place to get them from," rejoined Lord Melbourne, rubbing his hands and laughing.*

As the conversation proceeded, the gentleman, in a semi-serious tone, or in the proud consciousness of latent power which he afterwards expressed on a memorable occasion in the House of Commons, said that what he looked forward to was the premiership. "And I wish you may get it," quietly observed Lord Melbourne. This is the sole foundation of the dialogue which Mr. Torrens reports in such detail.

His account of the action "Norton against Lord Melbourne" is correct in the main, and we may as well dispose of it at once. The trial took place on the 22d of June, 1836.

The witnesses were chiefly discarded servants, nearly all of damaged character,† who had been, for a considerable time before, kept out of the way at the country-seat of Lord Grantley, and none of whom professed to be able to swear to any circumstances within the three preceding years. At the close of the plaintiff's case, late in the day, the attorney-general asked for an adjournment; but on an intimation from the jury, in which the judge also concurred, he waived the suggestion, and without calling witnesses proceeded to analyze the evidence that had been adduced. He branded the whole story as a tissue of fabrications which it was impossible men of discernment and impartiality could believe; and though his client was inadmissible as a witness, he was authorized to state upon the honor of a peer that the charge was entirely false. The judge left the issue fairly to the jury, who, without leaving the box, returned a verdict of acquittal. A loud cheer broke forth at the announcement, which was echoed by the crowd waiting without the court. At an audience next day William IV. cordially congratulated the minister on having baffled the machinations which, he did not doubt, had had their origin in sinister aims fomented by the meaner animosities of party.

Still the evidence, such as it was, remained uncontradicted, and left on many minds an unfavorable impression, which would have been obviated by full knowledge. It was therefore most unlucky that the trial was not adjourned, and that witnesses were not called for the defence; for on collating dates, it appeared that, during the entire period (two months) of the year specified by the servants, Mrs. Norton was suffering from a dangerous confinement, and saw no one but her medical attendants and her family.

According to the received code of honor, when a lady's reputation is concerned, a gentleman is bound to act like the loyal servant who (in 1716), when twitted with having sworn falsely to save Stirling of Keir's life, said he would rather trust his soul with God than his master's life with the Whigs. Lord Melbourne's solemn denial might not go for much, if he had not twice volunteered to reiterate it. Wilde (afterwards Lord Truro) was known to dislike undertaking a bad case, either from love of justice or haply because he disliked being beaten. When therefore he refused a brief for the defence — really because he had refused a retainer on the other side and intended not to act at all — Lord Melbourne, misunderstanding the motive, sent a message pledging his honor that justice and right were on his side.

Some years afterwards, when the Custody of Infants Act had been passed, Mrs. Norton resolved on applying to the Court of Chancery for her children, and it was understood that the application would be resisted on the grounds of moral unfitness. At all events, it was necessary to come prepared with affidavits negativing the imputation of infidelity; and one day a friend of hers engaged in getting up the case, received a message from Lord Melbourne, with whom he was personally acquainted, requesting him to call the next morning early. Calling between ten and eleven, he found Lord Melbourne in his dressing-gown and slippers in the act of shaving. "So," was the abrupt address, "you are going to revive that business. It's confoundedly disagreeable." "You know, my lord, that Mrs. Norton can't live without her children." "Well, well, if it must be done, it must be done effectively. You must have an affidavit from me. The story about me was all a d—d lie, as you know. Put that into proper form, and I'll swear it."

The circumstances under which Lord Melbourne became premier in July, 1834, and was summarily ejected in the following November, although already made tiresome by repetition, could not well be omitted or glossed over in this biography; but we are utterly at a loss to know why twenty pages are filled with the contest for the speaker-

* Hayward's "Essays." First Series. Vol. i., p. 261.

† Fielding says of one of his characters that, "not knowing what to say, she followed her instinct as chambermaid and lied." This instinct was strongly manifested by two of the female witnesses, who swore that Mrs. Norton was in the habit of rouging; that she always put on rouge when Lord Melbourne was expected, and renewed it after he had gone away. One of the jury, who was acquainted with Mrs. Norton, told the writer that he needed nothing more to convince him that they were lying, lying spitefully and in concert.

ship in 1835 — unless for the purpose of proving that Mr. Spring-Rice (afterwards Lord Monteagle) was aggrieved by being set aside, and was a much more important person than (after he had held high office) he was commonly considered by his contemporaries. But it is one of Mr. Torrens's weaknesses — an amiable one — to go out of his way to do justice, or more than justice, to his personal friends; and a letter from Lord Macaulay (from India, August 11, 1834) to Mr. Spring-Rice is introduced apparently for the sole purpose of elevating that gentleman: —

What shall I find you when I come back? Whatever you choose, that is my firm opinion. The game is in your own hands, and if you are not prime minister, or very near it, when I return — which will be, I hope, before the end of 1839 — I shall say that you have played the game ill.

. . . .

But Stanley's opinions are aristocratical, and his manners unpopular. Lord Althorp's talents are not eminent; and either of them may any day be translated to the House of Lords. I see no man among the Whigs so well qualified as yourself, by talents for business and talents for debate combined, to lead the House of Commons — or, in other words, to rule the empire. Stick to the *Centre Gauche*. Gain their confidence, and you may do what you please. *This is the game that I would have tried, if I had remained in England.* It is a game which you can play, and which nobody *now* in the House of Commons can play but yourself.

We cannot say that this letter lessens our distrust of Lord Macaulay's judgment or brings us over to his estimate of his friend, who was a clever, bustling, thoroughgoing politician, and an amiable man, but not the metal of which prime ministers are made.

The chief difficulties which Lord Melbourne had to encounter on his resumption of the premiership in April, 1835, were occasioned by Lord Brougham, who laid claim to the lord-chancellorship; and O'Connell, who had been led to expect the Irish attorney-generalship. O'Connell bore his disappointment like a man of sense, and supported the government as before. Brougham, after a short interval of suppressed irritation, broke out in a succession of intemperate sarcasms and diatribes against them. It was in reply to a brilliant display of this kind that Lord Melbourne rose and said: —

My lords, your lordships have heard the powerful speech of the noble and learned lord, one of the most powerful ever delivered in this House, and I leave your lordships to consider what *must* be the nature and strength of the objections which prevent any government from availing themselves of the services of such a man.

This is one of the most crushing replies in the annals of debate, turning the adversary's own admitted powers against him, leaving him in the position of the struck eagle, who

View'd his own feather on the fatal dart,
And wing'd the shaft that quivered in his heart.

A graphic description of Lord Melbourne in the House of Lords is given by Haydon: —

In the Irish Church debate the duke spoke well, without hesitation, enforcing what he said with a bend of his head, striking his hand forcibly and as if convinced on the papers. He finished, and to my utter astonishment, up starts Melbourne like an artillery rocket. He began in a fury. His language flowed out like fire; he made such palpable hits that he floored the duke as if he had shot him. But the moment the stimulus was over, his habitual apathy got ahead; he stammered, hummed, and hawed. It was the most pictorial exhibition of the night. He waved his white hand with the natural grace of Talma, expanded his broad chest, looked right at his adversary like a handsome lion, and grappled him with the grace of Paris.

On one occasion, exasperated by an unexpected move in party tactics by Lord Lyndhurst, he was provoked into saying: "The noble Duke (of Wellington) would not have taken such a course, but *he* is a gentleman." Lord Lyndhurst sprang to his feet: "Does the noble viscount mean to say that I am not a gentleman?" The offensive expression was instantly and handsomely withdrawn.

The years of Lord Melbourne's life to which he always looked back with unmitigated satisfaction, to which the biographer might point as the brightest illustration of his career, are those which intervened between the accession and the marriage of the queen. If, as is universally agreed, no monarch, male or female, ever better understood or more conscientiously fulfilled the highest duties of a constitutional sovereign, all honor to the sagacious, high-minded counsellor who watched over her with parental care whilst those duties were new, and devoted his best energies to guide and confirm the inborn rectitude of purpose and elevation of character, by which the prosperity of a great empire and the well-being of millions have been nobly upheld. It would be difficult to name a

more impressive scene than that of the elderly statesman reading to the young and inexperienced sovereign the verses in which Solomon, asked by God in a dream what he wished to be given him, replies: —

7 And now, O Lord, my God, thou hast made thy servant king instead of David my father: and I am but a little child: I know not how to go out or come in.

8 And thy servant is in the midst of thy people which thou hast chosen, a great people, that cannot be numbered nor counted for multitude.

9 Give therefore thy servant an understanding heart to judge thy people, that I may discern between good and bad: for who is able to judge this thy so great a people? *

On its being invidiously remarked to the Duke of Wellington that Lord Melbourne was a great deal at the palace, the duke sharply replied: "I wish he was always there." On August 24, 1841, the duke gave his public testimony to this effect in the House of Lords: —

"I am willing to admit that the noble viscount has rendered the greatest possible service to her Majesty. I happen to know that it is her Majesty's opinion that the noble viscount has rendered her Majesty the greatest possible service, making her acquainted with the mode and policy of the government of this country, initiating her into the laws and spirit of the constitution, independently of the performance of his duty as the servant of her Majesty's crown; teaching her, in short, to preside over the destinies of this great country."

In his later years Lord Melbourne had doubts whether he had given the proper advice to her Majesty on the occasion of what was called the "bedchamber question," in 1839. He admitted that he was unduly biassed by an unwillingness to blight the prospects of his followers: "I counted up more than two hundred of my intimate acquaintance, or their families, who would be half ruined and heartbroken by my going out." In reference to this affair, he said: "You should take care to give people who are cross time to come round. Peel's fault in that business, when he failed to form a government, was not giving the queen time to come round."

Amongst the most curious of the scattered notices of Lord Melbourne, which Mr. Torrens has culled from various sources, are some passages from the "Memoirs of Haydon," to whom he sat for his portrait in 1832. The artist speaks of him as having a fine head, and looking refined and handsome. Finding him free and easy, Haydon turned the conversation on one of his own favorite projects: —

With regard to art, he was afraid history would never have the patronage which portraiture obtained. Haydon said the government alone could do it. The minister ejaculated, "How?" "First by a committee of the House, then by vote." Melbourne was afraid selections might be invidious. The painter rejoined that the selected would be more likely to be envied than otherwise. He asked, had not sculptors had every opportunity, and had they generally done as well as they ought? Haydon replied "that they had not. But it was no argument, because one class of artists had acted as manufacturers that others must do so too." Melbourne, "Then we shall see what a popular Parliament will do. If Hume is not against it your scheme may be feasible."

The scheme has been tried, but without the anticipated result of creating a demand for historical pieces, which, for obvious reasons, can never be equally in request with portraits. Calling one morning, in January 1835, Haydon found Lord Melbourne reading the *Edinburgh Review*.

He began instantly, "Why, here are a set of fellows who want public money for scientific purposes, as well as you for painting; they are a set of ragamuffins!" "That's the way," said I; "nobody has any right to public money but those who are brought up to politics. Are not painting and science as much matter of public benefit as political jobbing? You never look upon us as equals; but any scamp who trades in politics is looked on as a companion for my lord." "That is not true," said he. "I say it is," said I; and then he roared with laughter and rubbed his hands.

Calling again on the 1st of March, he found Lord Melbourne reading the Acts, in a quarto Greek Testament that had belonged to Johnson, given him by Lady Spencer.

"Is not the world, Lord Melbourne, an evidence of perpetual struggle to remedy a defect?" "Certainly," he mused out. "If, as Milton says, we were sufficient to have stood, why did we fall?" Lord Melbourne rose bolt up, and replied, "Ah, that's touching on all our apprehensions." We then swerved to art.

Controversial divinity and ecclesiastical history were his favorite studies. He astonished M. Van de Weyer by his familiarity with the history of the Gallican Church, and its resistance to papal usurpation in 1682, when Bossuet played so prominent a part. He had no predilection for science, and there is a current story that, on being pressed to give Faraday a

pension, he parried the application by pretending to mistake him for an astron omer.

Asking how it was that Raphael was employed to decorate the Vatican, he was reminded that Raphael was a great painter. "But was not his uncle, Bramante, architect to the pope? It was a job." *

His dislike of humbug, pretension, and the affectation of knowledge, occasionally led him into the opposite extreme, and gave plausibility to the good-humored raillery of Sydney Smith: —

"Our viscount is somewhat of an impostor. Instead of being the ignorant man he pretends to be, before he meets the deputation of tallow-chandlers in the morning, he sits up half the night talking with Thomas Young about melting and skimming, and then, although he has acquired knowledge enough to work off a whole vat of prime Leicestershire tallow, he pretends next morning not to know the difference between a dip and a mould. I moreover believe him to be conscientiously alive to the good or evil that he is doing, and that his caution has more than once arrested the gigantic projects of the Lycurgus of the Lower House (Lord John Russell). I am sorry to hurt any man's feelings and to brush away the magnificent fabric of levity and gaiety he has reared; but I accuse our minister of honesty and diligence."

What Johnson said of Thurlow was equally true of Lord Melbourne: "Sir, he is a fine fellow: he fairly puts his mind to yours." But if you had no mind to put or be put to, the sooner you got out of his way the better. He had been induced to ask a literary man of note to one of his small dinner-parties by hearing that he was well versed in Massinger and Marlowe, with whom the gentleman had only a superficial acquaintance, but was ashamed to own it. "There now," was Lord Melbourne's comment, "that fellow has been trying for half an hour to make me believe he knows a great deal of what he knows nothing. We won't have *him* again."

On the breaking up of a Cabinet dinner at his house in South Street, at which the first step towards free-trade in corn, the substitution of a fixed duty for the sliding scale, had been settled, he called out from the top of the staircase to the retiring guests: "Stop a minute; let's all be of one mind. Is it to lower the price of bread, or isn't it?" a point on which the political economists were then far from unanimous. Hardly a year before, he had declared in the House of Lords that any minister who tampered with the corn laws must be mad.

Mr. Torrens conveys the impression that the spirited policy of England in the Syrian question was entirely owing to Lord Palmerston. This was not so. When Thiers (October 1840) announced an intention to call out an extraordinary conscription of one hundred and fifty thousand men, Lord Melbourne wrote to the king of the Belgians to this effect: "Thiers' announcement is a threat. By G—d! I won't stand it. If this goes on, I will immediately call Parliament together, and see what they think of it." This letter was passed on to the king of the French, and the Thiers ministry came to a speedy end.*

His patronage caused him an infinity of trouble and anxiety, because he was unfeignedly anxious to distribute it with an exclusive reference to merit and the public good. We find him in 1837 complaining of an epidemic amongst deans and judges; and "as for the bishops, it was his positive belief that they died to plague him." The judicial appointment most questioned was that of Baron Maule. His caustic wit had been freely exercised at the expense of his predecessors on the bench, who protested against him as a colleague; and attention had been called to his habits by the fire at the temple, which began in his chambers. But he had every qualification for a judge, except morals, which were a minor consideration from the premier's point of view. On Maule's name being mentioned at a dinner party some time after the appointment, a celebrated beauty (not a Sheridan) looked up and asked with a lisp: "Pray, Lord Melbourne, is that the man you made a judge *for* burning down *the Tower?*" A part of the Tower had recently been burned down.

He was less scrupulous about blue ribbons, regarding them merely as means of rewarding or conciliating support, and careful only to avoid wounding vanity and self-love. He declined taking the garter, saying that he did not want to bribe himself. There was a well-known reply of his to an earl soliciting a marquisate, beginning: "My dear ——, how can you be such a d—d fool?" Referring to it when it got abroad, he said that he could understand people being anxious for peerages, but not their caring so much about the grade; and he acted up to his principle by refusing an earldom. When a list of would-be baronets was laid before him, he exclaimed:

* Life of Reynolds, p. 308, note.

* *Ex relatione* Lord Palmerston, June, 1865.

'I did not know anybody cared any longer about these sorts of things. Now I have a hold on the fools."

It is unnecessary to dwell on the defeat of his ministry, and his resignation, August 28, 1841. From her Majesty's journal it appears that he betrayed no depression or chagrin: "For four years," he said, "I have seen you every day; but it is so different now to what it would have been in 1839: the prince understands everything so well."

During the closing years of his life, he retained a keen relish for intellectual intercourse; and at the little dinners in South Street and Bolton Street, the fulness, richness, and piquancy of his conversation were as remarkable as ever. He preferred bold, ready talkers when they had anything in them; and defended a lady who was thought too bold and positive, by saying: "That's what I like her for: she speaks out." On being told that George Smythe (Lord Strangford) wished to be introduced to him, he exclaimed, with evident satisfaction: "What! do these young fellows want to know *me*? Bring him to dinner by all means."

These young fellows did want to know him. It was a valued, envied privilege to be admitted to his companionship. It was he who, with failing health, gradually withdrew from the world, not the world that withdrew from him. It was therefore with wondering incredulity that we came upon these passages of the biography: —

Throughout his long and chequered life Melbourne had had his sorrows and his troubles. But the greatest of his trials was to come, in the sense of being neglected. Too susceptible not to feel, and too proud to masquerade in gay looks when his soul was sad within him, he chafed daily at the indifference with which he was treated, not merely by the common herd of fashion, but by those who for years had compassed him round with blandishments of what he had taken for respect and attachment. For a time he tried to persuade himself that the numerous omissions to call were partly accidental. Some were sick, and some had gone abroad; some were time-servers and shabby dogs who had learned to trim, and were ashamed to look in the face their old patron: was he not better without them? But as weeks and months rolled on, and the bed of the once full stream of attention grew more and more dry, the hope of its ever returning again shrank within him.

. . . .

One who truly and unalterably loved him found him in the afternoon looking more than usually dejected. "I am glad," he exclaimed, "you are come. I have sat here watching that timepiece, and heard it strike four times without seeing the face of a human being; and had it struck the fifth I feel that I could not have borne it."

He had only to say the word, and troops of admiring friends and affectionate relatives would have gathered round him. If Lady Palmerston had lived to be told that her idolized brother was abandoned or neglected when she was at the height of her social distinction and popularity! No doubt he had his moments of despondency, when it was painful to be alone. What highly gifted man or woman has not? —

Dearly bought the hidden treasure
Finer feelings can bestow —
Hearts that vibrate sweetest pleasure
Thrill the deepest notes of woe.

But far from complaining of neglect and ingratitude, he has been heard to declare more than once that his long tenure of office had made him think better of mankind. Pitt, according to Wilberforce, had arrived at the same conclusion.

Lord Melbourne particularly prided himself on the part he had taken during the Reform Bill agitation in preserving order. Great, therefore, were his mortification and surprise when, at the trial of Smith O'Brien in 1848, a letter from Young to Sir William Napier was produced, dated Home Office, June 25th, 1832, sealed with the official seal, and containing these words: —

Are you aware that, in the event of a fight, you were to be invited to take the command at Birmingham? Parkes got a frank from me for you with that view, but had no occasion to send it.

The vexation caused by this incident certainly aggravated Lord Melbourne's last illness. He died on the 24th November, 1848.

Differing on many points from Mr. Torrens, we recognize in him a man of undoubted ability, earnestly intent on raising an appropriate monument to one whom he esteems and admires. But we must say that he has an odd way of setting about it. He is always blowing hot or cold: there is no average temperature in his praise or dispraise. He leaves the impression that he never fairly thought out the character he has undertaken to delineate. Lord Melbourne may have been strong-minded or weak-minded, of a cheerful and hopeful, or a desponding and querulous disposition, but he could not have been all at once.

Even as regards his qualities of statesmanship, the biographer seems unable to come to a definite conclusion.

In his preface he says that the early impression made on him by Lord Melbourne "has not been effaced by any combination of high qualities in the statesmen he has subsequently known;" and he must have known all Lord Melbourne's successors in the premiership. Yet in the body of the work (vol. ii., p. 98) we read: —

It would be idle to claim for Melbourne the strength of will, the originality of resource, the knowledge of detail, or the unfailing eloquence, which in varying degrees characterized *most* of his predecessors and successors in the civil primacy. But he had a quality which they lacked, and which, at the juncture in question, tended in no small degree to bring about the unanimity wherewith it was agreed to have him a second time for chief of the party. He had no enmities and no enemies.

Dating from the fall of Walpole, he had twenty predecessors in the "civil primacy," and fourteen of them were: Pelham, Devonshire, Newcastle, Bute, George Grenville, Rockingham, Grafton, Shelburne, Addington, Portland, Perceval, Liverpool, Goderich, Wellington. Will Mr. Torrens, after reading this list, reiterate his assertion that Lord Melbourne was inferior in essential qualities to most of his predecessors in the civil primacy? Or, if he does reiterate it, how is he to maintain the honored subject of his biography in the proud position he has elsewhere claimed for him? But then the man who ended (we are told) by having no friends, had no enmities and no enemies. Is this a matter of congratulation or laudation? We incline to think with Sir Oliver Surface that it is not: —

Sir Oliver. Everybody speaks well of him [Joseph]! Pshaw! Then he has bowed as low to knaves and fools as to the honest dignity of genius and virtue.

Sir Peter. What, Sir Oliver! Do you blame him for not making enemies?

Sir Oliver. Yes, if he has merit enough to deserve them.

Lord Melbourne had merit enough to deserve both friends and enemies, merit enough to throw any co-existing demerit into the shade, merit enough to give him permanent rank as a high-bred, high-minded, highly cultivated, thoroughly English statesman of whom the contemporary and every succeeding generation of Englishmen may feel proud.

ERICA.*

TRANSLATED FOR THE LIVING AGE FROM THE GERMAN OF

FRAU VON INGERSLEBEN.

XXII.

OLD AND NEW ACQUAINTANCES.

It was a very pleasant surprise to Erica to find in Dorneck not only a Catholic, but an Evangelical church.

Although the latter are rare on the Rhine, since by far the larger majority of the population is Catholic, this little church had been built and endowed by Count Rodenwald's father, so Erica once more had a parsonage where she could make herself at home, and she soon earnestly requested permission to go there.

Fritz, who during his stay at his father's house daily received lessons from the pastor, instantly offered to accompany her. The parsonage stood at the end of the village, and in order to reach it they were obliged to pass through the principal street, which strongly resembled that of a city. Bakers', butchers', shopkeepers', and even lawyers' signs appeared, and now and then a villa, surrounded by gardens, which was occupied in summer by some family residing in the neighboring city. The pastor's little front garden, with its gillyflowers and mignonette, seemed to Erica like an old acquaintance, and the vine-covered house reminded her of the dwelling of her foster-parents.

The door stood open, and as no one was to be seen in the entry, Fritz unceremoniously walked into the sitting-room, where a young man sat at a table bending over a book, in which he was so completely absorbed that he did not hear the stranger's entrance.

"Tear yourself from your studies a moment, most revered Herr Reinhardt," cried Fritz, "and condescend to show us the way to the mistress of the house."

The young man hastily looked up, but instead of rising remained motionless, staring at the new comers.

"Fräulein Erica, you here!" he stammered at last, while his whole face crimsoned with surprise or pleasure. "How could I hope to see you here?" he added a little more calmly, approaching her.

Erica cordially held out her hand and answered laughing,—

"I think, Herr Reinhardt, you might have been more prepared for the meeting than I. Did you not hear I was expected?"

"Not a syllable, or how could I have neglected to come to the castle?"

"Well, mountains and valleys don't meet, but old friends do!" cried Fritz. "So you know Herr Reinhardt, Erica? I suppose he was careless enough to trust himself to the waves of the Baltic."

"He is my foster-father's nephew, and often came to Waldbad."

"This is a capital coincidence, but it doesn't absolve Herr Reinhardt from the duty of taking us to the lady of the house."

The young man, who seemed to have been rendered mute by his delight, bowed and led the way to the garden, where the pastor's wife was weeding her vegetables.

She received the visitors with great cordiality, and as a little flock of children appeared, with whom Erica instantly made friends, she left the parsonage with a feeling of great satisfaction, and in reply to her hostess's kind invitation promised a speedy repetition of the visit.

"Tell me, Erica," said Fritz on the way home, "was that Herr Reinhardt the originator of 'heather blossom'?"

Erica's brown eyes glanced mischievously at her cousin.

"How wise you are, Fritz!" she said, in a tone that harmonized admirably with the glance. "You see through every secret. One must be on one's guard against you."

The conversation was interrupted by the loud rattling of a carriage which rolled rapidly up the street. The occupants were Herr von Sonnenstein and another gentleman, who were engaged in such an eager conversation that they did not notice the pedestrians. Erica had scarcely cast a glance at the vehicle, when she started violently and turned so pale that Fritz looked at her anxiously.

"What is it, Erica, another acquaintance?" he asked, trying to assume a jesting tone. Erica did not answer immediately, she needed time to collect her thoughts. "I hope," she said at last, without replying to the question, "that those gentlemen are not going to call at Dorneck."

"To be sure they are. There is a great attraction there for Sonnenstein. Look, the carriage is just turning towards the castle."

"And Wehlen? Is he an acquaintance too. Does he often come here?"

"Wehlen? I have never heard the name. Sonnenstein is probably bringing him to our house for the first time. But what is the matter with this Wehlen. Why does he frighten you so?"

Erica again paused a few moments before she answered. She was considering how far she might be justified in expressing her perhaps unfounded suspicions.

"Herr von Wehlen does not like me," she said at last evasively, "and has shown his aversion so decidedly that I am afraid of him."

She seemed to wish to prove the truth of her words by her actions, for she became absent-minded and grave, and they completed the walk to the castle in almost total silence. On reaching home Erica went directly to her own room, and did not join the family for a long time.

The two gentlemen already mentioned happened to be the only visitors, and Fritz was greatly surprised to hear Sonnenstein's companion addressed as Herr von Ramsdorff. Erica must certainly have been mistaken, and yet it did not seem so, for Fritz saw a dark shadow flit over the stranger's countenance at the young girl's entrance. But he instantly regained his composure, and, advancing towards her, greeted her as an old acquaintance. Erica was so confused, and showed so little ease of manner, that her cousin came to her assistance and engaged the stranger in an animated conversation. When the name of Ramsdorff was mentioned, Wehlen turned to Erica — whose astonishment was plainly mirrored in her features — and said, laughing,—

"You are doubtless surprised to see your old acquaintance Wehlen transformed into a Herr Ramsdorff, but the matter is very simple after all. My name is Ramsdorff-Wehlen, and as an old aunt Ramsdorff has distinctly intimated an intention of making me her heir, I can well consent to please her by dropping the Wehlen and thus emphasizing the Ramsdorff."

The story sounded very natural and plausible, yet Erica did not believe it. This change of name was another justification of her fears that Wehlen had entered the family circle for some evil purpose.

He seemed to be on very intimate terms with Herr von Sonnenstein, for the latter resisted even the magic of Olga's presence to take a walk in the park with him. Wehlen put his arm in his companion's, and when they had left the rest of the party a little behind, began an eager conversation.

"To be frank, my dear baron, I must unfortunately acknowledge that you have less prospect of success than, judging

Digitized by CORNELL UNIVERSITY Original from CORNELL UNIVERSITY

from your circumstances and personal attractions, I thought possible. My task will be far more difficult than I supposed."

Sonnenstein looked anxiously into his companion's face.

"But you don't despair. You freely offered me your assistance before I ventured to request it, and ——"

"Have no fear, baron. I am in the habit of keeping my word under all impediments, only we must drop the original plan, and enter upon the business rather more energetically. I will hire one of these pretty villas and remain in Dorneck during the summer, in order to be constantly on the watch, and shape my course according to circumstances."

"You are really too kind, I am most sincerely grateful."

"Oh! it gives me pleasure to be able to do any one a favor," replied Wehlen laughing, "but there is one delicate point about the matter. My rich aunt unfortunately is not yet ready to die, and as I am poor ——"

"Of course my purse is at your disposal, since you are incurring all these expenses for me."

"That is the only consideration which can induce me to accept your offer. We must now direct our attention to the papa, for he evidently favors the rival in a most incomprehensible manner."

"Too true!" replied Sonnenstein dejectedly.

"And how are we to get hold of the old gentleman?"

Sonnenstein looked at his companion in astonishment. "I really don't know," he answered frankly.

Wehlen's lips curled. "I believe I do," he whispered. "But see, baron," he continued, raising his voice, "there are the ladies, so I suppose I must give up the pleasure of your society. Obedient as a trained poodle," he muttered between his teeth, gazing after his companion's retreating figure with a look of bitter scorn. "A rich simpleton and an old gentleman who is fond of pleasure. I think the affair will do. The presence of this little demon is disagreeable, to be sure. Who would have expected her appearance here? However, the serpent's gaze lures birds, why should my eyes be powerless to affect this awkward little girl? Besides, the point in question does not concern children, but very different affairs."

A few days after the visit which had so greatly agitated Erica, the long-expected arrival of old Countess Ingolstein set the whole household in a state of confusion, and completely changed the daily routine of life.

True, the old lady's appearance by no means justified this general excitement; her corpulence, small stature, and red face were anything but imposing, nay, on the contrary, extremely commonplace. Her manner, even, had a slight touch of that ease which persons of strong character readily take as a token of good-nature, and Erica could therefore scarcely understand why Count Rodenwald had spoken of this visitor with such a resigned expression.

But she was again destined to learn that, at first sight, things often look very differently from what they appear on closer examination. It was not long before she sighed over the constraint and weariness this visit imposed upon her, and there was probably not a single member of the family who would not have sympathized with her in this respect.

The good old lady herself neither intended to impose any such constraint, nor in her unsuspiciousness had the slightest idea of the possibility of such a thing.

Having always lived in the narrow circle of a home, similar to the one in which Sidonie had spent her childhood, she was as ignorant in regard to the world at large as the young girl herself had been. She was therefore always forced to judge everything by her own standard, and as she was treated with the greatest consideration, this, without her knowledge or desire, caused annoyance wherever she went.

The seclusion in which she lived had not only left her a child in regard to the views of the outside world, but also given her a wonderful freshness and capability of enjoying various amusements, which proved a source of inconvenience to those who could not fully share her feelings. This caused the singular spectacle of an exchange of characters, and the young people, out of consideration for the old lady, were compelled to enter into pleasures which they usually regarded as things of the past. The old countess's innocent delight did not always afford a sufficient compensation for this constraint, and when a poor play was attended, a commonplace concert heard, or pictures of very mediocre merit admired, the members of the family not compelled to form part of the escort were always envied.

Moreover, the countess, who usually led such a lonely life at her castle, was very fond of large parties, and wanted to be continually in young people's society.

The daughters of the house, who usually spent the morning in their own rooms and did not join the family circle until the afternoon, were therefore now obliged to assemble in the drawing-room directly after breakfast, and only separated to dress for dinner. Erica, who did not find the above-mentioned entertainments tiresome, because she herself had never before enjoyed them, was doubly wearied by these long forenoons.

The conversation usually turned upon subjects which she did not understand, and were utterly uninteresting. The old lady, whose family was large and possessed numerous branches, could make it her theme for hours, nay, she often revelled in family histories the whole forenoon. The countess, whose extensive circle of acquaintances embraced most of the persons who figured in these stories, felt an interest in them, which she politely magnified, and Sidonie, who was nearly related or acquainted with all, felt glad to hear the latest news of them, and thus constantly induced the old lady to go on. The intrusive existence of these unknown Egons, Walters, Maries, and Malvinas, became the most horrible torture to Erica, and though she listened sympathizingly to a long story about the illness of a Clara whom she had never seen, the detailed account of an unknown Eginhard's opinions, which were a matter of indifference to her, soon drove her to desperation.

She now made the acquaintance of that "*Almanach de Gotha*," which Werner had mentioned so bitterly, and whose very existence she had hitherto not suspected, and saw such interest displayed in this unknown book, such importance attributed to its contents, that she began to feel a little ashamed of her ignorance. A forenoon rarely passed without the guest's reading a few extracts from the "*Gotha*," as she called it, to shorten the title.

Familiar as the old lady was with all the families of the nobility, she could not oppose the "*Gotha*," and humbly bowed to its authority.

One morning, when Erica was bending over her sewing without taking the slightest interest in the conversation, a remark from Sidonie suddenly fell upon her like a thunderbolt.

"He looks like my cousin Elmar Altenborn," she heard the latter say.

"Do you call Elmar your cousin, Sidonie?" replied the old countess. "You are scarcely entitled to do so; his father was not related to you, and his second wife, I think, still less so."

"True, poor Elmar is only noble on one side of the house, but from a child I have always liked him so much better than Katharina, that I am glad to call him cousin. It is incomprehensible how, under the circumstances, Elmar can be so far superior to his sister in every respect."

"Nature sometimes plays strange pranks," said the old lady pathetically. "Besides the pure blood of the ancient Reich-baronial family may well gloss over the mother's. Elmar's grandmother is a Countess Geissenheim — whose sister was reigning Duchess of Rudolphingen — and, as you know, my own cousin."

Little taste as Erica had hitherto shown for genealogy, she now began to feel an interest in it, and was sorry when the conversation turned upon other subjects. While strolling about in the park with Fritz that afternoon, she asked suddenly,—

"Fritz, am I in the '*Gotha*' too?"

Fritz laughingly shook his head.

"Why, I am a Baroness von Hohenstädt!" said Erica angrily, with a defiant toss of her little head.

Fritz laughed still more heartily. "You make claims to a place in the '*Gotha*,' you simple little Pomeranian girl! That *is* rich. Why, I myself am only mentioned in an appendix to the book."

"And why am I not in it?"

"Because, aside from all other considerations, you belong to a barbarous people, who fraudulently deck themselves out in the names of some of the Germans who have wandered to their country."

"What, Fritz? Do you mean to say that we Pomeranians are not Germans?"

"Your pastor seems to have cradled you in delusive fancies. It is only slave-blood that flows in your veins, my poor Erica, and if the old countess suffers you to join her train, it is only because your relationship to me reflects a certain lustre upon you."

"Pshaw! I won't listen to your nonsense. Tell me, instead, what *Reichsfreiherr* means."

"Why, what *Reichsfreiherr* interests you?"

The color deepened in Erica's cheeks. "Well, *Reichsgraf*, then," she said smiling.

"Why, you see, Erica, the word '*Reich*' before the title divides the nobility into two classes; those who do not have the '*Reich*' belong to the lower, the happy possessor of it, on the contrary, to the highest aristocracy."

"And what is the distinction?"

"You ask a little too much at once.

This *Reich* nobility dates its origin from the golden days when the dear God reared his little nursery of ruling races. The young scions, it is true, were all fit for a throne, but unfortunately subjects were lacking, and the world was too small. This terrible deficiency of kingdoms was of course very sad, and as the whole misfortune really proceeded from a geographical error on the part of God, an attempt was made to compensate for it, as far as possible, by inventing equality of birth. That is, it was agreed that the lord of a million — we will say, for the sake of argument, thalers — should be entitled to no more consideration than he who possessed only a hundred pennies. The theory was beautiful, ideal, humane, for the poor man was thus, at least in his own opinion, made the peer of the millionaire, and therefore rich himself. These wealthy people — singularly enough — do not discharge the duty of giving with the same readiness that the poor display in fulfilling their obligations to receive. The latter, therefore, are naturally irritated against the wealthy egotists, and wrapping themselves in the beautiful consciousness of their own loyalty, assure Germany that the sanctity of this contract is securely treasured in their hearts. Thus the world knows where heroism and virtue find a resting place, and egotism does not rule alone."

"Did you learn all this wisdom from your uncle the fox-hunter, Fritz?" suddenly asked Sidonie, who had approached them unobserved.

Fritz laughed so roguishly, that it almost seemed as if he had been conscious of the young lady's presence before, and intended his words for her ear. "No, Sidonie," said he, "Uncle Bruno cares nothing about such things. I picked up my wisdom from Werner, who troubles himself a great deal about matters that don't concern him."

"So you are merely a parrot, Fritz?"

There was so much sharpness in the tone of Sidonie's musical voice, that Erica looked at her in astonishment, while Fritz, on the contrary, answered good-naturedly, —

"Dispose of your property according to your own pleasure, most beautiful and honored cousin. Your parrot can tell you many more such things, if you feel disposed to hear him."

Sidonie, however, did not seem inclined to jest, for she turned to Erica and asked if she had called upon the countess.

Erica cast an inquiring glance at Sidonie, who answered with a half-smile, "If you have not yet done so, Erica, don't neglect it to-morrow. My aunt would consider it a want of attention to her."

"But I am with her from morning till night," replied Erica, after she had partly recovered from her astonishment.

"Nevertheless, you are expected to pay her a formal visit in her own room. The best time seems to me to be just before dinner, when the countess has finished her afternoon toilette."

"Put on your shawl and best gloves, Erica, send your card to her by the footman, and if you can keep your face straight during the ceremony, you will do well."

"Hush, parrot!" said Sidonie; but there was no longer any sharpness in her tone, and her delicate white hand rested caressingly on the boy's curly hair.

XXIII.

THE RECEPTION AT COURT.

COUNT RODENWALD did not feel very well, at least so he assured his family, and especially his guest. He particularly regretted the condition of his health, because he had anticipated so much pleasure from his dear cousin's visit, and hoped to show her many things which would perhaps contribute to her entertainment. The old lady was quite touched by the great kindness of her "beloved cousin," and therefore doubly regretted an indisposition which deprived her of so much enjoyment.

If the count unfortunately was unable to join the numerous pleasure parties arranged for the afternoons, his illness happily did not prevent him from occasionally going to hunt wild ducks, or driving into Bonn, where troublesome business matters detained him so long that he did not return home until late in the evening, and thereby, to his great regret, lost the game of whist, which, in obedience to the promise made his wife, he often played with the guest.

The good old lady sincerely rejoiced that she could thus do something to help amuse the invalid, and therefore prolonged the game as much as possible. Little suspecting the torture inflicted upon her partner, who, besides being an admirable player, was accustomed to high stakes, she kindly offered to try piquet with him in the forenoon. The count, however, would not accept so great a sacrifice, and fortunately found compensation for his self-denial in another quarter.

Herr von Ramsdorff-Wehlen had speedily executed his plan of hiring one of the little villas in Dorneck, and, to Erica's

horror, one day presented himself to the family as a neighbor, which he certainly was in the most literal sense of the word, since his new residence adjoined the park. He had scarcely heard that the master of the house was not very well, and therefore often absent from the family circle, when, with most amiable readiness, he offered to share his sick room and endeavor to entertain the count.

Whether the gentlemen played piquet in their solitude was not clear, but at any rate they smoked a great many cigars, and consumed such a quantity of claret, that the countess, to whom the butler always reported the amount of wine used, began to feel very uneasy. Perhaps it was owing to this circumstance that the count's illness increased, for he appeared still more rarely in his wife's drawing-room, though he was in much more cheerful spirits than before.

Erica found herself in a most painful situation. She thought it her duty to inform the family of the suspicion that rested upon Wehlen, and yet with the lapse of time this suspicion had grown so vague that it sometimes seemed as if she had cherished it without cause. Besides, her uncle was evidently so much captivated with Wehlen, so fond of his society, that it appeared still more difficult to destroy this pleasure. She instinctively felt the consideration which the whole family showed towards the count. Familiar and affectionate as were the relations between the father and children, freely as they went to him with every request, because almost sure that it would be granted, they carefully avoided the slightest interruption of his comfort or pleasure. This was a thing from which every one timidly shrank, and the countess alone sometimes ventured to cross the universally respected limits, though only when it was absolutely necessary.

Erica would therefore have made her communication to the latter, if she could have found her a moment alone, but she lacked courage to ask her aunt for a private interview. In this embarrassment she hit upon the expedient of speaking to Werner, knowing that he possessed the entire confidence of both the count and countess.

Werner listened to her story attentively, allowed her to fully explain all the circumstances of the intended abduction, and then said eagerly: "I saw at the first glance that this Ramsdorff or Wehlen was a dangerous adventurer. He probably has designs upon the count's purse, and wants to tempt him to gamble. The only question is how we can prevent his doing so, for the count will permit no interference in this respect, and even the countess's influence would be powerless, especially as this Wehlen is a good shot, a fearless horseman, and entertaining companion, who will therefore be indispensable to the count in a short time."

Erica asked sadly, if, difficult as it would be, she might not be of use by telling her uncle the state of affairs.

"The sacrifice would be totally useless, Fräulein Erica," said Werner with a peculiar smile. "You have done everything in your power to prevent harm by telling me the facts. I will speak to the countess myself, and we will then see what is to be done."

This conversation soothed Erica in regard to her own conduct, and the next few days brought so much excitement that her mind was somewhat diverted from the affair. News arrived that the king and queen would visit the Rhine, and receive the homage of the Rhenish nobility at the castle of Brühl. Although Erica was not personally concerned — since she herself felt that she was not yet sufficiently "trained" for such an occasion — she was borne along by the whirl of excitement into which her cousins were thrown by the anticipation of this reception at court.

The question of dress became for the moment a matter of such paramount importance, that even the family histories receded into the background, and the household resembled a consulting committee under the direction of the old countess. This presidency, however — as every one knew except herself — was only apparent, the real leader was the mistress of the house. Sidonie gave the ladies the least trouble, as a complete outfit was ordered for her from the most fashionable dressmaker; but as the countess, from motives of economy, did not wish to make the same arrangement for her own daughters, the preparation of their toilettes cost far more labor.

The old countess had declared that, under these circumstances, she should be under the absolute and very pleasant necessity of prolonging her visit a few weeks. This time it was the Countess Rodenwald's turn to sigh. The castle, although a spacious edifice, was not very large in proportion to the number of occupants, and the countess — who was expecting a family to visit her on the way back from a watering-place — was somewhat embarrassed by the prolonged stay of her guest.

True, the good old lady, as she herself declared, had joyfully occupied as little space as possible, in order not to be too great a burden to her dear relatives, but with her servants she still retained six of the guest-chambers, and therefore other visitors, even if their requirements were equally moderate, might well cause the countess some little perplexity. She prepared her daughters and nieces for the possibility of being obliged to give up some of their rooms, and the young ladies did not greet the prospect thus set before them with much pleasure. Erica was the only one who felt differently, she was so overjoyed by the news that she blushed with mingled agitation and delight.

Was not Elmar also a dweller on the Rhine, would not he too wish to show his allegiance to the king, and was he not, moreover, Sidonie's cousin; so what was more natural than that he should be numbered among the expected guests? As the summer advanced she had wondered more and more whether he would probably go to Waldbad, ask for her, and be sorry not to find her. So while the other young girls were revelling in the anticipation of the gayety which would be caused by the coming of the court, Erica's heart was full of trembling expectation of the things that might happen after the reception was over.

At last the long-hoped-for day arrived, and the ladies disappeared for several hours in their dressing-rooms, to emerge in great magnificence and splendor. The count's health fortunately seemed to be very good, for it did not prevent him from accompanying the party. He had wished to go to Cologne the night before, in order to drive comfortably from there to Brühl, while the countess — on account of the large and unnecessary hotel-bills — opposed the plan, and said that they could easily drive the three miles directly from the castle. Her husband was a little annoyed by his wife's whim, and therefore went alone with Wehlen — for whom he had himself obtained an invitation — in a two-seated carriage, thus compelling two other equipages to be ordered for the remainder of the family, since five ladies in court dress could not possibly find room even in the largest carriage.

The toilettes were all very elegant and tasteful, and the old countess — who never travelled without all her diamonds — glittered and sparkled, spite of her sixty years, like a fairy queen. Sidonie, in a light green dress embroidered with gold, and a diadem of emeralds and diamonds in her dark hair, looked like an empress. All eyes were involuntarily fixed upon the beautiful vision, and Fritz gave utterance to the universal sentiment when he bent his knee before her, exclaiming, —

"Hail, my queen!"

"Rise, vassal!" replied Sidonie, smiling, "and in token of our favor, carry this shawl."

"Most gracious sovereign, you are more brilliant than the shining stars, more radiant than the dazzling sunlight, than — than — language is powerless, Sidonie, and so I will carry the shawl to the carriage without farther words."

Fritz, however, was guilty of great negligence in performing his duty of vassal, for he stood chatting gaily with his sisters, while Sidonie was about to enter her carriage. The servants happened to be engaged in helping the old countess into the other vehicle, and Werner stood alone beside the open door. He offered Sidonie his hand to assist her, but she drew back, saying coldly, —

"I will wait for one of the servants."

"They are all occupied at this moment," replied Werner quietly, "so permit me to offer my assistance, countess."

The delicate lips drooped in the scornful curve that sometimes marred the beautiful face, and she said less coldly, but with a shade of contempt in the tone, "If you insist upon rendering a lackey's service, it is not my fault."

"To render such lackey's service to a lady is a gentleman's duty," replied Werner, with the same quiet unconcern as before. The expression of Sidonie's lips said as plainly as if she had uttered the words, "If one *is* a gentleman," but Werner did not suffer himself to be disturbed, and would probably have continued the conversation, if Fritz had not darted up to the carriage.

"Your shawl, my queen!"

"My knight is very negligent; I shall be compelled to withdraw my favor."

"Adored sovereign, I hope your sea-green dress will dispose your heart to indulgence, and you will suffer mercy to take the place of justice."

Sidonie changed color. "I advise you to improve your knowledge of shades, sir knight, then you won't fall into the error of calling a dress like mine sea-green."

The carriages rolled away, and after the young people left at home had looked after them a few moments, they prepared to go into the house.

"You know, Edith," said Fritz, "children and dogs stay at home, as papa used

to say, when we teased to go on some long expedition, and this principle unfortunately seems to be carried out to-day."

Edith did not answer, but tossed her head and hurried up to her own room, while Erica and Werner went to the park, where Fritz joined them. The mischievous kobold that inhabited his mind seemed to be particularly active to-day, for he had scarcely reached Erica's side before he asked, —

"Do you know what that red spot on Sidonie's cheeks meant? She has heard that Count Meerburg will be at Brühl to-day."

"Is it really true?" asked Erica in surprise, while Werner looked steadily at the ground.

"Certainly. The old countess had a letter from one of her one hundred and fifty grandchildren this morning, which contained the news."

"Then we shall probably soon see the count here," observed Erica.

"I suppose he will come to-morrow, for only a polar bear could see Sidonie to-day and not fall head over ears in love with her. But you express no opinion, Werner; your thoughts are doubtless elsewhere. Are you lamenting that you could not go to court to-day?"

"You have guessed it, Fritz," cried Werner, laughing. "I confess I should like to be at Brühl this evening. I have aristocratic tastes, and like to see an assembly of the *élite*, whether of birth, art, or science."

"Do these aristocratic tastes extend only to large companies, and fail to embrace prominent individuals?"

"Right again, Fritz. I love true nobility, wherever and in whatever shape I find it, and that sentence which Goethe puts into a woman's mouth, and yet only a man can truly feel, 'There is no means of defence against a great nature except love,' I fully realize, because I have often and gladly perceived its truth."

"And why should not a woman feel this truth as keenly as you?"

"Because a woman possesses a larger share of that heavenly trait, humility, which protects her from hatred, while only love can save us. It grieves me to the heart, when I see that even great souls cannot fight their way to this love, but waste in petty opposition powers which, if acting in loving unison, might accomplish wonders. It is strange enough that, in a period which calculates almost solely by aggregate strength, individual consciousness should be cultivated to such a degree. There is the same contradiction in it as in the experience that we unselfish Germans cannot completely lose sight of our own personality, though that greatest of egotists, the Englishman, sometimes succeeds in doing so."

"And what causes these reflections just now, Werner?"

"Perhaps because I feel that it is well for me to rise from individuals to people in general. Moreover, I was particularly excited by a book I read to-day. It was an admirable novel, but contained such a narrow-minded, prejudiced, and therefore unjust representation of the nobility, that the book was almost spoiled for me."

"You have a particular fancy for the nobility, Werner, but everybody does not share your predilection, and perhaps this very spice renders the book more interesting to the public."

"That is just it," replied Werner eagerly, without noticing the boy's raillery. "With the public in general, feeling takes the place of thought, and whoever knows how to flatter its prejudices has right on his side, while people are only too ready to cover their own feeble arguments by the authority of a well-known name. The old saying, '*Noblesse oblige*,' does not concern the nobility of birth alone, but every individual whom God, by any superiority, has raised above his fellow-men and thereby ennobled. The author *ought* to be the peer of the king, but he must also, precisely because both stand on the heights of humanity, think royally in every respect. He must never forget that love alone gives a moral right to censure, and that if he does not bestow the reproof to correct and purify, but abuses his power to gratify any petty feeling, he thereby casts a stain upon his character, to efface which he must put forth all the energies of his mind. I was ashamed of the author who so wantonly sullied his beautiful work, and ashamed of the nobility that had given such an author so little opportunity to shake off these prejudices."

"I have never felt ashamed in consequence of any of my reading," replied Fritz, "but I've often laughed at the queer society into which the astonished reader is sometimes introduced. The author might perhaps have encountered these personages in the moon, for I at least have never yet met such baronesses and counts on earth."

"Fortunately, these caricatures are not very well represented in society, and most of these figures *are* caricatures. But it is all the more repulsive to be reminded of

the annoyances of life just when we hope to be able to forget them. It is different with the English; these egotists can lay aside their identity for a time, and rise into a higher, purer mental atmosphere. With us, selfishness strikes its roots too deeply into the soul, and since it seems as if the human race were obliged to carry about its allotted portion, I almost wish we were just as disagreeable outwardly, if we might thereby make ourselves freer in mind.

"As for the German nobility in particular, it certainly does not fulfil its task, but its failure is exactly in proportion to the deficiencies of the German people. Divided against itself, it has little resemblance to the closed phalanx with which the English nobility confronts us. Its lack of property is a reasonable cause of reproach — nobility without money can scarcely command reverence — but at the same time people oppose the only thing that can correct this defect, the law of primogeniture, whose drawbacks are easily discovered, while the advantages are steadily overlooked.

"Men scornfully remark upon the nobles' lack of skill in industrial enterprises, which almost always prove their ruin, and at the same time reproach them for holding aloof from trade. The instinct that guides the nobility is a correct one, for *the aristocracy must not understand how to gain property, but to use it.* As the artist, as the author, transfigures his subject, thereby raising it, and us with it, into a higher sphere, the nobleman must also take a loftier view of life, and, unhampered by the ordinary cares and anxieties of existence, strive to give this life a nobler meaning.

"We therefore judge him by quite a different and far stricter standard. The egotism that would be perfectly justifiable in the merchant or manufacturer — who must strive with the needs and toils of life — and without which his ruin would be inevitable, could not be pardoned in a nobleman. His purpose in life must never be his own advantage, and in and by this self-renunciation he pays a portion of the price of his distinguished position. Since he is thereby under double obligations to the public, the public welfare is his special task. To defend and serve his native land must be his first object, and therefore the army or diplomacy will probably claim his powers.

"It is the author's right, nay, his duty, to set forth the dark side of the nobility. Let him pitilessly expose in the pillory the man who forgets that he is only raised above the people to be able to serve them better, let him mercilessly show how often the owner of a brilliant name has no perception of his mission. But the light must also be suffered to appear beside the shadow; the battle of partisan hatred belongs to other lists, and no arbitrary distortion, but calm reflection, nay, loving comprehension, is imperiously demanded here. If he acts otherwise, he forgets his own nobility, and instead of obtaining for the people the treasures that belong to them, destroys them in a suicidal war.

"The Englishman is proud of his historic name, his ancient castle, and rich estates. They belong to *him*, because they belong to the nobility, and their accidental possessor considers himself the steward of the nation. We lack this feeling of unity; *L'union fait la force* is a motto too little prized, and if we now see the people struggling and striving towards it, all we who call ourselves noble, though we may not belong to the nobility, ought to consider it a sacred duty to assist them."

"You speak enthusiastically, Werner; really, you deserve not only to be a nobleman, but to be called one."

"I hope so, Fritz," answered Werner gravely. "It is precisely because I feel that the nobility of birth cannot fulfil its mission without wealth, that I desire to have a law of primogeniture. It will protect the family against the individual, and moreover impress upon Germans the great truth that individual freedom must have its limits for the sake of public welfare, as we unfortunately still cherish the error that freedom is connected with independence of will, while on the contrary it is the true sister of necessity.

"True, even without wealth, we have a closely allied community of noble blood, which for the present must perform the principal share of the task of the German nobility. The peculiarity of the Prussian army, in which every officer is a nobleman and therefore feels his obligations as such, has much to do with making that people the firm, self-sacrificing unit it is represented to be. Bound by the closest ties, and yet open to all, this army stands as a unit, and is the high school of noble sentiments to all Prussia. Every nation needs one. America is visibly degenerating for the want of it, and the constant struggling and striving for money is therefore increasing to absolute repulsiveness. But there, too, the fermentation will cease, and then the new world will find sufficient time to give nobility, art, and science a home. Refined manners and noble feel-

ings will smother the rudeness and thirst for gain, and the ideal will be interwoven with the practical into a beautiful whole."

"I fear we shall never live to see that happy time, Werner. But you say nothing, Erica, you are not interested in the conversation."

"You are mistaken, Fritz," replied Erica, "it interests me much more than family histories and the '*Gotha*.'"

"So you don't like the '*Almanach de Gotha*,' Fräulein Erica?" asked Werner, laughing.

"No, but as my name is not to be found in it, my want of interest is perhaps mere selfishness. You were speaking of the 'Prussian' army just now, Herr Werner; at home we should say 'our.' The people on the Rhine are rather peculiar in this respect. A gentleman in the cars told me that he was a Rhenish Prussian. If any one in our province should call himself an Oder or an Elbe Prussian, he would be laughed at."

"Yes, the people here do not feel so completely incorporated with the Prussians, but that will come in time. Look, there is Countess Edith on the veranda. I am afraid she has already waited for us to come to tea, so we must hurry."

"If I tell her you have been glorifying the nobility, Werner, she will be perfectly satisfied. Besides, I shall direct my attention to this subject, too. I have often been vexed by these constant attacks, and believe that the nobles and Jews are beginning to change parts."

"Perhaps Nemesis is at work here, Fritz."

"What, Werner? I hope you are not going to take sides with the Jews."

"You will do so yourself, if you think the matter over quietly. Only a people of the greatest natural nobility could live so long in this mire of degradation without being morally ruined, and yet the centuries have cast but few stains upon their character, and one or two generations will be sufficient to efface them."

"I feel as if I had fallen from the clouds, Werner. You a defender of the Jews, perhaps even a champion of their emancipation!"

"I think it a simple duty to make them our equals in social life; to give them the same representation in the government I should consider a misfortune. We cannot imitate the good example of the French, because the Jews are very different from us, and therefore could not enter into German ideas, but must always hold aloof. Although Börne swings the scourge of his satire over those who attack the Jews, not on account of God, but the market, he is a little too much of a partisan there. I think we are quite right not to wish to be crowded out of our own mart, and to act otherwise would be rather too much like the conduct of King Lear, and merit the mockery of his court fool."

"Well, and how will you escape from the dilemma?"

Werner smiled. "My solution is very simple, so simple that I would scarcely confess it to any one else for fear of ridicule. We ought first to treat the Jews in a Christian manner, endeavor to give them an example of true religion, and thus gradually win their affection. Then *their* advantages will become *ours*, and while we people of feeling have cause to fear the Jewish intellect, we shall derive the greatest benefit from this cordial intercourse. It will put iron into our heads and hearts, and thus harden and steel those who are effeminate."

"Well, Werner, if I tell Edith that you really expect her to marry a Jew in order to make him a Christian and a German, all your praise of the nobility will be of no avail. But I'll be as mute as a fish, and now let us go in to tea."

From The Cornhill Magazine.

CONGREGATIONAL SINGING.

THE last twenty-five or thirty years have seen great changes in the musical tastes and habits of the English people. In the sanctuary, in the concert-room, and in the drawing-room there is a striking difference between the popular music of now and thirty years ago. And to this the tavern, the singing-saloon, and the street are no exception. The old songs of sensuality have almost entirely disappeared, and most of the drawing-room music of our time is almost if not altogether free from anything to which an enlightened Christian would seriously object. For this general popularizing of better sentiments and better music the nation owes something to distinguished men who belonged to an earlier day. Julien, Russell, and Hullah have done much to raise the popular taste, and the effect of their labors will continue to be felt for years to come. The two former have passed away; the latter is with us still. It would be an injustice not to mention the national services of such great artists as Costa, Reeves, and Best.

Speaking more particularly of general

congregational singing, it may be said that the Wesleyans of fifty years ago were specially distinguished for the fire and force of their singing. There might be a lack of art, but you were always sure of heartiness. In this respect, as in others, the Wesleyans are somewhat changed. They have increased their musical education, but the energy and earnestness of their singing are diminished. This is partly owing to the congregations leaving the organ and choir to do the singing for them, and as long as they are content with a vicarious worship of this sort, their devotional fervor will be comparatively unemployed during the singing. Their falling off in congregational singing may be partly attributed to another cause. Education is spreading among the people, and the social level of the Wesleyans is higher than it was. Their children learn vocal music and the piano, and some of them know too much of music to like bad singing, and so avoid imperfect psalmody by remaining silent in the chapel. Without the slightest desire to give any opinion in this article as to the relative value of religious parties, it may be said in justice, and we trust without any offence, that of late years the Ritualists have decidedly taken the lead in popular congregational music. In fact, the fervor and popular character of their church music has proved not a little attractive to multitudes, and especially to the young.

It is not our design to discuss the religious and devotional part of the question of congregational music; that essential of the religious life may be safely left to the ministers and to the denominational organs of the various Churches. There is one remark, however, which may be made without offence in these pages. The practice of using music and singing in a place of worship merely as a relief from the prose of reading and preaching cannot be too severely condemned. If singing the praise of the great Creator cannot be made a part of the worship, and is a mere relief and easement from other parts of the service, then the Friends, who employ no music in their worship, are the more consistent in a religious point of view. Religious people are quite aware that worship by the aid of music has its human side as well as its divine, and it is most consistent with the highest reverence for the divine to endeavor to make the human as perfect as possible. Surely we are not to suppose that the only true reverence is not to exercise the understanding at all, and yet there are good people who act as though they believed it the duty of all to leave congregational music entirely to itself, lest the human should become too prominent, and the divine should shrink away before it.

The subject of congregational singing may be approached from many points of view, and discoursed upon with many and widely different purposes, but we neither write for the scorner, the professor, nor the clown. Believing as we do, that there is good in the music of the sanctuary, that the multitude are powerfully affected by it, and that many have by it been cheered amid the sorrows of life, and helped into nobler conditions of the spirit, it is our aim to contribute something to the wider diffusion, the greater improvement, and the better enjoyment of these human elements in divine worship. A subject in which the great body of the people are so much concerned needs an occasional and popular discussion.

It is worth while to have the best congregational singing possible in the circumstances, for the edification of those who do worship, and for the attraction of those who do not. Of the overwhelming majority of congregations it may be safely said that they do not sing as well as they can and ought. The musical part of the service is too often regarded as something perfunctory and subordinate. Now if the devotion and religious life were good in proportion as the music is bad, one might be reconciled to it; but there can be nothing in bad singing essential to the promotion of true religion. The majority of congregations do not know how much refreshment and enjoyment is to be got out of congregational singing, because they never put themselves to the expense and trouble of making the most and the best of it. Let no reader suppose that there is any cheap and easy road to excellent congregational music. It cannot be had without expense, pains, time, patience, toil, perseverance, and culture. These are the price of superior and delightful congregational singing, and any congregation paying this price will get the advantage of impassioned, powerful, polished, and sustained vocal music; for it may be safely said, as a general truth, that the difference between the singing in St. Paul's Cathedral and in the village choir is one of culture and expense.

In the success of congregational singing almost everything depends upon its aims, and those who have the direction of it. The end which is not definitely sought will not be obtained, and when the only aim is to have a choir performance with-

out regard to the congregation, the result will be that the choir will have the singing entirely to themselves. It is useless to speak of congregational singing if they cannot join in the music. The true aim is that instruments, choir, and congregation unite and blend together in the production of one body of devotional psalmody.

But the true purpose is too often frustrated by the whims and incompetence of those who have the chief direction. The trustee manager very often knows little or nothing of music, and either does not interfere when he ought, or else interferes for his own whims. It is not impossible for him to look upon the music department of the church as a private preserve of his own, and he will have such music as pleases himself and a few of his friends, while the majority of the congregation are left out of consideration altogether. He is the best manager who gets the best congregational singing, and he is the worst whose music interests nobody but himself and his uncultured admirers. Where the congregation does not sing there is no congregational singing, and there will be none until arrangements are made which will satisfy and engage the great body of the people.

The most ardent lover of congregational singing can only make the best of his materials, and if he cannot get his ideal, he must be content with the best he can attain.

The use of musical instruments in places of worship has ceased to be a matter of discussion in England, and nearly all the churches are settling down to organs and harmoniums; and it is certain that these instruments, with their capabilities of improvement, have become permanent institutions in the sanctuaries of this country.

Good organs, with the sweetness and firmness of subdued power, are not difficult to obtain; and so the harsh, hard, and brassy tones are more easy to avoid. There is much more difficulty with the player than with the instrument. If good organists were as plentiful as good organs, the churches might consider themselves as entering into a musical millennium. The one thing needful in the organists of the present day is not execution. The one thing lacking to so many of them is taste and judgment. It is no uncommon thing for a minister to stand before an organist who works off his tunes like a horse in a mill, without the slightest regard to the sentiment of the hymn, the tune that would be suitable for it, or the speed at which the music should be taken. According to mechanical organists, the funeral hymn, and the psalm of joyful adoration, must be taken exactly at the same speed, and the same tune will do for either of them. Wherever an organist of this mechanical and intractable class is master, the congregational singing is ruined.

It is generally the work of the organist to select the music, to play the instrument, and to train the choir and congregation; though he is frequently under some direction and control from the clergyman and the secretary of the choir committee.

The production of the best possible congregational singing is impossible without the selection of the most suitable music. Congregations are not exclusively composed of musical artists and highly educated musicians, and they never will be. Put together in one place of worship the choirs of St Paul's Cathedral and Westminster Abbey, and let their only congregation be the professional singers in London; let these meet together for worship on the Sabbath day; what music would they choose? Certainly they would never choose as their only psalmody some most difficult, elaborate, and highly ornamental music which too many provincial choirs murder in vain attempts to execute it, not for the good of the congregation, but for the glorification of themselves. Such a service of vocal artists as we are thinking of in London would be distinguished by the simple grandeur and stately reverence of its music. Let any one of the first vocal artists of the day have the choosing of the music for an ordinary congregation, and his first and only consideration would be which tunes will be best suited for united worship, which music comes best within the reach of all the people, and which tune will be most likely to unite them all in one melodious burst of praise. The music ought to be selected, not for the gratification of the organist or a few vain amateurs, but for the hearty reception and the musical quickening of all the congregation.

The constant introduction of new tunes is a practice very injurious to congregational singing. The people have not time to learn them, nor do they see the necessity for burdening their memory with a superfluous mass of music. It is not difficult for the organist and choir with the music-books open before them to execute new tunes for their own pleasure; but their pleasure is not the chief end of vocal

worship; their only delectation ought to be in helping the congregation to sing; and this end can never be gained by constantly changing the music. Considering the limited musical attainments of congregations generally and the little time they can give to united practice, it is far the best to keep almost absolutely to one set of tunes; and we may rely upon it there never can be more than two tunes suitable for any one given hymn. When tune and hymn are suitably wedded to each other, and never separated, they recall each other, and are most helpful to the soul in the service of song.

Many people who are accustomed to an organ in public worship have never seriously formulated to themselves what the use of it is, or ought to be. Definite ideas and convictions on the right use of the organ in worship are needful for its highest and best-received utility. The function of the organ in relation to the voices of the congregation is to sustain them, to lead them, and to blend them. The tendency of a body of voices when singing is to droop, become flat, and to fall into lower notes. This phenomenon has been proved again and again, and the members of any family may easily test it for themselves. Strike a chord, and let several persons commence singing from it, and after they have sung several verses without being accompanied by the instrument, strike the same chord again, and you will find that the voices have fallen half a note or a note, probably a note and a half if the singers are uncultured. The organ prevents this falling tendency, because it supplies a platform of sound upon which the voices may rest, and they cannot even force themselves below the plane without harshness, discord, and all the disagreeable sounds of being out of tune. Congregations sing without notes, without marking time, and have only the ear to guide them. Under these circumstances they cannot be kept together, unless they have some one to guide them, and this is what the organ and choir should do. The melody should be so strongly marked by the organist that the congregation cannot mistake it as it is interpreted to them by the organ and the leading singer. Some organists get such a handful of chords that it is next to impossible to tell what tune they are playing, and even the choir find it difficult to be sure of the air, and mark it distinctly. A skilful organist will remember that his chief duty is not to show how many notes his hands and feet can bring out of the instrument at once, but how he can keep the congregation to the right time and tune; and if he is firm and judicious he will mostly succeed. The practice of playing over the air before the singing begins is excellent, only some organists defeat the purpose of it by drowning the air in the multiplicity of chords. The organist should always keep to a suitable speed, and the choir and congregation should take their time entirely from him. If you ask some religious people, "Do you sing?" they will answer, "Not alone; but I can sing in the congregation, when all are singing." By this they really mean that they are destitute of the true intervals in the scale, that they cannot produce the singing voice properly, and that the quality of their own voice is disagreeable to their ear. Their notes are miserably defective, and remind one of the working of a saw in which several of the teeth are broken out. A saw with complete teeth well set works evenly, but when some of the teeth are broken out it sticks and jerks, and the regular and even working of it is impossible. So the voices in which the intervals are not correctly fixed work unevenly and in jerks, producing false notes, and an intermittent stream of sound disagreeable and out of tune. When such voices join in the congregational singing, these unpleasantnesses are drowned in the general volume of sound, and so become less disagreeable to their owners than when singing alone. In a large congregation there must be many uncultured, and some very bad voices, and the result is that the united sound is not full, liquid, sweet, and smooth. It is rather full of cracks and crevices, and jagged, going roughly and hardly, like a broken-toothed saw. The great advantage of an organ is that it pours a stream of correct notes into the volume of sound coming from the congregation, neutralizing and overpowering the incorrect notes, filling up the cracks and crevices, making the combined music soft and liquid, and drawing the ear of the congregation to better expression. The extent to which an organ blends the voices is one of its greatest benefits.

It may contribute something to the formation of a healthy public opinion against bad organ-playing in relation to public singing, if we point out some of the common faults of defective and half-trained organists. In some instances, no mortal can tell what will be the time of the singing from the speed at which the organist plays over the tune. It seems as though he were keeping the time a secret, only to

be disclosed when the congregational singing actually began. Some players make the widest and most startling contrasts between the loud and soft passages, and if these contrast-men could have their way with the music, they would be satisfied with nothing less than to pass at once from the soft flute to a loud peal of thunder. Grace-notes, runs and flourishes, such as were never written in hymn-tunes by any composer who was not an actual inmate in a lunatic asylum, are put in by the organist to the gratification of his pride and the destruction of everything like congregational singing. Perhaps the most painful and ludicrous performance by which a minister can be annoyed is the skipping and octave arpeggio with which some organists occasionally disturb the singing; they have only to go a little further and get somebody to shake a large bunch of keys in the orchestra in imitation of the tambourine, and then the suggestion of the leaping dance would be complete. Another instrument of torture, not unused by organists who occasionally become oblivious of the laws of good taste, consists in the abrupt and transient introduction of a few notes of the air played one or two octaves higher than the singing of the congregation. It suddenly begins, as it were, in the distance, like the piping wind, and while the shrill whistle attracts the startled attention of everybody, those who are painfully used to the extravagant innovation resort to the old soliloquy: "Here they are again, the drum and fife band, coming up behind the preacher." Sometimes it is impossible to hear with any enjoyment the singing of the congregation by reason of the persistent loud playing of the organ. The performer forgets that his work is not to overwhelm and drown the voices, but to help them, and develop them to the best advantage. Other organists have the habit of occasionally dying away in a whisper, as though they played best for the congregation when the congregation could not hear their pedantic whispers. To sing with a whispering organ is like walking on thin ice. There is nothing to sustain the voices of the congregation, nothing to blend them, and nothing to give them confidence. A good and judicious organist will neither try to show off himself nor his instrument in the house of God. His sole aim will be to assist in giving musical expression to those devotional sentiments which are in the hymn, and which are often inspired afresh by good singing. The use of the organ stops is a severe test to the performer, and the result of mixing the stops often indicates the difference between the true artist and the mere mechanical executant. Occasionally we have known an organist to be seized, in the midst of a solemn hymn, with a sudden fit of making the sound of his instrument as much unlike the human voice as possible; the congregation may be singing correctly, heartily, and with good intonation, when, in an instant, the organ gives a positive shriek of unearthly noises, which passes through the congregation like an electric shock. If the preacher is not too disgusted to look into the faces of the people while the jar is upon their nerves, he will behold them saying to themselves, "What has happened? Where are all our voices going to? What has thrown them out of tune? Is the organ crazy, or does the player really know what he is doing?" We have heard organists who were determined to assert themselves by their loud playing. Using at least five times more power than they had any occasion to do, they gave neither the choir nor the congregation the slightest chance of making their voices sufficiently heard. For a while the vocalists have tried to make themselves heard, but have been obliged to give up in despair, for the stoutest human lungs are no match for organ bellows worked by hydraulic pressure.

Even if the generality of the members of religious congregations had received a very good education in vocal music, which they certainly have not, it would still be necessary to have a choir, if the highest success of congregational singing is to be obtained. There must be persons present who can be relied upon for the singing whenever that part of the worship is required. Absence, indisposition, and all the various accidents of attendance to which congregations are liable, show how needful it is to have a body of singers whose attendance and efficiency can be trusted. What the organ is to the choir and the congregation, that the choir is, or ought to be, to the congregational singing. The singing of a very good choir is the model upon which the congregational voice may mould and form itself. It is the work of the choir to animate the vocal powers of the congregation, to call forth the congregational voice, and to lead and sustain it by filling the ears of the people with correct and pleasing sounds. Rightly used the choir-singing is as a melodious fountain from which the voices of the congregation may derive musical life and artistic nourishment.

It is only in large towns, and where money is no object, that the best choirs can be obtained, and while it may be cheerfully

admitted that the best artists should be well paid, it is greatly to be regretted that the gratuitous services of well-trained amateurs are not sufficiently available. There are many who can and ought to sing without money and without price, and as some of these believe that the singing service is a part of divine service, it is a pity they do not come forward and do it without being paid for it.

The churches can do no more than make the best use of the materials they can command, and most of us must wait a long time for the ideal, if it ever comes at all. As to how many singers there should be in the choir depends upon the size of the congregation and the means at command. If the highest efficiency is the only question to be considered and the means at command are ample, the answer is easy. Four bases, two baritones, two tenors, two sopranos, two contraltos, and eight boys, twenty in all, would make an admirable choir. There are those who object altogether to having females in a choir, but that is a question not within the province of discussion for this article.

One of the greatest musical necessities of our time is the supply of a sufficient number of competent teachers of choir and congregational singing, and until this want is supplied, the psalmody of the people will never be what it ought to be. So much in it depends upon instruction and so little upon originality and invention for all the ordinary uses of art, that unless competent teaching is supplied, a high degree of excellence can never be attained. It is altogether a mistake to suppose that because a gentleman can teach the piano or the organ, he can therefore teach singing. The organist, as such, may teach the choir to sing in time and tune, he may show them the difference between *piano* and *forte*, and that is about all he can do, unless he himself is specially gifted, or has been specially instructed in the vocal art. The teaching of singing is an art of itself, which in ordinary circumstances cannot be taught unless it has been learned. In private life, no person who wishes to attain to a high degree of excellence will ever think of completing their vocal studies without taking lessons from one specially distinguished for teaching singing, and everybody knows that vocal artists must finish their preparations in Italy. It is not a question whether the choir or congregation can be taught to sing in time and tune, for that is chiefly mechanical work. Two people may sing the same piece of music with equal mechanical correctness, and yet the music which they produce may be only a specimen of the delightful and the uninteresting; and all the difference is made by the production and management of the voice and by taste. It is in these three last things that choirs and congregations fail, and it is in these especially that they need to be instructed. To produce the voice in the best way, to accustom the ear and the imagination to scale practice, and the practice of various and correct intervals, is the essential preliminary of all excellent singing. But the organist cannot impart what he does not possess; and for this work special teachers are required all over the country. Such disciplinary practice ought to form a part of the work of all choirs and congregations when they come together for exercise in congregational music. Such discipline of voice is imperatively needed, but how difficult it is to enforce it! Many organists will not take the trouble, and many singers would think it beneath them to go through the drill. They want to sing tunes, tunes, only tunes. With them that is everything.

Superior choir-masters might get a very good living, and by employing them the singing of the churches might be greatly improved. The masses are in the dark as to the best methods of producing the singing voice, and who shall enlighten them? Unfortunately when men have come forward to teach congregational singing, they have sometimes proved themselves only musical quacks. Some new invention, some royal road to success, and some new tune-book have been their pride and joy; and six months after their departure, the congregations who took their lessons have sung no better than they did before.

Any organist who has to train a choir or congregation, or both, will find great assistance in Helmore's "Church Choirs," published by Masters, price one shilling. It is an excellent little book for the essential principles of producing and managing the singing voice, and its exercise should be practised again and again. It is indispensable for the choir and congregation to be drilled in producing the voice, and in such exercises as will develop the notes, and give them fulness, firmness, sweetness, and precision.

It may not be out of place to note some of the blemishes and defects of choir-singing as they have been sometimes painfully realized through a long and various course of observation. It is no easy matter so to subdue the pride and individuality of choir-singers as to induce them to

blend their voices together. Each, in some instances, seems inclined to make his part separate and independent from all the rest; and so it sounds not like twenty voices flowing into one common result, but twenty voices with twenty independent results. The *toute ensemble* of the choir and congregation voices is a prime essential for superior congregational song. When all the voices mingle and unite in producing one strain of sound the intonation is perfect. The individual voices still give coloring to the whole, but the individual distinctness is not detrimental to the intermingling. This excellent effect cannot be produced without study and practice. The singers should try to sing into each other's voices so that there may be unity and sympathy of tone. There are choir-singers who imagine that this unity comes as a matter of course. They do not practise together, they are not used to each other's voices, and when they pass into the performance of their music on the Sabbath their rendering of it is marked, not by the blending and interfusion of voices, but by that multitudinous and separate enunciation of sound which makes the true musician feel that the organ is vainly trying to blend a number of incohesive, self-willed, and antagonistic notes. Very often in country choirs and congregations one or two singers appear to be determined to set up for themselves. They are anxious that their voice should be heard separately from all the rest, and this they easily accomplish if their voice is at all strong. They give their voice what is called "a sort of twang" or "unusual flavor," to the delight of their own vanity, and to the disgust of all educated musicians. This unenviable distinction is generally gained by purposely singing out of tune; either too flat or too sharp, as the case may be; or perhaps both in turn for a change. These peculiar "twangs" are out of place in worship, and whatever gratification of individual vanity they may bring, they ought to be put down for the sake of art and reverence.

It is the ambition of some singers to "sing people down," as it is called. Such self-asserting musicians strain themselves to the uttermost, not so much to make themselves heard as to prevent other people from being heard. They go to the very verge of shouting and bawling to prove what a powerful voice they have. This overpowering rant completely prevents any approach to delicate expression. Where it prevails there is no harmony. The music is of the roughest and coarsest kind, in fact it is hideous.

If the reader is a minister, and happens to give out his hymns a verse at a time, instead of allowing the much better way of singing the hymn through without a break, he will sometimes find himself completely bewildered by the pronunciation of the choir behind him. Only forget what verse you gave out last, through thinking about your sermon, and you will be completely bewildered as to what verse to give out next. It is very often impossible for any human being to make out what words the choir behind you are singing. You have to strain your ears to the uttermost to catch the faintest indication of the words. All this tormenting gabble and slur of indistinct and slovenly pronunciation is the sole result of inattention and bad training. By all means let it be reformed both by teachers and singers.

In some ordinary places of worship, anthems are attempted. It is not for us to discuss the question here whether or not anthems are adapted for the religious purposes of worship. One thing is clear: they ought not to be undertaken, unless they can be rendered well. For ordinary choirs to attempt them is only to bring themselves under the censure and ridicule of competent judges. In an artistical point of view, ordinary choirs gratify none but themselves and others like them by their incompetent and blundering attempts to execute anthem parts. The result is a revelation of individual weakness which would be better hidden in the common mass of general song. We never remember hearing a single anthem rendered by any ordinary choir which was worth listening to. Many of the performances are little better than a painful burlesque upon art and religion. The best choirs alone should attempt music of this kind. The reader who wants to hear this kind of music to perfection must go to St. Paul's or Westminster Abbey.

Much more might be got out of the Sunday schools for congregational and choir-singing, with a little pains and good judgment. There are sweet singing voices in every Sunday school, and if they were only picked out and carefully trained, would be of great use. Every Sunday school should have a singing class for occasional practice on a week-day. It would not cost much of expense or labor to raise the general character of Sunday-school singing, and this would tell beneficially though indirectly on the congregations. The Sunday-school anniversary is a fine opportunity for the scholars. They take great interest in it, and are often very

diligent in getting up their music for it. Boys and girls can be greatly interested in public singing on the Sabbath, as is evident in their diligence and eagerness in relation to the Sunday-school anniversary.

About the worst use a congregation can make of a choir is to leave it to do the singing for the people. To say nothing of human worship by proxy, the congregation which leaves the choir to do all the singing misses many advantages. Yet this is too often the case, and in some quarters increasingly so. In too many places of worship, the work of the choir is becoming a separate and independent performance, and the body of the congregation look on with indifference, or listen with interest, as the case may be. You may call it a Sunday concert in the house of God, but never call it congregational worship when the people pay little heed to the singing, and take little personal part in it. Either the congregations should take more part and interest in the vocal worship, or leave it to the choir altogether, merely following them, programme in hand, as at an oratorio. Few congregations are prepared for such a decision as would exclude them altogether from the singing part of worship except as listeners. Then, if they would not give up their right to sing, let them show their appreciation of the privilege by more skilful and hearty singing.

Good congregational singing is not to be had without toil and cost. If it could come by merely wishing for it, then many congregations would sing much better than they do. They need to inform themselves what really is good congregational singing, and then lay themselves out for it accordingly. A minister cannot from the pulpit give much advice about singing; still less can he go into the details of art criticism. A few remarks occasionally calling upon all the congregation to join more heartily in the singing, is the most that he can undertake with propriety and success. The congregation needs to be called together apart from worship, and solely for practice and instruction in the vocal art. A skilful and judicious teacher can soon point out the usual faults, and lead them on by intelligent practice to better work. Occasional practice in congregational singing is indispensable, and there is no first-class work done without it. The exercises for the production of the voice should be gone through, as also exercises in the different intervals and through various keys. A month's practice of this kind will be of more use for improvement than the singing of a hundred tunes.

Those who take part in the psalmody of the congregation should be encouraged to practice the exercises at home. The unison practice has many advantages, but it does not supersede private practice. The defects of the voice may be pointed out very clearly in the singing class. They can be most effectually corrected by private practice; and those who will persevere in private for only half an hour a day will soon be able to make a better public contribution to the general worship of song.

If too many cooks spoil the broth, it is equally true that too many tune-books spoil the singing. One or two tune-books may be used at home for family practice, but six or seven books do more harm than good. Many families have given up altogether practising the psalmody of their church, because they have neither time nor patience to pick the tunes out of many books. One tune-book, even if somewhat inferior, well known to the families of the congregation, and constantly used by them at home, is better than a dozen volumes of tunes to which they have no access. Reference has been made to the popular singing of the Ritualists. Their success is greatly owing to the all but universal use of one tune-book, "Hymns Ancient and Modern." It is for the want of this unity, among other causes, that the Wesleyans have fallen off in their singing. There is no other Church in which so many different tune-books are used; this may be partly caused by the fact that the Wesleyans have published no new tune-book for many years past. Since this article was written the evil has been remedied, and a new Methodist tune-book has just been given to the people. It is having a large circulation, and is pronounced by competent judges to be a very excellent work, and admirably suited for its purpose. The sooner it is used in all the choirs and congregations, the sooner will the Wesleyans be on the road to their old fame for hearty, united, and congregational singing all over the land. In some churches it is the custom to announce the name of the tune, and where not more than one or two tune-books are used this is a good plan. The people may then have their tune-books in the pews, and those who can sing from notes may do so.

Familiarity with many congregations and their ways of singing enables one to sketch with passable accuracy some of the faults to be avoided. If the place were not sacred, it would be highly amusing to

listen to the grotesque attempts made to extemporize parts or "seconds," as they are called, in the congregational singing. You may be listening gravely enough, and the music may be going quite steadily, when all of a sudden somebody near you breaks out with a little solo of *his* (it is generally the men that do it) own; and before you can recover your surprise, the ludicrous little solo has done its work by gratifying the vanity of its author, who immediately submerges himself in the general sound. On one occasion, when Sir William Fairbairn was in France, he had to explain to his host the nature of home-brewed ale. In the course of the same visit he was asked to perform on the violin, when he astonished the party by giving them his best tune, "The Keel Row." It was a wretched performance, and the excited host, unable to bear it any longer, exclaimed in broken English, "Top, top, monsieur; egad that be home-brewed music." How much better it would be if the extemporizing soloists in the house of God would keep their "home-brewed music" to themselves!

Grace-notes are great favorites with many amateur musicians, and the taste for them needs to be kept under very severe restraint. Turns, shakes, and cadenzas are well enough as put down by the author of the music, and in the execution of great artists are sometimes enchanting, but for ordinary organists to be quavering, trilling, turning, and shaking is to distract attention and spoil the music by breaking in upon its steady, plain, and progressive harmony. Yet who has not been annoyed by the unreasonable grace-notes of the organist in the gallery and the singer in the pew?

Some individual singers in congregations might be called jerkers and spouters from the way in which they perform. As if seized by some sudden impulse, they start out of the ordinary level of their singing, and annoy their neighbors by rushing into a violent jerk, and by fits and starts they do this through all the hymn. You might think from their steady quietness that they had settled into the regular emission of even sounds; but before you have time to come to this conclusion they put on a violent spurt like some hurried and nervous oarsman. Probably they think they have got hold of a striking style, but they are alone in their opinion. People must sing regularly and always if they wish to make a complete and conscientious contribution to this part of divine worship.

There are good and bad notes in most voices. On one occasion in Italy, a composer, wishing to get rid of one of his opera singers, wrote his solos for the objectionable artist so as to bring in all his worst notes very frequently. The singer soon resigned his post. The difference between the good and bad notes in the same voice are sometimes strikingly brought out even in divine worship. A man finds out his best note, and makes it his pet note. Whenever his pet note occurs in the tune he feels he must make the most of his only chance. So he holds the note as if he loved it far more than all the others; holds it as if he could not let it go: the result is, that he breaks the time, and if his voice is strong, a number of the people are thrown out with him. We do not say, glory in your worst notes; but beware of your pet notes, and do not break the time by holding them beyond the proper length.

Individual faults in congregational singing are not the only ones; there are others of a general character. One of the most common is that of dragging the time, especially in villages. There seems a natural tendency in some congregations to go slower and slower, and the slower the time of their music the more weary they become. This excessive slow singing is quite as fatiguing to the voice as very rapid singing; in fact it is rather more so, because each note has to be held much longer. The result is, that the singing, when the fault is unchecked, degenerates into a sleepy and oppressive drawl. Unless the organist and choir are very true and firm to their time, they will find it impossible to keep the congregation from falling into this disagreeable defect. If congregations would always follow the lead of the organ and choir, they might keep out of this fault effectually.

Occasionally it appears as if the singing of the congregation were being carried on in two separate divisions. Owing to inattention or the misleading influence of one or two strong voices in a particular part of the congregation, the singing becomes divided, and one division will find itself half a bar behind the other. It is well when the chasm closes, and the voices come together again, but it would be much better if the gulf were never allowed to yawn.

There are organists, choirs, and congregations to whom most of these strictures would only slightly apply; but the vocal worship of all popular assemblies would be greatly improved by increased

and more intelligent attention to the true art of singing; and to stimulate this we have written with no unkindness, and with every good wish for the prosperity of the art, and the happiness of those concerned in it. Even in a human point of view, there are few influences more refreshing than those of good congregational psalmody. It has been our happy fortune, though, alas! not often, to be elevated and charmed by beautiful congregational singing. The tune was suitable to the words; no voice made itself heard by disagreeable distinction from the rest; the voice notes and the organ notes flowed into each other, and, blending together, rolled on in one sweet, strong, full, and liquid stream of song; and as we felt the firmness and precision of the music, and watched the delicate shadings of expression, as the compact and polished tones were poured through their finished course, we could not help exclaiming, would that every organist and choir and congregation were equally successful in art and refined in musical taste!

MACLEOD OF DARE.

BY WILLIAM BLACK.

CHAPTER IV.

WONDER-LAND.

A COOL evening in June, the club windows open, a clear twilight shining over Pall Mall, and a *tête-à-tête* dinner at a small, clean, bright table — these are not the conditions in which a young man should show impatience. And yet the cunning dishes which Mr. Ogilvie, who had a certain pride in his club, though it was only one of the junior institutions, had placed before his friend, met with but scant curiosity: Macleod would rather have handed questions of cookery over to his cousin Janet. Nor did he pay much heed to his companion's sage advice as to the sort of club he should have himself proposed at, with a view to getting elected in a dozen or fifteen years. A young man is apt to let his life at forty shift for itself.

"You seem very anxious to see Miss White again," said Mr. Ogilvie, with a slight smile.

"I wish to make all the friends I can while I am in London," said Macleod. "What shall I do in this howling wilderness when you go back to Aldershot?"

"I don't think Miss Gertrude White will be of much use to you. Colonel Ross may be. Or Lord Beauregard. But you cannot expect young ladies to take you about."

"No?" said Macleod, gravely; "that is a great pity."

Mr. Ogilvie, who, with all his knowledge of the world, and of wines, and cookery, and women, and what not, had sometimes an uneasy consciousness that his companion was covertly laughing at him, here proposed that they should have a cigar before walking up to the Piccadilly Theatre; but as it was now ten minutes to eight, Macleod resolutely refused. He begged to be considered a country person, anxious to see the piece from the beginning. And so they put on their light top-coats over their evening dress, and walked up to the theatre.

A distant sound of music, an odor of escaped gas, a perilous descent of a corkscrew staircase, a drawing aside of heavy curtains, and then a blaze of yellow light shining within this circular building, on its red satin and gilt plaster, and on the spacious picture of a blue Italian lake, with peacocks on the wide stone terraces. The noise at first was bewildering. The leader of the orchestra was sawing away at his violin as savagely as if he were calling on his company to rush up and seize a battery of guns. What was the melody that was being banged about by the trombones, and blared aloud by the shrill cornets, and sawed across by the infuriated violins? "When the heart of a man is oppressed with care." The cure was never insisted on with such an angry vehemence.

Recovering from the first shock of this fierce noise, Macleod began to look around this strange place, with its magical colors and its profusion of gilding; but nowhere in the half-empty stalls or behind the lace curtains of the boxes could he make out the visitor of whom he was in search. Perhaps she was not coming, then? Had he sacrificed the evening all for nothing? As regarded the theatre or the piece to be played, he had not the slightest interest in either. The building was very pretty, no doubt; but it was only, in effect, a superior sort of booth; and as for the trivial amusement of watching a number of people strut across a stage and declaim — or perhaps make fools of themselves to raise a laugh — that was not at all to his liking. It would have been different had he been able to talk to the girl who had shown

such a strange interest in the gloomy stories of the northern seas; perhaps, though he would scarcely have admitted this to himself, it might have been different if only he had been allowed to see her at some distance. But her being absent altogether? The more the seats in the stalls were filled — reducing the chances of her coming — the more empty the theatre seemed to become.

"At least we can go along to that house you mentioned," said he to his companion.

"Oh, don't be disappointed yet," said Ogilvie; "I know she will be here."

"With Mrs. Ross?"

"Mrs. Ross comes very often to this theatre. It is the correct thing to do. It is high art. All the people are raving about the chief actress; artists painting her portrait; poets writing sonnets about her different characters — no end of a fuss. And Mrs. Ross is very proud that so distinguished a person is her particular friend."

"Do you mean the actress?"

"Yes; and makes her the big feature of her parties at present; and society is rather inclined to make a pet of her too — patronizing high art, don't you know. It's wonderful what you can do in that way. If a duke wants a clown to make fellows laugh after a Derby dinner, he gets him to his house and makes him dance; and if the papers find it out, it is only raising the moral status of the pantomime. Of course it is different with Mrs. Ross's friend: she is all right socially."

The garrulous boy was stopped by the sudden cessation of the music; and then the Italian lake and the peacocks disappeared into unknown regions above; and behold! in their place a spacious hall was revealed — not the bare and simple hall at Castle Dare with which Macleod was familiar, but a grand apartment, filled with old armor and pictures and cabinets, and showing glimpses of a balcony and fair gardens beyond. There were two figures in this hall, and they spoke — in the high and curious falsetto of the stage. Macleod paid no more heed to them than if they had been marionettes. For one thing, he could not follow their speech very well; but, in any case, what interest could he have in listening to this old lawyer explaining to the stout lady that the family affairs were grievously involved? He was still intently watching the new-comers who straggled in, singly or in pairs, to the stalls. When a slight motion of the white curtains showed that some one was entering one of the boxes, the corner of the box was regarded with as earnest a gaze as ever followed the movements of a herd of red deer in the misty chasms of Ben-an-Sloich. What concern had he in the troubles of this overdressed and stout lady who was bewailing her misfortunes and wringing her bejewelled hands?

Suddenly his heart seemed to stand still altogether. It was a light, glad laugh — the sound of a voice he knew — that seemed to have pierced him as with a rifle-ball; and at the same moment from the green shimmer of foliage in the balcony there stepped into the glare of the hall a young girl with life and laughter and a merry carelessness in her face and eyes. She threw her arm around her mother's neck and kissed her. She bowed to the legal person. She flung her garden hat on to a couch, and got up on a chair to get fresh seed put in for her canary. It was all done so simply and naturally and gracefully that in an instant a fire of life and reality sprang into the whole of this sham thing. The woman was no longer a marionette, but the anguish-stricken mother of this gay and heedless girl. And when the daughter jumped down from the chair again — her canary on her finger — and when she came forward to pet and caress and remonstrate with her mother, and when the glare of the lights flashed on the merry eyes, and on the white teeth and laughing lips, there was no longer any doubt possible. Macleod's face was quite pale. He took the programme from Ogilvie's hand, and for a minute or two stared mechanically at the name of Miss Gertrude White printed on the pink-tinted paper. He gave it him back without a word. Ogilvie only smiled; he was proud of the surprise he had planned.

And now the fancies and recollections that came rushing into Macleod's head were of a sufficiently chaotic and bewildering character. He tried to separate that grave and gentle and sensitive girl he had met at Prince's Gate from this gay midcap, and he could not at all succeed. His heart laughed with the laughter of this wild creature; he enjoyed the discomfiture and despair of the old lawyer as she stood before him twirling her garden hat by a solitary ribbon; and when the small white fingers raised the canary to be kissed by the pouting lips, the action was more graceful than anything he had ever seen in the world. But where was the silent and serious girl who had listened with such rapt attention to his tales of passion and revenge, who seemed to have some mysterious longing for those gloomy shores he

came from, who had sung with such exquisite pathos "A wee bird cam' to our ha' door"? Her cheek had turned white when she heard of the fate of the son of Maclean: surely that sensitive and vivid imagination could not belong to this audacious girl, with her laughing, and teasings, and demure coquetry?

Society had not been talking about the art of Mrs. Ross's *protégée* for nothing; and that art soon made short work of Keith Macleod's doubts. The fair stranger he had met at Prince's Gate vanished into mist. Here was the real woman; and all the trumpery business of the theatre, that he would otherwise have regarded with indifference or contempt, became a real and living thing, insomuch that he followed the fortunes of this spoiled child with a breathless interest and a beating heart. The spell was on him. Oh, why should she be so proud to this poor lover, who stood so meekly before her? "Coquette, coquette" (Macleod could have cried to her), "the days are not always full of sunshine; life is not all youth and beauty and high spirits; you may come to repent of your pride and your cruelty." He had no jealousy against the poor youth, who took his leave; he pitied him, but it was for her sake; he seemed to know that evil days were coming, when she would long for the solace of an honest man's love. And when the trouble came — as speedily it did — and when she stood bravely up at first to meet her fate, and when she broke down for a time, and buried her face in her hands, and cried with bitter sobs, the tears were running down his face. Could the merciful heavens see such grief, and let the wicked triumph? And why was there no man to succor her? Surely some times arise in which the old law is the good law, and a man will trust to his own right arm to put things straight in the world. To look at her! — could any man refuse? And now she rises and goes away, and all the glad summer-time and the sunshine have gone, and the cold wind shivers through the trees, and it breathes only of farewell. Farewell, O miserable one! the way is dark before you, and you are alone. Alone, and no man near to help.

Macleod was awakened from his trance. The act drop was let down; there was a stir throughout the theatre; young Ogilvie turned to him.

"Don't you see who has come into that corner box up there?"

If he had been told that Miss White, just come up from Prince's Gate, in her plain black dress and blue beads, had just arrived and was seated there, he would scarcely have been surprised. As it was, he looked up and saw Colonel Ross taking his seat, while the figure of a lady was partially visible behind the lace curtain.

"I wonder how often Mrs. Ross has seen this piece," Ogilvie said. "And I think Colonel Ross is as profound a believer in Miss White as his wife is. Will you go up and see them now?"

"No," Macleod said absently.

"I shall tell them," said the facetious boy, as he rose and got hold of his crush hat, "that you are meditating a leap on to the stage to rescue the distressed damsel."

And then his conscience smote him.

"Mind you," said he, "I think it is awfully good myself. I can't pump up any enthusiasm for most things that people rave about, but I do think this girl is uncommonly clever. And then she always dresses like a lady."

With this high commendation, Lieutenant Ogilvie left, and made his way up-stairs to Mrs. Ross's box. Apparently he was well received there, for he did not make his appearance again at the beginning of the next act, nor, indeed, until it was nearly over.

The dream-world opens again; and now it is a beautiful garden, close by the ruins of an old abbey, and fine ladies are walking about there. But what does he care for these marionettes uttering meaningless phrases? They have no more interest for him than the sham ivy on the sham ruins, so long as that one bright, speaking, pathetic face is absent: and the story they are carrying forward is for him no story at all, for he takes no heed of its details in his anxious watching for her appearance. The sides of this garden are mysteriously divided: by which avenue shall she approach? Suddenly he hears the low voice — she comes nearer. Now let the world laugh again! But, alas! when she does appear, it is in the company of her lover, and it is only to bid him good-by. Why does the coward hind take her at her word? A stick, a stone, a wave of the cold sea, would be more responsive to that deep and tremulous voice, which has now no longer any of the arts of a wilful coquetry about it, but is altogether as self-revealing as the generous abandonment of her eyes. The poor cipher! he is not the man to woo and win and carry off this noble woman, the unutterable soul-surrender of whose look has the courage of despair in it. He bids her farewell. The tailor's dummy retires. And she? in her agony, is there no one to

comfort her? They have demanded this sacrifice in the name of duty, and she has consented: ought not that to be enough to comfort her? Then other people appear, from other parts of the garden, and there is a Babel of tongues. He hears nothing; but he follows that sad face, until he could imagine that he listens to the throbbing of her aching heart.

And then, as the phantasms of the stage come and go, and fortune plays many pranks with these puppets, the piece draws near to an end. And now, as it appears, every thing is reversed, and it is the poor lover who is in grievous trouble, while she is restored to the proud position of her coquetries and wilful graces again, with all her friends smiling around her, and life lying fair before her. She meets him by accident. Suffering gives him a certain sort of dignity; but how is one to retain patience with the blindness of this insufferable ass? Don't you see, man — don't you see that she is waiting to throw herself into your arms? and you, you poor ninny, are giving yourself airs, and doing the grand heroic! And then the shy coquetry comes in again. The pathetic eyes are full of a grave compassion, if he must really never see her more. The cat plays with the poor mouse, and pretends that really the tender thing is gone away at last. He will take this half of a broken sixpence back: it was given in happier times. If ever he should marry, he will know that one far away prays for his happiness. And if — if these unwomanly tears —— And suddenly the crass idiot discovers that she is laughing at him, and that she has secured him and bound him as completely as a fly fifty times wound round by a spider. The crash of applause that accompanied the lowering of the curtain stunned Macleod, who had not quite come back from dream-land. And then, amid a confused roar, the curtain was drawn a bit back, and she was led — timidly smiling, so that her eyes seemed to take in all the theatre at once — across the stage by that same poor fool of a lover; and she had two or three bouquets thrown her, notably one from Mrs. Ross's box. Then she disappeared, and the lights were lowered, and there was a dull shuffling of people getting their cloaks and hats and going away.

"Mrs. Ross wants to see you for a minute," Ogilvie said.

"Yes," Macleod answered absently.

"And we have time yet, if you like, to get into a hansom and drive along to Lady Beauregard's."

CHAPTER V.

IN PARK LANE.

THEY found Mrs. Ross and her husband waiting in the corridor above.

"Well, how did you like it?" she said.

He could not answer off-hand. He was afraid he might say too much.

"It is like her singing," he stammered at length. "I am not used to these things. I have never seen anything like that before."

"We shall soon have her in a better piece," Mrs. Ross said. "It is being written for her. That is very pretty, but slight. She is capable of greater things."

"She is capable of anything," said Macleod simply, "if she can make you believe that such nonsense is real. I looked at the others. What did they say or do better than mere pictures in a book? But she — it is like magic."

"And did Mr. Ogilvie give you my message?" said Mrs. Ross. "My husband and I are going down to see a yacht-race on the Thames to-morrow — we did not think of it till this evening any more than we expected to find you here. We came along to try to get Miss White to go with us. Will you join our little party?"

"Oh yes, certainly — thank you very much," Macleod said eagerly.

"Then you'd better meet us at Charing Cross, at ten sharp," Colonel Ross said; "so don't let Ogilvie keep you up too late with brandy and soda. A special will take us down."

"Brandy and soda!" Mr. Ogilvie exclaimed. "I am going to take him along for a few minutes to Lady Beauregard's — surely that is proper enough; and I have to get down by the 'cold-meat' train to Aldershot, so there won't be much brandy and soda for me. Shall we go now, Mrs. Ross?"

"I am waiting for an answer," Mrs. Ross said, looking along the corridor.

Was it possible, then, that she herself should bring the answer to this message that had been sent her — stepping out of the dream-world in which she had disappeared with her lover? And how would she look as she came along this narrow passage? Like the arch coquette of this land of gaslight and glowing colors? or like the pale, serious, proud girl who was fond of sketching the elm at Prince's Gate? A strange nervousness possessed him as he thought she might suddenly appear. He did not listen to the talk between Colonel Ross and Mr. Ogilvie. He did not notice that this small party

was obviously regarded as being in the way by the attendants who were putting out the lights and shutting the doors of the boxes. Then the man came along.

"Miss White's compliments, ma'am, and she will be very pleased to meet you at Charing Cross at ten to-morrow."

"And Miss White is a very brave young lady to attempt any thing of the kind," observed Mr. Ogilvie confidentially, as they all went down the stairs; "for if the yachts should get becalmed off the Nore, or off the Mouse, I wonder how Miss White will get back to London in time?"

"Oh, we shall take care of that," said Colonel Ross. "Unless there is a good steady breeze we sha'n't go at all; we shall spend a happy day at Rosherville, or have a look at the pictures at Greenwich. We sha'n't get Miss White into trouble. Good-by, Ogilvie. Good-bye, Sir Keith. Remember ten o'clock, Charing Cross."

They stepped into their carriage and drove off.

"Now," said Macleod's companion, "are you tired?"

"Tired? I have done nothing all day."

"Shall we get into a hansom and drive along to Lady Beauregard's?"

"Certainly, if you like. I suppose they won't throw you over again."

"Oh no," said Mr. Ogilvie, as he once more adventured his person in a cab. "And I can tell you it is much better — if you look at the thing philosophically, as poor wretches like you and me must — to drive to a crush in a hansom than in your own carriage. You don't worry about your horses being kept out in the rain; you can come away at any moment; there is no fussing with servants, and rows because your man has got out of the rank — HOLD UP!"

Whether it was the yell or not, the horse recovered from the slight stumble; and no harm befell the two daring travellers.

"These vehicles give one some excitement," Macleod said — or rather roared, for Piccadilly was full of carriages. "A squall in Loch Scridain is nothing to them."

"You'll get used to them in time," was the complacent answer.

They dismissed the hansom at the corner of Piccadilly, and walked up Park Lane, so as to avoid waiting in the rank of carriages. Macleod accompanied his companion meekly. All this scene around him, the flashing lights of the broughams, the brilliant windows, the stepping across the pavement of a strangely-dressed dignitary from some foreign land, seemed but some other part of that dream from which he had not quite shaken himself free. His head was still full of the sorrows and coquetries of that wild-spirited heroine. Whither had she gone by this time — away into some strange valley of that unknown world?

He was better able than Mr. Ogilvie to push his way through the crowd of footmen who stood in two lines across the pavement in front of Beauregard House, watching for the first appearance of their master or mistress; but he resignedly followed, and found himself in the avenue leading clear up to the steps. They were not the only arrivals, late as the hour was. Two young girls, sisters, clad in cream-white silk with a gold fringe across their shoulders and sleeves, preceded them; and he was greatly pleased by the manner in which these young ladies, on meeting in the great hall an elderly lady who was presumably a person of some distinction, dropped a pretty little old-fashioned courtesy as they shook hands with her. He admired much less the more formal obeisance which he noticed a second after. A royal personage was leaving; and as this lady, who was dressed in mourning, and was leaning on the arm of a gentleman whose coat was blazing with diamond stars, and whose breast was barred across with a broad blue ribbon, came along the spacious landing at the foot of the wide staircase, she graciously extended her hand and said a few words to such of the ladies standing by as she knew. That deep bending of the knee he considered to be less pretty than the little courtesy performed by the young ladies in cream-white silk. He intended to mention this matter to his cousin Janet.

Then, as soon as the princess had left, the lane through which she had passed closed up again, and the crowd became a confused mass of murmuring groups. Still meekly following, Macleod plunged into this throng, and presently found himself being introduced to Lady Beauregard — an amiable little woman who had been a great beauty in her time, and was pleasant enough to look at now. He passed on.

"Who is the man with the blue ribbon and the diamond stars?" he asked of Mr. Ogilvie.

"That is Monsieur le Marquis himself — that is your host," the young gentleman replied — only Macleod could not tell why he was obviously trying to repress some covert merriment.

"Didn't you hear?" Mr. Ogilvie said

at length. "Don't you know what he called you? That man will be the death of me — for he's always at it. He announced you as Sir Thief Macleod — I will swear he did."

"I should not have thought he had so much historical knowledge," Macleod answered gravely. "He must have been reading up about the clans."

At this moment Lady Beauregard, who had been receiving some other late visitors, came up and said she wished to introduce him to — he could not make out the name. He followed her. He was introduced to a stout, elderly lady, who still had beautifully fine features, and a simple and calm air which rather impressed him. It is true that at first a thrill of compassion went through him; for he thought that some accident had befallen the poor lady's costume, and that it had fallen down a bit unknown to herself; but he soon perceived that most of the other women were dressed similarly, some of the younger ones, indeed, having the back of their dress open practically to the waist. He wondered what his mother and Janet would say to this style.

"Don't you think the princess is looking pale?" he was asked.

"I thought she looked very pretty — I never saw her before," said he.

What next? That calm air was a trifle cold and distant. He did not know who the woman was, or where she lived, or whether her husband had any shooting, or a yacht, or a pack of hounds. What was he to say? He returned to the princess.

"I only saw her as she was leaving," said he. "We came late. We were at the Piccadilly Theatre."

"Oh, you saw Miss Gertrude White," said this stout lady; and he was glad to see her eyes light up with some interest. "She is very clever, is she not? — and so pretty and engaging. I wish I knew some one who knew her."

"I know some friends of hers," Macleod said, rather timidly.

"Oh, do you, really? Do you think she would give me a morning performance for my fund?"

This lady seemed to take it so much for granted that every one must have heard of her fund that he dared not confess his ignorance. But it was surely some charitable thing; and how could he doubt that Miss White would immediately respond to such an appeal?

"I should think that she would," said he, with a little hesitation; but at this moment some other claimant came forward, and he turned away to seek young Ogilvie once more.

"Ogilvie," said he, "who is that lady in the green satin?"

"The Duchess of Wexford."

"Has she a fund?"

"A what?"

"A fund — a charitable fund of some sort."

"Oh, let me see. I think she is getting up money for a new training-ship — turning the young ragamuffins about the streets into sailors, don't you know?"

"Do you think Miss White would give a morning performance for that fund?"

"Miss White! Miss White! Miss White!" said Lieutenant Ogilvie. "I think Miss White has got into your head."

"But that lady asked me."

"Well, I should say it was exactly the thing that Miss White would like to do — get mixed up with a whole string of duchesses and marchionesses — a capital advertisement — and it would be all the more distinguished if it was an amateur performance, and Miss Gertrude White the only professional admitted into the charmed circle."

"You are a very shrewd boy, Ogilvie," Macleod observed. "I don't know how you ever got so much wisdom into so small a head."

And indeed, as Lieutenant Ogilvie was returning to Aldershot by what he was pleased to call the cold-meat train, he continued to play the part of mentor for a time with great assiduity, until Macleod was fairly confused with the number of persons to whom he was introduced, and the remarks his friend made about them.

What struck him most, perhaps, was the recurrence of old Highland or Scotch family names, borne by persons who were thoroughly English in their speech and ways. Fancy a Gordon who said "lock" for "loch;" a Mackenzie who had never seen the Lewis; a Mac Alpine who had never heard the proverb, "The hills, the Mac Alpines, and the devil came into the world at the same time"!

It was a pretty scene; and he was young, and eager, and curious, and he enjoyed it. After standing about for half an hour or so, he got into a corner from which, in quiet, he could better see the brilliant picture as a whole: the bright, harmonious dresses; the glimpses of beautiful eyes and blooming complexions; the masses of foxgloves which Lady Beauregard had as the only floral decoration of the evening; the pale canary-colored panels and silver-fluted columns of the walls; and

over all the various candelabra, each bearing a cluster of sparkling and golden stars. But there was something wanting. Was it the noble and silver-haired lady of Castle Dare whom he looked for in vain in that brilliant crowd that moved and murmured before him? Or was it the friendly and familiar face of his cousin Janet, whose eyes, he knew, would be filled with a constant wonder if she saw such diamonds and silks and satins? Or was it that *ignis fatuus* — that treacherous and mocking fire — that might at any time glimmer in some suddenly presented face with a new surprise? Had she deceived him altogether down at Prince's Gate? Was her real nature that of the wayward, bright, mischievous, spoiled child whose very tenderness only prepared her unsuspecting victim for a merciless thrust? And yet the sound of her sobbing was still in his ears. A true woman's heart beat beneath that idle raillery: challenged boldly, would it not answer loyally and without fear?

Psychological puzzles were new to this son of the mountains; and it is no wonder that, long after he had bidden good-bye to his friend Ogilvie, and as he sat thinking alone in his room, with Oscar lying across the rug at his feet, his mind refused to be quieted. One picture after another presented itself to his imagination: the proud-souled enthusiast longing for the wild winter nights and the dark Atlantic seas; the pensive maiden, shuddering to hear the fierce story of Maclean of Lochbuy; the spoiled child, teasing her mamma and petting her canary; the wronged and weeping woman, her frame shaken with sobs, her hands clasped in despair; the artful and demure coquette, mocking her lover with her sentimental farewells. Which of them all was she? Which should he see in the morning? Or would she appear as some still more elusive vision, retreating before him as he advanced?

Had he asked himself, he would have said that these speculations were but the fruit of a natural curiosity. Why should he not be interested in finding out the real nature of this girl, whose acquaintance he had just made? It has been observed, however, that young gentlemen do not always betray this frantic devotion to psychological inquiry when the subject of it, instead of being a fascinating maiden of twenty, is a homely-featured lady of fifty.

Time passed; another cigar was lit; the blue light outside was becoming silvery; and yet the problem remained unsolved. A fire of impatience and restlessness was burning in his heart; a din as of brazen instruments — what was the air the furious orchestra played? — was in his ears; sleep or rest was out of the question.

"Oscar!" he called. "Oscar, my lad, let us go out!"

When he steathily went down-stairs and opened the door and passed into the street, behold! the new day was shining abroad — and how cold, and still, and silent it was after the hot glare and the whirl of that bewildering night! No living thing was visible. A fresh, sweet air stirred the leaves of the trees and bushes in St. James's Square. There was a pale lemon-yellow glow in the sky, and the long, empty thoroughfare of Pall Mall seemed coldly white.

Was this a somnambulist, then, who wandered idly along through the silent streets, apparently seeing nothing of the closed doors and the shuttered windows on either hand? A policeman, standing at the corner of Waterloo Place, stared at the apparition — at the twin apparition, for this tall young gentleman with the light top-coat thrown over his evening dress, was accompanied by a beautiful collie that kept close to his heels. There was a solitary four-wheeled cab at the foot of the Haymarket; but the man had got inside and was doubtless asleep. The Embankment? — with the young trees stirring in the still morning air; and the broad bosom of the river catching the gathering glow of the skies. He leaned on the gray stone parapet, and looked out on the placid waters of the stream.

Placid, indeed, they were as they went flowing quietly by; and the young day promised to be bright enough; and why should there be aught but peace and good-will upon earth toward all men and women? Surely there was no call for any unrest, or fear, or foreboding? The still and shining morning was but emblematic of his life — if only he knew, and were content. And indeed he looked contented enough, as he wandered on, breathing the cool freshness of the air, and with a warmer light from the east now touching from time to time his sun-tanned face. He went up to Covent Garden — for mere curiosity's sake. He walked along Piccadilly, and thought the elms in the Green Park looked more beautiful than ever. When he returned to his rooms he was of opinion that it was scarcely worth while to go to bed; and so he changed his clothes, and called for breakfast as soon as some one was up. In a short time — after his

newspaper had been read — he would have to go down to Charing Cross.

What of this morning walk? Perhaps it was unimportant enough. Only, in aftertimes, he once or twice thought of it; and very clearly indeed he could see himself standing there in the early light, looking out on the shining waters of the river. They say that when you see yourself too vividly — when you imagine that you yourself are standing before yourself — that is one of the signs of madness.

CHAPTER VI.

A SUMMER DAY ON THE THAMES.

It occurred to him as he walked down to the station — perhaps he went early on the chance of finding her there alone — that he ought seriously to study the features of this girl's face; for was there not a great deal of character to be learned, or guessed at, that way? He had but the vaguest notion of what she was really like. He knew that her teeth were pearly white when she smiled, and that the rippling golden-brown hair lay rather low on a calm and thoughtful forehead; but he had a less distinct impression that her nose was perhaps the least thing *retroussé;* and as to her eyes? They might be blue, gray, or green, but one thing he was sure of was that they could speak more than was ever uttered by any speech. He knew, besides, that she had an exquisite figure: perhaps it was the fact that her shoulders were a trifle squarer than is common with women that made her look somewhat taller than she really was.

He would confirm or correct these vague impressions. And as the chances were that they would spend a whole long day together, he would have abundant opportunity of getting to know something about the character and disposition of this new acquaintance, so that she should no longer be to him a puzzling and distracting will-o'-the-wisp. What had he come to London for but to improve his knowledge of men and of women, and to see what was going on in the larger world? And so this earnest student walked down to the station.

There were a good many people about, mostly in groups chatting with each other; but he recognized no one. Perhaps he was looking for Colonel and Mrs. Ross; perhaps for a slender figure in black, with blue beads; at all events he was gazing somewhat vacantly around when some one turned close by him. Then his heart stood still for a second. The sudden light that sprang to her face when she recognized him blinded him. Was it to be always so? Was she always to come upon him in a flash, as it were? What chance had the poor student of fulfilling his patient task when, on his approach, he was sure to be met by this surprise of the parted lips, and sudden smile, and bright look? He was far too bewildered to examine the outline of her nose or the curve of the exquisitely short upper lip.

But the plain truth was that there was no extravagant joy at all in Miss White's face, but a very slight and perhaps pleased surprise; and she was not in the least embarrassed.

"Are you looking for Mrs. Ross," said she, "like myself?"

"Yes," said he; and then he found himself exceedingly anxious to say a great deal to her, without knowing where to begin. She had surprised him too much — as usual. She was so different from what he had been dreaming about. Here was no one of the imaginary creatures that had risen before his mind during the stillness of the night. Even the pale dreamer in black and blue beads was gone. He found before him (as far as he could make out) a quiet, bright-faced, self-possessed girl, clad in a light and cool costume of white, with bits of black velvet about it; and her white gloves and sunshade and the white silver chain round her slender waist were important features in the picture she presented. How could this eager student of character get rid of these distressing trivialities? All night long he had been dreaming of beautiful sentiments and conflicting emotions: now his first thought was that he had never seen any costume so delightfully cool and clear and summer-like. To look at her was to think of a mountain-spring, icy cold even in the sunshine.

"I always come early," said she, in the most matter-of-fact way. "I cannot bear hurry in catching a train."

Of course not. How could any one associate rattling cabs, and excited porters, and frantic mobs with this serene creature, who seemed to have been wafted to Charing Cross on a cloud? And if he had had his will, there would have been no special train to disturb her repose. She would have embarked in a noble barge, and lain upon couches of swan's-down, and ample awnings of silk would have sheltered her from the sun, while the beautiful craft floated away down the river, its crimson hangings here and there just touching the rippling waters.

"Ought we to take tickets?"

That was what she actually said; but what those eloquent, innocent eyes seemed to say was, "*Can you read what we have to tell you? Don't you know what a simple and confiding soul appeals to you? — clear as the daylight in its truth. Cannot you look through us and see the trusting, tender soul within?*"

"Perhaps we had better wait for Colonel Ross," said he; and there was a little pronoun in this sentence that he would like to have repeated. It was a friendly word. It established a sort of secret companionship. It is the proud privilege of a man to know all about railway tickets; but he rather preferred this association with her helpless innocence and ignorance.

"I had no idea you were coming to-day. I rather like those surprise parties. Mrs. Ross never thought of going till last evening, she says. Oh, by the way, I saw you in the theatre last evening."

He almost started. He had quite forgotten that this self-possessed, clear-eyed, pale girl was the madcap coquette whose caprices and griefs had alternately fascinated and moved him on the previous evening.

"Oh, indeed," he stammered. "It was a great pleasure to me — and a surprise. Lieutenant Ogilvie played a trick upon me. He did not tell me before we went that — that you were to appear."

She looked amused.

"You did not know, then, when we met at Mrs. Ross's, that I was engaged at the Piccadilly Theatre?"

"Not in the least," he said earnestly, as if he wished her distinctly to understand that he could not have imagined such a thing to be possible.

"You should have let me send you a box. We have another piece in rehearsal. Perhaps you will come to see that."

Now if these few sentences, uttered by those two young people in the noisy railway station, be taken by themselves and regarded, they will be found to consist of the dullest commonplace. No two strangers in all that crowd could have addressed each other in a more indifferent fashion. But the trivial nothings which the mouth utters may become possessed of awful import when accompanied by the language of the eyes; and the poor commonplace sentences may be taken up and translated so that they shall stand written across the memory in letters of flashing sunlight and the colors of June. "*Ought we to take tickets?*" There was not much poetry in the phrase; but she lifted her eyes just then.

And now Colonel Ross and his wife appeared, accompanied by the only other friend they could get at such short notice to join this scratch party — a demure little old lady who had a very large house on Campden Hill which everybody coveted. They were just in time to get comfortably seated in the spacious saloon carriage that had been reserved for them. The train slowly glided out of the station, and then began to rattle away from the mist of London. Glimpses of a keener blue began to appear. The gardens were green with the foliage of the early summer; martins swept across the still pools, a spot of white when they got into the shadow. And Miss White would have as many windows open as possible, so that the sweet June air swept right through the long carriage.

And was she not a very child in her enjoyment of this sudden escape into the country? The rapid motion, the silvery light, the sweet air, the glimpses of orchards and farmhouses and mill-streams — all were a delight to her; and although she talked in a delicate, half-reserved, shy way with that low voice of hers, still there was plenty of vivacity and gladness in her eyes. They drove from Gravesend station to the riverside. They passed through the crowd waiting to see the yachts start. They got on board the steamer; and at the very instant that Macleod stepped from the gangway on to the deck, the military band on board, by some strange coincidence, struck up, "A Highland lad my love was born." Mrs. Ross laughed, and wondered whether the band-master had recognized her husband.

And now they turned to the river; and there were the narrow and shapely cutters, with their tall spars, and their pennons fluttering in the sunlight. They lay in two tiers across the river, four in each tier, the first row consisting of small forty-tonners, the more stately craft behind. A brisk northeasterly wind was blowing, causing the bosom of the river to flash in ripples of light. Boats of every size and shape moved up and down and across the stream. The sudden firing of a gun caused some movement among the red-capped mariners of the four yachts in front.

"They are standing by the main halyards," said Colonel Ross to his womenfolk. "Now watch for the next signal."

Another gun was fired; and all of a sudden there was a rattling of blocks and chains, and the four mainsails slowly rose,

and the flapping jibs were run out. The bows drifted round: which would get way on her first? But now there was a wild uproar of voices. The boom end of one of the yachts had caught one of the stays of her companion, and both were brought up head to wind. Cutter No. 3 took advantage of the mishap to sail through the lee of both her enemies, and got clear away, with the sunlight shining full on her bellying canvas. But there was no time to watch the further adventures of the forty-tonners. Here and closer at hand were the larger craft, and high up in the rigging were the mites of men, ready to drop into the air, clinging on to the halyards. The gun is fired. Down they come, swinging in the air; and the moment they have reached the deck they are off and up the ratlines again, again to drop into the air until the gaff is high hoisted, the peak swinging this way and that, and the gray folds of the mainsail lazily flapping in the wind. The steamer begins to roar. The yachts fall away from their moorings, and one by one the sails fill out to the fresh breeze. And now all is silence and an easy gliding motion, for the eight competitors have all started away, and the steamer is smoothly following them.

"How beautiful they are! — like splendid swans," Miss White said: she had a glass in her hand, but did not use it, for as yet the stately fleet was near enough.

"A swan has a body," said Macleod. "These things seem to me to be all wings. It is all canvas, and no hull."

And indeed, when the large top-sails and big jibs came to be set, it certainly appeared as if there was nothing below to steady this vast extent of canvas. Macleod was astonished. He could not believe that people were so reckless as to go out in boats like that.

"If they were up in our part of the world," said he, "a puff of wind from the Gribun Cliffs would send the whole fleet to the bottom."

"They know better than to try," Colonel Ross said. "Those yachts are admirably suited for the Thames; and Thames yachting is a very nice thing. It is very close to London. You can take a day's fresh air when you like, without going all the way to Cowes. You can get back to town in time to dine."

"I hope so," said Miss White, with emphasis.

"Oh, you need not be afraid," her host said, laughing. "They only go round the Nore; and with this steady breeze they ought to be back early in the afternoon. My dear Miss White, we sha'n't allow you to disappoint the British public."

"So I may abandon myself to complete idleness without concern?"

"Most certainly."

And it was an enjoyable sort of idleness. The river was full of life and animation as they glided along; fitful shadows and bursts of sunshine crossed the foliage and pasture lands of the flat shores; the yellow surface of the stream was broken with gleams of silver; and always, when this somewhat tame and peaceful and pretty landscape tended to become monotonous, they had on this side or that the spectacle of one of those tall and beautiful yachts rounding on a new tack or creeping steadily up on one of her opponents. They had a sweepstakes, of course, and Macleod drew the favorite. But then he proceeded to explain to Miss White that the handicapping by means of time-allowances made the choice of a favorite a mere matter of guess-work; that the fouling at the start was of but little moment; and that on the whole she ought to exchange yachts with him.

"But if the chances are all equal, why should your yacht be better than mine?" said she.

The argument was unanswerable; but she took the favorite for all that, because he wished her to do so; and she tendered him in return the bit of folded paper with the name of a rival yacht on it. It had been in her purse for a minute or two. It was scented when she handed it to him.

"I should like to go to the Mediterranean in one of those beautiful yachts," she said, looking away across the troubled waters, "and lie and dream under the blue skies. I should want no other occupation than that: that would be real idleness. With a breath of wind now and then to temper the heat; and an awning over the deck; and a lot of books. Life would go by like a dream."

Her eyes were distant and pensive. To fold the bits of paper, she had taken off her gloves: he regarded the small white hands, with the blue veins and the pink almond-shaped nails. She was right. That was the proper sort of existence for one so fine and pale, and perfect even to the finger-tips. Rose-leaf — rose-leaf — what faint wind will carry you away to the south?

At this moment the band struck up a lively air. What was it?

O this is no my ain lassie,
Fair though the lassie be.

"You are in great favor to-day, Hugh," Mrs. Ross said to her husband. "You will have to ask the band-master to lunch with us."

But this sharp alterative of a well-known air had sent Macleod's thoughts flying away northward, to scenes far different from these flat shores, and to a sort of boating very different from this summer sailing. Janet, too: what was she thinking of — far away in Castle Dare? Of the wild morning on which she insisted on crossing to one of the Freshnist Islands, because of the sick child of a shepherd there; and of the open herring-smack, and she sitting on the ballast stones; and of the fierce gale of wind and rain that hid the island from their sight; and of her landing, drenched to the skin, and with the salt water running from her hair and down her face?

"Now for lunch," said Colonel Ross; and they went below.

The bright little saloon was decorated with flowers; the colored glass on the table looked pretty enough; here was a pleasant break in the monotony of the day. It was an occasion, too, for assiduous helpfulness, and gentle inquiries, and patient attention. They forgot about the various chances of the yachts. They could not at once have remembered the name of the favorite. And there was a good deal of laughter and pleasant chatting, while the band overhead — heard through the open skylight — still played,—

O this is no my ain lassie,
Kind though the lassie be.

And behold! when they went up on deck again they had got ahead of all the yachts, and were past the forts at the mouth of the Medway, and were out on an open space of yellowish-green water that showed where the tide of the sea met the current of the river. And away down there in the south a long spur of land ran out at the horizon, and the sea immediately under was still and glassy, so that the neck of land seemed projected into the sky — a sort of gigantic razor-fish suspended in the silvery clouds. Then, to give the yachts time to overtake them, they steamed over to a mighty ironclad that lay at anchor there; and as they came near her vast black bulk they lowered their flag, and the band played "Rule, Britannia." The salute was returned; the officer on the high quarter-deck raised his cap; they steamed on.

In due course of time they reached the Nore light-ship, and there they lay and drifted about until the yachts should come up. Long distances now separated that summer fleet; but as they came along, lying well over before the brisk breeze, it was obvious that the spaces of time between the combatants would not be great. And is not this Miss White's vessel, the favorite in the betting, that comes sheering through the water, with white foam at her bows? Surely she is more than her time-allowance ahead? And on this tack will she get clear round the ruddy little light-ship, or is there not a danger of her carrying off a bowsprit? With what an ease and majesty she comes along, scarcely dipping to the slight summer waves, while they on board notice that she has put out her long spinnaker boom, ready to hoist a great ballooner as soon as she is round the light-ship and running home before the wind. The speed at which she cuts the water is now visible enough as she obscures for a second or so the hull of the light-ship. In another second she has sheered round; and then the great spinnaker bulges out with the breeze, and away she goes up the river again. Chronometers are in request. It is only a matter of fifty seconds that her nearest rival, now coming sweeping along, has to make up. But what is this that happens just as the enemy has got round the Nore? There is a cry of "Man overboard!" The spinnaker boom has caught the careless skipper and pitched him clean into the plashing waters, where he floats about, not as yet certain, probably, what course his vessel will take. She at once brings her head up to wind and puts about; but meanwhile a small boat from the light-ship has picked up the unhappy skipper, and is now pulling hard to strike the course of the yacht on her new tack. In another minute or two he is on board again; and away she goes for home.

"I think you have won the sweepstakes, Miss White," Macleod said. "Your enemy has lost eight minutes."

She was not thinking of sweepstakes. She seemed to have been greatly frightened by the accident.

"It would have been so dreadful to see a man drowned before your eyes — in the midst of a mere holiday excursion."

"Drowned?" he cried. "There? if a sailor lets himself get drowned in this water with all these boats about, he deserves it."

"But there are many sailors who cannot swim at all."

"More shame for them," said he.

"Why, Sir Keith," said Mrs. Ross,

laughing, "do you think that all people have been brought up to an amphibious life like yourself? I suppose in your country, what with the rain and the mist, you seldom know whether you are on sea or shore?"

"That is quite true," said he gravely. "And the children are all born with fins. And we can hear the mermaids singing all day long. And when we want to go anywhere we get on the back of a dolphin."

But he looked at Gertrude White. What would she say about that far land that she had shown such a deep interest in? There was no raillery at all in her low voice as she spoke.

"I can very well understand," she said, "how the people there fancied they heard the mermaids singing — amidst so much mystery, and with the awfulness of the sea around them."

"But we have had living singers," said Macleod, "and that among the Macleods, too. The most famous of all the song-writers of the western Highlands was Mary Macleod, that was born in Harris — Mairi Nighean Alasdair Ruaidh, they called her, that is, Mary the daughter of red Alister. Macleod of Dunvegan, he wished her not to make any more songs; but she could not cease the making of songs. And there was another Macleod — Fionaghal, they called her, that is, the Fair Stranger. I do not know why they called her the Fair Stranger — perhaps she came to the Highlands from some distant place. And I think if you were going among the people there at this very day, they would call you the Fair Stranger."

He spoke quite naturally and thoughtlessly; his eyes met hers only for a second; he did not notice the soft touch of pink that suffused the delicately tinted cheek.

"What did you say was the name of that mysterious stranger?" asked Mrs. Ross — "that poetess from unknown lands?"

"Fionaghal," he answered.

She turned to her husband.

"Hugh," she said, "let me introduce you to our mysterious guest. This is Fionaghal — this is the Fair Stranger from the islands — this is the poetess whose melodies the mermaids have picked up. If she only had a harp now — with sea-weed hanging from it — and an oval mirror ——"

The booming of a gun told them that the last yacht had rounded the light-ship. The band struck up a lively air, and presently the steamer was steaming off in the wake of the procession of yachts. There was now no more fear that Miss White should be late. The breeze had kept up well and had now shifted a point to the east, so that the yachts, with their great ballooners, were running pretty well before the wind. The lazy abandonment of the day became more complete than ever. Careless talk and laughter; an easy curiosity about the fortunes of the race; tea in the saloon, with the making up of two bouquets of white roses, sweet-peas, fuchsias and ferns — the day passed lightly and swiftly enough. It was a summer day, full of pretty trifles. Macleod, surrendering to the fascination, began to wonder what life would be if it were all a show of June colors and a sound of dreamy music: for one thing, he could not imagine this sensitive, beautiful, pale, fine creature otherwise than as surrounded by an atmosphere of delicate attentions and pretty speeches, and sweet, low laughter.

They got into their special train again at Gravesend, and were whirled up to London. At Charing Cross he bade good-bye to Miss White, who was driven off by Mr. and Mrs. Ross along with their other guest. In the light of the clear June evening he walked rather absently up to his rooms.

There was a letter lying on the table. He seized it and opened it with gladness. It was from his cousin Janet, and the mere sight of it seemed to revive him like a gust of keen wind from the sea. What had she to say? About the grumblings of Donald, who seemed to have no more pride in his pipes now the master was gone? About the anxiety of his mother over the reports of the keepers? About the upsetting of a dog-cart on the road to Lochbuy? He had half resolved to go to the theatre again that evening — getting, if possible, into some corner where he might pursue his profound psychological investigations unseen — but now he thought he would not go. He would spend the evening in writing a long letter to his cousin, telling her and the mother about all the beautiful, fine, gay summer life he had seen in London, so different from anything they could have seen in Fort William or Inverness, or even in Edinburgh. After dinner he sat down to this agreeable task. What had he to write about except brilliant rooms and beautiful flowers, and costumes, such as would have made Janet's eyes wide — of all the delicate luxuries of life, and happy idleness, and the careless enjoyment of people whose only thought was about a new pleasure? He gave a

minute description of all the places he had been to see — except the theatre. He mentioned the names of the people who had been kind to him; but he said nothing about Gertrude White.

Not that she was altogether absent from his thoughts. Sometimes his fancy fled away from the sheet of paper before him, and saw strange things. Was this Fionaghal the Fair Stranger — this maiden who had come over the seas to the dark shores of the isles — this king's daughter clad in white, with her yellow hair down to her waist, and bands of gold on her wrists? And what does she sing to the lashing waves but songs of high courage, and triumph, and welcome to her brave lover coming home with plunder through the battling seas? Her lips are parted with her singing, but her glance is bold and keen: she has the spirit of a king's daughter, let her come from whence she may.

Or is Fionaghal the Fair Stranger this poorly dressed lass who boils the potatoes over the rude peat fire, and croons her songs of suffering and of the cruel drowning in the seas, so that from hut to hut they carry her songs, and the old wives' tears start afresh to think of their brave sons lost years and years ago?

Neither Fionaghal is she — this beautiful, pale woman, with her sweet, modern English speech, and her delicate, sensitive ways, and her hand that might be crushed like a rose-leaf. There is a shimmer of summer around her; flowers lie in her lap; tender observances encompass and shelter her. Not for her the biting winds of the northern seas, but rather the soft luxurious idleness of placid waters, and blue skies, and shadowy shores. *Rose-leaf — rose-leaf — what faint wind will carry you away to the south?*

From Fraser's Magazine.

MURDER OF COMMISSIONER FRASER — DELHI, 1835.

A TALE OF CIRCUMSTANTIAL EVIDENCE.

In the grounds of Easter Moniack, the seat of the ancient family of Fraser of Reelig, near Inverness, there stands, under the shade of a wide-spreading cedar of Lebanon, a small cenotaph, sacred to the memory of four sons of the family, three of whom were in the service of the Honorable East India Company, and died in India.

The circumstances attending the death of one of the sons — William Fraser — are so curious, that a narrative of them may not be without interest to your readers.

William Fraser was a distinguished member of the Bengal civil service, and held, in 1835, the important office of commissioner of Delhi, under which denomination was included an area of some twenty thousand square miles, and a population of probably not less than three millions of people, besides several small *quasi* independent chiefships. He was a man deservedly popular with the natives of all ranks, and was beloved by them, more particularly by the lower classes, with whom, on many occasions, he showed strong sympathy; but being a man of considerable force of character and decision of purpose, he sometimes made enemies.

Upon the 22d March, 1835, between six and seven o'clock in the evening, Mr. Fraser was returning on horseback, attended only by an unarmed servant mounted on one of his spare horses, from an official visit to the rajah of Kishengurh, and was just entering his own grounds, when a native trooper rode up, and, as he passed, discharged his carbine into Mr. Fraser's back. So close was the assassin when he fired, that Mr. Fraser's coat was singed with the powder. The balls passed through his body, he sprang up in his saddle, and then fell dead on the ground. The trooper was seen by the terror-stricken servant to ride off at speed in the direction of the city of Delhi, situated about a mile distant. The servant rode to Mr. Fraser's house, gave the alarm, and his people hastening to the spot found their master dead, but his body still warm. All that the servant, a lad of about sixteen years of age, could say was, that the assassin was a horseman armed with a sword and carbine.

Mr. (now Lord) Lawrence happened to be at the time magistrate of the adjoining district of Paneeput. Early on the morning of the 23d March he received a brief note in Persian from one of his police officers, stating that news had just arrived to the effect that on the previous evening a trooper had ridden up to the commissioner as he was returning from his ride, and fired his carbine into his "sacred body," killing him on the spot.

Mr. Lawrence was much shocked at this tragic intelligence; and thinking that, as he was intimately acquainted with Delhi, he might be of use to Mr. T. Metcalfe, the senior civil officer, and to the magistrate, Mr. Simon Fraser, in tracing the murderer, he instantly ordered his

horse, and rode off to Mr. Metcalfe's house, a distance of forty miles. In reply to his inquiries, Mr. Metcalfe told him that no satisfactory traces of the murderer had been found; that no one was suspected; and that, further, some men of the Goojur caste, well known for their skill in tracking, had been sent to the scene of the murder, to follow up, if possible, the tracks of the assassin's horse. They had succeeded in doing so to a spot where the road divided into three branches, two leading into the country, and the third to the Cabul gate of the city of Delhi.

The Goojurs apparently considered it very improbable that any man in his senses, after the commission of such a crime, would venture himself into Dehli, full as it was of government police, and where he could scarcely hope to escape observation and arrest; they therefore did not think it worth while to examine the road leading to the city, but tried, without success, to follow up the tracks along the two roads branching into the country. It was too dark when they abandoned their ineffectual search for further examination toward the city. Recommencing the search the next morning, they found that all marks of the previous night had been obliterated by the footsteps of early travellers passing to and from the town. The Goojurs were therefore completely at fault, and could give no further assistance. Mr. Metcalfe, however, informed Mr. Lawrence that an old chief — Futteh Khan, a resident of Delhi (who was in receipt of a pension for good service under the Duke of Wellington in the pursuit of the celebrated outlaw Doondiah Waugh in 1804) — had just been calling on him, and, after expressing his deep sorrow for the sad fate of Mr. Fraser, observed that it might possibly turn out that his own nephew, Shumshoodeen Khan, the nawab of Ferozepore, had been implicated in the murder. Mr. Metcalfe, however, expressed his doubts of the nawab's having any share in the affair, and said that he thought very likely the old pensioner's accusing his nephew arose from some motives of private enmity. Mr. Lawrence remarked that it might be so; but as in hunting, when the scent is lost, one casts about at a venture to recover it, so in this case they must take up any chance clue which might present itself, in the hope of its leading to the object sought for. Therefore he would advise that in the absence of anything more tangible, it would be well to follow the clue suggested by Nawab Futteh Khan.

Accordingly, Mr. Lawrence left Mr. Metcalfe's house, and went to that of the magistrate, Mr. Simon Fraser, to whom he told the conversation that had passed between Mr. Metcalfe and the old pensioner. The magistrate stated that he was aware that the nawab of Ferozepore was at enmity with the late commissioner, in consequence of some proceedings of that officer in connection with the Ferozepore State. The late nawab had left two sons: the elder illegitimate, who had succeeded his father; and the younger, the son of his married wife, for whom no provision had been made. The late commissioner, thinking the case a very hard one, had been endeavoring to force the ruling nawab, Shumshoodeen, to assign a portion of his territory for the support of his younger brother, which the nawab bitterly resented, and hence his enmity to Mr. William Fraser.

Thinking that these facts, added to the suspicions expressed by the old pensioner, gave them a clue which they should at once follow up, Mr. Lawrence and Mr. Simon Fraser proceeded together to visit the house in the city of Delhi belonging to the nawab Shumshoodeen, in the hope of obtaining information which might lead to the detection of the murderer. On arriving at the house, and entering the court-yard in which it stood, they found no one, nor did any person respond to their repeated calls. Mr. Fraser then proposed to Mr. Lawrence that they should enter the house; that Mr. Lawrence should remain and watch below, while he went upstairs and looked about him. This they did. Mr. Lawrence, to occupy the time, sauntered about the court-yard, and came upon a very good-looking chestnut horse standing at his picket.

Being fond of horses Mr. Lawrence went up and began to examine the animal, and had reason to admire some of his points. While so doing, a man of the Goojur caste, whom until then he had not observed, joined Mr. Lawrence, who praised the animal to him. The Goojur, while admitting the merits of the horse, somewhat abruptly remarked, "Yes, sir; but do you not perceive that the hind hoofs are wider than the front ones?" And then, taking up a straw, he measured a hoof before and behind with it; and holding it up to view, said, "There is just one straw's difference between the one and the other; and the same difference was seen in the tracks of the horse which the murderer of Mr. Fraser rode. I am certain that this is the animal that was ridden by the murderer." As the Goojur was saying this, a native trooper, in undress, lounged up. On Mr. Lawrence

beginning to question him, he said that the horse belonged to him; that he was an orderly of Shumshoodeen Khan, the nawab of Ferozepore — a district some ninety miles south of Delhi; and that he had been sent on a special duty to the city.

Mr. Lawrence said, "This is a nice horse."

"Yes," said the man, "he is a fine horse; but he is very sick, and has not been able to eat much for a week, nor to do his work."

Upon this Mr. Lawrence, feeling strong doubts as to the truth of the statement, and espying the saddle and other furniture of the horse at a little distance on the ground, walked up to them, and moving them with his foot, observed the *tobrāh*, or nose-bag, full of grain, ready for the animal. He picked it up, and slung it on the horse's head, who commenced at once feeding greedily, proving that the trooper's statement was evidently not very correct. As Mr. Lawrence stood watching the animal, he was joined by the magistrate, who said he could find no one in the house, but that, as he came down the staircase, his eye lighted on some fragments of paper floating on the top of a large bucket of water. These fragments, on taking them up, bore all the appearance, to him, of a Persian letter, which had been read, torn up, squeezed together, and then thrown away. Even in their then condition, the magistrate, who was a man of quick apprehension and a good Persian scholar, could discern words in that language indicating instructions as to some transaction. He therefore put the papers into his pocket, with a view to further examination. Mr. Lawrence then told Mr. Fraser of the peculiarity in the horse's feet pointed out by the Goojur, and his own suspicion that the trooper was probably connected with the murder. Mr. Lawrence got into a conversation with the trooper about the late murder, as to who might have been connected with it, without making any special allusion to the nawab, his master; and without arousing his suspicions he induced the man to accompany him out of the nawab's premises, down the Chandeny Chowk (or great market-place) of Delhi, past the Begum Sumroo's garden, until they reached the magistrate's *kutcherry* and treasury, where there was a guard of sepoys posted under a native officer.

Mr. Lawrence then suggested to Mr. Fraser that it would be expedient to arrest the trooper, to which the latter consenting, they summoned the subhadar, who came up with two or three sepoys. Mr. Lawrence then turning to the trooper said to him: "This is an awkward business, this murder of the commissioner; and as it strikes me you must know something of the matter, you shall remain here under restraint until our doubts regarding you are cleared up." They then handed over the trooper, whose name was Wassil Khan, to the subhadar, with directions to keep him in confinement until further orders.* Subsequently, the nawab's house being searched, Wassil Khan's sword, which had been recently sharpened, was found among his clothes; but no trace of the carbine with which the murder had apparently been committed was forthcoming.

They then proceeded to Mr. Metcalfe's house, and reported to him all that had occurred, pointing out how, to their minds, it corroborated the old pensioner Futteh Khan's suspicions. It struck them both that in all probability the trooper had perpetrated the deed; that he, as a trusty follower of the nawab, had been instigated to it by his master, he himself having no motive of his own to engage in such an affair. At nightfall Mr. Lawrence again met the magistrate at his house, who informed him that, on coming home, he had tried to put the pieces of the Persian letter together, and to fix them with gum, but that they so stuck together, and the ink was so faded by the action of the water, that he was inclined to give up as useless any attempt to decipher the writing, and was about to do so, when Dr. Graham, civil surgeon of Delhi, called upon him, and, seeing how he was engaged, proposed to go for some chemicals which would restore the color of the ink. This was done; the letters became clear, and the writing proved to be a note from the nawab Shumshoodeen Khan to his servant Wassil Khan, to the following purport: "You know the object for which I sent you into Delhi; and I have repeatedly told you since, how important it is for me that you should buy 'the dogs.' If you have not yet done so, you must do it without delay; it is most *urgent* and necessary." It was then repeated, "It is necessary, it is very necessary, to buy the dogs."

The magistrate read the letter to Mr. Lawrence, and asked his opinion about it. He immediately replied: "I am certain 'the dogs' mean the commissioner, Wil-

* Wassil Khan was a Mogul, tall and well-made: he was known as an expert horseman and an excellent shot; just such a fellow as was *capable* of making a desperate resistance had time and opportunity availed; but taken at disadvantage, he probably thought it was his best chance to succumb to circumstances, and trust that no evidence of any importance would be found against him. He proved to be a desperate villain; but, nevertheless, undeniably possessed great courage, fortitude, and devotion to the cause of his master.

liam Fraser, whom the trooper was sent by his master, the nawab, to waylay and murder; and as there was some delay on the trooper's part, the nawab wrote this letter to him, enjoining him to do the work speedily." The magistrate concurred in this view, and Mr. Lawrence then left, and with this fresh evidence of the nawab's complicity, returned to the commissioner, telling him what had transpired, and urging him to send for the nawab at once, on the plea of wishing to consult him, as suspicions had arisen against one of his servants, the trooper Wassil Khan, in connection with the murder. The commissioner demurred, on account of the nawab's position and influence in the country, thinking it possible also that he would not obey the summons; but Mr. Lawrence continued to urge the measure, saying, "The nawab would either come or not come: if he did *not*, his refusal would give reasonable ground for believing that he was implicated — a result which he would probably be careful to avoid; and if *he came*, there would be this great advantage, that being out of his own territory, the nawab could not use his influence, as he otherwise certainly would do, to stifle the inquiries which ought at once to be instituted in the Ferozepore state by a special officer deputed for that purpose." Mr. Metcalfe then agreed to send for the nawab, and to depute Mr. C. Gubbins, magistrate of the adjoining district of Goorgaon, to prosecute inquiries. The nawab obeyed the commissioner's summons; and the coast being thus clear, Mr. Gubbins was able to pick up gradually, in conversation with the people, bits of intelligence throwing light on the case. He thus ascertained that it was the general impression there was a man on foot with the trooper on the fatal night, which had not hitherto been supposed. Mr. Gubbins learnt his name and abode, but could not get hold of him; as, for some reason or other not then clear, he had taken to the adjacent hills, and would not come in. This man was said to be Unyah Meo, a noted freebooter, well known for his power of enduring great fatigue, and for his swiftness of foot. Every endeavor was made by the government officers, but in vain, to arrest Unyah, or to induce him to surrender himself; and it was supposed that, fearing the vengeance of the nawab on himself and family if he gave evidence against him, and also the punishment which would be inflicted by the government if he admitted his complicity in the murder, Unyah continued to elude pursuit.

Colonel Skinner, the well-known commander of the corps of irregular cavalry called "Skinner's Horse," and a most intimate friend of William Fraser, had from the first exerted himself to help the magistrate in this difficult matter. With that view, Skinner had used every means in his power to induce Unyah to come in, but for a long time without success. At last Skinner received an anonymous Persian letter stating that the writer was well acquainted with the man whom he was in search of; and as he (the writer) was also desirous of bringing the murderer to justice, he would aid Mr. Skinner in his endeavors to secure the man. If, therefore, Skinner would send a party of horse under a native officer to a certain village in Bulundshuhur district, some twelve miles from Delhi, on a certain night, he would find the man he wanted. Whether this letter was written at Unyah's suggestion or otherwise, never transpired. Skinner acted on the information of the anonymous writer, and sent the party, which duly arrived in the village, but could find no one answering to the description of Unyah Meo. The party was just about quitting the village on their return to Delhi when suddenly a man appeared, and walking up to the native officer said, "I know whom you are seeking; I am Unyah Meo. I will go with you."

On being made over to the magiatrate, Unyah agreed to tell all he knew of the murder. He stated that the nawab Shumshoodeen Khan, being at enmity with the late commissioner, had instructed his servant Wassil Khan to go to Delhi, to watch his opportunity, and to kill Mr. Fraser some night as he was returning in the dusk from his customary evening ride. As William Fraser was well known to the natives for his great strength and remarkable courage, the nawab did not consider it prudent to devolve the task of murdering him on one single man, as in that case there would be a great chance of failure. The nawab had therefore sent Unyah Meo to remain in Delhi with the trooper, and to accompany him on all occasions when he went out with the intention of waylaying the commissioner. Unyah's instructions were to remain close by, so that when the carbine was fired, in the event of the shot not proving fatal, he could run up and help to despatch the commisssioner: however, as the shot killed the commissioner on the spot, there was no occasion for Unyah to interfere. At the suggestion of the assassin he at once started off to convey the intelligence to the nawab. Unyah ran all that night and the next day, arriving on the following evening at Ferozepore, a distance

of ninety miles. He entered the fort, and going straight to the door of the nawab's room, which was only closed by a thick curtain, told the orderly on duty to go in and inform the nawab that Unyah Meo had arrived and wanted to see him immediately, as he had very important news for him. The man went in and Unyah, with the natural caution and suspicion of his profession, crouching down lifted the corner of the curtain which closed the door to see what would follow, and hear what the nawab might say. The servant woke the nawab, who, on hearing of Unyah's arrival, ordered him to be admitted at once, but at the same time warned the servant in a low voice to take especial care, that when the nawab dismissed Unyah he should on no pretext be allowed to leave the fort. Unyah went in and told the nawab of the successful murder of the commissioner, at which he expressed great delight, and promised Unyah a handsome reward. He was then dismissed, and told to wait in the fort until the next morning, when he should receive the promised present, and he might then be allowed to go to his home.

But Unyah, remembering the orders he had overheard not to allow him to leave the fort, and surmising that they boded no good to him, slipped down to the gateway, and making some excuse to the sentry on duty there to allow him to pass through, sped away as fast as he could to his own house, situated in the jungle at a distance of seven miles from the fort, which he very soon reached. Unyah had two wives; he explained his situation to them, and said he must hide himself as best he could, for he was too tired to go further; it was pretty certain the nawab's horsemen would be sent to seize him. He then made a hasty meal, and going up to the flat roof of the house, his wives covered him up with some sheaves of straw placed there to dry.

Unyah's surmises were correct, for shortly after the nawab's horsemen arrived, as he had expected, and questioned the women as to whether they had seen Unyah. They, of course, denied all knowledge of him; and the horsemen, having searched the house in vain, returned to the fort, having made the women promise that should Unyah return he was to go at once to the nawab, who was anxious to reward him for his good services. Next morning Unyah, refreshed by his night's rest, fled to the hills, and defied every effort to find him, until he surrendered himself, as already related, to Skinner's troopers.

Ever since the murder of Mr. Fraser search had been made by the police, but in vain, to find the carbine used by Wassil Khan. It happened, however, that one evening, some time after the murder, a woman was drawing water from a deep well close to the Cabul gate of Delhi. While so employed, the rope broke, and the vessel attached to it sank into the water. She called her husband to her assistance; and he, letting a hook down fastened to a rope, pulled up not the lost vessel but a carbine, scarcely at all rusted, and bearing the appearance of having been recently discharged. On its being shown to Unyah, he at once recognized it as the weapon used by Wassil Khan.

Other evidence, tending to establish the guilt of the nawab and the trooper, was procured by degrees. Thus the grain-merchant who had supplied forage for the horse deposed that he had done so at the trooper's request for several days preceding the murder; then people of the bazaar adjacent to the nawab's house at Delhi, gave evidence that Wassil Khan had been in the habit of riding the animal out every afternoon, and that on the night of the murder he had returned with his horse in a lather, showing he had ridden hard. There happened to be a mosque near the scene of the murder, in which it was proved Wassil Khan had been seen on the very evening in question saying his prayers for an unusually long time, and that on their completion he had ridden his horse sharply off, as if intent on business of importance. It further appeared, that on the fatal night the commissioner had been detained later than usual, owing to the visit he had paid to the rajah of Kishengurh.

Both the nawab and the trooper were tried by a special commissioner, deputed by the government for the purpose, and their guilt being clearly proved, they were condemned to death. They were hanged close to the Cashmere gate of the city, and both retained their resolution to the last, and denied all knowledge of the murder.

Thus perished Nawab Shumshoodeen Khan, a chief of considerable position and wealth, all of which he owed to the British government, who had raised his father from comparatively humble circumstances for his services during the wars with the Mahrattas in the years 1802–3. The father was a man of ability, and was bred up in a school which demanded the exercise of the virtues of moderation, vigilance, and industry. In his old age he was highly respected and even honored; whilst the son, having no such inducements to self-restraint, passed a life of self-indulgence and recklessness, and came to an untimely and disgraceful death.

Some of the Mohammedans of Delhi regarded the nawab as a martyr, and erected a tomb to his memory, which was in due time regarded as a sacred shrine, to which numbers resorted to worship.

Of all the government officers employed in the investigation of this case, Lord Lawrence is now the sole survivor. Of those who have died, Mr. S. Fraser the magistrate, and Dr. Graham, met with violent deaths. Mr. S. Fraser, then holding the office of commissioner of Delhi, was killed in the king's palace by the mutineers on the morning of 11th May, 1857; and Dr. Graham was shot dead about the same time by the rebels at Sealkote in the Punjab, both falling in the execution of their duty.

DULCISSIMA! DILECTISSIMA!

A PASSAGE IN THE LIFE OF AN ANTIQUARY.

"COME, my dears," said I, looking in upon the room where my children were engaged in their various avocations, "come and see what a very interesting acquisition I have got to my collection of antiquities. It is the remains of a little Roman girl just discovered close to the place where the foundations of the Roman villa were turned up last summer; and it seems very probable that this little girl was a daughter of the house. Here is the glass jar — a more elegant and beautiful one than I have ever before seen used for the purpose — which contains her ashes; here is the lamp to light her on her last dark journey; here are the little ornaments she used to wear — mark especially this exquisitely enamelled *fibula;* here are her little shoes all quaintly studded with brass nails."

"O what funny shoes!" exclaimed one; "there must have been very bad roads in those days, when even little girls wore shoes studded with nails like that."

"On the contrary," said I, "the Romans were the first road-makers in the world; but never mind that now, here is the stone tablet which records her history, and a very interesting one it is."

D M
LVC. METELLAE
FILIOL. DVLCISS. DILECTISS.
VIX. ANN. VI.

"The letters D M at the top stand for Diis Manibus, something like," said I, with a free translation suited to family comprehension, "our 'Sacred to the Memory of.' The inscription then reads thus: 'Sacred to the memory of Lucia Metella, a little daughter most sweet, most tenderly beloved. She lived six years.' Observe that the Romans always, as Dr. Bruce remarks, avoided the mention of death; they tell us how long a person lived, never when he died. But is it not interesting," I went on, "to find more than a thousand years ago, and among a stern and warlike people like the Romans, these little touches of family tenderness and love?"

"O how very interesting! What a charming acquisition! How excited Dr. Harris (Dr. Harris was the antiquary of the district next in repute to myself) will be when he sees it!" were the various parting remarks made by my auditors, as they scampered back to their ordinary employments.

All but one. My Lily, my youngest, the apple of my eye, still stood, her fair head resting on her slender arms, gazing in silence, her lips slightly parted, a tear trembling in each soft blue eye, upon the relics of the little Roman girl. At last she spoke.

"Papa," she said, "this little girl was just the same age that I am."

"Yes, my darling," I said, "that is so; and moreover," I added, as a playful diversion to the child's gloom, "both your names begin with L — another coincidence."

But the thought that was in the child's heart was too deep for playfulness. After a pause she spoke again in pleading tones.

"Dear papa," she said, "it seems so pitiful for this poor little girl to lie here among all these queer things."

"My darling," said I, "these queer things, as you call them, are Roman things, such as this little girl was accustomed to see around her every day during her lifetime. Indeed, many of them came from the villa of which it seems very probable that she was the daughter."

"But, dear papa," she said, "you would not like *me*, when I am gone, to be laid out like a curiosity, and have strangers come and examine the little things I used to be fond of, and remark what funny shoes I had."

"Well — but, my dear child," said I, "what would you do with her?"

"I would bury her," she said, with childish seriousness, "in the garden, beneath the weeping ash, where good old Cato and my dear little dicky and Willy's white rabbit are buried. And — and," she added, in a lower voice, "I would add upon the stone, if there is room, 'Suffer little children to come unto me.'"

"My darling," I said, "I think all that would be a little incongruous; but I'll tell you what we might do," I went on, as a device occurred to me, which I thought might soothe the feelings of the child, "you shall gather from time to time fresh flowers to lay upon her as she lies, and then, if her poor little spirit can look down upon this world, she will see that, though a thousand years have passed, one dear little English girl still watches over her with tenderness and love."

"O yes," she said, brightening at the idea, "I think she would like that. I will gather fresh snowdrops for her now, and then when summer comes again I will change them for violets."

"*When summer comes again!*" A sudden pang of foreboding shot through my heart as the dear child spoke. She too was most sweet — she too was most tenderly beloved. But we were not without our fears on her account, and anxious whispers had passed between my wife and myself respecting her. But I cast aside the fears, as presently she returned, eager in her little work of love, with the snowdrops she had gathered, and, sitting down by my side as I was engaged in making out the maker's name upon the vase, she wove them with deft fingers into a pretty wreath, which done, she reverently laid it in its place, and hand-in-hand we left the room together.

The next morning after breakfast I had a considerable amount of congenial work to do. In the first place there was a full and detailed account of these interesting discoveries for the county society of which I was president, then a more condensed report for the Society of Antiquaries, of which I was a fellow, various questions of detail had to be examined and elucidated, and in the course of the morning an artist was to come up to take photographs of all these rare and beautiful objects. While I was thus engaged my wife entered the room with a troubled countenance.

"I am very uneasy," she said, "about dear Lily; she talks in such a strange way about a little girl in white that appeared to her last night. Of course it's all imagination, but I am afraid it looks as if there was something not quite right with her."

"We must have it looked to immediately," I replied gravely; "perhaps we ought to have had some better advice before. I will send off at once to London for Dr. S——, and as the distance is not great, we may have him with us this evening. In the mean time, will you send Lily to me, and let me hear what she has to say?"

"Now, my darling," I said, as Lily entered the room, "come and tell papa all about it."

She climbed upon my knee, threw her arms about my neck, and hiding her face against my breast, as is sometimes the wont of children when they have something grave to relate, she went on.

"I fell asleep, you know, papa dear, with my thoughts full of this poor little girl. I awoke in the night with a trouble, I could scarcely tell what, upon my mind. When I looked up, I saw standing by my bedside a little girl dressed all in white, and pale — oh! so pale. She held in her hand a wreath of snowdrops like the one that I had made, and looking at me with a mournful expression, but still very, very kindly, she stretched forth her hand as if to hand me back the wreath. When I looked again, she had disappeared."

I reasoned for some time with the child, trying to persuade her that what she fancied she had seen was only the result of her own excited imagination; but I could clearly see that though her deference to me prevented her from disputing anything I said, her belief in the reality of what she had seen remained unshaken. I saw too that the feeling on her mind was something more than mere sentiment. I saw how deeply she felt pained that the loved daughter of a thousand years ago should be treated so differently to our loved ones of to-day, and I resolved that, great as the sacrifice was, it should not stand in the way of the happiness, and perhaps the health, of my beloved child.

So at last I said to her, "Well now, my darling, just tell me what you think should be done, and what this little girl would like if she could tell us."

She burst into tears, flung her arms round my neck, and sobbed out, —

"O dear papa, I know you are so fond of it!"

"My darling," I said, "all the antiquities in the world are as nothing — *nothing* compared to my dear little girl's peace of mind."

"O dear papa," she said, through her tears, "how can I ever, ever love you enough!"

"My darling," said I, "I know you love me as I love you. But now, what is it you think this little girl would like?"

"I think that what she wants is to be laid in her grave in peace."

"And so it shall be," I replied; "and it shall be done at once."

So we dug a grave in the corner of the

garden where all the departed pets of the family were laid, and had it carefully lined with flat stones like a miniature vault, and therein we two — the puzzled gardener looking on — reverently laid the young Roman girl, with all her little treasures disposed around her, filled in the earth, and set up the stone tablet at the head.

We had scarcely finished our task when a well-known form was seen stalking up the avenue, and Lily, touching my hand in a little tremor, whispered, —

"O papa! Doctor Harris!"

Dr. Harris was the vice-president of the society of which I was president, an ardent antiquary, and in the main a very good fellow. But he was one of those men whose excessive vitality sometimes gives an appearance of roughness to their manner. I knew full well that the sensitive nature of my little girl made her rather shrink from his somewhat boisterous advances; and I had a pretty shrewd guess that poor Dr. Harris, glaring over the remains with his portentous spectacles, was in the mind's eye of the child when she made her appeal on Lucia's behalf. He was, morevoer, a man utterly destitute of sentiment, and in fact the last person we should have liked to come upon us in our present employment. I advanced to meet him, intending to explain it to him privately. But as he approached, he hallooed out with all the force of his lungs, —

"Lucky dog! I've heard of your discovery. Everything comes to you. Why does not some little Roman girl fling herself into *my* arms?"

And as he spoke he stretched out his arms, either in indication of his readiness to receive such a visitor, or as a salutation to my little girl, who had sheltered herself behind me. I took him aside to explain to him the state of the case.

"The fact is," said I, "that my dear little girl, whose health you know is rather delicate, took it so much to heart, that for her sake I have buried all the relics again."

"I see," he said, "and when the fit's over you'll dig them up again."

"Not so," said I, for some of my little girl's earnestness had imparted itself to me; "she shall lie in her grave for me till God comes to judge the world."

"Well, but I say," he went on, "suppose I come up some morning with a brand new doll, promise me you won't stand in the way of business."

"My dear friend," said I, "when you have a little girl like my Lily — I recommend you to take the preliminary steps" (the doctor was a bachelor) — "you will get to know something of what such little minds are capable."

"Ah!" he said; "*ah!* Now let me in my turn give you a little bit of advice. In case a couple of doctors come up some morning to interview you, if they should try to lead the conversation to this subject, be on your guard lest it should turn out to be a case of *de lunatico inquirendo*."

So saying, all in perfect good humor, "it was," as people said, "his way," he took his departure, leaving me for once not sorry to get rid of him.

By-and-by the photographer came up, and instead of the relics he was sent for to depict, we found him some work to do in the shape of sundry little groups of merry and happy children.

And towards evening the great physician from London made his appearance. He was one of those few men who, in addition to the skill born of natural sagacity and vast experience, are indued with something of that subtle intuitiveness which is a gift not to be acquired. And moreover, he had that winning charm of manner which makes even the most sensitive of patients yield up their inmost secrets. He listened with much attention and interest to the story we had to tell him, and had a long interview with Lily by herself before he came to us in the study, where we were anxiously waiting for his opinion.

"Well!" he said, "there is no great harm done as yet, but your little girl will require great care — very great care." And he then went into various details, which it is not necessary here to recapitulate. Before taking his departure, however, he said, —

"Just one word more. Let me tell you, my friend, you never did a wiser thing than when you yielded to your little girl's — whim I don't like to call it, for it seems more of a sacred feeling, about the Roman girl. I know well what a sacrifice it must have been, but I frankly own to you that I would not have liked to be responsible for the case of this child — so sensitive as she seems to be to certain deep impressions — with such a burthen on her pure, unselfish little mind."

"I cannot tell you, doctor," said I, "how thankful I am to you for that opinion, for now, thus fortified, I can set down my foot on all cavillers and scoffers. But does there not seem to be something not easy to understand in all this?" I went on. "My little girl retired to rest so perfectly satisfied with what I proposed, that it is difficult to conceive how anything could have arisen out of her own inner

consciousness to produce such a remarkable impression upon her mind."

"I think it may be accounted for on natural principles," he replied. "Your little girl's own idea was a genuine one. She felt pained that the remains of a beloved daughter should be exposed to the vulgar gaze, like, to use her own words, 'a curiosity.' Your alternative proposal, intended for the purpose of soothing her mind and at the same time keeping your treasures, was, however well-intentioned, something of a sham. Her deference to you, and perhaps a specious show of sentiment in the proposal, reconciled her to it in the first instance. But in the stillness of the night her little mind, brooding over it, waking or sleeping, came at last to see it in its true light, and produced on her, unduly excited as she probably was, this remarkable impression. This seems to me a fair way of accounting for it, but nevertheless I would not say that there is no other. Much as I despise the opinions of those who would have us believe that the spirits of the loved departed come back to twitch our hair and to play tricks upon tables, I dare not say that between two loving and kindred spirits circumstances may not arise to create a mysterious bond of sympathy for which it is beyond our philosophy to account."

"Something of that sort," said I, "seems to have been the belief of the Romans, who held that the *manes*, or spirits of the departed, attached themselves as guardian angels to kindred spirits yet on earth."

"Well, however it be," said he, rising to take his leave, "there is no doubt that the best cure for all such mental disturbances is a perfect state of bodily health. And I trust that with the return of warm summer weather, your dear little girl may regain all her wonted health and spirits."

"Amen!" said I, "doctor, amen!"

. . . .

Summer had come again. The golden sunlight shed a glory on our stately elms, and cast their flickering shadows on the grass; the birds — we all loved and cherished them — sang their blithe carols on every side; all nature around seemed wakened to new life and loveliness. Within, all was darkness and desolation; for the edict had gone forth that Lily was to die, and not to live.

I had prayed, as I had never prayed before, that God would spare me this one ewe lamb, but it was not to be. In spite of all that skill and tenderness could do, the disease had of late so rapidly gained ground, that now even love could no longer hope. She had seen, she told us, the little Roman girl once more, bright and glorious as an angel, with outstretched arms and loving smiles, waiting to welcome her; and too well we knew what that sign meant.

I stole to her bedside for the few minutes during which, in her now weak state, I was allowed to be with her. I found her propped up with pillows, so that she could get a view of the loved garden corner where, among the childish graves, the sunlight flecked with gold the grey memorial stone of Lucia. Her fair hair, soft and glossy as floss-silk, hung round her in tangled waves, that told of the restlessness of weariness and pain. Her sweet face was drawn in by hard, cruel lines, till the blue eyes stood out unnaturally large and bright; her poor little wasted arms trembled as she stretched them out to me. The wan little face lighted up with smiles as I approached, and, taking her hand in mine, bent over her to listen to her accents, now scarcely above a whisper.

"O dear papa," she said, "how I have longed for your coming! It is of you I have been thinking all this morning. How good you have been to me always — always — and especially that one time when you gave me up Lucia! She will be the first to meet me, for she will run before the rest, and I will take her by the hand, and lead her up to dear Aunt Mary and grandmamma; and I will take her aside and tell her all, and she shall love you — oh, how she shall love you! And then, oh, dearest — dearest papa! — when you — come — we ——" The lips still moved with loving words, but the feeble voice was choked.

Yet three days more, and I stood again by her bedside — to kiss for the last time the dear lips that should never smile a welcome to me more — to press for the last time the little hand that should never twine itself in mine again. All trace of weariness and pain had passed away; she lay, her long silky lashes veiling her drooped eyes, as in the slumber of innocence and peace. And on her breast — laid by unseen hands — was a cluster of summer violets.

They sleep together in God's acre — the loved ones of a thousand years apart. It was Lily's last request that the little Roman girl should rest by her side under the shadow of the text, "Suffer little children to come unto me."

O Dulcissima! Dilectissima!

R. FERGUSON.

A FLORENTINE CARNIVAL SONG OF THE SIXTEENTH CENTURY.

COMPOSED BY ANTONIO ALAMANNI,

AND SUNG BY A COMPANY OF MASQUERS, HABITED AS SKELETONS, ON A CAR OF DEATH DESIGNED BY PIERO DI COSIMO.

SORROW, tears, and penitence
Are our doom of pain for aye:
This dead concourse riding by
Hath no cry but penitence!

E'en as you are, once were we:
You shall be as now we are:
We are dead men, as you see:
We shall see you dead men, where
Nought avails to take great care,
After sins, of penitence.

We too in the Carnival
Sang our love-songs through the town;
Thus from sin to sin we all
Headlong, heedless, tumbled down:
Now we cry, the world around,
Penitence! oh, penitence!

Senseless, blind, and stubborn fools!
Time steals all things as he rides:
Honors, glories, states, and schools,
Pass away, and nought abides;
Till the tomb our carcase hides,
And compels this penitence.

This sharp scythe you see us bear,
Brings the world at length to woe:
But from life to life we fare;
And that life is joy or woe:
All heaven's bliss on him doth flow
Who on earth does penitence.

