be noted, that the length of a fhell perly. is properly from the Navle to the edge directly opposite; the breadth, between the two fides thence produced, which in this Shell are the two ends: as if you should crush the

144

PART I.

the two ends of a mouldable fubftance of an Oval figure, till you made the two fides become the two ends. Some of thefe are  $\frac{1}{2}$  foot wide, or more.

This Shell is found on the fhore near *Scarbrough* after long *Winter*-Storms. (a) The Animal fhines much in the dark, effectially when the fhell is full of liquor, the drops whereof glifter where ever they fall; by virtue of which, it is most probable, that the Flesh it felf becomes fhining. (b)

The ROUND-OYSTER, with fimilar fides produced from an oblique *Navle*. The Convex is very white, and finely wrought with circular, and radiated lines acrofs.

The MULTARTICULATE OYSTER with a bended *Bafe*. The Convex is fmooth, and ftained with *Cheftnut* upon *white*. Its *Bafe* is in a manner femilunar, produced a little forward from the *Navle*. Upon this *Bafe* are fourteen, fixteen, fometimes twenty fmall Joynts, ftanding obliquely, and alfo in a bended line anfwerable to the *Bafe*. To the two ends whereof, the *Seat* of the Animal is contiguous. The fore-edge and Margin are furrowed and toothed within. Here are four of this fort.

The BROAD-OYSTER, with fimilar fides.

The FISTULAR OYSTER. Concha Valvis Fiftulofis. Defcribed by Columna with the name of Concha exotica margine in Mucronem emiffa; who hath alfo figur'd it well. It hath not only feveral Furrows or Gutters reaching from the Navle to the edges round about, but the Furrows are alfo cover'd over, and fo properly fiftular; whence I have nam'd the Shell. The circumference or edg is alfo prolonged into feveral Peaks, which have fome kind of likenefs to Sword-points. But Columnas name is fomewhat obfurdly given, unlefs inftead of divers, there had been one only.

The MULTARTICULATE OYSTER, with a strait Bafe. Described and figur'd by Columna with the name of Concha TRANAL AND NOT A NOTE: Here are two of this fort. The chief marks hereof are, that it hath a great number (twenty or more) of slender Joynts, about ‡ of an inch long, placed parallel, upon a strait Base.

The ASSE-FOOT OYSTER. Oftrea Gaderopoda, So called

(a) Lyfter. de Conch.

(b) Pliny.

Of Shells.

called from its Figure. Described by Bellonius. Its chief Characters are, that it hath very great Joynts, like the eyeteeth of a Man, and upon a strait Base. It grows not loose, as other Oysters, but fixed to the Rocks under Water: and therefore in those Seas only, which ebb and flow not, (a) as (a) Bellonius the Ægean, the Hellespont, Gc.

The CORALLINE-OYSTER. Spondylus Echinatus & Corallinus. I meet with it no where. 'Tis of an unufual Figure. The Base hereof is strait, and an inch and ' over. In each end hereof is a roundish cavity, doubtless for the reception of anfwerable Joynts. An inch and 1 or more beyond this, the Navle, which is a little bended upward, fmooth within fide, and fcaly without. The inner part of the shell is exceeding white, smooth, hard, and thick. The outward Crust thiner, yet also very hard, wrinkled, fpiked, and of the colour of red Coral. Part of it is broken off.

MOTHER of PEARL. Concha Margaritifera. Sée a true, and good Figure hereof in Calceolarius's Museum. It is naturally within of the fame colour with that of a Pearl. It is fometimes feen with a pearly Knob growing within it, as in this here, near the centre. But the Pearls themfelves grow within the Animal : within the Flesh (as Athenaus (b) affirms) as that fort of Kernel in a Hog, called Grando. (b) Quoted Although more probably in the Stomach, as Bezoar, and by Rondelethe like, in other Animals. (c) As Eggs in the Belly of a (c) Philof. Pullet, faith Tavernier. (d) The Shell is faid to be found Tranf. N. near the Island Borneo fometimes fo big, as to weigh forty (d) Indianfeven pounds. (e)

Take Mother of Pearl, the finall White Venus-Shell of Charl. each equal parts. Pour upon them, being first powdered, the juyce of Lemons, and let them stand together (a day or two) then filtre the liquor, and keep it, as the best walh for the Face in the World. (f)

MOTHER OF PEARL, with the backfide cover'd all facile paraover with those little Shells called DENTALIA, as having lilibus. fome little likenefs to Teeth : that is to fay, White, Smooth, Conick, and bended Tubes, which grow to this and other Shells. See Gesner of Entali & Dentali, p. 940. The infide of the Sea-Ear, of fome forts of Limpets, and of divers other Shells, are commonly fold in Shops for true Mother of Pearl. ORI-

Voyage.

(f) Prævots . lib. de Med.

ORIENTALPEARL, round, and with a good Water.

PEARLS of the bigness of a large Peas, and perfectly round, but without a Water.

ROUND PEARLS, of divers Colours, fc. White, Ashen, Brown, Red, and Bay.

PEARLS of divers Figures, fc. Oval, Cylindrical, Flat, Conick, Twins, and three and four together.

WELSH-PEALR. Given by the Honourable Mr. Boyle. They are most of them flatish, and of a shining blackish colour.

Heretofore, the most rich fishing for Pearls, was at the (a) Gefner. Island Margarita. Whence their Name. (a) At this time the chief Fishings in the East-Indies are three, the Persian-Gulph, on the Coast of Arabia the Happy, and in the Island Ceylan. In the West-Indies, five; along the Islands Cubagna, and Manguerita, at Camogete, Riodela Hacha, and St. Marthas. They fish in twelve-fathome Water, five or fix leagues off at (b) Tavern. Sea, Spring and Fall. (b)

Indian-Voyage.

Of *Pearls* we have these following Preparations, and probably the first, of all, the best, if perfectly ground.

D. I in Eff.		Commune
Pulvis, Esjentia,	Flores,	Ruturaceum
Pulvis, Effentia, Sal, Tinctura,	Magisterium.	DI
Time And And	- 0.1	Plumaceum
Liquor, Arcanum,		CRiverij.

The PEARLY OYSTER. Concha Cælata. 'Tis shaped much like the Mother of Pearl, but is fomewhat oblong. It hath alfo a pearly-colour within-fide; but of a more leadenwater.

The SQUARE-MUSCLE. Concha Rhomboidea, f. Mufculus striatus Rondeletio. That part where the Values joyn, i. e. the Bale, is long, not rounded, but strait, and standeth erect or perpendicular, by which it may be diftinguished from other Shells. It lies in the deeper parts of the Sea, and is rarely found.

The RUGGED-OYSTER. Not defcribed, that I know. The Joynts hereof very shallow. The Navle very oblique. The Sides thence produced, diffimilar. The Back cut with round Furrows; and the Furrows edged, and befet with a number

number of little short prickles. It is of a dull ash-colour, roundish, and somewhat bigger than a *Half-Crown*.

The SAND-MUSCLE. *Tellina*. They live much in the Sand; for which reafon, unlefs they are fhaked long in / water, before they are boyl'd, they are very gritty. (a) At (a) Rondé-Rome, they are efteemed a pleafant Junket. (b) Here are letius. (b) Wormi-feveral fhells of this fort.

The TOOTHED-MUSCLE. It is of a roundifh Figure, and the edges, efpecially before, toothed almost like a *Saw*.

The GREAT WAVED-MUSCLE. Well defcribed and figur'd by *Columna* with the Name of *Concha Maxima marmorea exotica imbricata*. It is alfo called *Concha Tridachna*: becaufe it contains as much meat, as a Man can fwallow at thrice. A certain number put for an uncertain: for fome of them hold meat enough almost to fill a mans belly, being a foot in length, or rather in expansion or breadth; this here <sup>‡</sup> of a foot. The Back is waved with broad and deep Furrows, and the edges indented answerably. (c) Bellonius It is (c) commonly found in the *Red-Sea*.

The LONGISH-MUSCLE, with rough Wrinkles or Rays.

ANOTHER with fmooth Rays, i.e. Concha Rondelet. Striata 3.

The ROUNDISH radiated Muscle.

The PLAIN LONGISH MUSCLE. This hath no Rays on the Back.

The PLAIN BROAD MUSCLE. Of these here are two forts, the one lefs, the other more expanded. This latter is by *Rondeletius* called *Concha longa*; mistaking what is properly the breadth, for the length of the shell. Of this (d) Shell, is commonly made a fort of *Linie*.

The BROAD-MUSCLE, with deep Joynts.

The TOOTHED BROAD-MUSCLE. Defcribed and figur'd by Mr. Lyfter, (e) with the Name of Tellina intus (e) Lib. de ex Viola purpurascens, &c. 'Tis a little shell not much above Tit. 35. an inch broad, the edge indented round about with curious small Teeth; and having within-fide a faint purple blush.

ANOTHER little broad *Muscle*, without Teeth, or evenedged.

(d) Ronde. letius.

U 2

A

PART I.

A BLOBLIP'D-SHELL, which feemeth to be a kind of I find it no where. Here are feveral fingle shells Mulcle. of this fort, but not one pair : which makes me fomewhat doubtful what to make of them. Most of them have about an inch of expansion. The Concave in the infide, is triangular, with finall strait transvers Wrinkles, one Angle obtufe, two acute. From the two longer fides of the triangle, the Margin is spread out, and on one fide as it were doubled backward. It hath alfo one, fometimes two Joynts, very deep, and for fo fmall a fhell, remarkably ftrong.

The Natives of Brafile use Muscle-shells for Spoons and (a) Barlaus, Knives. (a) The albes of Muscle-shells, faith Wormius, are of a Cauffick-nature. As if it were peculiar to this shell. Whereas the shells of all forts of Shell-Fish, being burnt, obtain the like. Most of them, being fo order'd, and powder'd, make excellent good Dentifrices.

Hitherto go the Double Shells, or with two Values. There remain fome which are made up of feveral shelly pieces conjoyn'd to make one Concave-fhell : as

The Conick CENTRE-SHELL. Balanus major. Defcribed by Rondeletius, and others. It is in shape fomewhat like a *Tulip*, the feveral shelly Plates which compose it, being pointed at the top, and ftanding together, as fo many They always grow fixed to fome other Body. leaves. When boyl'd, they are a delicate fort of Meat.

The SPUNG-CENTRE-SHELL. Balanus Spongiarum. So I name it. Commonly, but fomewhat abfurdly, called Lapis Spongia. For being well observed, they appear to be little Centre-Shells, which probably never grow very big; and wherein the leaves feem to be a little more separate, than in the former Species. They look just like small petrifi'd Buds of Trees.

A fmall Centre-Shell, growing upon a Branch of Coral.

The FLAT CENTRE-SHELL. Balanus compressa. Commonly called the BARNACLE-SHELL; and CONCHA ANATIFERA. Because supposed to be the Egg of the Barnacle. And by fome (b) it is confidently deliver'd, that in the Orcades there are certain Worms grow in Hollow-Trees, which by degrees obtain the Head, Feet, Wings and all the man Dr. Tur- feathers of a Water-Fowl, which grows to the bigness of a Goofe.

de rebus geftis in Brafilia.

(b) Hector Boethius quoted by Gefner, and our Countryner.

# Of Shells.

149

Goofe. Scaliger alfo defcribes this (fuppofed) Bird within this fhell. (a) And with refpect to fo worthy a Perfon as (a) Exercit. Sir Robert Moray (who never meant to deceive) I my felf 59. toward was once induced to publish his Defcription of the fame. (b) (b) Philof. But having examined the Shell it felf, I am of Opinion, Transact. N. That all that is faid of a Bird, is fabulous. Bartholine (c) (c) Histor. would have it to belong to a kind of Cancellus. But I rather agree with Columna, that it is a fort of Centre-Shell; as being fixed in like manner upon it's Base, and composed of feveral shelly parts.

Of these Shells two Species are here preferved. One of them confisting only of five shelly pieces. Two greater, almost like little Muscle-shells. To these are joyned, edge to edge, and oppositely, a much lesser pair, sc. in such manner, as their Base stands over the Cone, and their Points descend half way towards the Base, of the greater pair. Both these pairs are on one side hem'd in with a fifth piece, narrow, long, and inwardly Concave, almost like a Larks Heel. The Neck to which they are fasten'd is here wanting. This Species is figur'd, and in some fort described by Wormius. But the Figure in Calceolarius's Muscum answers not.

The FLAT CENTRE-SHELL with the Scaled Baje. Balanus compressa & Squamata; fo I call it. This Species is in some fort figur'd by Rondeletius. But his Description worth nothing. 'Tis near an inch long, and <sup>2</sup> of an inch broad at the Bale, where it is fomewhat narrower than in the middle. Whitish, and with some Rays of blew. It confifts of five greater pieces, whereof the middlemost pair, the greatest and the longest. The lesser pair are joyned to them edge to edge, reaching half their length, but not oppositely with their Points downward, as in the former Species, but upward. The fifth piece not joyned to this leffer pair, as in the other Species, but to the oppofite edge of the greater. Round about the Bafe of the Shell feveral little pieces, fome bigger and fome lefs, ftand after the manner of Scales, with their points alfo forward. So that it looks almost like a great Bud crushed flat. 'Tis joyned to a Neck about i of an inch over; an inch, fometimes more, or lefs, in length; of a brown colour, rough, and composed of an innumerable company of fmall Knobs, almost like those on fome Fishes Skins. Several Shells, by the like Necks, commonly grow all together in a Clufter. Thave

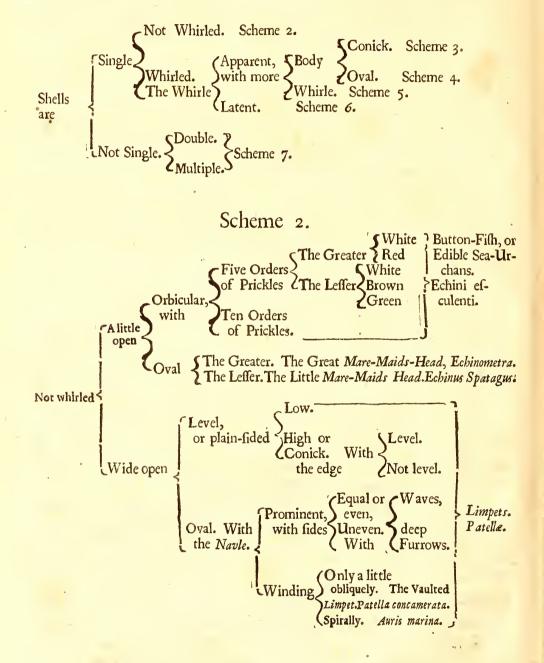

Of Shells.

PART.I.

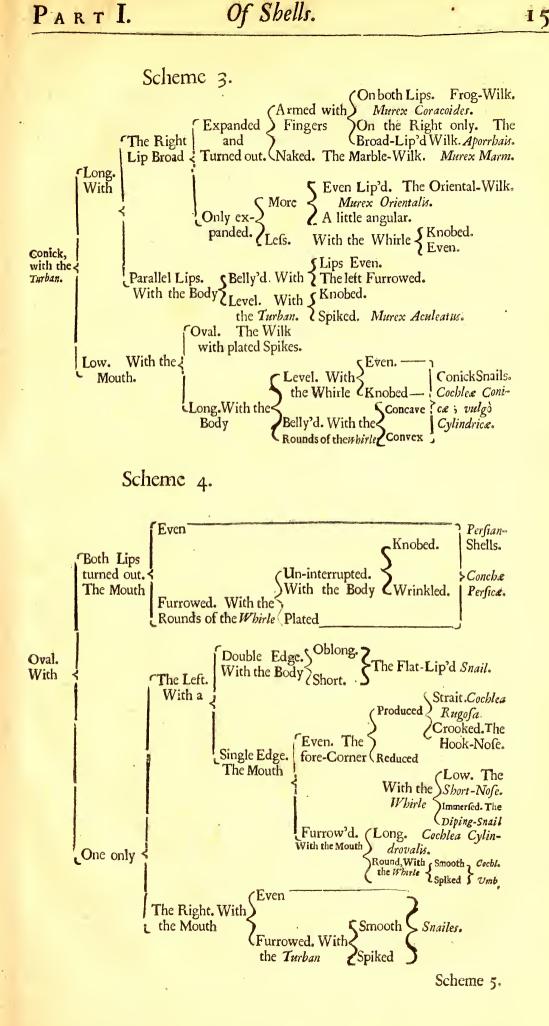

I have feen fome of these Shells perfectly formed in all their parts, not much bigger than a Cheese-Mite.

Thus far the Titles and Defcriptions; the Schemes follow, which take in all, fave one or two of the *Sub-Species*: and wherein the Order is a little more corrected.

#### Scheme 1.

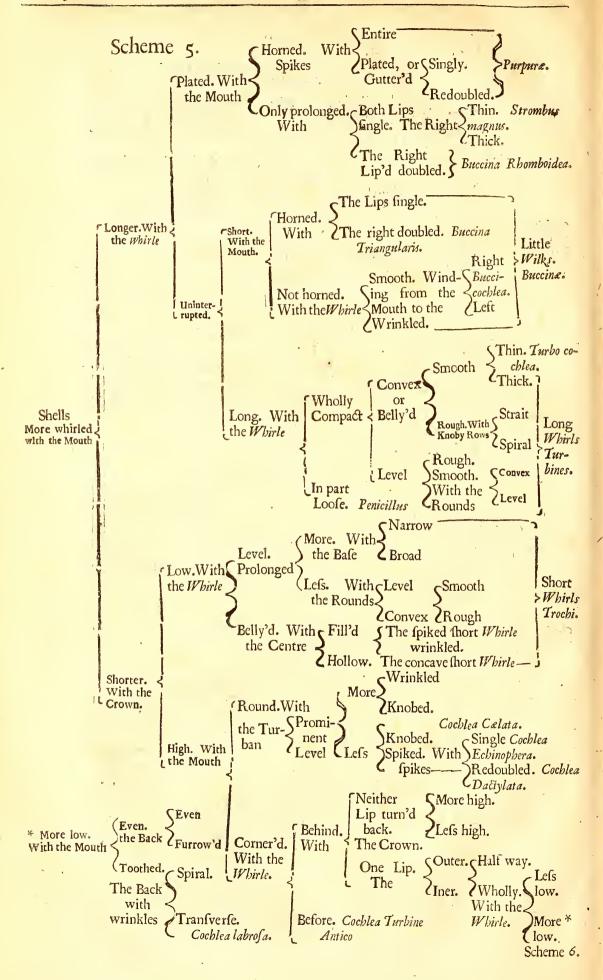

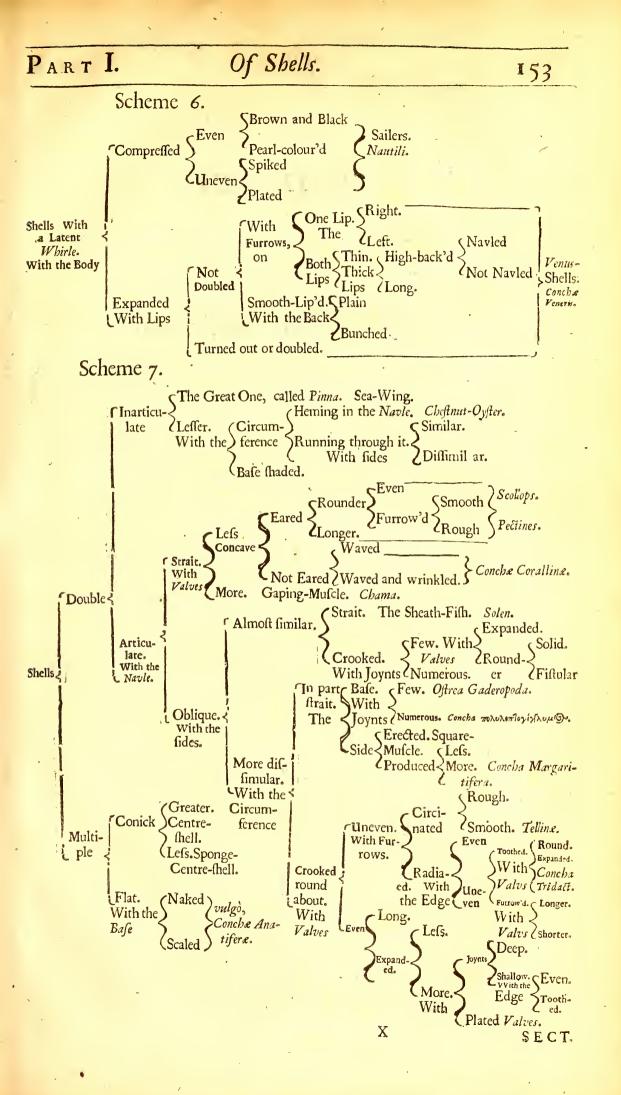

Scheme 3.

# Of Insects.

PART I.

SECT. VII. OF INSECTS.

#### CHAP. I.

### Of Infects with Naked-Wings.

THe Bigger HUMBLE-BEE. Bombylius major. First, With a broad-Belly, colour'd with Ashen, White, and Brown.

Another, with a Broad-Belly, Yellow and Citrine.

A Third, with a Long Tawny-Belly, and Brown Wings.

The Middle HUMBLE-BEE, with a Scarlet Breaft, and Wings fpoted with white and brown.

The Leffer HUMBLE-BEE, painted with Citrine and Iron-colour.

A WILD-BEE, with her Follicle or Bag, near the bignefs of a Wrens-Egg.

Another fort of WILD-BEE, with their BAGS. They are about  $\frac{1}{2}$  an inch long, of a Cylindrical Figure, very thin and transparent, like the inner Coats of the Eye. Admirably placed, for warmth and fafety; *fc.* length-ways, one after another, in the middle of the *Pith* of an old *Elder-Branch*, with a thin boundary betwixt each Bag. The little *Bees* are fomewhat thicker than the *Flying-Ant*; and their Bellies marked with four or five white Rings.

Another fort of WILD-BEE, which breeds in the flocks of old *Willows*. Curious to obferve. They first bore a *Canale* in the Stock, which, for more warmth, they furnish afterwards with Hangings, made of *Rose-Leaves*, fo rowled up, as to be contiguous round about to the fides of the *Canale*. And to finish their Work, divide the whole in to feveral Rooms or Nests, with round pieces of the fame leaves. Hereof fee in the *Philof. Tranf.* (a) the Observations

(a) Num. 65.

# Of Infects:

vations of Dr. Edm. King; whereto fome others are added by Mr. Willughby, and explained by Figures.

Some parts of the NEST of another WILD-BEE. Not much unlike the first of those not inelegant figures, which Johnston gives under the Name of WESPEN-STOCK.

The under or hinder Wings of a Bee, are the least; that they may not incommode his flight. (a) The Honey-Bag, (a) Mouf. de is the Stomach, which they always fill to fatisfie, and to fpare; vomiting up the greater part of the Honey, to be kept against Winter. A curious Description and Figure of the Sting, fee in Mr. Hook's Micrography. In windy Weather, Bees often hold a little stone in their hinder Feet; which ferves as a Ballast to make them fail through the Air more steadily. (b) The History of Bees, the best that Aristotle (b) Ibid. hath given us, (c) of any one Animal. Of their Polity, (c) Hift. An. Generation, Confervation, Difeafes, and Ufe; fee alfo lib. 9. c. 40. Moufet, Butler, and a late Treatife of Mr. Rufden. All that Authors speak of the Spontaneous Generation of Bees, is fabulous. The ashes of Bees are put into most Compositions for breeding of Hair.

A WASPES-NEST. Vespetum. Given by Sir Jonas Moore, who received it from Nem-England. See the Figure of one in Johnston. 'Tis above a foot high, and near a foot over. Composed of a great number of little Cells, as in the Wild-Bees Neft, and encompassed with a Cover of the fame *stuff*. All wrought about the Branch of a Tree.

Both this, and the Bees-Neft now mention'd, confift of the fmall Fibers of Plants, cohering, altogether as in *Paper*; as may be feen by a Glafs. So that the *Stuff* may not be improperly called BEE-PAPER.

Another WASPES-NEST, like the former. Given by Dr. Thomas Allen.

A LONG-OVAL FOLLICLE (perhaps of a fort of Hornet ) with this peculiar, That the Silk is cover'd with a kind of brown Cruft, marbled with blackish Veins.

A NESTED FOLLICLE, or one within another. Here are three of this fort, not fortuitous, but according to Nature. The utmost, is about an inch long, brown, and composed of Stiff-work, with a great many small Interstices : so that X 2

jt

### Of Insects.

PARTL

it looks just like an Oval-Net. Within this, lies loofe another much smaller, of a light Ash-colour, and made like other Infect-Bags.

The Polish'd FLESH-FLY; that which is of a blewishblack, like Steel.

Another FLESH-FLY with a ftrong Probofcis or Trunk, tawny Wings, black Eyes, bunched Back, brown, long, and tharp Belly, forked Tail, Chefnut Feet, the hinder the longeft.

The GOLDEN-EYE. Musca Chrysopis, as Moufet calls it. The Eye of this Fly is very curious, not only with its golden colour, but in being most elegantly latticed, like that of a Butterfly. Whilft alive, they have a very flinking fcent.

The OX-FLY. Musca Boaria. Asilus.

The WHAME. Musca Apiformis. Tabani species.

The WASP-FLY. Tabani species altera.

The TWO-BRISTLED-FLY. Musca Bipilis. He hath two Briftles upon his Tail, standing level. Moufet describes five Species.

The THREE-BRISTLED-FLY. Tripilium. Of thefe Moufet also describes five forts. Here are two of them; One greater, the other lefs. They are most in May and June before and after the Rains.

Flys, at the end of their Proboscis, have a Piercer where-(a) Mouf. de with they broach the Skin. (a) They go only, faith Moufet, with four Feet, using the two foremost instead of Hands. (b) This latter part of his Affertion is true; but the former, contrary to common Obfervation.

The Hair of the Head being often wet with the water of common Flys diftill'd in Balneo Maria, will grow to a (c) Id. c. 12. Very great length. (c) Almost all Flys, being chew'd and (d) Id. c. 12. fwallow'd, caufe violent vomitings. (d) out of Arnol-

Two FLY-NESTS; with fome of the Flys. They are all black, with four Wings, the Horns and hinder Legs both long, and the end of the Tail thick. Of kin to the M. Bipilis.

The Nests are fasten'd or wrought, one, upon a head of Cypress-Gras; above i an inch long: the other, on the top of a Branch of Fern; and is about an inch long. Both oval, and white like Wooll; very porous and compreffible, like

Inf. c. 10. (b) Ibid.

dus.

like a fine Sponge; and perforated with feveral little round Holes. Cuting one of them down the middle, I found, within, the more elaborate Work, confifting of a great number of little oval Cells, as in a Wild Bees-Neft. Thefe Cells are placed in their length transversity to that of the Neft. In each of which, each Fly is bred a part from the reft.

The Great BUTTERFLY. Papilio major. This is of the The Wings are painted with citrine fecond magnitude. and black, both in long streaks and spots.

The Great PLUMED BUTTERFLY. The Wings are painted with black and scarlet Rings. In the place of Horns, he hath a pair of Plumes in his Forehead.

Another, with LONGER PLUMES. The Wings of this are fpotted with black and tawny.

The leffer BUTTERFLY, with scarlet Wings; the foremost of which are far shorter than the other.

Another, having the Wings speckled with red, yellow, brown and black fpots.

Of the larger, middle, and leffer kinds, Moufet reckons up and defcribes five and thirty forts. (a) (a) Latter

That which feems to be a Powder upon the Wings of a part of C.14. Butterfly, Is an innumerable company of extreme fmall Feathers, not to be different without a *Microfcope*. (b)

Butterflys, as most Infects, faith Moufet, are very Diure-Powers Mi-tick (urinas egregie movent) and with more fafety. (c) 'Tis and Mr. worth the trial.

crography. The Great ADDERS Boult; from the strait long (e) Cap. 14. figure: Dragon-Fly, from the colour and bignefs. Water-Butterfly, because they most frequent Rivers and watry places. Perla, from its colour. Libella, from its figure, when the Wings are spread out. In this, the Bases of the Wings are fpoted, the Belly almost triangular, the Tail pointed, painted with black and gold-colour.

Another GREAT ONE, with filver Wings, a golden Mouth, a green Forehead, Chefnut Eyes, a round Belly painted with citrine and black.

A THIRD, with citrine Wings, a green Back, and a yellow Belly. It is furnished both with Horns and Plumes in the Forehead.

The Middle ADDERS Boult. It is of a dark-Green. The

(b) See Dr. Hook's Mi-

## Of Infects.

PART I.

The Head fmall, the Cheft or middle part short, the Belly very long and slender. *Moufet* reckons up in all about 20 forts.

The LANTHORN-FLY of Peru. Cucujus Peruvianus. A quite different Species from that defcribed by Moufet. And, with refpect to his Wings, is no way of kin to the Beetle or Scarabeus-kind, but rather the Locuft. I find it no where defcribed.

'Tis above three inches long, and thick as the *Ring-finger*. His Head, in bignefs and figure, admirable; near an inch and half long, in the thickeft part of it above half an inch over. From the Eyes forward it firft fwells or bellies out, afterwards contracts into a fmaller, yet blunt end. 'Tis alfo crowned with a broad blunt knob, and the end refimated or bended upward. In its Circumference it hath feven low Ridges or Angles, marked with fo many black lines, an eighth line being added betwixt the two uppermoft Angles. The greater part hereof (now) betwixt yellow and ftraw-colour. Yet ftained with brown and red ftreaks and fpots, neatly ranged, efpecially on the top and both fides. It feems, at leaft in the fore part, to be hollow, and almoft like a Bladder blown up.

The Eyes, for the bignefs of his Body, very fmall. Of a dusky-colour, yet gloffy, and Sphærical, looking juft like two brown Seed-Pearls. Under thefe ftand two fmall round parts, open at top, which feem to be the Roots of a pair of Horns : unlefs any will conceit them to be his Ears. Both thefe and the Eyes are guarded with a femilunar Ridge.

The other parts, being more or lefs fpoil'd, cannot be perfectly defcrib'd. His *Probofcis* fufficiently ftrong, about an inch long, and as thick as a ftitching or *Taylers* Needle. The Feet all broken off. His Body an inch and  $\frac{1}{2}$  long, not much exceeding the length of the Head; about  $\frac{1}{2}$  over. Compofed, befides the Shoulders, of about ten Rings. He hath four Wings, almost like those of the *Locust*; the uppermost fomewhat ftronger and ftiffer than the other. Both Pairs are of a dun-colour, fprinkled with dark-brown spots. They are extended confiderably beyond the Body; yet the ends are worn off.

That which, befide the figure of the Head, is most wonderful

# Of Infects.

wonderful in this Infect is the shining property of the same Part, whereby it looks in the Night like a little Lanthorne (Lamphorne.) So that two or three of these fasten'd to a ftick, or otherwife conveniently difposed off, will give fufficient light to those that travail or walk in the Night.

A BAULME KRICKET. Cicada. It is the fourth in order defcribed by Moufet. The upper Wings of this Infect alfo are stiffer than the other, like those of the Locust. But that which is most remarkable, is the broad Hood which is fpread over his Head and the top of his Shoulders. It is a Stranger here in England.

This Infect, faith Moufet (a) after others, feeds only upon (a) Lib. de Dew; and hath no Excrement; which is most unlikely. It is by fome given inwardly inftead of Cantharides, both as a fafer, and more effectual Diuretick. And fo far alfo a better Remedy in Veneris languorem. (b)

A Great WINGED-LOCUST. Given by Sir John Hoskins. It feems to be the fecond Male defcribed by Moufet. In length almost three inches. The Face perpendicular, from the Mouth to the Crown of the Head <sup>1</sup>/<sub>2</sub> an inch. The Wings Membranous; the upper pair, the ftiffeft, stained with dark brown spots, and a few Rays of Red. It is one of that Swarme which fome years fince deftroyed all the fruits in the Island of Tenariffa.

Of the Winged-Kind, Moufet reckons up about a dozen Species. Of their Generation, and the Defcription of the Parts thereunto fubferving, fee the fame Author. The Defcription and Figure of the Lungs in *Malpighius*. (c)

(c) De Bom-Locufts hurt the Corn, Meadows, and Hort-Yards, not byce p. 28. only by eating, but alfo by their Dung; and an ill-natur'd Spittle, much of which they spew out of their Mouths, as they eat. (d) 'Tis probable, That the Spittle (if they (d) Moufet fpew any) is not ill-natur'd; because the *Jews* were per-out of Valmitted to eat this as a clean Animal. Yet may prove hurtful to the Corn, as a Neft fit for the breeding of small Worms, or other Animals, which may difeafe it.

The Ethiopians, and divers other Nations, eat them, being (e) Muf. first falted and dryed. (e) Wormian.

The FEN-KRICKET or CHUR-WORME : Becaufe towards Night, when he comes out of his Buries, he

(b) Cap. 17. p. 133.

makes

# Of Infests.

PART I.

makes a noife like that of a Kricket. So great, faith Moufet, as to be heard above a mile off. Gryllotalpa: fo called by the fame Author, for that with his fore-feet, which are very ftrong and broad, and fhaped like thofe of a Mole, he continually digs up, and makes himfelf Buries in the Earth. His hinder Feet are very long, wherewith he leaps; and by which, as well as by his Hood, he borders at leaft, upon the Graſhopper-Kind. His Hood or Mantle, which Moufet I think omits, is about  $\frac{1}{2}$  an inch long; extended forward, over part of his Head; behind, over part of his Wings; before Concave, behind Convex.

His Eyes *protuberant*, yet not great (as *Moufet* would have them) but very fmall if compared with his Body : in colour, fhape, and bignefs like a *Strawberry-feed*.

His Wings, faith the fame Author, are longer than his Body. Whereby it appears, that he did not take notice, That this Animal hath four Wings, whereof the uppermoft pair are not above  $\frac{1}{4}$  of an inch long. The other indeed are prolonged above  $\frac{1}{4}$  of an inch beyond the Tail. Each of thefe apart is most curioufly foulded up inwards with a *double Roll*, fo as to end in a point; having their middle Rib (as I may call it) which covers the two Rolls, flat and edged, and divided with transfer lines at right Angles. Their being thus folded up, is a contrivance to fecure them from being torn, as he runs to and fro under ground.

#### CHAP. II.

### Of Infects with sheathed-Wings.

The TINGLE-WORME. Profcarabæus. He's remarkable, efpecially, for his Teeth, which are two great Hooks bended inward, almost as in the Squill-Infect. He differs from the Scarabæus, chiefly, in that the Vaginæ or Wing-Covers are very short, reaching but about ' way toward the end of the Tail. His Wings, notwithstanding Moufet calls them Alarum rudimenta, are very perfect, and by a treble fold lodged under their Crustaceous Covers. He also

# Of Insects.

alfo omits the Defcription of his Eyes, which, through a *Microscope*, are a curious fight.

This Infect, with the leaft touch, drops a kind of Oily liquor from his Mouth; for which cause Moufet calls it The Oil-Clock. (a) Being bruised, it yields a fragant smell. (b) (a) Cap. 23. They are numerous in Heidleburge and other parts of Ger-Toxites's Onomastimany.

Taurus volans maximus. The Great BULL-CHAFER. Johnston out of Marggravius in some fort describes four Species of Bull-Chafers, of which, as I take it, this is one. I meet also with the Picture of it in Olearius. (c) He hath (c) Tab. 16. three Horns. The first is only the Snout produced and Fig. 2. bended upward, and is therefore moveable with the Head. In length, according to the figure in Olearius (for it is here broken off) about an inch and i forked at the end, and with one upper branch a little before the Eyes. The Head very little. Upon his Shoulders he hath two immovable or unjoynted Horns, about <sup>2</sup> of an inch long, <sup>2</sup> of an inch over at the Bale, directed forward, and with their points inward, like a Bulls-Horns. From the end of his Snout or fore-Horn to the end of his Tail he is about five inches long, over his Back above two and a +; the bigeft of Infects yet known. His fore-Feet are armed with Spikes, as fo many Claws; wherewith, 'tis likely he digs himfelf Buries. Of his Wings it is Obfervable, That at their utmost Joynt, they are laped up, or doubled inward towards the Head, and fo kept fafe under the Wing-Covers; being, when out at their full length, almost twice as long as the hinder Body or Section of the Animal. The like is observable of the Wings of some other Beetles. His Horns, Legs, Back and Wing-Covers are all black; his Belly brown.

Another Great BULL-CHAFER. Of the fame fort.

The Leffer BULL-CHAFER. *Naficornis Triceros minor*, fo it may be called. 'Tis all over of a fhining-black. Above two inches long, almost one broad. The Snout-Horn is not bended upward, as in the former, but downward,  $\frac{1}{3}$  ds of an inch long, and edged above. On the top of his Back or fore-Section he hath two other little Horns, about of an inch long, thick as those of a *Snail*, and bended down as the former.

Y

The

# Of Insects.

PART I.

The HEAD and Fore-SECTION of the fame Animal; but of one far bigger.

The TODDY-FLY. Taurus volans Marggravii Quartus, or Naficornis Diceros. This here came from Guinea. Tis very well defcribed by the faid Author. Except, that he doth not well compare the Eyes to a Hemp-feed : for they are not only Sphærical, but as big as a well grown green But that shelly-Guard, which, as it were, hoops in Peas. the Eye, and hides the greater part of it, unless you lay the Infect on his Back, might occasion his mistake. He hath but two Horns, yet those great ones. A Snout-Horn bended and toothed upward, and a Shoulder-Horn bended downward. From the end of which to the end of his Tail, about five inches. But he is not fo broad as the Great Bull-Chafer.

Thirty or forty of these together, rasping or fawing off part of the Barque of the Toddy-Tree by the help of their Snout-Horn, will drink themfelves drunk with the liquor that flows from it: from whence their English Name. For which purpofe, Nature hath well placed the Teeth of the faid Horn, above: for that here, the Work is not done, as by a Man in fawing, by the weight of the Animal, which is inconfiderable; but by the ftrength of his Legs, which force the Horn upward.

See the Defcription of the Parts fubserving to Generation in the Philof. Tranfact. N.94. Communicated by Dr. Swammerdam.

Two more TODDY-FLY'S, like the former.

The RHINOCEROS BEETLE. Scarabæus Rhinoceros. See the Figure and Defcription hereof in Imperati. It hath only one Horn upon the Nofe standing almost upright, only bended a little backward, as in the Rhinoceros; whence its Name.

The PRICKLE-NOS'D BEETLE. Scarabæus Naso aculeato. I meet with it no where elfe. So I call it, becaufe that in the place of the Horn above-faid, it hathonly a fmall short Prickle. The fore-Section alfo, near the Head, is depressed and somewhat Concave. 'Tis very near as big as the former, and of a like Chefnut-colour.

The STAG-BEETLE. Cervus Volans. Defcribed by Moufet, Imperati and others. He hath his Name from his

his two Horns, which are branched like those of a Stag: but yet moveable. His Head is very big and broad; ratably, far bigger than in any other known Beetle, much exceeding the bignefs even of the fore-Section. Under his fore-Feet, he hath Tufts of short brown Hair. His Wings are doubled up inward and towards the Head, as in the Great Bull-Chafer. From the Tips of his Horns (which are about an inch long) to the end of his Tail, above three inches in length.

His Horns being moveable, he useth them to catch hold with, as a Lobster doth with his Claws. For which purpofe, they are not only branched inwardly, but alfo toothed with a numerous Series of little knobs, by which to take the furer hold.

The Description and Figure of the Lungs of this Infect The Description and Figure of the Europe of this (a) De Bom-is given by *Malpighius*. (a) Some Observations of his (a) De Bom-Nature, see in the *Philosoph. Trans. N.* 127. *Chioccus* faith, <sup>byce, p.27.</sup> That there are many of them in *Lombardy*. (b) (b) Mus. That there are many of them in Lombardy. (b) The Horns of this Infect being fet in Gold, and fo worn as Calceolar.

an Anulet, are faid to be of excellent force (c) in eafing (c) Chioccus of Pains, and against the Cramp. Read Fienus, Of the Power in Mus. Calof Phancy.

Four more STAG-BEETLES; but leffer than the former.

Another, with the Head broken off.

The little THREE-HORNED BEETLE. Scarabæus Triceros minor. Moufet feems to defcribe it by the Name of Burepais; but imperfectly. His Head is guarded with two Shoulder-Horns, and one in the Neck between them, not in his Forehead, as Moufet mistakes. They are all three immoveable or unjoynted, of the thickness of a little Pin, or the bigness of thort Gooseberry Thorns. That in the middle stands reared upward, the other two are bended a little downward. In all other parts 'tis shaped like the Scarabaus Melanocyaneus with furrow'd Wing-shells; of which anon.

The NOCOONACA. So called by fome of the Natives of the West-Indies, from whence it came. I meet with it no where elfe. 'Tis three inches long, and an inch broad. The Head i an inch broad, i of an inch long. The Horns rooted on each fide the top; but are all broken off.

Y 2

# Of Insects.

164

PARTI.

off, faving a Joynt or two: which are of that thicknefs, as he feems to be of kin to the *Capricorne*-kind; and may be called *The Great Weft-Indian GOAT-CHAFER*.

His Back-Piece near i an inch long, i broad, armed with two black sharp Prickles, i of an inch long, and bended a little backwards. The Wing-shells almost square, knobed on each fide before, where each of them hath one, and at the hinder end two more very fhort Prickles. They are cover'd with a kind of Down, or very short and fine Hair, like the Pile of Velvet; for the most part brown, but adorned with Dashes of Red and Yellowish, or Citrine, of an answerable shape upon both shells. The brown spaces before are also rough-cast with a great number of small round black knobs, like Mourning Pins-Heads. The fore-Feet are four inches and ½ long, as long again as the other; contrary to what, at leaft, for the most part, they are in other They are also set with sharp black Prickles like Beetles. those on the Back-Piece. The rest without them. All of them vary'd with the aforefaid Colours.

Another NOCOONACA of the fame bignefs.

The Great European GOAT-CHAFER. Capricornus maximus Europeus. Given by Sir Philip Skippon. Deferibed by Moufet. 'Tis about two inches long. Of a dark brown or Musk-colour. He hath on his Forehead two flender Horns, knoted or with many Joynts; above an inch long, and commonly flanding backward, like those of a Goat; from whence his Name.

The Goat-Chafer, faith Moufet, being weary with flying, to fpare his weak Legs, wraps his Horns (I doubt weaker than his Legs) about the Twig of a Tree, and fo refts himfelf.

The LONG-SHELL'D GOAT-CHAFER. Capricornus Vaginis longioribus. I think no where defcrib'd. It is above an inch long, and the Wing-fhells of themfelves an inch, being prolonged near  $\ddagger$  of an inch beyond the Anus; and near  $\ddagger$  an inch broad; fo deep, as to come down below the Belly on both fides. All over of a ftraw-colour. The Shoulders a little knobed. The Neck, red; and about  $\ddagger$  of an inch fquare. The Head ftill leffer, fcarce fo big as a Flefb-Flys.

(a) Cap. 21. It is of the Middle-kind. Defcribed by Moufet. (a) While

While it lives, and for fometime after its death, It hath a fragrant fmell; from whence the Name.

The leffer Goat-Chafer blew and green. Minor Chlorocyaneus, as it may be called. About i of an inch long, the Head and Neck green, the Wing-shells blew, both glossy. The Horns i of an inch. The Legs like bright Steel.

The little Saffron-Goat-Chafer. Minimus rubrocroceus. About = an inch long. His Horns - His Legs like polifh'd Steel.

The little Brown Goat-Chafer. Minimus pullocroceus, as we may call it. About inch long, and flender. Of a brown colour, with a yellow Ring on the upper part of his Neck, two more on his Wing-fhells, and two floap ftreakes upon each: His Horns and Legs of a Chefnut.

The GREAT GOGLE-EYED BEETLE. Carabus Indiæ Orientalis maximus. I find it no where described or pictur'd. Two inches and ½ long, and an inch broad. His Head of a middle fize. His Face perpendicular, about i of an inch long, in the middle of a golden green. His Teeth like polish'd Steel, of great thickness and strength. His Eyes of a fine colour betwixt a light Chefnut, and that of red Coral; of an Oval figure; and ratably, very great, fc. 4 of an inch long. Which alfo, fo far as I have observ'd, is the principal Character of all the Carabus-kind, fo far, as diffinct from the *Capricorne* : whence I take leave for the *Englis* Name. His Horns rooted between the Eyes and the Snout; but they are here broken off. His Shoulder or Back-Piece almost fquare; yet edged with a Convex Margin on each fide; above  $\frac{1}{4}$  of an inch broad, and  $\frac{1}{4}$  an inch by the length of the Infect; burnish'd with two large spots of the colour of polish'd Bellmettle; betwixt which, and on the edges or margins of a shining+green.

The Wing-shells almost two inches long, with small furrows running by the length, and united with short transverse lines, all together, like Network. Not Oval, but rather expressing the sigure of a Speer-Mint-Leas. At the end of each, two very small points or prickles. In the middle, of a glorious golden red like that of burnish'd Copper; On the edges of a shining blewish green. The Belly of the same colour with the middle of the Wing-shells; faving, that the fore part of every Ring (whereof there are

# Of Insects.

are three) and the Tail-piece, is also variegated with a curious fort of fmall white Streaks, which, at the first, look like fine Hair.

The great Joynts of the Legs (as is alfo beft obfervable in other larger *Infects*) are joyn'd together, not only by Ligaments, as are the Bones in other Animals; but the globular knob of one, is entirely inclosed, and fo winds, within the globular Concave of another. The imitation whereof, may be feen in the *Joynted Images*, which fome *Stone-Cuters* make use of, for their direction as to *Poftures*.

The THICK GOGLE-EYED BEETLE of the East-Indies. Carabus Orientalis crasses. I find it not defcrib'd. About an inch and i long, i of an inch over where thickeft. His Eyes near the colour, shape and bigness of golden Millet-feed. His Teeth of a fad Chesnut, and very robust. His Horns are broken off. His Forehead, the fides of his Breast, Shoulder-piece, and Wing-shells, all rough cast, especially the two parts last nam'd; the Shoulder-piece with numerous small punches, the Wing-shells with greater and fewer; two whereof before, rounder and larger than the rest.

On his Breaft he hath a short, thick and sturdy *Thorne* or *Spike* directed forward, and somewhat downward. He is all over of a curious green, bright and with strong Rays of Gold, but mostly on his Belly, Forehead, and the inward Margins of his Wing-shells. The hinder ends of which have one or two little Indentures. His Legs broken off.

The long GOGLE-EYED BEETLE of the *East-Indies*. Neither is this defcrib'd, that I find. About an inch and is long; where broadest is an inch. His Head fmall, fomewhat bigger than that of a common *Bee*. His Eyes great, Oval, and of a *Chesnut* colour. His Forehead between them of a shining green, and rough cast. His Teeth very strong. His Horns broken off. His Shoulder-piece almost square, but somewhat broader behind. This, his Wingssess field, and his Breast of a glorious green mixed with some faint Rays of Gold; but their outer Margins, especially, as you turn him on his Belly, look of a pure *Bice-Blew*. Their hinder ends (as also the Tail) tinged with the colour

167

colour of bright *Copper*. Their ends are likewife indented like the leaves of fome Plants; and fo rounded, as both together to make an Elliptick. His Feet are loft.

The LONG STRIATED CARABUS. Carabus fextus Aldrovandi. Above an inch long, and ‡ broad. The Wingfhells are furrow'd by the length with fmall Striæ, and alfo wrought with punched or pricked lines in the fame Order. The fore-feet are foled each with four little Tufts of Down or fhort Hair. Here are Three of this fort. One, all over of a blackifh colour. A fecond hath his Shoulders and the Rimms of his Wing-fhells, blew. The third hath Crimfon fhoulders, or like pure Lake, and the Wing-fhells of a fad green with fome Rays of Gold.

Another *Carabus* of the fame kind with the former, but leffer, being not above  $\frac{1}{2}$  or  $\frac{2}{3}$  of an inch long. Here are of this *Species* of feveral colours. Some, of a dark-brown; others, cole-black; others, of a gilt-green; and others, of a giltred like bright *Copper*. None of thefe are punched, but only ftriated.

The LONG SMOOTH CARABUS. 'Tis all over of a fhining-black; very fmooth, without either prick'd or ftriated Lines. Only a row of very fmall Pricks just above the Rimm of the Wing-shells. Also in proportion somewhat longer and slenderer than the former.

The little GREEN CARABUS. About  $\frac{1}{2}$  an inch long. His Head fmall, fcarce fo big as of the common *Black-Fly*. His Snout oblong. His Eyes gogling, and of a *Cheftnut* colour. His Neck alfo little. His Belly and Wing-fhells much broader, efpecially behind, which is unufual. Above, of a curious green; the Wing-fhells marked with feven or eight white Specks on the Margins, and two in the middle. Underneath of a golden red.

The Little BROWN CARABUS. Like the former, faving his colours; his Snout being of a fhining ftraw-colour; as alfo his Eyes, and very great; finely Cancellated; through a Glafs a curious fight. His Wing-fhells brown, with whitifh Spots, fewer and bigger. His Legs of a golden red.

The Little BROAD CARABUS. Shorter, and proportionably broader, than any of the precedent *Species*. All over black. The Head extream fmall. The Shoulder-piece broad,

broad, fmooth, and almost fquare. The Wing-shells striated, each with three ridge-lines, and each having a narrow and level Rimm or Margin; as in the other *Species*. Of this fort, here are three or four; the bigest; of an inch long, and; broad.

Of Insects.

The common flender SPANIHS-FLY. Cantharis vulgaris. It feems to border both upon the Capricorne and the Carabus.

Spanish-Flys, being taken in too great a dofe, will exulcerate the Bladder. Some bold Whores take them to kill and bring away their Conception. Moufet (a) speaks of a fingular Remedy which he had, Contra Veneris Languorem. Which seems to be fome Præparation of Spanish-Flys, by the Symptome which he faith did once follow the use of it, which was bloody Urine. Yet this hath sometimes happen'd, only ex effrænat a Venere.

Re Spanisch-Flys 3i, Rhenisch-Wine, or rather Spirit of Wine 3iiij. Digeft them, without fire, for fome days. Then filtre the Spirit through a brown Paper. To every fpoonful of this, add feven of clean Wine or Ale. Of this mixture take the first day, one fpoonful; the fecond, two; and fo increasing every day. Against a Virrulent Gonorrhæa, a fuppression of Urine, and the Stone, the happy fuccess of this Tinsture, faith Bartholine, (b) hath been experienced by Dr. James-Francis Kotzbue. I mention it, for a fase way of using this Infest inwardly, if in any Case we may expect more from them, than other Medicines.

The BROAD GILDED BEETLL. Cantharis latus Moufeti. Here are feveral of them. They all agree in fhape; their Principal Characters, That they are broad Back'd, and Headed, like the Scarabæus Melanocyaneus; Tail'd, like the Scarabæus Fullo (of both which anon) and have a finall Part indented betwixt the fore-ends of the Wing-fhells, like the Tongue of a Buckle. But their Colours are various. Two of a golden green on the Back, and like burnifh'd Copper on the Belly. One like Bell-metal on the Back and Belly. And one like Copper on the Back and Belly.

The DORR or HEDGE-CHAFER. Scarabæus Arboreus. Defcribed by Moufet. His chief marks are thefe, His Head finall like that of the common Beetle. This and his Eyes black.

Infect.c. 19.

(a) Lib. de

(b) Thom. Barthol. Hift. Cent. 5. PART Í.

black, notwithftanding *Moufet* faith thefe are yellow. His Shoulder-piece and the middle of his Belly alfo black; but juft under the Wing-fhells fpoted with white. His Wingfhells, Legs, and the end of his Tail (which is long and flatpointed) of a light *Cheftnut*. His Breaft, effectially, cover'd with a downy-Hair.

The LEOPARD-FLY. Scarabæus Fullo. Defcribed alfo by Moufet. 'Tis bigger than the Dorr. His Nofe as black as jet, his Wing-fheaths, and almost all other parts, speckled with ash-colour and black: in other respects like the Dorr.

The little TAIL'D-BEETLE. Scarabæus caudatus minor. The Head and Shoulders are wanting. The Wing-fhells almost two thirds of an inch long and 5 over. Of a dull ash-colour befprinkled with extream finall blackish specks. His Legs and Belly of the same. He hath a strait, pointed Tail prolonged beyond the Wing-shells 3 of an inch, from whence I have nam'd him; and by which he seems of kin to the Hedge-Chafer.

The SHORT-SHELL'D BEETLE. By Aldrovandus; called Scarabæus Serpentarius, fomewhat abfurdly, fc. for that he once found them in a Serpent. But his Defcription is not ill. He feems by the fhortnefs of his Wing-fhells to border on the Dorr or Hedge-Chafer, as the former. As alfo by their colour, composed of black and Chefnut Rings indented together. Here are five of this Species.

Another of the fame *Species*, with the Wing-fhells all over of a Chefnut colour. Defcribed alfo by *Aldrovandus*. Of this fort here are feveral finall ones.

The BLACK and BLEW BEETLE. Scarabæus Melanocyaneus. See Moufet's Defeription. Of this, the Wingfhells are ftriated or furrow'd by the length. All the upper parts are black, the under parts blew, exactly like that colour which Watch-Makers and others give to their Steel-Works. Sometimes the nether parts are rather reddifh, juft like pure bright Copper. Sometimes their Tails and Belly of a golden Green, of which is that called by Wormius, Scarabæus Xλωρόχρυσ. Here are of thefe, in all, about half a fcore.

ANOTHER, of the fame kind. But this hath both the Shoulder-piece, and alfo the Wing-shells very smooth.

A

A THIRD, a kin to the former. Yet different from them, not only in being all over black, but efpecially in the make of his Feet. In thofe, hard and fharp with feveral little Prickles ftanding in a Row, with fome ftragling hairs. In this, having only two fharp Hooks or Claws at the end of his Feet, and his Feet foled with a treble *Tuft* of a clofe fhort tawny Down.

Of Infects.

The SQUARE-SHELL BEETLE. The Head and Shoulders of this are loft. The Wing-fhells together, make almost a long fquare; being flat on the top, which is unufual, and the fides making right angles with their upper end. They are also ftriated or furrow'd by the length; and the fides curiously punched or pricked.

The BEETLE with pointed fhells. The Head and Shoulders of this alfo are loft. All over of a very dark fhining Bay. The Wing-fhells above = an inch long, and of a peculiar figure; being not only much narrower, but alfo pointed behind.

The LONG-HEADED BEETLE. Here are feveral of them; all of a dun or blackish brown. But that whereby they differ from all other *Beetles*, is the shape of the Head, which, in proportion, is very long and slender.

The fmall PURPLE BEETLE. Of this fort here are two fomewhat flat; and one thick and round.

The BLEW ROUND BEETLE. Viola. One as big as a Lady-Cow, but longer: the other near  $\frac{1}{2}$  an inch long; Both of a Violet colour.

The GREEN ROUND BEETLE, burnish'd with glorious golden Rays.

The Round Chefnut BEETLE, not without fome Rays of Gold.

It may be worth the trial, Whether any of the Gilded fort of Beetles, are of the fame Nature with Spanish Flys, or may produce the fame effect, with less pain.

The SPIKED WATER-CLOCK. It feems to be that which Aldrovandus defcribes (but very imperfectly) under the Name of Scarabæus Aquaticus. 'Tis about two inches long, and <sup>‡</sup> over where broadeft. All over of a fhining black: excepting, that his Eyes are brown; his Antennæ, tawny, his fore-Belly overlaid with a kind of Lemon colour'd Velvet. On his Back, there is a triangular piece indented between

between the Wing-fhells. The Legs are much broken, on the third Joynts, at leaft of four of them, grow a pair of black fharp Prickles about the length and thicknefs of the fting of a *Bee*. But that which is most remarkable, is a ftrong and fharp *Spike* or *Needle* which ftands horizontally on his fore-Belly, and with its point towards the Tail. His Wing-fhells are carry'd down confiderably below his Belly: fo that being turned on his Back, he looks as if he lay in a Boat.

By the shape of the Wing-shells, this *Infect* seems, like the *Notonecta* (whereof prefently) to swim on his Back. In which posture, in case of an approaching enemy, the aforefaid *Needle* is also ready for his defence.

The Great English WATERCLOCK. Hydrocantharus major Anglicus. Defcribed (a) and figur'd (b) by Mousset. (a) Lib. t. It comes near, in bigness, to the former; as also in shape;  $^{C,23}$ . but hath no Needle, neither are the Wing-shells below the end of the Belly. That part most observable in him, is his Eye, which Second Eook is of a curious bright colour, almost like a Butter flys.

Another Water-Clock of the fame Species.

The fmall brown *Water-Clock*. 'Tis flat and narrow, and  $\frac{1}{2}$  of an inch long.

The fmalleft *Water-Clock*. Scarce bigger than a Sheep-Tick, all over of a fhining black.

These Infects make use of their hinder Feet instead of Oars. They are feldom or never seen in the day, excepting in the Water, which they leave in the night, and fly up and down, (c)

(c) Moufet,

The BOAT-FLY. NotoneEta. Defcribed by Moufet, lib. 1. c.23. but very briefly. (d) A Water-InfeEt, in fhape like that (d) Lib.2. which lives in Cuccom Spittle, but fix times as big, fc.  $\frac{1}{2}$  of e. 38. an inch long. The upper Wings are opacous and thicker before; at their hinder ends, where they lap over, transparent and extream thin, like the Wing of a Fly.

He firing, faith Moufet, (e) contrary to other Creatures, on his (e) Lib. 2. Back. And the shape of his Back seems to favour it, being  $c.3^{8}$ . very like the bottom of a Boat. Nor do his hinder Legs, which are thrice as long as the former, unaptly refemble a pair of Oars.

The Great WINGED PUNEE. Cimex fylvestris alatus major. Moufet (f) hath given three good Figures of this (f) Lib. 1.  $Z_2$  Kind. C.29.

# Of Insects.

PART I.

Kind, but fcarce defcribes them. All the Species agree, in having a very fmall Head, broad Shoulders, a Pyramidal Back-piece, and the upper Wings fomewhat like as in the Boat-Fly, fc. half Cruftaceous and half Membranous. This, is almost  $\frac{1}{4}$  of an inch long, near  $\frac{1}{2}$  an inch broad. His Shoulder and Back-Pieces yellow, fhining and rough caft. The fore half or crufty part of the upper Wings of a ruffet, the Membranous of a fad green. The Belly ftraw colour'd and Chefnut, and divided into feveral Sections with black Lines, half of them meeting at the ridge of the Belly.

The SPIKED PUNEE. In proportion longer and narrower than the former. The Back ruffet, brown and black. The Belly, afhen. Where, that which is most observable, is a short, flat, and very sharp *Thorne* or *Spike* standing level, as in the *Spiked Water-Clock*, but with the point the quite contrary way, *fc*. towards the Head.

The HIGH-SHOULDER'D PUNEE. He is otherwife of the fhape and bignefs of the former : all over of a brown or dun colour, efpecially the Membranous parts of his Wings.

The SQUARE-WINGED PUNEE. Scarce ‡ of an inch long, and almost as broad. Partly colour'd with a shining black, and three spots of white on each side.

Another Square PUNEE, with the Crustaceous part of the Wings ruffet.

The SHORT-WING'D PUNEE. In which refpect chiefly, it differs from the former; the Wings being in those prolonged to the end of the Tail; here, but half way.

The LONG-PECKLED PUNEE. This kind, Moufet hath pictur'd among the fmall Beetles; but by a miftake, it being really a fort of Flying Punee, with Wings partly Cruftaceous and party Membranous, which is their Characteriftick. The Shoulder-piece, Back-piece, Sides, Belly, and crufty part of the Wings, are all red befpeckled with black fpots; the Membranous part, dun and fpeckled with white.

# Of Insects.

#### CHAP. III.

## OF CREEPING INSECTS.

THe SMALLEST ANT or EMMET. When well grown, they are then hardly bigger than a good big Flea. In Barbados, faith Ligon, there is a larg fort of Ants, that build their Nefts, with Clay and Lome, against a Wall or a Tree, as big as Bee-Hives, and divided into feveral Cells. (a) Of the Ingenuity of this Infect, fee divers (a) Hift. Relations in the fame Author. (b) They are exceeding nu- (b) P.63. merous throughout all India. So that they are forced to fet the feet of their Cupboards and Chefts in Cifterns of Water to preferve their Cloaths and Victuals (c) from them.

Of their Kinds, and Generation; as alfo their use for p. 80. feeding of Pheafants and Partridges, fee fome Obfervations in the Phil. Trans. (d) Communicated by Dr. Edmund (d) N. 23. King. Of their Nature, fome others in the fame Tranfact. (e) Communicated by Mr. Ray from Dr. Hulfe and (e) N. 64. Mr. Fisher. The former observing, amongst other particulars, That the Liquor which they fometimes let fall from their Mouths, droping upon the blew Flowers of Cichory, immediately gives them a large red ftain; and fuppofeth, it would produce the like in other blew Flowers. The latter, That not only the Juyce, but also the Distill'd Water or Spirit of this Infect will produce the fame effect, &c. Amongst which, Mr. Ray mixeth some Notes of his own.

The Liquor of Ants is commended by Schroder (f) for (f) Phara most excellent Ophthalmick.

The BAHAMA-SPIDER. It is of the Tarantula kind, and may be called Phalangium maximum Indicum; being the biggeft of all the Species, sc. two inches long. Deferibed by Wormius, and others. He hath fix Eyes, not fo big as the smallest Pins head. They stand not in a circle, as reprefented by Laet, Wormius, Pifo, and Olearius, but two and two on each fide, and two betwixt them transversly, thus :-- He hath two ftrong black shining Teeth, like crooked Claws, standing parallel, and with their points downward,

(c) Linchot.

The GRFAT GALLY-WORME. Scolopendra. Defcribed both by Moufet and Aldrovandus: but yet imperfectly. Neither is this here entire. Yet thus much remains Observable of the Feet; That each of them is armed, in the room of Claws, with three, four, or five Needles, of different thickness and length; fome of them above i of an inch long; of a black fhining colour like the Sting of a Bee, and equally sharp; in respect to which the Figure

# Of Insects.

Figure neither of *Moufet* nor of *Aldrovandus* doth any way anfwer. Befides thefe, there are a great many more on each fide, of the like fhape and bignefs, but of the colour of *Copper* or tarnifh'd *Brafs*. The Back and Sides are fhag'd, the Belly fmooth or bald. He is about three inches and  $\frac{1}{2}$  long.

The Teeth of this Animal, are faid by all to be venimous. And probably, all the Needles above defcribed, are fo likewife.

The middle Bald GALLY-WORM. Julus glaber. They have commonly betwixt forty and fifty Legs on a fide anfwering to fo many cruftaceous Rings, with fome refemblance to a *Triremis*; whence *Moufet* gives it the *Englifb* Name.

Another Bald *Gally-Worme*, of a yellowish colour, and fewer Feet; being the third fort mention'd by *Moufet*.

Of the Gally-Worme Mr. Lyster conjectures, That it may yield an acid Spirit, like that of Ants. (a)

The SILK-WORME. Bombyx. The full Hiftory hereof Tranf. N.68; is written by Malpighius; as to the manner of his feeding, the feveral changes he undergoes while a Worme, and while transformed into an Aurelia, and thence a Butterfly, with the business of Generation afterwards. But principally in the Anatomy of the Parts; as Feet, Mouth, Mufcules, Lungs, Heart, Stomach, Medulla Spinalis, Gc. in the Worme. And in the Butter fly, the Penis, Parastata and Tefticles of the Male; and the Womb and Ovarium of the Particularly, of the Lungs, he faith, That the Female. Silk-Worm hath not only thefe, or Parts analogous, but that almost every Ring hath two pair, which are branched out to all the other Parts abovefaid : their feveral Orifices being remarquable, by fo many little black Circles which encompass them, on the fides of the Worme. If any of these Orifices be oiled over, fo as to exclude the Aer, the Parts to which they belong, prefently grow Paralytick; and if all, the Worm will die within the space of a Pater Noster. Of the Medulla Spinalis, he faith to this purpose, That, from the Head to the Tail, there are about thirteen large Nodes therein; which he conceives to be, as it were, fo many little Brains; the Worme having no visible Brain diftinct from these Nodes.

A very

# Of Insects.

PART I.

A very large Aurelia and Slough of a Silk-Worme. Moufet affirmeth, That in the Transmutation of the Worme into a Fly, the Head of the Worme makes the Tail of the Fly; and the Tail of the Worme the Head of the Fly. But Sig<sup>r</sup>. Malpighius makes no mention hereof; neither is it any way likely to be fo.

Two BAGS of the Virginian Silk-Worme. They are of an Afh-colour, and about the bignefs of a Pullets Egg. Of exceeding thicknefs, thrice as thick as the fhell of a Hen-Egg. It feems not to be one entire piece of Work, but composed of feveral Skins one within another, woven by fo many Worms, ready for fpining, one after another. And accordingly, in each Bag, being opened, I find four Aurelias.

The RED or CRIMSON CATERPILLER. Vinula. So called, becaufe, while living, his Body is dy'd all over with a deep *Claret* colour. See *Moufet* hereof. (a)

The YELLOW-CATERPILLER. Eruca flavescens. Both this and the two former are all fmooth or bald. This is also mention'd by *Moufet*.

The PALMER-WORM. Ambulo. For that he hath no certain home, or diet, but pilgrims up and down every where, feeding upon all forts of Plants. In respect of his great shag, called also *The Bearworme*.

EARTH-EGGS. About the bignefs of *Nutmegs*, and fomewhat Oval. So called, becaufe made of Earth by fome fort of *Caterpillar*, or other *Infect*, for their Nefts, wherein to breed under ground.

(b) L.2.c.37.

The SQUILL-INSECT. Defcribed by *Moufet*.(b) So called from fome fimilitude to the *Squill-Fifb*: chiefly, in having a long Body cover'd with a Cruft composed of feveral Rings or Plates. The Head is broad and fquat. He hath a pair of notable fharp Fangs before, both hooked inward like a *Bulls* Horns.

(c) Cap. 38.

The WATER-SCORPION. *Moufet* (c) figures three forts; to the third of which, this anfwers. He defcribes it not. Nor can I well, being glewed to a Paper with the Belly upward. But it may be eafily known by its pointed Tail. He hath four Legs, and two Arms or Claws, betwixt which a very fmall Head. He's about <sup>2</sup> of an inch long.

(a) Lib. 2. cap. 2.

# Of Insects.

The SHARP-TAIL'D SEA-LOUSE. Pediculus marinus cauda acuta. Moufet (a) defcribeth an Infect by the Name (a) Lib. 38. of *Pediculus marinus*. But with a bunched, not a taper'd Tail, nor with long nodous Horns, like this. 'Tis about an inch and  $\frac{1}{2}$  long, and  $\frac{1}{2}$  inch broad, compos'd of feveral fhelly Plates, like the Afellus or Wood-Loufe, with as many Feet on each fide.

ANOTHER, with a Tail of four Spikes or Briftles, about ‡ of an inch long, thick as a fmall Needle, fharp, and fpread horizontally.

OSCABIORN. An Infect fo called in the Danish-Tongue, the name fignifies as much as Urfus Voti, or the Luck y Bear; Becaufe the people commonly believe, That he who for a good while holds a certain Stone or Body contained in it under his Tongue, shall enjoy his Wish. It is usually found adhering to a kind of Afellus or Cod-Fish in the Island-Sea, to which it is very troublefome. This account together with the Infect it felf were fent hither by Mr. Olaus Borrichius. Not difagreeing from That which is defcribed in fome fort by Wormius, by the fame Name: nor from That in Pifo, called by the Americans, Acarapitamba. Yet I find not the Figure any where to answer to the Animal, the entire length whereof, is about two inches and 1. The fore part Oval: whence it narrows all the way to the Tail. Where broadeft above <sup>2</sup> of an inch. Its shelly Armor confisteth of about twenty Plates, of a ftraw co lour: The Legs on each fide in number answerable. The Eyes are most curiously latticed with cross lines, fo as to divide them into an infinite number of Rhombs. He feemeth to have notable fharp Chifell-Teeth, whereby partly he becomes fo troublefome to his Bearer. The other parts are loft.

(b) De Inf.

177

The SEA-HORSE-LEECH. *Hirur do marinue*. Defcribed 6.7. by *Rondeletius*. (b) He hath a harder Skin, than the *Poole-Horfeleech:* for which caufe, he cannot draw up himfelf (c) Ibid, fo round, but exerts and contracts his Head and Tail only. (c)

À WATER-WORME. Lumbricus Aquaticus. Not four inches long: but doubtless shrank up much when it died.

The HAIR-WORME. Vermis Setarius. Given by Mr. Malling. 'Tis little thicker than a Horfe-Hair or a Hogs Briftle; Of a light Flesh-colour; and about <sup>‡</sup> of a A a foot

# Of Insects.

PART I.

foot in length. 'Tis commonly believed, but erronioufly, that this fort of *Infect* is nothing but a Horfe-Hair animated. By fome, that they are bred out of *Locufts*. See *Aldrovandus* hereof. But efpecially the Obfervations of Mr. *Lyfter* in the *Phil. Tranf.* (*a*) who found them in the Belly of a kind of black and not uncommon *Beetle*; in fome one only, in others two or three together: of all which he hath feveral Remarques.

Whether there are not a fort of Eggs first laid by some Animal upon the *Beetles* Breech, which being hatched cat their way into his Belly, may be a Question. And therefore, whether the like *Wormes*, may not sometimes be also found in the Bellies of *Locusts*.

A SEA-WORME NEST. 'Tis a piece of TUBULATED WOOD; part of the *Jheathing* of a Ship. Brought in, by *Wormius*, improperly amongft Woods; as not being naturally Tubulous, but made fo by a fort of *Sea-Wormes*; defcribed by *Rondeletius*, and out of him, by *Aldrovandus* and others. The Tubular Holes are numerous, of that width as to admit a *Swans-Quill*, very round, equally wide, and winding every way too and fro, fo as fome times to run one into an other. Moft curioufly lined, or as it were Wanfcoted with a white Teftaceous Cruft, of the fame fubftance and thicknefs with thofe called *Tubuli Marini*.

PART

Of Plants.

#### PART II.

(a) Linfch. l. i. c. 76.

Of this Tree there are two forts: (a) The beft, called Calamba, and grows most in Malacca and Sumatra. Much ufed in India for the making of Beads and Crucifixes. The wilder, called Palo Daguilla, and grows moft in Seylon and Choromandel. With this, they burn the dead Bodies of their Bramenes and other men of account in token of honor. (b) Notæ in See hereof alfo Fac. Bontius. (b)

Garfiam.

(c) Lib. 1. c. 65.

(d) Phil. Iranf. N. 43.

A piece of Indian-Wood, called GARON. Very oily; in colour, hardnefs and weight, like to Lignum Aloe. Butbeing held a little to the fire, hath a ftrong fragrant fcent, much like to that of *Cloves* ; and feems therefore, as well as by its Name, to be the Wood of the Clove-Tree. The Clove-Tree is defcribed by Linschoten. (c) Shaped like a Bay-Tree. It grows in Amboyna and the Neighbour The best fort in Makian and Tidor. Iflands.

The BARQUE of the Tree LAWANG. Sent from . Fava major, where it is fo called. Being well chewed, it hath the felf fame Taft with that of Salfafras-Barque, fo that, probably, the Tree is a Species of Saffafras.

Part of an Arm of the STINKING-TREE; as it may well be called : for it naturally finells like the ftrongeft humane excrements, efpecially, as upon the emptying of a House of Office. It grows in the Isles of Solon and Timor, from whence Sir Philiberto Vernatti, procur'd it and fent it to this Musaum. (d) Where, though it hath now been preferved many years, yet feems to give as full and quick a Yet in burning, it yields no finell; as do fcent as ever. Lignum Aloe and fome other Woods. 'Tis ponderous, hard, and of the colour of English-Oak; and as that, hath large Aer-Veffels; yet but few. I should have conjectur'd, that this Wood belong'd to the Tree called Abovaj, which hath a ftinking fmell, but that this is faid to be the more odious when it burns.

A piece of SERPENT-WOOD. Lignum Colubrinum. There are divers forts of Woods fo call'd. This here is different from all those Species described by Garfias, and out of him by J. Bauhinus. Yet comes nearest to the 'Tis above three inches in Diametre, the Barque Second. thin, the Wood folid, more than that of Pear-Tree: Of a very bitter Taft; especially when reduced to powder.

A piece of an other fort of SERPENT-WOOD. Within

of.

# Of Plants.

of a pale yellowish colour. Full of great Aer-Vessels. And also very bitter, as the former.

They grow in divers places of the East-Indies, as in Seylon, Gc. And have their Name from one of their efpecial! Uses, being an excellent Remedy (a) against the (a) Linsch. Bitings of Vipers and other venemous Serpents. They are 1. 1. c. 75. alfo, faith Bontius, given in India against Intermittent Fevers. From whence, and their bitter Taft, one may guefs, That they are either of kin to the Tree whereof the Pulvis Patrum; or might give occafion, to fome who have been in both the Indies, to find out the Virtue of it.

