STANDARD DENSITY AND VOLUMETRIC TABLES

CONTENTS

	Page
Introduction	5
TABLE 1. Density (in grams per milliliter) of mixtures of ethyl alcohol and water at 10°, 15°, 20°, 25°, 30°, 35°, and 40° C.....	6
TABLE 2. Density (in grams per milliliter) of mixtures of ethyl alcohol and water at 20° C, given to tenths per cent.....	8
TABLE 3. Specific gravity at $\frac{60^{\circ}}{60^{\circ}}\text{F}$ ($\frac{15^{\circ}.56}{15^{\circ}.56}\text{C}$) of mixtures (by volume) of ethyl alcohol and water given to tenths per cent.....	10
TABLE 4. Temperature corrections to readings of alcoholometers (standard at 60° F).....	12
TABLE 5. Percentages by volume at 60° F, corresponding to various percentages by weight in mixtures of ethyl alcohol and water.....	18
TABLE 6. Percentages by weight corresponding to various percentages by volume at 60° F in mixtures of ethyl alcohol and water.....	20
TABLE 7. Temperature corrections to readings of alcoholometers (standard at 20° C).....	21
TABLE 8. Density at 15° C of mixtures (by weight) of methyl alcohol and water.....	22
TABLE 9. Specific gravity at $\frac{15^{\circ}}{15^{\circ}}\text{C}$ of mixtures (by volume) of methyl alcohol and water..	23
TABLE 10. Percentages by volume at 15° C, corresponding to various percentages by weight in mixtures of methyl alcohol and water.....	24
TABLE 11. Temperature corrections to readings of saccharometers (standard at 20° C).....	25
TABLE 12. Density of solutions of cane sugar at 20° C.....	26
TABLE 13. Density of solutions of sulphuric acid (H ₂ SO ₄) at 20° C.....	28
TABLE 14. Temperature corrections to per cent of sulphuric acid determined by hydrometer (standard at 20° C).....	29
TABLE 15. Temperature corrections to readings of specific gravity hydrometers in American petroleum oils at various temperatures.....	30
TABLE 16. Temperature corrections to readings of Baumé hydrometers in American petroleum oils at various temperatures.....	31
TABLE 17. Degrees Baumé, pounds per gallon, and gallons per pound corresponding to various specific gravities.....	32
TABLE 18. Specific gravities, pounds per gallon, and gallons per pound corresponding to various degrees Baumé.....	33
TABLE 19. Degrees Baumé corresponding to specific gravities at $\frac{60^{\circ}}{60^{\circ}}\text{F}$ ($\frac{15^{\circ}.56}{15^{\circ}.56}\text{C}$) for liquids heavier than water.....	34
TABLE 20. Specific gravities at $\frac{60^{\circ}}{60^{\circ}}\text{F}$ ($\frac{15^{\circ}.56}{15^{\circ}.56}\text{C}$) corresponding to degrees Baumé for liquids heavier than water.....	36
TABLE 21. Degrees Baumé corresponding to specific gravities at $\frac{60^{\circ}}{60^{\circ}}\text{F}$ ($\frac{15^{\circ}.56}{15^{\circ}.56}\text{C}$) for liquids lighter than water.....	37
TABLE 22. Specific gravities at $\frac{60^{\circ}}{60^{\circ}}\text{F}$ ($\frac{15^{\circ}.56}{15^{\circ}.56}\text{C}$) corresponding to degrees Baumé for liquids lighter than water.....	38
TABLE 23. Conversion of density basis.....	40
TABLE 24. Weight (in grams) of 1 liter of dry air at various pressures and temperatures....	41