Living here, we all must die;
Dying, every soul shall live:
For the king of kings on high
This fixed ordinance doth give:
Lo, you all are fugitive!
Penitence! Cry penitence!

Torment great and grievous dole
Hath the thankless heart mid you:
But the man of piteous soul
Finds much honor in our crew:
Love for loving is the due
That prevents this penitence.

Sorrow, tears, and penitence
Are our doom of pain for aye:
This dead concourse riding by
Hath no cry but penitence!

Cornhill Magazine. J. A. S.

SAY not the struggle naught availeth,
The labor and the wounds are vain,
The enemy faints not, nor faileth,
And as things have been they remain.

If hopes were dupes, fears may be liars;
It may be, in yon smoke concealed,
Your comrades chase e'en now the fliers,
And, but for you, possess the field.

For while the tired waves, vainly breaking,
Seem here no painful inch to gain,
Far back, through creeks and inlets making,
Comes silent, flooding in, the main.

And not by eastern windows only,
When daylight comes, comes in the light,
In front, the sun climbs slow, how slowly,
But westward, look, the land is bright.

A. H. CLOUGH.

SONNET.

I KNOW a royal castle-builder. He
Has planned (in clouds) a house beyond compare,
And furnished it with treasures passing rare
Gathered from distant lands across the sea.
Fountains gush forth; and many a curious tree
Shadows rich lawns broidered with bright parterre
Of scented shrubs and flow'rs. And birds are there
Well skilled in notes of sylvan minstrelsy.
Closed is the door. Unopened are the gates.
The blossoms droop, and eke the birds are dumb,
The builder sadly sits as one who waits
For some loved friend — alas! who does not come.
In his fair mansion will he ever dwell?
One little maid — and only she — can tell.

Evening Mail.

FAREWELL.

MY love, I love thee with a love undying,
But love so fraught with sorrow that my heart,
Weary of waiting for a bright to-morrow,
Will say for thy sweet sake, dear love, we part!

Farewell, my darling! Yes, my own forever,
Wher'er I go, by land or sea, my star,
My star to guide me, guard me, ah, oh never
Can we forget, although we're sundered far!

Have pity, God! oh, hold her in thy keeping,
Upon her way I pray thee shed thy light.
Farewell! One kiss! Oh, cease thy bitter weeping,
I go into the night!

From The Quarterly Review.

A FRENCH CRITIC ON GOETHE.*

It takes a long time to ascertain the true rank of a famous writer. A young friend of Joseph de Maistre, a M. de Syon, writing in praise of the literature of the nineteenth century as compared with that of the eighteenth, said of Chateaubriand, that "the Eternal created Chateaubriand to be a guide to the universe." Upon which judgment Joseph de Maistre comments thus: "Clear it is, my best of young men, that you are only eighteen; let me hear what you have to say at forty"—"*On voit bien, excellent jeune homme, que vous avez dix-huit ans; je vous attends à quarante.*"

The same Joseph de Maistre has given an amusing history of the rise of our own Milton's reputation:—

No one had any suspicion of Milton's merits, when one day Addison took the speaking-trumpet of Great Britain (the loudest-sounding instrument in the universe), and called from the top of the Tower of London: "*Roman and Greek authors, give place!*"

He did well to take this tone. If he had spoken modestly, if he had simply said that there were great beauties in "Paradise Lost," he would not have produced the slightest impression. But this trenchant sentence, dethroning Homer and Virgil, struck the English exceedingly. They said one to the other: "What, we possessed the finest epic poem in the world, and no one suspected it! What a thing is inattention! But now, at any rate, we have had our eyes opened." In fact, the reputation of Milton has become a national property, a portion of the Establishment, a Fortieth Article; and the English would as soon think of giving up Jamaica as of giving up the pre-eminence of their great poet.

And Joseph de Maistre goes on to quote a passage from a then recent English commentator on Milton—Bishop Newton. Bishop Newton, it seems, declared that "every man of taste and genius must admit 'Paradise Lost' to be the most excellent of modern productions, as the Bible is the most perfect of the productions of antiquity." In a note M. de Maistre adds: "This judgment of the good bishop appears unspeakably ridiculous."

Ridiculous, indeed! but a page or two later we shall find the clear-sighted critic himself almost as far astray as his "good bishop" or as his "best of young men:"—

The strange thing is that the English, who are thorough Greek scholars, are willing enough to admit the superiority of the Greek tragedians over Shakespeare; but when they come to Racine, *who is in reality simply a Greek speaking French*, their standard of beauty all of a sudden changes, and Racine, who is at least the equal of the Greeks, has to take rank far below Shakespeare, who is inferior to them. This theorem in *trigonometry* presents no difficulties to the people of soundest understanding in Europe.

So dense is the cloud of error here that the lover of truth and daylight will hardly even essay to dissipate it; he does not know where to begin. It is as when M. Victor Hugo gives his list of the sovereigns on the world's roll of creators and poets: "Homer, Æschylus, Sophocles, Lucretius, Virgil, Horace, Dante, Shakespeare, Rabelais, Molière, Corneille, Voltaire." His French audience rise and cry enthusiastically, "*and Victor Hugo!*" And really that is perhaps the best criticism on what he has been saying to them.

Goethe, the great poet of Germany, has been placed by his own countrymen now low, now high; and his right poetical rank they have certainly not yet succeeded in finding. Tieck, in his introduction to the collected writings of Lenz, noticing Goethe's remark on Byron's "Manfred,"—that Byron had "assimilated 'Faust,' and sucked out of it the strangest nutriment to his hypochondria,"—says tartly that Byron, when he himself talked about his obligations to Goethe, was merely using the language of compliment, and would have been highly offended if any one else had professed to discover them. And Tieck proceeds:—

Everything which in the Englishman's poems might remind one of "Faust," is in my opinion far above "Faust;" and the Englishman's feeling, and his incomparably more beautiful diction, are so entirely his own, that I cannot possibly believe him to have had "Faust" for his model.

* *Goethe* in *Etudes Critiques de Littérature.* Par Edmond Scherer. Paris, 1876.

But now there comes a scion of the excellent stock of the Grimms, a Professor Hermann Grimm, and lectures on Goethe at Berlin, now that the Germans have conquered the French, and are the first military power in the world, and have become a great nation, and require a national poet to match; and Professor Grimm says of "Faust," of which Tieck had spoken so coldly: "The career of this, the greatest work of the greatest poet of all times and all peoples, has but just begun, and we have taken only the first steps towards drawing forth its contents."

If this is but the first letting out of the waters, the coming times may, indeed, expect a deluge.

Many and diverse must be the judgments passed upon every great poet, upon every considerable writer. There is the judgment of enthusiasm and admiration, which proceeds from ardent youth, easily fired, eager to find a hero and to worship him. There is the judgment of gratitude and sympathy, which proceeds from those who find in an author what helps them, what they want, and who rate him at a very high value accordingly. There is the judgment of ignorance, the judgment of incompatibility, the judgment of envy and jealousy. Finally, there is the systematic judgment, and this judgment is the most worthless of all. The sharp scrutiny of envy and jealousy may bring real faults to light. The judgment of incompatibility and ignorance are instructive, whether they reveal necessary clefts of separation between the experiences of different people, or reveal simply the narrowness and bounded view of those who judge. But the systematic judgment is altogether unprofitable. Its author has not really his eye upon the professed object of his criticism at all, but upon something else which he wants to prove by means of that object. He neither really tells us, therefore, anything about the object, nor anything about his own ignorance of the object. He never fairly looks at it, he is looking at something else. Perhaps if he looked at it straight and full, looked at it simply, he might be able to pass a good judgment on it. As it is, all he tells us is that he is no genuine critic, but a man with a system, an advocate. Here is the fault of Professor Hermann Grimm, and of his Berlin lectures on Goethe. The professor is a man with a system; the lectures are a piece of advocacy. Professor Grimm is not looking straight at "the greatest poet of all times and all peoples;" he is looking at the necessities, as to literary glory, of the new German empire.

But the definite judgment on this great Goethe, the judgment of mature reason, the judgment which shall come "at forty years of age," who may give it to us? Yet how desirable to have it! It is a mistake to think that the judgment of mature reason on our favorite author, even if it abates considerably our high-raised estimate of him, is not a gain to us. Admiration is positive, say some people, disparagement is negative; from what is negative we can get nothing. But is it no advantage, then, to the youthful enthusiast for Chateaubriand, to come to know that "the Eternal did" *not* "create Chateaubriand to be a guide to the universe"? It is a very great advantage, because these over-charged admirations are always exclusive, and prevent us from giving heed to other things which deserve admiration. Admiration is salutary and formative, true; but things admirable are sown wide, and are to be gathered here and gathered there, not all in one place; and until we have gathered them wherever they are to be found, we have not known the true salutariness and formativeness of admiration. The quest is large; and occupation with the unsound or half-sound, delight in the not good or less good, is a sore let and hindrance to us. Release from such occupation and delight sets us free for ranging farther, and for perfecting our sense of beauty. He is the happy man, who, encumbering himself with the love of nothing which is not beautiful, is able to embrace the greatest number of things beautiful in his love.

We spoke a year ago of the judgment of a French critic, M. Scherer, upon Milton. We propose now to draw our readers' attention to the judgment of the same critic upon Goethe. To set to work to discuss Goethe thoroughly, so as to arrive

at the true definite judgment respecting him, seems to us a most formidable enterprise. Certainly we should not think of attempting it within the limits of a review-article. M. Scherer has devoted to Goethe not one article, but a series of articles. We do not say that the adequate, definitive judgment on Goethe is to be found in these articles of M. Scherer. But we think they afford a valuable contribution towards it. M. Scherer is well-informed, clear-sighted, impartial. He is not warped by injustice and ill-will towards Germany, although the war has undoubtedly left him with a feeling of soreness. He is candid and cool, perhaps a little cold. Probably he will not tell us that "the Eternal created Goethe to be a guide to the universe." He is free from all heat of youthful enthusiasm, from the absorption of a discoverer in his new discovery, from the subjugation of a disciple by the master who has helped and guided him. He is not a man with a system. And his point of view is in many respects that of an Englishman. We mean that he has the same instinctive sense rebelling against what is verbose, ponderous, roundabout, inane — in one word, *niais* or silly — in German literature, as a plain Englishman has. This ground of sympathy between Englishmen and Frenchmen has not been enough remarked, but it is a very real one. They owe it to their having alike had a long-continued national life, a long-continued literary activity, such as no other modern nation has had. This course of practical experience does of itself beget a turn for directness and clearness of speech, a dislike for futility and fumbling, such as without it we shall rarely find general. Dr. Wiese, in his recent useful work on English schools, expresses surprise that the French language and literature should find more favor in Teutonic England than the German. But community of practice is more telling than community of origin. While English and French are printed alike, and while an English and French sentence each of them says what it has to say in the same plain fashion, a German newspaper is still printed in black letter, and a German sentence is framed in the style of this which we quote from Dr. Wiese himself: "*Die Engländer einer grossen, in allen Erdtheilen eine Achtung gebietende Stellung einnehmenden Nation angehören!*" The Italians are a Latin race, with a clear-cut language; but much of their modern prose has all the circuitousness and slowness of the German, and from the same cause — the want of the pressure of a great national life, with its practical discipline, its ever-active traditions, its literature, for centuries past, powerful and incessant. England has these in common with France.

M. Scherer's point of view, then, in judging the productions of German literature, will naturally, we repeat, coincide in several important respects with that of an Englishman. His mind will make many of the same instinctive demands as ours, will feel many of the same instinctive repugnances. We shall gladly follow him, therefore, through his criticism of Goethe's works, letting him as far as possible speak for himself, as we did when we were dealing with his criticism on Milton. As we did then, too, we shall occasionally compare M. Scherer's criticism on his author with the criticism of others. We shall by no means attempt a substantive criticism of our own, although we may from time to time allow ourselves to comment, in passing, upon the judgments of M. Scherer.

We need not follow M. Scherer in his sketch of Goethe's life. It is enough to remind our reader that the main dates in Goethe's life are his birth in 1749; his going to Weimar with the grand duke, Carl-August, in 1775; his stay in Italy from September 1786 to June 1788; his return in 1788 to Weimar; a severe and nearly fatal illness in 1801; the loss of Schiller in 1805, of Carl-August in 1828; his own death in 1832. With these dates fixed in our minds, we may come at once to the consideration of Goethe's works.

The long list begins, as we all know, with "Götz von Berlichingen" and "Werther." We all remember how Mr. Carlyle, "the old man eloquent," who in his younger days, fifty years ago, betook himself to Goethe for light and help, and found what he sought, and declared his gratitude so powerfully and well, and did

so much to make Goethe's name a name of might for other Englishmen also, a strong tower into which the doubter and the despairer might run and be safe — we all remember how Mr. Carlyle has taught us to see in "Götz" and in "Werther" the double source from which have flowed those two mighty streams — the literature of feudalism and romance, represented for us by Scott, and the literature of emotion and passion, represented for us by Byron.

M. Scherer's tone throughout is, we have said, not that of the ardent and grateful admirer, but of the cool, somewhat cold critic. Already this tone appears in M. Scherer's way of dealing with Goethe's earliest productions. M. Scherer seems to us to rate the force and the interest of "Götz" too low. But his remarks on the derivedness of this supposed *source* are just. The Germans, he says, were bent, in their "*Sturm und Drang*" period, on throwing off literary conventions, imitation of all sorts, and on being original. What they really did, was to fall from one sort of imitation, the imitation of the so-called classical French literature of the seventeenth century, into another.

"Götz von Berlichingen" is a study composed after the dramatized chronicles of Shakespeare, and "Werther" is a product yet more direct of the sensibility and declamation brought into fashion by Jean Jacques Rousseau. All in these works is infantine, both the aim at being original, and the way of proceeding to be so. It is exactly as it was with us, about 1830. One imagines one is conducting an insurrection, making oneself independent; what one really does is to cook up out of season an old thing. Shakespeare had put the history of his nation upon the stage; Goethe goes for a subject to German history. Shakespeare, who was not fettered by the scenic conditions of the modern theatre, changed the place at every scene; "*Götz*" is cut up in the same fashion. I say nothing of the substance of the piece, of the absence of characters, of the nullity of the hero, of the commonplace of Weislingen "the inevitable traitor," of the melodramatic machinery of the secret tribunal. The style is no better. The astonishment is not that Goethe at twenty-five should have been equal to writing this piece; the astonishment is that after so poor a start he should have ever gone so far.

M. Scherer seems to us quite unjust, we repeat, to this first dramatic work of Goethe. Mr. Hutton pronounces it "far the most noble as well as the most powerful of Goethe's dramas." And the merit which Mr. Hutton finds in "Götz" is a real one; it is the work where Goethe, young and ardent, has most forgotten *himself* in his characters. "There was something," says Mr. Hutton (and here he and M. Scherer are entirely in accord), "which prevented Goethe, we think, from ever becoming a great dramatist. He could never lose himself sufficiently in his creations." It is in "Götz" that he loses himself in them the most. "Götz" is full of faults, but there is a life and a power in it, and it is not dull. This is what distinguishes it from Schiller's "Robbers." "The Robbers" is at once violent and tiresome. "Götz" is violent, but it is not tiresome.

"Werther," which appeared a year later than "Götz," finds more favor at M. Scherer's hands. "Werther" is superior to "Götz," he says, "inasmuch as it is more modern, and is consequently alive, or, at any rate, has been alive lately. It has sincerity, passion, eloquence. One can still read it, and with emotion." But then come the objections: —

Nevertheless, and just by reason of its truth at one particular moment, "Werther" is gone by. It is with the book as with the blue coat and yellow breeches of the hero; the reader finds it hard to admit the pathetic in such accoutrement. There is too much enthusiasm for Ossian, too much absorption in nature, too many exclamations and apostrophes to beings animate and inanimate, too many torrents of tears. Who can forbear smiling as he reads the scene of the storm, where Charlotte first casts her eyes on the fields, then on the sky, and finally, laying her hand on her lover's, utters this one word: *Klopstock!* And then the cabbage-passage! . . . "Werther" is the poem of the German middle-class sentimentality of that day. It must be said that our sentimentality, even at the height of the "Héloïse" season, never reached the extravagance of that of our neighbors . . . Mlle. Flachsland, who married Herder, writes to her betrothed that one night in the depth of the woods she fell on her knees as she looked at the moon, and that having found some glowworms she put them into her hair, being careful to arrange them in couples that she might not disturb their loves.

One can imagine the pleasure of a victim of Kruppism and corporalism in relating that story of Mlle. Flachsland. There is an even better story of the return of a Dr. Zimmermann to his home in Hanover, after being treated for hernia at Berlin; but for this story we must send the reader to M. Scherer's own pages.

After the publication of "Werther" began Goethe's life at Weimar. For ten years he brought out nothing except occasional pieces for the court theatre, and

occasional poems. True, he carried the project of his "Faust" in his mind, he planned "Wilhelm Meister," he made the first draft of "Egmont," he wrote "Iphigeneia" and "Tasso" in prose. But he felt the need, for his work, of some influence which Weimar could not give. He became dissatisfied with the place, with himself, with the people about him. In the autumn of 1786 he disappeared from Weimar, almost by a secret flight, and crossed the Alps into Italy. M. Scherer says truly that this was the great event of his life.

Italy, Rome above all, satisfied Goethe, filled him with a sense of strength and joy. "At Rome," he writes from that city, "he who has eyes to see, and who uses them seriously, becomes solid. The spirit receives a stamp of vigor; it attains to a gravity in which there is nothing dry or harsh — to calm, to joy. For my own part, at any rate, I feel that I have never before had the power to judge things so justly, and I congratulate myself on the happy result for my whole future life." So he wrote while he was in Rome. And he told the Chancellor von Müller, twenty-five years later, that from the hour when he crossed the Ponte Molle on his return to Germany, he had never known a day's happiness. "While he spoke thus," adds the chancellor, "his features betrayed his deep emotion."

The Italy, from which Goethe thus drew satisfaction and strength, was Græco-Roman Italy, pagan Italy. For mediæval and Christian Italy he had no heed, no sympathy. He would not even look at the famous church of St. Francis at Assisi. "I passed it by," he says, "with disgust." And he told a young Italian who asked him his opinion of Dante's great poem, that he thought the "*Inferno*" abominable, the "*Purgatorio*" dubious, and the "*Paradiso*" tiresome.

We have not space to quote what M. Scherer says of the influence on Goethe's genius of his stay in Rome. We are more especially concerned with the judgments of M. Scherer on the principal works of Goethe as these works succeed one another. At Rome, or under the influence of Rome, "Iphigeneia" and "Tasso" were re-cast in verse, "Egmont" was resumed and finished, the chief portion of the first part of "Faust" was written. Of the larger works of Goethe in poetry, these are the chief. Let us see what M. Scherer has to say of them.

"Tasso" and "Iphigeneia," says M. Scherer very truly, mark a new phase in the literary career of Goethe.

They are works of finished style and profound composition. There is no need to enquire whether the "Iphigeneia" keeps to the traditional data of the subject; Goethe desired to make it Greek only by its sententious elevation and grave beauty. What he imitates are the conditions of art as the ancients understood them, but he does not scruple to introduce new thoughts into these mythological *motives*. He has given up the aim of rendering by poetry what is characteristic or individual; his concern is henceforth with the ideal, that is to say, with the transformation of things through beauty. If I were to employ the terms in use amongst ourselves, I should say that from romantic Goethe had changed to being classic; but, let me say again, he is classic only by the adoption of the elevated style, he imitates the ancients merely by borrowing their peculiar sentiment as to art, and within these bounds he moves with freedom and power. The two elements, that of immediate or passionate feeling, and that of well-considered combination of means, balance one another, and give birth to finished works. "Tasso" and "Iphigeneia" mark the apogee of Goethe's talent.

It is interesting to turn from this praise of "Tasso" and "Iphigeneia" to that by Mr. Lewes, whose "Life of Goethe," a work in many respects of brilliant cleverness, will be in the memory of many amongst our readers. "A marvellous dramatic poem," Mr. Lewes calls "Iphigeneia." "Beautiful as the separate passages are, admirers seldom think of passages, they think of the wondrous whole." Of "Tasso," Mr. Lewes says: "There is a calm, broad effulgence of light in it, very different from the concentrated *lights* of effect which we are accustomed to find in modern works. It has the clearness, unity, and matchless grace of a Raphael, not the lustrous warmth of a Titian, or the crowded gorgeousness of a Paul Veronese."

Every one will remark the difference of tone between this criticism and M. Scherer's. Yet M. Scherer's criticism conveyed praise, and, for him, warm praise. But "Tasso" and "Iphigeneia" mark, in his eyes, the period, the too short period, during which the forces of inspiration and of reflection, the poet in Goethe and the critic in him, the thinker and the artist, in whose conflict M. Scherer sees the history of our author's literary development, were in equilibrium. "Faust," also, the first part of "Faust," the only one which counts, belongs by its composition to this period. By common consent it is the best of Goethe's works. For while it has the benefit of his matured powers of thought, of his command over his materials, of his

mastery in planning and expressing, it possesses by the nature of its subject an intrinsic richness, color, and warmth. Moreover, from Goethe's long and early occupation with the subject, "Faust" has preserved many a stroke and flash out of the days of its author's fervid youth. To M. Scherer, therefore, as to the world in general, the first part of "Faust" seems Goethe's masterpiece. M. Scherer does not call "Faust" the greatest work of the greatest poet of all times and all peoples, but thus he speaks of it: —

Goethe had the good fortune early to come across a subject, which, while it did not lend itself to his faults, could not but call forth all the powers of his genius. I speak of "Faust." Goethe had begun to occupy himself with it as early as 1774, the year in which "Werther" was published. Considerable portions of the first part appeared in 1790; it was completed in 1808. We may congratulate ourselves that the work was already, at the time of his travels in Italy, so far advanced as it was; else there might have been danger of the author's turning away from it as from a Gothic, perhaps unhealthy, production. What is certain is, that he could not put into "Faust" his preoccupation with the antique, or, at any rate, he was obliged to keep this for the second part. The first "Faust" remained, whether Goethe would or no, an old story made young again, to serve as the poem of thought, the poem of modern life. This kind of adaptation had evidently great difficulties. It was impossible to give the story a satisfactory end; the compact between the doctor and the devil could not be made good, consequently the original condition of the story was gone, and the drama was left without an issue. We must, therefore, take "Faust" as a work which is not finished, and which could not be finished. But, in compensation, the choice of this subject had all sorts of advantages for Goethe. In place of the somewhat cold symbolism for which his mind had a turn, the subject of "Faust" compelled him to deal with popular beliefs. Instead of obliging him to produce a drama with beginning, middle, and end, it allowed him to proceed by episodes and detached scenes. Finally, in a subject fantastic and diabolic there could hardly be found room for the imitation of models. Let me add, that in bringing face to face human aspiration represented by Faust and pitiless irony represented by Mephistopheles, Goethe found the natural scope for his keen observations on all things. It is unquestionable that "Faust" stands as one of the great works of poetry; and, perhaps, the most wonderful work of poetry in our century. The story, the subject, do not exist as a whole, but each episode by itself is perfect, and the execution is nowhere defective. "Faust" is a treasure of poetry, of pathos, of the highest wisdom, of a spirit inexhaustible and keen as steel. There is not, from the first verse to the last, a false tone or a weak line.

This praise is discriminating, and yet earnest, almost cordial. "'Faust' stands as one of the great works of poetry, and, perhaps, the most wonderful work of poetry in our century." The *perhaps* might be away. But the praise is otherwise not coldly stinted, not limited ungraciously and unduly.

Goethe returned to "the formless Germany," to the Germanic north with its "cold wet summers," of which he so mournfully complained; to Weimar with its petty court and petty town, its society which Carl-August himself, writing to Knebel, calls "the most tiresome on the face of the earth," and of which the ennui drove Goethe sometimes to "a sort of internal despair." He had his animating friendship with Schiller. He had also his connection with Christiana Vulpius, whom he afterwards married.

That connection both the moralist and the man of the world may unite in condemning. M. Scherer calls it "a degrading connection with a girl of no education, whom Goethe established in his house to the great embarrassment of all his friends, whom he either could not or would not marry until eighteen years later, and who punished him as he deserved by taking a turn for drink — a turn which their unfortunate son inherited." In these circumstances was passed the second half of Goethe's life, after his return from Italy. The man of reflection, always present in him, but balanced for a while by the man of inspiration, became now, M. Scherer thinks, predominant. There was a *refroidissement graduel*, a gradual cooling down, of the poet and artist.

The most famous works of Goethe which remain yet to be mentioned are "Egmont," "Hermann and Dorothea," "Wilhelm Meister," the second part of "Faust," and the *Gedichte*, or short poems. Of "Egmont" M. Scherer says: —

This piece also belongs, by the date of its publication, to the period which followed Goethe's stay in Rome. But in vain did Goethe try to transform it, he could not succeed. The subject stood in his way. We need not be surprised, therefore, if "Egmont" remains a mediocre performance, Goethe having always been deficient in dramatic faculty, and not in this case redeeming his defect by qualities of execution, as in "Iphigeneia." He is too much of a generalizer to create a character, too meditative to create an action. "Egmont" must be ranked by the side of "Götz;" it is a product of the same

order. The hero is not a living being; one does not know what he wants; the object of the conspiracy is not brought out; the unfortunate count does certainly exclaim, as he goes to the scaffold, that he is dying for liberty, but nobody had suspected it until that moment. It is the same with the popular movement; it is insufficiently rendered, without breadth, without power. I say nothing of Machiavel, who preaches toleration to the princess regent and tries to make her understand the uselessness of persecution; nor of Claire, a girl sprung from the people, who talks like an epigram of the "Anthology:" "Neither soldiers nor lovers should have their arms tied." "Egmont" is one of the weakest among Goethe's weak pieces for the stage.

But now, on the other hand, let us hear Mr. Lewes: "When all is said, the reader thinks of Egmont and Clärchen, and flings criticism to the winds. These are the figures which remain in the memory; bright, genial, glorious creations, comparable to any to be found in the long galleries of art!"

Aristotle says, with admirable commonsense, that the determination of what a thing is, is *ὡς ἂν ὁ φρόνιμος ὁρίσειεν*, "as the judicious would determine." And would the judicious, after reading "Egmont," determine with Mr. Lewes, or determine with M. Scherer? Let us for the present leave the judicious to try, and let us pass to M. Scherer's criticism of "Hermann and Dorothea." "Goethe's epic poem," writes Schiller, "you have read; you will admit that it is the pinnacle of his and all our modern art." In Professor Grimm's eyes, perhaps, this is but scant praise, but how much too strong is it for M. Scherer!

Criticism is considerably embarrassed in presence of a poem in many respects so highly finished as the antico-modern and heroico-middle-class idyl of Goethe. The ability which the author has spent upon it is beyond conception; and, the kind of poem being once allowed, the indispensable concessions having been once made, it is certain that the pleasure is doubled by seeing, at each step, difficulty so marvellously overcome. But all this cannot make the effort to be effort well spent, nor the kind of poem a true, sound, and worthy kind. "Hermann and Dorothea" remains a piece of elegant cleverness, a wager laid and won, but for all that, a feat of ingenuity and nothing more. It is not quite certain that our modern societies will continue to have a poetry at all; but most undoubtedly, if they do have one, it will be on condition that this poetry belongs to its time by its language, as well as by its subject. Has any critic remarked how Goethe's manner of proceeding is at bottom that of parody, and how the turn of a straw would set the reader laughing at these farm-horses transformed into coursers, these village innkeepers and apothecaries who speak with the magniloquence of a Ulysses or a Nestor? Criticism should have the courage to declare that all this is not sincere poetry at all, but solely the product of an exquisite dilettantism, and — to speak the definitive judgment upon it — a factitious work.

Once again we turn to Mr. Lewes for contrast: —

Do not let us discuss whether "Hermann and Dorothea" is or is not an epic. It is a poem. Let us accept it for what it is — a poem full of life, character, and beauty; of all idyls it is the most truly idyllic, of all poems describing country life and country people it is the most truthful. Shakespeare himself is not more dramatic in the presentation of character.

It is an excellent and wholesome discipline for a student of Goethe to be brought face to face with such opposite judgments concerning his chief productions. It compels us to rouse ourselves out of the passiveness with which we in general read a celebrated work, to open our eyes wide, to ask ourselves frankly how, according to our genuine feeling, the truth stands. We all recollect Mr. Carlyle on "Wilhelm Meister," "the mature product of the first genius of our times:" —

Anarchy has now become peace; the once gloomy and perturbed spirit is now serene, cheerfully vigorous, and rich in good fruits . . . The ideal has been built on the actual; no longer floats vaguely in darkness and regions of dreams, but rests in light, on the firm ground of human interest and business, as in its true scene, and on its true basis.

Schiller, too, said of "Wilhelm Meister," that he "accounted it the most fortuuate incident in his existence to have lived to see the completion of this work." And again: "I cannot describe to you how deeply the truth, the beautiful vitality, the simple fulness of this work has affected me. The excitement into which it has thrown my mind will subside when I shall have thoroughly mastered it, and that will be an important crisis in my being."

Now for the cold-water douche of our Genevese critic: —

Goethe is extremely great, but he is extremely unequal. He is a genius of the first order, but with thicknesses, with spots, so to speak, which remain opaque and where the light does not pass. Goethe, to go farther, has not only genius, he has what we in France call *esprit*, he has it to any extent, and yet there are in him sides of commonplace and

silliness. One cannot read his works without continually falling in with trivial admirations, solemn pieces of simplicity, reflections which bear upon nothing. There are moments when Goethe turns upon society and upon art a ken of astonishing penetration; and there are other moments when he gravely forces an open door, or a door which leads nowhere. In addition, he has all manner of hidden intentions, he loves byways of effect, seeks to insinuate lessons, and so becomes heavy and fatiguing. There are works of his which one cannot read without effort. I shall never forget the repeated acts of self-sacrifice which it cost me to finish "Wilhelm Meister" and the "Elective Affinities." As Paul de Saint-Victor has put it, "when Goethe goes in for being tiresome he succeeds with an astonishing perfection, he is the Jupiter Pluvius of ennui. The very height from which he pours it down, does but make its weight greater." What an insipid invention is the pedagogic city! What a trivial world is that in which the Wilhelms and the Philinas, the Eduards and the Ottilias, have their being! Mignon has been elevated into a poetic creation; but Mignon has neither charm, nor mystery, nor veritable existence, nor any other poetry belonging to her — let us say it right out — except the half-dozen immortal stanzas put into her mouth.

And, as we brought Schiller to corroborate the praise of "Wilhelm Meister," let us bring Niebuhr to corroborate the blame. Niebuhr calls "Wilhelm Meister" "a menagerie of tame animals."

After this the reader can perhaps imagine, without our quoting it, the sort of tone in which M. Scherer passes judgment upon "*Dichtung und Wahrheit*," and upon Goethe's prose in general. Even Mr. Lewes declares of Goethe's prose: "He has written with a perfection no German ever achieved before, and he has also written with a feebleness which it would be gratifying to think no German would ever emulate again."

Let us return, then, to Goethe's poetry. There is the continuation of "Faust" still to be mentioned. First we will hear Mr. Carlyle. In "Helena" "the design is," says Mr. Carlyle, "that the story of 'Faust' may fade away at its termination into a phantasmagoric region, where symbol and thing signified are no longer clearly distinguished," and that thus "the final result may be curiously and significantly indicated rather than directly exhibited." "Helena" is "not a type of one thing, but a vague, fluctuating, fitful adumbration of many." It is, properly speaking, "what the Germans call a *Mährchen*, a species of fiction they have particularly excelled in." As to its composition, "we cannot but perceive it to be deeply studied, appropriate, and successful."

The "adumbrative" style here praised, in which "the final result is curiously and significantly indicated rather than directly exhibited," is what M. Scherer calls Goethe's "last manner."

It was to be feared that, as Goethe grew older and colder, the balance between those two elements of art, science and temperament, would not be preserved. This is just what happened, and hence arose Goethe's last manner. He had passed from representing characters to representing the ideal, he is now to pass from the ideal to the symbol. And this is quite intelligible; reflection, as it develops, leads to abstraction, and from the moment when the artist begins to prefer ideas to sensation he falls inevitably into allegory, since allegory is his only means for directly expressing ideas. Goethe's third epoch is characterized by three things: an ever-increasing devotion to the antique as to the supreme revelation of the beautiful, a disposition to take delight in æsthetic theories, and, finally, an irresistible desire for giving didactic intentions to art. This last tendency is evident in the continuation of "Wilhelm Meister," and in the second "Faust." We may say that these two works are dead of a hypertrophy of reflection. They are a mere mass of symbols, hieroglyphics, sometimes even mystifications. There is something extraordinarily painful in seeing a genius so vigorous and a science so consummate thus mistaking the elementary conditions of poetry. The fault, we may add, is the fault of German art in general. The Germans have more ideas than their plasticity of temperament, evidently below par, knows how to deal with. They are wanting in the vigorous sensuousness, the concrete and immediate impression of things, which makes the artist, and which distinguishes him from the thinker.

So much for Goethe's "last manner" in general, and to serve as introduction to what M. Scherer has to say of the second "Faust" more particularly: —

The two parts of "Faust" are disparate. They do not proceed from one and the same conception. Goethe was like Defoe, like Milton, like so many others, who after producing a masterpiece have been bent on giving it a successor. Unhappily, while the first "Faust" is of Goethe's fairest time, of his most vigorous manhood, the second is the last fruit of his old age. Science, in the one, has not chilled poetic genius; in the other, reflection bears sway and produces all kind of symbols and abstractions. The beauty of the first comes in some sort from its very imperfection; I mean, from the incessant tendency of the sentiment of reality, the creative power, the poetry of passion and nature, to prevail over the philosophic intention and to make us forget it.

Where is the student of poetry who, as he reads the monologues of Faust or the sarcasms of Mephistopheles, as he witnesses the fall and the remorse of Margaret, the most poignant history ever traced by pen, any longer thinks of the "Prologue in Heaven" or of the terms of the compact struck between Faust and the tempter? In the second part it is just the contrary. The idea is everything. Allegory reigns there. The poetry is devoid of that simple and natural realism without which art cannot exist. One feels oneself in a sheer region of didactics. And this is true even of the finest parts, — of the third act, for example, — as well as of the weakest. What can be more burlesque than this Euphorion, son of Faust and Helen, who is found at the critical moment under a cabbage-leaf! — no, I am wrong, who descends from the sky "for all the world like a Phœbus," with a little cloak and a little harp, and ends by breaking his neck as he falls at the feet of his parents? And all this to represent Lord Byron, and, in his person, modern poetry, which is the offspring of romantic art! What decadence, good heavens! and what a melancholy thing is old age, since it can make the most plastic of modern poets sink down to these fantasticalities worthy of Alexandria!

In spite of the praise which he has accorded to "Tasso" and "Iphigeneia," M. Scherer concludes, then, his review of Goethe's productions thus: —

Goethe is truly original and thoroughly superior only in his lyrical poems (the *Gedichte*), and in the first part of "Faust." They are immortal works, and why? Because they issue from a personal feeling, and the spirit of system has not petrified them. And yet even his lyrical poems Goethe has tried to spoil. He went on correcting them incessantly; and, in bringing them to that degree of perfection in which we now find them, he has taken out of them their warmth.

The worshipper of Goethe will ask with wrath and bitterness of soul whether M. Scherer has yet done. Not quite. We have still to hear some acute remarks on the pomposity of diction in our poet's stage pieces. The English reader will best understand, perhaps, the kind of fault meant, if we quote from "The Natural Daughter" a couple of lines not quoted, as it happens, by M. Scherer. The heroine has a fall from her horse, and the court physician comes to attend her. The court physician is adressed thus: —

Erfahrner Mann, dem unseres König's Leben,
Das unschätzbare Gut, vertraut ist . . .

"Experienced man, to whom the life of our sovereign, that inestimable treasure, is given in charge." Shakespeare would have said *Doctor*. The German drama is full of this sort of roundabout pompous language. "Every one has laughed," says M. Scherer, "at the pomposity and periphrasis of French tragedy." The heroic king of Pontus, in French tragedy, gives up the ghost with these words: —

Dans cet embrassement dont la douceur me flatte,
Venez, et recevez l'âme de Mithridate.

"What has not been said," continues M. Scherer, "and justly said, against the artificial character of French tragedy?" Nevertheless, "people do not enough remember that, convention being universally admitted in the seventeenth century, sincerity and even a relative simplicity remained possible" with an artificial diction; whereas Goethe did not find his artificial diction imposed upon him by conditions from without — he made it himself, and of set purpose.

It is a curious thing; this style of Goethe's has its cause just in that very same study which has been made such a matter of reproach against our tragedy-writers — the study to maintain a pitch of general nobleness in all the language uttered. Everything with Goethe must be grave, solemn, sculptural. We see the influence of Winckelmann, and of his views on Greek art.

English readers will be familiar enough with complaints of Goethe's "artistic egotism," of his tendency to set up his own intellectual culture as the rule of his life. The freshness of M. Scherer's repetition of these old complaints consists in his connecting them, as we have seen, with the criticism of Goethe's literary development. But M. Scherer has some direct blame of defects in his author's character which is worth quoting: —

It must fairly be confessed, the respect of Goethe for the mighty of this earth was carried to excesses which make one uncomfortable for him. One is confounded by these earnestnesses of servility. The king of Bavaria pays him a visit; the dear poet feels his head go round. The story should be read in the journal of the Chancellor von Müller. "Goethe after dinner became more and more animated and cordial. 'It was no light matter,' he said, 'to work out the powerful impression produced by the king's presence, to assimilate it internally. It is difficult, in such circumstances, to keep one's balance and not to lose one's head. And yet the important matter is to extract from this apparition its real significance, to obtain a clear and distinct image of it.'" Another time he got a letter from the same sovereign; he talks of it to Eckermann with the same devout emotion — he "thanks Heaven for it as for a quite spe-

cial favor." And when one thinks that the king in question was no other than that poor Louis of Bavaria, the ridiculous dilettante of whom Heine has made such fun! Evidently Goethe had a strong dose of what the English call "snobbishness." The blemish is the more startling in him, because Goethe is, in other respects, a simple and manly character. Neither in his person nor in his manner of writing was he at all affected; he has no self-conceit; he does not pose. There is in this particular all the difference in the world between him and the majority of our own French authors, who seem always busy arranging their draperies, and asking themselves how they appear to the world and what the gallery thinks of them.

Goethe himself had in like manner called the French "the women of Europe." But let us remark that it was not "snobbishness" in Goethe, which made him take so seriously the potentate who loved Lola Montes; it was simply his German "corporalism." A disciplinable and much-disciplined people, with little humor, and without the experience of a great national life, regards its official authorities in this devout and awestruck way. To a German it seems profane and licentious to smile at his Dogberry. He takes Dogberry seriously and solemnly, takes him at his own valuation.

We are all familiar with the general style of the critic who, as the phrase is, "cuts up" his author. Such a critic finds very few merits and a great many faults, and he ends either with a phrase of condemnation, or with a phrase of compassion, or with a sneer. We saw, however, in the case of Milton, that one must not reckon on M. Scherer's ending in this fashion. After a course of severe criticism he wound up with earnest, almost reverential praise. The same thing happens again in his treatment of Goethe. No admirer of Goethe will be satisfied with the treatment which hitherto we have seen Goethe receive at M. Scherer's hands. And the summing-up begins in a strain which will not please the admirer much better: —

> To sum up, Goethe is a poet full of ideas and of observation, full of sense and taste, full even of feeling no less than of acumen, and all this united with an incomparable gift of versification. But Goethe has no artlessness, no fire, no invention; he is wanting in the dramatic fibre and cannot create; reflection, in Goethe, has been too much for emotion, the savant in him for poetry, the philosophy of art for the artist.

And yet the final conclusion is this: —

> Nevertheless, Goethe remains one of the exceeding great among the sons of men. "After all," said he to one of his friends, "there are honest people up and down the world who have got light from my books, and whoever reads them, and gives himself the trouble to understand me, will acknowledge that he has acquired thence a certain inward freedom." I should like to inscribe these words upon the pedestal of Goethe's statue; no juster praise could be found for him, and in very truth there cannot possibly be for any man a praise higher or more enviable.

And in an article on Shakespeare, after a prophecy that the hour will come for Goethe, as in Germany it has of late come for Shakespeare, when criticism will take the place of adoration, M. Scherer, after insisting on those defects in Goethe of which we have been hearing so fully, protests that there are yet few writers for whom he feels a greater admiration than for Goethe, few to whom he is indebted for enjoyments more deep and more durable, and declares that Goethe, although he has not Shakespeare's power, is a genius more vast, more universal, than Shakespeare. He adds, to be sure, that Shakespeare had an advantage over Goethe in not outliving himself.

After all, then, M. Scherer is not far from being willing to allow, if any youthful devotee wishes to urge it, that "the Eternal created Goethe to be a guide to the universe." Yet he deals with the literary production of Goethe as we have seen. He is very far indeed from thinking it the performance "of the greatest poet of all times and of all peoples." And this is why we have thought M. Scherer's criticisms worthy of so much attention; because a double judgment, somewhat of this kind, is the judgment about Goethe to which mature experience, the experience got "by the time one is forty years old," does really, we think, bring us. We do not agree with all M. Scherer's criticisms on Goethe's literary work. We do not ourselves feel, in reading the *Gedichte*, the truth of what M. Scherer says, that Goethe has corrected and retouched them till he has taken the warmth out of them. We do not ourselves feel the irritation in reading Goethe's "Memoirs," and his prose generally, which they provoke in M. Scherer. True, the prose has none of those positive qualities of style which give pleasure, it is not the prose of Voltaire or Swift; it is loose, ill-knit, diffuse; it bears the marks of having been, as it mostly was, dictated — and dictating is a detestable habit. But it is absolutely free from affectation; it lets the real Goethe reach us. In other respects we agree in the main with the judg-

ments passed by M. Scherer upon Goethe's works. Nay, some of them, such as "Tasso" and "Iphigeneia," we hesitate to extol so highly as he does. In that peculiar world of thought and feeling, wherein "Tasso" and "Iphigeneia" have their existence, and into which the reader too must enter in order to understand them, there is something factitious; something devised and determined by the thinker, not given by the necessity of nature herself; something too artificial, therefore, too deliberately studied, — as the French say, *trop voulu*. They cannot have the power of works where we are in a world of thought and feeling not invented but natural — of works like the "Agamemnon" or "Lear." "Faust," too, suffers by comparison with works like the "Agamemnon" or "Lear." M. Scherer says, with perfect truth, that the first part of "Faust" has not a single false tone or weak line. But it is a work as he himself observes, "of episodes and detached scenes," not a work where the whole material together has been fused in the author's mind by strong and deep feeling, and then poured out in a single jet. It can never produce the single, powerful total impression of works which have thus arisen.

The first part of "Faust" is, however, undoubtedly Goethe's best work. And it is so for the plain reason that, except his *Gedichte*, it is his most straightforward work in poetry. Mr. Hayward's is the best of the translations of "Faust" for the same reason — because it is the most straightforward. To be simple and straightforward is, as Milton saw and said, of the essence of first-rate poetry. All that M. Scherer says of the ruinousness, to a poet, of "symbols, hieroglyphics, mystifications," is just. When Mr. Carlyle praises "Helena" for being "not a type of one thing, but a vague, fluctuating, fitful adumbration of many," he praises it for what is in truth its fatal defect. The "*Mährchen*," again, on which he heaps such praise, calling it "one of the notablest performances produced for the last thousand years," a performance "in such a style of grandeur and celestial brilliancy and life as the Western imagination has not elsewhere reached;" the "*Mährchen*" woven throughout of "symbol, hieroglyphic, mystification," is by that very reason a piece of solemn inanity, on which a man of Goethe's powers could never have wasted his time, but for his lot having been cast in a nation which has never lived.

Mr. Carlyle has a sentence on Goethe which we may turn to excellent account for the criticism of such works as the "*Mährchen*" and "Helena:" —

> We should ask [he says] what the poet's aim really and truly was, and how far this aim accorded, not with us and our individual crotchets and the crotchets of our little senate where we give or take the law, but with human nature and the nature of things at large; with the universal principles of poetic beauty, not as they stand written in our text-books, but in the hearts and imaginations of all men.

To us it seems lost labor to inquire what a poet's *aim* may have been; but for aim let us read *work*, and we have here a sound and admirable rule of criticism. Let us ask how a poet's work accords, not with any one's fancies and crotchets, but "with human nature and the nature of things at large, with the universal principles of poetic beauty as they stand written in the hearts and imaginations of all men," and we shall have the surest rejection of symbol, hieroglyphic, and mystification in poetry. We shall have the surest condemnation of works like the "*Mährchen*" and the second part of "Faust."

It is by no means as the greatest of poets that Goethe deserves the pride and praise of his German countrymen. It is as the clearest, the largest, the most helpful thinker of modern times. It is not principally in his published works, it is in the immense *Goethe literature* of letter, journal, and conversation, in the volumes of Riemer, Falk, Eckermann, the Chancellor von Muller, in the letters to Merck and Madame von Stein and many others, in the correspondence with Schiller, the correspondence with Zelter, that the elements for an impression of the truly great, the truly significant Goethe are to be found. Goethe is the greatest poet of modern times, not because he is one of the half-dozen human beings who in the history of our race have shown the most signal gift for poetry, but because, having a very considerable gift for poetry, he was at the same time, in the width, depth, and richness of his criticism of life, by far our greatest man. He may be precious and important to us on this account above men of other and more alien times, who as poets rank higher. Nay, his preciousness and importance as a clear and profound spirit, as a master critic of life, must communicate a worth of their own to his poetry, and may well make it seem to have a positive value and perfectness as poetry, more than it has. It is most pardonable for a student of him, and may even for a

time be serviceable, to make this error. Nevertheless, poetical defects, where they are present, subsist, and are what they are. And the same with defects of character. Time and attention bring them to light; and when they are brought to light, it is not good for us, it is obstructing and retarding, to refuse to see them. Goethe himself would have warned us against doing so. We can imagine, indeed, that great and supreme critic reading Professor Grimm's laudation of his poetical work with lifted eyebrows, and M. Scherer's criticisms with acquiescence.

Shall we say, however, that M. Scherer's tone in no way jars upon us, or that his presentation of Goethe, just and acute as is the view of faults both in Goethe's poetry and in Goethe's character, satisfies us entirely? By no means. We could not say so of M. Scherer's presentation of Milton; of the presentation of Goethe we can say so still less. The faults are shown, and they exist. Praise is given, and the right praise. But there is yet some defect in the portraiture as a whole; tone and perspective are somehow a little wrong; the distribution of color, the proportions of light and shade, are not managed quite as they should be. One would like the picture to be painted over again by the same artist with the same talent, but a little differently. And meanwhile, we instinctively, after M. Scherer's presentation, feel a desire for some last words of Goethe's own, something which may give a happier and more cordial turn to our thoughts, after they have been held so long to a frigid and censorious strain. And there rises to our minds this sentence: "*Die Gestalt dieser Welt vergeht; und ich möchte mich nur mit dem beschäftigen, was bleibende Verhältnisse sind.*" "*The fashion of this world passeth away;* and I would fain occupy myself only with the abiding." There is the true Goethe, and with that Goethe we would end!

But let us be thankful for what M. Scherer brings, and let us acknowledge with gratitude his presentation of Goethe to be, not indeed the definitive picture of Goethe, but a contribution, and a very able contribution, to that definitive picture. We are told that since the war of 1870 Frenchmen are abandoning literature for science. Why do they not rather learn of this accomplished Genevese, to whom they have given the right of citizenship, to extend their old narrow literary range a little, and to know foreign literatures as M. Scherer knows them?

WITHIN THE PRECINCTS.

BY MRS. OLIPHANT.

CHAPTER IV.

LADY CAROLINE.

LADY CAROLINE was in the drawing-room at the Deanery alone. Now that her daughter was married this was no unusual circumstance. It was late in the summer evening, after dinner, and she lay on a great square sofa so placed that the view from the large window was dimly visible from it, had she cared for the view. As a matter of fact, at no hour of the twenty-four, however bright or tempting it might be, did Lady Caroline care much for the view; but still, when a room is artistically arranged, such a possibility cannot be altogether kept out of consideration. This evening, however, there was no light to see anything by. The room was dark, nothing distinctly visible in it but the great broad Elizabethan window which filled one end. The upper part of this window was filled with old painted glass in silvery tinted quarries, soft greys and yellows, surrounding the golden and ruby glories of several blazons of arms, and drawing the eye irresistibly with the delight of radiant color; underneath opened the great plain all dim and wide, a suggestion of boundless air and distance rather than a landscape, while in the room itself nothing was distinct but here and there a glimmer of reflection from a mirror breaking the long line of the walls. Nor was its only occupant very distinguishable as she reclined upon her sofa in absolute stillness and tranquillity. The lace on her head and about her throat showed faintly white in the corner, that was all. Perhaps if the mind could have been seen as well as the body, Lady Caroline's individual soul, such as it was, would have told for little more amid the still life around: a something vaguely different from the chairs and softly cushioned sofas, a little more than one of the dim mirrors, a little less than a picture, was this human creature to whom all the rest belonged. She had lived irreproachably on the earth for a number of years (though not for nearly so many years as the great part of her furniture), and fulfilled all her functions very much as they did, honestly holding together, affording a temporary place of repose occasionally, convenient for household meals, and ordinary domestic necessities. Perhaps now and then Lady Caroline conferred something of the same kind of solace and support

which is given to the weary by a nice, warm, soft easy-chair, comfortably cushioned and covered; but that was about the highest use of which she was capable. She was waiting now quite tranquilly till it pleased the servants to bring her lights. They were in no hurry, and she was in no hurry. She never did anything, so that it was immaterial whether her room was lighted early or late, and on the whole she liked this dim interval between the active daylight, when people were always in motion, and the lamps, which suggested work, or a book, or something of the sort. Lady Caroline, though she had not very much mind, had a conscience, and knew that it was not quite right for a responsible creature to be without employment; therefore she made certain efforts to fulfil the object of her existence by keeping a serious volume on the table beside her, and putting in a few stitches now and then in a piece of wool-work. But at this hour there was no possibility for the most anxious conscience to speak, and Lady Caroline's was not anxious, only correct, not troubling itself with any burden beyond what was necessary. It may be supposed, perhaps, that she was sad, passing this twilight quite alone, so soon after the marriage and departure of her only daughter; but this would have been a mistake, for Lady Caroline was not sad. Of course she missed Augusta. There was no one now to wake her up when she dozed, as now and then happened, in a warm afternoon after luncheon; and, as a matter of fact, one or two visitors had actually been ushered into the drawing-room while her head was drooping upon her right shoulder, and her cap a little awry. But at this tranquil hour in the dark, when nobody expected anything of her, neither without or within — neither conscience, nor the dean, nor society — it cannot be said that any distressful recollection of Augusta mingled with her thoughts. Nor, indeed, had she any thoughts to mingle it with, which was perhaps the reason. She was very comfortable in the corner of her sofa, with nothing to disturb her. Had Jarvis her maid been at hand to tell her what was going on in the precincts, or any bit of gossip that might have floated upward from the town, it would probably have added a little more flavor to her content; but even that flavor was not necessary to her, and she was quite happy as she was.

Some one came into the room as she lay in this pleasant quiet. She thought it was Jeremie coming to light the candles, and said nothing; but it was not so dignified a person as Mr. Jeremie, the dean's butler, who was generally taken for one of the canons by visitors unacquainted with the place. This was indeed a shirt-front as dazzling as Jeremie's which came into the soft gloom, but the owner of it was younger and taller, with a lighter step and less solemn demeanor. He gave a glance round the room to see if any one was visible, then advanced steadily with the ease of an *habitué* among the sofas and tables. "Are you here, Aunt Caroline?" he said. "Oh, you are there! Shall I ring for lights? it must be dull sitting all by yourself in the dark."

"If you please, my dear," said Lady Caroline, who, having no will of her own to speak of, never set it in opposition to anybody else's; answering a question as she did thus promptly, there was no occasion at the same time to answer a mere remark.

"I am afraid you are moping," he said, "missing Augusta. To be sure, it does make a great difference in the house."

"No, my dear," said Lady Caroline, "I can't say I was thinking of Augusta. She is quite happy, you know."

"I hope so," he said, laughing. "If they are not happy now, when should they be happy? the honeymoon scarcely over, and all sorts of delights before them."

"Yes; that is just what I was going to say," said Lady Caroline; "so why should I mope?"

"Why, indeed?" He took his aunt's soft hand into his, and caressed it. Rollo was fond of his aunt, strange though it may appear. She had never scolded him, though this was the favorite exercise of all the rest of his family. When he came home in disgrace she had always received him just the same as if he had come in triumph. Whoever might find fault with him for wasting his talents, or disappointing the hopes of his friends, his Aunt Caroline had never done so. He could not help laughing a little as he spoke, but he caressed her soft white hand as he did so, compunctious, to make amends to her for the ridicule. Lady Caroline, it need not be said, attached no idea of ridicule to his laugh. "But I have come to tell you," said Rollo, "that I have been out again walking up and down the Dean's Walk, as I did the night of the wedding, and I have not been able to hear a note of your singer — the girl with the wonderful voice."

"Did I say there was a girl with a wonderful voice, my dear? I forget."

"Not you, but Augusta; don't you remember, Aunt Caroline, a girl in the cloisters, in — in the lodges, a Miss — I don't remember the name. Lottie something, Augusta called her."

"Ah! Augusta was too ready to make friends. It is Miss Despard, I suppose."

"Well; might we not have Miss Despard here some evening? If her voice is as fine as Augusta said, it might be the making of me, Aunt Caroline. An English *prima donna* would make all our fortunes. And unless I hear her, it is not possible, is it, I appeal to your candor, that I can judge?"

"But, my dear!" But was a word which scarcely existed in Lady Caroline's vocabulary. It meant an objection, and she rarely objected to anything. Still there was a limit to which instinct snd experience alike bound her. She was not unkind by nature, but rather the reverse, and if there was anything that approached a passion — nay, not a passion, an emotion — in her nature, it was for the poor. She who was little moved by any relationship, even the closest, almost loved the poor, and would take trouble for them, petting them when they were sick, and pleased to hear of all their affairs when they were well — conscience and inclination supplementing each other in this point. But the poor, the real "poor," they who are so kind as to be destitute now and then, with nothing to eat and all their clothes at the pawnbroker's, and their existence dependent upon the clergyman's nod, or the visit of the district lady — these were very different from the chevaliers in their lodges. There even Lady Caroline drew the line. She did what was suggested to her in a great many cases, but here she felt that she could make stand when necessity required. Not the people in the lodges! the shabby genteel people who thought they had claims to be treated as ladies and gentlemen, as if they were in society. The very mildest, the very gentlest must pause somewhere, and this is where Lady Caroline made her stand. "My dear," she said, something like a flush coming to her sallow cheek, for Jeremie by this time had brought the lamps and lighted the candles and made her visible, "I have never visited the people in the lodges. I have always made a stand there. There was one of them appointed through my brother Courtland, you know — your papa, my dear — but when Beatrice asked me to notice them I was obliged to decline. I really could not do it. I hope I never shrink from doing my duty to the poor; but these sort of people — you must really excuse me, Rollo; I could not, I do not think I could do it."

Mr. Ridsdale had never seen anything so near excitement in his aunt's manner before. She spoke with little movements of her hands and of her head, and a pink flush was on her usually colorless face. The sight of this little flutter and commotion which he had caused amused the young man. Jeremie was still moving noiselessly about, letting down a loop of curtain, kindling a distant corner into visibility by lighting one of the groups of candles upon the wall. The room was still very dim, just made visible, not much more, and Jeremie's noiseless presence did not check the expression of Lady Caroline's sentiments. She made her little explanation with a fervor such as, we have said, her nephew had never before seen in her. He was greatly astonished, but he was also, it must be allowed, somewhat disposed to laugh.

"You must pardon me," he said, "for suggesting anything you don't like, Aunt Caroline. But did not Augusta have Miss Despard here?"

"Oh, yes — with the rest of her people who sang. Augusta was always having her singing people — who were not in our set at all."

"I suppose that is all over now," said Rollo in a tone of regret.

"Oh, not quite over. Mrs. Long brought some of them the other day. She thought it would amuse me. But it never amused me much," said Lady Caroline. "Augusta was pleased, and that was all. I don't want them, Rollo; they disturb me. They require to have tea made for them, and compliments. I am not so very fond of music, you are aware."

"I know; not fond enough to give up anything for it; but confess it is often a resource after dinner, when the people are dull?"

"The people are always just the same, Rollo. If they have a good dinner, that is all I have to do with them. They ought to amuse themselves."

"Yes, yes," he resumed, laughing. "I know you are never dull, Aunt Caroline. Your thoughts flow always in the same gentle current. You are never excited, and you are never bored."

A gentle smile came over Lady Caroline's face; no one understood her so well. She was astonished that so many people found fault with Rollo. He was, she

thought, her favorite nephew, if it was right to have a favorite. "It is no credit to me," she said. "I was always brought up in that way. But girls do not have such a good training now."

"No, indeed — the very reverse, I think — they are either in a whirl of amusement or else they are bored. But, Aunt Caroline, people in general are not like you. And for us who have not had the advantage of your education, it is often very dull, especially after dinner. Now you are going to have a gathering to-morrow. Don't you think it would be a good thing to have a little music in the evening, and ask Miss Despard to come and sing. That is not like taking any notice of the chevaliers, poor old fellows! Have her to amuse the people just as you might have Punch and Judy, you know, or some of the sleight-of-hand men."

"I should never think of having either the one or the other, Rollo."

"But a great many people do. It was quite the right thing for a time. Come, Aunt Caroline! My uncle is often bored to death with these duty dinners. He will bless you if you have a little music afterwards and set him free."

"Do you really think so? I can't understand why you should all talk of being bored. I am never bored," said Lady Caroline.

"That is your superiority," said the courtier. "But we poor wretches often are. And I really must hear this voice. You would not like to stand in the way of my interests now when I seem really about to have a chance?"

"It is a very curious thing to me," said Lady Caroline, stimulated by so much argument to deliver herself of an original remark, "that such a clever young man as you are, Rollo, should require to connect yourself with singers and theatres. Such a thing was never heard of in my time."

"That is just it," he said, putting on a mournful look. "If I had not been a clever young man, things would have gone a great deal better with me. There was nothing of that foolish description I am sure, Aunt Caroline, in your time."

"No," she said; then added, almost peevishly, "I do not know how to communicate with the girl, Rollo. She is out of society."

"But only on the other side of the way," he said. "Come, write her a note, and I will take it myself, if Jeremie or Joseph are too grand to go."

"Must I write her a note? I never in my life sent a note to the lodges," said Lady Caroline, looking at her hands as if the performance would soil them. Then she added, with a look of relief, "I very often see her when I am out for my drive. You can tell the coachman to stop if he sees her, and I will tell her to come — that will be much the better way."

"But if she should be engaged?"

Lady Caroline gave him a very faint smile of amiable scorn and superior knowledge. "You forget these people are not in society," she said.

To make head against this sublime of contempt was more than Rollo could do. Lady Caroline vanquished him as she had vanquished many people in her day, by that invincible might of simple dulness against which nothing can stand.

Mr. Rollo Ridsdale was one of the many very clever young men in society who are always on the eve of every kind of fame and fortune, but never manage to cross the border between hope and reality. He had been quite sure of success in a great many different ways: at the university, where he was certain of a first class, but only managed to "scrape through" the ordeal of honors in the lowest room; in diplomacy, where he was expected to rise to the highest rank, but spoiled all his chances by a whisper of a state secret, of no importance to anybody, when only an unpaid *attaché*; in the House of Commons, where he broke down in his maiden speech, after costing what his family described as a "fortune" to secure his election; and finally, in commerce, where his honorable name was just secured from the *éclat* of a disgraceful bankruptcy by the sacrifice of a second "fortune" on the part of the family. It is but fair to add, however, that Rollo had nothing to do with the disgracefulness of the commercial downfall in which he was all but involved. And here he was at eight-and-twenty once more afloat, as the fashionable jackal and assistant of an enterprising *impresario*, indefatigable in his pursuit of the prima donna of the future, and talking of nothing but operas. This was why he had made that moonlight promenade, under Lottie Despard's windows on the evening of his cousin's wedding-day. He did not know her, but Lottie knew him as the populace know all, even the most insignificant, members of the reigning family. Lady Caroline's nephew, Augusta's cousin, was of much more importance to the community than any of the community had been to him up to this moment, though the thoughts which passed through Lottie's mind, as, with extreme surprise, she recognized him gazing

up at her window, suggested a very different hypothesis. What could Lottie imagine, as, with the most bewildering astonishment, she identified Mr. Ridsdale, but that he had seen her as she had seen him, and that it was admiration at least, if not a more definite sentiment, which brought him to wander in front of the window, as poor young Purcell did, whose delusion she regarded without either surprise or compassion? Rollo Ridsdale was a very different person; and Lottie had been too much bewildered by his appearance to found any theory upon it, except the vaguest natural thrill of flattered pleasure and wonder. Was it possible? When a young man comes and stares at a lady's window, going and returning, waiting apparently for a glimpse of her, what is any one to suppose? There is but one natural and ordinary explanation of such an attitude and proceeding. And if Lottie's fancy jumped at this idea, how could she help it? It gave her a little shock of pleasure and exhilaration in her depressed state. Why should she have been exhilarated? It is difficult to say. She did not know anything of Mr. Ridsdale — whether his admiration was worth having or the reverse. But he was Lady Caroline's nephew, who had always been inaccessible to Lottie; he was Augusta's cousin, who had neglected her. And, if it really could be possible that, notwithstanding this, he had conceived a romantic passion for Lottie, what could be more consolatory to the girl who had felt herself humiliated by the indifference and contempt with which these ladies had treated her? The idea brought the light back to her eyes, and her natural gay courage revived again. She would make reprisals, she would "be even with them," and pay them back in their coin; and where is the girl or boy to whom reprisals are not sweet?

This, however, is a digression from Lady Caroline, who went to her tranquil couch that night with a heavier heart than she had known for years. It was a revolution which had occurred in her life. During Augusta's reign she had been passively resistant always, protesting under her breath against the invasion of the singing people of all kinds into her sacred and exclusive world. She had supported it with heroic calm, entrenching herself behind the ladies who were really in society, and whom she could receive without derogation; but to Lottie and the other people who were outside of her world she had never shown any civility, as she was glad to think, on surveying the situation that night. She had not brought it on herself. She had never shown them any civility. A salutation with her eyelids, a cup of tea from her table, the privilege of breathing the same air with her — this had been all she had ever done for her daughter's *protégées*, and hitherto nobody, she was obliged to allow, had presumed upon it. But *that* Miss Despard was not like the timid and respectful singing ladies from the town. She was a bold young woman, who thought herself as good as any one, and looked as if she ought to be talked to, and taken notice of, as much as any one. And it was not possible to get rid of her as the ladies in the town could be got rid of. Lady Caroline could not go out of her own door, could not go to church, without meeting Miss Despard, and feeling what she called within herself "the broad stare" of that dangerous girl. And now was it possible, was it conceivable, that she was herself to take the initiative and re-invite Miss Despard? Not for years, if indeed ever in her life, had Lady Caroline gone to bed with such a weight on her mind. She sighed as she lay down on that bed of down — nay, not of down, which is old-fashioned and not very wholesome either, nowadays, people say — but on her mattress of delicately arranged springs, which moved with every movement. She sighed as she lay down upon it, and the springs swayed under her; and she sighed again in the morning as she woke, and all that had happened came back into her mind. Poor dear Rollo! She did not like to cross him, or to go against him, since he had made so great an object of it. Oh that Augusta had but held her peace, and had not inflamed his mind about this girl's voice! After all, her voice was nothing wonderful; it was just a soprano, as most girls' voices were; and that she, Lady Caroline, should be compelled to exert herself — compelled to go against her principles, to come into personal contact with a person of a different class! She who had always been careful to keep herself aloof! It was very hard upon Lady Caroline. She sighed at breakfast so that the dean took notice of it.

"Is there anything the matter?" he said. "Rollo, do you know what is the matter? This is the third time I have heard your aunt sigh."

"I am sure she does not look as if anything was the matter," said Rollo, with that filial flattery which women like, at Lady Caroline's age.

She gave him a faint little smile, but shook her head and sighed again.

"Bless my soul!" said the dean, "I must look in upon Enderby, and tell him to come and see you."

"Oh, there is nothing the matter with me," Lady Caroline said; but she had no objection to see Enderby, who was the doctor and always very kind. It even pleased her to think of confiding her troubles to him, for indeed she had the humbling consciousness upon her mind that she had never been a very interesting patient. She had never had anything but headaches, and mere external ills to tell him about. She had never till now been able to reveal to him even a headache which had been caused by trouble of mind. Lady Caroline, though she was dull, had a faint wish to be interesting as well as other people, and it would be a relief to pour out this trouble to his sympathizing ear. The ladies of the town did not love — any more than Lady Caroline did, and the other ladies in the cloisters — those nondescripts, neither one thing nor another, neither people to visit, nor people to be altogether ignored, who lived in the chevaliers' lodges — and she knew that she was sure of sympathy from the doctor, whose wife at least must have suffered from them too.

The idea of meeting Lottie when she went out was a very happy one, Lady Caroline thought. She could not but feel that necessity was producing invention within her. Perhaps she might not meet Lottie, perhaps Lottie might be frightened and would decline to come. She drove out that afternoon with a little excitement, full of hope, if she felt also the palpitation of a little fear. These emotions made quite a pleasant and unusual stir in the dull fluid that filled her veins. She was half disturbed and half pleased when she found that Rollo proposed going with her, a very unusual compliment from a young man. He said it was because he had hurt his foot and could not walk. "Dear me!" Lady Caroline said, "I will send Jarvis to see if it is a sprain." "Oh no, it is not a sprain," he said; "a little rest is all it requires." "You will find carriage exercise very nice," Lady Caroline said; "a perfect rest — and much more amusement than walking, which tires one out directly." And thus they set out perfectly pleased with each other. But the coachman had got his instructions carefully from Rollo's own lips, and there was now no possibility of escape for the poor lady, over whom Rollo himself had mounted guard. They had not gone above a few yards from the Deanery door, when the carriage suddenly drew up with a jar, to the side of the high terrace pavement which lay in front of the lodges. Rollo, who was on the alert, looked eagerly out, and saw a light, erect figure, full of energy and life, coming up in the plainest of morning frocks, one of those simple toilettes which fashion has lately approved. She looked perfectly fresh, and like the summer morning, as she came along, with a little basket in her hand; and suddenly it burst upon Rollo, as Lottie raised her eyes with a glance of astonished interest in them, wondering why it was that Lady Caroline's carriage should stop there, that this unknown girl was extremely handsome — a thing for which the young man had not been prepared. "Is this Miss Despard? but she will be gone unless you send to her. Shall I go and call her to you?" he said.

"Oh, she will come when she sees I want her," said Lady Caroline. But the only answer he made was to jump up and let himself out of the carriage before Joseph could get off from the box. He went up to Lottie with his hat in his hand, very much surprised in his turn by the vivid blush which covered her cheeks at sight of him. He was flattered, and he was surprised; was it a mere trick of unformed manners, the *gaucherie* of a girl who had never been in society, and did not know how to behave herself? or was it that she saw something unusually fascinating in himself, Rollo? To see so handsome a girl blush at his approach was a tribute to his attractions, which Rollo was not the man to be indifferent to. He almost forgot the business side of the transaction, and his hunt after a prima donna, in the pleasure of such an encounter. Could she have seen him somewhere before and been "struck" with him? Rollo wondered. It was an agreeable beginning. He went up to her with his hat in his hand as if she had been a princess. "I beg your pardon," he said, "my aunt, Lady Caroline Huntington, has sent me to beg that you would let her speak to you for a moment." Lottie looked at him bewildered, with eyes that could scarcely meet his. She could hardly make out what he said in the sudden confusion and excitement of meeting thus face to face the man whom she had seen under her window. What was it? Lady Caroline asking to speak with her, awaiting her there, in her carriage, in the sight of all St. Michael's! Lottie stood still for a moment, and gazed at this strange sight, unable to move or speak

for wonder. What could Lady Caroline have to say? She could not be going, on the spot, out of that beautiful chariot with its prancing horses, to plead her nephew's suit with the girl who knew nothing of him except his lover-like watch under her window. Lottie could not trust herself to make him any reply — or rather she said idiotically, "Oh, thank you," and turned half reluctant, confused, and anxious, to obey the call. She went to the carriage door, and stood without a word, with her eyes full of wonder, to hear what the great lady had to say.

But it was not much at any time that Lady Caroline had to say. She greeted Lottie with the usual little movement of her eyelids. "How do you do, Miss Despard?" she said. "I wanted to ask if you would come to the Deanery, this evening, for a little music?" There was no excitement in that calmest of voices. Lottie felt so much ashamed of her wonderful vague absurd anticipations, that she blushed more hotly than ever.

"At half past nine," said Lady Caroline.

"You have not presented me to Miss Despard, Aunt Caroline, so I have no right to say anything; but if I had any right to speak, I should say I hope — I hope — that Miss Despard is not engaged, and that she will come."

How earnest his voice was; and what a strange beginning of acquaintance! Lottie felt half disposed to laugh, and half to cry, and could not lift her eyes in her confusion to this man who — was it possible? — was in love with her, yet whom she did not know.

"Oh, I am not engaged — I — shall be very happy." What else could she say? She stood still, quite unaware what she was doing, and heard him thank her with enthusiasm, while Lady Caroline sat quite passive. And then the splendid vision rolled away, and Lottie stood alone wondering like a creature in a dream, on the margin of the way.

CHAPTER V.

AT THE DEANERY.

LOTTIE stood as if in a dream, hearing the ringing of the horses' hoofs, the roll of the carriage, and nothing more; all the sounds in the world seemed to be summed up in these. She could scarcely tell what had happened to her. A great honor had happened to her, such as might have impressed the imagination of any one in that little world of St. Michael's, but not so great a thing as she thought. Lady Caroline had asked her to tea. It was something, it was much; it was what Lady Caroline had never done to any one in the lodges before. Even Mrs. Seymour, whose husband was really *one of the Seymours*, people said, and whom Lady Courtland had begged Lady Caroline to be kind to, had not been so honored. But for all that, it was not what Lottie thought. She stood there with her heart beating, feeling as if she had just fallen from the clouds, in a maze of bewildered excitement, scarcely able to realize what had befallen her — and yet that which had befallen her was not what she thought. Most things that happen to us are infinitely better in thought and in hope than they are in reality; but this was doubly, trebly the case with poor Lottie, who found the cause of this new happiness of hers in a delusion, a mistake, most innocently, most unwittingly occasioned. It was not a thing that anybody had intended. Rollo Ridsdale had meant no harm when he strolled along the Dean's Walk in the evening on two separate nights, looking up at Lottie's window and hoping to hear her sing that he might tell his partner of a new voice to be had for the asking. And neither had Lottie meant any harm; it was not vanity, it was the most natural conclusion from what she saw with her own eyes. How could she doubt it? He must have seen her when she was not aware of it, and fallen in love with her, as people say, at first sight — a romantic compliment that always goes to a girl's heart. There was no other interpretation to be put upon the fact of his lingering about looking up at her window. She had said to herself it was nonsense; but how could it be nonsense? What other explanation could any one give of such a proceeding? And now he had managed to make Lady Caroline, she who was the queen of the place and unapproachable, take his cause in hand. For what other possible reason could Lady Caroline, who never noticed any one out of her own sphere, have paid this special and public compliment to Lottie, and invited her to paradise, as it were, to tea — not afternoon tea, which means little, but *in the evening?* But here Lottie's fancies became so bewildering that she could not follow herself in her thoughts; much less would it be possible for us to follow her. For, if Lady Caroline had thus interfered on her nephew's behalf, securing for him a personal introduction and an opportunity of making her acquaintance, what could this mean but that Lady Caroline was on

his side and meant to help him and approved of his sentiments? This thought was too wonderful to be entertained seriously; it only glanced across the surface of Lottie's mind, making her laugh within herself with a bewildered sense that there was something absurd in it. Lady Caroline stoop from her high estate to lift her, Lottie, to a place upon that dazzling eminence! The girl felt as if she had been spun round and round like a teetotum, though it was an undignified comparison. She did not know where she might find herself when, dizzy and tottering, she should come to herself. All this time Mrs. O'Shaughnessy, at her window where she always sat surveying everything that went on, had been knocking an impatient summons with her knuckles on the pane; and this it was at last which brought Lottie to herself. She obeyed it with some reluctance, yet at the same time she was glad to sit down somewhere till the giddiness should go off and the hurry of her thoughts subside. Mrs. O'Shaughnessy met her with a countenance full of interest and eagerness; a new incident was everything to her. She was as eager as if it was of vital importance to know every word that Lady Caroline said.

"Then what was she saying to ye, me dear?" cried the old lady, from whom excitement almost took away the breath.

"She did not say anything," said Lottie, relieving her feelings by a little laugh. "She never does say anything; she asked me to tea."

"And you call that nothing, ye thankless creature! It's spoilt ye are, Lottie, me darling, and I always said that was what would come of it. She asked you to tea? sure it'll be afternoon tea for one of the practisings, like it was in Miss Augusta's day?"

"No, I am going to go in after dinner. It is not the first time, Mrs. O'Shaughnessy; Augusta has often asked me. What else did I get my white frock for? — for there are no parties here to go to. She used to say: 'Come in, and bring your music.' It is not me they want, it is my voice," said Lottie, assuming a superiority of wisdom which she did not possess.

"All in good time, me dear," said Mrs. O'Shaughnessy. "And did my Lady Caroline bid you to bring your music too? The daughter is one thing, and the mother is clean another. I hope you've got your frock in order, me darlin'; clean and nice and like a lady? You should send it to Mrs. Jones to iron it out; she's the plague of my life, but she's a beautiful clear-starcher — that I will say for her; and if you want a ribbon or so, me jewel, or anything I have that ye may take a fancy to — there's my brooch with O'Shaughnessy's miniature, sure ne'er a one of them would find out who it was. You might say it was your grandpapa, me honey, in his red coat with his medals; and fine he'd look on your white frock ——"

"Thank you!" said Lottie in alarm; "but I never wear anything, you know, except poor mamma's little pearl locket."

"Sure I know," said the old woman with a laugh; "a body can't wear what they haven't got! But you needn't turn up your little nose at my big brooch, for when it was made it was the height of the fashion, and now everything that's old is the height of the fashion. And so me Lady Caroline, that's too grand to say 'Good morning to ye, ma'am,' or 'Good evening to ye,' after ye've been her neighbor for a dozen years, stops her grand carriage to bid this bit of a girl to tea, and Miss Lottie takes it as cool as snowballs, if ye please. Well, well, honey! I don't envy ye, not I; but you're born to luck as sure as the rest of us are born to trouble, and that all the Abbey can see."

"I born to luck! I don't think there is much sign of it," said Lottie, though with a tumultuous leap of the heart which contradicted the words. "And what is there, I should like to know, that all the Abbey can see?"

"If you think I'm going to tell you the nonsense that is flying about, and put fancies in your little head!" said the old Irishwoman, "go your ways, and see that your frock is in order; and I'll run in and see you dressed, me pet, and I'll bring the brooch and the box with me best ribbons; maybe at the last you'll change your mind."

Lottie went home with her head in the clouds; was she indeed "born to luck"? Was she going to be transplanted at once without the tedious probation which even in poetry, even in story-books, the good heroine has generally to go through, into that heaven of wealth and rank and luxurious surroundings which she felt to be her proper sphere? It was not that Lottie cared for luxury in its vulgarer forms; she liked what was beautiful and stately — the large noble rooms, the dignified aspect which life bore when unconnected with those small schemes and strugglings in which her existence was spent; but above all she liked, it must be allowed, to be uppermost, to feel herself on the highest round of the ladder, and hated and re-

sisted with all her soul the idea of being inferior to anybody. This was the thing above all others which Lottie could not bear. She had been brought up with the idea that she belonged by right of nature to the upper classes, a caste entirely removed by immutable decree of Providence from shopkeepers and persons engaged in trade, and to whom it was comparatively immaterial whether they were poor or rich, nothing being able to alter the birthright which united them with all that was high and separated them from all that was low. But this right had not been acknowledged at St. Michael's. She and her family had been mixed up in the crowd along with the O'Shaughnessys, and the Dalrymples, and all sorts of common people; and nobody, not even the O'Shaughnessys, had been impressed by the long descent of the Despard family and its unblemished gentility. Something else then evidently was requisite to raise her to her proper place, to the sphere to which she belonged. Lottie would not have minded poverty, or difficulty, or hard work, had she been secure of her "position;" but that was just the thing of which in present circumstances she was least secure. It was for this reason that Lady Caroline's notice was sweet to her — for this that she had been so deeply disappointed when no sign of amity was accorded to her on the wedding-day. And this was why her heart leapt with such bewildering hope and excitement at the new event in her career. She did not know Mr. Ridsdale; perhaps his admiration or even his love were little worth having; and nothing but what are called interested motives could have possibly moved Lottie to the thrill of pleasure with which she contemplated his supposed attachment. A girl whose head is turned by the mere idea of a lover who can elevate her above her neighbors, without any possibility of love on her part to excuse the bedazzlement, is not a very fine or noble image; yet Lottie's head was turned, not vulgarly, not meanly, but with an intoxication that was full of poetry and all that is most ethereal in romance. A tender, exquisite gratitude to the man who thus seemed to have chosen her, without any virtue of hers, filled her heart; and to the great lady who, though so lofty, and usually cold as marble to the claims of those beneath her, could thus forget her pride for Lottie. This feeling of gratitude softened all the other emotions in her mind. She was ready to be wooed, but then the very manner of the first step in this process, the lingering outside her window, which was a sign of the tenderest, most delicate, and reverential love-making (but she did not think it so in the case of poor young Purcell), showed what a respectful, ethereal, poetical wooing it would be. Thus Lottie's whole being was full of the most tremulous, delicious happiness, all made up of hope and anticipation, and grateful admiration of the fine, generous sentiments of her supposed lover, even while it was founded, as you may say, on self-interest and ambition, and sentiments which were not generous at all.

And with what a flutter at her heart she put on her white muslin frock, which (not having any confidence in Mrs. Jones) she ironed herself most carefully and skilfully, with such interest in keeping it fresh as no Mrs. Jones in the world could have. For girls who have no ornaments to speak of, how kind summer is, providing roses, which are always the most suitable of decorations! One knot of them in her hair and one at her breast — what could Lottie want more? Certainly not the big brooch with Major O'Shaughnessy in his red coat, which her old friend was so anxious to pin the roses with. Mrs. O'Shaughnessy thought it would be "such a finish," and prove satisfactorily that it was not poverty but fancy that made Lottie decorate herself with fresh flowers instead of the fine artificial wreath with a nice, long trail down the back, which was what the old lady herself would have preferred. Mrs. O'Shaughnessy, however, was mollified by the girl's acceptance of the Indian shawl which she brought to wrap her in. "And you might just carry it into the room with you, me dear, as if ye might feel chilly," said the old lady, "for it's a beauty, and I should like me Lady Caroline to see it. I doubt if she's got one like it. Good-night and a pleasant evening to ye, me honey," she cried, as under charge of Law, and with her dress carefully folded up, Lottie with her beating heart went across the broad gravel of the Dean's Walk to the Deanery door. It was a lovely summer night, not dark at all, and the signor was practising in the Abbey, and the music, rolling forth in harmonious thunders, rose now more now less distinct as the strain grew softer or louder. A great many people were strolling about, loitering, when Lottie came out, skimming over the road in her little white shoes, with the roses in her hair. All the rest of her modest splendors were hidden by the shawl, but these could not be hidden. The people about all turned their

heads to look at her. She was going to the Deanery. It was the same in St. Michael's as visiting the queen.

The dean's dinner-party had been of a slightly heavy description. There were several of the great people from the neighborhood, county people whom it was necessary to ask periodically. It was so distinctly made a condition, at the beginning of this story, that we were not to be expected to describe the doings on Olympus, nor give the reader an insight into the behavior of the gods and goddesses, that we feel ourselves happily free from any necessity of entering into the solemn grandeur of the dinner. It was like other dinners in that region above all the clouds. The ladies were fair and the gentlemen wise, and they talked about other ladies and gentlemen not always perhaps equally wise or fair. Mr. Rollo Ridsdale was the greatest addition to the party. He knew all the very last gossip of the clubs. He knew what Lord Sarum said to Knowsley, upbraiding him for the indiscretion of his last Guildhall speech. "But everybody knows that Knowsley is nothing if not indiscreet," Rollo said; and he knew that, after all, whatever any one might say to the contrary, Lady Martingale *had* gone off with Charley Crowther, acknowledging that nothing in the world was of any consequence to her in comparison. "Such an infatuation!" for, as everybody knew, Charley was no Adonis. Lady Caroline shook her head over this, as she eat her chicken (or probably it was something much nicer than chicken that Lady Caroline ate). And thus the *ménu* was worked through. There was but one young lady in the party, and even she was married. In Augusta's time the young people were always represented, but it did not matter so much now. When all these ladies rose at last in their heavy dresses that swept the carpet, and in their diamonds which made a flicker and gleam of light about their heads and throats, and swept out to the drawing-room: all, with that one exception, over middle age, all well acquainted with each other, knowing the pedigrees and the possessions each of each, and with society in general for their common ground, the reader will tremble to think of such a poor little thing as Lottie, in her white muslin, with the roses in her hair, standing trembling in a corner of the big drawing-room, and waiting for the solemn stream of silk and satin, and society, in which she would have been engulfed at once, swallowed up and seen no more. And what would have happened to Lottie, had she been alone, without any one to stand by her in the midst of this overflowing, we shrink from contemplating; but happily she had already found a companion to hold head with her against the stream.

For when Lottie came in, she found some one before her in the drawing-room, a tall, very thin man, with stooping shoulders, who stood by the corner of the mantelpiece, on which there were candles, holding a book very close to his eyes. When Lottie went in, with her heart in her mouth, he turned round, thinking that the opening of the door meant the coming of the ladies. The entrance, instead, of the one young figure, white and slender, and of Lottie's eyes encountering him, full of fright and anxiety, yet with courage in them — the look that was intended for Lady Caroline, and which was half a prayer, "Be kind to me!" as well as perhaps the tenth part of a defiance — made a great impression upon the solitary inmate of the room. He was as much afraid of what he thought a beautiful young lady, as Lottie was of the mistress of the house.

After this first moment, however, when she perceived that there was nobody alarming, only a gentleman (an *old* gentleman, Lottie contemptuously, or rather carelessly concluded, though he was not more in reality than about five-and-thirty), she regained her composure, and her heart went back to its natural place. Lottie knew very well who the gentleman was, though he did not know her. It was Mr. Ashford, one of the minor canons, a very shy and scholarly person, rather out of his element in a community which did not pretend to much scholarship or any special devotion to books. Perhaps he was the only man in St. Michael's whom Lottie had ever really desired to make acquaintance with on his own account; but indeed it was scarcely on his own account, but on account of Law, about whom she was always so anxious. Mr. Ashford took pupils, with whom he was said to be very successful. He lived for his pupils, people said, and thought of nothing else but of how to get them into shape and push them on. It had been Lottie's dream ever since she came to St. Michael's to get Law under Mr. Ashford's care; and after she had recovered the shock of getting into the room, and the mingled thrill of relief and impatience at finding that there was nobody there as yet to be afraid of, Lottie, whose heart always rose to any emergency, began to speculate how she could make friends with Mr. Ashford. She was

not afraid of him: he was short-sighted, and he was awkward and shy, and a great deal more embarrassed by her look than she was by his. And he was being badly used — much more badly used than she was. For Lottie reflected, with indignation, that to ask a gentleman like Mr. Ashford after dinner, was an insult to him, and that he must therefore stand in need of consolation and support. She ranged herself by him instantly, instinctively. They were the two who were being condescended to, being taken notice of — they were the natural opponents consequently of the fine people, the people who condescended and patronized. Mr. Ashford, on his side, stood and looked at her, and did not know what to do. He did not know who she was. She was a beautiful young lady, and he knew he had seen her in the Abbey; but further than this Mr. Ashford knew nothing of Lottie. The signs which would have betrayed her lowly condition to an experienced eye said nothing to him. Her white muslin might have been satin for anything he could tell, her little pearl locket a priceless ornament. He did not know how to address such a dazzling creature, though to any ordinary person in society Lottie's attire would have suggested bread-and-butter, and nothing dazzling at all.

"It is a beautiful evening," said Lottie, a little breathless. "It is scarcely dark yet, though it is half-past nine o'clock."

To both these unquestionable statements Mr. Ashford said "Yes," and then he felt himself called upon to make a contribution in return. "I have just found a book which somebody must have been reading," he said, growing red with the effort.

"Oh, yes; is it a very interesting book? What is it about?" said Lottie, but this was something for which Mr. Ashford was not prepared. He got redder than ever and cleared his throat.

"Oh! it does not seem about anything in particular. I have not really had time to read it;" then he made a hasty dash at an abstract subject, and said, with a falter in his voice, "Are — are you fond of reading?" This question at once lit up Lottie's face.

"Oh, *very*, very fond! But I have not many books nor much time. I always envy people who can read everything they please. Mr. Ashford, I wonder if I might speak to you about something — before they come in," said Lottie, coming a step nearer, and looking eagerly at him with her dangerous blue eyes.

Mr. Ashford got the better of his shyness in a moment. It did not embarrass him when there was anything to be done. He smiled upon her with a most beautiful beaming smile which altogether changed the character of his face, and put a chair for her, which Lottie, however, did not take. "Surely," he said, in his melodious voice, suddenly thawed out of the dryness which always got into his throat when he spoke first to a stranger. It has not yet been said that Mr. Ashford's chief quality as respected the community at St. Michael's was an unusually beautiful mellow voice. This was his chief claim, as it was Lottie's only one, to entertainment at the Deanery. "If there is any way in which I can be of use to you?" he said.

"Oh yes; so much use! They say you think a great deal about your pupils, Mr. Ashford," said Lottie, "and I have a brother whom nobody thinks much about ——"

That was the moment Lady Caroline chose to return to the drawing-room. The door opened, the ladies swept in one by one, the first looking suspiciously at both Mr. Ashford and Lottie, the second who knew Mr. Ashford giving him a smile of recognition, and looking suspiciously only at Lottie, the rest following some one example, some the other. Lottie knew not one of them. She looked trembling for Lady Caroline, and hoped she would be kind, and save her from the utter desolation of standing alone in this smiling and magnificent company. But Lady Caroline, coming in last of all, only made her usual salutation to the stranger. She said, "Good evening, Miss Despard," as she swept her long train of rustling silk over the carpet close to Lottie's trembling feet, but she put out her hand to Mr. Ashford. "It was so good of you to come," she said. Alas! Lottie was not even to have the comfort of feeling on the same footing with the minor canon. He was carried off from her just as he had begun to look on her with friendly eyes. The stream floated towards the other side of the room, where Lady Caroline seated herself on her favorite square sofa. Lottie was left standing all alone against the soft grey of the wall, lighted up by the candles on the mantelpiece. When a person belonging to one class of society ventures to put a rash foot on the sacred confines of another, what has she to expect? It is an old story, and Lottie had gone through it before, and ought to have had more sense, you will say, than to encounter it again. But the silly girl felt it as much as

if she had not quite known what would happen to her. She stood still there feeling unable to move, one wave of mortification and indignation going over her after another. How could they be so cruel? What did they ask her for if they meant to leave her to stand there by herself? And Mr. Ashford, too, was cruel. She had made up her mind to stand by him; but he had been carried away by the first touch; he had not stood by her. Lottie could have torn off the roses with which she had decked herself so hopefully, and stamped her foot upon them. She almost wished she had the courage to do it, to cry out to those careless people and let them see what unkindness they were doing. Meantime she made a very pretty picture without knowing it. "Look at that pretty, sulky girl against the wall," said the young married lady to her mother. "Lady Caroline must have set her there on purpose to look handsome and ill-tempered. How handsome she is! I never saw such eyelashes in my life; but as sulky as a thunder-cloud."

"Go and talk to her and then she will not be sulky," said the mother, who, though by instinct she had looked suspiciously at Lottie, was not unkind; nay, was a kind woman when she saw any need for it. Neither were the others unkind — but they did not see any need for it. It was Lady Caroline's business, they thought, to entertain her own guests.

Lottie, however, had her triumph later when she sang, all the whispered conversation in the room stopping out of sheer astonishment. Her voice had developed even within the last month or two, during which there had been no singing in the Deanery, and as the signor, who had come in after his practising, played her accompaniments for her, and did his very best to aid and heighten the effect of her songs, her success was complete. He had never accompanied her before, which was a fact Lottie did not remember. And she did not notice either in her preoccupation — thinking nothing of this but much of less important matters — that he knew everything she could sing best, and humored, and flattered, and coaxed her voice to display itself to the very fullest advantage, as only a skilful accompanyist can. No doubt he had his motive. As for Rollo Ridsdale, he stood on the other side of the piano looking at Lottie with a gaze which seemed to go through and through her. It meant in fact the real enthusiasm of a man who knew exactly what such talent was worth, and the less practical but still genuine enthusiasm of the amateur who knew what the music was worth as well as the voice. In the one point of view he saw Lottie's defects, in the other he saw all that could be made of her. An English prima donna! a real native talent as good as anything that ever came out of Italy, and capable of producing any amount of national enthusiasm! Rollo's eyes shone, his face lighted up, he did not know how to express his delight. He said to himself that she would make "all our fortunes," with an exaggeration common to his kind. "I knew I was to be charmed, Miss Despard, but I did not know what delight was in store for me," he said, with eyes that said still more than his words. Lottie's eyes with their wonderful lashes sank before his. He thought it was perhaps a pretty trick to show that remarkable feature, and since he was sensible at all points to the beautiful, he did full justice to them. "By Jove! how well she would look on the stage! Those eyelashes themselves! that pose! What a pensive Marguerite, what a Lucia she would make!" He longed to rush up to town by the late train and rush upon his astonished partner, shouting, "I have found her!" "You will not deny me one more?" he said, turning to her with glowing eyes.

Poor silly Lottie! She grew crimson with pleasure and excitement, pale with excitement and feeling. What did she know about the young fellow's motives? She knew only that he had kept watch at her window, lounging about for a glimpse of her, a thing which to be sure explains itself; and that every note she sang seemed to make him happier and happier, and more and more adoring. The incense was delicious to her. She had never had it before (except perhaps from poor young Purcell — a nobody! what did he matter?), and the happiness of flattered vanity and soothed pride raised her to a pinnacle and climax of soft delight, such as she had never thought possible. It seemed almost more than Lottie could bear. Even Lady Caroline was so flattered by the plaudits addressed to her on the entertainment she had provided for her guests, that a sense of superior discrimination came over her placid mind, pleasantly exciting its tranquillity. "Yes, I knew that she was going to have a beautiful voice," she said. And she smiled, and accepted the thanks with an agreeable sense that she had deserved them. As for Rollo Ridsdale, it was he who got Miss Despard's shawl and wrapped her in it when the dreadful moment came, as he said, for her departure.

"You have no carriage; you live on the other side of the way; then you must permit me to see you to your door," he said, "and to thank you once more for all the pleasure you have given me. This will be a white day in my recollection; I shall begin the dates in my history from the time when I first heard —— "

"Mr. Ashford is going Miss Despard's way. And, Rollo, your aunt wants you, I think. We have all been so much delighted that we have forgotten the progress of time, and Lady Caroline is not very strong. Mr. Ashford," said the dean, "I am sure we may leave to you the privilege of seeing Miss Despard to her own door."

"And I am here," said the signor. Nevertheless, poor Lottie felt as if she had stepped suddenly out of heaven to earth again when she found herself between the musician and the minor canon outside the Deanery door.

CHAPTER VI.

LAW.

LAW went with his sister dutifully to the door in the great cloister. He did not care much for the honor and glory of going to the Deanery, but he was pleased to walk with Lottie in her pretty evening dress with the roses in her hair. This gave him a certain gratification and sense of family pride, though he scoffed at that sentiment in general. Law did not feel that on the whole he had much to be proud of. Still, he was proud of Lottie, who was a creature quite out of the common, and like nobody else he had ever seen. He waited till the Deanery door was opened to her. That was a world of which Law knew nothing, and did not want to know anything. How Lottie had managed to get among these fine people, and why she liked to get among them, were equally strange to him. He admired her for the first, and wondered at her for the last. She was the only lady belonging to the chevaliers who had ever got footing in the Deanery; and this was just like Lottie, just what he would have expected from her, he said to himself; but how she could stand those old fogies, with their pride and their finery, that was what he could not tell. All the same, it gave him a certain gratification to leave her there in her element among the great people. And when the door closed upon him Law went off about his own business. He went through the cloister, and a curious little back cloister beyond — for there were many intricacies about the Abbey, the different degrees of the hierarchy being very distinct, one cloister for the chapter, another for the minor people, and a third for the lay clerks. He went through the little square of the minor cloister, and came out upon a stone staircase which abridged the slopes of St. Michael's Hill, and led straight down into the town. The lights had begun to be lighted in the picturesque street which wound round the foot of the hill; they twinkled here and there in the shops opposite, and appeared in glimmers in the villages across the river. The dim, misty plain lying doubly broad in the twilight, stretching out vaguely to the sky, was here and there defined by one of those twinkles which showed where a group of houses stood together. The town was all out in the streets and on the river this lovely evening: boats floating dimly about the stream, people walking vaguely up and down the hill. And the air was filled with pleasant, soft, uncertain sounds of talking, of footsteps, now and then the clocks chiming or striking, and a bugle sounding faint and far from where the soldiers were quartered, for there was a military depôt not far off. Law stopped at the head of the Steps, as they were called, and looked down over all this scene. The mere notion of being out in the *grand air*, as the French call it, with somehow a fuller sense of space and width than we can find a word for, was pleasant to Law; but if he paused, it was neither to enjoy the picture before him, nor was it because he had no definite place to go to. He knew very well where he was going. No vagueness on that point was in his mind, and he did not care a brass farthing for the landscape; but he paused at the head of the steps and looked about, just as a child will pause before eating his cake, a pause of anticipation and spiritual enjoyment of the dainty before it goes to his lips. Then he ran down the steps three at a time, skimming down the long flights, turning the corners like a bird. To take care of his sister had been duty, but Law was about his own business now.

What was Law's business? In all St. Michael's there was not a more idle boy. He was over eighteen, and he did nothing. Vague hopes that he would get some appointment — that something would turn up for him — that he would suddenly awake and find himself in an office somehow, doing something and making money — had been in his own mind and that of his family all his life. Law had no objection. Had some one taken him and set him down at once in any office, it was quite possible that he might have done the best he could in his place, and succeeded as

well as most men; but in the mean time there were a great many preliminaries to go through, for which Law had never been required or encouraged to fit himself. In these days of examination, when the pitifullest little bit of an office builds up those prickly thorns, those red-hot ploughshares before its door, how was he to get into any office without education? He had spent all his earlier years, as has been seen, in eluding school as cleverly as possible, and doing as little as he could of his lessons; and now here he was on the verge of manhood, with nothing to do and no great wish to do anything; a great, straight, powerful young fellow, without any absolute aim or tendency to evil, but good for nothing, not capable of anything, with neither purpose nor object in his life. He could row very well when any one would give him an oar. He was not amiss at cricket when any one asked him to play. He could walk with any man, and had won a race or two, and was quite capable of competing for a high jump, or for throwing a cricket-ball, or any of those useful accomplishments; but as for anything else he was not capable. He hated books with that sincere and earnest hatred which seems possible only to those who know books to be the preliminary of everything — a peculiarity of this examining age. Never before surely was such a candid and thorough detestation of the tools of knowledge possible. Law knew that no door could possibly open to him without them, and therefore he hated and despised them, illogically, no doubt, but very cordially all the same; and so went drifting along upon the stream, not asking what was to become of him, never thinking much of the subject, though he suffered greatly from want of pocket-money, and would gladly have made some exertion from time to time to obtain that, had he known what to do.

This want of pocket-money is the grand drawback to the education or no education of the youths of the nineteenth century. So long as they can have enough of that, what a pleasant life is theirs! For it does you no particular harm to be supposed to be "working for an examination," so long as you don't work much for that, and are exempted, for the sake of it, from all other kinds of work. Boating and cricketing and running races, and every kind of exercise, are known nowadays to be compatible with the hardest mental labor, and he is a stern parent indeed who interferes with his son's training in such essential points. But all these delights are more or less dependent upon pocket-money. Law, whose bread and cheese had never yet failed, and whose conscience was not active, would have found his life quite pleasant but for that; but it was hard upon him not to be able to pay his subscription to a cricket-club, nor the hire of a boat, nor even the entry-money for a race, though that was sure to repay itself abundantly if he won it. This was very hard upon him, and often stimulated him to the length of a resolution that he would work to-morrow and conquer all his subjects, and "scrape through" by sheer force of will, so as to have an income of his own. But the habit of idleness unfortunately overcame the resolution next morning, which was a pity, and Law "loafed," as he himself said, not being able to afford to "do anything." It is needless to inform the instructed who have to do with youths working for examinations, that it is cricket and boating and athletics these heroes mean when they talk of "having something to do."

Law, however, had a pleasure before him which had no connection with pocket-money. He went straight down with the directness of habit, till he came to a lane very tortuous and narrow, crowded with builders'-yards and coal-merchants, and affording glimpses of the little wharves where a little traffic was carried on, edging the river. Threading his way through them, he came to a red-brick house, the front of which overhung the stream with its projecting gable. Law went in through a door which stood open always, and showed signs of much and constant use. There were lodgings up-stairs, which were very pleasant in summer, and which were always let, and made a very comfortable item in the earnings of the family; but it was not up-stairs that Law went, though that would have done him good. On the first floor, in the room with the square window, which overlooked and indeed overhung the river, the excellent curate was living with whom Law occasionally "read," and to whom no doubt he would have said he was going had Lottie seen him at this door. But Law had no intention of disturbing the curate, who for his part did not want his pupil. He passed the staircase altogether, and pushed open a green baize door, beyond which was a short passage leading into a room, all ablaze with gas. The door of the room was wide open, and so were the windows, to admit all the air that was possible, and round the large table between sat three or four young women working and talking.

They were very busy; the great table was covered with silk and muslin, and all kinds of flimsy trimming, and though they chatted they were working as for bare life. As Law sauntered in they all looked up for a moment, and threw a smile or a nod or half a dozen words at him, but scarcely intermitted a stitch. "We're awful busy; we can't so much as look at you; we've got some wedding things to finish for to-morrow," said one fair-haired girl who seemed specially to appropriate his visit. She pushed her chair a little aside without pausing in her work, as if accustomed to make room for him; and Law took a chair and placed it sideways, so that he could lean his idle elbow on the table between this busy needlewoman and the rest. Perhaps as a stormy sea gives zest to the enjoyment of tranquillity on shore, so the extreme occupation of this workroom made him feel his own absolute leisure more delightful.

"Who is going to be married?" he said.

"Oh, you know just as well as I do. I am sure you have heard us talking of it for the last week. Polly, didn't you tell Mr. Despard all about it? It's a lady, you know. It's Miss Hare at the Golden Eagle, who is one of your papa's great friends. I don't know what the captain will do when she's gone. Polly, do you?"

"I don't know what the captain has to do with her, nor me neither," said the young lady at the head of the table. The rest of the girls were sisters, with fair frizzy locks a little out of order after the long day's work, what with the warmth of the room, and the fluttering of the faint breeze from the river that ruffled the well-crimped tresses. But Polly was of a different stamp. She had a mountain of dark brown hair upon her head in plaits and curls and puffs innumerable, and though she was sallow in complexion, had commanding features, a grand aquiline nose, and brilliant eyes. "The captain nor me, we haven't much to say to that sort," said Polly. "I don't go with them that has a word and a laugh for everybody. What I like is a young lady that respects herself. If you work for your living, that's not to say that you ain't as good as the best of them. Stick up for yourself, and other folks will think of you according, that's what I say."

"I am sure Miss Hare always sticks up for herself," said the girl by Law's side. "Going to be married in a veil, like one of the quality!"

"And so would I, if it was me," cried Polly. "The quality! What are they better than us, only they've got a pocket-ful of money? If I was the queen, I'd do away with them all. I'd be the queen, and all the rest should be the people. There shouldn't be one more than another, or one greater than another, only me. And then shouldn't I do whatever I pleased, and cut off their heads if they said a word?"

This instinctive perception of the secret of despotism made Law laugh, who thought he knew a great deal better. "It would be a funny world with Queen Polly over it," he said. "I hope you'd take me for your prime minister."

Polly gave him a look of saucy malice. "I'd take the captain," she said.

"Has he been here to-night, Emma? I think he's always coming here," said Law, under his breath. It was a kind of growl which the young fellow gave out when he spoke low, in the voice which not very long ago had been treble, a soprano, as clear and pure as Lottie's — but it was extremely bass now.

"He wants to know," said Emma, with a glance at the others as she pinned her work straight, "if the captain has been here;" upon which there was a chorus of laughter, making Law red and angry. He turned upon them with a furious look.

"I should like to know how you would all like it," said the boy, "if your governor were to come poking in the very same place where ——"

"Oh, you may make yourself quite easy, Mr. Lawrence," said Polly, with a toss of her elaborately-dressed head. "He don't meddle with you. The captain is a man of taste, he ain't a boy like some folks. He knows what's what, the captain does. Other girls may have their fancies; I don't say anything against that, but give me a man as knows the world, and knows what he wants. That's the sort for me."

"She gets more insufferable than ever. I wonder how you can put up with her," said Law under his breath.

"Doesn't she!" said Emma in a whisper. "I wish she had never come into our workroom; but she has taste, mother says, and we have to put up with it. Everything has to give way to the work," the girl added, threading her needle; and as she made a knot upon the end of the new thread, she shook her head with a sigh.

Everything has to give way to the work! Law could not but smile, feeling the superiority of his gentlemanhood. With him it was the work that gave way to everything. "Poor little Em!" he said, with

a little laugh. She was only seventeen, a year younger than he was; her fore-finger was seamed into furrows with her needle, and sometimes bled, which called forth no sympathy, but only scoldings, from the forewoman or her mother, when an unlucky red mark appeared on a hem. Emma did not very much mind the scoldings, which came natural to her, and she never made any comparison of herself with Law. He was *a gentleman*, that made all the difference. And it was a great deal nicer, and much more important, to have such a fine fellow to keep company with, than a young painter or carpenter, or even a tailor, which was what 'Liza had to be content with. Mr. Despard was a very different sort of person. As Law whispered to her, Emma felt her heart swell with pride. She went on with her work all the same, sometimes threatening to prick him with the needle which was at the end of that long thread. Emma was only "running a skirt," not trusted as yet with the more difficult parts of the work, and she pointed her needle at Law's nose when he came too close. But it was very sweet to her to have him there. Polly might brag as she pleased of the captain — the captain was old, and what was the good of him? He did nothing but puff Polly up with pride, the younger girls thought, and nothing would ever come of it. But Law was young, and there was no telling what might come of that. Emma threatened him with her needle, but in her heart was very proud of him. And there he sat and talked to her, while Lottie was having her little triumph among all the fine people at the rectory. The Welting girls were all pleased to have Law there. They liked to talk of Mr. Despard, "from the castle," and how they "could not keep him out of their workroom." By-and-by they began to joke about his idleness, the only idle one among so busy a company. "Can't you give him something simple to do — a skirt to run up or a long hem?" "Oh yes," said Emma. "Do, Polly, he bothers me so I can't get my skirt done." Polly opened her drawer and drew out from it the current number of a distinguished periodical, which all these young women admired.

"I'll tell you what he can do," she said, "and make himself useful — for we've got to sit up all night a'most, and there's nothing makes work go like reading out loud. Mr. Lawrence, if you want to be as good as your professions, and help us young ladies on, as are far harder worked than the like of you knows of even, there's the last number of the *Family Herald*, and we're all that anxious we don't know how to bear it, to hear how Lady Araminta got on ——"

"Oh, give it me," said Emma, with her eyes sparkling. "Oh, give it me! Oh, you nasty, cruel creature, to have it in your drawer all the time, and never to tell!"

"I'll give it to Mr. Despard," said Polly; "and we'll all be done half as soon again if he'll read it out loud ——"

"Give it here," said Law with lordly good-nature, and he began at once upon his task. How the needles flew as he read! Lady Araminta was a wonderful heroine. She wore nothing less than velvet and satin, and carried her diamonds about with her wherever she went, and the title-deeds of her estate in the bosom of her dress. Law leaned his long arm on the table, sometimes pausing to take breath and playing with Emma's pins and cotton. He would thus tantalize them now and then, when the story grew most exciting and his auditors most breathless. He was *bon prince* among them all, very good-natured and willing to please them, though Emma had his special vows. His head was not so much turned as was the head of virtuous Lottie, listening to the applause of Mr. Rollo Ridsdale, but he was very happy with this little court about him all the same.

From Macmillan's Magazine.

NATURAL RELIGION.

X.

The instinct on which we pride ourselves in political contests seems to desert us in religious. In politics we firmly grasp the principle that the issue must always be practical, never merely logical or speculative. We steadfastly put aside the question, Is this or that true? and as steadfastly keep before our eyes the question, Ought this or that to be done? It is curious to see that in the great religious debate of the day the opposite course is followed, and that it is supposed to be a proof of a masculine way of thinking to put aside the question what ought to be done until the public has made up its mind what is true.

We find ourselves surrounded in religion, as in polity, with a vast and ancient system of institutions. Each system has its practical object. If by the political system we defend ourselves against our

enemies, and preserve order and shelter industry, so by the religious we have been in the habit of cherishing by co-operation the higher life among us, of worshipping together, of receiving instruction together in the highest matters. Now as to the political system, we have been perfectly well aware that it was a makeshift, that other systems elsewhere might be intrinsically better — nay, we have had no objection to admit that the theory upon which our political constitution was for long periods supposed to rest, might be radically false. And yet we have always steadily refused to entertain the question of pulling this system down and building up another in its place. For a long time we absolutely refused to reform it, for fear of shaking its foundation; and now that we have overcome this timidity, we find that a process of gradual reform may save us the risk and anxiety that would attend all schemes of destructive criticism and fundamental reconstruction.

It would have been possible to proceed in another way. We might have given to dogma the same importance in politics that it has had in religion. Suppose we had formulated in the sixteenth century the principles or beliefs which we supposed to lie at the basis of our national constitution. Suppose we had made a political creed. A very strange creed it would have been! The doctrine of divine right and the power of kings to cure disease, possibly too the whole legend of Brute and the derivation of our state from Troy would have appeared in it. This creed once formulated would have come to be regarded as the dogmatic basis upon which our constitution rested. Then in time criticism would have begun its work, philosophy would have set aside divine right, science would have exploded the belief about the king's evil, historical criticism would have shaken the traditionary history, and each innovation would have been regarded as a blow dealt at the constitution of the country. At last it would have come to be generally thought that the constitution was undermined, that it had been found unable to bear the light of modern science. Men would begin publicly to renounce the constitution; officials would begin to win great applause by resigning their posts from conscientious doubts about the personality of King Arthur; and those who continued orthodox would declare that they felt more respect for such persons, much as they deplored their heresies, than they could feel for other officials who continued to receive the emoluments of the State when it was suspected that they had altogether ceased to believe in the cure of the king's evil, and when they explained away with the most shameless laxity the divine right of the sovereign. If any of this latter school, whom we may call the Broad State, should argue that the State was a practical institution, not a sect of people united by holding the same opinions, that it existed to save the country from invasion and houses from burglary, they would be regarded as impudent sophists. Was not the creed there? Were not all officials required to subscribe it? How then could it be affirmed that the State did not stand upon community of opinion, upon dogma? And if any of these sophists were evidently not impudent, but well-meaning and high-minded, they would be regarded as wanting in masculine firmness and the courage to face disagreeable truths. It would be generally agreed that the honest and manly course was to press the controversy firmly to a conclusion, to resist all attempts to confuse the issue, and to keep the public steadily to the fundamental points. Has the sovereign, or has he not, a divine right? Can he, or can he not, cure disease by his touch? Was the country, or was it not, colonized by fugitives from Troy? And if at last the public should come by general consent to decide these questions in the negative, then it would be felt that no weak sentiment ought to be listened to, no idle gratitude to the constitution for having, perhaps, in past times saved the country from Spanish or French invasion; that all such considerations ought sternly to be put aside as irrelevant; that as honest men we were bound to consider, not whether the constitution was useful or interesting, or the like, but whether it was *true*, and if we could not any longer say with our hands on our hearts that it was so, then, in the name of eternal truth, to renounce it and bid it farewell!

In spite of its logical appearance, we should all feel that this course was not only practically absurd, but actually illogical. It does not follow because a creed has been put forward as the basis of an institution and this creed has been disproved that the institution has been deprived of its foundation. There is another alternative. An ungrounded claim may have been made for the creed, and the institution may really stand upon quite a different foundation. When we are told nowadays, See how the tide of scepticism has risen round the creeds of the Church,

until the very first article of all is just disappearing beneath the waves! what can possibly remain of the Church, or of Christianity, in this spiritual deluge? It is obvious to answer, Christianity at rate is older than the creeds; is it not possible that a mistake was made when it was supposed that those creeds contained the very essence of Christianity? Surely this is a thing not even unlikely; for history shows that great societies or institutions, rising out of profound needs dimly felt, commonly give a more or less unsatisfactory account of their own origin. It was never supposed that imperial Rome was destroyed when doubt was thrown on the story of the asylum, or papal Rome, when it was questioned whether St. Peter was ever in Italy.

But what we feel most when we are considering political questions is the practical absurdity of this scholastic, dogmatic way of proceeding. To ask a large public to constitute itself into a jury to decide philosophical or critical questions is to put it into a false position. *Ignoramus* is the only verdict which, if it is modest, it will venture in such a case to return. Their views on such matters people must take with what caution they can from those who know better, and they may be sure that they will modify them in the taking, so that the most carefully stated philosophical propositions will acquire something of a mythological character in passing into popular creeds. We are aware in politics that we are only safe in discussing what ought to be done, and that we must carefully avoid raising the question, What is philosophically true? And so, though we are well aware that the State must have a philosophical basis, that there must be some theoretical ground both for authority and liberty, yet we carefully put all these questions aside, and feel that the State is real and indestructible only so long as we see that it defends us, that it gives us prosperity and well-being.

It is not equally easy to maintain this position with respect to our religious constitution. The wants which the State supplies are so urgent and palpable, that in comparison with them all mere political doctrines seem secondary; but the wants of the higher life, on the contrary, are by most of us but dimly felt, and seem shadowy, or, as we call it, sentimental, in comparison with theological dogma. Hence the same public which despises doctrinairism in politics is just as decided and united in despising everything but doctrinairism in religion. It is, in fact, so decided on this point, that it will scarcely listen to argument about it, and seems incapable even of a passing suspicion that it may be wrong. With the same contemptuous laugh with which in politics it puts aside abstract theories for practical needs, it refuses in religion to listen to practical views, and thinks it masculine to look only at articles of technical theology attacked and defended by controversial specialists.

Yet a time will naturally come when men's eyes will be opened to their enormous mistake. Perhaps, indeed, this time is now coming, for it is necessarily brought nearer by every apparent victory of the attacking party in the controversy. So long as the reigning theology maintains itself successfully, no practical question comes in view; but no sooner does it appear shaken than the question occurs, What is to be done? and the assailants themselves, embarrassed by their own success, are compelled, if only for decency's sake, to offer some equivalent for what they destroy. In such moments it flashes upon us all that religion belongs just as little as politics to the schools, and that the concern of practical men in the one department as much as in the other is not with scholastic controversies but with urgent practical needs, and that they deal not with a *tabula rasa* on which a new spiritual house might be built up from the foundation on a new design, but with an ancient house in which we have all lived for centuries, and which it would be exceedingly troublesome and uncomfortable, if not impious, to pull to the ground.

The doctrinaire method might indeed be justified by necessity if certain assumptions which are popularly made were true. If the clergy were right in supposing that they were commissioned to defend an immovable fortress of dogma, that in the original scheme of their religion no allowance was made for such a thing as progress, then indeed it would be impossible for them to regard the spiritual wants of man in the same plain, practical way in which the politician studies those more material wants which are supplied by the State. On this question, however, we need say nothing more; we have dwelt long enough already on that which is too evident to be mistaken, that in the original scheme of Christianity nothing is so grand and admirable as the treatment of progress, no point so capital as the further development which is reserved for the

system, and the indefinite vista which is opened in the future of new dispensations not less divine than the old. It is too evident to be mistaken, that, so far from the clerical school being fettered by the terms of their original charter so that they are not allowed to be progressive though they would, it is the narrowness of their own prejudices, the exclusiveness of their own professional pedantry, which reads itself into the Bible, and petrifies and fossilizes what is there full of vitality. But there is a misconception on the opposite side which hinders the attacking party from taking practical views, just as this hinders the clerical party of defence. They think that, though in the State it is quite possible to leave speculative questions in abeyance and proceed at once with practical reforms, this is only because those speculative questions do not affect the essence of the State, about which there is really no difference of opinion; but that it is not possible in the Church, where the question in dispute concerns those fundamental beliefs without which there cannot be a Church, actually the very existence of God and of a future life. However we might decide our disputes in political philosophy, they think it would be still necessary to have law courts and policemen, still essential to pay soldiers to keep off the enemy, and still highly convenient to have a post-office to carry our letters; but if on the contrary the religious debate should go against the Church, we should be obliged at last to pull down our pulpits and sell off our communion-tables, inscribe "eternal sleep" upon our cemeteries, suppress the clerical profession, add the Sunday to the working-days, turn our churches into halls for local business and our cathedrals into county markets or concert-halls, and explain to boys at school and youths at the university that, owing to an unfortunate oversight, the human race had taken a wrong path for about eighteen centuries, during which time it had been practically under a sort of mental derangement, and that now it was necessary to forget as soon as possible that idle dream, cancel the whole library of ecclesiastical history and ecclesiastical literature, and begin again at the point where Greek philosophy and classical literature stood when the Oriental inundation submerged them. This fancy too begins to seem a misconception the more the moment draws near for realizing it. There is really no more question of destroying religion than of destroying the State. The wildest innovators in their wildest fit have recognized this. They always set up some goddess of reason, some image of nature if not some supreme being, in place of the objects of worship which they renounced; and since that time how many more concessions of the same kind have been made by those who have been most uncompromising in their attacks on the reigning theology! Churches of the future have been planned in which the old Church has been freely used as a model, the centuries of Christian history have been found to be replete with admirable instruction — instruction to be found nowhere else; it has been discovered that our modern civilization has grown up, not in spite of the Christian Church, but out of and by means of it. Forms of worship adapted for the Church of the future are in preparation or expected, and it is thought that even though death be in reality an eternal sleep, yet it will not in the long run be advisable to say so; but that we must resort again to those "evasive tropes," of "subjective immortality," or "posthumous activity," or the like, which poor humanity has positively never had the fortitude to dispense with since the day when the shade of Achilles reproved Ulysses for "calling death out of its name."

Assuredly many more concessions of the same kind will be made in the future. As the sceptics, who hitherto have had all the irresponsibility of opposition, begin to familiarize themselves with the practical aspect of the subject, they will discover that many dogmas, many phrases to which they have urged abstract objections, may yet practically be quite well allowed to pass, and at times they will feel ashamed of the tastelessness of their captiousness, which has mistaken poetry and prophecy for logic, and criticised the visions of enthusiastic hope as if they were meant for simple matter of fact. Their conversion would be greatly hastened by a little more generosity on the part of their opponents. If it were acknowledged not merely that much of what is urged in the name of modern science may be true even though it seems opposed to clerical formularies, but that it may be actually that addition to our religious knowledge, that further revelation which Christianity itself promises, then it would become still more readily comprehensible that the religious controversy of the age is not the internecine thing it seems to be, and that there is no reason to suppose that it ought to take precedence of all practical religious re-

forms, and ought to be settled before they can be seriously attended to.

Much has been said of a reconciliation between religion and science upon the ground of speculative controversy; but the terms proposed have generally involved the complete submission of one side or the other, with just some slight salve for its wounded vanity. In speculative controversy, where the only object is speculative truth, all such transactions are corrupt and illusory. What is needed is no such reconciliation between the specialists on both sides, but a proper contempt for the specialists on the part of practical men. Just as in great political crises the lawyers have been pushed on one side, so in great religious crises should the theologians and the scientists. And this would promptly be done if we had the same grasp of the substance of religion which in some countries men have had of the substance of politics. For then we should know that it is the nature of the specialist to be one-sided, that he pays for his special knowledge in a peculiar ignorance of the value and the bearings of it, and that he can scarcely escape, even if he would, from the position and views of an advocate. Do we suppose that religion will be the better for being made the subject of an endless professional litigation? Will not the estate be swallowed up in the costs of the suit?

What this substance of religion is, these papers have been intended to make clear. They have labored to show that no dogmas whatever, not even that of a future life, not even that of a (so-called) personal God, are of such importance that religious life must be suspended, practical religious reforms adjourned until the professional disputants can come to a conclusion about them; nay, that Christianity itself does not depend upon them so absolutely as is supposed. It is true, that if there is no future life for man the value of the present life sinks so much, that any kind of earnestness begins to seem affected and uncalled for, all moral systems and disciplines seem a waste of trouble; but even then we should remain Christians rather than anything else; even then, practical men would call it wise to make the best of a spiritual constitution, in which "nineteen hundred years have garnered up their hopes and fears," which has actually brought together, nursed, and educated to civilization, all the progressive races — which has amassed for mankind an inestimable treasure of sacred memories, sacred thought, sacred imagination — rather than to supersede it by another, which after all the exhausting convulsions of the Revolution could teach nothing which could not be equally well taught now if the progressive character of Christianity were once restored to it. But if we stop at all short of the absolute negation of a future life — if we only think with Mr. Mill the hope of it worth studious cherishing, then it becomes at once frivolous to allow the disputes of the schools to interrupt us in the work of removing the corruptions and improving the machinery by which the higher life, by which religion, is kept alive and spread among populations always gravitating downwards towards the life of the beaver, or fox, or swine.

There is but one consideration that could make us think otherwise, and it need not affect us much in England. When a religious system, great and true in its first conception, has merely fallen into the hands of a profession, and so been crippled and made petty, sentimental, and childish, nothing is needed but to rescue and restore it. But it may no doubt sink lower, so that its intrinsic merits can no longer save it, nay, positively increase the necessity of destroying it. If we looked at Christianity with the eyes of a French Liberal, if we saw it not merely hampered by a feeble clericalism, but made the tool of a powerful and subtle sacerdotalism, the case would be very different. Then we might say, it concerns us little what the original character of Christianity may have been. It comes before us as part and parcel of a system which crushes us. If it was originally beautiful and glorious, so much the worse; our enemy is made all the more mischievous by being dressed in such charms. We cannot afford to do it justice when we meet it in company with that which threatens us with destruction. An echo of this is heard in our English religious controversies. Charges are brought against Christianity which have no meaning here, but would be quite reasonable where Christianity is practically convertible with Ultramontanism and Jesuitism. English Liberalism confounds its cause too much with the Liberalism of the Continent, and talks wildly, as if it were struggling with an organized cosmopolitan priesthood; nay, it actually turns against a Church dependent on the State the arguments and the invective which were originally used against a Church whose offence it is to have practically deprived the State of its independence. A foreign definition of Christianity has crept in among us which identifies it with the organized Church of the Middle Ages. Such a definition is wholly out of place in a country

which has for centuries drawn its religious inspiration from the Bible. To our people, the Church of the Middle Ages, that Church against the survival of which Continental Liberalism struggles, is a thing which would be unknown, even by tradition, but for some cathedrals which witness of its glory, and for Smithfield memories, which attest the fierceness of its last struggles. The Christianity which has influenced us so powerfully, and is still so fresh in all our minds, has scarcely anything in common with that mediæval Church. It has, in fact, scarcely any connection with the Middle Ages. Its Bible is not a mediæval book, but a book of the ancient world restored to general use and knowledge in the Renaissance. Our popular Christianity has its beginning where mediævalism ends; its earliest traditions are of a struggle like that of modern Liberalism against spiritual tyranny; the great occurrences in its history are emancipations, resistances, heroic achievements, the defeat of the Armada, the Covenant, the voyage of the "Mayflower," the emancipation of the slave. Priestly influence has here and there played a great part in it, as in Scotland; but the staple of its history, as of its Bible, deals with a resistance to priestly influence, and sets up the prophet against the priest or the scribe.

Let us not passively echo the party brawls of other countries as if we had not party brawls enough of our own. And let us not allow our own religious life to sink into a mere party brawl. Party life just now is at a low ebb among us, as well as religious life. There is a strong feeling that each may be enlivened a little by contact with the other. Sometimes we think we could almost feel religious again if we had a good squabble about a conscience clause. Sometimes, on the other hand, we feel that we should have more enjoyment of our Liberalism if there were a Church to disestablish. Surely cynicism could scarcely be carried to a greater length than in the recent suggestion that the Liberal party might get back to office if the Nonconformists could see their way to an organized onslaught upon the Church.

If we sweep away the cobwebs of inherited prejudices and inveterate partisanship, we shall see at the bottom of these Church controversies a practical question of vast importance which there is hope of solving by union, but not by disunion. We see the struggle of the lower with the higher life.

If this phrase, lower life, or the old religious phrase, world, seems vague, let us translate them into the language of plain facts. We mean then that each class of society shows in its own way that when the mere cares of livelihood are satisfied, or if they are not felt, it does not know how to pass the time. In other words, it has no life beyond that of the animal. Is it vague to say that the lower classes *will* go to the public-house? This means that when they have their wages they can think of nothing else which they would like to do but to drink and chat. Is it vague to say that the middle class in general is given up to money-making, that the small part of their life which is otherwise occupied falls into humdrum uniformity without charm or freshness; that they measure men's worth and importance by their wealth, and that in choosing the occupation by which money is to be made they are generally ready to renounce any inborn preference or vocation for the chance of making a larger sum? Is it vague to say of the higher classes that they appear to have lost the high ambitions which used once not to be uncommon among them, that they are neither performing great public services nor setting the example they might set of a dignified, beautiful, and beneficent life, but, their animal wants being satisfied, appear to desire nothing further except amusement for the passing hour, and strong sensations that may keep off ennui?

This is the want; what is wanted is the higher life. Now all Church organizations whatsoever exist for no other purpose than to supply it, to foster the growth of such life in men, to give it food and exercise. Churches are *not* societies of men bound together by holding the same opinions. No fancy more idle ever passed into a commonplace. Holding the same opinions is not in itself a tie to bind men together. If they agree, why should they come together? It is rather when people differ that they desire to meet. Churches are united as other societies are by a practical object, which is the desire to save men's souls. If indeed we allow a clergy to garble this phrase, and to persuade us that our souls are not threatened by the danger which is visible to all, the danger of being drowned in worldliness or animalism, but by quite another danger which we should never have found out but for a supernatural revelation, and which is to be avoided, not by the means which our higher instincts point out, but by quaint processes which seem to have something of magic about them, then no

doubt a Church will come practically to mean the society of people who have been induced to believe this story. But this too is a consideration which is of little importance in England. The religious writers of the last age — a Maurice and others — have broken the neck of that superstition. It is widely diffused through all schools, and has passed into our religious atmosphere, that the heaven beyond the grave and the higher life here are identical, and that the revelation of Christianity is not different in substance from the revelation which comes everywhere in advanced societies to the higher minds. "Soul," and "saving the soul," mean the same thing in a Christian mouth, and in the mouth of any one who takes a high view of life. Without signing any articles we may all take our place in the organizations which have this for their object.

If so, then let us look to see what progress they have made in their work. The vast achievements of the great spiritual heads of humanity strike the eye at once. They have removed the first great difficulties which philosophy might have continued always powerless to deal with. They have cleared a free space for the higher life to expand in. They have made room for it both in time and space. They have claimed for man's higher life a seventh part of his lifetime. They have set up everywhere the church, the Parliament-house of the spiritual State, and they have created the clergy, the official class or administrators of the higher life. The beginnings are made here, but it should have been a matter of course that these were only beginnings. It should have been a matter of course that the work thus begun would need to be developed through centuries, that innovations and changes would be needed in each successive age, that the higher life itself would be found subject to variation and development, and that into ecclesiastical machinery as into political, abuses would creep, that here too usurpations of authority would be committed, and that there would be need to investigate a science of spiritual as of civil government.

But we have adopted quite another and perfectly irrational view of the subject. When we meet with deficiencies or abuses in this department, instead of considering how they may be supplied or corrected, it is our habit to wash our hands of the whole matter, sanctimoniously expressing our regret that we have not found ideal perfection where for some inexplicable reason we had looked for it. We adopt the same vicious method which we love to reprobate in the politics of foreign countries. Instead of persistent activity, unwearied good temper, and timely reform, we adopt a policy of cold abstention and ironical reticence calculated to end in revolution. When we find the clergy monopolizing, as an official class will always strive to do, all functions, we do not resist them but take our revenge by remarking to ourselves with malicious pleasure that in reducing the laity to ciphers they are committing an unconscious suicide and are destroying themselves by destroying the Church. When rival priesthoods tear each other to pieces, we are not alarmed lest the higher life itself should suffer, but rather amused because it gives us occasion to furbush up again some rusty sarcasms. And yet we do not really, if we will ask ourselves the question, wish to see all Churches fall into ruin; we do not really think that it would be convenient to begin again from the beginning; we shrink, when we take the trouble to reflect upon it, from the infinite discomfort that such a revolution would involve, from the despair it would cause to thonsands at the time, and the well-nigh incurable prostration and debility it would leave behind it.

The practical question, if we can bring ourselves to take a practical view, is this: religion or the higher life starts with two great acquisitions, — what is the best use that can be made of them? There is the Sunday, and there are all the churches and chapels in Christendom with the machinery and *personnel* attached to them. We are not to begin by adding the Sunday to the week-days, secularizing all the churches, and unfrocking all the parsons in order that perhaps afterwards we may create a new set of institutions which will certainly be of the same kind. And if not, then it follows that we are not to help the Churches to destroy themselves. We are not to make a ring round the clerical pugilists and applaud their pugnacity; nor are we to say with studied decorum that we decline to assume any responsibility, only if the Churches see their way to committing suicide we are ready to lend them any assistance in our power and to place our party organizations at their disposal. But we are to consider how these great institutions may be put to the best use, how they may be most wisely reformed; and if we find that clerical cliques have got complete possession and control of them, then to resist such usurpation by ordinary temperate methods.

Why then do these two great institutions, the Sunday and the Church, fail of their object? In a country where all enjoy them, why should the higher life remain asleep? A large space is cleared for it. Business is forbidden to absorb the whole field of our life. Why should nothing better grow there? Why should nothing but frivolity, or dulness, or, in a lower class, drinking, fill the hours that are not spent in labor? It is evident, surely, that though we have cleared the field we have not tilled it, though we have got the room we have not furnished it. The Sunday is there, but how terribly dull it is! The Church is there, but who can bring himself to listen to the parson? And yet it is not any defect in the quality of the food offered to it that makes the higher life languish. If not the parson's sermon, yet the sublime Book, the work of ages, and many a lofty liturgy devised in later times, are precisely what one could wish and much more than one could expect. The deficiency is in quantity and variety. The Book itself, though it contains so much, yet does not contain all that is needed. However elevated its language may be, yet it was written two thousand years ago. We confess its insufficiency when we supplement it with a fresh discourse from a living mouth, but what a melancholy contrast between the inspired words of some ancient prophet, words for uttering which he suffered persecution from the professional orthodoxy of his time, and the modern sermon dictated and controlled by that very orthodoxy! But even if an Isaiah could speak from the pulpit as well as from the lectern, do we suppose that that alteration would suffice? Do we suppose that the higher life can live merely on exhortations, however true and impassioned.

When we complain of the deadness of the higher life among us, what is it that we want? What changes would satisfy us? It is when we ask this question that we recognize the pitifulness of the clerical ideal. Those devoted evangelists, whether of the High Church or the Low, are laboring to bring the population into what condition? If they could succeed, the doctrines of Darwin and Strauss would be forgotten as though they had never been broached. In other words, we should think of the universe and the Bible precisely as our fathers did, and all the thought and genius of the past age would appear to have been thrown away. Science would become a "Bridgewater Treatise," poetry would imitate the "Christian Year," and popular literature would be governed by the Religious Tract Society. Who can picture this without seeing at the same time the irresistible mutiny that would follow in the next generation? Meanwhile our working-class, instead of being jolly drunkards, would come "under concern" about the state of their souls and listen to revival preachers; young men of the middle and upper classes would begin to take orders freely, legislation would begin to take an ecclesiastical tinge, and the public mind would be convulsed with new Gorham cases. Is this really what we want? Are these really the signs of His coming, and of a new birth of the higher life among us?

All this was pretty well realized about thirty years ago, and we have seen the insufficiency of it, and, what is more, we have lost it again. It is a paltry ideal, and one which cannot be held when it is grasped, simply because it is so flimsy. We are now all of us asking again, how shall the people be kept from the public-house? And some of us are asking also, how shall the dull Philistinism or emptiness of the other classes be healed? And we have made some steps towards the true solution. We say, it is not enough to tell people to be religious, you must occupy their minds and give them a taste for something better than drinking. And we get up penny readings and popular lectures and working-men's colleges. Dimly at the same time we see that the deficiencies of the better classes are radically of the same kind and require the same remedy. What takes the working-man to the public-house is the same defect which ties the city man to his desk and makes his life monotonous and unlovely. It is the ignorance of anything better, — the want of occupation for his higher life. And something begins to be done for him too. We have begun to purify the idea of culture, and to understand that we must present it for the future as something precious and beautiful in itself, and no longer merely as a means of success and money-making.

These are the new convictions which practical reformers have lately acquired. They have led to a practical rebellion against the clerical revival of the last age, for they amount to a conviction that no such revival can by itself regenerate the country. And the clergy are acknowledging this by enlarging their field, by taking into their province much which hitherto they regarded as secular. They do so under the plea that that which is in

itself secular, such as music, architecture, popular science, may be made indirectly serviceable to religion. But meanwhile a great change and advance of opinion has been taking place among the professors of the so-called secular pursuits thus newly patronized. The future historian, describing the present age of English history, will mark it as the period when the English mind first clearly grasped the ideas of art and science. Look at our present clear conception of art in its different varieties all equally to be honored, the poet recognizing himself as the colleague of the painter or musical composer in the same great guild, and see what a space has been traversed since music was scarcely known and painting regarded as an ungentlemanly pursuit, while poetry acknowledged no connection with the sister arts, but rather classed herself with wit or with learning. In like manner, what a change since science asserted herself with the commanding self-consciousness which now distinguishes her! Not long since she lay huddled up indistinguishably with metaphysics and Greek scholarship and theology. Now she proudly stands aloof from all such association, and declares herself called to regenerate the world. Both in the case of art and of science it is a consequence of the new distinctness with which they are now conceived that their dignity is greatly raised. They take a religious character. The artist would be ashamed to speak of himself as a humble caterer for the public amusement, as, for instance, a Walter Scott always did. He is now in a manner bound to exalt his art if not himself, and to call himself a priest of the religion of beauty. Nor can the latter any more be content to speak of science as an elegant and liberal pursuit; it is a point of honor with him now to proclaim himself a votary of the religion of the future.

It has been the object of these papers to piece together all these glimpses which in different quarters are opening upon the world, and divine the whole wide prospect which will shortly lie before us. When we see on the one side the clergy confessing the insufficiency, so to speak, of the fund upon which they draw, and adding to it, under various pretexts, much which they do not acknowledge to be religion; when we see, on the other hand, that precisely this new matter, which the clergy find they cannot do without, is at the very same time declared by those to whose province it belongs to have the character of religion, we are forced to some such conclusion as this:—

The old distinction between sacred and profane, religious and secular, was a perfectly just one, but a mistake was made in drawing the line. The line was so drawn as to leave art and science among things secular, whereas they belong properly to things religious. And consequently the great religious reform for which our age is ripe consists in the full and free admission of art and science, their independence being at the same time preserved, to the honors of religion.

I remind the reader that this reform is only a restoration of the primitive view. In the vigorous periods of religion it is inseparable from science, and finds its manifestation in art, and the traces of this are clearly visible in our own religion. Our Bible begins with a cosmogony which was the science of the Jews. All our earliest art is about us in our cathedrals and churches. The schism that has happened since has not really arisen from any wish on the part of art or science to put off their religious character, but only to become independent of the religion of morality or humanity by which they were controlled. They did not wish to be secular, but to be independent religions. And independent they must still be, only they must be once more recognized as religions.

Practically, what would such a reform involve? It means that all our penny readings and well-meant but too humble efforts to keep the people out of the public-house by amusing them, should be developed into that which they implicitly contain, namely, a full initiation of the whole people in the religion of art; and in like manner that all our popular lectures, schemes of technical education, and so forth, should be developed into such a general initiation as is possible into the religion of science. It means also that art and science in being recognized as religious should be made free of the Sunday; and that, in order to avoid a most deplorable breach with all that is sacred in the past, a most sad quarrel with our dead forefathers, the new institutitions should not conquer their place by aggression upon the parish church and clergy, but should be welcomed to it by their cordial invitation.

How many hesitating steps are constantly taken in this direction! Even Evangelicals admit what High Church men have so long held, that religious services must become what they call more attractive. Here and there we have seen science classes opened in connection with cathedrals, clergymen lecturing on politi-

cal economy. Something has even been attempted towards a reconciliation between religion and the theatre. And there is one conspicuous case in which the attempt, made in this case centuries ago, has had most important consequences. By means of the oratorio a really fruitful alliance between religion and music was long since concluded. But it is not precisely such alliance as this that is here contemplated. The question is not how Christianity may draw the arts as captives in her triumphal procession, but of setting up the arts in perfect independence to co-operate with Christianity in that work in which, whatever may be their quarrel with Christianity, they are her natural allies, namely, the work of stemming worldliness and fostering the higher life. In the recent discussion of the Sunday question it might be plainly observed how near the settlement of it was now felt to be, and it was also instructive to see in what confusion of words the opponents of the proposal took refuge.

Who now seriously argues that the Sunday is desecrated by attention to art and science? But it is strongly felt that the Sunday must not be abandoned to money-making, and an attempt was made to confuse the two things by pointing to the money that passes at the entrance to theatres and concert-rooms. Certainly, if art and science are not distinguishable from money-making, nothing will be gained by throwing open the Sunday to them, for it is precisely because they are antagonistic to the spirit of money-making, because they are wanted to fill the room which it vacates on Sunday, and prevent it from returning in tenfold force on Monday morning, that we call them in. We call them in in aid to religion, or more properly as having themselves the nature of religion, and if they cannot be active on the Sunday without a little clinking of coin being heard, and an official here and there losing his Sunday freedom, the same is true of religion itself. A new church cannot be opened without increasing the amount of work done on Sunday, work for which money must be paid; and if it has nevertheless been found possible in the main to protect religion from being corrupted by the spirit of money-making, there is no reason why art and science should not be protected in the same way.

And as religion should share its day with art and science, so should it share its local vantage-ground and endowments. Hitherto it has done this in some degree. It has been the patron of primary education; but it has not yet had the courage to hold out the hand unconditionally both to art and science, and give them, without encroaching on their independence, an introduction wherever it has penetrated itself.

We are all anxiously considering how we may better the condition of the working-class — whether for their own sakes, that they may get more out of their lives, or for the sake of the State, that it may be protected from the discontent that undermines it. What good thing can we give them? The suffrage? Increase of wages? Organization to protect them against capital? Or some share in the profits of capital? Or some share in the land? But all these benefits belong to the lower life. The utmost result of them will be more of that leisure, more of that spending-money which the public-house is always waiting to absorb. A much greater gift, rather the only gift worth the giving, would be the gift of new occupations, new pursuits belonging to the higher life. And when once we recognize, not faintly or fitfully, but with decision, that these pursuits are not exclusively what we have hitherto called religion, that they are not exclusively church-going, nor hymnody, nor listening to clerical oratory or philanthropic projects; but that they include the two grand pursuits of art and science, religions also in the strictest sense, surely the prospect of a redemption for poverty and labor grows more distinct before our eyes. It becomes more clear along what road we are to travel, and we perceive the meaning of certain indications which have recently been given us. We have been told of popular amusements in use among other nations, which have often the nature of art, and which make the English traveller blush for the joyless life of labor in his own country; nay, when we have been told of the Ammergau mystery, it has flashed upon us that art itself may be born again, by being associated with labor, as much as labor by being inspired with art. And what is the moral of that story of the Scotch peasant-naturalist? Even if you cannot perceive that that eager study of nature is religion in its purest form, if it almost shocks you to hear it asserted that the object of his worship was actually the true God, still you can hardly help admitting that such worship belongs to the higher life, and is the true counter-charm of the public-house.

Nor is it only for the sake of a disguise under cover of which they may make their way into the Sunday that we would

represent art and science as having the nature of religion. It is quite as much because they will never be rightly cultivated until they are recognized as in some sort sabbatical pursuits. When the clerical party brand them as forms of money-making, they only take advantage of the corruption which has fallen upon them from being treated as secular. Here again we only follow plain indications which the history of art gives us. The work of Goethe and Schiller was principally directed to asserting a certain sacredness in art, and to rescuing it from the curse of commonness or vulgarity. So long as it is bandied about in the market, it does not perform its true function; it does not elevate. And is not this its fate among us? Who among us ever speaks of the elevating effect of art? It is a conception quite foreign to our minds. We think of art as amusing, or exciting, or thrilling, but not as elevating. And because we never question that it is a commodity to be bartered against other commodities, we make it up like other commodities for the market; and hence come works of the Dickens school, in which the most startling effects succeed each other without repose.

But will not religion, in the old sense, or at least will not Christianity disappear, when so much hitherto deemed secular throngs into the precincts which were sacred to it? Would not this enlargement of the idea of religion prove a step to the destruction of it? Religion larger would be also fainter, until it was lost to view. Does not the truly religious man resent the suggestion that there is any conection whatever between what he calls religion and science or art? Has not religion a warmth, antipathetic to the hard and cold grandeur of science? Has it not an awful solemnity still more alien to the frivolity of art? Yes; but the fact that Christian feeling has a quality which is all its own does not prevent it from having another quality which it shares with science and art. Christianity has, and always will have, a jealousy of both which tends to become hostility; nevertheless, it is one with them in its resistance to worldliness and to the dominion of the lower life. It would gain much by freely recognizing this affinity. In the first place, it would escape their attacks. Those negations of science which are now so terrible would be very much qualified, if not wholly explained away, if Christianity appeared as the zealous friend of science and the mediator between her and the people; and the half-concealed rebellion of art might be appeased in the same way. But it would gain also a more solid advantage. There is much too sharp a contrast between the insipid vulgarity of an ordinary English life and the height of the moral sublime in the New Testament. The higher life cannot be taught by presenting only ideal examples, or supreme moments of it. It is not all rapture and devotion, but has its routine and its ordinary occupations. These are wanting in our English religion, just as in our English Sunday there is nothing between dulness and divine service. And this routine of the higher life should be furnished by science and art, that is, by pure contemplations into which self-interest does not enter, while admiration and curiosity, the lower forms of worship, are kept awake. Formed in such a routine, would men appreciate the New Testament less than they do? Is it not evident that some such preparation, some such use of happy and peaceful thoughts, is absolutely demanded of those who would enter into the Christian view of life?

But suppose the population on Sunday flocking into picture-galleries and museums, and concert-halls; suppose even plays performed, not indeed the vulgar burlesques or loose comedies that pleased the theatre in its unregenerate days, but such as a Christian Æschylus might write for a Christian Athens, is it not evident that the parson, with his commonplaces, would be left to preach to himself in the deserted church? If it were so, if the church and the parson held their ground by means so purely artificial, would there be any hope of protecting them, or would they be worth protecting? But the considerations here urged do not lead to the conclusion that art and science, because they have the nature of religion, ought to take the place of what has hitherto been called religion among us. This has been asserted over and over again, but the view here taken is different. There is another religion, which is neither art nor science, and which is more important to mankind than either, the region of morality, or of the human ideal, which in its historic form is Christianity. No rebellion would have arisen against this religion, still less would it have been possible to represent it as a womanish sentimentalism, if it had rested on its own merits, and not on the one hand turned art and science into enemies by trying to tyrannize over them; and on the other hand, suffered itself to fall into the hands of a profession. Give back to Christianity the elasticity and the modesty,

of which clericalism has robbed it, and it will appear again in its proper place, that is, the highest place among the religions which compose the higher life. But, as religion is larger than Christianity, even when Christianity is most justly conceived, so is the true Christianity far larger than the clerical perversion of it. If it is the religion of the human ideal, and of the human race, evidently the material of it must be all human history, and all the sciences that deal with man. It must not confine itself to a narrow strip of history, the chronicles of a single tribe, or to the narrow thought and science of that tribe. The founders of Christianity connected with their religion, at least, the whole history of the race to which they belonged. They drew no distinction between ecclesiastical and civil history. We, with our wider knowledge, should take not narrower, but still wider views. While we see in the origin of Christianity the highest point in the history of humanity, the simultaneous revelation of the ideal and of the race, we ought to reject no part of the history of humanity, nor to imagine that some of that history is sacred and some profane. In like manner, while we regard one type of humanity as the highest, we ought not to imagine that only one type is worth study or imitation. And when these narrownesses have been avoided, why should the preacher of Christianity fear to be dull? Why should he want topics, or dread the rivalry of art and science? The whole history of mankind is open to him; or, if such catholicity if beyond his conception, at any rate he has the whole history of Christian nations. In what sense can Jewish history be sacred in which the history of Christendom is profane? Teaching on the duties of men, illustrated by history, and connected with a grand consecutive view of the plan running through human history — why should we fear that men would turn a deaf ear to this? They would not do so if they could once rid themselves of the suspicion that the teacher is fettered, or but half sincere, or but half competent.

This view of the coming phase of religion is realistic, and therefore has its shadows. It exhibits religion not as a kind of sacred asylum from all the anxieties and almost all the activities of the mind; not as giving all that the intellect desires while it absolves the intellect from trouble — conclusions without reasoning, knowledge without investigation, and poetry without imagination; but only as an asylum from worldly and material cares. More than this: it does not promise that religion will, in its next phase, render with any certain efficiency that service for which alone many have valued it. Religion may become less potent in consolation, and less able to inspire the hope of immortality into souls not naturally ardent. Those cold misgivings which hitherto have been thought incompatible with all religious beliefs, that there is, after all, nothing "behind the veil," will beset the religious as well as the worldly, as they seem to have done in Old Testament times. In that voyage towards a colder zone on which we are all bound, the story of some discoverable north-west passage will be less universally received, and some will affirm that no land, after all, is to be found about the pole, but only a sea of ancient ice. Is it possible, it will be said, that any religion worthy of the name can subsist amid such uncertainties? And yet religious faith and peace have lived on all this time in spite of an opinion about the future infinitely more appalling than that. Meanwhile, this very uncertainty about immortality, this very aversion of the religious life from the future, will lead to one good result, which perhaps could hardly have been attained by any less painful means. Religion will now, for the first time, fairly undertake that regeneration of the present life and of actual society which it always promised, yet always indefinitely postponed; and in doing so it will, as we have seen, reunite itself with those other inspiring influences from which it ought never to have been separated. Religion will once more be understood as the general name for all the worships or habitual admirations which compose the higher life. We shall no longer be told of high feelings which make men unselfish and pure-minded, and raise them above vulgar cares, but which, nevertheless, have nothing to do with religion. We shall no longer hear it said of some man of science, whose mind is possessed, beyond most men's, with the thought of the eternal laws by which the universe is governed, that "it is to be feared that he is an atheist," nor of some artist, whose heart is touched by a thousand sights which leave other men cold, that "he has no religion." All such high enthusiasms will be recognized as having the very essence of religion, and they will be prized the more rather than the less for appearing in the instinctive, inarticulate state. But of all such enthusiasms it will still be held that the highest and most precious is that which has man for its object, and which manifests itself

neither in works of art nor discoveries of science, but in emancipations, redemptions, reconciliations, and in a high ideal of duty; and this is the religion which bears the name of Jesus of Nazareth.

[*Published by arrangement with* HARPER & BROTHERS.]

MACLEOD OF DARE.

BY WILLIAM BLACK.

CHAPTER VII.

THE DUCHESS OF DEVONSHIRE.

LATE one night a carefully-dressed elderly gentleman applied his latch-key to the door of a house in Bury Street, St. James's, and was about to enter without any great circumspection, when he was suddenly met by a white phantom, which threw him off his legs, and dashed outward into the street. The language that the elderly gentleman used, as he picked himself up, need not be repeated here. Suffice it to say that the white phantom was the dog Oscar, who had been shut in a minute before by his master, and who now, after one or two preliminary dashes up and down the street, very soon perceived the tall figure of Macleod, and made joyfully after him. But Oscar knew that he had acted wrongly, and was ashamed to show himself; so he quietly slunk along at his master's heels. The consequence of this was that the few loiterers about beheld the very unusual spectacle of a tall young gentleman walking down Bury Street and into King Street, dressed in full Highland costume, and followed by a white and lemon collie. No other person going to the Caledonian fancy-dress ball was so attended.

Macleod made his way through the carriages, crossed the pavement, and entered the passage. Then he heard some scuffling behind, and he turned.

"Let alone my dog, you fellow!" said he, making a step forward, for the man had got hold of Oscar by the head, and was hauling him out.

"Is it your dog, sir?" said he.

Oscar himself answered by wrestling himself free, and taking refuge by his master's legs, though he still looked guilty.

"Yes, he is my dog; and a nice fix he has got me into," said Macleod, standing aside to let the empress Maria Theresa pass by in her resplendent costume. "I suppose I must walk home with him again. Oscar, Oscar, how dare you?"

"If you please, sir," said a juvenile voice behind him, "if Mr. —— will let me, I will take the dog. I know where to tie him up."

Macleod turned.

"*Cò an so?*" said he, looking down at the chubby-faced boy in the kilts, who had his pipes under his arm. "Don't you know the Gaelic?"

"I am only learning," said the young musician. "Will I take the dog, sir?"

"March along, then, Phiobaire bhig!" Macleod said. "He will follow me, if he will not follow you."

Little Piper turned aside into a large hall which had been transformed into a sort of waiting-room; and here Macleod found himself in the presence of a considerable number of children, half of them girls, half of them boys, all dressed in tartan, and seated on the forms along the walls. The children, who were half asleep at this time of the night, woke up with sudden interest at sight of the beautiful collie; and at the same moment Little Piper explained to the gentleman who was in charge of these young ones that the dog had to be tied up somewhere, and that a small adjoining room would answer that purpose. The proposal was most courteously entertained. Macleod, Mr. ——, and Little Piper walked along to this side room, and there Oscar was properly secured.

"And I will get him some water, sir, if he wants it," said the boy in the kilts.

"Very well," Macleod said. "And I will give you my thanks for it; for that is all that a Highlander, and especially a piper, expects for a kindness. And I hope you will learn the Gaelic soon, my boy. And do you know '*Cumhadh na Cloinne*'? No, it is too difficult for you; but I think if I had the chanter between my fingers myself, I could let you hear '*Cumhadh na Cloinne*.'"

"I am sure John Maclean can play it," said the small piper.

"Who is he?"

The gentlemen in charge of the youngsters explained that John Maclean was the eldest of the juvenile pipers, five others of whom were in attendance.

"I think," said Macleod, "that I am coming down in a little time to make the acquaintance of your young pipers, if you will let me."

He passed up the broad staircase and

into the empty supper-room, from which a number of entrances showed him the strange scene being enacted in the larger hall. Who were these people who were moving to the sound of rapid music? A clown in a silken dress of many colors, with bells to his cap and wrists, stood at one of the doors. Macleod became his fellow-spectator of what was going forward. A beautiful Tyrolienne, in a dress of black, silver and velvet, with her yellow hair hanging in two plaits down her back, passed into the room, accompanied by Charles the First in a large wig and cloak; and the next moment they were whirling along in the waltz, coming into innumerable collisions with all the celebrated folk who ever lived in history. And who were these gentlemen in the scarlet collars and cuffs, who but for these adornments would have been in ordinary evening dress? he made bold to ask the friendly clown, who was staring in a pensive manner at the rushing couples.

"They call it the Windsor uniform," said the clown. "*I* think it mean. I sha'n't come in a fancy dress again, if stitching on a red collar will do."

At this moment the waltz came to an end, and the people began to walk up and down the spacious apartment. Macleod entered the throng to look about him. And soon he perceived, in one of the little stands at the side of the hall, the noble lady who had asked him to go to this assembly, and forthwith he made his way through the crowd to her. He was most graciously received.

"Shall I tell you a secret, Lady ——?" said he. "You know the children belonging to the charity; they are all below, and they are sitting doing nothing, and they are all very tired and half asleep. It is a shame to keep them there ——"

"But the prince hasn't come yet; and they must be marched round: they show that we are not making fools of ourselves for nothing."

A sharper person than Macleod might have got in a pretty compliment here; for this lady was charmingly dressed as Flora Macdonald; but he merely said,—

"Very well; perhaps it is necessary. But I think I can get them some amusement, if you will only keep the director of them, that is Mr. ——, out of the way. Now shall I send him to you? Will you talk to him?"

"What do you mean to do?"

"I want to give them a dance. Why should you have all the dancing up here?"

"Mind, I am not responsible. What shall I talk to him about?"

Macleod considered for a moment.

"Tell him that I will take the whole of the girls and boys to the Crystal Palace for a day, if it is permissible; and ask him what it will cost, and all about the arrangements."

"Seriously?"

"Yes. Why not? They can have a fine run in the grounds, and six pipers to play for them. I will ask them now whether they will go."

He left and went down-stairs. He had seen but few people in the hall above whom he knew. He was not fond of dancing, though he knew the elaborate variations of the reel. And here was a bit of practical amusement.

"Oh, Mr. ——," said he, with great seriousness, "I am desired by Lady —— to say that she would like to see you for a moment or two. She wishes to ask you some questions about your young people."

"The prince may come at any moment," said Mr. —— doubtfully.

"He won't be in such a hurry as all that, surely."

So the worthy man went up-stairs; and the moment he was gone Macleod shut the door.

"Now, you piper boys!" he called aloud, "get up and play us a reel. We are going to have a dance. You are all asleep, I believe. Come, girls, stand up. You that know the reel, you will keep to this end. Boys, come out. You that can dance a reel, come to this end; the others will soon pick it up. Now, piper boys, have you got the steam up? What can you give us, now? 'Mony-musk'? or the 'Marquis of Huntley's Fling'? or 'Miss Johnston'? Nay, stay a bit. Don't you know 'Mrs. Macleod of Raasay'?"

"Yes," "Yes," "Yes," "Yes," "Yes," "Yes," came from the six pipers, all standing in a row, with the drones over their shoulders and the chanters in their fingers.

"Very well, then — off you go! Now, boys and girls, are you all ready? Pipers, 'Mrs. Macleod of Raasay.'"

For a second there was a confused roaring on the long drones; then the shrill chanters broke clear away into the wild reel; and presently the boys and girls, who were at first laughingly shy and embarrassed, began to make such imitations of the reel figure which they had seen often enough, as led to a vast amount of scrambling and jollity, if it was not par-

ticularly accurate. The most timid of the young ones soon picked up courage. Here and there one of the older boys gave a whoop that would have done justice to a wedding dance in a Highland barn.

"Put your lungs into it, pipers!" Macleod cried out. "Well played, boys! You are fit to play before a prince!"

The round cheeks of the boys were red with their blowing; they tapped their toes on the ground as proudly as if every one of them was a MacCruimin; the wild noise in this big empty hall grew more furious than ever — when suddenly there was an awful silence. The pipers whipped the chanters from their mouths; the children, suddenly stopping in their merriment, cast one awestruck glance toward the door, and then slunk back to their seats. They had observed not only Mr. ——, but also the prince himself. Macleod was left standing alone in the middle of the floor.

"Sir Keith Macleod?" said his Royal Highness, with a smile.

Macleod bowed low.

"Lady —— told me what you were about. I thought we could have had a peep unobserved, or we should not have broken in on the romp of the children."

"I think your Royal Highness could make amends for that," said Macleod.

There was an inquiring glance.

"If your Royal Highness would ask some one to see that each of the children has an orange, and a tart, and a shilling, it would be some compensation to them for being kept up so late."

"I think that might be done," said the prince, as he turned to leave. "And I am glad to have made your acquaintance, although in —— "

"In the character of a dancing master," said Macleod gravely.

After having once more visited Oscar, in the company of Phiobaire bhig, Macleod went up again to the brilliantly-lit hall; and here he found that a further number of his friends had arrived. Among them was young Ogilvie, in the tartan of the Ninety-third Highlanders; and very smart indeed the boy-officer looked in his uniform. Mrs. Ross was here too; and she was busy in assisting to get up the Highland quadrille. When she asked Macleod if he would join in it, he answered by asking her to be his partner, as he would be ashamed to display his ignorance before an absolute stranger. Mrs. Ross most kindly undertook to pilot him through the not elaborate intricacies of the dance; and they were fortunate in having the set made up entirely of their own friends.

Then the procession of the children took place; and the fantastically-dressed crowd formed a lane to let the homely-clad lads and lasses pass along, with the six small pipers proudly playing a march at their head.

He stopped the last of the children for a second.

"Have you got a tart, and an orange, and a shilling?"

"No, sir."

"I have got the word of a prince for it," he said to himself, as he went out of the room. "And they shall not go home with empty pockets."

As he was coming up the staircase again to the ball-room he was preceded by two figures that were calculated to attract any one's notice by the picturesqueness of their costume. The one stranger was apparently an old man, who was dressed in a Florentine costume of the fourteenth century — a cloak of sombre red, with a flat cap of black velvet, one long tail of which was thrown over the left shoulder, and hung down behind. A silver collar hung from his neck across his breast: other ornament there was none. His companion, however, drew all eyes toward her, as the two passed into the ball-room. She was dressed in imitation of Gainsborough's portrait of the Duchess of Devonshire; and her symmetrical figure and well-poised head admirably suited the long-trained costume of blue satin, with its *fichu* of white muslin, the bold, coquettish hat and feathers, and the powdered puffs and curls that descended to her shoulders. She had a gay air with her, too. She bore her head proudly. The patches on her cheek seemed not half so black as the blackness of her eyes, so full of a dark, mischievous light were they; and the redness of the lips — a trifle artificial, no doubt — as she smiled seemed to add to the glittering whiteness of her teeth. The proud, laughing, gay coquette: no wonder all eyes were for a moment turned to her, in envy or in admiration.

Macleod, following these two, and finding that his old companion, the pensive clown in cap and bells, was still at his post of observation at the door, remained there also for a minute or two, and noticed that among the first to recognize the two strangers was young Ogilvie, who, with laughing surprise in his face, came

forward to shake hands with them. Then there was some further speech; the band began to play a gentle and melodious waltz; the middle of the room cleared somewhat; and presently her Grace of Devonshire was whirled away by the young Highland officer, her broad-brimmed hat rather overshadowing him, notwithstanding the pronounced colors of his plaid. Macleod could not help following this couple with his eyes whithersoever they went. In any part of the rapidly moving crowd he could always make out that one figure; and once or twice as they passed him it seemed to him that the brilliant beauty, with her powdered hair, and her flashing bright eyes, and her merry lips, regarded him for an instant; and then he could have imagined that in a by-gone century ——

"Sir Keith Macleod, I think?"

The old gentleman with the grave and scholarly cap of black velvet and the long cloak of sober red held out his hand. The folds of the velvet hanging down from the cap rather shadowed his face; but all the same Macleod instantly recognized him — fixing the recognition by means of the gold spectacles.

"Mr. White?" said he.

"I am more disguised than you are," the old gentleman said, with a smile. "It is a foolish notion of my daughter's; but she would have me come."

His daughter! Macleod turned in a bewildered way to that gay crowd under the brilliant lights.

"Was that Miss White?" said he.

"The Duchess of Devonshire. Didn't you recognize her? I am afraid she will be very tired to-morrow; but she would come."

He caught sight of her again. That woman with the dark eyes full of fire, and the dashing air, and the audacious smile! He could have believed this old man to be mad. Or was he only the father of a witch, of an illusive *ignis fatuus*, of some mocking Ariel darting into a dozen shapes to make fools of the poor simple souls of earth?

"No," he stammered, "I — I did not recognize her. I thought the lady who came with you had intensely dark eyes."

"She is said to be very clever in making up," her father said, coolly and sententiously. "It is a part of her art that is not to be despised. It is quite as important as a gesture or a tone of voice in creating the illusion at which she aims. I do not know whether actresses, as a rule, are careless about it, or only clumsy; but they rarely succeed in making their appearance homogeneous. A trifle too much here, a trifle too little there, and the illusion is spoiled. Then you see a painted woman — not the character she is presenting. Did you observe my daughter's eyebrows?"

"No, sir, I did not," said Macleod humbly.

"Here she comes. Look at them."

But how could he look at her eyebrows, or at any trick of making up, when the whole face, with its new excitement of color, its parted lips and lambent eyes, was throwing its fascination upon him? She came forward laughing, and yet with a certain shyness. He would fain have turned away.

The Highlanders are superstitious. Did he fear being bewitched? Or what was it that threw a certain coldness over his manner? The fact of her having danced with young Ogilvie? Or the ugly reference made by her father to her eyebrows? He had greatly admired this painted stranger when he thought she was a stranger; he seemed less to admire the artistic make-up of Miss Gertrude White.

The merry duchess, playing her part admirably, charmed all eyes but his; and yet she was so kind as to devote herself to her father and him, refusing invitations to dance, and chatting to them — with those brilliant lips smiling — about the various features of the gay scene before them. Macleod avoided looking at her face.

"What a bonny boy your friend Mr. Ogilvie is!" said she, glancing across the room.

He did not answer.

"But he does not look much of a soldier," she continued. "I don't think I should be afraid of him if I were a man."

He answered, somewhat distantly, —

"It is not safe to judge that way, especially of any one of Highland blood. If there is fighting in his blood, he will fight when the proper time comes. And we have a good Gaelic saying — it has a great deal of meaning in it, that saying, '*You do not know what sword is in the scabbard until it is drawn.*'"

"What did you say was the proverb?" she asked; and for a second her eyes met his; but she immediately withdrew them, startled by the cold austerity of his look.

"'*You do not know what sword is in the scabbard until it is drawn,*'" said he carelessly. "There is a good deal of meaning in it."

From Fraser's Magazine.

THE GREAT FOURFOLD WATERFALL.

It has been said there are three supremely wonderful sights in India — the snowy Himalayan range, the marble vision of the Taj Mahal, and the mysterious sculptured halls of the Ellora caverns; the first earth's immeasurable altar raised by the forces that laid her foundations; the others the work of men's hands, guided by the deepest influences of humanity — sorrow for the dead, and awe of the unknown.

We dispute not the assertion. Many-peaked Olympus, with great Jove and his divinities, were but a footstool under the unapproachable thrones of Kailasa and Gangotri, on which gods older than the Olympians still hold their court and look down upon worshipping millions. Endless are the works of beauty inspired by the love of woman and mourning for its loss, but never from the depths of grief and tender memory arose elsewhere such an ideal of beauty and delicate symmetry as the snow-white structure that with sad and graceful dignity guards the dust of the Indian empress. Sublime is the cathedral soaring high and bearing the symbols of divine life over the dwellings and turmoil of men, with the sunshine piercing its dim aisles and disclosing the memorials of the past and presences that tell of eternity, but no daylight scatters the shadows of that Eastern temple in whose recesses, hewn from living rock, watch the giant gods of a faith, grey at the birth of Christianity, through whose shrines the mystic cry that once rang over the Ægean proclaiming the death of Pan and his brotherhood has not yet sounded.

Yet, granting the three great Indian wonders their places of preëminence, there is a fourth, but little lower, which all the world might be searched to parallel, where the beauty, grandeur, and sublimity of earth and water are concentrated and displayed in unsurpassable magnificence. This marvel is the Falls of Garsoppa, to which we will endeavor to conduct the reader.

On the western coast of India stands Honore, near the boundary between the Madras and Bombay presidencies. A wide river runs into the sea between cliffs of red laterite, which bending northward and southward from the mouth mark out the coast-line. Before the entrance of the river three or four lines of heavy rollers, incessantly rearing their white crests, swelling as they sweep on, and falling over with a hollow roar, indicate the presence of a bar, to cross which safely the quaint Indian trading craft must carefully watch the flow of the tide. Less than a mile beyond, a high rocky islet, green with foliage and crowned with cocoa-trees, shelters innumerable pigeons, whence it takes its name. Inland, a wild, hilly country stretches eastward till closed by the great cloudy barrier of the Ghauts. It is a fair scene in early morning when the sun has just risen over the toothed outline of peaks, clefts, and ridges that crown the mountain rampart. On the red cliff overlooking the river stand the white bungalows of the European residents amid masses of dark-green foliage, and a lofty white pillar, raised by a native regiment to the memory of a general officer who died there, serves as a landmark conspicuous afar over the Indian Ocean. The native town lies inland out of sight buried in groves of cocoa-palms, its narrow busy bazar streets shaded by immense screens of woven leaves stretching from side to side high overhead, a protection alike against burning sun and monsoon showers. Three or four native vessels are dropping down the river, their vociferous crews anxious to cross the bar with the out-running tide, and from the fishing-village of leaf-huts on the strip of sandy beach a score of long narrow black boats have just shot out seaward for the day's toil. It is amazing to watch the hardihood and address of these sinewy fishermen. The flight of boats, with four or five men erect in each, swiftly approach the lines of formidable rollers, where larger vessels warily watch the moment and opportunity, and, never slackening in speed, charge and surmount the foaming waves in succession, often for a moment suspended with bow and stern clear in air on their crests, and then, speeding onward over the smooth expanse beyond, are soon seen like black specks dotted over the fishing-ground.

But we can stay no longer at Honore, once a station, though remote, as pleasant as it was pretty; a centre of administration, with judge's and collector's courts and much commercial activity; but now, through change and rearrangement of headquarters and the growth of rival ports, a decaying, forsaken place. We prepare for a pilgrimage to the wonder far up amongst the distant mountains, which the waters of the river at our feet have passed and are ever murmuring of. Two hours before sunset a large boat capable of carrying some twenty or thirty people

is brought up to the little wave-washed jetty under the cliff. On it we embark with attendants, coolies, and baggage, the broad red sail is set square against the sea-breeze blowing briskly up the river, and we sweep up the stream between wooded banks, by reedy, egret-haunted islets and sand-banks, on which alligators lie grim and log like. There is but little sign of human life, only now and then a small boat is seen crossing with people, the only way of communication between villages sparingly scattered beyond either bank. Beholders are always struck by the varied and picturesque scenery of this river. Two and a half centuries ago a Roman knight, Pietro della Valle, travelled widely in the East. The account of his wanderings in the form of letters to a friend was thought worthy of translation into English,* and deservedly; it is full of close observation, accurate description and quaint remark. He passed down the western coast from Goa to Calicut, and wrote copious and entertaining details of all he saw. His eyes were open, in a manner unusual in that age, to natural beauties, and when on October 31, 1623, he ascended this very river to visit the court of a native prince above the Ghauts, no better idea of its course could be given than in the following extract: —

The three leagues of this journey was one of the most delightful passages that ever I made in my life, for the country on either side the River is very beautiful, not consisting of Plains that afford only an ordinary prospect, nor of towering Mountains, but of an unequal surface, Hills and Valleys, all green and delightful to the eye, clothed with thick and high Groves, and many times with fruit Trees, as Indian Nuts, Mango, Amber, and such like, all watered with innumerable Rivulets and Springs of fresh water: The sides of the River all shady, beset with Flowers, Herbs, and sundry Plants, which, like Ivy creeping about the Trees, and Indian reeds of excessive height (called by the country-people *Bambù,* and very thick along the banks), make the wood more verdant; through the middle whereof the River strays with sundry windings. In short, the River of Garsoppa, for a natural thing, without any artificial ornament of buildings or the like, is the goodliest River that ever I beheld.