The WOOD of a Tree of Angola, there call'd Tacufa. Tis very folid and ponderous, like that of the Lignum vita, and with a blackish grain.

Another fort of Angola-Wood by the Inhabitants called .CHICENGO. 'Tis fomewhat hard and ponderous, and of the colour of Spanish-Oak. Being power'd, it hath a bitterish Tast. Both these Woods, may be of the like use with the former.

Part of the Trunk of a young MOUNTAIN CAB-BIGE. Sent from Jamaica by Mr. Sam. Moody to the Now it is dry and thrunk in, not above a foot Author. and in compase. Confisteth of a great number of very thin fibrous Rings or Tubes one within another, now, by the shrinking up of the pithy parts, distinct.

Tis faid by Mr. Stubs (b) who lived for fome time in (b) Phil. Jamaica, where this Tree grows, That it is one fort of It grows alfo in Barbados: where, as it was Palm-Tree. confidently reported to the fame Perfon, there was one about three hundred feet high, i.e. about thirty yards higher than the great Dorickhing Pillar in this City called The Monument. The young tender Sprouts of one year, are eaten both boyl'd and raw, and are both ways excellent good meat.

The BARQUE of a kind of Pine-Tree in Nova Scotia. Hereupon grow up and down many Knots, about the bigness of a Horse-Bean, hollow, and filled with a liquid, clear, and fragrant Turpentine; which, as it drops, the Natives gather and use as the Balfom of Peru.

A natural KNOT of Wood of an Oval Figure, and as big almost as a Turkeys-Egg: the fibers whereof are prettily

Tranf. N. 36,

#### Of Plants.

## PART II.

prettily waved by the transverse eruption of several small sprigs.

A fuppofed naturally entire RING of Wood, almost in the shape of a Womans Head-Roll, but not so big as now worn, about four or five inches Diametre. *Wormius* also mentions one in his *Museum* like this, but somewhat bigger.

PITT-WOOD. Lignum fossile. Colour'd like that of the Cedar, but a little brighter. Smooth, light and foft; yet hath no confpicuous pores. Hath neither taft nor fmell. Whence this was dig'd, is uncertain. But in Lancashire, and fome other places here in England, the people find the Bodies of large Trees at a good depth underground, and which the poorer fort burn, being fplinter'd, to fave Candles.

A BRANCH of a Tree, by fome called The COCK-SPUR Tree. Perhaps more properly, Oxyacantha Americana, or the AMERICAN HAWTHORNE. I meet with it no where defcribed or mention'd. This Branch is an Eln long, without any appendent Branches. An inch Diametre. Of the folidity of Hawthorne-Wood. Encompaffed with great Thornes alternately placed on every fide, fo afcending, as every two Thornes on the fame fide are about four inches and <sup>1</sup>/<sub>2</sub> one above another. Moft of them about 1 <sup>1</sup>/<sub>2</sub> inch, fome an inch and <sup>1</sup>/<sub>4</sub> long, of the thicknefs of a large Cocks-Spur, and very strait. Not meerly Cortical, as the Thornes of Raspis, Gooseberry, and the like; but Lignous or Woody, as those of Hawthorne.

A BRANCH with a great WEN. It feems to be of the *Hawthorne*. The Branch, not above an inch in compaſs; the Knot or Wen, almoſt <sup>1</sup> of a foot. 'Tis tuberous and ſpiked. So that it feems to be made by the caſual eruption of ſeveral ſturdy Buds together, which having begun the draught of the Sap, it ſtill continu'd to ſwell the Knot, after they were faln off. And it is probable, that Animal-Wens are then produced, when two or three ſprigs of a Nerve bigger or more than ordinary, ſhooting into a part of a Muſcle, do thereby more invigorate it, and ſo make it capable of a more copious nouriſhment.

Another tuberous Knot like the former. There is one like these in the Museum Cospianum. (a)

(a) Lib. 2. c. 26.

182

A little

# Of Plants.

A little Oaken BRANCH with a great WEN growing round about it. 'Tis above a foot in compas, as big as a midling Bowl.

A WARTED BRANCH. 'Tis of Oak, about as thick as ones middle Finger; the Warts the bignefs of Hafle-Nuts.

Another BRANCH with four or five great Warts or Wens upon the fides. Wormius, who hath one like to thefe; not of Oak, but Hasle, calls it Lignum Strumosum.

An Oaken BRANCH permitted to grow for fome time; after the Barque had been cut round about to the Wood. By which means, that part of the Branch above the Cutis, is grown much thicker, than that underneath; the one being little, more than an inch about, the other almost two inches. Neither is it only the fwelth of the Barque, but the Wood it felf is augmented. An Experiment lately made by Sig<sup>r</sup>. Malpighi; and may feem an argument for the Circulation of the Sap. In what manner the Circulation of the Sap is performed, especially in the Root, the Author of this Catalogue hath fome years fince explicated. (a)

A piece of a BRANCH naturally shaped like a Penis first Book Of plants, Chap. with a pair of Testicles annexed. Wormius hath one like to 2. this, which he calls Lignum Inverecundum.

A WINGED-BRANCH of A/b. About two feet and 1/2 long, and fubdivided into two leffer. Where the division begins, the Barque is fpread out from the Wood for the breadth of above an inch, and of the thickness of Sheeps Leather, and fo joyns both the Branches together for the length of about a foot. From thence they are perfectly divided, and fo wind two feveral ways, almost like a Rams Horn ; the Barque being spread out all along to their ends : yet only fo as to make them edged. The two ends, with Buds like little Claws on the edges, look like a Seals Feet. Wormius hath fome Branches, not of Ash, but Firr, which feem in fome part answerable to this now described.

A HASLE BRANCH feeming as if it were naturally But made to by a Woodbind or fome other -TWISTED. Convolvulous Plant. In the Muf. Cospianum is fuch another of Hawthorne.

A WILLOW BRANCH, winding to and agen, like a Snake, with fix or feven clofe flexures. A Figure not uneafily given to a young Twig. A Pipe

(a) In his

## Of Plants.

184.

A Pipe made of a hollow BRANCH, and twifted into a loofe Knot, in which one part of the Branch is incorporated with the other.

Two large BRANCHES incorporated in the form of a St. Andrews Cross.

Two leffer, growing together in the fame form.

Two BRANCHES growing together in the form of our Saviours Crofs.

'Tis probable, That thefe were bound together (as may be any other) when they were young, and with the Barque pared off, where contiguous; and fo, by a kind of ingrafting, became coalefcent.

A PALMETO LEAF. Palmæ humilis folium. 'Tis a yard and  $\ddagger$  long. Hath about a hundred and forty Plates, feventy on each fide the middle Rib, whereupon they are all folded. Which Rib alfo diffributes it felf into Plates towards the top of the Leaf. The Plates are of feveral bredths from  $\ddagger$  an inch to an inch and  $\ddagger$ . Moft of them are now broken or torn afunder. But originally they make all one entire piece, rudely imitated by a folding *Fan.* 

These are the Plates, which both the Arabians and Indians make use of to write upon, by Impression with a Style.

Part of another fort of PALM-LEAF. 'Tis i of a yard long, and at one end feven inches broad: but rolled up, and with the ends of the Fibers unwoven, fo as to look like a *Broom*. Of a wonderful fubftance, in fome places i of an inch thick, and very denfe and flubborn work. Confifteth of great and leffer flat Fibers; and finall round ones; fomewhat alike as in the *Palm-Net*, whereof prefently.

The Leaves of fome *Palms*, are ufed, where they grow, for making of Garments, and thatching of Houfes. The Country-People Tap the *Wine-Palm* about two feet above the ground, and of the Liquor which runs from it, and which they catch in Earthen Veffels, they make an excel-(a) Thevetus lent Wine called *Mignol*, like the *White Champane*. (a) The fruitful kinds flourish chiefly in *Ægypt* and *Syria*: as also in the hotest parts of the *Indies*; and in the *Canary-Islands*: amongst which, there is one called,

The

# Of Plants.

The Palm-Ifland. (a) The barren kind in Italy and (a) J.Bauha Sicily.

The PALM-NET or BAG. The Tree which produceth it called, *Palma Saccifera*. Whether *Bauhinus* giveth this under the Name of *Folium Nucis Indicæ*, is uncertain. If fo, both the Figure and Defcription are very imperfect.

Some part of it hath been cut off both at the bottom and on the fide; yet is it above two feet long; at the bottom a foot broad; from whence it tapers to the top. Originally entire, like a taper'd Bag, commonly call'd *Hippocrates's Sleive*: but by fome inconfiderate hand cut open on one fide.

Tis naturally fewed or woven together with admirable Art. And yet not with more, than that which may be observed in every Plant; though not so visibly, and with variation. There is a five-fold Series of Fibers herein. The greateft of all fwell out above the reft, and like fo many Ribs, are obliquely produced on both hands, fo as to encompass the Sack. Along each of these woody Ribs, on the infide the Sack, runs a fmall whitish Line; which feems to be a Thred or Fiber of Aer-Vessels growing thereto. Betwixt the faid large Ribs, there are others, as it were leffer, parallally interjected. On the infide a third Series alfo obliquely produced, and transversly to the former. The fourth and fifth, confift of the fmalleft Fibers, not only transversly produced, but also alternately from the outside to the infide of the Sack, & vice versa. By which all the reft are most elaborately woven into one entire and strong piece of Work. A Cover which Nature hath provided, to protect the delicate Fruit of this Tree, from all the extremities of the weather, and the ravine of Birds.

Another PALM-SACK or Net, almost a yard long, and made of different Work. See one like to this in  $\mathcal{F}$ . Baubinus. (b)

(b) L. 3. c. 176.

About the Year 1599. the Hollanders, faith Cluss, returning from America, in an Island there, by them called Coronopes, found whole Woods of this Tree: and, probably, then first difcover'd the fame to Europe.

A LEAF of the ROCOUR-TREE. 'Tis near i a foot long, four inches broad, the lower end Oval or Elliptick, Bb pointed

186

# Of Fruits.

PART II.

pointed like a Spear. From the middle Fiber divers other collateral ones (all prominent underneath) are produced alternately, and at acute Angles. 'Tis fmooth on both fides, and of an obfcure redifh colour. Of this Tree (which I think grows in New-England) is made a fort of red powder, ufed for a dry colour; but being wet, at leaft, mixed with Oil, makes but a dull one.

#### CHAP. II.

## Of FRUITS; particularly such as are of the Apple, Pear, and Plum-Kinds.

(a) Hift. of Barb. p.70. **P**Art of a PRICKLE-APPLE. The Tree is in fome fort defcribed by *Ligon*. (a) The Fruit is remarkable for the feveral Tuflucks or Bunches of Thorns wherewith it is armed all round about : each Bunch confifting of about fix or eight Thorns; fome of which ftand erected, the reft couched down a little and crooked outward; of feveral lengths, from one inch, to above two; altogether, if pull'd off, fomewhat refembling a *Jack a long-legs*.

A MALE-ORANGE of Chio, commonly called Sio.

A FEMALE-ORANGE of the fame Ifland.

A CROWNED-ORANGE: that is, having an Orbicular Piece on the top.

A FRUIT like a little ORANGE : perhaps, Aracynap-(b).Tom.1. pil Paludani; defcribed by 7. Bauhinus. (b) This here is crowned with a circle of  $\frac{1}{2}$  an inch Diametre.

A fort of BASTARD-QUINCE. Cotoneaster Ges-(c) J. Bauh. neri. (c) Tom. I.

An HERMAPHRODITE-LIMON, exhibiting the pudenda of both Sexes.

A FRUIT of BRASILE, probably defcribed in *Bauhi-*(d) Tom. 1. nus by the Name of *Bras.* (d) Of the bignefs and fhape of a little *Limon.* 'Tis now yellowifh, when frefh, likely, of a golden colour. Filled with an innumerable company of Seeds, which *Baub.* defcribes not. They are almost as hard as Stones, ‡ of an inch broad, and flat, almost as the feeds of *Lillies.* 

An

#### Fruits.

An INDIAN FRUIT, having its furface (now) very uneven, with Furrows and Knobs all round about. The Furrows, ten. Both the Defcription and Picture hereof taken by *Baubinus* (*a*) from *Platerus*; But ill placed. (*a*) (*a*)

(a) Lib. 3. cap. 204.

187

A Round Indian FRUIT with one end pointed, and a (now) granulated furface. Defcribed as I take it by *Bauh*. (b) With the Name of *Fructus Peregrinus orbicularis cufpi*- <sup>(b) Lib. 3</sup>. (ap. 50.

The POLVILLERIAN-PEAR : becaufe either it grows moft about *Polvilla* in *Alfatia*, or was firft taken notice of there. A very fmall fruit, (now) no bigger than a *Nutmeg*. See *Bauhinus*.

The MOUNTAIN SERVIS. Sorbus Alpina. Chiefly upon the Alps.

MYROBALANUS CHEBULA. The largeft and longeft of all the five Kinds known in Shops. Next to which is the *Citrine*, alfo long. Then the *Belliricks* and *Emblicks*, but both thefe are round. The *Indian* or *Black*, the finalleft, and long. The Stone of the *Emblick* Myrobalan, of a peculiar angular Figure. This, and the five Myrobalans are all figur'd in *Befler*.

The GREAT CITRINE MYROBALAN. A rare kind. In fhape like that which *Baubinus* (c) gives by the Name (c) Lib. 2. of *Myrobal. Rauwolfij*; but is much bigger, near two inches <sup>c. 19.</sup> long, and above an inch and  $\frac{1}{2}$  over.

Myrobalans grow most of them in Cambaia, Goa, and Malabar; Chebs, in Bisnagar and Bengala; Emblicks and Belliricks, in Java; the Great Citrine, in Palestine.

Thefe Fruits, fay *Fallopius* and others who have purpofely made enquiry, are no where mention'd by any of the ancient *Greeks*; but by the *Arabian* Phyfitians firft of all. In the Countries where they grow, and may be had fresh, they are doubtless of good Medicinal use to the Natives. But as they come over hither, they are most of them meer rubbish, whereof, with the plenty of far better Medicines, we have no need. The *Chebs*, *Belliricks* and *Indians*, are *Preferved* with Sugar in *India*, and fent thence into all the Neighbouring Countries. The *Emblicks* are there used, as *Sumach*, &c. for the tanning of *Leather*.

SEBESTEN, *i. e. Fructus Mixæ*. It grows naturally in *Ægpyt* and *Syria*: And is alfo nourifhed in *Italian* Gardens. Bb 2 The

## Of Fruits.

#### PART II.

The JUJUBE of *Cappadocia*. Bacca Ziziphi Cappadocicæ. In fhape like the wild, but leffer, and fomewhat redifh. Of a dryifh fubftance, almost like that of *Hamthorne-Berries*. The Tree well defcribed by *Dalechampius*. It grows, to the bignefs of the *Willow*; effectively in *Syria* and *Ethyopia*.

A Black round FRUIT of the shape and bigness of the largest Red Cherries. Perhaps, Prunula Insana.

A STONED-FRUIT in shape and bigness like a *Quince*. The Flesh or Pulp being now dry'd and shrunk, very thin. It comprehends three very great Oval *Stones*, thin, and brittle : in each of which is also included a *Kernel* of anfwerable bigness.

An ORBICULAR STONE of an *Indian-Plum. Os Pruni Indici fere globulare.* Of the bignefs of a midling *Wallnut*, of a dark bay colour, knobed all round about, extraordinary hard, at the bafe and top a very little prominent.

Another GLOBULAR STONE. In fhape and bignefs, like the former; excepting, that the bafe is a very little broader. Of a citrine or ftraw-colour. Hard as a *Wallnut*. Very uneven and ruged all round about, with fmall furrows and holes intermixed.

A third GLOBULAR STONE. Yet fo, as to be divided into five Valves or Sides, all ruged as in the first, equally hard, and of the fame bay colour. But not bigger than a midling *Cherry*.

An OVAL PLUM-SONE. As big as a *Pigeons* Egg, and of the fame fhape. Somewhat rough, of an Iron colour, and hard fubftance, but not very thick.

Another OVAL STONE. As big as a *Hens* Egg: and almost of the fame figure; faving that the Bafe is a little blunter, the Cone or top a little fmaller. Of a bay colour. Wonderful hard. Divided into five fides, ruged and uneven, with a great many holes and deep furrows. The Sides diftinguished by as many strait Fiffures, beginning a little above the Bafe, and thence prolonged towards the *Cone*. Within each of which also grows a stony, and as it were toothed piece above an inch long. This, the Third, and the First, are all of kin.

A LONG OVAL STONE. In length two inches, and one inch over; fhaped like that of an Olive. Cover'd

with

## Of Fruits.

with a kind of ftraw-colour'd Membrane. Under which, 'tis all over unequal with furrows. Of a dark afh-colour without; inwardly, whitifh. Exceeding hard.

Another LONG OVAL STONE. Naked or without any Membrane. Much bigger than the former, being two inches and i long, and an inch and i over. The furrows alfo of this are more, and deeper.

A THIRD of kin to the former, but far lefs, not much bigger than the common *Cornelian-Cherry*. Thefe three laft are all of kin. Not to be fuppos'd the elder and young ftones of the fame fruit : for that they are all equally hard, and therefore at their full growth.

A PLUM-STONE almost like a *Wallnut*. An inch and 4 long, half an inch broad at the Bafe, which is a little hollowed in; in the middle an inch and 5, the top a little sharp and prominent. It hath three fides, all uneven with many furrows, and somewhat deep. Of a straw-colour, and very hard.

A STONE figur'd into a SPHÆRICAL TRIANGLE. Near two inches long. Hard, rough, and of a *Wallnut* colour. The three fides unequal: one above an inch broad, the others narrower; all united at acute angles, and a little prominent. This Stone feems to belong to the fruit which, together with the Tree, is defcribed in *Laet* (a) by the Name of *Totocke*.

ANOTHER, of like shape, substance and colour with Ind. Occ. the former. But much less; and ratably, broader; fc. about an inch long, and as broad. Consistent of three fides; whereof one the greatest, and convex; the other two almost plain or level.

A STONE ANOMALOUSLY figur'd. Above two inches long. One way, almost two, over. Another, an inch and  $\frac{1}{2}$ . Of a dark citrine, and fomewhat rough, as it were befprinkled all over with fand. On one fide, flattish, but unevenly. On the other fwelling up into a double Lip, very rough; and having a Fissure running by the length.

Another ODDLY figur'd Stone. Above two inches long; In the middle, two over. At the Bafe, in a manner, an inch and  $\frac{1}{2}$  fquare,  $\frac{1}{2}$  an inch over at the top. Almost fmooth, and of the colour of fpruce *Oker*.

(a) Defer. Ind. Occ.

A

A THIRD. Three quarters of an inch long; one way, f of an inch over; another, t. One fide, Concave; the other, Convex. The Margin pinched out into a fharpe edge. Of a dark bay.

Of Fruits.

A Great MAMMEE-STONE. Two inches and <sup>1</sup> long, an inch and i broad in the middle, flat, and fomewhat sharp at both ends. Bauhinus gives the Defcription and Figure hereof both out of *Clusius*, by whom it is called Avellana Indica. 'Tis alfo curioufly figur'd in Calceolarius: but with the fame Name. And with the fame, defcribed by Matthiolus. All of them miltaking it for a Nut. Whereas in truth it is the Stone of a kind of Fruit like a great *Peach*, and bigger; in which there are commonly two of thefe Stones.

A little MAMMEE-STONE. Defcribed by Clusius with the mistaken Name of Avellana Indica minor. And, (a) Tom. I. out of him, by Bauh. (a)

> A ROUND MAMMEE-STONE. Of the fame colour with the former; but that which is here the far greater part, of an obfcure brown, and fomewhat uneven with a few crooked furrows. The remainder and here the far lefs portion, of a shining bay. 'Tis of the bigness of a good large Walnut.

> The Fruit grows in Jamaica, Barbados, and other parts of the West-Indies. Of the flesh or pulp whereof, they there' make very good Conferves.

> A NETTED-STONE. Defcribed by Baubinus (b) with the Title of Fructus reticulato corio: miltaking it for a Nut. The greater part of the Stone is of the fame fubstance with that of other Plum-ftones. But over this is fpread a netted Work of larg woody *Fibers*. It was brought from *Guiney*; but it grows alfo in Virginia.

> Another WOODY STONE. A very great one; but ratably fhort, fc. two inches long, and two and <sup>1</sup>/<sub>2</sub> over, like a midling Pippin. Very little ftony, but all its outer part, at least, perfectly woody, or made up of a multitude of woody Fibers. The largeft whereof are prolonged from the Base to the Cone, affociated all along by leffer ones running betwixt them.

> A Third WOODY STONE. Almost of the shape and bignefs of a Pigeons-Egg. But a little compressed. 'Tis cover'd

(b) Tom. 1. p. 328.

Of Fruits.

cover'd all over with Liguous Fibers, fo extream clofely woven together, that it looks as if it were all Wood: Some of the greater run directly from the Stalk to the Flower or top. So great a difference there is betwixt thefe Indians Stones, and those of our Europæan Fruits, which have very few, and most not above two or three on the outfide:

The STONE of the Brasilian Fruit called ANDA. Wormius hath given hereof but a bad Figure : but defcribes it Yet with a miltaken Title, as if it were the entire better. 'Tis a very hard and great Stone, as big as a mid-Fruit. ling Bell-Peare, but a little compressed : broad at the Bafe, and fharp pointed, with fome refemblance to a Heart. The fides of the Shell of a wonderful thickness. Penetrated to the Kernel with three great holes.

Amongst many observable Instances of the Contrivances Nature makes for the growth of the Seed, in whatfoever Cover (a) it be included; this Stone is one. For being (a) See the Authors fo extraordinary hard and thick; it were impossible the Book Of Kernel within it (which is alfo great) should be supplyed Plants, c. i. with Aer and Sap fufficient for its growth; were not those three great holes made on purpose, for a plentiful admission of both.

& ult.

And as great an inftance it is of the feemingly wonderful force of the *Radicle*, or that fmall and tender part of the Kernel, which becomes the Root of the Plant; by which, chiefly, the fides of the Stone, those thick Walls, are made to cleave asunder to make way for its defcent into the ground. But Time feems to do the fame thing here, as Celerity doth in the Statera; where a fmall Weight fet at a greater distance from the Centre of gravity, will ballance a bigger that's nearer : because, what it wants in bignes, is made up by the *Celerity* of its motion. So the *Radicle* of a Kernel, having though a flow motion, yet fome, and that continu'd, it is able in time to mafter a flurdy Body which hath no contrary motion at all, but is at reft.

One or two of the Kernels, which are as big as Dama-· scene-Plums, both Purge, and sometimes Vomit. If taken raw, they work roughly: but boyl'd and preferv'd with Sugar, may be given to Children. (b)(b) Piso.

Another POYNTED-STONE. A very great one: three inches and i long, an inch and i over, one way; another

191

near

# Of Fruits.

near two inches. On one fide, very Convex; on the oppofite, almost flat. The Base Oval; the top, presently sharpen'd into a point. Of a russet colour, very hard, ruged, and having broad Furrows, most of them running by the length; out of some of which arise several woody *Fibers.* 

Another like STONE. 'Tis as big as a *Pullets* Egg. On one fide more Convex, as the former. Of a ruffet colour, hard and granulated. All over uneven with many, though not very deep Furrows, divers whereof are produced from the *Bafe* almost to the *Cone*.

The faid Furrows, both in this and all the other Stones, are to be underftood the Seats of woody *Fibers*, wherewith they were originally fill'd up.

A TWIN Almond-Stone.

GUM LACK, naturally adhering to a fmall Branch of its own Tree, called Ber Indica; a fort of Plum-Tree growing in Pegu, Martaban, and fome other parts, fometimes as big as a Wallnut-Tree. (a) 'Tis generally agreed, That this Gum is made, in Summer-time, by Winged-Ants, out of the Tree it felf. Garfias adds, as Wax is by Bees. How far the Comparison holds, requires examination. In the mean time, 'tis most likely, That these Ants finding the Sap or Gum of this Tree agreeable for their food or other use, and nibling the Barque to come at it, it thereupon is at the Wounds they make.

The Indians make feveral forts of artificial Lacks, by, mixing this Gum with other Materials of all colours. With thefe, all the turn'd Wood-Works in India and China are wrought and burnished. Trochifci Dialacca, a Medicine formerly much commended, but now obsolete.

192

CHAP.

#### Of Fruits.

#### CHAP. III.

# Of CALIBASHES, and some other like Fruits.

He Great OVAL CALIBASH. In length, almost 4 of a foot; above a foot and in compass. Its Figure. answerable to that of a Hens-Egg, one end, (c. the top, being fomewhat smaller than the other. 'Tis now of a kind of tawny colour, or like that of an old Pomgranate-About as hard as a Wallnut, and the shell somewhat Pill. thicker. Originally fill'd (as may be feen by fome of them) with a Pulp and a great number of Seeds, as is a Melon or Gourd. Yet a Calibash is the Fruit of a Tree. In fome fort · defcribed by Ligon. (a)

The Middle OVAL CALIBASH. Of the fame tawny (a) Hift. of colour, as the former; as also a little slenderer at the top, than the bottom. In length four inches and +, and 3 and 5 broad; of the bigness of a China Limon. It hath a little round knob at the top, as big as a Great Pins Head. The Seed, almost of the colour, fize and shape of an Apple-Kernel; faving that the top is shaped like the common Picture of a Heart.

The little OVAL CALIBASH. Of a like colour with the former, but stained with some black Spots. Three inches and ½ long; two and 4 over; fomewhat bigger than a Turkeys-Egg. Of a perfect Oval, that is, with both the ends cut by the fame Ellipfis, yet both a very little prominent. And the top apiculated, as in the former. It feems a kin to the Cucurbita Indica minor Taberna Montani; and that the faid Author miftook a Calibash, for a Gourd.

An ORBICULAR CALIBASH. Of the shape and bigness of a Fack-Bowl.

The halfs of an ORBICULAR CALIBASH, four inches and <sup>1</sup>/<sub>2</sub> Diametre.

The Middle (b) FLAGON CALIBASH. Figur'd after a (b) See the manner by Bauhinus with the mistaken Title of Cucurbita Great fort Indica Lagenaria: it being not a Gourd, but the Fruit of a Section. Ch.2. Tree, as is abovefaid. It hath a Head and Belly divided by a Neck, fomewhat refembling an old fashion'd Flagon. The

Barb. p. 72.

Сc

# Of Fruits.

#### PART II

The Belly, about five inches and ½ long, and four and ½ in Diametre. The Neck, two inches long, and about an inch over. The Head, about as long, and above an inch and ½ over. Originally, of a ftraw colour : but by the *Indians* painted, after a rude manner, with a dull red. The Shell very hard, and about a ‡ of an inch thick.

The little FLAGON or BOTTLE CALIBASH. About four inches and  $\frac{1}{2}$  long. The Belly,three inches over. The Head, an inch and  $\frac{3}{4}$ . The Neck, a little above an inch. The Shell, at the top of the Head above  $\frac{1}{4}$  of an inch thick.

The PEAR-CALIBASH. In length about five inches, the Neck fomewhat long and flender, the Belly two inches and over: fo as both in figure and bignefs to refemble the *Pear* figur'd by *Bauhinus* with the Name of *Pirum Strangulatorium*. On one fide, colour'd with a light, on the other with a deeper yellow.

A Double PEAR-CALIBASH.

A TRIANGULAR CALIBASH. 'Tis fmooth, and black, fhaped like the *Egyptian Cucumer*, called *Chate*. About five inches long. The Neck triangular; whether naturally, uncertain. From thence belly'd like a *Pear*; two inches and  $\frac{1}{2}$  over. The fhell very hard, and as thick as of the *Flagon-Calibafb*.

Thefe Fruits grow in Guiney; as alfo in Virginia, Barbados, and other parts of the West-Indies. Where they are used, either whole or cut through the middle, for Cups, Disbes, Basons, Buckets, Flagons, &c. according to their bignefs. The Natives fometimes line their infides with some kind of Rosin (as we rosin Wooden-Cans) the better to preferve the Liquor they put into them; which, if spirituous, would otherwise either drench through, or loose of its strength. Whether the Rosin they use, be such as gives no ill tast to the Liquor may be a query.

The BAOBAB. Abavi Clussi. Of affinity with the Fruit by Scaliger called Guanabanus. Wormius, I think mistakingly, makes it the fame. 'Tis well deferibed and figur'd by Baubinus. (a) This is of the bigness of a midling Pomecitrine, and of answerable shape. The shell of a good thickness, but not very hard; of a kind of dusky green, and faced almost all over with a velvet Down. When

(a) Lib. 1. G. 42.

# Of Fruits.

When fresh gather'd, 'tis fill'd with a fost Pulp, and as it should feem, much more juycy, than in the *Calibash*. Within the Pulp is contained a great number of Seeds, or little Stones, of the bigness, and with somewhat of the shape, of *Indian* Wheat. *Besser* hath a good Figure hereos, reprefenting it cut open, to shew the Seeds.

The GREAT LONG BAOBAB. I meet with no Defcription anfwering to this *Species*. Tis in length ten inches, a foot in compass, being ratably much flenderer than the former, and almost Cylindrical. The upper end, made a little flenderer; the top of all, flat, and an inch and ‡ over.

The GREAT BELLY'D-BAOBAB. Much bigger than the former, and no where defcrib'd, that I find. In length, an inch above a foot; and above a foot and  $\frac{1}{2}$  in compafs. Towards the upper end, belly'd. But the end it felf pointed almost like a *Limon*.

The Baobab grows in the Ifland Zeilan, and in *Ægypt*. The Juyce hereof is of an acidulated Taft, very grateful: of which the *Ægyptians* make much ufe, especially when they travail, to quench their thirst.

The MACOCQUER. A Virginian Fruit, defcribed by (a) Baubinus. It feems to be of affinity with the Calibaſb, (a) Tom. 1. or perhaps a finall Species thereof. It is of an Orbicular-<sup>254.</sup> Figure, and of the bignefs of a little Hand-Ball, Though Cluſius affirmeth (b) it to be fometimes four inches in <sup>(b)</sup> Exot. Diametre. The fhell is thin and brittle. Originally fill'd with a foft and juycy Pulp, in which a great many Seeds of the colour and bignefs of an Apple-Kernel.

The Natives, having empty'd the fhells of the Pulp and Seeds, and in the room hereof, put in fome little Stones, ufe them as *Rattles*, wherewith to rejoyce upon any fpecial Occafion.

The GENIPAT, Junipap, or Junipappeeywa. A Brafilian Fruit fo called. Deferibed by Baubinus. (c) And (c) Tom. 13 probably by Piso with the Name of Janipaba. This alfo<sup>253</sup> is a kind of little Calibash. Of the bigness of a Wallnut, and almost Oval; containing a Pulp and Seeds much like those of the Macocquer. It grows upon a tall Tree.

The Natives use this Fruit against *Diarrhæas*. As also to paint themselves. They chew the Pulp; and then C c 2 fqueezing

# Of Nuts.

PART II.

fqueezing the Juyce out, rub it upon their Body: as it drys, it turns to a blackish blew. This they do, when they visit a Friend, or upon any solemn Occasion, would be fine.

Another FRUIT, of kin to the former, with a pointed top. It was brought from Guiney.

A FRUIT refembling that defcribed by *Bauhinus* (a) under the Name of *Charameis Acoftæ*. Yet this here, by the reduction of the point or feat of the Flower to the Bafe, a little flatish.

#### CHAP. IV.

## Of NUTS, and Divers other like Fruits.

The JACAPUCAIO-NUT. A West-Indian Fruit. Both this and the Tree tolerably well defcribed by G. Pifo. (b) It is about the bigness of a Boys Head of ten or twelve years old, fomewhat oblong, with a circular Ridge toward the top. Now all over, without and within of a dark or

blackish colour. The fides extraordinary warm, being an inch thick. Within, divided into four Quarters. In each of which (faith *Pifo*) are contained about thirty Kernels. But here they are wanting. Defcribed alfo in part, and figur'd, in *Calceolarius's Museum*, out of *Jos. Acosta* (c) by the Name of *Amygdala dell' Anidi*.

Of these Kernels, much bigger than *Almonds*, the Natives make both Medicines, and pleasant Meats. Sometimes the Fruit of one Tree, hath ferved to Victual a whole Camp. Those that fall are, with leave, greedily devoured by the Cattel. Of the Timber of the Tree, are made the Rowls of *Sugar-Mills*; as being tougher, or otherwise fitter for that purpose, than other Woods.

Another of the fame NUTS of equal bignefs.

The COVER of the faid NUT. A like colour'd, and in fhape almost like a *Musbroon*. When the *Nut* is ripe (which always hangs down) this *Cover*, with the least fhake, falls out, and the Kernels after it, into the Laps of the Natives.

One half of the MALDIVE-NUT ; called Coccus de Maladiva.

(b) Hift. N. Ind.

(c) Hiftor. Ind. lib. 4.

# 196

(a) Tome 1.

Of Nuts.

*ladiva. Tavarcare*, in the Language of the *Ifland.* Defcribed by *Chioccus* (a) out of *Clufius* and *Garzias ab Horto*; and well (a) Mufæum figur'd. *Pifo* (b) alfo hath the Defcription and Figure,toge-(b) Mautiffæ ther with a prolix Difcourfe hereof. They are faid to be Aromaticæ, no where found, except upon the Sca-fhore. Nor is the Tree it felf to be feen any where in the *Ifland*. The entire *Nut*, fomewhat like a double *Box*, or a pair of *Panniers*. This half, about a foot long, and near  $\ddagger$  a foot broad; a kind of half Oval; yet flat on that fide, where the two halfs are conjoyn'd. The fhell about  $\ddagger th$  of an inch thick, and as hard as that of a *Coco-Nut*. As black as a *Coal*. This is empty; but originally they contain a certain white Pulp, of no great Taft.

Of this Pulp both the People and Princes of Malabar have a high opinion, as if of great Virtue againft moft Difeafes; efpecially in cafe of Poyfon, or Epileptick and other like Affections. So that fometimes they value them at about five and twenty pounds a Nut. 'Tis alfo highly commended for the fame purpofes, by Pifo, both from the experience of others, and his own. They fometimes make Drinking-Cups of the Shells, and tip them with Silver or Gold-Plate. 'Tis Death for any to be known to take up any of them; becaufe those things that are cast upon the shore, are the Kings.

The COCO-NUT. The Fruit of a very tall Tree, both in the East and West-Indies, growing only upon the top of it. Mention'd by many Writers of Natural Hiftory, but not by any one diffinctly defcrib'd. As by one fent me fresh by Mr. Sam. Moody from Jamaica, I had the opportunity to observe. Here are three of them entire. The bigeft whereof is about a foot in length, and one and in compass. With three fides, one whereof more flat; belly'd in the middle, and fomewhat Conick at both ends; fo that it is a kind of Sphærical Triangle. The Husk or outmost part of the Nut on the fides, about an inch thick; at the Corners, an inch and  $\frac{1}{2}$ ; almost wholly confisting of tough woody Fibers; fo that being cut transversly, it looks like a ftiff Scrubbing-Brush. Next within this Fibrous Part, lies the Shell, brown, hard, and brittle, like a Plum-Stone; the s of an inch in thickness; about three inches Diametre, and of an Oval Figure, not much unlike that of an Oftriches,

## Of Nuts.

### PARTI

Oftriches, or fometimes a Caffowarys-Egg. Yet fo, as always to be Trivalvous, i. e. composed of three Sides or Plates joyned together by the length of the Shell; one Side being commonly much bigger than either of the other two. At the Base of the faid Shell, are always likewife three confpicuous Holes, by which originally are admitted a confiderable number of Fibers into the Concave of the Shell. Next within the Shell is a thin, dry and Membranous Coat, branched or veined all round about with a great number of Fibers, chiefly for the conveyance of Within this Veiny-Coat, lie's a foft, white, Sap. thick and Oval Body, commonly; but falfly, fuppofed to be the Kernel: it being only the Cover next or immediate In thicknefs about  $\frac{1}{2}$  an inch, and of a fweet thereunto. and pleafant taft. This Body, while the Nut is yet unripe, is filled full with a very limpid and fweetifh Liquor; which, in the Nut I had fent me, was in all about i a pint : all conveyed from the faid fibrous Coat, and filtred through this thick foft Body. Out of this Liquor, the true Kernel is in time produced : the Liquor diminishing, as the Kernel increafes, in the fame manner, as in an Egg, the White wafts, as the Chicken grows. Or as, indeed, in the Seeds of all Plants whatfoever, (a) which are not meerly Metaphorically, but really fo many Eggs (like those of many Ani-Plants, Cap. mals ) without a Yelk.

> Letting this Liquor stand in a Bottle, corked up, for fome months; although at first as clear as Rock-water, yet was it not only grown very fetid, but being after left open for some time, did let fall a Sediment above ? an inch thick. Arguments of its being impregnated with a fufficient ftore of feminal Principles.

> And as no Animal Egg is vital without the Male: fo neither is this Liquor, without the above-faid Fibers; which communicate their prolifick Vertue to the fame. Amongít which Fibers, being many Aer-Veffels, they also ferve for the hardening of the Shell. As in like manner do all those that compose the outward brushy part of the Nut. For were the Shell not only fill'd with fo great a quantity of Liquor; but alfo, as in many Fruits, furrounded with a juycy Pulp; betwixt both, it would remain a foft Parenchyma (as all vegetable Stones at first are) and never, or not foon enough, harden into a shell. For

198

(a) See the

Authors first

Book Of

nlt.

## Of Nuts.

For the more cafie and convenient eruption of the *Radicle*, the Shell is not one entire piece, but divided into three (as are most Seed-Covers into two or more) distinct Plates; which gradually cleave asunder, to give way to the defcent of the faid *Radicle* into the ground.

Two more LONG COCO-NUTS, fomewhat lefs than that now defcrib'd.

A THIRD, about as long, but much flenderer. Of the rounder kind, there is a good Figure in *Befler*; as alfo of the Shell.

A LONG OVAL COCO-SHELL. About  $\frac{1}{2}$  a foot in length, and three inches and  $\frac{1}{2}$  over. One of the three Holes at the bottom, cut wider by fome Body, who had a mind to cheat the Spectator by imitating a mouth. Almost in shape and bigness like a *Casfowarys-Egg*.

Another Shell of the fame shape.

THREE short Oval COCO-SHELLS.

An ORBICULAR COCO-SHELL; four inches and long, and as much in Diametre.

Another Great ORBICULAR one. 'Tis a foot and ' in compass. A *Coco-Nut* of a foot and ' compass, hath a Shell in compass about nine inches. The *Nut* therefore to which this Shell belong'd, was in compass above three quarters of a yard.

The COCO is one of the most useful Trees in the World. Of the Husk or outmost fibrous Cover of the Nut, all manner of Ropes and Cables are made throughout India. Of the Shells, the Indians make Ladles, Wine-Bottles, and many forts of Vessels. The inmost Cover next the Kernel, while it contains only Liquor, they eat with falt, The faid Liquor, is commonly as a very pleafant meat. used, as a clear sweet and cool Drink. Sometimes they cut away the Bloffom of the young Nut, and binding a convenient Veffel to the place, thereby obtain a fweet and pleafant Liquor, which they call Sura. This standing an hour in the Sun, becomes good Vinegar, used throughout The fame Diftill'd (I suppose after fermentation) India. yieldeth a pretty ftrong Brandy, called Fulo, and is the first running. The fecond, is called Uraca, the only Wine of India. Of the fame Sura, being boil'd, and fet in the Sun, they also make a fort of brown Sugar, which they call Jagra. From

## Of Nuts.

PART II.

From the Kernel it felf, when fresh, and well stamped, they prefs out a Milk, which they always mix and eat with their Rice-Meats. Of the Kernel dry'd (called Copra) and ftamped, they make Oil, both to eat, and to burn. Of the Leaves of the Tree ( called Olas) they make the Sails of their Ships: as alfo Covers for their Houfes and Tents; and Summer-Hats. Of the Wood, they make Ships without Nails; fewing the feveral parts together with the Cords (a) Linfcho- made of the Husk of the Nut. (a)

ten. Joh. de Laet. Pifo, and others.

A fmall ORBICULAR FRUIT, as it feems, of the Nut-kind, not bigger than a Phyfical Pill; a little flattifh on that part which grows to the Husk. Very hard. And (b) L.2.c.30. of a fhining colour, like that of red Coral. Defcribed (b)

alfo by Clusius: and neatly figur'd in Calceolarius's Mu-(æum. (c) (c) Sect. 5.

ANOTHER of the fame hardness, shape, and bigness; but of a shining black.

ANOTHER hard and orbicular Fruit, by Cafp. Bauhinus called Milium Indicum. For what reason I fee not, it having no fimilitude thereto. That for which it is obfervable, is, that it looks as if it were artificially turn'd upon a Lath. See a rude Figure hereof in 7. Bauhinus.

An Oval Stone or Shell, of the bigness and shape of a midling Olive. Given by Mr. Anth. Horneck. It feems doubtful, Whether of the Plum or Nut-kind. 'Tis all over smooth, and of a shining light bay, like that of a Mammee. Excepting only the Bafe which is of a dull colour, and ruged, and having two narrow fmooth Margins like a pair of Lips, or an open mouth : from the corners whereof runs a natural Notch round about the Stone or Shell.

The YECOTL. The Fruit of a little Tree in New-Spain, which the Spaniards call Palmam Montensem; and which I take to be all one with the Palmapinus, or the Palma Conifera. 'Tis defcribed and figur'd both by J. Bauhinus, and by Wormius. Who Reports out of Laet, That thefe kind of Nuts are always found empty, or without a Kernel. Which is a miftake; for this here hath one. 'Tis likely all that he faw ( and fo he should have faid ) were barren. The length of this, about two inches and half; the Diametre, one and the Figure Oval. Smooth, and of a fhining

200

inen

fhining Bay. Composed of Scales, from the middle (where they are about i an inch broad) growing leffer towards both ends, fo as in some fort to refemble a *Cone*, of the *Picea Latin*: or *Male Firr-Tree*. Yet a quite different Fruit: for whereas in a *Cone*, the *Seeds* or *Kernels* are numerous, all placed between the Scales of the *Cone*; here (fo far as can be guefs'd by the found) we have but one fingle *Kernel*, within the hollow of the Shell.

But that which is most observable, and whereof no Author takes notice either in the Description or Figure of this Fruit, is this, That the Scales which compose the Shell, are not so fet together, as to have their open ends or points upwards, as in a *Cone*: but on the contrary, so as to have their roots uppermost, and their open and outmost ends or points downwards, or towards the Base of the Shell, as of the Slates upon a House towards the ground. A fingular contrivance of Nature, to prevent the rain from running into the hollow of the Shell, and so rotting the *Kernel*. And although the Scales of a *Cone* are open towards the point of the *Cone*, yet even hereby they answer the fame end; because it always or most commonly hangs upon the Tree with the point downward.

This Fruit is pictur'd in Besler, Tab. 1. But mistakenly, for the Arecca or Faveel.

The CONICK YECOTL. I find it not defcrib'd. 'Tis much lefs than the former; in length, an inch and <sup>3d</sup>; in the middle near an inch thick. Slenderer at both ends, and the upper plainly taper'd. The Scales, as in the former.

Of the Leaves (a) of this Shrub, the Indians make a fort (a) Ximenes of Thread.

A SCALED FRUIT a kin to the YECOTL. 'Tis of a rounder Figure, almost like a *Pippin*, and about as big as a midling *Peach*. See the Figure hereof in *Baubinus*, under the Title of *Nux Indica Teffellata*. They grow in *Guyana*.

A Great PALMACOCO-NUT. Bauhinus defcribes (b) (b) Tom. 1. another Species by the Name of Fructus Palmæ Nuciferæ. Perhaps the Tree may not be improperly call'd Palmacocus, as bearing a Fruit, though fmall, yet refembling the Coco-D d [hell;

# Of Nuts.

PART II.

*fbell.* This is the biggeft of feveral here preferved, which make it doubtful, Whether it belong to a *Cocus* or a *Palme*. In length, near  $\frac{1}{2}$  a foot; in the middle, two inches over. The *Bafe* fomewhat Oval, and Prominent, with three large Holes, as in a *Coco*; the upper end Conick, and a little inflected. Composed of three *Valves* or *Plates*, making fo many Angles, below, obfcure; above, more fharp. The colour mixed, according to the distribution of the woody Fibers.

A middle PALMACOCO-NUT. As big as a larger *Walnut*. In length, an inch and  $\frac{1}{2}$ ; the *Bafe*, an inch over. Figur'd into a kind of Convex *Cone*. Upon the *Margins* of the three Holes in the *Bafe*, are finely fpread a great many fmall black *Fibers*; like the *Fibrillæ* of the *Lig. cili* are round about the *Cryftal* Humour. See alfo *Clufius*'s Defoription hereof in *Baubinus*. Two of this *Species* are here preferved.

ANOTHER alfo Conick, but lefs. In shape like the *Pear* called *Moscatellinum*: but is scarce fo big as a small *Nutmeg*. Of a woody substance, and the colour of *Box*. With three open Holes, as in all the rest.

The DOG-PALMACOCO. Bauhinus defcribes and figures one of these Nuts by the Name of Nux larvata. The like is performed in the German Ephemerides. But I take this to be a different Species from them both. In length, an inch and ;; an inch over, where thickeft; and of a Conick Figure. The Crown or thicker end of the Shell is encompassed with a great many fmall Fibers, originally fpread all over the Shell, but here clip'd off by fome Body, to make it look like a Head of Hair. About the middle of the Shell are two natural Holes, ratably large, like a pair of Eyes; and the upper Margins prominent, like Eye-brows, whereupon are naturally fpread a number of small black Fibers, like the Hair on the Eye-brows. Underneath a third Hole, alfo hairy, standing in the place Betwixt which, or before, there are three of a Mouth. little Knobs, which together make no ill refemblance of a Nofe, and the upper Lip all natural; So that, at the first fight, one would take it to be a little Head of a Greyhound carved in Wood.

TWO more, of the fame kind, but much shorter.

An

## Of Nuts.

An Oval PALMACOCO, about the bigness of a *Nutmeg*.

Another, of a ftraw colour, wrinkled, knobed, and fomewhat compressed, Figur'd in some fort by *Bauhinus*, (a) (a) Tom. 1. under the Title' of *Avellana Indica peculiaris Came*rarij.

A BROAD PALMACOCO. An inch over or in breadth; from the *Base* to the top directly, not above  $\frac{3}{4}$ . That almost flat, this with a blunt point. It hath three Holes on the sides, almost equidistant.

An ORBICULAR PALMACOCO. Yet a little compreffed, as a *Bowl*. Not above  $\ddagger$  an inch Diametre; of the colour and hardnefs of *Box*; furrow'd as a *Peach-Stone*. On the fides are three equidiftant Holes, over-fpread with black capillary *Fibers*.

A RHOMBOID-NUT, of affinity with the former. An inch and  $\ddagger \log_3 \ddagger$  broad, and  $\ddagger$  an inch thick, the fides being a little compressed. Cover'd round about with small woody *Fibers*, produced from the Stalk or Base to the top of the Shell.

The FAVEEL or FAUFEL. The Fruit of a kind of *Palme*, by the *Malabarins* called *ARECCA*. Defcribed by *Garcias*, *Baubinus*, and *Wormius*. But by none of them well. It hath a three-fold Cover, of fo many forts of work. The utmoft, confifting of ftraw-colour'd, foft and (as *Garcias* rightly) downy *Fibers*. The middle, of yellowifh, and fturdy ones, of the thicknefs of a fewing Needle: about  $\frac{1}{2}$  an inch longer, than to the top of the Shell, yet couched down round about it. The inmoft, a thin flender Cafe, but woody. Yet lined with a pithy fubftance. All contrived for the greater warmth, and gra-dual expofing of the *Nut* within to the *Aer*. This *Nut* is about the bignefs of a little *Nutmeg*; but not fo long.

This Fruit grows in *Malavar* and the Ifland *Mombaim*. Being eaten unripe, it flupifies, and as it were inebriates. For which caufe, (b) fome eat them to make them unfenfi- (b) Garcias. ble of great pains. *Garcias* faith, That he ufed their Diftill'd-Water, in *Bilious Diarrhæa*'s, with great fuccefs.

A FRUIT very like to the *Faufel*. *Bauhinus* defcribes and figures it out of *Clufius*, by that Name. Yet it feems, to me, to be the *Faufel* it felf in the Bud.

Dd 2

The

### Of Nuts.

PART II.

The DATE-NUT, qu. Nucidactylus. I find it neither described nor figur'd by any Author. 'Tis above two inches long; near the Stalk, above an inchover; towards the top near two, being belly'd like a Pear. Along one fide, a little ridged. The Stalk cover'd with a whitish Down, like a Quince's. The outward Skin of a dusky Bay, fmooth, foft, and thin. Next under this is a Work of Fibers, not produced, as in other Fruits, by the length, but standing bolt upright, like the Pile of Velvet, about a i of an inch in depth; or rather, like the Briftles upon a Hogs back. So that the outward Skin being taken off, the Fruit looks Thefe Fibers are and feels like a round Scrubing-Brush. continuous all round about with the next Cover, which is of a woody fubftance, and very tough, about ; of an inch thick. Next within this Cover or Rind, is contained a foft and light fubftance, which, by the fpace it hath left, appears to have been originally a very fleshy and fappy Within This lies the Stone, about as big as a young part. Pigeons-Egg. This Stone is not hollow, like others, but altogether folid, like the Stone of a Date, and is within of the fame whitish, denfe, and horny substance : from whence I have taken leave for the Name. At the top of the Stone is formed, like as in a Nutmeg, a little round Cell, in which the true Seed is contained, no bigger than a midling Pins head.

A TWIN DATE-NUT of the fame Species.

A THIRD, a fingle one, with the outward Rind taken off, whereby the faid brifly *Fibers* are confpicuous.

A CACAW-NUT. Given by Francis Willughby Efq;. Tis five inches long; and about two, over; fhaped like a Garden-Cucumer; but the Stalk-end a little flenderer. Now it is dry, angular with five wrinkled and black Ribs an inch broad. The fpaces between, half as broad, fmooth, and of a redifh Bay: the blacknefs of the Ribs proceeding alfo from a fuller and deeper *Red* under the Skin; as in many other Fruits: or as Scarlet Blood makes blew Veins. Within the Rind are contained about fifteen or twenty Kernels, near as big as a Garden-Bean, but fmaller at one end; fomewhat like a little Birds Heart. Yet the fhape, I fuppofe, in different Nuts, may have fome variaton.

Another CACAW-NUT, like the former; given by Mr. John Short. This

204

## Of Nuts.

This Fruit grows principally in New Spain, and the Province of Guatimalla in Mexico. In which, and other places of the Weft-Indies, the Kernels are used, faith Jof. Acosta, (a) instead of Money; and commonly given to the (a) Hist. 1. 4. Poor, as Alms. With Chacawlate, the Indians Treat Noble <sup>c. 22</sup>. Men, (b) as they pass through their Country. (b) Ibid.

These Kernels being well pounded, as Almonds, in a Mortar, and mixed with a certain proportion of Sugar and Spices (according as the Trader thinks or finds it best for Sale) are commonly made up in Cakes or Rowles; which are brought over hither from Spain, and other parts. But those that would have a good quantity for their own private use, had much better procure the Nuts themselves (as fresh and new as may be) and so prepare and compound them to their own Constitution and Tast. And for those that drink it, without any Medicinal respect, at *Coffee-Houses*; there is no doubt but that of Almonds finely beaten, and mixed with a due proportion of Sugar and Spices, may be made as pleasant a drink, as the best Chacawlate.

The BUTTER-NUT: a Fruit growing in New England, and there fo called, becaufe the Kernel yieldeth a great quantity of a fweet Oil. I meet with it no where. In length, two inches and  $\frac{1}{2}$ ; in the middle, near an inch and  $\frac{1}{2}$  over; the two ends narrower, and a very little prominent, fhaped fomewhat like a fmall *Cucumer*. The Skin fmoothifh, and (now) brown. The fubftance within it, black: originally, a kind of Pulp or flefhy Rind about  $\frac{1}{2}$  of an inch thick, anfwering to that of a *Walnut*. The Stone almost Oval, and edged with fix or feven Angles by the length, the greatest, which are also opposite, ending in a fharp point. The Spaces betwixt the Angles, very uneven with a great many ruged and thin plates and knobs.

With a Decoction of the Barque of the Tree, the English Planters dey their Linsey Woolsey of a Cinamon colour, without Alum, or any thing else being added.

The EDGED-WALNUT of New England. In colour, as the common kind. Near an inch long, as broad, and a little above  $\ddagger$  an inch thick. The Bafe, and effectially the point, a little prominent. Figur'd with eight Angles or Edges, whereof one half fharper than the other. The Kernel fhaped, as in the common kind. A

# Of Nuts.

A WALNUT shaped like a *Pear*. Whether monstrous, or of any *Species*, is uncertain. 'Tis two inches long, at one end ‡ of an inch thick or over, and the other, above an inch.

Another, with one Concave of the Shell twice as big as the other.

A Third, with a Shell composed of three Values or Plates,

A NUT, which feems to be a fort of *Indian Filbert*. I find it not defcrib'd. Of a triangular Figure, one greater fide fubtended to two leffer. The *Bafe*  $\ddagger$  an inch thick; an inch and  $\ddagger$  long, or wide; from thence to the *Cone* as much. Of a brown afh-colour; and ruged all round about by the diffribution of a great number of *Fibers*. Only the true *Bafe*, by which it joyned to the Husk, is fmooth; and, as that of a *Filbert*, cleavable along the middle.

The HAZLE-NUT of *New England*. Neither is this defcrib'd. Here is a Box of them. They are florter, and broader, than the common fort ; the point depressed, and the *Base* more produc'd. In colour, both alike.

HAZLE-NUTS, fome three, and fome four growing together.

The NUT called MEHEMBETHENE. It grows upon a fmall Tree, like a *Hafle*, in *New Spain*. Defcribed in *Bauhinus*. (a) 'Tis fomewhat Oval, an inch and  $\ddagger \log_3 \ddagger^{ds}$ over. Divided by a triangular partition into three Cells, for the lodging of fo many *Kernels*.

The BARBADO-NUT. The Fruit, in truth, of a kind (b)Lig.Hift. of Plum-Tree. (b) Yet the Name prevailing, I have placed of Barb.p.67. it here. Defcribed in Bauhinus, Wormius, and others by the Name of Avellana purgatrix Americana f. Ben magnum (c) Muf. Wormian. Medicorum vulgò: (c) but not well. 'Tis about the bignefs of a Filbert. The shell blackish, thin, and brittle, and fomewhat angular. Within, there is a white fost Body,

fomewhat angular. Within, there is a white foft Body, commonly, but falfly fuppofed to be the *Kernel*. For this Body is not divided, as are all *Kernels*, into two diffinct *Lobes*, but is one entire part. Yet fo as to have fome little hollownefs in the middle, capable to lodge a very thin *Filme*. This *Filme*, is the true *Kernel*, confifting not only of two large and perfect Leaves (anfwerable to the two Lobes

(a) Lib. 3. c. 36.

Of Nuts.

Lobes in other Kernels) but of those parts also, which in time become the Trunk and Root of the Tree.

These Nuts work strongly both by Vomit and Stool; (a) four or five of them a great Dofe. Being eaten tofted, (a) Bauh. or injected in Clyfters, (b) which is the fafeft way of using (b) Monarthem, they are a prefent Remedy in the Cholick. One des. thing, very observable, is mention'd by Mr. Boyle; (c) and (c) In his fince, also by Mr. Ligon: (d) and that is, That the Ca-Book of the thartich Pomer of the Nut although Carton the Carton of thartick Power of the Nut, although fo great, yet lies only Forms. or chiefly in that very thin Filme above-faid, by me affirmed (d) Hilt. of Barb. p. 68. to be the *Kernel*: for this being taken out, the reft may be eaten, as any other Nut.

A fmall Indian Nut, about an inch long, and about half an inch over; with a pretty hard Rind, and of a fhining black. Excepting the colour, very like to that defcribed and figur'd in Bauhinus, with the Name of Nucula Exotica Pistacij specie.

The ANGOLA NUT. About tof an inch long, and as broad, on one fide Convex; on the oppofite, flat; and of a tawny colour. The Shell very hard. The Kernel thin and leafy, and loged within a thick white Cover, as in the Barbado Nut.

They purge upward and downward: one of them will give about a dozen Stools.

The Purging-CHESNUT. Castanea purgatrix. Well described and figur'd in Calceolarius's Musaum. (e) The (e) Sect. 5. Figure in Bauhinus (who defcribes (f) it by the Name of (f) Tom. I. Fructus Indicus decussatus) not so good. 'Tis a blackish lib. 3. c. 116. Fruit, about an inch and ‡ long, almost square, and pretty flat. But that which is most observable, is the double Sinus which compassed it both by the length and breadth, as if it had been girded across with a string. And, as it were, a Crefcent on that fide, by which it grows to the Shell.

A FRUIT in figure like a Chefnut; but'tis much lefs, at least, than the common fort. The outward shell of a dusky colour, and thin, yet almost as hard as a Pebble; or like that of the Seed of Gromwell. Under this lies another of the usual hardness of a Fruit Stone. Within which is included a whitish Kernel, of a pleasant tast, yet producing a roughness in the Throat.

### 208

## Of Nuts.

PART II.

The

Re Cib.

(b) Bauhin. (c) Lib. de Re Cibar.

(d) Lib. 3.

The New England CHESNUT. In figure, like the common fort; but a little lefs. The Chesnut was first (a) Mouf.de brought from Sardis in Lydia, (a) into Italy, France, and England. In fome places where they abound, the people make Bread (b) of them. Heretofore, faith Bruyrinus, (c) they were brought, with the last course, to the Tables of Princes. In his time, (about an hundred years fince) the French used to make and eat Chesnut-Pottage.

A kind of fmall HORNED NUT. Not fo big as a little Nutmeg, 'tis of a brown colour, and with two pointed knobs at one end, bended outward, like little Horns. Figur'd, as I take it, in Bauhinus (d) by the c.104.Fig.3. Name of Fructus peregrinus, exiguus orbicularis, cum Sex Nervis.

> A Virginian AKORN within its Cup. There is one like this defcribed and figur'd in Bauhinus out of Clusius, by the Name of Calix cum Glande incluso maximus ex Wingandecaow, i.e. Virginia. The Cup is about an inch and + Diametre, and the fides very thick; composed of a great number of Scales, as the Empalement of a Thiftle, and many other Flowers; but here very hard: of an Orbicular Figure, only open at the top about the breadth of an inch. The Akorn it felf, little bigger than the common fort. But their tast and substance may be more grateful. For in Virginia they are dry'd and preferved for They fleep, and boil them, and fo eat them either food. with Flesh or Fish.

The ANACARDIUM. A fruit fo called from fome likenefs it hath to a little Heart; but yet flattish, and near as big as a Garden-Bean. Described and figur'd by Garcias, Bauhinus, Wormius, Moscardi, Besler, and others. Being held (e) Bauhinus to the flame of a Candle, (e) it sits Fire, or sparkling flashes

of divers colours. Anciently much used in Medicines, now obfolete, as Confectio Anacardina, Gc. The Oil or Mellagi-

(f) Muf. Wormian.

nous Succus betwixt the Rind and the Kernel is that which is called (f) Mel Anacardinum. Either the Name of Oil (given it by moft) or of Honey, must be improper. It is of a very Cauftick and venimous Nature. Being mixed with Lime, 'tis used for the marking of Cottons (g) through-(g) Bauh. With Lime, tis used for the marking of or Fruit, (h) and eat Tom. 1.336. Out India. The Indians pickle the green Fruit, (h) and eat them as Olives. When perhaps they contain little or none

ab Horto.

of that Caustick Oil.

The ACAJU, or Cajous-AKORN. The Fruit, or rather one part of the Fruit of a Tree growing in Brafile (where it is called Acajaiba) and other West-Indian Countries. Chiefly defcribed and figur'd by Linschoten, (a) and (a) Lib. 1. *Pifo.* (b) The whole Fruit is called *Acaju*. That part next  $^{c. 5^2}_{(b) \text{ Lib. 4.}}$ the Branch, by Pifo, the Apple; but is shaped more like a c.s. *Pear.* To the top of which grows this part, which he calls In fhape almost of an Hares Kidney; faving the Akorn. that where it grows to the Apple 'tis thicker, than at the other end. Of a fmooth Surface, (here) mixed with afhen and brown.

Pifo in defcribing this Fruit contradicts himfelf. Flori (faith he) succedit Castanea, exqua crescit Pomum. A little after, Pomum hoc, tum Glans ei superinnascens---. Wherein he is falfe to himfelf, but true to Nature; the Apple not growing upon or after the Akorn, as he had affirmed at first; but the Akorn, upon the Apple: as by one I have now by me, may be feen.

Wormius confoundeth the Picture of the Acaju, with the Defcription of the Anacardium. As may be feen by comparing Chap. the 22. and 24. of his Second Book.

The Kernels being pounded or ground, as Walnuts, yield abundance of Oil by expression. That Oil (fo called) which is diffinctly contained in the Shell or Rind of the Akron, is of a hot biting taft, and of a kind of cauftick quality. Ufed by the Indians to cure the Itch, Shingles; Malignant Ulcers, (c) and St. Anthonys Fire. (d) But the (c) Pifo. Kernels are accounted a great dainty, either eaten raw (d) Linfchowith Wine and a little Salt; or efpecially, when they are roafted, or elfe preferved in Sugar. For the fake of this Fruit only, (e) the Natives fometimes go to Wars; the (e) Pifo. Victors keeping poffession of the Place, till they have pluck'd the Trees upon it, all clean.

By comparing what hath been faid hereof, and of the Anacardium, together; they feem to be two Species, under one Kind.

The ANOVAI. The Fruit of a Tree, or rather the Name of the Tree it felf, growing principally in Brafile. Pifo diftinguishes a leffer fort, from the Greater, or Aboaguacu, the Tree whereon this Fruit groweth. Of a triangular Figure, almost like a little Pouch; about an inch Ee from

# Of Nuts.

PART.II.

from corner to corner, very hard, fmooth, of a *Chefnut* colour, and now made hollow, the *Kernel* being pick'd out; and a hole cut on the top for that purpofe. Figur'd in *Bauhinus*, *Pifo*, and others; but more neatly in *Calceolarius*'s *Mufæum*.

(a) Pifo.

(b) Lerius.

The *Kernel*, being eaten, is a ftrong Poyfon. The Natives of *Brafile* (a) effectially when they go to Dancing, hang the empty Shells, for Ornament, and the pleafure of the Noife they make, about their Legs: as *Carriers* do Bells about their Horfes Necks. The Wood (b) or Boughs being broken, ftink intollerably; fomewhat like to *Garlick*.

The true METHEL; or the VOMITING-NUT commonly fo call'd. Nux Vomica Officinarum. Very well de-(c) Tom. 1. fcribed (c) in Bauhinus. Of the fhape and bignefs of a midling Troch, cover'd with fhort Hair, of a greenifh brown. Very hard, and horny, and almost folid; faving that in the middle it incloses, as the Barbado-Nut, a thin Filme, which is the true feed; whereof the faid horny Body, called the Nut, is only a great thick Cover.

(d) Muf. 1.2. Orientalis. And Wormius (d) fpeaking of it, faith, That no Body knows certainly what it is. Whereas, by Diffection, it plainly appears to be a Fruit.

> I find, that *Cordus* goeth thus far, as to obferve, That within this *Nut* is contained a Rudiment of the future Plant, confifting as it were of two little pretty veined Leaves, and a Stalk. But that thefe Leaves were the two *Lobes* or main Body of the Seed, that the Stalk of thefe Leaves, as he calls it, was the Root, and that between thefe Leaves was cooped the Bud, of the future Plant, are things whereof he had not the leaft notion. Neither did he know (for he fpeaks of it as a peculiar) that the like confpicuous foliation, is,as in truth it is,obfervable in the feeds of a great many other Plants.

> Half a Drachm of this Nut, given to a Dog, in powder, hath kill'd him, faith *Bauhinus*, in four hours. About 3, hath put a Dog into fo great Convultions, that he hath dy'd in lefs than half an hour.

The true VOMITING-NUT. -Nux Methel Officinarum. So that by a mistake, the Names of the Nut before describ'd,

and

## PART II. O

# Of Berrys, &c.

and of this, are commonly transposed. An *East-Indian* Fruit defcribed by *Baubinus* (a) with the Name of *Nux* (a) Tom. 1. *peregrina oculata & compressional compression* its flatness, although <sup>1.3.c. 144.</sup> a little fwelling on one fide; and from the refemblance which the Seed-Cells, in number five, have to fo-many little Eyes.

Two Drachms hereof being given to a man in Powder, purgeth ftrongly, and efpecially by Vomit, but alfo by Stool.

### CHAP. V.

### Of BERRYS, COXES, LOBES, and some other Parts of Trees.

**C**EDRE-BERRYS. The Tree by fome called *Cedrus Phænicea*; although *Baccifera* were better, thereby to diftinguifh it from the *Coniferous* or great *Cedre*. Defcribed by *Clufius* under the Name of *Oxycedrus*; from its fharp-pointed Leaves. It grows wild in *France* and *Spain*. The *Berry* bigger than that of the leffer *Juniper*, and of a deep *Purple*; with little knobs about it, and fome refemblance of Scales.

Great JUNIPER-BERRYS. Baccæ Juniperi majoris Clufio. As big as Myrtle-Berrys, round, foft, odorous, and of a redifh colour. The leffer Juniper-Berrys (and probably thefe) are of good and various ufe in Medicine, if they are fresh. One of the best ways of using them, is by extracting a deep and strong body'd Tincture of them with Spirit of Wine, whereof a spoonful, or more or less, to be taken in Wine or other convenient Vehicle.

The BERRYS of the MASTICH-TREE. Baccæ Lentiscinæ. About half as big as a midling Peas, round, and of a blackish colour. The Tree flourisches in Italy, Spain, and divers other places.

AROMATICK INDIAN BERRYS. Cocculi Indi Aromatici. There are a fort called Cocci Orientales, ufed for the taking of Fishes; but not fo round as thefe : neither, as E c 2 I take

# Of Berrys, &c.

PART H.

I take it, are they Aromatick. Of these some are not much bigger than a Black Pepper-Corn; others, as big as a Black Cherry : all of them of the colour of Cloves. They feem to come nearest to that Fruit commonly called Jamaican-Pepper.

A CONE of the CEDRE of Mount Lebanon. Conus Cedri magnæ f. Libani. Given by Abraham Hill Efq; Defcribed and figur'd by Bauhinus. (a) Yet with the Scales reprefented by far too narrow or not enough expanded : in which Besler is more exact. 'Tis about three inches and 1 long, and two and 1 over; of an Oval Figure, faving that the top is flat. Of this Tree it is affirmed by Melchior Luffy, (b) That upon the faid Mount (on which he hath feen them grow) there are fome fo thick, that fix or feven men can hardly encompass one of them with their Arms ftretched out: which may be supposed above half as thick again, as the thickeft Oak in England.

A CONE of the MALE-FIRR. Conus Abietis maris Defcribed by Baubinus. f. Piceæ Latinorum. It grows abundantly in Burgundy, and the Alps; fometimes in (c. Simlerus. height (c) above a hundred and thirty feet. The Cone almost Cylindrical, about eight inches long. To each Scale underneath, two winged Seeds or little Kernels are adjoyned. Curioufly pictur'd by Befler.

A little Twin PINE-APPLE. Pini Conus gemellus.

Several CONES of the WILD-PINE. Of this Tree they make great ftore of Pitch in Burgundy.

A CYPRESS-NUT. Strobilus Cupreffinus. By Cafalpine not fo properly called a Cone, becaufe of its Figure, which is rather Orbicular. Yet any Cone is appositely called Strobilus, from the winding order of the Scales. 'Tis not much bigger than a large Nutmeg. The Tree grows abundantly in France and Italy, and there bears Nuts.

CAMPHIRE. The Gum of a Tree about as big as the Hazle; and probably of the Coniferous kind. Formerly (d) Nomen- thought a Mineral; and by Kentman (d) called Bitumen There are two forts hereof. One of China, Odoratum. which is carried in Cakes and Balls, into all Places, in great abundance. The other of Borneo, which is far the beft.

A LONG FLAT LOBE. Lobus Buglosfoideus, fo I call it for its being fomewhat like a Coms Tongue. Defcribed

(a) Lib. 9. c. 15.

(b) In fux Peregrinat. Hierofolym. cap. 13.

clat.

fcribed by *Bauhinus* (a) with the Name of *Ceratium Mono-*<sup>(a)Lib.12.</sup> coccon Indicum. But this here, is thrice as big as his. 'Tis ten inches long; in the middle,  $4 \pm \text{over}$ ; both ends fomewhat Oval. Very flat, fcarce above  $\pm$  an inch where thickeft; the Belly level, the Back Convex and with a blunt Ridge. Of a dull ruffet, and all over rough with a great number of fimall Knobs. Its whole Cavity is filled up with one fingle Fruit; which *Bauhinus* not well examining, only calls it *FruStum ex fungofa quadam materie compaStum*. Whereas it confifteth chiefly of a wonderful Congeries of white *Fibers*; not produced by the length, or breadth, but the thicknefs of the Fruit, both ways, as the Teeth in a double Comb. The fpaces betwixt which are filled up with duft or powder; which was originally, the fappy *Parenchyma* or Flefh of the Fruit.

Another LOBE of the fame Species, but much lefs.

A THICK LOBE from Virginea. Lobus ex Wingandecaow. Not ill defcrib'd by Clusius. This here is not much above three inches and  $\ddagger$  long, an inch and  $\ddagger$  broad, and an inch thick. Unciam densus, faith Clusius improperly; that word not expressing the Dimention, but closeness or little porofity of a Body. There are fome Lobes, faith Laet (b) of the fame Species, that are two or three times (b) Lib. 3. the bigness of This.

A fhort FIBROUS LOBE. I meet with the Defcription hereof no where; nor the Figure, excepting in Befler,(c) (c) Tab. *i*. by the Name of *Fructus reticulato corio*. 'Tis almost three inches long, an inch and <sup>3</sup> broad, near an inch thick. At one edge it is cut through by the length; where, if you try to fpread the fides open, it refifts, from its great fibrofity, like a thick flurdy piece of tann'd Leather. Lined within with a most fimooth and thin Membrane. The Cavity all over even, or without any *Sepiment*: fhewing it to have been fill'd up with only one large Fruit.

A Great SCALLOP'D LOBE; or rather part of it. Of kin to that defcribed and figur'd in *Baubinus* (d) by the <sup>(d)</sup> Lib. 12.<sup>(A)</sup> Name of *Lobus Brafilianus ingens Siliquæ Acaciæ formâ*. The whole *Lobe*, is above two feet long; where broadeft, near four inches, flat; and composed of fix or feven Joynts, as *Baubinus* calls them; rather Cells, fo rounded or fcallop'd on both Edges, as to look like fo many Joynts;

## Of Berrys, Oc.

## PART II.

In this part of the Lobe, are only three. Toynts. In each of them is contained a great NUT round and flat, and of a shining Bay; an inch and i Diametre, and half an inch thick. In the Lobe Bauhinus defcribes they were not ripe.

A round FRUIT (probably) of a fort of SCALLOP'D LOBE. 'Tis almost of the colour, bigness, and shape of the former; faving that the fides are not fo flat, but both of them a little Convex.

ANOTHER, almost of the Figure of a Cat's Kidney; having at the edge a shallow Sinus or depressive where it was fasten'd to the Lobe. Described in Baubinus (a) by the Name of Phaseolus Novi Orbis, Cordis figura. But, as is most likely, very improperly; This being fo like the Fruit of the Scallop'd Lobe above defcrib'd, which he himfelf makes the Fruit of a Tree; Neither doth the Kernels, its being naturally cleft into two halfs, (ut funt omnia Pha*feolacea*, as *Clufius* fpeaks) argue any thing. For that is not peculiar to the Phafeolous kind; but all other Seeds whatfoever, excepting Corn and that Kindred, are naturally cleft (b) into two or more Lobes. This Fruit is faid to be Cathartick: and therefore 'tis probable, the other Plants, Chap. Species are fo likewife.

A long FRUIT of another LOBE. Defcribed and figur'd in fome fort in *Baubinus* (c) by the Name of *Faba* Americana purgatrix longior. 'Tis two inches and long, an inch and ibroad, flat, the edges thick, of an Oval shape, and dusky ash-colour. Where it was fasten'd to the Lobe, not depressed, as in the former, but a little produc'd.

A broad FRUIT of another LOBE. Probably de-(d) Lib. 17. foribed and figur'd in Bauhinus (d) by the Name of Lobus Membranaceus planus niger. If fo, he should not have called it a Lobe, but the Fruit contained in it. 'Tis about an inch and <sup>‡</sup> long, and almost as broad, flat, and very thin, and of a blackish brown. One of the edges sharp, the oppofite fomewhat thick.