TABLE 25. Difference between the mass and apparent weight of water when weighed in air..	41
TABLE 26. Density of water at temperatures from 0° to 102° C.....	42
TABLE 27. Density of pure water free from air from 0° to 41° C.....	43
TABLE 28. Weight of a gallon of water at various temperatures.....	44
TABLE 29. Weight of a cubic foot of water at various temperatures.....	46
TABLE 30. Apparent weight (in grams) of water in air from 15° to 30° C.....	48
TABLE 31. Temperature correction for glass volumetric apparatus.....	48
TABLE 32. Apparent weight (in grams) of water in air from 15° to 100° C.....	49
TABLE 33. Temperature correction for volumetric solutions.....	50
TABLE 34. Reduction of weighings to vacuo.....	51
TABLES 35 to 47. Tables for the calculation of the capacity of glass vessels from weight of water in air.....	52
TABLE 48. Master scale for the graduation of hydrometers to indicate percentages of ethyl alcohol by weight at 20° C.....	58
TABLE 49. Master scale for the graduation of hydrometers to indicate percentages of ethyl alcohol by volume of 60° F.....	62
INDEX.....	67

INTRODUCTION

The wide application of hydrometers as measuring instruments in the collection of revenues in commerce and in the industries makes it very important to define the various scales of indication of these instruments in terms of fundamental units.

The confusion and discordance heretofore resulting from the use of various insufficiently defined hydrometer scales, and the lack of opportunity for verifying standards on a uniform basis, led the Bureau to investigate the problems connected with hydrometry and to prepare standard density tables for definition of hydrometer scales.

In Bureau Circular No. 16 the conditions are announced under which the testing of hydrometers will be conducted, and specifications are given as to the construction, standardization, and accuracy required for hydrometers in order that they be approved as precision instruments.

The present circular comprises the density tables which have been adopted for definition of hydrometer scales, auxiliary tables which have been prepared for reduction of hydrometer readings, tables for computation of volumetric capacity, and others of similar nature giving physical constants for which the Bureau receives frequent inquiries.

In all tables found in this circular the term DENSITY is used to represent the MASS per UNIT VOLUME and is expressed in GRAMS per MILLILITER.

The term SPECIFIC GRAVITY is used to express the RELATIVE MASSES of EQUAL VOLUMES of the liquid in question and of water, EACH LIQUID being at a DEFINITELY STATED TEMPERATURE. For example, specific gravity at $\frac{60^{\circ}}{60^{\circ}}F$ means the specific gravity of the liquid at $60^{\circ} F$ referred to water at $60^{\circ} F$ as unity.

The density values in Tables 1, 2, 8, 12, 13, 26, and 27 are numerically the same as specific gravities at the various temperatures referred to water at $4^{\circ} C$ as unity.

For the sake of uniformity the same abbreviation, D, with the proper temperature basis, is used for both density and specific gravity.

S. W. STRATTON,
Director.

Approved:
WILLIAM C. REDFIELD,
Secretary.

² The density values given in this table are numerically the same as specific gravities at the various temperatures in terms of water at 4° C of unity.

^{2a} Tables 1, 2, 3, 4, 5, 6, and 7 of this circular are based on the work done at this Bureau and published in the Bulletin of the Bureau of Standards, vol. 9, No. 3. (Reprint No. 197.)

TABLE 4.—Temperature Corrections to Readings of Alcoholometers (Standard at 60° F)

[This table is calculated from the same data on the thermal expansion of ethyl alcohol as that from which Tables 1, 2, 3, 5, 6, and 7 are calculated. The hydrometer is assumed to be of Jena 16^{III} glass. For the per cents not given between 40 and 80, linear interpolation of the tabulated corrections will give results sufficiently exact for most purposes.]

TABLE 7.—Temperature Corrections to Readings of Alcoholometers (Standard at 20° C)

[This table is calculated from the same data on the thermal expansion of ethyl alcohol as that from which Tables 1, 2, 3, 4, 5, and 6 are calculated. The hydrometer is assumed to be of Jena 16^{III} glass.]