Looking on the same unchanged scenes which the old traveller describes, we quite agree with his judgment. The sun now sinks and darkness comes on apace; the rustle of the wind and gliding progress of the boat induce slumberousness, and an hour before midnight we find ourselves at the halting-place, as far as boats can go up the river, now little more than a stone's throw wide. Far round us in the jungle extend the ruins of the once royal city of Garsoppa, whence the falls we are about to visit derive their English appellation, not very appropriately, as they are twenty miles distant. It contained of old thousands of houses and seventy-four temples, in one only of which the image of a god still looks from his shrine over the surrounding desolation. Like many others in this part of India, the state of Garsoppa was once ruled by a woman under the prevailing law of inheritance in the female line; as our Roman traveller remarks, "These Gentiles having an opinion (as 'tis indeed) that the Issue by the Woman-side is much more sure of the blood and lineage of the Ancestors than that by the Man-side." However, this custom, though it may insure succession in one way, has its inconveniences, which are severely felt at present, as they must have been in past days. The last queen of Garsoppa fell in love with a stranger, to whom she resigned herself and all her power. In this there was nothing contrary to the existing law, but he so abused his position that the affairs of the kingdom fell into confusion, when a neighboring king, suddenly entering with a great force, took the queen prisoner, slew her paramour, and caused the whole town and palace to be destroyed, so that, as Della Valle reports, "that lately flourishing City is become nothing but a wood; trees being already grown above the ruins of the houses, and the place scarcely inhabited by four cottages of the Peasants."

At the landing-place a pony sent on a couple of days before is awaiting us. Attendants and coolies come on shore and assume their burdens. Three or four men bear on their heads huge bundles of primitive torches, each a long roll of cocoa-leaf midribs and fibres bound together, dry as tinder and extremely light; one will flame for ten minutes or more; then, as it burns out, another is plucked from the bundle and lighted, and so on. A ghaut road, not practicable for wheels, leads hence upward to the Mysore table-land, passing near the falls whither we are bound. Mounting the pony we proceed onward at a foot's pace, for all must accompany us, and the torch-bearers go in front, incessantly waving their torches to keep them alight. The road is not gen-

* The Travels of Sig. Pietro della Valle, a Noble Roman, into East India and Arabia Deserta; in Familiar Letters to his Friend Signor Mario Schipano. London, 1665.

erally steep, but winds with continual ascent amid the throng of ever-growing hills and along the upward-sloping valleys that lead into the heart of the great central plateau. For an hour we go on in deep darkness, the waving flickering torches only just showing the ground we tread, whilst before and behind darkness glooms like a wall. There is a great silence in the forest, only now and then the murmur of water sounds unwontedly distinct, but we see nothing of the scenery around. Let us then once again borrow a few lines from the old Italian traveller who ascended the same mountains by another pass, not to the falls of which he seems never to have heard, but to the court of the reigning Hindu king at Ikkeri. "Withal," he writes, "the Mountain is so watered with Rivulets and Fountains, and so clothed with Grass and Flowers, that, methought, I saw the most delightful place of the Apennine in Italy. If there be any difference, the Indian Mountain hath the advantage, because the height is much less than that of our Apennine — the ascent more easy, the woods more beautiful and thick, the waters not less musical and clear. If it yields to it in anything 'tis the frequency of inhabited places and the sumptuousness of buildings."

After for an hour or more threading our way through the palpable obscure, the sky in our front begins to brighten, and the trees fringing the heights become more and more visible against it. Presently the gibbous moon comes suddenly up over a long ridge, and, mounting higher and higher, begins to search out and disclose the mountain recesses. Whilst the feet of the long slopes are shrouded in deep blackness, their thickly wooded, many-folded sides are steeped in silvery sheen, tracts of light alternating with depths of inky gloom. The road we follow sometimes passes through clear moonlight and then plunges into ebon shadow. As we mount from the lower valleys the silence of the hills is sometimes broken. Strange sounds burst upon the ear. Now a deep sigh seems to rise up, and anon a sharp call rings out, and now and then a rustle betrays the neighborhood of a furry denizen of the woods. Once or twice a great owl comes sweeping noiselessly along, and on seeing us swerves aside with a startling whoop. After proceeding thus for some ten miles we halt at an open spot where a runlet crosses the road. The men put down their loads, quickly kindle a fire of sticks, sit round it, and pull out their frugal viaticum — a handful of cold boiled rice tied up in a corner of the waist-cloth. The moon is now riding high, and through a long vista we catch a glimpse of the low country, a spark of light glimmering here and there, the dusky sea-line and the moonshine on the watery waste beyond. Soon resuming march for eight or nine miles, the air perceptibly grows keener and the overarching trees larger and more umbrageous. At length we arrive before a long, low building; it is still an hour to daybreak, a white wet mist fills the air, and a strange muffled roar, now swelling now sinking, but sounding remote as though from depths immeasurable, strikes upon the ear.

But we are tired and drowsy, and entering the bungalow, and stretching ourselves on a cot, soon doze off. Suddenly awaking, we find it sunrise; volumes of mist are still wreathing and rolling past, and the strange far-off sound, like low subterranean thunder, continually swells or dies away. We are soon out in the dewy morning air. Nowhere, we think, all the earth over can there be a region more romantic and picturesque than this above the rim of the Ghauts — a land of hills, peaks, and ridges, stretching away in an ordered confusion, never rough, never monotonous, mantled with magnificent forests, of no single growth, but countless varied species, and the underwood fresh and graceful, thronged with beautiful plants and flowers. Amid these is spread a network of winding valleys, seldom very wide or deep, whose flat, fertile bottoms are covered with rice-plots, gardens, and orchards, amongst which may be discerned the frequent homestead, shaded by tall green fans of the plantain, and fruit-trees entwined with pepper-vines. These and the higher hilltops and grassy peaks are the only open spaces, the forest dominates everywhere else, and a few roads pierce its depths like long shadowy arcades.

Through this luxuriant country (on which the lean finger of famine, so killing, alas! on the wide regions eastward, can never heavily be laid) runs a broad, fair river, gathering the tribute of a thousand hills and springs, whose waters, except in the rains, find their way along its rocky bed in several streams. It winds on between banks fringed with trees and festoons of many-colored creepers, but showing no specially striking feature, till at one point, suddenly, with no warning slope or rapid, an appalling abyss opens across its course from bank to bank, and the whole great river disappears into this gulf.

Difficult it is to convey in words any picture of the stupendous scene. There is the river, some three hundred yards in width, flowing through soft woodland, its waters split into many glassy currents, gliding round worn boulders and islets, when instantly bed and banks are gone, and in their place are savage terrific walls of gaunt rock plunging to depths the eyes dare not look into, down which the shuddering waters fall at four points nearly equidistant on the irregular curve of the rim of the abyss.

These are the Falls of Garsoppa, not so famous as they should be, for nowhere the world throughout can there be another such vision.

From the lip of the precipice to the dark pools at its foot is an accurately measured distance of eight hundred and thirty feet, more than twice the height of the top of the cross that surmounts St. Paul's Cathedral, and down this prodigious descent pour the four cataracts, each arrayed in its own special robes of grandeur and beauty. First on the western side is the Great or Rajah Fall; a branch of the river runs over a projecting ledge, and nowhere touching the Titanic wall, which hollows in, descends in a stately unbroken column, gradually widening its shining skirts, into a black unfathomable pool eight hundred and thirty feet below. Imperially sublime the transfigured water passes with majestic calmness through the void in fold after fold of ermine whiteness spreading out its magnificence as it silently nears the end. The precipice runs backward, curving in an irregular bay, on whose farther side the next fall, named the Roarer, shoots slanting down a third of the height into a rocky basin that shoulders out, whence it boils out in a broad massive cataract, plunging five hundred feet into the same pool opposite its kingly neighbor. All the thunder and madness of the element are gathered in this writhing, headlong flood, and it is the voice of its fury that comes up from the abyss, like the roar and tumult of hurrying multitudes in the face of some great monarch moving to his doom. Leaving the bay, next on the general plane of the precipice comes the Rocket Fall, running impetuously over the brim and down the face of the stupendous wall, to which it only just clings with a broad band of glistening foam-white water, speeding in quick gushes incessantly darting out myriads of watery rockets and vaporous arrows, with which all its volume seems alive, and pouring clear at last in a dense shining curtain into its own pool. Last and loveliest, La Dame Blanche glides down the grim colossal rampart in lapse after lapse of delicate lace-like veils, now blowing out in bright misty spray and again quickly gathering up the white folds, and so stealing downward with a whispering murmur, till gently sinking in a sparkling shower into a pool whose ink-black surface is hardly ruffled.

At a point a furlong or two below the falls, on the farther side of the mighty ravine that cleaves the mountains from their feet, a platform has been hewn in the rock whence the whole overpowering precipice and the four falls are disclosed from top to bottom: the eyes at once takes in the sublime column of the Great Fall, the wild tumultuous plunge of the Roarer, the impetuous gush and foam-sheaves of the Rocket, and the hesitating, tremulous beauty of La Dame Blanche. All round the world there can be nothing to match the sight. The opposite side of the profound ravine, which maintains a uniform width and depth as far as seen, rising in tree-crowned crests higher than the line of the falls, sinks in a perpendicular drop of stern grey walls for more than a thousand feet to the floor of the colossal chasm; only here and there a dark rent or stunted tree rooted in a crevice breaks the awful uniformity. On the side where we sit the slopes, densely forest-clad, descend with only less than precipitous steepness. Looking down the ravine, the gaunt rocky faces gradually disappear, and a majestic wooded mountain closes the view. But one cannot turn long from the sublime vision of the falls, and the long pillars of bright water — too long to be taken in at a glance, the eye must follow them — bathed in light, as the Indian sun darts its radiance to their feet. Small trees, patches of herbage and grassy shelves, kept fresh by the spray-rain, soften the front of the abyss about the Rocket and the White Lady; but gloomy, cavernous recesses, which no sunshine reaches, lie hid behind the Great Fall as it pours from its beetling rim. Above in the background the higher summits of the mountains lift green peaks and darkly wooded crests into mid-air, and at the bottom of the falls a sunbow, ever rising slowly higher as the sun's rays penetrate deeper, arches the dark pools with its beautiful soft splendor. In the morning it lies long and low, but ascends with the sun, and after noontide spans the ravine with a glorious lofty semicircle. Not much mist-cloud arises except where the Roarer hurls down its massive volume,

but the air is laden with moisture, and often flushes with brilliant colors, as blasts of wind below scatter for a moment the symmetry of the sunbow, and fling wider the shining robe of the Great Fall. No, there can be nothing comparable to it elsewhere. The Staubbach dropping its single smoke-like veil from as lofty a brow, and the enormous flood and breadth and massiveness of Niagara, far less in height, belong to a different order of sublimity. The many torrents of the Zambesi Falls descend but one hundred feet into a long narrow fissure, "a gigantic crack," only eighty feet across. One hears of marvellous cataracts among Norwegian hills and in Californian valleys, but nowhere else are all the wonders and enchantments of water in every aspect of grace and beauty, force, majesty, and terror, so gathered and set in such a frame of surpassing sublimity and awful grandeur amid all the magnificence of tropical mountain scenery.

On an overhanging brow near the ledge over which the stream of the Great Fall glides to its tremendous plunge there is a point called the Rajah's Chair, from some tradition that of old a rajah of that region would resort there and sit on the brink, absorbed by the spectacle. He must have been gifted with a steadiness of brain, no less than an appreciation of scenery, unusual with his race; for on this point few can stand or sit, or do more than lie prone on the breast and cautiously peer over. Even so, the brain reels and sickens. There is the fearful void between the eyes and the dark pools and rock-strewn bottom plumb down below, so far does the rocky rim hang over, and such is the terrific perpendicularity of the dreadful precipice; only here and there far below a jutting point or shelf gives a measure and makes the depth beyond seem still more interminable. Countless flocks of pigeons winging the midway air show, not so gross as beetles, but like swarms of flies. Large stones brought from the river-bed behind and thrown over, fall and fall, and seem to vanish into the lowest depths, but reverberations still continue to come up, and after expectation is wearied, a faint splash tells they have reached the pool. The true height of the falls had long been a debated point, not easy of solution. Lines let down the face of the abyss stuck on the way, and calculations of the time taken by falling stones were delusive; and the general estimate, naturally inclined to excess, was never less than one thousand feet. About twenty years ago, however, a party of officers from a government ship employed in surveying the coast, visited the falls, bringing with them tackle and fathoming apparatus. They contrived to stretch a cable across the inward curve of the precipice above the cauldron into which the upper volume of the Roarer rushes, and slinging on to it a sort of bamboo cradle, which was then drawn out to the middle, let down a deep-sea line and lead to the pool beneath, and ascertained the exact depth from lip of precipice to pool to be eight hundred and thirty feet.

We now return to the vantage point on the farther side of the ravine, beyond whence all the grandeur and glory of the falls are sublimely displayed. One could well sit there the livelong day, but we will follow a narrow track that leads downward to the bottom of the gorge. Very steep and difficult it is, threading the declivity sometimes like a mere stony stairway, and twice or thrice descending slippery faces of rock by a rude ladder. Most of the distance the path passes through deep groves where the tree from which gamboge exudes and the large glossy leaves of the gutta-percha tree are conspicuous. Sometimes through the branches the eye catches the foamy gleam of the cataracts, which are more fully disclosed now and then when the path traverses a moist open space, where bright flowers and orchids stud the dripping shelves, and ferns, especially the curious *Pœcilopteris terminans*, with its long, thin, poignard-shaped, terminal frond, grow thickly. Flights of brilliant butterflies haunt such spots, and the prolonged shrilling of the cicada rings from the surrounding trees. At length the path emerges at the bottom of the gorge, a wild and weird place, strewn with large rounded stones and boulders indescribably slippery from the perpetual spray; the gigantic precipices so closely hemming it in on three sides seem to shut it out from the upper world. Slowly and cautiously we make our way over the perilous slime-covered stones towards the pools that receive the cataracts. A sense of the remote eeriness of the spot, as though it were in some forlorn fairyland, grows over us as we approach the largest and longest of those gloomy waters. Almost one thinks to see a dragon, or some monstrous beast, couched upon the brim. At the farther end the Great Fall descends in a massive shower; the other end is shaken by the furious down-pour of the Roarer. More to the right the water of the Rocket Fall, alive with endless flights of foamy arrows and outdarting shafts of spray, spreads out in a broad curtain that

descends over a dark-browed cavern, level with its own pool, and farther on the naiad of the spot, hidden in glistening delicate films and vaporous folds, vanishes in a thick, bright rain. Slowly we wander along the edges of the profound basins, whence many streams running out soon unite and continue their course along the gorge, and pausing before each fall watch their wonderful descent and disappearance. Long streamers of moss and vivid green vegetation hang from the chinks and crannies of the eternally dripping walls, and in guarded nooks and under shelves, ferns, and strange plants and flowers, find root. Especially round the arch of the cavern behind the Rocket grow clusters of some bright red flower, inaccessible and unknown. Here and there a wild plantain or banana clings in a sheltered nook, stretching out its large coarse leaves and small hard clusters, the indigenous stock as the crab of the apple. Looking upward with head strained back, the long jagged rim of the stupendous precipice can be discerned at a bewildering height above, and the tops of the falls seem as though issuing from the sky. The dreadful downward descent cannot be grasped at once, and a sense of fear, feebleness, and oppression spreads over the brain, different, however, from the sickening thrill of dread that grows over the gazer-down from the rim above. Burke, in his "Essay on the Sublime and Beautiful," observes: "I am apt to imagine that height is less grand than depth, and that we are more struck with looking down from a precipice than looking up at an object of equal height; but of that I am not so sure." Much depends on temperament. There are some who can stand upon the dizziest edge and look calmly down; but had the great statesman visited a scene like this, we think he would have decided that in the case of a really tremendous precipice there is a far fuller, deeper, and more unwonted pleasurable sensation in looking up to than down from it. In the latter case one is not so much struck as overwhelmed.

The floor of the abyss widens out in front of the falls, especially on the side of La Dame Blanche, but soon resumes its ordinary breadth as the river runs on between its colossal banks, and one of the wonders of the place is from a knoll above, on the side near the Great Fall, to look down on the stream pursuing its way along the bottom of the enormous chasm. Repassing the dangerous stony space, we retreat to the shade where the abrupt declivity meets the floor. Long sitting there alone, the spell of this enchanted spot grows over one more and more. Though seeming to be sunk far aloof from the winds above and the influences of the upper sky, the air around is as full of mystic noises as Prospero's isle. Even when all is still, and the leaves hanging motionless, the voices of the falling waters continually change, sometimes almost dying away, then rising in strange tones of far-off lamentation or sudden triumph; and at times, when the atmosphere is stillest, fierce blasts seem to go by far overhead with a long, wailing sough or unearthly shriek, and the arch of the sunbow and white skirts of the Great Fall are scattered for a moment in iris-tinted fragments, whilst the gulf is filled with moans and weird sounds echoing from steep to steep. The falling waters and long, deep, trough-like ravine doubtless influence the currents of air, but the effect is strange and startling. It is such a fastness as the gods of a dying religion might retreat to from their neglected shrines and temples, and gather to bewail and await the announcement of their final doom. And indeed while watching there in that sunny stillness, broken only by the mystic voices of the air and waters, the forms of the old gods of India almost seem to float and soar amid the rolling clouds of spray and sun-colored wreaths of mist. Siva, Vishnu, and their train, many-armed and monstrous, arrayed in jewelly splendor, gleam for a moment, and vanish in the dim recess beyond the sunbow, and suddenly a fierce rushing, as of harpies on the wing, is heard overhead.

Whilst thus dreaming, the rustle of a light approach along the downward path strikes upon the ear, and presently a man emerges from the bushes and advances over the slippery stones. A Hindu, old and gaunt, wrapped in an orange-colored cloth, and his forehead white with ashes. In his hand he carries a long staff, polished like glass with use. We perceive that he is of the Jăngăm or Vîra Saiva sect, a follower of the great saint Băsăva, an incarnation of Siva. He perceives us not where we sit aside under the overhanging foliage, and stepping, with bare feet, surely and lightly along, he seats himself, drawn together Eastern fashion, on a small sand-bank in the open sunshine.

Seven centuries ago, when Brahmanical ascendency and pretensions — the most crushing and tyrannical system of priestly domination the world has ever known — were strongest and most unquestioned,

Basava was born, the son of a Brahman in a village of Belgaum, in the southern Mahratta country, upon the western coast. When a boy, it is said, he refused to wear the Brahmanical thread, because the right of assuming it, requiring the adoration of the sun, involved an act of idolatry. Perhaps he did assume, but afterwards renounced it: there was some rebellion against the orthodox creed, and whilst still young he fled to the capital of the Carnataca country, where the reigning prince was a Jaina by religion, and his minister related to Basava. The minister gave the young man employment, and at his death, Basava succeeded to his office, and in time attained great power. Here it seems probable that after comparing the rival creeds of Jainas and Brahmans, and perceiving that both were idolatrous, he resolved to reject them both and worship only Siva, conceived as the one Supreme Being, God and Father of all. No Puritan or Quaker of the old stamp could have gone to work in a more root-and-branch style. He resolutely set himself against the Brahmanical priesthood and principles, and especially their exclusive hierarchial pretensions, renouncing the divine authority of the Vedas, Ramayuna, and Bhagavat Gita on which they are founded, and teaching that all men are equal by birth, and holy in proportion as they are temples of the Great Spirit.

He prohibited the superstitious rites of purification and the tedious funeral ceremonies, which are the burdens heavy and grievous to be borne of orthodox Hindu life, and tenaciously enforced by the Brahmans. Whilst they worship multitudes of gods and reverence the sun, rivers, cows, monkeys, and many animals, Basava declared there is but one God — Sāda-Siva — the ever blessed, a benevolent, gentle deity, somewhat resembling Saturnus, and with nothing but name in common with the Jupiter Siva of the Brahmans, represented always as an austere destroyer. Together with caste, he moreover renounced all Brahmanical observances and distinctions, fasts and feasts, penances and pilgrimages. The emblem of deity adopted by Basava was the Lingam, the most ancient symbol known to the Hindus, and in their minds totally separate from any obscene association. In Saiva Brahman temples it is called Sthâvara Lingam, the fixed or stable image, and to move it would be a great sin; but Basava called it Jăngăma Lingam, the moving or peripatetic image, a Vedic phrase used for a living being, and ordered it to be carried about by all his disciples as part of themselves; hence they are called Jangams, or living images of the deity, much in St. Paul's sense of a living sacrifice. Tiny images of it, the size of a pea, are inclosed in a small silver case or reliquary, and carried suspended on the breast by a string round the neck. Every Jangam is known by this badge. It can never be laid aside, or taken away, or permanently lost, for it is looked upon as part of the body; and should it ever be accidentally lost, the sufferer's friends fast and pray with him till it reappears in his hand, "descending through the air like a bee." This miracle they strongly affirm has repeatedly occurred, and they even declare that were it known to fail their faith would perish. In social matters the Jangams manifest the same determined opposition to all traditionary orthodox observances. By the Brahmans women are regarded with complete contempt, and widows are excluded from society, but the followers of Basava alone amongst Hindus, holding marriage not obligatory, behave with consideration and delicacy towards women, and treat widows with kindness and respect. Their heads are not shaved, and they may marry again. Amongst the Jangams a woman of piety is listened to as reverently as a man, and they accept and return the salutation of women equally as of men, observing that an insult to a woman would be an insult to the image of the deity which she wears, whilst it never even occurs to other Hindus to treat women with civility. Men and women eat together, and bless their meals in the name of their god, *after* which they consider the food holy, and are bound to eat it; it cannot then be defiled by the glance or touch of any person. Eating is expressly termed *sivapuja*, or worship; for the Jangams think with Jeremy Taylor, that "God esteems it a part of his service if we eat or drink; so it be temperately." Their literature is extensive and of high value, distinguished for moderation and purity, and free from the extravagance and abominable filth that characterize Brahmanical writings. They declare the doctrine of the fatherhood of God and the brotherhood of man as distinctly as any modern thinkers, and differ remarkably from other Hindus with regard to a future state, affirming that they will suffer for themselves according as they have done good or evil. Other men are liable to transmigration, but not they who have been brought into the faith. They depart either to heaven or hell, and that state is eternal. Basava's resolute

rejection of the established creeds and customs of course raised hosts of enemies; a civil war ensued, in which the prince, his patron, was slain, and this event was soon followed by the death of Basava, who, according to his followers, was "absorbed into the image," or vanished, a significant expression which may cover much. This was coeval with the murder of Thomas à Becket. At the present day the Jangams are very numerous in the Canara and Mahratta countries, and in Mysore and Berar. Several of the petty rajahs of those regions have belonged to them, as is still the case. Pietro della Valle, the first European who mentions them, reports that the king to whose court we have seen him journeying was a "Giangama." As now seen, they are a peaceable race of Hindu puritans, boasting that none of their number are found in courts of justice, where the common Hindu oath would be regarded by them as a crime; and, firm in their faith, boasting also that conversions to Christianity or Mahommedanism are unknown amongst them.*

In Europe the Hindus are regarded as beyond other races bigoted, fettered by caste, and immovable in their religion and customs; but there can be no more striking instance of the revolt of intellect and conscience against idolatry, superstition, and priestly domination than that achieved by Basava, himself the son of a Brahman, "twice born," at an epoch when the sway of his caste was firmest. Again, three centuries later in Bengal, where Brahmanical tyranny was most rigid and supreme over all relations of life and society, Chaitanya, born in the same year with Luther, flung caste to the winds, renounced the priesthood, proclaimed the sufficiency of simple and absolute faith without works, observances, or ceremonial, and died with four millions of followers, a number now believed to be doubled. In truth, Europe has lagged behind India in the sphere of moral and religious insurrection. The Jaina and Buddhist systems, older than Christianity, are instances on the largest scale of triumphs over hierarchical pretensions; triumphs, moreover, continuing through centuries, extending over vast regions, accepted by ruling dynasties, and associated with high civilization, magnificent architecture, and excellent morality. But India also markedly exemplifies how the indestructible human tendency towards sacerdotal direction, authority, and ritual reasserts itself, however slowly, and bears them again to dominion. The Brahman and his power long seemed near extinction; he is now supreme, and his rivals have faded from the land of their origin, and those who still defy him are in comparison but a few scattered dissenters.

Meanwhile, the man whose appearance has recalled these recollections of the history of his creed remains seated motionless on the sand-bank with eyes fixed upon the glorious scene before him. We can hardly conjecture what thoughts are passing through his mind; Hindus are little open to the impressions of natural scenery, and that sympathy with it, when cataracts, rocks, and mountains haunt like a passion, seems wholly alien to their nature; it is rare indeed in any race. Still this is a point on which the European mind hardly understands and fathoms the Hindu enough to form a judgment. Ideas and ways of thinking are so essentially different that something of the same result may be arrived at under very different forms and by very different paths. Indian poetry is far from destitute of the recognition of natural objects and beauties, but generally in subordination to some shrine or god, and introduced in a mechanical sort of way. Every poem, they think, ought to contain descriptions of the seasons, streams, love, morning and evening, etc., in certain formal proportions. But a sense of natural beauty shows itself in them in many ways — their love of flowers, the picturesque sites of their temples, and their veneration of streams and waterfalls, so grateful in a burning land. An educated and reflective man of a sect like the Jangams, whose mind has not been stuffed from childhood with absurd Brahmanical stories and notions of manifold gods and superstitions, may well be open to higher influences, and even be touched with that sublime sense "of something far more deeply interfused" in nature. Presently the man we have been watching rises, and holding in his hand the emblem of his faith suspended on his breast, repeats in a loud emphatic voice, as Hindus always use to do when reciting or reading to themselves, some verses in which we can distinguish the majestic march of a Sanskrit hymn or prayer, composed by the celebrated sage Agastya, and adopted by the Jangams as their *credo* and confession of faith, continually in their mouths, and prefixed as a motto to

* In the foregoing account the writer has been largely indebted to a learned "Essay on the Creed and Customs of the Jangams," by C. P. Brown, M.C.S. Madras, 1840.

their religious books. It runs thus, closely rendered line for line: —

The Being endless, Giver of goodness, Image of wisdom, whom pain and grief
Never can reach; the Sky His emblem, whose names are countless, and Truth the chief.
The One, everlasting, stainless, steadfast; who knows all secrets, Himself unknown.
Passionless ever, of perfect justice, — Him do I worship, and Him alone.

He who sits at the foot of the World-Tree, on the devout who before Him fall
Understanding and strength bestowing. Lord of the Universe, Teacher of all,
Embodied Glory of grace and mercy; Him I salute and adore, for He
From the burden of life and the bonds of death alone can deliver and set us free!

Scooping up water in his hand and drinking, he draws his cloth round him, and passing with long light steps over the slippery stones disappears on the upward path without having noticed us screened behind some bushes. After a time, and once again advancing to the brim of the dark pools and contemplating the wondrously lovely lapse and vanishing of the waterfalls in their bosom, we too address ourselves to the ascent, which shod feet and limbs less light and spare make far longer and more toilsome than to the ascetic who has gone before.

We do not neglect after moon-rise to resort to the wooded knoll above the Great Fall. Even the full moon at her midmost height cannot reach the lower depths of the gulf, or touch more than half of the mighty precipice, which from its overhanging and inwardly retreating character is mostly shrouded in gloom; only here and there a craggy point, outswelling slope, or rugged projecting brow catches the light and gives hint of the vast wall behind. The four falls descend into the abyss like huge columns of shining silver, writhing and quivering in the moonbeams, till suddenly swallowed and lost in the blackness of darkness. It is a weird and sublime sight, almost more impressive than the stupendous daylight vision. The voices of the water seem to change their tones, and a long lament, mingled with strange gusty sounds and cries as of struggling winds, rises fitfully up, laden with the intimation of appalling depths. By night too the spray clouds over the pools, which seldom mount high during the day, creep upwards in long spectral wreaths, and at dawn may be seen lifting their pale locks and brows over the brim of the abyss, but soon sink back and vanish as the sun mounts up.

Few travellers have visited the spot during the rainy season. At the height of the monsoon the whole forest country is a dripping, weltering wilderness, streamlets and threads of water become torrents, and roads are everywhere blocked up by floods and fallen trees. Movement and business are suspended, and the inhabitants almost as much confined to their homesteads as Arctic dwellers by the polar winter. Then the river, a wide furious flood, unbroken from bank to bank, rolls over the precipice in one tremendous torrent. The force and thunder must be overwhelming and sublime, but nothing can be seen — nothing of the precipice, of the gorge below or the river bed above; all are veiled by the enormous mist-clouds which fill the ravine and chasm, and roll in prodigious volumes far up the valley, ascending above the trees and bordering hills, and burying everything in a blank uniform grey. All is as much lost to view as a mountain prospect involved in clouds, and these clouds neither lift nor disperse whilst the monsoon lasts.

In this luxuriant region there are many marvellous spots; let us finally leave it with a glance at another wonder of nature, even stranger than the falls, and more difficult to convey an idea of by words. Some fifteen or twenty miles northward in the same continuous forest country are the Yêni, or Ladder Rocks, difficult to reach and seldom visited. In a rather low-lying undulating tract, in the heart of the jungle, where trees are broadest and undergrowth thickest, the visitor, long guided through labyrinths of narrow paths, often retarded by thorny bushes and the sharp hooks of rattan trailers, sometimes wading across swamps swarming with nimble leeches, and now and then over the paddy-plots of a lonely homestead, at length sees with surprise strange rocky shapes shooting abruptly above the trees, as cathedral towers rise over woodland. Previously for a long distance no rock has been encountered, the outlines of the country being low and rounded, but now advancing from between wooded eminences two extraordinary objects strike the eye, standing across an open space on either side the entrance of a narrow glen. Not columns or obelisks, not pinnacles or towers, yet unlike any of nature's freaks in rock or stone. Two great piles of rock rise abruptly some four hundred feet above the jungle that closely surrounds them. Huge, and of no describable out-

line at base, their shape, if shape it can be called, changes continually as they rise, square, rounded, many-sided, breaking out everywhere in overhanging ledges, sharp points and elbows, jagged edges, twisted pendents, and ending in wild irregular spires and turrets. No other rocks are near; they stand clear, sooty-black in color, for iron enters into their texture, which is hard crystalline limestone, grey at the fracture, but blackening on the surface. No more rocks of the kind are known in that part of the country; at this spot only they and their fellows seem to have been thrust up from the bowels of the earth. The narrow glen, between two hundred and three hundred yards in length, is bordered by a succession of these fantastic shapes, not so large or high as the gigantic warders at the entrance. There is nothing of the pillared regularity of Staffa, or rather one might imagine one's-self moving through a Walpurgis *day*, made mysterious by the dim forest-shadows, past "giant-snouted crags" and rocks animated with monstrous life, or amid a throng of the enormous misshapen Afrits of Arabian romance, or a revel of huge lumpish giants turned into stone by some potent magician or Merlin spell. The little glen widens at the end into a sort of amphitheatre, in which stands a pair of the most amazing and fantastic of these nightmare forms. On the right is a great towering mass rather suggesting in outline some vast megatherium, or one of the colossal brood of earth's younger days, its prodigious back covered with a close array of long sharp spines; the other, loftier and less bulky, rising in piles of dislocated angular masses, some poised and hanging on others, seamed with deeply overhanging brows shooting straight up in spires and pinnacles, and over them many-cornered shafts bearing ragged parapets, broken steps and buttresses, all mounting upward and ending in a long lean tooth. Could unlike conditions be compared, one might imagine a fleet of icebergs drifted from their Arctic birthplace into this tropical solitude, and transformed suddenly from white glittering ice into sable stone; the grotesque forms wrought by the magic ministry of frost would not be exceeded by the bizarre outlines of these sun-blackened Indian rocks, surrounded by no blue sea waves, but by the green billows of a forest wilderness. At the base of the great spined rock there are wide and lofty cavernous recesses, with rugged far-projecting eaves, in the hollows of which prodigious swarms of bees have, doubtless for ages, held their stronghold, and, far above reach, filled them with an enormous wealth of Brobdingnagian combs, which hang down in rich waxen stalactites. The deep incessant hum of this innumerable commonwealth is audible at a considerable distance. The natives relate that two European officers once visited the spot, one of whom foolishly and wantonly fired into this formidable fortress, and was instantly attacked by clouds of the defenders, and died from their stings. Since then, they say, it is not safe for any one to go too near the swarming legions of the guarded city.

Such are some of the wonders and impressive sights embosomed in these Indian western wilds. The grand picture of the matchless fourfold falls can never fade from the inward vision of eyes that have looked upon them. At the bungalow hard by a book used to be kept in which visitors wrote their names, and often their impressions, for the most part not unworthy of the spot, for its influence had been too much for even British jocosity. Amongst them a bishop had recorded his thanks to God for having been permitted before death to behold so sublime and glorious a manifestation of the works of his hands, and a German artist wrote that an account of the falls had led him thither all the long journey from his own land, but that he held the toil to be well repaid. Such expressions are nothing exaggerated.

M. J. WALHOUSE.

From The Nineteenth Century.

AN OXFORD LECTURE.*

BY JOHN RUSKIN.

I AM sure that all in this audience who were present yesterday at Dr. Acland's earnest and impressive lecture must have felt how deeply I should be moved by his closing reference to the friendship begun in our undergraduate days; of which I will but say that, if it alone were all I owed to Oxford, the most gracious kindness of the Alma Mater would in that gift have been fulfilled to me.

But his affectionate words, in their very

* Left, at the editor's request, with only some absolutely needful clearing of unintelligible sentences, as it was written for free delivery. It was the last of a course of twelve given this autumn; refers partly to things already said, partly to drawings on the walls; and needs the reader's pardon throughout, for faults and abruptnesses incurable but by re-writing the whole as an essay instead of a lecture.

modesty, as if even standing on the defence of his profession, the noblest of human occupations! and of his science, the most wonderful and awful of human intelligences! showed me that I had yet not wholly made clear to you the exactly limited measure in which I have ventured to dispute the fitness of method of study now assigned to you in this university.

Of the dignity of physical science, and of the happiness of those who are devoted to it for the healing and the help of mankind, I never have meant to utter, and I do not think I *have* uttered, one irreverent word. But against the curiosity of science, leading us to call virtually nothing gained but what is new discovery, and to despise every use of our knowledge in its acquisition; of the insolence of science, in claiming for itself a separate function of that human mind which in its perfection is one and indivisible, in the image of its Creator; and of the perversion of science, in hoping to discover by the analysis of death what can only be discovered by the worship of life, — of these I have spoken, not only with sorrow, but with a fear which every day I perceive to be more surely grounded, that such labor, in effacing from within you the sense of the presence of God in the garden of the earth, may awaken within you the prevailing echo of the first voice of its destroyer, "*Ye* shall be as gods."

To-day I have little enough time to conclude — none to review — what I have endeavored thus to say; but one instance, given me directly in conversation after lecture, by one of yourselves, will enable me to explain to you precisely what I *mean*.

After last lecture, in which you remember I challenged our physiologists to tell me how a bird flies, one of you, whose pardon, if he thinks it needful, I ask for this use of his most timely and illustrative statement, came to me, saying, "You know the way in which we are shown how a bird flies, is, that any one, a dove for instance, is given to us, plucked, and partly skinned, and incised at the insertion of the wing bone; and then, with a steel point, the ligament of the muscle at the shoulder is pulled up, and out, and made distinct from other ligaments, and we are told 'that is the way a bird flies,' and on that matter it is thought we have been told enough."

I say that this instance given me was timely; I will say more — in the choice of this particular bird, providential. Let me take, in their order, the two subjects of inquiry and instruction, which are indeed offered to us in the aspect and form of that one living creature.

Of the splendor of your own true life, you are told, in the words which, to-day, let me call, as your Father did, words of inspiration, "Yet shall ye be as the wings of a dove, that is covered with silver wings and her feathers with gold." Of the manifold iris of color in the dove's plumage, watched carefully in sunshine as the bird moves, I cannot hope to give you any conception by words; but that it is the most exquisite, in the modesty of its light, and in the myriad mingling of its hue, of all plumage, I may partly prove to you in this one fact, that out of all studies of color, the one which I would desire most to place within your reach in these schools, is Turner's drawing of a dove, done when he was in happy youth at Farnley. But of the causes of this color, and of the peculiar subtlety in its iridescence, nothing is told you in any scientific book I have ever seen on ornithology.

Of the power of flight in these wings, and the tender purpose of their flight, you hear also in your Father's book. To the Church, flying from her enemies into desolate wilderness, there were indeed given two wings as of a great eagle. But the weary saint of God, looking forward to his home in calm of eternal peace, prays rather — "Oh, that I had wings like a dove, for then should I flee away, and be at rest." And of these wings, and this mind of hers, this is what reverent science should teach you: first, with what parting of plume, and what soft pressure and rhythmic beating of divided air, she reaches that miraculous swiftness of undubious motion, compared with which the tempest is slow, and the arrow uncertain; and secondly, what clue there is, visible, or conceivable to thought of man, by which, to her living conscience and errorless pointing of magnetic soul, her distant home is felt afar beyond the horizon, and the straight path, through concealing clouds, and over trackless lands, made plain to her desire, and her duty, by the finger of God.

And lastly, since in the tradition of the old covenant she was made the messenger of forgiveness to those eight souls saved through the baptism unto death, and in the gospel of the new covenant, under her image, was manifested the well-pleasing of God, in the fulfilment of all righteousness by his son in the baptism unto life,— surely alike all Christian people, old and young, should be taught to be gladdened by her sweet presence; and in every city and village in Christendom she

should have such home as in Venice she has had for ages, and be, among the sculptured marbles of the temple, the sweetest sculpture; and, fluttering at your children's feet, their never-angered friend. And surely also, therefore, of the thousand evidences which any carefully thoughtful person may see, not only of the ministration of good, but of the deceiving and deadly power of the evil angels, there is no one more distinct in its gratuitous and unreconcilable sin, than that this — of all the living creatures between earth and sky — should be the one chosen to amuse the apathy of our murderous idleness, with skill-less, effortless, merciless slaughter.

I pass to the direct subject on which I have to speak finally to-day; the reality of that ministration of the good angels, and of that real adversity of the principalities and powers of Satan, in which, without exception, all earnest Christians have believed, and the appearance of which, to the imagination of the greatest and holiest of them, has been the root, without exception, of all the greatest art produced by the human mind or hand in this world.

That you have at present no art properly so called in England at all — whether of painting, sculpture, or architecture* — I, for one, do not care. In midst of Scottish Lothians, in the days of Scott, there was, by how much less art, by so much purer life, than in the midst of Italy in the days of Raphael. But that you should have lost, not only the skill of art, but the simplicity of faith and life, all in one, and not only here deface your ancient streets by the ford of the waters of sacred learning, but also deface your ancient hills with guilt of mercenary desolation, driving their ancient shepherd life into exile, and diverting the waves of their streamlets into the cities which are the very centres of pollution, of avarice, and impiety: for this I *do* care, — for this you have blamed me for caring, instead of merely trying to teach you drawing. I have nevertheless yet done my best to show you what real drawing is; and must yet again bear your blame for trying to show you, through that, somewhat more.

I was asked, as we came out of chapel this morning, by one of the fellows of my college, to say a word to the undergraduates, about Thirlmere. His request, being that of a faithful friend, came to enforce on me the connection between this form of spoliation of our native land of its running waters, and the gaining disbelief in the power of prayer over the distribution of the elements of our bread and water, in rain and sunshine, — seed-time and harvest. Respecting which, I must ask you to think with me to-day what is the meaning of the myth, if you call it so, of the great prophet of the Old Testament, who is to be again sent before the coming of the day of the Lord. For truly, you will find if that any part of your ancient faith be true, it is needful for every soul which is to take up its cross, with Christ, to be also first transfigured in the light of Christ, — talking with Moses and with Elias.

The contest of Moses is with the temporal servitude, of Elijah, with the spiritual servitude, of the people; and the war of Elijah is with their servitude essentially to two gods, Baal, or the sun-god, in whose hand they thought was their life, and Baalzebub, the fly-god, — of corruption, in whose hand they thought was the arbitration of death.

The entire contest is summed in the first assertion by Elijah of his authority, as the servant of God, over those elemental powers by which the heart of man, whether Jew or heathen, was filled with food and gladness.

And Elijah the Tishbite, who was of the inhabitants of Gilead, said unto Ahab, "As the Lord God of Israel liveth, before whom I stand, there shall not be dew nor rain these years, but according to my word."

Your modern philosophers have explained to you the absurdity of all that, you think? Of all the shallow follies of this age, that proclamation of the vanity of prayer for the sunshine and rain; and the cowardly equivocations, to meet it, of clergy who never in their lives really prayed for anything, I think, excel. Do these modern scientific gentlemen fancy that nobody, before they were born, knew the laws of cloud and storm, or that the mighty human souls of former ages, who every one of them lived and died by prayer, and in it, did not know that in every petition framed on their lips they were asking for what was not only fore-ordained, but just as probably fore-*done?* or that the mother pausing to pray before she opens the letter from Alma or Balaclava, does not know that already he is saved for whom she prays, or already lies festering in his shroud? The whole confidence and glory of prayer is in its appeal to a Father who knows our necessities before we ask, who knows our

* Of course this statement is merely a generalization of many made in the preceding lectures, the tenor of which any readers acquainted with my recent writings may easily conceive.

thoughts before they rise in our hearts, and whose decrees, as unalterable in the eternal future as in the eternal past, yet in the close verity of visible fact, bend, like reeds, before the fore-ordained and faithful prayers of his children.

Of Elijah's contest on Carmel with that sun-power in which, literally you again now are seeking your life, you know the story, however little you believe it. But of his contest with the death-power on the hill of Samaria, you read less frequently, and more doubtfully.

"Oh, thou Man of God, the King hath said, Come down. And Elijah answered and said, If I be a man of God, let fire come down from Heaven, and consume thee and thy fifty."

How monstrous, how revolting, cries your modern religionist, that a prophet of the Lord should invoke death on fifty men! And he sits himself, enjoying his muffin and *Times*, and contentedly allows the slaughter of fifty thousand men, so it be in the interests of England, and of his own stock on exchange.

But note Elijah's message. "Because thou hast sent to inquire of Baalzebub the god of Ekron, therefore thou shall not go down from the bed on which thou art gone up, but shalt surely die."

"Because thou hast sent to inquire:" he had not sent to *pray* to the God of Ekron, only to *ask* of him. The priests of Baal *prayed* to Baal, but Ahaziah only *questions* the fly-god.

He does not pray, "Let me recover," but he asks, "*Shall* I recover of this disease?"

The scientific mind again, you perceive, — sanitary investigation; by oracle of the God of death. Whatever can be produced of disease, by flies, by aphides, by lice, by communication of corruption, shall not we moderns also wisely inquire, and so recover of our diseases?

All which may, for aught I know, be well; and when I hear of the vine disease or potato disease being stayed, will hope also that plague may be, or diphtheria, or aught else of human plague, by due sanitary measures.

In the mean time, I see that the common cleanliness of the earth and its water is despised, as if *it* were a plague; and after myself laboring for three years to purify and protect the source of the loveliest stream in the English midlands, the Wandle, I am finally beaten, because the road commissioners insist on carrying the road-washings into it, at its source. But that's nothing. Two years ago, I went, for the first time since early youth, to see Scott's country by the shores of Yarrow, Teviot, and Gala waters. I will read you once again, though you well remember it, his description of one of those pools which you are about sanitarily to draw off into your engine boilers, and then I will tell you what I saw myself in that sacred country.

> Oft in my mind such thoughts awake,
> By lone Saint Mary's silent lake;
> Thou know'st it well, — nor fen nor sedge,
> Pollute the pure lake's crystal edge;
> Abrupt and sheer, the mountains sink
> At once upon the level brink;
> And just a trace of silver sand
> Marks where the water meets the land.
> Far in the mirror, bright and blue,
> Each hill's huge outline you may view;
> Shaggy with heath, but lonely bare,
> Nor tree, nor bush, nor brake is there,
> Save where, of land, yon slender line
> Bears thwart the lake the scatter'd pine.
>
> . . . .
>
> And silence aids — though the steep hills
> Send to the lake a thousand rills;
> In summer tide, so soft they weep,
> The sound but lulls the ear asleep;
> Your horse's hoof-tread sounds too rude,
> So stilly is the solitude.
>
> Nought living meets the eye or ear,
> But well I ween the dead are near;
> For though, in feudal strife, a foe
> Hath lain Our Lady's chapel low,
> Yet still, beneath the hallow'd soil,
> The peasant rests him from his toil,
> And, dying, bids his bones be laid,
> Where erst his simple fathers pray'd.

What I saw myself, in that fair country, of which the sight remains with me, I will next tell you. I saw the Teviot oozing, not flowing, between its wooded banks, a mere sluggish injection, among the filthy stones, of poisonous pools of scum-covered ink; and in front of Jedburgh Abbey, where the foaming river used to dash round the sweet ruins as if the rod of Moses had freshly cleft the rock for it, bare and foul nakedness of its bed, the whole stream carried to work in the mills, the dry stones and crags of it festering unseemly in the evening sun, and the carcase of a sheep, brought down in the last flood, lying there in the midst of the children at their play, literal and ghastly symbol, in the sweetest pastoral country in the world, of the lost sheep of the house of Israel.

That is your symbol to-day, of the Lamb as it had been slain; and that the work of your prayerless science; the issues, these, of your enlightened teaching, and of all the toils and the deaths of the Covenanters on those barren hills, of the prophetic martyrs here in your

Digitized by CORNELL UNIVERSITY Original from CORNELL UNIVERSITY

crossing streets, and of the highest, sincerest, simplest patriot of Catholic England, Sir Thomas More, within the walls of England's central Tower. So is ended, with prayer for the bread of this life, also the hope of the life that is to come. Yet I will take leave to show you the light of that hope, as it shone on, and guided, the children of the ages of faith.

Of that legend of St. Ursula which I read to you so lately, you remember, I doubt not, that the one great meaning is the victory of her faith over all fears of death. It is the laying down of all the joy, of all the hope, nay of all the love, of this life, in the eager apprehension of the rejoicing and the love of eternity. What truth there was in such faith I dare not say that I know; but what manner of human souls it made, you may for yourselves *see*. Here are enough brought to you, of the thoughts of a believing people.* This maid in her purity is no fable; this is a Venetian maid, as she was seen in the earthly dawn, and breathed on by the breeze of her native sea. And here she is in her womanhood, in her courage and perfect peace, waiting for her death.

I have sent for this drawing for you, from Sheffield, where it is to stay, they needing it more than you. It is the best of all that my friend did with me at Venice, for St. George, and with St. George's help and St. Ursula's. It shows you only a piece of the great picture of the martyrdom — nearly all have fallen around the maid, and she kneels, with her two servant princesses, waiting for her own death. Faithful behind their mistress, they wait with her, — not feebler, but less raised in thought, as less conceiving their immortal destiny; the one, a gentle girl, conceiving not in her quiet heart any horror of death, bows her fair head towards the earth, almost with a smile; the other, fearful lest her faith should for an instant fail, bursts into passion of prayer through burning tears. St. Ursula kneels, as daily she knelt, before the altar, giving herself up to God forever.

And so you see her, here in the days of childhood, and here in her sacred youth, and here, in her perfect womanhood, and here, borne to her grave.

Such creatures as these *have* lived — do live yet, thank God, in the faith of Christ.

You hear it openly said that this, their faith, was a foolish dream. Do you choose to find out whether it was or not? You may if you will, but you can find it out in one way only.

Take the dilemma in perfect simplicity. Either Christianity is true or not. Let us suppose it first one, then the other, and see what follows.

Let it first be supposed untrue. Then rational investigation will in all probability discover that untruth; while, on the other hand, irrational submission to what we are told may lead us into any form of absurdity or insanity; and, as we read history, we shall find that this insanity has perverted, as in the Crusades, half the strength of Europe to its ruin, and been the source of manifold dissension and misery to society.

Start with the supposition that Christianity is untrue, much more, with the desire that it should be, and that is the conclusion at which you will certainly arrive.

But, on the other hand, let us suppose that it is, or may be, true. Then, in order to find out whether it is or not, we must attend to what it says of itself. And its first saying is an order to adopt a certain line of conduct. *Do* that first, and you shall know more. Its promise is of blessing and of teaching, more than tongue can utter, or mind conceive, if you choose to do this; and it refuses to teach or help you on any other terms than these.

You may think it strange that such a trial is required of you. Surely the evidences of our future state might have been granted on other terms — nay, a plain account might have been given, with all mystery explained away in the clearest language. *Then*, we should have believed at once!

Yes, but, as you see and hear, that, if it be our way, is not God's. He has chosen to grant knowledge of his truth to us on one condition and no other. If we refuse that condition, the rational evidence around us is all in proof of our death, and that proof is true, for God also tells us that in such refusal we shall die.

You see, therefore, that in either case, be Christianity true or false, death is demonstrably certain to us in refusing it. As philosophers, we can expect only death, and as unbelievers, we are condemned to it.

There is but one chance of life — in admitting so far the possibility of the Christian verity as to try it on its own terms. There is not the slightest possibility of finding out whether it be true or not, first.

"Show me a sign first and I will come," you say. "No," answers God. "Come first, then you shall see a sign."

* The references were to the series of drawings lately made, in Venice, for the Oxford and Sheffield schools, from the works of Carpaccio, by Mr. Fairfax Murray.

Hard, you think? You will find it is not so, on thinking more. For this, which you are commanded, is not a thing unreasonable in itself. So far from that, it is merely the wisest thing you could do for your own and for others' happiness, if there were no eternal truth to be discovered.

You are called simply to be the servant of Christ, and of other men for his sake; that is to say, to hold your life and all its faculties as a means of service to your fellows. All you have to do is to be sure it *is* the service you are doing them, and not the service you do yourself, which is uppermost in your minds.

Now you continually hear appeals to you made in a vague way, which you don't know how far you can follow. You shall not say that, to-day; I both can and will tell you what Christianity requires of you in simplest terms.

Read your Bible as you would any other book — with strictest criticism, frankly determining what you think beautiful, and what you think false or foolish. But be sure that you try accurately to understand it, and transfer its teaching to modern need by putting other names for those which have become superseded by time. For instance, in such a passage as that which follows and supports the "Lie not one to another" of Colossians iii.— "seeing that ye have put on the new man, which is renewed in knowledge after the spirit of him that created him, where" (meaning in that great creation where) "there is neither Greek nor Jew, circumcision nor uncircumcision, barbarian, Scythian, bond nor free." In applying that verse to the conduct and speech of modern policy, it falls nearly dead, because we suffer ourselves to remain under a vague impression — vague, but practically paralyzing, — that though it was very necessary to speak the truth in the countries of Scythians and Jews, there is no objection to any quantity of lying in managing the affairs of Christendom. But now merely substitute modern for ancient names, and see what a difference it will make in the force and appeal of the passage: "Lie not one to another, brethren, seeing that ye have put off the old man, with his deeds, and have put on the new man, which is renewed to knowledge," *εἰς ἐπίγνωσιν*, according to the knowledge of Him that created him, in that great creation where there is neither Englishman nor German, baptism nor want of baptism, Turk nor Russian, slave nor free, but Christ is all, and in all.

Read your Bible, then, making it the first morning business of your life to understand some piece of it clearly, and your daily business to obey of it all that you understand, beginning first with the most human and most dear obedience — to your father and mother. Doing all things as they would have you do, for the present: if they want you to be lawyers — be lawyers; if soldiers — soldiers; if to get on in the world — even to get money — do as they wish, and that cheerfully, after distinctly explaining to them in what points you wish otherwise. Theirs is for the present the voice of God to you.

But, at the same time, be quite clear about your own purpose, and the carrying out of that so far as under the conditions of your life you can. And any of you who are happy enough to have wise parents will find them contented in seeing you do as I now tell you.

First cultivate all your personal powers, not competitively, but patiently and usefully. You have no business to read in the long vacation. Come *here* to make scholars of yourselves, and go to the mountains or the sea to make men of yourselves. Give at least a month in each year to rough sailors' work and sea fishing. Don't lounge and flirt on the beach, but make yourselves good seamen. Then, on the mountains, go and help the shepherd at his work, the woodmen at theirs, and learn to know the hills by night and day. If you are staying in level country, learn to plough, and whatever else you can that is useful. Then here in Oxford, read to the utmost of your power, and practise singing, fencing, wrestling, and riding. No rifle practice, and no racing — boat or other. Leave the river quiet for the naturalist, the angler, and the weary student like me.

You may think all these matters of no consequence to your studies of art and divinity; and that I am merely crotchetty and absurd. Well, that is the way the devil deceives you. It is not the sins which we *feel* sinful, by which he catches us; but the apparently healthy ones, — those which nevertheless waste the time, harden the heart, concentrate the passions on mean objects, and prevent the course of gentle and fruitful thought.

Having thus cultivated, in the time of your studentship, your powers truly to the utmost, then, in your manhood, be resolved they shall be spent in the true service of men — not in being ministered unto, but in ministering. Begin with the simplest of all ministries — breaking of bread to the poor. Think first of that, not of your own pride, learning, comfort, prospects in life: nay, not now, once come to manhood, may even the obedience to parents check

your own conscience of what is your Master's work. "Whoso loveth father and mother more than me is not worthy of me." Take the perfectly simple words of the judgment, "Inasmuch as ye did it unto one of the least of these, ye did it unto me:" but you must *do* it, not preach it. And you must not be resolved that it shall be done only in a gentlemanly manner. Your pride must be laid down as your avarice, and your fear. Whether as fishermen on the sea, ploughmen on the earth, laborers at the forge, or merchants at the shop-counter, you must break and distribute bread to the poor, set down in companies — for that also is literally told you — upon the green grass, not crushed in heaps under the pavement of cities. Take Christ at his literal word, and, so sure as his word is true, he will be known of you in breaking of bread. Refuse that servant's duty because it is plain, — seek either to serve God, or know him, in any other way, your service will become mockery of him, and your knowledge darkness. Every day your virtues will be used by the evil spirits to conceal, or to make respectable, national crime; every day your felicities will become baits for the iniquity of others; your heroisms, wreckers' beacons, betraying them to destruction; and before your own deceived eyes and wandering hearts every false meteor of knowledge will flash, and every perishing pleasure glow, to lure you into the gulf of your grave.

But obey the word in its simplicity, in wholeness of purpose and with serenity of sacrifice, like this of the Venetian maid's, and truly you shall receive sevenfold into your bosom in this present life, as in the world to come life everlasting. All your knowledge will become to you clear and sure, all your footsteps safe; in the present brightness of domestic life you will foretaste the joy of Paradise, and to your children's children bequeath, not only noble fame, but endless virtue. "He shall give his angels charge over you to keep you in all your ways; and the peace of God, which passeth all understanding, shall keep your hearts and minds through Christ Jesus."

From The Spectator.

THE CRUELTY OF PECUNIARY CRIME.

We entirely agree, though not always for the same reasons, with the correspondents who so frequently denounce the lenity of the magistrates towards those found guilty of cruel crimes. The wife-beaters, the men who commit aggravated assaults almost equivalent to murders, and especially the criminals guilty of torture to children, are constantly let off with ludicrously inadequate sentences, sentences which in no degree help either to protect the feeble or to strengthen the conviction among the rougher classes that such offences are grave crimes. But we confess we are not equally in sympathy with a feeling which the same correspondents sometimes express, that crimes against property are punished far too severely. No doubt larcenies occasionally are so punished, and isolated cases of theft under strong temptation, but in the great majority of graver cases the magistrates, and especially the judges, are right in the severe sentences they inflict. There is, we are happy to say, an abhorrence of direct, brutal, physical cruelty growing up among us, which sometimes leads the enthusiastic to forget how terrible the effects of indirect cruelty may be, what tortures innocent persons may suffer from elaborate thefts, and how completely without moral excuse an educated thief, not pressed by hunger, must always be.

The regular lawyer's excuse for the severity of our laws against skilful forms of theft, such as embezzlement, forgery, and fraud, is well known, and is as far as it goes unanswerable. It is necessary to punish such crimes severely, because the motive which prompts them exists in almost all human beings, and the temptation to commit them is scattered all around. Speaking broadly, all men desire to get money. Nine-tenths of them, at least, would rather acquire it with a minimum of exertion. And a very large proportion of them, even though honest under the strong coercion of the law, or through the vigorous conscience which the law builds up, do not at heart care much whether they get it by fair or by unfair means. There are extraordinary shades of difference in the degree of unfairness to which men will consent — a swindler, for example, declining to rob his blind mother — but to some shade a vast number of very respectable persons would, as all experience shows, without the law descend. At the same time, the provocation to this crime is perpetual, so perpetual that special inducements would seem not to be needed at all. The murderer must have a cause for murdering, the brute must have a victim near, the ravisher needs opportunity, but the forger, or the swindler, or the cheat is always provoked and always ready. There is always property

to be obtained, and he is always wanting it. In the presence of a passion so general and so easily gratified, the law must be made strong, or society would go to pieces, one-half of it being tempted by impunity to prey perpetually upon the other. There would be perpetual social war, ending in a rapid destruction, not only of property, but of the desire to accumulate what it was so inordinately difficult to keep. Civilization would perish, as in some districts the practice of horticulture dies away, because exertion always ends when no tangible result of exertion can be obtained or preserved. This reason is unanswerable, and is always quoted by statesmen as sufficient answer to any plea for reducing the penalties on pecuniary crime, but it is not, as some writers of recent letters seem to fancy, the only justification for the laws. They forget or have never thought what a scoundrel an educated thief, whatever branch of thieving he pursues, must necessarily be. He, almost alone among criminals, must perform his crimes in cold blood. He must, whether he is forger, embezzler, or only cheat, plan his crime down to its smallest details, coolly, soberly, with deliberation and with all his faculties at their utmost stretch. A man cannot forge in a passion, or under terror, or when nearly blind with drink. He must carefully foresee the consequences of his act, must be careful to avoid all haste or passion, and must be utterly indifferent to any suffering he may inflict, however disproportionate to the gain to himself. The larger his operations the greater intellect they require, the more cool and composed must be his judgment, and the greater the amount of torment the innocent will suffer. The defaulting banker, the lawyer who bolts with his clients' money, the forger who ruins a firm, the embezzler who destroys a family, constantly inflicts as much suffering as the most violent of the brutes whom the magistrates, moved by some reasoning we have never been able to follow, so frequently let off with inadequate sentences. We abhor the brute who half murders his wife, but he is scarcely more cruel than the defaulter who deliberately does acts which send whole families previously decent and respectable to the workhouse or the asylum. We detest the brutal rough, but is he more brutal than the agent who quietly swindles an aged clergyman out of his all, and sends him to die, and his children to live as paupers upon public charity? We are all agreed to hang the murderer, but is he so much worse than the man — we have known the case — who for years deliberately eats up old servants' savings, and leaves them, in dozens at a time, to suicide, starvation, or the Union? There is not a criminal lawyer in the country who does not know of cases where swindlers have destroyed whole families, have wrecked the happiness of dozens of persons, and have inflicted sufferings which in their long duration are as much worse than physical pain as misgovernment is worse than war, merely that they themselves might lead lives a little easier than they otherwise would have done. A fraudulent banker, a swindling attorney, a successful forger, scatters misery broadcast, misery as acute as any ever inflicted by the rough who kicks his wife half dead, or beats a casual passer-by into a long and dangerous illness. Take the old Anglo-Indian graduate — we know of such a case — who after forty years of most honorable labor returns to England with a competence, to be swindled in the first month out of the whole by a rascally agent, and left for another quarter of a century a poverty-stricken pensioner on the charity of a friend. Which suffered most, he or the murderer's victim? Charles Reade, the novelist, has not in the least overstrained his grimly humorous catalogue of some of the minor consequences which followed the fall of Hardie's bank, a fall produced by the banker's habitual theft of his clients' securities for purposes of speculation: —

Mr. Esgar, a respectable merchant, had heavy engagements, to meet which his money lay at the old bank. Living at a distance, he did not hear the news till near dinner-time, and he had promised to take his daughters to a ball that night. He did so, left them there, went home, packed up their clothes and valuables, and next day levanted with them to America, taking all the money he could scrape together in London, and so he passed his ruin on to others. Esgar was one of those who wear their honesty long, but loose; it was his first disloyal act in business. "Dishonesty made me dishonest," was his excuse. *Valeat quantum.*

John Shaw, a steady footman, had saved and saved, from twenty-one years old to thirty-eight, for "footman's paradise," a public-house. He was now engaged to a comely barmaid, who sympathized with him therein, and he had just concluded a bargain for the "Rose and Crown" in the suburbs. Unluckily — for him — the money had not been paid over. The blow fell; he lost his all, — not his money only, but his wasted life. He could not be twenty-one again, so he hanged himself within forty-eight hours, and was buried by the parish, grumbling a little, pitying none.

James and Peter Gilpin, William Scott, and Joel Paton were poor fishermen, and Anglo-

Saxon heroes, — that's heroes with an eye to the main chance; they risked their lives at sea to save a ship and get salvage; failing there, they risked their lives all the same, like fine fellows as they were, to save the crew. They succeeded, but ruined their old boat. A subscription was raised, and prospered so, that a boat-builder built them a new one on tick, price eighty-five pounds; and the publicans said, "Drink, boys, drink, the subscription will cover all; it is up to 120 already." The subscription-money was swallowed with the rest, and the Anglo-Saxon heroes hauled to prison.

Took to the national vice, and went to the national dogs, Thomas Fisher, a saving tinman, and a bachelor: so I expect no pity for him.

To the same goal, by the same road, dragging their families, went the Rev. Henry Scudamore, a curate; Philip Hall, a linendraper; Neil Pratt, a shoemaker; Simon Harris, a greengrocer; and a few more; but the above were all prudent, laborious men, who took a friendly glass, but seldom exceeded, until Hardie's bankruptcy drove them to the devil of drink for comfort.

Turned professional thief, Joseph Locke, working locksmith, who had just saved money enough to buy a shop and good-will, and now lost it every penny.

Turned atheist, and burnt the family Bible before his weeping wife and terrified children and gaping servant-girl, Mr. Williams, a Sunday-school teacher, known hitherto only as a mild, respectable man, a teetotaller, and a good parent and husband. He did not take to drinking, but he did to cursing, and forebade his own flesh and blood ever to enter a church again. This man became an outcast, shunned by all.

Three elderly sisters, the Misses Lunley, well born and bred, lived together on their funds, which, small singly, united made a decent competence. Two of them had refused marriage in early life for fear the third should fall into less tender hands than theirs. For Miss Blanche Lunley was a cripple; disorder of the spine had robbed her of the power to walk or even stand upright, leaving her two active little hands, and a heart as nearly angelic as we are likely to see here on earth. [She died of pity for her sisters' fate.]

It is nonsense to say that a criminal of this kind does not foresee the consequences of his crimes. He knows what want of money means, for it is his dread of it which helps to indurate his own hard egotism. He knows his victim's affairs, for he could not otherwise rob him to advantage. And he foresees the suffering he must cause, or he would not take, as he constantly does, such elaborate precautions to avert or elude his victim's vengeance. Cruelty does not cease to be cruelty because it is of the callous instead of the violent sort, nor is a thief better than a brute, because the thief would as lief rob one man as another, while the brute has usually one special victim. "Rely on it," said an experienced judge to the writer, "the worst men, as men, who come before me, the most cruel, the most base, the most hopeless of improvement are the professional swindlers, the men who make such good defences, and look so neat and clean. They are worse than professional gamblers, who are more cruel than almost any other men." There might be something of the horror of base crimes, as distinguished from the horror for violent crimes, about the speaker, an old and consistent Tory; but he was right to a degree which it is not well that society, even out of a philanthropic motive and for a passing moment, should forget.

From The Spectator.

THE EMOTIONS DUE TO CHRISTMAS BILLS.

If the new doctrine of the rapid selection and sure inheritance of artificial emotions adapted to the peculiar circumstances of men's artificial life be true, we ought to be finding in our children, even in the youngest of them, a special susceptibility and irritability in relation to pecuniary obligation, engrafted on that pride of proprietorship with which they regard their Christmas gifts. If the setter puppy feels the impulse to set whenever that affection of his nerves which is due to the neighborhood of game is set up, even though he may be under no authority which is expecting and trying to confirm the operation of this tendency in him, why should we not see in our children, long before the time comes when they bend beneath the weight of housekeeping liabilities, and are oppressed by the accumulation of those yearly bills which their parents had ever believed in their souls, and proudly proclaimed with their lips, that they discharged punctually week by week, the tendency to shudder at the advent of those long blue lists of parental liabilities? Is it possible that the childish irritability which is usually ascribed to the cessation of the Christmas excitements, may really be due to the rudimentary consciousness of maturer responsibilities awakened by this onset of those ominous blue breakers, in which so many households' peace is wrecked? If this be not so, we suppose we must ascribe the absence of any tendency to the generation of this periodic

emotion, to the fact that new blood is constantly modifying the nervous system of class-organizations, and that the season which brings nothing but inadequately estimated obligations to one class, brings perhaps less inadequately estimated receipts to another. For of course, whenever a man whose ancestry have long been in the habit of suffering from the *melancholia Januariensis*,— that is, the despair and indignation with which they discover that after paying everything, as they supposed, weekly or quarterly, they have an innumerable number of exclusively yearly obligations also to discharge, — marries into the class which *reaps* its harvest at the time when his ancestors have been accustomed to be reaped rather than to reap, the chances are that the tendency to the formation of this specific emotion will be suddenly neutralized; and this perhaps suggests the true antidote for the dejection appropriate to the month now passing away. If we were but as capable as the positivists aspire to make us, of "altruistic" emotion, we should feel a specific joy whenever we pay a long bill, not merely in getting rid of the sense of obligation, but in regarding the feelings with which our creditor will pay in the cheque to his banker's, and contemplate the swelling of the credit account to which we have just contributed. And no doubt, if we could feel this as we ought, January would be a month of neutralized feeling on this head; the unpleasant surprise with which we discovered that we owed what we had quite forgotten, would be neutralized by the pleasurable surprise with which we discovered that we had to confer a pleasure of the opportunity of which we were ignorant; and the sense of discomfort with which we should contemplate the dwindling balance at our banker's, would be neutralized by the gratification with which we should think of the growth of our builders' or plumbers' credits at their bankers', and the satisfaction with which the chancellor of the exchequer would be watching the repletion of the treasury. To disinterestedness of this kind, however, few men can probably at present lay any claim, though the present writer does know a lady who was so shocked (sympathetically) at the smallness of one of her tradesmen's Christmas bills, that she bought something extra on purpose to swell the amount at the time she paid it. This, however, for most of us is a "counsel of perfection." And we suspect, therefore, that if the theory of the rapid growth of artificial emotions of this kind be well founded, the intermarriage between families to which January brings large credits, and families to which it brings great payments, must be the explanation of our failure to observe any specific January melancholy apart from the pressure of individual claims.

Perhaps some one may say that the explanation is much simpler, that there is no tendency to the growth of a specific emotion of melancholy due to Christmas bills, because even in the class which has to pay in January, without any special January receipts, so many are equal to the emergency, that no surprise and indignation of the kind we have described are felt. But if there be a man or woman who really does foresee all the claims which will arise in this way, and finds only what was foreseen, we feel sure that such a person is too good, or at all events, too exceptional, to live, and could not expect to transmit his or her virtues to descendants. Professor Huxley says that if he could be offered the choice of always going right and being properly wound up, on condition he should become a machine, he would embrace the offer at once, — but then if he did, of course he would be the consummation of the race. There would be no need for repeating copies of a perfectly regulated machine, one specimen of which is even better than a hundred, because it would take up less space in a museum; and a man who really finds his Christmas bills come up precisely to his expectations, must be a calculating machine, neither more nor less.

Probably the pessimists have no case so strong for their theory that life is an evil so gilded by illusions as to look like a good, even up to the very end of it, as the perennial illusion with which men always say to themselves that *this* Christmas at least there will be nothing more than the ordinary quarter's bills to meet, since such and such a heavy expense which in former years has fallen due at Christmas, has this year not been incurred, or has been defrayed at the time. So we say every year, and every year brings more or less its heavy crop of hardy annuals, in which the place of any deficient expense to which we had lovingly referred in anticipation, is sure to be supplied by two or three others, probably greatly exceeding it in weight. The same thing happens every year, and yet every year again the same illusion returns, only to be once more severely dissipated. Surely here, if anywhere, is an impression for which no experience can account, — since it is wholly contrary to

experience, — yet so deep-rooted as to make it certain that it must be in some way advantageous to those who are under its spell, in their conflict for existence. While, then, the pessimist can boast of this constant illusion as one of the great verifications of his teaching that nature so gilds all her pills as to make them seem grateful before they are swallowed, the stern moralist who says that truth must always be the best, and that illusion, as such, can only lead us astray, must be sorely puzzled by this strange provision of nature to brace us by airy and baseless hopes for the stern onset of the Christmas bills. Of course, such a one will say that if we had but known the truth in all its blackness, — if we had really foreseen the sum-total of all such bills as January, nay, even February, brings us, early in December, we should have been better provided for grappling with them, since we should not have cast away so much in preparation for Christmas. But nature knows better than these pedantic adherents of the advantages of realism. The truth is that what we call moral vitality seems to mean a certain over-supply and redundancy of motive for all we do, whether in restraint of action or in stimulating it. Thus we save because we are in a mild panic as to our expenditure; and we spend because we are under some curious illusion as to the scope of our economies or savings. If we were never either over-frightened or over-bold, we should too often put off acting altogether till it was too late, and so lose half the lights and shadows of life, — that is, lose so much living. When are we so niggardly, so stony-hearted towards charities, so blankly indisposed to contrive pleasures for our children or nephews and nieces as in the month which follows the great carnival of the shopkeepers? We suspect that some of the best saving of the whole year will always be found to occur in February and March, just on account of the despair with which January has filled our hearts. And a visible augmentation in the severities of this mood has certainly followed Mr. Lowe's inhumane legislation, which piled the payment of income-tax on the head of all the other Christmas bills in this mid-"winter of our discontent." Cunning philanthropists are now so well aware of this, that they would as soon apply for a fresh subscription or donation in the first month or two of the year, as they would call to ask a business man for assistance or advice just at the moment when he is opening his pile of worrying letters, and is at least as fierce over them as a wild beast is over his meat. Sir Isaac Newton used to try to explain the bright little optical phenomenon called "Newton's rings," by saying, if we remember rightly, that light had "easy fits of reflexion and transmission." That would be an admirable phrase to express the periodic feeling of the middle class with regard to its money, except that just about the winter solstice the fits are rather too violent to be "easy." That class has in the course of the ordinary year alternate fits of reflexion and transmission, but directly the rather spasmodic fit of transmission which marks mid-winter is passed, a fit of very deep and stern reflexion ensues, which is no "easier" than its immediate predecessor, and in the immediate results of that fit a good deal of the saving of the year is done.

And after all, as the severity of the frost gives a new beauty to the mild spring breezes which break it up, and turn all the rivers again into motion, who would care so much for the relaxation of economic principle which is discernible towards May, but for the contrast it presents to the stern rigidity of the previous months? We once heard a lady say it was no fun asking her husband for anything, because it was so easy to get it. She would value it more, if she knew what it was to fail in the matter. And that is the feeling of half the tradesmen, too. The first purchases into which they manage to seduce you after the Christmas bill is settled, are obviously to them the sweetest of all the year. It is not only that such purchases constitute the embryo of the new account, but that there is the consciousness of special tactics and strategy in the victory. They well know that their customers are making a great struggle to prolong the time of cancelled obligations in which the old account can be thought of as cleared off and no new one has yet been opened, and they are just as determined to shorten it as the customer is to lengthen it. Hence the sweetness of the unexpected victory. Call it illusion if you will, what would life be without the changes of light and shade which — if it be illusion — illusion makes? — the changes of mood which break its monotony and render us tolerable to ourselves, — the see-saw of interchanging obligations, — the overcharge of motive that makes both action and self-restraint alike a pleasure instead of an effort, — the mere mental exercise involved in a complete change of parts? After all, Christmas bills are not a pure evil, even to those who have to pay them.

LITTELL'S LIVING AGE.

Fifth Series, Volume XXI. | No. 1759.—March 2, 1878. | From Beginning, Vol. CXXXVI.

CONTENTS.

I. MARCH OF AN ENGLISH GENERATION THROUGH LIFE, ... *Quarterly Review*, ... 515
II. DOCTEUR LAVARDIN: A SKETCH, . . . *Macmillan's Magazine*, . . . 525
III. SHAKESPEARE IN FRANCE, ... *Nineteenth Century*, ... 533
IV. ERICA. Part XIII. Translated for THE LIVING AGE, from the German of . . *Frau von Ingersleben*, ... 546
V. FRENCH HOME LIFE. Religion, ... *Blackwood's Magazine*, . . . 559
VI. PLEASANT PEOPLE, ... *Saturday Review*, ... 570
VII. WALKING IN WINTER, ... *Pall Mall Gazette*, ... 573
VIII. ANTOINE CESAR BECQUEREL, ... *Nature*, ... 574

POETRY.

WANTED, A SECRETARY OF STATE, . 514
FIAT JUSTITIA, ... 514
"WHAT WE, WHEN FACE TO FACE WE SEE," 514

MISCELLANY, ... 576

PUBLISHED EVERY SATURDAY BY
LITTELL & GAY, BOSTON.

TERMS OF SUBSCRIPTION.

For EIGHT DOLLARS, *remitted directly to the Publishers*, the LIVING AGE will be punctually forwarded for a year, *free of postage*.

An extra copy of THE LIVING AGE is sent gratis to any one getting up a club of Five New Subscribers.

Remittances should be made by bank draft or check, or by post-office money-order, if possible. If neither of these can be procured, the money should be sent in a registered letter. All postmasters are obliged to register letters when requested to do so. Drafts, checks and money-orders should be made payable to the order of LITTELL & GAY.

Single Numbers of THE LIVING AGE, 18 cents.

WANTED, A SECRETARY OF STATE.

WANTED, a politician
To fill a vacant place
In an administration
Which has sunk into disgrace.
He must not be ambitious
To cherish a good name,
But love humiliation,
And be partial to ill-fame!

Let him not think that England
For others' freedom cares,
Or that the cause of justice
Is part of her affairs;
That whether suffering peoples
Shall bear us love or hate,
Is matter to be pondered
By ministers of state!

To prayers of down-trod Christians
He must listen with a sneer,
But to the Moslem story
Lend sympathizing ear,
And hold that for these evils
'Tis vain to seek a cure,
For Turks must slay and outrage,
That England may endure!

He must not halt or murmur,
Tho' dreading what may come
Of Asiatic schemings,
Which sound like muffled drum;
But let the world imagine
That it is his greatest joy
To be the tool of Judah,
And the lacquey of Alroy!

He must without a scruple
Lead his countrymen to think
That the abyss is distant,
Though they are on the brink;
Must practise double-dealing
To serve his chief's caprice,
And when they're plotting mischief,
Pretend they are for peace!

And lastly, no misgivings
Must cause him to resign,
Or own a higher master
Whose dictates are divine!
On ministers with morals
No statesman can rely,
So people who are pious
Had better not apply!

Spectator. L. F. AUSTIN.

WHAT we, when face to face we see
The Father of our souls, shall be,
John tells us, doth not yet appear;
Ah, did he tell what we are here!

A mind for thoughts to pass into,
A heart for loves to travel through,
Five senses to detect things near,—
Is this the whole that we are here?

Rules baffle instincts, instincts rules;
Wise men are bad, and good are fools;
Facts evil, wishes vain, appear,—
We cannot go, why are we here?

Oh, may we for assurance' sake
Some arbitrary judgment take,
And wilfully pronounce it clear,
For this or that 'tis we are here?

Or is it right, and will it do,
To pace the sad confusion through,
And say: It doth not yet appear
What we shall be, what we are here?

Ah, yet, when all is thought and said,
The heart still overrules the head;
Still what we hope we must believe,
And what is given us receive.

Must still believe, for still we hope
That in a world of larger scope,
What here is faithfully begun
Will be completed, not undone.

My child, we still must think, when we
That ampler life together see,
Some true result will yet appear
Of what we are together here.

A. H. CLOUGH.

FIAT JUSTITIA.

YES, all is ended now, for I have weighed thee—
Weighed the light love that has been held so dear—
Weighed word, and look, and smile that have betrayed thee,
The careless grace that was not worth a tear.

Holding these scales, I marvel at the anguish
For thing so slight that long my heart has torn—
For God's great sun the prisoner's eyes might languish,
Not for a torch by some chance passer borne.

I do not blame thee for thy heedless playing
On the strong chords whose answer was so full—
Do children care, through daisied meadows straying,
What hap befalls the blossoms that they pull?

Go on, gay trifler! Take thy childish pleasure—
On thee, for thee, may summer always shine—
Too stern were Justice should she seek to measure
Thy fitful love by the strong pain of mine.

LOUISE CHANDLER MOULTON.

From The Quarterly Review.

MARCH OF AN ENGLISH GENERATION THROUGH LIFE.*

THE annual report issued by the registrar-general of births, deaths, and marriages in England is one of the many works performed by official hands of which comparatively little account is taken. Yet the volume always contains much that is valuable, and often much that is really interesting. But the form in which it appears, the long tables of figures, the innumerable columns carefully headed with their separate subjects, the immense mass of details, all are sufficient to turn aside the mere casual reader. And yet it is in the fact of this immense mass of details, combined with their skilful, their scientific arrangement, that the interest of the volume lies. The rise, maintenance, and progression of each generation of our fellow-countrymen is chronicled here, or rather, as each generation is connected by countless links of living interest both with that which precedes it and that which treads on its heels, we can never single out in fact, as we fancy we can in imagination, any one generation from its fellows, and we have laid before us here the gradual development of the entire population. The volume contains, so far as many points of material welfare are concerned, a history of the maintenance and progress of the English nation. The countless incidents which affect the welfare of the people, the births, the marriages, the deaths, the illnesses, the migrations, the adversity, the prosperity, are all reflected in these pages; marked, not indeed in any startling story, or with any striking connection of incidents, but by the slow and regular aggregation of details; the whole forming a history almost perfect in itself, constructed on the principle of allowing the facts to state themselves, preserving them strictly, truthfully, and completely. Separated from each other, these facts would be valueless, and generally devoid of interest. Collected and compacted together, they preserve a record of what has occurred, of the higher value from the fact that it gives a most honest transcript of what has been. It may be compared to one of those strange preservations of the past which have been found in excavating the relics of Pompeii, where the ashes accompanying the outburst of the volcanic forces which destroyed that doomed city have formed a covering so complete for those who were overwhelmed in the catastrophe, that the shape of every limb of the sufferer, of every fold of the garment, has been retained. Modern investigation pours a liquid and plastic material into the mould thus created, and is startled by recovering the almost lifelike image of the once brilliant maiden or the stalwart soldier who succumbed, ages since, before the terrible storm which preserved their forms, as it fixed them, in death.

Almost as complete, almost as minute, is the record of the past preserved by the registration of facts collected by the care of the registrar-general. The chapter in the "Supplement to the Thirty-fifth Annual Report," which narrates the "March of an English Generation through Life," gives a picture, vivid by its lively representation, of the various illnesses and accidents which befall the average inhabitant of our island. It commences by singling out, in imagination, a million children from the moment of birth. Of these, some are born feeble, some are early attacked by disease, their frail and immature forms are surrounded by many perils; it will be found that more than a fourth part of the whole number, taking England all over, will have been removed by death before they reach the age of five years. Most of the survivors have been attacked by some sort of disease, or by more diseases than one. Yet increasing strength enables them to withstand better the onslaughts of illness, and less than a seventh part of the number of deaths recorded in the first period of

five years is enumerated in the second. The deaths between the ages of ten and fifteen are fewer than at any other time of life. It is as if the destroying angel looked compassionately, for a few moments, on the weakened numbers of that mighty host, from which he had already exacted so heavy a tribute. At the age from fifteen to twenty the mortality increases again, especially among women; as consumption and childbirth, for a greater proportional number of deaths occur among those who marry at a very early age — alas! that the fair brides wedded in the first sweet bloom of youth should have to suffer thus — make severe havoc in their ranks. At this age the more dangerous occupations of men over those of women begin to show their influence, and fully eight times as many men as women die violent deaths. The number of deaths from violent causes increases in the next five years — from twenty to twenty-five — while, during it, nearly half the mortality is from consumption. From this point onwards the progress of the career of the remainder is only chronicled by the registrar at intervals of ten years. In the period from twenty-five to thirty-five consumption is again the most fatal disease; most of those who die have already settled into their several avocations, and are fathers and husbands, mothers and wives. Hence the deaths which occur leave more sorrow and trouble behind them than those which takes place at an earlier age. Between thirty-five and forty-five the same conditions continue in the main. The new generation, which is in time to succeed the one whose fate has been the object of inquiry, has now been born. We must not, however, pause to contemplate their career, but must fix our attention on the further progress of the rapidly thinning ranks whose onward march we have been mentally accompanying. The deaths by consumption still predominate; but the strain of time on the structure of the body has also been great at this age, and many succumb to diseases of the principal organs. The violent deaths at this age continue at much the same quota as at the period when men first begin to enter active life. The period from forty-five to fifty-five is justly marked as being "*nel mezzo del cammin di nostra vita*," for the million which was surveyed in imagination at the outset has now dwindled down to half that number. The number of deaths at this age is considerably greater than in the preceding decade. Consumption is still very destructive, and diseases of the brain and diseases of the heart show, by the number of their victims, the effect of the continued strain of wear and tear. "To the age of fifty-five," of the million singled out in imagination, to quote from Dr. Farr, from whose remarks the foregoing observations have been condensed, "near the middle of the possible lifetime of humanity in its present state, 421,115 attain, and from this point of time it is possible to look ahead, and discover the particular rocks, foes, collisions, tempests to be encountered, to be dreaded, or to be weathered by the fleet on its way to the utmost butt of existence, and very seamark of its journey's end."

One thing to remark is, that the rate, the degree of danger, which has hitherto increased slowly, now increases at so much faster a pace that, although the number of lives grows less, the number of deaths increases in every one of the next twenty years, and is afterwards sustained for ten years longer, until at last, in the distance, all sink into the elements from which they came.

Of the one hundred women living of the age of fifty-five and upwards, it is worthy of note that eleven are spinsters, forty-three widows, and forty-six wives; of one hundred men nine are bachelors, twenty-four widowers, and sixty-seven husbands.*

To continue the chronicle. At the age of fifty-three the number of men and women surviving becomes equal; but from fifty-five and onward the women exceed the men in number. Between fifty-five and sixty-five the diseases of the lungs, heart, and brain are very fatal to life. Among the men violent deaths are about as common as at the earlier stages. But it is a sad thing to contemplate that sui-

cides are more numerous, the greater number of deaths from that cause, in proportion, occurring at this age. That the cares and troubles of life increase, while vigor and energy decline, probably accounts for this melancholy fact. Between sixty-five and seventy-five the deaths are more numerous than in the ten years previous. By this time the majority of the grandchildren of the generation under consideration have been born, sixty-seven being about the average age of grand-paternity. A second great landmark in the life of the generation is thus passed. The age of seventy-two is that when the greater number of *men* die. From seventy-five to eighty-five the influence of weather upon health becomes more marked. One would hardly expect to find that, on an average, out of every million born, 161,124 reach the age of seventy-five. But by eighty-five this number has dwindled to 38,565, of whom Dr. Farr calculates that only about two hundred and twenty reach the age of one hundred.

Interesting as this chronicle is, recalling as it does to the mind the beautiful story of "The Vision of Mirza," it is impossible to read it, any more than it is possible to read that charming allegory, without a feeling of melancholy. One cannot help reflecting on the regrets which must accompany each departure from life — the hopes unaccomplished, the vigor prematurely cut short, the families dispersed, the histories of pain and sorrow condensed into one brief line of the general statement. One cannot help thinking of the continuous and constantly recurring labors of the father of the family, the lifelong exertions, the struggles to make or to maintain his position; of the labors, less seen but none the less arduous, of the mother, holding the household together with the bond of affection which makes the "house" the "home."

Und füget zum Guten den Glanz und den
Schimmer,
Und ruhet nimmer.

It is well to turn from these pages to those which relate the beneficial influences of improvements in the sanitary arrangements in towns. Thus a notable increase of health in Salisbury, gradually but steadily improving during the course of thirty years; in towns circumstanced as differently from Salisbury as Macclesfield and Wisbech, a diminution; and again an increase of mortality in Hull in the same period, — show how possible it is to combat the necessarily injurious influences of overcrowding and unhealthy occupations, if only there is a resolute determination to do so.

A short but very instructive statement in the report chronicles the different influences which the fact of living in a healthy or an unhealthy district of the country has over the lives of the population. It were natural to expect that in this vast metropolis, with its great density of population, its ceaseless wear and tear, with an atmosphere at all times heavily laden with smoke, with an uncertain and trying climate, life should not attain the length which may be expected in the calm quiet of a country home. But the metropolis is far from containing the least healthy portion of the population of England; the death-rates in the district in which Manchester is situated, and still more in the district of which Liverpool is the centre, are very considerably higher. The picture of "the march of an English generation through life," given in the preceding pages, would have presented very different and far sadder features had it been one which gave the experiences of an equal number of persons living in Manchester or Liverpool. Not only would fewer have reached maturity, but the deaths at almost every age would have been more numerous, and the comfort of those who did reach the higher ages would have been far more seriously interfered with by disease and suffering.

For it must be ever borne in mind that an excessive mortality at any age of life in a district means far more illness, far more distress, far more want, in that district than in those portions of the country which enjoy better health. The man in any rank of life, who is taken away early, probably leaves behind him those to whom his earnings, his assistance and his care, were most valuable. Had he lived longer he would have been able to provide more completely for his children, who have

either to be brought up in the workhouse among all the countless disadvantages of a pauper training, or if they struggle on at home, yet miss continually the help which a parent only can give.

Dr. Farr has an interesting chapter on the pecuniary value of life. A certain amount of expense has to be incurred in any class before a child can attain such an age and such strength that it can earn its own livelihood. It is very difficult to estimate what the expenses of even a careful man who passes through the ordinary university career must have been before he is able to earn anything for himself. Among the lower ranks the problem is simpler, though the facts and the general course of events have, making due allowance for difference in station, a considerable similarity.

> The value of any class of lives is determined by valuing first at birth, or at any age, the cost of future maintenance; and then the value of the future earnings. Thus proceeding, I found the value of a Norfolk agricultural laborer to be 246*l*. at the age of twenty-five; the child is by this method worth only 5*l*. at birth, 56*l*. at the age of five; 117*l*. at the age of ten; the youth 192*l*. at the age of fifteen; the young man 234*l*. at the age of twenty; the man 246*l*. at the age of twenty-five, 241*l*. at the age of thirty, when the value goes on declining to 136*l*. at the age of fifty-five: and only 1*l*. at the age of seventy; the cost of maintenance afterwards exceeding the earnings, the value becomes negative; at eighty the value of the cost of maintenance exeeeds the value of the earnings by 41*l*. (Supplement to the Thirty-fifth Annual Report of the Registrar-General, p. xlii.)

A computation of this kind places the value of a population before us in a new light. We see how great the vigor of the productive activity of the inhabitants of these islands must have been which has enabled the British empire to make such vast strides in material wealth during the last forty years, while parting with so many of the youngest and ablest of the community to colonize other lands, and to carry to them that wealth which their labor would otherwise have been worth to the mother country. This branch of the subject, the pecuniary value of life, naturally leads Dr. Farr to consider the health of men engaged in various occupations. In doing this, Dr. Farr has done full justice to the memory of Bernardo Ramazzini, who first collected, towards the latter half of the seventeenth century, a series of careful observations on the diseases of men engaged in different modes of work in the city of Modena; and different as life on the northern slope of the Apennines is from life in England at the present day, yet the classification made by Ramazzini was so complete, that it has been of great service to modern investigators into the same subject.

To commence with those occupations by means of which food and refreshments are distributed to the rest of the community, it is curious to notice, and contrary, we believe, to the ordinary opinion, that the mortality among butchers is greater than the average rate. This is the case whether the butchers carry on their trade in London or the country. Though butchers out of London enjoy healthier lives than those in London, yet, at all but the earlier ages, whether in the country or in the metropolis, the butcher is a less healthy man than his compeers. At the earlier ages, from fifteen to twenty-five, the health of butchers, both in London and in the country, is better than that of the rest of the population of the same ages. This appears to show that butchers are selected lives; that is to say, that young, strong, active, and naturally healthy men, pass into this class of occupation by a kind of natural selection, but that as life goes on, and their original vigor declines, the deleterious influences of their calling gradually affect their health. Fishmongers are not more healthy than butchers. But bakers, though this might not have been expected, do not appear to be more unhealthy than the average of their fellow-citizens, except that as they grow older their occupation appears to tell on them. For the class of publicans we shall prefer to quote Dr. Farr's own words.

> The numerous, useful, and as a body respectable men who supply the community with drinks, food, and entertainment in inns, are shown to suffer more from fatal diseases than the members of almost any other known class. They might themselves institute a strict enquiry into its causes. But there can be little doubt that the deaths will be found due to delirium tremens and the many diseases induced or aggravated by excessive drinking. It seems to be well established that drinking small doses of alcoholic liquors, not only spirits, the most fatal of all the poisons, but wine and beer at frequent intervals without food, is invariably prejudicial. When this is carried on from morning till late hours in the night few stomachs — few brains — can stand it. The habit of indulgence is a slow suicide. The many deaths of publicans appear to prove this. Other trades indulge in the publicans' practice to some extent, and to that extent share the same fate. The dangerous trades

are made doubly dangerous by excesses. (Supplement to the Thirty-fifth Report of the Registrar-General, p. iv.)

The clergy generally, whether of the Established Church, whether Dissenting ministers or Roman Catholic priests, have, on an average, good health. It is otherwise with the medical profession. The classes which minister to the health of the body have far less healthy lives than the clergy, and up to the age of forty-five experience a mortality much above the average. The hard struggles of life, anxiety as to success, contact with disease, disturbed rest, are among the causes which appear to lead to this result. Chemists and druggists also are less healthy than the average. So also are commercial clerks, mercers, and drapers. Those engaged in the service of railways likewise experience a high rate of mortality. Coachmakers are a fairly healthy class. Wheelwrights, carpenters, joiners, sawyers, and those who work in wood, have lives healthier than the average of men. The influence of the occupation on health is clearly shown in the case of the blacksmith, who, carrying on his occupation under much the same circumstances as the wheelwright, not necessarily in the towns, but scattered among the villages and hamlets of the country, is nevertheless not so healthy a man as the wheelwright. The health of carvers and of gilders is, on the average, now better than it used to be. But Dr. Farr observes that both the carver and gilder and the plumber and glazier require more protection against the metallic poisons, to the influence of which they are exposed in their several callings. How much may be done by care in these matters is shown in the following sentence : —

The wool, silk, cotton manufacturing population no longer experience an exceptionally high mortality. Lord Shaftesbury and his enlightened colleagues must be gratified, if not entirely satisfied, with the success that has crowned their lifelong labors. And it is creditable to the mill-owners to find the men and boys in their employ suffering less than many other people in towns. (Supplement to the Thirty-fifth Annual Report of the Registrar-General, p. lvi.)

What has been done for the operatives in these branches of manufactures still remains to be done for those who work up the goods which are the produce of their toil. Tailors and shoemakers still need much to be done for their health. Tailors especially are less healthy than the average, and the health of those employed in the earthenware manufacture especially appears to suffer from their occupation.

At the age of joining it is low ; but the mortality after the age of thirty-five approaches double the average ; it is excessively high ; it exceeds the mortality of publicans. What can be done to save the men dying so fast in the potteries, and engaged in one of our most useful manufactures ? (Supplement to the Thirty-fifth Report of the Registrar-General, p. lvii.)

Mining is also an unhealthy occupation. Some classes of mining are more dangerous than others ; but, in the aggregate, miners' lives wear out more rapidly than metal-workers', and both classes are far less healthy than the agricultural laborer. Outdoor occupations, in which there is not an excessive exposure to the vicissitudes of the weather, are beyond doubt the healthiest which a man can undertake. Farmers and agricultural laborers are at the present time among the healthiest classes in the community. For some reason which is not exactly understood, the young farmer appears to have a less healthy life than the laborer of the same age. But, from the age of thirty-five and upwards, the farmer is the healthier of the two. It is to be hoped that an improvement in the condition of the agricultural laborer may be accompanied by an improvement in his health. The health of the largest class of workers in the community is of vast importance to the well-being of the State.

After reviewing the chances of life among the different classes of the community, Dr. Farr proceeds to consider how great a part of the sufferings which they endure is due to preventible causes. Much may be, and has been, done by the law to promote health, by removing or diminishing the causes from which diseases spring. First among these come the two elements of water and air. Legislation has done much to improve the condition of the laborers in factories and mills, but Dr. Farr insists that much more may be still done to secure a removal of dangerous dusts from flour-mills, cotton-mills, and shops. Vegetable dusts, such as those which are produced in a flour-mill, are injurious to life, but they are much less hurtful than mineral dusts. Still there is every reason to think that their removal would be an advantage to the health of those at present exposed to their influence ; but it is probable that it is rather from scientific and mechanical improvements than from legislative ac-

tion that amelioration in their condition is likely to proceed.

Dr. Farr calls to mind, in speaking of this subject, the Chinese saying which regards the wants of the population as so many "mouths to be satisfied." And when we reflect on the millions who inhabit these islands, on their many and varied wants, on the fact that so large a proportion of their food has annually to be imported, and from great distances, it certainly appears a marvellous thing that all the necessities of so many persons can be supplied. The population contains men in work and men out of work, the extremes of life, the infant and those in extreme old age, the sick, the infirm, the incapable; and it speaks a great deal in favor not only of the charity of neighbors, often but little better off than those they assist, but of the manner in which the poor-relief of the country is administered, that so few people die of want annually among us. "The deaths now ascribed in all England directly to privation are at the rate of three every fortnight — seventy-seven annually." The fact that of these the majority are men, shows that the resolution not to apply for parochial relief is at the bottom of the deaths of many of these sufferers. Otherwise it is obvious that the feebler sex, those who at the best of times are able to earn less, whose powers are more rapidly exhausted, and who form considerably more than half the old folks of the country, would, if unassisted by extraneous relief, die from want in the greater numbers of the two. "Without the institution of poor-relief — imperfect it may be, but still admirable and English — deaths from starvation would, amidst all the chances of life, badness of seasons, the fluctuations of trade, amount to thousands a year." *

The deaths from want and privation touch the heart deeply, and it is only right they should. When one compares the boundless affluence of some members of the community, possessors of wealth sufficient to gratify every fancy, every inclination, every wish of its owner, with the abject want of those unable to procure even the bare necessaries needed to sustain life in the roughest and humblest manner, it seems incredible that any persons should be allowed to die of sheer want in this wealthy land; and doubtless if the necessities of the sufferers had but been known they would have been supplied. But the dulling effects of poverty, added to a reluctance to parade distress, in some cases account for the fact that no application has been made for assistance. And it is as well to turn to the other side of the picture. Those whose death is ascribed by the registrar-general to excess in food greatly exceed in number those who die from want. And this number shows a far larger proportion. "Though their numbers are fewer, the deaths of the wealthy and their servants ascribed to gout greatly exceed the deaths of the poor from starvation. The deaths by gout are nearly six weekly, two hundred and ninety-nine annually." Dr. Farr does not ascribe all these deaths to actual excesses in food, but to untoward combinations. There may be some hereditary predisposition besides actual excess in food and drink. And yet these deaths are but a small part of those which are properly to be ascribed to excess. If there are, as there must be, many more than those who actually succumb from hunger, whose lives have been shortened and rendered unhealthy by privation, on the other hand those whose constitutions have been sapped, and whose deaths have been accelerated by excesses, must be many more indeed than those registered as due to gout. Could an accurate statement be drawn up of all the illness, all the misery which is caused by excess, the suffering caused by it would greatly exceed that induced in this country by want alone.

The relations which exist between the rate of increase of the population and the rate of mortality deserve careful attention. It is possible in some degree to influence for better or for worse the rate of mortality among the population, and it is certainly one of the most remarkable instances of the controlling force of man over the powers of nature to find that by legislative enactments, and by scientific adaptation of means to the desired ends, it lies within his power to influence, not only the happiness, but the length of life of his fellow-creatures. The birth-rate is under control likewise, but not of the same description. "A flow of prosperity in the country is immediately followed and marked by the launch of a whole fleet of marriages. The ruin of an industry or the depression of a trade implies a stagnation of marriages. There are thousands of couples always on the look-out, ready to embark as the prospects brighten." And the numbers of marriages, and the consequent numbers of births, influence the death-rate in more ways than one.

If the various districts of England are arranged in order, from those in which the death-rate is least to those in which it is greatest, it is found that the mortality increases with a very constant regularity in proportion to the density of the population. Hence as the numbers thicken, the demand on those numbers also increase. Every additional birth is met by an additional death. The birth-rate has, under any but very unhealthy circumstances, slightly the advantage over the death-rate; but in those districts which are very densely peopled, the increase of the population goes on slowly when it becomes closely aggregated. The population may even under these circumstances tend to diminish. In Liverpool the population would not be kept up in numbers, far less would it increase, if it were not for continual immigration, which supplies fresh blood to fill the gaps made by the unhealthy circumstances which prevail in that town. Such districts are rare in England; but there are a good many instances in which the rate of increase among the population has declined as that population has increased in density. This forms a curious commentary on the balace between advance and retrogression which accompanies the apparent prosperity of a district. The stability of the rate of increase is thus promoted by the fact that the augmentation of numbers brings with it a diminution in the rate of progress.

The improvements which have been made of recent years in official registration have been of service also in other ways than in tracing the progress of disease. Considerable light is also thrown on the condition of the body politic by their means. Thus the remarkable fact that emigrants have returned to this country in such great numbers of recent years, has been traced out clearly by the care which has been bestowed on registration. There is no country in Europe probably in which emigration, and immigration also, have so great an effect on the condition of the people as in England. Emigration plays a great part in influencing the demand for labor, and the number of those who have returned to this country, especially from America, shows how severe the recent crisis in that country must have been, and also that notwithstanding the dense crowding of the population here, and the intensity of the struggle for life, yet the greater wealth, resulting in the more abundant appliances for production in this country, goes a long way to make up for the more abundant natural advantages of other lands.

Other curious points connected with the social condition of the people are recorded in the report. It appears that during the last thirty years woman have been married in England on an average at younger ages than they used to be — that is to say, women are married now at earlier ages than their mothers and probably their grandmothers were. At the present time not much short of a quarter of the brides in England are married under the age of twenty-one. This, beyond doubt, shows a considerable improvement in the condition of the people. And it is satisfactory to find that, while the birth-rate has continued at much the same average, the number of children born in wedlock has progressively increased.

The mortality of unmarried men continues above the average. This may be ascribed in part to the want of the comforts of home; but it is also probably due to the fact that it is rather the weakly men who do not marry. The proportion of those who have signed the marriage registers in writing has greatly increased of late years. And the increase among those who are able to write their own names has been considerably greater among the women than among the men. Thirty or five-and-thirty years ago, though education was generally very backward, it was undoubtedly more backward among the girls than among the boys in England. There are still fewer women able to write their names on their marriage day than men. But the spread of education throughout the country will rapidly show itself in this direction. It appears that marriages by banns rather than by licenses are considerably on the increase in England. Beyond doubt the arrangements for marriages by banns give facilities for clandestine marriages in large towns. The number of names read out, the want of clearness in the reader, render it difficult to trace a name among the multitude. The registrar-general observes in his report for this year that "the banns of ninety-nine couples have been published in the Church of St. Pancras, of one hundred and twenty-five couples in St. Mary's, Lambeth, of two hundred and two couples in the Cathedral Church of Manchester on one Sunday; in many cases the names being merely mentioned, unaccompanied with any announcement of condition, whether bachelor, widow, etc., and in many cases no searching inquiry having been made as

Digitized by CORNELL UNIVERSITY
Original from CORNELL UNIVERSITY

to previous actual residence in the parish, or as to consent of parents in case of minors. Nor is the banns-book accessible and open to the public." The registrar-general very naturally compares this state of matters with the care taken to prevent illegal marriages by the registrars. Instances, no doubt, take place in which these safeguards are broken through; and the following extract from the report is suggestive of the necessity of more stringent regulations being established:—

With respect to marriages by license in the Established Church, no interval, during which inquiry may be made by parents or guardians or relatives, is necessary between the application for the granting of a license and the solemnization of the marriage; a clergyman holding the office of surrogate, after administering to one of the parties to be married the oath that there is no legal impediment, may grant a license for a marriage in his own church, which he may himself in a few minutes be called upon to celebrate.

Some years ago two persons called at a church in London at 10.30 A.M. requiring to be married immediately, but producing no license; they were told at the church that by going to Doctors' Commons they might obtain a license and be married that morning. They went accordingly, returned with the license, and were married before twelve o'clock that same day. (Thirty-eighth Annual Report of the Registrar-General, p. xvi.)

It is worth remark that in 1875 the mortality throughout the country was high—while the birth-rate was low. The temperature of the year was exceedingly variable. Though the winter generally was very severe, yet it was broken by periods of warmer weather. These sudden alternations of temperature proved fatal to many persons, especially to those who were beyond the prime of life, while very young children also suffered from these influences in a similar manner. These vicissitudes of temperature appear to have influenced health all over the country, and they show the manner in which the forces of nature will exert their sway, notwithstanding all that man can do to shield himself from their power. Yet, as has been related, much has been done, and much more may be done. The registrar-general's report for 1877 mentions, among other matters, the way in which a watch can be, and has been, kept over some of those districts in which the mortality of the population has been shown to be above the average. Eighteen districts were selected in this manner. They were chosen because the annual rate of mortality was shown to have been higher in them for the ten years, from 1861 to 1870, than in the previous ten years. And special inquiries were made in these districts as to the reasons why the health of the population had retrograded in them. The report states, with regard to these inquiries: "For most of the particulars relating to the hygienic conditions of these eighteen districts, I am indebted to the courtesy of the respective medical officers of health of the urban and rural sanitary areas which are situated in these registration districts.* Now, investigations of this description are very important things. If the health of any district has suffered through the incomplete character of the sanitary works within it, through the fact that these works have been tardily or imperfectly carried on, or are insufficient to keep up with the increase of the population, the results of the inquiry should be made public in very distinct manner. The health of any population is most closely bound up with its well-being. And it is a very important thing for a place to know whether or not its population is more or less healthy than other populations similarly situated in other parts of the country; and further, whether, if it is less healthy, this fact proceeds from causes which are, or are not, preventible. Information of this description would stimulate the exertions of the local officers of health, and would stimulate, too, the local authorities who are charged with carrying out sanitary works in the exercise of their duties.

While feeling that the registrar-general has only been performing his duty in requiring the medical officers, in those districts throughout the provinces in which the mortality has been for a considerable time above the average, to supply him with a statement of the causes likely to affect the public health within their boundaries, it is worth noticing, that matters requiring, but not receiving, attention at least as close, occur continually in London itself. When we say requiring, but not receiving, attention, we do not in the least mean to infer that these matters fail to receive the attention of the registrar-general himself, but that all that lies in his power to do is to report on them. The power of action does not lie, with regard to such subjects, in his hands, and consequently when he has reported he has done all that is in his power to do. We refer at this point to the quality of the water supplied by the Metropolitan Water

Companies. An analysis of the water furnished by the different companies forms part of the regular reports of the registrar-general. This analysis is based on a chemical examination conducted at the present time by Professor Frankland of the Royal College of Chemistry. It is impossible to give here a complete description of the very careful statement which Professor Frankland periodically draws up, but space may be found for a few of the leading points in it. There are eight companies which supply London with water, but of these, the historic venture of Sir Hugh Myddelton, the "New River Company," and the more modern "East London Company," are considerably the largest and furnish between them not much less than the half of all the water which is used, and considerably more than half what is used in the great mass of London which lies north of the Thames. To show, if there is any need, that the complaints are not of recent standing, we will take the report of the condition of the water supplied in the year 1875. That report contains what may be aptly termed a historic statement of the quality of the water for the eight years previous. The following statement occurs in it:—

The water both of the Thames and Lea has again suffered marked deterioration during the past year, whilst that from deep wells in the chalk has slightly improved. Notwithstanding the application of partial remedies for sewage pollution at Banbury, Eton, and Windsor, and the greater care exercised by most of the companies in the storage and filtration of the water, the organic pollution contained in the Thames water delivered in London, though subject to fluctuations from the greater or less prevalence of floods, does not diminish.

Taking the mean proportion of organic impurity in the Thames water delivered in London in 1868 as 1000, I find that in subsequent years down to 1875 inclusive, the following proportions were present:—

Year.	Proportion of Organic Impurity present in Thames Water as delivered in London.
1868	1000
1869	1016
1870	795
1871	928
1872	1243
1873	917
1874	933
1875	1030

The maximum organic pollution in the water drawn from the Thames occurred in January, February, March, August, and November, when the river was in a very objectionable condition. Of the five companies drawing from this river the West Middlesex Company delivered the best, and the Lambeth Company the worst water.

The most serious pollution of the Lea occurred in the months of January, February, August, November, and December, but the worst water delivered by the New River Company during these months was much superior to that procured from the Thames.

Taking, as before, the mean proportion of organic impurity in the Thames water supplied to London in 1868 as one thousand, I find in that and subsequent years, down to 1875 inclusive, the following proportions in the Lea water delivered by the New River and East London Companies:—

Year.	Proportion of Organic Impurity present in Lea water as delivered in London.
1868	484
1869	618
1870	550
1871	604
1872	819
1873	693
1874	583
1875	751

The water of the Lea, therefore, appears to be progressively, though irregularly, deteriorating in quality, but it is still much superior to that of the Thames. (Annual Summary of Births, Deaths, and Causes of Death in London and other large Cities, 1875. Published by the authority of the Registrar-General, p. xxxv.)

The water supplied by the New River and East London Companies is, it will be observed, among the best in quality which is furnished to the inhabitants of London. The Kent Company, which derives its water from deep wells sunk in the chalk, supplies a class of water which is infinitely purer than that obtained either from the Thames or from the River Lea. As the report continues, "The water of the Thames and the Lea is, at its source, as free from pollution as the chalk-well water; but in its downward course the river water becomes largely contaminated by sewage and the washings of cultivated land, and especially so in winter." It might be possible, therefore, to obtain much purer water both from the Thames and Lea. It is beyond our province to follow here the efforts which have been made recently to prevent the contamination which these rivers receive. At the present time, things may be taken to continue in much the same state as that described in the report of Dr. Frankland; and the registrar-general's report remains a remarkable monument of the care which may be taken to preserve a record of what should be done, and of the want of care

which fails to supply any machinery for providing that what ought to be done should be done. The water-supply of London is indeed a subject which would have tested the energies of imperial Rome in her palmiest days of prosperity. A very ingenious and carefully thought out paper, by Mr. Edward Easton and Mr. F. J. Bramwell, read before the Economic Section of the British Association at their late meeting in Plymouth, proposed to cut the Gordian knot of the difficulty, by dividing the water-supply of London into two parts; one of water for the purposes of drinking and of extinguishing fires, to be delivered by a separate and new system of mains and pipes, on a system of continued high pressure; the other of water for washing and other purposes, to be supplied by the existing system. The reason for this division is based on the difficulty of obtaining a sufficient quantity of really pure water for both purposes. It is very doubtful whether this plan would answer in actual practice. We only refer to it as a proof of what is felt to be needed. In the mean time, however, while this scheme is being debated for the use of London, Manchester proposes to send to the Lake district for a supply equal in quality to that which Glasgow already enjoys, and which is drawn from Loch Katrine. These facts show how closely population in this island is already pressing on the means of life. They show the necessity of careful and well-considered legislative action to secure for the large masses of population throughout the country what they require, and of the undesirableness of considering the wants of each place by itself, without regard to the needs of the rest of the community. Meanwhile it is well to observe that the metropolis, notwithstanding all the great improvements recently made in it, is really, in such matters as the mode of dealing with the water-supply, among the most old-fashioned places in the kingdom. This is a natural consequence of its having been the first to attract and to employ arrangements which have remained unaltered and unimproved in London, while they have been carried to greater perfection elsewhere. While a continuous water-supply at a high pressure may be spoken of as general among the large towns of the north, and in other parts of England, London remains the only great example of supply on the intermittent system, with all the attendant disadvantages and inconveniences of cisterns. Great part of the difficulty in this case, as in most cases of the same kind, lies in the details, in the condition of the "fittings." Attention to detail, though distasteful to most minds, lies at the bottom of success in matters of this description. Without question the rearrangement of the existing system to admit of constant supply, would be attended with considerable expense, but there can be little doubt that an improvement in the water-supply would be followed by an improvement in the health of the population; and an improvement in health means — to put it on that ground alone — a great economy.

The report of the registrar-general calls attention to the curious fact, that the numbers of medical men in the country have not increased in proportion to the numbers of the population. The proportion of medical men to population has declined since 1851, when it was 9·7 to 10,000 persons living. In 1861 it was 8·3 to the same number, and in 1871 it was only 7·8. It would be interesting to trace to what this diminution in the number of medical men is due. It is certainly strange that, at a time when the population generally has increased greatly in wealth, and also in its consumption of luxuries, a growth in the number of those who have charge of its health should not have taken place.

The "Supplement to the Thirty-fifth Report of the Registrar-General," on which much of the foregoing statement has been based, contains a most carefully drawn up statistical account of the number of deaths from the prevalent diseases in each of the districts into which the country is divided for registration purposes, and which are more than six hundred in number. These facts are given thus for the ten years over which the inquiry extends. When one sees this enormous mass of detail, and considers the immense labor which must have been employed in its construction, one also has to feel of how much service it would be to the public health if, whenever such a statement is prepared, a copy of the return for each district were sent to the principal local authorities, together with a summary table giving the results for the whole of the country. It would thus be a very easy thing for those living in a particular district to ascertain whether their district were more healthy or less healthy than the average; and, where it differed for the worse from the average, it would be interesting to those living in each place to search out the cause, and, if possible, to guard against the recurrence of the disaster. Such subjects, which affect the welfare of all the inhabitants, would be discussed with great eagerness within the

boundaries of each district. And the interest in them is not confined to those living in each district alone. It is not without a deep meaning that "health, wealth, and happiness" are combined in the words of our time-honored liturgy. The health of a family is, as all know full well, closely combined with the happiness of a family. Whatever promotes health, in its broadest meaning, promotes happiness as well, and the nation is in this sense but an aggregate of families. What seems a slight improvement, or a slight deterioration, when carried on for a considerable length of time, produces a very important effect on the condition of the community. The higher civilization which our country has already attained is but a faint foreshadowing of what might be reached were all the hindrances to further progress rooted out or restrained. Dr. Farr has drawn a picture, with no uncertain or feeble hand, of the advance which has been shown to have been made within the short limits of the lifetime of one generation (so far as these matters can be ascertained by a careful system of registration), in health, and more than in health, in education and in morality. No doubt there are many points which cannot be ascertained by these means; but a proper use of them supplies a vast deal of information. It is only needful to allude to the deep feeling of regret which would have been expressed if contrary results had been noted down, to show the value of what has thus been ascertained. And from the results of the past the country may well take courage for the future.

From Macmillan's Magazine.

DOCTEUR LAVARDIN: A SKETCH.

I.

"Patitur qui vincit."

Docteur Lavardin had succeeded in his profession in a way that made more aspiring men envious, his success being due in a great measure to his want of any low ambition. The lamp in his room might be seen burning until the small hours, as he bent over his books and microscope, patiently and enthusiastically searching out the secrets of pathology. His contemporaries pitied him as a man of brilliant promise, stifling his chances by living the life of a hermit. One eminent Parisian doctor, a good deal his senior, took him to task in a kindly, patronizing way, and remarked that he would never get on unless he gave good dinners, and gathered around him a fashionable *clientèle*. "When I was your age, I was apparently as successful as I am now, though I had then to think a good deal more about my creditors than my patients; but the game was worth the candles — nothing succeeds like success; behold me now, physician in ordinary to his Majesty the emperor, cross of the legion of honor, and received in all the best houses of the *beau monde* of Paris. You have the same chances, if you go the same way to work." Any one less self-satisfied than this counsellor would have observed the half-suppressed ironical curve on the lips of the younger man, as he gravely and shortly thanked the elder for his well-meant advice. Ten years later the emperor was not, and his physician in ordinary, having got into serious money difficulties, through his extravagant living, had borrowed largely from Dr. Lavardin, who had then attained a foremost place among the medical men in Paris by sheer hard work.

He had learnt to perfection the great professional art of listening, and treated every case that came before him, whether of gentle or simple, as the most important in hand. He rarely claimed sympathy from others; when he did sacrifice his natural reticence, it was more to place himself in closer communion with the suffering, than for any other reason. There were some who presupposed that beneath his simplicity and truthfulness there lay unfathomed regions of astuteness and worldly wisdom. It was not so, however, he had simply the wit to know how to play the card of truth with tact. In his dealings with sick men, he found it necessary to be abrupt, sometimes to harshness; in most cases cutting them off from a good many selfish pleasures, and frankly telling them that keeping to their work would answer as well, if not better, than a visit to Monaco, or a trip to Vienna. "As for me," declared a spoilt boy of forty, "I can do nothing unless I am in perfect health." "If all acted on that principle, I fear there would be little work accomplished in the world," the docteur had unfeelingly replied. Women, whom he influenced, looked and felt invigorated by his medical advice; those of them who expected him to order their lives according to their wishes always came away with their fees unaccepted, and in time these ladies drifted into the hands of more amenable practitioners.

The relation of such a human being to the world around him must always be full of peril. But the peril is infinitely increased when the protected character of the physician comes into play. It was not until he had reached middle life that Dr. Lavardin felt any danger to himself in his position. The young wife of one of his staunchest friends had come to him for help and comfort in her wretchedness. Her husband, M. d'Hauteville, and Dr. Lavardin had been at school together, and each had achieved a brilliant reputation. D'Hauteville especially had been in the habit of carrying all before him. Later on, success had become not only a habit, but a necessity to his nature. He lived on the excitement of it. During the final examinations, however, at the Ecole Polytéchnique, he could not keep step with Lavardin's steady pace; he became worried and discontented, and soon dropped from even his second place. Lavardin little cared for those competitive successes. He wanted to know things well, because he really cared for the knowledge, but not for the sake of out-distancing his friend. At last came the examination for the coveted mathematical prize — the race was between Lavardin and D'Hauteville. Lavardin knew the prize lay within his own grasp, but, to the surprise of every one, he did not send in his papers on the plea of ill-health, and to D'Hauteville the honors were awarded.

"You were ill on purpose," said D'Hauteville, but the other only laughed it off. "Take my word for it, you will never get on in life if you cede to others — if you let your heart take the place of your head."

"We will see," replied Lavardin, with quiet confidence. "You lay too much stress, D'Hauteville, on the prizes of life; remember there is always a price to be paid for them."

D'Hauteville was now an overworked rising *avocat;* his rich marriage was generally looked upon as one of his successes, yet he had not filled the wide blanks in his wife's passionate, purposeless existence. She had found that her union with him, instead of being the realization of all her young dreams, was but the abrupt awakening to a series of disillusions, to sterner responsibilities and duties, to additional perplexities and fears. She had no children to occupy and engross her, no method of life, no pressing necessity to live for others. Her husband, too busy to be with her much, and trusting in her innate goodness, left her free and unquestioned liberty, while he drowned his own heart's disappointments in the absorption of his daily labors — in his hard-won successes. But she had no absorbing work, and her health gave way.

"Go and consult Lavardin, he will put you right; he is the best friend I have," said her husband, hurrying away with his briefs, after bestowing a passing kiss on her pale, cold brow. So to the physician she went.

She was very lovely, very pathetic, very desolate; with a wide capacity for happiness, for loving, for living. Dr. Lavardin's heart was touched and thrilled. He would fain have dismissed the case, and so guarded his own inward peace. But he could not. He was at first severe, introduced philosophy, told her that happiness is not a thing to be claimed, but that life is both possible and bearable without it. He spoke of time as the great healer, the great modifier, and that we must have compassion one for another. But as visit followed visit, these truths seemed to heal her wound but slightly. Feeling he had been too harsh, he spoke again more gently, until she lifted up her eyes to him with a look he never forgot; then his breath came quick and short; he turned towards her passionately, advanced, checked himself, and wearily sat down in the furthest corner of the room. He occupied himself for a moment in writing, and as Madame d'Hauteville passed out, and the next patient came in, it would have been impossible to discover from his calm manner that he had passed through any inward conflict. *Patitur qui vincit.* Dr. Lavardin suffered, yet he was loyally true to his friend. He became more tolerant, however, to all strictly human and momentary weaknesses. As a young man he had been very hard against any lapse from his own high, untried standard. All young people are pitiless, until they learn through experience the truth of that wise saying, "*Tout comprendre c'est tout pardonner.*"

The next news that his patients heard of him was that he had quitted Paris and gone to Amiens, where the cholera was raging, and where doctors were needed. "What a quixotic fool the man is to throw away such a practice to get killed off by pestilence in the provinces. A capital first plunge for beginners, no doubt (to be killed off), but for a man like Lavardin!" So exclaimed the faculty, so mourned his *cliéntele.* It was not quixotism, however; doctors are human, though the fact seems sometimes to be forgotten; and no power would have induced Dr. Lavardin, in his calm senses, to remain in a position where

he had the slightest doubt of himself. No one was dependent upon him in Paris; his private practice, though very lucrative, was not what he cared for most. His heart was in hospital work, and he was eager to try new remedies for stamping out the prevailing epidemic. The cholera did not cut him off as his friends predicted, and he lived to experience in himself what he had taught to others, that life is both possible and bearable without any particular happiness. He got greyer, however, and settled more decidedly into a scientifically abstracted middle-aged man, and after the excitement of the cholera had subsided, he in a measure gave up general practice and lived a studious, though a benevolently useful life. The good people of Amiens were very grateful to him for his self-sacrificing devotion during their time of trial, and highly gratified that he was content to take up his abode among them. It showed how quickly appreciative he was of their high moral and intellectual standard, and the generally advanced opinions of the town. Dr. Lavardin became very popular in the *cercle*, though he neither played high nor gossipped, and was very often asked out to dinner, though he was not a professed talker, and had no self-assertion. Those who gave him the benefit of their ideas would remark in a delighted way, "*Il est vraiment fort spirituel;*" though the docteur had in all probability confined himself to expressions such as *bien possible*, *mais oui*, *mais non*, *cela s'entend précisément.* From his sympathetically genial manner he seemed but to refrain from carrying all before him, in order, benevolently, to give younger ones a chance. It was only Sidonie, his housekeeper, who knew how much of ease and energy, sweetness and strife, there was in his nature, and she loved, feared, and respected him for his self-control. The townsfolk thought it a mighty piece of good-luck his getting such a treasure; even M. le Curé had not a better cook, and at the same time it was considered a great chance for Sidonie being under such a master, *un homme comme il y en a peu.*

Sidonie's father had been a well-known manufacturer of the town; long failing health and unfortunate speculations had reduced him to a state of bankruptcy, and obliged his children to make their own way in the world. On the whole, his family had done well, walking uprightly along the straight high-road of life, every one of them except Sidonie (whose character was a mixture of pride and impulse); she had taken, alas! a wrong step on that hard, pitiless road. Her lover died, and for a time she felt all the bitterness of lonely poverty and all the anguish of a proud, dumb despair. Other ways of gaining a livelihood failing her, she succeeded at last in becoming a first-rate *cuisinière;* and as time went on it was she who superintended all the grand repasts served in the town, and recipes revised by her were considered of priceless value. She maintained herself and her child with reticent dignity and independence; indeed there were some people who quite resented this steadiness of behaviour, deeming it an irreconcilable inconsistency. It was only the more liberal-minded who recognized that she was no ordinary woman; in fact, with her reputed book-learning, and her grave, dignified manner, she passed as a rather awe-inspiring personage. When Dr. Lavardin first saw her, in a formidable high cap, completely hiding the shape of her head, and her heavy grey cloak, he gave a little inward laugh, almost misdoubting the rumors he had heard concerning her past life, doubting too whether this delicate-minded lady, with her deep-set eyes and tensely closed mouth, would exactly suit his situation, would unquestioningly obey his behests; for our docteur, though mild, was a mild despot. As Dr. Lavardin stood, with his plump, sunburnt hands crossed meditatively behind him, reading by slow but sure degrees the characters of her face, he startled her self-distrust by abruptly offering extravagantly high wages. Her pale cheeks flushed, but with more pain than pleasure.

"I am not worth that," she said; "I cannot take so much."

"I think differently," he answered; "those are my terms; I shall not change them."

She looked up in his face with wounded pride.

"You are doing it because you are benevolent; but I am not a subject for benevolence; I wish to stand alone, and take but what I rightly earn. I ask only for justice."

"And I consider I am barely doing you justice. Believe me, I am not acting under the impulse of benevolence, I am only giving way to my instinctive knowledge of character." This he said with diffident persuasiveness. "None of us have justice done us," he went on, dropping his eye-glasses and looking down at her smilingly, but with dimmed eyes; "we are always either overrated or underrated; for instance, you have underrated me, in considering me more generous than just."

Still she protested, still he insisted; she would have her way, he his. It was the first and last battle between them. Of course the stronger gained the victory, and to Sidonie there only remained the hope that, by her devotion to his interests, she might in some small degree repay her master's generosity. When the interview was over, and she had passed out of sight into outside darkness, the severe mouth relaxed, and as hot tears sprang into the impetuous eyes, she bowed her head, crying out as if in pain, "My boy, my boy!"

For this satisfactory arrangement with Dr. Lavardin necessitated a mother's separation from her child. What money, or what assured position could make up to her for her son's loving caresses? As she passed through the lamp-lit streets, her cloak in the sleeting rain clinging damply round her, more than one wayfarer paused, but passed gravely by, on observing the maternal solicitude imprinted on her face.

II.

"He cared not only for 'cases,' but for John and Elizabeth, especially Elizabeth."

MOTHERS recognized at once that Dr. Lavardin was too staid a subject for any matrimonial project, so were happy and at ease with him, and guilelessly expansive, making what use they could of him. Passing over their daughters, they enlarged to him about their difficulties with their sons. One or other of them would naively ask him to find some situation in Paris that would suit her eldest boy — a berth with good emolument, little work, advancing prospects: her son, she was sure, would make a good *attaché*, a rare diplomat, a wise leader of men, if only he had an opening. Dr. Lavardin, as he listened to this fond mother, looking over his spectacles with a serio-comic gleam in his eyes, would never fail to soothe her by gentle compliments, sometimes even unwittingly stroking the fair hand in a grandfatherly way. And however elderly or stout the lady might appear to other eyes, she was sure to have an agreeable consciousness that the docteur admired her, and in truth he did admire the maternal love that made her courageous to ask favors. He did what he could, for no woman ever appealed for help to him in vain.

He would tell the husband in his business-like way of a cashier's place, or a vacancy for a medical student. There were no flatteries in his speech to the man. "The duties are hard; but all work is hard." The father might think that it was very easy for him to talk thus, living in ease and comfort with Sidonie as housekeeper. Yet, after toiling all day, had not the evening of life set in for Dr. Lavardin? Why should he not enjoy complete and remorseless leisure? It was not by chance that he had gained his money and position, but by the sweat of his brow, rising with the dawn, and working far into the night. And now he was supposed to have lived his life, and was going to devote himself to the study of scientific subjects. So the Amiens folk glibly explained the situation. How very ready we all are to shelve our friends, while for ourselves — ourselves — how difficult to realize that we have in truth lived the best part of our lives — we expected so much, and we have? — what we have worked for. We reap? — what we have sown. But why should Dr. Lavardin ever admit or allow others to assert that the fulness of life was over for him? Surely, as long as the beating of his heart goes on evenly and strongly, existence with its mysteries and miracles, its passions, and pains, is still before him. What though he has gained a certain amount of philosophic calm — he can still feel the sunshine and the shadow, the blue sky still bends above him, the world surges around him. There is twilight and night, and the long lonely hours of dawn, when his heart feels desolate — ill at ease — longing for something which has not come to him, has not been attained — dead to scientific problems —

> Blank to Zoroaster on his terrace;
> Blind to Galileo on his turret.

So mused Dr. Lavardin as he wended his way to one of his lady patients, who had neither daughters to dispose of nor sons to settle in life. She was not, however, one of the women whom the docteur influenced, nor yet was she of those who retired from his consulting-room with their fees in their hands, for the very good reason that she never brought hers; she was one of those licensed ladies who "remember to forget" to bring their purses on special occasions.

En revanche, her welcome to Dr. Lavardin in her own house was of the sweetest and easiest. She was charming and amiable, wishing no one ill, except those of course who stood in her way, and all she did then was to push them gracefully but promptly aside. Though left a widow in comfortable circumstances, she, like many others, would have liked more money, could have easily disposed of it, on

herself as the jewel, and on her house as the setting of the jewel. As it was "she did her best," as she often told Dr. Lavardin with a plaintive sigh; and he, looking at her and her elaborate setting, sadly re-echoed that sigh. Once on his return from visiting the wretchedest part of the town, amid vice, fever, and death, he had been simple enough to preach her a little sermon — invigorating, impetuous, fervent; inveighing against the temptations of unshared riches — the banefulness of egoistic lives. As he talked he got white and tremulous, walked about the room, looking fiercely in earnest, his face luminous, searching. He stretched out his big brown hands as if to shake her out of herself. An answering movement, a glance of understanding, a checked utterance of impulsive sympathy, might at that moment have subdued and thrilled him, perhaps captivated him forever. But the widow was calculating, not listening — "His voice is too loud; he is too large for ordinary-sized rooms; I should hate to have scenes like this; I like repose and darkness, and it is simply *agaçant* his drawing up all the blinds." This she said to herself consolingly, feeling him drifting out of her reach — beyond her depth. "Decidedly he has passed his first youth," was her after deliberate comment, as she gracefully set herself to answer him, and to enlighten him with her own ideas of life and love, duty and friendship — her aspirations, her hopes, her fears, her sensations — herself (for she too could perorate on her own pet subject). But she had let slip her moment. It was not given her to interpret the expression of eyes intrenched behind their spectacles, nor the movement of lips covered by so thick a moustache.

Such were the little shocks that Dr. Lavardin received on his passage through life. Yet his faith in human nature did not die out; he still went on hoping and believing that "there's perfect goodness somewhere;" always attributing his disillusions to some want in himself. He still continued to visit the widow in her scented and softly cushioned boudoir, listening with a wonderful patience to her monologues, and prescribing mild *tisanes* against a too introspective and luxurious life. Perhaps he hoped in time to influence her — or was it that she was gradually converting him to darkness and repose?

Sidonie had a strong conviction that even the best of men are apt in the end to fall victims to a woman's persistent flatteries; and as the visits went on she trembled for the fate of her master; for what are poor mortals to do but accept, in default of better, something lower than the angels — accept the graceful acting of a feigned love in lieu of the unbecoming and benumbing diffidence of a deep reality. She was aware of this possible phase in men's lives, and in silence waited for what was to come. Being one of those who have felt the heavy clouds of suffering, she was quickly grateful for passing sunlit gleams, and therefore was not going to "forestall her date of grief;" but by fulfilling the claims of every day as it passed maintained her own inward peace. In accepting God's will, knowing that he was great and good, she prayed for the welfare of her master, believing him also to be great and good; and thankfully remembered how she had been sheltered and set on high from the world's rough ways, from women's hard looks, and from men's light words; she had basked securely in the sunshine, and she was not now going to complain because the clouds were again gathering around her.

Possessing still a rich mine of wealth in that maternal love which no one could take from her, she found courage and strength in watching the vigorous young life unfolding itself before her. In her boy's innocent prattle and broad, trustful smiles she drew her comfort, feeling she had her share of love. When the day's work was done her child would occasionally be brought to her, and in a little sanctum opening out of the kitchen the mother and son would have quiet play together in the dancing firelight. They were sitting thus beneath the shadow of the great clock-frame when Dr. Lavardin returned home from one of his visits to the widow sooner than was expected. She did not hear the door open, and was softly singing, —

> Dis, quel est l'amour véritable?
> Celui qui respire en autrui.
> Et, l'amour le plus indomptable?
> Celui qui fait le moins de bruit.

It was the same Sidonie. The only difference in her was that she had her child on her knee and had forgotten all household cares. Her cap had fallen off, and her usually tightly imprisoned hair fell in heavy masses on either side of the fine outline of a noble head. One of the boy's hands had fast hold of a twisted plait, while the other lay sleepily upon her bosom. Dr. Lavardin did not speak, but stood leaning against the doorway, watching, fearing to break the spell. He had seen women under many phases — under the influence of various conflicting passions —

radiant with the might of love — dimmed and shrunken with the strain and conflict of self-suppression — glorified with victories over temptations — repellent with the preoccupation of an intriguing mind. But never before had he beheld a face so transformed as was Sidonie's with a pure maternal love. All the severe outlines had disappeared, giving place to dimples and smiles, while the unconscious cooings made a happy rift in the austere line of her mouth. The child took it in gravely and as a matter of course: for when had his mother's eyes looked at him otherwise than softly, or when was her voice other to his ears than the sweetest of all music? Only he nestled closer in the infolding arms, and beat time with his fingers on the gently-heaving breast. But to Dr. Lavardin it did not come as a matter of course.

"You must always have your child with you, Sidonie," he said, speaking and drawing near, though he had meant to have kept silent and retired. "I ought to have thought of it before; but it is your fault; you spoil me and make me selfish. See how the little one has clasped my finger and will not let me go, recognizing a friend, though a tardy one. You know we have plenty of room for him. I make one condition, however, of his becoming a member of our household."

Sidonie looked up shyly perplexed, into a grandly beautiful face, into love-lit, compassionate eyes.

"Which is," he went on, in a mock voice of command, "that you never again wear a cap.

She bowed her head, and touched with trembling, fervent lips the hand held prisoner by her child.

III.

"All people have sometimes a season of mental desperation and aberration, when they do exactly what their friends would least expect."

It was the early, buoyant morning. The widow's casement was open, and in a loose, luxurious wrapper she was leaning out, resting her languid elbows on the window cushion. Beneath, in the busy street, amid odorous piles of fruits and flowers, bright costumes, and shrill voices, passed Sidonie on her way to market, her crown of glistening braids wound round her well-poised head, her dark, subdued face illumined with an intense inner light. She was in the crowd, but not of it. There was a new rhythm in her carriage, a stately cadence in her walk, that at once arrested the widow's attention, who after gazing intently down at her, suddenly closed the window, and with a sharp energy and dangerously sparkling eyes, began the mysteries of an elaborate toilet. It was not the toilet of a woman in dubious anxiety, with passionate pulses, intent on beautifying herself for the sake of him she loves, nor yet that of a gentle, guileless maiden, watching in the mirror the reflected curves of her white arms, as she lingeringly gathers up the glory of her tresses. It was rather the deliberate adornment of an experienced coquette, where there was neither innocence nor passion. The widow was not readily prepared to part with her newly acquired liberty, nor to withdraw the plausible veil that screened her self-indulgent life; she only felt the need of a more piquant interest in that life — a fresh proof that her powers of fascination were not on the wane. If she did not greatly care for Dr. Lavardin, she at any rate greatly cared that he should not go to another. As she put the finishing touch to her reddened lips and the delicate shadow beneath her eyes, she had worked herself up to a pitch of almost righteous indignation. To save Dr. Lavardin from his impending fate would be a deed of charity — an act of grace.

Before Sidonie had returned from market the widow was in the docteur's study.

"I am going the round of my friends, begging for this sad case of starvation," she said, in soft, persuasive accents.

The appeal had been drawn up that morning by herself — the work of her ready imagination — the quick inspiration of a moment. Though the case detailed was a purely fictitious one, she truly meant to give the money she received to the needy, and in after-confession to her priest would omit no tittle of the lies told for so good a cause, believing, as she did, that the end justifies the means.

Dr. Lavardin received her with open arms; he felt that morning as if he could take the whole world into his embraces. He did not sermonize; indeed was quite touched by this newly-awakened consideration for the poor, and felt remorsefully that he had perhaps done her injustice — had been too hard upon her with his sledge-hammer. Here she was, up and dressed betimes, looking almost lovely, and was bestirring herself for others. He himself had idled away the morning hours; Sidonie had not yet shown herself; all night he had dreamed fitfully of a mother and child — of a tangible happiness for himself — of sweet, flickering smiles on a chastened face. And now he was impa-

tient — expectant, feeling alternately joyous and irritable; and there was nothing and no one to wreak his passing spleen upon until she appeared — this lightly-glancing, softly-speaking fairy, scented and furbelowed.

After perusing her document he looked down at her searchingly, hesitated an instant, and then, as if ashamed of his hesitation, blushingly placed a bank-note upon the paper.

"Thanks, thanks," she exclaimed, drawing close to him, and placing her hand in his. "Do you know," she went on, in a broken, die-away whisper, "that they are talking of you and me in the town? They say you are going to marry at last."

The hand that inclosed hers burned; but before he could speak Sidonie came into the room with the morning letters.

"Adieu, then, and thanks for your contribution," concluded the fairy, disappearing amid soft undulations of drapery. "I need not have taken so much trouble nor have gone so far," she thought, as her careless glance fell upon the grave, colorless face of Sidonie, whose faint voice seemed to come from some difficult distance as she answered the other's complacent salutations.

After leaving Dr. Lavardin's house the widow's intention had been to go direct to the alley so graphically described by herself, and there have persuaded some one or other into the belief that they were starving. But the heat was excessive, the way was long and uncertain, and her breakfast waited for her at home; besides, her reception by Dr. Lavardin had been most flattering. What need for further trouble?

Sidonie had certainly paled under the other's glance, seeming no longer the same woman that had passed on her way rejoicing, illumined with the gladness of the morning; yet, in the might of her love, she felt strong. As she shut herself up in the kitchen, which looked in the garish daylight so bare and commonplace, she began at once her round of duties — the wholesome necessary daily work that makes life possible to so many crushed spirits. For a moment she held her breath as she heard Dr. Lavardin's step in the hall — a quick, eager footfall — but he did not come to her; he passed out by the front door. For a moment she gave a stifled sob, and then, arrested by a little echoing cry from the cot in the chimney-corner, she turned to meet her child's wide, wondering eyes; awakening from his dewy sleep, he was ready to take his cue from her for laughter or for tears. She smiled at him, and talked his childish language, while he answered in his piping treble. She would not take him up, however, till she had finished her work in hand; he must have patience, and she too. And when afterwards she bent to raise him, and felt his rosy lips pressing hers, and the eager little arms twined about her neck, she told herself she had been ungrateful for the wealth she already possessed.

Dr. Lavardin lost much time that day in the town, trying in vain to find the name of the starving people for the purpose of administering instant relief. On the other hand, he gained a good deal of interesting information about himself.

The widow had certainly been correct in her statement concerning the rumors afloat of his contemplated marriage.

"Yes, I certainly am thinking of taking unto myself a wife; *mais vous autres*, you seem to know more about it than I do myself."

This he said laughingly to his friends at the *cercle;* then he was about to hurry home, but was called back for a consultation, and did not regain his liberty till late in the evening. In his own house his study looked bright and inviting, but he passed on to the room beyond, paused for a moment on the threshold, and then entered.

Sidonie was sitting on the same low chair by the fire under the tall clock, but instead of her boy on her knee, she was deep in the study of Pascal's "*Pensées*." She had forgotten her cares and herself, and, like a child entranced with the newest story-book, she sat isolated and absorbed in the pages of the closely-printed volume.

"That is mine," said Dr. Lavardin, coming behind her, and taking the book gently out of her hands. He drew in a chair, and began reading it aloud. But his voice failed him. "I am tired," he said carelessly; "you go on with it." And he threw his head back into the shadow, and watched her while she read. Clearly and firmly, and with unhesitating distinctness, she began at once, her sweet soothing contralto forming a marked contrast to his uneven bass. He had been self-conscious, and had had truant thoughts, but her mind was dipped deep in the subject matter, and she was only conscious of obeying his behests. And so the reading went on, filling the room with reposeful harmony, until the lamp flickered, flared, and finally went out.

"Now we have only the firelight," said Dr. Lavardin, leaning forward, and again possessing himself of the volume and the hand that held it. "Sidonie," he went on, "I came home worn out and worried, and this hour has been so full of rest and refreshment. You have been much to me already — very much; will you not be more, and crown my life with blessedness by becoming my wife?"

She lifted her sorrowful face to his.

"I am not worthy to be your wife," she said, trying to withdraw her hand from his firm clasp; but he only held her closer.

"Listen!" he went on. "I have traced and learned by heart your life from the time you were left motherless, and with a father powerless to protect you — there have been headstrong impulses at work — much self-sacrifice — sorrow which purifies. What has been — has been." His voice broke, and he pressed her hand over his burning eyes. "Ah, would to God we had met earlier in life, when we could have helped one another."

"But it is too late now," she said, with mournful resignation.

"No, it is not," he replied, turning upon her suddenly, with a radiant countenance. "It is never too late. You have already attained that peace that comes only to the few who

> have learned to tread the narrow way,
> That leads through labor to the light of day.

Help me to find it; let us labor together. For I too have had experiences that might make me unworthy of your love; but we cannot judge one another by isolated acts; we must look to their whole lives — the standard they set before themselves even though they fail to attain it — the truth and sincerity of their motives, though circumstances and the world's harsh judgment may set against them like the relentless currents of a strong tide."

He did not press her for an answer, but they sat together through the darkening hours, hand clasped in hand, like wayworn travellers, who have at last reached a longed-for bourne of safety and repose.

Dr. Lavardin's parting words to his friends at the *cercle* caused quite a stir of excitement; the news spread like wildfire, with additions and emendations — "Impossible!" "Who is she?" "An old friend?" "No, the widow; I foresaw it long ago." "It is an arrangement." "On the contrary, it is entirely a love-match, with some one quite young, in fact a long attachment." "I don't believe there is a word of truth in it; Dr. Lavardin is only laughing in his sleeve at us — these Parisian fellows will say anything — *capable de tout*." And so there was confusion and discussion, every one professing to know the ins and outs of the case better than his neighbor. The news was a nine-days' wonder, and before the mystery was solved the two whom the gossip most concerned passed amid the clatter of tongues and sabots, and the clanging of many-toned bells, quietly and unnoticed on their way to church, there to be united in the bonds of holy matrimony.

When the travelling-carriage containing the newly-married pair had rolled out of town, the loungers shrugged their shoulders, and touching their foreheads, indicated significantly that "the season of mental aberration" had set in for the docteur; while the women in their *salons* began tardily to realize the fact that this clever, kind, good man had been veritably looking out for a wife all the time he was among them. What was the use of old maiden ladies with their powers of contracting matrimonial alliances if they thus let slip so good a *parti*, and what was the pleasure of hospitably entertaining influential priests if they did not look better after the interests of their flock?

"*Tranquillisez-vous, mes chères âmes*," gallantly replied one of these much-abused agents; "Sidonie was the only woman who would have suited our friend, and in marrying her he has shown himself neither so clever nor so subtle as we believed him; and as for his goodness! he seems to have trifled inexcusably with the widow's affections. The fact is," concluded this *débonnaire* prelate, "that he is not quite up to our Amiens standard."

The docteur little dreamed that while he was giving himself his first holiday in life, and, like a boy released from school, revelling in the delights of new scenes and cities, new languages and faces, that he was the subject of so much comment and speculation at Amiens.

In due time he returned with his wife to his own country, and settled once again in Paris. Many men — most very successful men — would have shrunk from the idea of coming back to the scene of their former triumphs, taking the risk of being forgotten — of being overlooked. But our docteur was very philosophic on such matters, and quietly returned to his old house, and to the same life, "but with such a mighty difference," as he gleefully remarked to Sidonie, who one day was shyly and anxiously questioning him if he did

not regret the former excitement of occupation.

"Your voice and the boy's voice are what I care for most in life, and after that to be supreme in the biggest hospital, and I have got my ambitions gratified, and am very happy; the world takes up a fashionable medical man at forty, and may whirl him along till fifty-five, if he can stand the strain, and then he is dropped as suddenly as he is taken up. Now I have dropped myself, and yet somehow I feel that I have risen. I am wedded to you, my Sidonie, and not to a fashionable *clientèle*. A great English poet has said that those 'who love in age think youth is happy because it has a life to fill with love.' You and I are not so young that we can afford to waste the time before beginning to 'fill our lives with love.'"

Gradually the old patients began to return, and the doctor had to limit the number of his new ones, in order to give himself time for his beloved hospital work. Among his friends came D'Hauteville, leaning on the arm of his wife. The brisk, hard energy about him had given place to a softened, touching languor. "I am shattered, Lavardin, somewhat shattered," he said, holding out friendly, though emaciated hands. "I want you to send us for our second honey-moon; our first, you know, was a signal failure — flashed in the pan, didn't it, dear?"

But his wife interrupted him. "I want you to do him as much good physically," she said, turning to the doctor, "as you once did me morally — you roused me out of my selfish lethargy, and from a spoilt child you have made a woman of me."

"And I have come to acknowledge to you, Lavardin, that the prizes of life are not worth striving for, if one sacrifices for them the welfare of those nearest and dearest to us; in our haste to be rich and to be foremost, we may sever the closest ties, and miss all restful happiness."

"Well," said Dr. Lavardin, looking over his spectacles, half comically, half solemnly, "my sentence of punishment to you both is — exile from Paris for the winter to the warm south, and after that" (turning to D'Hauteville) "resumption of your work in a modified degree. We all overwork at one time or another, and then we are apt to fly off at a tangent, and doom ourselves to the penalty of a lifelong holiday; in the same way we make mistakes and suffer from misconceptions, deeming them, in our low estate, irretrievable, everlasting, whereas these faults and failings in our lives perhaps help us to a wiser knowledge of ourselves, and to a more perfect sympathy with our fellow-beings."

MARY CROSS.

From The Nineteenth Century.

SHAKESPEARE IN FRANCE.

ON an April day, in 1616, a group of mourners stood round an open grave in the noble church at Stratford-on-Avon. Within that grave lay the crowned king of all dramatic literature — William Shakespeare. Notwithstanding that distinction, there seems to have been nothing in circumstance or ceremony to distinguish the occasion. They who there mourned the poet dead, were of those who had been best loved by the poet, living. He required no other following, he desired no nobler place of sepulture. To this day, the epitaph high above his head claims for him the right to sleep on there in peace, undisturbed. There lies the burden of fifty-two years of life. Not a long life, counted by days. But life is not to be counted by days, but by deeds. He lives the longest who achieves the most. "*Ego me metior non ætatis spatio sed gloriâ*," as Alexander says in the historical romance, "*De Rebus Gestis Alexandri Magni*," of Quintus Curtius Rufus.

Of the man and the poet who thus passed away, there has been some diversity of opinion. A few persons have affected to doubt whether Shakespeare ever lived at all. Others, allowing him his life, have denied him his works. Finally, some sceptical and critical judges, granting to Shakespeare both his life and his works, are inclined to believe that the works were not especially popular during the author's lifetime, nor altogether worthy of the quasi-idolatry rendered to the works and their author in our own. The truth is, that the greatness of Shakespeare was both asserted and disputed by his contemporaries. Side by side with the ill-natured spurt of Greene, we have the testimony of Meres, who, in 1596, speaks of Shakespeare as being "among the English, the most excellent in both kinds (comedy and tragedy) for the stage." Only two years later, Gabriel Harvey wrote these words: "The younger sort take much delight in Shakespeare's 'Venus and Adonis,' but his 'Lucrece' and his tragedy of 'Hamlet, Prince of Denmark,' have it in them to please the wiser sort." The same year furnishes a second competent witness, Barnefield, who confessed the charm of

Shakespeare's "honey-flowing vein," and who asserted that "Venus and Adonis" had placed the author's name in "Fame's immortal book." Marston, the third worthy witness, in the year 1598, states that there was "nought" then playing but the woful story of "poor Juliet and Romeo." We further learn that young lawyers were looking into Shakespeare's plays when they should have been studying Coke; and in "The Return from Parnassus" (1600), the author, after referring to plays from university pens, utters the joyous cry, "Why, here's our fellow Shakespeare puts them all down!" Davies of Hereford (1610) calls him "good Will" and "our English Terence." About the same period, an anonymous writer bore witness to the popularity of Shakespeare, in the words: "Believe this; when Shakespeare is gone, and his comedies out of sale, you will scramble for them, and set up a new English Inquisition." Those who would investigate the whole body of evidence as to Shakespeare's popularity in his lifetime and during subsequent years may consult Dr. Ingleby's "Shakespeare's Centurie of Prayse." On the strength of the scattered evidence there brought together, they will certainly agree with the verdict of good Charles Knight, that Shakespeare lived in the hearts of the people; it may be added, of the people of all conditions, from "the wiser sort," who valued him as a great dramatic writer, down to the ostler at the inn at Pie Corner, who had a literary taste, and boasted of possessing "Lucrece" and "Venus and Adonis" among his "pamphlets."

Since the day when Shakespeare was laid to his rest in Stratford Church, he has, through his works, put a girdle round about the earth. The nation that came last within the magic circle to render homage to the magician, was the nation that is geographically nearest to us. But, on this point, France is not without apology, or even justification. Let us consider what may be said in her behalf.

In the sixteenth century the muses gave more than one brilliant son to England. Shakespeare and Marlowe were born probably in the same year, 1564. Ten years later, Ben Jonson first saw the light, in Westminster, 1574. In two years more, Fletcher came into the world, 1576, joined (again at a distance of ten years) by his noble colleague, Beaumont, 1586, a year later than Massinger. Ford was born in the same year as Fletcher, 1576. Now, here are above half-a-dozen dramatic writers, contemporaries, the like of whom was not then to be seen in the world, nor has been seen together in England since. When he who was king among them all died in 1616, the muses were only just beginning to furnish tuneful dramatic sons to France. The seventeenth century was the era of glory, as far as the poetry of the drama is concerned, for that country. In the year in which Shakespeare passed away, there was a boy in the Jesuits' school, in his native city of Rouen, whose name was Pierre Corneille. He was then ten years of age. Very early indeed in life, accident made of him a dramatist. There was, in that same city of Rouen, a young man, Corneille's old schoolfellow, who was deeply in love with one of the youthful beauties of a city once famed for daughters so richly endowed. The lover introduced his friend to the lady, whose name was Milet; and very soon the lady showed more regard for the friend than for the lover. The consequent course of things took such a dramatic character that young Corneille shaped the incidents into a comedy, which he called "*Mélite*." It is not a very remarkable play; but it is one of those weak things which only a young fellow of genius is likely to produce. Corneille, however, left the lady in Rouen, "for good and all," and came up to Paris with the comedy in his pocket. "*Mélite*" is acted, in 1628, with such success that one company did not suffice to satisfy public curiosity. It was played every afternoon on two stages. Years after, Corneille said of it: "'*Mélite*' is not written, according to rule, because I was ignorant of any." He alluded to the Aristotelian rules of unity — of time, place, and action; and it is to be regretted that Corneille came to know and to accept them; to insist on their being observed, yet to be forever on the point of evading them. However, on the French stage at that period only one of the unities was observed — that of time. Every piece was required to be "within the four-and-twenty hours;" but "*Mélite*" broke into a second day!

Corneille was now a briefless barrister. He wrote comedies, by the produce of which he slenderly lived and generously maintained other members of his family. Richelieu had him for a while as one of his poetical secretaries; but as the secretary criticised when he ought to have polished his master's verses, he lost his place. He had written half-a-dozen comedies which are not much better than the cardinal could have written, and which few people even read now, before his tragedy of "*Médée*," in 1635, gave promise of a

Original from CORNELL UNIVERSITY

man. In the following year, when he produced the immortal tragedy — or rather tragic drama — "*Le Cid*," French play-goers acknowledged that in Corneille they had not merely got a man, but a *master* of his art. Shakespeare had been just twenty years dead, when this new foundation of the French stage was so solidly laid. "*Beau comme le Cid*" became a popular expression of comparison. Lines from the play became popular quotations. Small critics flung dirt at the author, and Cardinal Richelieu, who wanted to pass for the first dramatic poet in France, was powerful and paltry enough to induce the Académie to censure the "*Cid*" as immoral and irreligious!

The master had yet to ascend higher, and the steps by which he was led to the summit of dramatic glory were made in his three tragedies, "*Horace*," "*Cinna*," "*Polyeucte*." The last (and some think the grandest) was represented in the season 1639-40. Corneille then descended with the majesty of a great king; still glorious, but with diminished strength. This descent began with "*Pompée*," 1641, a tragedy, the hero of which, like the heroine Peace, in the drama of that name by Aristophanes, never opens his mouth. But Corneille mounted again by the production of his comedy of character, "*Le Menteur*," first acted in 1642. In the remaining years, he gave to the stage "*Théodore Vierge et Martyre*," "*Rodogune*" (the author's, but not the public's, especial favorite), "*Héraclius*," "*Andromède*," "*Don Sanche d'Aragon*," which was a great success till the great Condé sneered at it, and then, to be of the same way of thinking as so illustrious a personage, the public neglected, if they did not hiss it. In 1650, "*Nicomède*" proved that the author could scale the great heights when he chose; but the tragedy is a political essay, to be read and thought over, rather than to be listened to — except as a series of lessons on government. Corneille lived on till 1684, poor, neglected, and adored. The Academy grudgingly opened its doors to him — who, if he had not illustrated all sides of humanity, as Shakespeare had done, had so treated the heroic side as to stand worthily, on that account, near Shakespeare himself.

Corneille was, for a brief season, contemporary with Shakespeare; six years after whose death was born, in Paris (1622), that young Poquelin who assumed the name of Molière, and became the second of the three dramatic glories of France. Like Corneille, Molière was a pupil in a college of the Jesuits. When, after a strolling life, he settled in Paris, he brought with him most of the plays of which we now know him to be the author, but none of his masterpieces. Molière's career in the French capital extended from 1658 to 1673. In the two years, 1666 and 1667, he produced the two dramatic pieces which have, so to speak, made him immortal, namely, "*Le Misanthrope*" and "*Tartufe*." Had he been the author of the latter play only, his dramatic place would be at the head of all the writers of comedy in the world. At his death, in 1673, his satire had made itself so stingingly felt, that the Church refused to honor his body with funeral rites, and a *curé de Paris* amiably expressed his regret that the author of "*Tartufe*" had not been burnt alive, like John Huss!

Shakespeare had been dead three-and-twenty years, when Racine was born (1639) at La Ferté Milon, on the Ourcq. Seventeen years younger than Molière, the same year saw them both winners of the crown of dramatic glory. In 1667, the year of "*Tartufe*," Racine's "*Andromaque*" proved that he who had gracefully rhymed the "*Thébaïde*" and "*Alexandre le Grand*," had received the true inspiration, and that France possessed a successor to Corneille worthy of equal (perhaps of greater) honor. Racine more immediately challenged Corneille when he produced "*Mithridate*," and he somewhat boldly touched the shield of Molière with his comedy "*Les Plaideurs*." The public pronounced the comedy a failure till the Grand Monarque declared it to be a success, and France has accepted the criticism. As to the contest between Corneille and Racine, Mme. de Sévigné thought she was the interpreter of public opinion when she protested that neither Racine nor coffee would long be thought much of in France! This protest, however, has not been endorsed by the dramatic judges of that nation.

The above-named three great dramatic writers, who lived and died within the seventeenth century, were the real founders of the French stage and drama. They naturally won a homage from their countrymen which, quite as justly, continues to be paid to them. But to neither of the glorious three nor to their contemporaries was a name known — that of Shakespeare — which is now as familiar to the intellectual portion of France as those of Corneille, Molière, and Racine, and which is, for the most part, as greatly honored. On the other hand, the names and the works of the three great French dramatists were

familiar to playgoers and to the stage in London while those great dramatists yet lived.

Corneille's "*Cid*," slightly altered in the translation, was acted before Charles the First and Henrietta Maria in 1640, just before the English stage and monarchy were suppressed by the Puritans in power. The "*Cid*" was among the first plays that Charles the Second and his queen went to see acted in the public theatre after the Restoration. Pepys says it was delightful to read, but a dull thing to see acted. To the matchless Orinda's translation of Corneille's "*Horace*," played at court, the little Duke of Monmouth spoke the prologue. The play (the last act of which was translated by tuneful Denham) had a great run on the court stage. Another version, at Drury Lane, was set down by Pepys as "a silly tragedy." "*Polyeucte*" was translated for readers. Katherine Philips (Orinda) translated "*Pompée*" with such dramatic success that Lord Orrery in execrable verse, assured her that Corneille, "if he could read it" (to which he was certainly not equal), "would deem the copy greater than the original." Later came a new translation by four fine gentlemen, Buckhurst, Sedley, Godolphin, and Waller. This version was treated with critical sourness by Orinda; and Pepys, reading it as he was rowed from the Custom House to Deptford, declared that it was "a mean play, and the words and sense not extraordinary." On the other hand, the diarist, who saw an English version of Corneille's "*Héraclius*," at the Duke's Theatre, says that it was "an excellent play," and that he saw it to his great content. The English stage also took Corneille's "*Menteur*," which, under various forms, has come down to the present day, and is now made to live and amuse by the perfect acting of Mr. Charles Mathews. Dryden has judged the original. "The most favorable to it," he says, "would not put it in comparison with many of Fletcher's or Ben Jonson's." In 1677, five years before Corneille died, his name was first pronounced on the English stage in the epilogue to Dryden and Lee's version of "Œdipus," which they (and chiefly Lee) built up out of Seneca and Corneille. The subject was there said to be

A weight that bent e'en Seneca's strong muse,
And which Corneille's shoulders did refuse.

Bancroft's treatment of "Sertorius" pleased nobody, and Corneille's "Cinna," which was not put upon our stage till Queen Anne's reign was drawing to a close, failed to attract, though Cinna was acted by Barton Booth.

The next poet in order of birth, Molière, was the great resource of writers of plays in England who lacked invention, or who were too lazy to stir it to activity. The immortal Frenchman is distinguished for a certain refinement. He rarely offends by grossness. If he has to go over delicate ground, he glides gracefully and swiftly over the surface, leaving the subsoil undisturbed; but those who stole whole plays from him, or acts, or scenes, or incidents, were unable or disinclined to follow his example. They ploughed up the surface and plunged through the subsoil, and "struck the offended sense with double stink." Molière offered them the pure and pungent essence of comedy, and his translators, paraphrazers, and imitators presented to the dramatic nostrils of our nation only the nasty materials from which some essences derive their pungency. Except Congreve, who was original in his nastiness and brilliancy, scarcely an English comedy writer can be named from unclean Dryden to filthy Ravenscroft, who did not openly rob or covertly steal from Molière. What they touched they soiled, what they took they polluted.

One example will show with what prompt alacrity the plays of Molière were appropriated by our "adapters." "*Tartufe*" was in its first blush of popularity in France, when a translation of the comedy by the young actor, Medbourne, appeared in 1667. It was, however, not acted, till 1670, at the King's House, Drury Lane. The title-page of the printed English play had, indeed, a smack of impudence in it, for the play is described as "*Tartuffe, or the French Puritan* — written in French by Molière, and rendered into English, *with much addition and advantage*, by Mr. Medbourne, servant to his royal Highness" (the Duke of York). In the dedication, Medbourne says: "How successful it has proved in the action, the advantages made by the actors and the satisfaction received by so many audiences have sufficiently proclaimed." This year, 1670, was the year in which Dryden produced his "Conquest of Granada," in two parts.

On the English stage Lee's "Nero" gave some faint idea of Racine's "Britannicus." In 1677, Racine was represented by Lee's "Alexander the Great" at Drury Lane, and by Otway's "Titus and Berenice" at the theatre in Dorset Gardens. It may, however, be remarked that Racine

was not adequately represented on our stage till after his death. His "*Andromaque*," first acted in 1667, was translated and adapted by Phillips, and, under the title of "The Distressed Mother," was first played in England in 1712.

At this last date, nothing whatever seems to have been known of Shakespeare in France. The question arises: who first made our national poet known to the French people? Was it the great Englishman who visited France and lived at Blois? Or the great Frenchman who visited England and lodged in Maiden Lane? Was it Addison, or was it Voltaire? It was not Addison. He had no feeling of homage for Shakespeare. Bracketing the latter with Lee, it was Mr. Addison's opinion that "in these authors the affectation of greatness often hurts the perspicuity of style." It is doubtful if Addison admitted Shakespeare to an honorable place among dramatic poets at all. He certainly refused to rank Shakespeare among them, when Addison himself was in his salad days. In that young time he wrote "An Account of the Greatest English Poets," and he dedicated that rhymed catalogue to his friend Henry Sacheverel — better known later as the "Jacobite Parson." The poets named are "down from Chaucer's days to Dryden's time." Of Chaucer Addison said, "The age has rusted what the poet writ." Spenser could "charm an understanding age no more." Cowley is styled "great." Milton is nobly spoken of, yet with some touch of censure. Incense is flung to Waller and Roscommon, to Denham, Montague, and Dorset; but Dryden is supreme among these "greatest poets."

> Great Dryden next, whose tuneful muse affords
> The sweetest numbers and the finest words.

Shakespeare is left unnamed upon this singular roll-call of the sons of song! The last of the three great French playwrights, Racine, had just died when Addison, in 1699, repaired to France. The Englishman studied French at Blois, and there constructed, upon purely French lines, four acts of his tragedy, "Cato." On his return, through Paris, Addison introduced himself to Boileau, by presenting to him a copy of his "*Musæ Anglicanæ*." The homage was acknowledged by Boileau's assurance that he had no idea the English were half so civilized as that work proved them to be! Boileau then entertained Addison with an account of the theatrical factions whose allegiance was rendered by one side to Corneille, by the other to Racine, adding that he himself belonged to the latter party. Of this golden opportunity to speak of similar differences of opinion in England with respect to our own dramatists, Addison took no advantage. Yet, at that very time, while the many acknowledged no supremacy but Shakespeare's, there were two respectable minorities, one of which bowed the knee to Ben Jonson, and the other doffed their caps to Beaumont and Fletcher. It was therefore not to Addison that the French owed their first knowledge of Shakespeare. The general voice awards the merit to Voltaire; but the acclaim is ill-founded.

Before Voltaire, in 1728, was writing his letters in London, at the sign of the White Perruque, in Maiden Lane, two remarkable men might occasionally be seen looking into St. James's Park from a window of a house in Duke Street, Westminster. One of these men was the Abbé Dubois, on a diplomatic mission here; the other was his secretary, Nicolas Destouches. The secretary was also a dramatic writer, one or two of whose comedies were subsequently shaped for the British stage by sentimental Kelly and neatly-spoken Mrs. Inchbald. Destouches translated a few scenes of "The Tempest," but they were not addressed to the public, and there is reason to believe that even before Destouches a venturous French hand or two had tried its cunning on a scene or so of Shakespeare; but, to all intents and purposes, the French public were as ignorant of our national poet as if he had never existed. Voltaire, when back in France, praised him with no better motive than that of twitting his countrymen with their ignorance. When their admiration was aroused by passages to which he had referred, his jealous temper was alarmed, and he declared that such passages were pearls indeed, but the only pearls that were to be found by scraping on the English dunghill. To an admirer who suggested that, to judge from the samples, Shakespeare was pure human nature, Voltaire made a characteristically coarse remark, which may be euphemized into the assertion that pure, naked human nature nevertheless required to be covered by the tailor and the dressmaker.

Neither Addison, nor Destouches, nor Voltaire introduced Shakespeare to the French nation. The next name that seems to have right with it is that of the amiable and clever Ducis; but Ducis only held Shakespeare as it were by the hand, hesitating to introduce him, half afraid whether

the company would welcome or repel the noble stranger. Ducis was of the school of Voltaire, a school which insisted on a religious observance of the impossible unities. That was called Voltaire's system, but "Voltaire's system" was not the especial system of Voltaire. It was in force before France was France; before Gaul was Gaul. It was the rule to which the Greek founders of the tragic drama forced their genius to bow. It was a rule that became lost and was revived; but Italy and not France was the scene of the revival. It was Trissino at the court of Leo the Tenth who polished up, and clapped on the limbs of the modern tragic muse, the heavy fetters of the triple unities.

Let it be first observed that Voltaire, like Dryden, is inconsistent in his criticisms on Shakespeare, who, according to his French unwilling admirer and frantic hater, was a barbarian and a demigod; an inspired genius and a jack-pudding. When people showed some alacrity in accepting the more favorable judgment, Voltaire asserted the more roundly his defamatory views. He wrote "*Le Mort de César*" to show how Shakespeare should have treated that heroic subject. Of the English tragedy it is not necessary to speak. In Voltaire's there is no human nature. Patricians and plebeians use the same lofty language, and history is treated with the most airy indifference. Voltaire's delicacy would not allow him to slay Cæsar by the hand of Brutus, as Cæsar was probably Brutus's father! The murder is achieved behind the scenes by Cassius, who, the deed being done, rushes on the stage, dagger in hand, and delivers a speech to the insurgents, precisely in the style of a modern French patriot, addressing the citizens of Belleville, stirring their vanity by exaggerated flattery, and giving them wind-bag rhetoric for political advice and instruction. These are the words of Monsieur Cassius: —

Peuples! imitez-moi, vous n'avez plus de maître.
Nation de héros! vainqueurs de l'univers!
Vive la Liberté! ma main brise vos fers!
etc., etc.

It was the object of Ducis to unite the system of Voltaire with the subjects taken by Shakespeare, and thereby to win the admiration of the French people for Voltaire's "barbarian." It was the singular fortune of Ducis to succeed as long as he devoted himself to rendering his countrymen in some degree familiar with Shakespeare. His "*Amélise*" had been hissed before he startled the town with the announcement, in 1769, of his tragedy of "Hamlet," after Shakespeare. A description of this first attempt will afford an idea of the method adopted by Ducis in all.

Ducis retains of Shakespeare's personages only five; namely, Hamlet, Claudius, Polonius, Gertrude, and Ophelia. Of these, Polonius is converted into a soldierly confidant of Claudius, and Ophelia is Claudius's daughter. To these are added Norceste, a confidant of Hamlet, and Elvire, who fills the same office to Gertrude. In those days, all great dramatic individuals had their confidants. By informing each other of events known to both, they contrived to let the audience into the secret, lacking which knowledge, the play would have come to a standstill.

Claudius and Polonius have half of the first act between them. Gertrude and Claudius have the other half. During the whole five acts, the scene is an apartment in the royal castle of Elsinore. Claudius describes Hamlet as an unsociable, fierce, languishing, malicious creature, who must not be allowed to succeed to the vacant throne of Denmark. Claudius's friends are prepared to prevent the accession to the crown of a prince who is pictured as having passed the days of his youth in inglorious pursuits, as being tainted by something like madness, and whose highest ambition is to live peaceably, honoring his mother and the gods. Even if such a marrowless phantom were to inherit his father's crown, he could not wear it long, for the hand of death is upon him; and as, in case of his demise, Claudius would ascend the throne, as next heir, it seems expedient that Hamlet should be put out of the story at once. To bring about this conclusion all the sooner, the most odious calumnies against Hamlet have been industriously spread; and as air, earth, and water have been violently disturbed, as fiery portents have agitated the popular mind, and monsters have been seen by mortal eyes which lost their power as they gazed, the courtiers in the interest of Claudius lay it all to some wickedness on the part of young Hamlet, to murder whom would be a pleasure to the gods. Polonius is delighted with the process and its prospects, but, as he is leaving Claudius, on the approach of Gertrude, he delivers himself of the sage remark, that success, and success only, can justify the means taken for the end in view.