A fquare FRUIT of an other LOBE. I find it no 'Tis almost an inch and # long; at one end, an where. inch and 'broad, at the other, an inch; above 'an inch thick in the middle, where it fwells up on both fides. Two of the edges opposite, Convex; the other two, Concave. Smooth, and of a blackish Bay. So

(a) Lib. 17. c.1, p. 276.

(b) See the Authors firft Book Of

(c) Lib.17. p. 277.

p. 278.

### Of Berrys, Gic.

So many of the above-faid Fruits, as are defcribed by Bauhinus, or other Authors, are number'd amongst Herbs, as if a fort of Beans. But by comparing them all together, and with the Fruit of the Scallop'd Lobe; they appear to have been all included in the Lobes of feveral forts of Trees.

The COD of the wild LOCUST of Virginia. Arbor. Lanif. Species. Defcribed by (a) Ligon. The Cod formewhat hard (a) Hift. of and brittle. In length, i a foot; sharp at both ends, in the middle an inch and i over, Convex on the back, the Belly plain. Fill'd with white Down, not like Cotton, but that of the Pappous kind of Plants, appendent originally to the end of the Seed: but the Seeds are here wanting.

A fort of SILK COTTON with the SEEDS. Given by Th. Povey Efq;. They feem to have been taken out of the Cod of a Tree which grows about Bantam; defcribed in Bauhinus (b) out of Clusius, by the Name of Lanifera (b) Lib. 3. Arbor peregrina. That this Cotton is not fo white as that of Clusius, may proceed from Age, or some difference in the Tree. 'Tis rather of the colour of raw Silk, and hath a gloss like it; extream foft and fine, but not fo long as *Cotton wooll*; and therefore unfit for Spinning.

Of this Cotton I suppose the Chineses make their soft thin Paper. And it is probable, That many of our English Plants yield a Down, which would be altogether as fit for the fame purpose. 'Tis also used, by the Indians, instead of Feathers, for the fluffing of Pillows.

## Of Shrubs.

PART II.

### SECT. II.

# Of SHRUBS and ARBORESCENT Plants.

### CHAP. I.

## Of SHRUBS, chiefty.

The DWARF-OAK. The Leaves fhaped like those of the *llex*, but not prickly. It differs not in the hardness of the Wood or Boughs, from the common Oak; nor in the shape of the Acorns it bears; some whereof are also here preferved. Yet is it not above a yard in height. Sent hither by Mr. Winthrop, not long fince Governour of Connecticut. In the Inland Parts of New England grow whole Forrests of this Oak.

The SEED of the Male HOLLY-ROSE, called *Ciftus*, *mas*; and the first in number, according to *Clusius*. "Tis included in a shelly Cover of a Pentagonal Figure; and is it felf also angular, about the bigness of the Seed of *Patience*, or *Lapathum Sativum*.

The SEED of the fecond Male CISTUS.

The SEED of the Female CISTUS. The shell of this, not fo big, nor fo sharp at top, as of the Male; and both this and the Seed it self blacker. It may be, because older.

Upon the Root of the *Ciftus* grows a *Parafitical* Plant, called *HYPOCISTIS*: the Juyce whereof, is commonly condenfed, and fo formed, like that of *Liquiris*, into Balls, and fold as a Drug.

The SEED of the CISTUS LEDON; being the first in order according to *Clusius*.

The SEED of the fourth CISTUS LEDON.

Off of the *Ciftus Ledon* is gathered, the Drug called *LADANUM*: which is a kind of Gummous Exudation, chiefly found upon the Leaves. 'Tis gather'd (*a*) in the *Dog-Days*, and when the Sun fhines hotteft, and therefore not without intollerable labour. Thefe Shrubs grow in *Cyprus*,

(1) Hereof fee Bellonius.

## Of Shrubs.

Cyprus, Creet, France, Spain, &c. In Creet, the Principal Place for Ladanum is at the Foot of Mount Ida.

The BERRYS of the Indian JASEMIN with a yellow and most fragrant Flower. The Oil of the Ben Nat being impregnated with the odor or spirit; especially of these yellow Flowers, and so mixed with Pomatum, is that which is commonly called Jasemin Buttyr.

The FRUIT of the NAMBUGUACU, a Shrub fo called by the Natives of Brafile. Defcribed by Pifo and others with the Name of Ricinus Americanus; & Palma Cbrifti. Curioufly figur'd by Tobias Aldinus. (a) Where (a) Defcr. note, That in the faid Author, through fome inadvertency, Horti Farnefiani. the Titles of this Plant and of the Spinacia Fragifera are transpos'd. The Seeds are of the bigness of a Horfe-Bean, fomewhat long, fmooth and glossy, ash-colour'd and mixed with black specks. The Kernel white and very oily. Given by Dr. Wilkins late Bishop of Chester, and to him, by Captain Hinde.

The Oil expressed out of these Kernels, is not only used in Lamps, but by the Natives of Brafile against all cold Diftempers (b) both outward and inward. Six or feven of (b) Pifon. the Kernels taken inwardly, purge and vomit with great Hift.1.4. c.31. vehemency. But a Tincture extracted out of them, is well proposed by  $Pi \int (c)$  as the faster Medicine. Although the (c) Ibid. Kernels themfelves work fo ftrongly; yet is it affirmed by Mr. Stubs, (d) That the Oil which is expressed out of (d) Phil. them, hath no Physical (Cathartick) Operation, although Trans. N. 36. a spoonful of it be taken down at once, or three put up in a Clyster. The Leaves, faith the fame Perfon, (e) are the only (e) Ibid. Remedy, which the Indians use for the Headach. Being fteeped in Water or Vinegar, they are daily experienced to cure the Shingles (f) and other like Affections. (f) Pifo, ubi

The FRUIT of the URUCU, a Shrub growing in <sup>fupra.</sup> Brafile. Defcribed by Clufius and Pifo. Bauhinus ventures to call it Bixam Oviedi; although Clufius only faith it is like it. In shape and bigness, faith Wormius, like an Aurange-Tree. This Fruit is about two inches long, an inch and  $\ddagger$ over; composed of two Concave Valves; below, Oval; above, Conich and sharp-pointed; befet all over with briss hairs  $\ddagger$  of an inch long. Within their Concaves, thirty or more little Grains, figur'd like a Pear, and originally of a curious bright red. Ff The

# Of Sbrubs.

The Shrub grows wild : Yet the Natives cultivate it in Gardens with great Care and Industry. For with the fcarlet Grains abovefaid, they paint and adorn themfelves. The Tincture alfo which they extract from them, called Orellana, they fell to the Portuges, and others which Trade with them. They likewife beat and make them up into Balls and Tablets, which they fend into all parts of Europe. (a) The fame Grains are fometimes mixed with Chacalet, for (b) Ximines the grateful colour and taft which they give to it. (b) Of (c) Wormius the Barque of the Tree, they make Ropes. (c)

A fmall Grain, in colour and shape not much unlike that above-faid, and probably belonging to a Species of the fame Kind, is brought hither from the Barbados by the Name of NOTTA. Yet used by Deyers, made up in Cakes, for a Limon-colour. With whom, nothing is more ufual, than to alter the colours of their Ingredients, by the admixture of Salts, and other ways.

BEIDEL OSSAR, *i.e.* The Egg or Cod of the Offar, a kind of Syriac Dogs-Bane fo called; Beid, being the Arabick word (d) for an Egg. Accurately defcribed by Honor. Bellus. And by Wormius very well figur'd. Yet Wormius in his Defcription, which he borrows of Alpinus, (with his Author) mistakes, in giving the Name to the Plant, which belongs only to this Egg or Cod. 'Tis foft or skinny, with fome afperity. About four inches long, at the upper end fharp, and (now) hooked backward. Filled with a company of fmall flat Seeds, enclofed in a fine and white Down.

This Shrub grows near Alexandria, upon a Branch or Arm of Nilus (e) called Calig. One Plant, at an Incifion of the Barque, will yield no lefs than four pounds of Milk. A Drachm and half of this Milk, (f) will purge a Man to Death. But used outwardly, is an excellent Remedy for the Itch. (g)

A COD, with the Wooll and Seeds, of the COTTON SHRUB; called Xylon Herbaceum. Said (b) to have grown heretofore only in *Ægypt*; but now is fown, and grows abundantly in Creet, Sicily, and divers other Places in Europe. The Cod is trivalvous, almost like to that of a Tulip, or the Peony. Upon the Seeds which are black Oval, and near as big as a Horle-Bean, hang the greatest part of the

(a) Pifo.

(d) Honorius Bellus.

(e) Wormius.

(f) Hon. Bellus.

(g) Muf. Calceol.

(b) Lacuna.

218

the Wooll. They are composed chiefly of two long and thin Leaves, admirably rowled up into an Oval Figure; as I may have occasion elfe where to reprefent. They are fometimes an Ingredient in Pectoral Medicines. Some Cotton Wooll, though of its felf, pure white; yet contrary to Flax and Hemp, loofeth of its whiteness by being washed. But whether it be that of this Shrub, or that of the Cotton-Tree; or whether, according to the Climate, &c. there is not good and bad of both, I determine not.

SAVINE-BERRYS. About as big as those of the common Juniper, and of a blackish blew. The little Sprigs, (of which there are fome here) are fquare; and not prickly, as those of the other Species. The Shrub, called Sabina Baccifera, and deferibed by Bellonius, grows plentifully in fome places in Alia.

The ROSE of JERICO, or CHRISTMAS-ROSE. Rofa Hierichuntina. Either an ignorant, or a crafty Name, agreeing neither to the place, nor nature of the Plant. For about Jericho 'tis no where found, (a) but in Arabia, upon (a) Bellonithe shore of the Red-Sea. A woody Shrub, but grows not us. above a foot or there about in height. Originally of an Aromatick fmell. The Leaves of this are foft, but the Flowers remain, fomewhat lefs than those of *Cumfrey*, and feem to confift only of two Leaves. All the Branches are clofed up together, with fome refemblance to the Umbel of the Plant called Bees-Neft, or fome others of that kind.

Being fet in Water, its feveral Branches will gradually be expanded. Which fome Imposters knowing, choose Christmas-Eve for the Experiment, and fo make people believe that it only opens at that time.

ANOTHER of the fame lefs globous, or with the Branches more erect.

Part of an INDIAN PLANT, in shape like a Wooll-*Combe*; being composed of a number of strait black Teeth, very tharp, near as thick as a Cock-Spur, and most of them two inches long, naturally fet upright, as it were, in a wooden-focket.

Ff 2

CHAP.

### CHAP. II.

## Of ARBORESCENT Plants.

A SPIKE of LONG PEPPER; a fort of Climber or Winder, after the manner of Hops, and other like Plants. Not much differing from the Round, faving in the Spike. It grows in Malabar, Java, and Sumatra; but effectially in (a) Mantiffæ Bengala, where it is called Pimpilim. See Pifo hereof. (a) Aromat. c.8. ATLIVOPIAN PEPPEP or rather the Coded Emin

(b) Lib.15. c. 46. ÆTHYOPIAN-PEPPER, or rather the Coded-Fruit hereof. Well deferibed by *Baubinus*. (b) By *Befler* curioufly figur'd. Here, upon one Stalk, hang about 15 Cods, moft of them three inches long, thick as a *Goofe-Quill*, fibrous, and of the colour of Cloves; containing ten or twelve blackifh and longifh Seeds, each in a Cell by it felf; not half fo big as the leaft of *French-Beans*, which *Baubinus* affirmeth them to equal, but more like the Seed of the *Laburnum majus*. Neither, according to the fame Author, hath it the taft of *black Pepper*, but rather of the *Clove*; viz. not much biting, yet very *Aromatick*, efpecially being well heated at a fire.

POYSON-BERRYS. So they are infcrib'd. The fruit of a Plant growing in the *Burmudas*, fomewhat like to *Ivy*. They grow in Bunches, almoft as those of *Round Pepper*, and are much of the fame bigness, almost of **a** ftony hardness, yet inclosed in a thin brittle and pellucid Cover. Whether they were gather'd full ripe, appears not.

The COD of a West-Indian Plant, called TAXOCO-QUAMOCHIT. This Cod, but not the Plant, is defcribed and figur'd in *Baubinus*. (c) 'Tis five inches long,  $\frac{1}{2}$  an inch broad, and sharp-pointed. Divided into twenty or four and twenty diffinct Cells, made by fo many thin Membranes, for the lodging of as many Seeds apart, of a dark Bay, and fomewhat like those of Broom.

The COD of a KIDNEY-BEAN of *Brafile*. (d) I find it not defcribed. 'Tis Divided into two Cells, by a Partition <sup>1</sup>/<sub>2</sub> an inch thick. Each of the Cells near two inches and <sup>1</sup>/<sub>2</sub> long, and as broad, fwelling out on both fides the *Lobe*, which outwardly is very rough and tawny, hath two furrows along the

(c) Tom.1. cap. 11.

(d) Lobus Fabæ Brafilianæ Nephroideæ.

# PART II. Of Arborescent Plants.

the Belly, the Back much bowed, and both of them about <sup>1</sup>/<sub>2</sub> an inch thick.

The BEAN belonging to the faid COD. Baubinus feems to defcribe and picture (a) under the Title of (a) Tom. 2. *Phafiolus peregrinus magnus*, colore Caftaneæ, cum magno Cap. 17. bilo, lævis. About half as big again as a Chefnut, flatish, and having a broad, blackish Seat, reaching above half its compass. Whereby it appears to be of the Bean-kind, and no Phasiolus; the Seat whereof, like that of the Lupine, is always round. Of these Beans, are here preferved both black and bay.

The COD of another *Brafilian* KIDNEY-BEAN, with the Beans enclofed. It differs from the former in being black, and in the number of its Cells, which are three. The Bean is fomewhat Oval, and wrinkled, and having a Seat which reaches almost its whole compass. See a good Figure hereof in *Calceolarius's Muſœum*.

HERCULES'S CLUB. Rubi facie (enticofa Planta. A tall woody Plant, defcribed in fome fort, and fo called, by Lobelius. Near three yards long; how much longer, is uncertain, being cut off at both ends; almost feven inches in compass, strait, and but very little taper'd. Originally, had two or three Branches, here cut off. Encompassed with a great many pointed Studs, (whence its Name) thick fet, and fometimes growing double, flatish, and about an inch broad by the length of the Club, after the figure of the Thorns of the Rasberry-Bush. Like to which they are also meerly cortical, having not one fiber of wood in them, whereby they break like Cork, but are not fo foft. The wood is as hard, as that of Holly, and the Pith but fmall. So that notwithstanding the fimilitude of their Thorns, yet is it a different Plant from the Rubus.

The STALK of a Plant like a NET. 'Tis only the woody part of it, the Barque and Pith being both taken away. 'Tis above an Eln long; likely, when entire, much longer, for now 'tis broken at both ends. Almost fix inches about. The spaces between the reticulated portions of Wood, are about  $\frac{1}{2}$  or  $\frac{1}{2}$  of an inch over, and from two inches to four, in length. *Prince Maurice*, looking upon This as a Curiofity, upon his Return from *Brafile*, brought it thence with him. This

## Of Arborescent Plants.

PART II.

This being, as is likely, an Annual Plant, and therefore having a large Pith, and very open Net-work, is a confpicuous example of the like Work (though more or lefs open, yet ) observable in the woody part of all other Plants whatfoever. (a)

(a) See the Author's Anatomy Of Plants, Ch.2. .823.

(b) Phil.

Several SPIKES or Heads of MAYZ or Indian-Wheat; with the Grains, as is not unufual, of three or four colours. The Defcription of the Plant, with a large Account of its Culture, and Ufe, were communicated by Mr. Wintbrop fometime fince Governour of Connecticut in New England: and by me lately published, in a fuccinct but full Relation, (b) with fome alteration of the Method. Tranf.N.142 The Plant grows to the height of fix or eight feet; and is joynted like a Cane. 'Tis alfo full of a fweet juyce like that of the Sugar-Cane. On the Spike grow feveral ftrong thick Husks, which, before it is ripe, fhut it clofe up round about. Thereby defending it, not only from all Weathers, but alfo the Ravine of Birds, to which, the Corn, while tender, is a fweet and enticing food.

> The Stalks of this Corn, are good Fodder for Cattel. As are alfo the Husks about the Spike. The Indian Women flit the Husks, and weave them into Baskets of feveral fashions. Of the Juyce above-faid may be made a Syrup as fweet as Sugar: which probably, may alfo be made of it, by the ufual method. The Indians eat the ripe Corn either boil'd; or more ufually parched; of it felf, or, The green Corn alfo, which, as is as Bread, with Flesh. faid, hath a fweet Taft, being boil'd, dry'd, and kept in Bags, and when they eat it, boil'd again, they account a The English, of the ripe Corn, make very principal Difh. good Bread: but it must be mixed nothing near fo stiff as our Wheat-Meal. But the best fort of Food made hereof, they call Samp. Having water'd, and ground it to the bignefs of Rice, and winnow'd or fifted the Hulls from it, they boil it tender, and fo with Milk, or with Butyr and Sugar, make it a very pleafant Difh. 'Twas often prefcribed by Dr. Willon to his Patients here in London. The Indians that live much upon it, feldom troubled with the Stone. The English alfo make very good Beer, both of the Bread, and of the Malt, made of this Corn. But it will not make good Malt the ordinary way, becaufe, not without fprouting both

PART II. Of Arborescent Plants.

both ways to a confiderable length : whereby it is fo matted before it is fully malted, that it cannot be opened without breaking the *Come*. To avoid which, they pare off a Turff about three inches thick, and laying the Corn all over the bare ground, cover it with the Turff, till the Plot looks like a green Field, at which time, the Corn is well malted. Then taking it up in matted pieces, they dry it on a Kiln, or in the Sun.

The SPIKE or HEAD of the ÆGYPTIAN MAUZE. Given by Sig<sup>r</sup>. Boccone (formerly Botanick to the Great Duke of Tuskany) who brought it with him from Sicily, where it is frequently nurfed in Gardens. The Figgs (as Acofta calls them) here grow upon it in feveral Bunches, nine or ten in a Bunch; two inches and ½ long, and as thick as the middle Finger of a labouring man; being now fhrunk up, and perhaps alfo dwarfed by the place of its growth.

This Plant, as it grows in *Egypt* and the *Indies*, is defcribed by *Thevetus*, with the Title above; by *Oviedus*, under the Name of *Platanus*, abfurdly received by fome, as himfelf noteth; by *Pifo*, who, with the Natives of *Brafile*, calls it *Pacoeira*; by *Acofta*, with the Name of *Mufa*, from the *Arabian Mous*. It grows three or four yards in height, and  $\frac{1}{4}$  of a yard (a) in compafs. Yet this Trunk, fo great, (a) Theveis (b) but annual. It hath Leaves above a yard and  $\frac{1}{2}$  (b) Oviedus. long, and more than  $\frac{1}{4}$  a yard broad. The *Figs* grow toward the top of the Trunk, near the fhape and bignefs of a midling *Cucumer*, fometimes one or two (c) hundred of (c) Acofta. them. Of a foft melting fubftance, and a fweet and moft delicious Taft. In *Brafile*, either eaten by themfelves, or with their *Mandioca-Flower*; boiled, or fryed (d) with (d) Pifo. Butyr.

Part of a fort of MAMBU, a great Indian Cane. In Baubinus's Pinax called Arundo Arbor. Defcribed by Wormius. But whereas his was black, This is of a ftraw-colour: and much fmaller, fc. about feven inches in compafs. Some of them grow nine or ten yards high. 'Tis hollow, quite through, excepting, that at every Joynt, 'tis clofed up with a transverse Plate or Floor. Necessary, for the adding ftrength and sturdiness proportionable to fo great a height.

It

## Of Arborescent Plants.

PART II.

It grows in *Malabar*, efpecially about *Coromandel*, near the Sea-fide. In the feveral hollows is found a curdled juyce, whereof the Natives make a fort of Sugar, by the *Æthyopians* called *Tabaxyr*, much valued by the *Arabians*, becaufe of the Medicinal Virtue, (a) they at least fuppofe it to have. In *Bantam*, the *Cane* is much ufed for the building of their Houfes.

(a) Wormius out of Garfias and others.

(b) Pifo, 1. 4. c. 1.

(c) Hift. 1. 4. c. 1. (d) Hift. of Barb. p. 86. &c.

The SUGAR-CANE. Arundo Saccharina. In Brafile called Tacomaxeé; to which place (b) it was first transplanted from the Fortunate Iflands. A great Reed about feven or eight feet high, with many Joynts, one at about every  $\pm$  foot, and a large close Pith; out of which, the greatest part of the Juyce, whereof the Sugar is made, is expressed. See the Description hereof at large in Piso (c) and Ligon; (d) together with the way of Planting, gathering and pressing the same; and of ordering the expressed Juyce, for the making of sugar, and Brandy: as also the Engines, and contrivance of Vessels for the same purposes.

The principal knack, without which all their labour were in vain, is in making the Juyce, when fufficiently boil'd, to kerne or granulate. Which is done, by adding to it, a fmall proportion of Lye made with (vegetable) Afbes: without which, it would never come to any thing by boiling, but a Syrup, or an Extract. But a little of that Fixed Salt, ferves, it feems, to Shackle or Crystallize (which is a degree of Fixation) a very great quantity of the Effential Salt of this Plant.

In refining the Sugar, the first degree of purenefs, is effected only by permitting the *Moloffes* to drain away, through a hole at the bottom of the *Sugar-Pots*; the *Pots* being, all the time, open at the top. The fecond degree is procur'd, by covering the *Pots* at the top with *Clay*. The reafon whereof is, for that the *Aer* is hereby kept out from the *Sugar*, which, in the open *Pots*, it hardens, before it hath full time to refine by feparation. And therefore, whereas the first way requires but one Month, this requires four. The finest *Sugar* of all, (e) is made with de Reb. Bra-*Lime-Water* (and fometimes Urine) and *Whites of Eggs*. fil.p.119.&c. *Sugar-Candy* (*Saccharum cantum*, becaufe it fhoots into angular Figures) by placing a great many flender flicks acrofs a Veffel of liquid *Sugar*, for it to fhoot upon.

#### PART II. Of Arborescent Plants.

That which Dioscorides calls Zanzapor; Galen, Sacchar; & Archigenes, Sal Indum; is the fame thing for substance, faith Matthiolus, with that we call Sugar: faving that, whereas this is made of the Juyce expressed and boil'd ; that of the Ancients, as is likely, was only the Tears; which burfting out of the Cane, as the Gums or Milks of Plants are used to do, were thereupon harden'd into a pure white Sugar. That the Sugar of the Ancients was the simple Concreted Juyce of a Cane, He well conjectures: and what is above-faid of the Mambu, may argue as much. But that it was the Juyce or Tears of the Sugar-Cane, he proves not. Nor, I think, could be, if, as is supposed, it was, like Salt, friable, and hard. And in affirming our Sugar to be the fame for fubftance with that of the Ancients, he much mistakes; that being the fimple Juyce of the *Cane*, this a compounded Thing, always mixed either with the Salt of Lime, or of Ashes; fometimes of Animals too.

The COD and SEED of the true Greater CARDA-MUM, figur'd by Befler, in Calceolarius's Mulaum, and others with the Name of the Middle Cardamum. The Plant it felf, both Leffer, and Greater, defcribed and figur'd by Bontius; (a) who glories himself the first that hath done (a) Hist. 1.6. it will. The Leffer grows about a yard high, with a joynted c. 36. Stalk, like a Reed. But bears its Spikes, with the Flower and Seed, near the Root. The Greater grows two yards in height, the Stalk not joynted, with a Spike of Flowers at the top, somewhat like to that of a Jacynth. Both of them plentiful in Java.

The Indians feafon all their boil'd Meats herewith, preferring it before other Spices, as not being biting.

That which is commonly received amongst Botanicks for the Greater kind, from the fiery hot Taft of its Seeds (called Grana Paradifi) feems to be no Cardamum, but of another Tribe.

The PAPYR-REED of Nile. Papyrus Nilotica. By the Ægyptians called Berd. Given by Sigr. Boccone, who brought it out of Sicily, where it grew. Described and figur'd in Baubinus; (b) who with Gesner, makes it a Species of Cy- (b) Lib. 18, perus, to which (in Leaf and Stalk) it is like; but hath a c. 196. more compacted Head. This feems to have been no tall Plant: but upon its Native Bed, sc. near the Banks of the River Nile,

Gg

### 226

# Of Herbs.

PART II.

Nile, it grows above three yards high, (as high, faith Alpinus, above the Water) and abundantly. Which Moses's Mother knowing, chose well, to lay her Babe in Pharaohs Daughter's way, yet, in the mean time, under good shelter from the scorching Sun.

Both the Barques and Leaves of fome Plants, are ufed for writing upon by Imprefion. But this Plant hath its Name, not from the ufe either of its Leaves or Barque, but of its Pith; whereof, being beaten into a Pulp, the Pulp fpread into thin Leaves, and feveral of those Leaves clapt together, *Papyr* fit to write upon was formerly made, as now it is of Rags. It was also used by *Chirurgions*, as fometimes *Spong*, or *Elder-Pith* is now, for the dilating of *Fistula's*, and imbibing the fanious matter of ill-natur'd Ulcers.

Another Head of the fame Plant.

#### SECT. III.

### Of HERBS.

### CHAP. I.

### Of STALKS and ROOTS.

The BULBIFEROUS GARLICK. Given by Dr. Daniel Whiftler. So called, because in the place of Seed, it bears Bulbs at the top of the Stalk. Described by Baubinus (a) with the Name of Allium proliferum : although Bulbiferum, be more apposite; for that every Plant which bears Seed, is proliferous; the Seed being Plantæ Proles, or the Fætus of a Plant. The Bulbs (not fully described) are about twenty; in a round Head or Cluster as big as a Nutmeg; each Bulb equal to a midling Peas; confisteth of four or five shells; of which, the outmost is shrunk up to a dry Skin, on one side, of a purplish colour; the inmost inclose that little Particle which in time becomes another bulbiferous Stalk, with a Root.

(a) Lib.19. c. 3.

The

#### Of Arborescent Plants. PART II.

The STRINGY BRITHWOORT. Aristolochia Polyrrhizos. So called in diffinction from the other kinds with tuberous Roots. Defcribed (a) by Bauhinus. It grows (a) Lib. 32. in France and Spain; but this came from Virginia. Of all c. 8. the Species the most Aromatick, as by tasting the Roots, although now very old, may eafily be perceiv'd.

The upright PENYROYAL. Pulegium erectum, Virginianum. It hath a Leaf almost as large as that of the Pulegium montanum. Yet fimells rather like Thyme. Which is all the defcription it admits, now wither'd.

A fort of SNAKEWEED, growing near the River in Connecticut. So called, because the Root is used for the biting of the Rattle-Snake. The Roots, especially pow-der'd, are of a fragrant smell, and very Aromatick tast. Yet feems a different Plant from the Serpentaria of the Shops, as having a Leaf deeply jagg'd or fcallop'd, as that of Ladies-Mantle.

The ROOTS of a fort of Afarum, found about Staniford in the Western parts of New England. It feems the fame with the Serpentaria of the Shops, i.e. the Virginian Snakeweed. A Plant of excellent use in some Feavers.

The ROOT NINZIN, corruptly called Genfing. Taken from a parcel fent over by a Chinese Physitian, and given by Dr. Andrew Clench. Described (b) by Guliel. Pifo. (b) Mantisfar Almost of the colour of a Parsnep, with something of a Aromat. yellowish hue. No bigger than a little Skirret; and of like confistence. Not stringy, as that in Pifo, but divided, as often the Mandrake and fome other Roots, into two Legs. Of a fweetish Tast, as Piso faith rightly. But this here is alfo bitter; fweet in the first or lowest degree, and bitter in the fecond.

This Root is not known to grow (wild) any where, but in the Kingdom of Corea. In which place, as also in Tunquin, China, and Japan, it is much used, and relied upon in Epilepsy, Feavers, and other both Chronick and Acute Difeases; either alone, or in composition (c) as the Basis. (c) Ibid. In China, accounted fo great a Cordial, that one pound hereof, is there fold for three (d) pounds (weight) of Silver. (d) Phil. Which shews, That there 'tis no Native, but only a Drug. Transf. N.14. So that if the Root or Seed be defired fresh for propaga- out of The-venot's Voytion, or other purpofe, it were better fought for, where it ages, Tom 3. grows wild, than from thence. Gg 2 The

## Of Arborescent Plants.

PART II.

(a) Pars 2. C. I. (b Rarior.) Pl. lib. 2. c. 18.

Lalf.

228

The ROOT of the Ægyptian ARUM. Defcribed by Fabius Columna, (a) with the Name of Arum Ægyptiacum: but called by Alpinus, (b) Colocafia Strogulorhiza f. rotunda Radice; not rightly, as Columna notes. Nor do either of their Defcriptions well reach it.

This here (as it is often) is a double Root; each of them round, and fomewhat flat. The uppermost like the dry'd Root of Arum, white and friable; but the Taft Full and frim, in breadth or transversly, two is extinct. inches; encompaffed with three or four very fmall Circles, whereupon feveral Leaves did once grow: underneath, are the portions of feveral finall dead Stalks; on the top and fides, the Buds of others to come. To this, by a short Neck between, hangs the lower; which being alfo the elder, is more fuzzy and thrunk up.

This Description cannot be understood, without knowing that, which is very observable of this, and a great number of other *Plants*; and whereunto, no one *Botanick* hath adverted: viz. That the Root is annually repaired, or renewed out of the Stalk it felf. Particularly, of this Plant, that one of its two Roots doth every year perifh, the other is new made; not out of the other Root before it perishes, but out of the Stalk it felf. The Stalk descending by fuch degrees, as that part thereof which, the last year, was the lowermost above ground; this year, being funk (or rather by the appendent strings pulled) under ground, becomes the upper Root; the next year, the under Root; and the year after, rots off; another new Root being still yearly made out of the Stalk. By which way, and not as Trees by the fame numerical Root, this and other like Plants are perennial.

This Root, the Egyptians eat very greedily, both raw, boil'd, and all manner of ways; supposing them, prævalide excitare venerem. The Roots of the common Arum boil'd, were heretofore eaten among the Greeks: and may taft as well as boil'd Onions.

A pair of large GINGER ROOTS; one of which, when green, might weigh four or five ounces. And is faid to be dug up, sometimes, of fourteen Ounces. The Plant uncertainly describ'd. Acosta compares it to that call'd La-(c) Lib. de chryma Jobi; Lobelius, (c) to a Reed; Garcias, to a Flag; and 111

# PART II. Of Fruits.

and *Bauhinus* pictures it accordingly with a trivalyous Cod. *Pifo*, out of *Bontius*'s Papers, gives two Figures, one of the Male, the other of the Female : and fuppofeth, that the uncertainty of Relations hereof may proceed partly from the not diffinguishing betwixt them. The Stalk of the Male indeed feems to have fome little likenefs to a *Flag*. But the Seed-Cod is there neither figur'd nor defcrib'd.

The beft Ginger grows upon the Coaft of Malabar. That which is preferved with Sugar, comes, or did at leaft in Linchotus's time, from Bengala and China.

### CHAP. II.

## Of FRUITS.

The great FLAGON GOURD, or rather CALA-BASH, for fuch I take it to be, and that therefore it fhould have been placed with that fort of Fruit. Baulsinus (a) defcribes a Gourd in fhape pretty like to this by the <sup>(a)</sup> Lib.16. Name of Cucurbita Lagenaria; but mentions neither how big, nor of what hardnefs the fhell; in which latter refpect the Fruit here before us, (as do most Calibashes) far exceeds all the forts of Gourds that I know. Tis very fmooth, and of a parchment-colour: near eleven inches long. That part of the Neck next the Tree three inches and  $\frac{1}{2}$  over; next the belly three and  $\frac{1}{2}$ ; the belly it felf, nine inches; or two feet three inches about; the top depressed. The shell as hard almost as a Plum-stone, and at the fmall end above a quarter of an inch thick.

A LONG Indian GOURD. I find it not defcrib'd. Almost of a golden colour; in length, ten inches; in the middle, where it is thickess, three over; from thence it grows flender to the Stalk; the top Oval. Made angular with ten Ribs, or great Fibers produced by the length, in the middle about an inch distant one from another, and appearing the higher, by the shrinking down of the fides between them. The Rind not hard, within, whitish and very fibrous. The Seeds, black and rough, near  $\frac{1}{2}$  an inch long,

### 229

# Of Fruits.

long, flat, oval, and horned, as it were, with two knobs at the Bafe: being chewd, of a very bitter taft.

PART II.

The WARTED GOURD. Figur'd, and in fome fort (a) Lib. 16. defcribed (a) in Bauhinus. Probably, Lobelius's Sicyopepon Strumofus. This is above a foot and # about, near # a foot long, thickeft towards the top, and there a little depreffed as an Apple. Soft and brittle, and now just of the colour of Buff-Leather. The Warts or Knobs all round about it, are neither blifters, nor folid, but emboffed parts of the Rind.

Another of the fame Species, but leffer.

The LONG WARTED GOURD. Not defcribed. Almost two feet in compass, and near a foot in length. In other respects, altogether like the former.

ANOTHER with small and few WARTS. About four inches long, towards the upper end, as much over. The colour, and shape at the top, as of the rest.

The BROAD TUBEROUS GOURD. Probably that defcribed and figur'd in Bauh. (b) by the Name of Cucurbita Clypeiformis f. Melopepon latus; at least of kin to it. Of a Buff colour, as the former; four inches long, four and i broad; furrounded with undulated Knobs an inch or 1 ± over, with furrows between each Knob and by the length; depressed at the bottom; the top with a knob i an inch over.

The FLAT GOURD. Melopepo compressure alter, Lobelio. This came from Virginia. 'Tis three inches long, or from the Stalk to the top, and three and inch broad ; at both ends, compreffed like a Bowl. Of a dusky yellow mixed with tawny.

The Little, Round, Bitter GOURD. Figur'd in Bau-(c) Lib. 16. hinus (c) under the Title of Cucurbita amara, fructu parvo, globofo, colore varia. The Defcription lies in the Name. A fort of Colocynthis.

The Yellow, Round, GOURD. In Baub. the Fruit and Plant together, entitul'd, Cucurbita aspera, minima, spharica, crocea, variegata. With a conjecture of its being the fame with that which by Tabernamontanus is called Pepo Indica minor.

Not only the shells of Calabashes, but also the Rinds of Gourds, are used as Vessels for Gums, and other matters better

(b) Lib. 16.

C. I.

C. I.

#### 230

C. I.

better than Earth or Wood, as being both light, and not brittle. The little bitter *Gourd*, being eaten, worketh by Vomit and Stool. The Water diftill'd from unripe *Gourds*, applied with Linnen, is moft fuccefsful, and a great Experiment against that Heat, called *Syriafis*, (*a*) effectially in (*a*) Bauh.lib. Infants.

A FRUIT in fhape fomewhat like a WILD CUCU-MER; yet not, as that, hairy, but fmooth. The Seeds alfo of both are in figure, colour, and taft, altogether alike. So that perhaps it may not be improperly called *Cucumis Sylve ftris glaber*.

A FRUIT, fuppofed by *Clufius*, (b) to be that of the (b) Exot.lib. EGYPTIAN-BEAN of *Diofcorides*, a Water-Plant. 'Tis<sup>2. c. 13.</sup> of a brown Bay, and of a foftifh and light fubftance; the top, which is broadeft, above three inches over, and flat; divided into about twenty round and open Cells, almost like an *Honey-Comb*. In each Cell is contained a *Bean* or *Nut*, alike colour'd, of an Oval fhape, as big as a fmall *Akorn*, and in the fame manner pointed at the top. See alfo the Figure in *Baub*.

A flender COD of GUINY-PEPPER. *Capfici Siliqua* angusta. *Piso* (c) defcribes and figures nine or ten forts, all (c) Hift. 1. 40 growing in *Brasile*, and there called *Quiya*; of which this <sup>c. 51.</sup> is the longest and most flender. 'Tis used as a great Stomachick Medicine, and in Sauces, both in substance and infusion, in *America*, *Spain*, and other Countries, and by many prefer'd before the best *Pepper*.

The COD of the Broad Leav'd DOGSBANE. Siliqua Apocyni latifolij. Given by George Wheeler Efq;. Deferibed and figur'd in Bauhinus: (d) but with the Cods fhorter and  $^{(d) L \ 15.}$ thicker than their natural fhape. Of kin to that which  $^{c.\ 15.\ p.\ 13}$ , thicker than their natural fhape. Of kin to that which  $^{c.\ 15.\ p.\ 13}$ , to belius calls the Scammony of Montpelier. Along the middle or centre of the Cod, runs a flender fibrous pillar, to which, and not to the fides of the Cod, the Seeds are faften'd on both fides it; and fo encompaffed about with Down, wherewith the Cod is fill'd up. A provident forecaft of Nature to keep them warm. The faid Down confifteth not of fingle Hairs, but Plumes, affixed to the Seeds, wherewith they are winged for their being more difperfedly wafted by the Aer, and prevent their falling in a ruck on the ground.

The

The CODS of the wild WOAD, (Glafti Sylvestris) together with the Seeds therein contain'd.

Of Seeds.

A fmall SPIRAL FRUIT. Above an inch long, and over. It confifteth of five little *Cods*, all growing upon one Stalk, and thence twifted all together (as feveral ftrings in a Rope) are at the end united in a flender point.

The WATER-CALTROP. Tribulus aquaticus. Defcribed in Baubinus. A kind of fhelly Fruit of a brown colour; divided into four thick and fharp-pointed Spikes, quadrangularly. In the centre of which is lodged a white and well tafted Kernel. They grow in the Rivers and Lakes in Italy and Germany. Where, in times of fcarcity, the people make Bread of the Kernels.

Some EARS of *Tangier* WHEAT. Given by the Honourable *Charles Howard* of *Norfolk* Efq;. The Plant defcribed in *Bauhinus* by the Name of *Triticum cum multiplici Spicâ*. For it is a great broad Spike, as it were branched out into feveral little leffer ones; yet all clofely compacted : in the middle  $\frac{1}{2}$  inch thick, and an inch and  $\frac{1}{2}$ broad; four long, and tharp pointed.

Some more EARS of the fame fort, brought from Portugal where it grew.

### CHAP. III.

### Of S E E D S.

The THICK FRENCH-BEAN. Phafeolum maxime tumidum. An inch and  $\ddagger \log$ ,  $\ddagger broad$ , and  $\ddagger an inch$ thick. The feat of the Bean, or of its Plancentula, that is,the part whereon it grows, as long; of a brown colour,with a black rimm.

The flender FRENCH-BEAN, of feveral fizes and colours, *fc*. Red, Black, White or Afh-colour, and the fame fpoted with black. Although thefe are quite different from the *Fabaceous* kind, yet I have retained the *English* Name, because in use.

The ROUND fcarlet Phafeolus. Abrus coccineum majus. Baubinus (a) defcribes it under the Title of Pifum Americanum; improperly, for that the Peafen, and the Phafeolous kind,

(a) Lib. 17. p. 264.

#### Of Seeds.

kind, are very different. And for the Figure hereof, by fome overfight, is placed that of a fort of Palme-Nut. 'Tis a scarlet Fruit about as big as a Rounseval Peas, and somewhat flat.

The LESSER AMERICAN-BEAN. About <sup>3</sup> of an inch broad, almost square, and very thick. The seat of the Placenta, black; which reaches almost half round the Bean. Here are preferved both Black ones, and of a Scarlet or Coralline colour.

An ORBICULAR Indian PEAS. A large one, fc. \$ of an inch Diametre : of a shining straw-colour, mixed with yellowish Striæ as it were in rings: not much unlike the little round ftones wherewith Children play, called Marbles.

Another ROUND Indian PEAS. About as big as the former, and alfo round. But fomewhat flat on both fides, as a Loaf. And of a whitish colour.

An OVAL Indian PEAS. A very large one, fc. near an inch long, and above an inch over; of a long Oval Figure, fo as to refemble a Sparrows Egg. But of a fhining blewish ash-colour, like a Jaspis. Batchinus (a) figures and  $p_{2.276}^{(a)}$  Lib. 17: defcribes a Fruit (or Seed) pretty like to this, with the Name of Phaseolus Ovo Columbino ferè similis. But by his Defcription it is neither of the Phaseolous, nor Fabaceous, but of the Peas-kind; as both This, and the two precedent ones, alfo are. The CharaCteristick of which kind is, To have the Placenta, and fo the Seat of it, always very fmall.

The GUINEY-PEAS. Defcribed in Bauhinus by the Name of Pifum Americanum coccinem f. Abrus minus. Although the Abrus majus be of the Phaseolous kind. 'Tis of the bignefs of a young Peas, of an Oval shape, and Scarlet colour, when fresh very pure ; and adorned upon the feat of the *Placenta* with a black fpot. Here are fome alfo of the fame fort, all over black. They grow in Madagascar and China; where they eat them not, but only use them for weights. In Europe, fometimes for Necklaces and Bracelets for the Wrifts.

The great CICHE. Cicer ruffus major. In Italy, Spain and France Ciches are commonly fown (as Clover-Grafs) in the Fields. In some parts of France, they use them not only medically, but for food. The Ηh

p. 276.

#### Of Seeds.

PART

The great LENTIL. Leus major. This alfo is fown, in France, in the Fields, as the Ciche.

The great Wild VETCH. Vicia maxima sylvestris. The CANDY VETCH. Arachoides Honorij Belli, f. Cretica. Described, in Bauhinus, (a) by the Author from (a) Lib. 17. whom the Name. The Seed it felf, like a little Lentil. Seldom more than one in a Cod. The Cod is short and broad, about the bignefs of a Silver Half-peny; On the outfide cancellated or favous, almost as in the feed of Рорру.

What H. Bellus affirms (b) of this Plant, is observable, fc. That it bears Cods not only on the Stalk, but also on the Roots under ground.

The KIDNEY-VETCH. Semen Anthyllidis leguminofæ.

The CRIMSON GRASS VETCH. J. Catanance.

The MEDICK FITCHLING. f. Onobrychis.

The EVERLASTING VETCH; fo it feems to be. Vicia multiflora perennis.

The EVERLASTING PEAS. Lathyrus perennis.

The PRICKLY HEDG-PARSLY Seed. Semen Caucalidis echinatum. ſ. Lappulæ Canariæ latifoliæ.

The Seed of MACEDONIAN PARSLEY.

The AZORICK fweet FENIL Seed. Shaped like that of the Shops, but much lefs.

The Seed of the stringy BIRTHWORT of Virginia. f. Pistolochiæ Virginianæ.

The Seed of Indian SCABIOUS. Somewhat bigger than the common.

The Seed of the BUGLOSS with the yellow Flower.

The Seed of a SENSITIVE Plant. J. Herbæ mimofæ. There are feveral Species defcribed by Clusius, and others. That of Clusius, about five handful high, and hath the tast and fmell of Liquirish. This Seed is of a dark brown, not much bigger than that of a Purple Stock, angular, and frequently of a Rhomboidal Figure. It takes its Name (as is commonly known) from its Imitation of fenfe or Animal motion. For fo foon as you touch the Leaves, they prefently fall, till they lie upon the ground. After a while, they rife again; but being touched, fall as before.

The Seed of VENUS LOOKING-GLASS. Of the

shape

fhape and bignefs of a *Fly-blow*, but of a dark gliftering colour, like polifh'd *Steel*. Figur'd and defcrib'd by Mr. *Hook*. (a)

(a) Micrographia.

The Seed of PRICK MADAM; Sedi minoris. In co-<sup>graphia</sup>. lour, fhape and bignefs, almost like to that of *Pancy-Seed*, or the *Viola tricolor*, but a little lefs.

The Seed of Wild GARLICK.

The SEED of the *Carduus* headed HAWKWEED. The Plant defcribed by *Baubinus*, but not the Seed. 'Tis of an inch long, as thick as that of the leffer *Hawkweed*, and of a yellowith ftraw colour; a little crooked, with the top fwell'd and pointed, and view'd in a Glafs, appears wrinkled round about.

The leffer Champaine TREACLE MUSTARD-Seed. f. Thlaspios Campestris.

The Seed of the great STAR of BETHLEHEM. f. Ornithogali fl. pleno. Of the bignefs of Mallow-Seed, and very black; on one fide round, on the other angular.

The Seed of the VERVAINE MALLOW of Japan. f. Alceæ Japonenfis. As fmall as that of the common Mallow, but longer and more like a Kidney; of a brownish yellow, yet cover'd with a white, thin, and very short Down.

Summer WHEAT of *New England*. So call'd (though lefs properly) becaufe fown and ripe the fame year. Whether from the Nature of the Grain, or the Soil and Climate, trial hath not been made.

#### SECT. IV.

#### Of MOSSES, MUSHROONS, &. Together with fome Appendents to Plants.

OF MOSSES here are about four and twenty Species. Most of them gather'd in a Wood in Surrey, and given by John Evelyn, Efq;.

The CREEPING TREE MOSSE of America. 'Twas found betwixt Virginia and Florida. It confifteth of feveral Threds, fomewhat thicker than a Taylors, cover'd all over with little skiny Scales, hardly visible without a Glass. H h 2 The

#### Of Moffes, &c.

#### PART II.

The greater number of thefe Threds put forth two or three more, and fo thofe as many, repeating them after every two inches, all of equal thicknefs. In which manner they fpread wonderfully both in length and breadth. 'Tis probable, that under thofe little Scales may lie the Seed of the *Molfe*.

The SHIELDY Tree MOSSE. Muscus arboreus scutellaris. So called, for that it grows with several broad round Heads, from a  $\ddagger$  to  $\ddagger$  an inch over, and a little Concave, not unlike a *Buckler*. Described and figur'd in *Bauhinus*.

The foft BEARDED Tree-MOSSE. Muscus arbor: barbat. Imperati. Defcribed by the Author of the Name. It confifteth of a great number of ftrings in a clufter; fome of them at the bottom, as thick as a Knitting-pin, and  $\ddagger$ a foot in length; all ending as fimall as a fine Thread; and not unaptly refembling a Beard.

The Crifp BEARDED MOSSE. Different from the former, only in being more rough and woody.

The FISTULAR Tree-MOSSE. Defcribed in *Baubinus* by the Name of *Muscus arbor: Villoss*. By whom it is mistakenly faid to be woody: it being wholly of a pithy fubstance, and having all its Branches hollow as fo many little Pipes: from whence I have nam'd it.

The Dwarf PIPE-MOSSE. Different from the precedent in being fhorter, and more fpread thick and bufhy. That which is called *Ufnea Officinorum*.

The HORNED Tree-MOSSE; confifting of short crooked Pipes.

The greater FLAT-MOSSE. Muscus arbor: ramofus, f. latiramis major. Figur'd, as if it were nothing elfe but a branched Skin.

The dwarf FLAT-MOSSE. M. latiramis humilis.

The CROWNED FLAT-MOSSE, having a flat Head or Crown on the top. Thus far of *Tree-Moffes*.

The greater CAPILLARY-MOSSE. Polytrichum majus.

The leffer CAPILLARY-MOSSE.

The greater BRAINCHED Ground-MOSSE. Defcribed and figur'd in Baub. with the Title of Muscus terrestris repens à Trago pictus.

The

PART II.

#### Of Mosses, &c.

The leffer BRAINCHED Ground-MOSSE. Muscus terrestris ramofus minor. Of the fame Species with the Skull-

Mosse. Described in Baubinus, as I take it, with the Title of Muscus Abietis facie.

The FIRN-MOSSE. *M. filicinus*; fo called from its likenefs to a young *Firn-Branch*.

The TOOTHED-MOSSE. *M. terrestris denticulatus*. The feveral strings hereof, border'd on both sides with jagged or toothed Membrans. Figur'd and describ'd in *Baubinus*, under the Name of *Muscus pulcher parvus repens*.

The fmalleft CREEPING MOSSE. M. terr. repens minimus.

The leffer ground MOSSE with REVERTED Leaves; that is, with their points doubled backward. So finall, as hardly to be obferved diffinctly without a Glafs.

The CROWNED Ground-MOSSE. The Branches hereof are of an afh-colour,  $\frac{1}{2}$  an inch log, flat and skinny, and crowned at the top with round, flat, and blackifh Heads.

The greater FISTULAR Ground-MOSSE. The Pipes of this *Moffe* are also of an ash-colour, about an inch long, and as thick as an *Oaten straw*.

The leffer FISTULAR MOSSE. The Pipes of this are an inch and  $\frac{1}{2}$  high, and as thick as a good big *Needle*.

The FLORID FISTULAR MOSSE. M. Tubul. Efflorefcens. The Pipes of this are alfo ashen, slender, an inch long, with jagged and redish Heads, somewhat like little Flowers.

The CUP-MOSSE. *Musc. Pyxidatus*; fo called, becaufe its feveral Sprigs have Concave Heads like little Cups.

Of *Moffes*, it may be Noted, That they are all comprehended under two general kinds. One whereof, is properly to be called *WOODT*, or That, in which we find a ftringy or fibrous Part, included within a *Cortical*: and are therefore to be number'd amonft perfect Plants. Of which fort, are the *Terreftris repens*, *Denticulatus*, *Ramofus*, *Capillaris*, *Filicinus*, *Folijs retroverfis*, *Barbatus*, *Scutellatus*, & *Amercianus*. The other fimply *CORTICAL*, whether flat or round; and therefore to be reckon'd of the Family of Imperfect Plants.

Of

#### Of Moss, Oc.

#### PART II.

A

Of which fort, are the Pyxidatus, Terrestr. Tubularis, Arboreus Tubularis (. Unea offic. Latiramis, Latiramis Coronatus, Corniculatus, Terrest. Coronatus & Tubul. efflorescens.

The Jagged Tree-LIVERWORT. Lichen arboreus laciniatus.

The Curled Tree-LIVERWORT. L. laciniatus crispus.

A Great FISTULAR MUSHROON. So I call it. Given by Sir Rob. Southwell. I find no Defcription of this Spe-They commonly grow upon the Elm. This is  $\frac{1}{2}a$ cies. Cone, as having grown to the fide of the Tree without The Diametre of the Base, near i a yard; from ftalk. whence it rifes above <sup>‡</sup> of a yard in height, narrowing all the way to the top. Girded with feveral Rings of various breadth. Outwardly, very hard and denfe. Inwardly foft and compreffable, like a *Pith*, and is in fubftance really fuch. Confifting of an innumerable company of fmall foft Fibers, wrought together almost as pure fine Wooll in a Hat. The bottom is all over perforated with Pores; of the bignefs of those little Foveæ in the feeds of Poppy; and are the extremities of as many fmall strait and parallel Pipes of a confiderable length, probably, almost through to the top, as I have feen them in a leffer of the fame kind. Thefe Pores or Pipes may be diffinctly feen without a Glafs. With one, a Slice of the Mulbroon looks like a piece of wood out of which Button-Moulds have been turn'd. Both the fubstance of the Pipes, and of the other parts of the Musbroon, fo far as visible, is answerable only to the Cortical, or pithy Part of a Plant. So that it feems to be but half of a perfect Plant: or wanting the Lignous Part, by which all Plants receive their various Figures, is a kind of Vegetable Mola; in comparison, a rude mishapen thing.

(a) See the Authors two Plants, the former Of Roots, the latter Of Trunks; cfpecially this, latter.

That which hath formerly (a) been by me observed last Books Of with the help of Glasses, by the Pith of this Mushroon is further confirm'd, and clearly represented to the naked eye, sc. That the Pith of a Plant, as well as the Wood, is wholly fibrous.

A imaller FISTULAR MUSHROON, about four inches in diametre. In which the aforefaid Pipes apparently run parallel for the length of near two inches and <sup>1</sup>/<sub>2</sub>, or from the bottom almost to the top.

PART II.

### Of Mosses, Erc.

A THIRD and FOURTH still leffer than the former.

Part of the CORK-MUSHROON. 'Tis eight inches in Diametre, exactly of the colour and fubftance of the beft Cork, fc. light, foft, compreffible and fpringy: from whence I name it. In the middle, an inch and  $\frac{1}{2}$  thick, the Circumference very thin; the upper fide folid, the under divided into feveral Plates by the Diametre, frequently fo joyn'd together, as to make a great many little Cells, formewhat like to thofe in a Honey-Comb.

The SPONGE MUSHROON. So it may be call'd, for that it is *porous* almost after the manner of fome *Sponges*, particularly the *Cup-Spunge* hereafter defcrib'd. And is alfo of the fame colour. But hath the fubstance of a *Tree-Musbroon*.

The CORAL-like MUSHROON. Defcribed in Bauhinus amongst Moffes, with the Title of Muscus Coralloides. Figur'd by Lobelius.

The SCARLET CATSTAIL MUSHROON of Malta. Fungus Typhoides coccineus Melitensis. Given by Sig<sup>r</sup>. Boccone, and by him defcribed and figur'd. (a)

The round Venimous MUSHROON of the Hazle. F. Coryleus orb. venen.

(a) Defc. Plant. Rarior.

The HART-FUSBAL. *Tuber cervinum f. Cervi Boletus.* So called, from a falfe Opinion, that they are there only found, where *Deer* go to *Rut*. Defcribed by *Baubinus*.

hereof. 'Tis in length  $\frac{1}{2}$  a foot; at the lower part, half an inch thick, or in Diametre; in the middle, two inches and  $\frac{1}{2}$ ; the top, oval or elliptick; not unaptly refembling the Boon critton-Pear. Of a brown colour, find, denfe, and tough, almost like Glew. Being fir'd, it burns with much flame, melts into a good deal of Oil, and yields a fmoak of a grateful Aromatick fmell. Soo p.385

The KERMES BERRY. Coccum f. Granum Infectorium. Commonly, but abfurdly, fo called; as not being a Fruit, but only a round Ball or Button, nourifhed on the Boughs and Leaves of the Dwarf-Ilex, or the Ilex Coccigera; a kind of Shrub, in France, Spain, and Italy, with prickly Leaves, like a little Holly-Bufb. This Berry when fresh gather'd (which is at the end of May and the beginning of June) is full of a Crimfon Juyce, or Pulp, fo called, which, for the

#### Of Moffes, Oc.

PART II.

the most part of it, is a heap of small red Mites. And containeth alfo, as is probable, one or more Maggots, which feed upon the Mites.

The faid Juyce or Pulp (as it is called) is made use of for the Confection of Alkermes, and other purposes. For the Deyers use, the Berrys are spread abroad upon Linnen, and to prevent heating, turned twice a day. When the Mites creep out and cover the Berrys, they are fprinkled with Vinegar, and rub'd a little, and fo feparated by a Searce; repeating, till the Berrys yield no more. Of this. Pulp, Powder, or Heap of Mites, are formed little Batts, and fo exposed to the Sun to dry. The use of the Vinegar, is to kill or weaken the Mites and Maggots, which otherwife would turn to little Flys (rather Bees.) The empty Husks, being washed with Wine and dry'd, are put up in Sacks, either alone, or with a quantity of powder in the This Account I have drawn up out of the Obmiddle. fervations communicated by Dr. William Croon (a) from Mr. Verny an Apothecary at Montpelier, and those of Mr. Lyfter, (b) which illustrate each other.

To the Remarques above mention'd, I shall add one more, which is, That as the Pulp or Powder, fo called, is a Clufter of fmall Animals: fo the Husk it felf is an Animal Body, as it were grafted on the Stock or Leaf, whereon it grows; and fo converteth all the nourishment it deriveth thence ( as Bread eaten is turned to Electronics own Appinal) Nature. And that the faid Husk is really an Animal Body, appears by that fetid fcent it gives, like that of Horns, Hair, and the like, upon its being burnt. A property, which I find belonging to no Plant whatfoever, except to fome Sea-Plants, as in the following Section shall be instanced So that, though in compliance with the Vulgar Opinion, I have placed it here, yet ought it to be treated of amongst Animals.

Obferved, and fent by English KERMES BERRYS. Martin Lyster Efq;. Together with feveral Remarques, re-Trans. N.71. lating both to the Foreign kind, and to This. (c) This, p. 2165. N. 72. p. 2177. he found upon the Plum, Vine, and feveral other Trees, ef-N. 73. p. pecially the Cherry. The Husk of a Chesnut colour, con-2196. comtaining four or five Maggots of the Bee-kind, producing a pared with Bee lefs than an Ant; together with a Pulp or Heap of N. 87. p. Mites,

(a) Phil: Tranf. N.20. p. 363. (b) Ibid. N. 87. p. 5059.

(c) Phil.

5059.

PART II.

### Of Moffes, &c.

Mites, (as the other Kermes) on which the Maggots feed. The empty Husk, rub'd upon a white Paper, tinged it with a beautiful Purple or Murrey.

The principal difference which I note betwixt the Forreign and these *English Berrys*, now dry, is, That in those, the powder is red, and more bitter, in these white, and less bitter. But whether the powder in these also was not once red, I cannot fay. For in some even of the Forreign *Berrys*, I find it white. Which I the rather note, that they may be separated by *Apothecaries* from the rest, as being stark naught.

COCHINELE. Coccus Radicum. The former Name, feemeth to be but the diminutive of Coccus. The latter, grounded upon the Opinion, That as the Kermes Berry grows on the Body and Leaves, fo this, on the Roots, of Plants, efpecially on those of Pimpinel; yet in some places only. Further, I find no certain account. To me, thus much seems evident, That 'tis neither a Vegetable Excrefcence, as some surgers, nor an Infect, as others: yet an Animal Body, as the Kermes Berry, by some Infect affixed to a Plant; and thence nourished for a time, but gather'd before it be fill'd with Mites or Maggots. For being held, as the Kermes Berry, in the flame of a Candle; it usually huffs and swells, but always stinks, like Hair or Horn when they are burnt.

A fcruple of *Cochinele* added to an ounce of *Saccharum Saturni*, makes a most curious *Purple*; but I believe fading.

A GREAT GALL, which grew upon that fort of Oak defcribed by *Clufius* in the third place; and frequent in *Spain.* 'Tis now of a dark brown, and fmooth; of a *Sphærical* Figure, with a few fmall knobs here and there; as big as a little *Apple*, *fc.* near two inches in Diametre.

Ti

SECT.

Sea-Plants.

PART II.

A

SECT. V.

#### Of SEA-PLANTS.

# CHAP. I. Of SHRUBS.

I Find, upon particular Observation, that of SEA-SHRUBS there are two general kinds. Such as are strictly woody, that is, have the colour and fibrosity of Wood, and burn and smell like Wood. And such as are, in a manner, horny, or look, bend, burn and smell like Horn.

A WOODY SHRUB. Frutex marinus verè ligneus. 'Tis here cut off from the Root. About a foot in height, with four Branches spread out as broad, and cover'd with several thick Knobs of a fort of softish white Coral; the fides of which Knobs are a  $\ddagger$  of an inch thick; the surface almost like that of Poppy-Seed.

ANOTHER, near a  $\ddagger$  of a yard high, as thick as the Ring-Finger, with white and hardifh Incrustations upon the tops of its Branches. Any strong *Acid* droped on the faid Crust, causeth an *Effervescence*: so that it seems to be a Coralline fubstance.

A THIRD, with the Branches broken, and without a Cruft, three or four inches high, and as thick as the middle Finger.

A FOURTH, with the Branches alfo broken, and without a Cruft. 'Tis a fmall one; but hath a very large Root, curioufly fpread all over the backfide of an *Oyster-shell*.

And it may here be obferv'd, That the Roots not only of this, but almost all *Sea-Shrubs*, instead of being Ramified, are spread out in the form of a Skin or Membrane, and so stick fast to some hard and steady Body as their *Base*.

Another slender one, about a t of a yard high, but the Root broken off.

#### Of Shrubs:

A FLAT WOODY SHRUB. Frutex M. lignews, expanfus, ramulis coeuntibus. In all the former, the Branches are expanded every way: in this, only one way, or in breadth. 'Tis alfo of a fofter fubftance, and more brittle. Of a Purple colour, almost like the woody part of Alkanet Root. Above  $\frac{1}{2}$  a foot high, and as broad. Several of the Branches united together, as in the Sea-Fan. Some of these Shrubs were found near the Straights of Gibraltar.

The Horny SHRUBS are alfo of two general kinds; either with the Branches loofe; or elfe united together.

A great tall HORNYSHRUB with LOOSE BRAINCHES. Frutex Corneo-ligneus major erectior folutis Ramulis. 'Tis above a yard and ± high. Confifteth of five or fix principal Branches, equal to a Tobacco-Pipe-Stalk where thickeft; having fcarce any callateral ones. Bends like Whalebone, and both without and within, looks not unlike to that, or Black-Horn. And in like manner, curles, huffs or fwells, and ftinks in burning. The Root cut off.

ANOTHER of the fame, <sup>‡</sup> of a yard high, and more branched.

A THIRD, with more numerous Branches than the former. Cover'd with a very thick, but foft Incrustation; originally of a Purple colour, but now for the most part turned brown; curiously perforated, as it were with Pinholes, all round about. Probably the foundation of one fort of perforated *Coral*.

A great ARBORESCENT HORNY SHRUB. Half a yard High, and a foot in breadth, being fpread in the form of an *Oak*, with great Branches about as thick as a mans Thumb. The Stock, fix or feven inches in compafs. The Root fpread upon a ftony *Bafe*, and of a brown colour. The Branches black both without and within; and fwell, or huff, and ftink, like Horn, in burning.

ANOTHER, spread also, in part, as a Tree. Half a yard high, and near as broad. Of a blackish colour; and stinks a little in burning; but swells not. Cover'd with a very thick, but soft purple Crust. To several of the Branches are also curiously fasten'd the WOMBS or NESTS of a certain *Infect*, as big as a *Horse-Bean*, of a roundish figure; I i 2 with-

#### Of Shrubs.

244

within, whitish, fmooth and glossy; without, cover'd with the faid fost and purple Crust.

A fmall HORNY SHRUB with LOOSE Branches: The Root is curioufly fpread upon a Stone like a thin skin. The Trunk of a yellowifh brown, and thick as an Oaten ftraw, divided into flender Twiggs, to about a foot in height; flexible, and having a foft and white Pith. Being burnt, they not only fend forth a very flinking fmoke, but alfo fwell into a light and fpongy Cynder, juft like that of Whale-bone, Cow-Horn, Leather, or other like Animal-Body. Moft of them are cover'd with a foft afh-colour'd Cruft. Neither Oil of Vitriol, nor any other, except a Nitrous Acid, droped upon this Cruft, caufeth an Effervenfcence. Which fhews the Salt therein contained, to have affinity with that in the ftones bred in Animals.

TWO more fmall HORNY and incruftated Shrubs.

TWO more, growing together on a stony Base, not Incrustated.

A FLAT, HORNY SHRUB, with LOOSE Branches. Frutex Corneo-ligneus, expansus, folutis Ramulis. In all the former, the Branches were expanded every way: in this, only one way, or in breadth. The Root spread like a Membrane, upon its Base, as in the former. Tis near  $\frac{1}{2}$  a foot high, and almost  $\frac{3}{4}$  broad, shaped not unlike a Feather-Fan, formerly in use. The Trunk  $\frac{1}{4}$  of an inch over, divided into a great number of Branches round, black, simooth, somewhat she former. Cover'd with a fost and assuring they huff and stink, as the former. Cover'd with a fost and assuring they former between the second states of the second states of the are fometimes perforated.

ANOTHER more tall, and with both a White or Grey, and Red *Cruft*; not on the fame but feveral Branches. The former, knobed; the other, as it were daubed upon the Branches. Given by Sig<sup>r</sup>. *Boccone*, and by him alfo figur'd.

ANOTHER of these growing Double, or divided next the Root into two spreading and parallel Bodies.

A flat HORNEY SHRUB, with more NUMEROUS Branches. About a foot broad, and near as high. Rooted in a kind of *Brain-ftone*. Without any *Cruft*. The Branches, as more numerous, fo flender, longer, and more flexible, fo as to be fomewhat bearded. ANO- PART II.

#### Of Shrubs.

ANOTHER, with lefs numerous Branches, and SEMI-PERSPICUOUS, if held up against the light. Above a foot high, and ‡ broad. It neither huffs nor stinks fo much in burning, as do the former.

A Flat HORNY SHR UB with COLLATEARAL Branches. Frutex corneo-ligneus filiciformis, So I name it. In all the former, the Branches are reciprocal, or not of equal height on both fides the great Stemm: in this, juft oppofite, as in a Feather or Branch of the Male-Firne. Near a foot high, and five inches broad. The finall or fide Sprigs are round, as in all the former. But the middle Stemm is flat. 'Both This and the others, Semiperfpicuous. They flink in burning, but fwell not. Cover'd with a foft, purple, knobed, and perforated Cruft.

ANOTHER large one, with two middle Stems, but all the fide Branches broken off. In height <sup>1</sup>/<sub>2</sub> an Eln. The Root of a light and skinny fubftance, fpread abroad fo, as to make fix inches compafs.

ANOTHER not fo tall as the former, (about a foot high) but the middle *Stems* thicker. The collateral Branches here alfo broken off.

Another fmall one: but with the Root curioufly fpread upon its ftony *Bafe*, like a thin fmooth Leafe. Most of these flat *Shrubs* grow in the *Mediterranean-Sea*.

A Flat SHRUB with UNITED Branches. Frutex expansus, Ramulis coeuntibus. 'Tis a foot high, and ½ a yard broad. Divided reciprocally into feverally Branches, containing a Pith. In all the foregoing, the Branches are all loofe or feparate; in this, fome of the fmalleft meet in one; as Inofculated Veins, or as the Fibers in the Leaves of Plants. Of a blackish colour, and fomewhat fetid upon burning. Cover'd with an ash-colour'd, soft, and knobed Crust.

ANOTHER, with the Branches and Conjuctions much more numerous, fo as to make very clofe Work. Near a foot high, and almost as broad. Stinks in burning, and is cover'd with a knobed *Crust*, as the former.

A Great SEA-FAN. Frutex m. maximus, RETICULATUS, f. Flabellum marinum maximum. In the two former, only fome, here all the Ramifications are united, fo as to make one entire piece of Net-work, in the shape of a Fan. 'Tis above <sup>2</sup> of a yard high, and almost a yard and <sup>1</sup> broad. The

#### Of Shrubs.

PART II.

The Root wonderfully fpread upon its ftony *Bafe*. For being extended every way, fome of its Skirts meet underneath, and fo embrace it round about. The Branches of a blackifh brown, and fwell and ftink, like Horns, in burning. Cover'd with a foft *Cruft*, originally *Purple*, but now for the most part faded into an ashen colour.

ANOTHER large SEA-FAN,  $\frac{1}{4}$  of a yard high, and  $\frac{1}{2}$  an Eln broad. Incruftated as the former. It hath this peculiar, *fc*. out of the fides of it, grow feveral other fmall *Fans*, about a  $\frac{1}{4}$  of a yard long (more or lefs) and near as broad.

TWO more large SEA-FANS, above  $\ddagger$  a yard high, and as broad. Incrustated as the former. Of one of these *Fans*, and about this bigness, see an elegant Figure in *Calceolarius*'s *Museum*. (a)

THREE Midling SEA-FANS, near <sup>1</sup>/<sub>2</sub> a yard broad, and a foot high. Incrustated as the others.

THREE finall SEA-FANS. Two of them are a tof a yard high, and as broad. The Third, is lefs. Yet hath feveral little netted *Labels* growing on the fide. All three incrustated, as before.

A SEA-FAN with CLOSE Net-work. Whereas the former confifted of more open work; as by comparing even a leffer of those herewith, is apparent. Neither hath this any *Crust*. "Tis <sup>1</sup>/<sub>2</sub> an Eln high, and a foot broad. Several of the smaller Ramification, thin or flat, *fc. transversly* to the breadth; looking like little *Splinters* of *Whalebone*." In burning, it swells, and stinks, as the others.

ANOTHER of the fame, but not above a foot high, and near half as broad. This alfo is naked or without any *Cruft*, as the former. Most of these *Fans* grow in the *American-Ocean*.

(b) Muf. 1.2. c. 35. at the end.

(a) Sect. 1.

Wormius, fpeaking of Sea-Shrubs (b) hath this paffage, ---Mirum profecto, quomodo hujus generis vegetabilia ex ijs (faxis puta) nutrimentum trahere valeant. Whereas'tis plain, That they receive no nourifhment from them, but the Sea-Water, and fuch nutritive Bodies wherewith it is impregnated. And it is therefore obfervable, That although the Trunk and Branches of these Shrubs are of a close and dense fubftance; yet their Roots are always made fost and spongy (especially when recently gather'd) the better to imbibe their

#### PART II. Of Sea-Plants.

their Aliment. So that the use of the Stone, or stony Body, on which they stand, is only to be a Bafe to keep them steady, and in the most convenient posture for their growth.

Thefe, and other Sea-Plants hereafter defcrib'd, flinking, as is faid, like Horns, in burning, and fome of them not uneafily procur'd, it may be worth the Trial; Whether in Hysterical, Epileptick, or other like Cafes, they may not prove more effectual, than Animal Bodies.

#### CHAP. II.

#### Of other SEA-PLANTS, and of SPONGES.

He HORN-PLANT. Tuba marina; as it may be called from its form. 'Tis about two yards and # high. At the bottom, not two inches about; from whence it grows thicker all the way to the top, where it is feven inches in compass, and of an Oval Figure. Hollow quite through from the top till within about two feet of the bottom. The fides no thicker than a Hazle-Nutshell. Not woody, but tough, like the young Barque of a Tree, or a piece of tan'd Leather; and within, of a like colour; but black without. It grows in the West-Indian Ocean. The Indians cut off the top and fo much of the fmall end as is folid, and lining the infide with a fort of Glew, or of Lacker, make themfelves Horns hereof either for Hunting, or other use.

A Tuft or Bunch of CORALLINE. Defcribed and figur'd by most Botanicks. I add (what I think is unnoted). That the inward part of this Plant is truly Ligneous or Fibrous: the outward, from whence its Name, being only a Crust growing upon it, as in the Shrubs above described. 'Tis effeemed an excellent Remedy against Worms.

FLAT CORALLINE, as it may be called, or Spangle-Wort. Defcribed in Bauhinus (a) by the Name of Opuntia (a) Lib. 39. marina. By Ferranti Imperato, (b) with the Name of Serot- c. 30. and lara. It confifteth wholly of Leaves, joyned edge to edge, as (b) Lib. 27. in the Indian-Fig; Somewhat round, and fcallop'd, and not

much

#### Of Sea-Plants.

PART II.

much bigger than a filver *Spangle*. The inward part of the Leaves is fibrous, and by fmall woody Threds are tacked together. But, as in *Coralline*, covered all over with a white *Cruft*; which, in like manner, makes a ftrong *Effervefcence* with *Acid* liquors.

The BEARDED SEA-WRACK. Fucus capillaris tinclorius, f. Roccella. Figur'd in Imperatus; (a) And out of him, (b) Lib. 39. in Baubinus. (b) But without a Defcription. Neither will it admit an exact- one, now dry. 'Tis three inches and i high, and five or fix about. The Root, in compafs, two inches, one in height, divided into a great number of fmall capillary Branches or Sprigs, thick fet, as in a Broom or Beard, very brittle, and of a faded Purple. It grows in the Eaft-Indies. Of excellent ufe, efpecially heretofore, for the making of Tinctures both for Painting and Deying.

A fort of the common SEA-Wrack, called *Alga Vitra*riorum.

The BLADDER'D SEA-WRACK. Alga Veficaria f. conifera, as it may be called; having on the tops of its Branches feveral Conick Bags, an inch, or an inch and ± long, warted round about, and originally fill'd with a light and fuzzy fubftance.

The WARTED SEA-WRACK. Fucus vertucofus Imperati. (c) On which grow a great many veficular and foft Knobs all along the Branches, as well as on the top.

The BROADEST SEA-WRACK. Alga latiffima Membranacea. The Root hereof, ftringy. The Stalk, round, as thick as a Goofe-Quill, and about five inches high. From thence 'tis fpread, by degrees, into a thin Skin too inches and <sup>‡</sup> broad.

ANOTHER of the fame Species, but not fo broad.

The POUNCED SEA-WRACK. Alga marina  $\pi \lambda \alpha$  Junepus, Baubino. Poro Cervino, Imperato. 'Tis wholly diffributed into flat Branches, a  $\ddagger$  of an inch broad, almost after the manner of a Stags Horns. Of a russet colour, and as it were all over pounced, somewhat after the manner of a Rue-Leaf, or that of St. Johns Wort, when held up against the light.

(d) DePlantis Rariorib. p. 70. Tab. 38. The SPIRAL SEA-WRACK. It winds about, very curioufly, with a great many Circumvolutions, almoft like a very deep Skrew. Defcribed, figur'd, and given by Sig<sup>r</sup>. Boccone. (d) The

(c) Lib. 27.

#### PART II.

Of Sea-Plants.