Observed Temperature in Degrees Centigrade	Observed Per Cent Alcohol by Weight

TABLE 11.—Temperature Corrections to Readings of Saccharometers (Standard at 20° C)

[This table is calculated using the data on thermal expansion of sugar solutions by Plato⁴, assuming the instrument to be of Jena 16^{III} glass. The table should be used with caution and only for approximate results when the temperature differs much from the standard temperature or from the temperature of the surrounding air]

Temperature in Degrees Centigrade	Observed Per Cent of Sugar

TABLE 19.—Degrees Baumé Corresponding to Specific Gravities at $\frac{60^{\circ}}{60^{\circ}}$ F ($\frac{15^{\circ}256}{15^{\circ}256}$ C)
for Liquids Heavier than Water

[Calculated from the formula degrees Baumé = $145 - \frac{145}{D \frac{60^{\circ}}{60^{\circ}} F}$, which defines the Baumé scale, in general use in the United States, for liquids heavier than water]

$\frac{15^{\circ}256}{15^{\circ}256}$ C	0	1	2	3	4	5	6	7	8	9	Diff.

TABLE 23.—Conversion of Density Basis

Prepared for use in reducing readings of a hydrometer graduated to indicate density or specific gravity at a specified standard temperature, T , referred to water at a specified temperature, T' , as unity, to the basis of another standard temperature, t , and reference temperature, t' .

The factor Δ (given in units of the sixth decimal place), multiplied by the density or specific-gravity reading, gives the correction to be applied to the reading to reduce it to the required basis.

Suppose a hydrometer indicates specific gravity at $\frac{20^\circ}{4^\circ}\text{C}$, and it is required to know the correction in order that it shall indicate specific gravity at $\frac{15.56}{15.56}\text{C}$, then,

$$D_{\frac{15.56}{15.56}} = D_{\frac{20}{4}} + \Delta D_{\frac{20}{4}}$$

That is, if the hydrometer indicates correctly a specific gravity of 1.5760 at $\frac{20^\circ}{4^\circ}$, then at $\frac{15.56}{15.56}$ the reading of the instrument will be too low by $1.5760 \times 0.001062 = 0.0017$. A correction of 0.0017 must therefore be added to the indication of the hydrometer.

Or, if a maker using standards indicating $D_{\frac{15.56}{15.56}}$ wishes to graduate a hydrometer to indicate density at 20°C referred to water at 4°C ($D_{\frac{20}{4}}$), the readings of the standard must be corrected by use of the factor $+0.001062$.

Suppose the standard reads 1.5760
The corresponding correction is $1.6 \times .001062 = \dots\dots\dots +0.0017$

Corrected reading 1.5777

The table is calculated for Jena 16^{III} glass.

TABLE 25.—Buoyancy Constants (mg/ml)

[Difference in milligrams between the mass and the apparent weight of 1 milliliter of water weighed with brass weights (d=8.4) in air at various temperatures and barometer readings (unreduced). A humidity of 50 per cent saturation is assumed. To find the weight of 1 milliliter of air under the conditions assumed in this table, multiply the buoyancy constant by 1.135 (42/37)]

Observed Pressure in Millimeters.	Pressure	Temperature in Degrees Centigrade			
		15	20	25	30

⁶ According to P. Chappuis, Bureau international des Poids et Mesures, Travaux et Mémoires, XIII; 1907.

TABLE 28.—Weight of 1 Gallon of Water

[This table is based on the water densities of P. Chappuis (Bureau International des Poids et Mesures, Travaux et Mémoires, XIII; 1907) for 0° to 40° C, and of M. Thiesen (Wiss. Abh. der Physikalisch-Technischen Reichsanstalt, 4, No. 1; 1904) for 41° to 100° C. The weights in air are for dry air at the same temperature as the water up to 40° C and at a (corrected) barometric pressure of 760 mm and against brass weights of 8.4 density at 0° C. Above 40° C the temperature of the air is assumed to be 20° C, i. e., the water is allowed to cool to 20° C before the weighings are made. The volumetric computations are based on the relation that 1 liter=1.000027 cubic decimeters and 1 cubic decimeter=61.023378 cubic inches. The weights corresponding to 15 $\frac{1}{2}$ ° C (60° F) and 16 $\frac{3}{8}$ ° C (62° F) have been included in the table because of the frequent use of these temperatures in engineering and industrial work.]