The two middle-aged murderers, Claudius

and Gertrude, are now together, and Ducis exhibits them in a rare love-scene! The former had murdered the king his brother, because that brother had ignored the services of Claudius to the state, and because Claudius himself was in love with his brother's wife, who reciprocates the feeling with candid alacrity; but she feigns some coyness at going with her fellow-assassin to the hymeneal altar. Claudius presses her like one of Florian's swains at the feet of his nymph, but she will not say him yea. He points out all the very loose parts in the dead king's character, but Gertrude literally "shuts him up" with the cry: "*Arrêtez! il était mon époux!*" indicating thereby, as well as by some ricketty arguments, that though his late Majesty was properly got rid of, it was a shabby thing to take away his character. She postpones the marriage till Hamlet has been crowned. Love, says the delicate lady, was the motive for their crime; and she suggests that they are bound to be sorry for, before they presume to profit by it. Claudius is dismissed with a rather uncivil "*Allez! que l'on me laisse!*" which he obeys in an abject-lover sort of way.

Then comes Elvire, the queen's confidante; but the former says but a few words, and the queen only expresses a desire to get at the secret of Hamlet's moodiness. Their dialogue is cut short because it was time for the act to come to an end. After an interval of five minutes, they renew the conversation on the same spot, and the course of it is a good illustration of French tragedy.

The confidante in most French tragedies is an inquisitive person, and it is necessary that she should be confidentially enlightened. Elvire seems, by her hints, to know everything; Gertrude, therefore, is frank enough to conceal nothing from her. Yes, she had murdered the king, but not in the Shakespearian style. The old king, her husband, was, she says, given to drinking! She

> Empruntait le secours de ces puissants breuvages
> Dont un art bienfaisant montra les avantages.

Of this abuse of a good thing the guilty pair took advantage. Claudius poisoned the royal bowl which Gertrude placed at the thirsty victim's elbow and left there. A short time after, repentance brought her back, but too late — her royal husband had quaffed, and he lay dead on his couch. She is humiliated at having to blush for such a deed, but Elvire treats it as an accident that *will* happen in high life, and Gertrude wishes she may die if she ever weds with her accomplice. A faint idea enters her mind that the gloomy waywardness of Hamlet has something to do with the event, and Norceste is commissioned to get at the bottom of it.

Norceste is a combination of Horatio, Rosencranz, and Guildenstern. Hamlet is brought in to be questioned. The canons of the French stage would not allow of a change of scene in sight of the spectator, so Mahomet comes to the mountain. Norceste is Hamlet's friend — this is the Horatio side of the character — and among the items of news he brings from England, his late residence, is, that the king thereof (he is discreetly left unnamed) has been poisoned in London by his queen, and that considerable political disturbance had ensued. Hamlet then remembers that his late father had revealed to him dreadful things in dreams — the whole truth in fact. Hamlet suggests that Norceste shall tell the story of the royal murder in England to his mother and uncle in Hamlet's presence; if they blanch he will be satisfied that dreams may be dreamed to good purpose, and he will slay Claudius. But, alas! Claudius is Ophelia's father, and if Hamlet slays the sire, the daughter might naturally decline to accept the murderer for her husband; indeed, as an affectionate daughter, she would not be expected to survive the slaying of her father. However this may be, Norceste is to narrate the regicidal act beyond seas; meanwhile Hamlet, remembering that his own father's ashes have been placed in a "vulgar urn," desires Norceste to fetch it from his monument, that he may startle the senses of guilty beholders by continually exhibiting it! Norceste accepts the double commission, and a catastrophe seems imminent, as it always should when the third act is coming on.

But here, where the interest of the audience should be immensely increased, their concern is rather relaxed than more closely knitted. In a mere gossiping group, Norceste tells the news of the murder of the English king, on which Claudius and Gertrude make most commonplace remarks. "He is not disturbed," says Norceste, *aside* to Hamlet. "No," replies the latter, "but look at my mother!" and I very well recollect that this "*Non! mais regarde ma mère*" was one of Talma's great points with which he brought down the house. The story fails to make them fly like guilty things, as the play does in Shakespeare's version; on the

contrary, it is Hamlet who retires rather precipitately with his friend; and Gertrude and Claudius, left alone, conclude, the former that Hamlet suspects something, the latter that he knows nothing; but both agree to walk warily, for, as Claudius remarks, "In order to be free from fear at all, we must ever bear in mind that everything may give cause for fear, and may conceal a peril." The only other scene in this act of any importance is the final one between Gertrude and Ophelia. The young lady announces that she has discovered the secret of Hamlet's melancholy and irritability — namely, that they, being mutally in love, see insurmountable obstacles to their union, which would be one of two cousins. But the queen recognizes in the marriage of her son with Claudius's daughter a way for having a comedy instead of a tragedy in Denmark; and the act concludes with a joyous exclamation with reference to charms, virtue, love, and kisses.

Hitherto Ducis has not approached the ground on which Shakespeare develops his story; but the fourth act opens with a soliloquy by Hamlet, which resembles the famous "To be or not to be," inasmuch as the following lines form part of it: —

Mourons! que craindre encore quand on a cessé d'être?
Peut-être! Ah! c'est ce mot qui glace épouvanté
L'homme au bord du cercueil par le doute arrêté.
Devant ce vaste abîme il se jette en arrière,
Ressaisit l'existence et s'attache à la terre.
Dans nos troubles pressants, qui peut nous avertir
Des secrets de ce monde où tout va s'engloutir?
Sans la foi qu'il inspire, et la terreur sacrée
Qui défend son passage et siége à son entrée,
Combien de malheureux iraient dans le tombeau,
De leurs longues douleurs déposer le fardeau!
Ah! que ce port souvent est vu d'un œil d'envie
Par le faible agité sur les flots de la vie!
Mais il craint dans ses maux, au-delà du trépas,
Des maux plus grands encore et qu'il ne connaît pas.
Redoutable avenir! tu glaces mon courage!
Va! laisse à ma douleur achever son ouvrage.

Now, it will probably occur to every one who will compare the two soliloquies on life and death that the French Hamlet feels the pain of mysterious uncertainty, but that Shakespeare's Hamlet gives to the feeling a poetic and sublime expression. It is the same with the interview between Hamlet and his mother at which Ophelia is present, and where the ghost of Hamlet's father is supposed once or twice to appear. The whole is Shakespeare without vigor or dignity, and when the scene closes with a blustering declaration by Hamlet to Claudius, who has come on the stage for the purpose of hearing it, that *he*, Hamlet, is king of Denmark, and will be controlled neither in his royal power nor in his human affections, he gains little respect for such vaporing. Claudius and Polonius resolve that Hamlet shall be controlled in both respects. Rebellion is decided upon, Hamlet is to be seized, with his ultimate fate marked out in Claudius's words that "a fallen king has no long space to live;" but nothing is to be made known to Ophelia, seeing that the lover would be more highly prized by her than the father.

Elle irait à l'amant sacrifier le père;

with which remark Claudius opens the rebellion and closes the fourth act.

Throughout the fifth act Hamlet is never off the stage. He enters, receiving from Norceste the urn containing his father's ashes, which is always in his arms or at his side. He holds it during a long interview with Ophelia, who, confessing all her love for Hamlet (and allowing for argument's sake that Claudius has murdered the late king), declares that she must stand by a parent, who, however criminal in the eyes of others, is innocent in her own; and she implores her lover to act towards her father as if he were guiltless, hinting that otherwise she can neither be his friend, his affianced mistress, or his wife. To this Hamlet replies with common sense and simplicity: —

Enfin, mon père est mort, il faut que je le venge.

. . . .

On remplace un ami, son épouse, une amante;
Mais un vertueux père est un bien précieux
Qu'on ne tient qu'une fois de la bonté des dieux.

Troth being broken, Ophelia departs to make way for the queen, at whose coming Hamlet expresses as much surprise as if it brought his father's ghost for the first time before him. But he goes to the point at once after his mother has asked him why he wears so stern and melancholy an air.

H. Ma mère!
G. Explique-toi.
H. Tremblez de m'approcher!
G. Qui? moi?

H. Ce n'est pas vous qui devez me chercher !
G. Que dis-tu ?
H. Savez-vous quel affreux sacrifice
Prescrit à mon devoir la céleste justice ?
G. Dieux !
H. Où mon père est-il ! d'où part la trahison ?
Qui forma le complot ? Qui versa le poison ?
G. Mon fils !
H. Vous avez cru qu'un éternel silence
Dans les nuits des tombeaux retiendrait la vengeance :
Elle est sortie !
G. Oh ciel !
H. J'ai vu . . .
G. Qui ?
H. Votre époux !
G. Qu'exige-t-il ?
H. Du sang !
G. Qui l'a fait périr ?
H. Vous !
G. Moi ! j'aurais pu commettre une action si noire ?
H. Démentez donc le ciel qui me force à le croire.
Son instant est venu.

Hamlet offers to credit his mother's assertion, if she will swear on the urn that she is guiltless. Gertrude places her hand upon it, mutters a weak *yes*, and, in an attempt to say more, faints. On her recovery, Hamlet too readily assures her that she and Heaven will be reconciled if she only feels remorse for the deed. Whereupon he is supposed to see the ghost, who dissents from the assurance, and Hamlet is about to fly rather than stab his mother, when he is stopped by a rush of his partisans as well as of those of Claudius, who is at the head of his friends, prepared to immolate Hamlet, and to put himself on the throne. A free fight ensues, in which Claudius is slain, and the true king, Hamlet, is triumphant. Gertrude, observing that a guilty victim was yet wanting, exclaims, with not scrupulous exactitude, "The monster counselled, I allowed, the crime," and then stabs herself. Hamlet expresses a hope that the sacrifice will win pardon for poisoning his father. Not a word is said about Ophelia; but Hamlet, looking round him, brings the curtain down with this "tag :" —

Privé de tous les miens dans ce palais funeste,
Mes malheurs sont comblés, mais ma vertu me reste.
Mais je suis homme et roi, réservé pour souffrir ;
Je saurais vivre encore ; je fais plus que mourir.

Ducis, in something of the spirit which led General Chassé to explain to the Duke of Wellington his method of defending Antwerp, and to express a hope of the duke's approval, wrote an apologetic letter to Garrick. It is characteristic of the writer's modesty and simplicity : —

I conceive, sir [he writes], that you must have thought me exceedingly rash in placing such a tragedy as "Hamlet" on the French stage. Not to speak of the barbarous irregularities (*irrégularités sauvages*) with which it abounds — the spectre in full armor and long speeches, the strolling actors, the fencing bout — all these appeared to me to be matters utterly inadmissible on the French stage. Nevertheless, I deeply regretted being unable to bring upon it that awful ghost who exposes crime and demands revenge. I was therefore obliged, in a certain sense, to create a new play. I simply tried to make an interesting part of a parricidal queen ; and, above all, to paint in the pure and melancholy soul of Hamlet a model of filial tenderness. I looked upon myself, while composing this character, as a religious artist who is working at an altar-piece.

The second attempt made by Ducis to unite the action of Shakespeare with the diction and method of Voltaire, occurred in 1772, when he gave to the stage "Romeo and Juliet." In his preface to the play, he makes the singular mistake of supposing that his countrymen were as well acquainted with Shakespeare as he was himself.

Je crois inutile de m'étendre ici sur les obligations que j'ai à Shakespeare et à Danté. Les poètes anglais et italiens nous sont trop connus pour qu'on ne sache pas ce que je dois à ces deux grands hommes.

There were probably not a dozen persons in the audience who could have read a line of Shakespeare in English ; and the proto-translator of Shakespeare's plays had not yet appeared. The French "Romeo and Juliet" has nothing in common with Shakespeare except the names. The two immortal lovers created by Shakespeare are commonplace creatures in the play by Ducis. The French Romeo adresses Juliet (who, you remember, was in the very grace and flower of girlhood, as Shakespeare saw her) with "Madame ?" and the lady replies with "Seigneur !" And if they get a little honestly impassioned, like flesh-and-blood lovers with hearts in their bosoms, they suddenly relapse into civility, which any stranger might witness without mistaking it for love-making. The story of the French drama shows no respect in the concoctor of it for the Shakespearian model. In it we come at once upon the discovery that a certain victori-

ous soldier named Dolvedo, who has lived in the house of old Capulet since his childhood, a sort of foundling adopted out of charity, is really a son of that house's enemy, old Montagu, that the young soldier's real name is Romeo, and that, since he had down upon his chin, he had been making love to Juliet. The family discord is tremendous; some malapert blood is spilt; and Juliet resists the paternal command to marry Paris, till she hears that the command is based on reasons of state, and that Romeo has slain her brother Théobaldo. The wavering on the part of Juliet is, however, only for a moment. She was born a Montagu, she declares, since her heart loved a son of that house. To this rather weak logic her sire does not yield. Indeed both sires are obstinate and unreasonable; and Juliet, at the end of the third act, foreshadows all that is to follow, by exclaiming to Romeo, "*Va! nous mourrons ensemble, ou je vivrai pour toi!*" It need hardly be said that as the respective fathers are obdurate, and marriage not to be thought of under the circumstances, the lovers commit suicide. For this Ducis humbly apologizes, on the ground that the moral of his piece had less to do with love than with the perils of hereditary hatred.

> Sans doute, il est dangereux de donner au théâtre l'exemple de suicide; mais j'avais à peindre les effets de haine héréditaire, et c'est sur cet objet seulement que j'ai voulu et dû fixer l'attention du spectateur.

Four years after Ducis had adapted Shakespeare's "Romeo and Juliet" to the French sense of dramatic propriety, the real, genuine introducer of Shakespeare to France appeared in Pierre le Tourneur. This gentleman, born in 1736, was in 1776 one of the secretaries to "Monsieur," afterwards Louis the Eighteenth. It may be mentioned by the way, that M. le Tourneur also introduced to his countrymen Young in his "Night Thoughts," and Hervey in his "Meditations among the Tombs," two grave works which were enthusiastically received by the gayest of nations. In 1776 M. le Tourneur presented to the public his first instalment of an intended complete translation of Shakespeare. It consisted of two volumes. In a preface, the translator spoke of the English poet as the most potent genius of the drama that the world had ever seen. The assertion was not made for the first time, but it fell like a thunderbolt on Voltaire, who had his own idea as to where France might find the most powerful of dramatic geniuses; and on the Academy, whose members were too ready to believe as Voltaire directed them. Voltaire's rage first found expression in a hysterical letter to D'Argental.

> Have you read [he says] the two volumes of this wretch, in which he dares to impose Shakespeare on us as the sole model of true tragedy? He calls Shakespeare *the divinity of the theatre.* Have you a sufficiently bitter hatred of this impudent idiot, and will you quietly submit to the insults he flings at France?

Voltaire sounded the call to battle in other directions. The trumpet-blast was responded to by La Harpe and D'Alembert. War was declared against "*Gilles* Shakespeare" and "*Pierrot* le Tourneur." Voltaire's famous letter to the Academy, written as he was almost dying, and read in his unavoidable absence, created an immense sensation. The celebrated Elizabeth Montagu was present. She had already, in a well-known work, defended Shakespeare from the aspersions of Voltaire. As the letter, which now treated the great poet as a *gilles* or half-crazed clown, was being read, the Abbé Suard, who was at Mrs. Montagu's side, remarked: "You must be much pained at hearing what M. Voltaire says against your national poet." "Why should I be pained?" replied the witty Englishwoman; "I am not one of M. Voltaire's friends." Le Tourneur was too dignified, too refined, too philosophically tempered, to answer Voltaire's ribaldry. He, aided by Catuelan and Fontaine Malherbe, and supported by the public, went on with the translation, which was completed in twenty octavo volumes in 1783. It is indeed far from perfect; there were difficulties the translators could not surmount; and they were occasionally as unhappy in their avoiding as in their encountering them. Nevertheless, Le Tourneur rendered an immense service to Shakespeare and to France. As a nation, France was, up to this time, completely ignorant of Shakespeare; even Paris had learned nothing from Ducis of Shakespeare's method or manner. The French learned something of both from Le Tourneur, who also conveyed to his countrymen some idea of the audacity with which the genius of our drama accomplished his sublime effects. M. le Tourneur did more; he loosened the hold of classical tragedy on France, he was the originator of that revolution which culminated in triumph years later when a play of Shakespeare, literally translated,

was first acted, and successfully acted, on the French stage. Moreover, the Le Tourneur translation of Shakespeare kept its ground — nay, keeps its ground; for the Guizot edition of Shakespeare in French, which appeared in 1824, in thirteen octavo volumes, is only a revision and correction of the work of the first French translator, who died in 1788, five years after he gave the last of the twenty volumes by himself and his staff to France.

The Academy cannot be said to have been influenced by Voltaire's protest against Shakespeare. That body elected Ducis to the chair left vacant by Voltaire's death. The new member opened his inauguratory address in 1779 with a most happy allusion to Voltaire and to himself: "*Il est de grands hommes à qui l'on succède et qui personne ne remplace.*" A second compliment to Marie Antoinette, who had wept at his "Romeo and Juliet" as well as at more classical tragedies, was turned with the gallantry common to the period and the nation: —

> Vous m'entendrez avec plaisir quand je vous parlerai d'une reine sensible à tous les arts que vous cultivez, qui a plus d'une fois honoré de ses larmes les chefs-d'œuvre de génie représentés devant elle, comme elle sait en verser à l'aspect des malheureux qu'elle soulage; devenue plus chère à la France par ce gage heureux de fécondité [birth of Madame Royale], qui annonce encore un plus grand bonheur à la nation.

The "King Lear" of Ducis was first played in 1783. He had wept over the king's sorrows, when his mother read the original play aloud to the family circle, in his boyhood. He saw the tears of the reader also falling freely; he had again been subdued to tears when composing his own piece out of the noble materials of Shakespeare's. He hesitated long, however, before he dared to bring a subject so difficult and delicate before a French audience. He so adored the divinity of kingship that it seemed sacrilege to represent a monarch subject to any human infirmity; absolute desecration to exhibit him suffering from madness.

> Je n'ignorais pas que la sévérité de nos règles et la délicatesse de nos spectateurs nous chargent de chaînes que l'audace anglaise brise et dédaigne. Shakespeare, le plus vigoureux et le plus étonnant poète tragique qui ait peut-être jamais existé; génie singulièrement fécond, original, extraordinaire, que la Nature semble avoir créé exprès, tantôt pour la peindre avec tous ses charmes, tantôt pour la faire gémir sous les attentats ou les remords du crime.

In the "Lear" of Ducis there is only an episode from the "Lear" of Shakespeare. The old king is suffering from the cruelty of two of his daughters, and the absence of the youngest. With the recovery of the latter he is restored to reason and happiness. He may be said to be the sole "character" in the play; but "Lear" was acted by Brizard, whose power to compel tears was marvellous. On this occasion they were plentifully shed by Marie Antoinette, and Brizard drowned the house in one solemn universal shower. There were little phrases in the piece that were as universally applauded. "*C'est le sort d'un roi d'être souvent trompé,*" was one of these. In recognizing the truth of it the loyal audience pitied the monarch whom they loved. There was no idea in the public mind of what was coming upon French monarchy. Moreover, when the words, "*En révolutions l'Angleterre est féconde,*" fell on the ears of the audience, they heard them with the satisfaction of those who hear of ills from which they consider themselves exempt.

In 1784, Ducis tried his hand on "Macbeth." There is something supremely droll in his method of adapting that grandest of English tragedies (where inexorable fate impels the reluctant yet ambitious hero) to the more delicate sense of the French stage and public. Ducis had not dared to introduce a visible and speaking ghost into "Hamlet." The spirit was only supposed to be seen. In "Macbeth" the witches are altogether indispensable. Where is destiny if their irresistible sorcery does not bind, fetter, and drive their victim? Ducis recognized the indispensability, but his courage gave way. He dreaded the scoffers and laughers, yet he felt the inevitable necessity of overshadowing his Macbeth by fate of some sort or another. Accordingly, he brought a single witch from stormy Scandinavia, and settled her among the Highland crags, there to rule the elements and shape the ways of men in accordance with her wicked will. Her name is Iphyctone. She is very much heard of, especially through her thunders and other means of disturbance, in which Frédégonde (the French Lady Macbeth) affects to read commands of the gods which she is bound to obey. While Ducis stooped to these poor means, he recognized all the poetical importance and dramatic power of Shakespeare's witches. He even (on printing his play) ventured to suggest a scene in which they might

appear, if managers could only be brought to believe that the public were not too tenderly nerved to bear it. "*La scène*," he says timidly and deferentially, "*servirait peut-être à augmenter la terreur du sujet.*" This is the scene. It is only necessary to state first, that Duncan, Sévar (to whom the king has entrusted his son, young Malcolm, to be brought up in disguise), and Glamis (a greater villain than Macbeth) are on the stage together, perplexed by the uncertainty of things in general. The future is thus revealed to them:—

(*Les trois Furies ou Magiciennes sont cachées derrière les rochers. La première tient un sceptre; la seconde, un poignard; et la troisième un serpent.*)

La Magicienne qui tient un poignard.

Le charme a réussi.
Le sang coule; on combat. Resterons-nous ici?

La Magicienne qui tient un sceptre.

Non, je cours de ce pas éblouir ma victime.

Celle qui tient un poignard.

Et moi, frapper la mienne.

La Magicienne qui tient un serpent.

Et moi, venger ton crime.

Les Trois.

Du sang! Du sang! Du sang!

(*Elles sortent toutes ensemble du milieu des rochers, et ne se laissent apercevoir qu'un moment; ou même elles peuvent échapper sans être vues du spectateur.*)

The comment of poor Duncan on this uncomfortable revelation is the very proper one. "*Soumettons-nous aux dieux.*" The Macbeth of Ducis describes himself as a man of "timid virtue." He talks admiringly of the "amiable innocence" of his son. Occasionally a line or two translated from Shakespeare relieves the dull monotony of the play, the end of which is entirely free from such welcome intrusion. Duncan slain, and Macbeth king, a young gentleman presents to the latter a document to show that the bearer is Malcolm, the late king's son, who has been confided to Sévar, like young Douglas to old Norval; like Egisthe to Narbas, in Voltaire's "*Mérope.*" Macbeth, who imagines Duncan's ghost to be at his heels, ever since the latter was killed, is in a fever of delight at the news. "*Oui!*" he exclaims, "*ce sceptre est à lui, je dois le quitter;*" and he summons his guards and household to witness his recognition of the rightful heir. Frédegonde, however, goes to Malcolm's bed to stab him in his sleep, but, by such mistakes as occur only on the stage, she slays her own son. At this blow, Macbeth makes several moral and religious reflections. There are worse people in the world than himself. If he has done ill, he has also done all he could to make it well again. He feels convinced that Heaven has forgiven him; but fancying that the same tribunal demands a victim, he asks permission to make the sacrifice himself, and with the words, "*Permets que mon bras te le puisse immoler,*" he and the curtain fall together.

The most successful scene in the play was that in which Macbeth's wife walks in her sleep. Such an incident had never before been seen on the French stage. "*Dans cette scène singulière,*" says Ducis, "*hasardée pour la première fois sur notre théâtre, comme elle a frappé de surprise et d'immobilité tous les spectateurs!*"

The next attempt of Ducis to familiarize his countrymen with the subjects which Shakespeare had treated dramatically, was made in 1791, when he produced his "*Jean Sans-terre.*" With his "King John" in five acts his audience had no sympathy. All the interest ceased with the death of Arthur. This induced the author to recast the play. He compressed it into three acts, in which Hubert is the principal character. Hubert has charge of Arthur, Constance, and a remarkably tedious old gentleman from Brittany, one Kermadene. As Hubert, after some hesitation, declines to murder his prisoners, John (after Arthur is blinded) stabs the young prince and his mother, and is punished by having to listen to a long tirade from Hubert in which he tells the king of the violent death he will die, according to Shakespeare. The curtain descends simply because Hubert is too much out of breath to say any more, and John is struck dumb by his impertinence. The only touch of Shakespeare communicated by Ducis to his audience is in the scene between the king and Hubert, when John suggests to him the cruel disposal of the legitimate heir to the throne. The wonderful success of these three acts was entirely owing to the luxury of tears enjoyed with the utmost alacrity by spectators who came provided for the most extravagant showers. This effect was worked by the magic of the pretty Mlle. Simon as Arthur, and the natural acting of Monvel (Hubert), the father of the subsequently celebrated queen of comedy, Mlle. Mars.

Finally we arrive at the last and perhaps greatest success of Ducis in fitting Shakespeare to the unity-system of Voltaire. His "Othello" was acted, for the first

time, in 1792. The great Talma played the Moor; Mlle. Desgarcins, Hédelmone (Desdemona). In this version Ducis drew nearer to Shakespeare, and left Voltaire and his system farther behind than he had ever done before. But there were things for which he could not bring his courage to the sticking place. He was convinced that the gentle-hearted audiences of 1792 would never bear the presence of such a wretch as Iago (Pesara in the French play). Consequently, to the audience, Iago wears the guise of the truest possible friend to Othello and all humanity in general. When his villany is made apparent, it is in his absence, and he is never allowed to appear again, as the feelings of the audience would certainly be too much for him and themselves. Again, "the handkerchief"! This was not to be thought of. How could such a suggestive word as *mouchoir* ever be uttered in a French tragedy? Impossible! The substitute is costly and awkward — a wreath of diamonds! Then the *dénouement!* Ducis went so far as to make Othello stab Desdemona at the side of her bed; the smothering her under her own pillow seemed too vulgarly horrible to be thought of for a moment. Ducis was not aware that Shakespeare's expedient was a refining of the original method which he found in the old novel, where the Moor beats his lady's brains out with a couple of sand-bags! The classical dagger might have been borne with, but to plunge it into a lady by the side of her own bed looked too much like a commonplace murder. The audience rose against it. The gentlemen put their hands over their hearts and protested against the barbarity. "*C'est un Maure qui a fait ça, ce n'est pas un Français*," was cried from the pit. The ladies went off into silent swoons or laughing hysterics. Ducis attempted in vain to maintain his tragic catastrophe. He had to give way, and his tragedy (with a comedy *dénouement*) continued popular for one generation at least. The plot is far away from the Shakespeare version, but Ducis follows his leader more closely than in any other of his plays built up on the British model. Now and then passages are almost literally translated, and a weak echo of the master music occasionally catches the ear. Here is a sample: —

> Sa pitié pour mes maux seule produit sa flamme;
> L'aspect de sa pitié seul a touché mon âme;

wherein we miss the sympathetic tenderness of

> She loved me for the dangers I had passed;
> And I loved her that she did pity them.

In later adaptations of Othello, attempts were made to introduce the Moor's demand for the "handkerchief." It is amusing to see how it was brought about. The "circlet of diamonds," the substitute invented by Ducis, was abandoned, and it was "that tissue work" which raised Othello's jealousy. Desdemona held a handkerchief in her hand, but her husband referred to it only as "that tissue," "that gift." At last Alfred de Vigny translated the play word for word, and this, or an equally literal translation, was acted at the Théâtre Français in the first quarter of the present century. This caused immense opposition. A compact phalanx of Voltairians occupied one side of the house; a similar body of Shakespearians the other. When the latter frantically applauded, the former as energetically hissed. But

> between the two factions [says the Duke de Broglie, *Revue Française*, January 1830, quoted in Guizot's "Shakespeare and his Times"] the body of the audience in the pit appears to have preserved a reasonable neutrality. They were evidently on their guard, fearing lest their consecrated maxims should be violated, and they be led into some hasty demonstration of feeling; and yet they were sensible, profoundly sensible, of the great beauties of the piece. Accordingly, during the whole course of the representation they appeared constantly astonished, moved, indulgent, submitting with good grace to the boldest departure from received rules. They willingly, though without warmth or violence, joined in the attempt to silence the detractors; and they good-naturedly allowed free scope to the enthusiasts, while taking great care not to enlist themselves on their side or to mingle in their transports.

On this occasion the word *mouchoir* was bravely uttered without the French Melpomene going into fits; and Shakespeare got a secure footing on the French stage. As between him and Voltaire, M. Guizot says in "Shakespeare and his Times," there is no question as to which has the superior genius, but it was still a question with Guizot whether the system of Voltaire be not superior to that of Shakespeare! Dumas *père*, at least, thought better of Ducis than of Shakespeare, when, after translating four acts of Shakespeare's "Hamlet," (played so magnificently by the now forgotten Rouvière), he wrote a new fifth act, in which he adopted the absurd idea of making Hamlet live. M. Jules Lacroix, in 1868, constructed a new "King Lear" on the old

classical lines. Nevertheless, "Attila Shakespeare," as the Duke de Broglie called him, has gained a permanent place on the French stage; and Ducis, who first made his name known there, is stigmatised by Paul Foucher, most irreverently, as a versifier of "lemonade-and-water tragedies"! They are worth reading, those tragedies of the earliest introducer of Shakespeare to the actors and public of France. Well worth studying also is the work of the last of his translators, M. F. Hugo. Between him and Le Tourneur there is a vast difference. The earlier translator conveyed an idea of Shakespeare to his countrymen; the later really naturalized him, and added Shakespeare to the brilliant roll of the dramatic poets of France. JOHN DORAN.

ERICA.*

TRANSLATED FOR THE LIVING AGE FROM THE GERMAN OF

FRAU VON INGERSLEBEN.

XXIV.

THE MEETING.

THE party from Brühl returned home very late at night or rather early in the morning, so the family did not breakfast together, but those who had remained at home, "the children," as Fritz took care to remark, drank their coffee, and then dispersed to their usual daily occupations.

Erica asked whether any visitors had arrived, and received a somewhat astonished answer in the negative, since it was not to be supposed that any one would come to the castle in the middle of the night, and directly from the reception at court. She, however, did not make these reflections, but felt as if some secret hope had been disappointed, and went out into the open air to conquer the depression that weighed heavily upon her soul.

True, she could scarcely give an account of this feeling, even to herself; she only knew that all the memories of the past, of her home, had awakened, filled her mind and heart, and caused unendurable pain. She felt so utterly lonely, that she sought refuge with nature.

The morning was bright and beautiful, but not so warm as usual at that season of the year. A strong wind blew from the Rhine, bringing a keen, fresh atmosphere, that reminded her of her native air. How often, amid the warm, soft breezes that whispered around her, she had longed for that sharp, bracing blast! It came to her like a greeting from home, which she inhaled with delight, and to enjoy it more fully, according to an old habit, removed her hat and hung it on her arm.

She heard the fir-trees in the park creak gently, and now and then a branch fall on the ground. Tears of mingled pain and pleasure sprang to her eyes; it seemed as if her sojourn here had been a dream, and she was again wandering on the familiar shore of the Baltic. She went to the river, for there the fresh, keen wind was strongest, there she could see the waves run, the faint reflection of the surges of her own dear sea.

She sat down on one of the benches on the stone platform, and gazed at the river, but the narrow expanse of water, and still more the limited view, which was shut in by the beautiful hills, soon oppressed and troubled her. "Oh, you wide, barren downs, how my heart sickens with longings for you!" she murmured. "How gladly I would resign all the beauty around me for the unlovely, often terrible spectacle you present! When the tempest sweeps over you, whirls the sand in clouds, carries the torn branches away in a wild dance, and accompanies its mad course with howls of rage, I feel a pleasant thrill of fear, and am ensnared by your magic spell. Crouching in a hollow of the ground, like a child safely rocked in its cradle, I hear the roar of the sea as it blends with the fierce exultation of the storm, hear the trees in the neighboring forest pitilessly uprooted and hurled to the ground, and my soul revels in this wild grandeur."

She involuntarily closed her eyes to let her imagination conjure up the downs, the pine forest, and the boundless expanse of the sea. She leaned her head against the trunk of the linden that shaded the balcony, and sat so motionless that one would have thought her asleep, but for the tears that ran slowly down her cheeks.

"Erica!" suddenly exclaimed a well-known voice.

But she did not stir. The voice harmonized so perfectly with her dreams, she saw the figure to which it belonged striding over the downs, and fancied the call was only a delusion of her own fancy.

"Erica!" said the voice again, and at the same moment a warm hand clasped hers.

She gazed steadily for a moment at Elmar, who was standing beside her, and then, putting both hands in his, murmured, "It is a dream, it is a dream."

The calm eyes, which had just been so vividly reproduced by her imagination, now really gazed steadily into her face, and rested there for a long time. "Your eyes are full of tears, Erica," he said at last, "was your dream so sad?"

"No, I was happy, for I was at home; I forgot all the oppressive beauty around me, and wandered freely over the barren downs."

"My poor Rhine, so that is the praise bestowed on all your charms," laughed Elmar. "But as we have no sand downs at our disposal here, we must sit on this stone bench, for I have obtained an hour's freedom, and want to hear everything that has happened since our parting."

"You have obtained an hour's freedom?" asked Erica in surprise.

"Why, I cannot conceal from you that my sister —— "

"Yes, I know," interrupted Erica incautiously, and then realized her own imprudence, for she blushed crimson and said no more.

Elmar's eyes rested upon her with an uncomfortably searching expression, then he asked the still more embarrassing question, "What do you know, little fairy? But," he continued in a different tone, "so much the better, if you know, you will find it easier to understand that Katharina would never allow me to wander about alone in a house so richly supplied with daughters, if I had not gained an advantage by stratagem. I ordered my most necessary baggage to be packed up at Cologne, and instead of driving back there with Katharina, ensconced myself, somewhat to my good uncle's discomfort, in his two-seated carriage, and in order not to make unnecessary trouble in the house, spent the night at Wehlen's on a sofa. When I got up I heard you were in the park, and as I supposed the little water-bird would fly to the river, came here, and found I was not mistaken."

Erica gazed steadily at the ground, absorbed in wondering whether the desire to see her had had anything to do with Elmar's stratagem, or if he even knew she was here. At last, with a diplomacy that did great honor to her aunt's training, she said, —

"You promised to come to Waldbad this summer, have you been there yet?"

Elmar smiled. "I promised to meet you again, Erica, and you see I keep my word. I should have come before, if Katharina had not taken it into her head that I was in love with Sidonie, and put every conceivable obstacle in my way. But how do you like to live with your relatives, Erica? Do you often have such sorrowful moments as the one I witnessed just now?"

"It is very strange, but at first I felt far less homesick than now, and often reproached myself because my home and the dear, dear friends there were cast into the shade by this new, brilliant life. But are these relatives of mine your relations too?"

"I pass for a nephew and cousin, since my father's first wife was the sister of Count Rodenwald and Sidonie's mother. But I hope, Erica, in spite of some sad moments, you feel happy here."

"Certainly, for I am treated very kindly and affectionately, but the heartfelt cordiality, the overflowing love which formerly spoiled me, cannot be found here, and I sometimes miss them very painfully."

"You will soon become more at home, Erica, the cooler temperature will no longer chill you, or the constraint which society imposes oppress you. Even now you are no longer the same as when you met me last summer, and soon I shall not dare to call you little heather-blossom, or woodland fairy."

Erica's brown eyes turned full on her companion with an expression of the most trusting confidence, the most earnest sincerity, although there was a gleam of mischief in them, as she replied,—

"The costume is very different. I might pass for one of the summer guests now."

"No doubt, Erica; and yet the contrast between your dress and your appearance was particularly charming to me."

"Then I must regret that it has now vanished."

"I don't know, little fairy. Some development, some continuation, must always follow an interesting commencement; although, as I have not seen you for a year, this development seems to have come about rather quickly. You are taller, more graceful, and I fear still prettier."

Erica turned towards him with a sudden gesture, and again the brown eyes rested steadily on his, as she asked, "Do you really think I am not quite so ugly as I used to be?"

"This time, little heather-blossom, I have a right to call you by the old name, for you still keep the eyes you had when a child. As for your ugliness, that is

entirely a matter of taste, over which it is not well to quarrel; you always had charms for me. But, Erica," continued Elmar, in a graver tone, "I must remind you of your promise. Katharina will undoubtedly renew her attempt to obtain you for her companion, so keep firm."

"Has the princess bought our house?" asked Erica, instead of replying.

"Do you think so?" was Elmar's answer.

Erica's mobile features betrayed some sudden emotion, a faint flush crimsoned her cheeks, and she cast down her eyes as if in reflection. Then raising her head, she held out her hand to Elmar, saying,—

"No, I do not think so, for I know that you are the purchaser."

He caught her hand and held it firmly in his own, then bent towards her, gazed into her agitated face, and exclaimed, "I hope, Erica, this knowledge has made you consider your house your own property again, has restored your home. It makes me happy to read an assent to my question in your features, little fairy, and the question in your eyes is easily answered," he continued in a jesting tone. "It needed no great familiarity with human nature to obtain this conviction, it would have been strange if you had felt otherwise. All now depends solely upon whether, in the future, amid the new scenes that surround you, you will feel this right of possession as vividly; and this question unfortunately is far more difficult to answer, time alone can solve it. If circumstances were different, I know not whether my natural and cultivated calmness would enable me to await the result so quietly, without any action on my side; but during the night of peril we shared together, I vowed to be your protector and defender, and unfortunately—in order to protect you—I must hold aloof."

"Her Highness Katharina, Princess von Bagadoff, has just arrived, accompanied by a wonderful sample of an ancient maid of honor, and a numerous train of servants."

These words were uttered by Fritz, who stood directly in front of the young couple, gazing at Erica with a surprised but mischievous expression. Her face crimsoned, and she hastily tried to release her hand, but Elmar held it firmly, and raising it to his lips, said with roguish formality,—

"Let this solemn kiss be the seal of our new alliance. The little woodland fairy has been transformed into a young lady, with whom we can no longer trifle. I hope, however, that our old acquaintanceship and somewhat distant relationship gives me a right to sometimes address the dignified young lady in the old way."

"Erica will gladly let you call her heather-blossom, Elmar!" laughed Fritz, "but I hope you won't forget her Highness Katharina."

"Good heavens, no, Fritz!" said Elmar rising, "you showed wisdom beyond your years in bringing me the news at once, I did not expect her so soon."

"Well, Werner, who is always troubbling himself about matters that don't concern him, sent me. I should never have had such an inspiration myself. Yet notwithstanding this, I intend to do all honor to my own good sense, and am, moreover, ready to meet you with swords or pistols on account of your admiration for Sidonie."

"I have a great many rivals in that quarter. To say nothing of Meerburg, there is Prince Wolfenhagen, as I had an opportunity to perceive yesterday."

"You are quite right, my son, and what did Count Meerburg say to it?"

"Nothing at all, for he was not present. He is said to be lying very ill at Coblenz, and therefore, in spite of universal adoration, a shadow rested on Queen Sidonie's brow."

"Well, the cloud will disappear, but tell me, how does Katharina happen to have this remarkable companion, who might be her great-grandmother?"

Elmar laughed and looked at Erica. "She borrowed her from grandmama, without the slightest ceremony. Of course the Princess Bagadoff cannot possibly travel without the companionship of a lady, though good old Fräulein von Arensburg is always in the way at hotels, as well as, I fear, here, and therefore seems very much out of place even to herself."

"Has little Carlos come too?" asked Erica, mingling in the conversation for the first time.

"No, there is not so much anxiety felt about his safety now. The prince wedded again six months ago, and therefore will probably have little inclination to forcibly appropriate the scion of his first marriage."

"This is the way to the parsonage, Erica," said Fritz, "I remember you wanted to call there. Inspire the silly swain, Reinhardt, with courage to preach his Sunday sermon, for the pastor is going away, and he will be obliged to take his place. He can say with the Psalmist, 'Who can tell the number of the stars or call them by name?' for there will be

plenty of stars in our pew, since, besides Katharina, dozens of aunts and cousins have been notified. I can imagine what a comfortable feeling of confidence such a prospect will afford the worthy Reinhardt."

"Who is the worthy Reinhardt?" asked Elmar, when Erica had taken leave of the gentlemen.

"An old acquaintance and admirer of Erica, and our pastor's assistant. But see! there is Katharina, she is looking 'with her sweet eyes' for her treasure — ah! she sees us, her suspicious heart has deceived her, and she turns quietly back again."

Elmar and Fritz found the family assembled on the veranda. Sidonie, who had pleaded a headache and remained in her own room, was the only person absent. Even Herr von Wehlen was present, as well as the master of the house, who, contrary to his usual custom, had been drawn into the family circle by the desire to discuss the entertainment that had taken place the day before. As Elmar and Fritz approached, they heard him say, —

"Certainly, my honored cousin, everything was very beautiful and magnificent; but when one has to drive several miles to a reception at court, and is then expected to be satisfied solely with the sight of beauty and diamonds, it is rather a cool demand on the part of the grand chamberlain."

"You don't consider, my dear Edwin," interposed the countess, "that the rooms at Brühl are not large, and the company was very numerous, so a supper was quite out of the question."

"With proper management, a supper can always be served. Why didn't the grand chamberlain order sideboards to be supplied with refreshments, after the royal family had retired? Even a sandwich and a glass of wine would have been a blessing; nay, I would have contented myself with a glass of porter, little as I usually like it."

"Everybody does not possess your excellent appetite, my dear Edwin, and therefore probably no one else complained of hunger."

"You are very much mistaken, Vally; all the gentlemen's stomachs rebelled. Everything I obtained during the evening was one bonbon, which I snapped up with great dexterity, since the rascal of a lackey held the waiter high over his head, in order to reach the ladies. Now ask whether a bonbon can be considered sufficient to sustain a man of my size a whole afternoon and evening, even if it has ever so beautiful a wrapper. I am ready to die for my king, but I see no reason why I should express my loyalty by starving. In future I shall ask whether a famine cure is to be connected with the reception at court, and, like a schoolboy, put my lunch into my pocket."

"But, my dear cousin, how could you miss your supper so much when you were in the midst of such a brilliant circle?" replied the old countess, in a tone of gentle reproof. "Consideration for all these magnificent dressess ought to have stifled such a wish. Besides, it was merely a reception, at which, so far as I am aware, supper is never served."

"It is all very fine, my honored cousin, but we had three miles to drive there and three back. I stopped at the first inn I reached, drummed up the servants, and ordered them to bring me something to eat. Your *amoroso* Sonnenstein, Olga, came up too, and asked for ham sandwiches, which he devoured with a gusto that raised him considerably in my estimation. We dwellers on the Rhine are no æsthetic residents of Berlin, where a hospitable lady invites half the inhabitants of the city to a tea-table supplied with a few thin slices of meat, and we rebel against a grand chamberlain who changes *rôles* in this way, for even in Berlin I have eaten the rarest delicacies at the court-balls."

Elmar, who perceived the annoyance the count was inflicting upon his wife, came to her assistance by asking for Queen Sidonie.

"She is staying in her own room on account of a pretended headache," replied Katharina, with a scornful curl of the lip. "Such insulting neglect may well cause headache, so perhaps she is really suffering from one."

"What do you mean by insulting neglect, Katharina?" asked the old countess sharply. "Do you intend any allusion to Count Meerburg's illness?"

"Why, my dear aunt, if you believe the tale of this sickness, you are probably the only credulous person; everybody else laughs at it. Gebhard Halleritz told me he saw Meerburg in perfect health a short time ago, but he said if Sidonie came to this entertainment at court he should of course stay away."

The old lady drew herself up proudly, and looked angrily at her niece: "Gebhard Halleritz was a braggart and liar when a boy; old Countess Degenhart, his great aunt on the mother's side, has often

told me her troubles about this nephew, but I would not have believed that his ridiculous assertions would be credited in my own family, and thus make mischief."

"Your partial affection for Sidonie utterly blinds you, aunt," replied Katharina sharply. "Meerburg's conduct, I think, has clearly proved how little he desires the marriage forced upon him."

Elmar saw with alarm, that he had only turned the conversation away from Scylla to fall hopelessly into the whirlpool of Charybdis, when the countess came to his assistance. The two partisans were soothed by her mediation, indifferent subjects were introduced, and as new visitors soon arrived, there was no farther opportunity for serious discussions.

XXV.

REINHARDT'S SERMON.

THE countess's fears about limited accommodations were soon verified, and the young ladies were obliged to give up their rooms and move into very narrow quarters. The old countess expressed the warmest sympathy for her dear relatives, and racked her brains to try to assist them. Unfortunately it was impossible to offer her reception-room, for with so many visitors in the house she would have a large number of calls; neither could she give up her sitting-room, for although she never occupied it, a sitting-room was an absolute necessity to every lady. Her dressing-room was equally indispensable, and her bed-chamber entirely out of the question. The good old lady was really grieved about the trouble she was causing, and repeated meditations at last produced the wonderful idea of using the same apartment for sleeping and dressing, in order to place at least one room at her dear cousin's disposal.

As, however, most of the visitors were to remain only a few days, the close quarters could easily be endured, and the young ladies did not allow their good nature to be disturbed, but spent the time in gayety and merriment. Sunday came while these numerous guests were in the house, and with it young Reinhardt's sermon. The family pew could scarcely contain the crowd of visitors, and the tasteful toilettes of the ladies formed a striking contrast to the simple village church.

Katharina, who wished to outshine every one else, particularly Sidonie — of whom she always felt a little jealous — had donned a costume of almost exaggerated magnificence, and even Sidonie's dress was richer and more carefully chosen than usual, as if she too were not wholly free from a little feminine vanity. The transparent embroidered white fabric which covered the under-dress of delicate lilac, was richly trimmed with lace and bows of ribbon of the same beautiful hue. Perhaps it was the color that made her look paler than usual, but the circumstance did not diminish her loveliness, for the regular features could well bear the absence of roseate tints.

In spite of the limited space, Count Rodenwald brought Wehlen into the pew, and accident placed him near Erica, whom he had scarcely noticed since his appearance had first alarmed her. He bowed politely, and as the place did not permit any conversation, gazed from one to another of the group of ladies. At this moment the princess turned her head, and Erica thought she greeted Wehlen with special friendliness, nay, familiarity, but she had no time to reflect upon the matter, for the service claimed her attention.

This, however, did not seem to be the case with her neighbor, for during a short pause he found time to whisper to the count, —

"I read yesterday, in one of Gerstäcker's stories, that the trappers' Indian wives ruin their husbands by purchasing gay handkerchiefs and glass beads, since the ambition of a trapper's wife cannot possibly be content with the dress of an ordinary Indian squaw. But, whether in America or Europe, women's natures seem to be always the same, and the ladies here would probably have thought me very indiscreet to laugh at the story."

The count committed the same imprudence, for he almost laughed aloud at the remark, so that his wife looked around with a stern glance, and he was compelled to cover the impropriety by a loud cough. But directly after, he whispered in his turn: "Look at that unlucky Reinhardt, Wehlen; he is trembling so violently now that the leaves of his Bible rustle, we shall have a terrible sermon."

The poor young fellow really seemed to be very nervous, for the flush that had crimsoned his cheeks during the reading of the liturgy had disappeared, giving place to a deathlike pallor, and when he crossed the short distance from the vestry to the chancel, his step was so faltering that the occupants of the count's pew, as well as the whole congregation, were greatly alarmed. To be sure, the preacher could console himself by remembering that he did not appear before his hearers un-

prepared, for he had labored hard many days at his sermon, which had appeared on paper a little masterpiece. But now, when he looked from the chancel upon the sea of heads, and saw all eyes fixed upon him, he was overpowered by a sudden faintness that almost threatened to rob him of thought and memory.

He felt somewhat calmer when he found the manuscript of his sermon between the pages of the great Bible, but the letters danced and flickered before his eyes, and it was almost impossible to decipher their meaning. Only by the exertion of all his strength did he at last succeed in commencing the discourse, though in a low, tremulous voice. By degrees, however, his courage increased, his voice grew louder, words flowed more easily from his lips, and the trying hour would perhaps have passed more easily than he himself hoped, if he had not unfortunately discovered, during the course of the sermon, that in its composition he had consulted his own taste, rather than the requirements of the parish.

He now felt only too keenly that references to Athanasius and Augustin were not exactly adapted to a country congregation, and saw but too clearly that dissertations on the Council of Nice and the Trinitarian differences — which had occupied his mind for months — not only did not edify the parish, but on the contrary caused a sense of annoyance.

In his distress, he cast a beseeching glance at Count Rodenwald's pew, which he had hitherto anxiously avoided. Had the thought of its occupants induced him to preach philosophy, instead of simple Christianity, had he hoped to be able to show these hearers that he was a skilful theologian? But the sight of the pew only brought fresh terrors. The clouds of transparent white muslin, the laces, veils, crèpe and straw hats adorned with flowers, bewildered him, for they plainly showed that a sermon on the vanity and transitoriness of all worldly things, would — if not received with applause — at least have been more appropriate than a dissertation on the Council of Nice.

A cold perspiration oozed from every pore of the young man's body; he hesitated, and instead of endeavoring to regain his composure and recover the train of thought, the pauses became so long and embarrassing, that the whole parish felt a sympathizing anxiety. At last he controlled himself, and — though at the expense of logical connection — clipped his sermon so as to shear away most of the excrescences. He avoided even mentioning the name of Abelard — whose theories he had intended to partially refute — as he rightly thought it doubtful whether his parish knew anything about Abelard the monk and philosopher, while on the contrary he feared the people were only too well informed in regard to Abelard the lover.

His sermon thus became a strange patchwork, but gained one merit which it had not originally possessed, it was short. When the amen was pronounced, both congregation and preacher uttered a sigh of relief, and the latter, on reaching the vestry, sunk into a chair utterly broken down. The humiliation he suffered was all the keener, because it was not entirely owing to timidity, and therefore could not be excused in that way. Some evil genius must have guided his pen when he wrote that unlucky sermon, which certainly gave a proof of deep theological study, but seemed almost like a profanation of the sacred place, where only the word of God should be the text.

The young man sprang from his seat as this last thought entered his mind. Self-reproach for having profaned the pulpit in the eyes of the congregation, burned the more fiercely in his heart, because he was really greatly impressed by the lofty and sacred nature of his calling and had chosen the profession of a minister from the most sincere conviction of its grandeur. Now, by his own incomprehensible blindness, he saw himself hurled back from his goal, accused by his hearers of a lack of true Christianity, and the earnestly desired parish removed to an unattainable distance. And with this parish another source of happiness crumbled into ruin, a happiness for which he had scarcely ventured to hope, yet whose loss filled his soul with such keen anguish, that even now, amid the fierce tumult of his thoughts, he bitterly felt the pain.

At last he fell into a sort of stupefied condition, in which he heard the congregation leave the church, and through the windows saw people standing about in groups to talk together. What other subject of conversation could they have than the sermon they had just heard, the exchange of indignant comments upon the unsuitable, unchristian words. Although he could not distinguish a syllable, he seemed to himself like the listener behind the door, who hears only his own ill-deeds.

At last the people disappeared, and the young man could return home without fear of meeting any member of the par-

ish. In order, however, to make sure of this, he took the path across the churchyard, which, though a more circuitous way to the parsonage, was also far more lonely. But he was disappointed, for he saw several gaily-dressed ladies wandering among the graves, and was greeted by the voice he least desired to hear.

"You must not run away from me, Herr Reinhardt!" cried Erica, as she saw that the young man was trying to avoid her. "You must hear how glad I am, that, on the whole, the sermon was so good."

"You are laughing at me, Fräulein Erica," replied the young man with quivering lips. "I am but too well aware of my failure."

"That depends upon the standard you hold up; to be sure, you spoke rather more hesitatingly than our pastor, and ——"

"And a little more nonsensically too," interrupted her companion bitterly.

"You are out of humor, because you have not proved yourself a perfect master; but masters do not fall from the skies, as the proverb says, and you will improve with every sermon. At any rate, other beginners must have fared still worse, for almost every one was surprised at your ease and calmness, and Countess Lauerstädt said that her tutor sank fainting on the sofa after his first sermon, and was only restored by giving him spoonfuls of wine, while Frau von Lauchert's brought on a fever by the anxiety he had endured."

The instinct of a kind heart took the place of worldly wisdom, for there is certainly no more successful method of cheering the despairing than the one she had adopted. The young man's gloomy features brightened a little, as he said, —

"So they sympathized with me, they did not laugh at me, but" — and the faint ray of sunlight quickly disappeared from the speaker's face — "they were undoubtedly all the more indignant."

"Indignant!" The unfeigned surprise in the tone was a sufficient answer. Indeed the drooping, utterly depressed young man seemed so unsuitable an object for indignation, that Erica was tempted to laugh. But she controlled the impulse, and continued gayly, "You study so hard that your head is full of whims; you ought to go out in the open air more, if I could I would row you about on the Rhine to-day. However, when you come up to the castle to dine, you will see for yourself that people neither laugh at you nor feel indignant."

Poor Reinhardt, who in the tumult of his misery had completely forgotten the invitation to the castle, felt a new stone fall upon his heart. He had never been there before, as the invitations had hitherto included only the pastor and his wife, and the one extended to-day was a distinction he had obtained by preaching his sermon. It had made him happy, for he would see Erica there, and moreover hoped at dinner to be able to continue the train of thought introduced into his sermon, and weave it into a beautiful, harmonious whole. Now the expected pleasure became a fresh torture, and he showed real heroism in keeping his resolution to go.

Moreover, his consoler, with a hasty farewell, suddenly left him, and if the sight of the slight, manly figure at the gate of the churchyard was the cause of her departure, the fact rendered it none the more pleasant. Was it girlish diffidence caused by the presence of a spectator, or a wish to speak to the intrusive stranger? These reflections, however, diverted his mind from his sorrowful thoughts, and aided him to regain his self-control, so instinct and accident proved the best allies of Erica's kind intentions.

She herself, on opening the gate of the churchyard, found Elmar, as she had expected, waiting for her at some little distance. His face, as well as that of the young man she had just left, was clouded by a dark shadow, not of despairing grief, but strong displeasure, and his tone clearly expressed the same feeling as he said, —

"You fancy yourself back on your downs, Erica, and forget that the little heather-blossom has now become a young lady, who must not disregard the rules of etiquette."

Erica started at the unexpected words, and cast a terrified glance at the speaker's face, but the next instant raised her head proudly, and answered in a somewhat angry tone, "It would be desirable to have the laws of the heart everywhere assert themselves, as well as the rules of etiquette. I think it was my duty to console and cheer poor Reinhardt. You ought to have helped me, and instead of ——"

"Instead of playing preceptor here, assumed the *rôle* of comforter yonder," interrupted Elmar, laughing. "Little fairy, you ask too much. The worthy Reinhardt must bear his mortification without my help. But tell me, what did you say to him?"

The eager indignation in the brown eyes softened into an expression of mischievous amusement, as she replied, "I am unable

to do so, since unfortunately the rules of etiquette compel me to bid you farewell as quickly as possible."

"Your progress is astonishing, little fairy! You are really already a finished coquette, and while I formerly possessed sufficient presumption to make the Æolian harp of your soul give forth my melodies, I now feel that mine can only re-echo the harmonies to which you give the key."

The social etiquette Elmar now valued so little, was, to his great regret, preserved by the approach of some of the guests from the castle; the whole party continued their walk, engaged in general conversation, and on reaching home dispersed to dress for dinner.

Just as the meal was about to be served, young Reinhardt appeared; but he looked more like a criminal awaiting sentence of death, than a guest invited to join a cheerful meal. The countess's admirable tact enabled her to successfully circumnavigate even this cliff; she addressed a few friendly, indifferent words to the embarrassed man, introduced him to the old countess, who instantly recollected that a Reinhardt — probably an uncle of this young man — had filled the office of chaplain at the castle of one of her relatives, and then saw that no farther notice was taken of him. The young man, who had mentally resigned himself to run the gauntlet of scornful glances and ill-concealed allusions, uttered a sigh of relief when he perceived that no one heeded him.

He really could not have eaten his dinner more quietly, or been less annoyed by attentions, if he had preached in Kamschatska instead of Dorneck, and dined alone. The richly-dressed ladies chatted and laughed together over very different matters from his unlucky sermon, and the gentlemen were so absorbed in interesting hunting stories, that they had no thoughts left for the unlucky Council of Nice. One old countess, it is true, directed her eyeglasses at him once or twice, and he blushed under the notice, but as the next instant she examined the dessert with the same interest, he soon grew calm again.

Although this neglect was very agreeable, he could not help saying to himself that a good sermon would probably have made very little difference in the situation of affairs, and he therefore would not have been able to expound to an eager company his views in regard to the philosophy of Abelard. Matters to-day were all quite different from what he had anticipated, and he could not help feeling his first sense of pleasure at the want of attention he received, gradually merge into something quite different. He was therefore obliged to consider it a sort of rebuke for this dissatisfaction, when, after dinner, the master of the house suddenly asked, —

"Tell me, Reinhardt, are you going to preach next Sunday?"

"I scarcely think so," he answered, in an embarrassed tone; "the pastor expects to return here Wednesday."

"Well, I only ask in order to make arrangements, if necessary, to drive to church at Bonn."

Poor Reinhardt's face flushed crimson, while the countess, who had very quick ears for her husband's words, said, in a tone of open displeasure, —

"You carry your jokes a little too far, my dear Edwin."

"Please allow me to finish what I was going to say, Vally. There is no jest intended. I would beg Reinhardt to let me have his manuscript, and after being edified in the morning by a simple sermon, bury myself in the afternoon in the intellectual dissertation of our young friend here, and, since no anxiety would paralyze my efforts, probably do them more justice than to-day."

"You can agree to this proposal, though it is blended with a little mischief, Herr Reinhardt," said the countess. "We all felt an anxious sympathy for you to-day, as no doubt every congregation experiences in listening to an unpractised speaker. But, for that very reason, we shall expect you to renew the attempt very soon, and if my husband drives to Bonn, we ladies will bravely battle through the trying hour with you, and afterwards rejoice together over the rapidity with which you will conquer your constraint. Besides, in preaching frequently, you will learn to prune your wealth of thought in order to make it more fruitful, and when at some future time, you are obliged to deliver a sermon every Sunday in your own parish, you will husband the treasures of your mind to enable them to supply the heavy demands upon them."

The countess nodded kindly to the young man, and turned to her other guests. He would have liked to kneel and thank her for her words; it seemed as if they had removed the burden from his heart, absolved him from his guilt. His life, his studies, which had appeared so gloomy, so destitute of charm, were freed from the shadow cast by the events of the morning, and everything once more seemed bright and fair.

XXVI.

THE LISTENER.

THE afternoon brought numerous additions to the already large circle, for visitors arrived not only from Bonn, but many of the neighboring estates and villas, and it seemed as if Dorneck were the rendezvous for the whole country. Yet, spite of the throng of guests in the castle, and the various arrivals from without, the countess's admirable housekeeping arrangements were not at all disturbed. Each individual was well served, and nothing reminded one of the domestic machinery, which, however, must have been heavily taxed to satisfy these unusual demands.

True, the countess had previously summoned her men, as her husband expressed it. Old huntsmen, who had been made keepers on condition of holding themselves ready, if occasion required, to act as huntsmen again, footmen, who by the countess's aid had set up some little shop, or found other means of support; cooks, to whom she had given a dowry on their wedding-day, had all come to her assistance; and as this fresh strength was properly apportioned and used, the household moved on in the quietest, smoothest manner.

Little as the excellence of this management was perceived — for its chief merit consisted in its unobtrusiveness — the guests keenly appreciated the comfort it afforded, and all agreed that the household was not only *comme il faut*, but perfectly *charmant*, and no one could be in better or pleasanter quarters than when at Dorneck. To be sure, such a magnificent style of living must be very expensive, and as the count could not be called extremely rich, the family would undoubtedly be ruined — but that was *their* affair, and did not in the least disturb the comfort of the guests.

The only one in the gay, joyous throng not in a merry mood, was she who, styled in jest "Queen Sidonie," usually played that part in every assemblage of young people. Eager as was the homage proffered on all sides, ardent as were Prince Eduard's attentions in particular, her smile was only lip-deep, and it required all her strength of will not to suffer the cloud that oppressed her heart to be seen.

Elmar, who, when in a large company, remained somewhat in the background, and was therefore a close observer, soon discovered the lack of real happiness in the heart of his beautiful cousin.

"Queen Sidonie has lost some of her Olympian repose, and condescends to feel human annoyances, perhaps even human weariness. What can I do to divert my sovereign's thoughts?"

"Nothing, my dear Elmar," replied Sidonie, "even the pleasure of making Katharina angry would not charm me to-day."

"That is, my attentions are coolly declined. But seriously, Sidonie, are you ill, or only out of humor? In spite of the admirable mask you wear, I know you too well to be deceived."

"Neither, or perhaps both, so many people are burdensome to me."

"That is a bad symptom, for it contradicts your usual taste, and I advise you to take a solitary walk. That will best restore mind and body to their balance."

"If they will only let me alone long enough. Cover my retreat, Elmar."

"The way to the western part of the grounds is over my dead body; for I see that is where you wish to go."

"Good-bye, Elmar. Defend your post bravely," cried Sidonie, and disappeared in one of the leafy avenues of the park.

Elmar strolled thoughtfully in the opposite direction, so absorbed in his own meditations that he did not see Werner, until the latter stood close before him.

"Ah, Werner!" he exclaimed in surprise, "I suppose some magnetic power attracts you towards those paths."

"Is Sidonie there?" asked Werner gravely.

"Yes, and moreover she is out of humor, and wants to be alone."

"Count Meerburg's absence from the entertainment at court has offended her pride," said Werner bitterly.

"Perhaps so, but after all that is only the drop that made the cup overflow. So far as I understand the matter, you have acted rather unwarrantably, my dear Werner.

"Then I have done no one more harm than myself. My punishment is harder than was merited by my crime, if, indeed, it can be called one."

"It is incomprehensible to me how the countess has allowed the affair to go so far. I don't understand my wise aunt in this case."

"I think I do, perfectly. The cause of her short-sightedness arises from the same feeling which made the Greeks forget to put a punishment for patricide in their code of laws. What the boy Fritz, the young, inexperienced Erica clearly perceive, remains entirely concealed from this clever woman, because such a thing seems to her an impossibility."

"As for the young, inexperienced Erica, you will oblige me by leaving her out of the question. Besides, the countess's blindness strongly condemns your course of action."

"I feel that only too keenly, and will put an end to this state of things this very day at any cost."

"I hope you won't be a fool, Werner! You will spoil all."

"Be it so! At any rate my fate will be decided," and, without heeding Elmar's call, he walked rapidly down the same path Sidonie had just taken.

"I am really doing honor to my trust," muttered Elmar; "now I have betrayed her retreat to the very person with whom she probably least desires to share her solitude. But I say like him, be it so; an open breach is preferable to this unfortunate state of affairs."

Meantime Sidonie had walked slowly on to a linden-tree, whose thick branches shaded several benches. She felt weary, and sitting down on one of them, gazed mechanically at the scene around her, and felt painfully that solitude brought the same dissatisfaction as society. She bent down and drew figures with the tip of her sunshade in the sand, figures which, if they unconsciously became initials, were effaced as soon as they appeared. Absorbed in this occupation, she did not hear Werner's hasty approach, and only looked up when he was close before her. For one instant the beautiful features betrayed violent agitation, but the next the usual proud, calm expression returned, as she asked, —

"Have you any message for me?"

Werner, although prepared for the meeting, could scarcely maintain his composure. The repellent hauteur which recognized no right on his part to approach her except in the character of a messenger, wounded and offended him at this moment so deeply that he could not instantly master his feelings, and with difficulty controlled them sufficiently to say in a trembling voice, —

"This time, countess, I wish to trouble you with my own affairs."

Again Sidonie's features betrayed some sudden agitation, and again she answered coldly and calmly, —

"You overrate my influence, Herr Werner. I fear I can neither do anything for you with my uncle, nor does my guardian permit me to choose the persons who manage my estates."

"Sidonie!" burst from Werner's lips in a tone of passionate grief and anger. There was such an agony of reproach, such loving, imploring entreaty in the word, that it was impossible for her to keep her mask of pride. She involuntarily sprang to her feet, as if to take refuge in flight, but he caught her hand in a firm clasp, and said, almost sullenly, —

"You *must* hear me, Sidonie! I will put an end to this misery at last."

A deathlike pallor overspread her face, a feverish tremor shook her whole frame, and the large, dark eyes gazed dimly into vacancy, as she murmured in an undertone, "I must not, will not hear you."

"But if I first implored your forgiveness, if the confession of my love —— "

Sidonie suddenly wrested her hand from his clasp, her dim eyes blazed with anger, she drew her tall figure up to its full height, and exclaimed with quivering lips, "Not a word more! You insult me beyond forgiveness."

The hasty words seemed to have exhausted her outburst of anger, for an expression of unspeakable sorrow quenched the indignation in her eyes, the delicate lips trembled with agony, as she continued in the same abrupt manner, —

"Your conduct is unpardonable; for it is ignoble — pitiless — cruel!"

Her voice seemed choked with tears as she uttered the last words, and with the same abrupt movement — which formed so strong a contrast to her usual manner that it revealed her agitation even more plainly than her words — she turned from her companion and rushed down the path, while Werner gazed after her as if stupefied, then sank on the seat from which Sidonie had risen, and covered his eyes with his hand.

"I have lost the game," he murmured sadly, "and it serves me right," he continued aloud in a stern, bitter tone. "Blind fool that I was, to hope to conquer pride by love, and now, too late, I am forced to perceive that I was assailing a religion. If I could save you, Sidonie, I would give my life, nay, more, the happiness of my whole existence."

For a long time he remained motionless in the same attitude, absorbed in thought, then rose and moved slowly away. Soon after he had left the spot, the branches of the nearest group of bushes parted, and Herr von Wehlen-Ramsdorff's head appeared, and was soon followed by his whole body. Scorn and malice were visibly impressed upon his features, as he slowly approached the linden.

"A precious, priceless discovery," he murmured. "Unfortunately, I could not catch the words, but the actions were un-

mistakable. The haughty countess's eyes were full of tears when she fled, and they were anything but tears of anger, as I clearly perceived. So her aversion is caused less by the declaration of love, than the unpleasant circumstance that her suitor is neither prince nor count. To be sure, it shows a great lack of consideration on his part, but I fear the fact can scarcely be changed.

"I must arrange this affair so as to derive the greatest possible advantage from it, and if my heart, feeling a little weakness for the beautiful girl, pleads for compassion, I hope it will soon listen to reason. After all, what can Hecuba be to me, that I should show her special consideration, and that fool who dashes headlong at every red rag she sees, will thus be sure to fall into my net. I may begin to believe in my lucky star again, since, after racking my brains for weeks to find some way to remove this Werner, he himself gives me the priceless material for his own destruction. He checks and thwarts me, I feel his opposing influence everywhere, so I must and will render it harmless.

"My simpleton of a lover has done me the greatest service by not keeping his appointment — but for that I should never have thought of throwing myself on the turf yonder. I don't understand how they failed to see me — the young people must have been too deeply absorbed in their own thoughts. But I shall really be compelled to hunt up the languishing *amoroso*, he really is not coming. Countess Olga's blue eyes are magnets altogether too powerful for him. My notes have made him a little skittish, as if he ought not to rejoice when people who know how to live, relieve him a little of the burden of a property he can't manage. Ah, here comes my Celadon! Now we will have a little scene too, though probably with not quite so much dramatic action."

Herr von Sonnenstein came up the avenue with somewhat lingering steps, evidently not quite comfortable in the thought of the impending "scene;" for when he saw Wehlen waiting for him, he paused and seemed inclined to turn back. Wehlen, however, quickly approached, put his arm through the young man's, and began in an easy, conversational tone,—

"I really ought to commence by reproaching you for having kept me waiting half an hour, but I know that the happy take no count of time, and ——"

"I am not at all happy," interrupted Herr von Sonnenstein, somewhat sulkily.

"Then you ought to have been more punctual, my dear fellow. But what marred your happiness, if I may ask?"

"You know as well as I," replied Sonnenstein, in the same grumbling tone. "When Generode is here Olga does not even look at me, and you promised, and I hoped, your presence would change all that."

"Most honored baron, that demand is rather heavy. I promised to win her father over to your side, and I think I have kept my word."

"Oh, yes, but what good will that do me, if Olga still has eyes only for Generode? You need have no villa here, for aught I care."

"Really, my dear baron, you make me laugh. I have heard of being married by proxy, but how people are to win hearts that way, is not quite clear to me."

"Then why did you voluntarily offer me your services in this affair?"

"I have already told you, Herr von Sonnenstein, that I engaged to win the father over to your side," replied Wehlen loftily, "and now inform you that it has cost me a great deal of labor to fulfil my promise. I am not accustomed to say much about my exertions in behalf of my friends, or you would have heard of this trouble before. If you regret your agreement with me, you need say but one word, and it will be broken, but I doubt whether you will then have any better chances of success with Countess Olga."

"You are riding a very high horse all at once, Ramsdorff. I have no such desire. Only the affair is becoming rather more expensive than I expected; I was really startled yesterday when I received the notes."

"Don't accept them, baron!" laughed Wehlen. "Send them back protested, you admirable housekeeper, but as long as you have such narrow-minded ideas, don't expect to win a girl like Countess Olga."

"Why, Olga will know nothing about the notes, I hope?" said the young man, somewhat perplexed.

"Of course she will hear nothing about the notes, but she will perceive your miserly disposition. My dear baron, though a man in years, you are still a child in your acts and feelings. Why has fortune poured out her horn of plenty upon you, if you wish to make no use of her gifts? Live more in the world, drink large draughts of the cup of pleasure, and be assured that you will obtain not only enjoyment, but advantage, the advantage of

more ready tact, the quiet, easy confidence which, in dealing with women, is half the battle. What gives Count Generode his superiority, except the possession of these very qualities, which you can only obtain in this way?"

"Do you really mean so?" asked the baron thoughtfully. "But I have no taste for drinking and gambling."

"As if those were all the charms the world can offer! You are a perfect child, Sonnenstein. I must really school you a little. But I'll see how I can help you, though I must act contrary to my usual good-nature, and bring discredit on Count Generode in the eyes of the fair countess. As for my notes, just send them to protest; to be sure I thought myself wonderfully economical, but people's views of the necessities of life are very different."

"Why, of course I will pay them, I don't wish to be considered a miser. But, for all that, I can't understand how you manage to spend so much money, when you are here all day long."

"I will explain it to you very shortly, *mon cher*, but now be kind enough to leave me. I see Princess Bagadoff yonder, and have a few words to say to her."

As soon as Wehlen had rid himself of his companion, he hurried towards Katharina, who received him with a bright smile. He could help her out of a little difficulty, for her dress was ill-suited to a walk in the park, and had caught on some bushes. Wehlen eagerly hastened to her assistance, deftly released the costly black lace robe she wore over a crimson silk petticoat, and drew the shawl once more over her shoulders.

"I was just looking for you, your Highness," said he; "I have hit upon an excellent way to gratify your wish, if you have not already succeeded in obtaining it."

"On the contrary, I am on the point of giving it up; I would gladly show my gratitude, but my patience is exhausted. My aunt even says Erica promised her mother on her death-bed not to become my companion, though of course this is only a ridiculous pretext, invented to annoy and irritate me."

"Or perhaps a misunderstanding. The lady probably felt her daughter's inability to fill the situation too keenly. If, however, you have resigned the wish, your Highness, I have nothing to say."

"The princess's restless eyes wandered hastily towards the horizon, as she replied: "I never resign a wish, and am curious to hear your expedient."

"Well, since there is a reluctance to permit the young lady to become the companion of the beautiful, petted Princess Bagadoff, perhaps there would be less difficulty in obtaining her for the old baroness."

"And what use would that be?"

"At any rate your kind heart could discharge its debt of gratitude," replied Wehlen, smiling. "Besides, you ladies live in the same castle, form one family, and thus an exchange would be easy, indeed almost a matter of course, since your Highness has already borrowed the baroness's companion."

"That would do!" said Katharina eagerly; "but how can I make grandmama yield to my wish. She is terribly obstinate, and allows no one to influence her except Elmar."

"Then call your brother to your assistance."

The princess's hands now moved restlessly to and fro as well as her eyes; she pulled a flower to pieces, scattered the leaves over the ground, and then, in spite of the long pause, answered hastily: "Elmar is incomprehensibly blind in this matter; he resolutely opposes me, and only a short time ago declared he would not have Erica come."

"That is strange; the baron seems to like the young girl."

"That is, he feigns an interest in her on account of that affair — you know — but she is not beautiful and attractive enough for him, and I want to have my own way, just to defy him."

Wehlen's face assumed an odd, searching expression, as he said slowly: "Might not Fräulein Erica inspire some feeling of interest in the baron. She has improved very much of late."

"No, I know better; I know Elmar thoroughly. No one can blame me for not wishing to have any love affair in my own house, and Elmar is inclined to flirt."

"Then I advise you to influence the baroness in Fräulein Erica's favor through old Countess Ingolstein, who is going from here to Altenborn. With your Highness's diplomatic talent, it will not be difficult to guide these two ladies, so that, while thinking they act independently, they will really only execute a commission. The baroness will then write to Countess Rodenwald, and the latter won't refuse her request, or I am greatly mistaken."

The princess hastily drew up the shawl that had fallen from her shoulders, saying joyously: "I like that, it is a capital idea to use my dear aunt and grandmamma for my own ends."

"And if, contrary to our expectations, the baron should become interested in the young girl, I could find a remedy at once. Young Reinhardt, who broke down so utterly to-day, is head over ears in love with Fräulein Erica, and if, as I hear, the parish of Altenborn has no pastor ——"

"That's true, it will be the very thing!" interrupted Katharina.

"Only it would be desirable to have the young man learn to preach better sermons."

"Pshaw! That will be a matter of course, besides, it is of no consequence. I'll see that he gets the place."

"I am glad you approve of my proposals, your Highness; you see how earnestly your humble slave has toiled to serve his noble mistress."

The princess's eyes rested upon her companion for a moment, then she said, with a half-sigh, "I thank you, but ——"

"But I see you still have some ungratified wish. Do the baron's relations to his beautiful, haughty cousin make you anxious?"

"Beautiful!" cried Katharina, "do you really think Sidonie beautiful?"

"I did not say so, your Highness; I spoke just then of the baron's opinions."

"Yes, Elmar certainly has the bad taste to think that apathetic statue beautiful. Beside, she places a ridiculous value upon her rank, and Aunt Ingolstein upholds her in the folly, because she shares it. The other day, at the reception at court, she told me that Sidonie ought to precede me, because my title was not equal to hers."

"That was a little too strong, your Highness," said Wehlen, repressing a yawn; "but to return to our former subject — so you really do not wish a marriage to take place between your brother and cousin?"

The princess drew her lace shawl around her shoulders for the third time, pulled a few leaves from the bushes, tore them to pieces in her hands, and at last muttered, with suppressed passion, "I would not allow it under any circumstances."

"Then perhaps I may be of use. Your Highness has doubtless noticed — for what escapes your penetration? — that that steward, or whatever office he holds here, that Werner, has the presumption to raise his eyes to Countess Sidonie."

Katharina started back so violently, that her lace shawl again caught on the bushes, and Wehlen was obliged to release it. What! Sidonie loves this Werner?" she asked breathlessly.

"I did not say that; I spoke only of the young man. But I rely upon the soft heart natural to women, who can rarely censure the love they have excited, even if they do not share it. At any rate, this might easily be used as a lever to alarm the baron, if unfortunately it would not compromise Countess Sidonie. But I must have your Highness's opinion of the matter."

The princess's wandering eyes rested steadily on her companion, as she contemptuously exclaimed: "What an idea! If Sidonie is compromised, it will be entirely her own fault."

"Very well, your Highness; yet I must beg you to give me a special commission, and," added Wehlen bowing, "to cover any possible failure with your authority."

"I will say, undertake anything!" cried Katharina in the same tone, "only unmask the hypocrite. Tell me, what are you going to do?"

"I will induce the haughty countess and this over-bold secretary to meet in some lonely place, and then bring spectators; I think that will do. But don't forget that I undertake this difficult task solely at your command; what other interest could I have in the affair?"

"I know you act only at my desire, and will be grateful." The princess held out her white hand, which her companion reverently raised to his lips, and then turned hastily away, as several persons appeared in the distance.

Wehlen looked after her, muttering contemptuously, "My puppets surpass each other in docility, everything favors me today. But what a fury that beautiful woman is! her eyes sparkled at the thought of revenge like those of a tigress. Poor Sidonie! I wish I could save you, but sentimentality is out of place with me, so I will let it drop.

"Really, it would be laughable if I got this young Reinhardt a good parish in return for his execrable sermon! But, spite of his profound knowledge of the fathers of the Church, in every-day life he is a mere child, who can be guided by a thread, so he will do me good service at Altenborn.

"My part here will soon be played out, and then I must pitch my tent there, though I am compelled to take this little demon with me — unfortunately I could not help that. I shall probably make Altenborn my residence for some time — this woman is an inexhaustible mine. Poor Molly! — how heartless the princess is, she did not even know where the girl had gone! — if I could have spared her I would

gladly have done so, but no one can strive against fate."

Wehlen seemed satisfied with this conclusion of his train of thought, for he resumed his lonely walk, and joined the rest of the company.

FRENCH HOME LIFE.

RELIGION.

Of all the influences which have contributed throughout the world to the formation of national character, there is, assuredly, not one which has been more powerful than religion. Its effects have varied so widely with the particular faith which has happened to be at work, its incitations and its issues have been so different amongst different groups of believers, that the very divergences of the results produced by it suffice to prove, by their number and their contrasts, how vigorous and how all-embracing must be the cause that could provoke them. Wherever we look about the earth, wherever we seek in history, we find diversities of temperaments induced by diversities of religious opinions. Origin and offspring hold so distinctly together, that it is not possible to deny their relationship. Religion has been, everywhere, an active and visible procreator of the special characteristics of races: its handiwork stands glaringly before us in the multiform and contradictory outgrowths of the creeds of the East; we observe the working of its fecundations amongst ourselves in the variations of the fruits which grow on the branches of Christianity. Even if we limit the comparison to Catholics and Protestants, we recognize at once that perceptibly different harvests of life are resulting, all around us, from the opposite guidances to which the members of the two Churches have been subjected. Catholicism, taken as a whole and excluding exceptions, is a religion of brightness; it is based, especially in its higher developments, upon a joyful and affectionate intimacy with divine things; it is a system which gladdens toil, which lightens pain, which suppresses doubts and responsibilities, which seeks to render its daily usage attractive, and to surround with charm the obligations which it imposes. In Protestantism, on the contrary, particularly in some of its Continental forms, there is often a certain voluntary building up of severity and gloom around the practice of religion, an obtrusiveness of the uglier aspects of morals, a disposition to render duty unpleasant: it does little to adorn existence; in many of its advanced phases, indeed, it sets purposely to work to blunt away imagination as a danger, and to dim out cheerfulness as a foe.

With such markedly opposing causalities in operation, it is but natural that, even between close neighbors, the resultants should also be dissimilar; and though it would be an exaggeration to pretend that the effects are as varied in Europe as in Asia, and that each great Christian communion has developed — like the leading Oriental faiths — a special outline of character which is proper to itself alone, there is no denying the general fact that the national idiosyncrasies of many countries of the Western world have been largely stimulated by religious leverage. The temperament of the French, for instance, is due most certainly, in part, to religious causes. Their peculiar emotional faculties cannot fail to have been quickened by the working of their creed. When we remember that for centuries after their constitution as a people, their faith and their practice of it remained not only unchanged, but virtually unweakened — that the brightening influences of that faith operated almost unchecked upon the entire nation — we are forced to own that so unceasing an action must have excited and have fortified certain peculiarities of their national temper, and that dispositions which were inherent in the Franco-Gallic blood must have been amplified and developed by the constant pressure of a congenial religion.

No other general cause can have exercised more sway than this one on the constitution of the interior life of France. No cause is more worthy of examination in a study of that life, especially as we are not limited in our investigation of it to the unchanging absolutism of a long-existing domination, but, on the contrary, are at once introduced to new springs of movement, and are brought face to face with the most eager actualities of our time. A survey of the question, however circumscribed it be, obliges us to take account not only of the stored-up energies of old forces, but also of the recent intervention of new ones,— not only of the inherited derivations of the past, but also of the tentative operations of the present. Our purpose is to try to measure the movement of these various potentialities in the home life of France. With that object before us, the simplest plan will probably be to

attempt to value the energies at work before we seek to determine their effects. Let us try, then, first of all, to estimate the general position of religious opinion in the country, and the actual form and force of its action.

We encounter a difficulty at the outset. We have two distinct and conflicting agencies before us: the past, which acts on the national character as a whole; the present, which presses on each individual separately. The sequences of the past we can measure with tolerable precision, but the achievements of the present are more knotty to determine. The old doings of French faith are written, in full light, in the history of the land; but the burrowings of the new workers are under ground. We can see without an effort what religion did formerly for France, — we can point to its magnificent action on the formation and the unification of the character of the race; but it is not so easy to detect with certainty what the competing forces of Ultramontanism and irreligion are effecting in her now. Consequently, in approaching this vast and delicate question of the action of religion on the contemporary life of a great people, it is prudent to begin by proclaiming that there is a grave obstacle in our way, that no convincing evidence is obtainable, that personal experiences are all that can be offered here, and that the results of personal inquiries cannot be expected to be regarded as satisfactory testimony by others: they may, indeed, be contemptuously denied by those whose opinions or whose interests lie in another direction. Private investigations on such a subject are limited to the area which private means of action may be able to cover; and though, in the present case, they have been continued through years of intimate contact with all classes of French society, and though their results have been confirmed by the declarations of careful observers to whom they have been communicated for purposes of verification, they produce, after all, nothing more than individual statements, which it is not possible to advance authoritatively or to control effectually. But still, though it is not pretended that they offer conclusive proof, it is not unreasonable to claim for them such value as long questioning can create, such force as patient scrutiny can bestow.

There are, however, fortunately, certain essential points of the subject on which disaccord or discussion is not likely to arise, for they have already acquired the character of generally accepted truths. No one, for instance, whatever be his standpoint, will deny that active faith is growing rarer and feebler in France, and that a gradual but continuous diminution of the religious sentiment is occurring there. No one acquainted with the realities of French life will doubt that the men of the working-classes, taken as a whole, have almost lost all religious convictions whatever. No one will seriously urge that what are called "practising" Catholic men can be found in any appreciable number, outside the educated strata. And even within that limited circle, after excluding nine-tenths of the population from the calculation, it would be exaggeration to pretend that any important number of men retain a publicly avowed faith that any serious proportion really "practise" religious forms. It is true that this situation is not limited to France — it is true that it extends, with slight variations of shape and of degree, to all the countries of Europe; but it is its existence in France which alone interests us here.

It is also clear to most lookers-on, that nearly the whole of the clergy of France, and a small but impetuous portion of the laity, are animated by a strong Ultramontane spirit; that is to say — in order to define the sense in which the word Ultramontane is habitually used in France — with an intense desire to claim and to obtain for the Church and for its ministers a recognized right of action and interference in political, social, and worldly matters. The efforts which have been made of late years to bring the entire priesthood of France into one mould of thought have now borne such full fruit that almost all the younger and more energetic members of the clergy have joined the Ultramontane movement; while such of the bishops and older priests who formerly held out against it are giving way in appearance, if not in conviction, and no longer offer any opposition to it.

So far all observers will probably agree in substance; but at the next step in the description, difficulties may arise, for a thorough knowledge of the under-currents of French life is needed in order to enable foreign spectators to perceive that while the mass of the clergy, under the pressure of seminary teaching and of episcopal direction, has been growing towards Ultramontanism, the mass of the educated laity, under the pressure of public opinion, has been growing away from it. It needs close watching to enable us to recognize that believing Frenchmen are becoming more and more moderate in everything

which lies outside strict faith: that while they resist the tendency to indifference or to active unbelief which fills the air around them, they are deeply pained and irritated by the aggressive attitude of the Ultramontane minority at their side. Influenced, as they cannot fail to be, by the generally progressive tone of the society in which they live, the greater part of the French Catholics regard religion, not as a state which provokes them to struggle for any political or special objects, but as a purely personal condition which they adopt and work out for their own satisfaction exclusively. Of course, there are many obvious exceptions; there are, manifestly, in France as elsewhere, enthusiasts who graft some outside purpose on to their faith. But, taking the Catholic gentlemen of France as a whole, it will certainly be recognized, by those who really know them, that their use of their religion does not generally stretch beyond the discharge of regular duties and the pursuit of their own moral amelioration. They hope that Ultramontanism is a passing accident, not a permanent principle of Catholicism; and that there may be some day, at last, a final separation between faith and politics.

This is the essential result of the personal inquiries which were alluded to just now. It is a result which may easily be denied, for it cannot be proved; it is a result which lies outside our ordinary touch, which can only be attained by long and careful personal research; but whatever may be said against it — however much it may be called false — it does express the truth of the situation to many earnest and honest watchers, who have sought patiently and anxiously for an insight into the true present condition of French opinion on the question. It shows a state of feeling which is very different from what is supposed by many foreigners to prevail in France; it stands out in absolute contradiction of the impression which exists in many minds, that Catholic France is, essentially, an ally of Ultramontanism. So far as it has been possible to ascertain the truth, for the purposes of this article, the truth lies directly the other way. There appears to be strong ground for confidently believing that, with the exception of the Legitimists, who support Ultramontanism because it fits in with their political ambitions, and of a small minority of excited Catholics who do not permit themselves to indulge a single idea which has not been previously ratified at Rome, the men who form the bulk of the Catholic body of France are heartily liberal.

It must, however, be added at once, distinctly, that with all this irritation as regards Ultramontane claims, no French Catholic who really is a Catholic would consent to abandon his faith, or to cease to be a dutiful son of the Church.

Whatever be the present difficulty of the struggle to unite dogmatic fidelity with absolutely independent thought on every subject which is not "of faith," nearly all moderate French Catholics are remaining Catholics. Some amongst them, it is true, are unable to withstand the pressure, and lose their faith altogether; but by far the greater part of them hold on steadfastly. Their obedience on matters of dogma is complete and unrejecting, but it is neither blind nor unreasoning; and furthermore, it is indisputably attended, in innumerable cases, by extreme sorrow that filial and dutiful affection should be subjected to the afflicting tests which Ultramontanism is now so ruthlessly applying to it. The old spirit of Gallicanism has left deep marks on France; the new spirit of social and political inquiry is gaining immense force there, not only amongst the lower classes, but in the upper circles too; and neither of those spirits is of a nature to allow men who are animated by them to abdicate free thought. On the contrary, the yearnings of the mass of Catholic Frenchmen are towards progress, not towards restriction — towards freedom of popular action, not towards the enforcement of clerical preponderance — towards the ennobling and enlarging of the human objects of life, not towards the concentration of those objects in the unquestioning acceptance of a politico-theological pretension.

Such is, according to carefully collected and wide-spreading evidence, the condition of a large majority of the Catholic men of France. It is not possible to determine, even approximately, the proportion of that majority, for no figures and no facts can be quoted with respect to it; but it does not appear to be unreasonable to guess, from the testimony accumulated, that they may perhaps constitute three-fourths of the whole. Their state is one of passive duty and of sorrowful obedience, coupled with an instinctive resolve to give up nothing of the love of social and political liberty, which has become the distinguishing mark of our time. And such being the situation of those men, is it not just to call them "moderate," and to draw a sharp line between them and the Ultramontane minority, which pretends that it alone represents the Catholic

sentiment in its dealings with the outside world? It is essential to preface what is to be said here by asserting the existence of this great mass of honest Catholics; for though it has no voice in the matter of Ultramontanism — though it remains respectfully and mournfully silent — there is still a weight in numbers, which may perhaps some day exert its influence in this case as in others.

Of course, the Ultramontanes will not admit that three-fourths of the small total of practising Catholic Frenchmen have opinions of their own on every point on which they are not strictly tied down by dogma; but how are they to prove that the statement is false? No statistics exist of the state of consciences; private information and personal inquiry are open to one side as well as to the other: individual assertion is all that can be put forward; but, assertion for assertion, is it not altogether reasonable and in accordance with the great teachings and the general experience of our time, that the mass of Catholics should, like all other people, think for themselves on every point on which their conscience is free? Would it not be a manifest improbability, as well as an act of injustice to a class, to suppose that a system like Ultramontanism, which is purely political in its main characteristics, and which is in violent opposition to all the enlarging tendencies of the epoch, can be supported by more than a minority? The mass of Catholics most certainly do not support it. They do want to save their souls by doing their duty silently and quietly; they do want to preserve for Rome the direction of their faith and the spiritual control of the great body to which they belong; but they do *not* want to diminish, in any shape or degree, the political power, the political right, or the political freedom, of governments or of peoples. And this, whatever Ultramontanes may say to the contrary, appears to be the point of view of millions of earnest though suffering Catholics, not only in France, but throughout the entire Continent.

Of course, these Catholics claim for the Church the right of protesting, not only against irreligion, but also, subsidiarily, against such political principles as are direct products of irreligion. Without such a right, the direction of souls by the Church would be a mere illusion. But they limit that claim to theory, and recognize that its practice is surrounded, for the moment, by so many difficulties, that the greater part of the moderate group turn away from these difficulties in silence, and leave them to the future, in the hope that a different manner of dealing with them may arise hereafter at the Vatican, and that what is now declared to be impossible may be found possible in coming time. The necessity of discovering and applying some practical working understanding between the Catholic Church and modern society appears to them to be so absolute and so indisputable, that, if they could do anything whatever in the matter, it is certain that their whole efforts and influence would be employed to obtain an immediate modification of the Ultramontane views, to which they are respectfully but most steadily opposed.

Unfortunately they can do nothing; their position condemns them to immobility; they remain in silence; they have no organization, no organs, and no chiefs; they carry their non-intervention to such a point, that they encourage the Ultramontanes to assert that they do not exist. And yet, as we have already said and repeated, there is good reason for believing that it is they who constitute the true Catholic body of France. Some day this fact will be at last recognized; some day it will be seen that Ultramontanes, who are as noisy as Radicals, have not numbers behind them, and that the mass of Catholics stand steadily against them.

And to supply one more argument in support of this view, is it not fair to assert that the position described here is precisely that which would most naturally and most logically result from the long struggle which France has carried on against Ultramontanism? Is it not in the order of things that the French should be, of all the Catholic nations of Europe, the least inclined to favor Ultramontane theories? They know that no government has fought so vigorously as their own against those theories, and that their history, for the last two hundred years, is full of combats against them. They know perfectly that, centuries ago, Ultramontanism was for a time a triumphant reality; that it once represented to France and to Europe not only the idea, but also the realization of a general public good — as public good was then comprehended; they know that it was then regarded as a legitimate expression of power and right. They know also that it gradually lost its position in the opinion of the world; that it became gradually separated more and more from the idea of public good; and that France had, in many ways, the largest

share in destroying it — especially by the personal resistance of Louis XIV., and by the action of the Revolution and the empire. They know that in the time of Pius VII. it was suppressed so thoroughly that Cardinal Gonsalvi was able to declare with truth that the Church "occupied itself exclusively with the salvation of souls and the spiritual good of nations." They know, too, that French events revived the Ultramontane theory, that it was partially resumed on the return of the Bourbons, and that the fears provoked by the Revolution of 1848 led to the attempt to once more apply it vigorously. But what they know best of all is, that this new effort has been made under conditions totally different from those in which the Church had found itself at any previous moment of its history; that the events of the last eighty years have changed the entire nature of the relations between Continental governments and their peoples, as well as between the Church and governments; that people now legislate for themselves, that they oblige their governments to adopt their views, and that governments have become powerless to enforce their will against the people; that the Church is consequently no longer face to face with governments which have the power of dealing with it as they alone think fit, but with governments controlled by legislatures, which legislatures are, in their turn, controlled by public opinion. Knowing all this, the French can see that the struggle of to-day is no longer, as it was in former days, a fight between the Ultramontane idea and a monarch or a minister; that it is now between that idea and nations as a whole — between it and the entire opinions, tendencies, and will of our epoch; that the circumstances of to-day are therefore new in history, and that they are rendered still more new by the simultaneous outburst of liberty and education; that Ultramontanism, which hitherto has had to treat with absolute sovereigns and ignorant populations, now finds itself at last face to face with powerless sovereigns and intelligent populations; that it can no longer appeal to single men, to personal ambitions, or to individual fears, but that it has to-day to come to terms with societies as a whole, with societies in all the emotion of newly-acquired rights, agitated by throbbing opinions and by ardent claims. They see all this; and yet it is with this spectacle before their eyes, — it is in this new state of public life — in the midst of this effervescence, after the whole conditions of existence have been changed, — that Ultramontanism is thrust again before them, and that they are asked to once more accept an obsolete political system, which was only rendered possible centuries ago because there were no books, no newspapers, no liberty, and no opinion.

Surely it is reasonable to urge that the entire probabilities of the position are against the acceptance of such a system. Surely those probabilities may be referred to in confirmation of the opinions which have been expressed here. Surely they are of a nature to support the assertion that, whatever small minorities may say to the contrary, the Catholics of France are not, and are not likely to become at any future time, allies of Ultramontanism. Not one-hundredth of the nation, taken as a whole, is now in favor of it.

And yet Ultramontanism is, at this moment, one of the greatest and the most immediate of the perils of France — as great and more immediate than the much-talked-of Radicalism. Its supporters, though so few in number, though regarded with keen suspicion by nearly all their fellow-countrymen, and with bitter hatred by a good many amongst them, are rich, high-placed, energetic, and astute; they possess the advantages of position, wealth, birth, and intelligence. But they are using these powers to disturb the interior peace of the country, and, what is just now infinitely graver, its international position too. They do not represent a force, but they incontestably constitute a danger. They are powerless to lead France to any effective action, but they divide her against herself and place her before her neighbors as a menace. The movement which they have undertaken will end in nothing, for the mass of the French people is publicly and resolutely opposed to it; but, so long as it continues, it will create difficulties between France and other countries, it will embitter the political struggle at home, and it will be a cause of pain and trial to the immense majority of French believers.

It is the main stumbling-block in the road of the moderate Catholics of France, for direct attacks against their faith affect them but little: they suffer from the exaggerations of their own party, not from the onslaughts of avowed enemies. Religion and irreligion are two conditions which stand apart in France; they both are active states, but yet they manage to avoid any struggle with each other in daily life. The members of the two bands move side by side in constant contact; but, in ordinary times, they keep their opinions

to themselves and have no personal quarrels. The indifferent form a third class around and amongst them, but not one of the three seriously attempts to act upon the others. The fight between them is public and political, it has no existence in private. Each man follows his own road with that perfect independence of his neighbor, that absolute freedom of individual action, which cast so much simplicity and so bright an atmosphere of social liberty over the life of the French. For this reason the bearings and the functions of irreligion in France might almost be left outside the present subject. But, though it is producing no perceptible effect on the ways and thoughts of the fraction of the nation which still holds to and practises a creed, another and a larger portion is, on the contrary, keenly animated by it. On that portion the effect of its working is manifest and vigorous, for the situation of the country has had the effect of attributing such exceptional importance to the collective public action of French irreligion, that it incontestably exhibits to us the most acute and the most energetic of the contemporary phases of the combat between belief and unbelief. The forms of French incredulity are substantially the same as those which offer themselves elsewhere; but its results are special, for they almost invariably lead the unbeliever, whatever be the causes of his unbelief, to become a political partisan and to join the attack against "clericalism." Indeed it is but natural that, in the face of such a political provocation as Ultramontanism presents, the other side also should give to their resistance a political form. We see the consequence in the curious fact that irreligion in France is becoming more and more a bond of organized political union, and less and less an individual condition affecting a particular person, or the society in which particular persons live. Irreligion leads Frenchmen to vote at an election for one candidate rather than for another, but it has extremely little influence on the separate or the social position of the man. It cannot, therefore, be too often repeated, that in France, unbelief, though a purely personal state, constitutes a purely political force, and that it possesses scarcely any social characteristics or influences. Its action on society is practically null. Unbelievers are as well-behaved as believers; they are good fathers, honest men, and obedient citizens; they are not disturbers of the peace in any shape whatever. When it has been said of them that they do not go to mass, and that they oppose the claims of the Church to interfere in politics, nothing more can be laid at their door as regards their external performances. French infidelity is to-day, in its personal aspects, a calm condition which shocks nobody; but politically it is growing into a force.

Thus far every word that has been employed has been applied to men — to men alone. Now let us turn to women. Through them we shall get on at last to the home-life side of the question.

The women of the Christian races are intuitively believers; negations offend their instincts; the nature of their education frequently suppresses in them the critical faculty; scarcely any of them have either the courage or the need to think out a faith for themselves; whatever be their land, their color, or their tongue, nearly all of them hold fast to the idea that religion is a necessity for women. It is so in France, as elsewhere; and for this reason we find the nation divided, religiously, into two great classes, men and women, almost as distinct in faith as they are in sex. Here it is that we find, conspicuously, the issues of the two great conflicting forces which were indicated at the commencement of this article — the power of the present and the power of the past: the men, as a mass, are under the dominion of the present, with its doubts; the women, as a mass, are still under the grasp of the past, with its faith.

The women of France, taken as a group, are gentle undoubters, rather than ardent believers. There are amongst them, particularly in the higher classes, superb examples of passionate and ecstatic enthusiasm. There are amongst them all the varieties and all the degrees and shades of devotion; but the mass of them are calmly and moderately pious people, neither curious nor learned, performing each of their spiritual obligations with temperate regularity, as a function which nothing could induce them to neglect, partly because it involves a recognized and accepted responsibility, very much because it supplies them with a pleasure and with the gratifying sentiment of liabilities discharged. Their religion is at once an occupation, an allegiance, and a gladness. It supplies to them a solace, a duty, and a joy. It does not, usually, exalt their intellectual faculties, but it both stimulates and contents their fealty, their conscience, and their heart. As Catholicism is, essentially and fundamentally, a creed of love; as no Christians love God — in the sweet, soft, familiar sense of love

—as Catholics do; so also are Frenchwomen indisputably the tenderest of Catholics. A thoroughly religious Frenchwoman supplies the most striking example of Catholic affection that the earth can show. Her inborn impressibility, her peculiar naturalness and simplicity of motives, her unchecked, outpouring emotionality, her constant longing for satisfaction of the sympathies, her vague but unceasing yearning for sensations, her very disposition to play a *rôle* and to act a part, most of her qualities and even some of her faults—all these find contentment in religion. But the contentment is in most cases instinctive. It is perceptive, not objective—felt, not reasoned. Frenchwomen handle their religion with intimacy, with fondness, with caresses; they treat it as a faithful friend whom they can thoroughly trust, with whom they can talk over their sorrows and their delights, and who is too nobly unselfish, too grandly sincere, to be offended by occasional negligences or momentary forgettings.

Of course, there are numbers of varieties; of course, there are quantities of women in France who have no faith at all; of course, there are crowds of others who are pleasantly careless about the entire subject. There are also thousands who attain exalted sanctity, and who wait for death in enraptured enthusiasm. But the majority are such as have been just described,—tender, loving, honest women, clinging tightly to religion as a cherished companion, clinging to it for its own sake, and also for the sweet excitement with which it provides them. At the same time, it cannot be denied that, notwithstanding the universality and the accessibility of its succors, religion is nevertheless, in France as elsewhere, somewhat of a class luxury; and that its intenser and more prolific growths are, for the greater part, a monopoly of the higher ranks of Frenchwomen. There are exceptions, of course, at both ends of the scale; but, speaking generally, the poor scarcely ever get beyond the elementary emotions of religion. Very few of them are prepared by teaching or are fitted by position to attain its more fervid and more passionate developments; and though the object and the interest with which they pursue it may be substantially identical with those of the more ardent women above them, they have neither the leisure, the training, nor the imagination which are essential for distilling out its full perfumes. Women who have to earn their own bread find it difficult to indulge in the elevating stimulations which are induced by the practice of the culminating forms of Catholic piety. Labor stifles unction. The result is, that though the wives and daughters of the working-men of France have infinitely more faith than their husbands and their fathers, still the usual fashioning of their practice remains incomparably less finished than that of women of the better-educated and richer classes. It might, indeed, be almost asserted, that the active sentiment of feminine religion, and the eagerness of its dilating aspirations, gain strength in France in a ratio corresponding to the rise of social position. There are, it must be repeated, most numerous exceptions in every grade; but it may be said with safety that, as a rule, the dry bread of religion is all that the mass of women of the lower strata can manage to consume—and that its more delicate aromas, its subtler tastes, its more exciting savors, its more intoxicating fragrances, are the almost exclusive privilege of the idle. And yet the women of France, taken as a whole, are a very Christian race.

The general state of religion throughout the land may be roughly summed up as follows. On the side of the men, the lower and lower-middle sections live in a general unbelief which presents all the conceivable shades of irreligiousness, from mere thoughtlessness to bitter, active, militant hatred of religion, as a detested enemy. In the middle and upper divisions of society faith is, relatively, frequent; it is not general, but its acceptors constitute a recognizable minority. There is a good deal of scientific or philosophic atheism, and a still larger proportion of indifference; but the professing Catholics count for something in the country, the mass of them being nineteenth-century Christians, with a small portion of ardent Ultramontanes thrown in around them. With the women, on the contrary, religion may be said to be really, not relatively, general. In their case it is the minority which is unconcerned, which raises difficulties and puts questions. Amongst the poor, in town and country, there is naturally plenty of callousness; but there is also a vast deal of simple, patient, unreflecting, trustful faith, rising rarely to strong emotion, but remaining absolutely untouched by doubt, because it has nothing to do with reason. In the upper strata, on the contrary, doubt is found, for there the intellectual forces come into play. Still, the educated Frenchwoman feels almost always an irresistible need of a creed which guides, of a doctrine which

lights up, of a sentiment which warms, arouses, and cements together her affections, her aspirations, her imaginations, and her convictions. She finds all this in the practice of Catholicism; and she throws herself into it with the eagerness of a fond woman, of an excited artist, and of a hoping soul.

And now, after this attempt to roughly sketch the present situation of the religious sentiment in France, let us try to go further, and to measure the working and the influence of that sentiment on the life of the people.

The first symptoms which offer themselves to the observer would seem to indicate, if taken alone, that religion is exercising very little appreciable action on that life. It appears, to the casual beholder, to lie outside the march of the visible occupations and the ordinary thoughts of the nation; to occupy a place by itself, away from everyday concerns; to direct its workings, its teachings, and its efforts to other objects than the guidance and the amelioration of existence in common. The signs of its operation are essentially personal and private; they have scarcely any public aspects; they must be looked for behind and apart from the active movements of society; they are hidden out of sight in hearts. The religion of the French — of those amongst them, that is, who have any at all — is, like family affection, a sentiment which is usually kept to themselves by those who feel it; it is an unaffected, simple, natural expression. Its marked tendency is to be modest and quiet: it does not thrust itself forward in the market-places; it does not cry out in the streets; it does not advertise its existence in newspapers.

But the absence of demonstrative obtrusive godliness is compensated for most efficiently and advantageously by silent forms of devotion, by frequent visits to church, by constant, reverential intercourse with the love-arousing mysteries of Catholicism. Close examination proves that a good many of these light-hearted people, whose religion is rarely easy to be perceived by Englishmen (partly because it is generally kept out of sight, partly because its shapes and fashions are so unlike those to which they are accustomed at home that they have difficulty in recognizing them), are, in reality, occupied by a singularly elevating type of devotion. And yet nobody says one word about it. Religious practices, even when passionate and absorbing, even when perpetual and profound, are regarded in France as the private affair of each one, and not as the business of the community at large.

The French, as a rule, do not, like some of their neighbors, regard their religion as a duty which they wish other people to see them perform. On the contrary, it stands distinctly before them as a responsibility which is strictly proper to each believer separately. It is not, in their eyes, an obligation to be discharged in public as a satisfaction of vanity; they view it as a sweet private comforter, as a secret gladness which they cherish for themselves alone, which they fondle in delightful solitude in their hearts. Each one of them treats it as a personal feast, and handles it as a self-belonging delight. Even when rough winds begin to blow — even when, in trial or in pain, they turn to it as a beacon or a compass, and seek to use it as a breakwater, a refuge, or an anchor, — even then it retains, in the majority of cases, its character of an individual resource — even then it preserves its marked idiosyncrasies of tender intimacy, of the affectionate sentiment of specific possession. At no time does it fall into the position of a mere general right or of a social propriety.

It is for these reasons that it is so difficult to discover demonstrations of the influence of religion as a patent national fact in France. Ultramontanism, of course, shows glaringly before us, with its purely political objects; official religion is there too, with its budget, its hierarchy, its schools, its convents, and its institutions: but of the comprehensive public action of religion as a sentiment — of the working of religion properly so called — of the religion which moralizes, cheers, and brightens — we can detect scarcely any out-of-door signs. Just as irreligion manifests its effective national action in a public and political shape, so, in contradistinction, does religion produce its fruits in a purely private and individual form.

But if religion has so little footing in France as a visible external force, it constitutes, on the other hand, an indoor power of distinctly tangible effect. The very individuality and affectionateness of action which deprive it, in so great a degree, of the faculty of collective pressure on the people at large, bestow upon it an ample and a real ascendancy in homes. At firesides it takes a foremost place amongst the sovereignties which rule the life of France. Here, at last, we find it manifestly at work; here, at all events, we can seize hold of it, and can try to see what it is doing for this generation.

The attempt is not very difficult. Provided we limit ourselves to the general outlines of the picture, omit all exceptions (save one), and resist the temptation to take individual cases as average examples, the main facts of this part of the situation are relatively easy to ascertain. No one can fail to recognize, for instance, after a little inquiry, that, in the vast majority of cases, without distinction of rank, all children are submitted to the action of religion. The feelings of parents, whatever those feelings may be, scarcely ever prevent children from receiving some sort of religious teaching. Of the upper classes it is surely needless to say anything; a well-born child would be ostracized amongst its playfellows, and even be disgraced for life, if its parents failed to send it to the catechism-classes at which the young are prepared for their first communion by special instruction extending over two or three years. In the country districts the same rule applies, with nearly the same rigor: a boy or girl who fails to make a first communion is pointed at and pitied. And even amongst the combatantly unbelieving workmen of the towns, — even amongst those very Radicals who are accused, by some of their fellow-countrymen, of an inclination to burn the churches and to shoot the priests — we find that an analogous feeling exists in curious abundance. There are, of course, exceptions; but, considering the hostility to religion which is so widely prevalent amongst the men of the lower classes, these exceptions are, proportionately, few in number. It is calculated by the clergy that, on an average, about nineteen twentieths of the children in the country, and about five-sixths of those in the towns, are sent in, at twelve years old, for their first communion. If this estimate be correct, it would follow that, out of a male population of which a considerable majority admits no religious opinions whatever, and of which a notable portion is apparently animated by bitter animosity against the Church, only a small portion carries its opinions to the point of preventing its children from coming into contact with spiritual instruction.

The fact is strange. It shows that many fathers in the working-classes adopt for their children a line of action different from that which they personally pursue, and that very few of them, comparatively, accept the responsibility of allowing their children to grow up without some instruction in, and some practice of, that religion which, in their own case, they profess to despise and to attack. Does it not seem fair to attribute this contradictory attitude to a latent action of religion in themselves? Does it not look as if they, like most other French fathers, are unable to resist its influence when brought to bear upon them in a true home form? Out of doors, in their own individual proceedings, they scoff at it, insult it, menace it; but when it comes before them as an accessory of the education of their children, when it presents itself to their eyes as a family observance, when it holds out its hand to their own boy and girl, then they find something in their hearts which prevents themselves from shutting the door in its face. In spite of their loudly declared mistrust and disdain, they allow their children to answer its call.

Surely there is something here which merits to be considered. If men who proclaim that they hate religion, and who act in many ways as if they really did hate it, can be led to suspend their hate, and to accept contact with the hated object directly it makes a sign of friendship to their offspring, it becomes difficult to admit that their hate can be as deep and positive as they pretend. We cannot help asking ourselves, in the face of such a situation, whether a hate which can be laid aside for a moment in deference to one touching consideration, could not be further stayed by the application of other similarly acting motives — whether the temporary could not be rendered lasting? The answer raises issues which cannot be dealt with here; they are too vast. All that can be done, in the space at present disposable, is to point to the fact which lies here before us; to the thought suggested by it that the mass of the French people cannot be, after all, entirely unsusceptible of religious emotion; to the consequent probability that it may still be reached through certain channels of attack; and to the seeming certainty that, if all the rest be true, the road to follow lies through the heart. It cannot be seriously pretended that, with a religion which is essentially a tenderness, and with a nation of which all the members are, theoretically, equal in their natural capacities of tenderness, the faculty of feeling that religion ought to be, as it now virtually is amongst the men of France, an affair of class. Of course we know that it is developed in the higher strata by the combined influences of comfort, of softening education, of social habit, and of exercised perceptions. We also know that it is suffocated below by ignorance, by suffering, and by political

teaching. But with the evidence we have here that it can be partially re-aroused by an appeal to the sentiment of paternity, it seems reasonable to imagine that a good deal more might be effected if the indication thus supplied were utilized with tact. If the priest is ever to acquire amongst the laboring men of France the position and the power of a trusted friend, of an inspirer of elevating thoughts, of a real moralizer, he must begin by changing his own attitude, by ceasing to act as an Ultramontane agent, by doing everything for religion as a system of love, and nothing for it as a system of politics.

This is all that can be said upon the subject here. And yet one word more may usefully be added — we can scarcely go on accusing of really dangerous Radicalism a set of men who send their children to their first communion.

Nearly all the boys and girls of France experience, then, in the middle of their childhood, the deep emotion which a first communion awakes even in the most careless heart. The effect wears off with time; the religious impress which it provokes rarely retains its first intensity against the hardening contacts of outside life; in many cases — in most cases, indeed — it disappears altogether: but in its home influence, in its character as a family event, in its special operation as creating a new bond between old and young, it preserves unweakened its position in French existence. The portrait of the daughter in her long white veil and frock, of the son in his white trousers and *brassard*, hangs in the cottage and the château; and with sweet remembrances, with undefinable impressions of purity, with unwontedly lofty thoughts of love, the mother gazes at it and feels unfadingly that the day of which that portrait is a record has left an ineffaceable mark in her heart. How, indeed, could she forget it? for it represents to her the moment at which her child achieved its first acceptance of responsibility, its first public discharge of comprehended and acknowledged moral action.

It may be said with tolerable exactness that these deep-working thinkings are common, in varying degrees, to nearly all French mothers, without distinction of rank, and that consequently the great majority of the women pass successively through them. And yet, in spite of the vigor and the alluringness of the sensations which they so generally arouse, it can scarcely be alleged that they help, as a rule, to render the women who are subjected to them more permanently, more solidly religious, in the practically applied sense of the word. Like most of the other elements of spiritual ardor in France, they seem to produce effects in the sentiments rather than in the conduct. They undoubtedly make the mother even more passionately fond than she was before; they evidently provide her with glowing emotions and with delicious memories; they incontestably establish a fresh tie between her child and herself: but it would be difficult to pretend that they habitually convert her into a better woman. And this brings us to the moral of the subject, for it leads us, naturally, to inquire whether these women really gain in character, in duty, and in attitude towards others, by the charming affectionateness of their religionism.

Such a question can only be answered by international comparisons; and comparisons of that sort are not always easy to effect impartially. Let us remember, however, that many competent travellers appear to arrive at the conviction that, much as the shapes and natures of feminine merits and defects may vary about the world, the totals presented by their respective additions in each Christian land come out everywhere in remarkable equality with each other. And let us recognize that there is in this conviction a *primâ facie* argument against the probability of the possession of any appreciable superiority of moral and religious worth by the women of any particular race whatever. This being so, the Frenchwoman can scarcely be offended if she is counted to be as good as, but no better than, everybody else, and to be no more capable than her neighbors of extracting particular virtue from the religion which she practises. She evidently gets more pleasure out of it than others do; for, as she feels immensely, she frequently attains, as a natural result of her peculiar aptitude for emotions, a variety of spiritual joys which do not seem to be generally accorded to women of other creeds, or even to Catholic women of other lands. But it cannot be pretended that she climbs higher than those others; that she is either gentler, truer, more self-sacrificing and more trustable than they. She furnishes one proof more that the capacity of feeling religion with ardor does not necessarily bestow upon us any exceptional power of curing our personal faults. Religion does help her undeniably to become a most admirable mother; it fortifies and increases her innate disposition towards works of charity; but there is very little satisfactory evidence

to show that it assists her more than other women in the ordinary functions and relations of life — that it aids her to become a better daughter, wife, or friend. Religion succors her interiorly, not exteriorly; it soothes, it satisfies, it encourages, or it excites her. But it seldom seems to particularly enlarge her capacity for self-reform.

It ties her to her home, though. It serves extraordinarily there, for there its glowings can be effectively translated without exertion into meritoriously profitable acts. No virtuous effort is needed to enable a woman to love her parents, her husband, and her children as a duty, provided she already loves them as a joy; the consciousness of having amalgamated joy and duty doubles indeed the value of each.

In this fashion it is that religion strengthens and develops the home ties of France. Not only does it fortify and encourage, not only does it sanctify and hallow, but, furthermore, it decorates duties, adorns labors, and throws pleasure over pains. It does not show itself in chilly ceremonies in French houses; there are no conventional formalities about it; there are no cold household prayers (excepting in infinitely rare cases), no gloomy Bible-readings, no dismal psalm-singings, no affectations of austere piety before the servants, no sanctimoniousness, no cant. But great quantities of women (and some men) go each day to mass — often in the earliest morning — and tens of thousands of them never pass before the always open churches without going into them for two minutes to say a whispered prayer, and to reap the privilege of entering the immediate presence of God; and all of them habituate their children to the same soft, touching customs, and to the exalting sensations which these customs arouse. And all this is done so naturally and so simply, so cordially and so heartily, that there is no oppression and no *ennui* about it: with these women religion is neither a show nor a mask. Neither is it so with such of the men as "practise;" for the reason, that as it is easy and usual for a man to have no religion at all, no purpose can be served, and no advantage gained by merely pretending to have it.

It is, then, in its power of gilding indoor obligations, of creating new forms of linkings in families, of illuminating and inspiriting the fireside, that religion produces its realest, sweetest, and most evident effects in French homes. It is essentially, in this as in its other social aspects, a brightener rather than an improver, a cheering friend rather than a teaching master, an allurement rather than a behest.

But there is one exception — the one exception which was reserved when we began just now to talk of the action of religion on home life. There is one actual form of French religious sentiment in which bitterness, violence, and uncharitable hate replace the delighting exaltations of mere simple, joyous piety, in which human passions drive out spiritual enthusiasms, in which politics suppress Christian generosity. That form is Ultramontanism.

Just as it has been easy to describe, in large, round lines, the main external characters of the tender loving faith of the ordinary woman of France, so is it difficult, if not indeed impossible, to select words which would accurately convey a sense of the fierce contempts, the wrathful enmities, the unpardonable abhorrences, which animate a large proportion of those other women who, by birth, by position, or by social affectation, belong, or pretend to belong, to the Ultramontane group. The men of this set are violent enough in their bitter hostility to all who do not think like them; but the women are immeasurably more excited and destructive. Families are at this moment being broken up, ancient friendships are being crushed out, new hates are supplanting old affections, — all this because a certain number of French gentlemen and ladies have adopted a particular form of politico-religious opinion, and will permit nobody who has the honor of approaching them to express in their presence, or even to silently entertain, any sentiments which differ from their own. It must, however, be added at once, that the particular ferocity of tone and attitude which is at this moment so painfully prominent in Ultramontane drawing-rooms, is, in great part at least, a product of the special agitation which has been at work since the 16th May. It is an exceptional, not a normal state. The Ultramontanes form always a band apart; they are always unquiet, irritable, and impetuous; but they are not, habitually, so strangely raging as they are just now. Under the best of circumstances the ladies of the party do not generally present to the spectator the pleasant pictures of religious manner which many other women offer; but it is just to them to recognize that their actual exasperation is altogether unprecedented, and that, for that reason, it may perhaps be only temporary.

Here must end this slender sketch; but it is scarcely possible to quit the subject

without a glance at one other of its elements, without a brief allusion to the influence of the clergy; for it has been indignantly asserted by Michelet, and by other writers of his school,—it is now again asserted, with equal indignation, by writers in the Radical press,—that the priest is constantly exercising a disastrous predominance on families, and that the home life of France is poisoned by the insidious but irresistible power of "the men in black."

Now it may possibly be that there really are some families in which the confessor does wield a veritable control; but, all the same, there are singularly few observers who, in all their memory, can find an undeniable example of such a case. Most women and children go, more or less often, to confession. So do some men. But the relations of these persons with their confessor are habitually limited to the confessional; at the most do they, in unfrequent cases, exchange an occasional visit. The longest and most widespread knowledge of French life fails usually to supply evidence of the single direction of a family by a priest. Not only do women habitually and instinctively shrink away from the influence of a stranger, whoever he be, in their private concerns, but, furthermore, the priest is scarcely ever personally capable of obtaining such an influence. The mass of the French clergy is composed of well-intentioned, worthy, laborious men, who do their duty, more or less mechanically, within certain clearly-defined limits, which nobody would permit them to exceed, even if they wished to do so. They are generally men of no initiative, of no inventivity, and of little tact; not one in fifty thousand of them is capable of playing, even if opportunity occurred, the wonderfully able and prodigiously difficult part which is so liberally attributed to the "Jesuit confessor" in Protestant novels and in Radical newspapers. Their own incapacity, their want of manners, their narrowness of views, suffice alone to shut the door against any efforts of the kind. They live apart from the nation, quietly and rather stupidly, but usefully, with an evident desire to interfere awkwardly in politics, if they find a chance, but with no desire whatever to meddle in households, because they know they cannot. It is ridiculous to pretend that such men offer, or are capable of offering, the very faintest danger to society. There are, of course, in so large a body, many high-bred gentlemen, many graceful scholars, many thinkers of elevated intellect; there may be even, here and there, amongst them, some schemers or some intriguers; but the immense mass of them are even-going, unaspiring nullities, to whom it suits the political purposes of the Radicals to attribute profound conspiracies which they are hopelessly incapable of either conceiving or executing.

The influence of religion in the home life of France lies virtually outside the action of the clergy; it assumes a personal form which is special to the country; it is one of the brightest of the many brightening causes that are at work there; and no true friend of France can fail to wish that that influence may extend and multiply.

From The Saturday Review.

PLEASANT PEOPLE.

THE man who can be characterized as pleasant in the full ideal sense of the word is born, not made. It is true that the epithet comes in in every definition of social excellence. A perfect gentleman is pleasant, the perfect Christian is pleasant, the genial companion is pleasant, and so on. Good temper, good nature, sociableness, and the like make people pleasant; but all this is distinct from that particular felicity and benignity of nature through which some people please universally; so that, by general consent, men of all tastes and conditions fall upon the same epithet as a comprehensive, satisfying definition. Persons not thus gifted can be pleasant now and then—pleasant to their intimates, pleasant when they are pleased, when they think it right to be pleasant, when they are on their good behavior, when nothing vexes them, though it is not everybody who manages it even under these favoring conditions. But the man to the manner born is pleasant from a sort of necessity of his nature; to be disagreeable is too much against the grain to be even a temptation, except under some upsetting of the whole framework of his being—some sort of moral convulsion. It is this necessity which separates the people so gifted as a distinct class. Of course, under favoring circumstances, a man polishes his natural good qualities to a greater brilliancy; but, whatever his condition, it distinguishes him. There is a subtle relation between him and his fellow-creatures peculiar to himself, which no effort, no art can establish. We do not say that severely adverse circumstances in early life may not interfere with its development. Dickens in

Mark Tapley gives us a broad, comic delineation of the character. Tapley is pleasant under extreme difficulties, but we are told nothing of his training. In persons pre-eminently pleasant we observe a harmony between themselves and their surroundings which might seem to argue that these surroundings have their share in the phenomenon; but we rather attribute the harmony to their gift of subjugating matter to mind and temper. It is not only animate things that range themselves on the side of the fortunate.

In considering this quality we have to think of the qualities that generally mark and attend it. We observe, then, in the ideally pleasant person self-possession, freedom from self-consciousness and everything morbid; a power of seeing things as they are, of accepting a position. Before all things the pleasant man is not hampered by vanity and love of display, any more than by nervous fear and bashfulness. He probably sees himself and everything about him at its best; but this is only due to the construction of his moral vision, which we hold to be an essential of the character, seeing everything, and more especially everybody, under a certain illumination. One of the charms of the pleasant person is that he makes all who come in his way satisfied, and in better humor with themselves and their place in the world than it is their habit to be, either under their own review or in what they gather to be the judgment of people in general; or, if they have already formed a complacent estimate of their merits and standing, they find themselves taken at it ungrudgingly and as a matter of course. This is a totally different thing from flattery, which can scarcely be applied without exciting some misgiving in the person flattered. There is nothing indulgent or patronizing in the pleasant person's tacit approval and appreciation. He takes all people at their best from no effort of charity, but from instinctive sympathy, making things bright to others by seeing them so. For the pleasant person is largely sympathetic up to a point. It is not necessary, perhaps is not common, that he should penetrate into depths of character. His penetration occupies itself on what he has to deal with. He does not assume that he sees the whole, and does not take people in hand beyond what they care to show themselves, either for their pleasure or their good. He does not force confidences; he acts on what he sees, and his nature makes his judgment a favorable one.

In looking for examples of the pleasant man we are driven to public and recorded specimens. Even if our friend were also the friend of the whole world, it would hardly do to draw his portrait; we must have recourse to print. Now a great many men who strike us as pleasant are likewise so distinguished on other grounds that they will not serve our turn. Pre-eminent qualities overshadow this milder grace. One prominent name, however, figures in the crowd of records of a day recently past, which is marked before all things by this quality. Lord Holland, of social memory (the third of the title), was before all things a pleasant man. This praise seems to have come first in the estimate of all his friends. George Ticknor, writing as a young man, on his first introduction to the Holland House circle, says, "I do not well know how dinners and evenings could be more pleasant;" and twenty years later he traces this pleasure to its true source — Lord Holland himself: "I cannot help agreeing with Scott that he is the most agreeable man I have ever known." And he goes on to define what constitutes this charm: "The reason, I apprehend, is that to the great resources of his knowledge he adds a *laissez-aller* arising from his remarkable good-nature, which is quite irresistible." "Lord Holland is an open-hearted gentleman, kind, simple, and hospitable, a scholar with few prejudices, and making no pretensions, either on the score of his rank, his fortune, his family, his culture, or anything else. I never met a man who so disarms opposition in discussion as I have often seen him, without yielding an iota, merely by the unpretending simplicity and sincerity of his manner." We have quoted the whole of this passage with a purpose. It is very clear that this agreeableness of the host, through which he made his guests alive to his high appreciation of their powers, was one active cause of the success of those historical dinners. But we would dwell rather on that gift of disarming opposition; thus opening all subjects to discussion, whatever the various opinions of the company. Clearly moderation is one important quality in the pleasant man. A great many people are not only excellent, but admirable and lovable, who yet do not come to our minds as pleasant, from the vehemence of their manner of holding opinions — a vehemence which does not allow them to discriminate time and place with judgment, which drives them to obtrude opinions, to pursue a topic when others would gladly

dismiss it, and which further leads them to convey sentiments with a severity implied towards those who differ that jars on the harmony of the assembly. We are not saying that vehemence carried to this point is not sometimes called for; we only say it is not pleasant on occasions of social intercourse. Now the pleasant man never lets things and views make him forget persons. In times of excitement, political or religious, when party spirit runs high, the pleasant person is a refuge. He is never carried away; so little so, that the chances are that he irritates the more eager partisan. But it is his nature to give every one with whom he willingly associates credit for good motives and for some sense in carrying them into action; and this interferes much with the luxury of party warfare. However, the whirligig of time brings every one and all sides to the pleasant man at last for consolation or repose. He does not lose his friends; nobody can afford to lose him.

Another conspicuous example of the auality under review must have been Ticknor himself. He has indeed what is called a European reputation as an author; but, as his subject was Spanish literature, this is not incompatible with an all but universal ignorance of his book. He will always be known best for the record he has left of the distinguished and various society — European also — in which he moved. The reader is puzzled how a young American, son of a grocer of Boston, U. S., should, from his first landing in Liverpool to wherever his travels led him, come to be on intimate terms with everybody of name throughout civilized Europe, should be passed on from England to France, France to Germany, Germany to Italy, thence to Spain, welcomed by all the "best people" in every country, making new friends wherever he went, and keeping them through life, finding himself by a sort of natural affinity on a familiar footing with authors, wits, statesmen, crowned heads, and leaders of fashion; being present at a critical moment to hear Talleyrand's deep oracular utterances, receiving Prince Metternich's confidences by the hour together, admitted to Mme. de Staël's dying couch, standing in the privileged circle near enough to hear Lady Jersey refusing the Duke of Wellington admittance to Almack's. The key to it all is that he was pleasant — pleasant in an eminent degree. He was no doubt remarkably gifted for making a figure in society; he took infinite pains to fit himself for it. Well-mannered, well-read, clever, ready, and so forth, he was, of course; but clever people are not scarce in such circles; what won him his place was his pleasantness, his power of appreciating the gifts of others, and showing that he did so. We see from his journal that he saw all people as they would themselves wish to be seen. He speaks well of almost everybody; he is not readily bored; he does not designedly smooth over or ignore faults and defects, but merit makes more impression on him. The men are finely gifted, full of genius, marked by some telling distinction; the women beautiful, gracious, clever, and charming. We live in the best company from beginning to end of his two volumes; and he is so agreeable and unpretending through it all, that the most cynical reader does not envy him his singular good fortune. The touches of description given in the few pages of biography bear out the impression; such as "his habit of consideration for others," "he was not disposed to be satirical," "as a student of character he was vigilant, thoughtful, and kind," "he had promptitude and presence of mind in conversation, the result of early, large experience of society," and "deference and politeness, which are the unselfish elements of good breeding."

But for humbler social purposes no literary reputation, no gift of eloquence, no ready wit, no experience of fine company is needed to endow a person with this quality in its fullest sense. It is a charm in itself, a gift of nature, needing only ordinary good breeding and ordinary common sense to set it off. It is an attraction which draws by its inherent winning quality. There are women who do not shine or talk much, who are not accomplished, not distinguished in any way, not beautiful, not young, who do not know why people gather round them, why they hasten to tell them good news before others with a more definite claim, why they look forward to their fireside as a rest, why they think of them first if they have a confidence to communicate, a dilemma or tangled perplexity to unfold. It is because they are pleasant, because they are sure to look interested, sure not to interpose their own affairs at the wrong moment; sure, above all, to take the side you want them to take, to see things in the light in which they are expected to see them, or at least to show a willingness to do so; sure, too, to infuse a certain comfortableness into the view of things, to act at once as a stimulus and a rest.

Nobody is pleasant in this characteristic

sense, as a prominent trait, who is not happiest and most himself in exercising his gift rather than in the exhibition of more commanding or more showy qualities. But he is pleasant without consciousness of personal performance. In parting with friend or acquaintance he does not ask himself, What did he think of me? what impression did I make upon him? Not that there is any harm in such inner questions if there has been an effort to talk well, to do oneself justice, to be equal to an occasion, to respond to some call upon the powers. The pleasant person, acting in his function, is always leaving to others the business of shining and making a figure. He assumes a second place, makes way, yields, listens, or, if he shines, it is to please, not to make a display; it is the response of sympathy to the call of the hour. But, after all, the native genius in this line is not to be described; he has a way with him that is incommunicable. We may indeed analyze; he is this or that; he is free from these and those defects. He is recognized when we see him.

From The Pall Mall Gazette.

WALKING IN WINTER.

We do not say it is wonderful that people do not indulge more in winter pedestrian excursions than they do, because we are apt to regulate our relaxations by habit; and there are undoubtedly some grave objections to winter walking. No one would dream, of course, of plunging out in broken weather through mire or snowdrifts. Among the most common conditions of our climate at this season are clouds that cover the landscape in wrappings of dripping damp, and the days are disagreeably short when the year is just upon the turn. On the other hand, you may have brief but most bracing spells of crisp, frosty sunshine. The breezy home counties offer some of the most charming scenery in the world for short spurts of pedestrianism; they are dotted with comfortable inns; and should the weather change in one of its sudden caprices, there are railways everywhere to bring you back to London. It will be granted that there is nothing like frost to make the well-conditioned pedestrian feel in condition. When the body is healthy, frost invigorates the nerves and knits up the muscles and sinews. Your spirits rise with the innocent intoxication of the buoyant atmosphere, and, as legs and arms seem to turn to iron, you easily persuade yourself that, in the language of American backwoodsmen, you are "fit to whip your weight in wildcats." Your blood flows in a rush unknown in summer when you have set your face in earnest to the steep of a hill. Indeed, the summer as the favorite walking-time is overrated. We confess all the charms of the balmy air, the delights of the fresh mornings and the evenings, with the splendors of lingering sunsets. But that balmy air disposes to languor, and the sun that beats down upon you in its vertical glare inclines you to indolence rather than effort. In southern countries, or even in central Europe, you must be up betimes and make the most of the coolness if you have much ground to cover; and then you must lie off perforce through the most shiny hours in a long siesta that may be very wearisome. Your appetite has to be tempted in spite of the tax upon your powers; and if you are out of condition your thirst is unquenchable, while the means of slaking it is often deplorably unsatisfactory.

In winter, on the other hand, if you time your walk to the weather, all these depressing conditions are reversed. You have gone to bed pleasantly tired over night, and you know you need not hurry over your start in the morning. A dip in the stinging cold bath and a rub down with rough towels warms you thoroughly to anticipation of the pleasures of the day. You come down to the little coffee-room with a fine edge on your appetite. You find a table plentifully spread in front of a good fire. You are by no means over-particular as to the fare provided. You are pretty sure to get good bacon and eggs, with a loaf that is probably home-baked, at which you may cut and come again. There is a luxury in the pipe that follows, to which, in the memorable words of Mr. Swiveller, the rich and the haughty are strangers. And by the time you have made yourself deliberately ready for the start the sun is showing himself over the neighboring hill, and the haze in the valleys is beginning to evaporate. The ice on the hard-bound roads crackles cheerily under your boots, and the sprays on the hedges and the trees are covered with a frost-work of silver. As the mists thin and finally disperse, there is a rare purity in the atmosphere. The crests of the distant downs cut clear against the deep azure of the skies. The smoke is going up in silvery wreaths from the chimneys of the cottages and homesteads. A supreme tranquillity lies over the landscape, a quiet heightened rather than broken by

the rural sounds that come floating to the ear from extraordinary distances. You can hear the rattle of approaching wheels from a good mile ahead of you, and listen to the tinkle of the sheep-bells from the pens in the adjacent turnip-fields. We may presume you know something of the geography of the county, and at all events you care very little whether your walk be prolonged or curtailed. On the theory of finding it a shorter cut, you strike down a side lane that lands you among woodlands. Though the leaves are down and the boughs are stripped, there is no lack either of foliage or coloring. There is a wealth of scarlet berries on the hollies that stud the copses and the hedgerows so thickly. Thrushes and blackbirds and fieldfares are holding high festival over the ruddy wild fruit, and are all the more happy for the sharpness of the weather. Of course the red-breasted robins are hopping and chirping, with their customary assumption of devil-may-care confidence, and the hedge-sparrows are twittering in merry troops. The relics of the coveys of patridges show portentously large as they cluster with ruffled feathers against the plough and on the bare fallows. And the hare goes limping leisurely along, as if still somewhat stiffened after the night in her form; while the rabbits are popping out and in among the burrows with which they have honeycombed the roots of the hedgerows. You hear the scream of the gay-plumaged jay as it flits through the neighboring coverts, and occasionally, as the day goes on, the cheery crow of the pheasant.

By one o'clock, we will say, you are ready for a halt; and it is no unwelcome sight to see the sign of the village public-house swinging from the tree before the door. Your breakfast is already a thing of the past: you cannot say you are tired, though even a hard chair is a luxury; and if your digestion, as may be hoped, permits of such liberties, you call incontinently for bread and cheese and a tankard. Then another pipe and another start. Now you take leave of the level and strike up through the chalk roads into the downs. It is just the hour for making an ascent, though there is but little time to spare; for the air is as translucent as ever it will be, and the views in the distance and middle distance are enchanting. The clumps of rabbit-nibbled furze-bushes show golden in the cold glow of the sun; the stretches of the short, yellow, weather-beaten turf look like a rolling sea of russet, while the herds of sheep, as they huddle themselves together, throw a light upon the landscape in gleaming patches. Nothing can be brighter or more lively while the light lasts, and when the day begins to dim and the sun to slant downwards you have a rare opportunity of studying haze effects. The vapors drawn up in the ephemeral warmth begin to envelop the woods and the villages in the weald. The clear outlines below are slowly confounding themselves, the misty veil floats gradually upwards, clasping the heights and the church towers in its embraces, until these at last grow more vague and disappear; while above and away to the westward all is brighter than before as the sun sinks down to his rest behind the ridge of the uplands, leaving those red streaks across the sky that give promise of a glorious morrow. And it is time that you followed his example and struck downwards too; although, should you see cause to prolong your walk by the starlight, you will have little reason to regret it. And we grant that a long evening in a country inn may be regarded as a take-off to winter pedestrianism. But then, after all, a man with a soul for the beauties of nature ought to have resources in himself; and to many a man there is no better time for voluptuous reading or calm meditation than when reposing from the labors of an enjoyable day in the light languor of exertions that have barely wearied.

From Nature.

ANTOINE CESAR BECQUEREL.

It is with regret that we record the death of the noted French physicist, Prof. Becquerel, which occurred on January 18, in Paris. Antoine César Bequerel was born at Châtillon-sur-Loing, in the Loiret department, March 8, 1788. After completing a course in the Paris Polytechnic, he entered, in 1808, the Imperial Engineer Corps. It was no time of idleness for young officers, and he was shortly in active service, taking part in the entire Spanish campaign under General Luchet. Here he was present at the sieges of Torbosa, Tarragona, Lagonte, and Valencia, and manifested such marked abilities that in 1812 he returned to Paris to receive the rank of captain, and be presented with the cross of chevalier of the Legion of Honor, from Napoleon's own hands. In the following year he was sent by the emperor to complete the fortifications on the German frontier. At the fall of the empire, in

1815, he resigned his position as chief of battalion in the engineer corps, and devoted himself exclusively to physical and chemical research, accepting a position as teacher in the Musée d'Histoire Naturelle, of Paris. In 1837 he was made professor in this institution, and occupied this position up to the time of his death. Shortly after entering upon his scientific career he commenced the remarkable series of investigations in electricity and magnetism which have been uninterruptedly continued during the past half-century, and have linked his name closely with every branch of these two leading departments of physics. In thermo-electricity Becquerel carried out a large number of experiments on the currents caused by heating both a single metal and two metals in contact, and formulated the well-known thermo-electric series bismuth, platinum, lead, tin, gold, silver, copper, zinc, iron, and antimony. In his studies on atmospheric electricity he proved that the water of the ocean and the solid crust of the earth are in opposite electrical conditions, a fact which explains the positive state of the air immediately above the sea, while at a distance from the ocean the positive change is noticeable only at a certain height above the earth. The physiological effects of the electric current formed likewise the subject of numerous observations, and by means of delicate apparatus he was able to demonstrate the development of minute currents by the various operations of life, the movement of the muscles, etc. In view of the purely chemical character of these operations these observations harmonized perfectly with the theory which he advanced that electric currents were produced by all chemical unions and decompositions.

The effects of electricity on the colors of flowers, he showed to consist chiefly in a mechanical bursting of the cells containing coloring matter, and not in a chemical change. The conductive powers of a number of elements and compounds for the electric current, as well as the thermal phenomena in bad conductors, formed likewise the subject of numerous investigations. In magnetism Becquerel's researches were confined chiefly to the demonstration of the ability of all bodies to be magnetized, and to the phenomena of terrestrial magnetism. His favorite field of discovery, and that in which he obtained the most brilliant results, was electro-chemical action; in the variety and value of his contributions in this department he is certainly surpassed by no other physicist, while he was the first to grasp and sum together the scattered observations, and fairly mould them into a science. In 1834 he observed the deposition of metal on the negative electrode when the two poles of a pile were introduced into solutions of the salts of various metals. Shortly after he discovered that by using feeble currents the metal could be deposited very evenly and equally on the surface of the electrode, and that the two solutions required for the purpose could be kept from mingling by the use of goldbeater's skin or animal membranes, without hindering the current. These facts were at once made use of by De la Rive, of Geneva, who based on them his technical process of gilding in 1840. Although not the first to make the practical application of his discoveries, Becquerel rapidly improved the methods derived from them, and contributed in swift succession an enormous number of facts which serve as the fundamental principles of the art of galvano-plastic. These are to be found in a compact state in Smee's "Elements of Electro-Metallurgy." Becquerel's famous *oxygen circuit*, discovered at this time, made his name known at once, to a large circle, on account of its simple, practical quantities. It consists of a glass tube covered at one end with linen, which supports a layer of kaolin, and designed for the solution of the metallic salt to be reduced. This is placed in a vessel containing a dilute acid, and the object to be electro-plated is immersed in the solution after being connected by a wire with a platinum plate in the acid. The action begins instantaneously, and is both rapid and regular. Another well-known apparatus is his *depolarizer*, an arrangement designed to obviate the reverse currents produced by the gaseous deposits on platinum electrodes, and consisting essentially in a continuous shifting of each of the plates to the liquid of the other, so that they have no opportunity to become polarized. The oxygen circuit, with its gentle regular current, was used by Becquerel for the decomposition of a large variety of chemical compounds. Among the more noteworthy preparations by its action can be mentioned aluminium, silicium, beryllium, sulphur, and the various earthy and metallic phosphates. Equally extensive were the preparations of crystalline salts, notably those occurring in nature, by the action of the electric-current on mixed solutions or on solutions of soluble salts in contact with insoluble substances. During the past ten years his attention

has been almost exclusively devoted to the novel and remarkable electro-capillary phenomena first observed by him in 1867. These can be observed in their simplest form when a cracked test-tube containing a solution of cupric sulphate, for example, is immersed in a solution of sodic sulphide. A deposition of metallic copper takes place at once on the crack. This elementary fact has been elaborated in a variety of directions with numerous solutions, and the laws regulating the development of electric currents by capillary action partially enunciated. The study of these phenomena is, however, still in its infancy. Becquerel regarded them as explanatory of the deposition of metals in veins in the rocks and of many physiological reactions taking place in the vegetable and animal tissues. A very detailed account of the experiments is to be found in vol. xxxvi. of the "*Mémoires de l'Institut.*"

Despite his manifold experimental investigations, Becquerel was an indefatigable author, and contributed a most valuable series of standard works to the physical literature of the past forty years. In the seven volumes of his "*Traité expérimental de l'Electricité et du Magnétisme, et de leurs Phénomènes naturels,*" 1834–40, he presented these two sciences with a completeness and systematic arrangement which has been hitherto wanting in physical literature. This work was followed by "*Eléments d'Electro-Chimie appliquée aux Sciences naturelles et aux Arts,*" 1843; "*Traité de Physique considérée dans ses Rapports avec la Chimie,*" 1844, 2 vols; "*Eléments de Physique terrestre et de Météorologie,*" 1847; "*Traité de l'Electricité et du Magnétisme; leurs Applications aux Sciences physiques, aux Arts, et à l'Industrie,*" 1856, 3 vols.; "*Résumé de l'Histoire de l'Electricité et du Magnétisme,*" 1858; and "*Des Forces physico-chimiques et de leur Interprétation dans la Production des Phénomènes naturels,*" 1875.

In 1829 Becquerel was elected a member of the French Academy, and received in 1874 the *médaille cinquantenaire*, although he had been but forty-five years a member. His scientific communications are to be found in the "*Comptes Rendus*" of the Academy and in the "*Annales de Chimie et Physique.*" The Royal Society elected him as a corresponding member a number of years ago, and he was one of the three French *savants* who have been recipients of the Copley medal. In 1865 Napoleon III. decorated him with the cross of commander of the Legion of Honor.

Prof. Becquerel leaves behind him a son, Edmond Becquerel, professor of physics in the Conservatoire des Arts et Métiers, who has assisted his father for a long series of years in the compilation of his numerous works, and whose researches in electricity fairly rival those of the latter. The funeral ceremonies took place on Monday in the church of St. Medard, at Paris.

HEAT PHENOMENA AND MUSCULAR ACTION. — On reading the article which appeared in *Nature*, vol. xvi., p. 451, on the heat phenomena accompanying muscular action, it has occurred to me to send the following problem which is akin to the subject.

If a man does work (say lifts a weight), the principle of the conservation of energy teaches us that the potential energy — the work done — (weight lifted) is at the expense of the man as a magazine of force, in fact that "virtue has gone out of him." Now suppose a man lifts say a ton of bricks and deposits the bricks one by one on the top of a wall six feet high, we can exactly estimate the amount of work done, the energy rendered potential and external, and if we knew also the extra amount of heat radiated or otherwise carried off from his body — as most probably the work would raise his temperature — we could exactly measure the amount of energy the lifting of the brick cost him.

Now suppose another man were to lift the bricks from the top of the wall and deposit them gently — *i.e.*, without concussion — on the ground, it is evident that there is a certain amount of potential energy disappearing, in fact that there is work being absorbed by the man, of course appearing in some other form, but the question is how? This second man's work is of course in one sense work, but in the sense of producing external, potential, or kinetic energy, is not so, unless, perhaps, in heat.

Strangely enough it follows that lifting down the brick ought to make the man either radiate heat more, waste tissue less, digest food less, or in some other way account for the energy absorbed by him.

Generally I think the conversion of force by obstruction is not always so clearly traced as it might be; in friction it is clear, as also in the compression of elastic bodies, but in the instance above, as also in the throttling of steam, it is not so clear.

POETRY.

THE FLOWER OF THE FIELD, . . . 578
GREEK MOTHER'S SONG, . . . 578
AT THE LAST, ... 578
"KIND! ES WARE DEIN VERDERBEN," 578

PUBLISHED EVERY SATURDAY BY
LITTELL & GAY, BOSTON.

TERMS OF SUBSCRIPTION.

FOR EIGHT DOLLARS, *remitted directly to the Publishers*, the LIVING AGE will be punctually forwarded for a year, *free of postage*.

An extra copy of THE LIVING AGE is sent gratis to any one getting up a club of Five New Subscribers.

Remittances should be made by bank draft or check, or by post-office money-order, if possible. If neither of these can be procured, the money should be sent in a registered letter. All postmasters are obliged to register letters when requested to do so. Drafts, checks and money-orders should be made payable to the order of LITTELL & GAY.

Single Numbers of THE LIVING AGE, 18 cents.

THE FLOWER OF THE FIELD.

THERE grew a poppy in a plot of corn,
And three men went thereby, before the heat
Had drawn from out the field beneath their feet
The freshness of the dewdrops and the morn.
Then did the loveliness of that lone flower
Strike in upon the sense of all the three;
And one, a youth, spake in that thoughtful hour,
And said, "Methinks this poppy well might be
Some rich dark southern beauty, sleepy-sweet,
Girt with a bending ring of gracious men."
The second, one that was of riper years,
Made answer, "Nay, a blood-red banner, torn
By steel of strife, and blown with winds of war,
And guarded round by ranks of shining spears."
Then spake to them the third, whose head was hoar, —
"Death comes to love and war; what aid they then?
This flower has one speech only unto me,
That man is as the grass, and all his pride
Of war, and beauty of love shall suddenly
Fade like the flowers in the sad autumn-tide;
The wind sweeps over them, and they are gone!"
And thereupon those three went silent on,
And the low sunlight lay uncrossed by shade,
Until a maiden came, who hummed a song
For very gladness, as she tripped along,
The freshness of the morning in her eyes;
Nor was she moved as they, in any wise,
To any thought of that which makes afraid,
But stopped and plucked the poppy from the ground,
And set it on the whiteness of her dress,
And so passed on, with added loveliness.
No hidden inner meaning had she found,
Nor thought of strife or death to make her sad, —
The sole sweet beauty was enough for her;
She took God's thought, the poppy, and was glad, —
So was she Nature's best interpreter.

Spectator. A. R. R.

GREEK MOTHER'S SONG.

I.

O WHERE is peace in all the lovely land?
Since the world was, I see the fair and brave
Downward forever fighting toward the grave.
A few white bones upon a lonely sand,
A rotting corpse beneath the meadow grass
That cannot hear the footsteps as they pass,
Memorial urns pressed by some foolish hand
Have been for all the goal of troublous fears.
Ah! breaking hearts and faint eyes dim with tears,
And momentary hopes by breezes fanned
To flame that fading ever falls again
And leaves but blacker night and deeper pain,
Have been the mould of life in every land.

II.

O is there rest beneath the meadow flowers?
Or is there peace indeed beside the shore
Of shadowy Acheron? nor any more
The weary rolling of the sickening hours
Will mark the interchange of woe and woe;
Nor ever voices railing to and fro
Break the sweet silence of those darksome bowers?
But there a sorrowful sweet harmony
Of timeless life in peaceful death shall be
In woodlands dim where never tempest lowers
Nor branding heat can pierce the sunless shade.
O sweet forever in that dreamful glade,
If there indeed such deepest peace be ours!

Macmillan's Magazine.

AT THE LAST.

COME once, just once, dear love, when I am dead —
Ah, God! I would it were this hour, to-night —
And look your last upon the frozen face
That was to you a summer's brief delight.

The silent lips will not entreat you then,
Nor the eyes vex you with unwelcome tears;
The low, sad voice will utter no complaint,
Nor the heart tremble with its restless fears.

I shall be still — you will forgive me then
For all that I have been, or failed to be:
Say, as you look, "Poor heart, she loved me well,
No other love will be so true to me."

Then bend and kiss the lips that will not speak —
One little kiss for all the dear, dead days —
Say once, "God rest her soul!" then go in peace,
No haunting ghost shall meet you in your ways.

LOUISE CHANDLER MOULTON.

"KIND! ES WARE DEIN VERDERBEN."

CHILD! it would be your undoing;
And I struggle hard, you see,
That your dear kind heart may never
Feel the glow of love for me.

That too well I have succeeded,
Pains me in my own despite;
And I often think, "Oh, would you
Love me, come whatever might!"

From The Westminster Review.

CHARLES SUMNER.*

It is one of the accidents of political life, both in England and America, that men who in their day exercised great influence on the legislation and administration of their country never attained office, but nevertheless will stand out more prominently on the pages of history than many members of the official hierarchy even of the highest rank. The Earl of Liverpool was premier for fifteen years. Richard Cobden was never in office at all; yet who can doubt that when the history of the nineteenth century is read hereafter, the reformer of our commercial legislation, the first Parliamentary advocate of international arbitration, will fill a far more prominent position than he whom Lord Beaconsfield called "the Arch Mediocrity." In America, Daniel Webster four times sought a nomination for the presidency, and each time failed; yet the name of Daniel Webster fills, and we believe will continue to fill, a far higher position in American history than the names of his rivals, General Harrison, James K. Polk, General Taylor, and Franklin Pierce, who successively filled the presidential chair of the American Union. The distinguished man whose life is now before us is another and perhaps more striking instance of the same kind. Charles Sumner was not only never president, but never even a member of any cabinet. Webster was twice secretary of state, but the highest posts Sumner ever held were those of United States senator from Massachusetts, and, when in the Senate, chairman of its committee on foreign relations during Mr. Lincoln's presidency; but in the memories of his countrymen and in the history of his time the name of Sumner stands, and will continue to stand, far higher than that of Webster. "There are," said Mr. Disraeli in reference to the death of Mr. Cobden, "some members of Parliament who, though they may not be present in the body, are still members of this House, who are independent of dissolutions, of the caprice of constituencies, and even of the course of time." We think the spirit of these words is applicable to Charles Sumner. He, next to William Lloyd Garrison, stands highest amongst that group of men and women,

On Fame's eternal beadroll worthy to be filed,

who were so vividly sketched by Harriet Martineau in the pages of this review,* who raised the slavery question out of the region of mere politics, and made it strike a far deeper-toned chord, arresting the religious feeling of the country, taking strong hold on the consciences of men, and who in the end rooted out the accursed thing from the land. The life of such a man cannot fail to be interesting. The book before us, however, gives only an account of Sumner's early career, and of his training for the public life in which he afterwards played so distinguished a part. The memoir closes with the year 1845, in which he delivered at Boston his memorable address on "The True Grandeur of Nations." "Had he died before this event," says his biographer," his memory would have been only a tradition with the few early friends who survived him. The 4th of July 1845, a day ever memorable with him, gave him a national and more than national fame. Student though he was to the last, he now went forth from the seclusion of a scholar's chamber, well trained by self-discipline and strong in purpose and hope, to enter upon the work which God had appointed him to do" (Memoir, ii., p. 384). After this it is somewhat disappointing to find the memoir concludes with these words, "How well it was done, with what courage, perseverance, and power, is written in the fourteen volumes of his works, which begin with the effort of this day, and in the history of his country for the twenty-three years he stood in the Senate, as the tribune of human rights" (ii., p. 384). It is only, therefore, of his private life and his less memorable years that we have any account. We have found so much to instruct and interest us in these two volumes, that we can but cherish the hope that Mr. Pierce may be induced to give them their proper

* *Memoir and Letters of Charles Sumner.* By Edward L. Pierce. 2 vols. London: Sampson Low & Co. 1878.

complement in a memoir of Sumner's public life and labors.

Charles Sumner was descended from one of the Puritan families who emigrated to America towards the middle of the seventeenth century. The Sumners first settled at Dorchester (Massachusetts), and various branches of the family remained at Dorchester and at Milton, in the same state, during the seventeenth and eighteenth centuries. They "were generally farmers, owning considerable estates in fee-simple, and blessed beyond the usual measure with large families of children." Charles Sumner's grandfather, Job Sumner, served with distinction in the War of Independence, and obtained the rank of major in the United States army. "He was," says our author, "a man of genuine courage, adventurous spirit, and capacity for affairs, generous with his money, and faithful in all trusts. He took life merrily, and rejected the severity of the Puritan standards" (i., p. 10). His son, Charles Pinckney Sumner, the father of Charles Sumner, entered Harvard College in 1792, and graduated in 1796. After trying the work of a schoolmaster, he settled down to the practice of the law, and was admitted an attorney of the Court of Common Pleas at Boston in July 1801. In his early years he took an active part in politics, and was a frequent writer and speaker. His first political speech was made so far back as 1804; it was a plea for the integrity of the Union, for "a common love of all its sections, for faith in popular government, and for confidence in the national administration, and in Mr. Jefferson, its head." He was clerk of the House of Representatives of Massachusetts for the years 1806–7 and 1810–11. In this last period he was officially associated with his early friend Joseph Story, then speaker of the House, which office he resigned to become judge of the Supreme Court of the United States. While holding this last office he composed his "Commentaries on Equity Jurisprudence" and his other legal works, which are of the highest authority both in England and America. Mr. Sumner was married in 1810 to Relief Jacob of Hanover. Of this marriage there were issue nine children, of whom the eldest, Charles, the subject of this memoir, and his twin sister, Matilda, were born in Boston, January 6, 1811. The family seem to have been in straitened circumstances until 1825, when Mr. Sumner was appointed sheriff of Suffolk County, which office he continued to hold until shortly before his death, which took place in 1839. He seems to have been a man of just and conscientious but rigid and cheerless nature, who imposed an iron rule at home which bore heavily on his elder sons. Charles when grown up ventured to intercede on behalf of the younger children for a milder rule. His intervention, though not altogether ineffectual, was resented, and from that time no communication passed between the father and the son. The father was a well-read lawyer, and a scholarly man for his time. "He took pains to lead his son Charles and his other children to the studies which he had himself pursued, teaching them, as their minds developed, to love history and all knowledge. Other homes enjoyed more of luxury, but his was enriched at least with the atmosphere of culture" (i., p. 28). Like most of the more educated men in Boston at that day, the elder Sumner attended an Unitarian Church, but "his religious belief was quite indefinite, and he was indulgent to all shades of doctrine." After his appointment as sheriff, he thought himself bound to abstain from all political action; but he was always an anti-slavery man. His papers contain abundant evidence of his strong sympathy with the anti-slavery movement; and he was accused of allowing this sympathy to interfere with the execution of his duties as sheriff. It was said that, in a case of reclamation of slaves under the Fugitive Slave Act of 1793, he permitted or connived at their escape. Accused of having expressed his sympathy with the fugitives to their counsel, he replied, "Whether I addressed Mr. Sewall as it is said, I cannot tell; but I should be ashamed of myself if I did not wish that every person claimed as a slave might be proved to be a freeman, which is the purport of the words attributed to me" (i., p. 25). His forecast discerned the conflict in which his son was to bear so great a part. So far back as 1820, speaking to

a neighbor on slavery, he said, "Our children's heads will some day be broken on a cannon-ball on this question." He was a promoter of the common-school movement, of temperance, and restrictive legislation on the liquor traffic. His wife, whose Puritan descent was indicated by her quaint Christian name, "Relief," is described as "equal, even imperturbable, in her temperament — a woman of excellent sense, and of unusual skill in domestic economies" (i., p. 30). The father did not live to see his son's public career; the mother lived through all its most striking portion, and survived the subjugation of the rebel states.

Such were the home influences to which the childhood and youth of Charles Sumner were subject, of which we shall see abundant manifestations in his character and after life.

After his first visit to Europe, and he had become intimate with men who had received the intellectual training, and in many cases won the honors of Oxford and Cambridge, and who had afterwards received the further training of Parliament and the bar, he was accustomed to speak of his education as "defective."

"I hope," he wrote from Italy in 1839, "that Horace," his younger brother, "when grown up, will not smart as I do under the mortification of a defective education" (ii., p. 98).

It was during this, his first visit to Europe, and while he suffered from the imperfect way in which modern languages were taught in America, that he wrote from Venice to his and his father's friends, Judge Story and the Sumners. "Let a boy," he wrote, "acquire one thing well, and he gets a standard of excellence to which he will endeavor to bring up his other knowledge; and, moreover, he will be aware of his deficiencies by observing the difference between what he knows well and what he knows indifferently. Let the requisites for admission be doubled, and subject all candidates for degrees to a most rigid examination. We must make a beginning, and where can it be done better than at Harvard?" We are glad to learn from the editor's note on this letter that in American colleges, and especially in Harvard, great changes have been made since 1839 in the direction to which Sumner then pointed.* So strongly did Sumner feel the importance of education, that on his father's death he devoted whatever present or future interest he had in his father's property to the purpose of giving his sisters the best education America could afford (ii., p. 103). If Sumner's education was not equal to that which he would have received had he been sent first to an English public school and afterwards to an university, yet it was as good an education as any young American of his day and generation could receive in his own country. His father originally intended to give him a common English education only, but the boy showed a sort of instinct for classical knowledge, and of his own free will bought with a few pence he had saved a Latin Grammar and a "*Liber Primus.*" "He studied them privately out of school, and one morning surprised his father by appearing with the books and showing his ability to recite from them. His father, impressed perhaps by this incident, decided to put him in the classical course provided by the public schools" (i., p. 36). At the close of August 1821, Sumner was therefore entered in the Boston Latin School. At school he gave no promise of a remarkable career. "He was not," writes a schoolfellow, "always attentive to his studies at school, that is, to the specially appointed lessons in Latin, Greek, and mathematics. But we boys felt the superiority of his mind and education, though we could get above him at times in school rank. I used to look at him with wonder as I heard him talk on subjects I knew nothing of. He had a full sense of his own knowledge, yet he never intruded it upon his fellows or showed any self-conceit."

He was always thoughtful, studious, and fond of reading; little given to sports, but fond of swimming; rarely seen playing with his mates; but, while thoughtful and somewhat reserved, he was in no respect severe or unsympathetic, and was liked by his school-fellows. His private pursuit was the study of history, reading it not in

an easy, careless way, but with earnest attention, with maps spread out before him. When fourteen years old he wrote a compendium of English history from Cæsar's conquest to 1801. The school-fellow whom we have before quoted gives us an illustration of the thoroughness of Sumner's self-education, and of his combined study of history and geography: —

He fell into a dispute one day in the middle of the class exercises with an ill-natured teacher, who undertook to put him down for ignorance on some point of geography — a branch not studied in the school, or made the subject of examination or admission. Sumner, then about eleven years of age, replied with spirit that he could answer any question which the teacher might put to him. The teacher bethought himself a moment, and going to his table, and looking up what he esteemed a difficulty, asked him where Cumana was. The boy replied instantly with a full and correct answer, and no further question was asked (i., pp. 39, 40).

If Sumner's school career was not distinguished, it was sufficiently meritorious to gain several prizes; and at the close of his five years' course (August 23, 1826) he was one of six scholars who each received at the hands of John Quincy Adams, then president of the United States, the decoration of the Franklin medal. It now became necessary to choose for him some trade or profession. Owing to his limited means, the father designed him for some occupation in which he could earn his livelihood sooner than in one of the learned professions. The inclination of the future author of "The True Grandeur of Nations" was for a military life. It was thought hopeless to apply for his admission into the National Military Academy at West Point. His father therefore wrote to Captain Partridge, the head of what was called "the American Literary, Scientific, and Military Academy," at Middletown, Connecticut, who had advertised that he wished to "employ" some lads in the institution. In this letter Mr. Sumner wrote: —

My means enable me only to think of usefulness. I wish him to learn all of agriculture, arithmetic, and bookkeeping he conveniently can by a year's attendance, service, and study at your institution; also something, and as much as you think proper, in the elements of soldiership; but, sir, if I send him at all, it must be on a footing of those who seek *employment*, according to that notice of yours which I have recently read, and I wish to know, before you see him, on what terms he would probably be received, and to what employment he would probably be put that would be serviceable to you and not disagreeable to his feelings — feelings that do not incline him to become improperly a burden on you or on me, or to ordinary menial services, that would injure him in the estimation of those lads who are now his associates, among whom he is destined to earn his living, and, I hope, to sustain a respectable rank.

The change in his father's circumstances, consequent on his appointment to the shrievalty of Suffolk County, relieved Sumner from the necessity of seeking such employment. An application was now made to the secretary of war for a West Point cadetship, but Bellona was not to have him for one of her worshippers: it was unsuccessful, and he began his studies as a freshman at Harvard College, September 1, 1826. Of his college career we find the following estimates given by fellow-students: —

Though reasonably attentive [writes one] to his college studies, and rarely absent from the recitations, I do not think that, as an undergraduate, he was distinguished for close application to his college studies. Having been much better fitted for college, especially in Latin and Greek, than the majority of his class, he continued to maintain a very high rank in both the ancient and modern languages through his whole collegiate course.

He stood also very well in elocution, English composition, and the rest of his theoretical pursuits. In the last year of his college course he failed in all the more abstruse and difficult mathematics.

His memory was uncommonly retentive, and it was sometimes said of him that he committed to memory, so as to be able to repeat by rote, some of the more difficult problems in mathematics, with but little apprehension of their import. Morally, so far as I have ever heard, his character while a member of college was without reproach (i., p. 5).

Another writes: —

Sumner had been accustomed to literary society from his youth, and was brought up among books, so that study was with him a kind of second nature. He never studied, as many young men do, for college honors, but for love of study, and for cultivating his mind — well disciplined and refined at that early age. He was by no means what, in our college days, was denominated a *dig* — one who has to study from morning till night and bring nothing to pass. In his declamations I always noticed a great degree of earnestness, with an entire freedom from any effort to make a dash. It was the same type of subdued eloquence inseparable from the man which he has often put forth on real and important actions in his public life. . . . He was a person of remarkable readiness and self-possession. He was always careful to lead an exemplary and blame-

less life, full of kindly feelings, and ready to say a pleasant word to all, and punctilious in all the proprieties which refined society is accustomed to observe (i., pp. 58, 59).

This last-mentioned characteristic led to his great social success, when in after-years he visited England.

Though his college career, like his school course, was not brilliant, yet, as in the one case, so in the other, it was not without distinction. In his senior year he competed for the Bowdoin prize, the subject given being, "The Present Character of the Inhabitants of New England, as resulting from the Civil, Literary, and Religious Institutions of the First Settlers." He sent in his dissertation signed "A Son of New England," and received the second prize of thirty dollars; these he laid out in the purchase of books, among which were Byron's poems, the "Pilgrim's Progress," Burton's "Anatomy of Melancholy," Hazlitt's "Select British Poets," and Harvey's "Shakespeare." "The last two" (says his biographer, i., p. 51) "were kept during life on his desk or table ready for use, and the Shakespeare was found open on the day of his death as he had left it, with his mark between the leaves. At the third part of "Henry VI." his pencil had noted the passage: —

> Would I were dead! if God's good-will were so;
> For what is in this world but grief and woe?

Those who are acquainted with Sumner's writings and speeches will not be surprised to learn that —

> The tradition is that Sumner's dissertation suffered in the comparison (with the other essays we presume) from its great length. Its style, while well formed, lacks the felicity of expression and fastidiousness in the choice of language which mark his compositions in mature life. In method it is manly and serious, never trivial, but wanting in condensation. [We may remark in passing, that the power of condensing was lacking in Sumner to the last day of his life.] He was, as a living classmate remarks, too "full of matter." His citations and extracts show that he left nothing unread which could illustrate the subject, and that his reading in English literature was beyond that of most undergraduates. On the whole, the dissertation, while creditable to his industry and thoughtfulness, does not foreshadow a distinguished career as a writer. Although doing justice to the Puritans in many respects, he dwells with some impatience on their narrowness and religious eccentricities (i., p. 56).

Macaulay's essay on Milton had appeared, of course anonymously, in the *Edinburgh Review* of August, 1825, and bearing in mind the antipathy which, as we shall see, Sumner afterwards felt towards Macaulay, it is curious to note that Sumner, in his dissertation, slightingly refers to Macaulay's essay as "the apotheosis of the Puritans in the pages of one of the British journals" (ibid., note 1). Later in life, when bearing the labor and heat of the anti-slavery conflict, and "dealing with the great issues of right and duty," his views of the Puritan fathers of his State became modified, and his speech at the Plymouth festival in 1853, "The Finger-point from Plymouth Rock," as it is called in his collected works, is a graceful and eloquent tribute to their stern and rugged virtues (ibid., note).

At this time the people of Boston were generally primitive in their mode of living, and the town was more like a large village than a city. In accordance with the simple habits of his neighbors, Sumner, during a vacation tour, travelled on foot. In 1829 he, with four classmates, travelled, "with knapsacks on their backs and umbrellas in their hands," to Lake Champlain. More than thirty years afterwards, at a dinner at Northampton of the Hampshire County Agricultural Society, he thus described this tour. The extract is a good specimen of his later style of speaking: —

> I cannot forget the first time that I looked upon this beautiful valley, where river, meadow, and hill contribute to the charm. With several of my classmates I made a pedestrian excursion through Massachusetts. Starting from Cambridge, we passed by way of Sterling and Barre to Amherst, where, arriving weary and footsore, we refreshed ourselves at the evening prayer in the college chapel. From Amherst we walked to Northampton, and then, ascending Mount Holyoke, saw the valley of Connecticut spread out before us, with river of silver winding through meadows of gold. It was a scene of enchantment, and time has not weakened the impression it made. From Northampton we walked to Deir Field, sleeping near Bloody Brook, and then to Greenfield, where we turned off by Coleraine, through dark woods and over hills to Bennington in Vermont. The whole excursion was deeply interesting, but no part more so than your valley. Since then I have been a traveller at home and abroad, but I know no similar scene of greater beauty. I have seen the meadows of Lombardy, and those historic rivers the Rhine and the Arno, and that stream of Charente which Henry IV. called the most beautiful of France; also those Scottish rivers so famous in legend and song, and the exquisite fields and sparkling waters of lower Austria, but my youthful joy in the landscape

which I witnessed from the neighboring hill-top has never been surpassed in any kindred scene. Other places are richer in the associations of history, but you have enough already in what nature has done without waiting for any further illustration (i., p. 70).