The SEA-MILFOYLE. Myriophyllum pelagium. f. Mufcus maritimus filicis folio. Clusius hath a Figure fomewhat answerable to this Title, and out of him Baubinus. Yet either it is faulty, or of another Species. His, reprefented with alternate Branches. Here, they are collateral, as in the Male-Firne. And curioufly denticulated, in the like manner. It grows in very deep Gulfs of the Sea.

This Plant hath the fame odd property, with feveral of the Sea-Shrubs before defcribed; which is, that being fired, it makes a ftrong ftinking finoak, like that of burnt Bones, Horns, or other parts of Animals. And may therefore be defervedly commended by Cortufus against Worms. And 'tis probable, all the reft of the ftinking kind, fome of which are much more plentiful and eafily procur'd, may have the like Virtue.

The STEM of another Sea-Plant, Perhaps of affinity with that in Bauhinus, entitled, Coralloides lenta faniculacea. The feveral Sprigs hereof are toothed, as in the Sea-Milfoyle, but with finer or fmaller Work. It ftinks, upon burning, as the former.

SEA-HEATH. Erica marina. Defcribed and figur'd in Bauhinus. Who yet omits the coalition of all the Branches in a round and plain Bafe.

S'E A-MOSSE, fomewhat like the Sea-Heath. The Branches hereof are united in a short Trunk. From whence they rife up to the height of three or four inches, and are then multipli'd into others. About the thickness of a small Rufb, all over shaggy, with fibrous hairs or briftles. Hath a ftinking fmoak, as the former.

The BEARDED SEA-MOSSE. A Congeries of tough or pliable, yellowish, capillary Threds or Strings, almost cylindrical, or of the fame thickness from the bottom to the top; where the most part of them are as it were horned or forked. It makes a crackling noife, in burning, and ftinks, but lefs than the Sea-Milfoyle.

The FISTULAR SEA-MOSSE. Bauhinus defcribes a Sea-Plant (without a Figure) by the Name of Fucus cavus, but of a quite different kind; fc. with the Leaves like a Fillet. Whereas this is a Clufter or Brush of cylindrical, pellucid, and strait unbranched Pipes, about the thickness of a great stitching Needle.

SEA-

#### Of Sea-Plants.

PART II.

SEA-BLOBBER. Veficaria marina. Spuma Maris Cæfalpino. Bauhinus defcribes two forts, That, which is branched; and This, which is not. 'Tis a Clufter of fmall roundifh Bladers, almost in the shape of little Oystersbells; of a light brown colour, all over veined with Fibers, like the uter Cover of a Plumstone. Which makes it the more doubtful, whether it be an Animal Body, or a Vegetable. Which foever, it is supposed the Matrix of a Sea-Infect.

Another CLUSTER of the fame fort, but confifting of finaller Bladders.

The ROPED SEA-BLADDER. I find it no where mention'd. This is alfo wrought with fibrous Veins, as the former. But the *Bladders* are of a different fhape, not with convex, but flat and parallel fides, and the Fibers principally running along and near the edges. Neither are they clufter'd in a lump, but joyn'd together, one after another, with a Ligament of the fame fubftance, almost like a Rope of *Onions*; faving that they are all on one fide. They flink, upon burning; fupposed to be the *Matrix* of those Shells whereof the *Indians* make a fort of Money, which they call *Wampanpeage*.

A GREAT SPONGE, of the common kind; of a flat Oval Figure, and almost a yard and half in compas.

The SHAGGY-SPONGE. Spongia Villofa. It hath no regular fhape. Of a Texture more rare, than of most if not all the other kinds. And with finall fhort capillary Fibers, as it were fhagg'd all round about.

The FUNEL-SPONGE. Spongia Infundibularis. Defcribed in fome fort by Clufius, and from him by Wormius. Figur'd by Baubinus, without a Defcription. This here is two inches and in height; the Rim, near three inches over. The fides about it of an inch thick. Of a Texture far more compact and clofe, than the common Sponge. Yet the Surface all over wrought with little round Pores, almost as in a Poppy-Seed: in fome places visible to the naked eye, but better through a Glass. On the infide, they are in fome places a little bigger, and near the Rim disposed into fhort Rays. Its Base, instead of a Root, as in Sea-Shrubs, is spread out upon a hard stone, to a confiderable breadth.

The Little BRANCHED SPONGE. Of much alike Texture

#### PART II. Of Sea-Plants.

Texture and colour with the common kind. But finely rifing up and distributed into feveral Branches, folid or not hollow, about i of an inch over, like a fprig of Coral. Given by Sigr. Boccone.

The BRUSHY-SPONGE. This also is branched, and the Branches not hollow. But much more numerous. The Trunk fomewhat denfe, two inches high, and thick as a Goose-Quill. Divided into three principal Branches, and thefe into about thirty more of the fame thickness with the Trunk it felf, two or three inches long, perforated with fome larger pores, as the Funel-Sponge, and near their tops, a little flat, and forked.

The CATSTAIL-SPONGE. This also is ramify'd, sc. into three large Branches, not hollow, rifing up strait, and immediately from the Root, to a foot in height; below, an inch over; at the top an inch, not unlike the Head of the Typha major, or a Cats-Tayle. To thefe, three other leffer Branches are appendent. All of them of a blackish colour, and a rare Texture, but the Fibers somewhat more thick and stubborn, than in the common fort, and fo woven, as to make fome larger fuperficial Pores. The Root or Bafe is fpread out upon a stone. The Ramous Sponges are fometimes found about the Islands of Fero.

The HOLLOW CONICK SPONGE. About a quarter of a yard high, and half a yard about. It confifteth of fiftular Branches, of a Conick Figure, rifing higher and higher, fmooth within, without porous, and as it were a little jagged.

The HOLLOW CYLINDRICK or PIPE-SPONGE. From the Bale rife up four or five Pipes, above an inch over, fmooth within, and tuberated without, with fome refemblance to the Corallium Verrucofum. Its Texture fomewhat clofer, than of the common Sponge.

The FLAT HOLLOW SPONGE. Near five inches high. Below, above two inches broad; above, more than three. Confifteth of two flat yet hollow pieces, above four inches deep; but without, diftinct for the space only of an inch and : Within alfo fmooth, and without tuberated, as the former, but more bluntly.

All Sponges stink, more or lefs, upon burning, as the Kk 2 Horny

#### Of Sea-Plants.

Horny Sea-Shrubs. So that it is a property belonging to most of the Vegetable Productions in the Sea.

It is the Opinion of fome, that Sponges have fenfe, becaufe faid to fhrink, if they are pluck'd; and are therefore reckon'd amongst Zoophyta. But of that property I doubt very much. For a Sponge being a springy Body, and so extensible, and yielding a little to one that plucks at it; so soon as he lets his hold go, it will, from its elasticity, shrink up again. Which motion of restitution, some probably, have mistaken for the effect of a Cap-Sense.

No Sponge hath any Lignous Fibers, but is wholly compreffed of those which make the Pith and all the pithy parts of a Plant. Yet vastly thicker, and their Texture much more rare or open, so as to be visible to a good eye, especially affisted with an ordinary Glass. So that a Sponge, in stead of being a Zoophyton, is but the one half of a Plant.

#### Of STONES.

#### CHAP. I.

#### Of ANIMAL BODIES PETRIFY'D; and fuch like.

T hath been much difputed, and is not yet refolv'd, of many fubterraneal Bodies, which have the femblance of Animals, or Parts of them, Whether they were ever fuch, or no. And I am not ignorant of the Arguments offer'd on both hands. If I may speak my own sense a little, Why not? Is there any thing repugnant in the matter? Why not a petrify'd Shell, as well as wood? Or is the place? If Shells are found under ground, far from Sea, or in Hills, unchanged; as we are fure they are; then why not petrify'd? Or is the form, to which no Species of Shells doth anfwer? The affertion is precarious: no man can fay, how many are known to fome one or other; much lefs, how many are not known: I have reafon to believe, that fcarce the one half of the under Species of Shells are known to this day. And fo for Artificials : if Coyns are found, every day under ground, then why not fometimes also Pictures, and other Works, in time petrify'd? And although Nature doth often imitate her felf; yet to make her in any cafe to imitate Art, is unphilofophical and abfurd: for the one, a natural reafon may be given, not for the other. On

#### PART III. Of Animal Bodies petrify'd.

On the other fide: although Nature cannot be faid to imitate Art: yet it may fall out, that the effects of both may have fome likenefs. Those white Concretions which the Italians, from the place where they are found, call Confetti de Tibuli, are sometimes so like round Confects, and the rough kind of Sugar'd-Almonds, that by the eye they cannot be diftinguish'd. To call these Petrify'd Sugar-Plums, were fenfelefs. What if we find in fome Stones under ground the likeness of a Cross? Doth not Sal Ammoniac often shoot into millions of little ones? Or do we find in other Stones the refemblance of Plants? Why not naturally there, as well as, in Frosty Weather, upon Glass Windows? Or as Salts fometimes figure themfelves (as Sir Th. Brown, (a) and Dr. Daniel Cox (b) observe) into some likeness to the Plants whereof they are made. Nay, why not too, a Face, or other Animal Form? Since we fee that there are divers Palm-Nuts which have the like. That the Volatile Salt of Harts-Horn, will shoot it felf into the likeness of little branched Horns. That of Flesh or Blood, into the shape of little flat fibrous Tendons or Muscles, as I have often observ'd. And though I have not seen it my felf, yet I have (c) Sir Tho- been told by one (c) that doth not use to phancy things, mas Milling- that the Volatile Salt of Vipers, will figure it felf into the femblance of little Vipers. But there can be no convincing Argument given, why the Salts of Plants, or Animal Bodies. washed down with Rains, and lodged under ground; should not there be disposed into such like figures, as well as above it? Probably, in some cases, much better, as in a colder place; and where therefore the Work not being done in a hurry, but more flowly, may be fo much the more regular. I shall now come to the Particulars, and leave the Reader to judge of them.

> Part of the Upper JAW of a strange HEAD, together with some fragments of other Bones, and three very Great Double TEETH, or Grinders, all supposed to be of the fame Animal. Found, about twelve years fince, feventeen feet under Ground, in Chartham a Village three miles from Canterbury. The Ground within twelve Rods of the River running thither, and fo to Sandwich-Haven. An Account hereof is written by Mr. William Somner: yet without a Description of the Jaw. But supposing it to be part of the

(a) Relig. Med. (b) Phil. Tranf. N. 108.

ton.

PART III. And Stones like them.

the Head of an Hippopotamus, takes occasion thence for a Difcourfe, wherein he endeavours to prove, That all the low Ground from the East-Kentish shore, to Romney-Marsh, was once under Water, and an Arm of the Sea. Published, fince his Death, by his Brother Mr. John Somner : in whofe Ground thefe Bones were dig'd up; and by whom they were bestowed upon this Museum.

This Jaw-Bone, is only part of the far Cheek; about fifteen inches long, and feven where deepeft: yet part of both the ends, and the Sockets of the Teeth are broken off. The Orbit of the Eye, neither fo round, nor fo big, as in the Hippopotamus : yet the Teeth far bigger. For the bigeft Grinder in the Head of the Hippopotamus here preferv'd, is lefs than fix inches about : one of thefe, near eight. And tis much, if they belonged to that Animal, that none of the long Cutters which grow before (as is reprefented in Tab. I.) should be found with them.

Befides, in that Skull of the faid Animal, the Orbits of the Eye ftand fo high, and the Forehead lies fo low, that it looks like a Valley between two Hills : whereas in this Bone, the Forehead evidently stands higher than the Eye. The Knob alfo at the Corner of the Eye in this Bone, is fix times as big, as in the faid Skull. Although this perhaps, as well as the tuberousness of the Bone in some places, may be the effect of its lying to long under ground; as if it were thereby a little fwell'd in those places: for they are more rare and foft, than the other, and the whole Bone, than the Skull of any grown Animal not bury'd. Confidering all together, it feems to me more likely to belong to a Rhinoceros, for the being whereof in this Country, we have as much ground to suppose it, as of the Hippopotamus. See Wormius's Defcription of the Double Tooth (a) of a Rhinoceros. (a) Muf. lib.

A PETRIFY'D CRAB. Carcinites. It feems to be of 3. the undulated kind; whereof fee the Defcription in Ronde-'Tis very hard and folid, and as heavy as a Pebble. letius. Yet diffoluble with Acids. There is one pretty like this in Aldrovandus, (b) under the Name of Pagurus lapideus. (b) Museum Metallicum. And another in Besler.

A FISH-MOLD. Ichthyites in modum Typi. There are feveral figures of Fishes in Stones in Besler, Aldrovandus, and Moscardo. In Aldrovandus also of the Heads of Birds, Beafts

Of Animal Bodies petrify'd. PART III.

(a) Of Gems ble. p. 156.

Beafts and Men, in *Flints. Septalius* hath a Head in *Marble.* And Mr. *Boyle* (*a*) a Pebble with a *Serpent* (all but the Head) perfectly fhap'd, and coyl'd up in it. All thefe (except perhaps the laft) are either femblances on a Plain, or at leaft in folid Stones. But this here is hollow, and was fo found in the *Ifland-Sea.* About five inches long; now fplit into two halfs, like thofe of a cafting Mould. On the infides of which, are fairly imprefs'd the form of the *Spine*, with the Ribs, Fins, and Tail, of a Fifh. Without, a long Plate of the fame fubftance, grows to each fide; and others crofs to thefe: as if to the Mould of the Fifh, were alfo added that of its Funeral Cloaths.

This Stone, for confiftence, is like that called Saxum Limofum, foft, inequal, and unpolifhable. Of a blewifh hue, like that of Tobacco-Pipe Clay, with fome very fmall gloffy Grains intermixed. Not only Spirit of Nitre, but Oil of Vitriol droped upon it, diffolves it, and is excited into a violent Effervefcence. But the Saxum Limofum ftirs not with any Acid. So that it is to be rank'd amongft the Gypfo-limofa, or Calcilimofa.

A petrify'd BONE, taken out of a Gravel-pit in St. James Fields, above eight yards deep.

A Stone like the VERTEBRA of a Fish. Given by Sir Philip Skippon. It may be called SPONDYLITES.

Part of the SPINE of another *Fifb*, confifting of feveral *Vertebræ*. 'Tis hard and ponderous; yet diffoluble with *Acids*. It breaks flaky, as the *Lapis Judaicus*, and many others, or with plain and gloffy fides.

The TOOTH of a TIGER, growing to a kind of *Limeftone.* 'Tis about as big as that defcribed in the First Part, and of the fame shape and colour.

A fquare crooked TOOTH, not much unlike that of a Bevir.

A very great DOUBLE TOOTH or GRINDER. 'Tis about five inches long, and two broad; twice as big as a *Sea-Horfe*'s. The flumps feem to have been faw'd off. The top divided into feveral Points and Ridges, as other double Teeth. Of a greyish colour and glossy; ponderous, and hard as a *Flint* or the hardest Pebble.

ANOTHER of the fame shape, but not an inch long. Befler hath one like this, under the Name of Pfeudocorona Anguina. The The SHARKS TOOTH. Gloffopetra: fo call'd, for that these Stones were fabled by some to be the Tongues of Serpents, in the Isle Malta or Melita, turn'd into Stones ever fince St. Paul Preached there. But the English Name, is much more anfwerable to the shape. Which yet is various, as well as the fize and colour; as ash-colour'd or black, long or broad, strait or crooked, with the edges toothed or plain. Of the brown, strait, indented and broader fort here are feveral very great ones. One, three inches broad; and four, long: with the exerted part, fmooth; the Root, rough. Every way, in shape, fo like the Tooth of a Shark, that one Tooth cannot be liker to another. Yet if it be fuch, then by comparing those in the Head of a Shark, with This, That to which This belong'd, to bear a just porportion, must have been about fix and thirty feet in length.

A GLOSSOPETRA, growing to a ftony Bed. 'Tis of a lightish colour: and was brought as is supposed, from Melita.

ANOTHER, of a leffer fort. The Root of this is rough, as of the reft. But not expanded with the exerted part, as is usual, but of a globular Figure.

These Stones are diffoluble with any Acid. Whereby it appears, That (befides fuch Metallick Principles they are fometimes tinctur'd with ) they abound with an Alkalizate-Salt. They are found not only in Melita, but in Germany, and many other places. Figur'd by Aldrovandus (a) and by (a) Mufaum others.

Metallic.

DRAGONS TEETH. Given by Sir Phil. Skippon. Gloffopetræ Claviculares. So I call them, becaufe they feem to be of the fame kind; and are long and flender, fomewhat like a fmall Nail; and much more like a Tongue (fc. of fome fmall Bird) than any of the former.

The GOATS-HORN. Tephrites Boetij; from its alhen Selenites Cardani; from its almost Semilunar colour. Figure. Inwardly, 'tis of a blewish Grey. Outwardly, mixed with oblique and white ftreaks. Of a bended figure, yet with one end thicker than the other, not unlike a Goats Horn; whence I have taken leave for the English Name. Broken at both ends, yet above i a foot long, and two inches and + where broadest. The Belly or inward Ambit, Ll an ....

#### Of Animal Bodies petrify'd. PART III.

an inch over, and furrow'd; the Back fomewhat edged. 'Tis found in Germany, Moravia, Silefia, and other Parts.

(a) Boet. de Gennis & Lapid.

C. IO.

258

A Scruple (a) hereof in powder, is an excellent Sudorifick. Spirit of Nitre droped hereon, diffolveth it with an Effervescence.

The FISHES EYE. Ophthalmites. A parcel of them given by Sir Philip Skippon. 'Tis a kind of Pifolythus. But by fome of them, the Humors of the Eye, with the Tunica Uvea, and therein the Iris, are not ill reprefented : for which reafon I have plac'd them here.

SOME other Varieties, from the fame Hand.

The HERMAPHRODITE. Commonly called Hyfte-(b) Lib. 37. rolithos. By Pliny, (b) Diphyes, more properly; as reprefenting, in some fort, the Pudenda of both Sexes. Well defcribed by Wormius. 'Tis a black Stone, not much broader than Half a Crown; very hard, and diffoluble with no Acid. Accounted an Amulet against Hysterical Fits.

Another of the fame shape, but leffer.

A foft BUTTON-STONE. Echinites albus. Given by Sig<sup>r</sup> Boccone. Of thefe Stones there is fome variety, with feveral Names, but confounded by Authors. They all agree, in having fome likenefs to the shell of the Button-Filb. This refembles that most with all fmall prickles. Of a white colour. Not very hard, and diffoluble, with Acids. See an excellent Figure hereof in Calceolarius's Mulæum.

Another of the fame Species and colour.

THUNDER-STONE or hard Button-Stone. Brontias. So called, for that people think they fall fometimes with Thunder. Yet different from the Ceraunias. This is shaped like a little round Cake. Very hard and indisfoluble with Acids; being a kind of yellowish and opacous Pebble. sector and a sola

Another, a leffer one of the fame Species. [AOD SAT

A THIRD, also very hard (as all of them are) but Semiperspicuous. Total world i bo in anomal as wel

PART III. Of Animal Bodies petrify'd.

A SIXTH, fomewhat oblong and striated all round about.

259

The SERPENTS EGG. Ovum Anguinum. From the roundnefs, and form of Snakes Tailes pointing upward, and towards the middle of the Stone. This alfo is an Echinites, and by Ferranti Imperato called Histrix Marinus petrificatus. Agricola makes it a fort of Brontias. It most refembles that fort of Button-Fish, with feveral Orders of great Knobs or Prickle-Bases, divided by leffer; described in the First Part of this Catalogue.

A STONE with the SIGNATURE of a Button-Fish upon it. So that it was once a Bolus or Clay.

The foft OVAL HELMET STONE. Given by Sig<sup>r</sup>. Boccone. So I name it from its fimilitude to the fhell of the Echinus Spatagus, (a) which the English call Helmet-Fish. <sup>(a)</sup> See Oval, to diftinguish it from the Conick. Soft, as being very brittle, and easily diffoluble with Acids. Several of these Stones are figur'd by Aldrovandus, (b) with the Name of (b) Museum Scolopendrites. And fome leaves after, divers others not much unlike, with that of Pentaphyllites from its likness in fome part alfo to the Cinquefoyle.

ANOTHER of the fame kind, with four narrow Furrows, composed of fine short Rays, and meeting in the form of a *Cross*; to which a fifth is added, more broad. 'Tis fomewhat hard, yet dissoluble with *Spirit* of *Nitre*.

The HARD OVAL HELMET-STONE. 'Tis an opacous Flint, and of a dark colour. But figur'd as the former.

ANOTHER, also flinty, and opacous; but betwixt citrine and yellow.

A THIRD, opacous and white.

A FOURTH, with one half, opacous and yellow; the other, whitish and Semiperspicuous.

A FIFTH, fomewhat rounder and more depressed than the former; and may therefore more particularly be called *Pentaphyllites*. Some of these *Ambrofinus*(c) hath misplaced (c) Aldrov. With the *Astroites*.

The blunt CONICK HELMET-STONE. It hath, as it were, the Signature of the *Echinus Spatagus*. But rifes up in the form of a *Cone*. Of which Figure I have not Ll 2 yet

#### Of Animal Bodies petrify'd. PART III.

yet feen any *fbell*. The top is blunt, and of a middle height. Encompafied with five double pricked Rows, all meeting in the fore part of the Belly. The fpaces betwixt which, are cancellated much after the manner of the *Sea-Tortoifefbell*. 'Tis a perfect Flint, brown without, and whitifh within.

ANOTHER of the fame fort, with bigger pointed Rows.

A THIRD, of the fame Figure, but foft, *fc*. of a kind of Limy fubftance, or that of *Gypfum*.

The SHARP CONICK HELMET-STONE. 'Tis a Semipellucid Flint. Surrounded with five double pointed Rows, meeting not only on the top, but alfo at the centre of the Bafe or Belly. Befler figures a finall Conick Helmet, by the name of Echinites: a great one, by that of Scolopendrites. And feveral Species hereof are alfo figur'd by Aldrovandus. (a) None of the flinty or other hard Helmet Stones make any ebullition with Acids.

The HELIX or Stone Nautilus; as from its Figure it may not improperly be nam'd. Cornu Ammonis; From Jupiter Ammon, pictur'd with Horns. Here are feveral of them, both in fize, fhape, and fubftance diftinct. I find no Author defcribing them much broader than the ball of a mans hand. The higheft Boetius reckons, about three pounds in weight. But in this Mufæum there is one near two yards in circumference, and proportionably thick. Of an Afh-colour, and fomewhat gritty fubftance. The feveral Rounds, as it were, carved with oblique waves. Given by the Right Honourable Henry Duke of Norfolk. With,

ANOTHER GREAT CORNU AMMONIS almost as big, *fc.* about five feet round about.

A SMALL CORNU AMMONIS, of an afhen colour, and foftifh fubftance: yet diffoluble only with Nitrous *Acids.* It maketh but one or two Rounds; ratably, far more fwelling, than in the other kinds.

ANOTHER, of a foft and whitish substance; dissoluble in any Acid, and confisting of several Rounds.

A THIRD, growing upon a Stone of a like fubftance. Figur'd in *Calceolarius's Museum*, and that of *Olearius*; in both under the Name of a *Petrify'd Serpent*.

The CASED CORNU AMMONIS. The outer part of

(a) Muf. Metallicum.

#### PART. III. Of Animal Bodies petrify'd.

of this is diffoluble with *Spirit* of *Nitre*: of a fhining blackish colour, thin, and as it were the shell of the far greater part within it. This also is very glossy, and transparent as Glass. Of a brittle substance, breaking into square flakes, like those of a flaky Spar. Yet no *Acid* will ftir it.

The HARD CORNU AMMONIS. 'Tis a perfect whitish and pellucid *Flint*. These Stones are found in Germany.

Note, that if one of these Stones be broken, the several Rounds will part so, as the ridges of one, and the answerable surrows of the other, are apparent.

Likewife, that in fome of them, there is not only a ridge, but a round part about as thick as the biggeft ftring of a *Tenor Viol*, winding round between two *Circumvolutions*, as the *Medulla Spinalis* runs within the Back-Bone.

The Helick SERPENT-STONE.Ophites Ammoneus.See the Defcription hereof in Wormius, with the Title of Lapis Sceleton Serpentinum ferens. 'Tis of kin to the Cornu Ammonis; wrought all over with Striæ, imitating the Scales of a Serpent. In fome parts of This, rather the jagged Leaves of a Plant. Of a pale Okre colour, but fomewhat hard, and diffoluble only with Nitrous Spirits.

ANOTHER, which in the room of Scales or Leaves, is wrought all over, and as it were joynted, with futures in the form of an *f*. obliquely waved from the rim towards the centre. Which *Articulations* are not only on the Surface, but, as *Wormius* well notes, in its intimate parts. This is of a dark amber colour, and fomewhat hard; yet maketh an *Effervefcence* with *Spirit* of *Nitre*.

The HELICK MARCASITE. Marcafita Ammonea. So I name it, for that it hath the fame Figure with the Cornu Ammonis, and to the first of these in Boetius, is next a kin, if not the fame. Yet appears to be a fort of Marcafite or Gold colour'd Fire-Stone; both by its Weight, and Copperas Tast. And some of them are cover'd with Vitriolick Flowers. Ambrofinus (a) figures two of these under the (a) Mus.Me-Title of Crysammonites: not so properly, as not having a tall. Aldrov. grain of Gold in them.

The HELICK MARCHASITE, having shallow Furrows on the Rim.

ANOTHER, with fome alfo channell'd.

E.

#### Of Animal Bodies petrify'd. PART III.

A THIRD, with the utmost round far more fwelling, than in the other kinds; having its Centre lying deep, and its front fpread wide on both fides.

A FOURTH, of all, the most flat, and with a sharp or edged Rim. Wrought all over, with undulated Strie, almost as in the Serpent-Stone. These two-last, particularly, (a) ubi fu- figur'd in Aldrovandus. (a)

A FIFTH, with the Rounds, on one fide, all concave: fo that it looks almost like one split through the middle.

A SIXTH, beded within a tuberated Fire-Stone.

Several finall ones, of the kinds above-mentioned.

The SHORT WHIRLE-STONE. Trochites.

The LONG WHIRLE. Turbinites. There are feveral of them. In one, the feveral Rounds are hollow : a ground to believe it was once a shell.

The WHIRLED or SPIRAL MARCHASITE.

The CONICK SNAIL-STONE. Cochlites pyramidalis. Very brittle, and maketh an Effervescence with any Acid.

Divers others SNAIL-STONES; fome of them of a Limy fubstance, others perfect Flint.

The SEA-OYSTER-STONE. Oftrites Cymbiformis. Shaped almost in the figure of a Boat. In the right fide especially there is as it were the fignature or feat of the Animal. So that one can hardly doubt of its being once a shell. Yet this kind of Stone is fometimes found many miles from Sea or any great River.

A Petrify'd Oyster and Wilk growing together.

A great petrify'd SCALLOP. Figur'd by Ambrofinus (b) Aldrov. (b) with the Name of Hippopectinites. Given with feveral Muf. Metall. more of the fame bigness, by Mr. Wicks. Tis

half a foot over. Many of the fame kind were taken out of a great Rock in Virginia, forty miles from Sea or River.

The fmaller PECTINITES, with fmooth ridges.

ANOTHER, of a kind of Lead-colour. Diffoluble with Acids.

The Coralline PECTINITES, furrow'd, and wrought all over with the Species of fine Needle-WORK. Alfo foluble with Acids.

A blackish PECTINITES, a perfect Flint.

262

pra.

Α

PART III. And Stones like them.

A foft Stone of a blewish grey, with part of the Belemnites growing to it on one fide, and a Pectinites on the other.

A petrify'd COCLE immersed in a Flint.

The SMOOTH SPONDYLITES, with an Oblique Navle.

ANOTHER, with an Oblique Navle, all over striated.

A THIRD of the fame, furrow'd.

A FOURTH, alfo furrow'd; and with the Navle sharper and more produced. So hard, as fcarcely diffoluble with any Acid.

A FIFTH, with a strait Navle, and numerous Joynts. -

The OXES HEART. Bucardia. So call'd from its figure. Defcribed and figur'd by Ferranti Imperato, and others, and out of them by Wormius. 'Tis divided, by a ridge along the middle, into two halfs. Each of them having a prominent Knob, a little winding, fomewhat like a Navle: fo that it may not be improperly called Conchites umbilicatus. Figur'd by Befler with the name of Hyfterapetra.

A SMOOTH CONCHITES, with an Oblique Navle, unequal fides, fomewhat round, and fill'd with a Limy fubftance.

Part of one, filled with a fort of granulated Spar.

A fmooth and round one, undulated.

ANOTHER, as hard as a Pebble; of a yellowish and pellucid red.

Another hard one, yet diffoluble with Acids. T calT

Another, with the Margins of the two halfs furrow'd and indented one into the other.

A LONG CONCHITES, of a black colour.

Another, undulated, and white; filled with a black and yellow fubftance, which with Acids maketh a ftrong Effervescence.

ANOTHER, compressed, and the end opposite to the *Base*, pointed, like the common form of a Heart: and may therefore be called *Cardites*. 'Tis of a Limy substance difsoluble with *Acids*. 'We can be an about the to be stated by the second point of the second poin

A Broad equilateral CONCHITES, radiated.

Another, undulated, and radiated on diversity where he

5.22

A Third, undulated, radiated, and circinated.

A Broad one, of a Limy fubstance, and fill'd with a flaky and glistering Spar.

The HIGH-WAVED CONCHITES; that is, where the middle of one Valve making a high and broad ridge, the other falls into it. 'Tis of a white Limy fubftance.

ANOTHER of the fame, but fhining and pellucid like a Spar. Diffoluble with *Acids*. I meet not with any fhell of this form.

A little BIVALVOUS MARCASITE. Conchites Marchasita.

The MUSCLE-STONE. Musculites. This is black and of an oblong Figure.

A Second, leffer and rounder.

264

Another of the fame, more Concave.

A Third, broader, and more expanded.

A fort of MUSCULITES fill'd with Earth like Tobacco-Pipe Clay or Marle. Found amongst the earth of a Hill that was overturn'd at Kenebank in New England.

The fquare MUSCULITES. Musc. quadrilaterus. I have not yet met with any shell of answerable shape. 'Tis, as it were, bivalvous: and each Valve, hath two sides. Of the four, two are broader, and a little Convex, especially towards the Base, at the other end somewhat sharp: with oblique surrows, from the sinft to the last growing shorter. The other two, striated and plain, joyned with the former at obtuse Angles. Of a limy substance dissolute with Acids.

The TOOTHLESS MUSCULE. Found, of feveral fizes, beded in a lump of *Irifh Slate*: yet not petrify'd, but a perfect shell. It is of a rare kind, no where figured or mention'd, that I find, 'nor have I met with it elsewhere. The biggest of them two inches long, and  $\frac{1}{2}$  over. That end near the *Base*, as it were pinched up, almost into the form of a Childs fore-Tooth. On the outside of the *Base*, share a plated piece; contiguous therewith at both ends, but in the middle, joyned to it by the intervention of other very small transverse Plates, like the Wards of a Lock : supplying the use of the Teeth in other *Muscles*, which are here wanting; from whence I have nam'd it. The outside, is adorn'd with circinated Lines, and in fome fort also radiated with very small *Tuberculi*, especially at the narrow end.

The

#### PART III. And Stones like them.

The SHEATH-STONE. Solenites. Like the petrify'd shell of the Sheath-Fish.'Tis fill'd with a kind of limy substance.

A piece of WHIRLY-ROCK. *Turbinites Saxum*. A fort of *Gypfum* of a dark colour, with the femblance of divers kinds of turbinated or whirled shells immersed therein. Dissoluble with *Spirit* of *Nitre*, but very slowly. There is one like to this in *Besler*.

A Piece of white MUSCLE-ROCK. Musculites Saxum. With the fimilitude of little, white, furrow'd Muscle-shells.

Another Piece of an Ash-colour, and more foft.

A piece of fpoted MUSCLE-ROCK, *fc.* with white, red and brown, in imitation of Marble. In which also are beded, as it were, feveral *Muscle-shells*. Although it hath the face of Marble, yet is it a kind of *Gypsum*, dissoluble with *Spirit* of *Nitre*.

A Piece of MIXED SHELL-ROCK. Conchites mifcellaneus. Composed of petrify'd shells, both of the Turbinated, and the Bivalvous kinds, beded in a kind of gritty Lime-Stone. In Calceolarius's Musaum (a) is one like to (a) Sect. 3. this, in the form of a Choping-Knife, but without a Name. p. 317. Another in Ferranti Imperato. (b) And in Aldrovandus's (b) Lib. 24. Musaum, by Ambrosinus called Ostracomorphos Lapis. Not c. 25. properly, Lapis, as being part of a Rock: nor, by the former word, sufficiently expressing the mixture of shells therein.

Another, confifting of fuch like shells (or their refemblance) beded in a brown Stone.

#### CHAP. II.

# Of VEGETABLE BODIES petrify'd, and other like STONES.

OF this kind, here is alfo great variety; being, or reprefenting, Fruits, parts of Flowers, Leaves, Branches, Stalks, Trunks, and Roots: in which order I shall set them down. Only referving *CORALS* with other like *Marine* Productions, to be spoken of by themselves.

A Petrify'd KATHERINE PEAR, or a Stone naturally very like one.Being, as that is fometimes, a little bended, very M m flender

#### Of Petrify'd Plants, PART III.

flender at the Stalk or Bafe; turbinated next the other end; umbellated at the top of all, or depressed round about the place of the flower; and of a yellowish tawny colour.

A STONE like a petrify'd DAMASCENE-PLUM. As that of a black colour, and of the fame Figure; fo far as to shew the feat both of the Stalk and Flower.

The Great petrify'd STONE of an exotick PLUM. As one would think, both from the figure of it, and the production of Fibers by the length, round about it, (as in many Indian Plum-Stones) very apparent efpecially, near the top. The granulated part of it, being turn'd to a foft opacous Stone; the Fibers into pellucid Flint.

A black Stone figur'd like the STONE of ( a Præcock-Plum) an Aprecock.

A petrify'd NUX VOMICA, sc. that of the Shops. As I call it from its figure exactly respondent; being round, and flat, on one fide a little Concave, on the other fome-(a) Mul.Me- what Convex. In Aldrovandus (a) we have the Figure of a petrify'd Nux Methel Officinorum : but under the mistaken Title of Caltanites. As also the exact figure of a petrify'd Castanea Purgatrix; but this too with the false. Name of Anacardites. The fame Author reprefents likewife a most exact figure of a petrify'd Melopepon.

A large JUDIAC STONE (Lapis Judaicus) in the form of a PEAR. 'Tis an inch and half long; stalked like a Pear; Next the stalk slender; turbinated upwards, to an inch in Diametre; and umbellated at the top, or depreffed as a *Pear*, round about the flower. Adorned alfo round about with fmall tuberated Striæ which run from end to end. This Species not well figur'd by any Author.

ANOTHER of a fomewhat like Figure, but much Best expressed by the least of the four in Boefmaller. (b) De Gem. tius. (b)

A THIRD like an ALMOND; both of the fame bignefs, and shape, oval at one end, pointed at the other, and fomewhat flat. Besler hath one or two like this, which he calls Petrified Almonds.

A FIFTH, like an AKORNE, being of a like thickness at both ends. Another of the fame. This fort particularly called Phoenecites.

A SIXTH, like an OLIVE-STONE; being more oblong

tall.

& Lap. 1. 2. c. 226.

#### PART III. And Stones like them.

long and oval than the precedent. Befler two or three Stones fomewhat like this, which he calls Petrify'd Olives.

267

A SEVENTH, of a long flender Figure, and knobed as the reft, almoft like a *Hazel Catkin*.

An EIGHTH, in shape like a *Pestil*. The upper part of this is knobed, the other smooth, whether naturally appears not.

These Stones either grow chiefly, or were first taken notice of in *Judea*; from whence their Name. They are commonly found, not in Earth, but in the Clefts of Rocks; by those that work in them. They are diffolved with *Spirit* of *Nitre*, not without *Effervescence*, especially when reduced to powder. And may therefore be justly esteemed *Diwretick*, and so fometimes bring away, or (as people think) break the *Stone*: for which, by *Pliny*, (*a*) 'tis call'd *Teco-* (*a*) Lib. 37. *Litbos*.

Thefe Stones always break flaky, and with a ftrong glofs, like a Spar; or the Entrochus hereafter defcrib'd.

Of these Stones it is further observable, That being cut and polish'd transversly, and then wetted, they fairly exhibit, at least in colour, a twofold substance. The one, whitish; answering to the Parhenchyma or Flesh of a Fruit: the other black or dark-colour'd, not only in the Stalk, but also thence produced, and disposed into two Rings, a large one next the Circumference, and a small one in the centre of the Stone; answerable to the Lignous Fibers, distributed in much alike manner in some Fruits.

Two ftrait flender *Stones*, refembling the COLUMNS erected in the middle of fome FLOWERS. One, Convex at the top, and almost flat. The other, spherically triangular, somewhat like the *Seed-Case* of a *Tulip*. Beneath, of an ash-colour; upward, of an obscure or brown Bay. Of that hardness, that if struck or let fall one upon another, they have a kind of Metallick found, like that of small round *Button-Bells*.

Two other *joynted Stones* of the fame nature with the former: looking as if they were pieces of the GENICU-LATED STALK of fome Plant.

Tis pleafant, efpecially with a Glafs, to fee the wrought Work on the furface of thefe *Stones*. In which the fmall and curious *Striæ* which run by the length, anfwer to the

Mm 2

Lignous

#### Of Petrify'd Plants. PART III.

Lignous Fibers, or the warp : and those which are transver fly as it were interwoven; to the Parenchymous Fibers, or Woofe of a Plant. A more particular explication of which real Work in all Plants, hath been by me elfewhere given. (a) Calceolarius hath one or two of these last fairly figur'd.

A Stone with the exact fignature of a STEM of PO-LYPODY with the LEAVES. 'Tis foftish, and fomewhat brown. Stirreth not with Acids.

HIPPURITES. Or a Stone with the impressed Image or fignature of the Equifetum or HORSETAIL. There are three stalks which very elegantly rife up from one Root.

DENDRITES. Or a Flint naturally adorned with the Images of feveral epitomiz'd or minute TREES. There is the figure of a fair one like to this in Calceolarius's Mufæum.

ANOTHER; being a SLATE about <sup>3d</sup> of an inch thick. reprefenting, as it were, a plain Field, inclosed with a HEDGE of TREES; fome bigger, others lefs; all fo lively, as if it had been the curious and elaborate Work of a Painter; or had been caft through a Glafs (as Kepler shews the way fometimes of taking Lanships) upon a Tablet in a Dark Room.

It is very observable, That the fame curious Work which appears upon one fide of the flate, doth alfo on the other. Agreeable to what Ambrofinus (b) also remarques, That if this fort of Stones be broken into feveral pieces, the like Work will appear in the intimate parts. Which plainly demonstrates, that not being superficial, it cannot be the effect of Art.

DENDROPOTAMITES. So I call it. 'Tis a piece of a kind of Alabaster, about seven or eight inches square, po-It hath much and pleafing varielish'd and set in a Frame. ty both in colour and figure: shewing a mixture of brown, tawny, white, and green; and not unaptly refembling a couple of *Rivers*. One crooked or very much winding too and fro; (as the Thames at King stone) and garbed all along with Trees upon the Bank. The other strait, with a Footwalk upon the Bank, and inclosed alfo with a little Hedge-. Row.

A fort of ALABASTRITES, reprefenting a Transverse Section of the TRUNK of a TREE. That part answering

to

(a) See the Authors Book Of Trunks. And that Of Roots.

(b) Aldrov. Muf. Metall.

## PART III. And Stones like them.

to the Wood, confifting of white and black Rings one within another. The other answering to the Barque, of two or three thin ones (like that of a Cherry-Tree) of a ruffet or barque colour. Yet the black Rings, being held up against the light, are transparent. So the clearest Glass, in some postures, appears black. Spirit of Nitre droped on it, diffolves it with a vehement Effervescence.

A Stone expressing part of a Tranverse Section of OLIVE-WOOD. On one fide, 'tis very well polifh'd. By means whereof, not only the Annual Rings (appearing in the Trunks of all Trees; ) but alfo the Infertions or Parenchymous Rays which run betwixt the Pith and Barque; and even the greater Veffels themfelves (either for Aer or Sap) are all to a good naked eye, but especially with the help of a Glass, very fairly visible. 'Tis just of the colour of the browner fort of Olive-Wood well varnish'd. 'Tis as hard as a *Fasper*, and seems to be of that kind.

ANOTHER fort of Jasper representing a piece of WOOD. 'Tis of a green colour, and stained with blackish fpots. One would take it for a fort of Lignum Vita.

A Stone, which in Colour and Texture, feems to refemble a piece of YEW-TREE.

ANOTHER, which looks like a piece of BEECH-WOOD.

A large piece of PETRIFY'D WOOD (as it is fuppofed) above half a yard long, and i of a yard about.

Another Piece about the fame bignefs.

A Globular Stone, which looks as if it had been a piece of ASH-WOOD turned in a Lathe into that figure. For it hath not only the colour, but the femblance of the Annual Rings, and of the Aer-Veffels, as in that Wood.

Small pieces of (reputed) petrify'd Wood, commonly found between the Beds of blew Marble. Two inches long, and near as thick as ones little Finger. Almost as black as Ebony.

A Piece of INCOMBUSTIBLE Wood, as it were HALF PETRIFY'D. For being held in the fire, it becomes red like a Coal; but neither flames, nor fmoaks in the leaft.

A very odd Piece of the BRANCH of a TREE as thick as a Cable-Rope, whereof the Barque is turned into perfect Iron, or at least a very rich Iron Ore; and the Wood into Stone. The

## Of Petrify'd Plants. PART III.

The petrify'd Barque of a Tree. 'Tisthin, and rowled up as *Cinamon*; but rather of the colour of that called *Winterane's*. Withall, rough and knobed without.

A Piece of *Oak* BARQUE cover'd with a ftony Cruft. Given by *Philip Packer* Efg; From a Stump above Ground.

(a) Foffil. Nomenclat. In Septalius's Museum, as I take it, is mention made of Petrify'd Wood found an hundred and forty Pertches under the top of a Mountain. And by Kentman (a) of a fort of petrify'd Beech (as the people call it) both Trunk, Branches, and Leaves, taken (for Whetstones) out of the Ground in the Joachimick Vale, an hundred and feventy Elns depth. But what kind of Eln is here meant, is not certain.

Of petrify'd Woods it may be noted, That none of them (at leaft of thefe here defcribed) will make the leaft *Ebullition* with any *Acid*. Which would make one fufpect, That they are *Stones* originally, *fui generis*; elfe it were ftrange, That fome of them fhould not lie in places where fuch *Stones* are bred, which with *Acids* make the faid *Ebullition*.

The STELENTROCHITE. By fome, called STELE-CHITES: Entrochites, by moft. But, in proper speaking, diffinct from both. For it is not only of a Cylindrical Figure, or near it, and containeth a fofter fubstance in the Centre, answerable to a Pith: and also radiated as the Branch of any Tree cut transverser But-moreover confifteth of feveral flat round Joynts like little Wheels, evenly pil'd, and, with the faid Rays, mutually indented, fo as altogether to make a Cylinder. Defcribed alfo by Gefner, (b) Boetius, (c) Ambrofinus, (d) and others. But we have two Accounts hereof given us in the Philosophical Transactions, far more accurate and particular, than is elfe-The former, by Mr. Lyster; (e) together where extant. with between thirty and forty Figures of their Varieties, with fome other Congenerous Stones. The latter, by Mr. John Beaumont (f) Junior; who hath added the Description of some more Diversities. And the manner of their growth. In this Musaum are feveral Species, which I shall here enumerate.

A ROUND one, near <sup>‡</sup> of an inch Diametre; with the Pith near a <sup>‡</sup>, of a darker colour, hard and denfe. The feveral

(b) De Lapid. Figur.
(c) De Lap.
& Gem.
(d) Aldrov.
Muf. Metall.
(e) Num.
100.

(f) Num. 129. feveral Joynts, about the tenth of an inch thick; diftinguished by flender Circles composed of very small knobs. With part of the Rock to which it grew, altogether irregular, but of the fame substance.

ANOTHER, with a Pith larger and more foft, the Joynts thicker, and the Surface almost fmooth.

A THIRD, of the fame thickness, with the Pith <sup>1</sup>/<sub>2</sub> an inch Diametre. 'Tis also a little bended ; and the Joynts distinguished not with knobed but entire Rings.

A FOURTH, with a Pith not much bigger than to admit a little *Pin*. Yet at one end 'tis  $\frac{1}{2}$  an inch over. At the other fomewhat more than  $\frac{1}{2}$ <sup>d</sup>. A little bended as the former. And the Joynts in proportion to its width, extream thin ; not above  $\frac{1}{2}$ <sup>6<sup>th</sup></sup> of an inch. Their circumference, convex, being diftinguished not with edged Rings, as the former, but with furrows.

A FIFTH, about ‡ of an inch over. The Pith anfwerable. The Joynts diftinguished with edged Rings. And as thick as in the former.

A SIXTH of the fame thickness. And a little crooked. The Joynts diffinguish with furrows.

A SEVENTH, with the Joynts unequal both in breadth and thicknefs; one narrower and thiner, the next broader, or ftanding further out from the centre, and thicker, and fo alternately: whereby it looks like fome fort of Turn'd-Work.

An EIGHTH, a fmall one, yet finely fhap'd. First with a Joynt embossed with a knobed Ring. Next two fmall Joynts, each of them fcarce thicker than a *Groat*; and fo alternately.

A NINTH, not above <sup>2th</sup> of an inch in Diametre; yet with Joynts as thick as in the fourth: and fmooth.

A TENTH, <sup>th</sup> of an inch over, and with much thiner or more numerous Joynts.

An ELEVENTH, a very fmall one, fcarce having any diffinction of Joynts.

CORALLITÉS. As it may be call'd. With no Joynts, no Rays, nor Pith, but more like to a folid piece of *Coral*.

The ASTENROCHITE, or an *Entrochites* with a *Pen-tagonal Pith*, like the fignature of a little *Afteria*, a *Stone* hereafter defcrib'd; from whence I have nam'd it.

ANO-

## Of Petrify'd Plants,

#### ANOTHER of the fame. And alfo with a double Ring of Rays; fo as to look like one of these Stones within another. And may therefore of all the kinds, be most properly called *ENTROCHITES*.

PART III.

A FLAT ENTROCHITE. All the former are perfectly round : this compress'd; one way, an inch over; the other, about \$ths.

ANOTHER, a fmall one of the fame shape.

A THIRD, not only flat, but also with two opposite edges, like the Scabbard of a *Rapier*.

The BRANCHED ENTROCHITE. Yet here the Branches, which grew alternately as Twigs on a Bough, are broken off. In one, leaving fo many cavities in the *Trunk* on which they grew. In another, fo many Knots. In both, radiated, and containing a *Pitb*, as the *Trunk* it felf.

The KNOTED ENTROCHITE. A very odd Species. Above two inches long, and in Diametre. The Surface fmooth, yet with an obfcure appearance of Joynts. The Knots, no way like those in the last mention'd, as not being radiated; and looking more like the bases of sturdy *Thornes*. Wherewith it not unaptly refembles a piece of a *Crab-Tree-Cudgel.* 'Tis composed of three diftinct substances. The outer part, (as one would fay, the Barque) is a flaky and glossy *Spar*, as in the rest. But as black almost as *Jet*. The middle part is *Ore* of *Marcasite*, or *Tellow Mundick*. The *Pith*, not unlike *Tobacco-Pipe-Clay*, when baked pretty hard.

A fort not much unlike thefe, being found in the Isle Malta, by some faith Mr. Ray, (a) are call'd St. PAULS BATTOONS.

The SYNTROCHITE, as we may name it, to diffinguish it from the reft. It confists of feveral Joynts as the former; yet not piled evenly one over another fo as to make a *Cylinder*: but fliden as it were half on and half off.

The TROCHITES. 'Tis nothing elfe but one of the above defcribed Joynts fingle; on both fides radiated, and alfo containing a *Pith*. So that it looks like a flice of a flick. Thefe, faith Mr. *Lyfter*, being ufually hollow, or eafily fo made, and ftringed, are therefore by fome called St. *CUTH-BERDS BEADS*.

The ASTROCHITES. As it were, the Trochites and the Asteria (hereafter described) together. That

(a) Phil. Tranf. N. 100.

## PART III. And Stones like them.

There's one which may be called an *Enthrochite*, yet not a *Stelechite*, becaufe Oval, or at leaft finaller at both ends; no way refembling a Stick or Branch. But there is no example hereof in this *Muſæum*.

The True STELECHITES, branched. "Tis not only radiated, and furnished with a Pith: but is one fingle piece without any Joynts or joynted Wheels: in which respect, it cannot be called *ENTROCHUS*; but very properly *Stelechites*, (from whence the *English* word *Stalk*) as more answerable to the *make* of a stick or stalk, than are any of the rest. "Tis of an ash-colour, and curiously wrought all over in the like manner as a *Poppy-Seed*.

A Piece of a Rock confifting wholly of feveral Species of ENTROCHI or Stelentrochi, immerfed in a bed of their Mother-Clay.

Another, with two or three fmall STELECHITES.

A hard Stone of the colour of a Magnet, with the fignature of a TROCHITES.

Thefe Stones being broken, look flaky, and with a glofs, as the Lapis Judaicus; but fomewhat more obfcure. They alfo make a like Effervescence with Acids, especially with Spirit of Nitre. And may probably be as good a Diuretick. That All Fossiles of what figure foever make an Ebullition with Vinegar, is affirmed by Mr. Lyster: (a) but Phil. Trans. was a flip of his, otherwise most accurate Pen. For there are N. 100.] many, and those of several figures, which, although powder'd, yet are fo far from making any Ebullition with Vinegar, that neither Oil of Vitriol, nor Spirit of Nitre it felf, (which taketh place fometimes where the former doth not) will ftir them: as appears in feveral Instances in this Catalogue.

They are found in as great variety here in England, as in any other Country. By Mr. Lyfter, in certain Scarrs in Braughton and Stock, two little Villages in Craven: in fome places of the Rock as hard as Marble. In fuch plenty, that there are whole Beds of Rock made of them. By Mr. Beaumont, in Mundip-Hills; in the Rocks, from the Grafs to twenty fathome: but most in Beds of a grey and grifty Clay. In a Grotto, five and thirty fathome deep, he observed their growth: which was, from the finest, and the softest of the Clay. At first, they were whits, fost, and fmooth.

273

Nn

After.

## Of Petrify'd Plants,

PART III.

Afterwards, grew hard, and ridged, or divided into *Trochi* or Joynts; beginning at the top, and fo defcending. Being all the while in a manner quicken'd with Mineral Steams; conveyed, from the Mother-Bed, through the Pith of the feveral Feet of the Root (which Mr. *Lyfter* figures) and of the Stock it felf.

It were alfo further worth the enquiry, In what Time, one of these *Stones* will grow up. Whether it doth fo, by *Starts*, as *Ice* often doth, and as I have feen a little *Icy-Tree* to grow level upon a Table? And whether fo much as ferves for the making of a fingle Joynt, at every *ftart*?

A Stone figur'd like a Piece of ANGELICA Root; with a large Pith, and very diffinct Rays, as the Cortical Infertions in that, or other like Root round about.

TWO leffer round ones or more *Cylindrical*: one refembling the Root of *CICHORT*; the other of *TORMEN*-*TILE*.

A STONE fomewhat FLAT, like the Root of Iris: but radiated as the former. More visible, if one end, being first polished, be then made wet; for so, both the *Pith* and *Radiation* are very distinct.

A FOURTH, as it were bared of the Rind; and having one end with a kind of *Button*, on which the *Rays* wind toward the Centre; as the Lines of a Rumb upon a Map, or the Suits of the Attire of any Corymbiferous Flower.

All these feem to be several stumps of Stone Roots, on which the above described Stones often grow.

A FIFTH, with a *Pith* and *Rays*; but CONICK and CROOKED, not unlike the young buded Horn of a *Calf*.

TWO more of the fame Figure, but much lefs; rather refembling a COCKS SPUR.

Several CLUSTERS (as they appear) of petrify'd MOSSE. Imperatus, with Dioscorides, makes it a fort of Alcyonium.

A petrify'd TUBER, with feveral fmall papillary knobs, not much unlike that called *CERVI BOLETUS*. It furs not with any *Acid*.

CHAP.

## Of Gorals.

### CHAP. III.

#### Of CORALS, and other like MARINE Productions.

Hefe having also a refemblance unto Plants, and a near analogy unto those Stones, last described in the precedent Chapter; they may therefore not unaptly be here fubjoyn'd.

A Piece of CORAL, fmooth, white, and folid; with its Bafe or Root spread abroad upon a Chalky Bed.

A SPRIG of folid Red Coral.

A knoted TRUNK of the fame inches and in compass.

A Piece of folid CORAL both RED and WHITE, growing together.

The ROOT of a folid Red CORAL, fpread upon the TRUNK of a White CORAL: in the fame manner, as the Membranous Roots of Sea-Shrubs are fpread upon Stones or other steady Bodies. As if it had been indeed originally one of those Shrubs; particularly, of the Lignous kind, which hath no Pith, like the Horny; but, as this Coral, is altogether folid.

The SHRUB-CORAL. Corallium fruticolum. So I call it, for its more efpecial fimilitude to a little Shrub. 'Tis of a brownish colour, upright, and very much branched. Curioufly adorned round about with Striæ running by the length; looking like the fuperficial Fibers in the stalks of fome Plants. And within, radiated, as the fame when cut trans-In fome of the greater Branches, the Rays being ver fly. pointed or pricked, as by the laxer distribution of the Fibers, they are in fome Plants. And many of them coming short of the Centre, fo as alfo to form a kind of Pith.

The KNEED CORAL. Corallium geniculatum. Pfeudocorallium fungosum Ambrosini. (a) Madrepora ramosa Impe- (a) Aldrova rati. (b) By which Name Baubinus also describes it well. Mus. Metall. (b) Lib 27 "Tis ftriated without, and radiated within, almost as in the Cap. 4. precedent. And is also ringed or knoted without, after the manner of Canes, or rather the upright Equisetum, and near of the fame thickness. Imperatus hath another kind a kin to this, yet diftinct; not only knoted, but joynted, and by him therefore called CORALO Articulato, in which the

Nn 2

*.*c

## Of Corals.

PART III.

the Conick end of one Joynt is received into the like Cavity of another.

A Piece of the fame CORAL found on St. Vincents Rock.

(*a*) Muf. Septal.

276

The Matripora, faith Terzagi, (a) and all Pores (as he calls them) and thefe only, are outwardly rough with transverse Wrinkles. But this now defcrib'd, feems by the Striæ more apparently wrinkl'd by the length. So that what he means, I do not well understand.

A JOYNT of the fhallow joynted CORAL. 'Tis near an inch in Diametre, two and  $\frac{1}{2}$  long, folid, heavy and white. Streaked by the length. The two ends a little thicker, as of Bones at the Joynts: and rifing up from the Rim to the Centre into a little knob; and this it doth at both ends: whereas in that of *Imperatus*, the Joynts are deeper, and one end hollow. It was given by Sig<sup>r</sup>. Boccone.

À Piece of white FIBROUS or striated CORAL, but not knoted. Given by the fame Hand.

The BUBL'D CORAL. Corallium bullofum. From the fame hand. 'Tis of an afh-colour; and rough caft all over, with very fmall Blifters or Bubles.

The COOME-CORAL. Corallium cancellatum. "Tis white, and divided into feveral fhort and thickifh Branches, turbinated or knobed at the top. Wrought all over with fmall cancellated Work, like that of an Honey-Comb, or the infide of that Ventricle in a Sheep or a Cow, called the R E T I C U L U M.

The FLORID COOME-CORAL. The Branches of this alfo are fhort; and numeroufly flourished. Inwardly, white and porous. The Surface of a pale yellow, and wrought, as the former, in imitation of an *Honey-Coome*.

A fprig of Rough and POROUS Red Coral.

The PUMIS CORAL. Corallium pumicofum. From the Perfon above-faid. 'Tis branched, of a grey colour, and porous, fomewhat like a *Pumis Stone*.

The POUNCED CORAL. Corallium punctatum. 'Tis white, and the Surface pricked full of fmall holes, almost as in the precedent.

The BRANCHING POUNCED CORAL. It feems to be that defcribed in *Bauhinus* (b) with the Title of *Corallium afperum caudicans adulterinum*. The Branches hereof

(b) Lib.

## Of Corals.

hereof are very broad, and divided only at the top. Not only porous within, but also pricked full of extream finall holes on the outfide.

The STOOPING POUNCED CORAL, C. punct. procumbens. Porus Ramofus Baubino. In this, fome of the Branches rife up obliquely, and diftinct. Others of them, trail or ftoop, and are in feveral places inofculated.

The RUSSET POUNCED CORAL. This is alfo branched; and the Root hereof, as that of a Sea-Shrub, fpread upon an Oyftershell.

The WARTED CORAL. This likewife is a fort of pounced and branched *Coral*; and white. The Branches being alfo as it were warted or knobed. (a)

ANOTHER of the fame; MORE branched.

The White STARRY CORAL. From the Perfon before nam'd. Defcribed and figur'd by *Imperatus*. So called, becaufe it is perforated with round and radiated Holes refembling little Stars.

The Brown STARRY CORAL. Within,a little whitifh. Not fo porous, as the precedent; and with nothing near fo many Stars. The Branches flat, like the Horns of an *Elk*; and fpread abroad.

The OCULAR CORAL. C. alb. oculatum Officinarum. Very well defcrib'd and figur'd by Ferranti Imper. (b) and (b) Lib. 27. J. Baubinus. (c) This fort is fiftular, and hath large round  $\binom{c. 4.2}{(c) \text{ Lib.}}$ holes in the fides of the Branches, fometimes near  $\ddagger$  of an c.inch over; fomewhat like a Birds Eye.

A Piece of the fame fort, with its expanded Root.

The fame growing on or round about fome of the Branches of a Sea-Shrub. As it is probable, That all the forts of fiftular Corals once did.

The CROWNED OCULAR CORAL. Given by Sir J. Hoskins. In this, which is also white, to the eyes on the fides, are added little Heads crowned or radiated round about.

A CLUSTER of Red Fiftular Coral.

The fpread FOLIATED CORAL. *Clufius* defcribes it by the Name of *Planta Saxea Abrotonoides*. Of whom *Baubinus* borrows his figure. His Defcription not clear. 'Tis white, and porous; efpecially the centre of every Branch, in imitation of a Pith. The feveral Branches encompafied

(a) Imperatus, Lib.27.

### Of Corals.

#### PART III.

encompassed with little short round hollow sprigs, or, as we may call them, Coral-Leaves, curioufly striated round about.

The Upright FOLIATED CORAL. In all refpects like the former, faving that it is lefs fpread.

Coral is filled for from the beginning of April to the end of July. Not in the Ocean, but the Mediteranian-Sea only. In which there are eight or nine Fisheries, among the Rocks, no where above forty miles from Land. Three upon the Coaft of Sardinia; on that of France, two; of (a) Tavern. Sicily, Catalonia, Corfica, and Majorque, one. (a) Of white Coral, there is great abundance in Brafile. (b)

Of the Nature and Generation of Coral, it is affirmed by the Honourable Mr. Boyle, (c) That whilst it grows, it is often found foft and fucculent, and propogates it Species. And by Georg. de Sepibus, (d) That of those who had been us'd for many years, to dive for Coral in the Red-Sea, Kircher learned thus much; That it would fometimes let fall a Spermatick Juyce, which lighting upon any (*fleady*) Body, would thereupon produce another Coral. And further, by Wormius and Tavernere, from the Relations of others, That this Juyce is white or milky. Which may feem the more credible, when we confider, that the like milky fubstance is found in divers Mines. (e) Sometimes inclosed as is observed by Mr. George Planton, in great Hollows of the Metallick Rock. (f) And that Mr. Beamont hath found in the Hollows of fome Stones called Entrochi, and Rock-Plants, or a kin to them, an evident concretion of fuch milky Juyce. (g)

Of Corals, are chiefly prepar'd, The Powder ground upon a Marble; the Magisterial Salt; and the Tincture. To good purpose, in some Feavers, and some other Cases. But the Name of Tincture, according to the common notion of it, is a meer deceipt: it being, in truth, no more but a Liquamen, or folution of the Magisterial Salt. For those Acid Liquors which are used as Menstruums for the making of it; by digestion or repeated heats, do always turn red: which not being heeded, the faid colour hath been believed to proceed from the Corals. Of the Effect (b) De Lap. of this Tincture, or rather Salt of Coral, upon a Malignant & G. lib. 2. Feaver, see a Memorable Relation of Boetius in his own «.154.p.312. Cafe. (b) BASTARD

Ind. Voyage, Chap. 21. (b) J. de Lact. (c) Of the Urig. of Forms,136. (d) Muf. Rom. p. 45. Col. 2.

(e) Dr. Brown's Trav. (f) Phil. Tranf. N. 100.

(g) Phil. Tranf. N. 129. p. 730. l. pen.

BASTARD-CORAL. Alcyonium. So call'd, becaufe a Marine Production, often of a roundifh form, like the Neft of an Halcyon, and by fome phantaftick thought to be one of those Nefts petrify'd. Hereof there are seven or eight forts here preferv'd. As

The Great, White, FISTULAR Alcyonium. Imperatus figures a Clufter of this under the ill Name of Vermi Marini Impetriti. (a) And Befler a fingle crooked Tube, (a) Lib. 24: with that of Exuviæ Serpentis in Lapidem converfæ; which cap. 26. is as bad. This is fuch an one, but more ftrait and fmooth, as thick as the upper end of a Tobacco-Pipe ftalk. But with a much greater bore.

The Middle white FISTULAR Alcyonium. A Clufter of Coralline Tubes, in fome places, meeting in parcels; in others, divaricated, almoft as the Veffels do in Plants. Not equally thick at both ends; beneath, not exceeding the Quill of a Crow; at the top, as wide as that of a Goofe. Rough all along with annular wrinkles, almoft like the flough of a Silk-Worm, or a Serpent. Being hollow, 'tis probable they ferve as the Matrices of fome Sea-Infects.

The finall white FISTULAR Alcyonium. By Imperatus (b) (whom Terzagi imitates (c)) called Vermicchiara; (b) Lib. 27. and Alcyonio Milefio; a much better Name. A Clufter of (c) Sept. crooked Tubes, not thicker than a Packtbread; and alfo Muf. c. 13. wrinkled.

The Red FISTULAR Alcyonium. By Imperatus call'd Tubularia purpurea. By Befler Alcyonium Maris Rubri. A Congeries of strait, and red Pipes, of a Coralline substance, about as thick as an Oaten straw, all standing parallel, as the Cells in a Honey-Comb: and divided into stories by transverse Plates or Floors, at several distances from a  $\frac{1}{2}$  to  $\frac{1}{2}$  an inch, or thereabout.

The BRANCHED Alcyonium. 'Tis white, and of a *Coralline* fubftance, but fomewhat foft. The Branches folid, and in fome places *coalescent*.

The KNOBED Alcyonium. Of a white and coralline fubftance, but fomewhat foft. Of fuch a Contexture, whereby it is every way, and pretty openly, pervious throughout; fomewhat anfwerable to that of a Sponge. Evenly tuberated all over the top and fides.

Another, unequally tuberous, and of a little more open compages. The

## Of Corals

PART III.

The LOBED Alcyonium. Of a like colour and fubstance with the former: yet not composed of round, but flat or lobed portions, with fome likenefs to Liverwort.

The BUBLED Alcyon. Given by Captain Th. Fiffenden. About i an Eln in compass. Confisting wholly of Platework, fo conjoyn'd, as to make feveral large Apertures, runing one into another : fomewhat after the manner of a Ruff. The Plates or whole Body compos'd of most minute Bubles, divided by a very thin Sepiment, and standing all in even, ftrait, and parallel Rows. So that it looks not much unlike Linnen-Cloath: faving its brown tawny colour.

A NETED Alcyon. Retepora Imperat. So called from its Figure.

MUSHROON-CORAL. Fungites. So called from a little likeness it hath to a Toad-Stool. Here are divers forts.

The WAVED Mulbroon Coral. 'Tis round, and above two inches over; ftriated beneath round about. The Rim and Area, both undulated. With thin Plates standing all along, and on both fides transversly to the Waves.

ANOTHER, with DOUBLE WAVES. Circular, and about four inches in Diametre. With the top rifing high and round. With transverse Stria, rather than Plates. And Waves both double, and more winding than in the former; much refembling those of a Mans Brain. From whence, this fort, most properly, are called BRAIN-STONES.

A POLISH'D BRAIN-STONE. It much refembles a fort of undulated Stone. Whereof hereafter.

Part of a large BRAIN-STONE from the Bermudas.

The PLATED FUNGITES. So efpecially to be called, becaufe it hath no Undulations, but Plates only. All very thin and fharp, and radiated, to the circumference, after the manner of those in a common Mushroon; excepting, that there they ftand underneath, here above. This fort is curioufly figur'd in Calceolarius's Museum.

A FLAT RADIATED Fungites. Figur'd by Bauhinus. (a) Lib. 39. (a) 'Tis fomewhat more than two inches broad, and with the fides as it were crushed together. Waved round about, and the Rim raifed like a border pretty high.

A STARRY FUNGITES. Of a circular figure; beneath, a little concave; above, convex. Wrought all over with a great number of small radiated Stars, every where con-A tiguous.

## Of Gems.

A Piece of Fungites with GREAT STAR-WORK: every Star, with the Rays, being near 1 an inch over; and the Rays alfo plated.

The COOMED Fungites. The top hereof is circular; all over carved into radiated Tubes, the Rays standing high without, and deep within. Composed together fo, as fomewhat to refemble an Honey-Coome, from whence I name it.

ANOTHER of the fame fort, of an Oval Figure. Given by Sir R. Moray.

A Fragment of a great One of the fame fort. In which the Texture is fairly observable. For the aforefaid Rays, are indeed the extremities of fo many Plates which run through the length of every Tube; and which are likeways all the way conjoyned with an infinite number of other extream fmall thin transverse Plates: dividing the whole Tube into little squares, after the like manner, as in the Pith of a Bullrush.

The Fungites is found in the Indian-Sea, and the River Nilus. (a)

(a) Chifins;

#### CHAP. IV.

## Of GEMS.

A ROCK of DIAMONDS. Given by Sir R. Moray. They grow upon their Bed (which is about three inches broad, and four in length) in Crystals Sexangularly pointed. Of feveral fizes from the thickness of a midling Pin, to a i of an inch Diametre, but all of them short. Not very perfpicuous, but a little greyish, like the Calcedony. Saving one finall clufter of them, tinctur'd yellowith. They cut Glass very deep and eafily.

The principal Diamond Mines now known, are four. That of Raolconda, in the Kingdom of Visapour; discover'd 200 years fince. In this Mine, the Diamonds lie in fandy Veins in the Rocks. Of all, the clearest, and of the whitest They pound and wash the Vein for the Diamonds, Water. just as we do some of our Ores for the Metal. A second call'd

 $0^{\circ}$ 

282

# Of Gems.

#### PART III.

call'd the Gany, about feven days journey from Golconda; found out 100 years fince. They dig here not above 14 feet deep. Sometimes above fixty thoufand Men, Women and Children at work. It affords the largeft Diamonds, but not clear: one fometimes above 40 Carats, i.e. <sup>3</sup> of an ounce. And there was one here found which weighed 900 Carats (i. e. Zvij ff.) A Third, that of Govel, a River in the Kingdom of Bengala. The Diamonds are found in the fand of the River, for the fpace of 50 Leagues. From hence come those fair pointed Stones called Natural Points : but not great. The Fourth, that of Succadan, a River in Bor-But there are none come from thence but by ftealth. neo. How the Indians prove, work, and fell their Stones, with (a) Ind. Tav. other particulars, fee in Tavernere. (a)

lib. 2. C. 11, 12, 13, 14, 15. (b) Mr. Boyle Of Gems, p. 11. & Lap. Lap. & G. (e) Lib. 1. c. 43. (f) Of Gems, p. 109.

G.

Rough Diamonds are often naturally figur'd into Triangular Plains: a mark to know a right one by, (b) as well as hardnefs. Many alfo of the best are pointed with fix Angles; fome, with eight; and fome Tabulated, or Plain, and (c) Joh. de Laet L. de G. Square. (c) Diamonds receive no hurt, but are rather mended, by the fire. (d) Some, faith Garcias, (e) being rub'd, (d) Boet. de will take up straws, as Amber and other Electrical Bodies. And Mr. Boyl(f) fpeaks of one of his, which with a little friction attracts vigoroufly. Of another, (g) which by water made a little more than luke-warm, he could bring (g) Ib.p.112 to fhine in the dark.

'Tis the property of all true Diamonds, To unite the Foyle (b) Boet. de clofely and equally to it felf, (b) and thereby better augment its lustre, than any other Gem. That which is called the Foyle, is a mixture of Mastick and burnt Ivory: The latter, being one of the blackeft of colours; used by Painters for Velvet, the Pupil of the Eye, &c.

The Water of those which are drawn not from the Rock, but the Ground, commonly partakes of the colour of that (i) Mr. Boyl, Soil or Ground : (i) and fome are found as yellow as a Of Gems, Topaz. (k) p. 51.

Between the Grain and the Vein of a Diamond, there is (k) Ib. p.35. this difference, That the former furthers; the latter, being fo infuperably hard, hinders the fplitting of it. Although it feems, that a Vein, fometimes is nothing elfe, but a Crofs-Grain. Our European Jewelers, when they fplit one, they take a very small iron Wyre, and having daubed it with with Oil and Powder of *Diamonds*; draw it upon the *Diamond*, by a Tool, to and fro like a *Sam*, fo long as is needful for that purpofe.

The BASTARD-DIAMOND. Pfeudo-adamas. Now remaining, as it was found, bred in a Musculites, a Stone like a Muscleshell. Given also by Sir Robert Moray. 'Tis angular, pointed, and very clear. And cuts Glass with great east and depth. Of our Bastard-Diamonds here in England, the Corniss are the best; much better than those on St. Vincents Rock near Bristol.

A CRYSTAL ROCK. In which, feveral leffer *Cryftals* Sexangular, pointed, and most perspicuous, grow round about a great one, in the form of a *Pyramid*, above eight inches about. The bottom of it being polish'd, all the fides to the top, are very pleafantly apparent through the fame.

A fmall COLUMN of Cryftal, alfo exceeding clear.

A ROCK of midling *Cryftals*, growing upon a Semiperfpicuous Bed, or *Grey-Mother*. They are very clear, notwithstanding that beneath they feem to be tinctur'd yellow; being there only daubed with fome fubstance of a yellow colour. Of these *Cryftals*, the two opposite fides, are the greatest: which is also observable in many others.

A fmall Cryftal COLUMN, with a whitish Base.

ANOTHER clear *Cryftal*, growing on a Semiperfpicuous *Mother*, together with a kind of *Marchafite Spar*, or teffellated Stone, of an *Amethyftine* colour.

A ROCK of fmall Grey Crystals, almost like a Calcidony.

Another of the fame fort, growing upon a kind of *Lime-ftone*.

A Third, with the Points of an Amethystine colour; growing to a Matrix of a purplish black.

A Crystal COLUMN, of an Hyacinthine colour, but dilute. An inch in Diametre, and almost  $\frac{1}{2}$  a foot long: The two opposite fides of this also are the greatest.

A leffer one of the fame Species.

A

#### 284

Of Gems.

## PART III.

p. 39. (b) Muf. Sept.

A THIRD, growing upon a Bed of the fame colour; (a) Of Gems, but opacous. Mr. Boyle (a) mentions a piece of Crystal, in one part of an Emrald-green. And Terzagi (b) another that was black.

> A Crftyal COLUMN, naturally inclosing a kind of Moss (or the likeness of it) at one end of the Column of a paler, at the other of a dark Green. 'Tis above ½ a foot in compass.

ANOTHER piece of CRYSTAL in which is immerfed a Mossy substance of a redish colour. And there are some Crystals have been known naturally to enclose a Li-(c) Mr. Boyle, quor. (c)

A Piece of polifh'd CRYSTAL in the figure of a half Globe. 'Tis on one fide flaky, and hath many very fmall Bubles, by which it appears cloudy.

ANOTHER Piece polish'd into a Sphærical Triangle, and fomewhat Oval.

A THIRD Piece polifh'd into a Cone.

A Maffy Piece of CRYSTAL. Not pointed, nor angular; but of a roundifh figure; much bigger than any mans head. One way, near a yard in compass; the other, above three quarters. In weight, thirty nine pounds and a Haverdupoife. Yet is it very clear, beyond the clearest Ice of the fame thickness. The biggest piece of Crystal I find mention'd elfe-where, is a Ball of fix and thirty ounces in Septalius's Mulaum.