Temperature, °C	Weight in Vacuo		Weight in Air

TABLE 29.—Weight of 1 Cubic Foot of Water

[This table is based on the water densities of P. Chappuis (Bureau International des Poids et Mesures, Travaux et Mémoires, XIII; 1907) for 0° to 40° C, and of M. Thiesen (Wis. Abh. der Physikalisch-Technischen Reichsanstalt, 4, No. 1; 1904) for 41° to 100° C. The weights in air are for dry air at the same temperature as the water up to 40° C and at a (corrected) barometric pressure of 760 mm and against brass weights of 8.4 density at 0° C. Above 40° C the temperature of the air is assumed to be 20° C, i. e., the water is allowed to cool to 20° C before the weighings are made. The volumetric computations are based on the relation that 1 liter=1.000027 cubic decimeters and 1 cubic decimeter=61.023378 cubic inches. The weights corresponding to 15½° C (60° F) and 16½° C (62° F) have been included in the table because of the frequent use of these temperatures in engineering and industrial work.]

TABLE 30.—Apparent Weight (in grams) of Water in Air

[This table gives the apparent weight, for temperatures between 15° and 30° C, humidity 50 per cent, unreduced barometer reading 76 cm of certain volumes of water weighed with brass weights. This table is based on the data given in Tables 25 and 27, and may be conveniently employed to determine definite volumes of water for calibrating instruments. The table assumes the air to be at the same temperature as the water]

TABLE 31.—Temperature Correction for Glass Volumetric Apparatus

[This table gives the correction to be added to actual capacity (determined at certain temperatures) to give the capacity at the standard temperature, 20° C. Conversely, by subtracting the corrections from the indicated capacity of an instrument standard at 20° C the corresponding capacity at other temperatures is obtained. The table assumes for the cubical coefficient of expansion of glass 0.000025 per degree centigrade. The coefficients of expansion of glasses used for volumetric instruments vary from 0.000023 to 0.000028]

TABLE 32.—Apparent Weight (in Grams) of Water in Air

[This table gives the apparent weight of certain volumes of water weighed against brass weights in air, humidity 50 per cent, barometer reading 76 cm (unreduced), weighings being made at 20° C, the water and air being at the same temperature. It differs from Table 30 only in its greater temperature range and in the fact that the water is allowed to come to a temperature of 20° C before the weighings are made. The weighings may be made at any temperature between 18° and 22° without introducing errors greater than 1 mg per 100 cc.]

TABLE 33.—Temperature Correction for Volumetric Solutions

[This table gives the correction to various observed volumes of water, measured at the designated temperatures, to give the volume at the standard temperature, 20° C. Conversely, by subtracting the corrections from the volume desired at 20° C, the volume that must be measured out at the designated temperatures in order to give the desired volume at 20° C, will be obtained. It is assumed that the volumes are measured in glass apparatus having a coefficient of cubical expansion of 0.000025 per degree centigrade. The table is applicable to dilute aqueous solutions having the same coefficient of expansion as water]

Temp. of measurement, °C	Capacity of apparatus in milliliters at 20° C						
	2000	1000	500	400	300	250	150
	Correction in milliliters to give volume of water at 20° C						
15	+1.54	+0.77	+0.38	+0.31	+0.23	+0.19	+0.12
16	+1.28	+0.64	+0.32	+0.26	+0.19	+0.16	+0.10
17	+0.99	+0.50	+0.25	+0.20	+0.15	+0.12	+0.07

27	-3.03	-1.52	-0.76	-0.61	-0.46	-0.38	-0.23
28	-3.55	-1.77	-0.89	-0.71	-0.53	-0.44	-0.27
29	-4.08	-2.04	-1.02	-0.82	-0.61	-0.51	-0.31
30	-4.62	-2.31	-1.16	-0.92	-0.69	-0.58	-0.35