The history of Sumner's college career is thus summed up by Mr. Pierce: —

If, when entering college, he aspired, as there is reason to believe, to high rank in his class, he soon gave up any ambition of this kind. He studied well such text-books as he liked, neglecting the rest. If he did not outrank others in the appointed studies, he had no rival in his devotion to miscellaneous literature. He delighted in Scott's novels, but most of all in Shakespeare, from whom he was perpetually quoting in conversation and letters. No student of his class when he left college had read as widely. His memory, both of thought and language, was remarkable, and he imitated with ease an author's style. Most of Sumner's classmates do not appear to have anticipated for him more than ordinary success in life, but those who knew him best were impressed with his love of books, and with something in his tone and manner which gave assurance that he would make his mark in the world. This feeling grew stronger near the end of his college course, and particularly after the announcement of his successful competition for a Bowdoin prize (i., p. 40).

Sumner passed the year following his leaving college at home, studying many hours daily and keeping aloof from society. Mathematics, to which, as already stated, he gave very little attention in college, he now felt to be a necessary part of a complete education, and he therefore determined to overcome his deficiencies, but he does not seem to have kept up the study more than five months. He was undecided as to what profession he should follow. A very short experience of what he termed "the harassing, throat-cutting, mind-dissolving duties, pounding knowledge into heads which have no appetency for it, and enduring the arguing of urchin boys, and all those other ills to which schoolmaster flesh is heir," convinced him that that was not his vocation. He became warmly interested in "the great and good cause of anti-masonry," on which subject the American mind was at that time much agitated.

He continued the practice of literary composition, and gained a prize from the "Boston Society for the Diffusion of Useful Knowledge" for an essay on commerce. The prize took the form of Lieber's "Encyclopædia Americana," valued at thirty dollars. It was presented to Sumner by Daniel Webster, the president of the society, and then United States senator for Massachusetts. In announcing Sumner to a meeting of the society as the winner of the prize, Webster remarked that "the public held a pledge of him," and added other kindly expressions. Neither of them thought at that time that the pledge would be afterwards redeemed by Sumner succeeding Webster in the Senate, and acquiring a purer and more enduring fame than his. At length Sumner decided on the law as his profession. The spirit in which he entered on his legal studies appears in a letter from which we make this extract: —

Your method and application are to me an assurance that the studies of the law office will be fruitful; but excuse the impertinence of a friend. I fear that Blackstone and his train will usurp your mind too much, to the exclusion of all cultivation of polite letters. The more I think of this last point, the more important it seems to me in the education of a lawyer. "Study law hard," said Pinckney, "but study polite letters as hard." So also says Story. The fact is, I look upon a *mere* lawyer, a reader of cases and cases alone, as one of the veriest wretches in the world. Dry items and facts, argumentative reports and details of pleading, must incrust the mind with somewhat of their own rust. A lawyer must be a man of polish, with an *omnium gatherum* of knowledge. There is no branch of study or thought but what he can summon to his aid, if his resources allow it. What is the retailer of law facts by the side of the man who invests his legal acquisitions in the fair garments of an elegantly informed mind? Every argument of the latter is heightened by the threads of illustration and allusion which he weaves with it. Besides, it is more profitable as to legal knowledge for a student to devote but a portion of his time to the law. A continued application to it would jade the mind, so that it would falter under the burden imposed by its own ardor. There must be a relaxation for a scholar, which will be found in a change of studies (i., p. 87).

Such was his advice to his friend, and such was the manner in which he himself studied the law, but he felt that the minutest business details of the profession must also be mastered.

My own reflections [he wrote to the same friend] and the advice of others, tell me that it is better to study with one whose business is other than that of a counsellor. The drudgery, writ-making, etc., of an office is what a young student ought to undergo. Give me my first year and a half in the entirely theoretical studies of a law school, and my remainder in a thronged business office, where I can see the law in those shapes in which a

Digitized by CORNELL UNIVERSITY Original from CORNELL UNIVERSITY

young lawyer can alone see and practise it. It is years which make the counsellor (i., p. 87).

With these views and feelings Sumner joined the Law School at Harvard University, 1st September 1831. The professors were at that time Mr. Justice Story and John H. Ashmun. Story's learning, copious speech, enthusiasm for the profession, and kindly interest in the students under his care, are well known. Ashmun, who died during Sumner's course, is stated to have been remarkable for his acumen and logical method. He "insisted always on definiteness of thought and exactness of expression, and was in the habit of testing the knowledge of his favorite pupils by close scrutiny and criticism" (i., p. 90). This was exactly the discipline which Sumner, with his disposition to too diffusive study, required. We have mentioned the official connection and the personal friendship which existed between Mr. Justice Story and the elder Sumner. A still more intimate friendship sprung up between the judge and Charles Sumner. "I have in some sort," wrote the judge to him, "as the Scotch would say, an heritable right to your friendship." "The judge admired Sumner's zeal in study, enjoyed his society, and regarded him like a son. Sumner conceived a profound respect for the judge's character and learning, and was fascinated by his personal qualities. This friendship entered very largely into Sumner's life, and for many years gave direction to his thoughts and ambition" (i., p. 91).

On the death of Ashmun, Simon Greenleaf succeeded to the vacant professorship. His treatise on the "Law of Evidence" is as well known and as highly estimated in England as in America. Professor Greenleaf's interest in Sumner was hardly second to Story's, and his friendship for him continued long after his connection with the Law School had ceased. The elder Sumner gave a much-needed caution to his son. "Charles, while you study law, be not too discursive. Study your prescribed course well. That is enough to make you a lawyer. You may bewilder your mind by taking too wide a range" (i., p. 98). Some of his surviving fellow-students recall that he was not thought to have "a legal mind." On the other hand, Lord Brougham, a few years after this time, said "that he had never met with any man of Sumner's age of such extensive legal knowledge and natural legal intellect," and predicted "that he would prove an honor to the American bar" (ii., p. 83, notes).

The remark has been made, and we think with justice, that his writings, both in his early and his later years, show that he preferred to write upon the literature of the law rather than upon the law itself. "He is," wrote one of his friends to another, "to the law what he used to be to history, a repertory of facts to which we might all resort" (i., p. 99). His memory was not less extraordinary than his industry. Story said of him, "He has a wonderful memory; he keeps all his knowledge in order, and can put his hand on it in a moment." During his course in the Law School he acted as librarian, and successfully competed for a Bowdoin prize offered to resident graduates for the best dissertation on the theme, "Are the most Important Changes in Society Effected Gradually, or by Violent Revolutions?" The spirit in which he dealt with his subject may be inferred from the motto prefixed to his essay, taken from the "Agricola" of Tacitus, "*Per intervalla ac spiramenta temporum*" (i., p. 95). "The dissertation," says Mr. Pierce, "bears the marks of haste in composition and is marred by digressions. . . . While not falling below the similar efforts of clever young men, it is not prophetic of future distinction" (i., pp. 105–107).

He studied so severely and continuously that his friends feared that his health would fail.

He now began a career as an author. While still at the Law School he contributed two articles on legal subjects to the *North American Review*, and he also sent to the *American Jurist* the first of a long series of contributions. The *Jurist* was a law periodical of high rank, and numbered among its contributors many men of eminence at the American bar. The subject of Sumner's first contribution was a review of a lecture at King's College, London, by Professor J. J. Park, on "Courts of Equity." It defined at some length, and with happy illustrations, the distinction between law and equity, and is described by Story, in his "Equity Jurisprudence," as a "forcible exposition of the prevalent errors on the subject," and "as full of useful comment and research."

Mr. W. W. Story, the judge's son, supplies an interesting sketch of Sumner at this time, from which we make the following extract: —

He had little imagination or fancy, and better loved strong, manly sentiments and

thoughts within the range of the understanding, and solid facts and statements of principles. . . . He was without all those tastes which are almost universal with men of his age. As for dancing, I think he never danced a step in his life. Of all men I ever knew at his age, he was the least susceptible to the charms of women. . . . It was in vain for the loveliest and liveliest girl to seek to absorb his attention. . . . Though he was an interesting talker, he had no lightness of hand. He was kindly of nature, interested in everything, but totally put off his balance by the least *persiflage*, and if it was tried on him, his expression was one of complete astonishment. He was never ready at a retort, tacked slowly like a frigate when assaulted by stinging feluccas, and was at this time almost impervious to a joke. He had no humor himself, and little sense of it in others; and his jests, when he tried to make one, were rather cumbrous. But in plain sailing no one could be better or more agreeable. He was steady and studious, and though genial, serious in his character. . . . I do not think in his earlier years he had any great ambition. *That* developed itself afterwards. Circumstances and accidents forced him forward to the van, and he became a leader terribly in earnest. He had the same high-mindedness, the same single aim at justice and truth, the same inflexible faith and courage then, that ever after characterized him.

We may add to this sketch, that neither while at college or at the Law School did Sumner show any signs of that power of public speaking which he displayed in his later years. On the contrary, in his appearances at the moot courts and the debating society connected with the Law School, he showed a want of such power. He was not fluent in speech, and felt a difficulty in selecting fit words to express his thoughts. A friend whom he consulted on this subject advised "a simpler style, with less effort and consciousness, and the rejection of large words, *sesquipedalia verba* (to which you know you are addicted), and uncommon, brilliant, and Gibbonic phrases. . . . You do not stumble, you utter rapidly enough. To be sure, you have not the *torrens dicendi*, and that is a very fortunate thing" (i., p. 94).

From his letters of this period we make this extract, on account of its prediction of the civil war, not, however, to be fulfilled until nearly thirty years had elapsed. The proclamation referred to is President Andrew Jackson's of December 1832, upon the occasion of the ordinance passed by South Carolina nullifying, so far as that State was concerned, an act of Congress.

We are truly in a sad state. Civil war, in a portentous cloud hangs over us. South Carolina, though the sorest part of our system, is not the only part that is galled. Georgia cannot stomach the high Federal doctrines which the president has set forth in his proclamation, and upon which the stability of the country rests. That is a glorious document, worthy of any president. Our part of the country rejoices in it as a true exposition of the Constitution, and a fervid address to those wayward men who are now plunging us into disgrace abroad and misery at home (i., p. 117).

The Rev. Dr. Osgood, a well-known minister of the Unitarian Church at New York, who saw a good deal of Sumner while a law student, writes of him, "He had great strength of conviction on ethical subjects, and decided religious principle; and yet he was little theological, much less ecclesiastical" (i., p. 117). Sumner's religious opinions at this time — which, so far as we know from these volumes or otherwise, he never changed — are expressed in a letter to a friend, then a student at Andover Theological Seminary, who had written pressing the Christian faith on Sumner's attention.

I attended Bishop Hopkins's lectures, and gave to them a severe attention. I remained, and still remain, unconvinced that Christ was divinely commissioned to preach a revelation to man, and that he was intrusted with the power of working miracles. But when I make this declaration, I do not mean to deny that such a being as Christ lived and went about doing good, or that the body of precepts which have come down to us as delivered by him were so delivered. I believe that Christ lived when and as the Gospel says; that he was more than man — namely, above all men who had as yet lived, and yet less than God; full of the strongest sense and knowledge, and of a virtue superior to any which we call Roman, or Grecian, or Stoic, and which we best denote when, borrowing his name, we call it *Christian*. I pray you not to believe that I am insensible to the goodness and greatness of his character. My idea of human nature is exalted when I think that such a being lived and went as a man amongst men. And here, perhaps, the conscientious unbeliever may find good cause for glorifying his God, not because he sent his son into the world to partake of its troubles and be the herald of glad tidings, but because he suffered a man to be born, in whom the world should see but one of themselves, endowed with qualities calculated to elevate the standard of attainable excellence. . . . I do not think that I have any basis for faith to build upon. I am without religious feeling. I seldom refer my happiness or acquisitions to the Great Father from whose mercy they are derived. Of the first great commandment, then, upon which so much hangs, I live in perpetual unconsciousness — I will not say disregard, for that perhaps

would imply that it was present to my mind. I believe, though, that my love to my neighbor — namely, my anxiety that my fellow-creatures should be happy — and disposition to serve them in their honest endeavors, is pure and strong. Certainly I do feel an affection for everything that God has created, *and this feeling is my religion.* "He prayeth well who loveth well both man and bird and beast," [he adds]. I ask you not to imagine that I am led into the above sentiment by the lines I have just quoted, the best of Coleridge's "Rime of the Ancient Mariner," but rather that I seize the lines to express and illustrate my feeling (i., p. 118, conf. ii., pp. 261–267).

This frank confession of unbelief would certainly have excluded its maker from any of the Churches of the Old World or the New; but if, instead of the creeds and standards of the Churches, we take the saying attributed to the author of Christianity, "By this shall all men know that ye are my disciples, if ye love one another" (John xiii. 45), or the test of character by which he proposed to test mankind at the final judgment (Matt. xxv. 31–46), there can be no doubt that Jesus himself would have owned Charles Sumner as one of his disciples in preference to many a rigidly orthodox follower of Luther or of Calvin.

It would appear from a letter to his brother George, written on the death of their sister Mary, that Sumner was a believer in human immortality (ii., p. 321).

In January 1834, Sumner entered as a student the office of Mr. Rand of Boston, a lawyer of great practice and extensive learning, and possessed of a remarkably well-stored library. The drudgery of an office was little to Sumner's taste, and his time was mostly devoted to the composition of articles for the *American Jurist.* In the May following he became one of its editors, and contributed more than one hundred pages to the July number. On one of his articles a friend made this critical remark, which was probably applicable to them all, "Your article on replevin was learned, and well and logically expressed. It was an extraordinary article for a young man, but it is not practical. You seem to delight in the speculative in the choice of your articles." His office and literary work was varied by visits to Washington and Philadelphia. At Washington, the friendship of Story secured him unusual civilities from the judges of the Supreme Court, and he made the acquaintance of many eminent members of the bar, as well as of other persons. One of these was Dr. Francis Lieber, a German settled in America, with whom Sumner during the part of his life related in these volumes kept up a constant correspondence. One of his Washington acquaintance "went so far at the time as to predict for him the highest judicial station, unless he should be diverted by literary tastes."

A lady thus describes his appearance and rather eccentric manners at this time: —

When he came to Philadelphia in 1834, he had finished his course at the Law School, I think; but had almost put out his eyes with hard study, and was forced to come away for rest. He was then a great, tall, lank creature, quite heedless of the form and fashion of his garb, unsophisticated, everybody said, and oblivious of the propriety of wearing a hat in a city, going about in a rather shabby fur cap, but the fastidiousness of fashionable ladies was utterly routed by the wonderful charm of his conversation, and he was carried about triumphantly and introduced to all the distinguished people, young and old, who then made Philadelphia society so brilliant. No amount of honeying, however, could then affect him. His simplicity, his perfect naturalness was what struck every one, combined with his rare culture and his delicious youthful enthusiasm (i., p. 127).

Sumner was not impressed by the national capital. His description of Washington is from all accounts as true now as it was when written forty-three years ago. He writes to his parents: —

Here I am in the great city, or rather the city of great design, of spacious and far-reaching streets, without houses to adorn them or business to keep them lively, with a Capitol that would look proud amidst any European palaces, and with whole lines of houses which resemble much the erections at Cambridgeport and Lechmere Point — poor stunted houses, with stores beneath and boarding above.

There is nothing natural in the growth of the city. It only grows under the hotbed culture of Congress. There is no confluence of trade from different parts of the country, and no natural, commercial, or manufacturing advantage to induce persons to live here. So, for ought I see, it must forever remain as it is now — a place of winter resort, as the Springs are of summer resort, and be supported entirely by travellers and sojourners.

While travelling to Washington, he for the first time saw a sight which produced on him an ineffaceable impression. This impression moulded his after-career.

"For the first time I saw slaves, and my worst preconception of their appearance and ignorance did not fall as low as their actual stupidity. They appear to be nothing more than moving masses of flesh, unendowed with anything of intelligence

above the brutes. I have now an idea of the blight upon that part of our country in which they live" (i., pp. 133, 134).

How strong the Puritan traditions and influences still were in Boston in Sumner's youth appears from the contrast he draws between a Boston and a Washington Sunday, on which day he dined *en famille* with the judges of the Supreme Court.

"Sunday here is a much gayer day than with us; no conversation is forbidden, and nothing which goes to cause cheerfulness, if not hilarity. The world and all its things are talked of as much as on any other day" (i., p. 137).

With no forecast of the part he was to fill in the legislature, he writes to his friend Professor Greenleaf:—

I probably shall never come to Washington again, and therefore I shall do myself best service by making the most of this visit. I wish to become acquainted with the manner and appearance of those gentlemen whose speeches I am to read for some years, and with whose fame the country rings from side to side.

Notwithstanding the attraction afforded by the Senate, and the newspaper fame which I see the politicians there acquire, I feel no envy therefore, and no disposition to enter the unweeded garden in which they are laboring, even if its gates were wide open to me; in plain language, I see no political condition that I should be willing to desire, even if I thought it within my reach — which, indeed, I do not think of the humblest (i., p. 141).

On Sumner's return from Washington, Story offered him an appointment as instructor at the Harvard Law School — in fact, Story and Greenleaf seemed to have had a strong determination to have Sumner not only as their colleague, but as one of their successors at that Law School (i., p. 150).

Sumner, however, declined the proffered appointment, and at the beginning of September 1834, being then aged twenty-three, he was, after a recommendation by the bar of Worcester County, admitted an attorney of the Massachusetts State Court of Common Pleas.* On this occasion, with prophetic insight, the same friend whose criticisms on Sumner's speeches and writings we have already quoted wrote of him:—

Let me speak plainly what I discern and feel. You are not rough-shod enough to travel in the stony and broken road of homely, harsh, everyday practice. You were neither made for it by the hand of nature, nor have you wrought and fashioned yourself to it by that less cunning but still most potent artificer, practice. All your inclinations (I but see through a glass darkly) and all your habits set you on with a strong tendency towards a green eminence of fame and emolument in your profession; but you are not destined to reach it by travelling through the ordinary business of a young lawyer in the courts (i., p. 128.)

For the next three years Sumner followed his profession at Boston, and in June 1835 he was appointed by Story a commissioner of the United States Circuit Court, and reporter of "Story's Opinions" in that court. In the winters of 1835, 1836, and 1837, he gave instruction at the Law School in Story's absence.

"In the last of these periods he had the chief responsibility of the school in the absence of both Story and Greenleaf. As a teacher he did not make a strong impression of any kind on the students, but he appears to have realized a fair measure of success for so young a lawyer." During these years he also continued in the editorship of the *American Jurist*, to which also he was a constant contributor, and in other literary labors, mostly of a legal kind, he was abundant. "My labors in the *Jurist*," he wrote, "are pressing and heavy, and lack the exciting stimulus of pecuniary profit. Indeed, I fear that exertions like mine will meet with very slight return in the way of this world's gear" (i., p. 167). But in Sumner's case, as in Macaulay's, "the pleasure of writing paid itself," * and he loved law and knowledge for their own sakes. He wrote to a young lawyer whom he had recommended for editor of some law cases:—

Don't regard the money as the pay. It's the knowledge you will get — the stimulus under which your mind will act, when you feel that you are reading law for a *purpose* and an *end* other than the bare getting of information, every spur and ambition exciting you. Depend upon it, no engraver will trace the law on your mind in such deep characters (i., pp. 167–169).

Sumner [at this period, writes Pierce] succeeded as well as the average of young lawyers, but he did not step into a lucrative practice, nor obtain the business which, with his laborious studies and many friends, he had expected. He was too much absorbed in amateur studies to become a shrewd and ready practitioner, and his mind, while so employed, was less inclined to the petty details of an office. His engagement at the Law School

* It will be remembered that in America there is not the distinction which exists in England between "the *bar*," and "solicitors," or the more ancient and honorable but now abolished order of attorneys, of whom the writer may say, "*Quorum pars minima fui.*"

* *Vide* Letters to Napier, Life, vol, i., pp. 452–464.

for the first three months of the year — the busiest season for a lawyer — seriously invaded the regularity of office hours, keeping him at Cambridge every alternate day at some seasons. Clients are quick to detect such departures from the professional routine, and prefer some painstaking attorney who is always to be found at his desk. But while with continuous devotion to the profession he would doubtless have attained a very respectable rank at the bar, it may be questioned whether he had the qualities which draw to a lawyer "litigious terms, fat contentions, and flowing fees." According to tradition, he weighted his arguments with learning where only a skilful handling of testimony would have been most effective; and was not gifted with the quickness of perception which is as essential in the court-room as in the field. His tastes and qualilies of mind fitted him rather for a position as judge or teacher, where his chief duty would be the exposition of the principles of the law. But he expressed no discontent with his profession, and certainly had no thought of leaving it. His enthusiasm in the study of jurisprudence as a science was unabated (i., p. 149).

He still gave no promise of distinction as an orator, while amongst his acquaintance several men, no older than himself, had already won public favor on the platform. At this time, too, he was persuaded for the first and only time to venture some money in a speculation. He lost all he invested, but he comforted himself under his disappointment with the reflection, that, "if he had lost money, he had gained experience." "I have learned," he wrote to a friend, "a valuable lesson; money and business dissolve all the ties and bonds of friendship."

During these years also he continued to increase his acquaintance. Through Story he became acquainted with the judge's classmate, Dr. Channing, whose book on slavery was published in 1835. The influence which this great and benevolent man had on Sumner's after-life is hardly to be overrated. "He was my friend," Sumner wrote on occasion of Channing's death, "and I may almost say my idol for nearly ten years. For this period I have enjoyed his confidence in no common way." One of Sumner's published orations, "The Philanthropist" ("Works," i., 284–298), is a tribute to the memory of his revered friend. At this time Sumner was not in general society nor a visitor at many houses. His most intimate associates were a group of young men of his own age who called themselves "the Five of Clubs." All, says Mr. Pierce, achieved an honorable place in literature, but of them, besides Sumner, so far as we know, only H. W. Longfellow has gained any fame on this side of the Atlantic.

The "Five" came together almost weekly, generally on Saturday afternoon. They met simply as friends, with common tastes and the fullest sympathy with each other, talking of society, the week's experiences, new books, their individual studies, plans, and hopes, and of Europe, which Longfellow and Cleveland had seen, and which the others longed to see. They loved good cheer, but observed moderation in their festivities. A table simply spread became a symposium when Felton [professor of Greek at Harvard University], with his joyous nature, took his seat amongst his friends; and the other four were not less genial and hearty. There was hardly a field of literature which the one or the other had not traversed, and they took a constant interest in each other's studies. Each sought the criticism of the rest upon his own book, essay, or poem, before it was given to the public. Their mutual confidence seemed to know no limit of distrust or fear of possible alienation; and they revealed, as friends do not often reveal, their inner life to each other (i., p. 161).

At this period, unlike most young lawyers, Sumner still took no interest in politics; but his letters show that his spirit was beginning to be stirred within him on the slavery question.

You [he writes, January 1836, to his constant correspondent, Francis Lieber] are in the midst of slavery. . . . What think you of it? Should it longer exist? Is not emancipation practicable? We are becoming Abolitionists at the North fast. The riots, the attempt to abridge the freedom of discussion, Governor M'Duffie's message, and the conduct of the South generally, have caused many to think favorably of immediate emancipation who never before inclined to it. [And again, to the same friend in 1837] Miss Martineau's book * will be published in a few days, and will make the feathers fly. From the extracts published in the papers, her work will be of a most decided character, mowing to the right and left with keenness and effect. I hope her castigation will do good. Already calumny has beset her amongst us, and she is classed with Hall and Trollope. Her comments on slavery are said to be scorching. I do not regret this. I hope through her some truth may reach the South. Perhaps her book may be burned by the hangman; certainly it will be placed on the *index expurgatorius* of the South. I wonder that your free spirit can endure the bondage to which opinion at the South must subject you, tying your tongue and taming all your expressions (i., pp. 173, 191).

We make one more extract from the

* Miss Martineau had made the acquaintance of Sumner and his friend Hillard when in the States, and pronounced them to be "glorious fellows."

letters of this period, because it contains Sumner's opinion on a matter interesting to English lawyers, and his opinion strikes us as singularly weighty. Writing to Professor Mittermaier, of Heidelburg, respecting the proposed codification of the law of Massachusetts, he says: —

Among us the *codification* proposed is simply *revision* and *redaction* — the reduction of a portion of the vast mass of decided cases (*jurisprudence des arrêts*) to a written text, thus establishing, as it were, a stratum of *written* law, which will give firmness and solidity to that portion which remains unwritten. By such a course, it seems to me that we in a great degree avoid the evils pointed out by Savigny and the historical school. We still preserve the historical features of the law, not presuming to frame a new system from *new* materials, without consulting the previous customs, habits, and history of the country. The error of Jeremy Bentham and of John Locke was in supposing that they in their closets could frame *de novo* a code for the people. Locke prepared a code a century ago for one of the North American colonies, which proved a signal failure (i., p. 189).

Here is another noteworthy passage from a letter written about this time to his friend Lieber —

I yesterday talked with Fletcher (member of Congress and afterwards a judge) about your "political ethics." We debated the question whether a citizen should be obliged under a *penalty* to vote, as he is to serve on the jury. If voting be a duty and not a privilege, should not the duty be enforced by law? At our recent election two of our wealthiest citizens, whose position is mainly accorded on account of their wealth, declined voting. Their immense property was protected by the law, and yet they would not interfere or assist in the choice of the law-makers. I wish you would ponder this question for your book. I promised Mr. Fletcher that he should some day read a solution of it from your pen (i., p. 205).

It may one day be necessary for English Parliamentary reformers to consider this question.

We wish we had space to transfer at length to our pages a letter to a law student, containing most admirable advice how to study law as a science. Should this review fall into the hands of any of that class of students, we trust it may induce them to study the letter itself. We have room only for these extracts: —

Let me suggest that you should not hesitate to propose to yourself the highest standard of professional study and acquirement. . . . Keep the high standard in your mind's eye, and you will certainly reach some desirable point.

I am led to make these suggestions from knowing, from my experience with law students, that the whisperings of their indolence, and the suggestions of practitioners with more business than knowledge, lead them to consider that all proper professional attainments may be stored up with very slight study. I know from observation that great learning is not necessary in order to make money at the bar, and that, indeed, the most ignorant are often among the wealthiest lawyers; but I would not dignify their pursuit with the name of a profession: it is in nothing better than a trade. . . . Pursue the law as a science, study it in books, and let the result of your studies ripen from meditation and conversation in your own mind. Make it a rule never to pass a phrase or sentence or proposition which you do not understand. If it is not intelligible — so indeed that a clear idea is stamped upon your mind — consult the references in the margin and other works which treat of the same subject, and do not hesitate, moreover, to confess your ignorance or inability to understand it, and seek assistance from some one more advanced in the pursuit.

Our remaining extract illustrates the tendency of Sumner's mind to study and write on the literature about the law rather than the law itself: —

Diligently study the characters of reporters and judges. . . . I assure you it is of comparatively easy accomplishment to familiarize yourself with the character of every reporter, and of all the important judges in English history. To this end read legal biography wherever you can lay your hands upon it. . . . Study legal biography; acquaint yourself with the time of publication of every legal work, and the repute in which it has been held; examine its preface, and look at the book itself, so that you may have it bodily before you whenever you see it referred to (i., pp. 206, 209).*

Sumner had long been desirous of visiting Europe, and especially England. He said, "The visions of boyhood and of the lengthened shadows of youth and manhood will then be realized, and I shall see what has so often filled my mind and imagination." "My journey," he wrote to a friend, "will not be peculiarly legal. I shall aim to see *society* in all its forms which are accessible to me; to see men of all characters, to observe institutions and laws, to go circuits, and attend terms and parliaments, and then come home and be happy" (i., p. 192).

* Sumner afterwards edited Vesey Junior's "Reports," adding valuable biographical notes, of which specimens will be found in "Memoir," vol. ii., p. 284, *et seq.*

Towards the close of 1837 he proceeded to carry out his design. It was a bold venture for one in his position. "In going abroad," he writes in his journal, "at my present age, and situated as I am, I feel I take a bold, almost a rash, step. One should not easily believe that he can throw off his clients and whistle them back, as a huntsman does his pack. But I go for purposes of education, and to gratify longings which prey upon my mind and time" (i., p. 214).

He had not saved enough out of his professional income to pay the expense of the journey, far more expensive then than now, for as yet no passenger steamer had passed between the Old World and the New, and the railway systems both of England and the Continent were in their early infancy. Indeed, it is doubtful whether even that term was then applicacable to the Continental railway system. What was lacking in his own resources was made up by loans generously offered by Story and other friends. It was not without serious misgivings that Story and Greenleaf saw their friend and former pupil set out for Europe. "They feared — an apprehension well founded — that the foreign experiences he counted upon would wean him from his profession. President Quincy [of Harvard University], in a parting interview, touched his sensitiveness by telling him rather bluntly that all Europe would do for him would be to spoil him, sending him home with a moustache and cane, — a remark meant in kindness, but with Sumner's reverent regard for the president, disturbing him for months afterwards whenever his memory recurred to his vacant law office" (i. p. 199). The fears of his friends that he would return from Europe spoilt were unfounded. Sumner, in the first entry made in the journal which he kept during his tour, expressed "an unabated determination on his return to devote himself faithfully to the duties of an American."

He was unusually fortunate in obtaining letters of introduction to many members of the English aristocracy, of the bench and of the bar, as well as to men of letters, and through his friend Lieber to several distinguished foreign jurists. His friend Mr. James A. Wortley (the late recorder of London), truly said of his English tour, "You have had better opportunities of seeing all classes of society, and all that is interesting amongst us, than any other of your countrymen" (ii., p. 140).

It is the extracts from the letters he wrote and the journal he kept during this tour, especially those relating to his visit to this country, which are the great attraction of this book for English readers.

He sailed from New York for Havre, December 8, 1837. As was natural in a New Englander, he notes, on nearing the coasts of Devon and Cornwall, "My mind has felt a thrill under the associations of these waters; it is my first experience of the rich memories of European history. On my left now are the cliffs of England, Plymouth, from which the pilgrim ancestors of New England last started to come to our bleak places" (i., p. 215). His first European experiences were gained at Havre, where he landed December 28, "with antiquity staring at him from every side." The chief points in which he found Havre to differ from an American city "were (1) antiquity; (2) dress of women with caps, and without bonnets in the street; (3) labor of women; (4) presence of the military and police, a soldier or policeman presenting himself at every turn; (5) narrowness and dirt of the streets; (6) houses of stone, and narrow and chimney-like" (i., p. 219). Another point of difference struck the descendant of Puritans. "Here," he writes, "Sunday shines no Sabbath day," all things proceed as on week-days.

At Rouen he first saw one of those great historic monuments which have such a peculiar charm for educated Americans, who feel as Sumner felt that theirs is a country which has no prescription, no history, and no associations (i., p. 264).

> The cathedral (of Rouen) is the great lion of the north of France, and is said to be the finest specimen of Gothic architecture on the Continent. Certainly it is vast and elaborate, transcending all that my imagination had pictured as the result of this architecture. The minuteness of the workmanship testifies that it was done by those who commanded hands for labor with a facility not unlike that which summoned the thousands of laborers who raised the pyramids of Egypt. I can hardly imagine such a work at the present day. No building, unless it be Westminster Abbey, abounds more in historical associations. Enlarged, if not built, by the ancient dukes of Normandy anterior to the conquest of England, it is the chosen place where the bones of many of them repose. Here are the remains of Rollo, the first Duke of Normandy and the ancestor of the Conqueror, and over them an effigy of William the Long Sword, his son; of Henry, the father of Cœur de Lion; and here the lion heart was itself deposited. At a later day the remains of the Duke of Bedford — the English regent of France, discomfited by the Maid of Orleans — were deposited here, and an inscription behind the great altar

marks the spot. Different parts in the neighborhood of altars are occupied by inscriptions and engraved effigies of bishops, archbishops, cardinals, and other eminent men, whose standing or character gave them admission after death to this company. Over all was the vast Gothic roof, stretching on with its ancient and numerous arches in imposing perspective; and the light which was shed upon this scene came through richly painted windows, where were martyrdoms and sufferings and triumphs such as the history of Christianity records — and here was I, an American — whose very hemisphere had been discovered long since the foundation of this church, whose country had been settled, in comparison with this foundation, but yesterday — introduced to these remains of past centuries, treading over the dust of archbishops and cardinals, and standing before the monuments of kings, and the founder of a dynasty the greatest and best-established of modern Europe. Now, indeed, may I believe in antiquity, and in the acts which are recorded. Often, in fancy, have I doubted if such men as history mentions ever lived, and did what we are told they did; if William of Normandy actually conquered England, and if indeed such a place as England existed for him to conquer. But this fancy, this pyrrhonism of the imagination, is now exploded. These monuments and their inscriptions, with the traces of centuries upon them, in this holy place, bear testimony to what I have read (i., p. 222).

From Rouen, Sumner went to Paris, where he was present at the closing of the once notorious gaming-house, Frascati's, having for that purpose hastened to be in Paris by New Year's eve, after which date all the "hells" of Paris were by law to be closed. But it was not for such sights that he came to Paris. He devoted himself, in the first instance, to acquire the French language, and with so much energy and success, that although, when "he arrived in Paris, he could understand hardly a sentence in French when spoken to him, in less than a month he could follow a lecturer, in six weeks participate in conversation, and at the end of three months he served as an interpreter before a magistrate on the examination of a fellow-countryman" (i., p. 228).

His industry while in Paris was immense. He attended one hundred and fifty or more lectures, not only on law, but other departments of knowledge. He frequented the hospitals, and witnessed the leaders of the medical profession, surrounded by their pupils, attending on the patients. To the Chambers and the theatres he was a frequent visitor. A visit to the Bibliothéque de St. Genevieve, with its two hundred thousand books and thirty thousand manuscripts, led him to this reflection: "What is authorship? Here are two hundred thousand volumes. Who knows the names of the wise, and learned, and laborious who built on them confident hopes of immortality on earth? The pages of an unread catalogue are the only roll of fame on which most of their names are inscribed, and dust gathers over the leaves of the works on which long lives have been consumed. It seems like passing through tombs and a city of the dead to walk through a large library; for here how many aspirations — proud and high-reaching as the stars — hopes, and longings, lie buried" (i., p. 230).

A comparison of the French, English, and American press caused him "to feel strongly the pettiness of the politics of his country, their provincialism, and their lack of interest for the cosmopolite" (i., p. 235).

When attending a lecture on the "Institutes" of Justinian by Professor Ducaurroy, he saw a sight which no doubt tended to influence his future actions, for on more than one occasion afterwards he publicly referred to it.

> Among the audience I noticed two or three blacks, or rather mulattoes — two-thirds black, perhaps — dressed quite *à la mode*, and having the easy, jaunty air of young men of fashion, who were well received by their fellow-students. They were standing in the midst of a knot of young men, and their color seemed to be no objection to them. I was glad to see this; though, with American impressions, it seemed very strange. It must be, then, that the distance between free blacks and the whites among us is derived from education, and does not exist in the nature of things (i., p. 242).

The then existing Chamber of Peers appeared to him

> A highly respectable assembly. The style of debate [he adds] was entirely creditable; it was animated and courteous. Indeed, I can hardly imagine an assembly appearing more respectable, or a debate conducted with more of that spirit by which truth and the public good are best advanced. Yet I cannot help recording that I observed a peer standing in a most prominent place, on the elevation of the president's chair, and in conversation with the president, with his thumbs stuck in the armholes of his waistcoat, which I remember hearing years ago was a Yankee trick (i., p. 262).

He conceived a great admiration for Louis Philippe.

> There is no individual [he writes] about whom I have more changed my mind by coming to Paris than Louis Philippe. I had hitherto esteemed him a sensible, prudent, but ordinary

sovereign. I find him a great one — truly great — mingling in business as much as his ministers, and controlling them all. He is more than his cabinet. Measures emanate from him. With skill that is wonderful, he has reined in the Revolution of July (i., p. 262).

This is high praise of him whom one who knew him well called "*le plus grand fourbe de l'Europe.*" *

It would be unjust to condemn for want of foresight a young man of twenty-seven, which was Sumner's age when in Paris; but it was Louis Philippe's control of his ministers and his reining in the Revolution of July, for which Sumner pronounced him to be a great sovereign, which led to the overthrow of the monarchy of July, as is well shown in the recently published "Memoirs" of M. Odillon Barrot.

The following sketch of the Chamber of Deputies of 1838 is interesting: —

I was infinitely disappointed in the appearance of the president. It was ordinary, and almost vulgar; and yet he is the famous M. Dupin, the editor of Pothier, the writer of sundry matters of law, and the sayer of several smart and memorable things. His head was partially bald, and the hair left was brushed smooth and sleek. Perhaps, on seeing this famous man nearer, I might alter the above impressions; but they are those of a first sight. I noticed in the Chamber of Peers what I thought was a Yankee trick; in the Chamber of Deputies I noticed others. For a good part of the debate, a *huissier*, whose place was very conspicuous, being directly on a level with the president, sat with his chair on its hind legs. Another, M. Salvaney, the minister of public instruction, sat for some time cutting with his penknife the mahogany desk before him. There were a good many speakers, one of whom was quite prominent, being able, eloquent, and humorous. This was the Count Joubert. He made a very severe attack on the ministry, which produced a sensible effect. He was very witty and caustic, and was constantly interrupted by cries of "*Tres bien*," or by murmurs of dissent, or more frequently by laughs at his sarcasm. I observed all the distinguished members of the House and scanned their features. Guizot is justly eminent. His literary labors have been immense, and his political elevation is now as distinguished as his literary. He is no longer in the ministry, but he is intensely regarded by all parties for the expansion of his views and their deep philosophical reflection. His forehead is high, but he is not bald, though his hair is thin. His face is mild and gentle in its expression. M. Thiers, the celebrated author of the "History of the French Revolution," is a most distinguished member of the Chamber. I did not hear him speak, but I narrowly regarded him. He is but little above the middle size, with sleek black hair, and with a bright countenance, which seemed to content itself with short and momentary looks. Lafitte sat on the extreme *gauche;* that is, at the extreme of the Liberal section. He was the great leader of the Revolution of July. His appearance is prepossessing. One would hardly expect to find in the gentlemanly person with silver locks, who sat so quietly during an exciting debate, the leader of a revolution. Odillon Barrot sat by his side, and his whole frame and features seemed to be in constant motion. His appearance was neat, attractive, and gentlemanly; but I saw him from a distance, so that I could not discern his particular features. The great astronomer Arago, who has mingled very much in politics, and who is an extreme Liberal, sat by his side. On the opposite side of the house was Lamartine, a tall, thin man, looking like a poet, of whom I had but an imperfect view; also Berryer, the eloquent Carlist, with his blue coat buttoned high up in his neck, and his burly face full of blood and passion. The members of the Chamber sat with their hats off, and generally preserved a respectful deportment; but they interrupted the speaker at pleasure, with notes of admiration or dissent, to as great an extent, I should think, as in the English Parliament (i., p. 268).

At the different courts of justice Sumner was a constant attendant and a shrewd critic.

A French court [he writes to Judge Story] is a laughable place. To me it is a theatre, and all the judges, advocates, and parties "merely players." In those particulars in which they have borrowed from the English law, they have got hold of about half of the English principle, and forgotten the rest. Thus they have juries. These they imported from England, but with none of the regulations by which the purity of our verdict is secured.

In the Court of Cassation [he notes in his journal] I heard M. Laborde, on one side, make what I thought a very beautiful speech, animated, flowing, *French.* He used a brief, which appeared to contain the quotations only which he made. I think the whole argument had been written out and committed to memory. Dupin was quiet and dry in his delivery, having his whole argument *written out*, reading it without pretending to look off his paper. He appeared here, as in the Chamber of Deputies, "vulgar."

In a letter to Story he wrote, "Dupin, the first lawyer of France, is not equal to Daniel Webster." To another friend he wrote: —

I am diligently studying the French code, in which I find much to admire. The whole

procedure has struck me most favorably. I will only say at present, that those who have spoken and written about it in England and in the United States have not understood it, or else have calumniated it grossly. A *tertium quid* which should be the result of the French and English manner of procedure would be as near perfection as I can imagine; but I am inclined to think — indeed, I am convinced — that if I were compelled to adopt the *whole* of either without admixture, I should take the French. My mind is full of this subject, but I will not enlarge upon it at present (i., pp. 282–284).

Although he admired the French law, he did not extend his admiration to French lawyers.

The *horizon* of the French lawyer [he writes to Professor Greenleaf] is extremely limited. Foreign nations, with their various laws, are nothing to him. Strong in the Chinese conceit that France is the celestial nation, he neglects with a truly Mohammedan indifference all but his own peculiar jurisprudence, and in the study of this I am strongly inclined to believe that he generally bounds his labors by the perusal of the codes and some few of the commentators. I write this with some hesitation, not, however, because what I have seen has left any doubt upon my mind, but because I am reluctant to judge foreigners. But one of the most distinguished of their professors made a confession to me similar to what I have stated above.

Writing to Story, he reiterates this opinion, and adds: —

I cannot hesitate in saying that the learning of the profession is of the most shallow kind. The code is the *vade mecum*, "the be-all and end-all" with the French *avocat:* this he possesses in a neat pocket edition, the different codes designated by the different color of the leaves, and carries with him to court. Among the younger lawyers whom I have met, I have found the greatest ignorance with respect even to the modern authors of France. . . . I can assure you without vanity (for between us there is no such thing) that I have several times felt that my acquaintance with the literature of French jurisprudence, and with the character and merit of its authors, was equal if not superior to that of many of the Frenchmen with whom I conversed. With them now it is indeed *Nil præter edictum prætoris*, the code and nothing but the code. Ignorant as they are of their own jurisprudence, it would seem superfluous to add that they know nothing of foreign jurisprudence, nothing of English and American in particular (i., pp. 287, 292).

His admiration of the code increased.

I have been most agreeably disappointed in the penal code. There is much in it which we must adopt. Would that I could draw a sponge over all our criminal law, whether by statute, custom, precedent, or however otherwise evidenced. When I see the simplicity, neatness, and common sense of the procedure here, I sigh over the cumbrous antiquated forms and vocabulary which we persist in retaining. But this is not to be discussed at the end of a letter. I shall return not simply a codifier, but a *revolutionist*, always ready, however, I trust, to be illuminated by the superior wisdom of my friends (i., p. 288).

His avowedly strong preference for some points in the French procedure alarmed the professor.

Greenleaf [writes Lieber to Sumner] runs up and down the coast of the Atlantic like an anxious hen, while you, a young duck, swim lustily on the ocean. He is very much afraid you will become too *principled* and too *unprecedented* (ii., p. 7).

The impression produced on Sumner by his sojourn in Paris is thus stated to Story: —

I have never felt myself so much an American, have never loved my country so ardently, as since I left it. I live in the midst of manners, institutions, and a form of government wholly unlike those under which I was born; and I now feel in stronger relief than ever the superior character impressed upon our country in all the essentials of happiness, honor, and prosperity. I would not exchange my country for all that I can see and enjoy here; and dull must his soul be, unworthy of an American, who would barter the priceless intelligence which pervades his whole country, the universality of happiness, the absence of beggary, the reasonable equality of all men as regards each other and the law, and the general vigor which fills every member of society, besides the high moral tone, and take the state of things which I find here, where wealth flaunts by the side of the most squalid poverty, where your eyes are constantly annoyed by the most disgusting want and wretchedness, and where American purity is inconceivable (i., p. 288).

Sumner left Paris for England 29th May 1838. With what feelings he approached this country we see from another letter to Story.

I start for England, and how my soul leaps at the thought! Land of my studies, my thought, and my dreams! Then indeed "shall I pluck the life of life." Much have I enjoyed and learned at Paris, but my course has been constantly impeded by the necessity of unremitted study. The language was foreign, as were the manners, the institutions, and the laws. I have been a learner daily; I could understand nothing without study. But in England everything will be otherwise. The page of English history is a familiar story; the English law has been my devoted pursuit for years, English politics my pastime, and the

English language is my own. I shall then leap at once to the full enjoyment of all the mighty interests which England affords, and I shall be able at once to mingle with its society, catch its tone, and join in its conversation, attend the courts, and follow all their proceedings as those at home (ii., p. 294).

"Sumner's acquaintance with English society," truly says his biographer, "was wider and more various than any previously enjoyed by an American, and even exceeded that of most Englishmen."

While in London or journeying in other parts of the British Islands, he mingled with the best society. His associations were not confined to any one set, but embraced persons widely divergent in professional callings, politics, tone of thought, and rank, — judges, lawyers, and divines; scholars eminent in literature, metaphysics, and science; titled persons who combined good breeding and intelligence; statesmen (Whig, Tory, and Radical), some of whom were aged and full of reminiscences of great orators; women, whose learning, cleverness, or grace enriched the thought and embellished the society of their day.

Sumner's opinions on English society and manners and institutions, and his judgments on the statesmen and lawyers he met, are given with unrestrained frankness in his journals and in his letters, especially those to Story and Greenleaf, and will be read with interest in this country. Some of the most striking of them we will transfer to these pages. We have seen with what feelings he anticipated his visit to England. He again gives expression to them in a letter to Story.

My pulses beat quick as I first drove from London Bridge to the tavern, and, with my head reaching far out of the window, caught the different names of streets so familiar by sound, but now first presented to the eye. As I passed the Inns, those chosen seats of ancient Themis, and caught the sight of Chancery Lane, I felt — but you will understand it all (i., p. 313).

This is surely the only instance in which that very squalid and dingy street, Chancery Lane, excited poetical feelings in any one's mind. "Paris," he said, "is great, vast, magnificent; but London is powerful, mighty, tremendous. The one has the manifestations of taste and art all about it, the other those of wealth and business."

Describing his first visit to the House of Commons, he writes to Story — "The business was dull, and — you will read it with astonishment — I slept under the gallery of the House of Commons."

His second visit was more successful. He was present on the 12th June, 1838, during a debate on the Irish Municipal Corporation Bill.

Need I tell you [he continues] the interest was thrilling during the whole time. Peel made a beautiful speech — polished, graceful, self-possessed, candid, or apparently candid, in the extreme. We have no man like him. Lord John Russell rose in my mind the more I listened to him. In person he is diminutive and rickety. He wriggled round, played with his hat, seemed unable to dispose of his hands or his feet; his voice was small and thin; but notwithstanding all this, a house of upwards of five hundred members was hushed to catch his slightest accents. You listened, and you felt that you heard a man of mind, of thought, and of moral elevation. Sheil then broke forth with one of his splendid bursts, full of animation in the extreme. He screamed and talked in octaves, and yet the House listened and the cheers ensued. Sir Edward Sugden [afterwards Lord St. Leonards] tried to speak; but calls of "Question," "Divide," and all sorts of guttural expectorating sounds from members in a corner or outstretched on the benches of the gallery prevented my catching a word of what he said during the half-hour he was on his legs. Sir John Campbell, the solicitor-general (Rolfe), and Follett all spoke; and of these, Follett was by far the best. O'Connell spoke several times, but only long enough to give me a taste of his voice, which is rich in the extreme, more copious and powerful than Clay's, though less musical (i., p. 316).*

Sir Charles Vaughan, once English minister to the United States, had been, when at Washington, on friendly terms with Judge Story; this led to a correspondence between Story and Mr. Justice Vaughan, the minister's brother, then one of the judges of the Common Pleas. Through him Sumner became acquainted with the judges and the leading members of the bar. With the English bar Sumner was highly impressed. "I cannot," he said, "sufficiently express my admiration of the heartiness and cordiality which pervade all the English bar. They are truly a band of brothers, and I have been received among them as one of them." The relations between the bar and the bench made a like impression on Sumner to that which they produced on Berryer.

J'ai assisté [he said on his visit to England in 1865] à toutes les cours de justice de votre pays, à toutes les délibérations judiciaires; j'ai été frappé de la situation qu'on y fait au barreau. Rien ne pouvait plus me toucher

* Of Lord John Russell Sumner wrote to Lieber, "You are right in your supposition about Lord John Russell. He is one of the greatest men I have seen in England."

que ces entretiens familiers entre le juge et l'avocat. Cela prouve à ce dernier l'attention qui lui est accordé; et j'y vois une garantie pour le sentiment d'indépendence qui doit appartenir à cet noble profession. I know nothing [wrote Sumner to Greenleaf] that has given me greater pleasure than the elevated character of the profession as I find it, and the relation of amity and brotherhood between the bench and the bar. The latter are really the friends and helpers of the judges. Good-will, graciousness, and good manners prevail constantly, and then the duties of the bar are of the most elevated character. I do not regret that my lines have been cast in the places where they are, but I cannot dismiss the feeling akin to envy with which I regard the noble position of the English barrister, with the intervention of the attorney to protect him from the feelings and prejudices of his client, and with a code of professional morals which makes his daily duties a career of the most honorable employment (i., p. 326).

We commend this opinion to those sciolists, as we venture to call them, who would efface the distinction hitherto existing in England between the senior and the junior branches of the legal profession.

Sumner heard

Lord Brougham despatch several cases in the Privy Council, and one or two were matters with which I was entirely familiar. I think I understand the secret of his power and weakness as a judge, and nothing that I have seen or heard tends to alter the opinion I had formed. As a judge he is electric in the rapidity of his movements; he looks into the very middle of the case when counsel are just commencing, and at once says, "There is such a difficulty (mentioning it) to which you must address yourself, and if you can't get over that I am against you." In this way he saves time, and gratifies his impatient spirit, but he offends counsel. Here is the secret.*

In the mean time Brougham is restless at table, writes letters, and, as Baron Parke assured me, wrote his great article in the *Edinburgh Review* for April last at the table of the Privy Council. I once saw an usher bring him a parcel of letters — I should think there must have been twenty-five — and he opened and read them, and strewed the floor about him with envelopes; and still the argument went on; and very soon Brougham pronounced the judgment in rapid, energetic, and perspicuous language — better than I have heard from any other judge on the bench.

This account of Brougham's judicial manner corroborates Mr. Greville's description of his demeanor at the hearing of the remarkable case of Swift *v.* Kelly. "On Saturday," writes Mr. Greville, "the court met, but no Brougham. They began, and in about two hours he made his appearance, read his letters, wrote notes, corrected some paper (for the press as I could see), and now and then attended to the cause, making flippant observations." * Sir David Brewster told Sumner "that he received several letters from Lord Brougham, written in court when chancellor, on *light*, one of them fourteen pages long" (i., p. 365). We fear that light must have been wanting in the chancellor's judgment in the case during the hearing of which his scientific dissertation was composed.

Sumner was introduced to Brougham by Joseph Parkes, the well-known Liberal solicitor, whose services to the party were recompensed under Lord John Russell's administration by his appointment, not to the benefit of the suitors or the profession, to the valuable office of taxing-master in chancery. Brougham took instantly to Sumner, and at their first meeting invited him to stay at Brougham Hall, saying, "Come down, and we will be quiet, and talk over the subject of codification." Sumner paid him the visit, but the subject of codification seems never to have been again mentioned between them. His account of Brougham at home is almost Boswellian, and exceedingly interesting. It confirms the accounts of Brougham's affection for and duty to his mother. The wife and daughter, as we believe was generally the case, were absent and from home, and Brougham's mother, then eighty-six, was the lady of the house. With her Sumner, like all those who had the honor and pleasure of her acquaintance, was particularly impressed and delighted.

Never [he notes] did I see a person who bore her years so well. During the dinner [Sumner writes to a friend] his lordship was constant in his attention to his mother, addressing her as "mother," and urging her to eat of particular dishes.

The title question was a puzzle to the young American.

I heard [continues Sumner] Mrs. Brougham address her son as "Lord Brougham." I could hardly make up my mind and my tongue to address this venerable woman as "Mrs. Brougham," which is all that belongs to her, and then speak to her son as "my lord."

His lordship took very little wine, less than I have seen any gentleman take at the head of

* The late Lord-Justice Knight Bruce, especially when, as vice-chancellor, he sat alone, was habitually guilty of the same fault.

his table in England; but if he have not that vice, which has been attributed to him, — and I fully believe he has it not, — he has another, which is perhaps as bad; certainly it is bad and vulgar beyond expression — I mean *swearing*. I have dined in company nearly every day since I have been in England, and I do not remember to have met a person who swore half so much as Lord Brougham; and all this in conversation with an aged clergyman. His manner was rapid, hurried, and his voice very loud.

He seemed uneasy and restless, and of course made me feel the same. His language, as you may well suppose, was vigorous and to the point. He told some capital stories of King William, from which I should infer, notwithstanding all the reports to the contrary, that he was on good terms with that monarch.

You remember Denman's famous appeal on the queen's trial, alluding to the slanders of the Duke of Clarence, "Come forth, thou slanderer!" Brougham said that the Duke of York, sitting in one corner of the House, said to a peer near him, "There is my brother William, he is always in some scrape;" while the Duke of Clarence, sitting on the other side of the house, whispered to his friend, "My brother Frederick is always saying some d——d absurd thing," each supposing the other referred to by Denman!

When asked by Sumner who then at the bar was most like Erskine, Brougham replied, "Nobody! there is a degenerate race now; there are no good speakers at the bar except Sir William Follett and Mr. Pemberton." He further spoke of Lord Langdale (than master of the rolls) as a person who had never done anything, and would never do anything, and who was an ordinary man,— an estimate which was certainly correct. A dinner at Lansdowne House was, according to Brougham, "a great cure for Radicalism."

Thus [continues Sumner] he passed from topic to topic, expressing himself always with force, correctness, and facility unrivalled; but I must say with a manner not only far from refined, but even vulgar. He had no gentleness nor suavity, neither did he show any of the delicate attentions of the host. He *professed* an interest in America, but did not seem to care to speak about it. He said he should certainly visit us, for, with the present facilities of intercourse, it were a shame in an Englishman to be ignorant of the practical working of our institutions. "I am a republican," said he, "or rather, I am for intrusting the people with the largest possible degree of power." He spoke to me [continues Sumner] in the most disparaging terms of the aristocracy; but I shall be afraid that he will not speak so much for truth's sake so as to promote his own fame and power, or perhaps to gratify a personal pique.

Sumner's acquaintance with Brougham is but an illustration of the old saying, "Familiarity breeds contempt." He might have said to Brougham, as Bentham used to say, "Harry, if you want to study insincerity, stand before a looking-glass." *

I am almost sorry [he writes] I have seen Lord Brougham, for I can no longer paint him to my mind's eye as the pure and enlightened orator of Christianity, civilization, and humanity. I see him now, as before, with powers such as belong to angels; why could I not have found him with an angel's purity, gentleness, and simplicity? I must always admire his productions as models of art, but I fear that I shall distrust his sincerity and the purity of his motives. . . . I am disposed to believe that there is in him a nervousness and immense activity which is near akin to insanity, and which at present jangles with the otherwise even measures of his character.

Mrs. Brougham told Sumner that once Brougham, when chancellor, apologized to William IV. for troubling him with so many petitions, when the king promptly replied, "I shall be glad to see you take anything out of the bag except the Great Seal." This shows that, in spite of the generally rude and rough demeanor of the sailor king, he was not without some of the craft and duplicity which his father showed in his intercourse with his ministers.

The well-known friendship between Brougham and Lyndhurst is illustrated by another Boswellian account of a dinner party at Brougham's, at which Lyndhurst and Sumner were amongst the guests: —

Lord Brougham presented me in the quiet way in which this always takes place in English society — "Mr. Sumner, one of our profession," without saying of what country I was. We had been at table an hour or more before he was aware that I was an American. I alluded to America and Boston, and also to Lord Lyndhurst's relations there, with regard to whom Lord Brougham had inquired, when Lyndhurst said, "When were you in Boston?" "It is my native place," I replied. "Then we are fellow-townsmen," said he, with a most emphatic knock on the table, and something like an oath.

He left Boston, he told me, when a year old. I was betrayed by the frankness of his manner into saying the rudest thing I have to my knowledge uttered in England. Brougham asked me the meaning and etymology of the word "caucus." I told him it was difficult to assign any etymology that was satisfactory; but the most approved one referred its origin to the very town where Lord Lyndhurst was born, and to the very period of his birth; in

this remark alluding to his age, which I was not justified in doing, especially as he wears a chestnut wig. Lord Brougham at once stopped me. "Yes," said he, "we know what period you refer to, about 1798." "Somewhere in the latter part of the century," I replied, anxious to get out of the scrape as well as I could by such a generality. I was gratified by Lyndhurst's calling upon me a few days afterwards, because it showed he had not been disturbed by my unintentional impertinence. The style of intercourse between Lyndhurst and Brougham, these two ex-chancellors, was delightful. It was entirely familiar. "Copley, a glass of wine with you." He always called him "Copley," and, pointing out an exquisite gold cup in the centre of the table, he said, "Copley, see what you would have had if you had supported the Reform Bill." It was a cup given to Lord Brougham by a penny subscription of the people of England. It was very amusing to hear them both join in abuse of O'Connell, while Charles Phillips entertained us with his Irish reminiscences of the "agitator," and of his many barefaced lies. "A damned rascal," said Lyndhurst, while Brougham echoed the phrase, and did not let it lose an added epithet (ii., p. 67).

This interview with Lord Lyndhurst probably modified the highly unfavorable opinion of him which Sumner had previously formed. "I heard Lyndhurst, and I cannot hesitate to pronounce him a master orator. All my prejudices are against him; he is unprincipled as a politician and a man. Notwithstanding all this, Lyndhurst charmed me like a siren. His manner is simple, clear, and directly enchaining the attention of all; we have nobody like him" (i., p. 323). It is interesting to read that

Lord Grey told Lord Wharncliffe on the evening of Brougham's speech on the Reform Bill that it was the greatest speech he ever heard in his life, and his life covered the period of Pitt and Fox.

In this judgment Lord Wharncliffe concurred. Mr. Rogers told me Sir Robert Peel said that he never knew what eloquence was till he heard Brougham's speech on the abolition of slavery in the West Indies (ii., p. 48).*

Brougham's estimate of himself, and of the object of his great aversion, Lord Durham, is shown by this characteristic anecdote.

Brougham said to Roebuck, "They say there will be a great contest between Durham and myself in the House of Lords. There will be no such thing. It were affectation not to *know* that I am a very great debater, and that Lord Durham is a very poor one; there can be therefore no *contest* between us (ii., p. 21).

* The speech referred to by Lord Grey was that on the second reading of the Reform Bill, October 7, 1831.

Lord Durham's appreciation of Brougham's truthfulness is shown by this occurrence. "I happened to tell a story," writes Sumner, "that I had heard from Lord Brougham. Durham looked me in the eye, and asked my authority for it. 'Lord Brougham; I had it from his own lips.' 'Did you ever verify it?' was the short but significant reply" (ii., p. 39).

With Lord Denman Sumner was equally intimate. He told Sumner that he considered the "wig" the silliest thing in England, and that he should try to get rid of it. The late Mr. Justice Allan Park, "a believer in the divinity of wigs," told Sumner "that it was all a piece of Denman's coxcombry; that he wished to show his person." Lord Brougham also seems to have been a believer in wigs, for he gave Sumner his "twelve-guinea full-bottomed wig" in which he made the speech on the Reform Bill to which Earl Grey referred. Lord Denman is long since gone, and there have been many changes in the law and its administration since his time, but the "wig" has survived them all, and to all appearance will continue to be the official head-dress of English lawyers. Sumner gave Brougham's wig to the Law School at Harvard. If it still exists, the students no doubt contemplate it with feelings akin to those of the Wesleyan Conference when on one occasion an old wig of John Wesley's was exhibited to its delighted gaze.

The sketches of the bar and bench as they were composed in the first years of the present reign are full and accurate. The especial object of Sumner's admiration among the judges was Lord Denman. So strong was the impression made by Denman on Sumner, that on Sumner's second visit to England (1857), at a dinner in Lincoln's Inn Hall, he said of him, "To have known him is among the valued possessions of life; to have seen him on the bench in the administration of justice, was to have a new idea of the elevation of the judicial character." The other judges whom Sumner especially admired were the chancellor (Lord Cottenham), Chief-Justice Tindal, Mr. Justice Patteson, and Mr. Baron Parke (Lord Wensleydale), although he pronounced the last to be not a little conceited and vain. "From Baron Alderson I heard a higher display of the judicial talent than from any other judge in England. The bar, however," he adds, "think him often unsafe." Lord Abinger he calls "the great failure of Westminster Hall." Among the members of the bar he considered the attorney-general

(Sir John, afterwards Lord Campbell) "a very powerful lawyer, but his manner is harsh and coarse, without delicacy or refinement."

Those who remember the late Sir William Follett — they are not many — will read with pleasure and assent the following sketch: —

Sir William Follett is a truly lovable person, and one great secret of his early success has been his amiability. As a speaker he is fluent, clear, and distinct, with a beautiful and harmonious voice. He seems to have a genius for law; when it comes to the stating a law point and its argument, he is at home, and goes without let or hindrance or any apparent exertion. . . . Strange thing in the history of the bar, he is equally successful in the House of Commons, where I have heard them call for "Follett, Follett," and here he shows a parliamentary eloquence of no common kind, and also wins by his attractive manner. . . . I do not think his politics are much founded on knowledge. Circumstances have thrown him into the Tory ranks, where he will doubtless continue. He has little or no information out of his profession, seems not to have read or thought much, and yet is always an agreeable companion. I feel an attachment for him, so gentle and kind have I always found him.

Of Follett's colleague (the late Sir Frederick Pollock, afterwards chief baron) Sumner writes to Story, "He is dull, heavy, and, they say, often obtuse at the bar." The editor, in a note (vol. ii., p. 93) quotes a letter of Lord Denman's written on the bench while Pollock was arguing, in which he said of him, "He bestows tediousness in a spirit of prodigality." He carried the same habit to the bench, and indulged in it so freely as frequently to draw from a member of the bar, his connection by marriage, and afterwards one of his puisnes, the pointed remark, "Hark to that d——d old parrot!"

The almost forgotten Charles Austin, of Parliamentary committee fame, was thought by Sumner to be "the only jurist" at the English bar.

We cannot pass over the following characteristic witticism of Chief-Justice Tindal on another nearly forgotten lawyer (Mr. Serjeant Bompas), who, under the name of Mr. Serjeant Buzfuz, will enjoy a longer posthumous fame than under his own. "In argument," writes Sumner, "he (Bompas) is very earnest and noisy, sometimes confused. Chief-Justice Tindal was once asked if he thought Bompas a *sound* lawyer. 'That will depend,' said the chiefjustice, 'upon whether *roaring* is an unsoundness.'" Those who remember the habits of the late Mr. Justice Talfourd, and the praise so often bestowed in his two volumes of "Vacation Rambles" on the wines of the countries through which he travelled, will appreciate the remark made by him on an eminent member of the bar distinguished for his temperance: "He is a humbug; he drinks no wine." "Here," says Sumner, writing of the Garrick Club, "Talfourd takes his *negus* on passing Westminster Hall in the morning, and his midnight potation on returning from Parliament."

But we must pass from the legal to the literary world. Here is an account of Sumner's first meeting with Walter Savage Landor: —

Landor was dressed in a heavy frock-coat of snuff color, trousers of the same color, and boots; indeed, he wore a morning dress, which one is more inclined to notice here than among us, where the difference between morning and evening dress is less imperiously settled. . . . Conversation turned upon Washington. . . . I spoke of "the *ashes* of Washington," saying "that his ashes still reposed at Mount Vernon. Landor at once broke upon me with something like fierceness. "Why will you, Mr. Sumner, who speak with such force and correctness, employ a word which in its present connection is not English? Washington's body was never burnt; there are no ashes — say rather *remains*" (i., p. 327).

Sumner visited Wordsworth at his home.

I cannot [he writes] sufficiently express to you my high gratification at his manner and conversation. It was simple, graceful, and sincere; it had all those things the absence of which in Brougham gave me so much pain. I felt that I was conversing with a superior being, yet I was entirely at my ease (i., p. 357).

From the Lake country Sumner went on to Scotland. He visited Abbotsford in the company of Sir. D. Brewster, at whose house he met at dinner Sir Adam Fergusson (well known by name to every reader of Lockhart's "Life of Scott"), who, in reference to the well-known line in the "Lay of the Last Minstrel," "assured him that Scott never saw *Melrose by moonlight* during all his life;" and Sir David added "that he had heard Scott say that twenty times. The truth was, Scott would not go there for fear of bogles." Abbotsford Sumner describes as "a confused pile — a folly made sacred by the memory of its great author. As I saw this building, I felt the fatal weakness of Scott's character more than ever, and sighed to think he could not have had the simple tastes which I found in Words-

worth. . . . The house is in wretched taste" (i., pp. 357, 358).

Sumner visited Jeffrey at Craigcrook.

Never [he writes] have I heard any one express himself with such grace, beauty, precision, and variety of word as did Jeffrey when I introduced Jeremy Taylor. [Again] Jeffrey against all the world! While in Edinburgh I saw much of him; and his talent, fertility of expression, and unlimited information (almost learning) impressed me more and more. He spoke on every subject, and always better than anybody else.

Sydney Smith [whom Sumner visited at Combe Florey] is infinitely pleasant, and instructive too; but the flavor of his conversation is derived from its humor. Jeffrey is not without humor, but this is not a leading element. He pleases by the alternate exercise of every talent; at one moment by a rapid argument, then by a beautiful illustration, next by a phrase which draws a whole thought into its powerful focus, while a constant grace of language and amenity of manners, with proper contributions from humor and wit, heighten these charms.

What a different man [writes Sumner elsewhere] is Lockhart! He is without words, conversation, heart, or a disposition to please, throwing nothing into the stock of social intercourse, and keeping himself aloof from all the hearty currents of life.

Sir William Hamilton he thought "quite learned, but brusque and *gauche* in manner" (i., pp. 359–561).

Amongst other men of literary and political reputation with whom Sumner became acquainted was John Arthur Roebuck, of whom he writes to Story, "I know Roebuck, and like him much. He is young, ardent, ambitious, and full of great things, accomplished, and a *republican*" (i p. 344). *Quantum mutatus ab illo!* It would have been interesting if Mr. Pierce — as he could have done — had told us Sumner's opinion of Roebuck after the outburst of the slave-owners' rebellion, when he was constantly advocating in Parliament the recognition by England of the slave-owners' confederation, of which Sumner said, "Better for the fast-anchored isle that it should be sunk beneath the sea, with its cathedrals, its castles, its fields of glory, Runnymede, Westminster Hall, and the home of Shakespeare, than it should do this thing." On further acquaintance with Roebeck, Sumner pronounced him to be "rash, self-confident, and unassimilating. His party is himself, for he will brook no shadow of variance from his own opinions." In this respect at least there is no difference in the earlier and later days of Mr. Roebuck.

At Milnes's (Lord Houghton) Sumner sat next to Macaulay, and opposite Bulwer (Lord Lytton). Sumner found "it was a relief from the incessant ringing of Macaulay's voice to hear Bulwer's lisping, slender, and effeminate tones. I liked Bulwer better than I wished. He talked with sense and correctness, though without brilliancy or force" (ii., p. 68). Macaulay Sumner thought "oppressive." He did not leave on him "an entirely agreeable impression;" still he confessed his great and magnificent attainments and powers (ii., p. 65). In truth, Sumner — himself a great talker, and used in America to be *primus inter pares* — in Macaulay's company felt himself overclouded. On another occasion Sumner met Macaulay at Holland House. "Macaulay," he wrote, "was dining, but more subdued than I have ever before seen. That common expression 'her' and 'me' for, as some say, 'she' and 'I,' was ingeniously discussed. Lord Holland defended the use of 'her' and 'me' as good idiomatic English, thus: 'No one is handsomer than her,' and 'He is absent oftener than me.' Lord Holland said that his uncle, C. J. Fox, had studied these points, and used these expressions. Macaulay was strong the other way, but was much struck by the authority of C. J. Fox. Thirty years after his death, the genius of the great Whig orator governed the frequenters of the venerable mansion in which he was born" (ii., p. 80).*

Of Lord Beaconsfield Sumner relates: "Mrs. —— said to Disraeli (the conversation had grown out of 'Vivian Grey'), 'There is a great deal written in the garrets of London.' Putting his hand on his heart, Disraeli said, 'I assure you "Vivian Grey" was not written in a garret'" (ii., p. 123).

Sumner's experiences of English society were by no means confined to London. He travelled through the south and west of England, through Winchester, Salisbury, and "down even to Bodmin in Cornwall, where the assizes of the Western Circuit were being held." There Sumner was the guest of the bar, as he was also of the Northern Circuit bar at Liverpool. At the meeting of the British and Foreign

* "In his choice of words," writes Lord Brougham of Fox, "he justly shunned foreign idioms, or words borrowed whether from the ancient or modern languages, and affected the pure Saxon tongue, the resources of which are unknown to so many who use it, both in speaking and writing."

Scientific Association, his health was proposed by Bishop Maltby (of Durham), whose guest he afterwards was at Auckland Castle.

Not only very few foreigners, but very few young Englishmen in the same social position as Sumner — a young barrister, not as yet distinguished in his profession — are admitted as freely as Sumner was into the highest aristocratic society. He was the guest of Lord Wharncliffe at Wortley Hall, of Lord Fitzwilliam at Wentworth House, and also at Milton. While at Wentworth he had

> a good opportunity to observe the way in which the wealthy sons of the aristocracy pass their time. The young Lord Milton had invited some of his friends, of about his own age, and keen in their love of horses, to visit him and have some private races. Milton offered, amongst various prizes, a gold cup and a dessert set. Among the young men were the future Lord Scarborough, and Lord De Mauley. They were all dressed as jockeys, with the cap, the close blue or red or yellow silk jacket, the leather breeches, and the white topboots. I observed a strong habit with them all; a remark could not be made without an offer to support it with a *bet*. If they were walking in the garden, one observed on the distance of a certain object, and straightway a bet was offered and taken with regard to it; and on one occasion the young De Mauley — who, besides being the heir of a peer, and at present a member of the House of Commons, has just married one of the handsomest women I ever saw in any country — offered to bet that he could run a certain distance within a given time. The bet was taken, the ground measured, he took off his boots and coat and waistcoat, ran, and gained the bet. At cards they were always disposed to make the sum played for quite high. I have found it universal in England to play for money. One evening I played with a *clergyman*. I won, and the clergyman paid me five shillings. Now, I must confess that I have disliked all this very much. I do not fancy cards in their best state; especially do I not fancy them when so nearly allied to gaming (i., p. 373).

Since this was written — nearly forty years ago — the passion for gambling in the shape of racing, betting, and card-playing has increased amongst and extended over all classes of English society. From Wentworth Sumner paid a visit to the town of Boston, after which his native town is named; "and whence," he writes, "John Cotton, 'whose fame was in all the churches,' went to settle our New England. I saw the old parsonage which Cotton left for the woods of America, and tapped at the back-door with a venerable triangular knocker, which, I doubt not, the hands of the Puritan preacher had often known before he forsook the soft cushion of the Established Church and the shadow of that fine Gothic pile, on which, even in his days, so many centuries had shed their sunshines and showered their storms." From Boston, Sumner went to the Earl of Leicester's at Holkham, "which," he wrote, "seems to me to blend more magnificence and comfort, and to hold a more complete collection of interesting things, whether antiques, pictures, or manuscripts, than any seat I have visited." Here he found a portrait of Sir Edward Coke, and saw his handwriting in annotations on many of the books in the library. "You may imagine" (he writes to Greenleaf), "that I have felt no common thrill in being thus permitted to look upon these things." "Lord Leicester," he writes elsewhere, "is now old and infirm. He is a very great friend of America, and recounts as the proudest event of his life the motion he made for the recognition of our independence. He speaks of Fox with the warmest friendship; of George the Fourth in no measured terms" (i., pp. 374–376).*

At Windsor, Sumner was invited to breakfast with the household, and those who remember Baron Stockmar's account of the total want of organization in the palace, before Prince Albert, at Stockmar's instigation, undertook the reform of its domestic affairs, will appreciate this extract: —

> I went down to breakfast, where we had young Murray (the head of the household), Lord Surrey, etc. Lord Byron — who you know was a captain in the navy — is a pleasant, rough fellow, who has not many of the smooth terms of the courtier. He came rushing into the room where we were, crying out, "This day is a real *sneezer*, it is a *rum* one indeed. Will her Majesty go out to-day?" Lord Surrey hoped she would not, unless she would ride at the "slapping pace" at which she went the day before, which was twenty miles in two hours. . . . Lord Byron proposed to breakfast with us, but they told him he must go up-stairs and breakfast with "the gals," meaning the ladies of the bedchamber and maids of honor. . . . Very soon Lord Byron came bouncing down, "Murray, 'the gals' say there is nothing but stale eggs in the castle." Again, the ladies sent a servant to

* The Earl of Leicester here spoken of was earlier known as Coke of Holkham. He was long member for Norfolk, and was created a peer on the queen's accession in 1837. He was the direct descendant of Lord Chief-Justice Coke, whose library is preserved at Holkham. Lord Leicester was in the habit of speaking of the Georges in unmeasured terms. He it was who called George III. "a bloody-minded parasite."

Murray complaining that there was no Scotch marmalade. Murray said it was very strange, as a very short time ago he paid for seven hundred pots of it (ii. 16).*

At Oxford, Sumner was lodged in All Souls', and "enjoyed the pleasing delusion" that he was a fellow of that peculiar institution. Thence he went to Cambridge. "Oxford is more striking as a whole," he thought, "than Cambridge, but less so in its individual features." At Cambridge he saw "most of the persons eminent at the university, and visited the various colleges."

The Christmas week of 1838 Sumner spent with Lord Fitzwilliam at Milton. Here he was brought, for the first time, face to face with the peculiar institution of England — fox-hunting. "I think," he wrote, "I have never participated in anything more exciting than this exercise." After describing how, contrary to his first intention, he had been led into the run, he continues: —

My first fence I shall not readily forget. I was near Lord Milton, who was mounted on a thoroughbred horse. He cleared a fence before him. My horse pawed the ground and neighed. I gave him the rein, and he cleared the fence. As I was up in the air for one moment, how was I startled to look down and see there was not only a fence but a ditch! He cleared the ditch too. I lost my balance, was thrown to the very ears of the horse, but in some way or other contrived to work myself back to the saddle without touching the ground. How I got back I cannot tell; but I did regain my seat, and my horse was at a run in a moment.

Those who remember Sumner's gaunt and ungainly figure will be as much surprised at his escape as he was himself. His feelings probably resembled those of the hero of a tale told by one who in his day was well known with the "Fitzwilliam," which described a leap of such width "that the rider, a pious man, said the Lord's Prayer in the air." Encouraged by the success of his first hunting expedition, Sumner the next day made a second, which had its incidents, one of which was, "I rode among the foremost, and in going over a fence and a brook together, came to the ground. My horse cleared them both, and I cleared him, for I went directly over his head." One feature of the hunting-field particularly impressed him, as it was sure to do one of Puritan descent.

I should not fail to commemorate the feats of the clergymen, as they illustrate the position of this body in England. The best and hardest rider in this part of the country is reputed to be a clergyman; and there was not a day that I was out that I did not see three or four persons rejoicing in the style of "Reverend," and distinguishable from the rest of the *habitués* by wearing a black instead of a red coat. They were among the foremost in every field, and cleared fences with great ease. Once we came to a very stiff rail fence; and as the hounds were not in full cry, there was a general stop to see how the different horses and riders would take it. Many were afraid, and several horses refused it. Soon, however, the Rev. Mr. Nash, a clergyman of some fifty years, came across the field, and the cry was raised, "Hurrah for Nash! Now for Nash!" I need not say that he went over it easily. Change the scene, and imagine Mr. Greenwood or Dr. Lyman Beecher* riding at a rail fence, and some thirty or forty persons looking on and shouting, "Hurrah for Greenwood!" "Hurrah for Beecher!"

Were an American now to visit the "shires," we believe that he would find the clerical element conspicuous by its absence, though it may be, as Mr. Froude says, that the total merging of the country gentleman in the ecclesiastic has tended to weaken rather than strengthen the influence of the country clergy in their parishes.

Describing the dinners and evenings at Milton, he says: "Conversation goes languidly. The boys are sleepy, and Lord Fitzwilliam serious and melancholy;" and this leads him to pass the following judgment on English fox-hunting: "I was excited and interested by it. I confess I should like to enjoy it more, and have pressing invitations to continue my visit, or renew it at some future period. But I have moralized much upon it, and have been made melancholy by seeing the time and money that are lavished on this sport, and observing the utter unproductiveness of the lives of those who are most earnestly engaged in it, like my lord's family, whose mornings are devoted to it, and whose evenings are rounded by a sleep" (ii., pp. 32, 33).† In this we cordially agree, but we are in the minority. Since Sumner's first visit to England the passion for fox-hunting has deepened and widened throughout society.

The hospitality shown to Sumner was not confined to the Whig aristocracy; he was received on equally intimate terms by several leading Tories. Amongst these

* Stockmar's Memoir, vol. ii., p. 118.

* Well-known American ministers of that time.

† One of the boys of 1838 has since met his death in the hunting-field.

were Lord Wharncliffe and Sir H. Inglis, of whom he writes: "Their strong Tory principles no one can doubt, and their beautiful private characters have invested these principles with a charm for my mind that they never had before. Not that I am a Tory; but meeting Tories of such a character has made me charitable and catholic, and convinced me that everything that proceeds from them is from the purest hearts and most cultivated minds" (i., p. 336).

Of English society, in comparison with that of his own country, Sumner formed this opinion: "In England, what is called society is better educated, more refined, and more civilized than what is called society in our own country. You understand me to speak of society as society, and not of individuals. I know *persons* in America who would be an ornament of any circle anywhere; but there is no *class* with us that will in the least degree compare with that vast circle which constitutes English society. The difference of education is very much against us" (ii., p. 78).

In March 1839, Sumner left England, and with that event the interest of the book ceases for English readers. We have dwelt so long on this portion of the memoir that we must compress our remarks on that which remains. Sumner travelled through Italy and through Germany, where he made the acquaintance of many distinguished jurists. While at Paris, on his way to Italy, the relations between England and the United States were embittered by the "north-eastern boundary question," and Sumner, at the request of General Cass, the United States minister at Paris, drew up the argument on the American side, which was published in *Galignani*. It was well received both in this country and in his own. In the United States it was considered a clear and able statement of the American view, and Lord Brougham told him it was "unanswerable." In May 1830, Sumner landed at New York, and thence went home to Boston, where he slowly returned to professional and literary work; but he "never took kindly to the details of law business," and "at times could not refrain from confessing to intimate friends that he had little heart for its drudgery." Law is a very jealous mistress, and "bears no rival near her throne;" and, as was to be expected, Sumner never obtained that eminence at the bar which might have been expected from his love of the study of jurisprudence, his knowledge, if not of law, about law, and his argumentative and rhetorical powers. He was gradually drawn to political life. "Questions of international law, growing out of the institution of slavery in the United States, supplied the first topics in the discussion of which Sumner participated after his return from Europe." The English as distinguished from the American view of the "right of search" was maintained by him in papers which received the strongly expressed approbation of both Story and of Chancellor Kent. At this time the Abolitionist party were urging the dissolution of the Union. William Lloyd Garrison denounced the national Constitution "as a pro-slavery instrument, a covenant with death, and an agreement with hell." Sumner, while equally urgent for abolition, refused to be a party to breaking up the Union. He was not at that time, therefore, in the strict party sense an Abolitionist. In January 1843 appeared his article, "The Nation's Duty as to Slavery," which the late Earl of Carlisle — one of Sumner's most intimate friends — thought "very close, clear, and unanswerable." Its arguments may be thus summed up: "It cannot be doubted that the Constitution may be amended, so that it shall cease to render any sanction to slavery. The power to amend carries with it the previous right to inquire into and to discuss the matter to be amended; and this right extends to all parts of the country over which the Constitution is spread — the North as well as the South" (ii., p. 240).

He continued his contributions to various periodicals on questions of general as well as legal literature. One of them, on the "Number Seven," which appeared in a law magazine, appears to have been a most singular production. But the slavery question gradually absorbed him. In 1843 we find him writing to the author of a pamphlet on "Caste and Slavery in the Church," "Is it not strange that the Church, or any body of men upon whom the faintest ray of Christianity has fallen, should endeavor to exclude the African, 'guilty of a skin not colored as their own,' from the freest participation in the privileges of worshipping the common God? It would seem as if prejudice, irrational as it is uncharitable, could no further go. Professing the religion of Christ, they disapprove that equality which he recognizes in his precepts, and they violate that most beautiful injunction which enfolds so much philanthropy and virtue, 'Love thy neighbor'" (ii., p. 261). Popular education and prison discipline were

also among the subjects which engaged his attention.

The turning-point of his life drew near. In commemoration of an episode in the War of Independence, known as the Boston Massacre, the town of Boston instituted an annual oration, "Upon the Danger of Standing Armies stationed in Populous Cities in time of Peace," which is yearly delivered on "Independence Day," July 4th. Many of the greatest American speakers have delivered the oration. On this occasion, "the mayor and aldermen, common council, and other city officers march in procession with music and military escort, accompanied by a crowd of citizens, to the appointed place to hear the speaker of the day." Sumner was chosen to deliver this oration on the 4th July, 1845. The subject he chose was "The True Grandeur of Nations." It was emphatically a "speech of peace."* It reads like one of Richard Cobden's Peace Congress speeches. Sumner had, while in England, been introduced to Cobden, not yet a member of Parliament. In 1845 Cobden was absorbed in the work of the Anti-Corn-Law League, and had not commenced his second career as the apostle of reduced armaments and international arbitration. Yet Sumner in 1844 writes in the very spirit of Cobden to his brother-in-law, then at Paris: —

The age of war among civilized nations has passed, and each year of peace is an additional testimony to this truth. . . . I cannot but think you regard with the complacency of another age the immense military establishments and fortifications by which you are surrounded. What a boon to France if her half-million of soldiery were devoted to the building of railways and other internal improvements, instead of passing the day in carrying superfluous muskets! What a boon to Paris if the immense sums absorbed in her fortifications were devoted to institutions of benevolence! She has more to fear from the poverty and wretchedness of her people than from any foreign foe; nor do I set much value upon any defence that can be made against any invading force that has once seen the smoke of the capital. The principles of free trade, now so generally favored, are antagonists to war. They teach, and when adopted cause, the mutual dependence of nation upon nation. They, in short, carry out among nations the great principle of division of labor which obtains among individuals. It was a common and earnest desire among our statesmen after the last war to render our country *independent*, for its manufactures and fabrics, of foreign nations. Far better would it be, and more in harmony with God's providence, if we were dependent upon all nations. Then would war be impossible. As civilization advances, the state of national dependence is promoted, and even England at this moment can hardly call herself independent of the United States.*

When we turn to the "oration" itself, we shall find the same coincidence of thought. Hitherto on these occasions the speakers of the day had been careful to conform "to the prevailing opinions of the moment." Sumner was the first to attack "a custom and opinions approved by popular judgment and sanctioned by venerable traditions." The main thesis of his oration was, "In our age there can be no peace that is not honorable; there can be no war that is not dishonorable." We have space but for one or two extracts. His opening rather savored of the pulpit, referring to the day "as the Sabbath of the nation, on which we put aside all the common cares of life;" adding, "May he who now addresses you be enabled so to direct your minds that you shall not seem to have lost a day." He then proceeded, according to custom, to pay homage to the fathers of the republic in a rhetorical passage, "borrowed," says Mr. Pierce, "almost literally, from words attributed by Plato to the fathers of Athens, in the beautiful funeral discourse of the Menexenus" (ii., p. 347). In the course of his address there occurs a passage in the style of Cobden, pointing out that "for the annual sum that is lavished on one ship of the line, *four* institutions like Harvard University might be sustained throughout the country." The practical point which he urged on his hearers was this: "Let us now, in this age of civilization, surrounded by Christian nations, be willing to follow the successful example of William Penn surrounded by the savages. Let us, while we recognize these transcendent ordinances of God — the *law of right*, and the *law of love* — the double suns which illuminate the moral universe — aspire to the true glory, and what is higher than glory, the great good, of taking the lead in the disarming of the nations."

Again: "If it be asked why, on this national anniversary, in the consideration of the true grandeur of nations, I have dwelt thus singly and exclusively on war, it is because war is utterly and irreconcilably inconsistent with true greatness (ii., pp. 350, 351). Enumerating the pecul-

iar victories of speech, his anti-slavery feeling, ever strong, was stirred within him, and he broke forth in a passage which reminds us of, and was probably inspired by, Brougham's anti-slavery speeches.

When the day shall come (may these eyes be gladdened with its beams!) that shall witness the peaceful emancipation of three millions of our fellow-men, "guilty of a skin not colored as our own," now held in gloomy bondage under the Constitution of our country, then there shall be a victory in comparison with which that of Bunker's Hill shall be as a farthing candle held up to the sun. That victory shall need no monument of stone. It shall be one of the great landmarks of civilization; nay, more, it shall be one of the links in the golden chain by which humanity shall connect itself with the throne of God (ii., p. 353).

Towards the close of his address, not foreseeing the events of fifteen years later, and the course he should then take, he said, "Here, in ampler ether and diviner air, are untried fields for exalted triumphs more truly worthy the American name than any snatched from rivers of blood. War is known as the last reason of kings; let it be no reason of our republic" (ii., p. 354). The closing sentence of his too long and too ornate peroration was, "Let us now, on this Sabbath of our country, lay a new stone in the grand temple of universal peace, whose dome shall be lofty as the firmament of heaven, as broad and comprehensive as the earth itself" (ii., p. 355).

If it be — as according to Lord Beaconsfield it is — the first property of eloquence to produce a sensation, this oration of Sumner's may rank amongst the masterpieces of the world's eloquence. Such an outspoken declaration of "peace principles" had scarcely ever before, if at all, and certainly not on such an occasion, been made in America. The press throughout the States rang with praises or censures of the speaker and his subject. With the account of this oration, the circumstances of its delivery, and the criticisms it produced, the memoir closes at the threshold of Sumner's public career.

We cannot but reiterate our feeling of disappointment at the abrupt close of the work, and the hope that the writer may be induced to conclude his task, and give the world the public life of Charles Sumner. Meanwhile we tender him our respectful thanks for the interesting volumes he has given us. The memoir, though perhaps too long, is well executed. Though not in style to be compared with Stanley's "Arnold," it is framed on the same principle. The biographer stands aside, and lets the subject of his biography tell the story of his life in his own letters and journals. Both these works possess what may be called, in the words which Macaulay uses of the fourth Gospel, "the peculiar charm of the narrative of the disciple whom the teacher loved." The memoir is enriched with notices of the statesmen, lawyers, and men of letters, both in England and on the Continent, whom Sumner during his European tour saw or was intimate with. They are wonderfully accurate, and show an extensive knowledge of men and facts. Mr. Pierce's familiarity with the lives and careers of former celebrities in Parliament, on the bench, or at the bar, is another illustration of how much there is in common between the peoples of the United States and of England; how the fame of our statesmen and advocates is amongst the cherished possessions of America.

We must conclude. Had space permitted, we should have liked to trace Sumner's career as the bold, unflinching leader of the Abolitionists in the Senate; to narrate his denunciations of slavery until the time when the exasperated slave-owners resorted to the appropriate argument of physical force, and felled him to the floor of the Senate House; and to have described his reappearance in the senate (4th June, 1860), when, with true moral heroism, he "resumed the discussion precisely where he left" it, and made his great speech on the "Barbarism of Slavery," which circulated by the thousand throughout the States, and powerfully contributed to the election, during the ensuing fall, of Abraham Lincoln to the chair of the Union.

Sumner's humanitarian views were rudely tested by the outbreak of the slave-owners' rebellion, and his "voice was for war" to an extent not easily reconcilable with the principles of "The True Grandeur of Nations." Still less consistent with them was his proposal, strongly urged at the conclusion of the war, to treat the Confederate States as a conquered country. The policy of our government at that time seemed to estrange Sumner from his well-beloved England; but after the subjugation of the South he once more visited our country, "and passed the last night before sailing on his return with John Bright at Rochdale, when he spoke with admiration of England and of her public men, and with much tenderness of the many friends he counted

among her well-known names" (ii., p. 341). The estrangement, therefore, was only temporary.

It is difficult to part with our subject withour making a comparison between Sumner and the only other American orator and statesman who was as well known in England — Daniel Webster. In point of oratory, Sumner must yield the palm to Webster. Webster in his massive logic, his simple language, and his power resembled Fox, Bishop Wilberforce, and Bright. Sumner's style was too diffuse, too ornate. He weakened his argument by the length to which he drew it out, and his speeches were overlaid by illustrations and quotations. His later style illustrated the deteriorated taste in oratory of his countrymen. But as a statesman, and in moral character, Sumner stood high above Webster. Those who remember Theodore Parker's scathing exposure of Webster's tortuous and sinister career as regards slavery, which he delivered in his "Oration on the Death of Daniel Webster," and contrast it with Sumner's statesmanlike foresight of the consequences of the aggressions of the slave-owners, and the unflinching resistance he offered to them, will agree in the judgment we have ventured to pronounce on the relative merits of these two great Americans.

ERICA.*

TRANSLATED FOR THE LIVING AGE FROM THE GERMAN OF

FRAU VON INGERSLEBEN.

XXVII.

THE ASPIRANT TO THE LIVING.

THE visitors at Dorneck were so well entertained that they prolonged their stay. In the morning the company dispersed to walk in the park, ramble over the hills, or row upon the Rhine, while in the afternoon all once more assembled, and unless prevented by visitors made excursions to different parts of the neighborhood.

They ascended the Drachenfels, and gazed in delight at the beautiful landscape beneath, visited and admired the ruins of Heisterbach, or spent the afternoon at Godesberg on the other side of the Rhine, which at this season was full of visitors.

* Copyright 1877, by Littell & Gay.

Old Countess Ingolstein, however, still gathered her little circle around her as before. Her age debarred her from sharing long walks, and as the guests were not inclined to consider the old lady's tastes, the members of the household, though with many secret sighs, undertook the duty of entertaining her. Sidonie was always one of the party, although she did not contribute to the general amusement as much as before, for she was usually grave and silent; but as, ever since the reception at court, she had complained of not feeling well, her manner did not attract any special notice from the others. Elmar alone watched her more closely, and redoubled his attentions to the beautiful girl, although any unprejudiced person would have perceived that they were only the expression of brotherly sympathy and affection.

The princess, who did not possess this want of prejudice, was still more enraged against her cousin, and her constant presence by no means increased the comfort of the little party. She was ever ready to contradict Sidonie, showed an utter want of consideration for Countess Ingolstein, and only the quiet, stern manner of the mistress of the house awed her sufficiently to keep her partially within bounds.

One day, when the little party was assembled on the veranda, Katharina suddenly said, "Do you know, Elmar, I have decided to give Herr Reinhardt the living at Altenborn."

All eyes were fixed upon the speaker in astonishment, and Elmar not only seemed extremely amazed, but even indignant, for he answered almost sharply, —

"Then the parish of Altenborn may congratulate itself that your decision is fortunately a matter of no consequence."

The princess flushed crimson. "You talk very inconsiderately and unwisely, Elmar. My ancestors built and endowed both church and living, and retained the right to appoint the pastor."

"Quite true, Katharina. I know that, but I am not aware that *you* have the right to dispose of the living of Altenborn."

The princess's flashing eyes wandered restlessly around; her lips quivered, and she would undoubtedly have poured forth a torrent of furious words, had she not chanced to meet the eyes of the mistress of the house, who was gazing steadily and gravely at her. As if controlled by some magnetic power, her restless glances remained fixed by the stern look, and then timidly sought the ground.

"Your pretensions are rather absurd, my dear Katharina," said the countess's clear voice; "have you really never learned, amid the sorrowful experiences of your life, that in an open struggle we women never gain the victory? After a little reflection, your good sense will undoubtedly tell you that this is the least probable way of inducing your brother to gratify your whim — for I can give your wish no other name."

"My nature is perfectly frank," murmured Katharina with repressed anger. "I don't understand the arts of other women, and have no desire to comprehend them."

"Then you do very wrong, my dear, and it is a pity that you have gained so little experience from your misfortunes. You unfortunately constantly endeavor to justify your former husband's acts to every one."

Countess Ingolstein, as well as all present, listened to these stern words with mingled alarm and surprise, and dreaded Katharina's passionate answer; but on the contrary, her face assumed a guilty, sorrowful expression, and she murmured in an undertone: "You are very harsh to me, aunt."

"I am sure it will now be my turn for a lecture," said Elmar, to put an end to the painful scene. "True, I confess I deserve it, for I ought to have laughed at Katharina instead of getting angry with her, but nevertheless I shall be cowardly enough to run away."

He rose and strolled slowly into the park. Countess Ingolstein took advantage of the involuntary pause which his departure made in the conversation, to get possession of her favorite subject, and it soon ran on in its former channel. The princess, who at first had seemed silent and depressed, gradually recovered and took her usual share in it, though her contribution to the general amusement rendered the company rather uncomfortable, in consequence of her proneness to suddenly branch off from the subject under discussion. After the ladies, the immediate relatives — the dear aunts and cousins now wandering in the park or sailing on the Rhine — had been thoroughly discussed, those in the neighborhood took their turn.

"That dinner at Rheinau was remarkably ill-served," observed Countess Ingolstein. "Such things always betray the new nobility. I suppose there was not enough silver, and it had to be washed, which always causes an unpleasant delay."

"That could not have been the difficulty," observed Olga; "I was in the silver-room with Rosa a short time ago, and the quantity really surprised me."

"It was simply owing to the ill-trained servants," said her mother somewhat sharply. "When people try to serve a dinner to forty people with only six servants, who, as I said before, do not even perfectly understand their business, it is not surprising if, though very *mauvais genre*, the guests are obliged to spend two hours at the table."

"Yet this is a proof of the ignorance of these people," replied the old countess, "for they are said to be so rich that a half-dozen servants more or less can make no difference to them. Little Rosa, however, is very pretty, and moreover very easy in her manners, and I think the parents want to use her as a lever by which to enroll themselves among the old families."

"Tell me, cousin," interposed Countess Rodenwald, "did you notice the remarkable dress that silly Countess Meinholdt wore? I really believe it was made of India pocket-handkerchiefs."

"Why, my dear cousin, how could I overlook such a toilette? Isabella resembled a walking sign, and yet she wore a pearl necklace of which a queen need not be ashamed. It is incomprehensible to me from whom she inherited her horrible taste; her mother always dressed well and like a woman of rank, and her grandmother on the father's side, the Princess von Strassfort, was celebrated for her tasteful costumes."

"You are mistaken, my dear aunt," interposed Katharina, "her grandmother on the father's side was a Handsrück."

"What, child, do you pretend to know more about Isabella Meinholdt's grandmother than I, who am distantly related to her through my brother-in-law Kronberg, whose brother married a sister of her sister-in-law?"

"But, my dear aunt, I assure you the countess has often spoken to me of her grandmother, I know all about it."

"This is a little too much!" said the old lady in a very excited tone. "It seems my mind is being weakened by age. Please hand me the '*Gotha*,' my dear Olga! Not there, child; there, close by you on the little side-table."

As Olga could not instantly find the important book, perhaps because instead of looking on the side-table, she was gazing out of the window, Erica started up and took advantage of the universal eagerness with which the verdict of the oracle was awaited, to glide out of doors.

She uttered a sigh of relief when she found herself safely concealed in one of the shady avenues of the park, and murmured laughing: "Does it really make much difference whether the wives of the forester and schoolmaster at Waldbad discuss their maidservants and their neighbor's silk dress, or whether countesses and princesses talk about liveried footmen and a lady's elegant costume; so far as I can see, people are very much alike everywhere, different as their outward adornments may be."

Erica walked hastily towards the stone balcony that overlooked the Rhine, and in her desire to reach the spot moved so rapidly, that it was perhaps want of breath that compelled her to stand still a few moments before reaching her goal, as if to collect her thoughts. Then, with some little effort, she continued her way, and entered the balcony, where Elmar was sitting on the stone balustrade with his feet on one of the benches, gazing so earnestly at the river that he did not perceive Erica's approach. She paused a moment to gain breath, and then went up to him. The rustle of her long dress on the stone floor was too loud to be unheard. He turned his head, and on seeing the young girl, sprang from his seat and advanced towards her, evidently not at all annoyed by the interruption, for his face was very bright as he cried gaily, —

"Ah! my little fairy! Has Katharina driven you away too, or was it only the family stories and the '*Gotha*'?"

"The latter put me to flight," replied Erica laughing, "but I only made it an excuse to myself for going away; I really wanted to see and speak to you."

Elmar's face was not quite so bright, though he answered in an equally gay tone: "Since you tell me this so openly, Fräulein Erica, it means less than I hoped — or, rather, than I wished. Now let us sit down and hear what you have to say to me."

"Let us take your former seat; I like the balustrade better than the benches, and when I am sure Aunt Vally won't see me, even walk on it."

"But that is rather dangerous, my little fairy."

"And that is just what makes the charm. See how we can overlook the whole beautiful landscape. The green waves of the river seem formed of emeralds and sapphires. The sun casts dazzling gold and glittering diamonds over it. What queen can boast of such jewels?"

Elmar, with his usual quiet expression, gazed earnestly into her face, and then said, "I have a dark foreboding, little heather-blossom, that you have nothing very pleasant to say to me, or you would not delay so long."

Erica blushed deeply, and seemed inclined to confirm his expectation, for she answered with forced gayety: "You need only refuse my request, if you do not like it."

"So you have a request to make. What wish could I gratify?"

"Have you really the sole right to dispose of the living of Altenborn?" The question came somewhat timidly, perhaps the young girl suspected the storm she was rousing. An expression of very unpleasant surprise flitted across Elmar's calm features; his brows contracted, his eyes flashed angrily, and he said in a far different tone from the one in which he had just spoken, —

"I hope you do not appear as Katherina's ally, and wish to propose that unlucky preacher as the pastor?"

"That is what is in my mind, certainly, but ——"

"This is going rather too far, Erica!" and Elmar's agitation became so violent that he sprang to his feet and paced rapidly up and down the stone floor of the balcony.

Erica remained in her seat, gazing at the river. She had been somewhat prepared for such a reception of her proposal, and therefore was not much annoyed, and moreover had gradually become so well aware of the influence she exerted over Elmar, that she hoped to be able to calm him again. So she did not utter a syllable, but waited to see what her excited companion would do next.

The latter at last checked his hasty steps, paused before Erica, and said, still in an angry tone, —

"Who would have thought that the little woodland fairy would ever change into such a teasing sprite, that she actually imperils my far-famed composure?"

Erica bent towards the speaker and answered mischievously, "It is true, your composure has made a complete *fiasco;* what a terribly impetuous man you are, Elmar!"

It was the first time she had ever uttered his Christian name, and though the continual repetition of it by others must have rendered it only natural for her to do so, the word fell like oil on the troubled waves of Elmar's anger.

"I shall probably be compelled to think the wood fairy a little witch or enchantress.

How else could you make me do whatever you please?" he whispered almost tenderly.

"For the present I see very few symptoms of any such state of affairs, Baron von Altenborn. I scarcely begin to timidly offer my petition, when you start up and rush about like a madman, and if I did not fall into the Rhine from fright, I owe it solely to the great presence of mind with which I instantly leaned towards the other side."

"Excellent, now you are joking too! But seriously, Erica, you cannot really ask me to make this young man pastor at Altenborn?"

"I am perfectly serious. I really wish it."

Elmar again found it necessary to pace up and down the pavement, but his steps were less hasty, and the walk was soon ended; he once more mounted his lofty seat, and took his place beside Erica.

"And what reason can you give for the wish, Erica?"

"A thousand instead of one, if you wish to hear them. In the first place, he is my foster-parents' nephew; secondly he has a mother and unmarried sister, whom he wishes to support; and thirdly, he is very anxious to have a parish."

"Your *protégé* is very peculiarly organized," replied Elmar. "Of a hundred theological students whom I have known, not one had this very strange wish, though to make amends, nearly all had poor relations whom they wished to support. So you see this cannot turn the scale in his favor, you must think of something else."

Erica, whose arguments were nearly exhausted, replied half pouting. "If that isn't enough for you, I can only say that he is a very good, clever young man."

"Who has proved himself a particularly excellent preacher, as we know."

"Only give him an opportunity to preach often, and you will soon say so with truth."

Elmar looked straight before him, without replying, then turned towards his companion and said slowly, "Remember, Erica, what I told you at our first meeting on this balcony. Unfortunately I now feel that I cannot carry out my self-imposed programme, and therefore am really unable to gratify your wish, for I fear and hate the young man."

Erica's eyes sparkled with mischief, as, bending towards Elmar, she replied, "Your hatred and fear must not deprive my good Reinhardt of his parish. You need only look at him closely, to convince yourself how little ground there is for either."

"Really, Erica?" said Elmar in a tone which, contrasted with her manner, seemed very grave. "You will not deceive me, you do not love this man?" he continued earnestly.

She made no reply, but the brown eyes that met his with a frank, steady gaze, must have been a sufficient answer, for he asked no further questions, but looked into them with such an earnest, searching expression, that Erica blushed and turned away. Then he took her hand, raised it to his lips, and would probably, very much in opposition to his programme it is true, have made a passionate declaration of his love, if Werner had not come up.

The latter paused in some little surprise at the sight of the young pair perched on the high balustrade, and then said smiling, "You have certainly selected, if not the most comfortable, the most conspicuous position in the neighborhood; you can be plainly seen even from the other shore."

"Then I wish, my dear Werner, you had selected that perspective to gaze at us. Neither would I have the slightest objection to your strolling under those tropical plants that fill our boxes, if, at this moment, a walk absolutely is indispensable to you."

"I am sorry I cannot gratify your friendly wish, Elmar, but you must endure my presence this time, I have something very important to say to you."

"Then I must go," said Erica, rising; "but what hope will you give to take with me?"

"Why, I am no Amureth, Erica, and have little taste for the *rôle* of tyrant. Reinhardt must, however, please the parish before I can appoint him to the living, so you can tell him to prepare his trial sermon, for I know you are burning with anxiety to impart the joyful news."

"Certainly; for it is happiness itself to make another happy," said Erica, and took leave of the gentlemen to turn into the path that led to the parsonage.

Werner and Elmar, on the contrary, paced up and down the shady avenue, the former talking eagerly and earnestly to his companion. Fortunately this time there was no listener, and when the two men approached the castle, Werner said,—

"So you will grant my request, Elmar?"

"Of course, Werner; but I cannot tell you how entirely against my wishes the whole affair has resulted. Pardon me, but for a clever man you have really acted with remarkable stupidity, since ——"

"I have said all that to myself often

enough, but now neither regret nor lamentations will avail. I am sorry for my speedy departure, for the countess's sake; dark days will come, and I would gladly have aided her; she is daily winning greater esteem from me."

"Esteem, my dear Werner, is everywhere offered to her; but it seems to me that she often longs for a warmer feeling, which is everywhere withheld."

"It requires close observation of this lady to penetrate her nature so far. Beneath the apparently cold exterior, which duty and perhaps temperament form, throbs a warm, loving heart. I know she passionately loves her husband, and that this love is the source of unspeakable sorrow, the more so as she feels ashamed of it, not only in the presence of others, but even before her own heart."

"Werner, what an assertion!"

"Do not misunderstand me, Elmar; she is not ashamed of her husband's person — although sometimes her feeling borders upon it — but of her unanswered love. She knows how completely all affection has died out of the heart of the man of her choice, and at the same time realizes with deep sorrow that it is impossible for her to obtain this affection. which can only be gained by the ruin of her family. Her duty, which she performs with inexorable sternness, always compels her to thwart him in his fancies, and she fulfils it with a heroism that wins my sincere admiration.

"What a lofty, noble spirit must dwell in this woman, that amid this constant conflict of feeling, her heart has neither been hardened, nor her temper embittered. She has a sharp glance, and a warm interest for each of those who are connected with her, in the widest sense of the word, and if she makes great demands upon all who surround her, she has a right to do so, for she never asks more than she returns in twofold measure. Sidonie and Ottomar were hitherto the only sympathetic natures with whom she could maintain the loving intercourse so grateful to her, but which she is obliged to almost entirely renounce. Strongly as my reason favors the alliance, my heart was painfully affected, when, a short time ago, I perceived that Ottomar loves the beautiful Rosa Steinfurt more than he believes, and therefore sorrow is awaiting his mother from this quarter also. As for Sidonie ——"

"You have torn Sidonie from her, Werner; for the secret of her love for you will form a gulf between them which, I fear, will never be filled."

"On the contrary, I hope the countess will exert a favorable influence upon Sidonie in this respect. If only we could remove this vampyre that clings so closely to the count that our united strength is unable to dislodge him —— But hush, there come some of the guests. It is fortunate that our subject was nearly exhausted."

When, a short time after, conversation in the family circle turned upon Elmar's consent to allow young Reinhardt to preach a trial sermon, the old countess sternly censured his weakness, and prophesied increased demands on Katharina's part. The master of the house, who chanced to be present, took sides with the young baron, saying,—

"Ah, ah! most honored cousin, it's all very well for you to talk so, but we unlucky men are all henpecked, and the more quietly we bear our fate, the more sensibly we shall behave. To be sure, it is ridiculous enough that one wretched sermon has helped a student to the expectation of an excellent living, and I congratulate Katharina on her strong nerves, for even now I feel my knees tremble whenever I think of the anxiety that unlucky sermon caused me."

XXVIII.

THE INTRIGUE.

MEANTIME Herr von Wehlen had not lost sight of his plans. He watched both Sidonie and Werner very closely, in order to find some point where he could fasten the threads with which he intended to weave a net for their destruction; but to his vexation as well us surprise there was not the slightest apparent understanding between them. The marble-like countenance of the young countess did not betray the slightest emotion at the sight of the secretary, her eyes did not linger on him for a moment, nor was the latter guilty of even a passing glance at her.

Wehlen might almost have believed that he had only dreamed of the passionate scene in the garden, and he would probably have yielded to this conviction, if he had ever been guilty of dreaming. But he was only too well persuaded that he had been wide awake, and, as time pressed — for the departure of the guests was close at hand — he found himself compelled to take a more active, and as he could not conceal from himself, somewhat more dangerous course than he had originally intended.

At dinner, to which Wehlen had re-

ceived a standing invitation from the master of the house, his seat was almost directly opposite Werner's, and therefore, without attracting attention, he could narrowly observe him. Without any quickened throbbing of the heart, for he was no novice in such matters, but with the excitement a gambler feels who is not quite sure of the chances of his play, Wehlen saw his opposite neighbor take his seat to-day.

Werner seemed absent-minded, as if his thoughts were elsewhere, and Wehlen feared he would pull off with his napkin the note which he had slyly slipped into his plate, and thus overlook it.

Werner, however, as he raised his napkin, plainly saw the dainty little missive that lay beneath, and strangely enough, showed no surprise, for he took it up quietly, and seemed about to open and read it with equal calmness, when his eye fell upon the seal. It was a sphinx, the device Sidonie used on the little notes not sent by mail, and when Werner once more glanced hastily at the direction of the letter, he recognized Sidonie's hand.

For an instant he gazed at the note as if trying to understand the affair, then, without breaking the seal, thrust it into his pocket, and cast a searching glance at the young countess, whose pale, weary face looked specially wan to-day. He received no responsive look, but she must have instinctively felt that his attention was attracted towards her, for a sudden flush crimsoned her face, at the sight of which Werner averted his eyes and commenced a careless conversation with his next neighbor. The keen observer opposite, however, could only too clearly perceive his restlessness and excitement, calm as he forced himself to appear.

When the party rose from the table, Wehlen detained him in a long conversation, discussed the most indifferent matters, and at last casually mentioned Sidonie. He thought her so very pale that he could not understand the absence of anxiety on the part of the family, and said he had already called Count Rodenwald's attention to it and begged him to consult a doctor, but the old gentleman laughed, and replied that young girls always looked pale when they were in love, and that was probably the case with his beautiful niece. Prince Eduard, however, was such a devoted slave to the young lady, that one could scarcely believe any heart-sorrow was paling her cheeks. Wehlen then spoke of many other things — to Werner's great annoyance, as he perceived with unspeakable delight — and at last released his victim.

On escaping from his companion's torrent of eloquence, Werner instantly hurried to his room, locked the door, drew the letter from his pocket, and examined it attentively in every direction. It was undoubtedly addressed in Sidonie's hand, and sealed with her seal, so he stood before a mystery which seemed so sweet that he hesitated to open the note, and thereby perhaps destroy his illusions. At last he conquered his reluctance, broke the seal, and read the following lines, —

"If Herr Werner is self-sacrificing enough to renounce his own feelings in order unselfishly to give his aid where he was so deeply wounded, let him be on the balcony overlooking the Rhine at eight o'clock this evening. There he will be told what is expected, besought from him, and his generosity affords a sure hope that he will make every effort to free a lady from bonds forged by too short-sighted care, and which have now become unendurable fetters that threaten to destoy the happiness of a whole life. This appeal is made to his honor, as well as his magnanimity, and the proof of esteem afforded by this letter will perhaps assist in healing wounds, whose infliction was demanded by the most inexorable necessity."

The note fell from Werner's hand, his agitated face assumed a grave, troubled expression, which gradually became more and more gloomy. "What does this mean? From whence does it come?" he murmured. "Who can know of our meeting, and wish to use it for his own purpose in such a way? I scarcely believed my own eyes when I recognized Sidonie's hand, and it is expected that I should ascribe this bungling performance to her. No, Sidonie. Whatever I have done, I would never insult you so deeply, even if the contents of this note did not make it senseless. If it should be intended for my mystification, and some one wants to play a very unsuitable trick upon me, the author might not find the matter quite so free from danger as he supposes.

"Could Fritz have a hand in the affair?" he continued. "He looked laughingly at me several times — but what folly! When did the boy ever give me occasion to suspect him of such a lack of delicacy? And yet, who can it be, and for what purpose was it written? Sidonie's hand has been admirably imitated, which makes the affair still more culpable; and suppose the intention was not merely to

deceive me, suppose the same snare was laid for Sidonie — might not the writer forge my hand equally well ?"

For a moment Werner's features assumed an expression of alarm, nay, actual horror, but his agitation instantly passed away, and he said, with a little laugh, "What a foolish anxiety! — how can I fear for Sidonie? She will only hate and despise me a little more for my apparent presumption; and I — I shall not be permitted to vindicate himself, for how can I offend her pride so mortally as to acknowledge that she was watched ?"

"But," and the speaker's expression again altered, and grew dark and threatening, "in this case a malicious trick, instead of an indelicate joke, has been attempted, and if so no other is the author of the letter than that rascally adventurer, who finds me in his way and would fain remove me from it at any cost. He would think any means justifiable, and though I cannot understand how he learned anything about this unfortunate business, I am almost sure he wrote the note.

"The cunning intriguer commits the error, on which such people are usually wrecked; he probably thought to do justice to a young lady's tenderness of feeling by the phrases 'self-sacrifice and magnanimity.' Here, however, the demon of chance, which usually favors scoundrels, thwarts him, for he could not possibly know how thoroughly I understand those relations —— But we will go to the balcony at eight o'clock this evening, and watch the farther development of the affair. That is the only way of getting any light upon the subject."

He carefully locked the note in his desk, and then left his room to go in search of Fritz, whom he found on the shore of the Rhine, just about to go out rowing.

"Will you delay your excursion a moment, Fritz, and listen to two words from me?" asked Werner.

"I'll hear a hundred, if you desire, my dear Werner. I am even ready to take you in my boat, and assure you that, in spite of the sweet burden, I'll row rapidly up the stream, although Erica persists in the ridiculous assertion that she understands the use of oars better than I."

"Fräulein Erica has robbed Countess Sidonie of an admirer," said Werner smiling.

"Not at all. I still acknowledge myself Sidonie's ardent adorer; but Erica is a friend, in a certain sense a comrade, who is daily becoming more indispensable to me. I really don't know how we could have gone through mamma's training without each other's assistance, but by mutual help and support we fare very well."

"I was going to ask you something, Fritz. If you have time, come to the stone balcony at eight o'clock this evening; I will have a surprise for you."

"Excellent, Werner, I won't fail you! And with what are you going to surprise, me?"

"That of course I must not tell, Fritz; but bring Fräulein Erica, Lolo, and the governess with you, they must all share it."

"The 'children,' in the narrowest sense of the term. Very well, Werner, we will all come."

"And be punctual, if you please; don't forget, Fritz, eight o'clock!"

"Unfortunately, I have no chronometer, Werner, but I think our venerable old clock in the corridor will be exact enough for you. Well, I see you won't come with me, so farewell until we meet at eight o'clock on the balcony."

Light clouds, which covered the sun and gave the atmosphere the hue we Germans call *gris jour*, had melted away towards evening, and the sovereign of heaven appeared in the full splendor of his beauty, poured molten gold on the trees and bushes in the park, thew dazzling lines of light on the grass, and transformed the fountain in the pond into a radiant, flashing shower of gems.

Many visitors had arrived during the afternoon, and therefore the family remained at home. The young people had played their favorite games on the lawn before the castle, while their elders sat on the veranda and enjoyed the fresh air. Some of the gentlemen had retired to the rooms occupied by the master of the house, to engage, under Herr von Wehlen's prudent direction, in card-playing, which lasted longer than usual, for Count Rodenwald, after tea, invited his friends to renew the game, thus compelling his wife to invite all the guests to supper. In this way Count Generode, who was one of the visitors, really obtained the gratification of being permitted to sup at Dorneck.

Herr von Wehlen, in trying to entertain the company, had entered into the game too eagerly not to feel a slight sense of weariness; he rose, pleaded a headache, and went out into the open air. His eyes wandered over the assembled company a moment, then he turned to the mistress of the house. "I don't see Countess Sidonie here; she looked very pale at dinner, is she ill?"

"She has unfortunately been compelled to remain in her room this afternoon, on account of indisposition," replied the countess; while Katharina, who sat beside her aunt, said scornfully,—

"Queen Sidonie makes her appearance more and more rarely; as Prince Eduard is not among the guests to-day, her Majesty doesn't think it worth while to favor us with her presence."

"The countess looked so pale that your satire can scarcely be deserved, your Highness," Wehlen cunningly interposed to prevent Countess Rodenwald's reply. "But," he continued turning to the latter, "will not your guests take a walk in the park this beautiful evening? The air is so delightful that it seems almost sinful not to enjoy its freshness."

"It is almost too dark for a walk," observed the countess, "the evenings close in very early. Autumn is beginning to make itself felt."

"Oh! this twilight will last a long time; that is a matter in which our temperate zone is more favored than tropical countries, where day and night almost clasp hands."

The speaker looked significantly at the princess, and bit his lips, when the latter took no notice of it, but let her wandering eyes roam everywhere except towards him. At last, perceiving that all his efforts to attract her attention were vain, he appeared without ceremony, and offering her his arm, said politely,—

"I am the most humble slave of your wishes, your Highness, where would you like to turn your steps?" and whispering a hasty "come" to the astonished princess, he led her from the veranda. Example is contagious, as is proved not only by the theory of the bell-wether, but also by the universal desire for water, which the sight of a glass of this precious fluid arouses in a whole company. Thus the first couple were soon followed by others, until at last the movement was communicated to the entire party. Even old Countess Ingolstein was infected by the universal departure, and, leaning on Olga's arm, slowly followed the long procession, thus compelling Count Generode to join in the duty of entertaining her.

Wehlen had endeavored to divert Katharina's mind from his arbitrary conduct by constant talking and jesting. He was not yet sufficiently sure of her to make her his confidante, and moreover feared that, in her haste, she might betray the secret. The way to the balcony overlooking the Rhine was tolerably long, and Wehlen repeatedly glanced at his watch to convince himself that he was not too late. He dared not, under any circumstances, leave the young couple too long alone, as an explanation would undoubtedly take place which might thwart his plans. He had the more reason to fear this, as he had himself doubted whether Sidonie could be lured to the spot by Werner's name. "She loves him, but she intends to marry Prince Eduard," he said to himself, "and therefore will beware of committing a folly." So he had put forward the prince, hoping that her love for the secretary would prove strong enough to induce her to listen to him, and thus sufficiently enter into the part assigned her.

Meantime Fritz and his little party, in order to be in time, had reached the appointed spot long before eight o'clock. They sat down, enjoyed the fresh air, and gazed at the slowly darkening sky. The low dip of oars echoed faintly from the Rhine, or the refrain of a song was borne softly from the distance, while the crickets chirped close by, and the shrill, sharp cry of a water bird sometimes interrupted the sweet stillness. The little party gradually relapsed into silence, and gave themselves up entirely to the delightful emotions aroused by the beautiful evening.

At last Werner arrived, and sitting down beside Fritz, said in a jesting tone: "Your punctuality is worthy of all praise, and I suppose you are very curious about the promised surprise."

"To tell the truth, I am not, Herr Werner," replied Erica; "the evening is so pleasant, the air from the Rhine so delicious, that I feel sufficiently repaid for the walk, and will cheerfully renounce any surprise."

"So much the better, Fräulein Erica, for, to be equally truthful, I am very doubtful about the result of my expectations."

At this moment there was a loud report, and the same instant a glittering shaft of fire rose into the air, illuminating the balcony and its occupants with a light as bright as day, and distinctly revealing, a few paces from them, the first couple of the procession of pedestrians, while the remainder of the company were only distinguishable as a confused, gay throng.

"So it proves to be fireworks, Werner?" cried Fritz.

"So it seems," replied Werner quietly, and then rose to approach the princess and offer her his seat. At the first sight of the group on the balcony, Wehlen had lost his composure for a moment, but instantly collected his thoughts to conceal his hu-

miliation. He politely led the princess to the best place, and then, turning to the company, said in a somewhat loud voice, —

"I am glad my manœuvre has succeeded so well, and you reached here exactly at the right moment. Baron Sonnenstein, to whom we owe the pleasure of these fireworks, will, I hope, acknowledge my deserts in the perfect success of his surprise."

"I?" asked the young baron in unutterable astonishment. "I?" he repeated again, as if one expression of his amazement were not sufficient, and he might perhaps have uttered a third 'I,' if Wehlen had not whispered angrily: "Hush! and don't betray how utterly incapable you are of inventing such impromptus!"

Once more a fiery ball rose into the air, and again the little party was brightly illuminated; then hissing crimson wheels revolved, while glittering stars rose above them to linger a moment in space, and then vanish as suddenly as they had appeared. Bengal lights illuminated the banks of the river for a long distance, making every object glow in blue, green, yellow, or red lights, and fiery serpents darted over the dark water and seemed to vanish in its depths.

The company attentively watched the beautiful spectacle, and bestowed special applause on the magical illumination produced by the Bengal lights, which invested the beautiful country with a strange charm. When the whole exhibition ended with a magnificent closing effect, every one crowded around Herr von Sonnenstein to thank him for his beautiful surprise, and the young man accepted these thanks very cheerfully and joyously. To be sure, it was not without alarm that he thought of the new notes which awaited him — as Herr von Wehlen had proved himself, though very ingenious, anything but economical — while Count Generode, on the contrary, once more sighed over his income, which unfortunately would not permit him to give such surprises.

All thronged so eagerly around Sonnenstein, that no one took any notice of the real author, Wehlen; and he was modest enough to think this neglect very agreeable. Werner was the only exception, he approached him and said, —

"I will not, like the others, offer my thanks to the wrong person; for such a mistake would be the more unpardonable on my part, as I am the only individual who is aware that your kind wish to assist in entertaining the company was far more comprehensive in design than it has unfortunately proved in execution."

Werner's voice, which had at first seemed perfectly calm, became more and more passionate, and as he was compelled to speak in a low tone, the fierce hate it expressed sounded more menacing than would have been the case had he uttered the words in the loudest key.

Herr von Wehlen's attempt to make an unconstrained reply was a total failure. True, he forced himself to express a quiet, and to the humble secretary, even half contemptuous surprise at his strange, incomprehensible remarks, but his voice also trembled with hatred and passion, and gave the lie to his words. When, in addition to the previous display, a fiery sheaf of wheat suddenly rose into the air, both saw each other's flashing eyes distinctly enough to know that it was war to the knife between them.

On the road home Countess Ingolstein found another support than Olga's arm, but Count Generode only fared the worse. The young lady had summoned Herr von Sonnenstein to her side, for she thought a little appreciative attention absolutely necessary, after such a prettily arranged surprise. The young man was so enraptured by this rare mark of favor, that at the moment he would gladly have paid every one of Wehlen's notes, and seriously reflected whether it would not be possible to have fireworks often at Dorneck.

Meantime Count Generode soon had his attention claimed in another direction. Werner, who with Elmar and Ottomar had lingered a little behind, engaged in earnest conversation, suddenly called him to make a fourth in the party; and in spite of the increasing darkness, the gentlemen sat down on some of the numerous benches placed in various parts of the park, and whispered together so earnestly that they were almost too late to supper, in consequence of which Count Generode had the mortification of seeing Olga go to the table on Sonnenstein's arm.

Wehlen cast a searching glance at the quartette of gentlemen when they entered the dining-room, but their faces could not have inspired him with any anxiety, for during the remainder of the evening he troubled himself no more about them. After supper Count Generode politely approached him, and after a few complimentary remarks about the admirably arranged fireworks, asked why he so rarely, indeed never, came to Bonn.

Wehlen looked at him with a glance not unlike the one a bird-catcher casts at

the bird fluttering into his net, and then answered that he was naturally disposed to remain at home, and knew the gentlemen there so little, that hitherto he had not thought of visiting them more frequently.

The young count made him a few friendly reproaches and then took leave, expressing a hope that he should soon see him in Bonn.

Before Werner retired to his room, after the household had dispersed, he again went out into the park and gazed from one to another of the long row of windows in the castle. Lights flashed from all the guest-chambers, and when he looked at the corner room, which he knew was Sidonie's chamber, and now used also as her sitting-room, he saw a bright light there also. It was too brilliant to proceed from a night-lamp burning in an invalid's room, so he could be sure that Sidonie was still awake, and had not yet retired.

His supposition soon became a certainty, for he saw her approach the window, open it, and lean out. He stood motionless under the trees, to avoid being discovered, and perceived her several times turn back into the room and then come once more to the window, until she at last closed it and drew down the curtain. The restlessness her movements distinctly betrayed he naturally attributed to the letter she had probably received in his name, and bitterly thought how hateful, how despicable, he must appear to her, and how the gulf that parted them must now be still wider.

Although he would probably have felt the same sympathy for Sidonie, he would have experienced less uneasiness in regard to himself, if he could have cast a glance at the letter the young girl had just crushed in her hand. As if under the influence of some magic spell, she had been forced to read the hated lines again and again, only to have her anger aroused afresh, and when she now threw the note on the floor and set her foot upon it, she had scarcely crossed the narrow space twice, ere she again raised it and approached the light. But just as she was about to burn it, she hastily withdrew her hand, murmuring,—

"I must taste my humiliation again, impress every word on my memory, in order to preserve myself forever from all arrogance. She opened the crushed paper, smoothed it, and read: —

"How shall I make Countess Sidonie a strange request, a request absolutely indispensable to the happiness of my whole life, without rendering myself miserable by arousing her displeasure? At least she will believe my solemn assurance, that if any other course were open to me I would choose it, rather than appear before her with a petition which may easily do me measureless harm.

"The happiness of my whole life depends — I will explain the strange chain of circumstances in person — upon seeing you to-day, and yet I am unable to reach Dorneck until the evening. But how am I to account for the late hour of my visit, above all, how am I to find an opportunity to speak to you alone about things which are a matter of life and death to me?

"Will Countess Sidonie take into consideration this strange combination of circumstances? Will she, with noble generosity, meet me at eight o'clock this evening on the balcony that overlooks the Rhine? Will she have sufficient confidence and regard for me to risk this step, and thus secure the happiness of my life? At our meeting I will explain the absolute necessity for my bold request, and thus purchase forgiveness for my presumption. If, however, this opportunity is not afforded me, no other course is left, except, with a breaking heart, to bid you in these lines farewell forever, for you will never again be approached by EDUARD."

When Sidonie had finished reading the letter, she again approached the lamp and let the sheet slowly consume to ashes. "And I really bestowed my favor on this man; I believed in his love," she murmured. "I was almost ready to give him my hand, if not my heart." She faltered, and then threw herself passionately into the nearest chair. "Humiliated on every side, deceived, misunderstood, betrayed by all!" she exclaimed sobbing. "What have I done to deserve so much degradation?"

She again started up, and once more paced up and down the room. "How can this prince dare to try to lure me to him by the bait of such a palpable falsehood? Me! Sidonie! Did he rely most upon female curiosity, or the fear of losing him to draw me into his net? And his manner was so quiet, so deferential, so —— But that is the way with all, all! It is a mere outside mask, and those are fools who trust to appearances."

"I have done with this prince," she continued a little more calmly; "I will verify his own words and never see him again.

He is just like all the rest. I long to get away from this deceitful world, to rest and solitude. I could not understand before how people could renounce society and shut themselves up in a convent, and now this asylum seems so sweet that I deeply regret I cannot fly to it. To lead a holy life of calm contemplation, behind high walls, safe from the outside world, protected from one's self, undisturbed by the tumult of passion that rages in our hearts and brains, must be an unspeakably happy fate.

"And is every way to that life barred to me? Can I not at least enter a convent, and —— " Sidonie suddenly paused and pressed her hand to her brow. "How could that idea so entirely escape my mind?" she said slowly. "The successor to the late abbess of Herdrungen is found! What my guardian asked in jest I will answer in earnest. I will indeed assert the rights of my house, and the walls of the old cloister shall close around me forever. The burning sense of humiliation, anguish, unutterable sorrow, will not enter there, and I shall have rest from the gnawing pain of unspeakable torment."

Sidonie's last words were suffocated by sobs, she threw herself into a chair, covered her eyes with her hands, and gave free course to her tears. At last, exhausted by weeping, she felt the need of rest, sought her couch, and soon fell into a restless, broken slumber.

XXIX.

THE FLIGHT.

RAPIDLY and pleasantly as time passed away in Dorneck, the guests were at last obliged to think of departing, and thus by degrees the castle became more empty, the party assembled at dinner smaller. Elmar delayed his leave-taking longest of all, and with him of course Katharina, but as old Countess Ingolstein intended to pay a visit to her dear cousin, the Baroness von Altenborn — all the old lady's relatives were "dear" — and therefore wished to travel with the brother and sister, the former, who at last feared she might prove a burden to the dear relatives she was now visiting, begged them to go.

Katharina seemed to have entirely relinquished her desire to obtain Erica for her companion, eagerly as she had pressed it at the commencement of her stay, and Erica was very happy to be relieved from the unpleasant situation of constantly refusing an apparently kind request.

She became much more frank and unconstrained, and therefore more winning in her manner, which to Katharina had formerly been somewhat formal, stiff, and even repellent.

Little sympathy as Elmar usually had with Wehlen, he seemed to agree with him in one thing, that the stone balcony was an excellent place for a private interview. On the last day of his stay at Dorneck, he whispered to Erica a petition to meet him there, that they might talk to each other once more without restraint before their long separation. Erica looked at him in surprise, but did not seem offended by the request, for her face assumed a very mischievous expression.

"I must take the liberty of calling your attention to the rules of etiquette, of which you are usually so severe a judge," she replied. "What would Aunt Vally, what would you yourself say, if I should grant such a request from any other young man?"

"I am I, Erica!" said Elmar laughing. "Have you never yet tried to measure the fathomless depths of this eternal truth, that you make me such a reply? Besides, little heather-blossom, this time I am perfectly right in not placing myself on the same level with other people where you are concerned. Our relations are exceptional, I consider myself partly as a father, partly a brother, partly a — well, in a word, I should certainly shoot any young man who dared to treat you as I do."

"Then it is really fortunate that nobody else has so much audacity. But in spite of the exceptional relations, I shall not grant your request."

"Then you will only induce me to come back the more quickly, in order to tell you what I cannot say to-day. Your continued refusal will therefore make me suppose that you eagerly desire my return."

"I shall be supported under the false suspicion by the thought that I shall not only deserve thanks from my relatives, but especially from the princess, who will thus have another pleasant journey."

"You have become a brazen coquette, little woodland fairy, as I have already told you, and I really don't know where this will yet lead us."

The interruption of others broke off the conversation, and Elmar made no farther attempt to persuade Erica to grant him an interview.

The following morning the whole party assembled on the stone balcony to await the arrival of the steamer from Cologne, by which the travellers were going to Coblenz, from whence they would drive the

few remaining miles in carriages. Old Countess Ingolstein was very much agitated; her advanced age made the farewell seem as if it might easily be an eternal one, and as she had a kind, affectionate heart, the thought made her eyes fill with tears.

All her relatives were touched by the sincere love the old lady showed, and forgot the little weaknesses from which they had suffered, to remember the many excellent qualities she possessed. Even Erica lost all memory of the tiresome family histories and the "*Gotha*," and bent forward with tears in her eyes to press the farewell kiss on her hand, upon which the old lady clasped her in her arms, and kissed her with a mother's affection.

The princess's leave-taking was less touching; on the contrary, her manner was cold and absent-minded. The beautiful, restless eyes had so much occupation in looking at the passing boats to distinguish the people in them, so much interest in trying to discover the tardy steamer, that they could take little heed of those around her. Besides, she was out of humor; Elmar had again been inconsiderate, and resolutely refused to have the Princess Bagadoff's coming announced on the steamboat. She would gladly have paid for the salute from the flag, which would have been the result of this announcement, by a generous present to the sailors. She placed special value on this salute to-day, when her aristocratic aunt, the "countess," spite of her family pride, could make no claim to the distinction, and she would thus have been brought forward as the principal personage in the party.

Katharina had even thought of carrying out her wish against her brother's will, but she knew him too well not to be aware that in such a case he would undoubtedly remain behind and leave her to continue her journey alone.

"I never sail under false colors," he had said during the discussion, to her great indignation, "and if you insist upon using your title in this way, I shall go in another boat. If you don't fear the laughter of society — which is only too well acquainted with the high rank of the Princess Bagadoff — you can at least bear it alone, I will not expose myself to it."

So the princess appeared out of humor and absent-minded, and formed a striking contrast to the heartfelt cordiality of the old lady. Elmar, whose grave face harmonized more with the latter, talked long and earnestly to Werner, who had also appeared on the balcony, and then found an opportunity to whisper to Erica, as he had done at their first parting. "I will soon come back, Erica, and," he added somewhat incomprehensibly, "I will not be idle in my absence."

At last the videttes, who had been posted at some distance, came hurrying up with the news that the belated steamer was in sight, and the whole party went down the steps, where the travellers entered the boat waiting for them, and those left behind looked after the rocking skiff as it moved directly towards the snorting monster of a huge ship, which for a moment threatened to crush it. But the immense wheels only turned with a threatening noise without moving forward, until the steamer had received its passengers, when it resumed its course with redoubled speed. The departing guests, as well as the friends left behind, waved their handkerchiefs until the boat gradually disappeared, and the family then ascended the steps and turned towards home.

In spite of the large family circle, the party who gathered around the dinner-table seemed small, conversation did not flow readily, a sort of oppression appeared to rest on all. Was it the absence of the relatives, the ill-humor of the master of the house, which was very apparent, or Sidonie's pale face, that produced this burdensome silence? No one could account for it; they only felt the presence of some disturbing influence, and were glad that the countess rose from the table earlier than usual.

It is an old law of nature that festivals must be atoned for by the dull reaction of the commonplace days that follow, and this rule asserted itself even at Dorneck. True, it was very comfortable to have the old freedom from restraint once more, but it cost some little effort before it was regained, before much that had been neglected during this period could be retrieved. Besides, the people residing in the vicinity had been so generous in their visits of late, that a short pause now ensued, and the family was usually alone in the afternoon; a fact that was felt the more on account of the rainy weather, which prevented any excursions to the beautiful spots in the vicinity.

The master of the house, who had so often sighed over the constraint imposed by old Countess Ingolstein's presence, seemed by no means relieved by her departure. He was very often out of humor, and perhaps this was the cause which induced Herr von Wehlen to frequently spend his afternoons in Bonn, instead of

Dorneck. The count was not the only person who missed the entertaining companion, for Olga — who hitherto had not seemed to value his conversation — suddenly showed a deep interest in him. Her eyes rested earnestly on his face when he entered the room, and she understood how to arrange matters so as to secure a few minutes' conversation with him, unheard by the others, but these whispered words did not seem to make her very cheerful, for she constantly grew more grave and quiet.

Even the countess, whose manner usually seemed so calm, showed a certain degree of anxiety. Her eyes sometimes rested so earnestly on the count's face, that the others noticed it, and then — contrary to her usual habit — she hastily averted them with a half-embarrassed air, if her husband, noticing the observation, cast an indignant glance at her. The uneasiness she felt in regard to her husband had even induced her to question his valet about his health and movements, and this was so unusual an occurrence that Johann could not help giving vent to his overflowing heart in the servants' hall, from whence it reached the kitchen, where all put their heads together and whispered about the strange state of affairs, which must portend a gloomy future.

The countess's anxiety, however, was not solely on her husband's account. Sidonie also claimed her sympathy. The young girl's pallor increased to such a remarkable degree, that her aunt, in spite of all objections, sent for the doctor. The latter, it is true, did not consider her indisposition serious, but prescribed change of air and amusement; though he might have known that there had probably been little lack of the latter. At the same time the countess received a very unexpected light upon the probable cause of Sidonie's illness, by her declaration that Prince Wolfenhagen had deeply insulted her, and was the more unpleasantly surprised, as Sidonie also stated that, under no circumstances, would she see the prince again.

The young man's attentions had become so marked that the countess daily expected his proposal for Sidonie's hand. He had lingered many months in Bonn without any apparent object, except to make use of its convenient vicinity to pay frequent visits to Dorneck. To be sure he had put forward the attraction of interesting philosophical lectures as a pretext for his long stay; but his irregular attendance on these interesting discussions did not seem to exactly warrant the supposition that he remained in Bonn "to study." Besides, the vacations had now begun, philosophy was resting, and its students were refreshing their eyes and hearts with the sight of the Swiss mountains, or the southern tints of upper Italy, but Prince Eduard remained in Bonn as before.

Willingly as Sidonie had at first received the young man's eager attentions, winning and gracious as she had been, a certain coldness had lately appeared in her manner which affected him very painfully, and had undoubtedly been the cause of the delay in his proposal. The countess had clearly perceived this, and, as she considered the match desirable in every respect, endeavored to change Sidonie's conduct. In so doing, however, she had met with far greater opposition than she expected, nay, than seemed intelligible, and — what grieved her still more — was forced to feel that Sidonie, whose heart had hitherto been perfectly open before her, did not now bestow her entire confidence.

The countess was too wise not to be aware that confidence cannot be forced, and tokens of irritated sensibility are least likely to obtain it. She had therefore appeared not to notice Sidonie's reserve, and contented herself with watching her carefully in secret. Sidonie's passionate declaration that she would never see the prince again, seemed to indicate some fault on his part, and she believed that she had here found the clue to the young girl's former coldness. At the same time, her agitation, her imploring entreaty to be spared any explanation of the cause of her decision, seemed to plainly betray love.

With this idea, the countess received with a half smile Sidonie's declaration that she intended to claim the right of her family in regard to the appointment of the abbess of the convent of Herdrungen, on her own behalf. She did not oppose her decision, but reminded her that a resolution which is to affect the whole life should not be hastily made, that it required due reflection, and she must also have some consideration for the world and its remarks upon this very extraordinary step. Sidonie, who had been prepared for grave rebukes, perhaps even mockery, was surprised, nay touched, by her aunt's gentle, quiet manner, and as she could not permit herself the happiness of relieving her full heart by entire confidence, threw herself into the arms of her second mother and gave free course to her tears.

From Macmillan's Magazine.

CONSTANTINOPLE.*

THERE are four cities in the world that belong to the whole world rather than to any one nation, cities that have influenced the whole world, or round which its history has at one time or another revolved, cities in which students and philosophers from every country are equally interested. These four are Jerusalem, Athens, Rome, Constantinople. The first has given to civilized mankind their religion; the second has been our great instructress in literature and art; the third has spread her laws, her language, her political and ecclesiastical institutions over half the globe. And though Constantinople can lay no claim to the moral or intellectual glories of these other three, though her name does not command our veneration like Jerusalem, nor our admiring gratitude like Athens, nor our awe like Rome, she has preserved, and seems destined to retain, an influence and importance which they have in great measure lost. They belong mainly to the past: she is still a power in the present, and may be a mighty factor in the future. For fifteen hundred years she has been a seat of empire, and for an even longer period the emporium of a commerce, to which the events of our own time seem destined to give a growing magnitude. To set before you anything like an adequate account of a city interesting in so many different ways, physically, historically, architecturally, socially, politically, would require not one lecture, but a big book — so you will understand that I cannot attempt more to-night than to touch on a few points which may help you to realize a little better what Constantinople is really like, what is the sort of impression it makes on a traveller, what are the feelings with which he treads its streets pondering over the past and speculating on the future. Anything that helps to give substance and vitality to the vague conception one forms of a place which one has been reading and hearing about all his life may be of some use, especially at this moment, when we are told that we ought to fight for Constantinople, and may any morning be informed that our own fleet has gone to anchor under its walls. Before I speak of its history, or attempt to describe its present aspect and characterize the men that inhabit it, let me try to give you some notion of its geographical situation, and of the wonderful advantages for strategical and commercial purposes which that situation confers upon it.

If you look at the map you will see what a remarkable, and indeed unique, position Constantinople, occupies. It is on the great highway which connects the Black Sea with the Mediterranean, and separates Europe from Asia. Thus it commands at once two seas and two continents. All the marine trade, both export and import, of the vast territories which are drained by the Danube and the great rivers of southern Russia, as well as that of the north coast of Asia Minor, and of those rich Eastern lands that lie round the Caspian, must pass under its walls. When the neighboring countries are opened up by railways it will be the centre from which lines will radiate over European Turkey and Asia Minor. With a foot, so to speak, on each continent, the power that possesses it can transfer troops or merchandise at will from the one to the other, and can prevent any one else from doing so. Then consider how strong it is against attack. It is guarded on both sides by a long and narrow strait — to the north-east the Bosphorus, and to the south-west the Dardanelles — each of which can, by the erection of batteries, possibly by the laying down of torpedoes, be easily rendered impregnable to a naval attack. For the Bosphorus, as you probably know, is fifteen miles long, with bold rocky hills on either side, and a channel which is not only winding but is nowhere over two miles and in some places scarcely half a mile wide. And it possesses a splendid harbor, land-locked, tideless, and with water deep enough to float the largest vessels. On the land side it is scarcely less defensible, being covered by an almost continuous line of hills, lakes, and marshes, with a comparatively narrow passage through them, which offers great advantages for the erection of fortifications. There is no other such site in the world for an imperial city. In other respects it is equally fortunate. Of its beauty I shall say something presently. Although the climate is very hot in summer, and pretty keen in winter, it is agreeable, for the air is kept deliciously fresh by the seldom failing breezes that blow down from the Euxine or up from the Ægean Sea, and the sea itself is a great purifier. Though there is no tide there is a swift surface current sweeping down into the Sea of Marmora and the Mediterranean, a current at one point so strong that boats have to be towed up along the shore, which

* A lecture delivered in Aberdeen on January 3rd, 1878, with some additions.

carries off whatever is thrown into the water. So, though it is one of the dirtiest towns in the East, I fancy it is one of the most healthy.

You may easily believe that such an attractive site was not left long unoccupied. In the year 667 B.C., not a hundred years after the foundation of Rome, and about the time when King Esarhaddon was attacking Manasseh, son of Hezekiah, at Jerusalem, some Greeks from Megara, a little city between Athens and Corinth, came sailing up into these scarcely explored seas, and settled on this tempting point of land, where they built a city, which they called Byzantium, and surrounded it with walls to keep off the wild tribes of the Thracian mainland. They were not, however, the first settlers in the neighborhood, for seventeen years before another band of Greeks, also from Megara, had established themselves on a promontory opposite, on the Asiatic side of the strait, and founded the town of Chalcedon, which still remains there, and is now called Kadikeui. It was a standing joke among the ancients that the people who took the site of Chalcedon when they might have taken that of Byzantium must have been blind: so the story went, that when the Megarians asked the oracle of Apollo at Delphi where they should send a colony to, the oracle bid them fix themselves opposite the blind men; when, therefore, on sailing up this way, they saw a town planted opposite this so far superior spot, they concluded that its inhabitants must be the blind men whom Apollo meant, and established themselves here accordingly.

The city soon grew and throve, not only because it was well placed for trade, but on account of the shoals of fish — a fish called pelamys, which has been conjectured to be a kind of tunny — that used to come down from the Black Sea, and which were attracted into the harbor by the stream of fine fresh water which flowed into the upper end of it. Whether the fresh water brought down insects or other tiny creatures on which the fish fed, or whether it caused the growth of beds of seaweed which served as pasture, is not clear, but at any rate it was the stream that lured in the fish, and the fish that made the fortune of the place. For the Byzantines drove a roaring trade in these fish — the name of Golden Horn, which the harbor still bears, is said to be derived from the wealth they drew from this source. They also raised a large revenue by levying a tax on the corn-ships that passed out through the straits from southern Russia; for that region, then called Scythia, had already become, as it is now, one of the greatest grain-producing countries in the world. With this command of a main artery of trade, Byzantium had grown by the time of Herodotus to be a considerable place, whose possession or alliance was thenceforward very valuable to the great powers that disputed the control of these countries. Having submitted, like other Greek cities of that region, to the Persians, it recovered its independence after the defeat of Xerxes, and became a member of the Athenian confederacy, till the Athenian power was in its turn overthrown. In the days of Philip of Macedon, it was again an ally of Athens, and stood a famous siege from that prince, a siege whose happy issue was due to the energy with which Demosthenes pressed the Athenians to send succor to it when it was on the point of yielding. It is related that during this siege a bright light in the form of a crescent was seen in the sky, and accepted by the Byzantines as a sign of deliverance; and that after Philip's repulse, they took the crescent to be the device of the city, which it continued to be till the Turkish conquest. Some hold that this is the origin of the Crescent as the Ottoman badge.* Many another attack it had to resist, both before and after it submitted to the dominion of Rome. But whatever misfortune might befall it at the hands of enemies, it always recovered its wealth and consequence. The inhabitants are described as a race of well-to-do, luxurious people, much given to good eating and drinking, since they had abundance of fish, and the neighboring country produced excellent wine. It was a story against them that when a Byzantine officer ought to be at his post on the walls, he was generally to be found in a cook-shop or tavern. In A.D. 330, Constantine the Great, who had then become sole emperor at Rome, determined to found a new capital, which would be a better centre of defence for the part of his empire which seemed most threatened by the barbarians of the north, and made choice of Constantinople as the spot. His practised military eye saw its wonderful strength, which had enabled it to resist him for some time in his great war with the emperor Licinius, and every traveller had long admired its advantages for commerce. Besides, he had just embraced Christian-

* There is, however, some evidence that the Seljukian Turks had used the Crescent long before; and it has been suggested that they borrowed it from the Chinese.

ity, and as Rome was full of the majestic monuments of paganism, he thought that the new religion would rise faster and flourish more freely in a clear field, where it would not be confronted or corrupted by the passions and prejudices of the past. He called it New Rome, but his court and people called it the city of Constantine; and the name of Constantinople at once superseded that of Byzantium.

Under his hands it sprung at once into greatness. The old Greek colony had occupied only the extreme point of the peninsula between the port and the Sea of Marmora: the new city filled the whole of it, covering almost the same area as Stamboul * does now; and was probably built a good deal more densely, since a considerable part of that area is now wasted in gardens or ruins. He brought some distinguished families from Rome, and allured settlers from all quarters by the offer of privileges and exemptions: as the seat of government it attracted many more, so that the population had risen in a century from his time to more than two hundred thousand. Immense sums were spent in the erection of palaces, law-courts, churches, and other public buildings; and the cities of the Ægean were ransacked to furnish masterpieces of Grecian art to enable its market-places and porticoes to rival those of Italian Rome. One such work of art has survived till our own day, and may stlll be seen in what was the hippodrome or race-course of the city. It is a brazen column, consisting of three twisted serpents, which was brought from Delphi, where it supported the tripod which the victorious Greeks dedicated to Apollo after the great Persian War. The tripod has long since vanished, and the serpents have suffered much — one of them had its lower jaw smitten off by the mace of Mohammed II., and all have lost their heads — but the venerable relic — probably the most remarkable relic that the world possesses — still keeps its place, and may perhaps witness as many vicissitudes of fortune in the future as it has done in the three and twenty centuries that have passed since it was set up in the Pythian shrine.

From A.D. 330 to A.D. 1453, Constantinople was the capital of the Roman Empire of the East; and its history may almost be called the history of that empire. It had many a siege to stand, sometimes in civil wars, sometimes from barbarian enemies like the Persians, who encamped for three years over against it at Scutari, or the Arabs in their first flush of conquering energy, or the Russians, who came across the Black Sea in huge flotillas. All these foes it repelled, only to fall at last before those who ought to have proved its friends, the French and Venetian Crusaders, who in A.D. 1204 turned aside hither from their expedition to Palestine to attack it. They drove out the Eastern emperor, and set up a Frank in his place. They sacked the city, and wrought more ruin in a few days than all previous enemies had done in as many centuries. The Eastern Empire never recovered this cruel blow; and though after a while these Franks were expelled, and a native prince again (1261 A.D.) sat on the throne of Constantine, his territory was now too small, and the organization of the State too much shattered to enable any effective resistance to be offered to the progress of the terrible foe who advanced first from Asia Minor, then on the side of Europe also. In A.D. 1453 the Turks took Constantinople, and extinguished the Eastern Empire. At that time Constantinople was sadly shorn of its glories. The public buildings had fallen to decay; war and poverty had reduced the population to about one hundred thousand, and these inhabitants had so little martial spirit that the defence of the city had to be intrusted to Western mercenaries. Of this scanty population the majority were slain or led captives by the conquerors, so that Mohammed II. found it necessary to repeople his prize by gathering immigrants from all quarters, just as Constantine had done eleven hundred years before. Small indeed can therefore be the strain of old Byzantine blood that runs in the veins of the modern people of Constantinople. Mohammed transferred his government hither from Adrianople, and since his day this has been the centre of Ottoman dominion and a sacred city, hardly less sacred than Jerusalem or even Mecca, to the Mohammedan world.

One word, before we part from old Constantinople, on the mission which was intrusted to her during the long ages that lay between Constanstine the Great, her founder, and Constantine Palæologus XVI., her last Christian sovereign. While the rest of Europe was plunged in barbarism and ignorance, she preserved, like an ark amid the far-spreading waters, the treasures of ancient thought and learning. Most of the Greek manuscripts we

* Stamboul (said to be a corruption of εἰς τὴν πόλιν) though often used as a name for Constantinople generally, denotes properly the old city between the inlet called the Golden Horn and the Sea of Marmora, as opposed to Galata and Pera.

now possess, and some of the most valuable Latin ones, were stored up in her libraries, and ultimately scattered from her over the Western countries. A succession of writers maintained, though no doubt in a lifeless way, the traditions of Greek style, and composed chronicles which are almost our only source of knowledge for the history of these borderlands of Europe and Asia. And the light which still burned within her walls was diffused over the Slavonic peoples of the Danube and the Dneiper valleys. She was the instructress of the Slavs, just as Italy was the instructress of the Teutons and the Celts, sending out missionaries, giving them their alphabets, and, in the intervals of the struggle she had to maintain against them, imparting to them some rudiments of civilization. And the services she rendered in this way have been too much forgotten by those who have been struck, as every student must be struck, between the theological and political stagnation of her people, and the powerful intellectual life which even in the Dark Ages had begun to stir among the new nations of western and northern Europe.

What remained of literature, art, and thought expired, it need hardly be said, with the Turkish conquest. From then, till now, the history of Constantinople is a tedious record of palace assassinations and intrigues. Not even a gleam of the literary radiance which surrounds the Mohammedan courts of Bagdad, Cordova, and Delhi ever fell upon the Seraglio of Constantinople. Some of the Turkish sultans, such as Mohammed II. and Suleiman the Magnificent, were undoubtedly great men; but their greatness seldom expanded itself in any of the arts of peace, and in the city there is nothing to remember them by except their tombs and the mosques that bear their names.

Let me now attempt — having tried to show you how the city has grown, and what are the different national influences, Greek, Roman, and Asiatic, that have acted on it and played their part in giving it its strangely mingled character — to present to you some notion of its structure and aspect. It consists of three main divisions. First there is the old city, the city of Constantine, which the Turks now call Stamboul, lying between the Golden Horn and the Sea of Marmora, and narrowing down to a point of land, the point which was the site of the first Megarian colony, and which marks the entrance from the sea into the long strait of the Bosphorus. Secondly, over against Stamboul, on the other side of the Golden Horn, is Galata — called probably from the Galatæ or Gauls (Galatians) who had occupied neighboring regions of Asia Minor not long after the time of Alexander the Great, and some of whom had apparently settled here — a long, low, dirty district running along the water's edge, and full of Greek sailors and bad smells. It was a mere suburb in Roman times, and bore the name of Sycæ (the fig-trees). In the Middle Ages it became the seat of a fortress colony of the Genoese, who carried on a great trade in these seas, and had their forts and trading factories all round the Euxine. Here they built a majestic tower nearly half way up the slope of the hill, from whose top one of the finest panoramic views of the city may be enjoyed. Behind and above Galata, rising up the steep hill, is the quarter called Pera, where Europeans of the better sort live, and all the European shops are to be found. Here, on the hilltop, stand the palaces of the ambassadors, among which, appropriately enough, our own and that of the German envoy are the most conspicuous, tall piles that look big enough to hold an army. Both these quarters are in Europe, and from them a long suburb meanders along the European shores of the Bosphorus, forming a line of villages with villas and gardens between, that stretches some eight or nine miles to Therapia. The third and last division is in Asia, on the further side of the Bosphorus, opposite both Stamboul and Galata; it consists of a series of towns, the chief of which is Scutari, forming an almost continuous mass of houses along the shore, and virtually a part of the great city, though separated by more than a mile of water, water which is sometimes so rough that the steamers cannot cross.

You may judge from looking at the map what a singular city this must be with the sea running through it in all directions, not merely in canals like those of Venice or Rotterdam, but forming great broad inlets whose water is intensely bright and clear, as well as deep to the very edge. It is as if you had a city built on both sides of the Kyles of Bute, at the point where one of the long sea lochs (Loch Riddon or Loch Striven) comes down into the main channel. Stockholm and New York are the only other great cities that can be compared with it in this respect; but Stockholm, though beautiful in its way, is on a comparatively small scale, while in New York man has done his utmost to

spoil nature, and nature herself has done infinitely less than at Constantinople. Let me try to tell you what nature has done for Constantinople. She has given it the bluest and clearest sea that can be imagined, and vaulted over it the most exquisitely bright yet tender sky, full of a delicious light that would be dazzling if it were not so soft. She has drawn the contour of the shores and hills as if with an artist's hand, the sweeping reaches of the Bosphorus, the graceful curve of the Golden Horn, the soft slope of the olive-clad heights behind Scutari, the sharp, bold outline of the rocky isles that rise from the surface of the Sea of Marmora; and far away on the south-eastern horizon she has raised into heaven the noble summit of the Mysian Olympus, whose snows blush rose red under the morning sun. The sea seems to pervade everything: turn which way you will it meets you, till you get confused among its winding arms. Its glittering bosom is covered with vessels of every size and style, from the long dark ugly ironclads, which the late sultan bought from the Clyde and Tyne ship-builders with borrowed money, to the sprightly feluccas and other odd little craft rigged in a fashion our language has no names for. During the day its surface is seldom calm, for there is usually a breeze blowing, and when this breeze comes up from the south-west and meets the strong current running down from the Black Sea, it raises in a moment short sharp waves, a kind of chopping sea that makes the small boats vanish. The nights, however, are often still and serene, and then under the brilliant moon the city seems to lie engirt by a flood of molten silver.

From the shore, lined with masts, the hills rise almost everywhere steeply, bearing on their side and tops the town, or rather these three towns, looking across at one another, which I have endeavored to describe. The houses are mostly of glittering white, densely packed together, but interrupted every here and there by a grove of tall dark-green cypresses. Such an ancient grove almost covers one side of the hill of Pera, overshadowing a large cemetery called the Field of the Dead. The Turks say that the smell of the cypress and the resin it exudes destroy the miasma of a graveyard. At any rate their sombre hue and stiff outline harmonize well with the ruinous tombs that lie scattered round their trunks; for in Turkey the graves are not inclosed, and the stone once stuck into the ground is left neglected to totter or fall. Out of the mass of white walls and red roofs rise the vast domes of the mosques, and beside or round each mosque, two or four, or even six slender minarets, tall, needle-like towers of marble, with a small open gallery running round the outside, whence, four times a day, the shrill cry of the man who calls the faithful to prayer is heard over the hum of the crowd below. The houses in Stamboul itself are seldom over two or three stories high, and often of wood, sometimes whitewashed, sometimes painted red or yellow, and generally rickety and flimsy-looking. In Pera and the suburbs one finds substantial mansions and villas, but these mostly belong to well-to-do Christian merchants. There are few public buildings besides the mosques to be seen, for the old palaces have been burned — Constantinople is a terrible place for fires — and as for the new ones, of which there are more than enough, they are mostly long, low structures in the modern French or Italian style upon the edge of the Bosphorus. Sultan Abdul Aziz spent millions upon these erections; in fact, the loans made since the Crimean war were nearly entirely sunk in these and in his men-of-war. They tell a story of one of the prettiest of them, that he built it at an enormous cost as a place to go to for coffee in the afternoon. When it was finished he went, and finding himself with a headache next morning, took a disgust to it, and never entered it afterwards. This is what personal government comes to in the East. As for the ordinary ornaments of European capitals — museums, picture-galleries, theatres, libraries, universities, and so forth — they don't exist at all. The administration cares for none of such things, and has hardly even supplied itself with respectable public offices (except the ministry of war, which is a large place with the air of a barrack, deforming the finest site in Stamboul); and private enterprise has produced nothing more than two or three wretched little places of amusement for the Franks and Greeks of Pera. Nowhere is there a church to be discovered. Half the inhabitants are Christians, and most of them devout Christians according to their lights; but the Muslim population, who are the object of our protecting care, are still intolerant enough to be irritated by the sight of a place of Christian worship. So the churches are all (except the English church in Pera) comparatively small and obscure, hidden away in corners where they don't catch the eye. The ancient churches have been nearly all

turned into mosques or suffered to fall to ruin, so that little material remains for the student of mediæval architecture. In fact, one may get a better notion of Byzantine art at Ravenna alone than in the whole territories of the later Eastern Empire.

People are always saying that the inside of Constantinople dispels the illusions which the view of it from the sea or the neighboring hills has produced. But those who say so, if they are not merely repeating the commonplaces of their guide-book, can have no eye for the picturesque. I grant that the interior is very dirty and irregular and tumble-down, that smells offend the nose, and loud harsh cries the ear. But then, it is so wonderfully strange and curious and complex, full of such bits of color, such varieties of human life, such far-reaching associations from the past, that whatever an inhabitant may desire, a visitor at least would not willingly see anything improved or cleared away. The streets are crooked and narrow, climbing up steep hills, or winding along the bays of the shore, sometimes lined with open booths, in which stolid old Turks sit cross-legged sleepily smoking, sometimes among piles of gorgeous fruit, which even to behold is a feast, while sometimes they are hemmed in by high windowless walls and crossed by heavy arches, places where you think robbers must be lurking. Then, again, you emerge from one of these gloomy cavities upon an open space — there are no squares, but irregular open spaces — and see such a group of gaily-painted houses, with walnut or plane trees growing round them, as one finds on the Bay of Naples. Or you come to a side street, and, looking down the vista, catch a glimpse of a garden full of luxuriant vines and rosy pomegranates, and beyond it the bright blue waves dancing in the sunlight. Now and then one finds some grand old piece of Roman ruin — an arch or a cistern, or the foundations of some forgotten church, whose solidity mocks the flimsy modern houses that surround it — and is carried back in thought a thousand years, to the time when those courses of fine masonry were laid by the best architects of Europe. Not that there are many considerable ruins, for in this respect Constantinople contrasts markedly with her Italian rival. The reason of this is doubtless to be sought not merely in the superior grandeur of Roman buildings, but also in the fact that while in Rome the old city on and around the Palatine, Aventine, and Cœlian hills was deserted in the Middle Ages for the flats of the Campus Martius, the site of the ancient city has here been continuously inhabited, each age constructing its dwellings out of the materials which former ages had left. In another point, too, one is struck by the contrast between these ruins and those of Rome. Constantinople has absolutely nothing to show from pagan times. Though Byzantium was nearly as old as Rome, the city of Constantine is the true creation of the first Christian emperor, and possesses not a relic of paganism, except the twisted serpents from Delphi and an Egyptian obelisk planted near them in the hippodrome.

There are no shops in the streets of Stamboul proper, for nearly everything, except food, is sold in the bazaar, which is an enormous square building, consisting of a labyrinth of long covered arcades, in which the dealers sit in their stalls with their wares piled up round them. It is all locked up at sunset. You may buy most things in it, but the visitor is chiefly attracted by the rugs and carpets from Persia, Anatolia, and Kurdistan, the silks of Broussa, and the stores of old armor (real and false) from everywhere. Purchasing is no easy matter, for a stranger is asked thrice the value of the goods, and unless he is content to be cheated both by the dealer and his own cicerone interpreter (who of course receives a secret commission from the vendor), he must spend hours and hours in bargaining. Business is slack on Friday (the Mussulman Sabbath) and on Saturday (since many of the dealers are Jews), as well as on Sunday. It is conducted under another difficulty, which drives the visitor almost wild — that of a multiplicity of "circulating mediums." There is a Turkish metallic currency, and a paper currency, greatly depreciated, besides all sorts of coins of other nations constantly turning up, among which the Indian rupee is one of the commonest; and you have to make a separate bargain as to the value at which the coins you happen to have in your pocket will be taken. Hotel lodging, and indeed almost everything, is very dear: for Western books you pay half as much again as in London or Paris. There is little sign of a police in the streets, and nothing done either to pave or clean them. Few are passable for carriages, and the Turks leave everything to time and chance. The only scavengers are the vultures, which may sometimes be seen hovering about in the clear sky, and the dogs, of which there is a vast multitude in the city. Though you must have often heard of these dogs, the

tradition which obliges every one who talks about Constantinople to mention them is too well established to be disregarded. Nobody owns them or feeds them, though each dog mostly inhabits the same quarter or street; and, in fact, is chased away or slain if he ventures into the territory of his neighbors. They are ill-favored brutes, mostly of a brown or yellowish hue, and are very much in the way as one walks about. At night they are a serious difficulty, for the streets are not lighted, and you not only stumble over them, but are sometimes, when you fall into one of the holes in the roadway, tumbled head foremost into a nest of them, whereupon a terrible snapping and barking ensues. However, they don't molest you unless you first attack them; and as canine madness is unknown, or nearly so among them, nobody need fear hydrophobia.

I have talked about streets from force of habit, but the truth is that there are very few streets, in our sense of the word, in any quarter of the city. It is a congeries of houses: some of them built, in proper Eastern style, round courtyards, some with doors and windows looking towards the public way, but very few arranged in regular lines. It has the air of having been built all anyhow, the houses stuck down as it might happen, and the people afterwards left to find their way through them. Even the so-called *Grande Rue* of Pera, which has some very handsome French shops, is in some places as steep as the side of Lochnagar, and in others as narrow as an Edinburgh wynd. It is a capital place to lose yourself in, for you never can see more than a few yards ahead, and the landmarks you resolve to find your way back by — a ruined house, for instance, or a plane-tree standing in the middle of the road — turn out to be as common as pillar letter-boxes in our own streets, so that you, in trusting to them, are more bewildered than ever. The Russians, one would think, must feel themselves sadly at sea in such a town, for in St. Petersburg nearly every street is straight, and some of the great streets run so far without the slightest curve (three miles at the least), that one literally cannot see to the end of them.

Perhaps the strangest thing of all is to have trains and tram-cars running through this wonderful old eastern mass of mosques, bazaars, graveyards, gardens, and ruins. There is now a line of railway, which, starting from the centre of the port, goes right round the outside of the city, following the windings of the shore, away into the country. It does a large "omnibus traffic," stopping every three or four minutes like the Metropolitan Railway in London, and I should fancy is the only thing in Constantinople that pays its way; while a tramway, beginning near the same point, passes along the principal line of streets — indeed, almost the only line level enough for the purpose — as far as the northwestern gate. The cars are much like ours, built, I believe, in America; but they have the odd trick of always running several close one after another, so that you may wait an hour for one to overtake you, and then find three or four come up, going in the same direction, in five minutes' time.

Of the countless sights of Constantinople I shall mention to you three only, the walls, the Seraglio Palace, and the famous church — now a mosque — of St. Sophia. The walls may be traced all round the sea front as well as the land side of the city, but they are naturally strongest and highest on the land side, where they run across the neck of the peninsula from the Sea of Marmora to the Golden Horn. And here they are indeed splendid — a double (in some places triple) line of ramparts with a deep moat outside, built of alternate courses of stone and brick, and guarded by grand old towers, the finest group of which (called the Seven Towers) stands at the sea end, and was long used as a state prison. In several places they are ruinous, and there the ivy and other climbing plants have half filled the gaps, and clothed the glowing red with a mantle of delicate green. Many are the marks on them of the sieges they have stood, of strokes from stones hurled by the catapult, and blows delivered by battering-rams, long before gunpowder was heard of. The effect of their noble proportions is increased by the perfect bareness and desolation of the country outside, where there is nothing like a suburb, in fact no houses whatsoever, but merely fields, or open ground, or groves of dismal cypresses. These ramparts were first built by Theodosius (for the line of Constantine's walls was further in), and repaired again and again since his time down to the fatal year 1453, when the Turks, under Mohammed II., took the city. Since then little has been done, except that the Turks have walled up a small gate, still shown to visitors, because there is a prophecy that through it a Christian army will one day re-enter and drive them back into Asia. The stranger probably agrees with the

Turk that the event predicted will happen, but doubts how far this simple device of theirs will delay it. It is a curious instance of their sluggish fatalism that they have not only allowed these walls to decay, which after all could be of little use against modern artillery, but that, when the present war began, they had done nothing to provide other defences, outlying forts and lines of earthworks, for the city on this its most exposed side. Indeed one is told that Sultan Abdul Medjid actually gave the walls as a present to his mother, that she might make something out of the sale of the materials; and they would soon have perished, had not the British ambassador interfered in the interests of the picturesque.

The Seraglio Point is the extreme end of the peninsula of Stamboul (*i.e.*, the old city proper, as opposed to Galata and Pera) where it meets the waves of the Sea of Marmora, looking down that sea to the west, and northeast up the Bosphorus towards the Euxine. Here a wall running across the peninsula severs this point from the rest of the town, and probably marks pretty nearly the site of the oldest Greek settlement. When Constantine founded his city he selected this district as the fittest for the imperial residence, since it was the most secluded and defensible, surrounded on three sides by the sea, and on it there was built a large, rambling fortress palace, where the emperors dwelt, shrouding in its obscurity their indolence or their vices from the popular eye. After their fall it passed to the Turkish sultans, who kept their harem here, and from its walls the disgraced favorite was flung, sewn up, according to the approved fashion, in a sack, into the deep waters, whose current soon swept him or her away down to the open sea. No palace offers so great a temptation to crime, for in none could it be so well concealed and its victims so easily got rid of. Great part was consumed by fire more than thirty years ago, and has never been rebuilt; so most of this large area, which is still divided from the rest of the city by a high wall, remains a waste of ruins, heaps of rubbish with here a piece of solid old masonry, there a gaunt yellowish wall standing erect, while in the midst are groups of stone pines and tall, stiff, sombre cypresses, that seem as if mourning over this scene of silence and decay.