Crystal, at least fome forts of it, is the foftest, faith Boetius, (d) of all Gems. He should have faid, of all perspicuous Gems: for the Turcois is much fofter. The most usual Figure of Crystal, is Sexangular: yet Terzagi (e) (e) Mul. Septal. c. 9. n. 54. mentions a Rock of square pointed ones. But it is observable, That he faith the Bed on which they grew, feem'd to be Gold-Ore. If fo, it might proceed from fome governing principle in the Ore. For I have heard it noted, as I reremember, by Sir Christopher Wren, That Grain-Gold is often found naturally figur'd into Cubes. Cryftal grows in most Countries, both cold and hot : the Globous, especially in Bohemia and Silecia.

A Drachm (f) of the Powder of Cryftal, with Oil of (f) Boet. de fweet Almonds, a present Remedy for those that have Gem. & L. Lib. 2. c. 74. taken fublimate. As alfo for bilious and chylous Diarrhaas. (g) Ib. (b) Terzagi (g) When Calcin'd, by fome called Pulvis Cafaris, of exin Muf. Sept. cellent use against the Epilepsie. (b) An

Of Gems, p. 43. & Mul. Calc.

(d) Lib. 2. c. 73.1. 1.

Of Gems.

An AMETHYSTINE ROCK. The Gem hath its Name from the opinion of its being an Amulet against Drunkennefs. This Rock confisteth of angular pointed and contiguous Crystals; growing from both fides the Matrix, inwards, where their Points meet, and are all closely indented. Some of them feem to be Pentagonal. Several are Conick from the Points towards the Roots. These are well tinctur'd, but the Roots are all white, or rather Diaphanous and colourlefs. As also is the Matrix, or inward part of it; yet not fo clear. The shell over all, flat, opacous, and of a redist brown. There is the Figure of a very fair one in Calceolarius's Mus.

ANOTHER, growing upon a *Matrix* or Bed fpotted red and yellow, and crofs-grain'd, or composed of fmall *Crystals* fet together *decussatim*.

A THIRD, the *Matrix* whereof is a kind of *Amethyftine Flint*, *i.e.* not composed of *Cryftals* or *Grains*, as is ufual, but one entire maffy Stone, Semiperspicuous, and of a pale blew, almost of the colour of some *Cows* Horns. Of an orbicular Figure, and somewhat flat like a *Loaf*. The Roots of the *Cryftals* are colourles, as in the former, and the points and upper parts of a pale *Purple*. With these, is included in the same *Matrix*, a whitish and flaky Stone, which is easily diffolved with *Spirit* of *Nitre*. Which is one, amongst many instances, how near together two Stones may be bred, of so different a nature one from another.

A WHITE AMETHYST. This is here naked, or without a *Matrix*. Confifteth of divers contiguous *Cryftals*, half an inch and an inch long; their Roots grey; but their Points clear, ufually fexangular. From the Points the Roots taper'd or conick : the Figure which doth efpecially diftinguish this Stone from *Cryftal*, whether white, or of an *Amethyftine* colour.

An AMETHYST of a pale Violet colour; found growing in Scotland. Given by Sir Rob. Moray.

ANOTHER, with a kind of *Chryfolite* growing to it.

The best of this kind, are, as *Theophrastus* well describes them, of the colour of a ripe (red) *Grape* : and are the hardest. These grow in the *Indies* : the rest in *Bohemia*; (a) Boet. de *Saxony*,  $\mathfrak{G}c$ . The best, being burnt, excellently imitate a *Diamond*. (a) Two

Of Gems.

Two little white or pale SAPHIRES, polish'd into a flat oval Figure. By fome called The Female: and fo the paler kinds of other Gems. The best, grow in Bisnagar, Zeilan, and other parts of the East-Indies, especially in Pegu. The meaner, in Bohemia, and other adjacent places. They are cut or fashion'd with Emery and Tripoly; and engraven with Diamond-Dust, as other harder Gems. Being (a) Boet. de burnt, they imitate a Diamond, as doth the Amethyft. (a) And As ultum and Glass melted together, imitate a Saphire. (b)

The Saphire, faith Boetius, (c) being applied to any bruifed part, prohibits the Inflammation of it, in a miraculous manner. See also the Salt and Tinsture (d) of it described and commended by the fame Author.

The GRANATE, qu. Ingranate, or Ingraind. And therefore by the French called VERMEILLE: and the Matrix, by Moscardo, Minera de Ingranata. The deepest, well compared by Imperatus to the Juyce of a ripe Mulberry. Here are of feveral fizes.

A BOHEMICK GRANATE, as big as a Nutmeg. With feveral more of the fame fize, or near it.

Some other Large GRANATES, polifh'd with Rhombs. But thefe are cloudy.

A Bag of Leffer GRANATES, of feveral fizes from a Peale to a Mustard-Seed.

A BED of GRANATES from the West-Indies. Given by the Honourable Rob. Boyle Efq;. Most of them as big as a large *Peafe*, beded in a Stone which is friable, and eafily rub'd to a rediff and gliftering powder; in fome places a little black, and growing with crofs Flakes. It feemeth, from its foftnefs, not to have been the original Bed or Matrix wherein the Stones were bred; but that being, in pecking the Rock or Mine, broken off from that, they were afterwards cafually lodged in this.

These Stones grow in Calecut, Cambaia, and *Ethyopia*. As alfo in Spain and Bohemia, where, contrary to what is (e) Boet. de observed of most other Gems, they are found exceeding the Gem. & L. (f) De Laet. Oriental. (e) Many of them will abide the fire, without de Gem. & change of colour. (f)

Spirit of Salt extracts a rich Tincture out of Granates (g) Mr. Boyle, calcin'd and finely powder'd. (g) And Aq. Regis, a rich Of Gems, p. 88. folu-

(e) Lib. 2.

c. 43.

(d) Ibid.

#### Of Gems.

folution of them, only powder'd; colour'd fomewhat (b) Ibid. like a folution of Gold. (a)

The Jewelers TOPAZ. Chryfelectron Plinij. This is an 'Tis of a perspicuous Golden colour, with Oriental one. fome scarlet spots or like a deep Tincture of Saffron.

The Whiter or Female TOPAZ. Composed of feveral Crystals; clear and colourless at the top; below, clear and yellow. Growing on a white Matrix, with a light yellowish Tincture. They grow in Arabia, Bohemia, Gc. The beft in India and Bactriana: the Europeans, effectially, being foft, and not without blackish Clouds. The Oriental, the hardeft of Gems, except the Diamond. And probably the Ruby. Found fometimes to big as to weigh twelve pounds. (b) (b) Boet. de Æsuftum, stannum ustum, Cinabar, and Crystal, melted together, imitate a *Topaz*. (c)

Gem. & L.,

(c) Aldrov. M. Metall.

The SMARAGDUS, growing together with a pale Amethyst in one Matrix. The Crystals are angular, but feem to hold no proportion.

The Occidental, fometimes as big as a mans fift, especially in Peru; but foft and cloudy. The Oriental, no bigger than a Filbert. The Europeans, in Cyprus, Gc. the worft. 'Tis imitated (d) with Æs uftum, and half as much Crocus (d) Ambro-fin. (in Al-Martis. drov. M.

Six Grains of this Stone, in powder, procureth fweat. (e) Met.) out of Porta. Applied entire to the Belly, stopeth all kind of Dysenetries in (e) Mut. Wormian. a miraculous manner. (f)

A CLEAR and GREEN STONE, (a kind of Smarag- (f) Boet. dus) which, being heated red hot, shineth in the dark for nerius. a confiderable time, sc. about <sup>+</sup>6<sup>th</sup> of an hour. Given by Dr. William Crown. I tried the experiment my felf alfo. And at the fame time obferv'd, That as it grew hot in the fire, its Green colour was changed into a Sky-blew; which it likewife retain'd fo long as it continu'd to fhine : but after that, recover'd its native green again.

The AGATE. So called from the River Achates in Sicily, near which it was first found.(g) Almost of the colour (g) Theophra of clear Horn. The hardest of Semiperspicuous Gems. They de Lap. grow in India, Germany, Bohemia. Naturally adorned with much variety of waved and other figur'd Veins, Spots, the reprefentation of Vegetable, and fometimes of Animal Bodies. None more memorable, than that mention'd by

#### 288

Of Gems.

PART III.

(a) Lib. 7. c. 11.

(b) Muf. Septal. by Pliny, (a) of Pyrrhus King of Epyrus, in which, without much strain of phancy, one might imagine a representation of the Nine Muses, and Apollo, with his Harp, in the middle of them. 'Tis used for Sword-Hilts, Kuise-Hasts, Beads, Cups, and the like. There are pieces of it, sometimes (b) as thick as a Mans Arm.

The ONYX. So called, becaufe in colour not unlike the Nail of a Mans Finger. Ambrofinus confounds the Agate and the Onyx together. But the Onyx differs from the Agate, chiefly, in that, inftead of Veins, 'tis generally compofed, faith Boetius, of Zones. But I think rather of feveral Balls, one within another : which, when the Stone is polish'd, do indeed reprefent a round spot in the centre, with feveral Zones or Rings about it. Here are of divers forts.

An ONYX with a white, and very broad Zone.

ANOTHER, of a pale Blew.

A THIRD, with *Rings* White and Bay.

A FOURTH, of a light yellowish colour, or of Citrine Amber, with ash-colour'd Rings.

A FIFTH, in Figure like an Eye, with the Iris, White; the Pupil, of the colour of Honey.

A SIXTH, with the middle Spot or *Pupil* encompafied with a grey *Iris*.

A SEVENTH, with the *Iris* party-colour'd, within, White; without, brown; and the *Pupil* also of the fame colour.

An EIGHTH, with an ash-colour'd *Pupil*, the Iris of a pale Amethystine within, and white without. These with more variety of colours, are by some particularly called NICCOLI; qu. Onyculi.

A NINTH, which may be nam'd, The BINOCULAR; as having the likenefs of two little Eyes. The Table on which Nature hath drawn them, is of the colour of yellow Amber, and femiperfpicuous. The Eyes are white, with their Pupils of the colour of the paleft live Honey.

A TENTH, diffinctly called *BELI OCULUS*: the Iris whereof is Grey; the *Pupil*, and the reft of the Eye, Black.

An ELEVENTH, of the colour of *yellop*. Amber, with grey Girdles, not round, as in all the former, but angular.

The

## Of Gems.

The EMBRIO of an ONYX. So I name it. 'Tis a half Globe, polish'd. The outer Crust or Shell, Semiperspicuous, and as hard as of a true Oynx. The part within, round, of an opacous liver-colour, and fo foft as to be diffoluble with Spirit of Nitre.

A PEBBLE of kin to the Onyx. " 'Tis round or globous, and on the two opposite fides, a little prominent. About an inch in Diametre. The outer Shell, yellowifh; the middlemost, red; both opacous. The intimate Part, diaphanous, and of the colour of a glowing Coal. It feemeth to me, That as fome Pebbles, fo many more Flints, are a fort of ONTX. The Onyx, amongst other things, is used for the making of Cups; of which, King Mithridates is faid to have had two Thousand. Sometimes so big, as to ferve for Statues. At Rome, in the Basilica of St. Peter, there are (or were in Boetius's time) fix little Onychine Columns. (a) (a) Boet. lib. They grow both in the East and West-Indies, and in 2. de Gem. Europe.

The ONYCHATE. Betwixt an Onyx and an Achate. Composed not of Zones, or Balls, but of Plates, perspicuous and ash-colour'd, mixed.

ANOTHER, of a Globous Figure, confifting of Plates ash-colour'd and brown : like a little turn'd Bowl of Ashwood.

A THIRD, confifting of Black, and Horn-colour'd Plates, mixed together, these latter, being also stained with red fpots.

The PSEUDOPALUS. 'Tis of a pale blewish Water, like a Fishes Eye, or a drop of Skim'd-Milk, with some Rays of yellow.

ANOTHER, growing to a thin Cruft or Matrix of an Iron-colour.

This, and the Opalus it felf, the foftest of Gems. (b) They (b) Boet. de are now found principally in Hungary. (c). The Opalus, Gem. faith Boetius, hath its variety of colours, only by Re- Voyages. fraction: (adds Laet, (d) like those in a Prisme) for if it be (d) Lib. 1. broken it looseth them. 'Tis true, that these colours are pro- de Gem. duced by Refraction : yet not as in a Prisme; as not depending upon the Figure, (for they will not be produced in other Stones of the fame figure) nor fo much as any flaw or flakinefs in the Stone; but its peculiar Texture, which Рp cauleth 

## Of Gems.

#### PART III-

as

caufeth those Refractions. Tin and Venis-Glass melted together, imitate an Opalus. (a) See alfo the Phil. Tranf. (a) Porta. (b) Num.38. hereof. (b)

The ONYCOPALUS. By fome called Oculus Cati. It hath the Zones or Rings of the Onyx, of a pale White. The best of these are found in Zeilan and Pegu. Much harder than the Opalus. It might be try'd, whether this Stone doth in any degree partake of the strange property of the Opalus; fome of which, being only steeped a while in common (c) Lact, ubi water, will become Transparent for some time. (c)

> The CALCEDONY, i. e. Onyx Chalcedonius, as Kentman not amifs. (d) This is polish'd and set in a Frame. Above four inches long, and near as broad. Semiperfpicuous, almost like to a piece of grey Ice. Confisting of white and most perspicuous parts fo mixed together, as to look in some fort like a Honey-Coome.

> Another fmall one, with a pointed and fexangular polish at both ends.

> This Stone is next in hardness to the German Agate. The clearest, with a pale cast of blew the best. In Germany, being cut into thin broad Tablets, many have their Arms either engraven thereon, or painted on the back-fide; prefering it to Crystal, as being harder, if good. Hereof alfo are made little Mortars for the powdering of Emery; likewife Cups, Religious Beads, Oc. (e)

The SARDIUS or Cornelian, qu. Carnelian. A femiperfpicuous Stone. The best, by some called The Male, of the colour of Flesh, faith Boetius, with the blood in it. I add, but of a living Animal. But this is diluted with fomewhat of an Amber-colour. Anciently not only This, but all the fmaller Gems, were used especially for Signets and Signet-(f) Theop. Rings. (f) de Lapid.

The SARDONYX. As it were compounded of the This is polish'd, and fo the better Sardius, and the Onyx. shews it felf. It confisteth of White and Blackish Rings, one with in another. And stained both with red, and pale green Spots interjected. The Rings, with the help of a Glas, appear much more numerous, curioufly reprefenting those in the Root of Taraxacum or Dan-de-Lyon, cut transversly. Note alfo, That the faid Rings are properly fo call'd, only in the polifh'd Stone; being, when entire, really fo many Balls,

fupra.

(d) Foffil. Nomencl.

(e) Georg. Agric.

as in the Bezoar or Onyx, one within another. This Stone is found in feveral parts in Afia and Europe. Harder than the Onyx, or the Agate; and is therefore figur'd with Emery. Hereof anciently Cups were made, and those Disches call'd Vasa Myrrhina. See Worm.

The JASPIS. An opacous Gem; always, faith Laet, (a) (a) Lib. de with fome kind of earthynefs. But I take this to be only the property of the Lapis Nephriticus. Tis found of most colours; of which here is fome variety.

A GREEN JASPIS, stained with White Spots.

A Flefh-colour'd JASPIS, with Blackifh Striæ.

ANOTHER, ftained with Purple and Blew Spots mixed together.

A FOURTH, stained with white and red Spots.

A FIFTH, Variegated with White, Carnation, Red, dark Green, and bright Green Veins and Spots. Very like to thofe, which *Boetius* faith are plentifully found in *Bohemia*.

A GEOMETRICK JASPER. It feemeth at leaft of affinity with the Lapis Sanguinalis defcribed in Boetius. (b) (b) Lib.2. But is certainly one fort of Lapis Cruciformis. (c) This Monardes. here is polifh'd into a plain Oval Figure, or flat on both (c) See Aldrov. Muf; fides. About an inch and  $\ddagger$  long, and  $\ddagger$  thick. In the centre Metall, or middle part of both fides ftands a Rhumb or Diamondfquare part, of a blackifh Green. From the four Angles whereof are produced as many Lines of the fame colour; and from each of thefe, two more, at acute Angles; the extreme parts whereof compofe four more green Parts, as it were half Rhumbs: all joyn'd together with a circle near the Rim of the Stone. Amongft thefe, fome yellow and red Spots are fprinkled up and down.

A Bag of a courfe fort of JASPER Stones, knockt off from those in *Wilts-shire* near *Marleborough*, called *The Grey-Weathers*. Given by *John Aubrey* Esq.: So hard, that no Tool will touch them. Generally of a light Grey, some almost white, many of a dirty red.

Another, of a blewish Grey. Taken from a like shelf of Stones at Stone-heng. 'Tis hard enough to scratch Glass.

Another like a green Pebble, found in one of the Streets of this City. Where alfo, faith the fore-mentioned Perfon, many more are met with, and that they are a fort of *Jasper*, brought, as *Ballast*, from the *East-Indies*.

The

Of Gems.

The JASPACHATES. 'Tis polifh'd, and fo figur'd, as to look like one half of a Pear, with the Stalk, Coar, and dead Flower cut out. Curioufly beautify'd with Yellow, Purple, and Blood-red Spots, immerfed in the Horny and Semiperspicuous colour of the Agate; with which also'tis equally hard. This alfo is a kind of BLOOD-STONE: as all other Jaspers with red Spots.

The JASPONYX. 'Tis polifh'd with an Oval Figure. Composed of white Zones, befprinkled with White, Brown, and Red Spots.

Another of a courfer kind, compos'd of Green and Afhcolour'd Plates. Like that Marble defcribed by Imperatus with parallel black Lines.

The JASPAMMITES. So I call it; Having the Figure of the Ammites, with the Colour and Hardness of the Falpis. For 'tis composed of little orbicular Stones, fomewhat bigger than a Pepper-Corn; all green without, and of a dark Purple in the centre. So as they feem alfo to have been once little crufted or shell'd Balls, as those of the Ammites, hereafter defcrib'd.

The Jaspis grows in India, Phrygia, Thracia, and Bohemia. Next in hardnefs to the Agate. Sometimes fo big, as to Of great efteem, as an Amulet, for be used for Statues. the stainching of all Hamorrhages. Of its Effect herein, fee fome Cafes in Boetius; one of them a most remarqua-(a) De Gem. ble one. (a) See also two others, in Mr. Boyle, Of Gems. lib. 2. c.102. The specifick Virtues ascribed to This and divers other Stones, feeming almost incredible unto fome : Mr. Boyle, to render an intelligible Account of the fame; doth reafonably suppose, That all opacous Medical Stones have been, some Bolus's, some Ores of Metals, or Minerals of kin to Metals, fo advantagioufly alter'd, as by application only to become Sanative. (c) The Green-Jasper is by fome Virtues Of Genus, p. 171. prefer'd: but that which Boetius us'd in the Cafes abovemention'd, was wholly Red.

The NEPHRITICK-STONE. Of affinity with the Jaspis, and rather harder. Of several colours; but no one of two, nor any Red: for the most part of a pale Green. It hath fome fofter parts intermixed, which make it look fometimes as if it were a little oily; and for which cause it admits not of a perfect polish. Of these here are The two Species; first,

(b) Pag-177, 178.

(c) Of the Virtues Of 172.

The NEPHRITICK STONE of Brafile. Gemma, Gefnero, Oripendula. Defcribed by the Author of the Name. But this is fmaller, and feems to be broken. Of a pale blewish Green, with some pores containing a whitish substance. Polish'd and shaped into a little Column. The better fort of the Natives of Brafile, to distinguish themselves, when they go abroad, wear this Stone (as we Rings on the Ear) upon their Lip; which is bored in their Childhood for that purpose.

ANOTHER, of affinity with the former. It confifteth mostly of parts of a dark Green; yet glossy; and firmly cohering. Yet so as in feveral conspicuous pores to contain a fost whitish substance.

This Stone, although of no beauty, yet is placed amongft Gems, for that it is highly efteemed, as an Amulet againft Nephitical Pains, and the Stone and Gravel in the Kidneys. Of the admirable effects whereof, in divers Cafes of this Nature, fee the Relations of Monardes, and from him of Boetius; as alfo from a Noble Perfon, his Kinfman. (a) The (a) Lib.2. Green one with black fpots, is commended by many. But <sup>C. IIC.</sup> Laet faith, (b) he had one almost of the colour of Honey, (b) Lib.1, which, upon frequent experience, he found to do all that <sup>de Lap.</sup> Monardes relates of it.

The TURCOIS. So called, becaufe brought to moft places from *Turkey*, or those that trade from thence. By the *Indians*, *Perose*; for that it is found, most abundant, faith *Cerutus*, (c) only, faith *Tavernere*, (d) in *Persia*. See (e) Muf.Calceol. S. 3. the Defcription hereof in *Boetius*. This here, is all over tuberous on the top with round Knobs, of feveral fizes, from that of the head of a small *Brass Nail* to that of a *Pin*; fome of a blewish, others of darker Green. Within (fomewhat like the *Onyx*) disposed into *Zones*, mixed with spots: both of a Greenish Black. 'Tis two inches broad, and near three in length: a great one, if, as *Boetius* faith, it feldom exceeds the bigness of a *Walnut*.

Another, about as big as a Filbert.

A Third, a fmall one, like those set in Rings.

The MOTHER of the TURCOIS, as is supposed. Found in the Mines of *Herngrunt* in *Hungary*; and given by Dr. *Edward Browne*. Here are two Pieces. One of them, for the greatest part, blew; with some places black. In

### Of Regular Stones.

## PART III.

In which is alfo immerfed a fort of fmall Sand-colour'd Stones, fo hard as to fcratch Glafs. The other, hath alfo a mixture of fome parts that are Green. The Blew and the Green, are both, and they only diffoluble upon the effusion of *Acids*.

(a) Boet. de
Gem.
(b) Laet de
Gem.

The best of these Stones are the Blewest. (a) They have alfo this property; fc. to look blew by Day, (b) and Green by Candle-light. Many, faith Boetius, have judged this to be reckon'd by Pliny, amongst Jaspers with the Name of Boreas. But either Pliny and the Ancients, or those that make that judgment of them, were greatly miftaken. For this is a very foft Stone, and eafily diffoluble, with Ebullition, immediately upon the effusion of some, especially Nitrous Acids : and may be fcraped with a Knife. So that I am of Opinion; That 'tis nothing elfe but a fort of Ærugo in some measure petrify'd. Which also is further confirm'd in that it doth not only refemble that in Colour, but, being (as it is eafily) burnt, is of the fame Taft. So that it is no marvail, if this Stone, with Age and efpecially much worn and exposed to the Air, looseth the beauty of its colour. And that it may be reftored to the fame by Oil of Vitriol: which eateth off its faded Surface.

#### CHAP. V.

#### Of REGULAR STONES.

A S Gems are diftinguished chiefly by their Colours; fo other Stones Regular, by their external Forms. This is of two general kinds. Such as is Circumscriptive, or depending upon the whole Stone, as ex.gr. in the Eagle-Stone; and this is properly call'd the Figure. Or fuch as is Accumulative, where there is a repetition of the fame Figure in feveral parts, as in Muscovy-Glass, composed of parallel Plates: and fo for the reft, whereof in their order.

A GLOBULAR PEBBLE, an inch and in Diametre, whitish and semiperspicuous. It seems to be an Aslay towards the *Eagle-Stone*, hereafter describ'd.

A

## PART III. Of Regular Stones.

A CLUSTER'D PISOLYTHOS. It confifteth of Globular and bay Stones, united together with an Ash-colour'd Cement : But this is very hard, and stirs not with *Acids*. *Boetius* and others figure a Cluster of these, but somewhat bigger.

This Stone may feem to belong to the fecond general kind above-faid. But is really a heap of diftinct Stones in one Bed. Which is alfo to be underflood of others alike.

ANOTHER, composed of *Globular Stones*, confisting of a whitish, and soft or friable substance; yet gritty, and indiffoluble with *Acids*. United together with a brown Cement.

A SINGLE one of the fame Figure, but bigger; *fc.* as big as a Phyfical Pill. As alfo femipellucid, almost as the bay *Amber*. Very hard and indiffoluble with *Acids*. *Befler* figures fome of these, with the Name of *Pisa majora lapidea*.

The SINEPITES, as it may be called. Being a Clufter of fmall hard *Globules*, like *Muftard-feeds*; and united together with an obfcure or dull Red Cement. Given by Sig<sup>r</sup>. Boccone.

The MECONITES. A Cluster of other like Globules no bigger than Poppy-feeds. See one of these in Boetius and Besler. These two last, are properly of the Hammites kind; but not the Pisolythos, although accounted fo by Boetius. Of these Globules, it is observable with the help of a Glass, That although they are fo very small, yet are they shell'd, or composed of little Balls one within another, as the Bezoar-Stone.

The CLUSTER'D STALAGMITES. A Congeries of Globular Stones, like fo many petrify'd Drops; of the colour of Oriental Bezoar; cemented together with a kind of Gypfum. The whole Mafs, which here is polifh'd, is two inches and i fquare, and an inch high. This, and the following Stones of affinity herewith, differ from the five former, not fo much in figure, as in fubftance, thefe being all inftantly diffoluble with Acids. So that they feem to be a kind of Gypfum, first diffolved in forme Mineral Menftruum, and after fetling in this Figure.

The CORALLINE STALAGMITES, also cluster'd. It

#### Of Regular Stones.

## PART III.

confifteth of little round Stones of the bignefs of the former, but of the colour of red *Coral*. Cemented together with a fort of *Gypfum*. It is diffolved, upon the effusion of any ftrong *Acid*, with a ftrong *Effervefcence*.

The POROUS STALAGMITES. 'Tis a ruder Species, the Stones of which it is composed, being not fo diffinct and round, as in the former. Cover'd all over with one common Cruft. Yet most of them pounced with small or more open pores.

A SINGLE one, call'd *PISUM CAROLINUM*; becaufe frequently bred in the *Caroline Baths*. Whitifh, fmooth and denfe; and near as big as a *Piftol Bullet*.

Two SINGLE ones. Given by Sir Philip Skippon. Of a gloffy Ash-colour, and very dense substance: yet easily disolved with Spirit of Nitre. These are somewhat angular.

Two more, which are TWINS. These are perfectly round, except where they joyn together.

A Great TIBULINE SUGAR-PLUM. This and the other Rough forts the *Italians* call *Confetti de Tibuli*; the place (not far from *Rome*) where they are bred. 'Tis above an inch in Diametre, Globular, White, and Rough; exactly like a great Confet.

A Parcel of SMALL ones; white, round, and as it were granulated: just like *Carvy Confets*, and such like. *Bester* figures several of these under the Name of *Petrify'd Aniseseeds*, *Fenil-seeds*, *Gc*.

The SUGAR-ALMOND, bred alfo in the fame place. In colour, figure, fize, and furface, fo like to the rougher fort which *Confectioners* fometimes make, that, excepting the Taft, nothing can be liker.

Three STONES found very deep under ground near Hartford in New England. One of an Oval Figure, flatish, and having a little Globule standing upon its centre. Another, two half Globes, joyn'd edge to edge. The Third, much bigger than the former, of a circular Figure, and flat; an inch and 4 over; almost like the Caps worn by Under-Graduates in our Universities. All soft, and fine, or not gritty, and not unlike a hard Bole. Spirit of Nitre dissolves them with Effervescence.

A little round, flat, and blackish Stone, resembling a Medicinal

## PART III. Of Regular Stones.

Medicinal TROCH, or a thin CAKE of *Terra sigillata*, having as it were the Impression of a small *Seal* on one fide. 'Tis a perfect *Pebble*, not affected with any *Acid*.

The EAGLE-STONE. *Ætites.* All the former *Stones* were round and folid. This is hollow. Named from a vulgar opinion, That the *Eagle*, when the fits, carries it to her Neft, to keep her Egg from being addle. And this, joyn'd with another, That Bodies operate according to their *Signature*: as this *Stone*, which often contains, or if you will, goes great with another *Stone* within it. Several forts hereof are here preferv'd.

The FLORID Male EAGLE-STONE. A rare kind. 'Tis a perfect *Flint*, and femiperfpicuous; of a Globular Figure, and as big as a good big *Apple*, or near three inches in Diametre. Flourished all round about with feveral fets of *Rings* one included within another, with some similitude to so many little *Roses* or double *Crowfoot-Flowers*. 'Tis very ponderous, being almost folid. Yet hollow at the centre; containing not one, but several similar *Stones*, as is argu'd from the noise they make, upon shaking the *Stone*.

An ANGULAR or Ridged Male EAGLE-STONE. This also is about the bigness of a good large *Apple*. Of a brown colour, but daubed over with a kind of *Okre*; and was therefore probably bred in a Bed of the fame. 'Tis very heavy; which argues it almost folid, as the former, and to have only a fmall hollow in the centre.

An ORBICULAR EAGLE-STONE. About the bignefs of a midling *Apple*. The outfide, rough and brown. Inwardly black. The Concave furface daubed with a fort of *Okre*; a quantity of which, 'tis likely, it once contain'd.

An OVAL EAGLE Stone. About as big as a midling *Walnut*. Without, blackifh and rough, as it were granulated with fome femiperfpicuous Sands. Smooth within, and of a fpruce *Okre* colour. On one fide, it hath an oblong Aperture, with a fmooth Lip as it were turned outward.

One half of an OVAL EAGLE Stone. 'Tis near three inches in Diametre. The infide rough-caft with fmall Grains, in fize, like those of *Bay-Salt*; fo hard as to cut Glafs.

The

## Of Regular Stones.

### PART III.

The FLAT round EAGLE Stone. Of a brown colour, and figur'd like a *Troch*.

The AMYGDALINE EAGLE Stone. Shaped like an *Almond*. Of a gloffy brown, like half bright Iron. It contains a fort of *Bole*, of the colour of *Fullers-Earth*.

The Eagle-Stone which containeth no Stone, but Earth, is called GEODES. GEÆTITES were more express.

ANOTHER, of the fame figure and bignefs; but fomewhat flatter.

A Rough and hard EAGLE Stone, the Concave furface whereof is daubed with a foft white wash, a kind of *Gypfum*, dissoluble with *Spirit of Nitre*.

ANOTHER Hard one, immerfed in Iron Ore. All thefe are Naked. Those that follow have a fost Coat.

A COATED EAGLE Stone: A hollow *Flint*; one way, near two inches in Diametre, and almost round. Cover'd with a kind of white Earth, about  $\frac{1}{2}$  of an inch thick: yet not Chalky, but *effate*, making no *Effervescence* with *Acids*. Containing feveral sparks or grains of *Flint*, cluster'd in a round Lump, together with some of the like *Earth*, as without.

A little Flinty LUMP taken out of another of the fame Species.

TWO more EAGLE Stones, of the fame Species, of a midling fize, and almost as round as a Ball. One of them as big as a good big *Walnut*.

A FOURTH, bigger than a *Musket-Bullet*, and as round. Cover'd, as the three former, with a white earthy Coat; and containing the like fubftance in the centre. The main Body of all thefe, is either true *Flint*, or of a hard fubftance approaching to it. All thefe are by fome called *Males*.

The FOEMALE EAGLE Stone. 'Tis round, and in a manner Oval. As big as a good large Apple. Afhcolour'd without, and white within. Of a foft friable and chalky fubftance, inftantly diffoluble with Acids. From the outfide, to the Concave, i an inch thick. Containeth a foft white chalky Stone, filling up its whole hollow, and anfwering to it, as the Yelk doth to the White of an Egg. This Stone is by Pliny called CALIMUS.

ANOTHER, fomewhat harder. 'Tis alfo round, and bigger

## Of Regular Stones.

bigger than the former, and the fides above i an inch thick. Rough on the outfide, and fmooth within. Yet fo, as to be furrow'd with certain shallow Rings. To which alfo the *Calimus*, therein contain'd, exactly answers, as any Metal doth to the Mould in which it is cast. Both of them make an *Effervescence* with *Acids*.

The CALIMUS of another Eagle-Stone, as big as a good big Gall, and knobed in the fame manner.

Several Species of this Stone are figur'd by Aldrovandus.(a) (a) Muf.Me-

The flinty Eagle-Stone, and many other Flints, if ob-<sup>t</sup> ferv'd when they are broken, feem to be an Affay towards the Onyx.

The Eagle-Stone is found in Apulia, Germany, Misnia, Germany, Misnia, Germany, Much accounted of by some, as an Amulet against Abortions.

The SEMIGLOBULAR TOAD-STONE. Lapis Bufoneus f. Garatronens. It looks like the the one half of a hard flinty *Eagle-Stone*; and probably, is nothing elfe. The Diametre<sup> $\frac{3}{4}$ </sup> of an inch.

The SEMIOVAL TOAD-STONE. 'Tis an inch long, an inch over, of a brown colour, and flinty.

The Long SEMIOVAL TOAD-STONE. This alfo is flinty, and of a fhining brown, or the colour of Oriental *Bezoar*, being polifh'd. 'Tis about an inch long, and near an inch over. *Befler* figures this, with the Name of *Batrachoides*.

Another fort of *Toad-Stone*, femiglobular, and folid, *fc*. with a flat bafe, is defcribed by *Gefner*. (b) Thus far of (b) Lib. de *Stones* more Round. I shall next defcribe those which are *Cylindrick*, or near that Figure. And first the *Ofteocolla*, of which here are feveral *Species*.

The SOLID or Pithlefs KNIT-BONE. Ranked by Kentman, (c) and not improperly, amongft the forts of Ofte- (c) Foffil. ocolla. Yet obtains the peculiar Name of ENOSTEOS: Nomencl: being porous, light, fpongy, and cylindrick; fo as to look just like the inward part of a Bone, or of Harts-Horn.

The KNIT-BONE with a fmall PITH. 'Tis bended almost like the Letter f. Cylindrick, and three inches round. Almost folid, yet containeth a very fmall *Pith*. The outer part, of an Ash-colour, and gritty or fabulous. The *Pith*, like most white Chalk. Both of them make a confpicuous *Effervescence* with *Acids*; but especially the *Pith*.

 $Qq_2$ 

The

## Of Regular Stones.

#### PART III.

The GREAT-PITHD KNIT-BONE. This is not a fingle one, but a Clufter. They ftand together parallel, equal to the thick end of a Tobacco-Pipe-Stalk; without exceeding fmooth, and of a yellowifh colour, fomewhat like that of the Plates in the Ludus Helmontij, hereafter deferibed. Filled with a very large Pith, anfwerable to that in an Eldern-Branch, hard and ftony, and of a blewifh colour, like that of blew Marle. The fpaces between the feveral Cylinders, fill'd up with another fort of Stone, of the colour of old Elm. The yellowifh Cylinders, being rub'd hard, or fcraped, hath a ftrong ftinking fcent: but what Species to compare it too, doth not at prefent occur. They are prefently diffolved with Spirit of Nitre.

ANOTHER CLUSTER like the former; faving, that the Cylinders stand together without any, or with little, order: and that the brown and blewish Stones are both mixed in Veins, and several of the Cylinders hollow.

The EMPTY KNIT-BONE. This is neither folid, nor hath any *Pith*, but a *Pipe*; yet with a very fmall bore. Smooth both within and without. And transversty striated, as the *Belemnites*, hereafter defcrib'd.

ANOTHER, somewhat more hollow. This also is transversly striated, as the former; but without rough and of an Iron-colour.

A THIRD, most hollow; knobed without, and of an Ash-colour.

(a) Phil. Trans. N.39.

Of these Stones, see the Relation especially of Job. Chrystophorus Beckmannus, Physick Professor at Frank furt; (a) who observes, That they grow in a fandy, feldom or never in a claiy-Ground. Sometimes two mens depth; and with Branches fide-ways. Taper'd, as in Plants; where thickess, equal to an ordinary Arm; the small Branches, to ones little Finger. The Place where found is noted by a white fatty Sand, the rest yellowish round about; and underneath a dark, moist, and fatty putrid substance, like rotten-Wood, running in Veins and is the Mother of the Ofteocolla. So that it seems to grow fomewhat after the manner of the Entrochus, or Stelechites above describ'd. 'Tis found most in Saxony, and the Palatinate.

This Stone, as is indicated by its Name, is highly effected for expediting the *Coalition* of broken Bones; 3j hereof being

### Of Regular Stones.

being given and repeated for above five days together. See one or two very remarquable Histories hereof in Boetius. (a)

The Larger Hollow STALACTITES, or WATER- & Gem. Lib. PIPE. The Greek Name fuppofeth it to grow fomewhat after the manner of Icicles, from Lapidifick-Waters. Yet how it should grow hollow, as this, is somewhat hard to conceive. For hereby, it feems rather to grow or fprout upward, as the Stelechites. Only with this difference, That as that grows from an open Bed : this probably, from Whence I take leave for the English one under Water. Name. 'Tis three inches long, in thickness equal to the little Finger. Of a Cylindrick Figure, faving that at both ends'tis a little more flender; whether naturally, appears not. Composed of several ash-colour'd and blackish Crufts, exceeding thin crifpe and brittle, not ill refembling a rouled Wafer. The Bore is lined through with a fmall granulated Candy. 'Tis inftantly diffolved with Spirit of Nitre.

ANOTHER, confifting wholly of white Crufts or Wafers one within another.

The SMALL WATER-PIPE. 'Tis a Cluster of very fmall *Tubes*, with the Bore fo fmall, as fearcely to be feen without a Glafs. Rough all over with a tuberous *Crust*. They are found in *Germany*, *Moravia*, and other Parts. One Drachm hereof in Powder, is a potent Sudorifick. (b)

A Stone like a Pebble with fmall TUBULAR KNOBS Lap. upon it, like the Primordia of a Water-Pipe. They are fo fmall, that their hollows cannot be obferv'd without a Glafs. The Stone on which they grow, though very hard, yet makes a ftrong Effervescence with Spirit of Nitre. Thus far of Cylindrick Stones.

The CONICK STALACTITES, folid. 'Tis about three inches long; the top sharp, the middle is an inch over; the base, an inch, with four or five excentrick Crusts. The whole composed of several Crusts, one within another, as the Water-Pipe. Yet not hollow, as that, or rather not empty, but filled with a Red stony substance. Being kroken, it shines like the Lapis Judaicus. Without, smooth, of an Ash-colour, with some little cast of red. Instantly diffolved

(b) Boet. de Lap. & G.

(a) De Lap. & Gem. Lib.

### Of Regular Stones.

PART III.

(a) Mufæum Metallic.

diffolved with Spirit of Nitre. Aldrovandus (a) hath one figur'd like this; but by himfelf, or by Ambrofinus, call'd Stelechites Pyramidalis; very improperly.

The CONICK STALACTITES, hollow. 'Tis three inches long; at the top, which is now open,  $\frac{1}{2}$  over; in the middle, near  $\frac{1}{2}$ ; the bafe fpread out, with feveral round *Crufts* on one fide, like half bubbles, to the breadth of above an inch. On the oppofite fide, with a fhort fingle piped one. All of them contained together within the utmost *Cruft*. Smooth and afh-colour'd without, within pure white.

The Black BELEMNITES. The generick Name is from the fhape, like that of a *Bolt-head*. This *Species* is outwardly of an afh-colour, but black within: and therefore by fome called *Coraceas*. Radiated as most of them are, with transfers *Striæ*. And bored at the thick end, which is not fo usual, with a *Conick* hollow. See the Description of two or three forts in *Boetius*, *Wormius*, and others.

The WHITE BELEMNITES. 'Tis Conick as the former; but the Rays not fo plain. Together with its white colour is joyn'd fome little transparency.

The bigger YELLOW BELEMNITES. Particularly called *Dactylus Idæus*; for that it is in fhape and bignefs like a little Finger; and was firft, or is now chiefly, found upon Mount *Ida*. 'Tis folid, femiperfpicuous, and of the colour of yellow *Amber*. They have ufually a kind of notched Ridge all along one fide; but this hath two oppofite ones.

ANOTHER, with a little Hollow fill'd up with a Pith of Earth.

A CLUSTER of broken pieces of the Belemnites.

The SHELL'D BELEMNITES. qu. Stalemnites. Opacous, and of the colour of grey Horn. Pointed at both ends, as the Belemnites is at one. And at one end, sheweth fix or feven shells one over another, as in the Stalastites above describ'd. From whence I have nam'd it.

Some of these being rub'd, take up *Chaff* or other light Bodies, as *Amber* doth. *Kentman* (b) mentions one of an Ash-colour, which being rub'd, smelt like a burnt *Cows* Horn. And a white one, which smelt not much unlike to white

(b) Foffil. Nomencl. PART III. Of Regular Stones.

white Ambar. They are found in Germany, and other Parts, fometimes in England. They all make a ftrong Effervescence with Acids. Thus far of Stones fimply Conick.

The WORME-STONE. 'Tis now broken at one end, yet about two inches and 1 long. Confisteth of about five folid Rounds, winding from the bigger end ( about <sup>1</sup> of an inch over) fo as to make a fpiral Cone. Not much unlike a Steel Worme used for the drawing of Corks out of Bottles.

Another of the fame shape and bigness. This Stone I find neither figur'd, nor mention'd by any Author, faving only Olearius. (a) They were taken out of the midst of a (a) A Dutch Mufæum. Rock.

A NETED-STONE. Lapis retiformis. It confifteth of black and roundifh portions, feverally furrounded with Veins, of an Okre-colour, running one into another after the manner of Net-work. Along the middle of each Vein (about <sup>isth</sup> of an inch broad) runs a fmall Thread or Line, almost of the fame colour.

Another, with the Are'as of the Net-work not fo black, fofter, and fomewhat flaky.

A FLINT of a dull Red, with the Figure, almost, of a  $\lambda$  encompassed with fix or feven Rings.

The FLAT BOLTHEAD. Anchorites. Of affinity with that well defcribed by Wormius (b) with the Title of Silex (b) Muf. lib. venabuli ferreum Cuspidem exacté referens. By Moscardo, (c) 1. Sect. 2. with that of Pietre Ceraunie; who also figures it with three (c) Muf. lib. or four Varieties. This like those, is a perfect Flint, and <sup>2. c. 50</sup>. femiperspicuous. <sup>2</sup>Tis likewise in the same manner, pointed like a Speer. Having at the other end, like those of Moscardo, a short Handle. But moreover, hath this peculiar, that 'tis pointed or fpiked alfo backward on both fides the Handle; with fome refemblance to an Anchor, or the Head of a Bearded-Dart: from whence I have nam'd it. <sup>2</sup>Tis likewife toothed on the edges, and the fides as it were wrought with a kind of undulated fculpture, as those before mention'd.

ANOTHER, different from the former, in that it is longer, hath a deeper Indenture, but no handle. Both of them strike fire like other Flints. That of Wormius was found in a Hill in the Diocefs of Ripen.

Not

#### Of Regular Stones. PART III.

Not only Moscardo, but others reckon these amongst the Cerauniæ or Thunder-bolts. So called, because believed fometimes with Thunder to fhoot down with violence out of the middle Region. Amongst other Relations hereof. that of Terzagi (a) is very express; who faith, That the Corps of one struck dead with Thunder, being inspected in the prefence of - Septalius, and feveral others, and a black Wound observed about the Hip, and searched to the Bone; they found therein a round and edged Stone, which being broken, had a very strong fulphurious stink. With this Author, I fcarce think any thing of this nature incredible, (b) Mufæum to those that read the Relation given at large by Wormius (b) of the Norwegick Moule.

> Thus far of Regular Stones, whofe external Form is Circumscriptive, or at least depending upon the whole Stone. I shall now defcribe those, whose Form is Accumulative, or where there is a repetition of the fame figure, or near it, in feveral Parts.

> The GRAPE-STONE. Botrites, Wormio. Here are two or three forts. One folid, of a yellowish colour, an inch and <sup>1</sup> long, knobed with feveral fmall Clufters, like a young bunch of Grapes.

> The HOLLOW GRAPE-STONE, with high Knobs or white Berries cluster'd all round about, as in the former, and fomewhat thicker.

> A SEMI-GRAPE-STONE, with white Drops or Berries only on one fide. They all make a vehement Effervescence with Acids; and are a fort of Stalagmites, next of kin to the Confetti di Tibuli before describ'd.

> The STAR-STONE. Afteria vera, Boetio. Generally of a ‡ or ½ an inch in Diametre, confifting of feveral Joynts, evenly piled one upon another, of a Pentagonal Figure, like a Star, and with the fignature alfo of another on both fides, which is composed of short transverse Striæ. When broken, it shines like the Lapis Judaicus, or the Entrochites; to which latter it is next of kin. Sometimes they are When confifting of more Joynts, it may found fingle. rather be call'd Synasteria. Several both of the joynted and fingles ones are here preferved.

> A very hard Stone, a kind of Pebble with the fignature of the Asteria upon it.

PART III.

Mr. Lyster hath given a particular Account of this Stone, and its varieties in feveral Figures; published by Mr. Oldenburge, (a) together with some Notes of Mr. Ray (a) Phil. thereupon. Mr. Lyster sound the fairest of them near Bugthorp and Leppington in York-shire, in a blew Clay.

The STARRED-STONE. Aftroites. So called, for that being tabulated, or polifh'd to a plain, it appears adorned with little Stars, about  $\ddagger$  or  $\ddagger$ <sup>th</sup> of an inch in Diametre. Boetius conjectures Pliny to reckon this Stone for a fort of Agate. Whether that be fo or no, himfelf is greatly miftaken (b) in affirming as much : this being a very foft (b) Lib. 2. Stone. The fame Author takes notice, as of a ftrange <sup>c. 145.</sup> thing, That this Stone being put into Vinegar (c) will move (c) C. 147. up and down in it. Whereas it proceeds (as Mr. Lyfter alfo obferves of the Afteria, which he calls the Aftroites) (d) Phil. Tranf. only from the Ebullition following upon the immerfion : and happens to any other Stone diffoluble with Acids, if immerfed in fmall pieces.

Another, two inches long, and near as broad. This is unpolifh'd, and feems to be but part of a far bigger Stone. So that although the figure which *Boetius*, and fome others give, is but fmall, *fc*. not an inch long: yet is it fometimes of good bulk.

The ASTROCHITES; polifh'd with the figure of a *Crofs*. The Stars are here more round, than in the former. The fpaces between the feveral Stars and Rays, of a dark blackifh colour. The Rays or Stars themfelves are pale. And alfo furrounded with a toothed Circle; fo as not unaptly to reprefent the Wheel of a *Watch*: from whence I have nam'd it.

The imperfect STARRY-STONE. Aftroites Boetio (e) (c) Lib. 2. quartus. In this the Stars are more obfcure, and fcarce radiated, but rather fpots. But the Stone for fubstance the fame as the former.

The WAVED Stone. Aftroites Boetio (f) tertius; but (f) Ibid. improperly fo call'd. For although it be, for fubftance, like the former; yet is not adorn'd with the likenefs of Stars, but of Waves. The feveral Waves are composed of whitish transforms Striæ.

Another, with the Striæ more confpicuous. The SEIVE-STONE. Lapis Cribriformis. A kind of R r Tophus.

## Of Regular Stones.

306

per Utañ

## PART III.

Tophus. 'Tis of a brown colour, porous light and friable, as a *Pumice*. And perforated with many Pores more confpicuous, about as big as to admit a large *Pin*, and regular, *fc*. round, ftrait and fiftular.

I now proceed to feveral Spars; of which, although fome belong to Metals; yet here, have no Metal adhering to them. Those that have, will fall in amongst Ores. And first of such as are pointed, both soft and hard, referving the Flaked for their place.

Let it only first be noted, That the specifick difference betwixt the *Stalactites* and the *Spar*, is, That the former, is always *Opacous*, and never *Angular*: the latter, always or usually perfpicuous, and never round.

A Silver-Ore SPAR. About an inch and i high, and three in compass. It confisteth of feveral Crystals fexangular and pointed, and composed into the figure of a great Bud. The four uppermost bigger than the rest. All semiperspicuous, of the colour of grey Chrystal; and seem to be as hard.

ANOTHER large Piece confifting of hard and fexangular Crystals, and of the fame colour with the former. Taken from the Coginnian Silver-Mines. Given by Mr. Colepres.

Several other Pieces of the fame, and given by the fame Hand.

• A METALLICK SPAR, of a pale AMETHYSTINE colour. 'Tis angular and pointed, as *Cryftal*; but with fides more unequal. 'Tis alfo foft and brittle. Yet harder than fome others. And hath no fenfe of *Acids*.

A SHOD. Spuma Lupi. The forerunner of the Load or Mother of the Tin-Ore. 'Tis both blacker, and harder than the Mother-Spar.

Another of the fame, mixed of black, grey, and yellow.

The MOTHER-SPAR of the Tin-Ore.

ANOTHER, arifing from a Whitifh Bed, mixed with a kind of rufty red. The *Cryftals* are angular, pointed, and foft, like the fquare *Lead-Spar*. Semiperfpicuous, yet mostly cover'd with an angular and blackifh shell.

A pretty hard Ash-colour'd and Opacuous Spar, growing near the Tin-Mines.

A

PART III.

## Of Regular Stones.

A YELLOW TIN-SPAR from Ireland. Given by Sir Rob. Moray. The feveral Crystals are angular, pointed, and foft; femiperfpicuous like brown Sugar-Candy. Diffoluble with Acids.

An Iron-SPAR. A Clufter of fmall, pointed Crystals, almost of the colour of brown Sugar-Candy, but fader, and less perspicuous. 'Tis hard enough to cut Glass.

ANOTHER, Mixed. In the middle, it hath many Striæ; of a Lead-Ore colour, running crofs one against another. These are encompassed with other parts of the colour of yellow Okre. With which are also mixed some white and green spots. The Stone tasteth like white Vitriol.

A large Copper-SPAR. Given by Mr. Langerman. 'Tis a  $\ddagger$  of a yard long, and near as broad. Confifting mostly of fexangular Points, upon a grey Bed, which is also mixed with Granulated Spars. The other fide, all befprinkled with yellow Mundick.

A MUNDICK-SPAR; confifting of tabulated or flat and fquare *Crystals*, of the colour of Citrine *Amber*, and growing to a whitish *Matrix*.

Note, That almost all Spars of this kind, are composed of tabulated, and square Crystals.

ANOTHER, confifting of black fhining *Cryftals*, of the colour of *fet*, and as broad as a *Dice*; and fome of them almost Cubical. Being broken, the fragments are of an *Amethyftine* colour. There are alfo, underneath, fome whitish *Cryftals*; above, fome of yellow *Mundick*.

ANOTHER, partly plated, and partly pointed; of a black fhining colour, like that of polifh'd *Steel*. 'Tis very ponderous, and maketh no *Effervescence* with *Acids*. Yet foft and brittle. Which three Properties, belong to most, if not all, *Mundick-Spars*.

A SPAR with CONICK CRYSTALS. They are moft of them an inch and  $\ddagger$  long. All very clofe and continuous, excepting at their Points, as in the *Amethyft*. Semiperfpicuous, and exactly of the colour of the beft brown *Sugar-Candy*. Very foft; and eafily diffolved with *Spirit of Nitre*. It was taken out of a *Portland-Stone*; and given by Sir *Rob*. *Moray*.

A SPAR with CRYSTALS TRIANGULARLY pointed. Tis a pretty round Lump. The *Cryftals* fo placed, that R r 2 the

## Of Regular Stones.

308

## PART III.

the Angle of one, for the most part, answers to the fide of another. Of a pale and semisperspicuous colour, coming near to that of white Sugar-Candy. In which also small parallel Streaks of a brighter colour, are observable. Very soft, as the former, and dissoluble with Spirit of Nitre.

The STYRIATED STALACTITES. Of the fame kind with the Styriæformis defcribed by Wormius. It is a congeries of strait, round Styriæ, fomewhat parallel, and as thick as a Cherry-Stalk, or small Packthred. Each Styriæ is composed of small, pointed and lose Grains, as big as those of Salt, piled in a strait line one over another. It makes an Effervescence with Spirit of Nitre.

The MOSSE-STALACTITES. Confifting also of Granulated Styriæ; yet not strait and parallel, but winding too and fro, and the Grains with bigger points; fo as to refemble petrify'd Mosse.

I NEXT proceed to PLATED-STONES; and first such as are of a Rhomboid Figure.

A CRYSTAL of TALK. Wormius defcribes Talk, to be a Stone divifible into flat Plates, varioufly intricated, and divifible like Silver, which is all he faith of the form, and his words unintelligible. Far from a definition of that form, which, fo often, as its Concretion proceeds freely on all fides, or without hinderance from any adjacent Body, it doth obtain : being then, a Congeries of flat, and perfpicuous Plates, fomewhat pliable, and figur'd into a kind of double Rhomboid; or as it were two Squares, with unequal Sides and Angles, clapt together, with the edges produced, to diftinguish them: fo, as to obtain twelve Angles, and ten Sides, fc. eight leffer, and two greater ones. A piece thus figur'd, I call A Crystal of Talk. And of this the form is both Accumulative and Circumscriptive: the difference betwixt which is shewed in the beginning of this Chapter.

An HALF-CRYSTAL, having only fix fides, four leffer, and two greater ones; as if it were a perfect one, fplit.

A piece of FOLIATED TALK. It confifteth of feveral pieces, pellucid, cleveable, and fomething pliable, of a Rhomboid Figure, and composed together fo as to refemble the indented leave of *Wild Clary*.

A large Piece of TALK, above <sup>1</sup>/<sub>2</sub> a foot square.

A Piece of TALK taken out of the Ground in Wiltshire.

A

## PART III. Of Regular Stones.

A lump of the TALK-ROCK near Spiral, in the upper Carinthia. Given by Dr. Edward Brown. It confifteth of broken pieces, like those of the Selenites, immersed in a white gloffy Stone, stained with purplish spots, and so hard as to scratch Glass.

Talk, although flexible, and regularly figur'd, yet feeleth no Acid; and is of that obstinate nature, as neither to melt; nor fcarce loofe its colour, in the fire. Confidering which, and that all Salts, yet known, will flow: I am induced to think, That it hath not its Figure from any Salt; but is almost a fimple Earth fui generis. And that there are earthy Particles, as well as Saline, which are regularly figur'd, and of which this and fome other Stones are composed. Hereof is prepared a wash for the Face, which fome Chymysts cry up for the best in the World.

A GREEN TALK-SPAR. The whole piece, is here of a rude Figure; but is eafily broken into Rhomboid Plates, refembling those of *Talk*, from whence I have nam'd it. 'Tis tinged with a pale Green. It stirreth not with any *Acid.* Yet is not flexible, as true *Talk*, but brittle as *Glass.* 

A great Crystalline TALK-SPAR. So I call it. Sent by Dr. Eralmus Bartholine, together with a large account of it, published in a the Phil. Transactions. (a) And by the (a) Num. 67. Dr. (b) himself in a diffinct Treatile. 'Tis a foot long, 1 a (b) Experifoot broad, and two inches and i thick. Of a Rhomboid menta Cry-Figure, and the narrow fides likewife floaped, as in the ci Dif-Di-Crystals of Talk. It breaketh also into parts of the fame aclassici Figure, or near it. Yet not flexible, but brittle. Polite, colourless, and transparent, as the clearest Chrystal. Yet foft and diffoluble efpecially with Nitrous Spirits; and by a strong fire reduceable to a Calx. Of a very different nature from Crystal, although the faid Dr. is pleased to to call it. When heated, it is of an *Electrick* Nature, or like Amber, taketh up ftraws and other light Bodies. That which he principally Notes is, That the Objects feen through it, in certain politions, appear fometimes fingle, fometimes double, and fometimes fixfold. Which he afcribes to a Refraction peculiar to this Stone. And to me, it feems probable, That this various Refraction depends upon the structure of the Stone, sc. as it is not one piece absolutely entire, but composed of feveral Plates; and those not all in

## Of Regular Stones.

## PART III.

in a like manner, but differently contiguous; fo, as in fome places, feveral *Plates* may make but one *Refraction*; in others, two or more. It was dug out of a very high Mountain in *Ifland*, one whole fide whereof confifteth of this *Spar*.

TWO PIECES of the fame Stone, about two inches and <sup>1</sup> long, broad, and thick. Thus far of Rhomboid Stones.

The RHOMBICK LEAD-SPAR. Frequently found in the Lead-Mines in Derbyshire, and in others. By fome called English Talk. But very improperly. For though it confisteth of feveral Plates, yet not flexible, but brittle as Glass. Befides, 'tis not of a Rhomboid, but Rhombiek Figure, that is, a Diamond-fquare, or with the Angles unequal, the fides equal. Nor doth Talk feel any Acid, but this with Spirit of Nitre is eafily diffolved. It breaks into pieces, which, though never fo fmall, yet retain the fame Figure. Being burned, it yieldeth a Lixivial Salt.

A clear FLINT, of the colour of yellow Amber, with Striæ on the fides shaped into little Rhombes.

A RHOMB of MUSCOVY-GLASS. This Stone is by moft called Selenites. By fome Mariæ Glacies. By Agricola, and Kentman, Magnetis. By Ambrofinus, (a) confounded, under the fame Name, with Talk. 'Tis indeed the neareft of kin to that of any Stone, being infenfible of Acids; and confifting of very thin, perfpicuous, gloffy, parallel, and flexible Plates. Seldom found figur'd. But when it is, I fuppofe always, as it is here in this piece, fc. into a Diamond-fquare, *i. e.* with unequal Angles, and equal fides; whereas in a Talk-Cryftal, both are unequal. It was taken out of Mount Hæmus.

A very white Piece of Muscovy-Glass.

ANOTHER, of a pale Green colour, with a kind of filver glofs, and femiperfpicuous.

Another, of the colour of tarnish'd Copper mixed with black.

A lump of Selenites. 'Tis immerfed in fmall pieces in a whitish Stone, a little Diaphanous, and so hard as to cut Glass.

This Stone grows in Cyprus, Sicily, Saxony, and many other places; efpecially in Muscovy, whence the English Name. Used in Saxony, and other places in Germany, in Windows,

(a) Aldrov. Muf. Metall.

310

Of Regular Stones. PART III.

Windows, instead of Glass. Ambrosinus (a) mentions a (a) Ubi Lead-colour'd fort so big, as to make not only Tiles, but supra. Tables.

The BONONIAN STONE, Prepared and given by Fr. Willughby Efq;. 'Tis fomewhat fiffile, and may be here ranked. Now of a greyish colour, and in some places like the Rombick Lead-Spar. No Acid will touch it. Its quality of thining in the Dark, after its being exposed a little while to the Sun, is now loft. See the manner of its preparation in Wormius. Given in Powder, (b) or the infusion (b) Muf. Wormian. of it, after calcin'd, is a strong Emetick.

An odd SPAR, Green by day; by Candle-light of an Amethystine colour. Softer than to cut Glass, yet harder than the common Rhombick Lead-Spar.

A FLORENTINE SLATE. A fort of Saxum fiffile. Hereon is naturally reprefented the PROSPECT of a City, Houfes, Churches and Steeples, standing in length. To make them all visible, it must be wetted.

ANOTHER, with the PROSPECT of a TOWN, lying round upon the fide of a Hill.

Another with the like PROSPECT; but shewing it, as at a much greater distance.

Another, with one half of the TOWN on a Rock, the other in a Plain. There are some of this kind in Septalius's Mulæum.

A SALTRAMSLATE. Very like to Efford-flate (used for Writing, and Mathematick Schemes ) but not all out fo good.

An odd SLATE with yellow Mundick in fmall Grains or Sparks immerced throughout the body of it.

RUMPLEY-STONE. A common blewish Slate, for colour and fubstance. But excelleth, in that it rifes large enough for Building. It may be cleft as thin as you pleafe.

A kind of whitish Slate, mixed with a rusly Iron-colour : plentiful in fome Mines

Some others; one grey and fpotted with tawny. Another, of a brown Purple. A Third, Red. Thefe abound in the High-Ways about the Mines in Cornwall. With thefe may be placed.

The WAXEN VEIN. Ludus Helmontij. A Stone composed of two distinct Bodies. One, and the far greater, is of

### Of Regular Stones.)

PART III.

of a dirty ash-colour : in substance, not unlike the Limestone. The other, somewhat harder; runs through it in several Veins, or rather Plates, as being usually plain, as thick as the back of a stender Knife, and exactly of the colour of yellow Wax; for which cause I have plac'd it amongst the Plated Stones, and taken leave for the English Name. Both of these two Bodies make an Effervessence with Spirit of Nitre, but the ash-colour'd, the greater.

The PIPED WAXEN-VEIN. So I call it, for that the greater ash-colour'd Body inclosed within the yellow *Plates*, is stuffed top full of small *Cylinders* and *Tubes* irregularly placed: most of which seem to be of the same yellowish substance, as the *Plates*. This *Species* hath some affinity with the piped *Offeocolla* above described.

The STARRED WAXEN-VEIN. Given by Sir Rob. Moray. Found in the Ifle of Sheapy. On one part of the Stone grows a fair Star, with many Rays, about an inch long, white and gloffy: from whence I name it. This Star is of a quite different nature from the Stone on which it grows, as making no Effervescence with Acids, and in figure agreeing rather with the Pyrites.

A Piece of WAXEN VEIN, with doubled *Plates*; in fome places, as it were efflorefcent with feveral little protuberances confubftantial.

From the Defcription of this Stone above given, it appears, that *Wormius* was miftaken, in reckoning it amongft *Flints*. This is that, which *Paracelfus* for much extols for a *Lithontriptick*. And thus far I believe, that 'tis a very good *Diaretick*; and may therefore fometimes be very well ufed for the carrying off of *Gravel*. But let all that have any Stone too big to be voided, take heed of fuch Medicines.

PLATED MARBLE. It feems to have been originally a ftriated Bole. Now a Stone as hard as Marble, composed of Portions, of an inch thick, **composed of Portions**, of an inch thick, **composed of Portions**, colour's, growing parallel, or as it were *ftratum fuper ftratum*; from whence I have nam'd, and here plac'd it.

Several foft PLATED STONES, found in the fame place, and of the fame colour and fubftance, with the *Fifb-Mould* formerly defcrib'd. One of them, Globular, a little compressed on the two opposite fides : but composed of

· · · · ·

## PART III. Of Regular Stones.

of *Plates* or *Crufts* narrowed from the middle of the Stone both ways, fo as to make that Figure. A fecond, Oval, with three Hemifpherick knobs appendent; all plated, as the Globular. A fourth and fifth figur'd almost like a Finger.

THUS FAR of *Plated Stones*. Next of those which we may call *Fibrous*. In the former, the Parts are answerable to the leaves in a piece of *Past-board*. In these to the *Bristles* in a *Brush*, or the *Threads* in a *Skeine* of *Silk*.

THRUM-STONE, as I call it. Amianthus Lapis & Asbeftinus. It grows in fhort Threads or Thrums, from about a ‡ of an inch to an inch in length; parallel, and gloffy; as fine, as those fmall fingle Threads the Silk-Worm spins; and very flexile, like Flax or Tow. Nothing answers it better, than the hard fibrous part of a large Oyster, when 'tis stew'd. Here are several pieces, both of White and Green. Of which, the latter hath the longest Threads, and the most flexile.

A piece of AMIANTHUS-ROCK; in which the *Thrums* (about <sup>1</sup> of an inch'in length) lie in *Layers* between feveral Beds of a Green Stone, in fome places of a redift brown.

Another, with Veins or Layers between Beds of a blewish colour.

A BASTARD-AMIANTHUS. It grows in Veins in a Claiy and Mundick Load, between Beds of a Greenish Earth. The Threads <sup>id</sup> or near <sup>i</sup> an inch long, of a glossy black, and brittle. Given by Mr. Colepres, who observed it amongst the Cornish Mines.

The beft is found in *Cyprus* and *India*. Of late, very good in fome *Mines* in *Italy*. Of which fee the *Philof*. *Tranfactions*. (a) It was anciently fpun, like *Tow*, into Sheets; (\*) Num.72: in which the Bodies of Princes, laid on the *Funeral Pile*, were wrapped up, to keep them entire, when they were burnt, from the other aftes. Thefe Sheets were made clean, not by washing, but by burning them; as being infuperable by the fire: from whence the Name of the Stone. The Art, as well as the Ufe, is thought to be gone. But not fo; for *Septalius* (b) hath or lately had both *Thread*, (b) Mufæum *Ropes, Paper*, and *Netted-Works* all made hereof; and fome of them with his own hand. *Boetius* defcribes (c) an (c) Lib. de Oyntment made of this Stone, which he highly com-Lap.& Gem.

## Of Regular Stones.

PART III.

CHAP.

mends against the Sore on Childrens Heads, usually called *Tinea Puerorum*; and Ulcers in the Legs. It hath no fense of Acids.

The FIBROUS BLOOD-STONE. Hæmatites. This I take to be that particularly, by Pliny call'd Androdamas. It hath affinity with the Amianthus, not only in being divifible into Fibers; but in that these Fibers are also somewhat flexile, and of a greenish colour. Yet here, they stand not just parallel, but rather so as to tend towards one point; like the Styriæ in some forts of Antimony. This Stone is also altogether infensible of Acids. Found in Germany, Bobemia, Silesia; among the Iron Mines; of an Iron colour, a dull red, yellow, and sometimes black. Much celebrated against an Hæmoptoe. Trallianus prescribes it ground to an impalpable powder, from  $\exists$  to  $\exists$  in for a Dose.

A Piece of SPAUD or TARRAS. Schiftus Capillaris; as I call it. It confifteth of white, gloffy, and parallel Fibers. But different from the Amianthus, in that they are very brittle; nor fo eafily divided. From the Schiftus defcribed by Wormius, (a) which is divifible into Plates. And that which Boetius defcribes, which is yellow. This is pure white, almost like polish'd Silver, and in a thiner piece, femiperspicuous. Being rub'd between ones Fingers, it divides into an infinite number of Hairs, twenty times smaller than the smallest Needle. It stirs not with Acids: and therefore feems neither to be any kind of Gypfum properly fo call'd.

Another Piece of the fame, from Warmick-Shire. Given by Sir John Hoskins.

A Piece of HARD TARRAS, from Stinchcombe in Gloucestersbire. Given by the same Hand. 'Tis more close and firm than the former, rather like those in Sal Armoniac; the Fibers not altogether so regularly pild; nor so white, more refembling the Mother of Green Vitriol.

The fame Analogy as is between Talk, Muscovy-Glass, and Amianthus: is also between the Rhomboid Spar, the Saxum Fisfile, and the Tarras.

(a) In fine, Cap. de Amiantho, &c.

314

#### PART III. Of Stones Irregular.

## CHAP. VI.

## OF STONES IRREGULAR.

A S GEMS are chiefly diftinguished by their Colours, and all other Stone's Regular, by their Figures : So thefe, by the different degrees of Hardnefs.

EMERY. Smiris. Of a kind of blackish Iron-colour. The hardest of unfigur'd Stones. And is therefore used for the polishing and cutting of all Gems, except the Diamond. For the hollowing of flinty Mortars, together with Sand. (a) For the brightening of Armour, and all Metal- (a) Muf. Metall. Ald. lick Equipage. And for Moulds or Forms for the caffing of Medals and other Coins. Yet Mr. Boyle (b) hath open'd (b) Of Gems, it with a Corrofive Menstruum fo far, as to make an infusion p. 160. of Galls therewith to turn blackifh.

A FLINT of the colour of yellow Amber. It alludeth to a Topaz.

A polish'd FLINT, not unlike a Calcedony.

A rough FLINT naturally perforated with feveral large Cavities running one into another. It feems to be an affay towards an Eagle-Stone, which is commonly a Flint.

Flints are of all colours. Some fo clear, that fome 7emelers cut and fell them for Bohemick Diamonds. (c) They (c) Boet. de are also used for factitious Gems, with the mixture of Metals, in fusion. For making of Glass. For Mortars for the powdering of the Fragments of Gems. And fometimes added to melted Metals, to keep them, as is supposed, by the Metallifts, from spending. (d)(d) Ambrof

in Aldrov.

it

A BALL of SERPENTINE MARBLE; called Ophites, Muf. Metal. from the winding of the Veins. Near four inches in Diametre. Of the nobleft fort; confifting of White, and Red or Murrey Veins, in Black.

- ANOTHER MARBLE-BALL, two inches and in Diametre, Veined, and fpoted with Red, Sand-colour, and White.

A THIRD, Veined and fpoted with Black, Sand-colour'd, and White.

A Ball of ONYCHINE MARBLE, about the fame bignefs; on one fide Sand-colour'd, on the other Grey. That which is observable is this, That instead of winding Veins,

Sf 2

#### Of Stones Irregular. PART III.

it hath feveral Circles one within another, as if drawn with a pair of Compasses on a Slate; or as in the Onyx; from whence I have nam'd it. The bigeft Circle is about an inch and i in Diametre.

Two pieces of ÆGYPTIAN MARBLE. Confifting of a blackish Ground, as it were inlaid with little Green pieces, most of them of an oblong square Figure.

A Piece of the worft fort of CORNISH MARBLE, used A blewish Stone, mixed with some whitish for Lime. fparry Veins; and fome of a redifh-flat, of the colour of Terra Lemnia rubra. Marbles, befides the places mention'd, are found in Italy, Germany, Cappadocia, Hetruria, Numidia, and other parts. The uses are as known, as great.

LAPIS LAZULI, i.e. Blew-Stone; Lazuli being the Arabick Whence alfo the corrupt Italick, word for a blew colour. Azure. It confifteth of parts of a full Blew (ufually with fome yellow fpecks) immerfed in a dull Bed, bordering upon the colour of Fullers-Earth. On this here, grow fome pieces of Spar, fo hard as eafily to write in Glass.

Another Piece growing to an ash-colour'd and fostish Stone, diffoluble with Spirit of Nitre.

This Stone is usually found in Gold Mines in Africa Of two kinds; The fixed, which being put in and Alia. to the fire, keeps its colour; The Not fixed, alfo in Ger-(a) Boet. de many. (a) Hereof are sometimes made Knife-Hafts and Spoons. But efpecially that most excellent BLEW, called The manner of preparing it, is very ULTRAMARINE. largely and exactly defcribed by Boetius. (b) The powder hereof given to the quantity of 3ß (or more or lefs) is an innocent and useful Cathartick. (c) It will sometimes work by Vomit. Hath been fuccessfully used in Quartans and Malignant Feavers. And yields a Narcotick Oil. (d)

The Fading BLEW-STONE. Lapis Armenius. This piece confifteth of Blew and Green parts mixed together. And the blew parts themfelves, at least, the colour made of them, will in time turn green. 'Tis fofter than Lazuli, and not infenfible of Acids; and of Oil of Vitriol more, than of Spirit of Nitre.

Another Piece of L. Armenius; confifting of Blew parts immerfed in a hard and redifh fand-colour'd Bed, with a Green piece growing to one fide. Given by Henry Olden-

Lap. & G.

(b) From Cap. 123. to 137. & 141. (c) Braffavolus. (d) Fioravantus.

burge

#### PART III. Of Stones Irregular.

burge Efq;. It grows in Germany, Hungary, and Transylvania. It makes also an excellent Blew, but, as is abovefaid, not The way of making it, fee in Boetius. (a) Given (a) Lib. 2. holding. in Powder, unwashed, to the quantity of 31 or Jilij, it works c. 144. by Vomit: washed, to the quantity of  $\exists v \text{ or } \exists ij$ , works by Stool; highly celebrated by fome, not only for its Innocent, and most easie; but also most effectual Operation, in

fuch Difeafes, as are fuppofed to depend on Melancholy. (b) See Tral-The LOADSTONE. Magnes; from Magnefia, a Coun-nerius, and try between Theffaly and Macedonia, where, it's faid, it was others. first found. For the most part of an Iron-colour, tending to Blew, by fome called The Male; if Black, The Female. Here are feveral both great and fmall. One weighing about fixty pounds. Given by Dr. Edward Cotton. Dug out of the Ground in Devonshire. Although it takes up no great weight, yet moves a Needle nine feet diftant. Some part hereof, which was broken off, being put in its proper place, adds much strength to it. Here are likewise some other great Pieces from the fame place.

Part of a LOADSTONE ROCK in Anglesey. Of a rufty Iron-colour, and in fome parts of a dirty flat-Blew.

Two Orbicular LOADSTONES; one of them with an Axis.

TWENTY SEVEN Leffer LOADSTONES: whereof eleven are Arm'd and Coated. They are usually found in Germany, Italy, Misnia, Gc. in the Iron-Mines; and fometimes yield Iron. See the Hiftory hereof in Kircher, and Vincent Leodaud, who have published what is faid both by our own Country-man Gilbert, and by others.

The admirable and known Properties of this Stone, are, in general, thefe, That it attracteth Iron; or any Body, if fmall, which hath Iron in it. That it hath no perception of any other Body, though never fo light. That it maketh the Attraction according to its Poles. And that it Communicateth to Iron both the fame attractive power; and a Verticity to the North-Pole. In which last, lieth its Great ufe, as applied to Navigation. Although by Obfervations made from the Variation of the Needle, Time may produce further Discoveries in Astronomy. Those that travail through the vast Deferts of Arabia, have also a Needle and Compass, whereby they direct themselves in their way; as (c) Majoli Mariners at Sea. (c) The Colloquia. Mariners at Sea. (c)

## Of Stones Irregular.

## PART III.

ANO-

(a) Muf. Septal. (b) Of Effluv. p. 33.