In using the above table to correct the volume of certain standard solutions to 20° C more accurate results will be obtained if the numerical values of the corrections are increased by the percentages given below:

Solution	Normality		
	N	N/2	N/10
HNO ₃	50	25	6
H ₂ SO ₄	45	25	5
NaOH	40	25	5
KOH	40	20	4

The weight of a body in vacuo is determined by adding to its apparent weight in air a buoyancy correction equal to the weight of the air displaced by the difference in volume of the body weighed and the weights required to balance it on an equal arm balance.

$$M = W + \rho \left(\frac{M}{d_1} - \frac{W}{d_2} \right) = W \frac{d_1}{d_2} \left(\frac{d_2 - \rho}{d_1 - \rho} \right) = W \frac{d_1}{d_1 - \rho} \left(1 - \frac{\rho}{d_2} \right) =$$

$$W \left[1 + \frac{\rho (d_2 - d_1)}{d_2 (d_1 - \rho)} \right] = W + kW / 1000$$

M = weight in vacuo; W = apparent weight in air; ρ = density of air; d_1 = density of body; d_2 = density of weights.

The following table has been computed for $\rho = 0.0012$:

**TABLES OF CORRECTIONS FOR DETERMINING THE TRUE CAPACITIES OF GLASS
VESSELS FROM THE WEIGHT OF WATER IN AIR**

Tables 35 to 47 are intended for the calculation of capacities of glass vessels of common sizes from the weight (in air) of the water contained or delivered. They give for each nominal capacity and observed temperature the amounts to be added to the apparent weight (in air against brass weights) of the water contained in or delivered by a glass vessel to give the capacity in milliliters at 20° C. They are calculated on the following data assumed as approximating ordinary conditions:

Observed barometric pressure..... 76 cm
 Relative humidity..... 50 per cent
 Coefficient of expansion of glass..... 0.000025 per deg. C

EXAMPLE OF USE OF TABLE.

Determination of capacity of glass measuring flask marked "To contain 250 ml at 20° C."

Apparent weight of water at the observed temperature 22.3 C..... 249.198g
 From Table 35, correction..... 0.813

Actual capacity at 20°..... 250.011 ml

TABLE 35.—Indicated Capacity 250 ml

MASTER SCALES FOR THE GRADUATION OF HYDROMETERS

The accompanying tables were prepared for the use of hydrometer makers in the graduation of hydrometer scales to indicate percentages of ethyl alcohol by weight at 20° C or by volume at 60° F, and they give the proportional length of any part of the hydrometer scale, assuming that the entire scale has a length of 1000 mm⁹ and that the hydrometer stem is of uniform cross section. For example, if it is required to construct a hydrometer scale having a certain range the spacing of the graduations of the scale should be made proportional to the differences of the lengths shown in the table for that range.

These tables were prepared from the alcoholometric tables published in this circular, (Tables 2 and 3). The original work on which the tables are based is described in detail in the Bulletin of the Bureau of Standards, Vol. 9, p. 328 (Reprint No. 197). The indications of hydrometers graduated in accordance with these master scales will be on the basis officially adopted by the Bureau of Standards. Hydrometers may also be graduated to indicate percentages of "proof spirit," according to the official tables of the United States Bureau of Internal Revenue (adopted 1913), by the use of the accompanying master scale intended for the graduation of hydrometers to indicate percentages of alcohol by volume at 60° F. The percentage of proof spirit is in every case twice the percentage of alcohol by volume. For example, 25 per cent alcohol by volume is equivalent to 50 per cent proof spirit; 50 per cent alcohol by volume is equivalent to 100 per cent proof spirit. The spacing of the graduations for proof spirit hydrometers can therefore be taken directly from Table 49, the per cent alcohol by volume being multiplied by 2 in each case to give the equivalent per cent proof spirit.

⁹Any other convenient unit may be employed; the tabulated lengths will then be in that unit.

TABLE 48.—Master Scale for the Graduation of Hydrometers to Indicate Percentages of Ethyl Alcohol by Weight at 20° C