It is no inapt type of the modern Turkish empire, where no losses are repaired and forebodings of death gather thick around. And the spectator is reminded of the Persian poet's lines which Mohammed II. is said to have repeated when, on the day of his conquest, he entered the deserted palace of the emperors, —

> The spider weaves her web in the palace of
> the kings,
> The owl hath sung her watch song from the
> towers of Afrasiab.

A part of the palace escaped the fire, and is still used, though not by the sultan himself; and in what is called the outer seraglio, close to the wall which divides it from the city, and immediately behind St. Sophia, there are two buildings of some interest. One is the Museum of Antiquities, a bare room, half open to a courtyard, in which there lie, heaped up over the floor, the monuments of Greek art which have been sent hither from the Greek isles and Asia Minor. Statues and fragments of statues, stones bearing inscriptions, pieces of pottery and glass, and a variety of other similar relics, have been thrown together here like so many skeletons in a burial-pit, uncleaned, uncatalogued, uncared for, sometimes without a mark to indicate whence they came. No government in Europe has had such opportunities for forming a collection of Greek art treasures, and this is the result. What it has cared for is seen when you take a few steps from this charnel-house of art and enter St. Irene, the Church of the Holy Peace, a beautiful bit of work in the best style of Byzantine architecture, which the Turks have turned into an armory. All down the nave and all along the walls rifles are stacked, swords and lances hung, while field cannon stand in the midst. The sanctuary of the divine peace teems with the weapons of war.

From whatever point you gaze upon the landscape of Constantinople this seraglio promontory, with its grove of lofty cypresses, seizes and holds the eye. It is the central point of the city, as it is also the centre of the city's history. Dynasties of tyrants have reigned in it for fifteen centuries, and wrought in it more deeds of cruelty and lust than any other spot on earth has seen.

St. Sophia, the third of the sights I have named, is one of the wonders of the world. It is the only great Christian church which has been preserved from very early times; for the basilicas of St. John Lateran and St. Mary the Greater at Rome have been considerably altered. And in itself it is a prodigy of architectural skill as well as architectural beauty. Its enormous area is surmounted by a

dome so flat, pitched at so low an angle, that it seems to hang in air, and one cannot understand how it retains its cohesion. The story is that Anthemius, the architect, built it of excessively light bricks of Rhodian clay. All round it, dividing the recesses from the great central area, are rows of majestic columns, brought hither by Justinian, who was thirty years in building it (A.D. 538–568), from the most famous heathen shrines of the East, among others from Diana's temple at Ephesus, and that of the sun at Baalbec. The roof and walls were adorned with superb mosaics, but the Mohammedans, who condemn any representation of a living creature, lest it should tend to idolatry, have covered over all these figures, though in some places you can just discern their outlines through the coat of plaster or whitewash. In place of them they have decorated the building with texts from the Koran, written in gigantic characters round the dome (one letter Alif is said to be thirty feet long), or on enormous boards suspended from the roof, and in four flat spaces below the dome they have suffered to be painted the four archangels whom they recognize, each represented by six great wings, without face or other limbs.

One of the most highly cultivated and widely travelled ecclesiastics whom Russia possesses (they are, unhappily, few enough) told me that after seeing nearly all the great cathedrals of Latin Europe he felt when he entered St. Sophia that it far transcended them all, that now for the first time his religious instincts had been satisfied by a human work. Mr. Fergusson, in his "History of Architecture," says something to a similar effect. This will hardly be the feeling of those whose taste has been formed on Western, or what we call Gothic models, with their mystery, their complexity, their beauty of varied detail. But St. Sophia certainly gives one an impression of measureless space, of dignity, of majestic unity, which no other church (unless perhaps the Cathedral of Seville) can rival. You are more awed by it, more lost in it than in St. Peter's itself.

The Mohammedan worship in this mosque, which they account very holy, is a striking sight. At the end of it next Mecca there is a sort of niche or recess, where they keep the Koran, called the Mihrab. Well, in front of the Mihrab, just like the Greek priest before his altar, stands the mollah or priest who is leading the devotions of the congregation, while the worshippers themselves stand ranged down the body of the building in long parallel rows running across it, with an interval of several yards between each row. As the mollah recites the prayers in a loud, clear, harsh voice, the people follow, repeating the prayers aloud, and follow also every movement of his body, sometimes bending forward, then rising, then flinging themselves suddenly flat on the floor and knocking their foreheads repeatedly against it, then springing again to their feet, these evolutions being executed with a speed and precision like that of a company of soldiers. Occasionally the reading of a passage in the Koran is interposed, but there is no singing, and this is fortunate, for the music of the East is painfully monotonous and discordant. Women are of course not present at the public service; for that would shock Mohammedan ideas, and in some Mohammedan countries, women, like dogs, are rigidly excluded from the house of prayer, and may occasionally be seen performing their devotions outside. Here, in Stamboul, however, I repeatedly noticed groups of half-veiled women seated on the floor of a mosque when worship was not proceeding, sometimes gathered into a group which was listening to a mollah haranguing them. On one of these occasions I asked the cicerone who accompanied us what the mollah was saying. He listened for a moment, and replied, "Oh, just what our priests say, to mind their own business and not to get into scrapes" (*pas faire des bêtises*), which seems to imply that the exhortations of the clergy of all denominations are, in Constantinople, of a more definitely practical character than one was prepared to expect. Islam has been so hard upon women, that it is something to find them preached to at all. I may say in passing that, although St. Sophia is by far the most beautiful of the mosques, some of the others, built in imitation of its general design, are very grand, their towering cupolas supported by stupendous columns, and the broad expanse of the floor almost unbroken by the petty erections and bits of furniture and chairs which so often mar the effect of Latin and Eastern churches.

Few buildings in the world inspire more solemn or thrilling thoughts than this church of Justinian. It witnessed the coronations of the Byzantine emperors for nearly a thousand years; it witnessed the solemn mass by which the cardinal legate of the pope celebrated the union so long striven for, and so soon dissolved, of the

Greek and Latin Churches; and it witnessed the terrible death-scene of the Byzantine Empire. On the 29th of May, 1453, the sultan Mohammed II. marshalled his hosts for the last assault upon beseiged Constantinople. The thunder of his cannon was heard over the doomed city, striking terror into its people, and, while the battle raged upon the walls, a vast crowd of priests, women, children, and old men gathered in St. Sophia, hoping that the sanctity of the place would be some protection if the worst befell, and praying the help of God and the saints in this awful hour. Before noon the walls were stormed. The emperor, who had fought like a true successor of Constantine, fell under a heap of slain, and the Turkish warriors burst into the city, and dashed like a roaring wave along the streets, driving the fugitive Greeks before them. Making straight for St. Sophia, they flung themselves upon the unresisting crowd; men were slaughtered — others, and with them the women and children, were bound with cords, and driven off in long files into captivity; the altars were despoiled, the pictures torn down, and before night fell every trace of Christianity that could be reached had been destroyed. They still show on one of the columns a mark which is said to have been made by the sultan's blood-smeared hand as he smote it in sign of possession, and shouted aloud, with a voice heard above the din, "There is no God but God, and Mohammed is his prophet." Looking round this noble monument of Christian art, and thinking of that awful scene, it was impossible not to wish for the speedy advent of a day when the fierce faith of Arabia shall be driven out, and the voice of Christian worship be heard once more beneath this sounding dome.

Now, let me pass from the city to the people that dwell in it, and try to give you some notion of its vast and strangely mingled population. One of the most striking points about it is the sense of a teeming population which it gives. Standing on the top of the hill of Pera, you look down over a sea and port covered with vessels and boats, and see upon the amphitheatre of hills that rises from this blue mirror three huge masses of houses, straggling away along the shores in interminable suburbs, while the throng that streams across the bridge of boats (reminding one of the "Vision of Mirza") is scarcely less than that which fills the great thoroughfares of London. Pass beyond the walls, or climb the hill that hangs over Scutari, and the contrast is extraordinary. You look over a veritable wilderness, great stretches of open land, sometimes bare, sometimes covered with brushwood (for the big trees have been mostly cut down by the improvident people) with hardly a village or even a house to break the melancholy of the landscape. Much of this land is fertile, and was once covered with thriving homesteads, with olive-yards and vineyards, and happy autumn fields; but the blight of Turkish rule has passed over it like a scorching wind.

Constantinople is a city not of one nation but of many, and hardly more of one than of another. You cannot talk of Constantinopolitans as you talk of Londoners or Aberdonians, for there are none — that is to say, there is no people who can be described as being *par excellence* the people of the city, with a common character or habits or language. Nobody knows either the number of the population or the proportion which its various elements bear to one another; but one may guess roughly that the inhabitants are not less than eight or nine hundred thousand, and that of these about a half, some say rather over a half, are Mohammedans. This half lives mostly in Stamboul proper and in Scutari, while Pera, Galata, and Kadikeui (Chalcedon) are left to the Christians. Except the pashas, who have enriched themselves by extortion and corruption, and various officials or hangers-on upon the government, they are mostly poor people, many of them very poor, and also very lazy. A man need work but little in this climate, where one can get on without fire nearly all the year, with very little food and clothing, and even without a house, for you see a good many figures lying about at night in the open air, coiled up under an arch or in the corner of a courtyard. Plenty of them are ecclesiastics of some kind or other, and get their lodging and a little food at the mosques; plenty are mere beggars. The great bulk are, of course, ignorant and fanatical, dangerous when roused by their priests, though honest enough fellows when left alone, and in some ways more likable than the Christians. But the so-called upper class are extremely corrupt.

These richer folk have mostly dropped the picturesque old Turkish dress, and taken to French fashions. They wear cloth coats and trousers, retaining only the red fez, which is infinitely less becoming than a turban; smoke cigarettes, instead of pipes, and show a surprising aptitude for adding Western vices to their own stock,

which is pretty large, of Eastern ones. It is they that are the curse of the country. They have not even that virtue which the humbler Mussulmans have, of sobriety. With all their faults, the poor Turks, and especially the country people, are faithful observers of the precepts of the Koran, and you will see less drunkenness in the streets of Stamboul in a year than in Glasgow upon New Year's Day. Indeed, if you do see a drunken man at all, he is pretty sure to be a British or a Russian sailor. When I speak of Turks, I do not mean to imply that these Mohammedans of Stamboul have any Turkish (that is Turkman) blood in them, for they have probably about as much as there is of Norman blood in the population of London. They are as mongrel a race as can be found in the world — a mixture of all sorts of European and Asiatic peoples who have been converted to Islam, and recruited (down till recent times) by the constant kidnapping of Christian children and the import of slaves from all quarters. Their religion, however, gives them a unity which, so far as repulsion from their fellow-subjects goes, is a far stronger bond than any community of origin.

Nearly equal in numbers to the Mohammedans are the Turkish Christians, Greeks, Armenians, and Bulgarians. Though I speak of them together, they have really little in common, for each cherishes its own form of faith, and they hate one another nearly as cordially as they all hate the Turks. The Armenians seem to be the most numerous (they are said to be two hundred thousand), and many of the wealthy merchants belong to this nation: the Bulgarians, however, are, according to the report of the American missionaries, who are perhaps the best authorities, really the most teachable and progressive. The Americans have got an excellent college on the Bosphorus, where they receive Christian children belonging to all the nationalities. Then, besides all these natives, one finds a motley crowd of strangers from the rest of Europe — Italians, Germans, Hungarians, Russians, Poles, Frenchmen, English. Thus there are altogether at least eight or nine nations moving about the streets of this wonderful city, eight or nine languages which you may constantly hear spoken by the people you pass, and five or six which appear on the shop fronts. Turkish, Greek, Armenian, French, and English are perhaps the commonest. Italian used to be the chief medium of intercourse between West Europeans and natives, but since the Crimean war it has been largely superseded by French. Indeed the varnish of civilization which the influx of Europeans has spread over so many parts of the East everywhere is, or pretends to be, French. So here the music-halls and coffee-gardens of Pera, which are of a sufficiently sordid description, have a sort of third-rate Parisian air about them which is highly appreciated by the repulsive crowd that frequents them.

The best place to realize this strange mixture of nationalities is on the lower bridge of boats which connects Stamboul with Galata, and from which the little steamers run up and down the Bosphorus. There are two such bridges crossing the Golden Horn, both somewhat rickety. The pontoons to form a new one have been made for some years, and are now floating beside the lower one, in the waters of the harbor, but, owing to a dispute between the government and the Frank contractors, they have never been put together, and may probably lie rotting there for years to come, perhaps till some new government is established in Stamboul. It is a delightfully Turkish way of doing things. This lower bridge is also the wharf whence start the little steamers that run up the Bosphorus and across to Scutari and Chalcedon, on the Asiatic shore. Stalls for the sale of food and trinkets almost block up its ends, and little Turkish newspapers, hardly bigger than a four-page tract, are sold upon it, containing such news as the Porte thinks proper to issue. Take your stand upon it, and you see streaming over it an endless crowd of every dress, tongue, and religion; fat old Turkish pashas lolling in their carriages, keen-faced, wily Greeks, swarthy Armenians, easily distinguished by their large noses, Albanians with prodigious sashes of purple silk tied round their waists, and glittering daggers and pistols stuck all over them, Italian sailors, wild-eyed soldiers from the mountains of Asia Minor, Circassian beauties peeping out of their carriages from behind their veils, and swarms of priests with red, white, or green turbans, the green distinguishing those who claim descent from the Prophet. All these races have nothing to unite them; no relations, except those of trade, with one another, no intermarriage, no common civic feeling, no common patriotism. In Constantinople there is neither municipal government nor public opinion. Nobody knows what the sultan's ministers are doing, or what is happening at the scene of war. Everybody lives in a per-

petual vague dread of everybody else. The Turks believe that the Christians are conspiring with Russia to drive them out of Europe. The Christians believe that the Turks are only waiting for a signal to set upon and massacre them all. I thought these fears exaggerated; and though my friend and I were warned not to venture alone into St. Sophia, or through the Turkish quarters, we did both, and no man meddled with us. Indeed I wandered alone in the streets of Stamboul at night, and met no worse enemies than the sleeping dogs. But the alarms are quite real if the dangers are not; and one must never forget that in these countries a slight incident may provoke a massacre like that of Salonika. Imagine, if you can — you who live in a country where an occasional burglar is the worst that ever need be feared — a city where one-half of the inhabitants are hourly expecting to be murdered by the other half, where the Christian native tells you in a whisper that every Turk carries a dagger ready for use. It is this equipoise of races, this mutual jealousy and suspicion of the balanced elements, that makes it so difficult to frame a plan for the future disposal and government of the city. When, at some not very distant day, the Turk, or, as I should rather say, the sultan, disappears from Constantinople, who is there to put in his place? We are all, whatever our political sympathies, agreed in desiring that it should not fall into the hands of any great military or naval state. And, what is more to the purpose, the powers of Europe are so well agreed in their resolve to forbid that issue, that the danger of a permanent Russian occupation may be dismissed as chimerical. But who, then, is to have this incomparable prize, this arbitress of war and commerce? Neither Greeks, nor Armenians, nor Bulgarians, are numerous enough to be accepted as rulers by the other two races. The elements out of which municipal institutions ought to be formed are wanting; and though each of these three peoples is no doubt more hopeful and progressive than their Mohammedan neighbors, none of them has yet given indications of such a capacity for self-government as could entitle it to be intrusted with the difficult task of reorganizing the adminstration of a bankrupt country, of developing its resources, and maintaining order and justice.

Looking at the present state of the inhabitants of Constantinople, and their want of moral and social cohesion, one is disposed to think that organization, order, reform, must in the first instance come from without, and that some kind of active intervention by the representatives of the European powers will be needed to set a going any local government, and to watch over it during the years of its childhood. And there is another reflection of some political consequence which forces itself strongly upon one who gazes over the majestic avenue of the Bosphorus, with the steamers and caiques plying across it. It is this. The two sides of this avenue must obey the same government. The notion of treating these two shores differently, because we call one of them Europe and the other Asia, is idle and impracticable. A strait so narrow as this is really, what Homer calls the Hellespont, a river; and rivers, so far from being, like mountain ranges, natural boundaries, link peoples together, and form the most powerful ties of social and commercial intercourse. You might as well have Liverpool in the hands of one sovereign and Birkenhead of another, as give Constantinople to a Greek or Armenian government, while leaving Scutari and Chalcedon to the sultan. Fancy custom-houses erected all along both shores, and every vessel visited, every passenger examined when he landed! Fancy a state of war, and hostile batteries firing across this mile or so of water, and destroying both cities at once!

Constantinople is not only a city that belongs to the world; it is in a way itself a miniature of the world. It is not so much a city as an immense *caravanserai*, which belongs to nobody, but within whose walls everybody encamps, drawn by business or by pleasure, but forming no permanent ties, and not calling himself a citizen. It has three distinct histories — Greek, Roman, and Turkish. It is the product of a host of converging influences — influences some of which are still at work, making it different every year from what it was before. Religion, and all those customs which issue from religion, come to it from Arabia; civilization from Rome and the West; both are mingled in the dress of the people and the buildings where they live and worship. Races, manners, languages, even coins, from every part of the East and of Europe here cross one another and interweave themselves like the many-colored threads in the gorgeous fabric of an Eastern loom.

Seeing the misery which Turkish rule has brought upon these countries, it is impossible not to wish for its speedy extinction. Indeed I never met any Frank in the East who did not take the darkest

view of the Turks as a governing caste. Even the fire-eating advocates of "British interests" owned this. They insisted that the maintenance of the independence and integrity of the Ottoman Empire was so essential to ourselves that we must fight for the sultan's government at whatever cost to his unhappy subjects. But they frankly confessed that it was not only a bad government, but an irreclaimable government, which could only be improved by being practically superseded. Premising all this, I am bound in turn to admit that the dominance of Mohammedanism adds infinitely to the rich variety and imaginative interest of the capital. Rome without the pope is a sad falling off from the Rome of twenty years ago, and Constantinople without the sultan and all that the sultan implies will be a very different and a far less picturesque place, for it will want many of those contrasts which now strike so powerfully on the historical sense as well as on the outward eye. He, therefore, who wishes to draw the full enjoyment from this wonderful spot ought to go to it soon, before changes already in progress have had time to complete their vulgarizing work. Already chimney-stacks pollute the air, and the whistle of locomotives is heard; already the flowing robes of the East are vanishing before the monotony of Western broadcloth. Before many years mollahs and softas and dervishes may have slunk away; there may be local rates and boards of works, running long, straight streets through the labyrinth of lanes; a tubular bridge may span the Golden Horn, and lines of warehouses cover the melancholy wilds of Seraglio Point. Even the Turks have, of late years, destroyed much that can never be replaced; and any new master is sure to destroy or "restore" (which is the worst kind of destruction) most of what remains.

The rarest and most subtle charm of a city, as of a landscape or of a human face, is its idiosyncrasy, or (to speak somewhat fancifully) its expression, the indefinable effect it produces on you which makes you feel it to be different from all other cities you have seen before. The peculiarity of Constantinople is that, while no city has so marked a physical character, none has so strangely confusing and indeterminate a social one. It is nothing, because it is everything at once; because it mirrors, like the waters of its Golden Horn, the manners and faces of all the peoples who pass in and out of it. Such a city is a glorious possession, and no one can recall its associations or meditate on its future as he gazes upon it lying spread before him in matchless beauty without a thrill of solemn emotion. And this emotion is heightened, not only by the sense of the contrast, here of all the world most striking, between Mohammedanism and Christianity, and the recollection of the terrible strife which enthroned Islam in the metropolis of the Eastern Church, but also by the knowledge that that strife is still being waged, and that the shores which lie beneath your eye are likely to witness struggles and changes in the future not less momentous than those of the past. It is this, after all, that gives their especial amplitude and grandeur to the associations of Constantinople. It combines that interest of the future which fires the traveller's imagination in America, with that interest of the past which touches him in Italy. Other famous cities have played their part, and the curtain has dropped upon them; empire, and commerce, religion, and letters, and art, have sought new seats. But the city of two continents must remain prosperous and great when St. Petersburg and Berlin may have become even as Augsburg or Toledo, and imperial Rome herself have shrunk to a museum of antiquities.

JAMES BRYCE.

From Blackwood's Magazine.

A RIDE FOR LIFE.

IT was the last day of December 1857 that the regiment of Sikh irregular cavalry with which I served during the munity in India was marching southwards from Meerut towards Futtehghur, in order to effect a junction with a strong force which was advancing in a northwesterly direction from Cawnpore. Our force had reached within ten miles or so of a small town named Bewah, where the old Grand Trunk Road branches off towards Futtehghur. The force under Lord Clyde, with which we were seeking to effect a junction, was known to be within some thirty-five or forty miles of us; but owing to the disturbed state of the country, it had been hitherto impossible to ascertain with any accuracy its precise position. Between eleven and twelve o'clock that night, I was awakened from a sound sleep in my tent by the adjutant of my corps. He told me that I must get up at once, as news had come that a strong party of rebels had advanced to Bewah, and was now probably between our column and the one with which we were wishing to effect a junc-

tion; that there was good reason to believe that the rebels had surprised and cut off a picket of our own regiment, which had been sent out under an officer that morning; and that consequently an order had just been issued that another strong patrol or reconnoitring party was to start off at once, in order to ascertain the truth of these reports, if possible — to find out if any body of the enemy occupied the road in front of us; and to pick up generally what information it could. As I was the next officer for duty, it devolved upon me to take command of the party, which was to consist of about four-and-twenty men. Hastily ordering one of my horses to be saddled, I proceeded to make myself ready for a start. The supposed and also the possible whereabouts of the enemy were pointed out to me on a map of the district, and my instructions were clear and precise. I was to steal along the road to the front as quietly and cautiously as possible; to pick up any men of our own patrol whom I might fall in with; to avoid any engagement with the enemy, and to send or bring back exact information of his strength and position as soon as possible. After carefully loading a double-barrelled pistol which I carried, I proceeded to inspect the men and horses of my party, who were already drawn up in readiness a few yards from my tent. Finding them all satisfactorily equipped, I put myself at their head and we moved silently off. It was a serene, bright, and very cold night, and the moon was shining forth with that intensely clear brilliancy only seen in the tropics, as we passed down the main street of the camp, where the troops were sleeping quietly in their tents ranged on each side, and struck into the road along which our intended route lay. After proceeding for about a mile and a half, we approached the last outposts of the camp, and were sharply challenged by the sentries in succession as we passed. After a few minutes' conversation *en passant* with the infantry officer in command of the picket, I passed on. As I did so, I felt that I might very probably require to have all my wits about me in order to execute the task I was instructed to carry out. After taking all necessary precautions to avoid surprise, I made my men follow each other in single file on each side of the road, where the ground was soft, and where, therefore, the sounds of their horses' footfall was not audible, except at a few yards' distance. Advancing thus cautiously along, I proceeded without seeing or hearing anything to indicate the presence of a rebel force for eight or nine miles. *En route* I passed through a couple of miserable villages, which appeared to be deserted, as there was not a soul to be found in them. Suddenly the native officer of the party which I had thrown out as scouts ahead, rode up to say that two men lay dead on the way about half a mile ahead, and that he had identified them as belonging to our patrol, which had been sent out in the morning, and of which nothing had since been heard. Giving orders to my party to follow on quietly, I galloped forward with the man who had brought the news, towards the spot where the bodies were. Sure enough, there they lay, evidently just as they had fallen. One of them, a fine, powerfully-built Sikh, was stretched full length across the road. He had been partially stripped, and lay in a pool of his own blood, his body covered with gaping sword-wounds, while his sabre, of which he had evidently retained his grip almost to the last, was close to his clenched hand, showing that he had fought desperately with his foes to the end. The other man lay under a tree a few yards off, on the side of the road, and had evidently been killed while trying to escape towards our camp; for he had been shot on the back, and had only one sabre-cut visible on him — viz., right across his throat. All this we could discover by the bright moonlight. One of my men had meanwhile lit a native oil torch (though there was, indeed, but little need of it), and as its glare threw a fitful light over the scene, I laid my hand upon one of the dead men, as it was necessary for me to guess how long it was since they had been killed.

Both men were quite cold, and had therefore been dead some hours. It was now but too evident that our patrol sent out in the morning had been attacked; but what had been the fate of the remainder of the party it was impossible to say. Directing my men to place the dead bodies under a tree by the side of the road, I waited till the main body of the patrol came up. In a few minutes they made their appearance, and on reaching the spot where we were, they busied themselves in scrutinizing, by the help of the bright moonlight, the upturned faces of the two dead men. One trooper, after a short scrutiny, dismounted, and kneeling down close to one of the corpses, made a hurried exclamation, and broke out into frantic protestations of grief upon recognizing his own brother as one of the slain.

I was obliged, in order to silence him, to remind him that it was neither the time nor the place to indulge his grief, but that all he could do was to avenge his death, if he had the chance. He became silent at once, and placing his hand upon his sabre, swore solemnly that if we met any of the rebels they should taste his vengeance — a sentiment warmly re-echoed by the troopers around. Mounting my horse, we again went forward in the same cautious manner as before. For about two miles we proceeded quietly enough, when suddenly the same native officer whom I had before sent on ahead, came galloping back with the news that about half a mile in front of us two more men of our patrol that had been sent out in the morning had been found badly wounded, but still sensible. I again galloped on ahead to the spot where the men were. They were sitting up, supported by the trunk of a tree, one of them so badly wounded as to be almost unconscious. The other man, though weak from loss of blood, was able to speak, and from him I endeavored to get a coherent account of what had occurred. At last, by dint of much cross-questioning and examination, I managed to extract the following facts: M——, the officer who had been sent out in command of the patrol in the morning, had got as far as Bewah without molestation, and had there learnt that the British force under Lord Clyde, which was advancing to meet us from Futtehghur, was still about twenty miles ahead. Being well mounted himself, he had picked out a couple of men to attend him, with the intention, if possible, of reaching the British camp, and so opening up a communication with our column. Before leaving his men in Bewah, he had given strict orders that they were to keep a sharp look-out for themselves, and to keep men patrolling up two or three cross roads that led out of the village. Regarding him and his escort, nothing more had been heard; but as the day worn on, and no sign of any rebels appeared, our Sikh troopers, "mere Asiatics," slackened in their vigilance, the patrols returned, the men dismounted — some of them even unsaddled their horses — and repairing to the *caravansera* of the town, prepared to cook their evening meal. Suddenly, just as it was growing dusk, about five or six o'clock, they were surprised by a band of fugitive rebels from a place called Etawah, who had been that day defeated by another small British force which had been operating in the neighborhood. These rebels, finding a detachment of Sikh troopers in the village, who were evidently taken by surprise, immediately set upon any of them whom they came across. Some of our men hid themselves in the village, and others, jumping on their horses, had, I was assured, made good their escape. Others, like those whom we found on the road *en route*, had been pursued for several miles, and had been killed and wounded in their flight. As to whether any of the rebels still occupied Bewah, the man could give me no information at all.

Finding himself surrounded by the enemy on all sides, he had jumped on his horse barebacked, and fled for his life, and was hotly pursued, overtaken, and left for dead in the road. This was all that could be elicited from him. Telling a man of my party to remain behind with him and his comrade (who was now almost past praying for), and to do the best for him that he could under the circumstances, I set myself for a moment to think. I was somewhat in a dilemma. Did the rebels occupy Bewah or not; and if so what was the strength and composition of their force? It was most important for me to ascertain this, as it was one of the main points which I had been instructed to find out. Again, what had become of M—— and his escort? Had they fallen into the hands of the rebels, or had they made good their way to Lord Clyde's camp? The difficulty was how to ascertain these points without being seen and attacked. After a few moments' consideration, I resolved to go forward with four picked troopers as near as I could to the town, and trust to the chapter of accidents to find out something. I therefore directed the main body of my party to conceal themselves under some trees about half a mile from the town at the side of the road, while I and my four men started off on our mission. Nearer and nearer we approached the little town, expecting every moment to be challenged. At length I halted, and listened anxiously for any of the usual sounds that might betoken the presence of troops in the place. No, not a sound. We therefore advanced confidently on into the town, or rather village, which we found deserted and empty. Indeed the only noise that greeted our ears was the re-echo of our horses' hoofs as we marched through the street. Not an inhabitant to be seen. So far, so good; the enemy was certainly not there.

At length, as I turned a corner in the street, a man started out from under a house-door where he had been crouching, and ran off in front of us, finally turning down a side street. I shouted to him in Hindustani to stop, but he took no heed; and as I urged my horse in pursuit, he disappeared through a gate. Hastily following him, I found myself in a courtyard overlooked by the windows of half-a-dozen houses. Through the chinks of the door of one of these dwellings lights could plainly be discerned. When fairly in the yard, I could not help glancing anxiously around, and feeling how easily I and my four men might be shot down from the upper windows, in the event of there being any of the enemy within. I was, however, determined, if possible, to gain admittance. I therefore dismounted, and beating loudly at the door, demanded to be let in. My men meanwhile had cocked their carbines and were ready for any emergency that might arise. There was no answer at first to my summons, but I could hear through the wooden door a hurried consultation in whispers going on inside, and at length a voice, tremulous with fear, demanded who we were and what was our business. As soon as I said that I was an English officer, the door was opened at once, and I found three men sitting over the embers of a wood fire. I demanded of them who they were, and which of them was the man whom I had seen run into the house. Upon this a respectable-looking native came forward, and assured me he was an *employé* in the intelligence department of the British force under Lord Clyde, and that he had been sent to see if he could gain any news of the whereabouts of the force to which I belonged. In proof of his assertions he produced several official documents, and implored my protection, adding that his reason for running away was that he mistook me and my party for some of the rebel horsemen, who, he said, had sacked the place on their way through a few hours previously. His fears for his personal safety were not altogether without foundation; for on glancing behind me I saw that two of my Sikh troopers, who had followed me into the house, were standing behind me with drawn sabres and eyeing him with great suspicion, and evidently prepared to cut him down at the least sign from me. In truth they were apparently somewhat disappointed at the turn affairs had taken, and at there being no one to kill in expiation of the blood of their own comrades. One of them, indeed, went so far as to remind me that the documents which the man produced might be forged, with various other suggestions of a similar kind. Ordering him to sheathe his sabre, and to hold his tongue, I proceeded to question this native; and I found out from him a good deal that I wanted to know. None of the rebel troops were left in the village, as they had passed through in hot haste in their flight from Etawah, thinking that they were pursued by the cavalry of the British force which had defeated them. (This, however, was not the case.) But of M—— and his escort he had heard nothing, nor did he know of the present whereabouts of the rebel troops. Upon hearing this, I sent back one of my troopers for the rest of my men whom I had left behind; and on their arrival I placed them in the *caravansera* just outside the town, to which was attached a small courtyard with high walls, and with a gate at the back, by which they could beat a retreat back towards our camp in the event of their being hard pressed; and I cautioned the native officer to keep a sharp look-out and to patrol the roads leading to his post. Meanwhile I determined myself to press on in company with two picked men to ascertain, if possible, the precise whereabouts of the enemy's camp, and also, if possible, to find out what had become of M——, about whom I was not at all easy in my mind. I was not, however, without hope that his good luck and his readiness of resource would carry him safely through his daring and perilous ride.

It was now drawing near to four A.M., and the moon, that had previously been so bright, had for some time past been obscured with clouds, so that it was no longer easy to distinguish objects at any distance off. As in a couple of hours or so it would be broad daylight, it was necessary for me to make the most of the darkness that remained, which was of course favorable to our movements. At night I might easily be taken, especially with my escort, for a native horseman; whereas, as soon as it was light, I should have no chance for an instant of being taken for anything else but what I was. Accordingly, I and my escort left the *caravansera*, and, riding forth, we again struck along the Grand Trunk Road in the direction I wished to explore. Sending one of my men ahead, with instructions to keep about three hundred yards in front, and, in the event of his being stopped, to have a plausible story ready, and to endeavor to

pass himself off as a rebel trooper, we proceeded at a brisk trot. We went on in this fashion for about four miles or so without seeing or hearing anything. As I knew from my map that we must shortly come upon a good-sized village, we now slackened our pace, and, on getting within three hundred or four hundred yards of it, I halted under a group of trees at the side of the road, where we were well concealed from observation, and ordered one of my men to enter the village and see what information he could pick up. Meanwhile I and the other trooper who was with me waited where we were. In about twenty minutes or so the man returned, bringing with him a respectable-looking Brahmin whom he had found in the village, and whose house had on the previous evening been sacked by the rebels, and who was therefore naturally anxious to be revenged upon them to the utmost of his power. He informed me that the rebel force of which I was in search was encamped about a mile and a half to the right of the road, on the further side of a thick grove of trees, which concealed them from observation, and that they would stay there at least till noon of the coming day. Furthermore, he volunteered to act as my guide, and to point out to me their exact position, on condition that I would go there while it was yet dark; for if we stole up to them in the morning, we should be almost to a certainty discovered; and, though I might escape by flight, he would assuredly pay the forfeit with his life. As I was fully resolved not to return without precise information, if it could be got, I decided, hazardous as it seemed, to at once accept his offer. I hoped, while it was yet dark, to be able to get close to the enemy's camp, and, having taken up a position where I could see and not be seen, be able to take stock of their strength and numbers as soon as it was light; and when I had learnt all that I wanted to know, to steal away unperceived and carry back the information to my headquarters, which I had left during the night. At any rate, thought I, if the worst comes to the worst, and we are detected, we can ride for our lives. Looking back at my resolve through the vista of years, it seems now, perhaps, that it was a foolhardy undertaking; but I was only twenty at the time, and at that age the spirit of adventure and daring is strong. Looking towards the east, I fancied that I could already detect a faint reddish tinge upon the edge of the horizon, which betokened the coming day. There was consequently no time to be lost. Making a slight detour in order to skirt the village, and as much as possible to avoid observation, we proceeded across the plain, which was here and there dotted with small clumps of tree. *En route* I carried on a whispered conversation with my guide, with the object of finding out as much as possible about the rebel force. He said that in his opinion it consisted of about six hundred infantry, two hundred cavalry, and twelve guns, with some artillerymen. He was positive as to the latter point, for he declared that he had counted the guns as they had passed. We had not gone far before I distinctly heard the busy hum both of men and animals that always goes up from a camp in India; and, looking in the direction whence the noise came, I could see the glare of the camp-fires reflected with a murky light against the sky. Cautiously we walked our horses along, the Brahmin on foot close beside me. All our senses were on the *qui vive*, and I was careful to mark and notice, as far as possible, the bearings of the country and the direction in which we were going,— a precaution on which I had afterwards good reason to congratulate myself. Arrived within three hundred yards or so of the camp, we halted under a thick clump of mango-trees to reconnoitre further. My guide said he must go now and hurry back, while there was yet time, to the village before it was daybreak.

"Yonder, sahib," said he, "is the camp, and you will have a good view of it as soon as it is light. A few yards to your right is a cart-track, which will lead you straight back to the village whence you have come. But," added he, "you are only three, and if they should see you and catch you, you may wash your hands of your life. May God preserve you."

The honest fellow would take no reward, though I pressed money upon him; and as I watched his retreating figure through the gloom, I tried to realize my position. Here was I, with only two of my men, within three or four hundred yards of nearly a thousand bloodthirsty rebels. I did not even know where their sentries were, and they might be within a stone's throw of us for all that we could see. Indeed I was surprised that we had not been challenged long ago. At any rate, for the present, the only thing to be done was to remain where we were till the dawn of day, inasmuch as my present

post was admirably suited to my purpose, which was to see and not be seen. It was a clump of low, leafy trees, in the middle of a high *dhal* field, on slightly higher ground than the camp, and overlooking it. Seated on my horse, as the day gradually broke, I could easily from time to time distinguish from this point of observation groups of rebel soldiers clustered around the numerous camp-fires, whose lurid and fitful glare every now and then brought out in strong relief all surrounding objects. There were the long lines of picketed horses, and the camels sitting down in readiness to be laden, and making the night air resound with their hideous bellowings. There were, moreover, many little signs and tokens with which my campaigning had already familiarized me, and which plainly told me that the rebels contemplated a march as soon as it was day.

Once more did I cautiously examine the caps of my revolver, and also those of a heavy double-barrelled pistol which I carried with me; and having done this, I anxiously awaited the dawn of day, which for the last half-hour had been faintly flushing the eastern horizon. The minutes, however, seemed to drag on like hours, and, like Mazeppa,

> Methought that mist of morning gray,
> Would never dapple into day.

Day, however, came at last, and as gradually it grew lighter and lighter, the critical nature of our position came home to me with startling clearness; a sort of daredevil feeling, however, took possession of me, and made me resolve at all hazards to endeavor to find out that which I wanted to know. As soon as it was light enough to see anything, I drew out my field-glass from its case, and advanced to the edge of the clump of trees under whose shelter we were hid from view, and my eye swept the camp from right to left. At first, owing to the uncertain light, I could not perceive any guns, but at length I managed to see where they were. I could, however, only make out four, and I had strong reasons, from what I had heard, for believing that there were more; judging from the position of those which I could see, I thought that the rest must be hidden by a row of tents at the further end of the camp. This was provoking, for it was about the strength of the rebels in artillery that I had special instructions to gain accurate information. It was, however, high time to be off, as it was impossible that we could remain much longer where we were undetected. For the past quarter of an hour, moreover, my two troopers, though as brave and reckless fellows as any man could wish to have with him, had been growing uneasy, and repeatedly urged me if I had any respect for my own life or theirs to be off while we could. "All right," said I; "I will just go forward to the edge of the field to find out if I can see any guns behind that row of tents, and then we will be off." Saying this, I advanced cautiously, bending my head low down on my horse's neck, and hidden by the tall herbage and a row of bushes, to the edge of the field where we were. I was right in my supposition. I could see now behind the row of tents, and there were the guns all packed in a row — twelve in number. This accorded exactly with the information that I had received, and was all that I wanted to know. The only thing that remained to be done was to get away unperceived as quickly as possible. I had just put my field-glass in my holster and was preparing to walk my horse cautiously back to the clump of trees, in order to make a start with my men from there. At this moment my horse, seeing and hearing many of his *confrères* in the camp, suddenly pricked his ears, and gave a loud and long neigh, as a friendly intimation of his presence. He was instantly answered by half-a-dozen equine throats in the rebel camp. Aroused by the noise, a black-bearded native, who had evidently been sleeping rolled up in his blankets under the shelter of the bushes close to me, started up about twenty yards off, and gazed at me for a moment in blank astonishment. Instinctively I drew my pistol from my waist-belt, in which I wore it, and levelled it at him. Recollecting, however, our critical position, I hesitated to fire, as I foresaw that the report, close as we were to the rebel camp, would inevitably betray us to the enemy. I tried, therefore, to terrify him into submission. Accordingly I called out to him in a low voice in Hindustani to come to me at once or I would shoot him. Instead of obeying, the man, evidently a rebel sepoy, took advantage of my momentary hesitation, and recovering from his first astonishment, turned round and fled like a hare in the direction of the camp, shouting with all his might and main as he did so. Our position was too critical to try and stop him, and I saw at once that it was high time to make good our escape while we could. My two men,

whom I had left concealed under the clump of trees, had grasped the situation at once, when they saw the man running, and rode up to me, exclaiming, "We must ride for our lives, sahib, for that man will bring the whole camp upon us." "Yes," said I, hastily, "we will ride for the village; and if hard pressed, we will separate, and make the best of our way to the main body of the picket." So saying, we put spurs to our horses, and rode rapidly for the village whence we had come. We had not gone more than eighty yards or so, when three rebel horsemen dashed out from a clump of trees upon our left front, and, urging their horses to their utmost speed, rode down upon us with the evident intention of cutting off our retreat. Here is a pretty mess, thought I, as I drew my sword hastily from my scabbard. I was in front, my two men were close behind. On came our foes at full speed, and as the foremost horseman neared me I thought at first of engaging him with my sword. Just as he came within three or four yards of me, the thought flashed across me that I could not afford to let him detain me, as time was everything to us, and that I might perhaps be able to make short work of him with my pistol. Quick as thought I dropped my sword, letting it hang by the knot from my wrist, and snatching out my pistol from my holster, I levelled it full at my assailant, a big, black-bearded Mohammedan, and fired as I passed him at about two yards' distance. The ball hit him fair in the side, and for a second he reeled in his saddle, then dropping his uplifted sword-arm, he tumbled headlong forward to the ground, and his riderless horse galloped past just behind me. A thrill of exultation bounded through me as I saw him fall. Meanwhile one of my troopers had engaged another of our assailants. The rebel was a brave fellow enough, but he was no match for the sinewy Sikh behind me, who, after a few rapid exchanges of blows and parries, managed to get inside his guard, and gave him such a slash across the face with his sharp sabre, that he fell, blinded with blood, from his saddle. The third of our assailants, who had cautiously ridden some yards in rear, seeing his two companions *hors de combat*, took himself off to the camp, and we were left free for a few moments to continue our way unmolested.

All this, though it takes some time to relate, happened in a few moments or so. I knew it would not be long ere we should be hotly pursued; for as we rattled our horses over the wide plain I could hear a tremendous uproar in the rebel camp, which was by this time thoroughly alarmed. Casting a hurried look behind me, I could see that my worst anticipations were realized. Already a dozen or two of the rebels had leaped upon their horses, and, sabre in hand, with wild shouts and gestures, were urging them on at their utmost speed as they strove to gain upon us. A ride for dear life, thought I, as I caught sight of them streaming after us. Faster and faster yet I led the way, over rough ground and smooth, looking well to the ground in front (as a fall or a stumble of one of our horses might have proved fatal to us), and my two men kept close beside me. Our horses, however, had been out for hours, while those of our pursuers were quite fresh, and we had not gone above a mile in this fashion when I began to fancy that our pursuers were gaining upon us. Before another half-mile had been passed, this idea of mine ripened into a certainty. Three or four of our pursuers, at any rate, were gaining rapidly upon us, and were two or three hundred yards in advance of the rest. If only they succeeded in stopping us, in order to fight with them, I saw that the whole pack would be upon us, and we should all be cut to pieces to a certainty. They also could afford, owing to their numbers, not to spare their horses, while, if our horses were once pumped, nothing could save us. Nearer and nearer they gained upon us, and their shouts of exultation and hatred were borne to my ears as they triumphantly fancied themselves sure of their prey. "We must separate," said I quickly. "Ride off to the right, and I will go straight on," as I thought that by thus separating we might perhaps divert our pursuers, and one or other of us would have a chance of getting off. They immediately turned off to the right, though still heading for the village. This *ruse* was fortunate enough for my men, but it did not avail much for me. Casting another glance behind me, I saw, to my dismay, that our enemies did not appear to trouble themselves at all about my companions, but all four of them continued to ride, without swerving, after me; for it was, as I might have anticipated, the English officer whom they had marked for their prey, and whom they were thirsting to kill. Closer and closer they creep up to me; but I now urge my horse on, and manage to forge a little ahead. At this rate, thought I, they will soon pump their horses, if I can only hold on. But they

are riding at a headlong pace, and I am forced to let out my horse also to his utmost speed in order to keep ahead of them. Already the foremost of the four is less than a hundred yards behind me, the other three close behind him, while there are a dozen more a short distance behind them. Even now, though twenty long years have passed since that day, it makes my blood jump to think of it. For a moment my heart dies within me, as I feel that the game is up; and I set my teeth and determine to die hard — to sell my life as dearly as I can, and fight it out to the last.

In the excitement of the ride I naturally had not looked far before me; but now I suddenly saw, just thirty or forty yards ahead of me, the dike full of water, which we had passed over in the early morning on our way to reconnoitre the camp. A thrill of hope and joy passed through me. It was a very fair jump, but nothing out of the way for a good horse; and I knew that mine, who was a good fencer, would clear it, and that there was a very good chance that the horses of my pursuers would not, as natives seldom practise their horses at jumping. They seemed hardly more than fifty or sixty yards off; and had it not been for the hope of placing the dike between myself and them, I felt that in another few moments, if they got much nearer, I should have been forced to turn at bay and fight it out to the last. Four to one, however, was hopeless odds, and with a ray of hope I rode straight at the dike. Even then, as I neared it, the thought flashed with a terrible misgiving through my brain that my horse might perhaps refuse it, and that in that case my pursuers would be upon me in a moment. Deadly as is the peril in which I am, I have yet the coolness and presence of mind to steady my horse somewhat as he comes up to the leap, and for a moment to slacken his speed. My gallant horse, a big, powerful Australian gelding, sets his ears as he sees the leap in front of him; and when, at the critical moment, I dig my spurs into him with all the energy of desperation, he answers to the call, takes off well, and lands clearly, despite a somewhat rotten bank on the other side. (Assuredly at that moment I felt but little tempted to agree with the Psalmist that a horse was a vain thing for a man to trust to.) My horse had scarcely regained his stride when the four foremost of my foes, who had pressed me so hard, were on the brink of the dike.

Scarcely daring to hope that I may escape, I look anxiously round to see if they too get over. Two out of the four are slightly in advance, and they ride straight at the dike. To my intense delight their horses both refuse, and will have nothing to say to the jump; while the other two do not attempt it, but ride along the bank in order to find an easier place to cross. As I widen every second the distance between me and my pursuers, and my spirits thrill with exultation at my renewed prospect of escape, I am unable to restrain a shout of defiance at my baffled foes, which is immediately answered by an angry carbine-shot from one of them, that, of course, does me no harm.

God grant that I may have a few moments more, and I shall be comparatively safe. Again I head straight for the village, which in the headlong race I had ridden a little wide of, and which was now but a short half-mile distant. Once I am safe through the village, I ought to fall in with some of my picket, to whom I had given orders that as soon as it was daybreak they should patrol the road in that direction. Once more do I look back. Full twenty of my foes are now on the further brink, but, as far as I can make out, not one of them is over as yet. Another two hundred yards are passed when I see that half-a-dozen of them have at length got over, and are following me up as before with frantic haste, and doing their best to make up the ground they have lost. On they come, but I have got such a start that they do not gain on me much before I reach the village, and am lost for the time to their view.

As I rattle down the main street of the village, which was surrounded by a high wall, a few of the villagers, just roused from their slumbers, come out to the doors of their houses and gaze curiously at me as I pass. As I near the old arched gate at the further end, I hear a shout behind me, and on looking round, I see my two men, from whom I had parted a few minutes previously, coming up a by-street. They had taken advantage of our pursuers having gone off in pursuit of me alone, to make good their flight to the village, and thinking themselves comparatively secure, were taking a pull at their horses. They were overjoyed to see me, as they had given me up for lost. There was, however, as I told them, no time to talk. Our horses were all of them pretty well pumped, and I knew well enough that our pursuers were hard upon our track, and that the villagers would be

sure to point out to them the route we had taken.

As we pass under the arched gateway, I see that there are an old pair of folding gates, evidently but seldom used, belonging to it. A happy thought strikes me, that if we could manage to shut the gates, and fasten them somehow or other, we might yet delay our pursuers a few minutes, and gain a little breathing-time for our horses. No sooner thought of than we attempt to put it into execution. I ordered one of my troopers to dismount, and while I held his panting horse, he attempted to swing the old gates (which were made of massive bars of wood with intervals of two or three inches apart) upon their hinges. One of them yielded readily enough to his efforts, but the other resisted all his strength. It was evident that the gates had not been shut for a long time. In vain did he pull and push, it would not budge an inch. There were none of the villagers standing by to help, and seeing that he could not manage it alone, I bade the other man dismount in order to help him. At last by their joint efforts they succeeded in moving the stubborn gate, and little by little were getting it to close. Every moment did I expect to hear the horses of our pursuers rattle down the street. Nor had we long to wait ere they were upon us. Just as the gates were closed, and before we had time to think about getting them fastened, seven or eight rebels appeared in view coming down the street. They were evidently thrown off the scent, and drew up to question the villagers as to our whereabouts. While doing so, one of them caught sight of me through the gate as I held one of my men's horses in the road. An instant shout told me I was seen, as with one impulse they put their horses to a gallop and rode towards us. They were only about five hundred yards from us. "Quick! quick!" said I; "your carbines, are they loaded?" "Here is mine," said one, as he picked it up from the ground where he had laid it, in case he wanted it. "Wait till they get quite close," said I, "and then shoot the foremost horse. You can make sure of him. We will stick by you to the last." The other trooper meanwhile had remounted his horse, so that we only awaited the effect of the shot to be off. In another moment they were almost upon us. "Steady," said I, as the man stood with carbine levelled and resting between the bars of the gates; "aim low." As I spoke, his shot re-echoed through the gateway, filling it for a moment with smoke. Its success exceeded my most sanguine expectations. I could just see that the foremost horse, badly wounded, had fallen headlong forward with his rider to the ground. Wedged in, as they were, in the narrow roadway, and going at a headlong pace, the two horses immediately behind fell over him, and, as far as I recollect, there seemed to me two or three men and horses struggling on the ground at once. But the rest of them, four or five in number, recovering from their confusion, were already at the gates, and, leaning forward, were tugging at them in order to open them, so as to get through. We could not be off for a moment, as we had to wait while the man who had fired had remounted his horse, which was excited and would not stand still. As he was scrambling into his saddle, I saw that our foes had succeeded in wrenching open the gate just sufficiently to get through, one at a time. The foremost of them was already half through, and the rest would have speedily followed, as with shouts and execrations, in their impatience to get at us, they were urging him on from behind. Seeing the necessity of giving them another check, I pulled back my horse just as we were starting, and riding up to within three yards or so of the gate, pistol in hand, I aimed it full at the foremost rebel and fired. I can recollect seeing his horse rear wildly up, but I waited not to see the effect of my shot, for we all three sped away at our best pace along the side of the road. Looking back after a time, I saw we were pursued no more. Whether it was that they found we were not to be molested with impunity, and were discouraged by the losses which they had suffered; or whether they despaired of catching us; or in consequence of their having started after us in such a hurry they had not brought any more ammunition with them, and therefore gave up the contest as unequal, I cannot say. We had not gone a couple of miles further before we fell in with a patrol of my picket, which, I was informed, was still at the *caravansera* awaiting my return. Being anxious to give our horses as much breathing-time as possible after their severe exertions, I proceeded at a walk in the direction of the picket, taking care to keep a sharp lookout in rear, in case we were again pursued. Arrived at the *caravansera*, I found the remainder of my men duly on the alert and ready to receive me. After a short halt, we began to retrace our steps towards

our camp, which we had left the night before. After we had gone about three miles or so we fell in with the advanced guard of our own force, which had already struck its camp and marched onwards that morning. Upon reaching the main body of the force I made my report to the general in command (who, with his staff, was riding at the head of the column), and had the satisfaction of receiving a good deal of praise for the information which I had brought, and warm congratulations upon my narrow escape.*

There is no need further to continue the tale. Suffice it to say that the rebels, whose camp I had discovered, were at once followed up; and though they had taken timely warning, and had already decamped, yet they were pursued for some miles; their guns were all captured, and their whole force scattered to the winds. When our force passed through the village referred to in the foregoing narrative, we found the horse which my trooper had shot in the gateway, and the man whom I had fired at, both lying dead upon the spot where they had fallen.

Reader, my tale of "a ride for life" is told. Certainly I and the two who were with me may be fairly said to have taken our lives in our hands and only to have escaped by the skin of our teeth.

* It may here be stated that M——, the officer in search of whom I had been sent out, rejoined the column in safety some hours later on the same day.

From Nature.

LIQUEFACTION OF OXYGEN.

THE number of the permanent gases is rapidly diminishing. We have had occasion recently to refer to M. Cailletet's successful attempts to compress nitric oxide, N_2O_2, methyl hydride, CH_4, and acetylene, C_2H_2 to the liquid form. The list of non-compressible gases was thus reduced to three, viz., hydrogen, nitrogen, and oxygen. Within the past week M. Raoul Pictet has succeeded in obtaining the last-mentioned gas in the liquid state, an event which is certainly one of the most novel and interesting in the chemical progress of the expiring year.

The *Journal de Genève* of December 23 gives the following account of the experiments: —

One of the most interesting physical experiments of our time has just been made at Geneva with rare success in the laboratory of the Society for the Manufacture of Physical Instruments. M. Raoul Pictet has succeeded in obtaining, by means of ingeniously combined apparatus, the liquefaction of oxygen gas. The following is the process by which the curious result was obtained: —

By a double circulation of sulphurous acid and carbonic acid, the latter gas is liquefied at a temperature of 65° of cold, under a pressure of from four to six atmospheres. The liquefied carbonic acid is conducted into a tube four metres long; two combined pumps produce a barometric vacuum over the acid which is solidified in consequence of the difference of pressure. Into the interior of this first tube containing solidified carbonic acid is passed a tube of a slightly less diameter, in which circulates a current of oxygen produced in a generator containing chlorate of potash, and the form of which is that of a large shell thick enough to prevent all danger of explosion. The pressure may thus be carried to eight hundred atmospheres.

Yesterday morning (December 22), all the apparatus being arranged as described, and under a pressure which did not exceed three hundred atmospheres, a liquid jet of oxygen issued from the extremity of the tube, at the moment when this compressed and refrigerated gas passed from that high pressure to the pressure of the atmosphere.

The great scientific interest of this experiment is that it demonstrates experimentally the truth of the mechanical theory of heat, by establishing that all gases are vapors capable of passing through the three states — solid, liquid, and gaseous. Only twenty days ago M. Cailletet, as we have said, succeeded in liquefying the bioxide of nitrogen, under a pressure of one hundred and forty-six atmospheres, and at a temperature of 11° of cold. After the experiment of M. Raoul Pictet there remain not more than two elemental gases which have hitherto escaped the attempt at liquefaction — hydrogen and nitrogen.

The experiment above described was to be repeated on Monday and subsequent days, with some slight changes in the processes and the arrangement of the apparatus.

PUBLISHED EVERY SATURDAY BY
LITTELL & GAY, BOSTON.

TERMS OF SUBSCRIPTION.

For EIGHT DOLLARS, *remitted directly to the Publishers*, the LIVING AGE will be punctually forwarded for a year, *free of postage*.

An extra copy of THE LIVING AGE is sent gratis to any one getting up a club of Five New Subscribers.

Remittances should be made by bank draft or check, or by post-office money-order, if possible. If neither of these can be procured, the money should be sent in a registered letter. All postmasters are obliged to register letters when requested to do so. Drafts, checks and money-orders should be made payable to the order of LITTELL & GAY.

Single Numbers of THE LIVING AGE, 18 cents.

HOW LONG?

IF on my grave the summer grass were growing,
Or heedless winter winds across it blowing,
Through joyous June, or desolate December,
How long, sweetheart, how long would you remember —
How long, dear love, how long?

For brightest eyes would open to the summer,
And sweetest smiles would greet the sweet new-comer,
And on young lips grow kisses for the taking,
When all the summer buds to bloom are breaking —
How long, dear love, how long?

To the dim land where sad-eyed ghosts walk only,
Where lips are cold, and waiting hearts are lonely,
I would not call you from your youth's warm blisses,
Fill up your glass and crown it with new kisses —
How long, dear love, how long?

Too gay in June you might be to regret me,
And living lips might woo you to forget me;
But ah, sweetheart, I think you would remember
When winds were weary in your life's December —
So long, dear love, so long.

LOUISE CHANDLER MOULTON.

ONE DREAD.

No depth, dear love, for thee is too profound,
There is no farthest height thou may'st not dare,
Nor shall thy wings fail in the upper air;
In funeral robes and wreaths my past lies wound;
No ancient strain assails me with its sound
Hearing thy voice; no former joy seems fair,
Since now one only thing could bring despair,
One grief, like compassing seas, my life surround,
One only terror in my way be met,
One great eclipse change my glad day to night,
One phantom only turn from red to white
The lips whereon thy lips have once been set:
Thou knowest well, dear love, what that must be —
The dread of some dark day unshared by thee.

LOUISE CHANDLER MOULTON.

"ES STEHEN UNBEWEGLICH."

IMMOVABLE, unchanging,
The stars stand in the skies,
Upon each other gazing
With sad and loving eyes.

They speak throughout the ages
A speech so rich, so grand;
But none of all the sages
That speech can understand.

But I that speech have mastered,
Can all its meanings trace;
What for a grammar served me
Was my belovèd's face.

Blackwood's Magazine. HEINE.

"WAS WILL DIE EINSAME THRANE?"

WHAT'S this? A tear, one only?
It blurs and troubles my gaze.
In my eye it has hung and lingered
A relic of olden days.

It had many shining sisters,
But away they all have passed —
Passed with my torments and raptures
In night on the driving blast.

Away, too, have passed like a vapor
Those deep-blue starlets twain,
That smiled those raptures and torments
Into my heart and brain.

Like a breath my very love, too,
Has faded and flown, alas!
So now, old, lonely tear-drop,
'Tis time thou too shouldst pass!

Blackwood's Magazine. HEINE.

"DU BIST WIE EINE BLUME."

THOU art even as a flower is,
So gentle, and pure, and fair;
I gaze on thee, and sadness
Comes over my heart unaware.

I feel as though I should lay, sweet,
My hands on thy head, with a prayer
That God may keep thee alway, sweet,
As gentle, and pure, and fair!

Blackwood's Magazine. HEINE.

From The Edinburgh Review.

DR. SCHLIEMANN'S EXPLORATION OF MYCENÆ.*

IN the ancient hippodrome at Constantinople, better known to tourists as the Atmeidan, still stands a relic saved from the wreck of precious offerings once stored up in the temple of Apollo at Delphi. After the Persian war the victors at Platæa dedicated as a thank-offering to the Delphic Apollo a gold tripod mounted on a bronze pillar composed of three intertwined serpents. The gold tripod has long since disappeared in the crucible, but the bronze pillar was transferred by Constantine the Great from Delphi to his new capital, and has survived to our times. The three heads of the serpents — an attractive mark for Moslem iconoclasts — have been broken off, one by one, since the time of Mahomet II.; but on the coils of the triple snake may still be read the original dedicatory inscription graven on the bronze about the 76th Olympiad (476–3 B.C). It contains the names of those Greek states which took part in the battle of Platæa, and among these names we find that of the Mycenæans, whose city, once the seat of a mighty dynasty, had at the time of the Persian war shrunk into comparative insignificance, overshadowed by the growing power of its jealous neighbor Argos. When the Greeks of the Peloponnese first collected an army to defend Thermopylæ, the Mycenæans refused to form part of the Argive contingent, and preferred associating their little band with the Lacedæmonians. They contributed eighty men to the heroic defence of Thermopylæ, and, together with their neighbors from Tiryns, mustered four hundred strong at Platæa; but their refusal to serve under the Argive banner probably contributed to hasten the catastrophe by which their city was soon after destroyed. Mycenæ was taken by the Argives B.C. 468, and never again reappears in history as an independent state.

That a city only capable of sending so small a contingent to Thermopylæ and Platæa should have had such pretensions to independence as to provoke the jealousy of a powerful state like Argos may be accounted for if we consider the strength of Mycenæ as a military position at the time of the Persian war. Its citadel was built on an isolated rock situated, as Homer truly describes it, "in a recess" at the foot of hills which bound Argolis on the north. While its distance from the coast protected it from sudden inroads of pirates, its position near the Argive frontier gave it the command of the roads leading to Corinth and to the cities of Arcadia. The steep rock of the Akropolis had been rendered almost impregnable by fortifications which, though executed in that remote period, when the myth is the substitute for history, still excite our wonder and admiration by the massive solidity of their structure and the skill with which they are designed. Independently of its military importance, the fortress of Mycenæ had traditions which could well vie with those of its proud and implacable neighbor. If Argos could boast of its long line of kings, beginning from Phoroneus, son of the river-god Inachos, its legend of Danaos, Akrisios, and Perseus, Mycenæ could refer with just pride to that Pelopid dynasty which, under Agamemnon, "ruled over many islands and all Argos," and whose king commanded the mighty host with which united Hellas besieged and captured Troy. If we look back through the long series of Argive myths which record the successive changes of dynasty from Phoroneus to Perseus, and from the Perseidæ to the Atreidæ, we find from a very early period traces of that antagonism between Argos and Mycenæ which lasted down into historic times. Both were strong fortresses, overlooking the fertile plain which extends from the mountains to the coast, and the possessor of either would naturally appropriate as much of this plain as he could wrest from his neighbors. A third fortress which plays a part in this legendary history is Tiryns, a place of great strength, which must have served to protect Argolis from invaders landing at Nauplia, and which

at times, according to the myths, was ruled by an independent prince. Now, if the dynasty of Atreidæ had the extended empire which Homer ascribes to it in the time of Agamemnon, it is to be presumed that the rulers of Argos and Tiryns and the other fortresses in Argolis acknowledged as their suzerain the king who ruled in Mycenæ. This wide-extended sway of the Pelopidæ which Homer so emphatically dwells upon, though it rested only on tradition, and was not supported by what we should call historical evidence, was to the Greek mind a real fact, which even the most sceptical of their historians never ventured to dispute. In their eyes Agamemnon was not, as one school of modern critics regard him, a mere shadow projected on the blank background of an unknown past, and of which we shall never grasp the substance. This *magni nominis umbra* to the ancients suggested a real personality — a king whose disastrous fate, coming so soon after his triumphant return from Troy, served in after ages as the favorite theme of epic and tragic poetry; his memory, embalmed in the immortal verse of Æschylus and his brother dramatists, still lives on, and it is not without violence to deep-rooted associations that an old-fashioned scholar can train himself to think of Agamemnon as merely a name representing a dynasty, still less as one of the *dramatis personæ* in a solar myth.

How much of the story of Agamemnon is really to be accepted as fact, and by what test we may discriminate between that which is merely plausible fiction and that residuum of true history which can be detected under a mythic disguise in this and other Greek legends, are problems as yet unsolved, notwithstanding the immense amount of erudition and subtle criticism which has been expended on them. At the present stage of the enquiry we may venture to assert that a solution of such problems is not to be found if we confine our researches to Greek and Roman literature. There remains the question, Is there any evidence other than that contained in classical literature which is worthy of consideration in this case? The recent discoveries on the site of Mycenæ have led many students of history to believe that such evidence is at length obtained, and we now propose to examine more closely the grounds for such a belief.

Before discussing the discoveries of Dr. Schliemann at Mycenæ, it may be well to notice the remains on that site which have been so often visited and described by travellers during the present century. Thucydides speaks of the remains at Mycenæ in his time as insignificant in proportion to the former greatness of the royal residence of the Atreidæ. Strabo, who seems never to have personally visited the interior of the Peloponnese, and to whom archæological information was only of secondary importance, states that in his day, at the close of the first century B.C., not a vestige was to be found on the site of this once famous city. About a century and a half after Strabo wrote, that diligent topographer Pausanias visited Mycenæ, and noticed the walls round the citadel, the great gateway leading into it, and the lions surmounting the gateway. These walls, he adds, were the work of the Cyclopes, who built the walls of Tiryns for Prœtus. He also mentions certain subterranean buildings in which Atreus and his sons deposited their treasure. The travellers who visited Mycenæ early in the present century had no difficulty in recognizing the ruins described by Pausanias. The Akropolis occupies a rocky height which projects from the foot of the mountain behind it, in the form of an irregular triangle of which the longest side lies south-east and north-west. The south flank of this natural fortress is protected by a deep gorge, through which winds the bed of a torrent usually dry in summer. On the north side is a glen stretching east and west. Between these two ravines the ground slopes down to the plain in terraces, through which may still be traced the line of an ancient way, leading from the principal gate of the Akropolis to a bridge over the torrent, the foundations of which may still be seen. At intervals on either side of this road are the remains of five of the buildings called by Pausanias treasuries; and here, extending over the space of about a square mile to the west, south-west, and east of the Akropolis, must have stood the lower city, connected

with the Akropolis by a wall, some traces of which may still be seen near the great gateway.

The walls of the Akropolis are said to be more perfect than those of any fortress in Greece, and range in height from thirteen to thirty-five feet, with an average thickness of sixteen feet. Originally they were probably much higher. The area which they enclose is rather more than one thousand feet in length. They exhibit several kinds of masonry, which Dr. Schliemann classifies in three periods. The masonry of the first period is composed of large unwrought blocks, the interstices being closed by smaller stones wedged in. This construction is identical with that of the walls at Tiryns, except that the blocks are smaller; and this is certainly what the ancients meant by Cyclopean masonry. In the second period the walls are built of polygons with hewn joints, so well fitted as to seem one solid face of wall. This is the kind of masonry of which so many examples may be seen in Greece and Etruria. In the third kind of masonry at Mycenæ blocks almost quadrangular are arranged in nearly parallel courses, but their joints are not always vertical. This masonry is used in the walls on either side of the great gateway. Near the north-east corner a gallery has been made in the thickness of the wall, and extends for rather more than sixteen feet. At Tiryns we find such galleries on a much larger scale. One of these Dr. Schliemann states to be ninety feet long and nearly eight feet broad. In its external wall it has six recesses or window-openings, with triangular-headed roofs formed of approaching stones. These galleries evidently served as covered ways leading from one guard-room or tower to another; while the openings may be regarded as embrasures where archers might be stationed. Such passages are, we believe, unknown in later Greek fortification; indeed, the average thickness of the walls would hardly admit of them. The great gateway in the north-west corner of the citadel, usually known as the Lions' Gate, stands at right angles to the adjacent wall, and is approached by a passage fifty feet long and thirty feet wide, formed by that wall and another running parallel to it, which, according to Dr. Schliemann, forms one side of a large square tower erected as a flanking defence. The gateway is nearly eleven feet high, with a width of ten feet below. The lintel is a single block fifteen feet long and eight feet broad. Over it is a triangular gap in the masonry, for the insertion of the slab on which the lions are sculptured. This slab is ten feet high, twelve feet long at the base, and two feet thick. The lions stand, like heraldic supporters, on either side of a column which rests on a base, thought by some to be an altar. The style of sculpture of these lions differs as completely from all other remains of archaic Greek sculpture as the column between them differs in type from the earliest specimens of Doric or Ionic architecture.

On the lower ground lying to the south-west of the Akropolis are the so-called treasuries. The largest of these is the building commonly called the Treasury of Atreus. The interior is a chamber fifty feet high and of equal diameter, resembling in form a beehive. It is built of well-wrought rectangular blocks of breccia, laid in horizontal courses which approach gradually till they converge in the apex. This kind of vaulting, formed by approaching horizontal courses, may be called Egyptian, as the earliest example of it is found in a gallery in the interior of the Great Pyramid. Such a vault would of course owe its stability to vertical pressure, while the lateral thrust would be very much less than in any variety of the keystone arch, and at Mycenæ any such lateral pressure was amply provided for by enormous masses of stone piled against the outer face of the courses of the masonry. Over these rude outside buttresses the earth was heaped to the level of the apex of the chamber, so that it was completely subterraneous. The blocks of the lower courses are one foot ten inches high and from four to seven feet long. As the courses ascend, the blocks of which they are built gradually diminish in size. From the fourth course upwards these blocks are severally pierced with two holes bored in the breccia for the reception of bronze nails, several of which have been found entire. They have broad flat heads, and it is very

generally agreed that they originally served to attach to the walls the plates of copper with which we may suppose the chamber to have been once lined.*

A *dromos*, or way, upwards of twenty feet wide and flanked by massive parallel walls of the same masonry as the chamber, leads up to the doorway, which is eighteen feet high, with a width of nine feet two inches at the bottom and rather less at the top. The lintel is formed of two immense slabs, of which the inner one measures three feet nine inches in thickness, with a breadth of seventeen feet, and a length of twenty-nine feet on its upper and twenty-seven and one-half feet on its lower surface. This enormous block, which is perfectly wrought and polished, is computed approximately to weigh nearly sixty-seven tons. Above the lintel is a triangular niche, each side of which measures ten feet, and which was probably filled up with a sculptured slab.

It may be inferred from various holes pierced in the stones of the doorway that the entrance, like the interior of this building, was anciently decorated. The side of the doorway was originally ornamented with semi-columns, fragments of which were still lying about *in situ* when Colonel Leake visited Mycenæ at the beginning of this century. He describes them as having a base and capital not unlike the Tuscan order in profile, but enriched with a very elegant ornament, chiefly zigzag, sculptured in relief, which was continued in vertical compartments over the whole shaft. Other fragments which have been found at Mycenæ indicate that the doorway was ornamented with strips of stone, on which are sculptured in low relief spiral and other ornaments. The material of these fragments was green, red, or yellow marble. They are engraved in the fifth volume of Stuart's "Athens," where a restoration of the doorway from these data by Professor Donaldson is also given.

As has been often remarked, the character of these ornaments resembles nothing in later Greek architecture; indeed, so strange is their aspect, that the authors of the French Expédition Scientifique were inclined to believe that the fragments collected by travellers were of Byzantine origin. The three other subterranean buildings at Mycenæ are of smaller dimensions and are not so well preserved as the so-called Treasury of Atreus.

* In the ruins of the vast chamber at Orchomenos, which Pausanias calls the Treasury of Minyas, Dr. Schliemann found blocks similarly pierced, and here and there remains of the bronze nails (p. 45).

We have now indicated the peculiar features of the site of Mycenæ as it appeared to travellers before the recent discoveries were made by Dr. Schliemann. These features have been described again and again by Leake, Dodwell, Gell, Mure, E. Curtius, and other authorities, who nearly all agree in referring the ruins of Mycenæ and Tiryns to the same period of remote antiquity to which, as we have already stated, not only Pausanias in the second century A.D., but Pindar and the tragedians, attributed them. The extent of the fortifications, the peculiar character of the masonry, the huge blocks employed at Tiryns and in the Treasury of Atreus, the transport and fixing of which must have been a very difficult and costly operation, the style of the architectural ornaments over the Lions' Gate and at the entrance to the Treasury of Atreus, so estranged from the associations of later Hellenic art, all predisposed the minds of modern travellers and archæologists to accept generally the tradition of antiquity that at Mycenæ and Tiryns we have remains of the heroic age. There is no spot in Greece where the *admonitus loci* has acted more strongly on the imagination than Mycenæ. The traveller, as he comes over the mountain pass from the interior, looks down on the ancient kingdom of the Atreidæ, as Orestes is invited to look down on it in the "Electra" of Sophocles; when again he stands within the Akropolis, and from its dismantled walls looks out on the plain of Argolis below him, with Tiryns and Nauplia and the sea in the distance, and the Heraion and Argos on either side, he is reminded of that ancient watchman who tells us at the opening of the "Agamemnon" how long he had strained his weary eyes looking out for the beacon light which was to tell of the capture of Troy. But it is in the Gateway of the Lions that these associations crowd on the mind with the greatest intensity. To the believer in the tale of Troy the very stones of this threshold seem to give back a faint echo of that far-off day when Agamemnon, in the first flush of dear-bought victory, entered that fatal gateway unheeding the warning voice of Cassandra in his ear.

Thus it was that most of the travellers who visited Mycenæ in the early part of this century gazed on its remains with a reverent faith, something like that with which pilgrims to some time-hallowed shrine regard the jealously guarded relics which they are at length permitted to behold. But, if the mere aspect of so famous

a site suggested so much to the archæologist, what might not be expected from its systematic exploration? From the time of Gell and Dodwell to our own generation, the excavation of Mycenæ has been earnestly desired by those who have most studied the antiquities and topography of Greece. We shall not now stop to enquire why so obvious an enterprise was not undertaken long ago, either by the Greek government or by some private society; our business here is to show how much has been accomplished by the untiring enthusiasm and liberality of one man, aided by his indefatigable wife, whose achievement entitles him to the gratitude not of Greece merely, but of all civilized races so long as the human past shall have any interest for mankind.

In the year 1874 Dr. Schliemann first made some tentative diggings within the Akropolis at Mycenæ. The results were encouraging; but it was not till August 1876, that, having obtained the necessary permission from the Greek government, he began the work of exploration on an adequate scale. The three objects to which he first addressed himself were the clearing out the treasury nearest the Lions' Gate, the removal of the ruins which blocked up the gate itself, and the digging a deep trench from north to south across the lower part of the Akropolis, where he had already sunk shafts in 1874. This part of the citadel falls with a considerable slope from the highest part of the Akropolis to the north-east, and here Dr. Schliemann encountered a great depth of soil, partly due to the accumulation of detritus from the rocky ground above. In the upper part of this soil various specimens of archaic pottery and implements, and other antiquities in metal, bone, or clay, were found in abundance. Soon lines of walls built of unwrought stones in Cyclopean masonry began to appear; then *stelæ* or tombstones of calcareous stone, on which were rude figures in relief; four of these tombstones stood in a line north and south, and scattered about were fragments of others. The ground on which these tombstones stood was a circular area ninety feet in diameter, enclosed all round by a double row of parallel rectangular slabs of calcareous stone. These slabs were originally set on end in a vertical or nearly vertical position, and held together by cross slabs, which have been fitted on to their upper ends with a mortice and tenon joint. The southern part of this enclosing circle rested on a massive rough-hewn wall of Cyclopean masonry, which was evidently built to bring the earth within the circular area up to a level, as the ground here falls abruptly towards the outer wall of the citadel. Immediately to the north and south of the circular area were a number of foundation walls of Cyclopean masonry, enclosing spaces which Dr. Schliemann calls the rooms and corridors of houses of a prehistoric period, and all these foundations lying round the circular area are bounded by a Cyclopean wall, which, starting from the north side of the Lions' Gate, runs for some distance nearly north and south, and then, turning at a right angle nearly to the west, is continued to the western outer wall of the citadel.

The whole space enclosed between this inner wall and the western outer wall appears on Dr. Schliemann's plan like a *temenos*, set apart from the rest of the Akropolis for some special purpose, while the discovery of the tombstones within the circular area at once suggested that it had been a place of sepulture. Going lower here Dr. Schliemann soon came on vestiges which confirmed this opinion. At the depth of three feet below the level of the tombstones he found two oblong blocks of stone, five feet seven inches long, one foot broad, and seven inches thick, lying one on the other; and at their south end a smaller slab in an oblique position; below these occurred here and there small quantities of black ashes, in which were studs plated with gold, and other curious objects. On reaching the native rock a quadrangular tomb cut in the rock was discovered (No. 1 of Plan B). This tomb at the brink was twenty-one feet six inches long by ten feet four inches in width, but this area was much reduced at the bottom by a wall faced with schistous slabs, which lined the four sides of the cutting to a height of six and one-half feet, and projected all round three feet from the face of the rock. At the bottom of this grave, fifteen feet below the level of the rock, and twenty-seven feet below the surface of the ground before the excavations, Dr. Schliemann found a layer of pebbles, on which lay the remains of three bodies, distant three feet from one another. From the marks of fire on the pebbles and round these remains, and from the undisturbed state of the ashes, Dr. Schliemann concludes that these three bodies had been partially burned at the bottom of the grave. All three had been placed with their heads to the east, and appeared to have been forcibly squeezed into the space left for them between the lining walls, which did

not exceed five feet six inches. The body which lay at the north end of the tomb had the face covered with a heavy gold mask (No. 473), and on the breast was a gold breastplate, fifteen and three-fifths inches long and nine and one-half inches broad (No. 458). On removing these a sight so marvellous presented itself to the astonished eyes of Dr. Schliemann that we must let him tell the tale in his own words:—

The round face, with all its flesh, had been wonderfully preserved under its ponderous gold mask; there was no vestige of hair, but both eyes were perfectly visible, also the mouth, which, owing to the enormous weight that had pressed on it, was wide open and showed thirty-two beautiful teeth. . . . The nose was entirely gone. The body having been too long for the space between the two inner walls of the tomb, the head had been pressed in such a manner on the breast that the upper part of the shoulders was nearly in a horizontal line with the vertex of the head. Notwithstanding the large gold breastplate, so little had been preserved of the breast that the inner side of the spine was visible in many places. In its squeezed and mutilated state the body measured only 2 feet 4.5 inches from the top of the head to the beginning of the loins; the breadth of the shoulders did not exceed 1 ft. 1.25 in. and the breadth of the chest 1 ft. 3 in. Such had been the pressure of the *débris* and stones that the body had been reduced to a thickness of from 1 in. to 1.5 in. The color of the body resembled that of an Egyptian mummy. The forehead was ornamented with a plain round leaf of gold, and a still larger one was lying on the right eye. I further observed a large and a small gold leaf on the breast below the gold breast-cover, and a large one just above the right thigh (p. 296).

These remains were of course in a very crumbling and evanescent condition, and Dr. Schliemann, fearing that they would not long resist the impact of the external air, had a painting made at once, from which a cut is given in his book. The body, however, held out two days, when it was rendered hard and solid by the ingenuity of a druggist from Argos, who poured over it a solution of gum sandarac and alcohol.

Across the loins lay a gold sword-belt, in the middle of which the fragment of a double-edged bronze sword was firmly attached. On the right lay two bronze swords, the handle of one of which is of bronze thickly plated with gold and richly ornamented. The handle of the other sword and the scabbards of both must have been of wood, as oblong and circular gold plates, ornamented with designs in relief, were lying alongside the sword-blades, just where we might expect to find them had they been attached to wood since decayed. Near the swords was found a tassel made of long shreds of very thin gold plate, which probably was attached to a sword-belt. At the distance of little more than a foot to the right of the body were lying eleven bronze swords, mostly decayed. There were in the same part of the tomb one hundred and twenty-four round studs, plain or ornamented, of which the two largest are the size of five-franc pieces; and six ornaments, which Dr. Schliemann calls crosses, but which might be better described as lozenge-shaped. All these ornaments were of wood plated with gold.

To the right of the body was a large gold drinking-cup, six inches in diameter, with one handle (No. 475), encircled with a row of arched ornaments in *repoussé* work, which have a curious resemblance in outline to a Roman aqueduct. At the south end of this tomb were fifteen swords, of which ten were placed at the feet, and between this body and the one in the middle of the tomb was a large heap of broken swords, which Dr. Schliemann calculates to have amounted to more than sixty, also a few bronze knives.

The remains of the central body appeared to have been disturbed after interment. The layer of clay and the upper layer of pebbles with which the other two bodies and their ornaments had been covered had been removed from this one, which was moreover nearly destitute of gold ornaments. Dr. Schliemann thinks that some sacrilegious marauder of later times must have sunk a shaft in the centre of the tomb and plundered this part of the grave. This would account for the gold studs and other objects which he found scattered in the upper soil in digging down to this tomb (p. 152), and which may have been dropped by the plunderer, in his hasty raid. The catalogue of what was found in this wonderful tomb is not yet finished. Besides the objects already enumerated which were found on or near the three bodies, Dr. Schliemann mentions two more gold cups; the remains of a vase partly of silver and partly of copper plated with gold, which must, when entire, have been two feet six inches high, with a diameter of one foot eight inches for the widest part of the body; eight large pommels for sword-hilts, of which seven were carved in alabaster, and one of wood, all ornamented with gold nails; also a large alabaster vase, of which the mouth was mounted in bronze plated

with gold, and which contained a quantity of studs which had been originally of wood plated with gold. No less than three hundred and forty of the gold plates of these studs were found in the tomb. Many of them were richly embossed with patterns, which will be noticed further on. This tomb also contained many fragments of wooden instruments and boxes, among which the most interesting were two sides of a small quadrangular casket, on each of which was carved in relief a lion and a dog. Food seems also to have been deposited in this tomb, as a number of oyster shells, and among them several unopened oysters, were found in it, also a large number of boar's teeth.

As Dr. Schliemann continued to explore the ground within the circular enclosure, he soon came on other tombs, the contents of which were equally surprising. We will take the largest of these (No. 4 of Plan B). Digging through a part of the circular area where no tombstone stood, he found black soil, which had evidently never been disturbed since a remote antiquity, and at twenty feet below the surface he struck upon an elliptical mass of masonry with a large opening like a well. At the depth of six and one-half feet below was a tomb hewn in the rock twenty-four feet long, eighteen and one-half feet broad; the bottom of this tomb was thirty-three feet below the level of the upper soil. All around the sides was a slanting wall of schist seven feet eight inches high, which projected four feet, and thus considerably diminished the area of the tomb at the bottom, on which lay the remains of five men, three with the head to the east, the other two with the head to the north. The bodies had evidently been burnt on the spot where they lay, as was proved by the abundance of ashes on and about each corpse, and the marks of fire on the pebbles and the schist. Upon the remains of the bodies lay a layer three or four inches thick of white clay, on which was a second layer of pebbles. On removing these layers a treasure equal in interest and value to that of the tomb already described was suddenly revealed. As the account of the contents of this one tomb occupies not less than seventy-four pages of the volume before us, we can only indicate here the principal classes of objects discovered. On the faces of three out of the five men here interred had been massive gold masks. Two of these bodies had a large gold breastplate, and close to the head of one was a magnificent gold crown (No. 337). To the thigh bone of one of the bodies was attached a gold band, supposed to have served for fastening the greave, *knemis*. In the same precious material were three shoulder-belts; ten plates to cover the pommels of sword-hilts; the remains of a sceptre, or perhaps a caduceus (p. 287, Nos. 451–2), richly inlaid with rock crystal; an unusually large and massive armlet; two large signet rings, on one of which a hunting-scene and on the other a battle were engraved in intaglio; not to mention endless studs and smaller personal ornaments. This tomb, like the one already described, had its little armory of weapons. No less than forty-six bronze swords, more or less fragmentary, were taken from it. With these were found several alabaster pommels of swords and fragments of wooden scabbards, together with the gold plates with which they were once ornamented, and the gold pins and nails with which these ornaments were fastened. Lances, too, were not wanting; the wooden shafts, though seeming entire on their first discovery, crumbled away on exposure to air. In one place thirty-five arrow-heads of obsidian lay in a heap; their wooden shafts had perished either from decay or cremation. Oyster shells and unopened oysters here, as in the tomb already described, indicated that the living had not forgotten to provide food for the dead; but this tomb contained in addition a whole *batterie de cuisine*, in the shape of thirty-two large copper cauldrons, and other vessels of copper which stood upright along the walls of the tomb. The cauldrons must be among the largest which have come down to us from Hellenic antiquity. Three of these have a diameter ranging from fourteen to twenty inches. Most of these vessels bore signs of having been long used on the fire. It might have been expected from the analogy of the famous royal tomb near Kertch, called the Koul Obo, that remains of food would be found in these cauldrons. This does not seem to have been the case, but one of them contained no less than one hundred large and small wooden studs, plated with gold. We will conclude our list of the objects found in this tomb by drawing attention to the nine gold cups, one of which, No. 344, weighs four pounds Troy; the two wine-jugs, one of gold, the other of silver; the ox's head of silver, with horns of gold, No 327; the silver vase in the form of a stag, No. 376, and the three-handled alabaster cup, No. 356.

We must now describe the contents of a somewhat smaller tomb (No. 3 of Plan

B), rather more than sixteen feet long and ten feet broad, cut in the rock, and lined with sloping walls of schist and clay, like those already described. In this tomb were the remains of three persons, thought to be women on account of the smallness of the bones, and particularly the teeth, and the quantity of female ornaments. All had the head turned to the east. Under and above them was the usual layer of pebbles. The bottom of the tomb was nearly thirty feet below the surface of the upper soil. The bodies had evidently been burnt as they lay, and were literally laden with jewels, all of which bore marks of fire and smoke. The ornaments were for the most plates of gold with a design in *repoussé* work. Of these no less than seven hundred and one were collected, some of which must have been strewn all over the bottom of the sepulchre before the funeral pyre was prepared, and the rest laid on the bodies before the fire was kindled. The subjects of the designs are a sepia or cuttle-fish, a flower, a butterfly, various spiral patterns, all contained within the circle of a disk. Other plates again were cut in outline, so as to imitate fan-shaped leaves. In another class of jewels animals or the human figure were not relieved on a ground, but embossed and cut out in outline, like the *emblemata* of later Greek art. Among these designs we find three gryphons (No. 261), a crouching lion, a naked female figure with a dove flying from each shoulder, and another perched on her head (Nos. 267, 268), another draped figure, the hands joined in the middle of the bosom (No. 273), butterflies, cuttle-fish, lions, hippocampi, sphinxes, and other varieties of animal life. In some of these ornaments quadrupeds or birds are combined in pairs, and rest on a triple branch growing like a palm. These seem to have formed the heads of pins for brooches. On the head of one of the persons interred was found a magnificent crown (*stephanos* *) two feet one inch long, formed by a band tapering to both ends, in which were set thirty-six large leaves, which must have stood upright (p. 185, No. 281). There were also five diadems similar, but much less rich in character, and a number of detached flowers and stars made in the same manner. The quantity of gold, agate, and amber beads in this tomb shows that many necklaces must have been deposited in it. Three small rectangular ornaments of gold, of an oblong form and perforated through their length, may have formed part of necklaces, if they were not mounted in swivel rings. On one side of each of these a design is rudely carved in intaglio. The three subjects are a man, perhaps Herakles, fighting with a lion, two warriors fighting, and a lion kneeling on rocky ground and looking back as if wounded. Some curious ornaments, composed of spirals of fine gold wire, may be parts of necklaces or bracelets, while other combinations of spirals may have been used, as Dr. Schliemann conjectures, to bind together separate tresses and locks of hair. The provision for the toilet for the nether world was clearly shown by the remains of a gold comb with teeth of bone, two small boxes of gold, and three large vases in the same metal, all with covers fastened on with gold wires in a very primitive manner; an alabaster scoop (No. 325) fashioned as if to represent a hollow formed by two hands in juxtaposition. Such objects may be regarded as the prototypes of the *pyxides* and other *mundus muliebris* so often found in Greek tombs, and of which they at once remind the archæologist; but some of the other antiquities found in this tomb are quite new to us, as for instance the four rectangular boxes (see No. 323) made of sheet copper, each of which is ten inches long, five inches high, and four and one-half inches wide, which were found filled with fairly preserved wood, and which it is supposed had been covered with a thick wooden plate. These were lying near the heads of the dead, and Dr. Schliemann conjectures that they may have been pillows. Remains of wood were also found in twelve gold hollow tubes; these probably belong to distaffs or spindles, and the two silver rods which have been plated with gold, and which terminate in crystal knobs, were probably used for the same purpose. The three other tombs, though not quite so remarkable as those which we have already noticed, contained much that is new to us, and worthy of a careful study. But no idea can be formed of the splendor and variety of these objects without reference to the cuts and engravings with which this volume is profusely illustrated.

Such were the marvellous contents of the five tombs within the circular enclosure on the Akropolis. But the treasure was not yet exhausted, for close to the circular area was a rectangular cutting in the rock, lined with a roughly-built wall of

* We have followed Dr. Schliemann in describing this and other gold ornamental bands as crowns, but the form of these bands is more like that of the *mitra* worn as part of the Greek panoply on the front of the body, and their scale seems too large for a headdress.

stones on its eastern and northern faces. On excavating here no remains of bodies or evidence of cremation were detected, but several curious objects, similar to those deposited in the five tombs, were found at the bottom of the cutting. The most remarkable of these objects were a gold couching lion, evidently the ornament of a large *fibula;* four gold cups, of which the handles terminate in dogs' heads at their upper attachment to the rim; and two large gold rings. On the oval chaton of one of these (p. 354, No. 530) is represented a most curious scene. On the left a female figure is seated on rocks at the foot of a tree, possibly intended for a palm-tree; behind her a smaller figure appears to be gathering fruit from one of the branches; in her left hand the seated figure holds out three poppy-heads; before her stands another female figure advancing her right hand as if to receive the poppy-heads; and between these two figures another smaller female figure stands immediately in front of the knees of the seated figure, holding up a flower as if offering it. Behind the taller standing figure, and on the extreme right of the scene, is another female figure holding flowers in either hand. Between the seated figure and the taller figure standing in front of her we see a double-edged battle-axe, or, perhaps, a pair of such axes. Between the two taller standing figures is what appears to be a palladium, in the hand of which is a spear held very much as it is shown in the ancient representation of the palladium. Between this figure and the top of the tree on the opposite side of the scene we see the sun and crescent moon, below which is a double wavy line bent round in a curve, which may represent the sea. Behind the standing figure on the extreme left six objects are ranged on the edge of the chaton, so as to follow its curve. These objects are thought by Dr. Schliemann to be masks representing Corinthian helmets. We have examined them repeatedly with a powerful lens, and can only see in them the faces of lions or panthers; the ears, which are distinctly visible, are entirely feline in character. The dresses of all the female figures are very curious. Across the skirts of the two standing figures are raised horizontal ridges which may be the edges of upper garments falling over the innermost garment. On the surface of the skirts zigzag lines may be traced which probably represent embroidered patterns; on one figure this pattern looks like overlapping scales.

The intaglio on the oval chaton of the other gold ring presents an equally strange subject. Here we see two parallel rows of animals' heads, between which is a row of small disks or bosses. In the upper row an ox's head is placed between two heads which, on the whole, it is safest to consider as representing lions; in the lower row there is a counterchange; between two oxen's heads is a single lion's head. On the extreme left is what looks like wheat ears growing from a single stem, and opposite, on the extreme right, is a single plant or flower.

We have now indicated the main features of Dr. Schliemann's memorable discovery in the Mycenæan citadel; and here several questions naturally present themselves. To what race and period are we to assign the remains in these tombs? Are they Hellenic or præ-Hellenic? What is their relation chronologically to that ancient citadel within the walls of which they were found? Did the lions over the gateway guard this immense sepulchral treasure, and for how long? What, again, is their connection with the buildings popularly called treasuries, below the Akropolis? Do the legends of the house of the Atreidæ throw any light on these sepulchral remains within their citadel? And again, do these remains illustrate or corroborate these legends?

Before we attempt to deal with the complicated problem involved in these questions, it may be well to interrogate the remains themselves and ascertain what evidence archæology can extract from them. Now in the outset of such an enquiry we must bear in mind that the contents of these tombs show us, as might indeed have been expected, that the same custom which prevailed through the ancient pagan world generally prevailed also at Mycenæ. The dead were regarded as personages deserving of pious attention from the living, and therefore their sepulchres were furnished with such things as in this life they took delight in. The sentiment conveyed in Virgil's well-known lines —

> Quæ gratia currum
> Amorumque fuit vivis . . .
> . . . eadem sequitur tellure repostos —

was not confined to Greece and Italy. Modern research has shown how the Scandinavian, Celtic, or Scythian warrior was buried not only with his armor and weapons, but with his war chariot, his horse, and sometimes with abundant supplies of raiment, food, and wine for his

Original from CORNELL UNIVERSITY

banquets in the other world. We also know that in proportion to the rank and wealth of the deceased, was the preciousness of the offerings deposited with him in the tomb. Now it may be fairly inferred, from the large amount of gold found in the Mycenæan tombs, that the bodies so lavishly decorated were those of personages distinguished in their day for wealth and power; and, if this was the case, it may be assumed that the art employed in fashioning all this gold into ornaments was the best art which was available in Mycenæ at the time when the deposit of this treasure was made.

If the criteria by which we are in the habit of judging of the art of the Greeks and other ancient races are applied to these Mycenæan antiquities we shall find that they rank very low in the scale. They present to us, it is true, considerable vigor and invention in the designing of mere patterns and ornaments, but in almost every case in which the representation of animal life is attempted, we see a feebleness of execution, the result of barbarous ignorance; those qualities and proportions of visible nature on the observation of which the representation of organic beings in art depends are either not perceived at all or are so rendered as to be unintelligible. In support of this criticism we would refer our readers to the illustrations in the work before us, which are sufficiently faithful to give those who have not seen the originals a fair impression of their merits. To begin with the gold masks. Two of these are so crushed out of shape that perhaps it is hardly fair to subject them to criticism, but the other two (No. 331, p. 220, and No. 474, p. 289) have suffered but little. After reading Dr. Schliemann's glowing description of these masks on the first announcement of their discovery, we confess that it was not without a shudder that we first beheld these hideous libels on the "human face divine." As representations of life we can hardly rate them much higher than the work of New Zealanders and other savages. In No. 331 the width from ear to ear is so disproportionate that the whole mask takes the form of an oval of which the longest diameter is at right angles to the nose. Let us hope that no race so repulsive as this specimen ever dwelt in the fortress of the Atreidæ. The other mask, No. 474, is a little more comely; the nose, though almost devoid of nostril, has the merit of being straight, and the moustache, beard, and eyebrows are tolerably rendered. But there is the same disproportionate width from the outer corners of the eyes to the ears, and there is no attempt to model the features. Dr. Schliemann thinks that these masks are meant to be portraits of the persons on whose remains they were found. This is more than probable, and the artist may have had the assistance of a squeeze in clay or wax taken from the face after death. If he had sufficient skill to use this squeeze as a matrix, he may have obtained a cast in relief from it. Our belief is that, having obtained such a cast in some yielding material, he copied that by hand, carving it out in wood or some material hard enough to hammer gold upon. We may thus account for the curious realism in such details as the moustache and beard, the smooth surface of which suggests the notion that oil had been applied to this part of the face to make the mould deliver, as is done now by *formatori*. We have already mentioned that on the tombstones above the sepulchres were subjects sculptured in relief. On one of these (p. 81) in an oblong sinking is a figure standing in a chariot drawn by a quadruped galloping, which we must assume to be a horse, in spite of his tail, which curls upwards like an angry bull's. Before the head of this quadruped a figure runs brandishing a falchion. Another tombstone (p. 86) has a similar design, and on a third below the figure in the chariot is an animal which Dr. Schliemann describes (p. 81) as a "tolerably well-preserved dog, but which is more probably a lion chasing some quadruped, which, were it not for the inordinate length of his tail, we might call a deer." These reliefs are hardly superior to the rudest specimens of sculpture over the doors of some of our Norman churches. Even Dr. Schliemann's enthusiasm fails him here, and he admits that "the men and animals are made as rudely and in as puerile a manner as if they were the primitive artist's first essay to represent living beings." The same incapacity for representing the forms of organic life appears in the smaller works where human figures are introduced.

When we turn from the representations of the human figure to that of animals in these Mycenæan antiquities, we see that superiority in the treatment of the lower forms of organic life which is characteristic of very early art in many barbarous races. As a rule, quadrupeds are more correctly represented than men, birds than quadrupeds, fishes and insects than birds. This is certainly the case at Mycenæ. Of animals, the lion seems to have been the

Original from CORNELL UNIVERSITY

most studied and the best understood. It is true that the gold mask of a lion, represented on p. 211, fails as much to express the true characteristics of the animal, and errs as much in proportion, as the human masks already noticed; but the action of the lion springing on his prey in the embossed plate, No. 470, is expressed with a spirit to which the cut in the work before us by no means does justice. The lion (p. 178, No. 263) in *repoussé* work, which was probably designed as an ornament to be worn on a garment, is also not without character, though rudely beat out and treated as mere decoration; but in the couching lion (p. 361, No. 532) we have an animal that reminds us at once of the granite lions of Egypt and the bronze lion weights found by Mr. Layard at Nimrud. The style has something of the repose which is the characteristic of Egyptian lions, but in the modelling we trace the influence of an Asiatic school. Next in merit to this lion must rank the silver ox's * head with the two long gold horns and a gold star on the forehead. The surface of the silver is so much corroded as to detract very much from the effect of this head, but the proportions are well preserved, and, judging from the muzzle, which, having been plated with gold, has not equally decayed, the modelling must have been very fair. A stag (p. 257, No. 376) made of a base metal, of which the analysis yielded two-thirds silver and one-third lead, is chiefly interesting as a primitive attempt to represent a quadruped standing on his legs without any other support. The result is somewhat ungainly. The body of the stag is hollow, and on his back is a spout, showing that the form of this animal has been adapted for a vase.

When we pass from the representation of quadrupeds to the lower forms of life, we find fish, probably intended for the dolphin and the sepia or octopus, which occur frequently both on the embossed disks (p. 166, No. 240) and also (p. 268, No. 424) as reliefs without a background, so that the outline of the cuttle-fish is left free. This is the mode in which the *emblemata* are made which we find in later Greek art attached as ornaments to mirror covers and vases. No less than fifty-three of the cuttle-fish represented (No. 424) were collected out of one tomb. Dr. Schliemann states that their perfect similarity can only be explained by supposing that they were all cast in the same mould. They may, however, have been all hammered out on the same model, and afterwards united in pairs, so as to present the same relief on both sides, as Dr. Schliemann suggested in reference to a similar class of ornaments (p. 183). The spirals in which the arms of the octopus terminate would of course give facilities for fastening them as ornaments on garments. Moths are another favorite subject with the Mycenæan goldsmiths. We find them on the disks and also separately cut out like the cuttle-fish. It is curious, on comparing these, to see how carefully some of them appeared to have been studied from nature, and how the same type reappears in a more conventional form.

The patterns borrowed from the vegetable world are not so varied. Among the embossed disks of which so large a number was found in the tomb of the women were fan-shaped leaves cut out of gold plates in outline, with the inner markings of the leaves raised in relief, so that they seem like botanical diagrams. In another place are two pomegranates (p. 176, Nos. 257, 258) which have evidently formed the pendants of necklaces. In a large proportion of the ornaments, whether disks or crowns, the basis of the pattern is a circular flower, of which the leaves are sometimes pointed, and sometimes rounded at the ends. Sometimes again these leaves, radiating from a common centre, have their points bent in the same oblique direction, as if they were obeying the force of a whirling movement. The effect of the large detached flowers is exceedingly rich, though produced by a process so simple that a modern goldsmith might despise it. The separate leaves of the flower are first cut out of thin gold plate; each leaf is ornamented with bosses, spirals, beadings, and other ornaments, all cut out of the plate in relief; these leaves are then united by a central stud or plate, which forms the eye of the flower. Each leaf being covered with raised patterns, a great variety of light-reflecting points is obtained from a very small surface of gold, and the whole effect is very striking.

When floral forms are not adopted, round bosses and other circular patterns and combinations of spirals are the basis of most of the patterns, and these combinations of spirals seem to have been first suggested by the facility with which gold wire can be worked into such a pattern, as is shown by the spiral bracelets and clasps (p. 196). In the ornaments which

* Dr. Schliemann calls this a cow's head, but we are assured by naturalists that he has mistaken the sex.

the Mycenæan goldsmiths seem to have applied to gold we are always reminded of its malleability and ductility; and if they had been as skilful as later goldsmiths in the processes of casting, chasing, and soldering, to which this metal lends itself so easily, their ornaments would have had a different character, less broad and simple, but capable of greater refinement of execution and variety of composition. Two fragments of Mycenæan goldsmith's work, of singular beauty and unique of their kind, must not be passed over here. The original objects to which these two fragments belonged may have been a *caduceus*, as one of the pieces represents a coiled snake, the other part of a hollow cylinder which had enclosed a wooden staff. The cylinder is formed of four-leaved flowers united at the points of their leaves, of which the edges all round are raised so as to form casemates or *cloisons*, in which pieces of rock crystal are inlaid. The spaces between each pair of flowers are filled with pieces of crystal, all nicely adjusted to their places. In like manner the scales of the serpent are of crystal inlaid in gold *cloisonné* work. Of these crystal inlays one only had fallen out, though the surface had been exposed to the action of fire. The gold vessels found in the Mycenæan tombs are chiefly drinking-cups of several kinds. The prevailing type is a one-handled cup tapering more or less from the mouth to the base, so that the form may be likened to a truncated cone inverted. In another type, the cup, in form something like a modern goblet, springs from a stem more or less taper, which again spreads out at the base into a circular foot. In cups of this type the foot, stem, and bottom of the cup are hammered out of one plate of gold, into which the body of the cup is then fitted like an egg into an egg-cup, and riveted by gold nails. Two of these cups are loaded with some other metal at the juncture of the stem with the body. The handles are rudely formed of strips of gold bent to the required shape and riveted by gold nails. The forms of these gold cups are somewhat clumsy, and the inelegance of their design is evidently due to want of skill in metallurgy. The great goblet (p. 234, No. 344) must, before it was crushed in, have been the finest of all the cups in design, as well as being intrinsically the most valuable, its weight being four pounds Troy.

We have already noticed the richly embossed gold plates which once decorated the wooden scabbards and the hilts and pommels of the swords. The blades of these swords are of bronze and many of them are remarkable for their great length, which Dr. Schliemann calculates as more than three feet. These swords are double-edged, with a high projecting ridge or thread down the centre of the blade. It may be inferred, therefore, that they were used like rapiers for thrusting or guarding. Other shorter swords seem to have been used like a falchion only for delivering a chopping blow, as they have only one edge. All these swords are beautifully made.

We have endeavored to direct attention to the more striking characteristics of style and fabric in the Mycenæan antiquities. The exceeding strangeness of their aspect led to some mystification on their first exhibition. The extreme antiquity claimed for these objects by Dr. Schliemann was strongly contested. It was said that many of them were as late as the Byzantine period; the ornaments were said to be not Hellenic but rather Celtic in character. It was even insinuated that they had been brought from other localities and dexterously inserted in the soil of Mycenæ by their discoverer; that he had, to use an American expression, "salted" his tombs. These doubts and insinuations would be hardly worth noticing here were it not that more than one distinguished archæologist helped to give them currency, misled, as they have since frankly acknowledged, by first impressions.

That these antiquities appear on their first aspect more barbarous than Hellenic may be admitted, but the patient student will not fail to detect many links by which they may be connected with archaic Greek art as we have hitherto known it from extant specimens. In order to discover these latent affinities we must enquire what evidence of the earliest stage of Greek art has been obtained from the islands in the southern part of the Archipelago, and especially from Rhodes, Melos, Crete, Santorin, and Cyprus, islands which lay in the track of the most ancient Phœnician navigation, and were colonized by the Greeks at a very early period. From these islands have been collected certain gems which have only lately received from archæologists the attention they deserved, and a few samples of them have been published by M. F. Lenormant in the *Revue Archéologique*, 1874, p. 1, pl. 12, and also by Ludwig Ross, in his "*Reisen*," iii., p. 21. These gems are pebbles of crystal, sard, onyx, red and green jasper, steatite, and other stones which have been for the most

part roughly wrought into the form of a lens; some few are rhomboid. Both kinds are pierced, evidently to be strung on a necklace, or mounted on a swivel ring. On these stones are engraved, in the rudest manner, animals, monstrous combinations of human and animal forms such as sphinxes, chimæras, etc., and lastly human figures, one of which probably represents Herakles fighting with the lion, another perhaps Prometheus with the vulture.

These intaglios are cut with a rudeness which shows no trace of the influence either of the Egyptian scarab or the Assyrian engraved cylinder, both of which appear to have been imitated by the Phœnician and early Greek gem-engravers. The rude gems from the Greek islands seem to carry us back to some remote time before Hellenic art had any style of its own; before it was sensibly, if at all, affected by foreign influences, whether Asiatic or Egyptian, and the majority of the subjects represented on these primitive gems are such as would be taken direct from nature by a semi-barbarous people. On these gems, as in the similes of Homer, the lion, either alone or devouring cattle or deer, is a favorite subject; we find, too, the wild goat with very large horns, which still inhabits Crete, and was once general in the mountains of the Archipelago. We would refer our readers to the interesting series of these *intagli* in the gem-room of the British Museum, and invite them to compare their rude designs with those of the rings in gold in Dr. Schliemann's work; the resemblances will be found most striking, not only in the subjects and general design and execution, but also in certain minute details. Thus on a museum gem is a female figure of which the dress and general type at once remind us of the strange ladies on the Mycenæan gold ring, No. 530; on another museum gem are two warriors fighting, one of whom is armed with a very long oblong shield, with straight parallel sides, but curved at the top — just such a shield as is worn by one of the warriors on the Mycenæan signet ring, No. 335. We find, too, on one of the museum gems the same irregular wavy lines to represent water which occur below the sun and moon in the Mycenæan ring, No. 530. But the connection between these gems and the Mycenæan *intagli* in gold does not end here. In the tomb (No. 3) which contained the bodies of three females were found two of the very gems which we have been describing (Nos. 313 and 315). It should be here noted that six gems of this class were found with other very ancient objects in the upper soil above the tombs, at a depth ranging from ten to thirteen feet (p. 112), and three more were obtained by Dr. Schliemann from the neighborhood of the ancient site where once stood the Argive Heraion.

Ruder and perhaps even more ancient than these gems are the little marble idols representing a naked female figure which are occasionally found in the Greek islands. These figures, which range from ten to fifteen inches in height, remind us at once of the rude carvings of savage races, such as may be seen in ethnographical collections. The lower limbs are indicated by a variation in the outline, and by a deep line of demarcation cut in the marble to show that they are separable one from the other. The arms, marked off in like manner by a deep channel, are folded on the breast; the face is featureless, save a projection which serves to represent the nose, and behind this face is no cranium, only a slight thickness of marble. The one peculiarity which distinguishes these figures from the idols of more recent savage races is that the pelvis is marked very distinctly by three incised lines which form an equilateral triangle.* Among the Mycenæan antiquities are two little gold ornaments representing a naked female figure, which, from the doves associated with it, is probably a very early type of Aphrodite. This figure, though a little less rude than the marble idols, has the arms folded on the bosom in the same manner, and the pelvis is in like manner marked off as a triangle, though in the work before us (p. 180, Nos. 267, 268) the engraver, trusting to photographs, without seeing the originals, has failed to detect this peculiarity.

We have now to call attention to certain equally rude representations of the human figure in terra-cotta, specimens of one variety of which are given in Plate A and B and Plate xvii., Nos. 94–96. These terra-cottas, which do not exceed five inches in height, are rudely fashioned in the form of a draped female figure, only to be recognized as such by the two slight protuberances which indicate breasts. From the waist downwards the draped body is represented as a round column which spreads outwards at the base. There are no indications of feet. The arms pro-

* F. Lenormant, "*Premières Civilisations*," ii., p. 376. It is a curious illustration of this primitive anatomical diagram that the Greeks called this part of the body Delta, from its supposed likeness to the fourth letter in their alphabet.

ject on each side of the shoulder like the ends of a crescent, and are enveloped in a kind of tippet, which falls as low as the waist, and is distinguished from the lower dress by stripes of color. The face is as featureless as the little marble figures already described. This is the type which Dr. Schliemann believes to be an idol representing the cow headed Hera, whose horns he recognizes in the arms projecting on each side. That these figures are idols is very possible, that the position of the arms may have some hieratic significance, and that it may possibly typify the crescent moon, may be conceded to Dr. Schliemann; but, after a study of this type as it may be traced through the series of ancient terra-cottas from Ialysus and Camirus in the British Museum, we fail to recognize any horns at all, and consequently the ingenious identification of this figure with the Homeric Hera falls to the ground.

In another variety of this type (Pl. C., fig. 1), the arms are folded as in the little marble idols, already noticed. The great antiquity of both these types might be inferred from their extreme rudeness, and the discovery of a single specimen by Dr. Schliemann in one of the five tombs shows that they were in existence as early as the date of those tombs, whatever that may be. As many as seven hundred of such terra-cottas were found in digging through the stratum of ancient soil above the tombs, and similar figures were found in digging through the passage to the treasury, explored by Madame Schliemann. But such archaic types in terra-cotta are not limited to Mycenæ and Tiryns. They have been found in tombs at Athens, and also at Ialysus in Rhodes, and evidently belong to the same primitive class as the rude figures of horsemen found in the tombs of Cyprus, Rhodes, and Athens, of which one mutilated specimen occurred in the diggings of Mycenæ.*

In digging the strata of soil above the tombs Dr. Schliemann found not only potsherds, such as earlier travellers had remarked on the surface, but whole vases, and in the tombs themselves were broken vases. One of the most frequently recurring types is that figured on p. 64 (No. 25), which may thus be described. The body is nearly globular, its neck serves as the support of the two handles which spring from either shoulder of the vase. The neck is closed at the top, the mouth of the vase is a spout on the shoulder. This type is so peculiar that its recurrence in various localities could not have been due to any chance coincidence. We find it in Egypt, in Cyprus, and forty-three examples of it were obtained from Ialysus in Rhodes. Another form which Mycenæ has in common with Ialysus is the goblet type (p, 70, No. 83), in which a shallow cup with one handle rises from a tall stem. In the ornaments painted on the Ialysian vases we are still more reminded of Mycenæan art. The cuttle-fish, so favorite a symbol with the goldsmiths of Mycenæ, recurs on several of the fictile cups from Ialysus. We have too the same friezes of dolphins or lions encircling the body of the vases in both cases; the combination of spirals such as are found on the gold breastplates constantly recur; and when we compare the fragments of pottery from Mycenæ with the vases from Ialysus, the identity not only in the peculiar ornaments, but in the fabric, is so complete, that we are justified in concluding that the vases of both places, if not the actual products of the same school of fictile art, were made about the same period, and derived their ornaments from some common source.

The Mycenæan ornament seems derived not so much from traditional forms as from nature herself, and flowers seem to have suggested many of the patterns, while shells and other marine products may have suggested others. This preference for floral ornament is equally marked in certain pottery from Santorin on which leaves and tendrils are painted in a free, bold style. From the circumstance that this Santorin pottery was found with other remains under a stratum of lava, a very high antiquity has been claimed for it by M. Lenormant.* As his argument is dependent on certain geological assumptions which have not yet been confirmed by independent enquiry *in situ*, we shall only here remark that the pottery of Santorin presents strong resemblances to the pottery of the Mycenæan tombs and of Ialysus, and that the fictile art of all three places is distinguished by certain peculiar characteristics.

Not only is the pottery of Ialysus almost identical with that of the Mycenæan tombs, but in both we find certain ornaments in a vitreous composition which present a most singular coincidence both in material and pattern. There seems to be good ground for believing that these vitreous ornaments

were originally covered with gold-leaf like some of the terra-cotta ornaments, which in later Greek art supplied necklaces for the dead. In one of the tombs at Mycenæ were several specimens of glass in a more advanced stage of the art. These are described by Dr. Schliemann as small cylinders pierced through their length, and square pieces composed of four such cylinders. Externally these cylinders were cased with greyish-white matter which crumbled under the touch. Within that again was a hard, blue, transparent tube, which, according to Professor Landerer, is of cobalt glass, and within this again another tube, with a lustre like silver, and which is pronounced by the same authority to be a vitreous substance containing lead. It would seem from this evidence that at the period when these tombs were furnished the art of casing cylinders with concentric tubes of glass, one over the other, was already known. No other specimens of glass were found by Dr. Schliemann at Mycenæ except a few beads in the soil above the tombs. One more point may be noted which connects the remains at Ialysus with those at Mycenæ — a peculiarity in the form of the gold rings. In the rings from both sites, the back of the chaton is hollowed to fit the round of the finger, and the form and fabric of these rings are peculiar and unlike any other Greek rings with which we are acquainted.

We have now indicated some of the resemblances which may be detected by a careful comparison of the antiquities from Santorin, Ialysus, and Sparta with those of Mycenæ, but the enquiry, to be complete, should be carried much further. If certain ancient remains from Melos, Attica, Megara, the Rhodian Ialysus and Camirus, and Cyprus, were combined with the contents of the Mycenæan tombs, and arranged as far as possible in their presumed chronological sequence, a phenomenon which has for some years been recognized by archæologists would be more generally known and more easy of demonstration. This phenomenon is that the slow and painful advance of Greek art, from its first rude efforts, is interrupted at a certain stage by a foreign influence. When we examine that most interesting and varied collection of archaic objects, found by Messrs. Biliotti and Salzmann in tombs at Camirus, and now exhibited in the British Museum, we find but very few, if any, traces of the peculiar pottery of which the neighboring city Ialysus has furnished so many specimens; on the fictile vases of Camirus we find zones of lions and other animals, drawn with great spirit and combined with ornaments which, since the discoveries at Nimrud, we know to have been derived from an Assyrian source. Again, while we find numbers of terra-cotta figures of which the earliest are as rude as those of Mycenæ and Ialysus, and of which the series exhibits so many successive stages of progress towards a truer representation of the human figure, we have other terra-cotta figures which, though still retaining certain archaic characteristics, seem the product of a mature school of art; and these later figures, when compared with certain terra-cottas from tombs at Sidon and other places in Phœnicia, are found to be identical in type and to present only slight differences in style.*

When we turn to the gold ornaments of which Camirus has yielded a rich collection, we see in the earlier specimens figures embossed on plates of gold, which in their rudeness both of design and execution remind us of the work of the Mycenæan goldsmiths; but there are other specimens in which the art has made a decided advance, both in modelling and in technical skill; and in this later style we meet with earrings ornamented with winged lions very similar to those so familiar to us in Assyrian sculpture. The ornaments, too, both in gold and ivory, at Camirus are constantly reminding us of Assyrian prototypes. On the other hand, we find many objects which seem to connect these remains with Egypt, such as a silver bowl and a gold ring, scarabs, vases, and many other objects in Egyptian porcelain, some with hieroglyphics; and these hieroglyphics are, in some cases, so incorrectly rendered and so blundered as to prove that the artist by whom they were copied had no real knowledge of Egyptian writing.† If we pass from Rhodes to Cyprus, we find that there, too, the early art presents the same curious mixture of Assyrian and Egyptian types and subjects. In General Cesnola's most interesting work, on which we regret to be unable to bestow here more than a passing notice, several bowls in gold, silver, and bronze are engraved (see pp. 77, 114, 276, 316, 329, 337), and two more, found many years ago in Cyprus, are to be seen in the French museums at the Louvre, and the Bibliothèque Nationale.‡ Inside these bowls are designs, either engraved or embossed, rep-

resenting battle-scenes, in some of which a king takes a part, hunting-scenes, animals; the predominating style is rather Egyptian than Assyrian, but there is a strange mixture of symbols and ornaments from both sources. If we pass from the Greek islands to Italy, we find that silver bowls very similar to those of Cyprus in style and subject were found in the celebrated Regulini Galassi tomb at Cervetri, and also in more than one ancient site on the west coast of Italy; and if we go eastward we meet with the same curious mixture of Assyrian and Egyptian influences in the bronze bowls and inlaid ivories discovered by Mr. Layard at Nimrud.* Here, of course, the question presents itself, how can we account for these resemblances in style and subject in the metallic art of countries so wide apart as Nimrud and Cervetri, and at an age when commercial intercourse and navigation were as yet restricted within narrow limits? The answer to this question which has been generally accepted by archæologists of late years is that it was the Phœnicians who in the course of their commerce brought this particular class of art to the markets of Greece and Italy, and that these engraved and embossed bowls, and probably most of the early jewellery such as we find at Camirus and Cervetri, were made by the artificers of Tyre, Sidon, and other Phœnician settlements. The correctness of this opinion has been strikingly confirmed by the recent discovery of a treasure at Palestrina, in which a bowl with pseudo-Egyptian hieroglyphics, and with an inscription in true Semitic characters, was associated with gold ornaments, which correspond in certain technical details with the jewellery of Camirus.

The examples which we here adduce are only a few links in a long chain of evidence, most of which will be found in a recent dissertation by Professor Helbig on the Palestrina treasure.† The number of instances in which Phœnician and Greek remains have been found intermixed on the same site points to a period when the rude untaught instincts of the Hellenic artist were stimulated and developed by the importation of foreign works, the product of a more advanced civilization, and it will be convenient for the present to designate this period as the Græco-Phœnician. But what were its limits? We can hardly conceive it to extend downwards later than B.C. 560, when the Assyrian Empire and its art had been swept away by the fall of Nineveh; when Greek art had nearly freed itself from foreign influences and was developing a free, independent growth; when we begin to hear of celebrated Hellenic artists, some sculptors in marble, some excelling in the art of casting, embossing, and chasing works in metal; when the Doric and Ionic styles of architecture had reached a certain maturity, and sumptuous temples in marble were being built.

With regard to the limits of the Græco-Phœnician period upwards, all that we can positively assert is that, in the time of Homer — whenever that was — the Greeks received from Sidon, Tyre, and Cyprus certain works of art which they greatly prized, and which they thought worthy to be laid up in the treasuries of kings. Such were the silver *krater* which Achilles gave as an agonistic prize at the funeral of Patroclus, which, as the poet tells us, was made by the Sidonians and brought over the sea by the Phœnicians, and the cuirass of Agamemnon, inlaid with many metals, which was given him by Kinyres, the king of the Cyprian Paphos.

Homer, too, describes, in an often-cited passage, the traffic between Phœnician traders and the Greeks on the coast, when the crafty Orientals contrived to kidnap Greek women, luring them to the shore by the display of necklaces and other toys — *athyrmata*. Among such *athyrmata* may be reckoned the shells engraved with Assyrian subjects which have been found whole or in portions at Vulci in Etruria, at Camirus, at Nimrud, and at Bethlehem. The shells so engraved are known to naturalists as the *Tridachna squamosa*, and are found in the Red Sea and Indian Ocean, but not in the Mediterranean. It is to be presumed that, like other products from the more distant East, they were brought by Phœnician ships up the Red Sea, and thence to Greek or Etruscan marts. The ostrich eggs covered with subjects carved in relief in an Asiatic style, which were found with other Græco-Phœnician remains in the Polledrara grotto, near Vulci, are another example of *athyrmata* brought from a far country in the course of trade.*

How early this Phœnician traffic in the eastern Mediterranean began, and whether on the coast of Italy Carthage had any share in it, are questions which we have as yet no certain means of determining. That Tyrians were already eminent in metallurgy and other arts as early as the time of Solomon, B.C. 1000, we know from the books of Kings and Chronicles, in which the varied talents of Hiram, the artist sent to decorate the temple at Jerusalem, are described in terms which would be applicable to the Samian Theodoros, that versatile genius to whom is ascribed so prominent a part in the development of Greek art some four centuries later.

When we compare the descriptions of works of art in Homer with those extant specimens which we have assigned to the Græco-Phœnician period, the correspondence is very striking. It is true that in the shield of Achilles the poet's imagination has evidently contributed some of the marvels of that famous composition; and, considering that this masterpiece was the work of the god Hephaistos, we could expect no less. But, allowing for a certain amount of poetic license in the description, we find both in the design of the shield and in the technical method of its execution much that reminds us of the Phœnician bowls, of the great shield found in the Regulini Galassi tomb at Cervetri, and of several other specimens of archaic metallurgy of the same period.* The same observation applies to the description of the shield of Herakles in Hesiod. Now when we compare the Mycenæan antiquities with the description of works of art and handicraft in the poems of Homer and Hesiod, we find that in all that may be considered products of the mere craftsman, such as swords, scabbards, sword-belts, or the domestic utensils, such as cups or cauldrons, the descriptions in Homer tally sufficiently with the objects found by Dr. Schliemann to make it probable that at the time when the Homeric poems were composed the fashion of such products of handicraft had not greatly changed; but the tombs of Mycenæ have produced no work of art at all comparable in design and execution to the battles and hunting-scenes which the Phœnician artists beat out in relief or engraved on bowls and other metallic surfaces. Still less do we find at Mycenæ any composition which at all reminds us of Homer's shield. It is obvious that artists so ignorant of the human figure as the Mycenæan goldsmiths would have been incapable of producing compositions with a sustained dramatic interest, such as the description of the Homeric shield implies, and of which the designs of the Phœnician bowls already referred to seem to contain the germ.

We therefore do not hesitate to state our opinion that, viewed in relation to the descriptions in Homer, the art of Mycenæ seems of a præ-Homeric period; viewed again in relation to the best extant works of the Græco-Phœnician period, this Mycenæan art is certainly very much ruder and earlier in style, whatever may be its date. We cannot but believe that the masterpieces of those Sidonian artists whom Homer calls πολυδαίδαλοι must have been very superior to what seems to us for the most part the uncouth product of a race destined ultimately to assimilate and to improve the arts and inventions of the Phœnicians and older races, but who had not yet entered into this rich inheritance. In the dim twilight of the mythic past the names of Cadmus and Dædalus stand out conspicuously. The first of these names marks the period when the Greeks adopted alphabetic writing from the Phœnicians; the name of Dædalus, on the other hand, expresses the change from the rude, shapeless idol to a truer and more lively representation of the human form — a change wrought, as we conceive, by the quickening influence of foreign schools of art acting on the Greeks through the medium of the Phœnicians. Thus, as we may call the period before the use of writing among the Greeks the præ-Cadmean period, so the period before this quickening influence transformed their rude efforts into a distinct style of art may be called the præ-Dædalian period. In our judgment, the antiquities of Mycenæ belong to this præ-Dædalian period, with the exception of some three or four objects, which appear to us to have been imported from some country in a more advanced stage of civilization. That country may have been Egypt, but the carriers were probably Phœnicians.

It will be seen from the foregoing remarks that, in calling the antiquities from Mycenæ præ-Dædalian and præ-Homeric, we incline to the belief that they are of a very high antiquity. Dædalus is so entirely a legendary personage, that we can only offer vague guesses as to the period which his name represents; but the age of the Homeric poems, however much con-

tested by ancient and modern chronologers, can hardly be later than the age assigned to them by Herodotus — namely, about four centuries before his own time, or B.C. 850. If, then, the Mycenæan antiquities are præ-Homeric, they must be regarded as earlier than the middle of the ninth century before our era. We have already set forth the general grounds for such an opinion, as deduced from a comparison of the Mycenæan treasure with other extant examples of archaic art. In further suppport of such a view, it may be here noted that, on a well-known mural picture in a tomb at Thebes, tributaries of the Egyptian king Thothmes III., believed to be Cyprians or Phœnicians, are bringing vases and other offerings, one of which is in the form of an ox's head very closely resembling the silver ox's head of the Mycenæan treasure, while other figures bear cups, which have a strong family likeness to those found by Dr. Schliemann.* According to Egyptologists, the date of Thothmes III. falls somewhere between B.C. 1400 and 1500 at the latest.

We have already pointed out that the close resemblance between the antiquities of Ialysus and those of Mycenæ makes it probable that we ought not to separate one series from the other by any long interval of time; and here we must call attention to the fact that in one of the tombs at Ialysus was found another Egyptian relic of remote antiquity — a porcelain scarab with the cartouche of King Amenoph III., whose date, according to the authorities on Egyptian chronology, is not later than B.C. 1400. Of course, neither this discovery nor the resemblance between the Mycenæan ox's head and cups to similar objects depicted in the tomb at Thebes are conclusive as to the date of the respective tombs in which they were found; for a sepulchral deposit cannot, of course, be older than the most modern objects it contains, and the Mycenæan cups and Ialysian scarab may be somewhat older than the other objects found with them; but we hardly think it likely that this possible greater antiquity would exceed three centuries. We should thus arrive at the eleventh century B.C. as an approximate date for the antiquities of Mycenæ and Ialysus.

We have now endeavored to answer the question, What can be inferred as to the age and origin of the antiquities found on the Akropolis at Mycenæ by the study of the antiquities themselves? From a comparison with extant remains found on other ancient sites, we are led to infer that the contents of the Mycenæan tombs belong to the most remote period to which we can venture to ascribe any Greek antiquities as yet known to us, and the reasoning which has conducted us to this conclusion would, we conceive, seem equally valid to any one trained in archæological research, whether these antiquities had been found by Dr. Schliemann at Mycenæ or on any other Greek site, not so marked out by tradition and extant monuments as the seat of a great monarchy in præ-Homeric times. On the other hand, it is not possible in the discussion on the discoveries at Mycenæ to divest the mind of the associations which the very name of this site calls forth, and thus we are brought back to the question to which we have already briefly adverted in the earlier part of this article. Have those singular monuments, the so-called treasuries, and the Lions' gateway, that direct connection with the dynasty of the Atreidæ which local tradition in the time of Pausanias ascribed to them? Are they, as most archæologists believe, almost the sole surviving specimens of the architecture of the heroic age, an architecture which has passed away like the fauna of that remote period to which geologists assign the mastodon and megatherium; or are they, as ultra-sceptics have maintained, simply masses of ancient masonry of uncertified date and origin? Henceforth, it is obvious, the discussion of this question cannot be separated from that of another question, What is the age of the antiquities discovered by Dr. Schliemann in the Akropolis at Mycenæ? Was this immense treasure deposited at a time when Mycenæ still merited the epithet "much-golden," which Homer bestows on it? Were the bodies with which it was found those of royal personages of the line of Pelops, or of some unknown *fortes ante Agamemnona* or *post Agamemnona?*

At this stage of the enquiry we would state certain propositions which, we think, may be fairly assumed as postulates in all future discussions of the problem: —

1. There was a powerful Achæan dynasty at Mycenæ which in mythic tradition is represented by the three successive names, Atreus, Thyestes, Agamemnon, and which at some time was dominant in Argolis, and perhaps over much more of the Peloponnese.

2. This Achæan dynasty lost its ascendency after the revolution commonly called the Return of the Herakleidæ, when

Original from CORNELL UNIVERSITY

the Dorians established themselves as the ruling race in Argos and other parts of the Peloponnese, and of which revolution the date is B.C. 1104 according to one ancient authority, or B.C. 1048 according to another.

3. The buildings which Pausanias calls treasuries and the Lions' Gate at Mycenæ were erected during the period of Achæan supremacy in Argolis.

4. From the amount of treasure which the tombs discovered by Dr. Schliemann contained it may be fairly inferred that they were royal tombs.

5. As we have no record, legendary or historical, of any kings reigning at Mycenæ after the termination of the Achæan dynasty, it is to be presumed that the tombs in the Akropolis are not later than that dynasty.

But admitting these premises, have we any reasonable ground for supposing that the tombs found by Dr. Schliemann are those which Pausanias believed to contain the remains of Agamemnon and his companions? It may be well here to cite the exact words of that author:* "In the ruins of Mycenæ are the fountain called Perseia, and the subterranean buildings of Atreus and his children, in which they stored their treasure. The tomb of Atreus is there, and also the tomb of Agamemnon and such of his companions as Ægisthus slew at a banquet on their return from Troy. The identity, indeed, of the tomb of Cassandra is called in question by the Lakonians of Amyclæ, but one of the tombs is that of Agamemnon, another of his charioteer Eurymedon. Teledamus and Pelops, who are said to have been twin children of Cassandra, and to have been slain while yet infants with their parents by Ægisthus, are both in the same tomb, and there is the tomb of Electra, for Orestes gave her in marriage to Pylades, and, according to Hellanicus, Medon and Strophios were the issue of this union. *But Clytemnestra and Ægisthus were buried at a little distance from the fortress*, being thought unworthy to be buried within it where Agamemnon and those slain with him were interred." We quite accept in this passage Dr. Schliemann's interpretation of the word *τεῖχος*, by which he understands the fortress on the Akropolis, not, as former authorities have maintained, the wall round the lower city; and it must be acknowledged that the text of Pausanias thus interpreted presents a most curious coincidence with the recent discoveries. His statement would lead us to expect that royal tombs might be found within the Akropolis; search has been made, and tombs containing a treasure worthy of the ruler of Mycenæ "the golden" have been found. The coincidence seems almost too perfect to be true. What its real value is as evidence in the question before us will be, it is easy to predict, hotly contested. It will be urged that the passage which we have cited from Pausanias was written more than twelve centuries after the reputed date of the death of Agamemnon; that his statement about the tombs rests apparently on no other authority than the local tradition current in Argolis when he visited Mycenæ, and that on the same loose authority of local tradition, elsewhere in Greece, he points out in the course of his work the tombs of many other personages of the heroic age, some of whom are manifestly mere mythical figments. Nor can we blame Pausanias for recording these local traditions, which could only have been tested by an operation as repugnant to the feelings of that pious traveller as it would have been to those of his contemporaries who claimed for their cities the distinction of possessing the tombs of ancestral heroes, sacred in their eyes as the shrines of saints still are in Christendom. Though in the second century of the Christian era tomb-burglary was not unknown, no archæologist would have been permitted by the Greeks to violate the tombs of their ancestors for the sake of satisfying historic doubts, which they themselves did not entertain, and which they would have indignantly repudiated.

Again, it may be said that the legends about the death of Agamemnon, like some of the incidents of his life, are contradictory. According to Pindar it was at Amyclæ in Lakonia, and not at Mycenæ, that he was slain, and Pausanias himself admits that the Amyclæans, Mycenæan tradition notwithstanding, maintained that Cassandra was buried in their city, and showed what they considered to be the tomb of Agamemnon.* It will be said too that to talk of Agamemnon as an historical personage is merely begging the question, but that, even if we admit the possibility that a king of that name did return from Troy and was treacherously slain in the manner related by Homer and the tragedians, how can we be sure that the tombs discovered by Dr. Schliemann are those meant by

* Pausan. ii. 16, 6.

* Pausan. ii. 16, 6; iii. 19, 6. In the latter passage the integrity of the text has been doubted by recent editors, but, as it appears to us, on no good grounds.

Pausanias? It is obvious that nothing short of a thorough exploration of the Akropolis can give a satisfactory answer to this question, and, while this article is still in the press, comes news from Athens announcing that Mr. Stamataki, who has been appointed by the Greek government to continue the excavations at Mycenæ, has already found there another tomb containing gold.*

We should not here omit to mention that in the course of Dr. Schliemann's operations at Mycenæ, one of the five subterraneous chambers, called treasuries by Pausanias, was excavated by Madame Schliemann, who, here as at Hissarlik, proved herself the intelligent and devoted partner in her husband's toils. In the course of further exploration something more may yet be found to throw light on the question what was the purpose of these vast subterranean chambers. Pausanias calls these buildings and the similar one at Orchomenos, treasuries; in both cases probably accepting the local tradition current in his time with his usual unquestioning faith. But we venture to assert that, if Pausanias had not given this name to these chambers, it would never have occurred to archæologists to call them treasuries. It seems inconceivable that Atreus and his successors would have placed their treasure in the city below, when they could have stored it in such an impregnable stronghold as the Akropolis; why too should they build five separate treasuries, and scatter them about the city, when, if placed close together in a row, they could have been much more easily guarded? Moreover the peculiar Egyptian vaulting of these buildings, the long passage leading up to them, and the smaller inner chamber in the largest of them, all remind us of a class of tomb which was probably much more common in Greece in the kingly period than in the later republican times, and of which we find the type surviving in the Græco-Scythic royal tomb, called the Koul Oba, near Kertsch, and in certain parts of Asia Minor.† We agree then with Mure and E. Curtius in considering the treasuries at Mycenæ tombs of the Achæan dynasty which reigned there. Such a supposition seems at first sight at variance with the theory that the tombs in the Akropolis are also royal sepulchres; but we may reconcile both views, if we assume that such vast masses of masonry as the so-called treasury of Atreus were constructed when the dynasty had that wide-extended sway "over all Argos and many islands," which would have enabled the ruling despot to command the large amount of labor required for the building of such a tomb, and when the lower city of Mycenæ was well guarded from any invasion. There may have been an after period when the mighty kingdom of the Atreidæ had shrunk to much narrower limits, and when the "labor of an age in piled stones" was no longer attainable to perpetuate the memory of the dead, and to protect their remains. In this later period the Akropolis would undoubtedly be the safest place for tombs containing so much treasure. Dr. Schliemann suggests that the circular enclosure round the tombs on the Akropolis may mark the limits of the *Agora*. This may be so, though we should rather have expected to find the Agora in the lower city. Ancient tombs are constantly surrounded with a *peribolos*, and though such an *enceinte* is generally a parallelogram, the circular form may have been adopted at Mycenæ, because the part of the Akropolis where the tombs are may have been already crowded with the buildings of which the foundations are shown on Dr. Schliemann's plan. Possibly, we may have in this circular enclosure the primitive form of the *prytaneum*, which in later Greek times was usually a round building with the altar of Hestia in the centre.* In the foundations to the south of the circular enclosure, a number of very archaic objects were found, which we have no space to notice here. Dr. Schliemann thinks that these foundations indicate the site of a royal palace. The position of such a palace close to the wall and principal gate of the Akropolis reminds us of the palace at Khorsabad, planted in a gap in the wall of the Assyrian city. If the palace of the Atreidæ was a superstructure of wood built on these foundations, as Dr. Schliemann supposes, the circular enclosure would be the most appropriate place of meeting for the elders, whom we may suppose to have been summoned by the king to his council.

Here we must close our notice of the discoveries at Mycenæ, and before we leave the Akropolis let us cast one upward glance at those gaunt lions who have kept watch over the massive gateway for thirty or more centuries. When last we saw

them lit up by the slanting rays of the western sun, we thought how admirably their proportions were designed for the place they occupy; how well that rough, uncouth treatment of the anatomy harmonizes with the rugged masonry round. Headless as they are, they are in our eyes a higher effort of art than all the golden treasures of the tombs within. Was it a Cyclops imported from Lycia who carved these strange animals for Perseus, or did the Tantalid Pelops bring from his Lydian fatherland some tradition of Asiatic art to the peninsula which still, in this nineteenth century, bears his name? These and many other questions suggested by the discoveries of Dr. Schliemann must be postponed till the excavation of certain ancient sites in Asia Minor has told us more of Lydian, and, perhaps, of Phrygian art. The solution of the problem with which we have been endeavoring to grapple will, perhaps, be found when the tombs of the Lydian kings near Sardis and the tumuli in the Troad have been properly explored.

ERICA.*

TRANSLATED FOR THE LIVING AGE FROM THE GERMAN OF

FRAU VON INGERSLEBEN.

XXIX.

(*continued.*)

THE physician's prescription of a change of air seemed to the countess the best possible pretext for sending Sidonie away, in order to thus unravel the tangled condition of affairs. One visit from the prince had already been declined, and the next time he came she had permitted Sidonie to remain in her own room, but this could not continue without attracting general attention. Besides, the prince was so perfectly unembarrassed, so evidently unconscious of the meaning of the delicate allusions by which the countess sought to investigate the affair, that the latter, confused and perplexed, at last did not know what to make of the matter herself.

As her anxiety about her husband rendered it impossible for her to travel with Sidonie herself, she constantly endeavored to find some suitable pretext for sending her away from Dorneck. Unfortunately, this could not be found immediately; several plans were relinquished, various arrangements broken up, and the countess herself became annoyed and irritated by her want of success.

Mysterious circumstances were utterly abhorrent to her clear, precise mind, and now, when both her husband and the young girl who was so near her heart stood before her like impenetrable enigmas, this incomprehensible something that surrounded them seemed doubly threatening and terrible. She constantly strove to solve the riddle, and thus lost a portion of her customary self-control, thereby in her turn becoming an enigma to those around her.

Life in Dorneck, which had hitherto flowed so calmly and peacefully, appeared to have reached a turning-point. Every member of the household felt oppressed, perplexed, involuntarily experienced a certain fear of what the future might bring, and yet no one could exactly tell what caused this perplexity, or what he really dreaded.

"Why are we all so dispirited, like a hound, which after hunting to suit himself, now expects his punishment?" asked Fritz one morning, as he strolled through the park with Erica. "What *has* happened, or what *is* to happen, that we are so anxious and uneasy, for there must be some cause for this universal discomfort?"

"I think I had good reason to turn pale with terror, when I saw Wehlen," replied Erica. "I am sure that he is the real cause of everything."

"But what in heaven's name has he done? If the devil, as the old saying goes, has laid an egg in the house, we can at least see and touch it."

"That is just the peculiarity about the devil's egg, Fritz. It can neither be seen nor touched, but all the more bitterly felt."

"Oh, nonsense! an evil that hovers invisible in the air I shall let stay there, and trouble myself no more about it. But, for instance, I can tell you plainly enough how the devil's egg appears to poor Olga."

"Well, I am curious to hear. She was very angry with me yesterday, when I told her she looked almost as pale as Sidonie."

"Wehlen, as you know, now goes to Bonn nearly every afternoon, and of course is always with the officers, who probably don't spend their time so much in telling stories as in drinking and gambling. Wehlen is a tolerably good leader in both, and either because he thinks it a merit, or from some other motive, constantly informs Olga of Generode's heroic deeds in

this department. I don't exactly understand Rüdiger's conduct, for though he never had an actual horror of such things, he was far from being disposed to any undue indulgence in them. Probably Wehlen has bewitched him, as well as papa, for he gives him constant opportunities to relate something to Olga. Moreover, the latter doesn't do this in any tone of censure, but in a very eulogistic, delighted manner, as if such things cast a sort of halo around a young man. Olga almost cries her eyes out in private, for now of course there is not the slightest prospect of conquering mamma's opposition, since she has always expressed doubts of Generode's strength of character."

"You ought to speak to the young count yourself, Fritz; and though I am sure that almost the whole story is based on Wehlen's slanders, he ought to avoid every occasion for them, and no longer have any intercourse with him."

"Do you suppose I have not done so? But what do you think Rüdiger answered? 'Don't be anxious, Fritz,' he said, laughing; 'this time I must exclaim with Prince Henry, "Yet herein will I imitate the sun, who doth permit the base, contagious clouds to smother up his beauty from the world." I can't help it, Fritz,' he added gravely, 'and I hope, if Olga loves me, she will also trust me, however base, contagious clouds may dim and smother me.'"

"That seems to show a little levity on Generode's part," said Erica disapprovingly. "I am sorry for poor Olga."

The two companions now heard the sound of the dinner-bell, and therefore abruptly broke off their conversation and hastened their steps to reach the house in time. The meal passed in the same uncomfortable manner which now seemed to be the order of the day. The conversation was far from fluent, interrupted by long pauses and evidently forced; and, contrary to the usual etiquette, Count Rodenwald did not wait for his wife to give the signal to leave the table, but pushed his chair back before the dessert was over, nodded to the company, and went to his own room.

Every eye was fixed upon the countess, and it required all her self-control to maintain her usual bearing, at least before the servants. She spoke a few words in relation to important business to Werner, who instantly entered into it, and then skilfully turned the conversation to indifferent subjects. But another source of excitement was still in store, for the doors of the dining-room were suddenly thrown open, and Generode's groom, his clothes covered with dust, entered. The countess's eyes turned towards the intruder with a stern, questioning glance, and an equally stern reproof was hovering on her lips, but when she saw Olga's deathlike pallor, her face softened, and she would undoubtedly have spoken more gently if she had had time to do so.

The groom, however, hastily approached, and standing stiffly before her, said, in the tone of a military report, "Orders from the Herr Lieutenant, Count Generode, to deliver this letter instantly into Herr Werner's hands, wherever I find him."

"To me?" asked Werner in astonishment, as he took the note from the groom. "Pardon the man, countess, for his over-zealous execution of his master's commands. Count Generode could not possibly have expected him to perform them in this way."

"Read the letter!" said the countess anxiously, as she rose from the table. Werner went to the window to break the seal, while the others lingered in the dining-room in eager expectation; and the countess involuntarily grasped Sidonie's hand and drew her into another window, from which she watched Werner, as if deeply interested in the contents of his letter, and when the latter finished reading it, and seemed to be reflecting a moment, she beckoned to him.

"Well, what is it?" she asked hastily. "Was the news very important?"

Werner looked thoughtfully at her. "It depends upon the way one understands it, countess. Here is the letter."

The lady's hand trembled as she took the sheet of paper, but she was by no means prepared for its contents; for she had scarcely read a few lines, when she exclaimed in surprise, "What is this, Werner — are you threatened?" She did not await the reply, however, but carefully read the note. It contained the following lines: —

"Your expectation has been rapidly fulfilled, my dear Werner; they will seek to make you harmless under any circumstances. Unfortunately for you, it has been discovered that you are not Werner, but the political fugitive, Oswald von Tendern, who, aside from his past life, has sent from his concealment the most horrible documents into the world. Unhappily you cannot deny that you, like him, are exactly five feet ten inches high, that you also have dark eyes and whiskers, so you can do no better than escape arrest

by immediate flight, since, under all the circumstances, you will doubtless wish to avoid any scene.

"The gendarmes are to start for Dorneck this afternoon, so you will have just time enough to get out of their way. I would have come to give you the information myself, if this troublesome service did not prevent me; but by the threat of instant dismissal, I have impressed it on the mind of my not-over-bright servant that he must hand you the letter at once. Meantime we will act for you, and the whole farce may recoil upon its originator.

"He is much more cunning than we supposed, and though your suspicion is undoubtedly well-founded, we have not yet been able to catch him. Well, he is at least withdrawn from Dorneck for the present, and that is a gain. Farewell! Hasten your flight, or we shall have the pleasure of seeing you enter Bonn between two gendarmes. GENERODE."

For a few moments after reading the letter, the countess also seemed absorbed in thought, then she asked the young man, who was still standing before her, —

"What will you do, Werner?"

"Set out as soon as possible, countess. The prospect of such an entry into Bonn has little charm for me."

"But have you really anything to fear?" she asked again, casting a penetrating glance at him.

"Do you think so, countess?" was his only reply, as he fixed his eyes upon the lady's face with the same earnest, inquiring gaze.

The countess did not answer immediately; she cast down her eyes, but soon fixed them upon him again, and said almost cordially, "No, my dear Werner, for I do not believe you capable either of such unworthy deception or fanatic folly."

A slight tinge of color suffused Werner's cheeks and brow, as he somewhat hastily answered, "I must take that fugitive's part a little, madame; for a deception which necessity compelled may deserve a milder judgment. True, I cannot plead for his fanaticism, which is always mysterious, but I must confess that my friends often call me an enthusiast."

The countess's keen eyes rested steadily on the young man, as she replied, with a calm smile, —

"Your friends are wrong in doing so, my dear Werner. If the effort to unite practical and ideal life more closely than is the case with the world in general, can be called enthusiasm, you are certainly very guilty, but if a correct appreciation of intellectual limits, the constant perception of antagonistic interests, the quick grasp of the best means to an end, distinguish the man who steadily follows a high purpose, you ought not to laugh at the name bestowed upon you. Nay, more," she continued in a half jesting tone, "your reason holds the reins so firmly that I will even say a good word for you on the *one* point where men easily become enthusiasts. You will never love a girl whom you cannot also esteem, never woo one whose position is unlike your own. You will always strive for what is attainable, but will place the goal high enough to be forced to strain all your energies to reach it."

Werner could not help glancing at Sidonie, who was still standing beside her aunt. She had been a mute witness of the whole interview, and though she possessed too much control over her features to betray too deep an interest in it, her changing color plainly showed her emotion. Now the rising blood crimsoned face and neck, but instantly receded again, making her pallor still more striking. Werner soon averted his eyes and fixed them on the countess, whose hand he raised to his lips.

"Thanks for your favorable opinion," he said warmly. "I will try to deserve it. You thoroughly understand character, and therefore are not misled by individual traits. Whatever you may hear of me in future, however different may be the light in which I appear, I have the firm hope that you will always retain the same kind feelings towards me, because you will never lose sight of the whole affair, and with it my vindication."

"Let us part now, my dear Werner," said the countess as she extended her hand in farewell. "If your flight is necessary, you ought to delay no longer."

"If I could be of use in Dorneck, no consideration of any kind would induce me to leave it. But unfortunately I can do no more, so I will bid you farewell, countess, and beg you to keep a friendly recollection of me."

He once more raised her hand to his lips, and then turned to Sidonie, who was gazing out of the window.

"Farewell to you also, countess," he said gently, "may the thought of me not form too dark a spot on your memory."

He involuntarily held out his hand; slowly, but without hesitation, she placed hers in it. The icy coldness of this little hand, which seemed utterly lifeless, startled him; he cast a quick, anxious glance

at her face, whose rigid features were wearily striving to maintain the mask of indifference, and for a moment he himself lost his composure. But the next instant he raised Sidonie's hand to his lips, hastily bowed to the ladies, and hurried out of the room.

As soon as Fritz heard the cause of the bustle, he instantly went to Werner and accompanied him down to the Rhine, nay, even took a seat in the boat that conveyed him to the opposite shore. When he returned, he met Sidonie and Erica in the park, and as he saw the former's eyes fixed upon him with an expression of anxious inquiry, although she did not utter a syllable, he instantly exclaimed,—

"Well, Werner is safely off. The gendarmes, whom I saw riding up the road, will only find him missing."

Sidonie made no reply, but released Erica's arm, nodded a farewell, and turned into one of the other paths.

"Do you know, Erica," said Fritz, when they were alone, "I am firmly convinced that Werner is really that Oswald von Tendern."

Erica stopped, and asked in alarm, "What put that into your head, why do you think so?"

"In the first place, all his property was packed up as if he must be prepared to take to flight at any moment. Then, as if by magic, the boatman was in the skiff the instant we needed him, and we had scarcely reached the other shore, when some people met us and hastily led Werner to a spot where horses were standing ready saddled and bridled. So his flight was prepared beforehand, and Generode's note merely hurried it a little. Then, too, the meeting with Ottomar and Elmar was rather strange, at least they had certain things to say to each other that no one else was allowed to hear."

"At any rate not you, Fritz!" replied Erica laughing. "You won't wish to make Ottomar and Elmar high traitors next, I hope?"

"That Oswald won't fare so badly either, who knows how the affair is mixed up, for one thing is certain, Elmar has a hand in the game too."

Erica turned hastily towards the speaker, exclaiming,—

"What do you know about Elmar?"

"The very latest thing of all, Erica. I've just seen him myself, with my own eyes."

Erica stood perfectly still, gazing fixedly at her companion; the latter, however, was too deeply occupied with his own thoughts about the problem before him, to be able to answer in his usual mischievous manner.

"I saw him plainly enough," he continued eagerly, "in a post-chaise, drawn by four horses, dashing along the road towards Bonn. As soon as he recognized us, he stopped, alighted, and rushed towards us. 'This is what I call a wonderful piece of good luck, Werner,' he exclaimed, 'for I really thought the day would pass without your coming.'

"'I am really making my escape, Elmar,' replied Werner, 'they say I am the political fugitive, Tendern.'

"'So that was the dog's game,' cried Elmar, laughing. 'Well, let us make haste that we may thwart it.'

"'Where are you going?' asked Werner.

"'I have now become an antiquarian, and am rummaging all the old archives in search of interesting manuscripts. I have been told of the collection at Bonn, though I have no idea how much it will help me, but, as you see, my longing to discover is so great that I am travelling there by extra post. Now, however, I think my best plan will be to turn and go back with you. People won't look for a fugitive in an open post-chaise, so get in, quick.'

"'You are making a great sacrifice for me, Elmar,' said Werner, hesitating.

"'Of course. I hoped to be able to spend the evening at Dorneck, and I fear the expectation was the only thing that made the archives of Bonn interesting. But when one has once entered into an affair, he must carry it out; so let us waste no more words, get in.'

"Both really entered the chaise, which turned round and dashed off in the opposite direction, and I stood alone looking after them."

"And did they say nothing more to you, Fritz? Nothing——"

"Nothing more, Erica. Not a word! Elmar only told me, by way of a friendly farewell, that if I uttered a syllable to betray his presence here, I might be prepared for all sorts of terrible consequences."

"This is very strange, Fritz," said Erica thoughtfully, and both, absorbed in their own reflections, walked backed to the castle almost in silence.

XXX.

PLANS.

A BRIGHT afternoon had tempted all the family to assemble on the stone balcony overlooking the Rhine, and it seemed

Generated on 2020-05-04 08:49 GMT / https://hdl.handle.net/2027/coo.31924079893586

Original from CORNELL UNIVERSITY

as if the radiant sunlight and beautiful scenery were asserting their power, and rendering all more happy and unconstrained than they had been for many days. Large and small boats glided along the river, ships of all sizes passed by and formed a gay, animated scene. The atmosphere reminded one of autumn, for it was so pure and clear that the eyes could wander far into the country beyond the opposite shore, and perceive the busy, ceaseless activity of men.

Fritz, moreover, had provided himself with a spy-glass, and was attentively watching distant objects, now and then informing the company of his discoveries, especially when he recognized an acquaintance, and he now eagerly exclaimed,—

"There goes Generode's young bay! The quartermaster must look out if he wants to keep in the saddle. Ah! he just shied again, and leaped half way across the road."

Olga, who had involuntarily attempted to take the spy-glass, let her hand fall. The quartermaster did not interest her sufficiently to expose herself to a reproof from the countess. Besides, the latter seemed unpleasantly affected by her son's words, for she frowned, and said sharply,—

"Young men make themselves quite too comfortable nowadays. The owner would do better to ride his horse himself; independent of all other considerations, he would save the money he pays the trainer."

"It doesn't cost much," replied Fritz good-naturedly. "He would ride his breeches almost through for a few thalers."

"Fritz!" cried all the young ladies in horror.

"Why, what have I said?" asked the lad, somewhat confused.

"It seems, my dear Fritz," said the countess, "that you have not yet passed ——"

"The days of clownishness, mamma," Fritz politely suggested.

"Very well, we will say the time of sowing wild oats."

"So one mustn't talk about articles of clothing. Very well, I'll take note of that," observed Fritz penitently, but the glance he cast at Erica expressed so little contrition, that it almost seemed as if the whole affair had been one of his mischievous tricks. There come several boats with gentlemen from Bonn," he exclaimed. "They are probably making an excursion together. There's Prince Eduard! Ah, he has recognized us, and ordered his boat to turn this way; he is leaving the rest of the party to take advantage of this opportunity of offering his homage to Queen Sidonie."

Sidonie slowly rose, pleaded the necessity of writing a letter, and walked through the pavilion into the park.

"Why, what does this mean?" asked Fritz in surprise; "the prince is really coming here, the boat is close to the landing-place."

The countess took no notice of the question, and received the young man in a cordial, unembarrassed manner. After addressing a few words to the mistress of the house, his eyes wandered over the group of young ladies. "Did I not see Countess Sidonie on the balcony just now?" he asked in surprise.

"You were not mistaken, prince," replied the countess quietly, "Sidonie went away a short time ago to write some important letters."

The prince bit his lips; the young lady's intentional avoidance of him seemed perfectly apparent. He hesitated for a moment what course to pursue, and, if it had been possible to do so without making his motive too apparent, would have preferred to go away at once, but he forced himself to remain and also to talk, though, in spite of his exertions, his annoyance was plainly visible.

The countess, on the contrary, conversed as frankly and readily as if she had not the slightest suspicion of the conflict in the heart of her young guest, and her composure gradually exerted a favorable influence upon him; Sidonie's departure began once more to appear a mere accident, which was unpleasant, but not offensive. His face gradually brightened, his words grew more animated, and although he often cast eager glances towards the park to see if Sidonie had appeared, his mood was evidently far more cheerful.

This change was both welcome and unwelcome to the countess, since his visit was thus prolonged, and Sidonie's continued absence could not fail to appear very strange. Tea was also served without the presence of the young lady or the master of the house, who chanced to be absent in Bonn. The prince's cheerful spirits gradually disappeared, and when he took leave of the countess, he bent towards her, and said in a tone that revealed deeply wounded feelings,—

"When one is punished, it is usually for some crime, but I am conscious of no fault that could deserve such chastisement."

"Have a little patience, my dear prince," answered the countess gently, "even mis-

understandings are explained by time. So let us wait, and hope for the best."

When the guest had gone, the countess asked whether her husband had returned from Bonn, and on receiving an answer in the affirmative, went to his room. He was sitting at his desk rummaging among his papers, but when at the sound of the opening door he turned and perceived his wife, he thrust them hastily into a drawer, and asked in no very pleasant tone,—

"What do you want, Vally?"

"I am sorry if I disturb you, my dear Edwin," said the countess, in her usual quiet manner, "but I cannot help it, for I must discuss matters which ——"

"What sort of things?" hastily interrupted the count. "What has happened that you alarm me so?"

"I don't think you need be alarmed about the matter, at least it does not seem so to me. It concerns Sidonie and Erica."

"Sidonie and Erica," said the count, stretching himself with a careless, lazy air, "well, go on, Vally. What is the matter with them?" and he rose from his seat to throw himself into one of the most comfortable chairs, while his wife took her place opposite to him.

"You have doubtless observed that Sidonie's appearance and manner are very much changed."

"To tell the truth, I have not noticed it much, but I heard all sorts of things to-day in Bonn. They say that there is a breach with the prince. What has got into her head that she is so coy?"

The countess's face darkened, and she said in a tone of ill-repressed vexation, "It is incomprehensible to me how the news of this state of affairs has already reached Bonn."

"Ah! my dear Vally, you don't understand the ways of a garrison town, it is a worse place for gossip than an old woman's tea-table; as a general thing, they know to-day the thoughts you will have to-morrow. But what of Sidonie?"

"Some misunderstanding seems to have occurred; Sidonie refuses to give me her confidence, so I know of no other way than to remove her from this place for a time. I hoped to be able to make arrangements for her departure before the prince suspected its real motive, but unfortunately the events of this afternoon baffled my expectations. Now there is nothing left for me to do except to speak frankly to him, and console him with hopes of the future, which, I trust, will not be too difficult for me, as he is probably tolerably convinced of Sidonie's love."

"Then he would be a fool, for what man can boast of understanding a woman, or being able to rely on her love?"

An expression of bitter suffering flitted over the countess's features. "I think you have always been able to rely on me and my love, Edwin," she answered gently.

"Of course, Vally. I was not thinking about you, you are an exception to the rule. But where is Sidonie to go?"

"To Altenborn"—the countess's composure was not yet sufficient to permit her to make a longer reply.

"To Altenborn? But she and Katharina are like cats and dogs."

"Perhaps that will cause a wholesome diversion of her thoughts," replied the countess with a faint smile. "Besides, she does not go alone, Erica will accompany her."

"Erica? But so far as I know, she has always strenuously resisted going to Katharina; how does she happen to make this resolution now?"

"She knows nothing at all about the plan yet, as I wished first to discuss it with you. She is not to go to Katharina, but to her grandmamma, who occupies an entirely different part of the castle. Old Countess Ingolstein has told the latter so much about Erica's fresh, lovable nature, that she earnestly begs me to let her come to her."

"If there isn't another matrimonial project in your head, I don't understand anything about the affair. Old Baroness von Altenborn is a strange companion for that fresh, bright young girl."

The countess cast down her eyes a moment, then looked at her husband and said smiling: "Your penetration does not deceive you, Edwin; it is really consideration for Erica's future that induces me to assent to grandmamma's proposal."

"Well, then, we are on the right track, Vally. So grandmamma has a rich young gentleman in the neighborhood ready to be hooked."

"Your foresight is not quite correct this time; the husband in question is no other than the young master of the house himself."

"What, Elmar? But so far as I understand, Katharina insisted upon having Erica for a companion because Elmar did not care for her."

"Katharina, like a fool, has allowed the opinion once formed to lead her astray. He may not have been interested in her during his stay in Waldbad, for Erica was then almost a child, but it is quite another

matter now, and if Katharina does not notice the change, she only proves her want of penetration or persistent obstinacy."

"True, she described Erica so strangely, that I was utterly astonished to find her a pretty, agreeable girl."

"The strange surroundings among which she grew up have rendered her somewhat unlike other people, given her a certain peculiarity of manner that may well arouse interest. I don't know whether Elmar's affection for her is very deep, but I am sure that frequent intercourse will strengthen the feeling to one of ardent love. He is rich enough himself not to need a wealthy wife, and all these considerations would have induced me to yield to Katharina's entreaties if her own character had not given cause for hesitation. Although Erica possesses a firm, independent nature, I should not venture to place her with a woman who hovers on the verge of insanity."

The count sprang from his comfortable attitude. "Do me the favor, Vally, not to startle me in this way. I have sometimes said Katharina's head was a little turned, but you are expressing it rather too strongly."

"It is not my habit to use too vivid colors," said the countess quietly, "and I will be responsible for what I say. I have already spoken to Elmar, nay, have even warned Katharina herself of the abyss towards which she is constantly moving."

"You are always wiser than the rest of us, Vally," said the count, leaning back in his former comfortable attitude, "and therefore act differently, and doubtless more sensibly. For instance, I don't quite see how a person can be cautioned against insanity, any more than cholera or nervous fever."

"Even that might be done, if the person's mode of life must infallibly lead to those diseases. In mental afflictions, however, far more than bodily, there is almost always a participation in guilt, and the cases where purely external causes produce aberration of the mind are largely in the minority. Here Katharina's yielding to the most unrestrained, unbridled desires, her reckless pursuit of every passing fancy, leads her continually on in the downward path, where want of inclination passes into lack of ability. The measureless egotism which knows and considers only itself, has developed in her to a height that inspires actual horror, her unreasonable wishes and uncontrolled whims are getting beyond her command, and thus she will become the slave of her own caprices. Her reason will be more and more unsettled, she will lose the balance of her mind, and at last sink into complete lunacy. I have convinced myself that Elmar cannot protect his sister against her own folly, as he is obliged to put forth all his strength to ward off the blow that threatens him."

"But it was not particularly wise in him to yield to Katharina's absurd desire to make young Reinhardt pastor of Altenborn."

"I doubt whether it was done on Katharina's account," replied the countess, after a pause; "that was the very thing that revealed Elmar's regard for Erica, as the latter, for her guardian's sake, undoubtedly interceded for the young man. Elmar is quiet, but by no means weak; he is not quick in action, but reflects for a time to see whether he can spare himself the necessity. If, however, he once feels it, he carries out a measure with energy and consistency.

"Now, for instance, in spite of all Katharina's scenes, he has broken up their system of mutual housekeeping, as he plainly saw it would prove his ruin, and set apart one wing of the castle for her use. She still grumbles over the injustice done her, as she calls it, the more so as she considers Elmar an interloper, and believes herself to be the real owner of Altenborn. She looks upon her father's second marriage, not only as a great wrong to herself, but, on account of his wife's inferior station, scarcely valid. To be sure, it would have been better if the old baron had made a suitable match, but — "

"Let that pass, Vally, she was a charming woman, and might fearlessly take her place beside our little Queen Sidonie. Elmar can afford to laugh at his sister's nonsensical notion, as no one else will share her opinion."

"He probably has little fear of her legal rights, but dreads the public scandal Katharina will recklessly cause if her anger is seriously aroused. Hitherto we have laughed at the strict watch she keeps over her brother, for we thought it impossible it could really prevent his marriage; he may, however, have shrunk from this decisive time, and therefore not yielded to any passing interest. One thing is certain, in such a case Katharina will put forward her absurd pretensions."

"I don't know, Vally, how, with all these complications, you can think it advisable to involve Erica in such a situation."

"If I could alter the situation I would not fail to do so, but as it must be faced

sooner or later, in my opinion the more quickly this is done the better. An open quarrel with his sister will free Elmar from a mountain, and since, as I said before, he can be of no use to her, there can be no objection to it on the score of good feeling. Erica, however, unless I am greatly mistaken in her, is just the person not to yield to the storm she will probably meet, and so grandmamma's request seemed like a sign from heaven."

"I know you like to play at providence a little, Vally, and therefore the idea of punishing Katharina by granting her own request undoubtedly had its charm for you."

"That is very true, my dear Edwin, and I earnestly hope the punishment may benefit her."

"So we have another cleverly arranged intrigue begun. Poor Erica must be helped to a rich husband. She again must be the stumbling-block between the brother and sister, that Elmar may be freed from his burden, and lastly Katharina must be chastised, softened, and cured by the little storm her kind aunt brings over her head. The principal matter to us is of course invariably the matrimonial project, only it seems to me that in spite of all our clever diplomacy, the love affairs don't make much progress. I have already thought it would be better to leave the girls to God and themselves, that they might marry according to his and their pleasure."

"That would certainly be far easier and more comfortable, my dear Edwin, only I believe that the happiness of possessing children imposes stern duties. To be allowed to follow the impulses of the heart would be a fate so unusually happy, that no one who does not possess the blessing has a right to grumble. When people are not rich, and have a large family ——"

An involuntary movement from the count made the speaker pause and look at her husband. He turned away, saying peevishly: "Why do you go back to those old stories? the girls certainly know that they are not rich."

"Yes, they know it, but as they have always lived in luxury, they do not suspect what a necessary element of existence money is now. But for this, I would gladly place Olga's hand in Generode's, for his agreeable manners have won me also; but duty imperatively commands me to prevent the marriage, for I foresee nothing but sorrow and trouble."

The count's impatient movements increased, and he replied in his former sulky tone: "Who is talking about Generode? The only person in question is Sonnenstein, and he can frame Olga in gold if he desires. Why will not the silly girl take him, and why don't you use your authority to compel her to do so?"

The countess glanced at her husband with a look of mingled anxiety and surprise. "You can scarcely expect me to adopt such a course, Edwin," she said, in a somewhat unsteady voice. It is my duty to warn my children from the path of error, I must try to guide them into the right one, but never, even for their own happiness, would I dare to force them. I believe Sonnenstein to be a worthy, kind-hearted, though not particularly brilliant man, whose moral qualities can inspire sufficient esteem to fully compensate for the deficiency of his intellectual ones, and I earnestly desire the marriage, but my authority can extend no farther."

The count drummed impatiently on the table beside him. "Very well, as people make their beds so they must lie, and Olga can give up camel's-hair shawls and Paris dresses." He rested his elbow on the table, shaded his face with his hand, and continued in the same tone: "Besides, it seems to me great folly to educate poor girls in luxury, in order to compel them to look out for rich suitors in the matrimonial market." The count paused once more, covered his eyes with his hand, and added in a lower tone: "I believe it is our duty to change this, Vally, and — and if it is agreeable to you, we will adopt a simpler style of living."

He removed his hand from his eyes, but examined the toe of his boot with such close attention, that he did not look at his wife. She had turned somewhat pale, but instantly composed herself, and said quietly, —

"That reason is scarcely sufficient, my dear Edwin, for most daughters of houses where the property is entailed are in a similar situation."

"Then it is so much the worse, so much the more reprehensible on the part of the parents. Besides, I hate this display; I love and long for greater simplicity, and desire it to be inaugurated in our household."

His eyes were still fixed upon the toe of his boot, and he did not notice the deathlike pallor that overspread the countess's features. She involuntarily pressed both hands upon her heart, as if to stifle some pain, then rose and approached her husband. As she laid her hand on his shoulder, he looked up, but instantly cast

down his eyes and turned impatiently away.

"Why have you so little confidence in your wife, Edwin?" she asked gently, in a trembling voice. "Why does it require such a pretext to make her acquainted with your situation? Why do you not pour forth all your cares, and speak frankly of the troubles that oppress you?"

The count half rose from his seat, thus removing his wife's hand from his shoulder, then threw himself back in his chair, exclaiming in a loud, angry tone, "Oh, deuce take this confounded sentimentality! When people want to discuss practical subjects, there is no occasion for this display of conjugal love. I think we are both too old to perform touching scenes together."

Countess Rodenwald's delicate lips were firmly compressed, she again clasped both hands over her heart, and then returned to her seat, and sinking into it, gazed steadily at him. Her face, though somewhat pale, had regained its expression of cold repose, and her tone sounded equally chilling as she said slowly, —

"As you have expressed yourself so decidedly in favor of the practical standpoint, I will discuss the matter from that side. You wish to economize, not on your daughters' account — that pretext is scarcely worth contradiction — but probably for the sake of your own disordered affairs. Although it is difficult for me to act in a matter which I but partially understand, I will gladly enter into your wish as soon as I know what I can do for you."

The count's eyes were again magnetically attracted by his boots, as he murmured, "I think I have already mentioned, Vally, that we must spend less money."

"In other words, Edwin, I must give you some money, for as I defray all the housekeeping expenses and those of my children's wardrobes out of my own property, I do not know how my economies could benefit you."

The count's eyes at last rested on his wife, as he said with a somewhat unsuccessful effort to assume a jesting tone, "The word housekeeping is a very relative, and therefore comprehensive idea, Vally. You might assist in bearing a large share of the burdens imposed upon me, especially the wine-cellar and the payment of that crowd of idlers, the servants and such people. Besides, Ottomar's allowance is, I think, unnecessarily large; your partiality for him has imposed a very heavy burden on my purse."

"I will take charge of Ottomar's allowance," said the countess quickly; "he at least shall not suffer from these circumstances."

"You can do so with less hesitation, as you will have no provision to make for Fritz, who is his wealthy uncle's sole heir, and will perhaps be richer than Ottomar."