318

The power of the *Magnet* dependeth not on its Bulk; the fmaller, being ufually the ftronger. *Tergazi* (a) mentions one, that would fufpend fixty times, and Mr. *Boyle*, (b) another, eighty times, its own weight. But the beft, in time loofe very much of their ftrength; as thefe here kept have done: None of them now taking up above  $\exists v_i ff$ . Of what they would have done formerly, I find no Regifter.

Some means have been proposed for preferving the ftrength of a Load stone. But there is none mentioned by any Author, that I know of, comparable to That, experimented by Mr. Theodore Haac, Fellow of the Royal Society; not only for Preferving, but alfo Recovering, and Encreafing the strength of the Loadstone. For he having One weighing about 3iiij s. arm'd, which would take up fixteen times its own weight: and having laid it by for the space of some years unus'd, found it to have loft <sup>1</sup>/<sub>4th</sub> part of its ftrength, fo that it would now take up but about thiij. And, upon fearch, meeting with no means effectual to recover it; confidered with himfelf, That as in Morals, the exercise of Virtue, makes it more generous; and that Animal Motions, by ufe, become more vigorous: so it might possibly prove also as to fome Properties of Inanimate Bodies. Whereupon, he hung as much at his Stone, as it would bear; and fo left it for the space of some Weeks. Then, returning to it, and applying more weight to the former, it very eafily held the fame. And repeating the addition of more weight, at feveral periods in the space of about two years; he at last found, That his Stone had not only recovered its former ftrength, but encreas'd it; for whereas before he had never known it to take up more than fixteen, it would now take up twenty times its own weight. And he is now continuing the Experiment, to fee how far it will go further.

A GRITTY-STONE, from the Forrest of Dean; with which they there make the infides of their Iron Furnaces; wherein their fire is fo vehement, that it either breaks or melts down any other Material. The Grains of the Stone must therefore be insuperable; yet not fo united, but that it is somewhat soft and crumbly: of a dirty colour, near that of Fullers-Earth. Given by Sir John Hoskins.

#### PART III. Of Stones Irregular.

ANOTHER, from the fame Hand, more gritty, harder, and of a brown colour.

A Stone like a pure white Pebble, to which another leffer of the fame colour, by mediation of a clean Red, and alfo ftony Cement, is affixed. Hard, yet diffoluble with Acids.

A little Red Oval Stone, on one fide obliquely furrow'd; on the other, pounced, and stained with a stony Blot. This alfo is hard, yet eafily diffolved with Spirit of Nitre.

A piece of Soft ALABASTER. Alabastrites. 'Tis white and crumbly, an infinite congeries of Chrystalline or thining Grains, no bigger than fine fands. It grows in Warmick-Ibire. And is like to that which comes from Holland. Given by Sir John Hoskins.

Another piece, from Shepfton near the Seafide.

Another piece of a YELLOW colour, almost like to that of expressed Oil of Mace. It hath some of a blewish Clay upon it; but might rather cafually fall into fuch a Bed, than be bred therein.

A FOURTH, of VARIOUS colours, in spots, fc. White, Yellow, Red, Leaden, Brown, and Black, mixed together.

A FIFTH (in a Frame) confifting of Afh-colour, Black; and Tawny, mixed in Spots and Veins.

"Tis found alfo in Caramania, India, and other places. It hath been more used than now for the preferving of some more precious Oyntments. But why, rather than Glafs or Glafed Veffels, I know not, unless for thew. A Scruple hereof given in Milk, is affirmed by Boetius (a) to be a (a) De Gem. certain Cure of a Dyfentery. Yet I would have no man to c. 270. trust to this, who may have other Remedies.

BASTARD-ALABASTER, spoted. Gypsum variegutum. Here are Examples of feveral Colours. One Black, with white fpots. Another, confifting of parts fome Black, and fome of a pale Green. A Third, of a dark Green, mixed with White and Red Veins and Spots. A Fourth, confifting of White, Brown, and Yellow. A Fifth, of White, Red, and Yellow. A Sixth (in a Frame) of Afh-colour, Citrine, Red, Black, and pellucid Spots. A Seventh, of White, Green, and a dark Purple. All these Stones make a strong Effervescence with Nitrous Spirits. They are found in Mifnia, Burgundy, Gc. Of

## Of Stones Irregular.

#### PART III.

Of thefe lightly burnt, is made that which is properly called Gypfum. And Statues of any defirable bignefs, yet very light.

A LIME-STONE (Saxum Calcarium) having greenish Veins mixed with a filver gloss. This being burnt, is that commonly called Quick-Lime. . Pliny mentions a mixture of Quick-Lime and Hogs-Greafe, usually call'd Maltha: whence our English word Mortar. 'Tis alfo (a) See Agri- used for the Trying of Ores. (a) Boetius describes an Aqua Calcis, mixed with Sal Armoniac, as an admirable Remedy for Burns, Fistulas, Cancers, and Spots in the Eyes; (b) De Lap. he adds, and Spots in Cotton-Cloaths. (b)

& G. lib. 2. FLAKED DROPSTONE. Stalactites Laminatus. Found c. 293. in the top of the Hills near Wooten Underridge in Gloucester-In Aldrovandus (c) are feveral of these called Succi (c) Mafæum *(hire.* Metallic.

Concréti.

ANOTHER, digged from under the Root of a Tree in Cre-Forrest. Given by Dr. Edward Brown.

A SPÓNGY DRÓPSTONE, of an afh-colour, as the reft.

A piece or two of fmall Dropftones fent from Pendennis-Caftle: faid to to have had a ftrong fcent; but now hath none.

Yellow GREAT-GLIST. Ammochryfos, Boetio. So call'd, for that it confifts of a great number of gloffy fparks almost of the colour of Gold, immerfed in a gritty Bed. And by Wormius and others therefore called Mica.

White GREAT-GLIST. Ammargyros, as I call it, the sparks in this being of a bright filver-colour.

(d) Foffil. Nomencl.

Kentman (d) ranketh both these with Muscovy-Glass. And 'tis plain, That the faid sparks are flaky, and flexible, as that Stone : and is therefore either the fame broken to small pieces, in digging for it; or, at least, an affay of Nature towards it. But furely no Metallick Body, as Wormius fupposeth it; unless he means, that 'tis fometimes found in Metallick Mines.

A Red DAZE, or fmall GLIST, from Cornwall. It differs from the Mica, chiefly, in the smallness of the For they feem to me, to be altogether of the fame fparks. nature. and privid Spars A Second of Land

A Brown DAZE (from the fame place) with an angular Vein of yellow Daze in it; and both mixed with very fmall

#### 320

cola.

PART III.

## Of Stones Irregular.

fmall fparks of a yellowish Spar. Of kin to these, seems to be.

A piece of Gold-colour'd Stone, from a Vein of the fame, found in digging a Trench in New England.

SOAP-STONE. Steatites. Given by Dr. Richard Lower. Taken from a Rock of the fame in Cornwall. Somewhat different from that defcribed by Boetius. Confifting of parts white, red, purple, and green mixed together, as in Caftile-Soap; and feeming, like hard Suet, greafie to the touch: whence the reafon of both the Names. Yet is it not at all diffoluble either in Oil or Water. Nor in any indifferent Fire; by which it only becomes fomewhat harder and whiter. It feems to me to be much of the nature (for fubftance) of the Lap. Amianthus; and that it is the Mother of it.

A foftish Dirt-colour'd STONE (Saxi Limosi Species) from Staffordsbire. Of which those Pots are there made, wherein they melt their Glass.

The Red CAULE (a Stone fo call'd about the Tin Mines in Cornwall) beaten to powder, and made up into a Ball with water. Of a faint red like that of a wither'd Pink. Another of a purplish Brown, with black shining sparks.

A base Slate, i. e. neither of one colour, nor good Grain.

An ash-colour'd PUMIS STONE. There are also whitish ones; and some Black, as in *Sicily*. Where, and at *Vesuvius*, amongst other places, they are frequently found. The fmoothest are, or heretofore were, used by the *Germans* to rub the skin, in their Baths. (a)

(a) Boet. de Gem. & L.

A CYNDER from Mount Ætna; of a blackifh colour, homogeneous fubftance, and fomething metallick. Quite through full of great Bubles. 'Tis ground to a long Oval Figure.

ANOTHER, much more denfe, and ponderous like Iron Ore. Given by Sig<sup>r</sup>. Boccone.

A THIRD, in fome part vitrify'd. Of the Burning and Eruptions of this Mountain we have a copious Hiftory given us by *J. Alph. Borelli*.

A Vitrify'd CYNDER, taken out of the Ruines of this City by the late general Fire, and kept as a Memorial of it.

SECT.

## Of Metals.

PART III.

**Sест.** II.

Of METALS.

## CHAP. I.

## Of GOLD, SILVER, and COPPER.

GOLD ORE of HERNGRUNT, holding Silver. Given by Dr. Edward Brown. It confifteth of fparks of a shining Gold-colour, together with some Black ones, alternately immersed in a white and pretty hard Stone.

GOLD ORE of *Chremnitz*. Given by the fame Hand. Here are feveral pieces. One white, and femiperfpicuous. Another, blackifh, not much unlike fome *Flints*. The others, mixed of both. All fo hard, as to write upon *Glafs*. Yet *Spirit of Nitre* droped on them, in a little while, will fink into them, almost as Water into a *Bolus*. Which perhaps may depend upon fome invisible Cracks in the Ore.

(a) D<sub>r</sub>. Brown's Travails, p. 99. (b) P. 103. (c) Ib. p. 99.

222

That with black fpots in white, is accounted the beft. (a) In an 100 l. weight of Ore, is contained about 3j of Gold, holding one third part of Silver. (b) In this Mine, fometimes are found pieces of pure (c) Virgin-Gold. This, by fome, is called Aurum Obryzum: qu. Ophrifum, like that of Ophir. Of feveral particulars of the Working here, and of feparating the Gold from the Ore, with the Engines, &cc. See the forementioned Doctors Travails.

GOLDEN SAND, from the River *Tagus*. 'Tis very fine, and ponderous; confifting of Grains of a redifh Iron colour mixed with black.

A lump of pure GOLD of the bigness of a Peas, melted out of the forementioned fand.

GRAIN GOLD, or Golden Sand from the River Danuby. Given by John Bembde Efq; taken thence with his own hand. Very fine as the former. Confifting mostly of black Grains, wherewith are mixed fome of a pure Gold colour; in the proportion of about one to twenty.

SAND

PART III.

SAND out of a River near Conimbria, in which there are fome few sparks of GOLD. Together with a Knob of Gold fus'd out of it. Given by Sir Robert Southwell.

Gold hath the least variety of regular figure, in the Ore, of any Metal. Becaufe, more folid, and therefore, lefs wanton, than the reft. "Tis a rare Specimen, mention'd by Georgius The (a) Muf. de Sepibus, (a) which he calls Aurum Ramescens. Ductility of Gold is admirable: one Grain, in Leaves, is extended to above fifty inches square: and one ounce employ'd in gilding fmall Hair-Wyre, will be extended to almost an 100 miles in length; as Mr. Boyle hath observ'd. (b) (b) Of Ef. The Lifes of Cold for Vessels Coins Armour Correspondent flux. p. 13. &

The Uses of Gold for Vessels, Coins, Armour, Garments, 14. &c. are infinite. The Luxury of Galienus the Emperour, taught him to powder his Hair with the Duft of Gold. Some Painters, faith Ambrosinus, (c) hang plated Gold over (c) Aldrov. Vinegar, whereby is produced a pure Blew (as Ceruss out of Lead) which they prefer before the Ultramarine. Of the Art of Refining, fee the Phil. Transactions, (d)

Chymically manag'd, it is reduced to feveral forms, called Communi-cated by Aurum Potabile, Aurum fulminaus, A. Vitæ; as alfo, Auri Dr. Chrift. Calx, Crocus, Sal, Sulphur, Tinctura, Oleum, Vitriolum, Flos: Merret. of which fee Libavius, Crollius, Schroder, and others. One principal use of Gold in Medicine is, for the Correction of Mercurial Medicines. The original use of Leaf-Gold in Electuaries, and divers other Preparations, was not only for better grace, but from the opinion of its adding Virtue to them. And Plates of Gold, anciently, have been us'd; efpecially for Children, as an Amulet. Which I take to be the true reason, why the Kings of England hang a piece of Gold upon those they Touch.

Pure SILVER, naturally BRAINCHED in the Mine. From a Silver-Mine in Suecia. Some of the Branches are blackish being tarnished; the rest of a clear filver colour. Some pieces of a white Spar, diffoluble with Spirit of Nitre, flick to them.

A piece of CAPILLARY SILVER, or with fmaller Branches, alfo from the Mine: which a kind of white Rhombick Spar growing to it. Ferranti Imperato & Aldrovandus, (e) both give an Example of this kind.

PLATED-SILVER from the Mine. Argentum nativum Bracteatum. It lies in thin Plates, of a clear filver colour,

Tt 2

(d) N.142.

(e) Mul. Met.

between

## Of Metals.

## PART III.

between the Flakes, or in the Grain of a hard white Stone; as the yellow *Plates* in the *Ludus Helmontij*, defcribed in the former *Section*. The feveral *Plates* are curioufly wrought with *Striæ*, which obliquely decuffate each other, and make their Impression all along upon the *Stone*. This *Stone* is infensible of *Acids*. In fome places, the Silver alfo lies crude in a black *Ore*.

Pure Native SILVER, FLAKED, or as it were the *Plated* broken into feveral thin pieces; lying alfo in the Grain of a white *Spar*, but diffoluble with *Spirit of Nitre*.

Thick PLATED SILVER from the Mine; with a mixture alfo of Crude Silver Ore; both in a white Stone diffoluble with Spirit of Nitre.

WHITE SILVER ORE, or of a filver-colour, from Cremnitz in Hungary. There are also fome parts of Black Ore mixed with it. And fome Cinnabar; partly of a Scarlet or Vermilion colour, and partly of the Lapis Hæmatites. Given by Dr. Edward Brown.

Another piece of WHITE SILVER ORE, growing in a white *Stone*, having a blackifh caft in fome places, with the hardnefs of a *Gem*.

YELLOW SILVER ORE, or near the colour of Gold, from Kottenberge in Bohemia. 'Tis granulated in a hard white Stone. In fome parts, alfo blackifh.

ANOTHER Piece, rather of the colour of Copper, from the fame place. It grows in a hard, black and white Stone.

BLEW SILVER ORE, from the Silver-Mine of Berre Ferris. Not Granulated, but Flaked. In fome positions especially, of a curious blew, like that of Cichory-Flowers, or some blew Glass, but much fairer. Some yellow Mundick also, with a piece of Green Spar, grow to it on one fide.

PURPLE SILVER ORE, with Cinnabar.

GREEN SILVER ORE, The colour is fomewhat obfcure, but lies not only in the furface, but inward parts of the Ore. Here are growing to it fome of the Lapis Armenius, and yellow Okre.

BLACK SILVER ORE, for the most part Granulated; from the Silver-Mine at Schemnitz. Given by Dr. Edward Brown. This fort is the best. An 100 l. of Schemnitz Ore yields

324

PART III.

# Of Metals.

yields from an Ounce of Silver to twenty Ounces. Some hath been found to yield half Silver. (a) Moft of it holds Brown's Trafome Gold; the beft <sup>th</sup> part in proportion to the Sil- vails, p. 91. (b) Ibid. p. 93.)

GROGUNNION ORE; alfo Black, and Granulated. It holds fifty *lib*. (fterling) per Tun.

CUMBSIMLOCK ORE, Black, and most of it Granulated, immerfed in a blackish Stone, dispersed throughout It holds twenty eight *lib*. sterling *per* Tun. This, and some other *Welsh Ores*, given by Sir *Rob. Moray*.

COGINNIAN ORE, holding fifteen *lib*. fterl. *per* Tun. It runs in *Veins* or *Layers*, rather Grained than Flaked, together with yellow *Mundick*, between two forts of Beds; one of whitifh Clay, the other of brown Stone.

A BLACK and FLAKED SILVER ORE, with fome pieces of the Lapis Hæmatites growing to it.

ANOTHER Piece FLAKED, from the Forrest of Cre, not far from St. Veit in Carinthia. With some adhering Cinnabar of a brown Purple. Given by Dr. Edward Brown.

BLACK FLAKED S. Ore from Freyberge in Misnia. Here are two pieces: one fimple; the other, mixed with white Ore and Cinnabar.

The SCORIUM of the FREYBERGICK S. Ore. Porous, of a blackifh gloffy colour, and brittle: qu. Vitrum Argenti.

B. FLAKED S. Ore from Kottenberge.

B. FLAKED S. Ore from Cummustwith Rock. It runs in Veins, through a blewish Grey Stone, together with a white, hard, and granulated Spar. 'Tis also immersed in Grain, in the Grey Stone. Both the Stones are so hard as to cut Glass.

CUMSUMLOCK ORE, holding twenty *li*. fterl. per Tun. 'Tis much like to that of Cummustwith.

ANOTHER like Ore from CORNWALL. Given, with feveral others, by Sam. Colepress Esq. It grows together with Mundick and green and yellow Spar.

Black and fmall FLAKED S. Ore, from the fame place. Tis immerfed in a Slate, with yellow Mundick.

A Piece of Bl. FLAKED S. Ore growing to a very hard Spar, white within, and rediff without, and incrustated

## Of Metals.

PART III.

crustated with sparry Grains, not much bigger than Poppyleeds.

Another Piece, with Red Cinnabar growing to it.

A large Piece of SILVER ORE, with MUNDICK ; running between Beds of White, Yellow, and Green Spar. The White, fo hard as to cut Glas: The other two, foft: The Ore runs in a Vein obliquely, fo as to make an Angle. By which, the Underlying or Dipping of a Load, may be well conceiv'd.

The Preparations of Silver, are made in most of those Forms, as of Gold, and defcribed by the fame Authors before mention'd. Goldsmiths fometimes give a filver-wash to Copper, with that which is called Oleum Luna. Soder (from the Italick, Saldatura) of Gold is made of Silver, and half as much Brass. Painters make a pure Blew here-(a) Ambrof. of with Sal Armoniac. (a) Of the Silver-Mines in Mexico, and the way of feparating the Silver from the Ore, fee the (b) Num.41. Phil. Transactions. (b) And of the Art of Refining, Num. 142.

Pure CAPILLARY COPPER from the Mine at Herngrunt. Given by Dr. Ed. Brown. 'Tis very ponderous, the feveral Styriæ or Capillary parts but short, of a redish Golden colour, growing together almost like those of the little Stone-Mols.

Another Piece of the fame Species.

Pure GRANULATED COPPER, from the Mine. a redifh colour, mixed with a fad purple, and fome green. Grows to a Stone, outwardly of a Liver-colour, within Whitish; not very hard. This fort of Native Copper, by Chiocco, is call'd Æris Flos verus. (c)

An Iron-Chain and Heart, at least, cover'd with a Crust of pure GRANULATED COPPER; by lying in one of the two Springs in the Copper-Mine call'd the Ziment in Hungary. Given with the next by Dr. Edward Brown.

Pure Native COPPER, both CAPILLARY, and GRA-NULATED, in one piece. The Capillary part, above two inches broad; and furrounded, like a Wood, by the other. Aldrovandus (d) hath a fort that is pointed, or at least angular; which Ambrofinus calls Æs nativum figuræ pangoniæ.

BULLATED COPPER, Native, or from the Mine. Given by Sir Rob. Moray. 'Tis pure and of the colour of the best concocted. Whether this piece was not fluxed by fome fub-

(c) Muf. Calceol.

in Aldrov.

Muf. Metal.

## PART III. Of Metals.

fubterraneal fire may be question'd. Of the rest, 'tis plain to the contrary.

Pure MASSY COPPER from the Mine. Given by the fame Hand. It grows to a white and femiperfpicuous Spar, which cuts Glass eafily, and deep.

YELLOW COPPER-ORE, from the Mine at Herngrunt. Given by Dr. E. Brown. 'Tis of a rediffy yellow, mixed with fome sparks of the colour of Gold, both with- (a) P. 108: out and within. It yields ordinarily, th part Copper : fometimes<sup>3ths</sup> or above half. See his Travails. (a)

Another piece of YELLOW COPPER ORE. Given by Mr. Oldenburg. 'Tis immerfed in fmall sparks in a brown Stone; to which adhere fome very green Flakes of the nature of the Turcois.

BLACK COPPER ORE, holding SILVER. There are fome Grains of a dark Purple mixed with it. Given by Dr. Brown.

Another Piece, with some efflorescence of white Vitriol upon it; perceived especially by the Tast.

A Third piece, with natural Verdegriece.

BLACK COPPER ORE, immerfed in a Blackish Stone, which is flaked fomewhat like Lead-Ore; probably a courfer fort of Cinnabar. Given by Sir Rob. Moray.

Of Copper, with the addition of Calamy, is made Brass with increase, in the proportion of <sup>3d</sup> or more, according to the Stone, and manner of operation. Of the making of Brass, see Agricola.

Of Copper are prepared, the Calx, Crocus, Quintescens, Tincture, Oil, Vitriol and Flowers. Some of them much, and well used outwardly against ill natur'd Ulcers. And alfo justly to be reckon'd among the best Remedies for the Eyes. That the Labourers in the Copper-Mines, have them always good, is an observation of Macrobius.

### CHAP

## CHAP. II.

## Of TIN, LEAD, and IRON.

A Piece of pure TIN, refined in the Furnace.

Pure TIN, Native, or from the Mine. It lies as it were in bright drops in a brown Stone.

CRUDE TIN powder'd, confifting of thining black and Iron-colour'd Grains.

TIN-ORE, holding Silver.

FAT TIN LOAD, of a great Grain, in a blewish Clay. 'Tis a Cluster of *Crystals* like black *Glass*.

Another piece alfo very FAT, but fmaller Grain'd; confifting rather of fparks.

A SHOAD, a FAT TIN-Stone fo call'd; of an Iron colour, with fome glofs where it is broken. Very ponderous.

A fort of TIN ORE, with its Grewt. That is, a Congeries of *Crystals* or Sparks of *Spar* of the bigness of *Bay-Salt*, and of a brown shining colour, immersed therein. They are so hard, as to cut *Glass*.

TIN ORE, confifting of extream fmall black Sparks or Grains, immerfed in a green and yellow Grit.

TIN ORE, of an Okre colour, with a mixture of black fhining Sparks.

A Specimen of GRAIN-TIN ORE of feveral colours; fc. blackifh, brownifh, purplifh, redifh, and yellow. So good, that they need little or no preparation, by ftamping or dreffing for blowing : neither is there any confiderable waft in the melting.

A SLAG, remaining in the bottom of the *Tin-Floate*. Sent by Mr. *Coleprefs*. Of a bright colour next to *Silver*. Yet contains (faith he, moftly) Iron; which he accidentally perceiv'd, by applying the *Magnet* to it, both quickly uniting. But note, that now, at leaft, they will not, unlefs you take fmall Sparks only, and these will leap up to it. He alfo faith, That one Dr. *Stall* a *German Chymist*, affirmed, the *Dutchmen* make good *spelter* of it.

SCUM taken from melted TIN. Of a blackish brown,

with

328

#### Of Tin, Lead, and Iron. PART III.

with fome sparks of Metal. It seems near as heavy as the pure Tin it felf.

CHIMNEY-TIN, forced up from the Herd. 'Tis black thining and heavy; almost like very fine black fand.

A Metalline Slat from the Tin-Mines.

See a large Account of the Tin-Mines of Cornwall and Devonshire, in the Phil, Transactions; (a) communicated (a) Num.69 by a Perfon much converfant among them. As alfo another accurate one particularly of those in Cornwall; communicated by Dr. Christepher Menet, and by Me published in the faid Transactions. (b) (b) Num:

Tin is mixed with Copper, in the making of Metal for Bells, Organ-Pipes, Oc. the proportion of Tin to Copper, as two to feven, or thereabout. If under, it will be too foft; if over, too brittle. The Metal used for Concaves and Speculums, is likewife a Mixture of Tin and Copper. Of Tin, with Lead, and the Marchafite of Antimony of each ith part, is made one fort of Printing Letters. Of this Metal is made that fort of Cerufs, called Spanish White; one of the best, used either by Painters, or by Women. Stannum ustum, the best prefervative of the polish of Metallick Concaves, and the like. Riverius (c) highly commends his Bezoardicum (c) Observ. Jovis against Malignant Feavers.' A Mixture against the Obf. 56. Bitings of Mad Dogs, confifting chiefly of Mithridate and the Filings of Tin, is much used and relied upon by fome Hunt(men.

CRYSTALLINE LEAD, from the Mine. So I call it, not that it is clear, but confifteth for the most part of Hexagonal Points. Of the bigness of a midling Apple.

LEAD ORE, rich in SILVER. Given by Sir R. Moray. 'Tis of the usual colour, but mixed with white Spar, fo hard as to cut Glass. And I suppose, that most Lead Ores with fuch a Spar, have Silver in them.

LEAD ORE holding SILVER, and growing together with Iron Ore.

LEAD ORE, probably alfo holding Silver. It lies in a whitish Spar, which is not fo flaky as is usual, and will cut Glas.

LEAD ORE holding SILVER, with a large Crystalline Spar confifting chiefly of Hexagonal Points, and of the Uu colour

Cent. 4.

### Of Tin, Lead, and Iron. PART III.

colour of a Calcedony. Férrant. Imperato hath one which he entitles Ingemmamento di Piombo; and feems to be like this.

SPARKS of LEAD ORE in the Caulk. One of the Sparks is branched almost like a small Leafe. The Stone or Caulk is a Congeries of white Crystals of Spar laid crofs every way. They will cut Glass.

A large piece of LEAD ORE, flaky, and lying in fpots in a white perfpicuous, flaked, and foft Spar.

Some other pieces of Lead Ore, English.

LEAD ORE, from Freiungen, called WEISSER FLIES. It confifteth of a foft and friable Spar, of a pale colour, near that of the Diaphanous natural Sulphur; together with a redish substance intermixt.

LEAD ORE, from the fame place, called Schlich. Tis a fine grey Sand, like that used for Writings: with fome few black Grains; which is, I fuppofe, the true Ore.

Lead (befides the uses commonly known) is also em-

A large piece of LITHARGE ( of Silver.)

See a large and accurate Account of the Mendip Lead (e) Num.28. Mines in the Phil. Transactions; (a) communicated by & 39. Dr. Fof. Glanvile.

> ployed for the Refining of Gold and Silver by the Cupel. Hereof is made common Cerus with Vinegar. The way briefly, yet perfpicuoufly fet down by Theophrastus. (b) Of Cerus, Red Lead. Of Plumbum ustum, the best yellow Ochre. Of Lead and i as much Tin, Solder for Lead. Hereof are also made the like Chymical Preparations, as of other Metals, as the Oil, Tincture, Salt, Gc. Some of which, many bold Chymifts, without Difcretion, give inwardly, and alfo extol them. But those that are careful of their Health, will beware of them. I do not deny, but that 'tis possible this Metal, as well as Mercury, may be fo order'd and given, as to be innoxious.

BRUSH-IRON, Native or from the Mine. It confifteth of strait, round, long Styria, about the thickness of a small Kniting-Pin, bolt upright, like the Briftles of a ftiff Brush, or the Teeth of a Wooll-Comb. They grow on a double-Bed, the uppermost of an Iron-colour, the undermost of a dark yellowith red.

BRUSH ORE; From Doward in Herefordshire. Given

by

• (b) Lib. de Lap.

#### PART III. Of Tin, Lead, and Iron.

by Sir John Hoskins. A rich fort. It confifteth alfo of strait and almost parallel Styriæ, most of them as thick as a strong Kniting-Pin; incrustated with very fmall Grains of Spar, of the colour and bigness of the Corns of Bay-Salt, but very foft.

MIXED BRUSH ORE; from Clower-Wall in the Forreft of Dean. By the fame Hand. It confifteth of feveral Piles of round and parallel Styria, and Layers of unfigur'd Ore, a Pile of the one, and a Layer of the other, crofsways; feven or eight in this piece, within the extent of betwixt four and five inches.

A piece of IRON ORE, from Doward, of kin to the former. By the fame Hand. 'Tis rich, yet hath only fome few Styriæ.

ANOTHER piece, from the fame place, and by the fame Hand. In this the Styriæ, or figur'd pieces, are flat, and (a) Muf.Me-irregularly clufter'd. Aldrovandus (a) gives the figure of an tall. Iron Spar (Ore) ramify'd.

A piece of RICH IRON ORE, from a Hill of the fame in Wiltsbire, upon which is foituate a Village called Seen or Send, about nine miles from the Bath. Given by J. Aubrey Efg. Who faith, It is fo good, that the Smith there can make that which he takes up in the street, to melt in his Forge; which that in the Forrest of Dean will not do.

The fame Perfon observing there was great abundance of it, conjectur'd, it might Impregnate fome Neighbouring Spring. And upon trial, found one, amongst others, in the middle of the ftreet very ftrong, beyond that of *Tunbridge*. For upon the affusion of a *Tincture* of *Galls*, it immediately became as black as Ink. The Village is well built, and standing fo near the Bath, may be very convenient for those who drink Chalybiate Waters, either before or after they go thither. Mention alfo is made of this place by Dr. Christopher Merret. (b)

MIXED IRON ORE, from Doward in Hereford/bire. Given by Sir John Hoskins. It confifteth of four or five fubstances. The best part, both brown and red, or brickcolour'd. Wherewith is mixed a white and foft fpar. With a blackish, shining, and crumbly Body, knobed on the top, after the manner of the Turcois.

Ordinary IRON ORE, from Clower-Wall. By the fame Uu 2 Hand.

(b) I think in his Pinax.

Hand. Almost of a Brick-colour, or that of the Colcothar of Vitriol.

IRON BALLS, about the bignefs of Musquet Bullets. Made by the rowling of Iron-Sand off the Banks among the Iron-Mines near Senneck, especially after rain.

TWO BONES, (part of a Mans Foot) turn'd into Iron-Stone.

A Piece of *Drop-Stone* turn'd to Iron.

An IRON ORE rifing near the Silver-Mines (in Wales.). In fome parts of a brown Cinnabar-colour, and mixed with Slate. The Loadstone takes up little Corns of it no bigger than Sand.

An odd IRON ORE, fcarce fixable. In a white Spar, almoft like a Calcedony, hard enough to cut Glass.

A fort of BLACK CAULE, holding IRON. Yet fo little, that the *Loadstone* will not take up any part of it, bigger than *Pins head*. It hath a black, fhining, and very crofs Grain; with white *Spar* interfpers'd, which cuts *Glafs*.

Another IRON-SPAR, confifting of little white and umber-colour'd Columns, laid together crofs-ways.

• An IRON BODY, that rubs away in gloffy Duft; with part of its Wall, (a brown Spar) in which it lay inclos'd.

A Piece of the OLD CYNDER, which now they use as a Flux for the Iron Ore; fomewhat bubly. From the Iron-Mines in Monmouth.

Another, from the Forrest of Dean, by Sir John Hoskins. 'Tis run into Styriæ, fomewhat like those of Ice, brittle, ponderous, opacous, glossy, and of the colour of the coursest fort of Crocus Metallorum.

A Vitrify'd Cynder, of no use; like a piece of course green Glass.

An IRON STONE, with a *Spar*, on one fide, confifting of pellucid fquares; on the other, of white flakes fet crofsways, almost at right Angles one against another.

A Piece of RUSMA or crude Zernick, almost of the colour of Crocus Metallorum, or some forts of the Hæmatites. Given by Mr. Lannoy, a Conful at Smyrna.

See a very good Account of the Iron-Mines, and Iron-Works in the Forrest of Dean. Communicated by Henry Powle Esq; and by Me published in the Philosoph. Transactions.

actions. (a) Some of the ways of giving a due Temper to (a) Num. Iron, according to the use made of it, are set down by 137. Ambrofinus. (b) For one Temper is requir'd for drawing it (b) Aldrov. into Wyre; another, for a File; another, for a Chifel; another, for a Sword; another, for the Edge of a Sword in particular; and the like. For the hardening of Iron for Files; one of the Kings Farriers, upon my enquiry, commendeth this following way.

Take Horfe Hoofs or Rams Horns, and hang them over the fire till they drop like Glew. Take alfo pieces of Leather, and burn them black. Powder them both, and put to them stale Urine, and Bay-Salt. Let them stand together; the longer the better: at three or feven years end it will be excellent. Cafe the Iron with this Mixture, and give it a ftrong heat, fufficient to fuse the Mixture, for three hours; and then cool it. The furface of this Iron will be as hard as the hardeft Steel, and will make excellent Files: but the hardening reaches not to the heart of the Iron.

Of Rusma (a brown and light Iron substance) with as much Quick Lime steeped together in Water, the Turkish Women make their Pfilothron, to take off their Hair wherefover they pleafe. There are many Medicinal Preparations of Iron or Steel: But none, that I know of, equal to the Tincture made without Acids; especially in Obstructions, and to strengthen the Tone of the parts, as in Lienterick, and other like Cafes. Against all outward and inward Hamorrhages, Quercetan highly extols his Oleum Martis. A Tincture of Steel made with White Wine, faith Ambrofinus, (c) is a (c) Androv. ftrong Cathartick. What he means, I know not. Perhaps he might find fome fuch effect upon himfelf, from that, as one I know in this City, doth from Mithridate, which commonly gives him a Stool extraordinary. And another, upon whom Marmalad hath the like effect.

333

#### CHAP. III.

## Of ANTIMONY, MERCURY, and other METALLICK BODIES.

STYRIATED ANTIMONY, from the Gold Mines of Chremnitz. Given by Dr. E. Brown. The Styriæ, in this, are very fair, many of them as thick as in that which is factitious.

STYRIATED ANTIMONY, alfo Native, from Cornwall; called ROSCARROCKS. A Congeries of ftrait, long, flender, and edged Styriæ, of a bright Steel-colour, almoft like a clufter of finall broken Needles. Aldrovandus (a) hath a fort of native Antimony, which Ambrofinus calls Plumofum.

GRAINED ANTIMONY, or rather Antimonial Ore, from Hungary. Given by Mr. Oldenburge. It looks like black grained Silver Ore. Immerfed in a Stone, although of a feurvy opacous and fandy colour, yet fo hard as to cut Glas.

ANTIMONIAL ORE from Transylvania. Given by Dr. E. Brown. It grows in a foft Bed, almost like Lead Ore.

ANTIMONIAL ORE, holding Iron, from *Cornwall*. Almost of the colour of *Amber*: yet with a Grain fomewhat glosfy and very cross.

A Metallick (probably an ANTIMONIAL) Cornifb Stone, black, hard, and ponderous. It confifteth of a great many Clufters of fhort gloffy Styriæ, radiated almost as in the Belemnites. But because irregularly broken and heaped together, but difficulty observ'd.

Antimony is of excellent use for the Refining of Gold: fee an accurate Process, communicated by Dr. Jonathan Godard, and by Me published in the Philosph. Transactions. (b) An it part in proportion to the Copper, is by some added with the Tin, for the best Metallick Speculums. Founders add a little to their Bell-Metal, to make it more fonorous. And so Pewterers, to their Pewter, to make it found more clear like Silver. 'Tis also used in the casting of Iron Bullets, to make the Metal run the better. The Spanish

(a) Muf. Met.

(b) Num.

#### PART III. Of Antimony, Mercury, &c.

Spanish Women rub their Eye-brows with it, to give them an acceptable Black. (a)

The Cathartick Property of Antimony, was first taken others. notice of by Paracellus. And feveral Preparations hereof both Cathartick, and Diaphoretick, are now much celebrated. Of the Virtue of it alfo taken Crude, fee the Phil. Transact. (b) The Red Oil, called Stibij Sanguis, admirable (b) N. 39. in Malignant Ulcers. (c) (c) Wecker.

MERCURIAL ORE. Given by Mr. Oldenburge. 'Tis all of one colour, much like that of the Hepatick Cinna - Dr. Popes bar, but somewhat sadder. In the West-Indies, all their account of the Mines. filver is refined, or elfe melted down with Quick-filver. (e) (e) Kirch. A Past made hereof with Gold, is sometimes used for gild-Hift. Ind. 1.4: ing of Brass Vessels; which being daub'd with the fame, and held to the fire, the Gold adheres, and the Mercury exhales. With this the *Tin-Foile* is made to flick clofe to the backfides of Looking-Glasses. Of Sublimate, Cerus, Juyce of Limons, and Rofe-water, mixed like an Oyntment; is made That *Paint*, which is both the best and the worst in the World.

In Medicine, the great use of Mercury is in the Lues Venerea; fometimes in the Cholick and Iliac Paffion; and for Wormes, especially those small ones, called Ascarides; against which, if duly prepar'd, there is no Medicine so effectual, or more fafe. Being prepar'd, and mixed with convenient Catharticks, 'tis alfo very properly us'd in divers Chronick Difeafes.

A rich piece of Native CINNABAR, from Carinthia. It weighs above Zij and zij, and is entirely of a Scarlet colour.

Another Piece of CINNABAR, of a Scarlet-colour, from Tyrol.

A Piece of Native CINNABAR, of a purple colour, almost like that of fine Lake. Given by Mr. Oldenburge.

A piece of BLACK CINNABAR. Given by Dr. Walter Pope. Hard and ponderous, about as big as a Lambs Heart. Where it breaks, of a fhining black.

Another piece, of a shining Black, mixed with a fad Purple. By the fame Hand.

The best Cinnabar in the Schemnitz Mines, ground with Oil.

(a) Ambro-

finus, and

Of Antimony, Mercury, S.C. PART III.

(a) Dr. Brown's Trav. p. 91.

336

Oil, makes a Vermillion, equal to, if not furpassing, that made by sublimation. (a)

YELLOW MUNDICK. Marchasita. Pyrites Aureus; not for that it hath any Gold in it, but is both within, and without, of a shining Metallick yellow. As heavy, as most Ores. Here are of various Figures; as

The ORBICULAR MARCHASITE; tuberated, about the bignefs of Hand-Ball.

Another, leffer, and a little compreffed.

The GRAP-MARCHASITE. March. Botryidea. It confifteth of fmall Globules growing together in the form of a young Bunch of Grapes. There is one like this in Ferr. Imperato.

The APPLE MARCHASITE, as it may be call'd. 'Tis round, excepting on one fide, where it falls in, and hath a ftalk, like a young *Apple*.

The FLORID MARCHASITE. So I name it. For it looks like a Clufter of Buds ready to flower.

The YELLOW BUD. Marchafita Phylloidea. For it looks like a fingle Bud composed of several small leaves.

Part of a CYLINDRICK MARCHASITE, radiated from a Vitriolick *Pith* or *Centre*.

The TABULATED MARCHASITE. Broad and plain, or flat like a *Tablet*. Confifting of flaked and finall Cubick knobs, growing on a rough Stone.

Another, only Flaked; growing to a blackish Stone.

A Third flaked, but of an irregular form.

The GRANULATED MARCHASITE. It grows on a brown Stone, in a Cruft of about  $\frac{1}{2}$ th of an inch thick, with the furface all over grained. This kind is found near *Hindon* in *Middlefex*.

Not only the greater Flakes of which the other Varieties confift, but even the fmalleft and almost invisible Grains, are all either Squares, or at least pointed with Right Angles. Whereas the Pyrites, fimply fo call'd, is always Radiated. Which, and not the colour, according to others, I take to be the principal difference between them.

The CUBICK Marchasite, about <sup>1</sup>/<sub>d</sub> of an inch square. The Marchasite seems to attain the perfection of its Figure, in a Cube; that is, a Square upon a Square. But sometimes it consistent of parts neither Cubick nor Square; as in

The

Piart III. Of Antimony, Mercury, Oc.

The PENTAGONATE Marchasite. About the bigness of a little Gall; fomewhat round, defined with several sides, each with five Angles.

A Tuberated Marchafite with a Green Spar.

A MARCHASITE growing to its own Spar, together with a white one pointed and femiperfpicuous.

A Mixed MARCHASITE. It confifteth of yellow pieces partly cubick, and partly flaked: with *Lead-Ore* holding *Silver* growing to it on one fide; on the other, feveral fets of aſh-colour'd Flakes growing together in the form of little *Rofes*.

As all Metals, fo Marchafites have their SPARS, called *Fluores*. Both becaufe they melt in the fire; and make the Ores to which they belong, to melt the better. The reafon whereof is, For that in all Spars, there is a certain Salt which lies more loofe and open, and which in mixing with the Ore, frets and tears it all to pieces.

A Piece of WHITE MUNDICK.

WHITE MUNDICK ORE, immerfed in Grains in an asth-colour'd Stone.

GREEN MUNDICK, or Mundick Ore, running in Veins in white Clay.

A large fphærical and knobed FIRE-STONE, or *Pyrites*, about two inches in Diametre.

Another, of the fame Figure, as big as a *Walnut*, and of an Iron-colour.

A Piece of a large one of the fame Figure, and with a black furface. The whole Body is radiated from a Vitriolick Centre or *Pith* about <sup>‡</sup> of an inch in Diametre. Which radiation is also feen in most *Fire-stones*.

Another whole of the fame form, a little leffer.

A Round PYRITES, compressed. Another lesser.

A PYRITES, partly Cylindrick, and partly Oval; Cylindrovalis. 'Tis two inches long, and near an inch and over; Cylindrick in the middle, and Oval at both ends. The Surface, fmooth, and of a fhining black.

MUNDICK ORE, as it may be call'd; having the fame Analogy to that which is figur'd; as the Ores of Metals, have to fuch as are pure and perfect. This is for the most part of a greenish ash-colour, not very hard, and somewhat gritty.

Yellow

Yellow Mundick GRAIN-ORE; immerfed in a Spar of an Amethystine colour.

Another fort, like Silver Grain-Ore, in a Spar of the colour of that of Tin. So hard as to cut Glass.

A piece of Mundick-Ore in a white Spar, both Grained and Vein'd.

A piece or two of Veined Ore from a Silver-Mine.

Mundick Ore and Vitriol mixed with a White and Green Spar.

Mundick Ore, and Black Daze, mixed with a Vein of - White and Green Spar; all lying between two firm Beds or Walls. These Ores, by some are called Mock-Ores.

A MOCK-FIRE-STONE. Pyrites stirilis. Outwardly, of the colour of polish'd Steel. And radiated from the Centre, as the true Pyrites. But of a light and useles fubftance.

No fort of Mundick, that I find, either in the Ore, or perfect, stirreth with Acids. Every Metal hath its Marchafite : (a) Boet. de which is fometimes added to them, inftead of Lead, (a) to make them flow the better. But if too much, it robs them, Brown's Tra- by over volatilizing them (b) in the Furnace. Out of most Fire-fones, may be made both Vitriol and Sulphur.

## SECT. III.

## Of Mineral Principles.

Y Mineral Principles, Imean, neither fuch imaginary D ones as fome have talked of : nor fuch as may poffibly have a real existence, yet were never feen folitary or uncompounded : but those which come within the cognizance of fense, sc. Salt, Sulphurs, and Earths; and fuch Bodies as are reduceable to these Tribes. For it seemeth to me, That most subterranial Bodies are either compounded of these Three, or are hereinto resolved. So Copperas is the falt of a Metal; either as an ingredient in its Generation; or refulting from its Corrofion by fome Natural Menstruum; equivalent to fuch as are applyed by Art. In like manner, a Bolus, as it feems to be the Bafis of most Stones and Metals; 10,

338

Lapid. l. 2. (b) Dr.

vails.

## PART III.

## . Of Salts.

fo, upon the Refolution of the fame, to be nothing but their Caput mortuum. There being a Circulation amongst Minerals, as amongst Plants and Animals ; the fame Principles paffing from one to another. And fo, probably, amongft all Bodies, at least between the Atmosphere and the Centre of the Earth.

#### CHAP. I.

## Of SALTS.

A Parcel of NATURAL SAL ARMONIAC. (Rather Ammoniac, from its fuppofed fimilitude to that of the Ancients, bred under the Sands in Africa.) This I call Natural, as being found fublimed, by the fubterraneal Fire, in a Cole-Mine near New-Castle upon Tyne. Given by Dr. L. Hodg fon, who first made experiment of the nature hereof. And hath answer'd feveral Quaries about it, propofed by Mr. Boyle. (a) Here is fome of it lying upon and (a) See Phil. between Beds of a light and footy Earth ; and fome pure Iranf. N. 130. and white as Sow. It hath the perfect Taft of the Factitious; confifteth of the like Fibers or Styria; and may be eafily fublimed into Flowers. (b) Cerutus hath alfo de- (b) See Part fcrib'd a Sal Ammoniac, as he calls it, fublimed by the fub- 4. terraneal Fires of Puteoli; but This is of a different kind, as appears from his Defcription of it. (c) Hereof are made fe- (c) Muf. veral Preparations of great Use to Physitians, Alchymists, and Calceol. S.2. others, as the Spirit Simple, Aromatiz'd, and Tinctur'd; the P. 149. Tinctur'd Flowers, &c.

A parcel of SALT taken from Tenariffe, 1674. and given by Dr.George Trumbal. 'Tis very white, and light like flowers of Sal Ammoniac, or the Earth call'd Agaricum Minerale. Taken by fome to be a kind of Nitre. But not rightly. For it hath the perfect Taft of a Lixivial Salt. Makes an Effervescence with Aqua Fortis, as those Salts will, but Nitre will not do. Hath, as those, a fixed Body : neither will it flow, or flame, though exposed naked to the fame fire, wherein Nitre will do both. Yet hath it fomewhat of a nitrous Taft intermixed; as have alfo many Lixivial Salts. I conclude it therefore to be a fixed Alkaly, or, in nature, a kind of Lixivial Salt.

X x 2

Ano-

## Of Salts.

PART III.

Another parcel of the fame fort of SALT, taken out of the Cave or the Pique of Tenariffe, 1674. by the fame Hand. Different from the former, only in being of a purer white.

A Third parcel of the fame, taken, I fuppofe, from another guarter of the faid Mountain.

A fquare piece of Crystalline Sal Gemmæ (rather Gemmeus) weighing almost twenty Ounces.

A Ball of Crystalline Sal Gemmeus; with another piece of the fame Species.

A piece of ftyriated Sal Gemmeus, tinctur'd with fome Rays of yellow. It grows almost in the form of Sal Ammoniac.

A piece of ftyriated Sal Gemmeus tinctur'd with partly an Amethystine, partly a Saphirine Blew.

Ambrofinus gives a Figure of Crystal of this Salt, much like that of the Corns of common Sea-Salt; from which it differs no more, than Pit-Salt.

Sal Fossilis properly fo call'd, is, as it were, the Ore of the Yet This, as well as Metals, is fometimes Sal Gemmeus. The principal Mines are in Poland and Cafound native. labria: of which, fee a Relation in the Phil. Transactions.(a) In the leffer Poland, faith Comer, (b) are fome pieces of this (b) Defcript. Salt ( he means the Ore) like huge Stones; fo hard, that Polan. lib. 1. Salt ( he means the Ore) like huge stones; fo hard, that Houfes and even whole Towns are built with them. Near Eperies, a City in Upper-Hungary, is a Salt-Mine, in which are pieces Ten thousand pounds weight. (c)

> Of This as of common Salt, may be diftill'd that Acid Liquor commonly, but abfurdly call'd the Oil. This moderately taken, but especially if it be dulcify'd by Cohobations with a fimple, or rather with an aromatiz'd Spirit of Wine, is fometimes of excellent use to reftore the Digestive Faculty to the Stomach. But the common fort, taken, as it often is, without difcretion, really breeds more Difeafes, than it pretends to cure. See feveral Preparations of Salt in Schroder and others. Ambrofinus, I think it is, who reports, (d) That in the Province of Canicla, in the Great Cam's Dominions, the people melt and cast Salt into a round Form, for Money. But who ever knows the nature of common Salt, must also, that this Report is a great mistake.

PART III.

#### Of Salts.

BLEW VITRIOL, Native, and crystalliz'd, from the Copper-Mines of Herngrundt in Hungary. Given by Dr. Edward Brown, together with the feveral Species following.

GREEN VITRIOL, Native; from the Silver-Mines of Schemnitz in Hungary.

Native GREEN VITRIOL, mixed with fome Rays of a pale Blew; from the fame place. With its aftringent and fweetish Tasts, is joyn'd fome Acritude. It grows to its own Ore, of a purplish ash-colour; and of a milder Tast.

A parcel of the fame Species, from the Copper-Mine of Herngrundt.

Native VITRIOL of a pale *Purple*, and confifting of pointed *Crystals*. This alfo hath fome Acritude. From the fame *Mine*.

Native WHITE VITRIOL. It grows in gloffy Grains like *Nitre* grofly powder'd; and not without fome Acritude. From the fame place.

Made WHITE-VITRIOL of Chremnitz.

WHITE-VITRIOL Ore of Chremnitz. Of a pale Okre colour, and meanly aftringent.

A fort of Native VFRDEGRIESE, from the Copper-Mines of Herngrundt. It confifteth of flat and parallel Plates, as in a Slate; of a blewish Green, yet not so blew, as the factitious. 'Tis also of a much milder Tast. It maketh a strong ebullition with Spirit of Nitre. These from the above-mention'd Person.

A rich ORE of Green Copperas, from Cornwall. Of a kind of Brick-colour, crack'd a little with lying in the Air, and hath upon it feveral efflorefcent lumps of Copperas.

A poorer fort of Green Copperas ORE. On one fide, being fcraped, of a blewifh afh-colour; and with little Taft. On the other, of a yellowifh Green, and tafteth ftrong as Vitriol. Maketh an Effervescence with Spirit of Nitre.

A Fibrous or STYRIATED ORE of Green Copperas. 'Tis white, and form'd almost like Sal Ammoniac; but hath the perfect Tast of Green Vitriol. Acids ftir it not.

Befides the places mention'd, and others, Green Copperaas is plentifully made here in England, as at Debtford, and elfe where. The Copperas Stones or Fire-Stones are found on the Sea-Shore in Essex, Hamphire, and fo Westward; the best of a bright Silver-colour. For the making of Copperas, they

#### Of Salts.

PART III.

they make Beds fometimes an hundred feet long, and fifteen broad at top; well ram'd first with Clay, and then with Chalk. In thefe Beds the faid Stones are laid about two feet thick: which by Sun and Rain, are gradually diffoly'd; and in five or fix years time, begin to turn into a kind of Vitriolick Earth, which will fwell and ferment like levened-Dough. And once in four years, the Bed is renewed with fresh Stones. In a Boyler containing about twelve Tuns of Vitriolick Liquor running from the Bed, they put in by degrees, about fifteen hundred pounds of old Iron; which both quickens the boyling, and prevents the fetling and melting of the Copperas at the bottom of the Boyler, and of the Boyler it felf. Sometimes, in stirring the Earth on the Beds, they find pieces of Native Copperas. See a particular and exact account of thefe Works at Debtford, communicated by Mr. Colmal, the Founder of this Mufaum, (a) N. 142. and by Me published in the Philosophical Transactions. (a) Of the Nature of Vitriol, fee feveral confiderable Obfervations grounded on Experiment, in the fame Transactions. (b)

Amongst other particulars, an excellent way of purifying it from its Okre.

The three principal Parts hereof are, an Acid Spirit, fixed Salt, and Sulphur. The last, a good Hypnotick, in fome Cafes, where Opium is not fafe.

(c) Aldrov. Muf. Met.

(b) N. 103. & 104.

342

Native Vitriol, faith Ambrofinus, (c) given to the quantity of 3j in any convenient vehicle, is a great Remedy in Germany and Hungary for the Plague. Blew Vitriol of excellent use against Venereal Ulcers. Both of this, and the Green, is made the Powder called Sympathetick; the Defcription whereof may be feen in *Papinius*, and out of him in Wormius. I doubt not, but that the Stiptick Liquors of Mr. Lyster and of Mr. Deny, are both made of Vitriol.

A fort of ALUMINOUS Earth, found near the River Patomach in Virginia. 'Tis foft and very light; of an afhcolour, and acid-aftringent Taft, almost like that of Alum. Whether the people there make Alum of it, or use it in Deying, we have no account.

Of the Nature of Alum, fee a very good Difcourfe in (d) N. 103. the Philosophical Transactions. (d) Of the English Alumand continu'd, N. 104. Works an accurate Account, communicated by Daniel Colmal Efg; and by Me published in the fame Transactions. (e) (e) Num. 1420 The

### PART III.

#### Of Sulphurs.

The Alum-Stone (of a blackifh colour, and flaky, like Cornifb Slate) is found in moft of the Hills between Scarbrough and the River of Tees in York-fbire. As alfo near Prefton in Lancafbire. Of thefe Stones calcin'd, is made a Lee; and of the Lee, Alum. The Lee after the firft fhooting of the Alum; is called Mothers. In which, certain Nitrous and other parts call'd Slam, being predominant; to precipitate the fame, they add the Lees of Kelp; made of Tangle, a Sca-Weed commonly among Oyfters. And then, a certain proportion of Urine, both for the fame purpofe, and to keep the Kelp-Lees from hardening the Alum too much. The Mine, before it is calcin'd, being expofed to the Air, will moulder in pieces, and yield a Liquor whereof Copperas may be made.

*Fallopius's Aq. Aluminis Magistralis, is of good use against untoward Ulcers. Deyers boil their Cloaths, or Tarn in Alum-Water, that they may take both a better, and more durable colour. It is used, likewise, for the making of a Leather foft and white, or fit to take a clear colour, which the Tan'd, will not do. And I little doubt, but that to wash the Skins of Beasts or Fowls herewith on both fides, or perhaps on the Feathers, only strewing <i>Alum* in fine powder, would be a good way to keep them from the *Moth,* and growing dank in moist Weather, and strewing the preserve them for ever.

#### CHAP. II.

#### Of SULPHURS.

A Piece of Opacous yellow AMBER half a foot long. Given by Fromas Hensbar Efq;. Found, with feveral leffer pieces, in digging of a Ditch under the Walls of Rensburge in Holstein, eighteen fect under ground. Which place is at least five and twenty miles both from the Baltick and German Seas.

A Piece of AMBER of the colour of Honey.

A Piece of clear yellow AMBER. Given by Captain Tailor.

Another yellow Piece, semiperspicuous; from the same Hand.

#### Of Sulphurs.

#### PART III.

A Ball of yellow and opacous AMBER.

A Piece of clear yellow Amber, with a CIC ADA drowned in it.

A Piece of Citrine Amber', with feveral GNATS immerfed.

A little Ball of citrine Amber, with an immerfed Emmet.

A Heart of yellow Amber, with two FLIES.

Two or three more Pieces, with fome other INSECTS. In Septalius's Mu(æum, is one fo-large as to bury a Frog.

(a) De Gem. And Boetius (a) affirms that Pieces are found fometimes as big as a mans Head.

Found in great quantity in *Pomerania*, and upon the Coaft of *Pruffia* in the *Baltick-Sea*. The *Elector* of *Branden-Ind. Voyage.* burge, Soveraign of that Coaft, farmes it out (b) for twenty Thoufand Crowns yearly. Alfo plentiful on the Coafts of

Soffala, Mosambique and Melinde.

(c) De Dem. lib. 2. c. 160.

(d) Muf. Septal.

Gem.& L.

Boetius defcribes a Powder, (c) in which Amber is the chief Ingredient, and which he highly commends for the *Epilepfie* both in Children and grown perfons. The two Salts of Amber united, faith Terzagi, (d) make an admirable Specifick for that Difeafe.

Take Telks of Eggs fixteen, Gum Arabick 3ii, Gum of Cherry-Tree 3i. Diffolve them, and fet them in the Sun for an Artificial Amber. Amongst the many Opinions of the Original of Amber, I put this question, Whether it is not a kind of harden'd Petroleum?

FLAKED STONE-COAL. Lithanthrax fciffilis. By fome called Black Amber; not properly. For, when fir'd, it hath fcarce any taft or fmell. Neither doth it yield any Oil, or melt, as Amber. Only makes a very weak and thin Flame, which prefently vanishes; and little smoak. Yet keeps fire for a confiderable time. 'Tis black, glossy, and pretty hard. Yet being struck, easily breaketh into Flakes of a square Figure. Found in Misnia, Bohemia, Gr. In some (d) Boet. de Pits two Hundred paces deep. (d)

A STONE taken out of the Dead-Sea. Blackish and fomewhat flaky. Diffoluble with Spirit of Nitre. When fir'd, it yields a fulphurious scent. Yet the barbarous Arabians use it for fewel.

A Piece of Jet. Gagates, from Gaza a River of Lycia, where

# PART III.

#### Of Sulphurs.

where first found. Given by Sir Rob. Moray. Of a shining colour, and in some places, staky. It cracks when held to the fire; and in it, burns with a thick stame and smoak, and very stinking. If rub'd till its warm, it takes up pieces of Feathers, and such light Bodies. 'Tis found in France, Sicily. And in this Island, in Cleaveland, on the top of Huntley and Whitby Clifts, where the Sea-water never comes.

Pit EBONY. *Ebenum foffile*. Very brittle, and when held in a flame, breaks into Flakes; it burns, with a footy fmoak, into afhes; but with fcarce any flame.

A parcel of ORPMENT. Auripigmentum f. Arsemicum croceum.

Native SULPHUR or BRIMSTONE, cryftalliz'd, of a pale Golden colour, and femiperfpicuous. Sent from *Peru*. The like is defcribed in *Calceolarius*'s *Mufæum*, and by *Wormius*.

ANOTHER Piece, of fuch a like colour. Found in the *Pike* of *Tenariff*, and given by Dr. George Trumbal.

A Lump of Native SULPHUR of the colour of fome Olibanum Drops, or opacous yellow Amber. From the fame Hand, and Place. As alfo,

Two Pieces of SULPHUR ORE. One, *Earth*, of a brown colour; the other, *Stone*, of a Sand-colour and gritty.

Native SULPHUR of *Ifland*. Of the colour of the common factitious *Brimftone*; and immerfed in a ftony Bed.

SULPHUR, of a curious Orange-colour, extracted out of Gold-Ore. Given by Henry Oldenburge Efq;.

SULPHUR ORE of *Freyberg*. Here are three Pieces. One, almost of the colour of *Cinabar*. Put into the fire, it fmells like *Brimstone*, but flames not. The other two, confist of blackish and ash-colour parts mixed with the red; together with some grains of *Mundick*. If fired, they small like the first, but not so strongly; nor make any flame.

GREEN SULPHUR-ORE. Like that in the Copper-Mines of Suecia, mention'd by Wormius.

SULPHUR-ORE of *Ifland*. Opacous, and immerfed in a blewifh *Glebe*. If burnt, it hath the fcent of *Brimftone*; but yet weak, and flames not.

#### Of Earths.

PART III.

(a) Num. 104.

346

Of the nature of Sulphur, Copperas, and Alum, fee a very good Difcourfe in the Phil. Transactions. (a) Of the Ufes, fee Agricola, Libavius, Crollius, &c. I have feen a Tincture of Sulphur of Mr. Boyls, brought over the Helm, which will fume all away. I remember not where he defcribes it, but as I take it, 'tis made with Sal Ammoniac.

#### CHAP. III.

#### Of EARTHS.

**T**Wo Parcels of EARTH RAINED on the Archipelago, upon the Eruption of *M. Vefuvius*, Dec. 6th 1631. Given by J. Evelyn Efq.: One, is gritty, and of the colour of Amber. The other a foft Bole, and looks like powder'd Jalap. I dropped fome Oil of Vitriol on them, but they flir not. This Earth began to rain about Ten of the Clock at Night, and continu'd till two next Morning: So that it lay two inches thick on the Deck of Captain W. Badily's Ship, who fent this Relation. While it rain'd, no Wind ftirring. It fell in feveral parts a hundred Leagues (b) See Phil. diftant. (b)

Tranf. N.21. A parcel of EARTH, RAINED lately upon Tenariff. Given by Mr. Joseph Bowles, a Merchant in this City. Of a pale Clay-colour, and infipid. Yet upon the affusion of Oil of Vitriol, makes a fuddain Effervescence; herein different from the former.

FINE SAND, from a Sand-Pit near Bruley in Kent. Given also by Mr. Evelyn. Of this is made the clearest and best English Glass. It confisteth of some Grains, as clear as Crystal: with which others obscure, being mixed, give a whitish ash-colour to the whole Mass.

A Sandy fubstance of a Gold-colour, found in a Vein of Stone in Hartford in New-England.

Black SAND of Virginia.

Black SAND found on the shore near New-Haven in New-England; with some Grains of red and white.

The like out of St. Christophers Island.

Fine white SAND of Saco in New-England.

PART III.

#### Of Earths.

- Of BOLES and other EARTHS, here are examples of all colours, as White, Ash-colour'd, Yellow, Red, Green, Blew, Brown, Black. Of which in their Order.

A parcel of MELITA EARTH. Given by Sir Phil. Skippon. By fome called St. Pauls Earth. 'Tis of a white colour, but inclining to that of Mortar. Not gritty, yet lefs foft than many other Earths. Makes a ftrong Effervescence with any Acid. Cerutus (a) extols the use of it in (a) Mus. Pestilential Feavers, and against Worms in Children, and Sect.2. p. 130 not unjustly. Not only the Earth it felf, but the Images, Veffels, and the like, made hereof, are fabled to derive thefe and other Virtues, as against the bitings of Serpents, Gc. from St. Paul, who liv'd fometime there, and miraculoufly preferv'd himfelf from the Venome of the Viper. And Wormius (b) hath given himfelf the trouble to transcribe a print-(b) Muf: 1, 1, c, 44 ed Paper hereof.

SAMOS EARTH. 'Tis white, and fofter than the former. Maketh an ebullition with any Acid; but very weak and flow. It hath fomewhat of an aromatick Taft, like that of calcin'd Harts Horn. Of this alfo Veffels were antiently made of great efteem.

STONE MARROW. Stenomarga Agricolæ, i. e. Saxi Medulla: because found between the Commissures of great Stones. Agaricus Mineralis, Imperato; from its likenefs to Agarick in colour; but no further. For between the Teeth it feels fomewhat like fine fand or grit; and hath no Taft. Nor is it fenfible of Acids. 'Tis fometimes used by Chirurgions for the drying of Ulcers.

A BOLE like that of WHITE (c) Terra Lemnia. Very (c) Muf. clofe and heavy, and when fcraped, of a pale white, fmooth, <sup>Worm, l, I;</sup> and gloffy ; almost like to white Wax. 'Tis but flowly diffolved in the mouth.

This and other like fmooth Earths are commonly called Pingues, or Fat: abfurdly, for Læves or Subtiles. Their feeming Pinguitude proceeding only from the exquisite fineness of the Particles of which they consist.

A fmooth BOLE, almost of the colour of Castile Soap. More eafily diffolved than the former, fo as it feems to melt in the mouth like Butter.

A parcel of very white, light, and foft EARTH. Taken out of the Cave opened at the Royal Fort at Plymouth; where

#### Of Earths.

#### PART III.

where it lies in little Veins containing much water. Supposed to be the materia prima of white Marble. .....

A White EARTH lying in a Load degenerated from Tin. very gritty, and infenfible of Acids. The set bour A

A White EARTH, with a Ray of Red; very foft, without any grit, and inaffected with Acids. Nor hath it the common Taft of Boles, but is altogether infipid: Found in the fame place, as the former; but in different Veins: Supposed to be the Embrio of white and red Marble.

A BOLE of a yellowish fandy colour; fomewhat gritty and friable.

SILESIAN BOLE. Of a redifh yellow, exactly like the paler Emplastrum de Minio. As dense as any other, crackling a little betwixt the Teeth. Yet without the least Particle of Grit; feels as fmooth as Caftile-Soap; fcrapes with a glofs; and breaks like Bees-Wax, or the Salve above-faid. Tafteth like other Boles.

The BOHEMICK fealed BOLE. It agrees in all properties with the former; faving that it hath fomewhat more of red.

The HEPATICK BOLE of LEMNOS. Of kin to the red Lemnian. And anfwers to that which Wormius defcribes by the Name of Terra sigillata hepatica. It stirreth not with Acids.

ANOTHER of the fame more PALE. Somewhat harder than the Armenian Bole. It makes a fmall ebullition with Oil of Vitriol, and with Spirit of Nitre a very ftrong one.

I take the principal Difference between Earths, as applied to Medical Ufe, to be this, That fome are not affected with Acids; others are: Those, Pauperes or Fatuæ; coming nearer to fimple or meer Earths; Thefe Saline, or impregnated with a Mineral Alkali, and therefore of greater energy.

A fmooth and pale rediff CLAY, lying in a little vein, running East and West, through a great Pillar of Sand, in a firme Marble-Rock. Supposed to be the Embrio of the red. Marble.

Red LEMNOS EARTH. As red as Radle; but much more close and coherent, and fo colours not the Fingers. (a) Lib. de Theophrastus (a) reckons up three forts of Terra Lemnia; sc. the Deep Red, the Pale Red, and the Whitish.

Celebrated

Lapid.

PART III.

#### Of Earths.

Celebrated by fome of the Antients against Poyfon, which, if right, it expels by Vomit. Yet *Theophrastus* faith, That in his time, it was used only for *Painting*.

ARMENIAN BOLE. From that part of Armenia next to Cappadocia. Both of a deep and a pale Red. Very foft, and eafily rub'd to powder. Never makes any ebullition with Acids. Firft brought to Rome in Galen's time, when the Plague was there. In which, and other Malignant Difeafes, it hath generally been efteemed of good ufe. Joubertus relates, as a Teftimony of its Virtue, That four men preparing fome Cathartick of Antimony, were all well nigh fuffocated. And that upon his giving them each  $\exists ij$  of this Bole, they became very well. But the queftion is, Whether fo foon as they were got out of the reach of the Antimonial Fumes, (from which we may be fure he took them) they would not have been well without it ?

An English BOLE, like the Armenian. From Sir J. Hoskins. A Red MINERAL EARTH, with fome little gloffinefs in fome places. Of the colour of the deepest Armenian Bole.

Red Cornish MARLE, used in Agriculture. It hath some grains of fine Sand, which, through a Glass, looks like Metal. A piece also of common Radle.

A BOLE confifting of Red and White Plates, thin and parallel; fo as to look like ftriped Work.

BERG-GRUN; a Green *Earth*, the fediment of a green Water in the *Copper-Mine* at *Herngrundt*. Given by Dr. *Ed. Brown*. 'Tis ufed by *Painters*.

A VERDAZURINE BOLE. So I call it, for that it is on the out-fide of a blewifth green, like Verdegriefe. Within, of the colour of a Leek. It flicks to the Tongue, as the Armenian, or Lemnian, and hath the like Taft. Stirs not with Acids. Not unlike to that, which is defcribed by Wormius with the Name of Creta Viridis. Yet cannot be the fame, unlefs that Name be ill given: for Chalk properly fo call'd, maketh a ftrong Effervescence with any Acid.

A GREEN EARTH like that which Kentman (a) calls (a) Foffil. Saponariam (. Fulloniam.

A BLEWISH Grey MARLE mixed with Red. Ufed in Agriculture.

A BLEWISH EARTH, with the fignature of an Escallop upon it. It gently diffolves with Acids.

Earthen

#### Of Earths.

PART III.

Earthen BALLS, about as big as mounting Stones, of a Blewish colour, or that of *Tobacco-Pipe-Clay*. With other irregular Lumps of the fame nature : found among the *Earth* of a Hill overturn'd at *Kenebank* in *New-England*.

A Piece of IRISH-SLATE, fo called. Given by Mr. Rob. Hook. Of the fame colour as the Cornist, only fomewhat paler. But as foft as the Terra Lemnia, and feveral other Boles. And is therefore to be reckon'd amongst them. Befides the common Tast of Boles, it hath a little Astringency. Yet not alike perceived in all, for there is better and worse: which Apothecaries will do well to observe.

Kentman (a) mentions a fort of very white Earth near Padoa, which in a fhort time would turn Blew, only by being exposed to the Aer.

A fort of BROWN EARTH, very light; lying in Veins, incompassed with a Body of greenish Sand. From Cornwall.

A BLACK EARTH, taken out of a fpot enclosed in the fame Sand, without any Vein iffuing from it.

#### SECT. I.

# Of Things relating to CHYMISTRY, and to other Parts of NATURAL PHILOSOPHY.

A LL Arts are referred either barely to the Obfervation, Or alfo to the Command and Management of their Object, for the Ufe of Man. But I must speak of those Particulars here preferv'd, in that Order, as they will bear : and so shall reduce them to four General Heads, *fc*. such as relate to *Chymistry* and other parts of *Natural Philosophy*; To the *Mathematicks*, *Mechanicks*, and *Antiquity*.

The Phlegme, Oil, Spirit, Volatile, and fixed Salts, both of the Serous, and Grumous Parts of HUMANE BLOOD. Together with the Oil, Volatile, and fixed Salts, of that of an OX. Prepared, and given by Dr. Walter Needham. By whom alfo was read a Difcourfe before the Royal Society, in which, as I take it, the proportions between the faid parts, with divers other Remarques were deliver'd. But I meet with no Register hereof. The different Proportions of the faid parts, as they are obfervable in the feveral Viscera, I may have occasion elfe where to reprefent. I shall now only note, That the fixed Salts of Blood above mention'd, are three of them Grey, and all but weak. The fourth, viz. that of the ferous part of an Oxes, although calcined to whitenefs; yet is not fo strong, as That of most Vegetables.

The OIL of TOBACCO diftilled per descension. The notable effect hereof upon a Cat, was try'd some years fince before the Royal Society. One or two Drops of it being 352 Of Things relating to Chymistry, Oc. PART IV.

ing put upon her Tongue, she fell immediately into horrid Convulsions, and dy'd within the space of one minute of an hour. This very Oil I have several times prescribed to my own Father (who takes Tobacco) in Lint to be held betwixt his Teeth, against the Toothach, with a good effect, and no ill one. But I, who take none, having once us'd it, my self in the same manner, although I swallow'd not so much as any of my spittle, yet it made me extremely sick, and vomit once or twice.

The Stillatitious OIL of LAWANG BARQUE. Sent from Java major by Sir Phil. Vernatti. It partaketh much of the colour, fmell, and taft of That of Saffafras; but is much more fragrant. The Oil of Saffafras is diftill'd only from the Wood. But if one were diftill'd from the Barque, it might equal This.

An Oil diftill'd per Alembicum, from the ROOTS of the CINAMON-TREE refembling Camphire. From the fame Hand and Place. The Roots being only bruifed, and fteeped in Water, are then diftill'd. The Tree is about the bignefs of the Olive. Defcribed by Linfchot. (a) Grows in Cavit and Subanin, but the beft and most in the Island Seylon; there in whole Woods.

The LIQUID OIL of MACE, by expression. 'Tis made of fresh Mace. Hath some few curdled parts, as sometimes in that of Olives: but the most part of it is liquid without heat, which the best expressed Oil of Mace in the Shops, is not. Almost of the colour of a Tincture of Saffron, and very fragrant. Confirming what Linschot faith, sc. That the original colour of Mace, is Scarlet.

The FIXED SALTS of Carduus bened. Garden and Sea Scurvy-Grass, Ash and Oak Barques, Rosemary, Mint, Mugwort, Agrimony, Wormwood, Sorrel, Mallows, Liquorifb, Anife-Seeds, Sena, Jalap. By Me prepared and given. Together with a Difcourfe read before the Royal Society concerning the fame, which I purpose to publish ere long. Ι shall here only Note, that although Many think and affirm, That all the Fixed Salts of Vegetables are alike : yet by Thefe, duly managed, it doth appear, That there is a great difference, both as to strength, and otherwife, between divers of them, even when they have been equally calcin'd. So far, that the promiscuous use of some of them, in Physick, is unfafe:

(a) Lib. 1. c. 63. PART IV. Of Things relating to Chymistry, Oc. 353

unfafe: as, for inftance, of Tartar and Wormwood; half a Scruple of the former, being as ftrong as one whole Scruple of the latter. Of the Fixed Salt of Vegetables, fee a Difcourfe in the Phil. Transact. N. 107, & 108. Of the Volatile Salt, N. 101.(a)

(a) Both

An East-Indian Composition (as it seems of Vegetables) communica-ted by Dr. called CATO. Very aftringent, and infus'd in water makes Daniel Cox. it yellow. Us'd by the Indians against the Inflammations of the Mouth or Throat.

SAL AMMONIAC fublim'd in a Sugar-Mould from Beds of the fame taken from a Coal-Mine near New-Caftle upon Tyne; of which, fee the foregoing part of this Catalogue. Prepar'd and given by Dr. Luke Hodgson.

SPIRIT of Sal Ammoniac diftill'd from the faid Salt mixed with Quick-Lime. By the fame Hand.

The Parts of the Medical WATERS of SCARBROUGH. Prepared and given by Dr. Witty: together with an account of them. But this I find not. The Preparations are thefe, The Phlegm, and Acid Spirit, not ftrong. The Sedement upon evaporation, of an ash-colour, a bitterish and nitrous Taft. The Precipitate, upon the mixture of Gall-powder; black, and of little Taft. One or two Grains will precipitate 31 out of a Gallon of the Water. The Nitrous or Effential Salt, as I take it, before the Precipitation The like Salt, after the Precipitation is made. be made. These Salts have also somewhat of a Nitrous Tast, but mixed with a fmatch of a Vitriolick: And the latter, I take notice, is figur'd into long square Crystals, or little fquare Bars. The Black Precipitate calcin'd. The Lixivial Salts, made, as I take them, from the Precipitate, and from the fimple Sediment or Extract both before and after Precipitation made: fomewhat like to that of Vitriol.

What ever Ingredients, as Niter, Vitriol, or other known Salts, may go to constitute these abovesaid ; I am of Opinion, That the predominant is fome Metallick Principle different from them all.

A Solid HERMETICK PHOSPHORUS; a mixed Matter, which being exposed for about half a minute of an hour to the Sun, or only to Day-light, or to a bright Fireor Candle; will shine in the dark for some minutes. Made by Dr. Fr. Slare, and by him given to the Royal Society, Apr. 3.

Zz

# 354 Of Things relating to Chymistry, &c. PART IV.

Apr. 3. 1679. The first of this kind was made by Monfieur Baldwin, a German Lawyer who gave it the Name above, but with no direction for the making of it. Nor doth he fo much as mention the Materials.

I call it Solid, to diffinguish it from two Liquid kinds. The Author of one, supposed to be Mr. Dan. Krafft. The other invented by the Honourable Mr. Boyle; which He calls the Aerial Noctiluca; and whereof He hath lately published an excellent Discourse. In whose Laboratory, the folid kind was also made by his direction, feveral ways.

Of the Procefs for This here, Dr. Slare fome years fince received a hint from Dr. Christian Connerding, Archiater to the Duke of Zell. And not hearing of any one, amongst many that have try'd, besides these Three, to have fucceeded in the making of it, he hath imparted the following Account.

Take good firm *Chalk*, ignite it in a *Crucible*, and then powder it. Put into a pint or half a pint of ftrong *Spirit* of *Nitre*, *Cochleatim*, as much hereof, as will ferve well to fatiate it, *i. e.* till it becomes fweetifh, and makes no *Effervefcence* upon the injection of the *Chalk*. Then dilute this Liquor with fair Water, filtre it through a Paper, and fo evaporate it in a large Glafs, or glazed Veffel, or good *Haffian Crucible* to a dry *Salt*. The preparation whereof may be perform'd in four hours: whereas I have feen a Pocefs, that would take as many Weeks to follow it.

The main business lies in the good *Enchires*; about which these several Directions must be carefully obferv'd.

First you must prepare a Vessel of Clay, somewhat like a shallow *Coffee-Difb*, of three, four, or five inches in Diametre, and an inch in depth, very well baked and neal'd. Then place it under a Mussel after the manner of a Refining Furnace, in the place where the Cuppels usually stand: and so make it red hot. Then put the prepared *Salt* into it, by little and little, not above 3j ff. or 3ij at a time. Keep the fire to that degree, which will suffice to make the *Salt* boil in the Difh, so as to so so for the *Salt*, last put in, be confumed, be fure always to be ready, to make a new addition, otherwise your labour so far is lost, and you must begin again. When PART IV. Of Things relating to Chymistry, 5.c.

When five or fix Drachms are fum'd away, take the Difh nimbly out of the fire, fo foon as the Salt last put in is dry. If you have wrought well, what remains in the Difh will be yellowish in some parts, and every yellow part will shine. Secure this Matter from the Air by fitting and cementing a Glass to it: otherwife it will loofe its property in one Week.

As to the Caufe of this strange Phanomenon, Dr. Slare continues to this effect. I shall in short offer my Thoughts, and refer them to your Judgment. Two Questions may arife: What it is in this Mixture that yields the light? and, How it doth it? As to the first, I take it to be the pure fiery part of the Spirit of Nitre embraced by the Chalk. For that the reft is weak and phlegmatick; as appears, if it be diftill'd. Alfo, that about the end of the Operation, a black Fume begins to rife and fly away. That if by continuing the Dish too long in the fire, you drive all the Nitrous parts away, the Chalk which stays behind will not be luminous. Or if the Matter duly prepar'd, be exposed to the Air, and thereby prey'd upon, the fame effect will follow.

As to the Second, I suppose, That it shines not by Imbibition of Light, but by Impression from it, from whence proceeds a motion therein productive of Light. Which we may the rather be induced to believe, In that if it be put into an Iron Cover, and then an Iron Box, and a good heat given to it, it will shine so vigorously as to seem to kindle the Air about it. That two Men by following their blow clofe, will make a Bar of Iron glow, or thine in the dark. And although the Impulse of Light may seem small; yet upon Bodies nearly related to it, as This feems to be, it appears to be great. As in those odd effects it sometimes hath upon Infants unus'd to it; and People that have fore Eyes; or have been newly Couch'd; as it happen'd to Dr. Caftle fometime fince, who by making bold with his Eyes too early, (*i.e.* by a too frequent admission of light to them, ) after that Operation, did thereupon fuffer fuch extreme pains, and mischief in his Eyes, that he now dispairs of ever feeing more.

Mr. Haac (a) faith he, hath frequently repeated the (a) Author following Experiment upon this *Phosphorus*. If it be ex-posed to the Morning Light a little before Sun rifing, it the Load-Z Z 2 prefents frome, Part 3.

# 356 Of Things relating to Chymistry, &c. PART IV.

prefents a bright Rofy hugh. As the Sun approaches the *Meridian*, it advances to a higher and more firey Complexion, like that of a red hot Iron. A little after Sun-fet, declines to a pale wan colour, like *Chalk*, or rather *Mother* of *Pearl*.

Expos'd, faith he, to the light of a Candle, or flaming Fagot, it receives a pale Luminous colour, as from the Sun towards fetting. But being expos'd for a confiderable time to the most clear Moonshine that I have seen in London, I could not perceive it to become Luminous in the least.

It hath been kept, faith he, in the Vacuum of my Great and Noble Patron, the Honourable Mr. Boyle called Vacuum Boyleanum, and by his Highnefs Prince Rupert and Himfelf obferv'd, for above four or five months, without any diminution of its fhining property.

He adds, That he hath lately found a way to affix this Shining Matter to Glafs, whereby fome not unpleafing Experiments may be made. Thus far Dr. *Slare*.

As to his Ingenious Conjectures of the Subject and Caufe of Light in this *Phofphorus*: becaufe he hath defired my Opinion, I shall therefore subjoyn it in a few lines.

As to the first, What it is which gives the Light: It feems hard to fay, Whether it be the *Cretaceous Salt*, the *Nitrous Salt*, or fome *Igneous Particles* incorporated with them in the Operation? It is plain, That one way or other, they do all concur to produce it.

As to the Queftion, How these *Particles* give light? It should first be stated, What Light is; Whether it be a Body? Which, though much disputed, yet in strict speaking, is an absurd Question; all one, as to ask, Whether a Quality, be a Body? But the meaning of the Question is, or ought to be, Whether there be any Body in Nature, which is the peculiar subject of Light, or metonymically may be called Light? Or whether more Bodies than one, may fuccessively be the immediate subject thereos? If so, Whether it be any other Adjunct besides Motion? If only Motion, Whether as there is one peculiar Motion, at least for a Musical sound, so another for Light? And in regard there are some Experiments which seem to favour each of these Questions: such an Answer should be given as will

cor-

PART IV. And Natural Philosophy.

correspond with all those experiments; and will be too long to fuit with this Catalogue.

I shall here only fay, I am inclined to believe, That, in this Cafe, all the three Bodies above mention'd ferve together to compose an Apt Recipient of that which is the true Luminous Body. That, as in the mixture of Sulphur and Water, fulphurious Salts, of affinity with both, are ufed as a medium: fo here, the Cretaceous Parts ferve to fix the Nitrous; and the Nitrous, to fix the Igneous; being of a middle nature and readily incorporated with them both. And being in this union exposed to the Sun Beams, or other Light, the Igneous parts ferve, for fome time, to retain a certain portion of fuch as are Luminous, or to give, as I may fay, a degree of Fixation to These also: and that therefore this Mixture is kindled or made to thine, by puting it into the Light, as a flick is made to burn, by puting it into the fire.

Of thining Fleth, fee a Relation of fome Remarkable Circumstances, made by Dr. J. Beal, and published in the Phil. Trans. (a) (a) N. 125;

Of Instruments relating to Natural Philosophy.

N AIRE-PUMP; or an Engine to exhaust the Air out A of any Veffel fitly applied. Contrived and defcribed (b) (b) Experi-by the Honourable *Rob. Boyle* Efq: Who hath alfo made fico-Mechatherewith, and published in feveral Tracts, a great variety nick of the Spring of of accurate and instructive Experiments.

the Air.

A Great CONDENSING ENGINE of Brafs; contrived to ram and crowd a great quantity of Air into a little room. Whereto is also fitted an Iron Gun or Barrel.

A Little CONDENSING ENGINE of Glafs, with a Brafs-Neck, Rammer and Valve fitted to it ...

A WEATHER CLOCK. Begun by Sir Chr. Wren, (c) (c) See Hift. now Prefident of the Royal Society. To which other of the Royal Motions have fince been added, by Mr. Robert Hook p. 312; Professor of Geometry in Gresham-Colledge. Who purposes to publish a Description hereof. I shall therefore only take notice,

#### Natural Philosophy. PART IV.

notice, That it hath fix or feven Motions; which he fupposeth to be here advantagiously made altogether. First a Pendulum Clock, which goes with tof a 100 lib. weight, and moves the greatest part of the work. With this, a Barometre, a Thermometre; a Rain-Measure, such an one as is next describ'd; a Weather-Cock, to which subserves a piece of Wheel-Work analogous to a way Wifer; and a Hygroscope. Each of which have their Regester, and the Weather-Cock hath Two; one for the Points, the other for the Strength of the Wind. All working upon a Paper falling off of a Rowler which the Clock alfo turns.

An Instrument for MEASURING the quantity of RAINS that fall in any fpace of time, on any piece of Ground, as fuppose upon one Acre in one year. Contrived by Sir Christopher Wren. In order to the Theory of Vapours, Rivers, Seas, &c. A triangular Tin-Veffel hanging in a Frame, as a Bell, with one Angle lowermost. From whence one fide rifes up perpendicular, the other floaped; whereby the water, as it fills, fpreads only on one fide from the centre, till at length it fills and empties it Which being done, a leaden poife, on the other fide, felf. immediately pulls it back to fill again.

The Model of an Iron Inftrument to fetch Earth, or other Bodies, from the bottom of the Sea; made with feveral Values and Springs to open and shut it for that purpofe. Contriv'd by Mr. Hook.

A LAMP-FURNACE. By the fame Perfon. Towards the bottom is a partition with a hole in the middle; below which, stands a Vessel of Oil with a Wick, and a Cork to float it, fo as to ftand within the faid hole. Over this is placed a Pan, viz. with the bottom about two inches di-Itant from the partition. Within which, is fine Sand. Defign'd for the hatching of Eggs, in order to obferve the Process of Generation. As also for digesting of Li-quors.

(a) See bis Lampus, p. 14. (b) Ibid. Tab.3.Fig.4.

A pair of Semicylindrick LAMPS. Contrived, defcrib'd, (a) and delineated (b) by the fame Perfon. Defign'd, for the poyfing the Liquor which is to feed the Flame, fo as to keep the furface thereof always at the fame height, till it be all confum'd. And thereby not only to fecure, that it never defert the Flame, and fo to fave Attendance: but

4

but also to keep the Flame of equal strength, for all such purposes as require it.

The MODEL of an EYE. In which the Humours are reprefented by Glaffes of an anfwerable Figure.

A BURNING-GLASS, about half a foot in Diametre.

A HOLLOW BURNING-GLASS. That is to fay, two thin concave Glasses fet together, and so to be fill'd up with water when it is us'd. About the fame bigness as the former: but burneth not altogether so strongly. Contrived and given by Dr. John Wilkins late Bishop of Chester.

A Large MICROSCOPE, with three Glaffes, and feveral Screws to fit it for all manner of politions. It magnifies the *Area* of the Object to above a hundred times the extent thereof to the bare Eye.

A Leffer MICROSCOPE, fomewhat more managable than the former.

The advantage of one with more Glaffes, is that it takes in a bigger Object, or a greater part of it. Of one with a fingle Glafs, that it thews the Object clearer. So that to have a diffinct reprefentation of it, 'tis convenient to make ufe of both. Of the latter kind, I have feen feveral made by Mr. John Malling in this City, not only with melted, but with Ground-Glaffes fo very finall, that one of thefe Ground-Glaffes being weighed in the Affay-Scales in the Tower, was found not above the fourfcorth part of a Grain. The Diametre or Chord  $\frac{1}{2}$ th part. of an inch. Another, fo finall, that those Scales were not nice enough to weigh it. The Chord hereof to that of the former, is as two to three. These are the clearest and best that ever Ifaw.

An OTOCOUSTICK, or Inftrument to help the hearing, made of *Ivory*. In fhape like a *Funnel*, faving that the *Nofe* is bended for the more convenient application to the *Ear*, and reception of the found. Given likewife by Bishop *Wilkins*.

Another of *Copper*, funnel'd at one end, as the former, and alfo belly'd in the middle.

A Third of *Tin*, of a *Conick* Figure, and with a *Cochlea* within it. The beft of all the three, is the first.

A Pair of HYDROSTATICK Scales. Ufed, amongst other purposes, to examine the specifick Gravity of Bodies.

# 360 Of Things relating to Mathematicks, GC. PART IV.

A Box of ANATOMICK Inftruments; fc. Saws, Steel and Ivory Knives, Chizels, a Forceps, a Leaver, a Tenter, a Sirynge, Pipes, Probes, and Needles.

#### SECT. II.

#### Of Things relating to the MATHEMATICKS; and some MECHANICKS.

**T**O Aftronomy. A REFLECTING TELESCOPE. Contrived by Mr. Ifaac Newton, Profession of the Mathematicks at Cambridge. Whereby not only the cumber and charge of other Telescopes is avoided; one of these less than a foot long, magnifying as much as another of fix feet: but the Object likewise, both by a more regular Refraction, and a less expence of Rays, is much more clearly reprefented.

It confifts of a *Tube* open towards the Object, and clofe at the other end. Where is placed a *Metalline Concave*, inftead of an *Object-Glass*. Near the other end, a flat *Speculum*, alfo of *Metal*; placed obliquely towards a finall *Eye-Glass*; *fc*. upon that point of the *Tubes Axis*, on which the perpendicular falls from the faid *Eye-Glass*. So that the Rays coming from the Object, first fall upon the *Concave*; are thence reflected to the flat *Speculum*, thence to the *Eye-Glass*, and through that deliver'd to the Observers *Eye*. The Authors Description hereof at large; together with a Discourse of the Materials which are or may be thought fittes for the *Speculums*; a *Table* of Apertures and Charges for feveral lengths; As also Mr. *Hugen's de Zulichem's* Remarques on the fame; fee in the *Phil.Transactions*. (a)

Arithmetick. An Inftrument for working Questions by Multiplying and Dividing. Contriv'd by Mr. Hook. Who purposes to give the Description hereof himself.

Geography. A WAY-WISER. Given by Bishop Wilkins. 'Tis very manageable. It hath five Indexes pointing to fo many different Measures, *fc.* Perches, Furlongs, Miles, Tens of Miles, and Hundreds of Miles; and turn'd about with as many Wheels. Made to Work in a Coach, thus; In the

(a) Num. 81, 82.

# PART IV. Of Things relating to Mathematicks, Oc. 361

the middle of the Axletree is cut a little Box to receive the Wifer : from whence the Axeltree is made hollow to the end. In this hollow lies a Rod, loofe from the Axletree, and fasten'd at one end to the Nave of the Wheel, and fo turns round with it. And with a Worm it hath at the other end, at the fame time, it turns the Perch Wheel of the Wifer, and that all the reft. Yet by this measure, 1 yard will fometimes be lost in a 100 yards.

Architecture. A Model of a Geometrick FLAT FLOOR. Given by the forementioned Perfon. Contrived and delineated (a) by Dr. 7. Wallis Professor of Geometry at Oxford. Who was pleas'd to give me the following Account, as an Abstract of that he hath formerly published hereof. (a)

oftract of that he hath formerly published hereof. (a) (a) See his I did first, faith the Doctor, Contrive and Delineate It in tu, Cap. 6,. the Year, 1644. at Queens-Colledge in Cambridge. When Prop. 10. afterwards I was made Professor of Geometry at Oxford, Fig. 243. about the Year, 1650. I caufed it to be framed of fmall pieces of Wood, reprefenting fo many pieces of Timber; prepar'd by Mr. Rainsford a Joyner in Oxford, and put together by my felf.

This I shewed foon after to divers in Oxford, and particularly to Dr. Wilkins, then Warden of Wadham-Colledge in Oxford: Who was fo well pleafed with it, that he caufed another to be made for himfelf, according to that Pattern. Which he kept by him for many years, and afterwards prefented to the Royal Society.

After the King's Restauration, I caus'd another to be made; and, in the Year, 1660. prefented it to his Majefty; who was well pleas'd with it, and caufed it to be repofited in his Clofet.

On the Model first mention'd, I Read two Publique Lectures at Oxford, on the Vespers of the Publique ACT: the one, in the Year, 1652. as to the Construction of it; the other, in the Year, 1653. as to the computation of what weight every Joynt of it fustains; whereby it might be the better judged how far it may be fafely practifed. The greatest weight charged on any one Joynt, doth not amount to Ten-times the weight of one Beam : And the greatest weight bor'n by any one Beam; not to seventeen times its own weight: and even this, not laid all on the fame part, but distributed to several parts of it. The sum of these two Lectures, is to be seen in the Sixth Chapter of my Book de Motu. Aaa A

# 362 Of Things relating to Mathematicks, Gr. PART IV.

A Third Lecture, much to the fame purpofe, I read, May, 1699. in the fame place, before the prefent Grand Duke of *Tuscany*, who honoured the University with a Visit, and me with his Presence at that Lecture. After which, he was pleased very particularly to confider both the Delineation and Model, and declared himself very well pleased with it,

The contrivance is obvious to the Eye. The outfides reprefent the Walls of the Building on which this Flat Floor or Roof is to be laid. The Beams next adjoyning to the fides, have one end lodged on those Walls; the other end fustained by another Beam, lying cross; both ends of which, are in like manner fustained by other cross Beams; and those again by others; till they reach the other Walls. So that no one of them can fall, unless the Walls fail, or the Beams break: all mutually fustaining each other without any Pillar or Prop to fupport them, befides the outer Walls.

The Models I caufed to be made, and that of the *Royal* Society in imitation thereof, are in Breadth, about four times as much as the Length of the longeft Beam. But may be continu'd, at pleafure, to farther breadth, as fhall be thought fit. With this Caution: That the farther the Work is continu'd, the greater Weight will be charged on every Joynt; efpecially near the middle. And though in this Model, no one Beam is charged with fo much as feventeen times its own weight : yet if the Work be continu'd to a greater breadth, the proportional Weight will be thereby increafed. And therefore muft be limited, according to the ftrength of Timber, able to bear more or fewer times its own weight.

I do not know, that yet it hath been reduced to practife, in more than four Pieces, in this Form. Such is one of the Floors in the *Tower* of the Publique Schools at *Oxford*: the Breadth whereof, to the Length of the Beams, is as three to two. But

may doubtless be continu'd much further: especially in fuch a Roof or Floor, as is not to bear much more than its own weight.

Thus, for inftance, a *Bowling-Green* of near an Acre of Ground, may be cover'd with a Frame of long flender pieces,

# PART IV. Of Things relating to Mathematicks, Oc. 363

pieces, without any other Prop than on the fides, for *Vines*, or other like *Plants* to run upon, fo as to fhade the whole.

Note here, That whereas the ends of the feveral pieces are to lie upon those that cross them, about the middle thereof; it will be neceffary at every Joynt to abate both pieces half way, or near it; that one may be thus let into the other, and the whole reduced to a Flat. But whether fuch piece, so abated doth end even with that on which it lies, or doth lie over somewhat beyond it; is indifferent. And though That may seem more elegant; This, perhaps, may be fitter for use.

Each piece, I fay, must be fo abated half way, or near it. For, whereas those Beams, especially if of a confiderable length, will, with the weight, bow a little; if this abatement be fomewhat less than half way, (whereby without fuch bowing, the whole would fomewhat rife in the middle) it will by fuch bowing be reduced to a Flat.

Note alfo, That a Frame thus contriv'd, needs neither Nail nor Pin; the feveral pieces faftening, as well as fupporting one another. Yet, if it be to bear a great weight more than its own; it will be convenient to faften each Joynt with Pins; and, if need be, to ftrengthen it with Iron-Plates, or line it with other pieces of Timber, to be faften'd with Iron-Bolts; to make amends for what is weaken'd by the abatements at the Joynts: which will make the whole Frame exceeding ftrong.

A Model of a Double Winding STAIR-CASE. The Foot of one is opposite to that of the other; whereby both make a parallel afcent, and within the fame Cylinder. The Newel or Column in the Centre, is hollow, and built with long Apertures, to convey Light, from Candles placed at the bottom, and on the fides of the Newel, into both the Cafes.

Another, of a fingle one, with a folid Column or Newel.

Navigation. A Model of the Hull of a DOUBLE-BOT-TOM'D SHIP. Contrived by Sir William Pettey.

It hath two Heads, two Ruders, two Keels, two Holds, and a Vacancy between them.

From Stem to Stern, four feet and feven inches long. The Deck, about four Feet. From the foremost Rib to

Aaa 2

the

# 364 Of Things relating to Mathematicks, Oc. PART IV.

the *Rudder*, three Feet and feven Inches. The *Keel* three Feet and about five Inches.

The Beam or breadth of the Ship, fixteen inches, or with refpect to the Keel, as two to five.

The height of the Round-House, or the Room in the place of it, three inches and  $\ddagger$ . Of the Great Cabin, three inches. Of the Fore-Castle, as much. The depth of the Wast an inch and  $\ddagger$ . Of the Holds, fix inches and  $\ddagger$ . Each of them four inches broad. The Vacancy between them, eight inches over. Their inner fides not belly'd, but plain, and perpendicular.

These are the principal Measures; which I thought fit to fet down. The great Advantages of this Form, with respect either to the Speed, the Course, the Safety of the Ship, or otherwise, I leave to the Authors own excellent Hand, from whom is expected a particular Account hereof.

An INSTRUMENT, contrived by Sir Christopher Wren, to demonstrate, How far against the Wind a Ship may Sail. Shewing, that the Mechanical Power, to which Sailing (efpecially against the Wind) is reducible, is a Wedge: And that a Transient Force upon an Oblique Plane will cause the motion of the Plane, against the first Mover.

A TERELLA, or an Orbicular Loadstone, about four inches and in Diametre, with the one half immersed in the Centre of a Plane and Horizontal Table; so as to be like a Globe with the Poles in the Horizon. Together with 32 Needles upon the Margin of the Table. By which the different respect of the Needle to the several Points of the Loadstone; the reduction of the Filings of Steel to Helical Lines, or near them, by the Magnetick Effluvia; and other particulars may be observed. Contrived by the same Person.

Two DIPPING-NEEDLES. Defigned for the taking, of Longitudes.

A CANOO. Given by Mr. Hocknel. A fort of Boat fo called, ufed in Greenland, and fome other places. Figur'd almost like a Weavers Shuttle. The Wooden-Work is made up of five flender pieces, running by the length : one, which is round at the bottom or in the place of the Keel; and two flat ones in each fide: Made steady with fmall

# PART IV. Of Things relating to Mathematicks, Oc. 365

fmall bended pieces, fet or pricked in crofs-ways, inftead of *Ribs*: and fo ty'd all together with *Fin-Whale-Bone*.

This Wooden-Work is cover'd all over, both below and above, with *Seal-Skins*, fewed together with *Leathern-Thongs*. Saving, that towards the middle, is an Oval Hole, encompafied with a *Rim* about four inches high, big enough for a man to fit down in.

In length, feventeen feet. From the Centre of the faid *Hole* or *Seat*, forward, Ten feet; from thence, backward, feven. In breadth at the *Seat*, a foot and  $\frac{1}{4}$ . In depth, backward, feven inches and  $\frac{1}{2}$ ; forward, a foot; becaufe of the mans feet. And the Boat feems thereby to be carried forward with the more eafe: as a Coach, in being hung higher behind. The whole Boat is anfwerable to a great Bladder, in which, though the Waves dafh and beat over it never fo much, the man ftill fits fafe.

He makes use but of one *Oare*, about nine feet long. Made of *Afb*, and shaped somewhat answerable to a strong *Bow*. In the middle, an inch and ‡ thick, and an inch and ‡ broad, by the *Horizontal* measure: towards both ends, about ‡ of an inch thick, and two inches and ‡ broad, by the *Vertical*. At each end is fasten'd a *Padle*, here wanting. This *Oare* he holds in the middle, and Rowing with both ends alternately, makes it ferve instead of two.

War. A GUN affixed to an Iron Triangle; the middle of the Gun, to one of the Angles; and the Breech, to the middle of the fubtended fide: and fo to be fasten'd to a Floor or fleady Frame, either at all the three Corners, or only at one of the hinder. Contriv'd by my Lord Vicount Brouncher, for the making of Experiments of the RE-Delineated in the Hiftory of the COYLING of Guns. Royal Society. (a) Together with the Experiments made (a) Part 2; herewith by his Lordship; first before the faid Society, P. 233. and afterwards before the King: fet down in a Table of five Columns. The First shewing the Corner stoped from Recoyling; the Second, the different Charges of Powder; the Third, the Diftances to which the Bullet was carry'd wide of the mark; the Fourth, the fide on which it was carry'd; the Laft, the diftance of the Mark from the Muzzle of the Gun. As alfo, the Caufes affigned by his Lordship, for the particulars most observable.

An

366 Of Things relating to Mathematicks, Oc. PART IV.

An ASSAYER to try the ftrength of Gun-powder. Contriv'd by his Highnefs Prince Rupert. Compos'd of two flat, upright and parallel Stands of Brafs, about a foot and  $\frac{1}{4}$  high, with a fhallow Indenture on both their inner edges. Upon the Bafe on which they ftand, and between them, is placed a Powder-Pan. Over which, a Slider, with a thin Plate-Spring, which plays against the faid Teeth, and two Arms for the charging it with weight at pleasure. The ftronger the Powder is, it forceth the Slider to a greater height.

A WIND-GUN. Given by Dr. *Wilkins* late Bishop of *Chefter*. Composed of two Barrels, one within another. To which is fitted a Rod to charge it with Air. At the Breech, where the two Barrels are open one into the other, is placed a *Valve*, to admit the Air into the outer Barrel, as the Rod drives it, and to keep it there.

A Seven-SHOT GUN, or a *Gun* which carries Powder and Bullets, for feven Charges and Difcharges to be made prefently one after another. Given by *Dudly Palmer* Efq;. Under the Breech of the Barrel, is one *Box* for the Powder. A little before the Lock, another for the Bullets. Behind the Cock, a *Charger*: which carries the Powder from the *Box* to a *Funnil* at the further end of the Lock; opens one *Valve* to let it into the Barrel, and the Priming-Pan; another, to let in the Bullet after it; raifes the Cock; and lets down the Steel; all at one time.

An Indian Poyfon'd DAGGER. About 'a yard long. The Hilt is a fort of Wood, as firm as Box. Very curioufly carved into a kind of Antique Head. The Neck by which it joyns to the Blade, plated with Gold, and embos'd with a Ring in the middle, in which is fet fome fmall sparks of Gems. The Blade about 14 inches long, and an inch broad about the middle; waved in the manner of fome Swords hung up for Signs, and much expanded next the Hilt, the better to ftay the Hand : where it is alfo curioufly Damask'd with Gold. But every where elfe with white flourish'd Work of the colour of Silver. Saving both the Edges, which are left naked, and are very sharp. But that which is most observable is the Scabbard, which is one entire piece of Wood (near the colour of the best Walnut) with a Cavity cut down to the bottom of it answerable to the Blade. A

PART IV. Of Things relating to Mathematicks, Orc. 367

A TAMAHAUKE, or *Brafilian* Fighting-CLUB. Made of *Brafile*-Wood. About an Eln long. The Handle, above two inches and  $\frac{1}{2}$  broad; in the middle, two; and four at the other end. Hath two double or fquare Edges  $\frac{2}{3}$  of an inch thick. The broad end wrought on both fides with two *Tables* or *Areas* of finall lines obliquely croffed, and fill'd up with a chalky fubftance to make them appear. In the middle of which, feems to be a rude Reprefentation of fome one of their *Idols*, whofe help they expect.

A West-Indian TARGET. Given by H. Whistler Esq:

A West-Indian' BOW, ARROWS, and QUIVER. The Bow is made of Asb. Near two yards long. In the middle, not an inch broad, but high-back'd and belly'd, sc. above an inch, as our Bows. But betwixt the middle and the ends, of a different shape, sc. above an inch and ± broad, and not much above ± an inch thick. The string made of a fort of Catgut; but consisting of three of them hard twisted together, looks like thick Packtbread.

Some of the Arrows are almost an Eln long. Made of a fine fort of unjoynted and hollow *Cane*; about the thicknefs of one of our Arrows, and feather'd in the fame manner. The Notch fortify'd with a Swath of fplit Quill, made tite with a fine fort of *Glew*. In the other end of the *Cane*, is fasten'd a brown Stick, about feven or eight inches long, and the *Cane* there kept firm from cracking, with a Swath and *Glew*, as the Notch. This Stick is usually knoted, for greater strength: and always Arm'd. One of them, with a curious Shark's Tooth near an inch long, and indented or ferrated on both edges: a fcurvy Weapon. The rest with Bones, Stones, and pieces of Metal, usually stated not much unlike the faid Tooth.

The *Quiver* made of the Skin of the Beaft, fomewhat like the *Pig-Badger*. With a round piece of wood for a Bottom; and in the middle of the wood, an Iron Wreft, to keep it from the ground.

À Pot of MACASSAR POYSON. Given by Sir Phil. Vernatti. With this the people of the Ifland commonly poyfon their Arrows. They have of feveral forts; the most dangerous faid (a) to be made of the juyce of certain (a) Taven. Ind. Trav. Trees in Borneo. But in This are plainly to be feen the Legs 1. 3. c. 19,

and

# Chiefly of Mechanicks. PART IV.

and other Parts of fome Species of Cantharides; which feem to be mixed with a kind of Corrofive Salt.

368

Three Cane-pieces = a foot long, fill'd with the fame Poyfon.

A Siam DRUM. Given by Mr. John Short. The Body of it, as it were a great thick Neck'd Earthen-Jug, fourteen inches long; the Belly nine over, the Neck four; and with the Bottom out. In the place whereof is fpread a thin Parchment, made of a Fishes-Skin, befet all over with fmall round knots in strait and parallel Rows. Stretched out tite with numerous little Braces made of Split-Cane, all spread over the Belly of the Jug, and very curiously platted together at both their ends. The Neck of the Jug flouriss and the round about with a Mould. Both this and the Belly cover'd with a black Varniss; and the Neck also with Red, Green, and Gilt.

#### SECT. III.

#### Chiefly of MECHANICKS. Relating to

Rade. An Arabian BALSAME-BOTTLE. Given by Thomas Henshaw Esq;. 'Tis two feet high, and near an Eln in compass. Shaped like a Long-Neck used in a Reverberating Furnace. Examining it well, I find it made neither of Glass, Earth, Wood, or any Vegetable Body; but only of Leather and Parchments. The inmost Parchment, as thick as that us'd by Scriveners. Next to which, is another, as thick as the best Cordovan-Leather; but as sturdy as Whale-Bone. Next to This, another like the Inmost. Over all, is very titely and curioufly few'd a Cover of tan'd Leather. The top of the Neck hath a Ring or Collar, made only with raming in a kind of Gummy Earth very hard between the middle and the utmost Skin. The Stople made of Firwood. So much of the Balfame which sticks to the sides of the Bottle, is of an extraordinary fragrancy: and feems not inferior to that which fome Drugists fell under the Name of the Balm of Gilead.

ASSAY-SCALES, included in a Cafe with Glass Panels; to weigh with, out of the Air.

#### PART IV.

#### Of Mechanicks.

A China STATERA, in the form of a Steel-Yard. The Chinefes carry it about them, to weigh their Gems, and the like. The Beam or Yard is of Wood, round,  $\ddagger$  of an inch over, and a foot in length. Upon it are Three Rules of Meafure, made of fine Silver-fludded Work, as in Watch-Cafes. One of the Rules is divided into inches; and every inch into (25) equal parts. The other Two are alfo divided into equal parts; but not into inches. They all begin from the end of the Beam: whence, the First is extended (8) inches; the Second,  $6 \ddagger$ ; the Third,  $8 \ddagger$ . The first, is our Europe-Measure; the other two, I take to be the China-Measure, and that of fome other Country trading with them.

At the other end of the *Tard* hangs a round *Scale*, marked with a fquare Seal of *China*-Characters. At Three feveral Diftances from this end, are fasten'd fo many flender ftrings. The First Diftance makes sths of an inch; the Second, is double to the First, or an inch and  $\frac{1}{2}$ ; the Third, two inches and  $\frac{1}{2}$ .

When they weigh any thing, they hold up the *Tard* by fome one of thefe three ftrings, and fo hang a fealed weight (about an Ounce and  $\ddagger Troy-weight$ ) upon fome point of the *Rule*, as the Thing requires. 'Tis kept in a *Cafe* fitted to it, almost like a *Dancing-Master's Kit*. There is one like to this in the *Musaum Romanum*. (a)

(a) P. 34. Col. 2.

A Pair of WOODEN-BELLOWS. Contrived to fave Leather. Given by Sir Rob. Moray. They may be compared to a Box; faving, that here the Box moves, and ftrikes not within, but over the Lid: and both of a fquare Figure. The length of the Box from end to end, within, two feet. The breadth, at the Breech, a foot and  $\ddagger$ ; the depth, about a foot. The breadth of the Nofe-end, feven inches and  $\ddagger$ . The Breech-Board is bended, fo as to make part of a Zone, anfwering to the Lid (which moves upon an Iron Centre or Axis) as the Radius.

The Lid hath a *Margin* placed inward on both fides and both ends. From the inner edge, to edge, longways, nineteen inches; in breadth, at the *Breech*, ten inches; at the Nofe-end, four. The Nofe, of Iron, like that of an ordinary pair of *Bellows*. The *Value*, of Wood.

On the middle of the faid Margin, are two Springs on each Bbb fide

#### Of Mechanicks.

#### PART IV.

fide the Lid, and one at each end. Between the two Springs on the fides, and at the four Corners, a kind of half Staple like a *Bench-Hook*. Within or under which are placed fquares of Wood, andby the faid Springs, kept clofe to the fides of the *Box*, (to keep in the Air) as it plays over the Lid.

A ROUPY of Silver. Given by G. Ent Efq;.

A HALF-ROUPY of Silver. By the fame Hand. Thefe and divers other like Coins are currant all over the Dominions of the Great Mogul. I place them here, as not relating to Antiquity, but of prefent known ufe.

Several forts of *Indian* MONEY, called WAMPAM-PEAGE. 'Tis made of a fort of Shell, formed into fmall *Cylinders*, about a  $\ddagger$  of an inch long, and  $\ddagger$ <sup>th</sup> over, or fomewhat more or lefs: and fo being bored, as *Beads*, and put upon *Strings*, pafs among the *Indians*, in their ufual Commerfe, as *Silver* and *Gold* amongft us. But being loofe, is not fo currant.

The meaneft is in SINGLE STRINGS. Of which, here is both the White and Black. By measure, the former goes at Five shillings the Fathome; the latter, at Ten. By Number, the former at Six a penny; the latter, at Three.

The next in value is that which is Woven together into BRACELETS about ‡ of a yard long; Black and White, in Stripes, and fix pieces in a Row; the Warp confifting of Leathern Thongs, the Woofe of Thread. These Bracelets the Zanksquaes or Gentlewomen commonly wear twice or thrice about their Wrists.

The beft, is woven into GIRDLES. Of This here are two forts. One about a yard long; with fourteen pieces in a Row, woven, for the most part, into black and white Squares, continu'd obliquely from edge to edge. The other, not all-out fo long, but with fifteen pieces in a Row. Woven into black *Rhombs* or *Diamond-Squares*, and *Croffes* within them. The spaces between filled up with white. These two last, are sometimes worn as their richest Ornaments; but chiefly used in great Payments, esteemed their Noblest Prefents, and laid up as their Treasfure.

A string of Virginian MONEY. A Row of Teeth in shape like the fore-Teeth of a Hare: all woven together,

at

#### 370

PARTIV.

# Of Mechanicks.

at one end, with brown twifted Thread, into one Piece ? of a yard long.

Husbandry. The Frame of a SAFFRON KILN. Given by the Honourable Charles Howard Efq;. Together with a Defcription hereof; and the way of Planting Saffron, and ordering it upon the Kiln. And by Me published in the Phil. Transactions. (a)

The Spanish SEMBRADORE. A Machine for Plowing, equal Sowing, and Harrowing all at once. Contriv'd by Don Joseph Lucaleto a Spanish Knight. Used and approv'd both in Spain and Germany. Given by J. Evelyn Efq; together with the Defcription extracted out of the Authors Treatife hereof, and published in the Phil. Trans-(b) Num: actions. (b)

A CIDER-PRESS. Described also by Mr. Evelyn. (c) (c) Appen-Contriv'd by Mr. Hook. For better Difpatch, and thorow dix to Pobreaking of the Apples. Confifteth chiefly of four Cylinders. Those two, which are first to bruise them, more diftant; the other, to prefs out the Juyce, as close as will well confift with their motion.

A BOX-HIVE. Given by Sir Rob. Moray. But contrived by Sir Christopher Wren: And the Description hereof first published (d) in the Year, 1652. Since then by Mr. Moses Hartlib. Rulden. Defign'd to keep them warmer, and more fafe; but efpecially, to prevent their Swarming, and the better to propagate them into Colonies.

Houswifery and Housbold-stuff. CASSAVI-BREAD. Made of the Root of the Hyjucca Mexicana. They first pound it, and prefs out the Juyce; which is of a noxious (fay fome, of a deadly) quality : and the *Pulp* of the Root is reduced to a Cake. These Cakes they fry, or rather bake over a gentle fire, and fo fet them in the Sun to dry, for their Bread. The thicker Cakes, called Caffavi, and eaten by the poorer fort. The thiner, called Sciam Sciam, by the Rich. (e) In (e) Aldin. Hier. Benzoni's time, (f) all the Ships that were bound from Hort. Farnef. Spain to Mexico; when they returned, were Victualled Out of Mo-nerdes and with Callavi-Bread. That is, inftead of Bilco't.

A HAMMOCK. Like a Great Net, with feveral finall (f) Hittor. *Taffels* on the fides, and two huge ones at the ends. Be-  $c_{2,2}$ . tween which, 'tis fifteen feet long. The Weft, feven feet; and

(a) Num: 138.

Oviedus.

Bbb 2

#### Of Mechanicks. PART IV.

372

and about as broad. It confifteth of twifted Thread, as thick as finall Packtbred; made of the Barque of the Coco-Tree, and of the Rind of the Nut. Not Netted; nor Woven with Warp and Woofe; but after the manner of Bobbin-Work. At both ends, the Weft gather'd up into feveral fmall Ropes, and those at last into greater : by which it is commonly fasten'd to two Trees fome yards above ground. Thus fitted, the people in fome parts of the Indies, lie down in them, and fo fleep fecure from Serpents and wild Beafts.

A Pattern of the STUFF made by the Planters in New-England: the Yarn whereof they Dey of a kind of Phileamot, with a Decoction of the Barque of the Butter-Nut-Tree ( defcribed in the Second Part ) without Alum, Copperas, or any thing elfe to frike the Colour.

A fort of LEATHER, as thin as that of a Kid. Of which it is affirm'd, That it will keep out water better than the best Neats Leather. And I have been told, That it hath been us'd in the French-Camps, fpread upon the ground, for Beding. It feems to be made, by being throughly foaked in a mixture of Oil and Bees-Wax.

A CUP Turn'd out of Saffafras Wood.

A Little BOX Turn'd out of a Nutlbell.

A JAPAN Wooden CUP: cover'd with a Red Varnifb within, and with yellowish Flowers without, upon a Black Ground.

An INDIAN-PAIL. Made of the Barque of Birch-Tree. Square at the bottom, and thence rifing up into a Conick Form. So ingenioufly contriv'd, that the Sides and Bottom are all made out of one fingle piece of Barque.

An INDIAN DISH or Potager. Made also of the Barque of a Tree, with the Sides and Rim fewed together after the manner of Twiggen-Work.

Another DISH, cut out of Wood, as Hollow Ware commonly is here in England.

A RUSH-BASKET. The Rushes are partly of their Native colour, and partly deyed with a rediff and brown Tawny. Very prettily woven together by the Indian Women, in striped and indented Work. And alfo very oddly: for it feems to have a double Woofe, one on each fide the Warp; the Rusbes running on the out-fide, one way; on the in-fide the contrary. A

PART IV.

# Of Mechanicks.

A BASKET made of *Porcupine-Quills*. The Ground is a *Packthred-Caule*; not Netted, but Woven. Into which by the *Indian*-Women are wrought, by a kind of *Lap-Work*, the *Quills* of *Porcupines*, not fplit, as the Perfon that fent it affirms, but of the young ones entire : mixed White and Black in Even and indented Waves. Efteemed by themfelves as one of their chiefeft Curiofities.

ANOTHER, made of the fame Materials; but with the Quills wrought in Triangular Chequer-Work.

An Indian COMB. A Stick, whereof fomewhat more than one half is cut into three fharp and round Teeth, four inches long. The other part left for the Handle, adorned with fine Straws laid along the fides, and lap'd round about it, in feveral diffinct Swaths.

*Cloaths* and *Ornaments*. An *Indian* PERUQUE. Made, not of *Hair*, but *Feathers*, *fc*. black, grey, yellow, red and white : all cut at the tops to the length of about five inches. Saving the fore-Lock, which is made of finall ones an inch and  $\frac{1}{2}$  deep. Faften'd to a courfe *Netted-Caule* of *Packthred*.

An Indian MANTLE; Alfo made of Feathers. Given by Dr. G. Smith. About an Eln fquare. The Feathers all of a Brown or Eagle-colour, fmall and wrought into a Caule of Packthred.

An Indian BRACELET for the Wrift. Made of the Scarlet Feathers of the Indian Sea-Curlew (defcribed in the Firft Part) Clipt short, and woven into a Caul of Packtbred two inches broad. There are also  $\frac{1}{2}$  a dozen Tufts of blew Feathers in the middle, and two of Black at each end. Much like the usual Bumbast of black Bits sewed into Ermine, which our English Women are made to think very fine.

A Pair of Iceland GLOVES. Given by Th. Henshaw Efq;. About is a yard long, and is broad at the Tops. Made of Deer-Skin; not tan'd, but only dry'd, with the Hair on; and lin'd with the fame. The Tops faced with Scarlet Serge, Embroyder'd with Flower-Work, made of Leaden-Wyre, twifted (as Silver-Wyre on Silk) upon brown Hempen Thread. I call it Wyre, not because it is Drawn, which this Metal cannot be, but for that it is so fmall. In the vacancies of the

# Of Mechanicks. PARTIV.

the Work, are fet Copper-Spangles with knots of the fame Wyre.

An Indian SCEPTRE. Made, as it feems, of a fort of A yard long; and as thick as a middle *walking-Cane*; Cane. without any Joynt, and perfectly round. Confisteth of hard and blackish Cylinders, mixed with a fost kecky Body; fo as at the end cut transversly, it looks as a bundle of Wires. Gilt and varnished all over with Flowers in Green, Red and White; faving the two ends which are Black.

The FAN of an Indian King. Given by H. Whiftler Efq;. Made chiefly of the Feathers of Peacocks Tailes; composed into a round Form. Bound altogether with a circular Rim, above a foot over, confifting of the parts of The middle strengthen'd certain Plants like (plit Cane. and divided into squares with cross Bars, made of the fame materials, and some of them deved Red. The bottom of each Square over-laid with Moscovy-Glass. And in the middle of each, a knot of white Feathers, like the Flower of a Facynth.

A plain Indian FAN, used by the meaner fort. Made of the fmall stringy parts of Roots, spread out in a round flat Form, and fo bound together with a Splinter-Hoop, and strengthen'd with small Bars on both fides. The Handle painted with Japan Varnish, black, red, and yellow. When they use them, they sprinkle them with sweet Water, which perfumes the wafter Air.

An Indian PURSE or CASE for the Pudenda of a Man. 'Tis a foot long, and clofed at the bottom. Made of fmall Reeds woven together after the manner of courfe Linnen.

An APRON for the Pudenda of a Woman. A i of a yard deep, and shaped like a Widows Peak. Hath two transverse Labels, with feveral fmall Tassel'd Strings, to tie it about her middle; and a great one hanging down before. Made of Rusbes, and other Plants. The out-fide of feveral colours, (c. white, yellow, red, tawny, and brown; as flexible as any Thread. Woven in feveral Squares, and <sup>1</sup> Squares in a most exact and geometrick Order. The infide of smaller Rushes, all of one colour, and the Weaving uniform : as fome Silks are plain on one fide, and flowered on the other. A piece of Work, which an European could hardly imitate with all her Art. A

#### 374

PART IV.

#### Of Mechanicks.

A Pair of Iceland BOOTS. Given alfo by Mr. Hen *fbam.* Made of dry'd Deer-Skin, as the Gloves. Somewhat above a foot long, and about a foot broad at the Tops. The fmall of the Leg, above  $\frac{1}{2}$  a foot. The Foot, but eleven inches. Lined with another fort of Skin, and that only dry'd. The Knee faced with courfe red Cloath; and the top of the Foot with Lists of the fame; both Embroyder'd with twifted Leaden-Wyre, like that on the Gloves. On the end of the Toe, a Button made of a Leathern Thong knoted in a round form, and wrought over, not with twifted, but plain Leaden-Wyre. They are flitch'd together with Cat-Gut. How the people use them, I fee not; for the very fame Skin, which is thin, and with the Hair on, makes the Sole, as well as the Top, of the Foot, and the Leg.

A SNOW-SHOOE, ufed in Greenland, and fome other places. Given by Mr. Linger. A yard and ± long, and in the middle fifteen inches broad. Oval behind; the foreend, fharp. The Margin is a piece of Wood of the breadth of a Lath, reduced to the Form above-faid, and fo made tite and fteady with two crofs Bars. To the fides round about, is ftretched and faften'd three pieces of woven Work, refembling Net-Work; made of fmall Leathern Thongs, in three parallel Orders, one directly, and two obliquely tranfverfe. In the middle piece is a hole made, to affix It to the Foot.

Painting. A LANDSKIP, being the Profpect of a fair City, painted upon Stone.

A Natural Landskip, or Profpect of Ruinous Buildings in Stone. Humour'd with a Tree painted over it.

Another, with a Woman in a praying pofture.

CATOPTRICK PAINT, on a Table or Board. Given by Bishop Wilkins. On one fide, the Paint looks as if it were altogether rude and irregular, fo as nothing can be made of it. But a Metalline Cylinder being placed perpendicular upon a certain Point of the Table; the Rays are in fuch fort incident thereon, and thence reflected to the Eye, as to reprefent a variety of curious Work: *fc. a Shepherd* playing on a Pipe; and his Wife dancing with a Child in her Arms, and a Basket on her Head.

On the other fide, St. George and Don Quicksot both on Horfe-back, and a Wind-Mill betwixt them. And Don having

#### Of Mechanicks.

#### PART IV.

having made his Horfe leap at the Sail, his Horfe hangs upon it, and himfelf is thrown to the ground. But a Metalline Octogon, placed as the Cylinder, fhews St. George in good pofture upon Don's Horfe, killing the Dragon.

An Inftrument to draw PERSPECTIVE with. Contriv'd by Sir Chriftopher Wren.

An Optique BOX, used as a help in DRAWING.

A piece of SMALT-GLASS. Used by *Painters* for *Picture-Frames*, and other purposes. Given by Mr. J. Linger.

The Picture of a MUSK-DEER, in Colours, and after the Life. Taken in Java major, and fent from thence by Sir Philiberto Vernatti.

The Picture of a BASILISK. Pretended by those that shew it, to be a real Animal so call'd. But is an Artificial Thing, made chiefly of the Skin of the Raja, and the Legs of a Dodo, or some great Fowl. Given by Ellis Cri/p, Efq;.

The Picture of the *Plant* called *NINSIN*. The whole *Plant* is drawn after the *Life* on *Parchment*, in Colours. The *Root*, of a redifh yellow ; about five or fix inches long, and near as thick as a *Skirret*: agreeing with the Defeription hereof in the Second Part of this *Catalogue*. The *Stalk* as thick as a *Wheaten-ftraw*, and a foot high. The *Leaves* fomewhat like thofe of the *Stock-Gilly-Flower*. The *Flowers* redifh in the Bud, and white when open; three and three together, and composed of fix round *Leaves*, like those of the *Round-Flower'd Moly* figur'd in *Baubinus*, but not fo big.

The Draughts of feveral *Indian* PLANTS on a Table. In the first place, of

The CLOVE-TREE: Together with a Branch of the fame after the *life*: The *Mother* or *Prolifick-Clove*, from which the *Plants* are propagated: And the Stone and Kernel of the fame. Next of

The NUTMEG-TREE: Together with a Branch of the fame after the *life*: The Fruit of the *Female-Nutmeg*: Of that called the *Thieving-Nutmeg*, becaufe it infects and fpoils the good ones where it lies: The *Male*, with its Fruit, both long and fhort: And the little Kind, wherewith the Natives dey their Teeth black. Next of

A PLANT which beareth a Fruit hanging with a long Stalk

376

## PART IV. Of Mechanicks.

Stalk upon the top of the Leafe; almost in the shape of a *Can*, with its Lid. If it be open'd, though the Weather never so hot, 'tis half full of Liquor. Then of

A SAGEWAR-TREE; whofe *Flower* being cut, renders a Juyce like *Wine*, far above the *Coco-Tree*: With the Fruit both of the *Male* and *Female*. In the laft place, of

The SAGOUS-TREE; which those that inhabit the *Molucca* Islands, eat instead of Bread: With the Fruit, after the *life*.

Defign. An Armed SOULDIER, in the pofture of fighting. Together with a Landskip, and the Prospect of an Army. Given by Mr. Will. Brownest; and all very curiously Drawn with his Pen.

Wrighting. A fewish PHYLACTERY. This here is only a fingle Scroll of Parchment,  $\frac{3}{4}$  of an inch broad, and 15 inches long; with Four Sentences of the Law, (viz. Exod. 13. from 7. to 11. and f. 13. to 17. Deut. 6. f. 3. to 10. and 11. f. 13. to 19.) most curiously written upon it in Hebrew. Serarius, from the Rabbies, faith, That they were written feverally upon fo many Scrolls. And that the fews to this day, do wear them over their Foreheads in that manner. So that they are of feveral forts or modes, whereof this is one.

The original use of them, for Memento's: grounded on that Command, (a) And thou shalt bind them for a sign upon (a) Deut. 6. thine Hand, and they shall be as Frontlets between thine Eyes. 8. and in the other But afterwards, ferved more for Oftentation. And at last, places above for Spells or Amulets. (b) From whence also the use of quoted. (b) Hierome, Charms amongst Christians was first learn'd; and those who quoted by gave them called Phylacterij. Prohibited by the Council in tague. Irullo. (c)

An Example of the ARABICK Letter in one or two Variations upon *Parchment*.

An Example of the CHINA-Language, in a confiderable Variety of CHARACTERS, upon two forts of *China* Papyr.

An Example of the MALABARINE Letters and Language. The Letters have fome little refemblance to those of the *Coptick*. Written upon a fingle Plate of the *Palmetto-Leaf*, an inch and  $\frac{1}{2}$  deep, and 10 inches long. It feems, from the Hole punched at the end of it, to have been Ccc filed 378

filed with a great many more, and fo to have made a Book.

Another Variety of the ARABICK Letter, not properly Written, but Impress d with a Style, or as it were Engraven, upon two double Plates of the Palmetto-Leaf.

Sculpture. A CARVED Shell of MOTHER of Pearl. On which Andromeda ftands naked upon the Shore, having her Arms faften'd to a Rock with two Chains. Near the Shore, a great Sea-Fifb or Monster making towards her, and spouting out Water at Perseus. Who comes flying upon Pegasus, with his Shield, and his Sword advanced, to kill the Monster. Upon a Promontory between Andromeda and Perseus stands a Cupid, and among the Trees upon it another, signifying their Marriage afterwards. All done with extraordinary Art.

ANOTHER, with the fame curious Work, but different Phancy. *Neptune* making towards the Shore, without his Mace, advances and fpreads abroad his Arms, in Courtship towards *Diana*. Who stands on the Shore in her Mantle half naked, and holding forth her Hand in the posture of denial. Between them, two naked *Nymphs*, one giving aim to the other, shooting a Dart at *Neptune* to give him a further repulse. And a *Cupid* flying away over *Dianas* Head.

About 36 pieces of *lvory*, with IMAGES CARVED upon Each. On fome, of Men; on others of Women and Children; and on others, of Cattel. One of them, a *Crucifix*, with the Eleven Apoftles. They feem to have belonged to a *Cabinet* or *Cheft of Drawers*, and to make fome flory; but the reft being wanting, unintelligible.

One of them, is a curious piece of Work. On the top of a Rock, ftands a Caftle. At the foot, a George or Chevaleer, armed and mounted, and combating a Dragon; defending her felf, and shewing her rage in a most lively posture. Behind the Horse stands one of her young Ones, expecting her Conquest. On the brow of the Rock, a Woman, or if you will the Lady, praying for her overthrow. Hereto may be refer'd,

A SEA-PIECE, confifting wholly of INLAY'D-WORK, of feveral Colours, in Stone. As alfo,

A FORREST, with a Houfe at the end of it; and feveral Beafts Of Mechanicks.

PART IV.

Beasts both wild and tame, as the Lion, Unicorne, Boar, Camel, Stag, and a Dog pursuing him: all Cut in PAPYR, in the compass of about three inches square.

Turn'd Work. A Box of CUPS, from Norimberge: being an Hundred of them one within another; the Boll of the utmost about two inches and in Diametre. Given by Dudley Palmer Efq: I take the Wood to be Maple.

A piece of TURN'D Work in *Ivory*. Given by *H. Olden*burge Efq;. A folid Triangle, turn'd open on the four fides. With a *Flower* ftanding out on each fide, and loofe. In each *Flower*, a little Spike, alfo loofe. But all the four *Flowers* by themfelves, and fo the Spikes, are united in the centre. On the Necks of the *Flowers* likewife hangs a Sphærical Triangle; and on each Neck, feveral fmall Rings. Preferved in a Round *Ivory Box*.

The HEAD of a Princes, in her HAIR, and with a CORONET; in an Oval of *Ivory*. That which is extraordinary, is, That it is not CARVED, but all TURNED Work. 'Tis kept in an Oval *Box*, wrought with Undulated Work of feveral Forms, all likewife Turn'd. The Art, I think, is now dead with the Author.

Molded-Work. Two HALF BODIES in Armor, betwixt four and five inches in length. Given alfo by Mr. Dudley Palmer. The phancy is this, That upon a rude molded Ground of Rofin and Wax, or fome fuch fubftance, are laid, chiefly the parts of feveral Plants and Infects, by which the Figure is compleated. As the Forehead, (all the Face of one) with the Scales of the Belly-Piece, of the Broad Golden Cantharis; the Ball or White of the Eye, with Gromwell-Seeds; the Lids, with those of a fort of Marigold; the Nose; with that of Carthamum; the Beard with those of Lettice. Part of the Armor, of one, with the Wing-Sheaths of the Green Broad Cantharis: of the other, with the Seeds of Cow-Parsnep: and so for the rest. A couple like to These; are figur'd in Olearius's Museum.

Sir Robert, Moray's HEAD in WAX. Taken off of a Plaster-Mold, which was made upon it.

## Of COYNS, and other Matters relating to Antiquity.

The Effigies of JOHN HOWARD, the first Duke of Norfolk, in Colours Neald on Glass. From whom the Right Honourable the present Duke of Norfolk is the eighth, inclusive. Given by Mr. S. Morgan. He is reprefented kneeling in a Chappel, with his Dukes Cap by him, and Invested in his Coat of Armour, bearing four Coats, Quarterly: fc. of Howard, Brotherton (Son to King Edward the First) Plantagenet (Earl of Warren and Surrey) and Fitz-Allan. The first, is Gules, a Bend betwixt fix Crosslets fitchy, Argent. The fecond, the Arms of England, with a Label of three Points Argent. The third Checky Or and Azure. The fourth, Gules, a Lion Rampand Or.

The PEDEGREE of the most Noble Family of the HOWARDS, from the first *Duke* above-faid: Engraven on a *Copper-Plate*. Given by the fame Hand.

A ROMAN URNE, of Glafs, with a Handle. Given by Sir Christopher Wren. Above fifteen Hundred years old. Almost like a Bottle containing a Gallon and  $\frac{1}{2}$ ; but with a very short Neck, and wide Mouth, and of whiter metal. Encompassed girth-wife, with five parallel Circles. Found in Spital-Fields.

STONES, not long fince found near the Foundation of *Charing-Crofs* at a great depth. Given by Sir *Joseph Wiltliamfon*. They feem to be a fort of courfe *Marble*. Of a blackifh colour, and figur'd into feveral plain fides; but irregular : from whence they may be argu'd to be very ancient.

A Piece of MOSAICK WORK, found deep under ground, in *Holbourn* near St. *Andrews* Church. Inlaid with black, red, and white Stones, in Squares and other Regular Figures.

A parcel of little fquare Stones, belonging to MOSAICK-Work, found in a Field near *Bath*, in the Year, 1664.

Several Examples of MORTARS of old Caftles and Roman Buildings. Given by John Aubrey Efq; for comparing them with those now in use.

A

PARTIV.

## Of Coyns.

A ROMAN MONEY-POT. Given (with the Coin below mention'd) by the fame Hand. Found in the Year, 1651. in Week-Field, in the Parish of Hedington, in Wilt*shire*; half full of Roman Coin, Silver and Copper, of feveral Emperors near the time of Constantine. Of the colour of a Crucible, and fashion'd almost like a Pint Jug without a Neck. Closed at the top, and having a Notch on one fide, as in a Christmas-Box. In the fame place (where anciently was a Roman Colony) and at the fame time, were dig'd up the Foundations of feveral Houses for a Mile together.

## Of COTNS.

M Oft of them being obfcure, left I should mistake, I prefently took the help of my Worthy Friend Mr. Abraham Hill, Fellow of the Royal Society, very well acquainted with This, as well as other parts, of Antiquities.

#### Silver.

## Of some Particulars lately given by Dr. Christopher Merret.

**NO** which I shall only premife a Note concerning the CLYSTER-BAG, defcribed p. 239. of this Catalogue; but should have been placed in the last 'Twas given by Sir Rob. Southwell; of whom I lately Part. learn, That the Portugal Negros, having rowled a lump of Clay into the shape mention'd p. 239. they cut the Branches of a certain Tree which yields an Oily Gum, and fo turn the Clay round, as the Gum drops upon it, till it hath cover'd it all over like a thick Skin; which being dry'd in the Sun, will be almost as tough as Leather. Then picking out the Clay, it ferves them for a Bladder. To which they tie the Shank of a Hare for a Pipe: and fo filling it with Sea-water, as often as they feel themfelves much chafed with heat, put it up for a Glyster. These Bags they commonly hang by their fides, to be always ready for their ufe.

The Particulars given by the Doctor are these that follow; with the Descriptions, in his own words.

SAGU. A Gum, fo called. It comes from the Iflands of *Malacca*. It drops from the Trees in finall roundifh Grains, of the bignefs of *Turnep-feed*, but whitifh. Chewed, it tafteth fomewhat clammy. Boil'd in water, exactly repre-fents *Frog-Sperm*; and in confiftence, comes neareft to *Gum Tragaganth*. 'Tis ufed in *Medicine* and *Diet*.

TERRA JAPONICA. Call'd alfo *Catechu*, *Categu*, and *Calbeu*. 'Tis a *Gummo-Refina*. For most of it will diffolve in Water; and some parts of it only in *Re&. Spirit of Wine*. Most of it contains a great deal of Earth; the reason of the Name. 'Tis cover'd with a rough brown Coat; within which it comes near the colour of *Aloe*; but darker, and D d d with

## Appendix.

with brown earthy Particles intermix'd. The Taft Aftringent and very Dry. The Tincture of a bright Claret colour. An ufeful and effectual Medicine; and not ungrateful.

POCO SEMPIE. A Golden Mofs, confifting of moft fine, foft and flexible Threads. Accounted a great Cordial. And faid wholly to diffolve in the Mouth; and feem'd fo to me, in barely chewing it: but the contrary upon Experiment, which was thus: I ty'd fome of it in a Cloath, and chew'd it; keeping it in my mouth a whole Night: but in the Morning, I found no diminution, nor alteration. So that chewing only unfolds it, and then 'tis infenfibly fwallow'd with the Spittle.

RIZAGON. A Root brought from *Bengala*, of good ufe. Cut into flat pieces, of a whitish colour, bitterish and aromatick Tast; and hath very large *Fibers*.

CAROLINA. A long red Root, fo call'd, from the Place from whence it comes. It draws on Paper red Lines. Anfwers not expectation, as to deying.

SADORE, or Bitter Wood. It hath a brownish Barque : the Wood yellowish, and exceeding bitter. If it be fliced long ways, you will find very white *Fibers* running by the length.

CAIUMANIS Olearij. (a) By the Sea-men, Caiomanes. By the Portugefe, Canella de Mato. An Canella Craffiori Cortice. (b) This Barque above i of an inch thick. Diftill'd, it affords a fomewhat harfh and rough Liquor. But by Infusion, makes an Aromatick and grateful fyrup.

SALT of Soap-Lees. An Exotick. Found in fome quantities on the fides of the Boylers. I have yet made no trials of it.

TEUTENAGE. A fort of Speltar, as many Experiments fhew. Hereof Parallellepipedon Veffels are made in Japan, wherein their Thea is brought over.

I have feveral other *Rarities*, which, when I fee what is wanting in the *Societie's Museum*, I shall add to it.

Most of these Things were communicated by Mr. Samuel Clark, learned, judicious, experienced in all things Natural and Artificial which are brought to the King's Warebousse in the Port of London, whereof he is Surveyor.

## An Advertisement to the Reader.

WHereas a Book Entitul'd, Exercitatio Anatomico-Medica de Glandulis Inteftinorum, earumq; Uíu & Affectibus. Cui subjungitur Anatome Ventriculi Gellinacei. Studio Joh. Conradi Peyeri Scashusa-Helvetij, 1677. In which are found some of those Observations contained in the following Lectures. It was therefore thought fit, here to take Notice, That the said Book was not Published, till the Year after these Lectures were Read.

## Of Stomachs and Guts.

### CHAP. I.

## Of the Stomachs and Guts of Six Carnivorous Quadrupeds; fc. The Weefle, Fitchet, Polecat, Cat, Dog and Fox.

Am not ignorant of what many Learned and Inquifitive Men, both at home and abroad, efpecially in this laft *Century*, have performed in the Anatomy of Animals. After all whom, if it be demanded, what is left for me to do? I Anfwer in the words of *Seneca*, (a) Multum (a)Epift.64. adhuc reftat operis, multúmq; reftabit; nec ulli Nato, poft mille Sæcula, præcludetur occafio, aliquid adhuc adjiciendi.

I shall omit most of what is already noted by *Anatomists*; and princially speak of those things, which have hitherto been unobserv'd.

#### A Weefle.

The Gulet of a Weefle (which from the Ears to the fetting on of the Tail was 10 inches) about five inches long, in Diametre, equally wide, and thin. Enters the Stomach at the left End.

The Stomach about three inches long; proportionably, more than a Dogs. An inch in Diametre at the upper Orifice; at the nether,  $\ddagger$ ; having a *flexure* towards its Conjunction with the Guts: fhaped like to the body of a pair of *Bag-Pipes*. Thin, and plain, or without Folds. Which feems to be the property of the Stomachs of moft Rapacious *Quadrupeds*.

The Guts *thin*, and plain, or with little ftore of *Glands*, efpecially of fuch as in most *Carnivorous* Animals are confpicuous. About a yard in length, and  $\frac{1}{2}$  an inch in Diametre; without any confiderable contraction, difference of Size, Texture or Substance from the *Stomach* to the *Anus*. No *Colon*. No *Cæcum*. So that it feems to be all but *One fingle Gut*. Contrary to what is feen in any other *Quadruped*, I have opened.

At the Anus, a Couple of Bags grow to the Gut; one A on

on each fide. Each of them, fill'd, about the bignefs of a large Garden-Peas: containing a yellow, and thickifh Liquor, extraordinary fatid, and having the peculiar fcent of the Animal in the most intense degree. Over the Bags or Bladders, is spread the Sphincter-Muscle; which compressing Them and the Anus both together, forceth them to a contemporary evacution.

I have not yet diffected the *Civet-Cat*, but fuppofe, that thefe Bags are analogous to those that contain the *Civet* in that Animal.

These Bags, so far as I have observ'd, are proper to all *Carnivorous Quadrupeds*, and those only: as will further appear by the following Examples.

#### A Fitchet.

A FITCHET, being of kin to the Weefle; hath alfo a Stomach and Guts much alike.

The Guts about a yard and two inches. At moft, but two. The first, about two feet and  $\frac{1}{2} \log \frac{3}{2}$ ; and  $\frac{3}{2}$  the of an inch over, where widest. Hath five or fix Necks or Contractions. And a little before most of them, stands a small *Cluster* of *Glands*, about as big as a *Silver Half-peny*. The fecond, is about  $\frac{1}{2}$  a quarter of a yard long, and  $\frac{1}{2}$  an inch over where widest. Very thin, plain, and without any *Glands* visible to the bare Eye.

On each fide the Anus, there is also a Bag of fatid Liquor, with the flink of the Animal.

The Guts of these Two Animals, and I suppose likewife of the Ferret, are the most simple, and plain, of all I have observed in Quadrupeds.

#### A Pole-Cat.

The Gulet and Stomach of a POLE-CAT, are in shape like those of a Weefle. But the Guts are different.

They may be reckon'd, four. The first, about <sup>‡</sup> of a yard long; <sup>‡</sup> an inch over; very thin, and plain.

The fecond,  $\ddagger$  of a yard in length;  $\ddagger$  of an inch over, and in fome places more. This *Gut* is Glandulous and very thick, in comparison with the other, from end to end. The Glands

Glands extream finall, no bigger than little *Pins heads*. Yet every Gland hath its *Orifice*, out of which a *Mucus* or *Pituita* may be vifibly fqueez'd.

The Third, is  $\frac{1}{2}$  a yard long; and about  $\frac{1}{2}$  an inch over, as the firft. About the middle hereof, is a *Cluster* (of petite *Glands*) about two inches long, and  $\frac{1}{2}$  of an inch broad. At the further end alfo, joyning to the fourth *Gut*, is another like *Cluster*, but as broad again. Each Gland in both these *Clusters*, is about the bigness of a *Mustard-Seed*.

Each of these *Clusters*, may be called a little *PANCREAS INTESTINALE*. Their difference is, That This hath not one common *Ductus*.

Of these *Clusters*, it is observable, That both here, and in all the other Animals hereafter mention'd, they stand directly opposite to that side of the Gut, into which the Vessels are inferted.

The Fourth, or *Rectum*, is feparated from the former by a Contraction. Almost five inches long; and near the *Anus*,<sup>‡</sup> of an inch in Diametre. So that all the *Guts* together, are two yards, within  $\frac{1}{2}$  a quarter.

This Animal hath neither Colon, nor Cæcum.

At the Anus, a pair of Bladders grow to the Gut, as in a Weefle; containing also a Liquor with the peculiar fator of the Animal, most intense.

#### A Cat.

The Gulet of a well grown CAT,  $\ddagger$  of an inch, where wideft. The Texture two-fold. The Muscular Fibers of the upper half next the Throat, plainly Platted. A fort of Work, which will beft be feen in the Gulet of a Sheep. Those of the other half, rather Annular, though not exactly fo.

The Stomach in shape like that of a Dog, and most other Carnivorous Quadrupeds; only somewhat shorter and rounder; being not above five inches long, yet  $3^{\frac{1}{2}}$  over.

But in the Guts divers Specialties are observable. Altogether, about two yards and ‡ long. With respect to their substance, but two in number: To their shape, the first may be subdivided into four. 3

A 2

This

This first may be called *Musculare*: being in proportion, thicker or more carneous than the *Guts* of any *Quadruped* I have open'd.

It hath about 28 or 30 *Contractions*; fome an inch,others two or three inches diftant one from another. I have not feen a quarter fo many in any other Animal. It may be fubdivided into four.

The First, *i.e.* from the Stomach to the place where the Gut is confiderably amplify'd, about a  $\ddagger$  of a yard; and fomewhat more than  $\ddagger$  of an inch, over.

The Second, *i. e.* to the place where more confpicuoufly contracted, about ‡ a yard; and in its wideft place, above ‡ an inch, over.

The Third, *i.e.* to the next greater dilatation, a yard and <sup>3th</sup>; and <sup>3ths</sup> of an inch, over; near the fame width with that of the first.

The Fourth, about <sup>1</sup>/<sub>4</sub> a yard and <sup>1</sup>/<sub>4</sub><sup>th</sup>; and <sup>1</sup>/<sub>2</sub> inch, over. So that two flender, and two ample ones are reciprocally joyn'd.

This Inteft. Musculare, is furnished with feveral Clusters of Glands, fix or feven in number : each Cluster about <sup>3</sup> of an inch long; and the last above three inches. This especially, as in the Pole-Cat, may be called PANCREAS IN-TESTINALE.

The Next Gut (in the place of the Rectum) may be called Membranaceum, in diffinction from the former; being far more perfpicuous and thin. About  $\ddagger$  a yard long; and where wideft, an inch and  $\ddagger$ , over. So that its hollow is more than four times as great as of any part of the Inteft. Mufculare; and eight or ten times as great as of the finall parts. And doth therefore contain far more than all that Gut.

To the undermost part of this Gut, about an inch and before the Anus, is fasten'd the end of a stender Muscle; the other extremity, to one of the Vertebræ of the Loins.

This Gut is furnished with feveral large Glands, not standing in Clusters, but fingly, as in a Fox or a Dog presently to be described; but not so big.

The upper End of this Gut where it joyns to the Muscular, for the length of <sup>2</sup> of an inch, is partly Conick and partly Helick; being, as it were, the beginning of a Cacum. On

4

On each fide the Anus, a Bag of fartid Liquor, as in the former Animals.

To the Guts of a Cat, I suppose those of a Leopard, Tiger, and Lion, may have some Analogy.

#### A Bitch.

The Gulet of a BITCH (from the top of her Head to the fetting on of her Tail about ‡ of a yard) near an inch in Diametre. Somewhat thick, redifh, and muscular.

The Stomach shaped as a Cats; faving that it is a little longer. In length, nine inches; in breadth, fix; in depth, as much. Somewhat Muscular, as the Gulet. Not very visibly Glandulous, except near the lower Orifice. Where, for the space of three or four inches, are a great number of small Glands, yet fairly observable round about.

The Guts are Four. The Frift, or Craffum, two yards and <sup>1</sup>, and near an inch over, where wideft.

The Second, or *Tenue*, about a yard and <sup>‡</sup> long, and fomewhat more than <sup>‡</sup> an inch wide.

The Third, or *Cæcum*, where wideft, near an inch; and about i a foot long; but winding with three flexures, three feveral ways. Not joyned to the *Tenae*, but the *Rectum*; and fo poftur'd, as to make an acute Angle not with the *Rectum*, but the *Tenue*; in other Animals. And the paffage between This and the *Rectum* fomewhat ftraight.

The Fourth, or *Rectum*, half a yard ; next the *Cacum*, an inch over; near the *Anus* an inch and  $\frac{3}{4}$ . All the *Guts* together, near five yards.

This only, of the Animals yet mention'd, hath a  $C \propto cum$ . Yet without a *Colon*.

The Guts of this Animal, as well as the Gulet, are all of them thick, redifh, and Mufcular. The like, I fuppofe, are those of all Offivorous Quadrupeds.

They are furnished with store of *Glands*. In the *Cæcum*, at feveral distances from  $\frac{1}{2}$ <sup>th</sup> to  $\frac{1}{2}$ <sup>ths</sup> of an inch. Very confpicuous to the naked Eye, even after they are blown up and dry'd. In the two foremost, they stand in *Clusters*; and the *Clusters* in all, about 20. Some of them round, as big as a *Silver Peny* or *Two-peny*; and some Oval, the compass of an *Almond*: and some, especially towards the *Cæcum*, two

or

6

or three inches long, and i an inch broad. Every Gland, as big as a *Turnep-Seed*. The *Cacum* befprinkled with Flat Glands, the breadth of a *Marshmallom-Seed* or little Spangle. And fo the *Rectum*, especially towards the *Anus*; but here big.