The footman, who at this moment announced that supper was served, interrupted the conversation. The count was evidently well pleased, for his brow cleared, and he politely offered his arm to his wife to take her into the dining-room.

"You are an exemplary wife, Vally, I have always known it," he said as calmly as if the words were the conclusion of a friendly conversation. "So you will take charge of the wine-cellar, at any rate, for there is a little champagne-bill of several hundred thalers to be paid at once. I had entirely forgotten it, and when it was handed to me to-day was rather embarrassed, because I did not have sufficient ready money to settle it."

Without waiting for her reply, he instantly spoke of other things, and during the meal was unusually gay, jested with his children, teased Erica, and cheered the whole circle by his bright spirits.

XXXI.

THE CATASTROPHE.

When the countess suggested to Sidonie the plan of a journey to Altenborn, she found less opposition than she had expected. True, the prospect of meeting Katharina was not tempting, but Sidonie loved the old lady whom she was to visit, liked Elmar, for whom, ever since her childhood, she had cherished a warm affection, and moreover felt only too plainly that her departure was necessary. She hoped to find some diversion for her torturing thoughts in the changing scenes of the journey, and her new surroundings; for her situation seemed so painful that any alteration must be a benefit.

Contrary to her expectations, the countess met with far greater opposition from Erica. At first her astonishment at the proposal was so great that she could not utter a word; but her aunt plainly saw that no joy blended with the surprise, and as soon as Erica had partially recovered her composure she frankly expressed her feelings, and there was almost angry defiance in her eyes as she said at last, —

"If you think it better for me to leave Dorneck, my dear aunt, some other and more suitable place can doubtless be found."

The countess gazed searchingly at the flashing eyes and quivering lips of the young girl, whose refusal gave her an unpleasant surprise, since it seemed to contradict the idea of her regard for Elmar; therefore when she spoke, her words sounded even colder than she had intended: "Certainly, I think it better for you not to remain in Dorneck. The object of your residence here is tolerably well accomplished, and you have no opportunity to use your powers or develop your manifold talents. We have almost too many young ladies in Dorneck," she continued with a faint smile, "and I would have sent one of my own daughters to Alternborn too, if the affair could have been so arranged."

She paused, as if awaiting an answer, but as Erica remained silent and the countess's keen eyes saw that the young girl could scarcely restrain her tears, she continued in a more affectionate tone: "I hope you see, in my care for you, not a lack but a proof of my love; of course, in spite of your temporary absence, Dorneck will remain your home, and your stay at Altenborn, whether longer or shorter, can and will be considered only a visit. Fortunately, you are so situated that you are not compelled to be dependent upon any one, so your acceptance of the old lady's invitation will be a kindness on your part, which will not impose the slightest obligation upon you. If you do not like Altenborn — although so far as the charming old baroness is concerned, this is scarcely possible — you can return to us in a few weeks. You need not come into any close contact with Katharina, and thus there can be no fear of breaking your promise to your mother."

Erica's face brightened as her aunt uttered the last words, but she was still silent, and only when the countess directly asked for an answer, hesitatingly replied,—

"I would willingly accede to your wish, dear aunt, but Elmar von Altenborn does not want me to come; I cannot possibly enter his house against his will."

"Elmar does not want you to come!" asked the countess in astonishment. "So you have discussed the subject together."

The deep blush that crimsoned Erica's cheeks afforded the countess great satisfaction, for she perceived that she had not been mistaken in her former inferences. She therefore instantly helped her out of her embarrassment, by continuing,—

"I remember you became very well acquainted with each other during his stay in Waldbad and your adventure in the forest; but he thought only of your coming as Katharina's companion, and no true friend could desire that. Now, however, the case is very different, and he will have no objection to your paying a visit to grandmamma, for he sincerely loves and honors her. I think I can answer for his approval of our plan; will you accept my security, Erica?"

The brown eyes now rested so affectionately on the countess, that any other language was superfluous. The lady eagerly answered the entreaty of the loving look, and clasped the young girl in her arms with a mother's fond affection. "Child of the only friend I had in the world," she whispered softly, "you are as dear to me as my own daughters."

She passed her hand lovingly over Erica's soft brown hair, and then added more gravely: "Take from this conversation, Erica, the lesson that true love cannot selfishly follow its own impulses, that it is often its painful duty to seem stern." She pressed a light kiss on Erica's brow, and then left her, as she clearly perceived that the latter needed solitude.

At dinner the countess mentioned the intended journey, and though none of the younger members of the family had had the slightest suspicion of it, no one ventured to express surprise. An old lady, who lived in the neighborhood, and was going to Coblenz by the steamer, was to take charge of the two young girls as far as that city, where a carriage from Altenborn would meet and convey them to the castle.

The few days that intervened before their departure passed rapidly enough in making preparations for the journey, and finally the evening arrived when the family circle was assembled unbroken for the last time. Sidonie, as usual, seemed very grave, and Erica also felt agitated at being compelled once more to leave the place, which of late had seemed like home. Besides, notwithstanding her aunt's words, she felt a little dread at the thought of Elmar; true, his earnest request that she would not come to Altenborn referred solely to Katharina, but it seemed like a want of proper reserve to enter his house without his invitation. As neither the countess nor her daughters appeared to be in a very cheerful mood, this last meeting, at which Ottomar was also present, would have been rather dull, but for the unusually good spirits of the master of the house. He jested and laughed continually, nay, his exuberant mirth at last seemed almost forced, or the result of some secret

excitement, and the countess now and then glanced anxiously at her husband.

"What is that letter?" asked the count hastily, as a servant entered. "If the scrawl is mine, hand it to me," he cried impatiently.

He broke the seal, hurriedly read the letter, then, without making any apology, rose and left the room. The countess and her eldest son exchanged anxious glances, while a vague sense of oppression brooded over the rest of the party. Conversation became less fluent, and was with difficulty maintained by the countess, although she externally retained her composure. But now came a fresh interruption, for the servant soon entered and requested Count Ottomar to go to his father's room.

Ottomar hastily started up, whispered a few words to the countess, and then obeyed the summons. When he reached his father's room, the latter was standing at the window staring through the panes, he turned his head towards the new comer, and murmured in an undertone, —

"Read that scoundrel's letter, and then advise and help me."

He again turned towards the window, leaving his son to find the letter himself. Ottomar saw a sheet of paper lying on the writing-desk, and stretching out his hand towards it, asked, "Is this the letter, dear father?"

"Of course," replied the count, without turning; "I think you can see I am not in the mood to use many words."

Ottomar took the paper and read the following lines: —

"I sincerely regret, my dear count, that I am unable to fulfil your wish, but even the best intentions recoil before an impossibility. I have already fully explained the condition of my own affairs, so you will certainly believe me when I tell you that my hands are tied. I am completely in the power of this damned usurer, and it is not I — whence should a man like me get this horrible avarice? — but he alone, who is the inexorable demon that oppresses you, or rather me, and thus puts the stamp of a dishonorable action on my brow.

"I have tried both threats and cunning, but all my efforts have recoiled from this impenetrable armor of baseness. All I have obtained is a few days' delay, so instead of to-morrow, the note will not be presented to you until Wednesday. Of course I was obliged to purchase the favor very dearly, but you seem, Herr Count, to regard a short respite as especially important, so I wished under any circumstances to accommodate you. If it would be too great an inconvenience to pay the whole sum of sixty thousand thalers on Wednesday, I will again make every exertion to induce him to wait a few weeks for half the amount, though I fear this can only be accomplished by utterly disproportionate sacrifices, and therefore would earnestly advise you, if possible, to pay the abominable fellow in full.

"I would have come in person to discuss this matter, if I were not detained in the city by urgent business, which will keep me here several days. Therefore, Herr Count, pardon these hasty lines, with their unpleasant contents, and be assured that I feel the affair far more painfully than yourself. With the warmest esteem, dear count, I am,

"Respectfully yours,

"WEHLEN-RAMSDORFF."

Ottomar had turned somewhat pale as he read the letter; when he completed it, he gazed thoughtfully at the ground. The count, to whom the pause probably seemed too long, hastily turned, and seeing his son absorbed in reflection, said with a scornful laugh, —

"Well, Ottomar, is a note such a strange thing that it petrifies you like Medusa's head?"

"You cannot afford to pay it, father?" Ottomar asked gently.

The count shrugged his shoulders impatiently. "Folly! If I could, I should not ask your assistance."

"Has not Werner collected many old debts? Has he not largely increased your income, and ——"

"What does this mean, Ottomar?" cried the count furiously; "are you meddling with matters that don't at all concern you at present? What is the meaning of these confidences from my employees, which are in no respect proper for you to hear? It seems that you only recommended Werner in order to have a hand in the management of Dorneck; henceforth I positively forbid any interference on your part."

"You just requested it, dear father," said Ottomar, looking steadily into his face.

The latter perhaps felt the reproof conveyed by his son's words, for he changed the subject, and with the same scornful laugh with which he had opened the conversation, said: "You are unfortunate in your *protégé*, or rather your bosom friend, Ottomar; very strong warrants have been issued, and it would be strange if he escaped the police."

"I used to think you liked Werner, father; I am very sorry to hear you speak of the matter in this way."

"I liked my secretary Werner, for he was a useful servant, but I do not extend my kind feelings to a political fanatic, who used my house for a hiding-place. With you, Ottomar, I am extremely displeased for having deceived and compromised your family in this way."

A scarcely perceptible smile played around the young man's lips; many weeks had elapsed since Werner's flight, and now for the first time his father's irritation led him to make this reproach. This was exactly in accordance with the character of the count, who often deferred the unpleasant task of reproof until he could avail himself of it as a convenient excuse for an outburst of anger. Ottomar therefore made no reply to the last words, but said, —

"In what way can I serve you in this matter, my dear father?"

"Very simply; get the money. As you have once committed the boundless indiscretion of discussing this matter with Werner, I can tell you that all my means have been absorbed by this scoundrel, that the vampyre with his cheating has drained me dry."

"That is certainly a very unfortunate situation," said Ottomar, in a somewhat tremulous voice. "You reproach Wehlen with cheating, have you any tangible proof of your assertion?"

"Don't torment me with your questions, Ottomar!" replied the count, in his former irritated manner. "Should I allow myself to be plundered by this villain, if I had the proof? I can even tell you, that of late my principal reason for playing was to obtain it, but I did not succeed. In order, moreover, to blunt the edge of your moral indignation against me, which — unpleasantly enough for myself — I read in your face, I can also tell you that of this last sum, I lost only a sixth or perhaps an eighth at play. The infamous scoundrel, however, has formed a league with another rogue as bad as himself, who apparently presses him, and as I could not pay at once, neither made the least objection to extending the note, merely making the trifling condition of doubling the amount, until after a few months the debt has grown like an avalanche."

This peculiar apology did not make the son's face brighter; on the contrary it grew still graver, and he asked almost sternly: "On what favorable turn in your circumstances did you depend, dear father, to allow yourself to be led on by the hope of payment to constantly extend the note?"

"You are adopting the tone of an inquisitor, Ottomar," cried the count, reddening with anger. "I do not intend to endure such conduct from my son. I sent for you to help me, not to subject myself to impertinent questions. If you know of no expedient, you can go; in that case, I prefer to be alone."

Ottomar's face regained more and more of the repose his father's flushed, agitated features so strikingly lacked. This new outburst of anger did not offend him, for he knew his character too well not to be aware that he was only the accidental conductor of the wrath seething within him. He therefore did not think of leaving the room, but remained quietly leaning against the table, and said, —

"Forgive me, dear father, if I am compelled to ask you another question; but I can't possibly propose any expedient while I am so completely in the dark. I know that no mortgages can be given on Dorneck, but would it not be possible to sell a portion of the forest, and —— "

"Impossible!" cried the count in violent agitation. "The neighbors trouble themselves far too much about affairs that don't concern them even now. Only a short time ago, several of my beloved cousins presumed to remonstrate with me about the management of my woodlands. I suppose this wonderfully clever Werner, who constantly told me the same thing, is at the bottom of the matter. If I order more timber to be felled, I shall bring all my relations about my ears, and that would cause an agreeable scandal, which, to be sure, would be a special gratification to your mamma."

"Then I know of only one expedient, which, however, I propose with a very heavy heart, — we must try to induce my mother to help you."

The count uttered a sigh of relief. "Indeed! Has that idea really occurred to you at last, Ottomar?" he cried, almost with a laugh. "I think you might have mentioned it before, for any child must see it is the only way."

A sudden light flashed upon Ottomar's mind; he now perceived why his father had made him his confidant. He wished to avail himself of his son's influence over the countess to induce the latter to pay the needful sum, and moreover, if possible, spare himself a disagreeable scene. Ottomar, however, did not intend to smooth his father's way so completely, and there-

fore, contrary to the latter's expectation, said quietly, —

"It is very natural, my dear father, for me to shrink from the thought of imposing so heavy a sacrifice upon my mother, and before it is done, it is our duty to try to wrest from the usurer at least a portion of his spoils. At the worst, we can bring the matter before the court ——"

"Have you gone crazy, Ottomar?" cried the count, bursting into another fit of passion. "Do you suppose you are talking to one of your young ensigns, whose guardian pleads his minority to protect him? Do you intend to represent me as a fool or a lunatic, in order to defend me against the leech by means of the law? I hope you will acknowledge your father to be a man, who knows how to answer for his acts, and regulate your own measures accordingly."

Ottomar listened to this new outbreak of anger with a sad smile, and then said, quietly, "Then there is no other way except to apply to my mother?"

"Of course; and that as soon as possible. As her favorite, you will understand the best way of arranging this disagreeable business."

"I, father?" said Ottomar, opening his eyes in amazement. "If my mother is expected to make so great a sacrifice, I think she deserves the respect of having you go to her with the request yourself."

"Then I should succeed admirably. Was it necessary for me to call you for that? I think you must see that your mediation is desirable for both parties."

"I regret that I cannot fulfil your wish, but this course would be too repugnant to my own sense of right. I will prepare my mother, but you must ask the favor and settle the affair with her yourself."

The count drummed impatiently on the panes of the window at which he was standing, and then said, without turning, "It seems to be the fashion now for children to dictate to their parents; in my young days matters were reversed. However, if you force me to have a scene with your mother, I'll get through with it as soon as possible, so go and call her."

Ottomar instantly left the room, while the count continued to drum on the window-panes, and then paced hastily up and down the floor, while at every noise in the adjoining room his face twitched convulsively, and he seemed relieved when, contrary to his expectation, the door did not open. At last, however, the solitude appeared to become oppressive and his son's delay very long, for he glanced more frequently towards the door and muttered an impatient execration between his teeth. At last he heard his wife's step in the ante-room, and instantly took his former position at the window, that he might not be obliged to face her at once, and when the door opened did not turn, but murmured in an undertone, —

"Have you come at last, Vally? You have kept me waiting a long time."

The countess's face was deadly pale, there was a deep furrow between her contracted eyebrows, and her lips were tightly compressed. Her eyes were red, and the lids sometimes drooped as if overpowered by weariness, but her bearing was as erect as ever, though her usual composure had changed into an almost frightful rigidity. She allowed Ottomar to lead her to a chair, fixed her eyes earnestly upon her husband, and said, somewhat sharply, —

"I cannot possibly, at this distance and in the singular position you have chosen, discuss such an important matter with you, Edwin. Therefore, first of all, be kind enough to leave the window and sit down here with us."

There was something in the stern, resolute tone that startled the count, and made him instantly yield to her request. He took one of the chairs opposite to her, while Ottomar remained standing between his parents.

The countess leaned back in her chair and wearily closed her eyes; but the next instant opened them again and looked steadily at her husband.

"I will not reproach you, Edwin," she said in the same stern, cold tone, "it would be useless, and, in Ottomar's presence, doubly painful to us all. Unfortunately, I am compelled to detain him as a witness of the only conditions upon which I can undertake to help you."

"Oh! of course, I expected nothing different," replied the count, half contemptuously. "You are much too clever a woman, Vally, not to avail yourself of a state of affairs so advantageous to you."

"It would certainly be a weakness almost bordering upon crime, if I did not attach to my assistance conditions, which will protect us from similar occurrences."

The count cast a hasty, anxious glance at his wife. "What do you mean by that, Vally?" he asked eagerly; "I hope you will not take an unfair advantage of my embarrassment."

"The sum required," continued the countess, without heeding her husband's words, "will absorb nearly half of my property, for the bonds in which it is in-

vested are now below par, and if I am compelled to sell them at this time, I shall be forced to sustain very heavy losses. This property, however, is the sole support of my daughters, since nothing has been saved for them from the revenues of the estates."

"A somewhat superfluous remark, it seems to me, Vally. I don't see any necessity for such a detailed explanation of these well-known facts."

"But it is needful to recall these things for my own justification, dear Edwin, that you may realize the absolute necessity for my course of action."

Again the count cast a hasty, anxious glance at his wife, and said in an agitated tone,—

"Will you come to the point, Vally?"

"This property, which is already so small compared with their station in life," continued the countess, "I cannot, without violating my duty, so greatly reduce, unless I have some prospect of restoring it to them at some future day."

"So you want to economize; I proposed it long ago. How many retrieve their losses in that way! For instance, the Adlerwens drew scarcely three thousand thalers from the revenues of their large estates, and in two years all the debts were paid, and they can now live in the same style as before."

The countess's eyelids again drooped wearily, as she slowly replied, "To impose such a period of suffering upon ourselves would be folly. I have very little knowledge of the revenues of Dorneck, but I am aware that in comparison with the size of the estate, they are not large enough, that the expense of managing them is too great, and ——"

"Ah! So in future you want to have an insight into this management. I almost thought so."

The inflexibility, which for the moment was visible in the countess's whole demeanor, became almost unpleasantly apparent in her eyes, as she replied in a loud, stern tone, "I ask more, Edwin. I ask to have the whole control placed in my hands."

The count sprang from his seat, crimson with rage, and approached his wife. "Beware, Vally! Do not abuse your power in this way," he passionately exclaimed. "A bow too tightly bent breaks. Mark that, you clever woman, and let your good sense control your desire to rule."

This time the countess's eyes remained closed so long, her head sank back so wearily against the chair, that Ottomar feared she was fainting, and bent anxiously over her. But she gently waved him back, sat erect once more, and in the same stern, resolute tone, said to the count, who was pacing up and down the room,—

"Sit down, Edwin; I am unable to talk to you when you move about in this way."

The count unwillingly yielded to the request; the dark frown on his brow, and the firmly compressed lips plainly revealed the anger raging within him, and when he now turned towards his wife, it was with a look of actual hatred, which made her shudder. "Perhaps you have another similar proposal *in petto*, Vally," he exclaimed scornfully, "so be quick, my patience may not hold out much longer."

"Yes, I have still another, and a very important condition, without which even my management of the estates of Dorneck would be useless." The countess paused, took a long breath, which sounded almost like a moan of anguish, and then said in low, broken, but perfectly distinct words: "I ask, in the presence of your son, your word of honor that you will never sign a note again."

The count stared at his wife a few moments, as if he could not trust his ears, the veins on his forehead swelled with anger, he kicked one of the chairs that stood near him furiously across the room, and at last exclaimed in a voice trembling with rage: "This is too much. Your measure is full, Vally!" Then he continued in a somewhat calmer tone, "If you wished to avail yourself of your son's presence to insult his father, you ought at least to have considered that this scene will make a gulf between us, which can never, never be filled. I have borne your improper intermeddling with affairs that did not concern you, your boundless desire to rule, because I love peace, and because I remembered that you are the mother of my children. But if you think you can take advantage of my weakness to get me into your power with fettered hands, like a boy who is still in his minority, you somewhat underrate my strength of will. Never will I consent to conditions so dishonoring to me! You have thrown your missile rather too far, it has passed the goal, and as you desired to obtain too much, you are in danger of losing all."

"Take me to my room, Ottomar," said the countess faintly; "as the conversation with your father is over ——"

"Over! You seem to have a singular idea of the manner in which business affairs are managed, my dear Vally; for as far as I see, we are scarcely at the beginning of our discussion."

"I am sorry, Edwin, that I must remain firm in my views. I have mentioned my conditions, you have rejected them, and so the matter seems settled."

"Very well, and what is to become of the note? Do you wish to have the pleasant spectacle of seeing Count Rodenwald arrested?"

"God will enable me to endure even this," murmured the countess softly.

The count cast an almost timid glance at his wife.

"What does this mean, Vally? Is the honor of our name, our family, of so little value that even this extremity makes no impression upon you? Is our disgrace to be discussed in all the cafés, at all the old ladies' tea-tables, and wherever else these noble gossiping clubs may meet? I have upbraided you for arrogance, jested about the pride which induced you to give an undue value to the name of Rodenwald, and now you will drag this name in the dust, suffer it to be branded forever?"

The countess trembled from head to foot. "God has rebuked my pride," she murmured gently. "I bow under his chastening hand."

The count looked at his wife in actual alarm, approached her and gazed anxiously at the deathlike features, and rigid, motionless figure. "Vally!" he said gently, "I may, in my anger, have uttered words which did not come from my heart. Forgive them, and remember how terribly you had irritated me. Your conditions were dishonoring, and therefore impossible to accept, so you cannot insist upon them."

Again her whole frame shook with a sudden chill, as she answered mournfully, "I must, Edwin — God is my witness that I cannot do otherwise!" she cried passionately, raising her hand towards heaven, while large tears ran down her cheeks.

The count again drew back, the momentary gentleness was over, and he walked hastily to the window, while his wife leaned back in her chair with closed eyes. The long pause that ensued was even more painful to Ottomar than the previous conversation, and he at last turned to his father, saying, —

"Let me entreat you, dear father, to end this matter. I think you must perceive how terribly exhausted my mother is, and —— "

"And you therefore wish me to make myself her obedient servant, and moreover express the deepest gratitude for it. You probably think you will then be able to lord it at Dorneck yourself, but you are mistaken, you would soon feel the limit's of your mother's love."

"I will not answer a reproach, father, that can only spring from your momentary irritation. But what is to be done, what do you decide? Perhaps you will consider my mother's condition until to-morrow, and in that case, permit us to go now."

"What is the use of considering? The absolute necessity will be the same to-morrow as to-day, and that my wise wife unfortunately knows but too well." Then approaching the countess, he said gloomily, "Have you already formed any plan by which this transfer of authority is to be effected without exposing your husband and the father of your children to public scorn?"

"I have had too little time for reflection to decide upon the most expedient course to pursue. But I think a long journey and temporary charge of the business, which could afterwards be made permanent, will be best."

"You are like a quack doctor; you have the same universal remedy for all diseases," said the count, wilh a scornful laugh. "So I am to take a journey too! Shall I go to Altenborn, as the young ladies' mentor, or are matters to be reversed, and the girls act as mine?"

The countess suddenly rose from her chair. "My strength is exhausted, and I am unable to continue this scene," she said, with visible effort. It was with difficulty that she stood erect, clinging to the table for support, and after vainly waiting some time for the count's reply, she took her son's arm to leave the room.

The count stepped before her, and whispered passionately, —

"Have you considered, Vally, that this parts us forever; that in depriving me of my honor, you also extinguish every spark of love for you?"

She bent her head in assent, but was unable to speak, and when the count moved aside, walked on towards the door.

"Stop!" cried the count imperiously. "Rejoice in your victory! If *you* have no regard for the honor of your family, I at least will shun no sacrifice to avoid this open scandal."

From Blackwood's Magazine.

ABOVE THE CLOUDS: A REVERIE ON THE BEL ALP.

THERE is unquestionably, my dear editor, a singular charm about a château in cloudland. It is something like living in heaven. All our days we have gazed enviously at the snowy clouds and the blue skies overhead, as at a world remote and inaccessible. And now the clouds are drifting along below our feet. We look, through a break in the thunderstorm, not at the stars twinkling in the firmament, but at the lights burning in the valley. The Philistines of the plains behold a blue-black veil of mist drawn lightly along the mountain-side; behind that veil, in the old time, the immortal gods were hidden. *Nous avons changé tout cela.* Olympus could not have been one-half so comfortable as the hotel on the Aegischhorn. The Bel Alp, with a famous philosopher discoursing largely over the sparkling pine logs, is a more lively Walhalla. Pan is dead: and his place has been taken by the British tourist, Mr. Smith.

> The goats may climb and crop
> The soft grass on Ida's top
> Now Pan is dead.

The sweet *un*-reasonableness of woman, as Mr. Matthew Arnold would say, is never more manifest than when you meet her, like the herald Mercury, new-lighted on a heaven-kissing hill. Heine declares, in a charmingly graceful and characteristic passage, that he saw the young spring god, large as life, standing on the summit of an alp; and there is a whole covey of girls in the hotel just now, any one of whom might be taken, any day of the week, in the attitude of that blooming boy. With their petticoats gathered into a sort of beatified knickerbockers, these sweet girl-graduates of the Alpine Club prove themselves adepts on rock and ice. They have scaled every peak in the neighborhood; and when you see them trooping home from the Sparren-horn in the gloaming — the alpenstock serving for bow and quiver — you think of Diana hunting with her nymphs, or stooping out of her cloud to clasp Endymion.

> Tell thee tales of love, —
> How the pale Dian, hunting, in a grove,
> First saw the boy Endymion, from whose eyes
> She took eternal fire that never dies;
> How she conveyed him softly in a sleep,
> His temples bound with poppy, to the steep
> Head of old Latmos, where she stoops each night
> To kiss her sweetest ——

But tales of love are scorned by our blue-eyed virginal climber; if you wish to strike a responsive chord in the heart which beats under the braces of her knickerbockers you must become a Tyndall or a Huxley; and enlarge, *purpuereo ore*, on glaciers, and *névé*, and crevasses, and *seracs*, and moulins, and moraines, and *berg-schrunds*, and ice-tables, and ice-needles, and erratic blocks.

There can, however, be no doubt that the Bel Alp is one of the most delightful spots in this world (or out of it, for that matter, so far as I know yet). It occupies what is called in advertisements "a fine, airy situation," seventy-one hundred and thirty feet above the sea. You have no idea of what a storm can be and do until you have felt it in this upper world. The wind actually *raves* round about us at such times. I use the word "rave" advisedly, — it is intended to signify that Boreas has entirely gone out of his senses, and is as mad as a hatter or a March hare. (Why a March hare? and why a hatter? Have the Lunacy Board or the registrar-general any statistics on the subject?) At any rate, there is an ample store and a very lively interchange of ozone on our alp at all times, and that, I suppose, is what makes it so bracing. You feel the champagne in the air. You become electrical, and give out sparks like a cat. Even English dulness and stolidity cannot resist the infection, — there is a Scotchman here at present who has actually made a joke. (It has been sent home by parcel-post to the *Saturday Review*, with a request that the editor would ascertain whether it is a true joke, or only "wut.") The splendor of the mountain-peaks on the other side of the valley, rosy in the sunset, pallid in the moonrise, is enough by itself to drive an excitable man into a fit. There are moments when every one who can handle a brush rushes distractedly to his sketch-book. But the heavenly color on mountain and sky is as intangible as the coloring of a dream. (And, by the way, pray remind me to ask Professor Huxley if there *be* any coloring in dreams. I suspect, for my own part, that dreamland, like moonland, has no positive tints, but only light and shade, and the grey mystery of an atmosphere "unquickened by the sun.") Then the turf at our feet is the most wonderful enamel-work ever put together, and the grass itself is like the grass in Paradise — that is, in Dante's vivid words, *like emeralds newly broken.* Add to all this the delicious pastoral music of Swiss alp or Scotch hillside, —

> The hum of bees in heather-bells,
> And bleatings from the distant fells.

Yet, be it said frankly, a Swiss alp and a Scotch hillside are as different as possible. The lines I have quoted are Scotch to the core: they bring before us the hillside, fragrant with heather and vocal with the bleatings of the black-faced. There are, of course, swarms of bees in a country like this where *fragrantia mella* is the only luxury for which you have not to pay; but there is no heather and few sheep, only the tinkle of innumerable cattle-bells. The scenery in Wordsworth's poems in like manner is purely local, not to say sectarian. Even his mist is the mist of the Lakes, and of the Lakes only —

> Such gentle mists as glide
> Curling with unconfirmed intent
> On yon green mountain-side.

That is not the way in which a Swiss mist behaves itself — a Swiss mist exhibits none of the charming coquetry, of the maidenly indecision, which the Lake poet loved. Swooping down upon us as a *lämmergeier* swoops upon its prey, or flung aside in one breathless moment of delight, as when an immortal casts aside her cloud, there is no leisure for the arch by-play which suits the other so well. Dip into Wordsworth anywhere, and you will find that he has entered too deeply into the spirit of his own mountains to have much understanding of the mountains of other people. He may comprehend Yarrow; but then Yarrow was his near neighbor.

> The grace of forest charms decayed,
> And pastoral melancholy.

> The silence that is in the starry sky,
> The sleep that is among the lonely hills.

No: neither of these (nor many others as perfect that might be quoted) are in the smallest degree characteristic of our alp. The intense light, for one thing, is inconsistent with this tender pensiveness of the imagination. Then the sleep that is among the lonely hills may fitly be enjoyed in the Lake country — the natural sense of repose not being driven away from these quiet solitudes by any disturbing influence. How different it is in Switzerland, where the tension on mind and body is seldom relaxed! We are in the midst of the mighty primeval activities of nature. The glacier cleaves its way through the valley; the avalanche is never silent. Sleep, indeed! Sleep at your peril! Nor do I think that even Byron himself struck the characteristic note of Alp or Apennine. The mystery of the Scotch hillside haunted his memory, —

> And Lochnagar with Ida looked o'er Troy.

But there is one of Shelley's shorter poems, which has been fearfully mutilated by the printer (some of it past recovery) which, in four or five lines, presents us with a picture of all that is grandest, and noblest, and most peculiar in the scenery of the Alps, —

> dome, pyramid, and pinnacle,
> A city of death, distinct with many a tower
> And wall impregnable of beaming ice.

Do not fancy, however, from what I have said, that Wordsworth is ever out of place. His scenery may be local; but the moral element is world-wide. The grave and lofty homeliness of his imagination, indeed, has somewhat obscured our perception of the supreme felicity of its presentation. Any casual reader will be surprised to find how much of Wordsworth has become proverbial, is in daily use, has been incorporated into the English language as presently spoken. Running the eye over his pages, we find familiar phrases at every turn. "But she is in her grave, and, oh! the difference to me" — "A privacy of glorious light is thine" — "We feel that we are greater than we know" — "The light that never was on sea or land" — "The heavy and the weary weight of all this unintelligible world" — "Not uninformed with phantasy, and looks that threaten the profane" — "Sole-sitting by the shores of old romance" — "Plain living and high thinking are no more" — "An ampler ether, a diviner air," — these, and countless others, we owe to the bard of Rydal. This is the *curiosa felicitas* of speech: still it is a secondary, and not, as with Keats and Tennyson, a primary quality of the poem; and Wordsworth has been assimilated almost unconsciously — at least without direct recognition — by the English-speaking races.

And now, my dear editor, let us to business. Only, in the first place, you are, of course, anxious to learn how I got here. I wrote you last from Venice — probably in the worst of tempers. For, between them, they have contrived to ruin that precious gem of the Adriatic. Mr. Ruskin is firing a portentous battery of minute guns at the authorities; but is is no good. The free kingdom of Italy has played the mischief with Venice, as with much else in Italy. They have got a united people, and a parliamentary constitution, and the eternal principles of civil

and religious liberty, for which Hampden died on the field and Sydney on the scaffold, and I hope they like them. But to the lover of old cameos, and old pictures, and old streets, and old churches, Italy is not what it used to be. The virtue has gone out of it.

> Something ails it now;
> The spot is curst.

I had promised to meet the Macs on the Lake of Geneva; and my artist friends at the Academy had warned me that I was bound to visit, *en route*, the house in Cadore where Titian was born. *I* do not care much for shrines, artistic or ecclesiastical; but Cadore is among the Dolomites, and the Dolomites seem to exercise a peculiar fascination over the people who have seen them. So I resolved to go by the Dolomites.

We left the outside world at Conegliano, where we engaged an *einspanner*, which we kept till we reached Cortina. The country to Ceneda is as flat as a pancake; but Ceneda itself is a reminiscence of Venice — there are such charming little scraps of the old Venetian architects to be found in its streets and piazzas. We passed the first night at a small *albergo* near Santa Croce — a strange, uncouth, solitary house. But the landlady was blythe and buxom, and the charges were ridiculously small; and we slept in high, old-fashioned beds in the attics quite comfortably, though one of us dreamt of brigands. The whole country thereabouts is *eerie* — stony, desolate, God-forgotten — the houses cracked by recent earthquake, propped up by huge wooden beams, and looking as if another shake would reduce them to utter ruin. Yet the little bits of water — even the Lago Morto — are wonderfully blue, and the people (the children and young girls especially being of a most rare and noble type of beauty) are surprisingly handsome. The true Venetian comeliness, indeed, is to be found now only in the valley which so long was part and parcel of Venice — certainly not in Venice itself, where the women are extremely plain. Next day we drove up to Cadore, where Titian was born, through a valley which the yellow turbid Piave has covered with mud and stones. It is not till one mounts to the upper valley from Perarolo — a tremendous pull — that the glory of the Ampezzo Thal discloses itself. But from Cadore till it joins the Pustherthal at Toblach, it is probably the most singular and striking valley in Europe. These grand Dolomite peaks, which rise up in weird procession on either hand — the Pelmo, the Antelao, Sorapis, Tofano, Croda Rossa — are not of this world. The architecture of Pandemonium, — at least of some primeval, disorderly, titanic force of which we have nowhere else in this orderly old world any other memorial. It is with a feeling of absolute awe that we see afar off, spectral in the sunset, these splintered, fantastic pinnacles,— a feeling which grows more uivid when we enter the mysterious valley in which such weird pranks have been played. Among these devils' rocks a witches' Sabbath might be held — no doubt was, before all the witches were abolished. Not till we reach Hollenstein, however, is the valley at its grimmest, Cortina itself, the Dolomite capital, lying in a fair and fertile strath. The mountains stand back and leave you room to breathe; yet are they not so distant, but that the boom of the great bell of the campanile is heard in all their valleys. A child playing with matches in the barn had burned down Ghedina's Hotel, where the frescoes by the artist-son were really fine, and so we stayed at the Stella d'Oro "*conditta dalle Sorelli Barbaria.*" The sisters are proud of Venetian descent, and the house is daintily adorned with old Venetian furniture and old Murano glass, with the arms of the Barbaria figured upon it: still they are as attentive as if they had no noble connections, and the trout from the Misurina Lake, and the black-cock from the Caprili pine-woods were cooked in an unexceptionable manner. We were quite alone in the valley,— an enterprising Yankee — "Moses A. Dropsie of Philadelphia, U.S." — having left before we arrived. It is worth while to climb the southern heights to see the Marmolata — the queen of the Dolomites — and the Civetta; but the walk across the Tre Croce to Landro is not to be surpassed. We had a fine spring day for our ramble,— waves of mist, indeed, were surging through the passes, and clinging to the higher cliffs; but mist, if not too densely opaque, rather adds to the strange glamor of these Dolomite mountains. Until we reached the summit of the pass, we found the mule-track free of difficulty (on *that* side it was exposed to the sun); but from the three crosses till we sighted the Lago Misurina, we waded through deep snow. On the summit, just beyond the crosses, several prodigious crags of Dolomite have been discharged from the mountain overhead — the Christallo — and there they lie like huge cannon-balls across the road. It is

impossible to say how long they have lain there, for they are covered with vegetation — an aged pine, rooted in a fissure, springing from the most massive. We pass through a noble pine wood; a deep trench lies at our feet, with a brawling stream in its depths, and on the opposite side rises the wonderful *cirque* of the Croda Malcora — a gleaming crescent of rock and snow down which the avalanches thunder. There is no human creature in all that spacious valley,— no one except ourselves and the cuckoo, whose friendly note that day amid these ghostly solitudes sounded remote and unfamiliar. You know the kind of day — one of those miraculous spring mornings among the mountains, when the mist is dry and buoyant, and penetrated with sunshine. The lower snow-slopes shone brilliantly in the transparent light, and ever and again the great peaks were translated from partially veiled phantoms into shapes of dazzling distinctness. In the evening we came down upon Landro, a pleasant, homely post-house, where stout little Baur and his comely motherly wife (you will find their portraits painted by Ghedina in the best bedroom) gave cordial welcome to the first birds of passage of the season. A great Carinthian hound (Luc by name) sleeps summer and winter outside the door. There are splendid black-cock among the woods up yonder on the road to the Drei Zinnen — one is shot next morning, and brought in for us to admire. All night the Christallo is visible from our bedroom window, reflected in the Dürren See — a spectral presence dimly revealed to us by the forlorn light of the waning moon, which we had seen, in its full glory, a week before at Venice. There is a break in the valley-line just opposite the post-house — made on purpose, it might seem — into which the Drei Zinnen fit with mathematical exactness; and the Drei Zinnen, the three weird sisters, are the consummate flowers of Dolomite architecture. And then, bidding farewell to our kindly hosts, and promising that we would one day return, we enter the deep trench that leads to the Pustherthal. The profound shadow cast by a wall of rock two thousand feet in height, comes down upon us suddenly; but the shadow creeps slowly up the opposite face, and the eastern peaks keep the sun-glow for long. We left them behind us still brilliant with carmine, rising effulgently into the frosty silence of the gathering night. And then away along the pleasant Pustherthal to the great fortress of Franzensfeste, and over the Brenner to Innsbruck, which we found in a blaze of glory by reason of a snowstorm which had whitened all the mountains round about, — these mountains from which in winter the wolves, they say, look down into its streets.

A few days thereafter I joined the Macs at Vevay, and then we came on here. You will fancy, of course, that we drove up the Rhone valley, and got to the hotel in the course of the afternoon. Quite the contrary; it took us about ten days: and, zigzagging in the most delightful fashion, we entirely escaped that pestilential and most detestable swamp. This is how we did it.

Quitting the railway at Aigle, we wandered among the valleys in which Lanenen, Gsteig, An der Lenk, and Adelboden are situated, crossing from valley to valley by the Krinnen, the Trüttlisberg, and the Hahnenmoos passes. The people are primitive and homely, and the inns hospitable and unhackneyed. The great mountain wall is somewhat flat, as a rule; but the Wildstrubel and the Wildhorn are wild and romantic, and the path leads through shady pine forests, and across fertile pastures, over which crag and glacier rise gleaming into the sky. Then we crossed the Gemmi, and the Rhone valley at Susten, and walked up the glorious Val d'Annivers to Zinal. The Arpitetta Alp is one of the great places of Switzerland — the Weisshorn being chief among mountains as the Venus of Milo is chief among women. From Zinal along the watershed to St. Luc; from St. Luc to the Bella Tolla, and across the snowy Meiden pass to Gruben, in the Turtmann Thal; over the Jung Joch to St. Nicolas, Stahlden, Visp, — nowhere else in Europe will you find the mountain glory and the mountain gloom in more absolute perfection; for in each of these southern valleys the vestal Weisshorn is the *genius loci*.

Now, my dear editor, I have reached, at length, one of the main purposes of this epistle, and that is to thank you for the bundle of new books which I found waiting me here. A volume by Froude, a novel by Mrs. Oliphant, a large and liberal discourse by Stanley, or Tulloch, or Abbott, the current number of "Maga," what more can the heart of man desire among the mountains? This last volume of "Short Studies" seems to me to contain some of the very finest things that Mr. Froude has written. "Our English," as Milton affectionately called it, has seldom been used to better purpose. How weighty the argument, how graphic the illustrations, what picturesque-

ness of style, what a wealth of thought! A man of genius like Froude ought to be a Tory, not merely because men of real imagination are Tories by instinct (the only literary Radicals being lean logicians like Mr. Mill), but on the special ground that nowhere else that I know of do we find the Tory point of view more adequately and brilliantly stated than in these essays. Of course we shall have some ill-conditioned animal yelping at his heels: as Dryden had his Shadwell, as Pope had his Dennis, so Froude has his Freeman. There are certain courtesies that are happily observed in our literary as in our political society — a temperance of manner as well as of language; but a superior person like Mr. Freeman is released from the restraints of common politeness. The violence with which he has assailed gentlemen of high position and character — Lord Beaconsfield, Lord Derby, Mr. Froude — seems to justify Mr. Arnold's complaint that an academy for the cultivation of what he calls "amenity" is urgently needed among us. One consolation is, that such grotesque animosity defeats its end — it puts the man who uses it out of court. We send our shrews, male and female, to Coventry.

What an afternoon! How silently the great peaks rise into the blue-black vault overhead! Yet even in this breathless summer-time we have a deliciously balmy breeze on our alp. That is the advantage of a fine, airy situation on the southern slopes of the Finster Aarhorn. Don't suppose, by the way, that I am an indiscriminate admirer of fine, airy situations: a fine, airy situation during a Swiss summer is one thing; a fine, airy situation in your beastly and infernal climate (pardon the *Freeman-ism*) is another; the truth being that in a country tormented by the devil, in the shape of the east wind, shelter, adequate shelter, is the one thing needful.

Froude, and Stanley, and Tulloch, and Mrs. Oliphant are read by everybody; but there is one modest little volume in your wallet which, from its very modesty (though it has been published, I see, for some months), may possibly pass unnoticed in these noisy times. This life of an unknown Scotch probationer * is equal in interest to anything of the kind we have had since Carlyle's "Life of Sterling" was written. I wish you could get one of your best hands to recommend it to the public; for Thomas Davidson as a poet, as a humorist, as a simple, loving, honest, reticent, valiant soul, demands adequate recognition at your hands. Meantime there are one or two things that may be said regarding him before I close this epistle. What he was, what he did, and what he proves, is the arrangement — is it not? — which your sententious Puritan logician and divine (a capital good fellow at bottom, in spite of his theology) would adopt.

Thomas Davidson was born in 1838, and his death took place in 1870, so that he was thirty-two years of age when he died. For four years before his death he was an invalid. He was bred in a Border parish school; his father was a Border shepherd; nearly all his life he lived in a Border cottage. He went from the parish school to the university (where Aytoun, as was his wont, gave him kindly recognition); he studied for the United Presbyterian Church; he became a "probationer" of that Church; he preached for a couple of years; and then he died. A brief and unostentatious career, — glorified, however, in its uneventful homeliness by a rare vein of poetry and a rich vein of humor.

The key-note of the character is its sound and healthy, but modest, manliness. The *mens sana* is a most precious possession. Davidson began to sicken of the disease of which he died before he was eight-and-twenty; but sickness did not unsteady the even balance of his mind. It is after he is laid aside from active work that his humor is at its best and brightest, and his lyrical faculty in its finest mood. The whole picture is pleasant; but the finishing touches make it nearly, if not altogether, unique. The tender humorist looking at death sadly but fearlessly; going down the road that leads into the dark valley with a patient sweetness in the eyes that take a wistful farewell of the sunshine; untouched by envy, untainted by bitterness; simple as a child, and yet strong with a strength beyond the force of manhood. There is no loud or noïsy assertion, religious or political, anywhere in this life; but a gentle composure which never wearies, and a soft playfulness against which even the waves of death beat in vain. The poetry is genuine, the humor is genuine, and the character (that which underlies both) as genuine as the poetry and the humor. The humor, indeed, went deep into the life. It is impossible, some one says, to

* The Life of a Scottish Probationer: being a Memoir of Thomas Davidson. By James Brown. Glasgow: Maclehose. 1877.

imagine Sydney Smith in a planet from which *wit* is excluded; and one may be sure that Thomas Davidson's soul would be ill at ease, barely recognizable, in a world over which the soft, lambent light of humor does not play.

That is what he was; what remains to us of his genius is to be found in his letters and lyrics. The delicate life of a grave and quaint fancifulness pervades his letters. It would be a sin to break them into fragments; and the same is true of his poetry.* We must, as the Laureate has observed, take him all in all or not at all. That Thomas Davidson had the true lyrical faculty is undeniable; but he was terribly fastidious. Thus each of the trifles in verse that he has left us has that organic finish which is characteristic of works of high art — nothing could be taken away, nothing added, without marring the effect of the composition. So that I can only ask you to find room for one or two short swallow-flights of song which seem to me to combine the vivid simplicity and pathetic directness of the Border ballad with the cunning quaintness of the Elizabethan muse. Among our dantiest singers of songs a place must be kept for this humble licentiate of the U. P. Kirk.

This is a Border song, — musical exceedingly. It was written when he was twenty-one: —

THE AULD ASH-TREE.

There grows an ash by my bour door,
  And a' its boughs are buskit braw
In fairest weeds o' simmer green,
  And birds sit singing on them a'.
But cease your sangs, ye blithesome birds,
  An' o' your liltin' let me be;
Ye bring deid simmers frae their graves
  To weary me, to weary me!

There grows an ash by my bour door,
  And a' its boughs are clad in snaw;
The ice-drap hings at ilka twig,
  And sad the nor' wind soughs thro' a'.
Oh, cease thy mane, thou norlan' wind,
  And o' thy wailin' let me be;
Thou brings deid winters frae their graves
  To weary me, to weary me!

Oh, I wad fain forget them a';
  Remember'd guid but deepens ill,
As gleids o' licht far seen by nicht
  Mak' the near mirk but mirker still.
Then silent be, thou dear auld tree —
  O' a' thy voices let me be;
They bring the deid years frae their graves
  To weary me, to weary me!

In a "Reverie at the End of Summer" he gives us a picture of the Cheviots which may hang side by side with Wordsworth's picture of Yarrow. These are the opening stanzas: —

ON THE CHEVIOTS.

Once more, upon the hills!
  No more the splendor quivering bright,
  Which finger laid at summer height
Upon the lips of half the rills,
  Pours on them, but the year's most mellow
    light.
  Far through yon opening of the vale,
  Upon the slopes of Teviotdale,
The green has ta'en a fainter tinge;
  It is the time when flowers grow old,
And summer trims her mantle fringe
  With stray threads of autumnal gold.

The west wind blows from Liddesdale;
  And as I sit — between the spring
Of Bowmont and of Cayle —
  To my half-listening ear it brings
All floating voices of the hill —
  The hum of bees in heather-bells,
  And bleatings from the distant fells,
The curlew's whistle far and shrill,

* Yet human nature cannot resist the temptation (if in nothing higher than a foot-note) of asking you to look at the picture of certain Jeddart worthies on the occasion of the queen's visit: "But the greatest effort of all is the triumphal arches, and of all the three triumphal arches the great-grandfather himself is getting himself erected just close to Jack's door. Indeed, it darkens his shop a good deal. From day to day there is some new limb or feature added to this great triumphal arch, and the progress of it interests us all very much indeed. We all go and stare at it every fine day, and most of us whether the day be fine or no. I take my own stare in the forenoon about ten or eleven o'clock; the shopkeepers stare chronically. Then there are three grand stares every day by the work-people — at breakfast-time, at dinner-time, and after their tea. The grandfather of all stares will be to-night (Saturday), after they have got their beards shaved, but the damp forbids me to join in it. In short, we are all pleased but Wattie Lowrie. He asks — 'What the better wull she be o' gaun through a' that wud?' He advises Jack to 'pit a stop till't,' because it darkens his shop! Jack, in his reply, takes up ground which I consider impregnable. 'It's no every day, Wattie,' he says, 'that ane gets ane's shop darkened wi' a triumphal airch.' To which Wattie has not yet replied, but he still holds out about the futility of 'a' that wud;' and as he is very deaf, and the benefit to be derived from passing underneath a triumphal arch metaphysical and difficult to be expressed, I fear he will never be able to get over his difficulty. Like most deaf people, too, he gets deafest at the approach of conviction. However, since writing the above, I have heard of another case of discontent — a case of a somewhat different complexion. It seems that we are all pleased except Wattie Lowrie and Archie Knox. This malcontent is engaged in the dissemination of pounds of tea; he lives by hawking tea about the country, principally among the hinds' wives. He has followed this occupation for a long time; he makes his round periodically; he rides on a small pony; like the minstrel boy and the wild harp, Archie rides

'With his tea-bags slung behind him;'

and he is a very decent man — what people call a 'serious man,' indeed. Like Wattie Lowrie, he also is impressed with an overwhelming sense of the utter futility of *wud*, but he does not stop there; his theory of futilities includes everything of a material kind, everything visible to what the ministers call the 'eye of sense.' 'Man,' he says, 'wad they gang into their closets and pray for her!'"

And babblings of the restless rill
That hastes to leave its lone hillside,
And hurries on to sleep in Till,
Or join the tremulous flow of Teviot's sunny tide.

"On a Certain Premature Report" (in its mixture of grotesque gaiety and gloom, irony and deep sadness, by far the most striking of his poems) is too long for extraction; so also is the delightful "In Redesdale," — though a few verses from the latter will bear to be detached.

Then brake the light of morning clear
O'er that old field of Border fray;
And rose to inward eye and ear
The armor-gleam, the battle-bray,
And all the ballad-singers say
Of the stout deed that here was done
About the dawning of the day,
When Earl Percy was led away,
And a dead Douglas victory won
In Redesdale.

The Percy ta'en, the Douglas slain,
I watched them borne for Teviotdale,
Till I, too, in the proud, sad train
Bore bloodied sword and battered mail.
But suddenly the dream did fail:
Vanished the form of either earl
With spear and pennon from the vale,
For there sate she, this winsome girl
Of Redesdale.

She sate beside a tiny stream,
Which by the highway-side outwelled
From moorland into morning-gleam;
One hand a half-filled pitcher held,
The other caught, and would have quelled,
The little waves which chafed their strand;
O foolish waves that still repelled
The daintiest little lily hand
In Redesdale!

"Love's Last Suit" might have been written by Herrick in his best mood: though even in his best mood it has a touch beyond Herrick's reach.

LOVE'S LAST SUIT.

Love, forget me when I'm gone.
When the tree is overthrown
Let its place be digged and sown
O'er with grass; when that is grown,
The very place shall be unknown.
So court I oblivion;
So, I charge thee by our love,
Love, forget me, when I'm gone!
Love of him that lies in clay
Only maketh life forlorn,
Clouding o'er the new-born day
With regrets of yestermorn.

And what is love to him that's low,
Or sunshine on his grave that floats?
Love nor sunshine reacheth now
Deeper than the daisy roots.
So, when he that nigh me hovers —
Death, that spares not happy lovers —
Comes to claim his little due,
Love, as thou art good and true,
Proudly give the churl his own,
And forget me when I'm gone!

And, finally, here is a "Love Sonnet," sent to the correspondent to whom so many of the letters and verses are addressed, a year or two before he died.

LOVE SONNET.

There is no date in love's eternal year
Saving its first, — O deeply loved and long!
Nor shadow invades the sunshine clear and strong
Which dominates forever its azure sphere.
Yellow the woods grow — yellow and winter-drear;
Storms trample down the infinite leafy throng,
Even as my fortunes. Yet the spirit of song
Lives in me, and the warmth of hopeful cheer.

There is no winter in this love of ours!
Thinking whereon, when with least clemency,
This winter of the world and fortune lowers,
Straightway that summer's noon breaks in on me,
Which has no ending nor decline; whose flowers
Are of the soul, and share her immortality.

The moral of the life is (and now we reach the last head of the discourse), that Davidson could not have been what he was except for the parish school and the Ancrum "dominie." The old parochial system of Scotland (when one comes to look at it through the lives of men like Robertson of Ellon or Thomas Davidson) was a rarely successful invention. In every parish there was to be found a teacher with some sort of scholarly acquirement, and with a certain capacity, as it would seem, for imparting his classical lore to his pupils. Year after year one (or more) of his boys was drafted off to the nearest university. This year it might be the son of the laird; next year it might be the son of the laird's shepherd: there never was a more democratic institution. Once at the university, the lad's course was clear; thereafter he could not accuse the partial gods of keeping him a peasant or a ploughboy; it depended upon himself whether he was to return to the hovel in which he was bred, or to take his place in the world where fame and fortune are won. The Church, the bar, the army, have been thus recruited from the ranks of the peasantry; and India, Canada, and Australia are indebted to the parish school for many an enterprising citizen and eminent

administrator. It is quite true that the humor and the poetry in some obscure fashion must have been in Thomas Davidson from the beginning, long before he went to school. Yet native and idiomatic as his vein of humor and his vein of poetry are, it is undeniable that without adequate culture, without the familiarity with the great masterpieces of our literature, which thorough culture alone can give, his rare and singular gifts would have been lost to us — he could not, in any view, have become the humorist and the poet that he was.

Is it true that you are going to change all this? Is it true that you are going to abolish the scholarly Scotch "dominie"? Is it true that the education of the Scotch people is to be handed over to the Philistines of Whitehall? It is hard to believe in such infatuation. I saw in the Greyfriars Churchyard the other day a monument which you have recently erected to a distinguished scholar, on which these words are written: —

In memory of Alexander Murray, D.D., born at Dunkitterick, in Galloway, 22d *October* 1775, *died* 15*th April* 1813, *aged* 37 *years, and interred here. Minister of Urr* 1806–1813; *Professor of Oriental Languages in the University of Edinburgh,* 1812–1813. *This monument was erected by admirers chiefly connected with Galloway, to commemorate the genius and fame of the "Shepherd Boy," who rose to be the most eminent linguist and oriental scholar of his day.* 1877.

One comfort is, that no more subscriptions for monuments of this kind will be needed. When you have made anything like true culture impossible in the parish school, the shepherd boy will remain the shepherd boy to the end of the chapter.

I have zigzagged far away from our Alp: and there is no saying how much farther I might have wandered; but the peaks of the Mischabelhörner are growing grey in the twilight, and the glow has faded out of the sky. *Euge et vale!* or, as they say in the Gaelic, "May the Lord be long spared to preserve you!"

From The Westminster Review.

THE EDUCATION OF GIRLS: THEIR ADMISSIBILITY TO UNIVERSITIES.

ONLY twelve years ago the University of Cambridge consented to take the first step towards delivering the girls' schools of England from the sad state of irresponsibility under which they groaned, by extending the privileges of its local examinations to the feminine portion of the community. Previously to that date, every schoolmistress, with no past of university training for herself, and no future of external tests for her pupils as guide, had done that which seemed right in her own eyes; and seeing that her chances of enlightenment had been in general the least possible, one can only wonder that matters were not much worse than they were. Of desire for the best, there must, however, have been at that time a goodly quantity; for an address, signed by more than eight hundred teachers, was presented to the university, praying for the extension of the examinations, and increasing numbers and steady improvement have marked the examination career of the girls ever since. In the early years, as every one knows, the number and kind of failures in arithmetic were lamentable; but of late the school that has had the smallest percentage of failures in that subject is a girl's school. The past twelve years have indeed been years of rapid advance in the education of girls, and in the education of the public mind to appreciation of a nobler ideal concerning it, as well as of constant struggle on the part of Englishwomen for certain long-withheld and much-needed educational and professional facilities.

But in 1876 the College of Physicians in Dublin declared itself ready to grant medical diplomas to women, and during the past year five ladies, three of whom had fought hard (how hard is well known) at Edinburgh, availed themselves of this sudden solution of their difficulties. Truly it seemed that the tide had turned; for, early in 1877 the Senate of the London University passed a resolution in favor of admitting women to its medical degrees, and appointed a committee to carry the resolution into effect. Soon after, however, a petition, signed by two hundred and fifty medical graduates, was presented to the Senate, praying it to rescind that resolution; and on the 7th of May a stormy meeting of Convocation issued in a resolution, carried by a majority of thirteen, declaring it advisable that admission of women to the medical degrees should be postponed till the question of admitting them to degrees in general should first be settled. Many hearts, perhaps with an undue appreciation of the powers of Convocation, were saddened by this vote, implying, as every one knew it to imply, a vigorous attempt at indefinite postponement of the immediately possible reform,

by adding to its opponents the hostile forces of other professions.

The Senate hearkened to Convocation's voice — not with the effect intended, but contrariwise. At the meeting of the 20th of June, the Senate resolved to adhere to its decision of opening the medical degrees to women, and further to apply to Parliament for a new charter, enabling it to open the other degrees also. Thus the general question was settled, so far as the university alone can settle it; and we hope there will now be only the necessary delays in at last making university degrees attainable to women in England.

Tardily, indeed, has the concession been granted. The men and women of a hundred years hence will perhaps read its history, and not be struck with the prominence in it of the boasted national instinct of fair play; for in England, last of all civilized countries, has this instinct triumphed over use and wont; the freest of European lands has been the last to accord, not only equality of educational privileges, but even liberty of professional choice in any form to its women — surely a strange anomaly, not even matched by the parallel anomaly that in Germany, where the importance of education and the equal right of every citizen to it is most clearly recognized, the separation between boys' and girls' education is slowest in being bridged. Arguing with eyes shut, one would say: in England they will not make mighty efforts about educating girls equally with boys, but they will cede to every Englishwoman her British right of doing what she likes; whereas in Germany they will raise and widen the education of German girls as much as any one can desire, but they will take care to give German women no chance of stepping out of their sphere into masculine professions. But England can now boast a goodly list of girls' schools where Latin, mathematics, and natural science are taught, besides associations for the extension of university teaching, and a ladies' college in all details of curriculum and examinations a veritable equivalent for those of Cambridge, and yet no amount of equivalent examinations gains a degree; while Germany offers a university career to women in Leipzig and elsewhere, but has no means of preparation for it — the higher girls' schools being inadequate on account of their limited range of study, and not comparable at all to the *Gymnasien* of the boys, though efforts to obtain the equivalent of these have already begun.

The doctrine of the equality and similarity of education for boys and girls was first preached and acted upon in America; but even there it is scarcely half a century old. Before the year 1826 girls were only allowed to attend the schools of Boston, Massachusetts, during the summer months, when there were not boys enough to fill them. In that year an attempt was made to establish a high school for girls on the plan of those already existing for boys. Two hundred and eighty-six candidates presented themselves for admission, while the applications for the boys' high school had never exceeded ninety. This eagerness for knowledge, so unbecoming in girls, was too much for the good people of Boston to endure unmoved. In the words of the school committee of 1854, the school had an "alarming success;" and accordingly, after eighteen months' trial, it was discontinued. After this, however, the girls were allowed to remain in the grammar schools throughout the year.

So America has had its days of women's education panic. But in the Western States better counsels soon obtained. Oberlin College was founded in 1833, offering equal advantages of education to both sexes; and both sexes have availed themselves of it; for up to the year 1873 it had graduated 579 men and 620 women, exclusive of 426 men in the Theological Faculty. Soon after, in 1837, Mount Holyoke Seminary, for girls only, was founded; Antioch, for boys and girls, followed in 1852; and Vassar, for girls only, in 1865. These are a few out of the many institutions which are now scattered far and wide through the United States, and act on the principle, still so much contested, that the similarity of mental development in average individuals of both sexes is so much greater than the difference (if there be any), that, for purposes of education, this presumed difference may be considered as evanescent. Michigan University opened its gates in 1870; Boston, founded in 1871–72, has admitted women from the beginning; and Cornell University yielded to the current in 1875. Harvard and Yale, the two great American universities, still resist all demands and entreaties, and perhaps this is the bitterest grievance of American women, though even it has been slightly alleviated, since some years ago, in 1873, Harvard consented to grant local examinations for girls. But be Harvard and Yale as unyielding as they may, when we turn from the story of the Boston high school in 1826, and observe that in 1867 there were 22 colleges in the States open to men and women

Original from CORNELL UNIVERSITY

alike, and in 1873, by the report of the United States' commissioner of education, 97, while Boston itself boasts a university containing, according to its annual report of 1876, 483 young men and 144 young women, the increase per cent. during the previous year having been 28 for the former and 41 for the latter, we are not inclined to think very badly either of the liberality of American men or the energy of American women.

And it does not seem that the education of American men has suffered from this liberality. "If any have cherished a fear that the admission of women would tend to reduce the standard of work in the university," says the president of Michigan University in 1873, "their attention may be drawn to the fact that during the last three years we have been steadily increasing the requirements for admission and broadening the range of studies;" and again, in 1872: "Their presence has not called for the enactment of a single new law, or for the slightest change in our methods of government or mode of work." Similar testimony reaches us from the other universities. The Boston report, before referred to, states that in several cases the presence of the women has aided in elevating the standard of scholarship, and that at all times their influence has promoted order, studiousness, and a true social culture.

Side by side with this powerful educational movement, the sister movement of opening up the professions to women has been also making steady way. The attainability of university degrees, and the instruction leading up to them, involves this indeed, as giving the efficiency and the guarantee of it which are the main requirements for entering a profession; but quite independently of the general educational question, the medical education of women early became in America, as elsewhere, a matter of supreme importance. On the first Wednesday in November, 1848, the first medical college for women in the world was opened at Boston. This second shock fell hard on public opinion in that city; but twelve women were found brave enough to face the storm and form the first class of lady medical students. This was the small beginning of a movement that has since spread so rapidly over America and Europe. In 1850 the Female Medical College in Philadelphia was opened, one in New York in 1863, and another in 1868. As a consequence, we find that the census of 1870 reports 525 lady doctors in the States, whereas in 1848 there was not one. Many of these are professors in the medical colleges, or hold public appointments; and their success in private practice leaves no doubt as to the existence of a felt want which they are fitted to supply. The purely medical male institutions have slowly enough recognized their professional sisters. The Pennsylvania College of Dental Surgery opened its doors to women only in 1873, the opportunity being speedily turned to account by two ladies, the first of whom received her diploma in June 1874. The first woman admitted to a medical society in New York was Dr. Mary Green, physician to the Women's Prison Association in that city, who was elected a member of the New York Medico-Legal Society in 1871.

All along, be it remembered, women were studying medicine in the universities open to them, not separately either, but in mixed classes. In reference to this we may again quote from the Boston University report: "From the first there has been no difficulty or embarrassment on account of co-education. . . . No lecture or operation has been restricted to either class, and the presence of the two sexes has been a wholesome restraint upon all." It is curious to compare this statement from those who have had experience of medical co-education with the woful prophecies of those who have had none. Usually the facts of the past are more believable than the predictions of the future.

Not till a later date did American women turn their attention to law as a profession. But inevitably the legal faculty in due time attracted its share of fair students at the universities; and in one state after another lady candidates for admission to practice in the courts made their appearance. Chicago, we believe, had the honor of being the first possessor of a woman lawyer. In 1870 there were five in the States, and since then several reports of other cases have reached our ears in England. Two ladies were admitted to practice at Utah, with much complimenting, in 1873. During the same year the first lady lawyer in Iowa was sworn in; and another young lady passed the best examination of any applicant, and was admitted to the bar as an attorney by the Supreme Court of Illinois. There are also several instances of lawyers' wives becoming lawyers, and practising in partnership with their husbands. A lady in New Hampshire was appointed justice of the peace in 1871.

Turning from law to theology, we find women as ministers of religion not infre-

quently. Their admission to the theological faculty at the universities would lead to this, and we do not hear of any peculiar difficulty in the state of public opinion respecting the adoption of this profession by women, such as we might expect at home, or indeed anywhere in Europe. In 1870 sixty-seven lady preachers recorded themselves professionally in the census.

Besides all these, we find a few isolated instances of women being employed in some of the other higher walks of life. In 1871 there was in Ohio a lady deputy-collector of the revenues, while in Cedar Rapids, Iowa, a lady was appointed chief-engineer of the fire-department, and in New Hampshire a member of the fair sex contracted to construct a section of the Valley Railroad. That America is not yet the land of perfect liberty is, however, borne out by the fact that in the profession of teaching, where women so largely outnumber men, their salaries are still for the same work considerably smaller. This points to the fact of considerable tension against them as regards other work generally, which, forcing them in this, the direction of least resistance, keeps up the time-honored custom of unequal payment. Nevertheless, Englishwomen may well congratulate their American sisters on "their lines having fallen in pleasant places" comparatively. The Englishwomen have an advantage only in this, that when they have won their cause wholly at one of the elder seats of learning, they will practically have won it throughout the country. For Great Britain, despite its hatred of centralization, has an essential unity running throughout its modes of thought and action in such matters; no one moves till there is a certain preparedness on the part of all, then the leaders move in rapid succession, and the rest follow like sheep. Whereas the world of the United States has to be conquered in little pieces, and the educational and professional facilities granted to woman are by no means on a par in all the states. Besides, any small American college can award degrees to its own students instead of submitting them to a true university test as with us, and the value of all degrees and the significance of the admission of women to them are consequently diminished. Even the conversion of Harvard would not be equal in its effects in America to those of the conversion of Cambridge or Oxford with us; and Cambridge has gone a much longer way towards conversion than Harvard has done. It is even possible that America, which was first in recognizing women's claims, may be last in recognizing them completely. In England, while "use and wont" hold out beyond all reason, the forces of opposition behind them are being rapidly dissolved away, so that soon there will be only this crust of "use and wont;" and when it yields, all will yield.

In California, a few years ago, a new university was opened to both sexes alike; and even so far away as the ancient capital of the Incas the new principles have found their way and their acceptance. A young lady of Cusco in 1875 applied for permission to study for the degree of doctor of laws, to which application the Peruvian minister of justice replied that the laws of the republic recognized no such difference between the sexes as would prevent the lady from being a lawyer. This answer touches the root of the whole matter; whatever difference there may be, it is not such as to justify the restrictions on human liberty and the artificial limitations of human intellect which we have made or allowed to grow up among us. It is quite beside the point to devote pages of physiological argument to proving that there is sex in mind, unless it be also proved (an arduous undertaking) that the mind-difference involved in sex-difference is such as to warrant the practical conclusions unhesitatingly and illogically deduced from the assumption of *some* difference.

While the far West was working out its solution of the problem of women's education and sphere after the fashion of a republic and a confederation, and while its example was exerting beneficial influence on the thought and intention of a certain section of the British public, eastern Europe had engaged itself on the same problem after the manner of a despotic government.

Previous empresses of Russia had interested themselves in the education of the girls of the nobility, and the schools they established for these girls became models for the voluntary efforts of the bourgeoisie. The present empress, however, proposed to herself a larger scheme, and in 1855 instituted a grand system of *Gymnasien* for girls of all classes, formed on carefully studied models taken from Germany and Switzerland. In a surprisingly short time, 186 establishments with 23,400 pupils were opened; and to these others have since been added, so rapidly did the demand exceed even this suddenly large supply. For such a work, State aid was indispensable; and there was the less difficulty about this, as the chief funds were derived

from the liberality of a former empress, Marie Feodorovna, widow of Paul I., who had left a large fortune for the education of girls. The curriculum of the new schools comprised Russian language and literature, French, German, geography, arithmetic, geometry, algebra, elementary physics and natural history, pædogogy, dancing, singing, and drawing. This was not the curriculum of our girls' schools twenty years ago, and most of us can only add Latin to it now. But to appreciate rightly the significance of this organized system of girls' schools in Russia, we must remember that it is not so long ago since the education of boys was also generally neglected in that country. Secondary educational provision has been made for both sexes almost simultaneously.

Certainly there were currents of opinion adverse to this education of women beyond their sphere in Russia twenty years ago, as there were difficulties in *noblesse* minds regarding the school association of the daughters of nobles and carpenters. But the new schools made answer to all these by distinctly announcing as principle of their action that — a woman is not necessarily and exclusively wife, mother, mistress of a house: before specializing her for any particular destination, it is necessary to give all the development possible to all her moral and intellectual faculties. As for the social difficulty, the gymnasiums very often had princesses for inspectrices and were under imperial patronage; the education was good, and the nobles were soon glad to avail themselves of it.

Educate a woman and she will immediately ask for something to do. The first pupils of the gymnasiums found this something in teaching. After a time passed in the Institution of Pædogogy — another product of this educational movement — many young women became teachers in the gymnasiums where they had been pupils. Thus the teaching gradually passed more and more into the hands of women, though the still existing want of a higher education necessitated the aid of men in the upper classes. Then the women became too many, and salaries were very low. Now, whatever theories theorizers may hold as to suitable feminine occupation, it is certain, as matter of experience in all countries hitherto, that women have always regarded the healing art as next in desirableness to education as a professional occupation. In Russia, however, there existed, and exists, among the tribes of Asia, and in the country districts generally, a special demand for medical women of some degree of professional knowledge and skill. Probably this was the reason, so far as it was not the absence of a reason to the contrary, why women were, as a matter of course, admitted to study medicine in the Russian schools, though not to receive degrees. But the number of these students increased, and their position in all likelihood raised itself by the influx of some of the cultivated Russian ladies from the gymnasiums.

The increase of numbers, and perhaps the possibility that these more cultivated women might make a demand for further privileges, must have excited apprehension; for suddenly the permission to study in the schools of medicine was withdrawn by government.

One Russian student, Miss Suslova, nothing daunted, went to Switzerland, and by much tact and patience won her way at Zurich, and was admitted into the university in 1864, her admission being speedily followed by that of another Russian lady. The number of lady students of all nationalities grew in this one university admitting them. In 1871 there were four students of philosophy and fifteen of medicine, and during the next year this fifteen grew to sixty-three. But in 1873 the numbers rose to eighty-eight of medicine, twenty-five of philosophy, and one of social science. Out of this total of one hundred and fourteen, one hundred were Russians, a fact explained by the educational facilities afforded to women in Russia, which we have roughly attempted to sketch. University education is an empty show without the supply of a secondary education high enough to lead to it, and without a public opinion recognizing its value; and so among all these students there were but few Swiss, for in Switzerland the notion of women's education being limited by her sphere, and her sphere by masculine will and convenience, decidedly prevails. Yet with what comparative ease were universities opened to women in Switzerland! Can it be that the liberality of men in extending their educational privileges to women is inversely proportional to the eagerness with which women of their own country desire them? We hope not; and, at any rate, granting them is a likely way of causing them to be desired. There is at present in Zurich a Swiss lady, Dr. Marie Heim Vögtlem, who began her studies at the university in 1868, and is practising with much success. We believe it was

thought at first by many Swiss that women physicians would never prosper in Switzerland.

In 1873 a Russian ukase was published, ordering the Russian women to give up their studies at Zurich, under pain of being disqualified, on their return to Russia, for admission to any examination, educational establishment, or appointment of any kind under the control of the government. The most important reason assigned for this step was to the effect that Zurich had become a centre of Russian revolutionary societies, in which the students were involved, some of them going "two or three times in the year to Russia and back again, taking with them incendiary letters and proclamations." The ukase also stated that those young women who really desired a scientific education had ample opportunities afforded to them in Russia, where the medical schools were then ready to admit them, and other educational facilities had been opened up.

The majority of the students obeyed the order of their government and returned to Russia; twelve remained in Zurich, thereby abandoning any intention of returning; and twenty-one applied to the authorities of Berne University for admission there. Without much difficulty this was granted, and in the session of 1874-75 there were thirty-two lady students at Berne — twenty-eight of medicine, three of philosophy, one of law.

By this time women were also admitted to the Polytechnic School at Berne, the Polytechnicum at Zurich, and to the Concordat examinations, enabling them to practise in the cantons.

Geneva University has followed the example which Zurich set to Europe. This has placed the French Swiss on a level with their German-speaking sisters, as compared with whom they were at a disadvantage before. At present there are two ladies studying medicine at Geneva.

The numbers at Zurich are now reduced to about six, but at Berne there is a larger number. This falling off is, of course, at once explained by the opening of universities elsewhere, and especially in Paris, which has naturally become the chief centre of medical instruction for women.

As regards the intellectual capacity of women for the advantages granted to them, professors at Zurich and Berne have spoken as professors of Michigan and Boston spoke. They, too, have not found the minds of the weaker sex a drag on those of the stronger. Up to the present, fourteen women have graduated at Zurich; and if this seems a small number, we would remind our readers that a great many of the Russian students did not all along intend to complete the course, and, therefore, according to that intention, stopped short of the degree.

The first of the Zurich students, having obtained her degree, returned to St. Petersburg, and presented herself for the state medical examination, which it is necessary to pass for admission to practise in Russia, and as a foreign physician she was admitted and passed. Then, after spending some time at the hospitals of Prague and Vienna, she established herself in the Russian metropolis, and is now in very successful practice.

Meanwhile the events in Switzerland had made it evident that Russian women were thoroughly in earnest about obtaining entry for themselves into the medical profession, and in 1872 an imperial decree gave them admission, under certain conditions, to the Russian schools. Classes for women were formed at the Medical Academy in St. Petersburg, during November of that year. The professors and lecturers were the same as for the young men; but the requirements for examination were different, and the diploma granted was called a diploma for the diseases of women and children. Though required to attend the lectures on legal and forensic medicine, they were not examined upon these subjects, or, strange to say, upon nervous diseases, but were supposed to go more thoroughly into the special diseases for which they received their diploma; also the course prescribed for them was reduced to four years instead of the usual five.

Energetic attempts were at the same time being made to obtain a higher general education for women, in addition to the good secondary education which they already had. In 1869 a system of university lectures for women was organized in St. Petersburg; and in 1873 a college for women was opened at Moscow in connection with the university there, the first professors of the university being engaged to teach the classes. And here we may mention, as an interesting fact, and illustrative of the close connection in the public mind of the imperial family and education, that the Russian municipalities, as a mode of complimenting the daughter of the czar on her marriage, made a number of educational donations, and founded exhibitions for students quite remarkable in liberality. All the gifts were not to girls, but the girls had, it seems, the larger

share. Meanwhile the friends of girls' education in England hope to get something in time out of ancient, misapplied, or possible future endowments, and the same class of people in Ireland petition for some of the Irish Church spoils, and the higher education of British girls has struggled into its present hopeful condition by dint of private effort and good-will.

Turning now to France, we find, on the one hand, universities granting instruction and degrees to women; on the other, a separation of the education of boys and girls surpassing even England ten years ago. The education of boys is wholly under government control, and is much more in accordance with the modern spirit, and, for the generality of students, very much better as a whole than in England. But for girls there is no system of schools organized by government, and only a few municipal schools, leaving the chief work of secondary education to be done in the convents, or by the private enterprise of those who object to the convents. When a government is so paternal as to look after the boys, it seems hard that the fate of the girls should be left to chance. This is not all, however. To protect the youth of France from quack education, every teacher is required to pass an examination and receive a certificate of his efficiency. But nuns are not required to pass examinations, and nuns are allowed to teach young girls, and have been their chief teachers hitherto. The State, so careful of half its children, neither provides for nor protects from imposition the other half. Thus, while the boys are trained to scientific thought, the minds of the girls are steeped passively in superstition, and a little surface smattering is held as the feminine counterpart of solid knowledge; after which the men of France, like men elsewhere, wonder that women are so incapable of reasoning.

We cannot do better than quote M. Léon Richer's description in "*La Femme Libre*," of the accepted model of a girl's education:—

> The studies pursued in boarding-schools are what we might expect them to be, that is to say, very superficial. Grammar, arithmetic, geography, history—in particular sacred history—a little botany, and a little astronomy (one is reminded of the well-known use of the globes), form their basis; to this certain social accomplishments are superadded.
>
> But great would be the reluctance to teach the dead languages there, to teach mathematics, geometry, chemistry, physics, philosophy, —above all philosophy! In short, any kind of learning which widens our horizon and develops our intellect—any kind of discipline which teaches us to reason.
>
> Men have lyceums, women have convents; men have public lectures on law, on literature, on history, on physiology, on anatomy, and medicine. . . . Have women an equivalent for these things? No.

This description might have been written of a section of girls' education in England twelve years ago, but it could not have been written in the year 1877. There may be schools not unlike the French convent, though scarcely so inaccessible to new ideas, in England now; but these exist as a heritage from the past, and are rapidly being either improved or eliminated. The death-warrant of every one of the non-repentant among them is already signed, and beside them the schools of the modern type grow up and flourish not less in numbers than in scholarship. If we ask whether girls in England have the equivalent of boys' schools, we must answer, for a section of the community, certainly yes. In England, too, the education of girls has not a more distinctly theological cast than that of boys, the reverse of which makes the state of things in France so peculiarly mischievous and so peculiarly difficult to cure. Attempts are being made to cure it, however. The education of girls, if not under the guardianship of the State, is not under its control either, and it only remains for private enterprise to take up the matter, as in England, and by successful experimenting convert public opinion from the convent ideal of the past. Schools of a better class are being established in this way, and it may be hoped that the movement from above in the universities will go far towards encouraging this movement from below. We have much faith in French accessibility to new ideas, and French directness in giving them effect, as illustrated by French action respecting the universities.

The first attempt to gain an entrance into these universities was made by Mlle. Daubré at Lyons so long ago as 1861. Mlle. Daubré presented herself before the Faculty of Letters, and after causing much astonishment, and the creation of some difficulty, was allowed to pass her examinations. Then she claimed her diploma, which, on reference to the minister of public instruction, was refused. Mlle. Daubré told her story to M. Arles-Dufour, who set off for Paris the same night, and returned after three days with the diploma in his pocket. Thus the precedent was

made; another lady followed in 1869, and she has had her successors. Meanwhile Montpellier also granted a degree in arts to a lady in 1865.

There were in France during the early part of the century women distinguished in medicine. One, Madame Boivin, who died in 1841, was a member of the medical societies of Paris, Bordeaux, Berlin, Brussels, and Bruges, and as an authoritative writer on obstetrics has an European reputation. She was intrusted with the direction of the Hospice de la Maternité, and of the Maison Royale de Santé, besides other important offices. Before her was Madame Lachapelle, her teacher, who was esteemed one of the ablest teachers of midwifery during the latter part of the last century. She died in 1821.

These women, having made their way to the first rank of their profession, were honored as exceptions rather than regarded as precedents. But some time between 1860 and 1870 Miss Mary Putnam obtained the permission of the minister of education to study in the Paris School of Medicine. Mrs. Garrett Anderson followed her, and obtained her degree in 1870 with congratulations from her examiners on her success. Miss Putnam, who had been taking time for original researches during her studies, graduated in August 1871 with much honor. Paris soon became the centre for medical women, and in 1874 there were twenty students in the Ecole de Médecine. Every one of these, however, had, as every woman must have now, a special permission from the minister. Not long ago, also, a young American lady succeeded in obtaining the degree of bachelor of arts from the "Faculté de Science de Paris," the first to avail herself of the other than medical privileges of that university so far. And just at present one lady, a Russian, is studying in the schools of law.

At the end of last year, 1876–77, there were twenty-two women entered as students in the Medical Faculty — five French, six English, eleven Russians. During that year five women received the degree of M.D. — two English, two Russians, one German. There are now fourteen Englishwomen studying medicine in Paris. We see from these facts that it is quite as much, or rather more, in her character as one of the capitals of the world than in that of capital of France that Paris has undertaken to supply the demand of women for a medical education. In Paris, as in Switzerland, it was the request of a foreigner that opened the university to women, and in Paris, as in Switzerland, it is to foreigners still the greatest boon.

The education of German girls may be good, but the education of German boys is a great deal better. German girls are educated to be German women; and German women are destined, if not by nature, at least by man, to domesticity of the narrowest type. The party who take exception to this narrowing down of human thought and life — for such a party does exist in Germany — distinctly look to England for light, and covet the action of the English universities with respect to the secondary education of girls.

Germany has an organized system of *Gymnasien* and *Realschulen* for boys under the control of the State, a system which supplies, it may be said without fear of contradiction, the best secondary education in the world. For girls, government has furnished no equivalent. Private effort has done something to supply the want, and of late years *höhere Töchter Schulen*, not recognized as part of the State system, have been established. The undefined position of these schools led to a general conference of their directors and teachers in September 1872; and from the resolutions of this conference we learn several facts: —

1. That the object of the higher girls' schools is to impart intellectual culture to the rising generation of girls, and to occupy for them the place supplied for boys by the *Gymnasium* and the *Realschule*, and that its future development consists *not in a direct imitation of these institutions, but in such organization as is adapted to the vocation of women:* that technical training is therefore to be avoided.

2. That it aims at the harmonious development of the intellect, mind, and will, in accordance with the principles of art, morality, and religion.

3. That the same elementary teaching be given as in elementary schools, such teaching to serve as a basis for further training in general knowledge; and in two foreign languages.

4. That the schools admit pupils from the ages of six to sixteen; the school course to be divided into three sections and to cover ten years.

5. That the staff of teachers consist of a director and masters with university degrees; also experienced elementary masters and certificated mistresses.

6. That the State, in acknowledgment of the fact that the higher girls' school shall be a public institution under the immediate control of the municipal author-

Original from CORNELL UNIVERSITY

ities, should endeavor to promote its establishment whenever needed, and admit it to the same State jurisdiction as the *Realschule* and the *Gymnasium*, and that the masters and mistresses should enjoy the same privileges as the teachers in those schools.

We see, then, that the scheme of the higher girls' schools in Germany does not rise above the notion that there is in the feminine mind and the feminine vocation some peculiar reason for ending the years of education at sixteen, and excluding classics, mathematics, and science generally from its programme. We see, also, that it is thought desirable to place this peculiarily feminine work almost wholly in the hands of men, for the certificated mistresses rarely hold positions beyond the fourth class. The fairness of this was discussed at the Woman's Union Conference at Eisenach the same year, but without arriving at a satisfactory conclusion. If girls' education is to be so limited, however, it is not surprising that there should be hesitation to place much control over it in the women who are themselves products of this limited education.

These schools certainly do not seem to us to supply the equivalent of the *Gymnasium* and the *Realschule*, and so think some Germans also. Hence, within the last seven years, attempts have been made in Berlin, Darmstadt, Bremen, and other cities, to give opportunities for further culture to girls above sixteen, by means of courses of lectures somewhat similar to those in England. And at the Women's Union Conference also, in the year 1872, a paper was read by Dr. Wendt on a proposal for the institution of a parthegogium, or real gymnasium, for girls, in which they should receive the same intellectual training as is given to boys. The conference expressed interest in the scheme, and no doubt the idea will work and bear fruit in time; but opinion in Germany is hardly ready yet for the actual levelling of the time-honored barriers that separate mind male from mind female. Dr. Wiese, in his "German Letters on English Education," devotes a few pages, not very much to the purpose, to this novel American gospel of education for women, concluding by the statement that the thing is wholly un-German, and therefore, we suppose he means, to be disliked.

But notwithstanding all this, there have been women in Germany who contrived to "step out of their sphere," and receive, instead of condemnation, university degrees. Early in the century there was a Frau von Siebold who distinguished herself so much in the practice of midwifery, that the University of Giessen bestowed on her the degree of M.D. Frau von Siebold had a daughter, Marianne, afterwards Frau von Heidenseich, who studied at the universities of Giessen and Göttengen, and took her degree regularly in 1817. She died only in 1859, and was much esteemed as one of the first authorities in her special branch of science.

We suppose that these ladies, like their French contemporaries, were regarded and admired as quite exceptional, for we find no chain of successors such as would rapidly spring up to-day. The next instance known to us of a degree being granted to a woman in Germany is that of a young Russian lady who had for a long time been attending lectures in law at Leipzig, and graduated there in the early part of 1874. She was not long alone in her studies, however, for at the time of her graduation there were several other women attending lectures in medicine, natural science, and jurisprudence. We believe, however, they were not German women. Later in the same year one of these, a young Jewish lady, received the degree of doctor of philosophy; and Göttingen University also conferred a degree of doctor of philosophy and magister of liberal arts on another young lady, Miss Kowalewsky. Leipzig is the largest university in Germany, and contains about three hundred students. Women are fortunate in having the right of admission within its walls, and the privilege of graduation from it. We hope they will soon be able to bridge over the gulf of secondary education which at present yawns between them and it; but in Germany, where the habit of depending on the State in such matters has been formed, and the wealth of individuals is comparatively inconsiderable, this is not so easy unless the State steps in; and to convert the State is a difficult undertaking.

In Italy we find a low though improving state of secondary education, and universities that in truth were never closed to women. We cannot wonder at the first of these facts, seeing that Italy is still so fresh from the days of her regeneration, while we must greatly admire the disposition at all times implied in the second.

And Italy has not tarried long in regenerating the education, and consequently the general position, of her women. Previously to the year 1861 there was no State-recognized secondary education for girls at all, except that given in the nor-

mal training-schools for teachers. The sexes were on a perfectly equal footing as regarded these and the elementary schools; and girls, not intending to be teachers, frequently entered the normal schools only because there was no other way of continuing their education. This was not a very convenient way, because, while the elementary course was complete at twelve years of age, the normal school did not begin till fifteen. For those who chose them, there were, of course, the convent schools, which even now outnumber all the others; but these are a negative quantity as regards true enlightenment, though happily obliged, since 1866, under penalty of dissolution, to employ only teachers having the government diploma — a great improvement on things in France. There were also some institutions inherited from ex-governments not differing much in spirit from the convent schools, and six government colleges, one at Milan, Florence, Palermo, and Verona respectively, and two at Naples, with a course now somewhat similar to that of the new schools. These were and are boarding-schools.

Thus, while it was possible for the poorest boy, from twelve to eighteen years old, to make his way from the elementary school to the university through the gymnasium, and for young men from eighteen to twenty-one to pass through the lyceum, for the girls there were only the elementary schools, and, perhaps, the convents. Frankly recognizing as wrong this inequality, the municipality of Milan in 1861 determined to establish a higher school for girls. The report of its scholastic council states the resolution thus: —

> In your work . . . there has been till now a serious deficiency which must be supplied. While, in fact, the instruction for males has a graduated course, that for females is cut short at the elementary course. The law has entirely forgotten that branch of secondary schools, as if women were entitled only to a superficial and most elementary instruction, and as if it were not rather of great moment to educate the intellect of those who are to be the earliest teachers of men. It is, therefore, the duty of the municipality to give to women also that amount of average instruction which none but those occupied in the humblest manual labor should be without.

The municipality accepted this view of its duty; the project was realized, and no expense was spared to render the new school efficient. In 1864 Turin followed the good example, and then the government, appreciating the importance of the movement, promised large subsidies to all cities that should do likewise. So now in Asti, Genoa, Venice, Padua, Bologna, Florence, and last of all in Rome also, schools of the same kind have been organized. The Roman school was opened only in January 1874. They are all public day-schools, somewhat similar in scope and organization to the endowed girls' schools and the new high schools of the Girls' Public Day Schools Company in England.

> The curriculum is divided into a lower and higher course. The lower, besides the ordinary branches of school instruction, includes the outlines of natural science, domestic economy, and hygiene, geometry, and drawing. The higher course . . . adds the elements of moral philosophy and social economy, the history of Italian literature, foreign literatures, political geography, the history of the Middle Ages and modern times, the elements of physical geography, natural history, physics, and chemistry. Optional subjects, without extra fee, are French, English, and German, gymnastics, choral singing, and needlework; with extra fee, landscape and figure drawing, and instrumental music.

Considering the state of things which it followed, this curriculum promises well for the full intellectual recognition of Italian women, when time enough shall have been given for the new ideas to grow and give birth to higher ones. The chief fault that may be found with these municipal schools is the limitation of the learning age to sixteen, but the stimulus given to the education of girls by the opening of the universities to women will probably lead to some arrangement by which the time and the studies may be extended, at least for some of the pupils.

This limitation of age reminds us of Germany, but in the matter of State recognition the Italian municipal schools are very much better off than the German higher girls' schools. The whole course of instruction is drawn up by the scholastic council of the municipality or of the State, according to circumstances; and the schools are placed under the same official inspection, and their yearly examinations are conducted by the same public authorities as those of the gymnasiums and lyceums. Indeed, the interest shown throughout by successive ministers of public instruction in improving the education of girls has been most encouraging, and has considerably smoothed the path to knowledge of women in regenerated Italy.

As regards the higher education, a society for its promotion was formed at Rome

in connection with the high school there on its establishment, and courses of lectures were accordingly given to ladies by the professors of the university. Some classes with a similar object were, about the same time, formed at Genoa. But these attempts were not long left, any more than the attempt to obtain secondary education was left, without aid and recognition from above. In 1876 a State decree formally opened to women the fifteen universities of Italy. Actually they were not closed before to those earnestly desirous of using them, and many exceptional women had used them in the past; but neither were they actually open in the sense of women having an equal right in them with men. In the year that the universities were opened a lady received a medical degree at Pisa, and two others are thought likely to distinguish themselves in the Faculty of Arts, one at Bologna and one at Turin.

The higher education of women is now as completely provided for as the higher education of men; but the secondary education of the fairer sex still needs improvement in order to render it equal to the secondary education of boys. This distinct uplifting of a university goal must, however, accelerate immensely the efforts to improve this education. Last year a movement was set on foot in Florence to provide for girls the same means of pursuing the studies preparatory to admission into the university which the State supplies by gymnasiums and lyceums for boys. We quote from the circular issued by the promoters of this excellent design:

> All those who have favored and promoted a higher education and instruction for women must rejoice that, whenever a larger field of education and instruction has been opened to them, Italian women of all classes have eagerly and confidently pressed into it. And the facts have corresponded to the hopes entertained, for each year a goodly number of excellently instructed pupils have issued from all the schools opened up to this time for the instruction of women. These admirable results convinced many of the possibility and expediency of imparting to women a larger and more solid culture than they had hitherto received; and, inspired by this conception, the Bonglic Regulations admitted them to the universities of the State, to pass through the course of studies required for the laureate,* and for matriculation in any of the faculties there taught. But, to arrive at the university, it is necessary to pass through the gymnasium and the lyceum; and, as yet, no gymnasiums or lyceums exist for women in Italy. . . . In order, therefore, that the Regulations should not remain a dead letter for most girls, a gymnasium first and then a lyceum should be opened for them, where they could go through the studies necessary for admission to the university.

Accordingly, the circular announced the opening of a gymnasium in Florence the following November, provided that twenty-five pupils were secured; and further, that on the application of ten families a lyceum should be opened in addition to the gymnasium. It was proposed that the necessary funds should be raised by shares.

But the history of the education of girls in Italy has not hitherto, as we have seen, been that of a painful struggle, against adverse circumstances, into existence; and now a law to establish gymnasiums for girls is under discussion, and will, no doubt, soon be passed. When this law is passed, the schools will be gradually established all over the country, and Italy may probably be the first of all civilized nations to obtain a completely organized system of education, from the elementary school to the university, perfectly fair to all classes and to both sexes alike. This would well befit the land on which the first rays of the Renaissance fell.

Mention has already been made of the consideration at all times shown to women by the Italian universities. No other country can boast so many early manifestations of liberality or gallantry, whichever it was; and pre-eminent among Italian universities stands Bologna. So long ago as 1209, the degree of doctor of laws was conferred on a lady whose name was Betisia Gozzadini; and other instances not quite so early occurred at Padua, Milan, Pavia, and elsewhere;* while at Bologna, in 1380, there was Maddalena Buonsignori, professor of laws. The last century is rich in distinguished Italian women at the universities. At Bologna, in 1733, Laura Bassi was professor of philosophy, Maria Gaetana Agnesi, professor of mathematics in 1750; and Clothilde Tambroni, professor of Greek in 1794. Then, about the middle of the century, there was an Anna Marandi Mazzolini, whose husband held the chair of anatomy. It happened that he fell ill, and she, being a loving wife, sought to supply him the place of his enfeebled powers. So she became an anatomist, and presently delivered his lectures for him from behind a curtain. She be-

came famous, and was offered a chair at Milan, which, however, she refused, and remained at Bologna till her death in 1774. Her anatomical models in wax are the pride of the Anatomical Museum at Bologna. During the next half-century several other women followed in her footsteps, of whom the most distinguished was Maria delle Donne, who received her degree at Bologna in 1806, and was afterwards appointed by Napoleon Bonaparte to the chair of midwifery in that university.

This will suffice to show what kind of spirit the advocates of the intellectual rights of women had to encounter in Italian universities, and agrees well with the readiness evinced by the State and the secular authorities in general to aid the new movement when it reached the Italian shores. Another story might be told of priestly opposition and adverse influence, but that was to have been expected.

In Austria, there exists at present a considerable movement for improving the education of girls, and in 1873 a powerful society was constituted, originating, we believe, in Gratz, with a view to found schools, and spread the principles which it adopted by organizing branch societies throughout the country. It was announced that the first object of the society was to save women from the pernicious influence of the prejudices and superstitions generally propounded under the guise of education; and the programme of studies in the new schools was to include the German language, history, modern literature, and the natural sciences. As a scheme of superior instruction, this does not so very much impress us, and we fear the previous state of things which it reveals was indeed sad; but the upward tendency at all is a great thing, and in its time is sure to have its full effect. A new lyceum was shortly afterwards opened at Gratz. Before this time, however, the University of Vienna had stamped the new movement with approval by admitting women to degrees and as students in its classes where the professors do not object. This was in March 1870. In 1873, there were four ladies as medical students, one of whom took the prize for an essay on "Operative Course in Surgery," and was pronounced by the professor to be one of the best operators in the class.

In Austria, therefore, as almost everywhere else, the professional difficulties of women are fairly solved, and the higher education is placed within their reach. It remains to make them generally capable of reaching it, by completing the reconstruction, already begun, of their secondary education.

In Holland, a State decree opened the examination of apothecaries to women in 1870. The universities have followed in due course; and in 1873 the first lady medical student in the Netherlands, Mlle. Jacobs, passed her examinations in physics and mathematics at the University of Gröningen. The cordon of university education has therefore been broken through in Holland also. Our nearest, and, as we are apt to suppose, slower-thinking blood-relations have actually surpassed us in celerity. With regard to the secondary education, it seems that in 1874 the Netherlands possessed forty-seven higher burgher schools for boys, receiving an imperial grant of over £15,000, whereas only seven of the larger cities had a higher burgher school for girls, these seven admitting them from the twelfth to the fifteenth year. Lately, however, a ministerial order has, we are told, been issued opening every gymnasium as well as every university to women, which bridges the gulf of secondary education in a very simple way.

In 1875 the University of Copenhagen opened to women all its classes and degrees except those of theology. It was expressly provided, indeed, that they should not be allowed to participate in the benefices and stipends set apart for the male students — a reservation which has an odd look of unfairness about it. Still, the admission is the chief thing, at any rate in the beginning. As regards secondary education, this also is going forward. An "association of women" at Copenhagen had been at work in promoting it for some years previous to this action of the university.

Sweden, like Italy, has for the last fifteen or sixteen years been industriously promoting the secondary education of its daughters, and during the last seven years, the privileges of the universities have been open to them. At Stockholm, a State seminary for the higher training of women teachers was founded in 1861, and a State normal school preparatory to the seminary in 1864. Courses of classes for girls giving a more advanced education than that of the ordinary schools, which in Sweden are exceptionally good, were instituted the following year; and there are now higher girls' schools similar to the normal school for girls in every large town, with the exception of those in the extreme

north, while Stockholm can boast of five and Upsala of three. These are all, however, private schools, and it has depended on individual effort to make them what they propose to be — a true preparation for university tests and studies.

In August, 1870, a State decree granted to women the right to matriculation and other examinations at the universities. The great Swedish University of Upsala throws open its doors freely, irrespective of class or sex, giving instruction gratuitously to all sorts and conditions of men and women who choose to come and take the gift. With the exception of divinity and law, women are admitted to all the examinations; and as regards the rules and customs of the university, women are exactly on the same footing as men.* Between the year 1871–73, four women passed the matriculation examination, and took their places as students in the university — two in the medical and two in the philosophical department. Even then there were two women who had passed the dentists' examination at Stockholm and were practising successfully, and three who had passed the surgeons' examination.

Before this university movement had opened up the medical profession to women, public opinion had been educated to the idea by the fact that the position and education of midwives was already better in Sweden than almost anywhere else. In 1697, a Dutch physician, Hoorn, who lived in Stockholm, proposed that some knowledge of their profession should be imparted to these women before they entered on it, and accordingly set about delivering lectures to them. After this the profession was from year to year made the subject of regulations. In 1771, the first lying-in hospital was erected, which henceforth afforded means of training to the midwives; and when in 1822 Professor Cederschiold was placed at its head, he reorganized everything, and put the lessons for female students on the same level as those for the male. All that he could do to elevate the position of the former he did, and by his representation he ultimately obtained for them the legal right of using obstetrical instruments, another month's study being required to gain the right. The possession of this qualification raises the midwife considerably, and those who have it are more regarded and better paid. Much trust is placed in them, and the physician is called upon only in exceptional cases. There were in 1873 one hundred and forty of these women practising in Stockholm, and in all probability the number has since increased. It is evident that the existence of so large a body of efficiently instructed and thoroughly trusted women leads naturally to the idea of the lady physician, who differs from them only by her wider professional knowledge and higher general culture.

It is not unworthy of mention that in Finland also the cry of women or of men for the higher education of women has gone up and been answered. An academy for this higher education was opened at Helsingfors three years ago, starting with ninety-one ladies as pupils. The curriculum includes, among other subjects, physiology, natural science, and mathematics.

On all sides the desire for a new state of things has issued in fruition, and the days of subjected intellects and stifled or wasted activities are numbered throughout the civilized world.

England, as we know, has not been idle all this while, but her slower methods have enabled her own colonies to outstrip her in liberality. It was not enough that she should be last of all civilized nations to give even to the most exceptional women such a simple recognition of their merit as a university degree; but England proper has tarried behind her dependencies. In the year 1875 there were in Canada, as in England, several lady physicians practising; but during that year a Canadian medical license was for the first time granted to a woman by the College of Physicians and Surgeons in Ontario.

Canada borders on the United States; but India is only subject in this matter to the ordinary influences of common sense, justice, and practical expediency. The great desirability of women physicians has been evident in India for some time past, and in 1875 the Madras Medical College was opened to women, a limited course of study being allowed, with a certificate of the degree of proficiency obtained, to those who did not desire to take the whole course and study for a degree. The ladies attend the courses of lectures with students of the opposite sex, except for some few lectures which it is thought more desirable to be delivered separately. This is a practical way of solving that mountain-of-a-molehill difficulty, medical coeducation. It is so easy to make satisfactory practical arrangements when once the importance of giving women medical education at all is perceived.

Australia had taken up the education question with some vigor meanwhile, and in 1872 girls were admitted to the matriculation examinations at Melbourne University. Two young ladies presented themselves that year and passed. The numbers rose soon, and in December 1873 the successful girl candidates were nineteen in number, while at the previous examination the only two of all the candidates who passed in the first class were girls. Matriculation was not, however, allowed, though the senate had more than once urged upon the council the desirability of not keeping up the anomalous custom which prevails in England of granting a test without granting the usually accompanying privilege.

But to New Zealand University the real honor belongs of having been the first throughout the British Empire to admit a woman to its degrees. On July 31, 1877, the degree of bachelor of arts was conferred on Miss Edgar, a student of the Auckland college and grammar school.

In England the rapid forward movement of the education of girls cannot be dated much before the extension of the Cambridge local examinations to them. After a trial of this extension in 1863, it came formally into effect two years later. The College of Preceptors had, however, in the earlier days of 1860, admitted candidates from girls' schools to its examinations, and improvement up to a certain point must have been going on for some time previously to make the demand for these privileges as eager as it was. But without some such external aid, in presence of the general confusion of ideas on the subject, and the non-existence of any true models in the boys' schools, for the improvement of which these examinations had been organized, the tendency to improve could not have been so widely carried into effect. The peculiarity of English education is its entire irresponsibility: however ignorant the schoolmaster and the public may be, the State does not protect the latter from the former. Now this protective function, which the State fulfils in other countries, the universities have been trying to fulfil for us by local examinations; and whether constant external examining is in itself good or bad, it is quite certain to be better than absolute anarchy.

To the girls' schools the introduction of this regulative principle was the greater benefit, seeing that schoolmistresses had no university or equivalent traditions of their own to guide them, and seeing that the education of girls was so much lower, both actually and ideally, than that of boys. It was something that schoolmistresses who had perhaps scarcely heard of such a thing as mathematics should become acquainted, through university regulations, with that science or group of sciences as something to be taught. Slowly but surely new notions of a curriculum and a higher standard within it have filtered into the many obscure nooks and crannies of the female educational world. Year by year the number of girl candidates has swollen, and the quality of their work has improved.

Cambridge having led the way in giving this important helping hand both to those who wanted help and those who wanted light, Oxford followed in 1869, four years later, during which year also the London University and the Cambridge higher local examinations for women were instituted. Oxford has now its higher local scheme also, and a joint-board examination of the two elder universities has been organized within the last few years and extended to girls. Edinburgh was as early as 1865 in instituting its local examinations, and the two Irish universities looked on for five years, and began respectively their examinations for girls and women in 1870. And last year St. Andrew's University announced itself ready to grant a higher certificate to women, the standard of attainment being the same as that required for the M.A. degree. It has since been decided that the successful candidates are to be allowed to adorn themselves with the title of literate of arts (L.A.). How dearly does the British mind love to keep up distinctions of sex in matters to which sex is quite irrelevant! So far as we know, degree certificates and equivalent titles are wholly indigenous to British soil.

So much for the action of the universities in promoting ideas of improved secondary education. On the other hand, we have the solid work done in establishing good girls' schools and other means of education. The Women's Education Union, which was founded in 1872, publishes a list of "colleges, schools, lectures, and other means of education for women and girls in the United Kingdom." From this we cite a few facts.

There are now eighteen endowed schools for girls, six of which are in London. The scheme for the first of these, the North London Collegiate and Camden Schools, founded as a private school in 1850, and now numbering between the two schools about one thousand pupils, became law in 1875. Latin is taught in

Original from CORNELL UNIVERSITY

nine of these endowed schools, mathematics in ten, natural science in fifteen, political economy in five, domestic economy in fourteen, physiology in ten, Greek in one, moral philosophy in one, the usual girls' subjects holding, of course, their accustomed place.

Next we find twelve schools of the Girls' Public Day-Schools Company, the first of which was opened at Chelsea in January, 1873. The curriculum includes in the schools generally Latin, physical science, and mathematics.

Besides these, there are 26 other high schools, in 20 of which Latin and mathematics are taught, natural science in 18, political economy in 7, physiology in 4, logic in 2, and Greek in 4.

This makes a total of 56, to which we have to add the numerous private schools, many of which have adopted the new kind of curriculum, and send in their pupils for testing at the local examinations.

Then for colleges we have Girton College and Newnham Hall with their Cambridge courses; also a college at Bristol, three in London, and two in Dublin. These have the usual curriculum, including classics, natural science, and mathematics, taught up to the level of the student's previous attainments. Among them, Queen's College and Bedford College in London deserve special honor as products, and successful products, of the earliest efforts to procure for girls a higher education. Besides these, the public lectures of twenty-six professors of the University of Cambridge, and, in University College, London, the classes of jurisprudence, Roman law, political economy, geology, logic, and mental science, higher senior mathematics, and mathematical physics, are open to women. This last-mentioned class at present consists of five professors, five young men, and five young women; and at the end of the last session, 1876–77, the only young lady which the senior mathematical class could boast carried off the prize far above the heads of her male competitors; nor was this the first instance by several in which lady students had been guilty of similar unkindnesses. In addition to these mixed classes, which solve the higher education difficulty in the readiest and most economical way, we have the lectures of the Ladies' Educational Association in connection with University College and delivered by its professors, the lectures and classes of the Society for the Extension of University Teaching in London, the lectures of the Cambridge Association for Promoting the Higher Education of Women, the lectures of the Edinburgh Ladies' Educational Association, and lectures in connection with Alexandra College by professors of Trinity College, Dublin.

For those who cannot avail themselves of any of these means of instruction, and yet desire to get rid of the inheritance of ignorance left them by their early education, a system of instruction by correspondence has been organized at Cambridge, and more lately at Edinburgh, by means of which help and guidance are extended far and wide to earnest women struggling into light. A story is told of a lady in some remote corner of Scotland, who, bitterly oppressed with the sense of her own deficiency in arithmetical knowledge, went to a schoolmaster in the neighborhood and prevailed on him to let her stand, slate in hand, in the class with his boys till the mysteries of vulgar fractions became plain. To such women the correspondence system is an inestimable boon; and it speaks well for the thoroughness of this education reform that some such means should have been devised for aiding the victims of past mistake, though we shall certainly be glad when it is no longer possible for women in remote corners of Scotland or anywhere else to find themselves so sadly in need of aid from afar. That section of the community which desires a new state of things is indeed leaving no stone unturned to bring it about, and the stir of thought in the vast mass of thoughtlessness on this subject is felt everywhere. "A little leaven leaveneth the whole lump."

The improved secondary education of girls is certainly growing steadily in England, and converting public opinion to approve of it in its growth; but much still remains to be done in widening the area of its action. The higher education is comparatively better off, by which we mean that it is about as well provided for as the state of public opinion requires. The supply is equal to the demand, and the demand has to be increased by education on the secondary plane, and by the direct encouragement of the established universities. In October 1868 the college for women was opened at Hitchin, which has since been removed to Girton, three miles from Cambridge. Meanwhile, in 1870, Newnham Hall was opened in Cambridge. Both these colleges are taught by professors from Cambridge University, and both are full. But what distinguishes

these two from all other ladies' colleges is the fact that the papers set for the previous and degree examinations at Cambridge are sent down to Girton and Newnham half an hour after they are given out in the senate-house, and the merits of the girls' answers are pronounced upon by some of the examiners, after which degree certificates are given to the successful candidates, stating in each case which class the owner would be in if she did not happen to be a woman.

There is no use in quarrelling with one's bread and butter, and Girton students are duly grateful for their degree certificates. Still, looking at the concession from a little distance, the effect is slightly ludicrous. Is it that the idea of a mere certificate has in it something of an antidote to the unsexing influence of university distinction? or has it some kind of charm to prevent the overtaxing of feminine minds with masculine study? Is it necessary to devise some such expedient for keeping women in their proper place, seeing that they *will* be educated? or would it be too much for the feelings of the poor young men to place them absolutely in competition with the fairer, and, we are told, sometimes more industrious sex? But, in truth, we suppose the real cause of these curious devices may be found in the extraordinary difficulty which the English mind has in conceiving anything quite different from that to which it has always been accustomed. The English political system has grown up by a slow process of patchwork, and perhaps Teutonic islanders cannot at present, by their mental constitution, grant educational privileges to women except after a similar fashion. But we hope the patchwork is in this instance nearly complete, and that, after a very little more of the present tentative course, Girton and Newnham will be regularly affiliated to the University of Cambridge. When that is done, the demand for higher education will rise rapidly.

A proposal for an Oxford Girton has been lately talked about, and, as extending the new ideas to a slightly different section of the community, we hope it will soon be carried out, and have as much success as the sister project at Cambridge. By the affiliation of such a college, in due time Oxford too, most conservative of universities, may be induced to extend its full privileges to women.

In Ireland the movement for improving the education of girls was early taken up, but the comparative poverty of Ireland makes the lack of endowments a very serious difficulty. In the year 1861 the Queen's Institute in Dublin was founded. This valuable society combines, with the Institute for Technical Instruction, a college for the education of women, which supplies the examinations of Dublin and the Queen's Universities with many of their best candidates. Alexandra College, modelled after Queen's College, London, was established in 1866, and has now a school in connection with it. Its classes are taught by professors from the university, within the walls of which the will to aid the higher education of women is not wanting. Last year a number of the Trinity College students called together a meeting, which was presided over by the provost, "for the purpose of expressing sympathy with Alexandra College as an institution which is proving effective in promoting the higher education of women." The spirit which this little fact reveals is so pleasant, that we have thought it worth while to state it here. We hardly think that the large number of gallant young Irishmen who attended this meeting would so particularly object to the society of young ladies in their lecture and examination halls, or even at the private lessons of an "honor grinder." Alexandra College is not the equivalent of Girton. Ireland is poor, and has much to do for the secondary education of her girls; she must provide for their higher education in the most economical way. And the most economical way is the American way, and the way of all the civilized world except in these our islands, of granting the privileges of the existing universities to daughters as well as sons. Questions of residence would be so easily arranged that they are scarcely worthy of mention. We have faith in Celtic elasticity of thought and practical capacity for leaping over obstacles, and hope that the university which first acknowledged the principle of justice between creed and creed will not delay long in administering justice between sex and sex.

But naturally the younger Irish university will be the first to do this. The Queen's University has, as a university, declared its willingness to grant medical degrees to women; but the colleges have not consented to give the appropriate education, without which the university cannot move. This is a pity, but it is hardly likely that the colleges, under such circumstances, will long harden their hearts; and certainly if they consent to give med-

ical instruction, they can have no difficulty about giving any other, which indeed they might perhaps consent to give first.

But with respect to secondary education, the want of funds stops the improvement sadly. In 1873 a memorial was presented to the government then in office from the Queen's Institute, Dublin, the Belfast Ladies Institute, and the National Union for Improving the Education of Women of all Classes, asking for a royal commission to inquire into the state of education in Ireland, including that of girls, and for the admission of girls to a fair share in the surplus revenues of the disestablished Church. This is a fair request; wherever there is money to be disposed of for educational purposes, it is only just that girls should have the benefit of some of it. And the simplest and most economical way of aiding the secondary education of both sexes is to establish mixed schools for both. Why should not some of the surplus revenues be so expended? Perhaps British mixed education on a large scale may first appear in the west. British medical diplomas have, at any rate. The College of Physicians in Dublin has gained that honor for the western island, and during the past year the ladies who obtained their education in Edinburgh have, after many trials, received their diplomas in Dublin.

The story of the ladies' attempt to gain entrance in Edinburgh, and its ultimate failure, is too well known to need more than mention here. The universities of St. Andrew's and Glasgow, one of which has just instituted, and the other is considering, a system of higher examinations for women, may now be before their sister of the metropolis in granting full educational privileges to women; but we hope that Edinburgh University will not be long in recovering the character for liberality and nationality which she has temporarily lost. The educational movement is earnest in Scotland, and as this brings Scotch women in numbers up to the level of requiring professional privileges, the leading Scotch university will no doubt turn from its suddenly perverted ways and repent. The economical advantages of mixed education in the universities is not likely to remain long unappreciated by Scotch common sense. As for the secondary education, the local examinations of the University of Edinburgh have done good work in improving it, but the want of endowments presses very hardly in Scotland as elsewhere.

Medical education for women has long been a difficulty in England — a difficulty of which, however, last year saw the solution. In 1864 the Female Medical Society was established; and in 1866 a hospital for women, with women as physicians, was opened. Between 1869 and 1874, the matter was pending in Edinburgh; but the closure of the doors of that university, which the rejection of Mr. Cowper Temple's bill in 1875 made definitely effective, caused all the chief energy of the effort to be transferred to London. In 1874, a medical school for women was organized, and an excellent staff of teachers secured. But the regulations of the examining bodies require that medical students should attend for at least two or three years at a hospital which in London must contain not less than one hundred beds. This condition is fulfilled by thirteen hospitals only, and at none of these could female students gain admission; so that, even if the examining bodies had recognized the school, it was unable to comply with their requirements. Laboring under this double difficulty, matters looked dark for the Female Medical School. But the Gordian knot is now cut. The Royal Free Hospital is open to women, the Irish College of Physicians has given its diplomas, and the University of London has promised its degrees. The difficulties of medical women, it seems, are finally overcome; and not only finally but peacefully, for with a separate school wholly their own, and a purely examining university to deal with, the danger of shocking the nerves of the stronger sex ought certainly to be reduced very nearly to the vanishing point.

The question still in the balance at London University is that which bears so closely on the advance of the higher education of women, namely, their admission to equal rights and privileges with men in the matter of degrees generally. On this, our rulers in Parliament will have to decide when the new charter is applied for, and in the acceptance of that charter, if granted, convocation will have power as well as voice. We do not indeed fear that convocation, when the sacredness of its favorite medical degrees is gone, will care to preserve intact the sacredness of the others. The graduates of medicine, at least, will hardly act so as to imply that, among the manifold degrees of the University of London, this one of medicine, and it only, is within the capacity of the weaker sex; and the arts and science graduates have not such weighty profes-

sional and other reasons as the medical graduates have for violent resistance to the invasion of their premises.

The programmes of the women's examinations being already assimilated to the regular university examinations, the only conceivable reason that can be assigned against the opening of these arts and science degrees is that they may and probably will act as a more powerful stimulus to mental exertion, and that in this, women being intellectually and physically less than men, lies a great evil.

We do not believe this assumption as a necessary fact; but that question need not be discussed here. What if the average woman is capable of less mental work than the average man? It still remains indisputable that many women are capable of much more than many men, and that the strong women run less risk of overtaxed brains than the weak men. There are women with nerves of iron, and men with nerves of flax: what sort of classification is that which shuts out the one from the higher goals of intellectual effort, and tempts the ambition of the other by them? Have there been cases of eager girls in England or America who marred their health by overwork? Have there never been cases of overworked young men? Have we never heard of the worn appearance of high wranglers and other prizemen,— of energies (male energies) slackened for life because of one great strain,— of Cambridge parlance about senior wranglers killing so many men who tried to keep up with them,—of brain fevers and deaths among too zealous male students,—of things that would give rise to fifty Dr. Clarkes if only they happened to girls? Are we to be told, because here and there a girl, who escapes control, has the folly and the wickedness (for it is a wickedness) to work herself into a weak state of health, that therefore the goals of a higher education must be withheld from all stronger, or cleverer, or more sensible young women also? Why do we not shut up our senate halls altogether, and forbid at once the competition of talent because it has had its sad number of young men victims? Let us be consistent, and visit the sins of the few upon the many all round or not at all.

It will be well, indeed, when one's duty to one's own physical organization is as well understood at Oxford and Cambridge as it is in the new English girls' schools. Meanwhile the universities of the British isles might consider the advisability of passing a by-law requiring candidates for all degree examinations to undergo a medical examination as guarantee that they had not wickedly offended in the matter of overwork. But, till there is some State or university regulation to prevent the weaker of young men from working for university laurels because they may have the folly to overwork, such paternal arrangements for the weak and strong alike among women are surely very much out of place. Let those among them who can easily (an undoubted number) have their chance, and leave the common sense of English women and men to take care of the rest. Women know very well (better than men, perhaps, so much have they been scolded about it) that "there are twelve hours in the day in which men can work;" and the slower laborers must do their work, not by increasing the number of hours, but by increasing the number of days.

And the women, upon whom most depends, have shown themselves quite able as well as willing to deal satisfactorily with this question of temperance in work. In the principal girls' schools, every pupil has a home time-table on which the amount of time given to each lesson is prescribed, and the parents or guardians are responsible, as part of the school agreement, to see that this time-table is not exceeded. In one school, the largest and most important, a further guarantee has been adopted: each girl brings in every morning on a printed form an account of her home-work, signed by herself, stating when she began her lessons, when finished them, and the total time occupied, the maximum allowed to the elder girls being three hours. Long hours and late hours are thus at once detected, and every one's attention, which is perhaps the most important point, is drawn to the truth that health is a sacred trust to be guarded by this one definite measure, among others, of temperance in the expenditure of nervous force. Trained in this way, and with some knowledge of physiological laws, the young women of the future will not be likely to forget duty to their bodies in fulfilling duty to their minds.

Surely, then, there is no true reason in this health argument to justify us in holding up a lower grade of education for women than for men, or in giving up to a certain point the same standard shorn of the honors naturally accompanying it, lest the attainability of the latter should goad weak brains to mad efforts. As for femi-

nine inferiority of intellect, whether necessary, contingent, or imaginary, it does not affect this matter in the least. If the *kind* of education for which London University degrees are organized be equally suitable to girls and to boys, and if humanity can or must (surely it must) be trusted to take care of its health as a private undertaking, then the smallness or the greatness of the number of women capable of distinguishing themselves has no importance as bearing practically on what ought to be done. Let young women be tested by the same ordeal as young men, and accept the natural position in the scale of excellence to which that ordeal assigns them. Whether it will be a high place or a low place cannot be absolutely known till the experiment has been fully tried. Only it is worth while to remember that, whenever and in so far as the experiment has been tried elsewhere, women have not found themselves in the lowest rank.

But *cui bono?* we have heard it said. London University does not give instruction which is the solid good; what benefit can it do women to have the degrees which bear no professional significance?

Have the degrees of London University no general educational bearing, then? Are they not, as they profess by implication to be, an important adjunct to the higher education of boys; and would they not be just such an equally important adjunct to the higher education of girls? In fact, the attainability of these university honors would create a new demand for higher education among women, the existence of which demand is indeed the only condition at present necessary for its being supplied. The means of supply, as we have seen, are at hand, capable of development up to any required point; but a certain sufficient demand is necessary to effect this development. Now a demand for higher education depends largely, first, on good secondary education, and secondly, in the undeveloped state of English thought as to the value of education *per se*, on the existence of some goal of endeavor of sufficient effectiveness on the imagination. The satisfaction of this second need is, from an educational point of view, the *raison d'être* of the University of London, and the boon which it can confer on girls educationally. And girls need it even more than boys; for if English thought is undeveloped on the subject of education generally, much more is it embryonic as concerns the education of women.

The public mind never needed the instruction as to the value of certain ends which an examining university can give more sorely than it needs instruction on this point, and the concession of the privileges in question would be this instruction. The admission of women to the degrees in London would affect people as a sort of national resolve that the kind and degree of education thereby encouraged was to be adopted as a national end; for the action of the universities in England is, as regards general education, almost parallel to the action of the State in Continental countries. Nor would the results of this admission be limited to accustoming the public mind to, and therefore creating a demand for, the higher education of women; a high external goal would be set up as a mark of effort for the whole feminine education of the country, the tone of which throughout must inevitably be affected by the attainability of these higher privileges.

Again, it often happens that girls who learn chemistry and conic sections at school are treated as small phœnixes by their friends, these not being accustomed to the association of such subjects with girls, and foolish vanity may sometimes result. Now the elevation of the ideal fixed on as the honorable termination of an educational career will certainly have a bracing moral effect where this state of things exists. Girls *and their parents* will realize mental insignificance in the light of this their final goal of effort more than they do at present in the light of lower goals, just as now they certainly have as individuals a much truer idea of their position in the scale of intellect than in former days, when every woman had actually the right to think herself the equal of every other and of every man, just because she never had any means of knowing better. Education produces humility, especially when its subject knows distinctly that there is a higher plane of education which it may attain if it has the ability. Competition produces humility, especially when the competition is not limited to a class or to a sex. How well it would be for the friends and relations of some women if these had found themselves among the failures in early womanhood!

But there is another kind of woman, clever, well-educated, and often naturally unassuming, to whom it is a severe injustice that she should be unable to obtain that full recognition of her talent which a university degree implies. Without it she

is placed at a disadvantage with many a mental inferior who flourishes an honored title after his name: she needs, indeed, to be possessed of a fair measure of self-confidence to keep uppermost even in her own mind and act upon their relative intellectual merits; whereas any such simple fact as having taken a scholarship which he failed to take would make matters rather easier. The absence in these cases of any common measure, however imperfect, is indeed no imaginary grievance, but a real practical inconvenience where competition for an appointment occurs, and a special trial to those more yielding spirits who cannot assert, and can scarcely believe, what they have not been allowed to prove. Who knows how much the world may have lost by the non-belief in themselves of such?

One word more and we have done. The question at issue stands quite apart from that of the goodness or badness of our whole examination-regulated educational system. It may be that we are ripening towards a thorough reconstruction of this system. It is said that, as the examination test, pure and simple, is bad, we had better not extend it. But the examination test is one means towards an end, and at least better than none. Till some other means is found this means should be extended on all sides equally, so that the education it fosters may grow up equally for boys and for girls. Then, if reconstruction does come about, it will find, and therefore make, no difference between the sexes. Meanwhile, if we believe in our present system, we must admit both halves of the nation into it. If we regard it as experimental and temporary, we must apply our experiments consistently. And that we are in a fair way to do this there can happily now be little doubt. We look forward to the day when the University of London will fulfil its function of guide and judge impartially, when Oxford and Cambridge will have colleges for women affiliated to them, and when the universities of Scotland and Ireland will have taken the simpler and more economical way of merely abolishing nouns and pronouns of gender so far as education is concerned. The nouns and pronouns of gender have their origin far too deep down in human nature for us to fear any disastrous result.

Old Names and Customs. — As they went through London or elsewhere it was very instructive to ask always what was the meaning of the name of the place where they happened to be; he (Dean Stanley) always did. To take the place where they were at that moment — John Street, Adelphi, Strand. What did that mean? Some of them, of course, knew. Any one knowing Greek knew that Adelphi meant brothers; but why was it called "brothers"? It was because there were four brothers named Adam, who came from Kirkcaldy. These brothers were great architects, and they determined to rescue the part of London where they were at that moment from the mud of the Thames; they were, in fact, the founders of the Embankment. They were named Robert, William, James, and John, and those streets were called after them, and would continue a memorial of their energy and how they kept together by their strong brotherly affection. As they went along the Strand and looked at the names of the streets from side to side, it revealed to them at once the connection of all the great English families; the streets, as they now are, being called after the names of the ancient nobility who lived there. The names of the streets recalled the history of England. There were two things which ought to be preserved as much as possible in London — the names of streets and, if possible, the few remains there were of ancient architecture. In the city there were, he knew, great difficulties as to the last; but, with regard to the old churches which were being pulled down, he would say, "at any rate save the towers." Another piece of advice which he would give them in the art of questioning was as to the days — to try and fix in their minds what had happened on a particular day. That day, for instance, was the 17th of November, and had they been passing by Westminster at twelve o'clock they might have been surprised to hear the bells of Westminster Abbey pealing. It was the only day on which the bells of the Abbey rang to record any past event, and they were merrily pealing that day, as it was the day of the accession of Queen Elizabeth. From that day the history of England turned over a new leaf; she began that course of continual, steady advance which has never since passed away.

Dean Stanley at the Society of Arts.

LITTELL'S LIVING AGE.

Fifth Series, Volume XXI. | No. 1762.—March 23, 1878. | From Beginning, Vol. CXXXVI.

CONTENTS.

I. PRECIOUS STONES, ... *British Quarterly Review*, . . 707
II. MACLEOD OF DARE. By William Black. Part V., ... *Advance Sheets*, ... 721
III. QUEVEDO, ... *Gentleman's Magazine*, . . 736
IV. WITHIN THE PRECINCTS. By Mrs. Oliphant. Part IV., ... *Advance Sheets*, ... 746
V. THE TELEPHONE, ... *Westminster Review*, . . . 761

POETRY.

"STILL IST DIE NACHT, ES RUH'N DIE GASSEN," 706
"FEY," 706

PUBLISHED EVERY SATURDAY BY
LITTELL & GAY, BOSTON.

TERMS OF SUBSCRIPTION.

For EIGHT DOLLARS, *remitted directly to the Publishers*, the LIVING AGE will be punctually forwarded for a year, *free of postage*.

An extra copy of THE LIVING AGE is sent gratis to any one getting up a club of Five New Subscribers.

Remittances should be made by bank draft or check, or by post-office money-order, if possible. If neither of these can be procured, the money should be sent in a registered letter. All postmasters are obliged to register letters when requested to do so. Drafts, checks and money-orders should be made payable to the order of LITTELL & GAY.

Single Numbers of THE LIVING AGE, 18 cents.

"FEY."

I'm no way "superstitious," as the parson called our Mat,
When he'd none sail with the herring fleet, 'cause he met old Susie's cat.
There's none can say I heeded, though a hare has crossed my road,
Nor burnt my nets as venomed, where a woman's foot had trod.

And though it's mebby wisest to hearken when they tell,
The sea-maids shriek their warning, from the reef beside the bell;
Seeing I reckon one hears them, when the wind has a northerly set,
And at the lip of the Nab out there, the breakers rouse and fret;

Still I'm no way superstitious, but this I allis say,
You may get the coffin ready, when a doomed man is fey.
Aye laugh, and call it folly, I see you glance aside,
Wait a bit until I tell you how poor Jem Dobson died.

We were mates, but he was master, and a cautious man was he,
Forever studying at the glass, and watching sky and sea,
I'se sure it ofens put me about, when the fish were as rank as ought,
And he'd none sail, for "the wind was shy," or "the clouds were raffled," he thought.

One day, an April morning, it was blowing east-nor'-east,
The call of the surf was on the Scar, the billows frothed like yeast;
Great foam-flakes rested on the sand, and the hollow, sullen roar
Rose in the offing loud enow to bid us keep ashore.

Guess how the boldest among us stared, when Jem came swinging down,
And bade me help to launch the "Rose," with an oath, and with a frown.
I was loath, but young and foolish, and shrank like from a sneer:
There's naught a frightened lad won't do, to prove he has no fear.

There were plenty spoke to stop him, but he'd nor hear nor heed,
But sorted gear, and hauled up sail, all in a strange, dumb speed;
I tell you my heart leapt fit to burst, as we shot out in the bay,
For I met poor Jem's wild, wandering eyes, and I knew the man was fey.

I said when I durst, "There's mischief there," and I nodded where, right ahead,
The black squall lay on the water, the foe we mariners dread;
But he scarcely shifted the helm a point, as his eye o'er the distance ran,
But laughed and said, "The breeze is like to wait for a sure-doomed man."

Doomed, aye, for the squall burst on us, and he turned her broadside-to,
I sprang to the helm, but over late, the stout sheet strained and flew;
And as the "Rose" heeled over, and the seas broke fierce and grim,
I heard Jem saying quietly, "Poor lad, it's hard on him."

Sam Lacy told me afterwards — he steered the lifeboat then —
And their work was set to save me, those strong, seafaring men,
Jem just threw up his hands to heaven, and with never a cry or call,
Went down to the death he was bound to die, in the very face of them all.

So, though no way superstitious, I neither jest nor sneer,
When old wives talk of omens and signs, they reckon should guide us here;
For it's little we know of the world beyond, and I cannot forget the day,
When I so nigh touched hands with Death, and poor old Jem was fey.

All The Year Round.

"STILL IST DIE NACHT, ES RUH'N DIE GASSEN."

Still is the night, and the streets are lone,
My darling dwelt in this house of yore;
'Tis years since she from the city has flown,
Yet the house stands there as it did before.

There, too, stands a man, and aloft stares he,
And for stress of anguish he wrings his hands;
My blood runs cold when his face I see,
'Tis my own very self in the moonlight stands.

Thou double! Thou fetch, with the livid face!
Why dost thou mimic my lovelorn mould,
That was racked and rent in this very place
So many a night in the times of old?

Blackwood's Magazine. HEINE.

From The British Quarterly Review.

PRECIOUS STONES.*

A CERTAIN Chinese mandarin, who delighted in covering his richly-dressed person with precious stones, was one day accosted in the streets of Pekin by an old bonze, who, bowing very low, thanked him for his jewels. "What does the man mean?" cried the mandarin. "I never gave thee any of my jewels." "No," replied the other; "but you let me look at them, and that is all the use you can make of them yourself; so there is no difference between us, except that you have the trouble of watching them, and that is an employment I do not want." This little anecdote will probably commend itself to the majority of our readers, as it is the few only that possess any quantity of precious stones, and most of us have to be contented with the sight of them in the possession of others.

The objects we are about to describe are known by three names, which are often unnecessarily confused together. The expression "a precious stone" explains itself, and includes both the raw material and the artistic product, for every gem is a precious stone, but every precious stone is not necessarily a gem. The term "a gem" is conventionally applied to an engraved stone, and the value of the gem in general depends more upon the artistic skill of the engraver than upon the preciousness of the material in which it is displayed. A jewel is a precious stone set in some ornamental form, as a ring or brooch, but oftentimes it is merely a specimen of ornamental work in some precious metal. We intend chiefly to confine ourselves to the consideration of the simple stones, because a history of gems is more intimately connected with the early history of art. It will, however, be necessary to notice incidentally the engraving, as well as the substance upon which it is exhibited.

The books noticed at the head of this article are all of considerable value, and we shall have frequent occasion to refer to each of them in the following pages. Mr. King has made himself so well known, by the thoroughness of his books, as one of the first authorities on this subject, that it is needless to criticise them here. The practical knowledge of the dealer in precious stones is exhibited in Mr. Emanuel's volume, which contains a large amount of valuable and interesting information in a small compass; and Dr. Billing, with the elegant taste of a true connoisseur, has produced a work in which science and art are admirably united and exhibited in the beauty of its appearance and the trustworthiness of its contents. A special feature of his "Science of Gems" is the biography of Pistrucci, chief engraver to the mint, which contains a most interesting portraiture of that great artist.

Precious stones are now as highly esteemed as ever for their beauty, but the awe in which they were once held for the qualities that superstition attached to them has long been a tale of the past. Besides the superstitious notions that were once prevalent, those habits of association which even now are not quite dead must not be forgotten. Pope Innocent III. sent four rings to King John of England, each of which contained a different colored stone, viz., the emerald, the sapphire, the garnet, and the topaz, as emblematical of the cardinal virtues — faith, hope, charity, and good works — much neglected by the English sovereign. Twelve has been a favorite number for the arrangement of precious stones, apparently in connection with the twelve stones on the breastplate of the Jewish high-priest. Thus, certain stones are appropriated to the twelve apostles, and others, again, to the twelve months. The practice of adopting the stone of the wearer's birth-month in a ring still exists among the Germans.

The Bible contains three lists of precious stones, besides those mentioned

* 1. *Antique Gems: their Origin, Uses, and Value, as Interpreters of Ancient History, and as Illustrative of Ancient Art.* By C. W. KING, M.A. 1860.

2. *The Natural History, Ancient and Modern, of Precious Stones and Gems, and of the Precious Metals.* By C. W. KING, M.A. 1865.

3. *The Handbook of Engraved Gems.* By C. W. KING, M.A. 1866.

4. *Diamonds and Precious Stones: their History, Value, and Distinguishing Characteristics.* By HARRY EMANUEL, F.G.S. 1865.

5. *The Science of Gems, Jewels, Coins, and Medals, Ancient and Modern.* By ARCHIBALD BILLING, M.D., A.M., F.R.S. New Edition. London. 1875.

separately in various parts of the sacred volume. 1. The description of the four rows of three stones each, with the names of the children of Israel engraved upon them, which composed the breastplate of judgment (Exod. xxviii. 17–21; xxxix. 10–14). 2. The list of the ornaments of the king of Tyre, comprising nine stones, viz., sardius, topaz, diamond, beryl, onyx, jasper, sapphire, emerald, and carbuncle (Ezek. xxviii. 13). 3. The Apocalyptic vision of the heavenly Jerusalem, in which the twelve stones named jasper, sapphire, chalcedony, emerald, sardonyx, sardius, chrysolite, beryl, topaz, chrysoprasus, jacinth, and amethyst, figure as the foundations of the heavenly city (Rev. xxi. 19–21).

There has been considerable confusion in the translation of the names of some of these stones, and the authorized version is often incorrect. Thus, there is every reason to believe that the diamond was confounded with the white sapphire or corundum. Chrysolite was the same as our oriental topaz, and the topazion was the peridot, a yellowish-green stone. Mr. Emanuel devotes a chapter of his book to a full account of the stones in the breastplate of the high-priest, with a table of the names used in the several translations from the original Hebrew. Mr. King makes the startling remark that as no lapse of time produces any sensible effect upon engraved gems, these venerable relics must still be in existence; and suggests that when the dark recesses of the sultan's treasury are rummaged by the Russian heir of the sick man, these stones may emerge from oblivion, to delight the eyes of the archæologist and the theologian.

The twelve precious stones mentioned in St. John's vision are not arranged in the order of those on the breastplate, but according to their shades of color; and here and elsewhere the writer of the book of Revelation exhibits an intimate acquaintance with the colors and qualities of jewels. Gems and precious stones have been offered to the gods from the earliest times, and these valuable objects were to be seen in the ancient temples, arranged with the greatest profusion. The contents of the treasury of the Parthenon are enumerated in Boeckh's "Inscriptions," but the Greek temples seem poor when compared with the shrines of imperial Rome. These articles of jewellery were not always safe from the depredations of covetous hands; and Zosimus ascribes the tragic death of Serena, the widow of the great general Stilicho, who was strangled by order of the wretched Honorius, to the vengeance of the goddess Vesta, whose statue she had robbed of a valuable necklace of precious stones. This practice of devoting gems to the adornment of shrines was continued by the Roman Catholic Church. The shrine of Edward the Confessor in Westminster Abbey, constructed by Henry III., was rich in the possession of cameos, one of which was valued in that day at the enormous sum of £200. The shrine of Loretto was excessively rich, and that of our Lady at Walsingham almost rivalled it in the abundance of its treasures; but two of the most magnificent collections were preserved at the shrine of the Three Kings of Cologne, and in the Abbey of St. Denis. However sacred these sanctuaries might be held, their keepers had need to be upon their guard, in order to save the jewels from passing into dishonest hands. One of the monks or canons attached to a religious house was usually the shrine-keeper. It was his duty to watch night and day, and "a watching chamber" was constructed for him near the shrine. On extraordinary occasions the Canterbury shrine was guarded by a troop of fierce dogs, and Dalmatian dogs were till lately the shrine-keepers at the Church of St. Anthony at Padua. Valery tells the story of a servant who, absorbed in prayer before the shrine, did not observe the closing of the church doors. He was, however, brought back to recollection by two dogs, who placed themselves one on either side of him, and would not allow him to stir until the morning. One case is recorded of an apparent worshipper, who, seeming to kiss the jewels on a certain shrine, managed to detach some and carry them off in her mouth. In a large number of instances, however, the guardians of the shrines have taken the precaution to substitute paste for the true stones, and the blaze of jewels that worshippers look

at with wondering eyes is due merely to glass.

The regalia of great monarchs are among the most interesting objects which are associated with precious stones, and many of them contain some gem of historical renown. One of the principal ornaments of the crown of Charlemagne was a lustrous emerald, and the Russian, Saxon, and papal crowns all contain emeralds of wonderful beauty and of large size. The treasury of the Vatican includes seven or eight tiaras, the last of which was given by the late queen of Spain, in 1855. It weighs only three pounds, and cost £12,000. Napoleon I. had one made for Pius VII, after the Concordat, the three crowns of which are all different (those on Queen Isabella's tiara are alike). It weighs eight pounds, and cost £8,800.

The iron crown of Lombardy was originally all gold, but Theodolinda, queen of the Lombards, put an iron ring inside to make it stronger, and the legend runs that this ring was constructed out of one of the nails of the true cross, given by Pope Gregory the Great. Theodolinda espoused Agilulf, general of her troops, who was baptized by the name of Paul, and crowned with this crown in the month of May, A.D. 591. It consists (this thirteen hundred years old crown) of a broad circle composed of six equal pieces of beaten gold joined together by close hinges, and set with large rubies, emeralds, and sapphires, on a ground of blue and gold enamel. It is considered a permanent miracle that there is not a speck of rust upon the iron. It was used by Napoleon when he was crowned king of Italy at Milan, on the 23d of May, 1805. He placed it on his head, with the words, "*Dieu me l'a donné, gare à qui la touche*," the motto attached to it by its ancient owners. After his coronation, Napoleon instituted a new order of knighthood for Italy, called the *Iron Crown*, similar to the Legion of Honor.

The queen's state crown, preserved in the Tower of London, was made in the year 1838 by Messrs. Rundell and Bridge, with jewels taken from old crowns. It contains three thousand and ninety-three precious stones, which are summarized as follows by Professor Tennant: one large ruby, irregularly polished; one large broad-spread sapphire; sixteen sapphires; eleven emeralds; four rubies; thirteen hundred and sixty-three brilliant diamonds; twelve hundred and seventy-three rose diamonds; one hundred and forty-seven table diamonds; four drop-shaped pearls; two hundred and seventy-three pearls.

The first item in this list is the famous ruby said to have been given to the Black Prince by Don Pedro, king of Castile, after the battle of Najara, A.D. 1367, and afterwards worn in his helmet by Henry V. at the battle of Agincourt, A.D. 1415. It is pierced quite through, after the Eastern manner, and the upper part of the piercing is filled up with a small ruby.

The office of master of the jewel-house was originally one of great honor and emolument, but its consequence was gradually much reduced, and one of the first blows given to it was by the first Duke of Buckingham, of the Villiers family. It was the duty of the master to keep the royal plate and crowns, but Sir H. Mildmay, the holder of the office in James I.'s reign, was professedly ignorant of jewels, so his enemy Buckingham prevailed on the king to make all his presents to ambassadors in jewels, and not in plate, as previously, and then to send them by the master of the ceremonies.

Kings did not confine the exhibition of their treasures to their crowns, but ornamented nearly everything that appertained to them with jewels. Harold's standard, which William the Conqueror sent to the pope, was "sumptuously embroidered with gold and precious stones in the form of a man fighting;" but we must go to the East to see the extreme of profuseness with which jewels may be exhibited by great kings. Tavernier, the French traveller and jewel-merchant, gives a most gorgeous account of the treasures of the Great Mogul; and Dinglinger, the German Benvenuto Cellini, constructed a remarkable representation of the court of Aurungzebe, on his suggestion, which is now in the Green Vaults at Dresden. Tavernier saw seven thrones, some of which were set over with diamonds, and others with rubies, emeralds and pearls. On one he counted about one hundred and

eight pale rubies (the least weighing one hundred carats, and some as much as two hundred), and about one hundred and sixty emeralds. The canopy was embroidered with pearls and diamonds, and had a fringe of pearls round about. Everything used by the emperor was covered with precious stones. The bridles of the horses were enriched with diamonds, rubies, emeralds, and pearls. The bits were of pure gold, and a fair jewel hung about the neck of each.

Old literature is full of the glorification of precious stones, and eastern writers pretend that King Solomon wrote a book on gems, one chapter of which treated of those stones which resist or repel evil genii. Poets and travellers alike gave rein to their imaginations, and described halls that were formed of colored marbles, studded with jewels. But the most favored belief was the supposed light-giving properties of certain stones, more particularly of the carbuncle. Epiphanius affirmed that it was impossible to conceal that stone, for, in spite of the clothes it might be covered with, its lustre would appear outside the envelope. In John Norton's "Ordinal," there is an account of an alchemist who projected a bridge over the Thames of a very remarkable character.

> Wherefore he would set up in hight
> That bridge, for a wonderfull sight.
> With pinnacles guilt, shininge as goulde,
> A glorious thing for men to behoulde.
> Then he remembered of the newe,
> Howe greater fame shulde him pursewe,
> If he mought make that bridge so brighte,
> That it mought shine alsoe by night.

And in order to obtain this result he studded the pinnacles with carbuncles, which diffused a blaze of light in the dark. Richesse, in the "Romaunt of the Rose," is covered with precious stones.

> But alle byfore ful sotilly
> A fyn carboncle sette saugh I.
> The stoon so clere was and so bright,
> That also soone as it was nyght,
> Men myghte seen to go, for nede,
> A myle or two, in lengthe and brede.

Lucian relates that the lychnis (lamp-stone) fixed in the head of the goddess Astarte's statue lighted up the whole temple in which it stood; and Alardus, a Dutchman, writing in the year 1539, states that a chrysolampis, set in a gold tablet dedicated to St. Adelbert, gave out sufficient light to serve instead of lamps for the reading of the "hours" late at night.

Precious stones, when unset, are of more interest to the scientific inquirer than to the seeker after objects of beauty; and when set, they are so peculiarly personal ornaments, that they are not often found in collections. Therefore it is that most of the celebrated collections of stones consist principally of engraved gems, which unite the beauties of art and nature. The history of the first dawnings of gem-engraving is lost in antiquity, and in Cæsar's time the term "antique" was looked upon as one of the highest praise. The art reached its fullest development under Alexander, and after a decline of many centuries again rose into prominence through the labors of the artists of the *cinquecento.* Julius Cæsar had a mania for gems, and dedicated six cabinets to his patron goddess, Venus Victrix. His boots were covered with fine specimens, and in order to display them, he is said to have held out his foot to Pompeius Pennus, to be kissed. Augustus made a large collection, as may be inferred from the fact that he employed a "keeper" of his cabinet of gems, and his minister Mecænas is recorded as a connoisseur by Horace. In more modern times the passion for collecting gems commenced with Lorenzo de' Medici, who formed the Florentine collection, and caused his own name to be incised upon his gems. The French collection as a whole dates from the reign of Charles IX., but some of the gems were brought by St. Louis from the East. The Berlin collection consists of the united cabinets of the elector of Brandenburg and the margrave of Anspach, which last was collected by Baron Stosch, a Hanoverian spy over the Pretender's movements. The British Museum contains a fine collection of gems, formed from the bequests of the Towneley, Payne Knight, and Cracherode Cabinets, and the purchase, in 1866, of the Blacas Museum. The Towneley collection numbers among its treasures some half-dozen *intagli* which are not to be surpassed by any gems in the most famous cabinets of Europe. Payne Knight's collection contains the famous *Flora* which Pistrucci cut for Bonelli, and which that dealer passed off on Knight as an antique. The Blacas Museum was principally formed by the Duc de Blacas, who was French ambassador at Rome and Naples for many years. He died in 1839, and his son, who inherited the collection, added to it. Nearly all the most valuable gems came from the Strozzi Cabinet, which was formed by Bishop Leo Strozzi, in the beginning of the eighteenth century.

Original from CORNELL UNIVERSITY

At that time gem-collecting became a perfect mania, and as the supply was not equal to the demand, unscrupulous men set to work to produce what was required. Mr. King calls it "the age of forgery," and tells us that for every antique gem of note, fully a dozen of its counterfeits are now in circulation. It is said that the artists of Rome sought after and paid liberally for antique pastes with unhackneyed subjects, which they destroyed after they had copied them, in order to save themselves from the charge of plagiarism. The Devonshire and Marlborough Cabinets are the most renowned collections in England. The first was formed by William, third Duke of Devonshire, during the first half of the last century, and has been augmented by its various possessors. It now numbers upwards of five hundred of the finest gems, and a connoisseur of the greatest taste and experience once observed that were the choice of any fifty gems to be offered him out of all the collections of Europe, he would prefer the Devonshire, limited as it is, from which to select them.

From this treasure [writes Mr. King] eighty-eight gems of the most beautiful in material and the most interesting in subject were selected by Mr. Hancock, . . . and mounted . . . in a complete set of ornaments, to be worn, for the first time, by the Countess of Granville, lady of the English ambassador at the coronation of the present emperor of Russia. This parure consists of seven ornaments: a comb, a bandeau, a stomacher, a necklace, a diadem, a coronet, and a bracelet. . . . While others were vying in the splendor of their jewels, in which the Russian imperial, princely, and noble families are very rich, none attracted so much attention as the Countess of Granville, whose parure was the triumph of art over mere material wealth. Others displayed a perfect blaze of diamonds, but it was for the English lady to assert a higher splendor; and if *their* jewels were the more costly, *hers* were positively priceless. For while lost diamonds may be replaced, each of these fine gems is unique.

The Marlborough cabinet was formed by George, third Duke of Marlborough, and includes the collections of Thomas, Earl of Arundel, and William, second Earl of Bessborough. The "Cupid and Psyche," which is said to be the finest antique intaglio extant, was presented to the duke by Lady Betty Germaine. Public attention has been called to this magnificent collection by its late sale, in one lot, to Mr. Bromilow, of Battlesden Park, Bedfordshire, for thirty-five thousand guineas. It was stated at the time of the sale that the present Duke of Marlborough had been led to consider that it was worth at least £60,000, but having taken the opinion of Signor Castellani, that gentleman estimated it at £35,000. This was therefore the reserve price at which the collection was put up for sale, and after a brief pause Mr. Agnew bid thirty-five thousand guineas. There being no advance upon this sum, the auctioneer's hammer fell, amid loud applause.

We need now only to mention a collection which has attained a most unenviable notoriety. Prince Poniatowsky (who died at Florence in 1833) inherited from his uncle Stanislaus, the last king of Poland, a collection of about one hundred and fifty-four true antique gems, which he supplemented by a series of about thirty-three thousand forgeries. Although these last are masterpieces of skill, engraved by the best Roman artists upon stones of fine quality, they now fetch a mere trifle. Had these gems been engraved with the names of their makers, instead of with the supposititious names of artists of antiquity, they would have realized large sums. So little judgment was exhibited by the attendants at the sale of the collection in London, in 1839, that the head of Io — believed to have been engraved by Dioscorides — was sold for £17, although a few years before it was valued at £1,000. Here is a marked instance of the evil of keeping bad company, and Dr. Billing makes some judicious remark upon this depreciation of fine work. He writes: —

If connoisseurs who are fond of gems would trust to their own eyes and taste, and purchase only what is beautiful — whether antique or modern — it would bring things to a just value; but under the present system ordinary work has been over-estimated, if supposed to be antique, and beautiful work underrated, if known to be modern. A beautiful intaglio of Pichler's, with a Greek name of an ancient artist forged upon it, which was originally made for Poniatowsky for perhaps twenty or thirty pounds, will not now fetch more than as many shillings, because it is not really antique; though a work of the same Pichler, genuine, with his name on it, will fetch, as it deserves, the price in pounds sterling, although no better than the other, which, though depreciated by the forged name, is quite as good, and if bought for its real merit, worth quite as much. So far does prejudice outweigh judgment.

Wherever gems have been esteemed, the forger has flourished, and notices of pastes or imitations in glass of precious stones can be traced back to the most remote ages of antiquity. Seneca mentions that one Democritus had invented a process for imitating emeralds by giving a

green color to glass, then called crystal; and Pliny remarks upon imitations of various stones, such as hyacinths, sapphires, etc., made of glass, since called "paste." During the two first centuries of the Roman empire the art of making pastes was cultivated to a remarkable extent, in order to meet the requirements of the poorer classes. False emeralds and opals are found mixed up with real stones in ancient crowns, and the celebrated jewelled cup of the Sassanian king, Chosroes, now in the Bibliothèque Nationale of Paris, which was long supposed to have belonged to Solomon, has been discovered to be decorated with pastes. Trebellius Pollio relates how Gallienus punished a cheat who sold a piece of glass instead of a stone to his empress, Salonina. The emperor sentenced the man to be exposed to the wild beasts in the arena, and when the poor wretch was thrown in, and the door of the den raised, a cock only strutted out, so that, as Gallienus said, he was deservedly made a fool of. One of the cleverest frauds that has been resorted to is the formation of a doublet or semi-stone, in which the top of the stone is genuine and the under part glass. The reverse process is practised in regard to engraved gems, and the paste is backed with a slice of stone of the same color, which of course stands the test of the file, and the whole passes muster as a true gem. Clarac was shown a paste with Marchant's usual signature upon it, which was thus metamorphosed into a reputed antique sard. The glass and stone are frequently joined so ingeniously that the most experienced are deceived. Not long ago a very fine emerald was sold at one of the London salerooms, and bought by a jeweller of standing. When the latter had obtained possession of the stone, he wished to have the opinion of a well-known connoisseur upon it. This gentleman, immediately upon taking the jewel into his hand, characterized it as a doublet. The purchaser naturally demanded his money back, and in the presence of the auctioneer and other witnesses, the emerald was taken out of its setting, when it was found to be, as the connoisseur asserted, only half a stone. This same gentleman has so remarkable a knowledge of precious stones, that he can discriminate Cape from Brazil diamonds, and both from Indian stones, and can tell the weight to a fraction by merely holding them in his hands. There are, however, paste impressions of gems that are not meant to deceive, but are of the greatest value to the student, such as the Orleans and Tassie Collections. The regent Duke of Orleans engaged the services of the celebrated chemist Homberg (1691–1715), and assisted him with his own hand in the operations carried out in a laboratory established within the Palais Royal. The duke reproduced in glass all the gems that he himself had collected, and, besides these, a large number selected from the royal cabinet. Later on in the eighteenth century, Tassie, a Scotch sculptor established in London, brought out an immense series of pastes and enamels from gems of all dates and styles, to the number of fifteen thousand. He first copied the whole of the Stosch Collection, and afterwards reproduced every famous gem known in the cabinets of Europe. Precious stones have been imitated by those who are thoroughly acquainted with the chemical constitution of the originals, but most of these artificial stones have been small, and they can only be looked at as results of curious experiments, because they are not of sufficient value to be worth the expenditure of the time and labor that are necessarily devoted to them.

The comparative value of precious stones has varied greatly at different periods, and the diamond, which now takes the lead as the very chief of jewels, has not always held that position. Before the skill of the lapidary (which now brings out all the beauties of the diamond) was brought to perfection, the pearl and the ruby stood before it. Even now a perfect ruby exceeding one carat in weight is worth considerably more than a diamond. Thus, £300 has been given for a ruby of three carats, although a diamond of the same weight would sell for no more than £90. But, as Mr. Emanuel writes, "no matter how brilliant the ruby, or how free from defects and flaws, it must have the precise pigeon's blood red to make it the gem which surpasses the diamond in value." The Indians have always given the diamond the first place, but the Persians, in the thirteenth century, placed it fifth, after the pearl, the ruby, the emerald, and the chrysolite. Cellini ranked it after the ruby and emerald, and Garcias ab Horto, in 1565, wrote: "The diamond is considered the king of gems, on account of the hardness of its substance; for if we look to value and beauty, the emerald holds the first place, and the ruby (if clear) the second."

We have mentioned the pearl as a precious stone, because it was anciently supposed to be such, and also because no list

of jewels would be complete without some notice of this beautiful object. As, however, its origin is totally different from its fellows, we will consider it first, and then follow on with the true precious stones in their order of precedency. The pearl is a mere concretion of the carbonate of lime forming the shell of the oyster or mussel, which accumulates upon some foreign body accidentally introduced (usually a grain of sand), for the purpose of preventing the irritation its roughness would otherwise occasion to the animal. The Chinese are in the habit of producing pearls artificially by the introduction of small images of Buddha into the mussels, which in course of time are covered with the pearly substance. Pearls are found over a considerable geographical range, but the best are brought from the coasts of Ceylon. The Persian Gulf pearls are inferior to these. Pearls are obtained in great abundance from the river Tay, but although at first they are scarcely distinguishable from the Oriental, they are found to turn black with wear. It was once believed that the shoals of pearl-oysters had a king, distinguished by his age and size, exactly as bees have a queen, wonderfully expert in keeping out of harm's way; but if the divers once succeeded in capturing him, the rest, straying about blindly, fell an easy prey. The beauty of pearls is entirely due to nature, and art cannot improve it. When the surface is examined with a microscope, it is found to be indented with a large number of delicate grooves, which by their effect upon the light give rise to the play of colors.

The largest pearl known to the Romans weighed more than half an ounce, a size that has rarely been equalled; but the largest on record is now in Russia. It was brought from India in 1620, and sold to Philip IV. of Spain. The merchant, when asked by the king how he could venture all his fortune on one article, replied, because he knew there was a king of Spain to buy it of him. Tavernier mentions in his travels a remarkable pearl belonging to an Arabian prince. He says, "It is the most wonderful pearl in the world; not so much for its bigness, for it weighs not above twelve carats and one-sixteenth; not for its perfect roundness; but because it is so clear and transparent, that you may almost see through it. The Great Mogul offered, by a Banian, forty thousand crowns for his pearl, but he would not accept it." *Perles baroques*, or pearls of an irregular shape, are usually set in some fanciful form with gold enamel. In the Devonshire Cabinet there is a very fine specimen of a distorted pearl, which is made to represent a mermaid; and the Green Vaults at Dresden contain a remarkable collection of monster pearls in the shape of human figures, animals, fruits, etc. The Persians have always been the greatest admirers of the pearl, and the portraits of the Persian queens exhibit them as wearing for ear-pendants three pearls, increasing downwards in size.

It is needless to do more than mention Cleopatra's costly draught, and to note that the same story of the "dissolved" pearl is told of Sir Thomas Gresham. "Here fifteen hundred pounds at one clap goes instead of sugar. Gresham drinks the pearl unto his queen and mistress. Pledge it, lords!" * If the Egyptian queen and the London merchant swallowed their pearls, they must have taken them undissolved, for no acid that the human stomach can endure is capable of dissolving a pearl. Of the many tales told of notable pearls, none can compare in interest with that related by Procopius of King Perozes and the pearl which a daring diver obtained from the guardianship of the enamored shark at the sacrifice of his own life. When the king was entrapped into a vast pitfall by the feigned retreat of the Ephthalite Huns he was pursuing, he tore from his right ear this glorious jewel, and cast it before himself into the abyss, comforted in his last moment with the thought that he had deprived the foe of the greatest trophy of their victory. The pearl is well supplied with names, and the etymology of all of them is of much interest. The chief of these is margarite (Greek, μαργαρίτης, Latin, *margarita*), which is evidently closely related to the Persian word *murwari;* but the great German philologist Grimm has given the following very reremarkable explanation of the word: "Coarse gravel (*glarea*) is termed in old High German, *krioz*, *griez* (masc.), and in the new High German, *gries* (masc.); the Anglo-Saxon *greot*, English, *grit*, means *terra*, *pulvis;* the old Norse (neuter) *griot*, *lapis*. As men found the pearls on the seashore, they took them for stones, and named them, in old High German, *merikrioz* (masc.); in middle High German, *mergriez*, or *mergrieze;* in Anglo-Saxon, *meregreot* (neuter). To the ancients, μαργαρίτης, *margarita*, was a barbarous word (Plin. 9, 35). *Mergriez* affords a cor-

rect sense, and cannot be deduced from *margarita*. In *margarita*, therefore, a German word of a very early time has been preserved to us in one of the oldest monuments of our language (Gothic, *marigriuts*, *marigruitôs*, or *marigruit*, *marigruita*). At a later period it was superseded by the foreign *perula*, *perle;* and we find *mergriezen* used in the sense of grains of sand." * The real objection to this conjecture is the fact that μάργαρίτης was an adjective, the primary substantive being μάργαρον, and consequently the last part, γαριτης, could not be deduced directly from any German form of the substantive *grit*. The real problem is the origin of *margaron*, and not of *margarites*. It is, however, a remarkable coincidence that the Teutonic compound meaning "sea-grit" should so closely resemble the Greek word, which is apparently of Persian origin. As in a university list of honors the man who is without peer is marked off from his fellows in the examination, so it seems well to specially honor the jewel which has given a favorite Christian name to the female sex, and has added a word to the language to represent an object of priceless value and a woman of exceeding excellence.

The ordinary precious stones divide themselves broadly into crystallized, and uncrystallized or amorphous. The most beautiful jewels belong to the first class, and the substances chiefly used by the gem-engraver, such as onyx, agate, cornelian, etc., to the last. The diamond is crystallized carbon, the sapphire and ruby are crystallized clay, and the rock crystal and amethyst are crystallized flint or quartz. The cut and polished diamond is one of the most beautiful of objects, but the rough stone is uninviting in appearance. It greatly resembles the common gravel by which it is surrounded, and is not unlike a lump of gum-arabic, yet experts find but little difficulty in detecting it. When Tavernier visited the Indian diamond mines, he saw the children of the merchants, from the age of ten to fifteen or sixteen, seated in a prominent position, and ready to become purchasers of the stones that were found. His relation is as follows: "Each boy has his diamond weights and bag with money. If any one brings them a stone they hand it to the eldest boy, who looks at it and then hands it to the one next him, by which means it goes from hand to hand till it returns to him again. After that he demands the price; but if he buys it too dear it is upon his own account. In the evening the boys bring the diamonds they have bought to the great merchants, and the profit is divided equally among them."

* Grimm's "*Deutsche Grammatik.*" 1831. Part iii. p. 380.

The diamond is the hardest of all known natural substances, and this quality alone would make it a valuable object, even had it no value as a jewel.

> The diamond — why 'twas beautiful and hard,
> Whereto his invised properties did tend.

In the popular mind the qualities of hardness and toughness have been confused in this instance, so that the notion has been prevalent that if a diamond is laid upon an anvil and struck with a hammer, instead of breaking, it will be driven into the anvil, but we may presume that few have sufficient faith in this test to make the costly experiment. In point of fact, the diamond is very easily broken, on account of the very thin layers of which it is composed, and those who are accurately acquainted with the point of cleavage can divide it with a simple penknife. Dr. Wollaston used his knowledge of this peculiarity with great advantage to himself when he bought a faulty diamond from Messrs. Rundell and Bridge for £6,000, and after separating the flawed portions, which served for a ring and a set of sleeve-studs, resold the remaining perfect stone for £7,000. The word *adamas* among the earliest Greek writers signified a hard metal, and not a precious stone, as we may guess when we read of the adamantine chains of Prometheus, which certainly were not strings of diamonds. Plato's *adamas* is supposed to have been the white sapphire. Manilius, who flourished in the latter part of the Augustan age, is the first writer who describes the true diamond under the name of *adamas*.

The Romans placed the diamond in the very highest rank as a precious stone, but as they were in the habit of wearing the crystals in their native form, this eminent position must have been given to it more on account of its scarcity than for its beauty. It was supposed to keep off insanity, dispel vain fears, drive away phantasms and nightmares, and baffle poison, but that if swallowed it became itself the deadliest of all poisons. Cellini tells a fabulous story of how his life was preserved from the machinations of an enemy by the roguery of an apothecary, who, being employed to pulverize a diamond

intended to season the artist's salad, substituted a bit of beryl in its stead.

We do not know when the diamond was first polished with its own dust, but the art of cutting it into a regular form, so as to bring out all possible lustre, was not practised before the year 1456, when Louis van Berghem made a revolution in the trade by the discovery of the art of diamond-cutting. In 1475 he was employed by Charles the Bold of Burgundy to cut three large stones, previously worn by the king in their natural state as eight-sided crystals (*points naives*). It was nearly two hundred years later (1650), during the supremacy of Cardinal Mazarin, that the true brilliant shape was discovered. The English diamond-cutters used to be renowned for the perfection of their work, and even now an old English cut brilliant will command a higher price in the market than one cut by the Dutch. When those cutters died off the trade fell into the hands of the Jews, who chose Amsterdam as the place where they could obtain most freedom, and that city became the seat of this branch of industry. Professor Tennant, however, tells us that the diamond-cutting trade is coming back to England again, and some excellent work has been done here of late years. It is estimated that out of the twenty-eight thousand Jews living in Amsterdam, ten thousand are dependent directly or indirectly upon the trade of diamond-cutting. Although the greatest skill is required in the cutters, they are rather poorly paid. The three forms in which diamonds are cut are the table, the rose, and the brilliant. The two first forms were long the only ones in use, but when the brilliant cutting was introduced they were superseded, except for inferior stones. The brilliant is a double pyramid or cone cut off by a large plane called the table, at the top, and by a small one, called the collet, at the bottom. The facets have to be so adjusted that the girdle (which determines the greatest horizontal expansion of the stone) shall present a prismatic edge; and so accurate is the eye of the cutter from constant practice, that this is done by a sort of instinct, without any measurement. The adjustment of the relative sizes of the table and the collet is also a very important matter, as the light that penetrates from above must be totally reflected internally. Jacomo da Trezzo engraved subjects upon the diamond in the year 1564, and is said to have been the first to do so, but his right to this honor has been disputed, and claimed for Birago, another Milanese. It is supposed, however, that much of this misplaced ingenuity was displayed upon the white topaz or the colorless sapphire, which stones have often been mistaken for diamonds.

The diamond has been found in almost every color, from the slightest tint to the most pronounced dye, and the rose-colored diamond as far eclipses the ruby as the green does the emerald and the blue the sapphire. A yellowish tinge is considered a great defect, but a decided color is valued for its rarity as well as for its beauty. Thus, Mr. Emanuel notices a brilliant emerald green stone of five grains,* that sold for £320, which, if white, would only have been worth £28. In the jewel-room of the Dresden Green Vaults is the unique green brilliant which weighs forty and one half carats, and formerly belonged to the elector of Saxony — Augustus the Strong. The celebrated Hope blue diamond is supposed by Barbot to be the stone that disappeared from the French regalia at the time of the great Revolution. It then weighed sixty-seven carats, but has since been recut as a brilliant, and reduced in weight. In the Russian treasury is a brilliant red diamond of ten carats, which was bought by Paul I. for one hundred thousand roubles. Mr. King writes that the most charming piece of jewellery he ever beheld was a spray, composed with exquisite taste, entirely of colored diamonds of all the tints that could be collected during ten years' research by the skilful but unfortunate artist-goldsmith who designed and executed the ornament.

The first record of the burning of a diamond is to be found in the proceedings of the Accademia del Cimento of Florence, in the seventeenth century; but although some French chemists burnt one in 1771, the question of its combustion continued for some years to be disputed. It was subsequently proved that it burned, and produced carbonic acid gas. Diamonds are found in the beds of rivers, mostly in companionship with gold. The diamond mines of central India originally supplied the world with nearly all the notable diamonds, but they are now nearly superseded. During the centuries that they were worked they produced an enormous quantity of fine stones, and it is said that one of the Mahommedan emperors, who died at the end of the twelfth century, managed to amass in his treasury four

* The weight of diamonds is calculated as follows: — 4 grains = 1 carat; 141 1-2 carats = 1 ounce troy. It will thus be seen that a diamond grain is less than an ordinary troy grain. 5 diamond grains are equal to 4 troy grains.

hundred pounds' weight of diamonds. At the beginning of the seventeenth century a Portuguese gentleman went to the ancient mine of Currure, belonging to the king of Golconda, to dig for diamonds, but after spending a large sum of money, and converting everything he possessed, even to his clothes, into coin, he had still found nothing. While the miners were employed upon the last day's work that he had money to pay for, he prepared a cup of poison, to drink if the men came empty-handed from work; but in the evening they brought him a valuable stone, and his purpose was instantly changed. Before returning to Goa, he set up a monument, with an inscription in the native tongue to the following effect: —

Your wife and children sell, sell what you have,
Spare not your clothes — nay, make yourself a slave;
But money get, then to Currure make haste,
There search the mines, a prize you'll find at last.*

The diamonds of Borneo are held in high repute, and according to Sir Stamford Raffles, "few courts of Europe could perhaps boast of a more brilliant display than in the prosperous days of the Dutch was exhibited by the ladies of Batavia, the principal and only mart then opened for the Bornean diamond mines."

The dealers have always looked with disfavor upon any attempts to discover mines in new quarters, and when in the year 1727 Bernardino Fonseca Lobo brought news to Lisbon of the existence of large numbers of diamonds among the gold washings in the province of Minas Geraes, Brazil, they spread a report that the stones had been sent surreptitiously from Goa to South America. The discovery was made by accident, owing to Lobo having noticed the peculiarity of the small stones which the miners used as card counters. The same suspicion was exhibited when it was first reported that diamonds had been found in Africa. Professor Tennant made a very interesting report respecting these Cape diamonds before the Geological Section of the British Association in September, 1875. He said that the late Mr. Mawe, who wrote on diamonds and described their mode of occurrence in his "Travels in Brazil" (London, 1812), told him of the probability of their existence in South Africa, and affirmed that if people only knew them in their natural state they must be found. Mawe died in 1829, and Mr. Tennant took every opportunity of making the subject known; but it was not until March, 1867, that the first Cape diamond was found. The supply since then has been very considerable, and it is estimated that the value of the diamonds found during the period that has elapsed since the first discovery is above thirteen millions of pounds sterling. In spite of this immense addition to the store of diamonds, their value has not diminished, but rather increased, since Jeffries published his rule for ascertaining the value of cut diamonds.

The number of remarkable diamonds which possess a history is large, and the following is a table of some of the most celebrated of these: —

	Weight after cutting. Carats.	Weight in rough. Carats.
1 Braganza (probably a white topaz)		1680
2 Matan		367
3 Orloff	193	
4 Austrian, or Florentine Brilliant	139½	
5 Pitt, or Regent	136¾	410
6 Star of the South	124¼	254½
7 Koh-i-noor	102¼	
Indian-cut	186	
8 Stewart (largest Cape diamond)		288⅜
9 Shah	86	
10 Pigott	82¼	
11 Nassack	78⅝	
Indian cut	89¾	
12 Mr. Dresden's Brazil diamond	76½	
13 Prof. Tennant's Cape diamond	66	112
14 Sancy	54	

1. The "Braganza," one of the Portuguese crown jewels, which is preserved in its rough state in the royal treasury at Lisbon, is by far the largest stone professing to be a diamond in existence. It was found in 1741 in Brazil, and is as large as a hen's egg, but as the Portuguese government will not suffer it to be examined, many persons believe it to be only a white topaz.