In the centre of these Flat Glands, the Orifice, or if you will the Anus of every Gland is very confpicuous: by which the Gland speweth out a certain Mucus or Pituita; as by compressing the Gut may be easily seen.

So that although the Glands of the Stomach and Guts, efpecially in Men and *Quadrupeds*, feem to lie behind, or under the inner Membrane : yet the Mouths of them all, do open into the Hollow of the Stomach and Guts. The *Pituita* which is always found very copious in both, not being half of it, the fpittle, or bred of the *Aliment*, as is generally conceiv'd; but fpewed out of thefe Glands.

At the Anus, are two Bags of stinking Liquor, as in the aforefaid Animals.

## A Fox.

The Gulet, Stomach and Guts of a FOX, ( $\frac{1}{2}$  a year old, and  $\frac{1}{2}$  yard from Head to Tail) are much like to those of a Dog. But with some differences. The Gulet, in proportion, somewhat larger. The Stomach deeper.

The first Gut, or the *Craffum*, far shorter, not above  $\frac{1}{2}$  a foot. The fecond, or the *Tenue*, fomewhat wider. The *Cacum*, much larger; near  $\frac{3}{4}$  of a foot long. It lies not strait out, but is wound up almost spirally. Where it joyneth to the other Guts,  $\frac{1}{2}$  an inch over; at the other End, near an inch.

The Guts furnished with feveral Clusters of Glands, as in a Dog, about 14 in number. That next the Cæcum four inches long, and above i an inch broad. Before every large Cluster is a little Contraction in the Gut. In the Cæcum and Rectum much larger than in the Bitch.

I suppose it is proper to all other Offivorous Animals, for the *Rectum* to be furnish'd with such Glands.

Just upon the Anus lie two Bags of stinking Liquor, as in the Animals above-faid.

#### CHAP. II.

## Of the Stomach and Guts of the Mole; which seems to feed on Insects. As also of the Urchan, Squirel, and Rat; which are chiefly Frugivorous.

#### A Mole.

THe Gulet of a MOLE, is not fasten'd to the End of the Stomach, as in the foregoing Animals, but to the middle.

The Stomach shaped somewhat like that of a *Polecat*, and is as big; being three inches long, an inch and ‡ broad, and as deep: which in comparison with the simall bulk of the Animal, is exceeding great: this Animal weighing not much above three Ounces; but an ordinary *Polecat* betwixt 20 and 30.

The Guts, a yard and ‡ long; longer than in the Carnivorous kind. About ‡ of an inch over every where. Near the *Anus* a little wider. So that they feem, fo far, to be but two. Yet taking in their Texture, they may be three.

The Texture of the First (about <sup>4</sup> of a yard long) is plain and fimple, to the Eye, as in other Guts. Of the Second, extreme Curious; the Fibers of the Muscular Membrane, making Undulations or Indentures, continued for the length of <sup>3</sup> of a yard, round about the Gut: very much refembling the Needle-work, commonly called Irist-stich. But the Graver, though in other respects he hath done tolerably well, yet cometh short of the elegancy of this Work.

Both these Guts are furnish'd with five or fix small Clusters of Glands; each Cluster as big as a little Spangle.

The *Rectum*, of a plain Texture, as the First. And without any confpicuous Glands. Half a  $\ddagger$  of a yard long, and where widest,  $\ddagger$  inch over.

Here are none of the Bags described in the Weessle, Gr. Nor any Cacum nor Colon.

An

### An Urchan.

The Gulet of an URCHAN enters the Stomach towards the middle, as in a *Mole*. Somewhat fmall, not ‡ of an inch over.

The Stomach not fo large as in the *Mole*, yet bigger than in Carnivorous Animals; as than that of a *Weefle*, although the Body of an *Urchan* of the fame age be no bigger, as is plain, when the Skins of both are taken off. 'Tis alfo of a rounder fhape.

The Guts, for fubftance, feem to be but One. But from the difference of fhape, may be accounted Four. The Firft, or *Craffum*, a yard and <sup>4th</sup> long; and near <sup>1</sup>/<sub>2</sub> an inch over, where wideft. It hath feveral, about 12 obfervable Contractions; fome of them an inch or two long, fome more, and fome lefs: which, as to their length, is peculiar to this Animal.

The Second, or *Gracile*, is about  $\frac{1}{2}$  of a yard long;  $\frac{1}{2}$  of an inch over, and of an equal fize throughout.

The Third, or Ampliffimum, <sup>th</sup> of a yard long; and above <sup>t</sup> of an inch over, where wideft.

The *Rectum*, about as long; and above  $\frac{1}{2}$  an inch over. So the length of all the Guts, is Two yards and an inch or two: much longer, than in the Carnivorous kind.

The Third and Laft, are fprinkled with an innumerable company of extream fmall Glands, fcarce difcernible without a Glafs; through which, they fhew as big as little *Pins heads*.

This Animal hath none of those Bags near the Anus, above defcribed in the Weefle, &c. Hath no Cæcum. No Colon.

## A Squirell.

That I open'd, was a Virginian, fmaller than the European. The Gulet enters the Stomach towards the middle, as in a Mole and Urchan very fmall, like the top of an Oaten-ftraw: fo that the upper Orifice of the Stomach, hardly lets any thing, fo much as wind, to pass into it.

The Stomach two inches long; the left end, an inch over; the right, <sup>1</sup> an inch. The

The Guts may be reckon'd Four. The First, which reacheth to the *Cæcum*, above <sup>±</sup> a yard long; and near <sup>‡</sup> of an inch over.

The Cacum very large, near three inches long, and about an inch over. Lies fpirally wound up on it felf.

The Third, about three inches long, not above <sup>1th</sup> of an inch over.

The Laft, about as long. Hath two Contractions and Dilatations; where wideft,  $\ddagger$  of an inch over. All the Guts together without the *Cacum*, not  $\ddagger$  of a yard : the fhortest of all yet describ'd.

Here are none of those Bags upon the Anus, above mention'd.

### A Rat.

The Gulet of a RAT, is extream fmall, like that of a Squirel; and inferted into the Stomach in the fame manner.

The Stomach, with refpect to that of a Mole, very finall; fe. three times lefs: although the Body of a Rat, is above twice as big as the Body of a Mole.

The fubstance hereof is also more plainly diftinguish'd into two forts. One half, towards the left end, more pellucid, thin and membranous. The other half, *fc*. from the Infertion of the Gulet to the *Pylorus*, more opacous, thick and Muscular.

tio The Guts may be accounted Five. The First, or Gracile, #an Eln long, and # of an inch over.

over.

In these two together, are eleven or twelve Clusters of Glands; every Cluster about the breadth of a Spangle.

The Third, or Cæcum, contained by a Ligament in an Orbicular pofture round about the Amplum. Above  $\ddagger$  an inch over, and three inches long. So that take it breadth and length, and it is as big as the Stomach it felf.

The Fourth, I crave leave to call the Abomafideum: for that it is in figure or structure very like to that Ventricle in a Sheep or Cow, called the Abomafus. About two inches long; and near its Conjunction with the Cæcum, <sup>3d</sup> of an inch over, narrowing all the way to the other end. That B which 9

#### The Stomachs and Guts.

which is curions herein, is, That 'tis furnished with a confiderable number of oblique Plates, about 46; 23 or thereabout, on each fide oppositely; exactly like to those in the Abomasus of a Sheep.

The Last, or Stercoraceum, is fix inches long; ‡ of an inch over, where widest. And hath one or two Contractions, as in a Squirel.

The Gulet, Stomach and Guts of a MOUSE, are little different. Only the Glands of the Guts fewer; and the Cacum, lefs.

On the contrary, in a SHREW-MOUSE, the Cacum is rather greater, being <sup>1d</sup> of an inch over, and two inches long. Yet the Body of the Animal five or fix times lefs than that of a *Rat*.

#### CHAP. III.

## Of the Stomach and Guts of such Animals as are both Frugivorous and Graminivorous; as the Rabbit, Horse, and Pig.

#### A Rabbit.

The Gulet of a RABBIT is inferted into the middle of the Stomach, as in a Rat.

The Stomach shaped almost like a Dogs, but bigger, with respect to the Animal. Its inner Membrane is gather'd up into several little Plates, like those in a Man. At the End next the *Pylorus*, much thicker, and more Glandulous, Neryous, and Muscular than in any other part.

The Guts, without the *Cacum*, are four yards long. In number, five. The First, or *Jejunum*, about four feet long, and an inch over.

The Second, or *Ileum*, as long; and above i an inch over. Whereas in fome, as the *Polecat*, *Dog*, *Urchan*, the Second Gut is fmaller than the First.

The Jejunum is befprinkled with a great number of very fmall Glands: which when the Guts are blown up and dry, look like a multitude of little Specks. Whence the Gut is more opacous than the Ileum.

51'

Besides

III

Befides these smaller Glands, the Jejunum and Ileum together, are furnished with four or five Clusters, about as broad as a *Two-penys*; and every Gland as big as *Wallflower-Seeds*.

Where the *lleum* enters the *Colon*, it hath a very thick white and Glandulous Body, or *Pancreas Intestinale* : and the mouth of each Gland very apparent.

The Cacum, of a prodigious fize; above <sup>±</sup> a yard long, and and an inch and <sup>±</sup> over where wideft.

At the End of the *Cæcum* hangs a certain Label, alfo continuoufly hollow with the *Cæcum*, and may be accounted part of it. Betwixt three and four inches long; and at the upper end, ‡ of an inch over; in fhape like a Man's Finger. Lined quite through with a thick Glandulous Body, like that in the end of the *Ileum*.

All the reft of the *Cacum* very thin, and transparent : fo as being blown up, it looks like those Skins of *Iceing-Glass*, formerly us'd for Transparent *Flower-Works*.

This Gut feemeth at first, to have many Valual & Conniventes. But by being blown up, is fairly represented one fingle Value or Plate, stretched out perpendicularly from the circuit of the Gut, and most curiously winding, in a spiral Line, from one End to the other.

This Gut runs into the Colon, which is above a foot long, where wideft or next the Cæcum, an inch over; at the other end i an inch. It hath a double Vinculum, one on each fide; by which 'tis gather'd up into a great number of little Cells, contiguous one to another throughout.

In opening this Animal, being just dead, the *Peristaltick* motion of the Guts, was very apparent, especially in this Gut. By means whereof, the several Cells aforefaid, were made reciprocally to move in and out; so as while one moved and was convex inward, another next adjacent, moved and was convex outward; and so on by a kind of undulation, for several inches together.

This Gut is very thick and Glandulous all over, the Glands ftanding every where clofe and contiguous: fo that the infide of the Gut, looks like the *Seal-Fifbes* Skin. The Glands are not flat, as in the Guts above defcrib'd, but ftanding up round and high, like an infinite number of *Papillæ*: the Mouths of each vifibly open; from whence a *Mucus* may cafily be exprefs'd. B 2 So

#### The Stomachs and Guts.

So that all Inteftinal Glands are either Flat, or Spherical; both with a Mouth in the centre. Anfwering to a Button-Mould; the Flat Gland, to a flat Mould; and the Sphærical Gland to the like Mould. The former may be called Rotulares: the latter Papillares.

The Last Gut is about four feet long; as wide as the *Ileum*, and near the *Anus* wider by ‡ of an inch.

This Animal hath none of those Bags observed at the Anus of the Carnivorous kind.

## A Horfe.

The Gulet of a HORSE, is large, thick, red, and very Muscular. The properties of the Gulet in all Voraceous *Quadrupeds*. Inferted into the Stomach, not at one End, but the middle, as in a *Rabbit*.

The Stomach fingle. Not much above a foot long, about  $\frac{1}{4}$  of a yard deep, and feven inches over. Which in refpect to the Animal, and effectially to his Guts, is exceeding fmall, I had not time to obferve the infide, but probably, 'tis gather'd up into Plates or Folds as That of a *Rabbit*.

The Guts are fix. The Firft, or fmall Gut, about 28 yards. Near the Stomach, two inches over; towards the other end, two inches and  $\frac{1}{2}$ . Which though it be wider by far, than the fame Gut in any other *Quadruped* that I have open'd: yet in refpect to the Amplitude of the other Guts in this Animal, it may properly be called the *Small Gut*. It hath fix or eight Contractions or fhort narrow Necks; and amongft them, a long one, about a foot before its entrance into the *Cacum*.

It hath very few, and but fmall Clufters of those larger Glands, observable in the fore-mention'd Animals. But of a fmaller kind, the inner Coat is every where full as it can hold, each Gland not fo big as a *Cheefe-Mite*.

The Second, or *Cacum*, is fquare; having not two, but four Ligaments which contain it in that figure. By means whereof the fides are alfo gather'd into many Cells, finall and great, as the *Colon* it felf in this and other Animals.

The Bulk is vaft: Near the Cone, or close end, about three inches over. But at the Bafe, or where it joyns to the

Colon,

12

Colon, a  $\frac{1}{4}$  of a yard over. And in length, a full yard. So that it is more than twice as big as the Stomach.

The Learned Dr. Gliffon, in speaking of the Stomachs of Quadrupeds, faith, That a Rabbit and a Horfe have a double Cæcum. His words are these; In Equis, Cuniculis, & Porcellis Indicis, Cæcum duplex deprehenditur. But herein he is mistaken. As to a Rabbit, the contrary hath been seen in the Guts presented entire before this Honourable Presence. And who ever will take the pains to examine all the Guts of a Horfe, will find, That neither hath he, any more than One Cæcum, which I have above describ'd.

The Third Gut, is the Colon. The unufual fhape, and prodigious Amplitude whereof, might give occasion to the Doctor to mistake it for another Cacum. So that although a Horse hath but one single Cacum; yet may he not improperly be said to have a Treble Colon; sc. Two Ample ones, next the Cacum; and a simaller one next the Restum. Unless any please rather to call the two Great ones, the two BELLIES of one and the same Colon.

The First Belly next the Cacum, is no less where widest, than  $\ddagger$  of a yard over; and in length, above a yard and  $\ddagger$ .

The Second Belly, next the *Rectum*, as wide as the former; and above a yard long. So that each of these Bellies are bigger than the *Cacum*. That next the *Cacum* half as big again: And about four times as big as the Stomach.

These two Bellies are joyn'd together by a Neck, about four inches over, and  $\frac{2}{3}$  of a yard long. Gather'd likewise into Cells, as all the other parts of the Colon. But with four Ligaments, as the Cæcum. By which also they lie square. And upon a passing view, might be another occasion of the forementioned mistake. So that if any one shall call either of these Bellies, a Cæcum; then a Horse will not have two only, but three Cæcums. But these Bellies have neither of them, the defining property of a Cæcum; which is, To be pervious at one end only.

The fmall Colon, or the fmaller part of it, runs betwixt the Second Belly and the *Rectum*: likewife full of Cells, contain'd together by two opposite Ligaments as in other Animals. 'Tis about three inches over; and fix yards long.

The Rectum, very thick and Muscular, as in most other large

#### The Stomachs and Guts.

large Quadrupeds; about three inches and  $\frac{1}{2}$  over, and not above  $\frac{1}{2}$  a yard long. The length of all the Guts (without the Cacum) is about 37 yards. So that the Guts of a Horfe, although they come much short of those of the Animals next mention'd: yet in wideness, much exceed them: So as to contain about ten times more than his Stomach.

## A Pig.

That which I procur'd was but 16 days old. The Gulet was torn off; fo that I could only obferve the Infertion of it, which is about the middle of the Stomach, as in a Horfe. But that of a *Hog*, I have often feen, and it is very thick, mufcular and red.

The Stomach, was five inches long, and three over. Shaped fomewhat oddly; in a manner with a double *Ventricle*. The one, and the principal, may be called *Venter magnus*, fhaped like that of Carnivorous *Quadrupeds*. Very thick and Mufcular; effectially in the Neck and at the *Pylorus*.

Against the *Pylorus* stands a round Caruncle, as big as a small *Filbert Kernel*, like a stopple to the *Pylorus*. A part I think peculiar to this Animal.

This Ventricle within, hath feveral Folds, about <sup>th</sup> of an inch broad, and as deep; and wind to and and fro, as in a *Rabbit* or a Man. Scituate only about the right End or half of the Belly: the other End being, though alfo Mufcular, yet very plain.

At the left End of this greater Ventricle, another far lefs, yet diffinct one, is appendent. Much after the fame manner as the Reticulum in a Sheep is to the Panch. Or as the Intestinum Cacum to the other Guts: for which reason it may be called Cacus Ventriculus. Separated from the greater by a Muscular Ligament, like a half Valve. Where it joyns to it, an inch and i over, and thence extended two inches in length; ending in a twisted or hooked Cone. Not fo Muscular, as the greater Venter, but thin and Membranous. The inner surface also plain, or without Folds. Yet is it Glandulous, as the other: but the Mucus the Glands yield fomewhat thiner.

The Guts of this Pig (fo young) were near fourteen yards

yards in length. Which is more than doubled, perhaps trebled in a well grown Hog. They may be reckon'd fix or feven. The First, hath several Flexures, next the Stomach, within the length of a  $\ddagger$  of a yard, and may be called Serpentinum.

The Second, about five yards and  $\frac{1}{2}$  long, and  $\frac{1}{2}$  an inch or  $\frac{1}{2}$ <sup>ths</sup> over. In this (no more than in the first) are fcarce any confpicuous Glands; fo that it may be called, *Perfpicuum*.

The Third, of the length of the Second; and fomewhat lefs in Diametre. The Veffels of This, are more numerous than of the former. And 'tis furnish'd with feveral large Clusters of Glands, about nine or ten: fome of them an inch and ; two or three inches long; and ; or ; an inch over. And may be call'd *Minus Glandosum*.

The Fourth, is a yard and long; where wideft, as the Third; but the greateft part of it not above  $\frac{1}{2}$  of an inch. This Gut, inftead of Clufters, is Lined with a Glandulous Lace, extended from one end to the other. At the beginning i of an inch broad; at the end next the Cacum, i of an inch. Spread or extended (as was first observed of the Glandulous Clufters) upon that fide of the Gut, as is directly opposite to the Infertions of the Veffels. The other part of the Circuit of the Gut, is very thin and perfpicuous. This Gut may be called *Magis Glandofum*.

The extremity of this Gut, doth not only joyn to the *Colon*, but is inferted into it, and therein *protuberant* : very like, in fhape and bignefs to the Nipple of a Womans Breaft that gives fuck: and is likewife punched in feveral places at the top and round about with the *Orifices* of fo many feveral Glands.

The Fifth, or *Cacum*, is four inches long, and an inch and sover. Among all the *Quadrupeds* I have open'd, peculiar to This and the *Cacum* of a *Horfe* to have the fame ftructure with the *Colon*.

The Sixth, or Colon, is  $\ddagger$  of a yard long. Where it joyns to the Cæcum an inch over; from which place it tapers all along to the other end, where it is not above  $\ddagger$  an inch over. Gather'd up into feveral Cells from end to end, with two opposite Ligaments, as in a Rabbit. At the top of it, just under the above faid Nipple, is a large round Cluster of Glands with very fair Orifices. Of

#### The Stomachs and Guts.

Of all the Quadrupeds I have open'd, peculiar to this Animal, a Horfe, and a Coney (perhaps alfo an Afs and a Hare) to have a true Colon: if that of a Man be the standard for the Definition of it.

The Laft, or Stercoraceum, is alfo  $\ddagger$  of a yard long. Scarce any where more than  $\ddagger$  an inch over; and towards the Anus, not fo much. Whereas in most *Quadrupeds*, 'tis there wideft.

Here are no Bags, as above defcribed in the Carnivorous Animals.

#### CHAP. IV.

## Of GRAMINIVOROUS QUADRUPEDS; a Sbeep and a Calf.

## A Sheep.

The Gulet of a SHEEP (three years old, and weighing 120 pounds Haverdupoife) about an inch and tover: which with refpect to the Panch is but fmall. Composed of feveral Organical Parts: which because they are here, as well as in some other larger Animals, more conspicuous, I shall somewhat more particularly describe them.

They are all of them, by *Anatomists*, usually, but improperly called *Coats*: for the inermost, are the chief Body of the *Gulet*: So that 'tis the fame, as to call the Wood of a hollow Plant, one of its Coats. 'Tis therefore composed of Five Membranes; Three in the middle, lined with a Fourth; and faced with a Fifth.

The Utmost, and the Inmost, are both Cuticular. The Inmost, or *Glandulata*, exceeding white, and very friable: answerable to the outward Rind of the Root of a Plant.

The next to it, is the Nervous. Which here, and in fome other Voraceous Animals, is fo very thick, that it may more properly be called the CORPUS NERVOSUM. Compofed of Fibers, partly running by the length of the Gulet, and in part tranverfly to the two Muscular Membranes. Throughout

Throughout the length of it, run many fmall Nerves, like the fineft Lawn-Thread.

This Corpus Nervofum, is, as I conceive the TENDON to the two next or Muscular Membranes.

Thefe Two (they are at least two) are truly Muscular. Stenon hath observed them to be spirally continu'd: which of fome of them is true, not of all. And Dr. Willis faith alfo truly, That they Decussate, the one winding from the right hand downwards, the other from the left. But, to proceed where these two accurate Persons have left; of the admirable Texture of these two Muscules, it is further obfervable, That of each parcel of Fibers, one half is fo diftributed, as those Fibers which belong to the uppermost Mufcule on the right hand, are in their progress towards the left, caft into that which lies underneath. And fo on the contrary, those which belong to the Upmost on the left hand, are caft, into that which lies underneath on the right: both together making a perfect Plat, fomewhat like to that in a Riding-Whip. The other half keeps always above, and is continu'd by a compounded line, partly Spiral, and partly Elliptick; especially towards and at the bottom of the Gula.

The Stomachs or Venters in a Sheep are Four. The First, or Panch, confisteth of as many Membranes as the Gulet. The Inmost and the next, fc. the Nervous, are raifed up, and made all over rough with a multitude of fmall Nervous and pointed Knots, in some places smaller and round; in others larger and flat: all very like those upon the Tongue.

In the *Panch* alfo are feveral *Gibbofities*; caufed chiefly by the doublings and thicknefs of the Mufcular Membranes, in those places. So that they are as it were the *Tendons* of the faid Membranes.

The Second Venter, is by the Latins called Recticulum. In which are the like Nervous Knots, as in the Panch, but fmaller. And comprehended within feveral round Ridges or Plates composed together in the form of a Net or Honey-Coome.

The Third, is called the Omasus: by Butchers the Feck. Of a wonderful structure : being divided into above 40 Receptacles by so many Sepiments, great and small:

#### The Stomachs and Guts.

fome \*, \*, or \* of an inch, others an inch, or two inches broad. All cover'd with the like Knots, as the two former *Venters*; but extream fmall.

The Fourth Venter is called Abomafus: by Butchers, the Read. The only analogous one to that in a Man; the Membranes hereof being all alike. Saving, That the Plates (as here they are rather than Folds) are far deeper; and oppofitely and regularly mett in an oblique pofture.

The Guts are Six or Eight. The length of all, near 32 yards. The First, or Serpentine, from its Flexures, about i a yard long, and i of an inch over.

The Second, or *Jejunum*, about 13 yards and <sup>1</sup>, and as wide as the first.

The Third, or Ileum, 11 yards long; and an inch over.

The Fourth, or *Cacum*, above a Foot in length; and where wideft, two inches and  $\frac{1}{2}$ .

The Fifth, is continu'd from the *Cæcum* without either Valve or Contraction intervening. Above a yard long; and an inch and where narroweft.

The Laft, may by way of Eminence, be called the *Mufcular*: being as thick as the *Gulet* it felf. And This may be fubdivided into Three. From the Fifth, it grows fmall to the length of an Eln; where it is  $\frac{1}{2}$  an inch over. Of this width it continues two Elns more and  $\frac{1}{2}$ . After it widens again, to the *Anus* or the length of another Eln and  $\frac{1}{2}$ ; where 'tis near an inch and  $\frac{1}{2}$  wide. In the *Jejunum*, the Veffels are lefs numerous; in the *Ileum*, more; in the *Cæcum*, and the next, moft; and in the Mufcular, leaft.

The Glands, not fo obfervable, as in those of a *Calf*, which I shall next describe.

#### A Calf.

The Number, Shape, and Texture of the Gulet and Venters of a CALF, are the fame, as of a Sheep. The Guts much different. In length, about 20 yards. In a well grown Ox, at leaft thrice as long. Asking a Butcher, at his Slaughter-House, How long he thought they might be; he guessed 30 yards. But believing him mistaken, I caused them to be measured, and found them full 60 yards, and four over, which may be allowed for their stretching, for that they were measured empty. They

They may be reckon'd feven or nine. The First, the Serpentinum, as in a Sheep. In length  $\frac{1}{2}$  a yard, and  $\frac{1}{2}$  of an inch wide.

The Second, or Amplum (being the widest of all the reft but the Cacum) is five yards and i long; and an inch and i broad. These two are very thin, and have scarce any conspicuous Glands.

The Third, or *Magis Glandofum*, near feven yards long, and an inch wide. Furnished with a great many Clusters of Glands, like those in a *Pig*, about 50 of them; an inch  $\ddagger$ , or  $\ddagger$  long, and fome longer.

The Fourth, or Gracillimum, about two yards long; and not above i an inch over. Whereas in a Sheep, the Guts next the Venters, and that following, are near of one width. Somewhat thicker and more fleshy than any of the former. Hath feveral Clusters of large Glands; but nothing near fo many, no not with respect to its length, as the precedent : and may therefore be also called Minus Glandosum.

The Fifth, or *Maxime Glandofum*, is a yard and  $\frac{1}{2}$  long, and an inch wide. By far the most opacous, thick and ponderous of all the five. Lined throughout the length, with fuch a Glandulous Lace, as in a *Pig*. This Lace is thicker than all the other Parts of the Gut together. At the beginning  $\frac{1}{2}$  an inch, at the lower end an inch broad. The rest of the Gut, over which this is not fpread, is perspicuous.

The Sixth, or *Cacum*, near two feet long, and above two inches and  $\div$  over where wideft; where narroweft, an inch. Very thin, and without any confiderable Glands.

The Last, or *Musculare*, two yards and  $\frac{1}{2}$  long, and of the fame Diametre in its feveral parts as in a *Sheep*; being wide at both ends, and flender in the middle: and may therefore, as that, be fubdivided into three.

CHAP.

C 2

#### CHAP. V.

## Of the Uses of the Gulet and Stomachs of Quadrupeds. And first of the Gulet.

IN speaking hereof, I shall, as in the Anatomical Part, infist chiefly on those Particulars which have been omitted by others.

It may therefore first be noted of the bore of the Gulet, That it is not every where alike answerable to the Body or Stomach. As in a Fox, which both feeds on Bones, and swallows whole, or with little chewing; and next in a Dog, and other Offivorous Quadrupeds, 'tis very large; fc. to prevent a contustion therein. Next in a Horfe; which though he feeds on Grass, yet swallows much at once, and fo requires a more open passage. But in a Sheep, Rabbit, or Ox, which bite short, and swallow less at once, 'tis smaller. But in a Squirel, still lesser, both because he eats fine, and to keep him from difgorging his meat upon his descending leaps. And fo in Rats and Mice, which often run along Walls with their Heads downward.

The Thickness of the Gulet is also different. So in a Weefle or Pole-Cat, which eat no Bones, more Membranous In Dogs more Muscular, greater force being reor Skiny. quired to carry down Bones, than Flesh. But in Sheep, Hogs, Cows, Horles most of all; for three Reafons: First, For that Grass, and especially Hay is less flippery, and apt to clog by the way. Secondly, Becaufe they eat continually, and fo the Gulet is in continual action, which it could not bear without pain, were it not made flurdy for hard labour: in like manner, as are the Muscules of the Chaps, and effective the Maffeter, in all the faid Animals. Thirdly, For that all they eat and drink (because they hold their Heads down) must be made by a greater force to ascend into their Stomachs. Whereas in Carnivorous Animals, and effecially a Man, it paffeth by defcent. And there are few, but may remember, how difficult it was, when they were Boys, to drink with their Heads down at a Spring. And although Dogs drink with their Heads down, yet they can only

only Lap, their Gulet not being Muscular enough to carry up much at once.

The feveral Parts of the Gulet, have their diffinct Ufes. The outer Membrane, is both a Fence, and a Swath to all the reft; efpecially to the Muscular. For the Nervous underneath, being always capable of, and fometimes fubject to inordinate expansions (as Dr. *Willis* doth well conjecture) it would Rack the Muscular Membranes beyond their Tone, were they not bound up within this.

The two Musculars, chiefly fubferve the feveral Motions of the Gulet. Amongst which, Dr. Willis reckons Ofcitation or Yauning, and Expution. Of the first, (a) his words are (a) Pharthese; In Ofcitatione, Oefophagi ductum ampliari, & quasi a mac. Ration. vento quodam inflari & expandi fentimus. But who knows not, that the Windpipe, and not the Gulet, is the part concern'd in all kinds of Respiration, whereof Ofcitation is one. Of the latter, his words are these; (b) Gulæ Tunica carnosa, (b) Ibid. duplex quasi Musculus censeri debet; quorum alter, expuisionis opus perficit. At that time forgeting, that no man ever spat any thing out of his Stomach; no more than he can be faid to vomit or eructate out of his Mouth. The Doctor is one, of whom I have learned much: and therefore I mention these Things, only because they lie in my way: and that we may ftill remember, Nullius in Verba.

The Actions of the Gulet are therefore principally these Three, Deglutition, Vomition, and Eructation. By one of the Muscular Membranes, faith the forementioned Doctor, fc. that which defcends, Deglutition is performed; by the afcendent, Vomition. His words (c) are these, Cùm unius Fi- (c) Ibid. brarum ordo descendens, Deglutitioni inserviat; alter ascendens, Vomitionis opus perficit. But that he was herein mistaken, I conceive, appears from the structure of the faid Membranes, neither of which, is ascendent or descendent, more than the other; and from the manner of their Contexture, as is above describ'd. Besides, if it were so, why should there not be Ascendent and Descendent Fibers or Muscules, for the Natural, and the Inverted Motions also of the Guts?

I conceive therefore, That Deglutition and Vomition are made by the Cooperation of both the faid Membranes : only in the former, the Motion goes from the Throat downward, in the latter, from the Stomach upward. And

to in Erustation, only with lefs force. For the performance of which Actions, Two Muscules or Muscular Membranes are yet requifite; and those platted and interchanged, as hath been defcrib'd : That is, by a double Plat of the Fibers of both; whereby half the nether Membrane on the one fide the Gulet, becomes half the upper Membrane on the other fide: and fo vice versa, in spiral rounds through-To the end, That the Gulet being hereby contracted out. in one part, and dilated in the next, might at the fame time, thrust forward, and let pass, any body therein contain'd: and that the faid Contractions and Dilatations might be more eafily and regularly made, and by reciprocal Undulations, carry'd on from one end of the Gulet to the other. These Undulations, in the Gulet of a Horse, when he drinks, are very plainly feen.

And that this Undulation may be made with more fpeed, it is obfervable, That the faid Muscular Fibers are not continu'd by a close, but very oblique or open spiral Line. Whereby, as the spiral Rounds or Circuits, so the Undulations, are the fewer; and confequently, not slowly (as in the Guts) but much sooner finished.

Hence it is, That a *Cat* hath fo difficult a fwallow, the meat commonly feeming to flick in her Throat. Not from the fmallnefs of her *Gulet*; but for that in the longer half of it, the *Mufcular Fibers* are continu'd in fo clofe a fpiral Line, as rather to feem *Annular*. Whereby, the *Undulations* of the *Gulet* are more flowly and difficultly made. So that a more difficult fwallow, being one thing neceffary to make her not greedy, but patiently to watch for her Prey; Nature hath therefore contriv'd her *Gulet* for that purpofe.

The Nervous Membrane, or (as in fome Graminivorous Animals it may be call'd) Corpus Nervofum, hath hitherto been thought to ferve only for fenfe. Dr. Willis Conjectures, That it is alfo the Inftrument of fome certain motions of expansion in Ofcitation and Preternatural Inflation: which is all he faith.

But to Me, it feemeth, That it Cooperates with the Muscular Membrane to all the Natural Motions of the Gulet, in Deglutition, Vomition, and Erustation. And, to speak properly, That 'tis nothing elfe but a HOLLOW TEN-

TENDON; that is, the *Tendon* of the two Muscular Membranes.

It may be Objected, That then it should lie above, not under the Membranes. But in a *Gizard*, we find the *Tendon* spread within or underneath the Fleshy part of the Muscules, as well as above.

The truth of this will further appear, if we confider the great Thicknefs of this Membrane, where the moft forceable motions of the *Gulet* are required. For it would ferve as well for fenfation, if it were ten times as thin: the grofsnefs of the fenfory, not being neceffary to the exquifitenefs of the fenfe; but of the mover, always to the ftrength of the motion. And therefore, whereas the *Cuticular* or utmoft Membrane is much of the fame thicknefs in all Animals; the Nervous is much varied according to the thinnefs or thicknefs of the Mufcular: that is, where the Mufcule is thick, the *Tendon* is proportionable. The notice of which in *Oxen*, &c. fhe weth the fame ufe hereof in a man.

The Inmost Skin or Lining of the Gula, is to be a protection to the Nervous, as the outer is to the Mu f cular; that fo nothing hard, falt, fower, or any way acrimonious, may be injurious to it. To keep it the better within bounds, in all the motions of the Gulet. To be the Bed of the Glands. And one feat of Thirst; which oftentimes lies no deeper than the Throat and upper part of the Gulet: and is cured by any thing which by moistening the Throat shall give vent to the Mucus ftagnant therein.

#### CHAP. VI.

#### Of the Uses of the Stomachs of Quadrupeds.

A Nd first, all Carnivorous Quadrupeds have the smallest Ventricles; sless gain farthest. Those that feed on Fruits and Roots have them of a middle size. Yet the Mole, because It feeds unclean, hath a very great one. Sheep and Oxen, which feed on Grass, have the greatest. Yet the Horse (and for the same reason the Coney and Hare) though Grami-

24

Graminivorous, yet comparatively have but little ones. For that a Horfe is made for labour, and both This and the Hare for quick and continu'd motion : for which, the most easie Respiration, and so the freest motion of the Diaphragme is very requisite; which yet could not be, should the Stomach lie big and cumbersome upon it, as in Sheep and Oxen it doth. For which cause Nature hath here transfer'd the greater part of the Alimental Lugage into the Cæcum.

The Neck of the Stomach, near the Gut, is commonly reflected backward, fo as to make an acute Angle with the Back of it. To the end, the extrusion of the prepared *Aliment* to the Gut, may be ftinted. And that the thiner part, which will more eafily wind about, may the better pafs away, and leave the reft behind. Sometimes it hath three or four *Flexures*, as in *Sheep* and *Oxen*: for that the Gut being fo fmall with refpect to the *Venter*, and with all fo very thin; it would, by too fudden or copious an irruption of the *Aliment*, be in danger of being burft. And for the fame reafons, the Stomach of a *Pig*, fo voraceous a Creature, is alfo furnished with a Stopple.

The diffinct uses of the Parts of the Stomach, are many of them the fame as of the *Gulet*. I shall not therefore repeat, but proceed to those particulars as remain to be explicated.

And first, 'tis plain, in those thick Stomachs of an Ox or a Sheep, that the carneous Membranes are true Muscules: which conducteth us more easily to believe that of a man also Muscular. 'Tis certain, that the Muscules of the Abdomen in some Animals, as in Squirels, are thiner than those of a mans Stomach.

Now the Nervous and Muscular Parts joyntly subferve to all the motions of the Stomach, which I reckon five, viz. Corrugation, Astriction, Undulation, Convulsion, and Voluntary Motion.

Corrugation, is when there is a double motion of Contraction, beginning from both the Orifices of the Stomach, and fo drawing it up into innumerable fmall Wrinkles. For the better expression of the Mucus out of the Glands of the inner Membrance. For a closer comprehension of the Aliment, and immission of the faid Mucus or other fermenting Juyce, into it. And for the gradual expression of the colliquated

quated parts thereof into the Gut. In this motion, the utmost Muscular Fibers contract the Stomach in length; and the inermost, in breadth.

Afriction, is a Contraction only about the Pylorus; performed by the inermost Fibers alone. For the firmer Retention of the Aliment, and its orderly difmission into the Gut.

Undulation, is when the Contraction is made in feveral parts of the Stomach fucceffively, beginning at one Orifice, or End, and terminating at the opposite. Made alfo by the Inner Fibers; after the fame manner, as the Undulation or Peristaltick Motion of the Guts. The use of it, is either for Excretion or Eructation. If it begins from the Gulet, it ferves, after the fineft of the Aliment is difcharg'd by Corrugation, for Excretion of the reft. But if the Undulation be Inverted, or begins from the Pylorus, it produceth Erustation. Anfwering to the like Inverted Motion, which fometimes happens in the Guts.

Convulsion, is a forcible and fuddain Contraction of all the Orders of Fibers, outer, middle, and inmoft. The ufe hereof with Undulation, is for Vomition. For first, there is only an Inverted Undulation, that is, I conceive, when there is only a Naucea or tendency to Vomit. Which Undulation alfo, carries part of the matter by degrees, to the upper mouth of the Stomach. And growing quicker and ftronger, at last turns into a Convulsion; the Stomach being hereby contracted both in width and length, and the Pylorus forced up to the upper Orifice (as a Barbars Puff in powdering the Hair, or the Bladder in the Injection of a Clyfter) and fo produceth actual Vomition.

The Voluntary Motion of the Stomach, is that only which accompanies Rumination. That it is truly voluntary, is clear, from the Command that Ruminating Animals have of that Action. For this purpose it is, that the Muscules of their Venters are fo thick and ftrong; and have feveral Duplicatures as the Bafes of those Muscules, whereupon the ftrefs of their motion lies. By means whereof, they are able with eafe to rowl and tumble any part of the meat from one Cell of the fame Venter to another, or from one Venter to another, or from thence into the Gulet, whenfoever they are minded to do it. So that the Ejection of the meat m

in Rumination, is a Voluntary Eructation. Not at all laborious to them, becaufe of the great strength of the Muscules of their Stomach and Gulet to command and govern the fame:

By the Joynt affiftance of the Glandulous and the Nervous Membranes, the business of Chylification feems to be perform'd. The Mucous Excrement of the Blood being fupply'd by the former, as an Animal Corrofive, preparing; and the Excrement of the Nerves by the latter, as an Animal Ferment, perfecting the Work. And the Cacus Ventriculus of a Hog, feems to be a Repolitory provided for fuch a mixed Leven or Menstruum : whereby he not only becomes more voraceous, having thence continual irritations to cat: but all he eats, is thereby likewife well digefted.

The Folds of the Stomach, which in its Corrugation muft needs be much deeper than when it is dilated, or of ufe, To divide the Aliment into feveral Portions, and thereby administer their Ferments not only to the Circumference, but intimate parts of the Mass to be fermented.

The pointed Knots, like little Papilla, in the Stomachs of divers Ruminating Beafts, are also of great use, viz. For the Tafting of the Meat. Dr. Willis defcribing the Inner Membrane of the Stomach (not of a Beaft, but expressly of a Man ) fpeaketh thus; Hac Crusta Ventriculum (Humanum puta) intus obtegens, similis videtur Illi, quæ Linguam obtegit. Wherein he was miftaken: this Inner Membrane being Glandulous; the Skin of the Tongue not fo, but only Fibrous. But of divers Beafts which Ruminate, thus much is true, That in their Three first Venters, the Inner Membrane is Fibrous, and not Glandulous; the fourth only being Glandulous, as in a man. Of the Fibers of this Membrane and the Nervous, are composed those pointed Knots (a) Chap. 4. before defcribed (a) both in fubstance and shape, altogether like to those upon the Tongue. Whence I doubt not, but that the faid Three Ventricles, as they have a power of Voluntary Motion: fo likewife, that they are the Seat of Taft, and as truly the Organs of that fense, as is the Tongue it felf.

> Laftly, and confequently, the faid Nervous Knots, are of use to Methodize the Work of Rumination, after this The Animal having eaten enough for the Panch manner. well

27

well to govern; rowles and tumbles the meat to and fro therein: and at the fame time, with the help of the faid Nervous Knots of feveral degrees of fineness (as the Gold-(mith hath his Affayers of feveral degrees of niceness) judges of the Courfeness or Fineness, Crudeness, or Concoction of any part of it; and accordingly lets it reft, or removes it. So then the groffeft of these Affayers standing about the Gulet, and fo in the paffage of the meat between the Panch and the Reticulum, being the proper judges of what is Courfe or Crude; if they find it fo, then 'tis tumbled back to receive a further maturation in the Panch. If fomewhat fine and Concocted, 'tis then permitted to pass on and rowl into the Reticulum. And the faid Affayers or Nervous Knobs being here sharper and softer, than in the Panch; have still a more accurate Taft: and therefore what they yet find too courfe, the Reticulum forthwith throws it up into the Gulet and Mouth. From whence, being further refined, 'tis remanded to the Reticulum; and thence after a while, into the Third Stomach or the Omafus. And This again being a more nice Assayer than the Reticulum; if it feels the meat fine and fost enough, passeth it into the last Stomach or Abomasus. But if otherwise, throws it back into the Reticulum, and the Reticulum into the Gulet and Mouth to be labour'd once again, and fo remanded.

\$2 ·

# Of the Uses of the Guts of Quadrupeds.

I Shall here, as before, pass over fuch particulars as have been spoken of by others; and divers also which being observable in the Gulet and Stomachs, as well as here, have been already sufficiently explain'd.

And first the different Bore of the Guts is observable. So, for example, the Guts of a *Horse* are very wide. For that he both swalloweth, and dischargeth from his Stomach into his Guts, the meat more gross; which therefore requireth a more open passage, left it should clog. As also, that it may move with greater speed towards the *Cacum*, D 2 here

(a) Chap. 6. here, (a) for the reafon above-faid, defign'd by Nature to be a fecond Stomach. Whereas in an Ox or a Sheep, the meat having paffed four fucceffive Concoctions, 'tis thence delivered to the Guts of a much finer fubftance; and fo moveth fafe enough throuh a much fmaller Chanel; and faft enough, there being much lefs work here left, for the *Cacum* to perform.

> The Contraction alfo of the Guts, or leffening of the Bore by feveral Necks, is of good ufe. As for inftance, in an *Urchan* or *Cat*; ferving to ftint the Transition of the meat, that it be not over quick, and dividing the Guts into fo many little *Venters*, in which the meat reftagnates for fome time, in order to its reception of as many repeated Concoctions. Whereby alfo in thefe Animals the work of the *Cacum*, and therefore the making of it, feems fuperfeded.

> Moreover, the rarious length of the Guts is observable, according to the cleanness, or more fewer nutritive parts of the Food; or its colliquability into Chyle. So in a Wee fle or Squirel, that feeds much on Eggs, and Nuts, and fuch like fine and nutritive food, they are extream short. And in all Gross eaters, longer than in other Quadrupeds. And therefore one reason, why the Guts of a Sheep or Ox are flender, is, that they may be long. For were they shorter and wider, it would not be tantamount : For the food being Grass, it is not fufficient that they should hold enough: but alfo neceffary, that they give a longer voyage to a fubstance so jejune, for a thorow solution and exuction of all its nu-Besides, that in a smaller Channel, the faid tritive parts. parts will all along lie nearer to the Lacteal Veins, and fo more eafily be express'd into them.

The Membranes of the Guts, have a general analogy in all *Quadrupeds*, and divers of their Ufes have been well affign'd. I shall therefore only Note, That as the spiral *Fibers* contract or purse up the Bore of the Gut; so those that run by the length, draw it up shorter, and so dilate it. Whereby, as one part of the Gut may press the meat forward, or as it were disgorge it, so another gape to receive it, at the same time. And in case one Gut should by another, or by some Bowel, be oppress'd, being by the said Contraction in length removed a little out of its place; the freedom of its motion, or any thing therein, will thereby be regain'd.

But in a Mole, the fame Fibers which run by the length, being Indented, do alfo for a little way, each parcel obliquely run by the breadth of the Gut. Whereby they are able, without the help of fpiral Fibers, to narrow or fhorten the Gut of themfelves: and alfo to do both in the fame place. For by the Relaxation of the Fibers, the fides of every Indenture, must needs grow both wider and more diftant, and the Gut wider and more extended, at the fame time : and fo Vice verfa. Probably with this defign, That the Shells of Infests may make a more fafe transition, without raking againft the tender fides of the Guts.

The Glands of the Guts are likewife of great Ufe. The Mucus which they fpew, ferves to make the Guts flippery, that the meat may the more eafily and fafely glide along. As alfo for another Ferment fuperinduc'd to that of the Stomach, and fo a further colliquation of the meat. With refpect to both which Ufes, the faid Glands, according to the Bore of the Guts, the hardnefs or foftnefs, courfenefs or colliquability of the meat, are more or lefs numerous; as in the precedent Examples.

And that this *Mucus* may be duly fupply'd, Nature ftill allows *Blood-Veffels* proportionable to the plenty of Glands. And hath taken care that the Veffels enter not the Guts on the fame fide on which the Glands are feated, but the oppofite: that having fpace enough to branch themfelves into the fmalleft capillary Tubes, before they reach the Glands, there may be the lefs danger, that any fincere Blood fhould with the *Mucus* make an Inundation into them.

Through the fame Glands, as fo many little Springs, I conceive, That the Humours are either emunged, or precipitated, out of the Blood, in Purgation. For that one fo fmall a *Pipe*, as that of the *Pancreas* should bring fo great a quantity, is not at all probable. And the Glands being a visible way, I know no reason, wherefore we should have recourse to any invisible one.

Thus the fame Glands are a great means to prevent Feavers, and other ill effects of Cold by a Diarrhea. For when by a fuddain aftriction of the Pores of the Skin, or otherwife, the ufual perfpiration is ftop'd : the redundant matter in the Blood, is often fafely difcharged, by the Glands, into the Guts. But if the matter be very fharp, or rusheth upon the the Glands too fuddainly; it fometimes corrodes or breaks them, and fo makes way for Blood alfo: as may be observed in the Guts of such as die of a *Dysentry*.

The Use of the Cacum is manifold, but divers in divers Animals; according to the make of it, and the Relation it bears to the Stomachs and the Guts. And first, for the most part, it ferves to give a fecond Deliberate Concoction to the meat, that nothing nutritive in it may be loft. For which purpofe, it is always furnish'd with Glands, as well as the other Guts. And, with refpect to its width, is commonly but thin, or lefs muscular, that to being lefs apt to constringe it felf, it may give a due time of flay to the meat deliver'd For which end also it is placed out of the common to it. Road of the Guts; that being thereby lefs receptive of their Peristaltick Motion; it may lie the more still. For the fame intent the Cæcum in a Sheep hath feveral Flexures answerable to those in the 4th Stomach or Abomasus. And in a Hog, 'tis drawn up into Cells on both fides, like the Colon, to make it fo much the more retentive. In the Coney, the fame is done still more effectually, by the spiral Plate, or Connivent Value winding from end to end. And in the Horse, not by two only, but four Rows of Cells on the four fides. In which two last Animals the faid Use is fo eminent, that the Cacum, confidering its bignefs withall, is the chief Stomach, and much superior to the Stomach so call'd. And it is also obfervable, That the Aboma fideus in a Rat, hath the fame relation to the Cacum; as in a Sheep, the Aboma fus hath to the other Stomachs. Hence likewife it may be, that fome Animals have little or no Cacum: either because the meat is fo diffoluble, as not to need a fecond deliberate Concoction, as in a Weefle; or for that Nature hath made fomething elfe to ferve without it; as those feveral Contractions in the Guts of a Cat; and the Valvulæ Conniventes in the small Guts of a Man. Where we may observe, That these Values are not every where spiral, as is thought, but do also make fome perfect and diffinct Rings: whereby they are fitter to retard the motion of the meat in its descent.

Another Ufe may be, For a Retreat; Either to the meat, if it fhould chance to rush too fast into the Gut below it: Or to the Excrements, in case the Animal is diverted from a present ejection of them. The laft Ufe, I shall name, may be this, That in case the meat, or the Excrements in the lower Guts should be at any time fo dry and hard, as too flowly, and not without much stress to the Guts, to defcend; the *Cæcum* is as a *Clyster-Bag*, always ready with its liquid Content, to be in some part thereinto injected. For which purpose, it usually makes an acute angle with the upper Guts, and opens directly into those below it.

The Make of the Colon, with other Ufes, alfo anfwers to the greater need of Retention. Either becaufe of the upright pofture, as in a Man; or frequent and fpeedy motions, as in a *Horfe* or *Hare*: where, without the Cells of the *Colon*, to retain the Excrements from the *ReEtum*, there would be a continual *Conatus egerendi*.

The *Rectum*, or rather *Stercoraceum* of a *Cat*, being peculiarly of fo great a bulk ; I will conclude with a Conjecture of one Ufe of it : and that is, To be as a *Counter-poife* to her Head : whereby, from what height foever fhe falls, fhe ftill lights upon her feet.

#### CHAP. VIII.

## Of the Stomachs and Guts of BIRDS.

**B** Ecaufe that many particulars will here occur, which are intelligible from the former Defcriptions, and have already been explain'd; I shall therefore be the shorter. Of about Forty, which I have open'd, I shall defcribe these Thirteen that follow, sc. of a Casowary, an Owl, a Cuckow, a Dunghil-Cock, a Tame Pigeon, a Jackdaw, a Starling, a Tellowbammer, a Bull-finch, a Wry-neck, a Bunting, a Reed-Sparrow, and a House-Swallow: and figure them all, but those of a Cuckow. With Notes upon others, as I proceed.

#### Of a Casomary.

The CASOWARY hath no Crop. But a wider Gulet, I fuppofe, as well as Guts, than in any other Bird. Far greater than those of an *Oftrich*; although the Body be much lefs. The Gulet, where widest, or near the Throat, about five inches over ;

over ; next the Stomach, two. Sprinkled with many fmall Glands, as it is, more or lefs, in all Birds.

At the bottom of it, the *Echinus*; common to all Birds that I have open'd. But here lefs confpicuous. The Figure hath not express'd it. It hath always a Lining of much larger Glands than those in the *Gulet* or *Crop*; commonly of an Oval Figure, and each of them with an open mouth spewing out a *Mucus*.

He hath no Gizard (as hath the *Oftrich*); yet a thick Mufcular Stomach, as in other Carnivorous Birds. Almost of an Oval shape; and small with respect to the Guts: expressed fomewhat too big for the Scale, (as also the *Gulet* and *Guts*) in the Figure. The *Pylorus* guarded with a kind of *Valve*.

The Guts not two yards and half long. Befide the two Caca, are three. The larger, next the Stomach: as it is, in almost all other Birds. About three inches and  $\ddagger$  over, where widest. The smaller, somewhat above two. The Restum, the largest, fc. about four. Much wider than even those of a Horse, excepting only his Cacum and his Colon.

He hath two *Caca*; as have almost all Birds. Yet here very fmall, about  $\ddagger$  a foot long, but no thicker than a Womans little Finger. Here, as in all other Birds, making obtuse Angles with the *Rectum*. So that what is faid of them in Mr. *Willughby's Ornithologia*, ----*Cum Intestino Recto angulos acutos faciunt* : was only a flip of that most accurate Pen.

The *Rectum* is feparated from the next above, by a Connivent *Value*.

#### Of an Owle.

The Gulet of a young Grey-OWLE, is of an indifferent fize. At the bottom of it, the *Echinus*. And fomewhat more apparent, than in the *Cafowary*, but lefs than in moft frugivorous Birds.

The Stomach, a middle Thing betwixt that of other Carnivorous Birds, and a Gizard, fc. a plain Bag, yet in the middle fomewhat Tendinous.

The Guts in length two feet and 5. Three, befides the

#### Of Birds.

Cæca. The first or Amplum, a foot long; and above  $\ddagger$  of an inch broad. The Gracile, which reacheth to the Cæca, a foot and three inches; and above  $\ddagger$  of an inch where narrowest. In this Gut, are 15 or 16 Contractions, like those in a Cat's, but made longer.

The Caca, four inches and  $\frac{1}{2}$  long. As the Gizard of a middle Nature, fo thefe of a middle fize, betwixt those of fome Carnivorous, and fome Frugivorous Birds. At their close or further ends,  $\frac{1}{2}$  an inch over. But where they enter the Rectum, no thicker than the bigeft ftring of a Trebel Vial.

The *Rectum*, three inches long; towards the *Anus*, near an inch wide; almost in the Figure of a little *Pear*. As it is also in most *Wild-Fowl*.

#### Of a young Cuckow.

Neither hath this Bird any Crop, nor a Gizard. But to the Gulet it is peculiar, That it hath Ten or Twelve Rows of more confpicuous Glands, which run along from the Throat to the *Echinus*.

The *Echinus*, of a ratable bignefs, and more diffinct from the Stomach, than in the *Owle*; being divided from it by a *Muscular Neck*. As it is also in most other Birds.

The Stomach, a plain Bag, much like to that of an Owle; yet fomewhat thicker, and more Tendinous.

The Guts about a foot and  $\frac{1}{2}$  long. Three befides the *Caca*. The first, an inch and  $\frac{1}{4}$  long; and near  $\frac{1}{4}$  of an inch wide. The fecond, above a foot, and  $\frac{1}{4}$ <sup>th</sup> wide. The *Caca*, as wide in the middle, as the first; and above an inch long. The *Restum*, two inches and  $\frac{1}{4}$ .

The Wild-Duck and Teal alfo, and I fuppose all of this kind, and most other Birds, are without a Crop.

#### Of a Dunghill-Cock.

A DUNGHILL-COCK, hath one Stomach or Ventricle more than the former Birds, *fc.* a Crop: all over befprinkled with fmall Glands, formewhat more visible than in the Gulet.

The upper part of the Gulet, leading to the Crop, <sup>‡</sup> of an E inch inch over. But the lower part, leading from it towards the *Echinus*, very flender, not above ‡ wide.

The *Echinus* almoft an Oval shape, being divided from the Gizard by a pretty long and slender Neck. And may therefore be properly call'd the *Second* or *Oval Ventricle*.

The Third, is the Gizard, in the place of the plain Bag or Stomach in the former Birds. , 'Tis made of Six Mulcules and a Cartilaginous Lining in the greater Concave; which may be called the Laboratory. Those four, which make the greatest part of the Gizard, may be called the Grinders. Of extraordinary thickness; whereby the length of the Convex, is cross to the length of the Concave of the Gizard. Yet thinner towards the Edges, fo as to make a kind of double Hyperbola. In the Centre hereof on both fides meet the Tendons of the faid Muscules, continued or expanded for about i an inch in breadth, without any Carneous or Red Fibers mixed with them. From whence, they are divided, the one, which is the ftronger, fpread over, the other, under the Muscules; into which they are also branched all the way, fo as meeting in the body of the Muscule they make a fort of fine Cancellated Work, as may be feen better in the Gizard of a Goole; especially in a thin flice hereof parboyl'd, and held up against a Candle. And in all Gizards, fo as to be feen to run crofs, as in that of a *Pullet* in *Tab.* 29.

The Fifth *Muscule* is that which ftandeth between the *Echinus* and the four *Muscules* now defcrib'd, and may be called the *Deductor*, from the use hereafter mention'd. Very thin with respect to the former; placed at the upper end of the left edge of the *Gizard*, and spread a little on the side, but not fo much as in the Figure. Better represented, *Tab.* 29.

The Sixth, is fuch another *Muscule*, ftanding opposite to the former, *sc.* on the right edge of the *Gizard*, and may be called the *Reductor*, as shall be shew'd why.

The four Grinders are strengthened within, not only with a Tendon, but a Gristly Lining, thicker than the outer Tendon, with a rough surface, and wrinkled into several Tranfverse Furrows, from one end to the other.

The Guts are about a yard and  $\frac{1}{2}$  long. Three befides the Caca. The first, the smaller; contrary to what it is in most Birds. Not much above  $\frac{1}{2}$  of an inch, where widest. About

## Of Birds.

About two feet and 1 long. Where it joyns with the Greater, stands the end of the Ductus Intestinalis, accurately defcribed (a) by Dr. Walter Needham.

The Greater, where widest an inch. The Rectum, some-Foctu For-The Caca near eight inches long : at the furwhat more. ther end, above tof an inch over; but where they open into the Rectum, no thicker than the great string of a Bale-Viol.

'Tis proper to the Gallinaceous kind, to have a great Gi-That of a good big Turkey, near eight Ounces Troy. zard. Whereas that of a Japan Peacock is not above two: yet the Body about half as big as that of the Turkey.

Not only all the Gallinaceous kind; but the Duck, and, I suppose, all of that kind, have two very long Caca.

## Of a Tame Pigeon.

The Gulet of a Tame PIGEON, near the Throat, very wide; almost an inch and i over.

The Crop is above three inches broad; above two, long; and an inch and <sup>1</sup>/<sub>4</sub> deep. Not fo diffinct from the Guler, as in the Gallinaceous kind; this and the Gulet running one into another in a direct Line. In the Belly of it, are few visible Glands: but the Neck thence down to the Echinus, is curioufly Lined with fix or feven Glandulous Laces.

The Crop of a Carrier-Pigeon, is curioufly shap'd; as it were Treble-Belly'd: the two outmost or fide-Bellies, opening into that in the middle. The bottom and Neck whereof, are lined with feveral Glandulous Laces, as that of the Tame Pigeon.

The Crop of the Cropper-Dové, is almost of the fame Figure. But the Gulet of a wonderful extent; when blown up lightly, above nine inches in the girth.

The *Echinus* large, and fo the Glands therein; for the fight of which, I have reprefented it infide outward. Divided, as ufually; from the Gizard by a Muscular Neck.

The Gizard rounder than of most other Birds. The Muscules very thick and high in the middle, and flater at the edges. The Deductor stands at the top of it, and the Reductor at the bottom.

(a) Lib. de

The

The Greater Gut a foot long, and near  $\frac{1}{2}$  the of an inch where wideft. The flender Gut above  $\frac{1}{2}$  a yard long, and not much above  $\frac{1}{2}$  th of an inch over where fmalleft. The *Caca* not more than  $\frac{1}{2}$  of an inch long, nor thicker than a *Kniting-Pin*. Placed about an inch above the *ReEtum*. The *ReEtum* near  $\frac{3}{4}$  of an inch wide, and an inch and  $\frac{1}{2}$  long.

## Of a Jackdaw.

The Gulet above  $\frac{1}{2}$  an inch over at the top;  $\frac{1}{4}$  at the bottom; being *Conick* all the way, as in most Birds.

The Gizard, above  $\frac{1}{4}$  of an inch over, an inch and  $\frac{1}{4}$  long, and very Tendinous. The Guts a foot and  $\frac{1}{4}$  long. The first or Greater,  $\frac{1}{4}$  of a foot; and  $\frac{1}{4}$  of an inch wide. The fmaller, Ten inches long, and fomewhat more than  $\frac{1}{4}$  of an inch over. The *Rectum*, two inches long, and above  $\frac{1}{4}$  an inch over; shaped like the end of a *Plummers fodering Iron*. The *Cæca*, not much above  $\frac{1}{4}$  of an inch long, and very fmall.

All along the flender Gut, and in part of the *Rectum*, the chief *Muscular Fibers* are most curiously *Indented*, as in the *Mole*; especially near the *Cæca*. Not ill refembling the Needle-Work called *Irisb-Stitch*.

Transverse to these Fibers which make the Indentures, and which are continu'd by the length of the Gut, run others of the fame colour, round about it; one of them to every Indenture, which it divides into two equal parts.

The fame Indented-Work is feen in most other fmaller Birds, as well as here, but not every where after the fame manner, nor in the fame place. In the Twite or Avicula Anadavadensis, it continues also very far, sc. four inches above the Caca. In the Redstart, above three. And in the Titlark, as fax. In the Water-Wagtaile, not above two and  $\frac{1}{2}$ ; and an inch below them. In the Solitary-Sparrow, they are also very pretty below the Caca. In the House-Sparrow, they are visible only in the scale on inch and  $\frac{1}{2}$  above the Caca. In the Chaffinch, only in the Restum.

The Gulet of a Jay, being contracted in the middle, is divided into two flender Venters, as the Guts of fome Animals. So alfo is that of a Japan Peacock.

The Rectum of a Jay, hath feveral Muscular Plates, or Valvulæ

# Of Birds. R. M.

Valvulæ Conniventss placed at the diftance of sors of an inch.

### Of a Starling.

The Gulet exceedeth not  $\frac{1}{2}$  an inch in width. The Echinus fmall, with refpect to the other parts. The Gizard, mean; near an oval fhape: the *Reductor* confpicuous. Next to the Gizard ftands the flender Gut, and the Greater follows; as in the *Dunghill-Cock*: contrary to the order kept in most other Birds. Where they meet, there is a remarquable Contraction. The Indentures run along the lower half of the Ample Gut; with fome *Undulations* over-against the *Caca*.

#### Of a Yellowhammer.

The Gulet, at top is dilated into a Crop an inch and long, and above an inch over. The Axis whereof, as in a Pigeon, is the fame with that of the lower part of the Gulet, and not transverse, as in the Gallinaceous kind. Curioufly Laced with 16 or 18 Rows of Glands, about half an inch long. The Green-Finch hath a Crop of the fame shape: but the Glands sprinkled all over it; very small, yet distinct.

The *Echinus* very fmall; not above \* of an inch long; and as broad.

The Gizard above  $\frac{1}{2}$  an inch long, almost  $\frac{1}{2}$  an inch broad; thin edg'd, but high in the middle; very flrong and Tendinous. And it may here be observ'd, That although the Gallinaceous kind have a very large Gizard: yet in many other Birds, even of the smalless fort, the Gizard, with respect to its bulk, is altogether as flrong: that is to fay, the Muscules, with respect to their length and breadth, are as Thick, and their Tendons answerable; as not only in this Bird, but the House-Sparrow, Linnet, Titlark, and many more. And with respect to the Body, some small Birds have also a great Gizard, as a Chaffinch, which hath one four times as big as that of a Linet.

The Guts about eight inches long. The Greater, three; and above  $\frac{1}{2}$  over where wideft. The fmaller, about three and  $\frac{1}{2}$ ; and above  $\frac{1}{2}$  th wide. The *Rectum* an inch and  $\frac{1}{2}$  long, fhaped like a *Pear*;  $\frac{1}{2}$  th over in its wideft place: very great. The *Caca* ftand  $\frac{1}{2}$  of an inch, below its finaller end: not above  $\frac{1}{2}$  th of an inch long. The

The Indentures continu'd about <sup>2</sup> of an inch from the *Cæca* both upward and downward.

The Annular, or rather spiral Fibers, in the Rectum more apparent.

## Of a Bull-Finch.

A very different Bird from all the Finches. For first he hath a Lateral Crop. 'Tis above <sup>1</sup>/<sub>2</sub> an inch broad, and about <sup>1</sup>/<sub>2</sub> long. The Gulet, between the Crop and the Echinus, near <sup>1</sup>/<sub>2</sub> m over. The Echinus near <sup>1</sup>/<sub>2</sub> an inch long, and above <sup>1</sup>/<sub>2</sub> broad : Thrice as big, as that of a Martlets, Swallows, or Sparrows. The Gizard near <sup>1</sup>/<sub>2</sub> an inch broad ; broader than long.

The Guts no lefs than  $\frac{1}{2}$  a yard and an inch long : much beyond what they are in any of the *Finches*. The Greater, a foot and  $\frac{1}{2}$  an inch; and  $\frac{1}{2}$ <sup>th</sup> wide. The finaller five inches and  $\frac{1}{2}$ ; and  $\frac{1}{2}$ <sup>th</sup> in width. The *Cæca*, at the end of the *Rectum*, not above  $\frac{1}{2}$ <sup>th</sup> of an inch long. The *Rectum*, near an inch: and where wideft, almost  $\frac{1}{2}$  an inch. Figur'd like a *Pear*, as in most other Birds.

The whole fmaller *Gut*, and about five inches of the greater, very curioufly Indented. And the Indentures deeper in the latter.

#### A Young Wryneck.

Hath no Crop, and but a fmall Gulet; not much above  $\frac{1}{2}$  of an inch, where broadeft. The Echinus of a prodigious bignefs; near an inch and  $\frac{1}{2}$  long, and  $\frac{1}{2}$  an inch over. Much bigger than in a *fackdaw*, that is yet near fix times as big as this Bird. I found it full of meat. The Gizard of a mean fize;  $\frac{1}{2}$  an inch long, and  $\frac{3}{2}$  the broad. The Guts about eight inches. The greater, near two; and near  $\frac{1}{2}$  wide. The next, four; and fomewhat more than  $\frac{3}{2}$  the broad. The *Rectum*, above two and  $\frac{1}{2}$ ; and  $\frac{3}{2}$  the, where wideft. The fpiral Fibers herein more visible. He hath no Cæca. The Indentures not fo regular, as in most Birds, and but few.

As this Bird hath no Cæca; fo the White-Throat, hath no fmall Gut.

Of.

# Of Birds.

## Of a Bunting.

Hath no Crop. The Gulet from end to end; above a  $\ddagger$  of an inch over where flendereft. The Echinus  $\ddagger$  the long, and as broad. The Gizard large, about  $\ddagger$  of an inch fquare. The Guts, ratably, extream, fhort, not above nine inches long. The larger, four inches, and  $\ddagger$  wide. The next, as long; and  $\ddagger$  th over. The Rectum, about an inch; and not very wide. The Caca not above  $\ddagger$  the Indentures continu'd from the Caca upward, three inches, but lefs vifibly. Downward or towards the Anus, a  $\ddagger$  of an inch, very curious.

#### Of a Reed-Sparrow.

The Gulet, Echinus, Gizard, and Guts of this Bird, are all much like in shape to those of a Bunting : and ratably, lefs.

## Of a House-Swallow.

The Gulet above  $\ddagger$  of an inch over next the Throat; next the Echinus,  $\ddagger$ <sup>th</sup>. Laced with eight or nine Rows of Glands by the length, as in a Pigeon. He hath no Crop. The Echinus, above  $\ddagger$  of an inch long, and as wide. The Gizard near  $\ddagger$  an inch long; and  $\ddagger$  the broad. The Guts about five inches long. For the bignefs, ftrong and mufcular. The Indentures, for the length of an inch and  $\ddagger$ , very fine; efpecially, when the Guts are blown up. The Cæca  $\ddagger$  th of an inch. Between the Indented Gut and the Rectum, a great Contraction : but is omitted in the Figure.

In a *Robin-Redbreaft*; the Guts are more Mufcular, than in any fmall Bird. The *Caca*, faften'd, not as ufually either on the Neck of the *ReEtum*, or where that and the fmaller Gut meet; but  $\ddagger$  an inch above the end of the fmaller Gut. None of them have any visible Indentures.

#### CHAP. IX.

## Of the Uses of these Parts.

The Gulets of Birds, are bigger or lefs, according to the quantity they fwallow. More or lefs Glandulous, according to the Solidity, or the Drynefs of their Meat. And with refpect to the fame, the Figure thereof is more fimple; or expanded into a Crop; by which it is retain'd a longer time, before it further defcends. And according as lefs or more Time is requir'd, the Crop is made fo, as either to have its Axis, the fame with that of the Gulet; or elfe to ftand Collateral, and fo open transverfly into it.

After the Meat hath been fufficiently macerated there, it defcends into the *Echinus*, for a fecond preparation. So much the more thorowly made here, becaufe by far greater Glands. And what was done before to all at once, is here in, to fmaller parcels. This Part in fome fort anfwering to the *Crop*, as the *Reticulum*, in a *Sheep*, to the *Panch*. Withall it fhould feem, That when the *Gizard* is either over loaded, or the Meat not enough prepar'd; 'tis thence returned back to this Part, (as the *Reticulum* alfo fubferves the *Omafus*) till It and the *Gizard* are more ready, one for the other. For which end alfo the *Mufcular Neck* below the *Echinus*, ferves as a Sphincter to purfe it up.

At length it descendeth into the Third Ventricle. Either Membranous, as in most Carnivorous Birds; where the Meat is concocted as in a Man. Or fomewhat Tendinous, as in an Owle; as if it were made indifferently for Flesh, or other Meat, as he could meet with either. Or most Thick and Tendinous, called The Gizard; wherein the Meat, as in a Mill, is ground to pieces, and thence preffed by degrees into the Guts in the form of a Pulp. For which purpose, the Deductor ferves to deliver the Meat from the Echinus to the Laboratory; as a Hopper to a Mill. The four Grinders or chief Operators, as the Millftones : Partly, as they are extraordinary Thick, and made with double Tendons; whereby they are constring'd with the greater force. And partly, as their Tendons stand high in the centre, so as to be arched : for fo, every time the Tendons are contracted, they must needs

## Of Birds.

needs make a shallower Arch, and so force the infides of the Grinders closer together. And as the *Millftones* are peck'd and cut with small Gutters, least their force should be evaded: so the Gristly Lining of the Gizard is all over rough, and gather'd into answerable Furrows. And because the force-able motion of the Grinders, must needs work the Meat from under them : as therefore in fome *Mills* there is one attends still to turn the Gristly under the Stone; so the *Re-dustor* here, to deliver it back to the Grinders, and so over and over, till it be fufficiently elaborated for the Guts.

And as the ftrong and continual motion of all these *Muscules*, is taught us from their ftructure, fo likewife from their red colour, which especially in the Grinders is intense. Hence in a *Fish*, the *Muscules* which move the *Fins* are usually Red, although the rest of the Flesh is very white : And fo the Leg of a *Domestick Fowl*. Whereas the Wings alfo of a *Wild Fowl*, are of the fame colour. So likewife the Flesh of a driven *Calf*, or of a *Hare*, though that of a *Coney* be white. And that which comes nearer, the Heart in all Creatures, having the like continual motion, is of a Red Colour.

The Guts are of different length and bignels, not always proportionable to that of the Bird, but the nature of the Meat. So those of a *Casowary*, though it be neceffary, that they should contain Meat enough for so great a Body : yet not, that the Meat, which is very nutritive, should make any long voyage. Yet is it needful there should be a *Connivent Valve* before the *Rectum*, for the guarding of so open a pasfage. And so with Variety in other Birds, according as they feed on *Worms*; *Seeds*, *Fruits*, *Flys*, or *Shell'd Infects*, requiring a longer, or more open passage, for their more deliberate, or fafer Transmission to the *Anus*.

The *Indentures* alfo feem to be made, and with variety, to the fame Intent : *fc*. That the Guts hereby receiving the greater Contraction and Dilatation, may fo much the more forceably detrude the Meat, or more eafily give way to it ; as it is fofter, or mixed with Shells, Stones and the like.

The *Caca*, efpecially where large, and made for a further Concoction of the Meat; for the better Retention hereof, where they open into the *Rectum*, are very ftraight. And for the fame reason, also thinner and lefs *Muscular* than the F other

other Guts: that fo the Meat therein may lie the more quiet.

The ampliation of the *Rectum*, chiefly in *Wild Fowls*, amongft other Reafons, is, I fuppofe, That the Dung lying there in good quantity, may be as a *Counter-poife* to the Head, to keep it up in flying.

#### CHAP. X.

#### Of the Stomachs and Guts of FISHES.

IN fo many as I have open'd, two Things are more generally obfervable, viz. That many of them have no Stomach, that is one that is not Belly'd; as in the Salmon, Jack, Tench, Barble, Breme: or very little, as in the Place. And many more, inftead of One Cæcum, as in fome Quadrupeds; or Two, as in most Birds; have three or four, as the Pearch; nine or ten, as the Rochet; many more, as the Trout, above thirty; the Whiting, above forty; the Salmon many more.

The Stomach of a *Place* fhaped almost like the *Echinus* of a Bird. Bounded at the bottom with a *Connivent Valve*. The Guts two only. The upper end of the first, hath two little extuberant Parts, the use whereof may be answerable to one use of the *Cacum*, *fc*. To divert the Meat, less upon any Inverted Motion of the Gut, it should regurgitate into the Stomach, or strain the *Valve*. The bottom of this Gut is feparated from the *Restum*, by another pretty *Connivent Valve* : both which, and the visible Texture of the *Fibers*, are shewed in the last *Table*.

The Stomach of a Salmon is only like a wide Gut. He hath about fourfcore Cæca, hanging on the great Gut, almost like the Mane upon the Neck of a Horfe. Being ty'd altogether with finall Veffels, and the Veffels hid with Fat; they have been mistaken by fome for a Pancreas. The Rectum is guarded with about thirty Annular Valves.

The Whiting hath a large Stomach, which is a diffinct Bag or Belly. And numerous Caca, not ftanding as in the Salmon, but all in a Ruck. The Stomach and Guts of a Cod are very like.

Some