2. The "Matan" is one of the largest and most esteemed diamonds in existence. It is uncut, and in form resembles an egg indented on one side. It was found at Landak, in Borneo, about the year 1760, and belongs to the sultan of Matan. Wars have been waged to obtain it, and the owner has refused to sell it, because he believes that on its possession depends the fortunes of his family. The Dutch gov-

ernor of Batavia offered two gun-boats, with stores and ammunition complete, and £50,000 for it, but his offer was refused. Mr. Crawfurd sets its value at £269,378. Strangers are not shown the real stone, but a bit of crystal to represent it.

3. The "Orloff" is a rose diamond, now set in the top of the Russian imperial sceptre, but has passed through many vicissitudes before arriving there. Some say it originally formed one of the eyes of the idol at Sherigan, and others that it was set in the famous peacock throne of Nadir Shah. It was stolen by a French soldier, who sold it at Malabar for £2,800. The Armenian Schaffras, who bought it of a Jew, made a profitable bargain with the empress Catharine II., for he received four hundred and fifty thousand roubles, a pension of twenty thousand roubles, and a patent of nobility as well.

4. The "Austrian or Florentine Brilliant," also called the "Grand Duke of Tuscany," has a slightly yellowish hue, and is said to have been bought as colored crystal out of a jeweller's shop in Florence. It has been valued at £100,000.

5. The "Pitt," or "Regent," is the most perfect brilliant in existence, and is without a rival in shape and water. It weighed four hundred and ten carats in the rough, and is said to have been found in 1702 in the mines of Parteal, twenty miles from Masulipatam, by a slave, who concealed it in a gash made for its reception in the calf of his leg, and running away from his master, offered it to a sailor, on condition that he assisted him to escape. The sailor lured him on board a ship, and after throwing him overboard, sold the stone to Jamchund for £1,000. Thomas Pitt, governor of Fort St. George, purchased it of this Hindu merchant for £12,500, and then had it cut into a fine brilliant. The cutting occupied two years, and cost £5,000, but the fragments cut off were valued at £3,000 to £4,000. Pitt seems to have found his diamond a rather unenviable possession, for so fearful was he of robbery, that he never made known beforehand the day of his coming to town, nor slept two nights consecutively in the same house. The fame of the diamond spread over Europe, and many persons tried to obtain a sight of it; but Uffenbach, who visited this country in 1712, found all his efforts fruitless. Many tales floated about in society which were not very creditable to Pitt, and he was therefore forced to clear himself in a pamphlet. Pope wrote: —

Asleep and naked as an Indian lay,
An honest factor stole a gem away;
He pledged it to the knight, the knight had wit,
So kept the diamond, and the rogue was bit.

This celebrated stone gave point to one of the first Lord Holland's speeches in the House of Commons. His great opponent, the first William Pitt, had expressed a wish that a certain motion might be a millstone about the mover's neck, to drag him to the lower regions. Pitt afterwards (when in office) adopted the plan he had before stigmatized, so Henry Fox rose and said, "I am happy the right honorable gentleman has retracted the opinion he has hitherto maintained, and I sincerely wish that what he hoped would prove a millstone about my neck may become a brilliant equal, if not superior, to that of his namesake's, to grace his hat withal." In 1717 Pitt sold the stone to the Duc d'Orleans, regent of France, for £135,000. It was stolen during the Reign of Terror, but was restored in a mysterious manner. Napoleon I. found it of inestimable value to him, for after the 18th Brumaire, by pledging it to the Dutch, he procured the funds that were so indispensable for the consolidation of his power. It was afterwards redeemed, and ornamented the pommel of the emperor's sword. In 1855, it was shown at the Paris Exhibition.

6. The "Star of the South" is a brilliant which was found by a negro in the province of Minas Geraes, Brazil, in 1853.

7. The "Koh-i-Noor," or "Mountain of Light," was the talisman of India for many centuries. According to Hindu legend it was worn by Karna, king of Anga, and one of the warriors who were slain in the Great War, which is the subject of the Sanscrit epic "*Maha'bhárata*." The emperor Baber records the fact of this diamond having been taken at Agra, by Humayun, in May, 1526, and when Tavernier visited the court of the Great Mogul it was in the possession of Aurungzebe, who treated it with the greatest solemnity. According to tradition, Mohammed Shah, the great grandson of Aurungzebe, wore the Koh-i-noor in front of his turban at his interview with his conqueror, Nadir Shah, when the latter monarch insisted upon exchanging turbans in proof of his regard. Mr. King believes that Tavernier did not see the Koh-i-noor, but a much larger stone called the "Great Mogul." Professor Maskelyne, however, proves that the traveller's calculations are not to be depended upon, and shows that the weight in *ratis* given by Tavernier is identical with the emperor Baber's statement of the weight of his diamond, and

that both agree with that of the Koh-i-noor. On the annexation of the Punjaub in 1850 by the British government, it was stipulated that the Koh-i-noor should be presented to the queen. After the East India Company became possessed of the gem, it was sent by Lord Dalhousie to England in the possession of two officers. After having been the cynosure of all eyes in the Exhibition of 1851, it was recut in Mr. Garrard's house, by workmen brought over from Mr. Coster's establishment at Amsterdam. The cutting by the new process, which included the employment of a small steam-engine, is said to have cost £8,000. Mr. King relates a curious story of the danger the stone was in at this period. He writes: "The London jeweller entrusted with the recutting of the Koh-i-noor was displaying his finished work to a wealthy patron, who accidentally let the slippery and weighty gem slip through his fingers and fall on the ground. The jeweller was on the point of fainting with alarm, and on recovering himself reduced the other to the same state, by informing him that had the stone struck the floor at a particular angle it would infallibly have split in two, and been irreparably ruined."

9. The "Shah" was presented to the emperor of Russia by Chosroes, the son of Abbas Mirza. It is a faceted prism, and is engraved with a Persian inscription.

10. The "Pigott" has passed through many vicissitudes. At the end of the last century it was sold by lottery for £30,000, and was afterwards bought by Rundell and Bridge for £6,000. The pasha of Egypt then gave the original price of £30,000 for it.

11. The "Nassack" was captured from the peishwa of the Mahrattas by the Marquis of Hastings. It was then Indian-cut, and weighed eighty-nine and three-quarters carats; but after changing hands several times it was purchased by the Marquis of Westminster, who employed Messrs. Hunt and Roskell to recut it. Mr. King treats the "Pigott" and "Nassack" as the same stone.

12. This is a very large and beautiful diamond, which was found in Brazil a few years ago.

13. This diamond is now offered for sale at £10,000.

14. The "Sancy" is a renowned stone, but more credit has been given to it than is its due. It has been supposed to be the diamond worn by Charles the Bold of Burgundy when he was killed at the battle of Nancy, but Mr. King gives the following reason for disbelieving this story. De Boot states that the largest diamond ever seen in Europe was the one purchased from Carlo Affetati, of Antwerp, by Philip II., in 1559, which weighed forty-seven and one-half carats. Now Philip had been presented with the jewel of his unfortunate ancestor six years before this date, so that could not be the "Sancy," which weighed fifty-four carats. The Baron de Sancy died in 1627, and forty-two years afterwards his diamond was in the possession of the queen of England, probably Henrietta Maria. Subsequently it belonged to James II., who sold it to Louis XIV. for £25,000. Louis XV. is said to have worn it in the clasp of his hat at his coronation. The stone was stolen in the great robbery of September, 1792, but appears again in 1838, when it was sold to the Demidoff family. In February, 1865, it was purchased by Messrs. Garrard for Sir Jamsetjee Jejeebhoy, of Bombay, and thus, after many vicissitudes, it again returned to India. The price paid for it was £20,000.

No list of celebrated diamonds would be complete without some mention of the notorious necklace which played so important a figure in the events of the French Revolution. This matchless jewel was the result of an order given by Louis XV. for the most costly set of diamonds, to be presented by him to his mistress, Madame du Barry. The king died before the order could be executed, and the jewellers were in consequence ruined. The necklace, which contained six hundred and twenty-nine diamonds, was however finished, and offered to Marie Antoinette, who refused it. That arch impostor, Madame de la Motte, then appeared upon the scene, and by the help of lies and forgery obtained possession of it, with what consequences both to innocent and guilty, is known to all.

The ruby as well as the sapphire is formed of corundum, or crystallized clay, and the two stones are, in fact, identical in composition, so that the red sapphire is a ruby and the blue ruby a sapphire. Thus a long crystal has been found which was red ruby at one end, blue sapphire at the other, and colorless beryl between. The ruby is the most valuable of all stones when free from flaw, of large size, and of a color which should exactly resemble that of pigeon's blood. The finest rubies are obtained in Siam and Burmah, but they are also found in Ceylon and in several parts of Europe. One of the titles of

Public Domain / http://www.hathitrust.org/access_use#pd

the king of Burmah is Lord of the Rubies, and he is said to possess one as large as a pigeon's egg, but no European has ever seen it. A fine stone of four carats' weight is worth from £400 to £450, but above this weight they are very rare, and would command fancy prices.

The ruby has been most successfully imitated in paste, and garnets backed by a ruby foil are often met with. The monster ruby of Charles the Bold, set in the middle of a golden rose, for a pendant, which was captured by the Bernese after his rout at Granson, turned out, when purchased by Jacob Fugger, to be false. Many so-called rubies are nothing more than spinel or balas rubies. Crimson spinel is named spinel-ruby, and rose-red or pink spinel, balas-ruby.

Magical properties have been assigned to the ruby, and Brahman traditions speak of the abode of the gods as lighted by enormous rubies and emeralds. It was supposed to be an amulet against poison, plague, sadness, evil thoughts, wicked spirits, etc., and it warned its wearer of evil by becoming black or obscure.

The "heaven-hued" sapphire is found in all tints and shades of blue, and the ancients called the dark-colored male and the pale female. It is not so valuable when of a great size as the ruby, but a fine stone fetches a high price. Mr. Emanuel tells the story of a noble lady who possessed perhaps the finest known sapphire, but sold it during her lifetime, and replaced it by a skilful imitation, which deceived the jeweller who valued it for probate duty. It was estimated at £10,000, and the legatee paid legacy duty for it before he found out the deception. The largest sapphire is the "Wooden Spoon-seller," so called from the occupation of its finder in Bengal, but also known as the Ruspoli. Its weight is one hundred and thirty-two and one sixteenth carats. It was bought by Perret, a French jeweller, for £6,800, and is now in the Musée de Minéralogie, Paris. One of the finest sapphires is in the possession of Lady Burdett Coutts, and was formerly one of the crown jewels of France.

The sapphire was sacred to Apollo, and was worn by the inquirer of the oracle at his shrine. It was supposed to prevent evil and impure thoughts, and was worn by priests, on account of its power to preserve the chastity of the wearer. St. Jerome affirmed that it procures favor with princes, pacifies enemies, and obtains freedom from captivity; but one of the most remarkable properties attributed to it was its power of killing any venomous reptile that was put into the same glass with it.

The emerald has been found in various parts of the world, but the most abundant and finest supply comes from Peru and Chili. The Spaniards obtained large hoards of emeralds after the conquest of Peru, for the priests of the goddess whom the Spaniards called Esmeralda, and who was supposed to reside in an enormous emerald of the shape and size of an ostrich egg, gave out that she esteemed no offering so much as one of her own daughters. The king of Spain is said to have received one hundredweight, but many were destroyed on account of the Peruvian priest who accompanied the Spanish army persuading the soldiers that the test of their genuineness was to smite them with a hammer on an anvil. The emerald is of the same chemical composition as the beryl, or aquamarine, which is of little value. When first withdrawn from the mine it is so soft as to crumble by friction, but it hardens by exposure to the air. It is so rarely perfect, that "an emerald without a flaw" has passed into a proverb, and fine specimens are worth from £20 to £40 the carat. In the Middle Ages its value was enormous, and Cellini puts it at four hundred gold scudi the carat, or four times the amount at which he values the diamond. It is sometimes of great size, and the largest known is the Devonshire emerald, found at Muro, near Santa Fe di Bogota, and purchased by the Duke of Devonshire from Don Pedro. It is not cut, and is two inches in diameter, weighing eight ounces eighteen pennyweights.

The ancients dedicated the emerald to Mercury, and supposed it to be good for the eyes.

> The deep-green emerald, in whose fresh regard
> Weak sights their sickly radiance do amend.

The lapidaries who cut the stone were thought to possess in consequence a good eyesight. Nero observed the feats of the gladiators through an eyeglass of emerald, and the gem was therefore sometimes called Neronianus, a name continued as late as the close of the fourth century. The huge emeralds made into cups and dishes that are mentioned by the ancients are supposed to have been green fluorspar, or composed of a kind of glass. The Cingalese anxiously seek after the thick bottoms of our wine bottles, and cut out of them apparently fine emeralds, which they dispose of at high prices. The Brighton emeralds are of a like origin.

The broken bottles, thrown purposely into the sea by the lapidaries of the place, are by the attrition of the shingle speedily converted into the form of natural pebbles.

The turquoise, or Turkish stone, is sky-blue and opaque, and is found in Persia. A variety is also found at Mount Sinai, in Arabia Petrea, in the matrix of a calcareous rock. The shah of Persia is supposed to have in his possession all the finest gems, as he allows only those of inferior quality to leave the country. In consequence, large turquoises of good quality and fine color are extremely rare, and realize large prices. This stone was formerly highly esteemed as a talisman, and De Boot gives a long list of its virtues. Some persons have supposed the turquoise to be composed of fossil bone colored by copper, but this is a misapprehension, as the bone or fossil turquoise (odontolite) found in Languedoc is a totally different production, and is sometimes called turquoise-Bricaud, from the name of the original owner of the mine.

The opal was highly prized by the ancients, and Nonius went into exile rather than surrender his fine opal to Mark Antony. Marbodus says that it confers the gift of invisibility upon the wearer, so that the thief, protected by its virtue of dazzling all beholders, could carry off his plunder in open day. It was also supposed to confer upon the wearer all the qualities granted by nature to itself. There are several varieties of this beautiful stone, as the noble or precious opal, the fire or reddish opal, the common opal, and the hydrophane or Mexican opal. The colors are produced by the polarizing and refracting effect of the laminæ of the stone upon the light. The hydrophane loses it beauty on being exposed to water, and it was this stone which was worn by the Baroness Hermione of Arnhem in "Anne of Geierstein." It is said that the absurd notion of the opal being an unlucky stone, cannot be traced farther back than the publication of Scott's novel. The empress Josephine's opal, called the "Burning of Troy," from the innumerable red flames blazing on its surface, was considered to be the finest stone of modern times, but its present owner is unknown. In the Museum of Vienna is an opal of extraordinary size and beauty, for which £50,000 has been refused.

The amethyst, one of the quartz family, varies in shade from delicate pink or lilac to deep purple. It was highly esteemed by the ancients as an amulet against intoxication, on account of the supposed etymology of the word ἀμέθυστος, and it was thought that wine drank out of an amethyst cup would not inebriate. It is known as the bishop's stone, from being worn as a ring by the Roman Catholic bishops, just as the green variety of tourmaline is said to be used as a ring-stone by the clergy of Brazil. In 1652 an amethyst was worth as much as a diamond of equal weight, but after large quantities had been sent from Brazil they became nearly valueless. Even in the last century it was still held in estimation, and Mr. King tells us that Queen Charlotte's necklace of well-matched amethysts (the most perfect ever got together) was valued at £2,000, but it would not now command as many shillings. The Oriental amethyst is quite another stone. It is a purple sapphire, or a rare and valuable species of the precious corundum.

The garnet is of little value, but is effective in jewellery on account of its brilliant color. When cut *en cabachon*, that is, oblong and raised like the section of a plum, it is called a carbuncle. The pendent carbuncle to the necklace of Mary Queen of Scots, which that queen wore at her marriage with Darnley, was valued at the enormous sum of five hundred crowns. The purple or red-wine-tinted garnets are named almandine.

Here we must end our account of the most precious stones. Had we space we might give some notice of those less precious, and of the many other substances used in jewellery which are of interest from their beauty or from the superstitions that are attached to them. The makers of acrostic jewellery often use stones that are held in little estimation, in order to obtain a letter they want. Thus, lapis lazuli must be used for *l;* nephrite or jade for *n;* verde antique for *v;* and zircon for *z.* There are no stones whose names commence with the letters *f*, *k*, *u*, *w*, and *x*, but all the remainder of the alphabet is appropriated.

Precious stones are objects of the greatest beauty, and although often used for purposes of mere display, they have a permanent and abiding value, on account of their distinguishing qualities of hardness and indestructibility. A stone which has a history that can be traced back a decade of centuries or more, cannot but exert some influence over our imaginations. Besides their beauty, precious stones are of interest on account of their optical qualities, their chemical constitution, and the prominent position they have

held in universal history; therefore their praises have been published by science, art, history, and poetry. We have already noticed how poets have sung of the virtues of gems, and we cannot do better than close our roll with the greatest of them all, who tells us of

> deep-brain'd sonnets that did amplify
> Each stone's dear nature, worth, and quality.

MACLEOD OF DARE.

BY WILLIAM BLACK.

CHAPTER VIII.

LAUREL COTTAGE.

A SMALL, quaint, old-fashioned house in South Bank, Regent's Park; two maidens in white in the open veranda; around them the abundant foliage of June, unruffled by any breeze; and down at the foot of the steep garden the still canal, its surface mirroring the soft, translucent greens of the trees and bushes above, and the gaudier colors of a barge lying moored on the northern side. The elder of the two girls is seated in a rocking-chair; she appears to have been reading, for her right hand, hanging down, still holds a thin MS. book covered with coarse brown paper. The younger is lying at her feet, with her head thrown back in her sister's lap, and her face turned up to the clear June skies. There are some roses about this veranda, and the still air is sweet with them.

"And of all the parts you ever played in," she says, "which one did you like the best, Gerty?"

"This one," is the gentle answer.

"What one?"

"Being at home with you and papa, and having no bother at all, and nothing to think of."

"I don't believe it," says the other, with the brutal frankness of thirteen. "You couldn't live without the theatre, Gerty — and the newspapers talking about you — and people praising you — and bouquets ——"

"Couldn't I?" says Miss White, with a smile, as she gently lays her hand on her sister's curls.

"No," continues the wise young lady. "And besides, this pretty, quiet life would not last. You would have to give up playing that part. Papa is getting very old now; and he often talks about what may happen to us. And you know, Gerty, that though it is very nice for sisters to say they will never and never leave each other, it doesn't come off, does it? There is only one thing I see for you — and that is to get married."

"Indeed."

It is easy to fence with a child's prattle. She might have amused herself by encouraging this chatter-box to go through the list of their acquaintances, and pick out a goodly choice of suitors. She might have encouraged her to give expression to her profound views of the chances and troubles of life, and the safeguards that timid maidens may seek. But she sudddnly said, in a highly matter-of-fact manner, —

"What you say is quite true, Carry, and I've thought of it several times. It is a very bad thing for an actress to be left without a father, or husband, or brother, as her ostensible guardian. People are always glad to hear stories — and to make them — about actresses. You would be no good at all, Carry ——"

"Very well, then," the younger sister said promptly, "you've got to get married. And to a rich man, too; who will buy you a theatre, and let you do what you like in it."

Miss Gertrude White, whatever she may have thought of this speech, was bound to rebuke the shockingly mercenary ring of it.

"For shame, Carry! Do you think people marry from such motives as that?"

"I don't know," said Carry; but she had, at least, guessed.

"I should like my husband to have money, certainly," Miss White said frankly; and here she flung the MS. book from her, on to a neighboring chair. "I should like to be able to refuse parts that did not suit me. I should like to be able to take just such engagements as I chose. I should like to go to Paris for a whole year, and study hard ——"

"Your husband might not wish you to remain an actress," said Miss Carry.

"Then he would never be my husband," the elder sister said, with decision. "I have not worked hard for nothing. Just when I begin to think I can do something — when I think I can get beyond those coquettish, drawing-room, simpering parts that people run after now — just when the very name of Mrs. Siddons, or Rachel, or any of the great actresses makes my heart jump — when I have ambition, and a fair chance, and all that — do you think I am to give the whole thing up, and sink

Original from CORNELL UNIVERSITY

quietly into the position of Mrs. Brown or Mrs. Smith, who is a very nice lady, no doubt, and very respectable, and lives a quiet and orderly life, with no greater excitement than scheming to get big people to go to her garden-parties?"

She certainly seemed very clear on that point.

"I don't see that men are so ready to give up their profession, when they marry, in order to devote themselves to domestic life, even when they have plenty of money. Why should all the sacrifice be on the side of the woman? But I know if I have to choose between my art and a husband, I shall continue to do without a husband."

Miss Carry had risen, and put one arm round her sister's neck, while with the other she stroked the soft brown hair over the smooth forehead.

"And it shall not be taken away from its pretty theatre, it sha'n't!" said she pettingly; "and it shall not be asked to go away with any great ugly Bluebeard and be shut up in a lonely house ——"

"Go away, Carry," said she, releasing herself. "I wonder why you began talking such nonsense. What do you know about all those things?"

"Oh! very well," said the child, turning away with a pout; and she pulled a rose and began to take its petals off, one by one, with her lips. "Perhaps I don't know. Perhaps I haven't studied your manœuvres on the stage, Miss Gertrude White. Perhaps I never saw the newspapers declaring that it was all so very natural and lifelike." She flung two or three rose-petals at her sister. "I believe you're the biggest flirt that ever lived, Gerty. You could make any man you liked marry you in ten minutes."

"I wish I could manage to have certain schoolgirls whipped and sent to bed."

At this moment there appeared at the open French window an elderly woman of Flemish features and extraordinary breadth of bust.

"Shall I put dressing in the salad, miss?" she said, with scarcely any trace of foreign accent.

"Not yet, Marie," said Miss White. "I will make the dressing first. Bring me a large plate, and the cruet-stand, and a spoon and fork, and some salt."

Now when these things had been brought, and when Miss White had set about preparing this salad dressing in a highly scientific manner, a strange thing occurred. Her sister seemed to have been attacked by a sudden fit of madness. She had caught up a light shawl, which she extended from hand to hand, as if she were dancing with some one, and then she proceeded to execute a slow waltz in this circumscribed space, humming the improvised music in a mystical and rhythmical manner. And what were these dark utterances that the inspired one gave forth, as she glanced from time to time at her sister and the plate?

"*Oh, a Highland lad my love was born — and the Lowland laws he held in scorn* ——"

"Carry, don't make a fool of yourself!" said the other, flushing angrily.

Carry flung her imaginary partner aside.

"There is no use making any pretense," said she sharply. "You know quite well why you are making that salad dressing."

"Did you never see me make salad dressing before?" said the other, quite as sharply.

"You know it is simply because Sir Keith Macleod is coming to lunch. I forgot all about it. Oh, and that's why you had the clean curtains put up yesterday!"

What else had this precocious brain ferreted out?

"Yes, and that's why you bought papa a new necktie," continued the tormentor; and then she added, triumphantly, "*But he hasn't put it on this morning — ha, Gerty?*"

A calm and dignified silence is the best answer to the fiendishness of thirteen. Miss White went on with the making of the salad dressing. She was considered very clever at it. Her father had taught her; but he never had the patience to carry out his own precepts. Besides, brute force is not wanted for the work: what you want is the self-denying assiduity and the dexterous light-handedness of a woman.

A smart young maid-servant, very trimly dressed, made her appearance.

"Sir Keith Macleod, miss," said she.

"Oh, Gerty, you're caught," muttered the fiend.

But Miss White was equal to the occasion. The small, white fingers plied the fork without a tremor.

"Ask him to step this way, please," she said.

And then the subtle imagination of this demon of thirteen jumped to another conclusion.

"Oh, Gerty, you want to show him that you are a good housekeeper — that you can make salad ——"

But the imp was silenced by the appearance of Macleod himself. He looked tall

as he came through the small drawing-room. When he came out on to the balcony the languid air of the place seemed to acquire a fresh and brisk vitality: he had a bright smile and a resonant voice.

"I have taken the liberty of bringing you a little present, Miss White — no, it is a large present — that reached me this morning," said he. "I want you to see one of our Highland salmon. He is a splendid fellow — twenty-six pounds four ounces, my landlady says. My cousin Janet sent him to me."

"Oh, but, Sir Keith, we cannot rob you," Miss White said, as she still demurely plied her fork. "If there is any special virtue in a Highland salmon, it will be best appreciated by yourself, rather than by those who don't know."

"The fact is," said he, "people are so kind to me that I scarcely ever am allowed to dine at my lodgings; and you know the salmon should be cooked at once."

Miss Carry had been making a face behind his back to annoy her sister. She now came forward and said, with a charming innocence in her eyes, —

"I don't think you can have it cooked for luncheon, Gerty, for that would look too like bringing your tea in your pocket, and getting hot water for twopence. Wouldn't it?"

Macleod turned and regarded this new-comer with an unmistakable "Who is this?" — "*Cò an so?*" — in his air.

"Oh, that is my sister Carry, Sir Keith," said Miss White. "I forgot you had not seen her."

"How do you do?" said he, in a kindly way; and for a second he put his hand on the light curls as her father might have done. "I suppose you like having holidays?"

From that moment she became his deadly enemy. To be patted on the head, as if she were a child, an infant — and that in the presence of the sister whom she had just been lecturing!

"Yes, thank you," said she, with a splendid dignity, as she proudly walked off. She went into the small lobby leading to the door. She called to the little maid-servant. She looked at a certain long bag made of matting which lay there, some bits of grass sticking out of one end. "Jane, take this thing down to the cellar at once! The whole house smells of it."

Meanwhile Miss White had carried her salad dressing in to Marie, and had gone out again to the veranda, where Macleod was seated. He was charmed with the dreamy stillness and silence of the place, with the hanging foliage all around, and the colors in the steep gardens, and the still waters below.

"I don't know how it is," said he, "but you seem to have much more open houses here than we have. Our houses in the north look cold, and hard, and bare. We should laugh if we saw a place like this up with us; it seems to me a sort of a toy place out of a picture — from Switzerland or some such country. Here you are in the open air, with your own little world around you, and nobody to see you; you might live all your life here, and know nothing about the storms crossing the Atlantic, and the wars in Europe, if only you gave up the newspapers."

"Yes, it is very pretty and quiet," said she, and the small fingers pulled to pieces one of the roseleaves that Carry had thrown at her. "But you know one is never satisfied anywhere. If I were to tell you the longing I have to see the very places you describe as being so desolate —— But perhaps papa will take me there some day."

"I hope so," said he; "but I would not call them desolate. They are terrible at times, and they are lonely, and they make you think. But they are beautiful too, with a sort of splendid beauty and grandeur that goes very near making you miserable. . . . I cannot describe it. You will see for yourself."

Here a bell rang, and at the same moment Mr. White made his appearance.

"How do you do, Sir Keith? Luncheon is ready, my dear — luncheon is ready — luncheon is ready."

He kept muttering to himself as he led the way. They entered a small dining-room, and here, if Macleod had ever heard of actresses having little time to give to domestic affairs, he must have been struck by the exceeding neatness and brightness of everything on the table and around it. The snow-white cover; the brilliant glass and spoons; the carefully-arranged, if tiny, bouquets; and the precision with which the smart little maid-servant, the only attendant, waited — all these things showed a household well managed. Nay, this iced claret-cup — was it not of her own composition? — and a pleasanter beverage he had never drank.

But she seemed to pay little attention to these matters, for she kept glancing at her father, who, as he addressed Macleod from time to time, was obviously nervous and harassed about something. At last she said, —

"Papa, what is the matter with you?

Has anything gone wrong this morning?"

"Oh, my dear child," said he, "don't speak of it. It is my memory — I fear my memory is going. But we will not trouble our guest about it. I think you were saying, Sir Keith, that you had seen the latest additions to the National Gallery ——"

"But what is it, papa?" his daughter insisted.

"My dear, my dear, I know I have the lines somewhere; and Lord —— says that the very first jug fired at the new pottery he is helping shall have these lines on it, and be kept for himself. I know I have both the Spanish original and the English translation somewhere; and all the morning I have been hunting and hunting — for only one line. I think I know the other three —

> Old wine to drink.
> Old wrongs let sink.
> . . . . . .
> Old friends in need.

It is the third line that has escaped me — dear, dear me! I fear my brain is going."

"But I will hunt for it, papa," said she; "I will get the lines for you. Don't you trouble."

"No, no, no, child," said he, with somewhat of a pompous air. "You have this new character to study. You must not allow any trouble to disturb the serenity of your mind while you are so engaged. You must give your heart and soul to it, Gerty; you must forget yourself; you must abandon yourself to it, and let it grow up in your mind until the conception is so perfect that there are no traces of the manner of its production left."

He certainly was addressing his daughter, but somehow the formal phrases suggested that he was speaking for the benefit of the stranger. The prim old gentleman continued, —

"That is the only way. Art demands absolute self-forgetfulness. You must give yourself to it in complete surrender. People may not know the difference; but the true artist seeks only to be true to himself. You produce the perfect flower; they are not to know of the anxious care — of the agony of tears, perhaps — you have spent on it. But then your whole mind must be given to it; there must be no distracting cares; I will look for the missing line myself."

"I am quite sure, papa," said Miss Carry spitefully, "that she was far more anxious about these cutlets than about her new part this morning. She was half-a-dozen times down to the kitchen. I didn't see her reading the book much."

"The *res angustæ domi*," said the father sententiously, "sometimes interfere, where people are not too well off. But that is necessary. What is not necessary is that Gerty should take my troubles over to herself, and disturb her formation of this new character, which ought to be growing up in her mind almost insensibly, until she herself will scarcely be aware how real it is. When she steps on to the stage she ought to be no more Gertrude White than you or I. The artist loses himself. He transfers his soul to his creation. His heart beats in another breast; he sees with other eyes. You will excuse me, Sir Keith, but I keep insisting on this point to my daughter. If she ever becomes a great artist, that will be the secret of her success. And she ought never to cease from cultivating the habit. She ought to be ready at any moment to project herself, as it were, into any character. She ought to practise so as to make of her own emotions an instrument that she can use at will. It is a great demand that art makes on the life of an artist. In fact, he ceases to live for himself. He becomes merely a medium. His most secret experiences are the property of the world at large, once they have been transfused and moulded by his personal skill."

And so he continued talking, apparently for the instruction of his daughter, but also giving his guest clearly to understand that Miss Gertrude White was not as other women, but rather as one set apart for the high and inexorable sacrifice demanded by art. At the end of his lecture he abruptly asked Macleod if he had followed him. Yes, he had followed him, but in rather a bewildered way. Or had he some confused sense of self-reproach, in that he had distracted the contemplation of this pale and beautiful artist, and sent her down-stairs to look after cutlets?

"It seems a little hard, sir," said Macleod to the old man, "that an artist is not to have any life of his or her own at all; that he or she should become merely a — a — a sort of ten-minutes emotionalist."

It was not a bad phrase for a rude Highlander to have invented on the spur of the moment. But the fact was that some little personal feeling stung him into the speech. He was prepared to resent this tyranny of art. And if he now were to see some beautiful pale slave bound in these iron chains, and being exhibited for the amusement of an idle world, what would the fierce blood of the Macleods

say to that debasement? He began to dislike this old man, with his cruel theories and his oracular speech. But he forebore to have further or any argument with him; for he remembered what the Highlanders call "the advice of the bell of Scoon" — "*The thing that concerns you not, meddle not with.*"

CHAPTER IX.

THE PRINCESS RIGHINN.

THE people who lived in this land of summer and sunshine and flowers — had they no cares at all? He went out into the garden with these two girls; and they were like two young fawns in their careless play. Miss Carry, indeed, seemed bent on tantalizing him by the manner in which she petted and teased and caressed her sister — scolding her, quarrelling with her, and kissing her all at once. The grave, gentle, forbearing manner in which the elder sister bore all this was beautiful to see. And then her sudden concern and pity when the wild Miss Carry had succeeded in scratching her finger with the thorn of a rosebush! It was the tiniest of scratches; and all the blood that appeared was about the size of a pin-head. But Miss White must needs tear up her dainty little pocket-handkerchief, and bind that grievous wound, and condole with the poor victim as though she were suffering untold agonies. It was a pretty sort of idleness. It seemed to harmonize with this still, beautiful summer day, and the soft green foliage around, and the still air that was sweet with the scent of the flowers of the lime-trees. They say that the Gaelic word for the lower regions, *ifrin*, is derived from *i-bhuirn*, the island of incessant rain. To a Highlander, therefore, must not this land of perpetual summer and sunshine have seemed to be heaven itself?

And even the malicious Carry relented for a moment.

"You said you were going to the Zoological Gardens," she said.

"Yes," he answered, "I am. I have seen everything I want to see in London but that."

"Because Gerty and I might walk across the Park with you, and show you the way."

"I very much wish you would," said he, "if you have nothing better to do."

"I will see if papa does not want me," said Miss White calmly. She might just as well be walking in Regent's Park as in this small garden.

Presently the three of them set out.

"I am glad of any excuse," she said, with a smile, "for throwing aside that new part. It seems to me insufferably stupid. It is very hard that you should be expected to make a character look natural when the words you have to speak are such as no human being would use in any circumstances whatever."

Oddly enough, he never heard her make even the slightest reference to her profession without experiencing a sharp twinge of annoyance. He did not stay to ask himself why this should be so. Ordinarily he simply made haste to change the subject.

"Then why should you take the part at all?" said he bluntly.

"Once you have given yourself up to a particular calling, you must accept its little annoyances," she said frankly. "I cannot have everything my own way. I have been very fortunate in other respects. I never had to go through the drudgery of the provinces, though they say that is the best school possible for an actress. And I am sure the money and the care papa has spent on my training — you see, he has no son to send to college. I think he is far more anxious about my succeeding than I am myself."

"But you have succeeded," said Macleod. It was, indeed, the least he could say, with all his dislike of the subject.

"Oh, I do not call that success," said she simply. "That is merely pleasing people by showing them little scenes from their own drawing-rooms transferred to the stage. They like it because it is pretty and familiar. And people pretend to be very cynical at present — they like things with 'no nonsense about them;' and I suppose this sort of comedy is the natural reaction from the rant of the melodrama. Still, if you happen to be ambitious — or perhaps it is mere vanity? — if you would like to try what is in you —— "

"Gerty wants to be a Mrs. Siddons: that's it," said Miss Carry promptly.

Talking to an actress about her profession, and not having a word of compliment to say! Instead, he praised the noble elms and chestnuts of the park, the broad white lake, the flowers, the avenues. He was greatly interested by the whizzing by overhead of a brace of duck.

"I suppose you are very fond of animals?" Miss White said.

"I am indeed," said he, suddenly brightening up. "And up at our place I give them all a chance. I don't allow a single weasel or hawk to be killed, though I have

a great deal of trouble about it. But what is the result? I don't know whether there is such a thing as the balance of nature, or whether it is merely that the hawks and weasels and other vermin kill off the sickly birds; but I do know that we have less disease among our birds than I hear of anywhere else. I have sometimes shot a weasel, it is true, when I have run across him as he was hunting a rabbit — you cannot help doing that if you hear the rabbit squealing with fright long before the weasel is at him — but it is against my rule. I give them all a fair field and no favor. But there are two animals I put out of the list; I thought there was only one till this week — now there are two; and one of them I hate, the other I fear."

"Fear?" she said: the slight flash of surprise in her eyes was eloquent enough. But he did not notice it.

"Yes," said he, rather gloomily. "I suppose it is superstition, or you may have it in your blood; but the horror I have of the eyes of a snake — I cannot tell you of it. Perhaps I was frightened when I was a child — I cannot remember; or perhaps it was the stories of the old women. The serpent is very mysterious to the people in the Highlands; they have stories of water-snakes in the lochs; and if you get a nest of seven adders with one white one, you boil the white one, and the man who drinks the broth knows all things in heaven and earth. In the Lewis they call the serpent *righinn*, that is, '*a princess;*' and they say that the serpent is a princess bewitched. But that is from fear — it is a compliment ——"

"But surely there are no serpents to be afraid of in the Highlands?" said Miss White. She was looking rather curiously at him.

"No," said he, in the same gloomy way. "The adders run away from you if you are walking through the heather. If you tread on one, and he bites your boot, what then? He cannot hurt you. But suppose you are out after the deer, and you are crawling along the heather with your face to the ground, and all at once you see the two small eyes of an adder looking at you and close to you ——"

He shuddered slightly — perhaps it was only an expression of disgust.

"I have heard," he continued, "that in parts of Islay they used to be so bad that the farmers would set fire to the heather in a circle, and as the heather burned in and in you could see the snakes and adders twisting and curling in a great ball. We have not many with us. But one day John Begg, that is the schoolmaster, went behind a rock to get a light for his pipe; and he put his head close to the rock to be out of the wind; and then he thought he stirred something with his cap; and the next moment the adder fell on to his shoulder, and bit him in the neck. He was half mad with the fright; but I think the adder must have bitten the cap first and expended its poison; for the schoolmaster was only ill for about two days, and then there was no more of it. But just think of it — an adder getting to your neck ——"

"I would rather not think of it," she said quickly. "What is the other animal — that you hate?"

"Oh!" he said lightly, "that is a very different affair — that is a parrot that speaks. I was never shut up in a house with one till this week. My landlady's son brought her home one from the West Indies; and she put the cage in a window recess on my landing. At first it was a little amusing; but the constant yelp — it was too much for me. '*Pritty poal! pritty poal!*' I did not mind so much; but when the ugly brute, with its beady eyes and its black snout, used to yelp, '*Come and kiz me! come and kiz me!*' I grew to hate it. And in the morning, too, how was one to sleep? I used to open my door and fling a boot at it; but that only served for a time. It began again."

"But you speak of it as having been there. What became of it?"

He glanced at her rather nervously — like a schoolboy — and laughed.

"Shall I tell you?" he said, rather shamefacedly. "The murder will be out sooner or later. It was this morning. I could stand it no longer. I had thrown both my boots at it; it was no use. I got up a third time, and went out. The window, that looks into a back yard, was open. Then I opened the parrot's cage. But the fool of an animal did not know what I meant — or it was afraid — and so I caught him by the back of the neck and flung him out. I don't know anything more about him."

"Could he fly?" said the big-eyed Carry, who had been quite interested in this tragic tale.

"I don't know," Macleod said modestly. "There was no use asking him. All he could say was, '*Come and kiz me;*' and I got tired of that."

"Then you have murdered him!" said the elder sister in an awe-stricken voice; and she pretended to withdraw a bit from him. "I don't believe in the Macleods

having become civilized, peaceable people. I believe they would have no hesitation in murdering any one that was in their way."

"Oh, Miss White," said he, in protest, "you must forget what I told you, about the Macleods; and you must really believe they were no worse than the others of the same time. Now I was thinking of another story the other day, which I must tell you —— "

"Oh, pray don't," she said, "if it is one of those terrible legends —— "

"But I must tell you," said he, "because it is about the Macdonalds; and I want to show you that we had not all the badness of those times. It was Donald Gorm Môr; and his nephew Hugh Macdonald, who was the heir to the chieftainship, he got a number of men to join him in a conspiracy to have his uncle murdered. The chief found it out, and forgave him. That was not like a Macleod," he admitted, "for I never heard of a Macleod of those days forgiving anybody. But again Hugh Macdonald engaged in a conspiracy; and then Donald Gorm Môr thought he would put an end to the nonsense. What did he do? He put his nephew into a deep and foul dungeon — so the story says — and left him without food or water for a whole day. Then there was salt beef lowered into the dungeon; and Macdonald he devoured the salt beef, for he was starving with hunger. Then they left him alone. But you can imagine the thirst of a man who has been eating salt beef, and who has had no water for a day or two. He was mad with thirst. Then they lowered a cup into the dungeon — you may imagine the eagerness with which the poor fellow saw it coming down to him, and how he caught it with both his hands. *But it was empty!* And so, having made a fool of him in that way, they left him to die of thirst. That was the Macdonalds, Miss White, not the Macleods."

"Then I am glad of Culloden," said she, with decision, "for destroying such a race of fiends."

"Oh, you must not say that," he protested, laughing. "We should have become quiet and respectable folks without Culloden. Even without Culloden we should have had penny newspapers all the same; and tourist boats from Oban to Iona. Indeed, you won't find quieter folks anywhere than the Macdonalds and Macleods are now."

"I don't know how far you are to be trusted," said she, pretending to look at him with some doubts.

Now they reached the gate of the Gardens.

"Do let us go in, Gerty," said Miss Carry. "You know you always get hints for your dresses from the birds — you would never have thought of that flamingo pink and white if you had not been walking through here —— "

"I will go in for a while if you like, Carry," said she; and certainly Macleod was nothing loath.

There were but few people in the Gardens on this afternoon, for all the world was up at the Eton and Harrow cricket match at Lord's, and there was little visible of 'Arry and his pipe. Macleod began to show more than a schoolboy's delight over the wonders of this strange place. That he was exceedingly fond of animals — always barring the two he had mentioned — was soon abundantly shown. He talked to them as though the mute, inquiring eyes could understand him thoroughly. When he came to animals with which he was familiar in the north, he seemed to be renewing acquaintance with old friends — like himself they were strangers in a strange land.

"Ah," said he to the splendid red deer, which was walking about the paddock with his velvety horns held proudly in the air, "what part of the Highlands have you come from? And wouldn't you like now a canter down the dry bed of a stream on the side of Ben-an-Sloich?"

The hind, with slow and gentle step, and with her nut-brown hide shining in the sun, came up to the bars, and regarded him with those large, clear, gray-green eyes — so different from the soft, dark eyes of the roe — that had long eyelashes on the upper lid. He rubbed her nose.

"And wouldn't you rather be up on the heather, munching the young grass and drinking out of the burn?"

They went along to the great cage of the sea-eagles. The birds seemed to pay no heed to what was passing immediately around them. Ever and anon they jerked their head into an attitude of attention, and the golden brown eye, with its contracted pupil and stern upper lid, seemed to be throwing a keen glance over immeasurable leagues of sea.

"Poor old chap!" he said to the one perched high on an old stump, "wouldn't you like to have one sniff of a sea-breeze, and a look round for a sea-pyot or two? What do they give you here — dead fish, I suppose?"

The eagle raised its great wings and slowly flapped them once or twice, while it uttered a succession of shrill *yawps*.

"Oh, yes," he said, "you could make yourself heard above the sound of the waves. And I think if any of the boys were after your eggs or your young ones, you could make short work of them with those big wings. Or would you like to have a battle-royal with a seal, and try whether you could pilot the seal into the shore, or whether the seal would drag you and your fixed claws down to the bottom and drown you?"

There was a solitary kittiwake in a cage devoted to sea-birds, nearly all of which were foreigners.

"You poor little kittiwake," said he, "this is a sad place for you to be in. I think you would rather be out at Ru-Treshanish, even if it was blowing hard, and there was rain about. There was a dead whale came ashore there about a month ago; that would have been something like a feast for you."

"Why," said he, to his human companion, "if I had only known before! Whenever there was an hour or two with nothing to do, here was plenty of occupation. But I must not keep you too long, Miss White. I could remain here days and weeks."

"You will not go without looking in at the serpents," said she, with a slight smile.

He hesitated for a second.

"No," said he; "I think I will not go in to see them."

"But you must," said she cruelly. "You will see they are not such terrible creatures when they are shut up in glass boxes."

He suffered himself to be led along to the reptile-house; but he was silent. He entered the last of the three. He stood in the middle of the room, and looked around him in rather a strange way.

"Now come and look at this splendid fellow," said Miss White, who, with her sister, was leaning over the rail. "Look at his splendid bars of color? do you see the beautiful blue sheen on its scales?"

It was a huge anaconda, its body as thick as a man's leg, lying coiled up in a circle; its flat ugly head reposing in the middle. He came a bit nearer. "Hideous!" was all he said. And then his eyes were fixed on the eyes of the animal — the lidless eyes, with their perpetual glassy stare. He had thought at first they were closed; but now he saw that that opaque yellow substance was covered by a glassy coating, while in the centre there was a small slit as if cut by a penknife. The great coils slowly expanded and fell again as the animal breathed; otherwise the fixed stare of those yellow eyes might have been taken for the stare of death.

"I don't think the anaconda is poisonous at all," said she lightly.

"But if you were to meet that beast in a jungle," said he, "what difference would that make?"

He spoke reproachfully, as if she were luring him into some secret place to have him slain with poisonous fangs. He passed on from that case to the others unwillingly. The room was still. Most of the snakes would have seemed dead but for the malign stare of the beaded eyes. He seemed anxious to get out; the atmosphere of the place was hot and oppressive.

But just at the door there was a case some quick motion in which caught his eye, and despite himself he stopped to look. The inside of this glass box was alive with snakes — raising their heads in the air, slimily crawling over each other, the small black forked tongues shooting in and out, the black points of eyes glassily staring. And the object that had moved quickly was a wretched little yellow frog, that was now motionless in a dish of water, its eyes apparently starting out of its head with horror. A snake made its appearance over the edge of the dish. The shooting black tongue approached the head of the frog; and then the long, sinuous body glided along the edge of the dish again, the frog meanwhile being too paralyzed with fear to move. A second afterward the frog, apparently recovering, sprung clean out of the basin; but it was only to alight on the backs of two or three of the reptiles lying coiled up together. It made another spring, and got into a corner among some grass. But along that side of the case another of those small, flat, yellow-marked heads was slowly creeping along, propelled by the squirming body; and again the frog made a sudden spring, this time leaping once more into the shallow water, where it stood and panted, with its eyes dilated. And now a snake that had crawled up the side of the case put out its long neck as if to see whither it should proceed. There was nothing to lay hold of. The head swayed and twisted, the forked tongue shooting out; and at last the snake fell away from its hold, and splashed right into the basin of water on the top of the frog. There was a wild shooting this way and that — but Macleod did not see the end of it. He had uttered some slight exclamation, and got into the

open air, as one being suffocated; and there were drops of perspiration on his forehead, and a trembling of horror and disgust had seized him. His two companions followed him out.

"I felt rather faint," said he, in a low voice — and he did not turn to look at them as he spoke — "the air is close in that room."

They moved away. He looked around — at the beautiful green of the trees, and the blue sky, and the sunlight on the path — God's world was getting to be more wholesome again, and the choking sensation of disgust was going from his throat. He seemed, however, rather anxious to get away from this place. There was a gate close by; he proposed they should go out by that. As he walked back with them to South Bank, they chatted about many of the animals — the two girls in especial being much interested in certain pheasants, whose colors of plumage they thought would look very pretty in a dress — but he never referred, either then or at any future time, to his visit to the reptile-house. Nor did it occur to Miss White, in this idle conversation, to ask him whether his Highland blood had inherited any other qualities besides that instinctive and deadly horror of serpents.

CHAPTER X.

LAST NIGHTS.

"GOOD-NIGHT, Macleod!" — "Good-night!" — "Good-night!" The various voices came from the top of a drag. They were addressed to one of two young men who stood on the steps of the Star and Garter — black figures in the blaze of light. And now the people on the drag had finally ensconced themselves, and the ladies had drawn their ample cloaks more completely round their gay costumes, and the two grooms were ready to set free the heads of the leaders. "Good-night, Macleod!" Lord Beauregard called again; and then, with a little preliminary prancing of the leaders, away swung the big vehicle through the clear darkness of the sweet-scented summer night.

"It was awfully good-natured of Beauregard to bring six of your people down and take them back again," observed Lieutenant Ogilvie to his companion. "He wouldn't do it for most folks. He would'nt do it for me. But then you have the grand air, Macleod. You seem to be conferring a favor when you get one."

"The people have been very kind to me," said Macleod simply. "I do not know why. I wish I could take them all up to Castle Dare and entertain them as a prince could entertain people —— "

"I want to talk to you about that, Macleod," said his companion. "Shall we go up-stairs again? I have left my hat and coat there."

They went up-stairs and entered a long chamber which had been formed by the throwing of two rooms into one. The one apartment had been used as a sort of withdrawing-room; in the other stood the long banquet-table, still covered with bright-colored flowers, and dishes of fruit, and decanters, and glasses. Ogilvie sat down, lit a cigar, and poured himself out some claret.

"Macleod," said he, "I am going to talk to you like a father. I hear you have been going on in a mad way. Surely you know that a bachelor coming up to London for a season, and being asked about by people who are precious glad to get unmarried men to their houses, is not expected to give these swell dinner-parties? And then, it seems, you have been bringing down all your people in drags. What do those flowers cost you? I dare say this is Lafitte, now?"

"And if it is, why not drink it and say no more about it? I think they enjoyed themselves pretty well this evening — don't you, Ogilvie?"

"Yes, yes; but then, my dear fellow, the cost! You will say it is none of my business; but what would your decent, respectable mother say to all this extravagance?"

"Ah!" said Macleod, "that is just the thing; I should have more pleasure in my little dinner-parties, if only the mother and Janet were here to see. I think the table would look a good deal better if my mother was at the head of it. And the cost? — oh, I am only following out her instructions. She would not have people think that I was insensible to the kindness that has been shown me; and then we cannot ask all those good friends up to Castle Dare; it is an out-of-the-way place, and there are no flowers on the dining-table there."

He laughed as he looked at the beautiful things before him; they would look strange in the gaunt hall of Castle Dare.

"Why," said he, "I will tell you a secret, Ogilvie. You know my cousin Janet — she is the kindest-hearted of all the women I know — and when I was coming away she gave me £2000, just in case I should need it."

"£2000!" exclaimed Ogilvie. "Did

she think you were going to buy Westminster Abbey during the course of your holidays?" And then he looked at the table before him, and a new idea seemed to strike him. "You don't mean to say, Macleod, that it is your cousin's money ——"

Macleod's face flushed angrily. Had any other man made the suggestion he would have received a tolerably sharp answer. But he only said to his old friend Ogilvie,—

"No, no, Ogilvie; we are not very rich folks, but we have not come to that yet. 'I'd sell my kilts, I'd sell my shoon,' as the song says, before I touched a farthing of Janet's money. But I had to take it from her, so as not to offend her. It is wonderful, the anxiety and affection of women who always live out of the world like that. There was my mother, quite sure that something awful was going to happen to me, merely because I was going away for two or three months. And Janet — I suppose she knew that our family never was very good at saving money — she would have me take this little fortune of hers, just as if the old days were come back, and the son of the house was supposed to go to Paris to gamble away every penny."

"By the way, Macleod," said Ogilvie, "you have never gone to Paris, as you intended."

"No," said he, trying to balance three nectarines one on the top of the other, "I have not gone to Paris. I have made enough friends in London. I have had plenty to occupy the time. And now, Ogilvie," he added brightly, "I am going in for my last frolic, before everybody has left London, and you must come to it, even if you have to go down by your cold-meat train again. You know Miss Rawlinson; you have seen her at Mrs. Ross's, no doubt. Very well, I met her first when we went down to the Thames yacht race, and afterward we became great friends; and the dear little old lady already looks on me as if I were her son. And do you know what her proposal is? — that she is to give me up her house and garden for a garden party, and I am to ask my friends; and it is to be a dance as well, for we shall ask the people to have supper at eight o'clock or so; and then we shall have a marquee — and the garden all lighted up — do you see? It is one of the largest gardens on Campden Hill; and the colored lamps hung on the trees will make it look very fine; and we shall have a band to play music for the dancers ——"

"It will cost you £200 or £300 at least," said Ogilvie, sharply.

"What then? You give your friends a pleasant evening, and you show them that you are not ungrateful," said Macleod.

Ogilvie began to ponder over this matter. The stories he had heard of Macleod's extravagant entertainments were true, then. Suddenly he looked up, and said,—

"Is Miss White to be one of your guests?"

"I hope so," said he. "The theatre will be closed at the end of this week."

"I suppose you have been a good many times to the theatre?"

"To the Piccadilly Theatre?"

"Yes."

"I have been only once to the Piccadilly Theatre — when you and I went together," said Macleod coldly; and they spoke no more of that matter.

By-and-by they thought they might as well smoke outside, and so they went down and out upon the high and walled terrace overlooking the broad valley of the Thames. And now the moon had arisen in the south, and the winding river showed a pale gray among the black woods, and there was a silvery light on the stone parapet on which they leaned their arms. The night was mild and soft and clear, there was an intense silence around; but they heard the faint sound of oars far away — some boating party getting home through the dark shadows of the river-side trees.

"It is a beautiful life you have here in the south," Macleod said, after a time, "though I can imagine that the women enjoy it more than the men. It is natural for women to enjoy pretty colors, and flowers, and bright lights, and music; and I suppose it is the mild air that lets their eyes grow so big and clear. But the men — I should think they must get tired of doing nothing. They are rather melancholy, and their hands are white. I wonder they don't begin to hate Hyde Park, and kid gloves, and tight boots. Ogilvie," said he suddenly, straightening himself up, "what do you say to the 12th? A few breathers over Ben-an-Sloich would put new lungs into you. I don't think you look quite so limp as most of the London men; but still you are not up to the mark. And then an occasional run out to Coll or Tiree in that old tub of ours, with a brisk sou'wester blowing across — that would put some mettle into you. Mind you, you won't have any grand banquets at Castle Dare. I think it is hard on the

poor old mother that she should have all the pinching and none of the squandering; but women seem to have rather a liking for these sacrifices, and both she and Janet are very proud of the family name — I believe they would live on seaweed for a year if only their representative in London could take Buckingham Palace for the season. And Hamish — don't you remember Hamish? — he will give you a hearty welcome to Dare, and he will tell you the truth about any salmon or stag you may kill, though he was never known to come within five pounds of the real weight of any big salmon I ever caught. Now, then, what do you say?"

"Ah, it is all very well," said Lieutenant Ogilvie. "If we could all get what we want, there would scarcely be an officer in Aldershot Camp on the 12th of August. But I must say there are some capitally good fellows in our mess — and it isn't every one gets the chance you offer me — and there's none of the dog-in-the-manger feeling about them: in short, I do believe, Macleod, that I could get off for a week or so about the 20th."

"The 20th? So be it. Then you will have the blackcock added in."

"When do you leave?"

"On the 1st of August — the morning after my garden party. You must come to it, Ogilvie. Lady Beauregard has persuaded her husband to put off their going to Ireland for three days in order to come. And I have got old Admiral Maitland coming — with his stories of the press-gang, and of Nelson, and of the raids on the merchant ships for officers for the navy. Did you know that Miss Rawlinson was an old sweetheart of his? He knew her when she lived in Jamaica with her father — several centuries ago you would think, judging by their stories. Her father got £28,000 from the government when his slaves were emancipated. I wish I could get the old admiral up to Dare — he and the mother would have some stories to tell, I think. But you don't like long journeys at ninety-two."

He was in a pleasant and talkative humor, this bright-faced and stalwart young fellow, with his proud, fine features and his careless air. One could easily see how these old folks had made a sort of pet of him. But while he went on with this desultory chatting about the various people whom he had met, and the friendly invitations he had received, and the hopes he had formed of renewing his acquaintanceship with this person and the next person, should chance bring him again to London soon, he never once mentioned the name of Miss Gertrude White, or referred to her family, or even to her public appearances, about which there was plenty of talk at this time. Yet Lieutenant Ogilvie, on his rare visits to London, had more than once heard Sir Keith Macleod's name mentioned in conjunction with that of the young actress whom society was pleased to regard with a special and unusual favor just then; and once or twice he, as Macleod's friend, had been archly questioned on the subject by some inquisitive lady, whose eyes asked more than her words. But Lieutenant Ogilvie was gravely discreet. He neither treated the matter with ridicule, nor, on the other hand, did he pretend to know more than he actually knew — which was literally nothing at all. For Macleod, who was, in ordinary circumstances, anything but a reserved or austere person, was on this subject strictly silent, evading questions with a proud and simple dignity that forbade the repetition of them. "*The thing that concerns you not, meddle not with:*" he observed the maxim himself, and expected others to do the like.

It was an early dinner they had had, after their stroll in Richmond Park; and it was a comparatively early train that Macleod and his friend now drove down to catch, after he had paid his bill. When they reached Waterloo Station it was not yet eleven o'clock; when he, having bade good-bye to Ogilvie, got to his rooms in Bury Street, it was but a few minutes after. He was joyfully welcomed by his faithful friend Oscar.

"You poor dog," said he, "here have we been enjoying ourselves all the day, and you have been in prison. Come, shall we go for a run?"

Oscar jumped up on him with a whine of delight; he knew what that taking up of the hat again meant. And then there was a silent stealing down stairs, and a slight, pardonable bark of joy in the hall, and a wild dash into the freedom of the narrow street when the door was opened. Then Oscar moderated his transports, and kept pretty close to his master as together they began to wander through the desert wilds of London.

Piccadilly? — Oscar had grown as expert in avoiding the rattling broughams and hansoms as the veriest mongrel that ever led a vagrant life in London streets. Berkeley Square? — here there was comparative quiet, with the gas lamps shining up on the thick foliage of the maples. In Grosvenor Square he had a bit of a scam-

per; but there was no rabbit to hunt. In Oxford Street his master took him into a public-house and gave him a biscuit and a drink of water; after that his spirits rose a bit, and he began to range ahead in Baker Street. But did Oscar know any more than his master why they had taken this direction?

Still further north; and now there were a good many trees about; and the moon, high in the heavens, touched the trembling foliage, and shone white on the front of the houses. Oscar was a friendly companion; but he could not be expected to notice that his master glanced somewhat nervously along South Bank when he had reached the entrance to that thoroughfare. Apparently the place was quite deserted; there was nothing visible but the walls, trees, and houses, one side in black shadow, the other shining cold and pale in the moonlight. After a moment's hesitation Macleod resumed his walk — though he seemed to tread more softly.

And now, in the perfect silence, he neared a certain house, though but little of it was visible over the wall and through the trees. Did he expect to see a light in one of these upper windows, which the drooping acacias did not altogether conceal? He walked quickly by, with his head averted. Oscar had got a good way in front, not doubting that his master was following him.

But Macleod, perhaps having mustered up further courage, stopped in his walk, and returned. This time he passed more slowly, and turned his head to the house, as if listening. There was no light in the windows; there was no sound at all; there was no motion but that of the trembling acacia leaves as the cold wind of the night stirred them. And then he passed over to the south side of the thoroughfare, and stood in the black shadow of a high wall; and Oscar came and looked up into his face.

A brougham rattled by; then there was utter stillness again; and the moonlight shone on the front of the small house which was to all appearance as lifeless as the grave. Then, far away, twelve o'clock struck, and the sound seemed distant as the sound of a bell at sea in this intense quiet.

He was alone with the night, and with the dreams and fancies of the night. Would he, then, confess to himself that which he would confess to no other? Or was it merely some passing whim — some slight underchord of sentiment struck amid the careless joy of a young man's holiday — that had led him up into this silent region of trees and moonlight? The scene around him was romantic enough, but he certainly had not the features of an anguish-stricken lover.

Again the silence of the night was broken by the rumbling of a cab that came along the road; and now, whatever may have been the fancy that brought him hither, he turned to leave, and Oscar joyfully bounded out into the road. But the cab, instead of continuing its route, stopped at the gate of the house he had been watching, and two young ladies stepped out. Fionaghal, the Fair Stranger, had not, then, been wandering in the enchanted land of dreams, but toiling home in a humble four-wheeler from the scene of her anxious labors? He would have slunk away rapidly but for an untoward accident. Oscar, ranging up and down, came upon an old friend, and instantly made acquaintance with her, on seeing which, Macleod, with deep vexation at his heart, but with a pleasant and careless face, had to walk along also.

"What an odd meeting!" said he. "I have been giving Oscar a run. I am glad to have a chance of bidding you good-night. You are not very tired, I hope."

"I am rather tired," said she; "but I have only two more nights, and then my holiday begins."

He shook hands with both sisters, and wished them good-night, and departed. As Miss Gertrude White went into her father's house she seemed rather grave.

"Gerty," said the younger sister, as she screwed up the gas, "wouldn't the name of Lady Macleod look well in a play-bill?"

The elder sister would not answer; but as she turned away there was a quick flush of color in her face — whether caused by anger or by a sudden revelation of her own thought it was impossible to say.

CHAPTER XI.

A FLOWER.

The many friends Macleod had made in the south — or rather those of them who had remained in town 'till the end of the season — showed an unwonted interest in this nondescript party of his; and it was at a comparatively early hour in the evening that the various groups of people began to show themselves in Miss Rawlinson's garden. That prim old lady, with her quick, bright ways, and her humorous little speeches, studiously kept herself in the background. It was Sir Keith Macleod who was the host. And when he re-

marked to her that he thought the most beautiful night of all the beautiful time he had spent in the south had been reserved for this very party, she replied — looking round the garden just as if she had been one of his guests — that it was a pretty scene. And it was a pretty scene. The last fire of the sunset was just touching the topmost branches of the trees. In the colder shade below, the banks and beds of flowers and the costumes of the ladies acquired a strange intensity of color. Then there was a band playing, and a good deal of chatting going on, and one old gentleman with a grizzled moustache humbly receiving lessons in lawn tennis from an imperious small maiden of ten. Macleod was here, there, and everywhere. The lanterns were to be lit while the people were in at supper. Lieutenant Ogilvie was directed to take in Lady Beauregard when the time arrived.

"You must take her in yourself, Macleod," said that properly constituted youth. "If you outrage the sacred laws of precedence ——"

"I mean to take Miss Rawlinson in to supper," said Macleod; "she is the oldest woman here, and I think my best friend."

"I thought you might wish to give Miss White the place of honor," said Ogilvie, out of sheer impertinence; but Macleod went off to order the candles to be lit in the marquee, where supper was laid.

By-and-by he came out again. And now the twilight had drawn on apace; there was a cold, clear light in the skies, while at the same moment a red glow began to shine through the canvas of the long tent. He walked over to one little group, who were seated on a garden-chair.

"Well," said he, "I have got pretty nearly all my people together now, Mrs. Ross."

"But where is Gertrude White?" said Mrs. Ross; "surely she is to be here?"

"Oh, yes, I think so," said he. "Her father and herself both promised to come. You know her holidays have begun now."

"It is a good thing for that girl," said Miss Rawlinson, in her quick, *staccato* fashion, "that she has few holidays. Very good thing she has her work to mind. The way people run after her would turn any woman's head. The Grand Duke —— is said to have declared that she was one of the three prettiest women he saw in England: what can you expect if things like that get to a girl's ears?"

"But you know Gerty is quite unspoiled," said Mrs. Ross warmly.

"Yes, so far," said the old lady. "So far she retains the courtesy of being hypocritical."

"Oh, Miss Rawlinson, I won't have you say such things of Gerty White!" Mrs. Ross protested. "You are a wicked old woman — isn't she, Hugh?"

"I am saying it to her credit," continued the old lady, with much composure. "What I say is that most pretty women who are much run after are flattered into frankness. When they are introduced to you, they don't take the trouble to conceal that they are quite indifferent to you. A plain woman will be decently civil, and will smile, and pretend she is pleased. A beauty — a recognized beauty — doesn't take the trouble to be hypocritical. Now Miss White does."

"It is an odd sort of compliment," said Colonel Ross, laughing. "What do you think of it, Macleod?"

"These are too great refinements for my comprehension," said he modestly. "I think if a pretty woman is uncivil to you, it is easy for you to turn on your heel and go away."

"I did not say uncivil — don't you go misrepresenting a poor old woman, Sir Keith. I said she is most likely to be flattered into being honest — into showing a stranger that she is quite indifferent, whereas a plain woman will try to make herself a little agreeable. Now a poor lone creature like myself likes to fancy that people are glad to see her, and Miss White pretends as much. It is very kind. By-and-by she will get spoiled like the rest, and then she will become honest. She will shake hands with me, and then turn off, as much as to say, 'Go away, you ugly old woman, for I can't be bothered with you, and I don't expect any money from you, and why should I pretend to like you?'"

All this was said in a half-jesting way; and it certainly did not at all represent — so far as Macleod had ever made out — the real opinions of her neighbors in the world held by this really kind and gentle old lady. But Macleod had noticed before that Miss Rawlinson never spoke with any great warmth about Miss Gertrude White's beauty, or her acting, or anything at all connected with her. At this very moment, when she was apparently praising the young lady, there was a bitter flavor about what she said. There may be jealousy between sixty-five and nineteen; and if this reflection occurred to Macleod, he no doubt assumed that Miss Rawlinson, if jealous at all, was jeal-

ous of Miss Gertrude White's influence over — Mrs. Ross.

"As for Miss White's father," continued the old lady, with a little laugh, "perhaps he believes in those sublime theories of art he is always preaching about. Perhaps he does. They are very fine. One result of them is that his daughter remains on the stage — and earns a handsome income — and he enjoys himself in picking up bits of curiosities."

"Now that is really unfair," said Mrs. Ross seriously. "Mr. White is not a rich man, but he has some small means that render him quite independent of any income of his daughter's. Why, how did they live before they ever thought of letting her try her fortune on the stage? And the money he spent, when it was at last decided she should be carefully taught —— "

"Oh, very well," said Miss Rawlinson, with a smile; but she nodded her head ominously. If that old man was not actually living on his daughter's earnings, he had at least strangled his mother, or robbed the Bank of England, or done something or other. Miss Rawlinson was obviously not well disposed either to Mr. White or to his daughter.

At this very moment both these persons made their appearance, and certainly, as this slender and graceful figure, clad in a pale summer costume, came across the lawn, and as a smile of recognition lit up the intelligent fine face, these critics sitting there must have acknowledged that Gertrude White was a singularly pretty woman. And then the fascination of that low-toned voice! She began to explain to Macleod why they were so late. Some trifling accident had happened to Carry. But as these simple, pathetic tones told him the story, his heart was filled with a great gentleness and pity towards that poor victim of misfortune. He was struck with remorse because he had sometimes thought harshly of the poor child on account of a mere occasional bit of pertness. His first message from the Highlands would be to her.

O, Willie brew'd a peck o' maut,

the band played merrily, as the gay company took their seats at the long banquet table, Macleod leading in the prim old dame who had placed her house at his disposal. There was a blaze of light and color in this spacious marquee. Bands of scarlet took the place of oaken rafters; there were huge blocks of ice on the table, each set in a miniature lake that was filled with white water-lilies; there were masses of flowers and fruit from one end to the other; and by the side of each *menu* lay a tiny nosegay, in the centre of which was a sprig of bell-heather. This last was a notion of Macleod's amiable hostess; she had made up these miniature bouquets herself. But she had been forestalled in the pretty compliment. Macleod had not seen much of Miss Gertrude White in the cold twilight outside. Now, in this blaze of yellow light, he turned his eyes to her, as she sat there demurely flirting with an old admiral of ninety-two, who was one of Macleod's special friends. And what was that flower she wore in her bosom — the sole piece of color in the costume of white? That was no sprig of blood-red bell-heather, but a bit of real heather — of the common ling; and it was set amid a few leaves of juniper. Now the juniper is the badge of the clan Macleod. She wore it next her heart.

There was laughter, and wine, and merry talking.

Last May a braw wooer,

the band played now; but they scarcely listened.

"Where is your piper, Sir Keith?" said Lady Beauregard.

"At this moment," said he, "I should not wonder if he was down at the shore, waiting for me."

"You are going away quite soon, then?"

"To-morrow. But I don't wish to speak of it. I should like to-night to last forever."

Lady Beauregard was interrupted by her neighbor.

"What has pleased you, then, so much?" said his hostess, looking up at him. "London? Or the people in it? Or any one person in it?"

"Oh," he said laughingly, "the whole thing. What is the use of dissecting? It is nothing but holiday-making in this place. Now, Miss Rawlinson, are you brave? Won't you challenge the admiral to drink a glass of wine with you? And you must include his companion — just as they do at the city dinners — and I will join too."

And so these old sweethearts drank to each other. And Macleod raised his glass too; and Miss White lowered her eyes, and perhaps flushed a little as she touched hers with her lips, for she had not often been asked to take a part in this old-fashioned ceremony. But that was not the only custom they revived that evening.

After the banquet was over, and the ladies had got some light shawls and gone out into the mild summer night, and when the long marquee was cleared, and the band installed at the farther end, then there was a murmured talk of a minuet. Who could dance it? Should they try it?

"You know it?" said Macleod to Miss White.

"Yes," said she, looking down.

"Will you be my partner?"

"With pleasure," she answered, but there was some little surprise in her voice, which he at once detected.

"Oh," said he, "the mother taught me when I was a child. She and I used to have grand dances together. And Hamish he taught me the sword-dance."

"Do you know the sword-dance?" she said.

"Any one can know it," said he; "it is more difficult to do it. But at one time I could dance it with four of the thickest-handled dirks instead of the two swords."

"I hope you will show us your skill to-night," she said, with a smile.

"Do you think any one can dance the sword-dance without the pipes?" said he, quite simply.

And now some of the younger people had made bold to try this minuet, and Macleod led his partner up to the head of the improvised ball-room, and the slow and graceful music began. That was a pretty sight for those walking outside in the garden. So warm was the night that the canvas of one side of the marquee had been removed, and those walking about in the dark outside could look into this gayly lighted place with the beautifully colored figures moving to the slow music. And as they thus walked along the gravel paths, or under the trees, the stems of which were decorated with spirals of colored lamps, a new light arose in the south to shed a further magic over the scene. Almost red at first, the full moon cleared as it rose, until the trees and bushes were touched with a silver radiance, and the few people who walked about threw black shadows on the greensward and gravel. In an arbor at the furthest end of the garden a number of Chinese lanterns shed a dim colored light on a table and a few rocking-chairs. There were cigarettes on the table.

By-and-by from out of the brilliancy of the tent stepped Macleod and Fionaghal herself, she leaning on his arm, a light scarf thrown round her neck. She uttered a slight cry of surprise when she saw the picture this garden presented — the colored cups on the trees, the swinging lanterns, the broader sheen of the moonlight spreading over the foliage and the lawn and the walks.

"It is like fairy-land," she said.

They walked along the winding gravel paths; and now that some familiar quadrille was being danced in that brilliant tent, there were fewer people out here in the moonlight.

"I should begin to believe that romance was possible," she said, with a smile, "if I often saw a beautiful scene like this. It is what we try to get in the theatre; but I see all the bare boards and the lime light — I don't have a chance of believing in it."

"Do you have a chance of believing in anything," said he, "on the stage?"

"I don't understand you," she said gently; for she was sure he would not mean the rudeness that his words literally conveyed.

"And perhaps I cannot explain," said he. "But — but your father was talking the other day about your giving yourself up altogether to your art — living the lives of other people for the time being, forgetting yourself, sacrificing yourself, having no life of your own but that. What must the end of it be? — that you play with emotions and beliefs until you have no faith in any one — none left for yourself; it is only the material of your art. Would you not rather like to live your own life?"

He had spoken rather hesitatingly, and he was not at all sure that he had quite conveyed to her his meaning, though he had thought over the subject long enough and often enough to get his own impressions of it clear.

If she had been ten years older, and an experienced coquette, she would have said to herself, "*This man hates the stage because he is jealous of its hold on my life*," and she would have rejoiced over the inadvertent confession. But now these hesitating words of his seemed to have awakened some quick, responsive thrill in her nature, for she suddenly said, with an earnestness that was not at all assumed,—

"Sometimes I have thought of that — it is so strange to hear my own doubts repeated. If I could choose my own life — yes, I would rather live that out than merely imagining the experiences of others. But what is one to do? You look around, and take the world as it is. Can anything be more trivial and disappointing? When you are Juliet in the balcony, or Rosalind in the forest, then you have some better feeling within you, if it is only for an hour or so."

"Yes," said he; "and you go on indulging in those doses of fictitious sentiment until—— But I am afraid the night air is too cold for you. Shall we go back?"

She could not fail to notice the trace of bitterness, and subsequent coldness, with which he spoke. She knew that he must have been thinking deeply over this matter, and that it was no ordinary thing that caused him to speak with so much feeling. But, of course, when he proposed that they should return to the marquee, she consented. He could not expect her to stand there and defend her whole manner of life. Much less could he expect her to give up her profession merely because he had exercised his wits in getting up some fantastic theory about it. And she began to think that he had no right to talk to her in this bitter fashion.

When they had got half-way back to the tent, he paused for a moment.

"I am going to ask a favor of you," he said, in a low voice. "I have spent a pleasant time in England, and I cannot tell you how grateful I am to you for letting me become one of your friends. Tomorrow morning I am going back home. I should like you to give me that flower — as some little token of remembrance."

The small fingers did not tremble at all as she took the flower from her dress. She presented it to him with a charming smile, and without a word. What was the giving of a flower? There was a cart-load of roses in the tent.

But this flower she had worn next her heart.

From The Gentleman's Magazine.

QUEVEDO.

In one of Quarles's instructive epigrams we are informed that God buys his wares by weight and not by measure, that he inclines less to words than to matter, and prefers the balance to the yard in his estimate of the exact value of prayer. Whether the same or a contrary course of proceeding be in use in the literary market presided over by the public, in whatever regard the compositions of Quevedo may be considered, in whatever scale they may be laid, they are little likely ever to be found wanting. For his papers in quantity are (though many have been lost) at least as numerous as those of Mariner, Lope's friend, who is said to have left behind him three hundred and sixty quires of paper full of his own lucubrations, unfortunately in a writing so exceedingly small and so exceedingly bad that no person but himself could read it, and in quality comprise subjects most useful and entertaining, expressed in terms from which not a single line, scarcely a single word, can well be taken away. In Spain the name of Quevedo is about as well known and as much talked of as that of Milton in England. His works there are as little read as the "Areopagitica" or "Paradise Regained" here. His reputation is in direct, but his countrymen's intelligence of its proper cause in inverse, proportion to his merit.

Francisco Gomez de Quevedo Villegas was born at Madrid in 1580, and died at Villanueva de los Infantes, in the land which Don Quixote made illustrious, in 1645. So far, at least, his biography has not been, as too many biographies are, fashioned at random to suit the reader's fancy. So far all his biographers agree; but uncertainty, which haunts all human things, too soon arises respecting the color of his hair. Some say red, others, and the majority, black. In this world it is better to agree with the majority, which thus continues the outlines of the map of his microcosm. Fair complexion, lofty brow, dark eyes debased by spectacles, small moustache and imperial, middle-sized figure, distorted feet. Such was his mind's lodging; for his mind itself there are his books, and, as it is written on Wren's monument, *Circumspice*. There are plenty to investigate. He was a contemporary of Lope de Vega and Cervantes, of whom the former calls him, in the seventh *silva* of his "Laurel of Apollo," prince of lyric poets and rival of Pindar and Petronius, and the latter, child of the sun-god. The accident of being littered in what is known in the language of footmen as the "sphere of high life" bore for him the bitter fruit of a court education. He graduated in the University of Alcala, where he became, if in this matter the singular unanimity of his biographers can be trusted, a doctor of theology before the age of fifteen. Such premature proficiency puts under a bushel that of Cowley and Pope. Lisping in theology is a little more difficult than lisping in numbers. For the former one wants something more than bees swarming about one's mouth in one's cradle. Nor this alone: before he had, in the eye of our English law, ceased to be an infant, he had studied French, Italian, Latin, Greek, Arabic, and Hebrew (in which last tongue he afterwards assisted Juan de Mariana in his edition of the Bible), civil and canon

law, mathematics, astronomy, medicine, and natural philosophy. The man seems to have suffered from a literary dropsy; no wonder he paid for his assiduity with distorted feet and half-blinded eyes! A duel, of which the only certain information is that it was fought about a woman of whom he knew nothing, and arose in a church, the hothouse of Spanish amatory intrigue, banished him from Madrid, and he became a minister of finance under the Duke of Osuna, afterwards viceroy of Naples. With this master, after a stormy political life, he suffered shipwreck. He was twice imprisoned — like Cervantes, he is the glory and the shame of Spain — and in both cases apparently with gross injustice. During these long-continued seclusions from worshipful society, he chewed to considerable purpose the hard cud of oppression and poverty, of insolence and neglect. At the conclusion of his first imprisonment he retired to his paternal estate of La Torre de Juan Abad in the Sierra Morena, and there proposed, after so many years of his life spent for others, to live the remainder for himself. "There," as he says, "surrounded with fit books though few, I converse with the departed, and listen with my eyes to the dead who speak to me with a low counterpoint in life's dream. There I watch the dragging of the harrows, and live like an ant amidst a heap of corn." There, like a daughter of Zion, he sat down and sang by the waters of his native stream. Well for him had he continued thus to amuse himself. But his evil destiny reconducted him to the capital, and he was again sentenced to confinement, and only released when long restraint had ruined his health and brought him so near to the end of his days that no indulgence could add many, no inhumanity take many away. He had, as Tacitus tells us about the Germans, *funerum nulla ambitio*. In a word, he objected to the waste of money in furnishing a ridiculous religious farce for an idle rabble. Quoth he, *La musica paguela, quien la oyere* — let him who hears the music pay for it. Some of the historians of his life make him lose his senses just before his death. They declare that he begged the holy tribunal of the Inquisition to correct with its prudent pen any clause which clashed with the ideas of propriety entertained by that excellent institution.

It has been said that an acquaintance with Quevedo's works is rare in Spain; in England, even in this highly educated age, few of us are acquainted with his name. Shortly after the Restoration, the good knight, Sir Roger L'Estrange, made English a minute portion of him, which he was pleased to christen "The Visions of Dom Quevedo, Knight of the Order of St. James," and which was so popular as in a very short time to reach an eleventh edition. So Sir Roger stands out in the dark background of time, lightened by the halo of the glory of the intellect of Quevedo, as Urquhart by that of Rabelais, and as Cotton by that of Montaigne. But Sir Roger's version is not nearly so faithful as those sufficiently unfaithful of Cotton and Urquhart. It is, indeed, obviously a translation, not from the original Spanish, but from the French of Le Sieur Raclots, taken in its turn from that of Le Sieur de la Geneste, as may be seen from the very first lines of the first vision of the "*Alguacil Alguacilado*," or "Catchpole Possessed:" — "Going t'other day to hear mass at a convent in this town, the door, it seems, was shut, and a world of people begging and pressing to get in. Upon inquiry what the matter was, they told me of a demoniac to be exorcised or dispossest, etc." The corresponding French rendering has: "*Ces jours passez m'en allant ouïr la messe en un couvent de cette ville, j'y trouvai la porte fermée et une affluence de peuple qui tâchoit par prières d'y pouvoir entrer; je m'informay*," and so on. Now, in the Spanish we have, first of all, a dedication to the Conde de Lemos, president of the Indies, in which Quevedo, after saying he well knows that, in the eyes of the count, the author is more bedevilled than his subject, divides the *alguaciles*, or Spanish police, into six classes: those of fire, of air, of earth, of water, those under the earth, and those that fly from the light. Next, in an address to the "pious reader," he asks him to read his discourse if he likes, and if not, to leave it alone, as there is no penalty for not reading it; and lastly, the subject is opened thus: "I happened to enter St. Peter's in search of the licentiate Calabres, a man of a bonnet of three orders made after the mode of a half-peck measure, eyes suited to louse-hunting, quick and restless; wristbands of Corinth, a *soupçon* of shirt about his neck, his sleeves as they had been in skirmish, and all the braid in tatters; his arms set akimbo like the handles of a pot, his hands hooked; with a voice between that of a penitent and one who has mortified himself with the lash; with a downcast look and thoughts in treble; his complexion in some parts cracked, in others dull; a dawdler at responses, but a breviator at meals; a

mighty caster out of spirits, so much so that he sustained his body therewith; a good hand at uttering charms, making in his benediction crosses bigger than belong to those that have married ill. His sluttishness he called humility, recounted visions he had had, and if folks were too careless to believe him, worked miracles which wearied me. This, sir, was one of those fair sepulchres whitened without, and full of mouldings, but within rottenness and worms; feigning externally honesty, and being internally of a dissolute disposition, and of a conscience torn wide open. He was, in ordinary language, a hypocrite, a living fraud, a speaking fable, an animated lie."

Cowper, in his "Table Talk," tells us that Quevedo "asked when in hell to see the royal gaol," and on expressing surprise at the few kings he found there, was informed by his black attendant that all were there that ever reigned. There is no passage like this in the "*Zahurdas de Pluton*," or "Pigsties of Pluto," perhaps he most pleasing of Quevedo's "Dreams;" it is therefore probably to be discovered, since the singer of Olney was seldom inaccurate, in the version of Sir Roger L'Estrange, though the writer has searched for it there also without success. Sir Roger has not precisely preserved the eloquent introduction to the "*Zahurdas:*" Quevedo wrote, "I found myself in a place favored by nature with a pleasant calm, where beauty free from malice ravished the view (mute recreation, and without human reply), where fountains prattled among their pebbles, and trees amidst their leaves, and where from time to time some bird sang, whether in rivalry or to reward them for their music I cannot determine. Look how curious is our desire, which discovered no contentment in such a scene!" Sir Roger translates freely, not to say elegantly, "Being one autumn at a friend's house in the country, which was indeed a most delicious retreat, I took a walk one moonlight night into the park." Le Sieur Raclots has of course almost word for word the same in French; and the Edinburgh edition of 1798 also generously accords to us the autumn, the country house, the moonlight, and the park, of all which, it is needless to add, there is no vestige in the original.

It is indeed difficult, as Captain Stevens, another of his translators, says, to "make him speak English with that diverting sweetness as he does Spanish." The titles even of the "Dreams" are distorted: the "*Visita de los Chistes*" becomes "Death and her Empire," and "Hell" in all its naked simplicity of grandeur takes the place of the "*Zahurdas de Pluton.*" From ignorance or indifference, from involuntary or voluntary inaccuracy, every translator writes as if he had opened the volume at random and taken a leaf out here and there. Only the *disjecti membra poetæ* remain, a few grains of Castilian gold mixed and scarcely seen in much French or English mud. Guided apparently by that humane desire of pleasing the populace, which is the polar star of all literary progress, Sir Roger has introduced us to Tyburn Gallows and Ratcliffe Highway, Hackney and Covent Garden, my lord mayor and Oliver Cromwell, thus adding considerably to one of the chief literary values of Quevedo as the illustrator of the manners of his place and age. In this latter respect L'Estrange's work bears much the same relation to that of Quevedo as Pope's "Imitations of Horace's Epistles" to Horace himself. But the bard of Twickenham professes only to imitate, and is at least consistent. When he has represented

Flore, bono claroque fidelis amice Neroni,

by "Dear Colonel, Cobham's and your country's friend," he does not afterwards translate *Luculli miles* by "a soldier of Lucullus."

L'Estrange's book was published not to oblige the public, or to gratify the importunities of friends, the wearisome lie which, now pretty well worn out, used to adorn the preface of nine publications out of ten, but, as he himself informs us, out of pure spite for the hard measure with which it had been meted unto him by physicians, lawyers, and women. Quevedo's satire is indeed universal, but perhaps chiefly directed against these objects of the indignation of L'Estrange. It is not to be found elsewhere more condensed than in that dream of "*El Mundo por de Dentro*" or "The World from Within," where we find vice so long as it is advantageous known as virtue, and virtue when disadvantageous stigmatized as vice, where a regard for the welfare of others is the disguise of curiosity or pride, and where male and female selfishness flaunt abroad boldly under the masks of honor and of virtue.

The works of him of whom a glimpse was caught in the seventeenth century as of a Spanish Lucian laughing at the *domus exilis Plutonia fabulæque manes* bear witness to a rare marriage, the mar-

riage of a native genius to untiring industry. They may be divided into serious and comic, the religious portion of the former alone being larger than all the rest, and each of these divisions may be again subdivided into prose and poetry. The joyous satirist is also the profound philosopher, the ascetic moralist, the consummate historian. But the colossal statue is seldom seen save on one side only; the light of fame, like that of the sun, can, it seems, only illumine one part at the expense of corresponding shadow on the other.

It is sad to reflect that while his "Dreams" have done most to make him known in Spain and elsewhere, and next to them his "*Vida de gran Tacaño*," or "Life of a Great Rascal," his works on the scholastic divinity of Catholicism; his version of the "Introduction to a Devout Life" of Francis de Sales; his "Virtue Militant against Envy, Ingratitude, Avarice, and Pride, the Four Pestilences of the World, and against the Four Bugbears of Life, Contempt, Sickness, Poverty, and Death;" his sonnet on the immaculate conception of the Blessed Virgin; his "Politics of God and Government of Christ our Lord," in which he collects a complete body of political philosophy from the example of Jesus, grounded on the idea of Gregory that the whole of Christ's life is a practical lesson, are rarely opened, and not a page of one of them has ever been translated. Some few may have laughed at his letters of the "Knight of the Nippers," but who will be found acquainted with his "Compendium of the Life of S. Thomas of Villanueva"? After such an example of perversion of popular interest, no one will wonder at the subordinate neglect of his satires after Juvenal, his translations of Epictetus and Phocylides, his imitations of Anacreon; of his poetry of all kinds, *xacaras*, *canciones*, *endechas*, *bailes*, madrigals, and burlesque sonnets, which parodied the extravagant images of the Marinists, and the affected singularity of Gongora, a fault to which Quevedo was himself far too liable.

An explanation of the prodigious fecundity of this *magnum decus Hispanorum*, as he is called by his friend Justin Lipsius, may be partially found in that little *labor limæ* to which he submitted his work, but lies chiefly in that order and distribution of his time to which he rigorously adhered. Few of life's wasted opportunities can be set to the debit side of his account. That jealous interference with industry on the part of idleness, that apparently natural desire of the unoccupied to interrupt occupation, attacked Quevedo to no purpose. The unhappy beings sick of that sadly common disease of nothing-to-do, who wander about, as the elder Disraeli bitterly lamented, privileged by a charter of society to obstruct the information they cannot impart, could little hurt a man who, like Diogenes in his cask, took up his habitation in an inn to avoid the daily worry and anxiety of domestic interruption, who dated his letters from its sign-board, and would receive his friends only at one appointed hour. Liberal of all things except of time, of which alone avarice is a virtue, he weighed the priceless moments which never return to us for prayer or praise with the minutest measures of the apothecaries' scale. The little odd intervals of existence, the drops of time which added together make so large a draught, he carefully economized by carrying always some book in his pocket, and so found himself never less alone than when alone. It is even reported that he had a revolving reading-desk, made after his own receipt, set by him at his meals, and thus seasoned a little meat with much learning. To Quevedo meditation was more to be desired than mutton, and the taste of wisdom sweeter than the taste of wine. Nay, he kept a lamp with flint and steel standing on a little table by his bedside, and was even loth to pay the dues of that universal tax-collector, sleep. Idleness he has himself named the moth of virtue and the holiday of vice.

Jovial, like Sir Thomas More, and saturnine by turns, of rare originality of thought and rarer boldness of expression, of a disposition to show at every opportunity "Truth in her smock, only a little less than naked;" truth whom he loved like Pius V. and would not injure like Louis XI.; with the quiet independence of Voltaire, and the bitter bile of Swift, is it a matter of wonder that he had many enemies? Were the proud *hidalguia* or the *nouveaux riches* of Spain likely to love a man who regarded rank and birth and riches as they will always be regarded by him who is conscious of having in his own mind something far rarer than these; a man who advised the *linajudos*, or boasters about their ancestry — a convenient term for which, however pressing our necessity, we have in English no equivalent — not to search into time's protocol, nor tear away the veil of ancient silence, nor vex buried bones, wherein are more worms than blazons, warning them with the example of Phaethon, who fell from

heaven in seeking to prove his descent from Apollo?

Human nature never changes. Though, as a rule, the Spanish Martial avoided the person, and sought only to punish the vice, yet he was found guilty of being singularly wise. Envy proportional to his merit pursued him as its shadow. Not being able to come near him in piquant satire, in varied extent of doctrine, in enchanting excellence of style, his enemies published at Valencia, in 1635, a libel full of malicious misinterpretation, a work woven with the woof of coarsest calumny and the warp of most insipid insolence. On its title-page it bears the name, of course assumed, of the licentiate Arnold of Francofurt as its author. Who wrote it is a matter of no mighty moment. Probably it was a joint composition of the Doctor Juan Perez, of Montalvan, and Fr. Diego Niseno. Only from churchmen could such a sample of Christian charity have come. Its title will certainly be quite sufficient for the satisfaction of the reader. "The Tribunal of Just Vengeance instituted against the Master of Errors, the Doctor of Indelicacies, the Licentiate of Buffoonery, the Bachelor of Filth, the Professor of Immortality, and the Archdevil of Mankind."

Instead of lowering himself and exalting his Zoilus or Zoiluses by a reply, as has been in our English experience only too often the case, he refused to answer the fool according to his folly, left the would-be remora of his ship unnamed, asking with his compatriot, —

Nam cur te aliquis sciat fuisse?

So he suffered in patience and possessed his soul in quiet, notwithstanding these answerers of books, as Goldsmith calls them, who, like eunuchs in a seraglio, being incapable of giving pleasure themselves, hinder those that would, and who revile the moral character of him whose writings they are unable to injure, writings which, compared to their own, are as the sculpture of Michael Angelo to a dog in Dresden china.

The "Tribunal" is only of value in determining the genuineness of the works of the Spanish Menippus, since, with a view of discrediting them, it presents a catalogue of all printed or in MS. until the year 1635.

Quevedo's mind did not, as some of his biographers would have us believe, decay with his body. In his "Life of Marcus Brutus," consisting of a commentary on the text of Plutarch stuffed with moral and political reflection, which was written but a short time before his death, is the following passage, "Justice, clemency, valor, modesty, and temperance are virtues which the populace seldom applauds universally, inasmuch as the revenge and envy and evil customs of most of the common sort make them desire their king to be cruel to others, lewd to give easy access to themselves, cowardly to allow the bargains of their craft, and unjust to give license to their crime. Howbeit, the liberality in which all participate, all praise — the virtuous as their reward, the wicked as their pay. Liberality seasons all the actions of a king; it magnifies the good, and excuses the bad; it absolves him during life from accusations, and acquires tears for him at his death." Certainly his fame was not likely to be lessened by such lines as these. To adopt Garth's poetical and tender allusion, the falling off of his hair had none other effect than to make his laurels seen the more. Perhaps the best, or rather the least unfaithful, in the versions of Quevedo's "Dreams," is that called in English "The Last Judgment," of the Spanish "*El Sueño de las Calaveras*," or "The Dream of the Skulls." The worst is that entitled "The Vision of Loving Fools," which corresponds, or is intended to correspond, with the Spanish "*Casa de Locos de Amor*," or "The House of those that are Mad for Love." In this sparkling moral fantasy the lord of Juan Abad takes for his motto that verse which Virgil took from Theocritus, —

Ah, Corydon, Corydon, quæ te dementia cepit!

On a sudden he finds himself in a fair meadow of sweet and bitter waters, wherein love's servants are dipping his shafts of gold. In the meadow's midst is a large building of Doric architecture, with chapter and cornice, pilasters and architrave, and frieze with bossy sculptures graven, for all the world like Satan's palace of Pandemonium, made of many-colored stones, and with portals standing forever wide open. Underneath the chapter is written,—

House of those that are mad for love,
Wherein unto him who best knows how to love
The best place is given.

Entering in at the door, of which Beauty is the keeper, he finds a folk of pale and violet-hued faces, among whom all faith to friends, all loyalty to lords, all piety to parents, is unknown, where maidservants

become mistresses, and where mistresses serve as maids. Here Time is the only physician, and cures not a few of the sick lovers by simply setting himself betwixt them. In the strongest part of the house the women are confined, whose days are chiefly spent in playing with little dogs with collars of bells, in asking fortune-tellers how they may regain their modesty, and in writing love-letters that it is given to few to read. Widows, when not occupied in painting themselves, are weeping for their lost husbands with one half of their face, and laughing at their new sweethearts with the other. Maids in general, he says, desire men to be of the tribe of Dan: "*hidalgos en dar algo y Platones en hacerles buenos platos*." Here it is difficult to avoid noticing that curious affectation in language, which sought to please the ear if not the understanding by the juxtaposition of words widely different in sense but nearly resembling one another in sound. For quibbling Quevedo had, of course, the highest authority. The Bible is beset with puns. In our own Shakespeare they meet us at apparently the most inopportune occasions. They come in when we should least expect them, like the singing of a *prima donna*, which is generally loudest with her latest breath. But notwithstanding that the good Bishop Andrews is said by such conceits to have turned many to repentance, notwithstanding the success of burlesques big with this play of words, in our own enlightened era on the stage, a pun is not universally pleasing. Dr. Johnson, for one, expressed his opinion on punning with the exact estimation of character and genial view of his fellow-beings for which he is so deservedly famous. A pun is especially provoking to a translator: it defies illustration alike of pencil and of pen; and Quevedo is, alas! so passionately fond of this form of equivocal allusion as to make a man fully understand the feeling of Shenstone, when he devoutly thanked God for bestowing on him a name over which this particular court of facetiousness could claim no jurisdiction.

His "Life of a Great Rascal" was inspired by the "*Lazarillo de Tormes*" of Hurtado de Mendoza. It is what the Spaniards call *novela picaresca*, a romance of roguery, and falls under the same category as the "*Guzman de Alfarache*" of Mateo Aleman, the "*Marcos de Obregon*" of Vicente Espinel, the friend of Cervantes, to whom Le Sage is so deeply indebted, and the "*Diablo Cojuelo*" of Luiz Velez de Guevara. The romance represents an old story, the success of immorality, the flourishing of the wicked like a green bay tree. It is the "*Reineke Fuchs*," the *Weltbibel*, as Goethe called it; the good fortune of a fox among geese, of a knave among fools. In compliance with what seems to have been almost a custom of the period, the recital is left unfinished. The rascal, whether *picarillo*, *picaro*, *picaron*, *picaronazo*, or *picarate*, for which it is difficult to find corresponding terms in any other language, is invariably distinguished by audacity and astuteness. In Quevedo's rascal we have pictures of inner Spanish life, painted not indeed with the superfine delicacy of Boucher or Watteau, but with the coarse natural truth of Adrian, Brauwer, and Ostade. This species of novel in Spain supplies the place of the sentimental sort in other countries. Spain, before France instructed her, knew nothing of that nauseous dough, which, compounded of the fashionable portions of passion and piety and spiced to taste, is baked into sweet cakes yearned after and purchased by the young. Not the least graphic of the portraits in Quevedo's sober tale is that of the licentiate Cabra, the Segovian schoolmaster, whose leanness was such that you might suppose he had forgotten to have himself buried. He was says Paul, the protagonist, hunger personified, death's footman, a kind of ecclesiastical pea-shooter, red-haired, with eyes that seemed to peep out of baskets, a beard colorless from fear of his mouth, which threatened to devour it out of mere famine, most of his teeth banished as idle rogues and vagabonds, a throat like that of an ostrich, his legs like a two-pronged fork or a pair of compasses, and when he walked came a rattling like that of castagnettes. On Sundays he wore a bonnet which was once of cloth, half-eaten by rats, and bordered with dandruff and grease; each shoe might be a Philistine's grave. Not a rat or spider ever reached his room. His soup was so clear that Narcissus had run more risk with it than with his fountain; at the bottom thereof one orphan pea and a struggling adventurer of a turnip.

The letters of the "Knight of the Nippers" commence with the exercise to be performed by every man, to save his money at the hour when it is demanded of him. His daily grace is to be "Blessed be God, who gives me an appetite, but not guests." Before sleeping he shall utter this thanksgiving, "Blessed be thou, O Lord, that I strip myself, and another has not done it

for me." If one comes to ask money of him he shall be beforehand with him in complaining of the hardness of the times, but if he cannot succeed in this, he shall say, "I was just about to borrow a trifle of you." If one praises anything belonging to him, he shall say, "For this reason I shall keep it henceforth with greater care." He may express affection with words but not with his purse. The letter of the "Knight of the Nippers" to a lady with whom he had lived on intimate terms, but who having sucked him like an orange, naturally threw him away, and proposed pious conduct for the future, contains some amusing lines. "I have not yet ceased crossing myself at your billet of this morning. After having picked my body clean, gnawed my bones, sucked up all my silver, you say, 'It is a holy time; this cannot last forever — the neighbors begin to talk — let us lay aside some part of our life for God.' Painted devil! so long as I had a halfpenny the time was sinful, there was no neighborhood. I find the only way to convert you is to show you a bankrupt. You turn to God at once when you see a man without a farthing. An empty purse is your death's-head, your *memento mori*, your most sacred relic. A fine thing to lay aside a part of your life for God! A fine life to bestow a part of it on anybody but Lucifer! You rob man of what he wants, and give God what he does not want. The bare-faced beggar would be bountiful of another life! Certainly you were bound apprentice to learn conscience of a tailor. I will repent of what I have given you, and you shall restore it to me to obtain God's mercy. The rest we will leave to be decided in Purgatory — if you chance to go that way, for if you go to Hell I quit my claim, being unwilling to sue you in your aunt's dominions."

And the same man who wrote this, in all good faith in his life of St. Paul the apostle quotes the contents of a letter which the Virgin Mary wrote to the citizens of Messina, and in his "Cradle and the Grave," a composition which recalls almost on every page the "*Manresa*" of Ignatius Loyola, and the "Holy Living and Dying" of Jeremy Taylor, entertains this sentiment, which he versified a little before his death: "Leave, O mortal, to weary thyself in the acquisition of wealth, for at the end thou wilt lose both silver and gold, and at the last Time will be thine heir. Live for thyself alone if thou canst, since for thyself alone, when thou diest, thou shalt die."

About the "Knight of the Nippers," by the way, is told a pretty tale. A certain Bernardin monk, a conventual of Galicia, sent to the author a packet, of which the postage, two reals, was not paid. In it he wrote, "I have read with unwearied interest the letters of the 'Knight of the Nippers,' and the different manners you mention for men to deliver themselves from all the crafts and assaults of the ladies, yet have I discovered none to free you from paying the postage of this packet. God preserve you."

Quevedo was somewhat of a misogynist. He had passed through a husband's experiences. He calls nature's fair defects "sweet-tasted devils," and would doubtless have defended South's derivations of surrogate from sorrow-gate and matrimony from matter of money. "I would," he says, "have my wife neither foul nor fair, but between these extremes, or more fair than foul, for it is better to be anxious than to be afraid, to have something to shield rather than to shudder at. I would have her neither poor nor rich, that she be not sold to me nor I to her. I would have her merry, for in our daily life will not be wanting sufficient sadness for both. I would not have her young nor yet old, not a cradle nor yet a coffin, for I have forgotten my lullabies and have not yet learnt my responsories. Were she deaf and tongue-tied I would give God infinite thanks for all his goodness."

In the only two anecdotes we have touching his intercourse with what is so suggestively called the opposite sex he has no reason to respect it. In the first matter he is banished from Madrid, and the second afforded him a brave opportunity of adopting the advice of Bacon, and being the first to laugh at his own defects in order to mar the malicious point of his friends. One day, being at a party, or *tertulia* as the Spaniards call it, one of his feet stole out by accident, not exactly like Suckling's little mouse, from beneath a long cloak which he wore to hide his legs from the light. "Oh what a foul foot!" said a lady with that ready wit and delicate sense of polite humor which makes woman so charming. Quoth Quevedo, "There is yet another foot more foul in this good company." Then they began to look one on another doubting of whom he spake, and a general registration of feet followed, until the philosopher, with a *sang-froid* which would have astonished the noble author of "Childe Harold," presently produced his other foot, yet more distorted.

His condemnation of women is less coarse but more cutting than that of Juvenal or Boileau. They are forced companions with whom you must speak under suspicion. He is the prudent person who enjoys their caresses but never trusts them even in a trifle. Our senses starve for what a woman is, and are surfeited with what she seems to be. If you kiss her, you smear your lips; if you put your arms round her, you punish yourself with steel rods and make dints in her padding; if you bargain for her barefooted, you leave half of her behind you, for shoes, like death, make all women equal; if you woo her, you weary yourself; if you obtain her, you obtain embarrassment; if you keep her, you become poor; if you leave her, she pursues you; if you love her she leaves you. Reading about these ridiculous women of Quevedo's age, two centuries and a half ago, how sincerely thankful we ought all to feel for the many improvements time and good sense have wrought upon those of our own.

But almost every class of society was in its turn the subject of the satire of this Spanish Voltaire. Lawyers save their clients in a suit as sailors their vessel in a storm, by taking out all they possess, that they may come, God willing, void and empty to the shore. Doctors he loved as Molière loved them. In the "Catchpole Possessed" a gentleman is haled before the judgment-seat of the king of hell, and accused of many horrible murders. He is at once shut up with the medical men. Next to a doctor the most dangerous disease to a wealthy man is to make his will. The fires of Purgatory boil the priest's pot, and to pray for the poor and to pocket for yourself is a very stale kind of stealing. The confines are faint between resignation and hypocrisy. In "Pluto's Pigsties" he is of opinion that he has seen the lower regions already in the higher. On being asked how, he answers, "In the covetousness of judges; in the tongues of evil speakers; to this St. James's idea is somewhat similar: in the appetites of the luxurious; in the vanity of great men; but the whole of Hell, without the loss of a point, is in the pietism of the pawnbrokers of virtue." Harder words than these he uses, inspirations of a bolder invective, but such as cannot be interpreted in an age in which greater vices necessitate greater delicacy of language and reserve.

In Spain unowned tatters of wit and shreds of satire escheat to Quevedo, as in this country they are usually collected to adorn Dr. Johnson; the lesser bubbles floating on the sea of letters are absorbed by the greater; the unclaimed property accrues to the crown. To Condé, who had exceeding many flocks and herds, has been given the one little ewe lamb of Madame de Cornuel, "No man is a hero to his *valet de chambre*," and it is very certain that no few of the witticisms attributed to Quevedo might be divided among many of his poorer brethren. It is not, for instance, easy to find where we should most expect it, in the life of Marcus Brutus, that model of austere morality and concise style, these apophthegms: "The vapor of princely friendship produces death;" "Men enter palaces with envy, live in them under persecution, and leave them with confusion;" nor the celebrated sentence, "Monarchs should remember that Satan was the first privy councillor;" nor this: "To see of how little value are the kingdoms of the earth in the sight of the gods, it is sufficient to look on those to whom they give them," which may be compared with the conclusion of Arbuthnot's polite epitaph on Francis Chartres. The reflection is also to be found in La Bruyère, and the common fountain seems to be Seneca's treatise on Providence: "*Non sunt divitiæ bonum. Itaque habeat illas et Ellius leno, ut homines pecuniam quam in templis consecraverint, videant et in fornice.*"

Sir Robert Filmer would scarcely have endorsed the remarks of the Spanish politician on the subject of monarchs which are to be found in the "*Politica de Dios, y Gobierno de Cristo.*" There a king is said to be a public person, whose crown is the necessities of his kingdom. Reigning is not an entertainment, but a task. He who conceals himself from the complaints of his subjects, and has doorkeepers for the aggrieved but none for the aggressors, retires from his duty and is on the same footing as the destroyers of Christ, of whom he will not learn to be a king.

Here is a curious passage, almost literally translated, of the "*Politica.*" "If you allow yourself to be seen by those who are not allowed to see you, do you not give sight to the blind? If you free your court from the evil spirits of covetous ministers, do you not cast out devils? If you are a father to the widow and orphan, who are mute and on whose behalf all are mute, do you not give speech to the dumb? If by relieving the poor you banish famine and its resultant diseases, do you not cure the sick? And if he cannot be a good king who gives not to his subjects health, speech, liberty, and sight, what shall he be who deprives them of all these?"

One of the most amusing of the many sketches of this Spanish Scarron is entitled, "A Book of all Things, and of Many Others Besides," containing ghastly and fearful secrets, tried, certain, and proved, and never known to fail. The book begins with sundry riddles and solutions, many of which are familiar to us, though few would think of finding them in Quevedo. "*Question.* How to make a woman follow you, without having spoken to her, wherever you will? *Answer.* Steal what she has; she will never leave you in sun or shadow, but follow you to the world's end. *Question.* How to prevent tailors cabbaging your stuff? *Answer.* Never let them cut out your clothes, for this is the only remedy. *Question.* How to make your horse turn in any direction? *Answer.* Send him to a lawyer for half a day. *Question.* How to be beloved by all? *Answer.* Lend money, and don't ask for it again, treat, suffer, endure, do good turns, hold your peace, and allow yourself to be cheated." This, the popular humor of Marcolfo, of Tyll Eulenspiegel, of Jocrisse, is succeeded by a treatise on divination, astrology, etc., which looks as if it had been written yesterday for a satire on "The Handbook of Astrology," by which every question of the future on which the mind is anxious may be truly answered, by Zadkiel Tao Sze. Herein we learn that Jupiter in Libra is extremely obnoxious to shopkeepers, or, as we say now, proprietors of establishments. The full moon signifies that she can hold no more, and this is an aphorism of Hermes. A blazing star with a long tail foretells that many are likely to look at it, and all princes die in that year who cannot live till the next. Evidently Quevedo troubled himself little about the sweet influences of the Pleiades or the bands of Orion. A chapter on omens advises the reader if on leaving his house he sees crows flying, to let them fly and mind where he sets his feet, and informs him that Tuesday is an unlucky day for those who travel without money, and for those who are cast into gaol. Sunday is a good day to spunge a dinner, for the sun is in his own house and you in another man's. Thursday is a good day not to believe flatterers. A chapter on physiognomy furnishes much that would have delighted Lavater. Another on chiromancy is death to the gypsies. This man of little faith declares the lines in the palm show simply that the hand has been bent, and predict union neither with dark man nor with fair. "The Book of all Things, etc," is concluded with advice how to learn all the sciences and arts, liberal and mechanical, in a single day. There is no room to give his receipts for acquiring languages with small expense of time and none of money, receipts at least as sure and far more ingenious than those of many modern professors who bait their linguistic mouse-trap with the toasted cheese of "a perfect knowledge of French in five weeks."

Almost unknown as a prose writer, Quevedo is, with one famous exception, in England perhaps entirely unknown as a poet. Yet his poetical works are numerous and, as has been already mentioned, of many styles. He is especially hard, even as a Spanish poet, to translate, and his excellent critic, Ochoa, has declared that some of his conceits it is quite impossible to decipher. Nevertheless, he assigns him a high position on the Castilian Parnassus. His poems are chiefly collected under the title of "The Nine Muses," according to the subjects of which they treat. Under Clio, for instance, he writes of famous men, deeds, times, and things, under Melpomene of deaths and funerals, under Erato of love and beauty, under Urania of religion.

In a sonnet of the first division, Clio, addressed to Rome buried under its ruins, he contrasts its ancient and modern condition, observing that most of the solid structures of the city have perished, while the river Tiber yet remains the same, and the conclusion of this sonnet forms the single exception above referred to. The little brook, which Horace describes in his "Journey to Brundusium," keeping its former channel in spite of agriculture and earthquakes, introduces in Boswell's "Life of Johnson," this conclusion, miserably distorted. Quevedo wrote,—

> Huyó lo que era firme, y solamente
> Lo fugitivo permanece y dura.

This passage is taken, as Boswell's guide, philosopher, and friend pointed out, from James Vitalis, a theologian and poet of Palermo, who died at Rome in 1560. The whole sonnet is, indeed, copied from the same author, omitting many of his antithetic conceits as that of Rome conquering herself at last, that nothing in the world might remain unconquered by her. The reference to the Albula at the conclusion of the Latin epigram is written thus:—

> Immota labascunt,
> Et quæ perpetuo sunt agitata manent.

It is unfortunate that the best-known poetical quotation from Quevedo is not Quevedo's own. The English reader, judging

from this sole evidence, might suppose one of the most original of Spanish writers nothing better than a plagiarist. Joachim du Bellay, who died in the same year as Vitalis, has the same thought in his "*Antiquitez de Rome*," so excellently translated by our own Spenser: —

> Le Tybre seul qui vers la mer s'enfuit
> Reste de Rome. O mondaine inconstance!

The idea has been ingeniously utilized by Mr. Tennyson in his "Song of the Brook."

The four idylls in the muse Erato, which conclude the poems, dedicated to the lady whom he celebrates under the name of Lysis, are fair specimens of his amatory effusions. The first is a loving lament, *pur et simple*, in the second the lover is already sick, and soon dead of love, in the third he rises from the dead to compose his own epitaph, and in the fourth he makes his will. The Marinistic expressions touching this lady completely cut out those of Cowley and Donne. So much is even a poet the creature of the period in which he lives, that Quevedo, while laughing at the cultism of Gongora, wrote himself hundreds of lines full of the fantastic incongruities of Italian imagery, and debased by injudicious association of quaint metaphor and metaphysical extravagance. What is the scholastic speculation of Cowley, who compared a lover's heart to a hand-grenade, to the ingenious absurdity of Quevedo, who imagines his own heart floating in the waves of his mirtress's hair, heaven studded with its stars out of her eyes, and yet surplus stuff remaining sufficient for Lysis to lengthen day and dissipate night, and her disdainful mouth a diamond of sonorous ice? What is Donne's somewhat far-fetched idea of a woman's name on glass making it less fragile to the description of the seashore as a sandy statue? Well might Dr. Johnson say that the metaphysical school aimed less at nature than at saying what was never said before, and that it failed to give delight in its endeavor to extort admiration.

Four of Quevedo's most festive and remarkable romances in Thalia are rare invectives against those marvels of natural history known as the phœnix, the pelican, the basilisk, and the unicorn. In the last especially, the popular belief is made the means of much matrimonial merriment. In one of his *redondillas*, short poems of four octosyllabic verses, some original conceits occur concerning the old subject of Orpheus' descent to hell for the redemption of his wife Eurydice. The poem begins with saying that a worse subject could not have brought him into a worse place; goes ou to inform us that his song caused much admiration, but his intention of taking his wife back with him more; that Pluto could not punish his intrusion with greater cruelty than by granting his request; yet that for the sake of the singer's music he attached to his grant a condition which facilitated the prevention of the ill-advised prayer touching the singer's wife.

Quevedo was not more remarkable for caustic wit or versatile ingenuity than for his widely extended knowledge of character. He was at home alike in the prince's presence chamber and the brothel of the prostitute, in the holy cloister and the gambler's hell. The *xacaras* in Terpsichore are poems written chiefly in the *patois* or slang of the *xaque*, pimp and bully. They are a *novela picaresca* in verse. In the first, Escarraman writes to La Mendez from prison, into which he has been pushed by some "live pins," the Spanish *argot* of Quevedo's period for *alguaciles*. His chains chink like grasshoppers in a stubble field at evening. He was taken in a drinking-bout after his sixty-ninth draught. He mentions some of La Mendez's friends whom he meets in gaol, and owing to a little dispute wlth these, is ordered a public beating by the governor, whom he calls a bellows of Satan. The ass on which he rides during his punishment is big as a dromedary — the reader will remember Cervantes' comparison of the friar's mules to the same beast — so that all may behold him; as slow as a tortoise, not to hurry the slashes of his executioner. The letter concludes with a request to La Mendez to lend him a little money. That lady's reply is enshrined in another poem. She begins somewhat sententiously: "All woe is drowned in wine, all cares are calked with bread. I have nothing to give you, except indeed some good advice, such is my misfortune." She gives advice suited less to this paper than to the occasion, and remarks incidentally that all women will prefer a rich pagan to a poor Christian, however pious. Here La Mendez forms as evil an estimate of her sex as the English philosopher who expressed it as his deliberate opinion that a maid would as soon marry Jonathan Wild as St. Austin, if the thief-taker had twopence-halfpenny more than the saint.

The pleasure of reading these roguish romances is much diluted by the difficulty

of their words. It is like painfully elaborating a joke in Aristophanes without the assistance of Liddell and Scott. No gentleman like Mr. Hotten ever published a slang dictionary in the time of Quevedo of a language as rich perhaps in this article as any in what is known as the civilized world. But the *xacaras* could never bear a literal rendering. Maldegollada and Zamborodon speak with the tongues of Lysistrata and Gargantua, rather than with those of Madame de Maintenon and Louis XIV.

Sufficient has been shown of Quevedo, it is to be hoped, to make it understood that he, like the great High Priest of all the Nine, as Campbell is pleased to call Dryden, was not a confessor to the finer secrets of the human heart. He was anything but one of the "gentle bosoms." Had the subject of Eloise fallen into his hands, he had left us a mighty coarse draft of her passion. Neither was this poet remarkable for the great regard which he paid to *les convenances*, which pester us from the cradle to the grave. He did not, like the Pharisee, thank God that he was not as this publican. A wicked heathen and a sincere Christian met with the same treatment at his hands. He had little sympathy with what is known as the moral greatness of his species. He is scarcely a suitable companion for the young; his works contain few neutral tints, and his philosophy is wont to walk abroad without a veil.

JAMES MEW.

WITHIN THE PRECINCTS.

BY MRS. OLIPHANT.

CHAPTER VII.

IT was late before Law got home. In the first place he read the *Family Herald* through to his interested and busy auditors. Their needles flew like lightning along the lengthy seams: trimmings were as nothing to them, and even a hem became interesting as he read. When he had pursued Lady Araminta to the end of this little portion of her history, showing how she refused that wicked duke who was at the bottom of all her troubles, and whose expedients to get her into his power were so manifold, he began the next story — and so on till all was finished. It took some time to get through the delightful pennyworth. What good it did to the poor girls at their work! They were not patient, superior, noble-minded needlewomen, pensively bearing up against the privations of their lot, but very commonplace girls, grumbling at their privations frankly, yet sitting up half the night over wedding finery or funeral robes, without any very clear idea that it was a hardship, or indeed more than an inevitable feature of "the dressmaking." It was under this simple matter-of-fact aspect that their vigil appeared to them now, and they did not feel it any very great grievance; but, such as it was, it was infinitely lightened by Law and the *Family Herald*. He was, to tell the truth, a little bit interested himself in the stories. He thought them very finely written. He liked the bits about Araminta's true, but alas! poor and unfortunate lover. This lover was tall and strong, interesting and clever beyond description. He could do whatever he tried to do, and managed to live comfortably upon nothing at all. Law had a half notion that this elegant and perfect being was like himself. He would not have breathed it to any one, but yet he thought so. And when one story was finished he began another. He did not mind whether it was the beginning, or the middle, or the end of the tale; all was the same to Law; he went stoutly on, and read the whole number through — poetry, answers to correspondents, and all. It was not very fine literature perhaps, or, rather, it was very superfine literature, with nobody below the rank of a baronet in the leading stories; but what it did for these poor dressmaking girls! They followed Lady Araminta through every turn of her wonderful fortunes, with eyes that glowed and shone over their needlework. They identified themselves with her, exclaiming, "That's just what I'd have done!" and, "No, I wouldn't have had him, not I, if he'd been fifty dukes!" with true enthusiasm. Their needles flew, and the work got on as by magic; their excitement showing itself in the speed with which they worked. The wedding things were done an hour sooner than they would otherwise have been done, under this stimulus, and it was little more than twelve o'clock when Polly, after folding up the last dress, in readiness to be sent home first thing in the morning, said, "Now, Mr. Lawrence, you've been a deal of use. If you like, you can see me home!"

"As if it was a treat for him to see her home!" Emma cried, who owned the special allegiance of Law; but the youth, for his part, had no objection. It was a beautiful night, and a little additional walk was nothing but a pleasure to him; and he was quite good-natured, ready to exert him-

self in any way that was not legitimate and necessary. Emma, indeed, did not smile upon this undertaking. She (who had been obliged to do as much before now without any one to take care of her) did not see what Polly wanted with an escort in a quiet place like St. Michael's. "You'll meet nobody worse than the policeman," she said.

"Policemen are bad enough, sometimes," said Polly.

"Mind you don't meet the captain," said Emma's elder sister, "and get him into trouble with his papa."

At this Polly laughed, tossing her head with its innumerable plaits and puffs. "I hope I can manage the captain," she said. And whoever had heard the style of Polly's conversation as she walked up the sweep of the steep street by Law's side, with the soft night air blowing in their faces, would have recognized at once the superiority of Polly to all the insinuations addressed to her. All was very quiet in the High Street of St Michael's; they met nobody worse than the policeman, as Emma had suggested; and everything was still and dark, except the stars shining far away overhead; for the shop-windows had long been closed, and the lamps glimmered few and far between.

"You mustn't think anything of what these foolish things say about the captain," said Polly; "because I'm a bit more reasonable than the rest, he likes to have a chat with me now and again. He's a very well-informed man, is your papa; but you mustn't think nothing of what they say ——"

"Oh, I don't!" said Law, with the serenest confidence; "I know the governor's way."

This, however, was not a reply which pleased Polly. "What do you mean by the governor's way?" she cried sharply. "You are not half respectful enough, if you would like to hear my opinion. You shouldn't talk of the captain like that; he's a fine man, and he's one that many in this town thinks a deal of."

"Is he really?" said Law, in genuine surprise; "I did not know that. I wonder what kind of people they are. Is it far off where you live, Polly? I haven't got a latch-key, so I don't want to be very late."

"You never thought of being late so long as you were sitting by Emma; though what you can see in a little white-haired thing like that, like a white cat! You haven't got a latch-key? I should think not, at your age. Mr. Lawrence, take my advice, and never be so late out of bed unless there is a very good reason for it."

"I like that!" cried Law, "when it was you that kept me there all the time."

"I thought it would do you good," said Polly. "I am almost sure you had not done a thing besides, or looked into a book for the whole day."

"Oh! I should not mind standing an examination in the *Family Herald*," Law said with a laugh. He had occupied the post of reader in the workroom before, and knew a great deal about Lady Araminta. There could not be any doubt that he was very good-natured, and ready to make himself of use.

"I should like to know," said Polly — and though he could scarcely see her face, Law felt, with a mixture of amusement and indignation, by the sound of her voice, that Polly, too, meant to give him good advice — "I should like to know, Mr. Lawrence, what you intend to be. Are you going into the army, like the captain? If I were a young gentleman, that's what I should choose above everything."

"I can't afford the army, worse luck," cried Law; "we haven't got any money, and a fellow can't live on his pay. And there's those dash'd examinations to pass everywhere before you can get into anything; it's enough to drive a man out of his senses. I sometimes think I shall emigrate — that's the only thing you can do without an examination."

"But you can't do that without money — a little money at least," said Polly. "If I were you, I should make a push and get in somewhere. I can't think how you can stay at home doing nothing, a great strong young man like you."

"Oh! as for being strong, that don't do much for an exam.," said Law. "The little fellows stand the best chance there."

"I wouldn't make jokes about it, if I were you. I wonder how you can go on living on the captain, and such a burden on him — both you and your sister ——"

"Hallo!" said Law, in extreme surprise. The mention of Lottie bewildered him. He was not even angry for the moment — he was so profoundly astonished.

"Yes, indeed, you and your sister too. You don't show any consideration for the captain, and how can you expect that he's always to be thinking of you? The captain is a young man still, and he is a fine man, and if he were to marry again, as would be very natural at his age, where would you and Miss Despard be?"

"Let my sister alone, if you please," said Law, with a momentary flash of

anger; and then he relapsed into a laugh. "The governor should be much obliged to you, Polly, for taking his part."

"Somebody ought to take his part," said Polly. "I don't suppose he's much over fifty — what I call quite a young man still; and why should he deny himself and spend all he's got on two grown-up young people that ought to be making their own living? A man like the captain, he wants his ease and his little comforts and a wife to look after him — that's what he wants. He ain't an old man to give in to his family. If I were to put upon my folks like that, do you think I'd be walking up St. Michael's Hill at this hour of the night, after slaving and stitching all day? Not a bit of it, Mr. Lawrence. If I were to do as you're doing, I might sit at home and make myself comfortable; but I was always one for being independent, and as for the captain, poor dear! he oughtn't to be spending his money upon them that can do for themselves. It is himself he ought to be thinking of, to get all the pleasure he can as long as he's able to enjoy it. And if he were to marry again, as there's nothing more likely, where would you and Miss Lottie be? Oh yes, I know your names quite well," said Polly. "We often talk about you. These sort of names for short are a mistake. For instance, me, my name's Maria, that's a very ladylike name; but what does it matter when everybody calls me Polly? But, if my name's common, nobody can say of me that I don't behave handsome to my parents," Polly said with emphasis. As for Law, he had felt himself growing hot and cold all through this speech. It plunged him into an entirely new world of thought. He tried to laugh, but there was no laughter in his mind.

"It is very kind of you, Polly," he said, with scorn in his voice, "to take the trouble to give me so much good advice."

"Oh, I assure you, it's not for your sake, but the captain's," said Polly. "I told him if I had a chance with either of you, you should hear a bit of my mind, and I saw my opportunity to-night — that's why I asked you to come with me, Mr. Lawrence. Oh, it wasn't for the pleasure of your society! I told the captain I'd give you a bit of my mind. This is my home, so I'll bid you good-night, and I hope you'll lay to heart what I say."

Law turned up the Abbey Hill when thus dismissed with much secret excitement in his mind. It was altogether a new idea to him that his father was, as Polly said, quite a young man still, and that it was on himself, not on his grown-up children, that his money should be spent. Law had never looked upon the income of the family as belonging exclusively to his father. It *was* the family income, and it had seemed to him that he had just as good a right to have everything he wanted as his father had. As a matter of fact he did not get all he wanted, as Captain Despard managed to do; but that was because his father had the command of everything, not that he had a better right to it than Law. The idea that he had no right at all, as Polly seemed to think, and that his father might make the home untenable by marrying somebody, perhaps Polly herself, struck him as the most extraordinary of revelations. It was too extraordinary to be thought of calmly — his blood boiled and bubbled with the extraordinariness and novelty of the thought. The governor, who was only not an old fogey because he was so much less respectable, less orderly than old fogeys ought to be! — Law could not associate his father's image with the idea of, even comparative, youth. But he could not dismiss the suggestion from his mind. He tried to laugh, but something seemed to hang over him like a threat, like a cloud of evil omen. He walked quickly up the slope to the Abbey gate, trying to shake off the uneasy feeling in his mind — trying to postpone at least the new idea which he could not get rid of. When, however, Law had got into the precincts he saw a passenger not much less active and considerably more jaunty than himself on the way before him, walking with a slight occasional lurch, up the pavement to the lodges. The lurch was quite slight, and might not have been noticed by an indifferent eye, but Law noted it with the jealous observation of one whose own credit was at stake. It was hard upon a fellow, he thought, that his father should be seen going home night after night with a lurch in his walk, and that his name should be recognized in all the lowest quarters of the town as that of "the captain's son." Why should he suffer for such a cause? Other old men were respectable, were no shame to their sons, but on the contrary furnished a margin of honor and reputation upon which to draw when there was occasion; but this was not the case with Captain Despard. Other old men — but there suddenly flashed across Law's mind, as he instinctively placed his father in this class, a recollection of the words which had just been said to him, "He is what I call a young man still." Pricked by this thought,

he looked at the figure before him with eyes suddenly cleared from the mists of habit and tradition, and saw it in an altogether new light. Captain Despard was straight and active, he carried his head high, and his step, though to-night slightly irregular, was both firm and light. To see him walking in front humming and whistling by turns, perhaps with a certain bravado to show how steady he was, gave Law the most uncomfortable sensation. It was true what Polly had said. This was no old fogey, no heavy father; though up to this moment Law had looked upon the captain in no other light. He felt a shiver come over him, a sudden realization of all the possibilities. Who should say that the governor ought not to do what he liked best, whatever that might be? Law felt conscious that he himself, who was so much younger, did what he liked in indifference to everybody's opinion, and he was under no affectionate delusion as to the superior virtue of his father. What if Polly were right? Polly perhaps had a better chance of knowing the captain's wishes than either his son or his daughter, to whom he was not likely to talk on such subjects. A chill came over the lad thought the night was so warm. Life had always seemed sure enough to him, though it had its privations. He had to put up with that chronic want of pocket money, and with frequent "rows" from his father, and passionate remonstrances from Lottie. These were the drawbacks of existence; but Law was aware that, except in very favorable circumstances indeed, as when you were born a duke, or at least born to the possession of five thousand a year or so, existence was very seldom without drawbacks. This, however, was very much worse than the want of pocket-money. The governor with a new wife, perhaps Polly! The situation was too horrible to be realized, but for the moment the idea seemed to pour a current of ice into Law's veins.

He had no latch-key, but as soon as he saw his father he made up his mind to take advantage of Captain Despard's entrance in a way which he had found practicable before this. Light and swift as he was, when the captain had fumbled and opened the door, Law stole close behind him and entered with him in the darkness. "What's that?" Captain Despard growled, feeling the movement of the air as his son passed. "I'll swear there's a ghost in this house," he added, grumbling to himself. Law, however, was safely out of the way before his father managed to strike a light, and went, swaying from side to side, up the narrow staircase which creaked under him. The young fellow, standing back in the darkness, saw Captain Despard's face illuminated by the light of the candle he carried, and gazed at it with eyes sharpened by anxiety. It was a handsome face — the contour still perfect, the hair crisp and curling, a heavy military moustache shadowing the well-formed lip. The captain was flushed, his eyes were blinking, half-closed, and that unloveliest look that can be seen on a man's face, the look of partial intoxication approaching the sleepy stage, took all spirit and sentiment from him. Yet Law could not but acknowledge that his father was a handsome man. He stood quite still, watching that progress up-stairs, half because he was unwilling to be seen, half because he was anxious to see. Captain Despard was "a fine man," as Polly had said. Law could see now, looking at him between the bars of the railing which guarded the little staircase, that there was nothing in common between him and the old white-haired chevaliers, who pottered up and down in the sun before the lodges. A grain of pride mingled in the exasperation with which he acknowledged this to himself — and yet he was not only exasperated but alarmed. He retired to bed very softly afterwards, creeping on tiptoe and in the dark up the stairs. There was still a gleam of light under Lottie's door, but Law preferred not to direct his sister's attention to the late hour of his own return by going straight to her room to relieve himself of his trouble. He did not want to be forced into confidences or to betray where he had himself been, and how he had heard the alarming prophecies which had so suddenly cleared his sight; and though the temptation was great he resisted it. Thus the lights were burning all at once in three of the little rooms in Captain Despard's house, each illuminating a separate world of excitement, unsuspected by the others. The captain's share of the disturbance was less of the mind than the body. He had lost some money which he could not afford to lose, and was annoyed on this account; and he was excited, but more sleepy, on account of the potations which had accompanied his play. "By ——, I'll have it back to-morrow night — luck can't be so against me one night after another." This was the only burden of his simple and uncomplicated reflections. He thought nothing of his children one way or another. Both his children, however, though in different ways, were thinking of him.

Lottie, though she dared not openly sit up for her father, remained up in her own room until he came in, and she had made sure that he did not want anything, and was not likely to set the house on fire. But Law's reflections were more serious than those of the other two. It seemed to the idle lad as if suddenly a real burden had got on to his shoulders. He was thoroughly frightened out of the pleasant calm of nature — the sense that everything must go on as everything had gone since he could remember. In later days, indeed, things had gone better for Law — Lottie had managed now and then to scrape a shilling or two off the housekeeping to give him, and of late she had not bullied him quite so much as usual. The current had been flowing more evenly — everything had conspired to make the happy-go-lucky of his life more smooth than before. He woke up with all the more fright and surprise to the sudden danger now.

CHAPTER VIII.

LOTTIE had gone home that night, it need not be said, with her head full of excitement. Had she not good reason to look upon this evening as of importance in her life? She had met the man who, before he had ever spoken to her, had, according to all appearances, placed her on the highest pinnacle on which a girl can be placed — the throne of a romantic love. Though it had been a temporary downfall to her to be placed in the charge of Mr. Ashford and the signor, instead of crossing the Dean's Walk in the company of this secret and poetical lover, yet she was almost glad to be thus let drop into quietness, to avert any word or look too much, which might have spoiled the visionary elevation on which she felt herself. Yes, she was glad that they had never been alone. Had he whispered an avowal of any kind into her ear, she was not, she knew, prepared for it; Lottie was honest even in her self-delusion, and she knew that, however profoundly to her advantage it might be, she could not make any response to a man whom she did not know, whom she was speaking to for the first time, notwithstanding her consciousness that he must have been thinking of her for a long time. She could not have made any fit reply. She must have said something which probably would have hurt him in the fervor of his romantic passion; for, though grateful to him and romantically touched by his evident devotion, Lottie could not have persuaded herself that he was anything to her except a delightful wonder and most flattering novelty. No, it was better, much better, that he did not come; she must have hurt his feelings, discouraged him, probably driven him away from her; and she was very far from wishing to drive him away. Lottie thought, with an innocent calculation, if she saw a little more of him, had a little time given her to make his acquaintance, that probably she would come to love him quite naturally and spontaneously; but at present it was not possible that she could do so, and she felt a natural shrinking from any premature disclosure of his feelings. Thus it was evidently most fortunate that the dean had interposed, that Rollo had not been allowed to come home with her — fortunate, and yet a little disappointing too. There had been very few words exchanged with her companions as they crossed the Dean's Walk. Mr. Ashford had most kindly and courteously reminded her that she had expressed a wish to speak to him about something. "It is too late now to ask what it was," he said; "I must not keep you out of doors at this hour; but if you will permit me, I will call and inquire in what way I can be of any use to you." "You know in what way *I* would like to be of use to you, Miss Despard," the signor said on the other side. All this was very flattering, even though she might be displeased by the signor's reiteration of his disagreeable offer. She made him a curtsy like Lady Caroline, while to the minor canon she gave her hand, which perhaps was quite sufficient to mark her different estimation of them. And indeed the signor had been very kind about the accompaniments, which he had certainly played to perfection. This recollection came to her mind as he thanked her for her singing, undaunted by the stiffness of her leave-taking. "Indeed, I owe you more, a great deal more, than you can possibly owe me," Lottie said, with a burst of compunction; "I never sang so well before, because I never had such an accompaniment." "Then I hope I may accompany you very often again," he said, with a smile, as he went away. Thus even with the signor Lottie felt herself in perfect good-humor and charity. A man who paid such compliments to her voice, how could she be hard upon him, even if he made a little mistake in respect to her position? He had been deceived by the nocondition of the other chevaliers, she said to herself. And she went in out of the summer night in a state of celestial satisfaction with all the people surrounding

her — and herself. Even Lady Caroline had melted into something which was warmth for her. She had said, "I have enjoyed your singing very much, Miss Despard," and had touched Lottie's hand with two limp fingers — that was something, indeed it was much for Lady Caroline. And all the other great ladies had spoken, or at least had smiled upon Lottie, thanking her. What could she have wished for more? She went up into her little tiny room, which was not much bigger than Lady Caroline's grand piano, and throwing off the Indian shawl (if Mrs. O'Shaughnessy could but have seen it!) on the floor, sat down upon her little white bed and began to think. To think! nothing of the sort — to go over everything that had happened, with a dazzle of light and delight and triumph round her. She seemed to herself to have thrown down all the boundaries that had hitherto separated her from her lawful sphere. If a suitor should come from that higher and better world who could wonder now? Had she not been adopted into it — received to her just place at last?

And naturally it was upon Rollo that her recollections chiefly centred; he was the chief figure of the whole company to Lottie. She remembered minutely everything he had said and done, the expression of his face (though she put infinitely more meaning in it than was there), the tone of his voice. How the room had become at once full of interest, of excitement, when he came in, clearing away all the dimness! Lottie had scarcely time even to wonder how and where their next meeting would be, for thinking of this first meeting. How his face had lighted up when he saw that she was there; how he had been caught by some one on his way to her, and kept talking in spite of himself, with his eyes upon her all the time; how he had escaped and pressed through all the fine company to get to her side; how he had confessed that he had but a very visionary right to claim her acquaintance at all, but nevertheless meant to stand on that right as, for the time being, the son of the house! Lottie had scarcely forgotten a word of all he said. And, as a matter of fact, Rollo had been very careful to behave himself with due discretion, not to make it too apparent that her voice was the thing that most interested him. She thought that he admired her singing as a part of his enthusiasm for herself. She had not a suspicion of the real state of the case. It seemed to her that her voice was a delightful discovery to him, a something *pardessus le marché*, an added charm; that it was the sole foundation of his apparent enthusiasm never occurred to the girl; neither, though she knew that her general triumph was caused by her singing, did she solely set down to that cause the friendly looks and smiles and flattering compliments she had received. This was absurd, but we do not pretend that Lottie was beyond the reach of absurdity. She knew that it was her singing which had suddenly silenced all the conversation going on in the room, and called the attention of everybody; but yet it was surely something more; it was herself, not her voice, which brought that kindly look to their eyes as they smiled upon her. It is hard to acknowledge to ourselves that it is for some special, perhaps accidental, quality we may possess, that we are favored and esteemed by our fellow-creatures. Human nature is humbled by the conviction that it is the possession of a gift worthy of popularity which makes an individual popular. We all prefer to be prized for nothing at all, for ourselves. And this, in the face of circumstances, and clean against all reason, was what Lottie hoped and determinedly believed. She could not consent to the other idea. To be praised and made friends with *for her voice* was intolerable. The only approbation which is really flattering and delightful is that which is given upon no ground at all.

She had been sitting thus for some time on her bed, musing, with eyes that sparkled and a heart that fluttered with happiness; and had taken off her evening gown, and loosed the roses from her hair, and wrapped her white shining satin shoulders in a white cotton dressing-gown; and had even brushed out those long, dark locks, and twisted them up again close to her head for the night, with innumerable fancies twisted out and in of all she did, before Captain Despard, fumbling for the keyhole, opened his own door and came in, in the dark. It was Lottie's habit to sit up till he came in, but to-night she had been too much occupied by her own concerns to hear his approach, and it was only when he came up-stairs that she woke up to think of him. Lottie's experienced ear caught the lurch in his step just as Law's experienced eye had caught it. "Again!" she said to herself, with a momentary flash of anger; but it did not make her wretched as it might have done a more sensitive daughter. Lottie was accustomed to accept her father without question, not expecting much of him, and somewhat disposed when he did not come up even to

the little she expected, to satisfy herself that it was just like papa. But his entrance relieved her from her habitual vigil. She heard Law steal up-stairs afterwards, and wondered how or when he had got in, and where he went at night, with more curiosity than she expended on her father; but even that did not much disturb Lottie, who had been used all her life to irregular entrances and exits. After a while all was still in the little house, notwithstanding the anxieties and excitements collected under its roof. Disquietude and trouble could not keep Law from sleeping any more than excitement and triumph could keep his sister; and, as for the captain, the sleep of the just was never so profound as that which wrapped him in a not too lovely tranquillity. The air was all thrilling with emotion of one kind or another, but they slept as profoundly as if they had not a care in the world — as soundly as the good O'Shaughnessys next door, who had been asleep since eleven o'clock, and who had no cares but those of their neighbors to disquiet them; or old Colonel Dalrymple, on the other side, who dozed through his life. The soft night stilled them all, young and old and middle-aged, in their kind, just as it held in soft shadow the Abbey, with all its grey pinnacles and immemorial towers. Nature cared nothing for the troubles of life; but life submitted to the gentle yoke of nature, which relieves the soul, while it binds the body, and makes a temporary truce and armistice with all the army of mortal cares.

Next morning Law lounged into the little drawing-room after breakfast with a big book in his hand. He had almost given up the pretence of reading for some time, so that it was all the more wonderful to see a book which was not a yellow railway novel in his hand. Lottie had been up early, awakened by the commotion in her mind, which did not allow her to rest — or rather which prevented her from going to sleep again when the early noises of the morning woke her up. Accordingly she had got through a great deal of her ordinary household work by this time, when Law, after a breakfast which was later than usual, lounged in upon her. He was very big, and filled up the little room; and his habit of doing as little as possible, and his want of money, which made some imperfections in his toilet inevitable, gave him a look of indolence and shabbiness such as was not natural to his age, or even to his disposition, for by nature Law was not lazy. He came sauntering in with one hand in his pocket, and with his book under the other arm; and he sat down in the only easy-chair the room contained, exasperating Lottie, to whom his very bigness seemed an offence. There were times when she was proud of Law's size, his somewhat heavy good looks, his athletic powers; but this morning, as many times before, the very sight of those long limbs jarred upon her. What was the use of all that superfluous length and strength? He took the only easy-chair, and stretched out his long limbs half across the room, and Lottie at the height of her activity felt impatience rise and swell within her. She could not put up with Law that morning. His indolence was an offence to her.

"What do you want, Law?" she said, in a voice which was not so sweet as it had been at the Deanery. She gave a rapid glance up at him as she went on with her darning, and took in the whole picture, the easy-chair and the lounging attitude. If he had sat upright upon the little hard wicker-work chair, Lottie would have felt more merciful.

"Well, I want nothing in particular, except to talk to you a little," said Law. "You need not be so cross."

"I am not cross; but to see you in an easy-chair, idling away all the morning —"

"How do you know I've been idling this morning? Look at my book; that's Virgil," said Law, looking at it with simple admiration. "I don't think a fellow could do much better than that."

"But have you *really* been reading?" Lottie's tone modified; she began to look at him with respect. "Oh, Law, if you only would work! it would make such a difference, it would make me quite happy. I was speaking to Mr. Ashford last night. You know Mr. Ashford, the minor canon. He is so clever with his pupils. If you could but go to him, if he would only take you, Law!"

"He would take me fast enough if we could afford the money. I say, Lottie, the governor was awfully late last night. Did you hear him coming in? I want to tell you something about him — something I have heard."

"I think you were very late, too, Law."

"Oh, never mind about that; it does not matter about me. Lottie, listen. A friend — I mean somebody — was speaking to me about him. Did it ever come into your head that he was not an old man, and that such a thing was possible as that he might — it seems too ridiculous to say it — marry again?"

"Marry again? you are dreaming!" cried Lottie loudly, in her astonishment.

"Yes, while we knew nothing of it. After all, when you come to think of it, when you look at him, you know, he is not so awfully old. One thinks he must be, because he is one's father. But some of these old beggars are just as silly" — said Law in awestruck tones, "and you can't stop them doing things as you can a fellow that is young. It is an awful shame! A fellow that is under age, as they call it, you can pull him up, though there's no harm in him; but an old fellow of fifty, you can't stop him, whatever nonsense he may set his face to. That's what I heard last night."

"It is not true. I don't believe a single word of it," said Lottie. "You must have been in very strange company, Law," she added with severity, "to hear all this gossip about papa."

Lottie did not mean to pass such a tremendous sentence on her father; she spoke simply enough. To hear this gossip her brother must have been in haunts such as those that Captain Despard frequented. She did not know what they were, but she knew they were evil; therefore she made use of this weapon instinctively, which she found, as it were, lying by her, not meaning any censure upon her father, only a necessary reproof to Law.

"You may say what you please about bad company," he said, "but that's what I heard; that he wasn't so old after all; and what would become of us if he married again? It was not gossip. I believe really, though I was very angry at the time, that it was meant kindly; it was meant for a warning. You would have thought so yourself, if you had been there."

"I do not believe a word of it!" said Lottie; but she had grown pale. She did not ask again who had told him or where he had been; she set herself seriously to prove the thing to be false, which showed that she was not so sure of not believing it as she pretended to be. "It is all a falsehood," she said. "Is papa a man to do that sort of thing? Marry! he would have to give up a great many things if he married. He could not afford to spend his money as he does; he would not be allowed to be always out in the evenings as he is now. Why, even poor mamma, she did not give in to him as we are obliged to do; he had to pay a little attention to her — sometimes. And now he has got more used to do what he likes than ever, and has more money to spend; do you think he would give up that *for a wife?*" cried Lottie with disdain. "It only shows that you don't know papa."

"Ah! but you don't know" —— said Law. He was about to say Polly, but stopped in time. "You don't know what might be put into his head, Lottie. He might be made to believe that to get rid of us would put all right. If he got rid of us, don't you see, he would want a woman in the house; and if it was some one he liked himself, that would make herself agreeable to him, and flatter him, and coddle him — that would please him better," said Law, with precocious knowledge of a man's requirements, "than you who are always trying to keep things straight but not to humor him, Lottie; or me — that am of no use at all."

Lottie grew paler and paler during this explanation. She had never humored her father, it was true. She had made desperate exertions "to keep things straight," to recover the family credit, to pay the bills, to keep regular hours; but, with the hardihood of youth, she had not hesitated even to stint her father of a meal when it seemed to her impetuous determination to be necessary, and she had not flattered him, nor made his convenience the absolute rule of the household, as some girls would have been wise enough to do. Lottie had reflected that he kept the lion's share of the family income to himself, and was quite able to remedy all shortcomings; and she had carried out her regulations with a high hand, feeling no compulsion upon her, no primary necessity to please her father. She perceived all this at a glance while Law spoke, and immediately felt herself confronting such a breach of all the ordinary usages of her life as made her shiver. What might he not do? Turn them out suddenly from his doors, out upon the world, at any moment whenever he pleased. He had the power to do it whenever he pleased, whatever seemed to him good. She drew a long shivering breath, feeling as if all were over, as if already she heard the door clanging and barred behind her, and was looking out penniless and destitute upon the world, not knowing where to go. Was it possible that such a fate was reserved for her? She was as white as her dress with that sudden panic of the imagination which is more terrible than any reality. Law was very anxious and alarmed also, but he had got over the worst on the previous night, and it gave him a kind of half pleasure to see how he had frightened Lottie; though, at the same time, the

effect of his communication upon her deepened his own conviction of the danger about to overtake them. He leaned back in his easy-chair with a certain solemn satisfaction, and stretched his long legs farther across the room than ever.

"You see, Lottie," he said, "it is what I have told you before; you never would humor him. I don't say that he's not unreasonable, but he might never perhaps have dropped among those sort of people if you had laid yourself out to —— "

Lottie sprang to her feet in a sudden gust of passion. She took Law by the shoulders, and with the sudden surprise of her assault got the better of him and turned him out of the chair. "You sit there, lolling all over the room," she cried, "and tell me my duty, you lazy, idle, useless boy! If papa turns you out, it will serve you right. You have a hundred things open to you; you have the whole world open to you; but you will not so much as take the trouble to pass the door. You would like to be carried over all the ditches, to be set up on a throne, to have everything and to do nothing. It will serve you right! And where do you get all this gossip about papa?" she went on. "Who are the sort of people you are spending your time with? You thought I did not know how late you came in last night. Where were you, Law? where are you always, all these long evenings? You say you are going out, and you never mind that I am sitting in the house all alone. You go somewhere, but I never hear that you have been with anybody — anybody in our own class —— "

"In our own class! I wonder what is our own class?" said Law, with a scornful sense of the weakness of the position. "Would you like me to take a hand in old O'Shaughnessy's rubber, or go out with Jack Dalrymple? I suppose that's what you call our own class."

Lottie felt that she had laid herself open to defeat, and the consciousness subdued her greatly. She sat down again on her little chair, and looked up at him as he stood leaning upon the door, red with indignation at her onslaught. Lottie herself was flushed with the exertion, and the shame of having thus afforded him an opportunity for a scoff. She eluded the dilemma as he proposed it, however, and flung herself back into the larger question. "You are grown up," she said indignantly; "a great big boy, looking like a man. It is a disgrace to you to be dependent on papa. It would be a good thing for you, a very good thing, if he were to — marry, as you say, and cast you off, and force you to work for yourself. What else have I been saying to you for years?"

"And what would it be for you?" said Law, taking, she thought, an unkind advantage of her; "there are two of us to be considered. What would it be for you, Lottie, I should like to know? What could you do any more than I?"

He stood up against the door, with a provoking smile on his face, and his big book under his arm, taunting her with her helplessness, even, Lottie felt, with her high notions, which made her helplessness all the worse. He smiled, looking down upon her from that serene height. "If the worst came to the worst," said Law, "I could always carry a hod or 'list for a soldier. I don't stand upon our class as you do. I haven't got a class. I don't mind if I take the shilling to-morrow. I have always thought it would be a jolly life."

Lottie gave a scream of horror, and flew upon him, seizing his coat collar with one hand, while she threatened him with her small nervous fist, at which Law laughed. "Will you dare to speak of 'listing to me," she said, flaming like a little fury; "you, an officer's son, and a gentleman born!" Then she broke down, after so many varieties of excitement. "Oh, Law, for the sake of heaven, go to Mr. Ashford! I will get the money somehow," she said, in a broken voice, melting into tears, through which her eyes shone doubly large and liquid. "Don't break my heart! Be better than we are — oh, Law! Climb up as far, as far as you please, above us; but don't fall lower. Don't forget you are a gentleman, unless you want to break my heart."

And then, in the overflow of feeling, she leaned her head upon his shoulder, which she had just gripped with fury, and cried. Law found this more embarrassing than the rage at which he laughed. He was obliged to allow her to lean upon him, pushing his book out of the way, and his heart smote him for making Lottie unhappy. By this time it could not be said that he was unhappy himself. He had shuffled off his burden, such as it was, upon her shoulders. He shifted his book, and stood awkwardly enough, permitting her to lean upon him; but it cannot be said that he was much of a prop to his sister. He held himself so as to keep her off as far as possible. He was not unkind, but he was shy, and did not like to be placed in a position which savored of the ridiculous. "I wish you wouldn't

cry," he said peevishly. "You girls always cry — and what's to be got by crying? I don't wan't to 'list if I can help it. I'd rather be an officer — but I can't be an officer; or get into something; but I never was bred up to anything, and what can I do?"

"You can go to Mr. Ashford," said Lottie, feeling herself repulsed, and withdrawing from him with a glimmer of indignation relighted in her eyes. "I met him last night, and I spoke to him about you. He seems very kind. If you go to him, he will at least tell us whether he thinks you have a chance for anything. Oh, Law, now that you do see the necessity——"

"But it's a great deal more serious for you," said the lad, mischievously. He was not unkind, but it seemed something like fun to him to treat Lottie as she had treated him so often, holding up before him the terrors and horrors of his idleness. Because she was a girl, did that make any difference? She had just as good a right to be bullied as he had, and to be made to see how little she could do for herself. Emma, who was younger than Lottie, worked for her living, and why should not Lottie do the same? why should she be exempted? Thus Law reasoned, whom Lottie, it must be allowed, had never spared. He watched with mischievous curiosity, making an experiment, not knowing whether it would be successful or not. But the way in which Lottie took it did not give Law the amusement he expected. She sat quite still in her chair, taking no notice at all — thinking — suddenly separated from him, by all the distance and inaccessibility of that mental condition in which the most trivial creature is beyond the reach of the greatest. Her face was so serious that he again felt very remorseful. But his own mind had recovered its elasticity, for, after all, if the worst came to the worst, if the governor was such an ass as to marry Polly, it would not matter so very much to Law. Something, there was no doubt, would turn up, or he would 'list — that was an alternative not to be despised. He was tall enough for the Guards, among whom Law had often heard a great many gentlemen were to be found; and the life was a jolly life — no bother about books, and plenty of time for amusement. There was nothing really in the circumstances to appal him now he had considered them fully. But it was a great deal more serious for Lottie. After all the bullying he had endured at her hands, Law may perhaps be excused if, in sheer thoughtlessness, he rather enjoyed the prospect of this turning of the tables upon his sister. He wondered how she would like it when it came to her turn, she who was so ready to urge himself to the last limits of patience. He did not wish anything unpleasant to happen to her. He would not have had her actually brought into contact with Polly, or placed under her power. But that Lottie should "just see how she liked it herself" was pleasant to him. It would not do her any real harm, and perhaps it would teach her to feel for other people, and understand that they did not like it either. A slight tinge of remorse crossed Law's mind as he saw how pale and serious she looked, sitting there thinking; but he shifted his Virgil to his other arm, and went away, steeling his heart against it. It would make her feel for other people in future. To have it brought home to herself would do her no harm.

CHAPTER IX.

AND what a problem it was with which Lottie Despard was thus left alone! The house was still, no one moving in it — nothing to distract her thoughts. Now and then a swell of music from the Abbey, where service was going on, swept in, filling the silence for a moment; but most of the inhabitants of the lodges were at matins, and all was very still in the sunshine, the Dean's Walk lying broad and quiet, with scarcely a shadow to break the light. Down-stairs the little maid-of-all-work had closed the door of the kitchen, so that her proceedings were inaudible. And the captain, as in duty bound, was in the Abbey, trolling forth the responses in a fine baritone, as he might have done had they been the chorus of a song. Lottie sat like a statue in the midst of this stillness, her eyes abstracted, her mind absorbed. What a problem to occupy her! Law, rustling over his books in his own room, grew frightened as he thought of her. She would break her heart; it would make her ill; it might almost kill her, he thought. She sat with her work dropped on her knee, her eyes fixed but not seeing anything, her mind — what could occupy it but one reflection? the sudden possibility of a breaking up of all her traditions, an end of her young life — a dismal sudden survey of the means of maintaining herself, and where she could go to in case this unthought-of catastrophe should occur at once. Poor desolate Lottie, motherless, friendless, with no one to consult in such an emergency, no one

to fly to! What could be more terrible than to be brought face to face with such an appalling change, unwarned, unprepared? What was she to do; where was she to go? Worse than an orphan, penniless, homeless, what would become of her? No wonder if despair was paramount in the poor girl's thoughts.

Well — but then despair was not paramount in her thoughts. She made a stand for a moment with wild panic before the sudden danger. What was it that was going to happen? Lottie gave a momentary gasp as a swimmer might do making the first plunge; and then, like the swimmer, lo! struck off with one quick movement into the sunshine and the smoothest gentle current. Change! the air was full of it, the world was full of it, the sky was beautiful with it, and her heart sprang to meet it. Do you think a girl of twenty on the verge of love, once left free to silence and musing, was likely to forget her own dreams in order to plunge into dark reveries as to what would happen to her if her father married again? Not Lottie, at least. She launched herself indeed on this subject, the corners of her mouth dropping, a gleam of panic in her eyes; but something caught her midway. Ah! it was like the touch of a magician's wand. What did it matter to Lottie what might happen to other people; had not everything that was wonderful, everything that was beautiful, begun to happen to herself? She floated off insensibly into that delicious current of her own thoughts, losing herself in imaginary scenes and dialogues. She lost her look of terror without knowing it, a faint smile came upon her face, a faint color, now heightening, now paling, went and came like breath. Sometimes she resumed her work, and her needle sped through her mending like the shuttle of the Fates; sometimes it dropped out of her hand altogether, and the work upon her knee. She lost count of time and of what she was doing. What was she doing? She was weaving a poem, a play, a romance, as she sat with her basket of stockings to darn. The *mise en scène* was varied, but the personages always the same — two personages — never any more; sometimes they only looked at each other, saying nothing; sometimes they talked for hours; and constantly in their talk they were approaching one subject, which something always occurred to postpone. This indefinite postponement of the explanation which, even in fiction, is a device which must be used sparingly, can be indulged in without stint in the private imagination, and Lottie in her romance took full advantage of this power. She approached the borders of her *éclaircissement* a hundred times, and evaded it with the most delicate skill, feeling by instinct the superior charm of the vague and undecided, and how love itself loses its variety, its infinite novelty, and delightfulness when it has declared and acknowledged itself. Law, in his room with his big book, comforting himself under the confused and painful study to which the shock of last night's suggestion had driven him by the idea that Lottie too must be as uncomfortable as himself, was as much mistaken as it was possible to imagine. His compunction and his satisfaction were equally thrown away. Still the feeling that he had startled her, and the hope that it would "do her good," gave him a little consolation in his reading, such as it was. And how difficult it was to read with the sun shining outside, and little puffs of soft, delicious air coming in at his open window, and laying hands upon him, who shall say? He was comforted to think that next door to him, Lottie with her basket of clothes to mend, patching and darning, must be very much disturbed too; but it would have been hard upon Law had he known that she had escaped from all this, and was meanly and treacherously enjoying herself in private gardens of fancy. He had his Emma to be sure — but of her and the very well-known scenes that enclosed her, and all the matter-of-fact circumstances around, he felt no inclination to dream. He liked to have her by him, and for her sake submitted to the chatter of the workroom (which, on the whole, rather amused him in itself), and was quite willing to read the *Family Herald* aloud; but he did not dream of Emma as Lottie did of the incident which had happened in her career. It was true there was this fundamental difference between them, that Lottie's romance alone had any margin of the unknown and mysterious in it. About Emma there was nothing that was mysterious or unknown.

It was not likely, however, that these two young people in their two different rooms, Law gaping over his Virgil, and feeling his eyes wander after every fly that lighted on his book, and every bird that chirped in the deep foliage round the window; and Lottie with her needle and her scissors, thinking of everything in the world except what she was doing or what had just been told her, should be left undisturbed for long in these virtuous occupations. Very soon Law was stopped in

the middle of a bigger yawn than usual by the sound of a step coming up the stairs, which distracted his not very seriously fixed attention — and Lottie woke up from the very middle of an imaginary conversation, to hear a mellow round voice calling her, as it came slowly panting up-stairs. "Are you there then, Lottie, me honey? You'd never let me mount up to the top of the house, without telling me, if ye weren't there?" Mrs. O'Shaughnessy, like many of her country-folks, was half aware of the bull she was uttering, and there was a sound of laughter in her voice. Lottie, however, sat still, making no sign, holding her needle suspended in her fingers, reluctant to have her pleasant thoughts disturbed by any arrival. But while Law and Lottie, each behind a closed door, thus paused and listened, the captain (audibly) coming home from morning service, stepped in after Mrs. O'Shaughnessy, and addressed the new comer. "Lottie is in the drawing-room," he said, "though she does not answer. "I am just going out again when I've fetched something — but I must first see you up-stairs;" and then there was an interval of talking on the stairs and the little landing-place. Lottie made no movement for her part. She sat amidst her darnings, and awaited what was coming, feeling that her time for dreams was over. Captain Despard came lightly up, three steps at a time, after Mrs. O'Shaughnessy had panted to the drawing-room door. He was jaunty and gay as ever, in his well-brushed coat with a rosebud in his button-hole. Few, very few days were there, on which Captain Despard appeared without a flower in his coat. He managed to get them even in winter, no one could tell how. Sometimes a flaming red leaf from the Virginia creeper answered his purpose, but he was always jaunty, gay, decorated with something or other. He came in behind the large figure of their neighbor, holding out a glove with a hole in the finger, reproachfully to Lottie. "See how my child neglects me," he said. He liked to display himself even to Mrs. O'Shaughnessy, and stood and talked to her while Lottie, with no very good grace, put down her darning and mended his glove.

"When I was a young fellow, my dear lady," he said, "I never wanted for somebody to mend my glove; but a man can't expect to be as interesting to his daughter as he was in another stage of life."

"Oh, captain, take me word," said Mrs. O'Shaughnessy, "the likes of you will always be interesting to one or another. You won't make me believe that ye find nobody but your daughter to do whatever ye ask them. Tell that — to another branch of the service, Captain Despard, me dear friend."

"You do me a great deal too much honor," he said, with the laugh of flattered vanity; for he was not difficult in the way of compliments. "Alas, Mrs. O'Shaughnessy, who would pay any attention to an old married man, the father of a grown-up son and daughter, like me?"

"Sure, and you're much to be pitied, so old as ye are, with one foot in the grave, captain dear," the old Irishwoman said; and they both laughed, she enjoying at once her joke, and the pleasure of seeing her victim's pleased appreciation of the compliment; while he, conscious of being still irresistible, eyed himself in the little glass over the mantelpiece, and was quite unaware of the lurking demon of good-humored malice and ridicule in her eyes.

"Not so bad as that perhaps," he said, "but bad enough. A man grows old fast in this kind of life. Matins every morning by cockcrow, to a man accustomed to take his ease, Mrs. O'Shaughnessy. The major grumbles, I make no doubt, as well as I."

"Sure it's nothing half so bad as morning parade. That's what O'Shaughnessy says; and he never was used to his ease, captain. I took better care of him than that. But, Lottie, me honey, here we're talking of ourselves, and it's you I've come to hear about. How many hearts did ye break; how many scalps have ye got, as we used to say in Canada? It wasn't for nothing ye put on your finery, and those roses in your hair. The captain, he's the one for a flower in his coat; you're his own daughter, Miss Lottie, dear."

"Were you out last night, my child?" said Captain Despard, taking his glove from Lottie's hand. "Ah, at the Deanery. I hope my friend the dean is well, and my Lady Caroline? Lady Caroline was once a very fine woman, Mrs. O'Shaughnessy, though you would not think it. The Courtlands were neighbors of ours in our better days, and knew all our connections; and Lady Caroline has always been kind to Lottie. I do not think it necessary to provide any chaperon for her whan she goes there. That is where a girl feels the want of a mother; but Lady Caroline is a very kind friend."

"Fancy that now," said Mrs. O'Shaughnessy, "how a body may be deceived! I never knew ye were among old friends, captain. What a comfort to you — till you find somebody that will be a nice chaperon for your dear girl!"

"Yes, Mrs. O'Shaughnessy, that would be a satisfaction; but where could I find one that would satisfy me after Lottie's dear mother, who was a pearl of a woman? Good morning to you, my dear lady; I must be going," he said, kissing the fingers of the mended glove. And he went out of the room humming a tune, which, indeed, was as much a distinction of Captain Despard as the flower in his coat. He was always cheerful, whatever happened. His daughter looked up from her work, following him with her eyes, and Law, shut up in his room next door, stopped reading (which indeed he was very glad to do), and listened to the light carol of the captain's favorite air, and his jaunty step as he went down the stairs. No lurch in that step now, but a happy confidence and cheerful ring upon the pavement when he got outside, keeping time surely not only to the tune, but to the captain's genial and virtuous thoughts. Mrs. O'Shaughnessy looked after him without the cloud which was on his children's faces. She laughed. "Then, sure it does one's heart good," she said, "to see a man as pleased with himself as me friend the captain. And Lottie, me darlin', speaking of that, there's a word I have to say to you. Ye heard what I said and ye heard what he said about a chaperon — though, bless the child, it's not much use, so far as I can see, that you have for a chaperon ——"

"No use at all," cried Lottie, "and don't say anything about it, please. Papa talks; but nobody pays any attention to him," Lottie exclaimed, with a flush of shame.

"If he'd stop at talking! but Lottie, me dear, when a man at his age gets women in his head, there's no telling what is to come of it. I wouldn't vex ye, me dear, but there's gossip about — that the captain has thoughts ——"

"Oh, never mind what there's gossip about! There's gossip about everything."

"And that's true, me honey. There's your own self. They tell me a dozen stories. It's married ye're going to be (and that's natural); but there's them that uphold it's not marriage at all, but music, or maybe the stage even, which is what I never would have thought likely ——"

Lottie had risen to her feet, her eyes sparkling, her face crimson with excitement. "Wherever you hear it, please, *please* say it is a lie. I — on the stage! Oh, Mrs. O'Shaughnessy, could you believe such a thing? I would rather die!"

"Dying's a strong step to take, me dear. I wouldn't go that length, Lottie; but at your age, and with your pretty looks, and all the world before ye, it's not the thing I would advise. I don't say but there are chances for a pretty girl that's well-conducted ——"

"Mrs. O'Shaughnessy! do you dare to speak to me so?" said Lottie with crimson cheeks, her eyes blazing through indignant tears. Well-conducted! the insult went to her very soul. But this was beyond the perception of her companion.

"Just so, me dear," she said. "There was Miss O'Neil, that was a great star in my time, and another stage lady that married the Earl of ——, one of the English earls. I forget his title. Lords and baronets and that sort of people are thrown in their way, and sometimes a pretty girl that minds what she is about, or even a plain girl that is clever, comes in for something that would never —— Who is that, Lottie? Me dear, look out of the window, and tell me who it is."

Lottie did not say a word; she gasped with pain and indignation, standing erect in the middle of the room. How it made the blood boil in her veins to have the triumphs of the "stage ladies" thus held up before her! She did not care who came. There was nobody here in this place, where nobody understood Lottie's position, to whose coming she could look with any satisfaction. She scorned the interference of any one. And what was the use even of standing up for herself where everybody would laugh at her? There was no one in the chevaliers' lodges who could render her justice. They would all think an earl or a Sir William "caught" by any exposure of herself to the public gaze to be a rich recompense for her toil. So long as she was well-conducted! To be well-conducted, is not that the highest praise that can be given to any one? Yet it made Lottie's blood boil in her veins.

While she stood thus flushed and angry, the door was suddenly pushed open by the untrained "girl," who was all that the household boasted in the shape of a servant. "She's here, sir," this homely usher said; and lo, suddenly, into the little room where sat Mrs. O'Shaughnessy taking up half the space, and where Lottie stood in all the excitement and glow of passion, there walked Rollo Ridsdale, like a hero of romance, more perfect in costume, appearance, and manner, more courteous and easy, more graceful and gracious, than anything that had ever appeared within that lower sphere. The captain was jaunty and shabby-genteel, but even he sometimes dazzled with his grand air the inexperienced ladies in the lodges; but

Mr. Ridsdale was all that the captain only pretended to be, and the very sight of him was a revelation. Mrs. O'Shaughnessy, sitting with her knees apart and her hands laid out upon her capacious lap, opened her mouth and gazed at him as if he had been an angel straight from the skies. Mrs. O'Shaughnessy knew him, as she knew every one who came within the Abbey precincts. She was aware of every visit he paid to his aunt, and saw him from her window every time he passed up and down the Dean's Walk, and she had the most intimate acquaintance with all his connections, and knew his exact place in the Courtland family, and even that there had been vicissitudes in his life more than generally fall to the lot of young men of exalted position. And, if it did her good even to see him from her window, and elevated her both in her own opinion and that of her friends to be able to point him out as the Honorable Rollo Ridsdale, it may be imagined what her feelings were, when she found herself suddenly under the same roof with him, in the same room with him. Mrs. O'Shaughnessy sat and stared, devouring his honorable figure with her eyes, with a vague sensation of delight and grandeur taking possession of her soul.

"You must pardon my intrusion at such an early hour, Miss Despard," he said. "I wanted your maid to ask if I might come in, and I did not know she was ushering me into your very presence. But I have my credentials with me. I bear a note from Lady Caroline, which she charged me to support with my prayers."

The passion melted out of Lottie's countenance. Her eyes softened — the very lines of her figure, all proud and erect and vehement, melted too as if by a spell — the flush of anger on her cheek changed to a rose-red of gentler feeling. The transformation was exactly what the most accomplished actress would have desired to make, with the eye of an able manager inspecting her possibilities. "I beg your pardon," she said instinctively, with a sudden sense of guilt. It shocked her to be found so full of passion, so out of harmony with the melodious visitor who was in perfect tune and keeping with the sweet morning, and in whose presence all the vulgarities about seemed doubly vulgar. She felt humble, yet not humiliated. Here was at last one who would understand her, who would do her justice. She looked round to find a seat for him, confused, not knowing what to say.

"May I come here?" said Rollo, pushing forward for her the little chair from which she had evidently risen, and placing himself upon the narrow window-seat with his back to the light. "But let me give up my credentials first. My aunt is — what shall I say? — a little indolent, Miss Despard. Dear Aunt Caroline, it is an unkind word — shall I say she is not fond of action? Pardon if it is I who have acted as secretary. I do so constantly now that Augusta is away."

"Lottie," said Mrs. O'Shaughnessy, as Lottie, confused, took the note from his hand, and the chair he offered, "me dear! you have not presented me to your friend."

Rollo got up instantly and bowed, as Lottie faltered forth his name ("A real bow," Mrs. O'Shaughnessy said after; "sure you never get them but in the upper classes"), while she herself, not to be outdone, rose too, and extended a warm hand ("What does the woman expect me to do with her hand?" was Mr. Ridsdale's alarmed commentary on his side).

"I'm proud to make your acquaintance, sir," said Mrs. O'Shaughnessy. "Me husband the major was once a great friend of an uncle of yours, Mr. Ridsdale — or maybe it was a cousin; when we were out in Canada, in the Hundred and Fiftieth — the Honorable Mr. Green; they were together in musketry practice, and me major had the pleasure of being a great deal of use to the gentleman. Many a time he's told me of it; and when we come here, sure it was a pleasure to find out that me Lady Caroline was aunt — or maybe it was cousin — to an old friend. I am very glad to make your acquaintance," Mrs. O'Shaughnessy continued, shaking him warmly by the hand, which she had held all this time. Mr. Ridsdale kept bowing at intervals, and had done all that he could, without positive rudeness, to get himself free.

"Oh yes," he said, "I have cousins and uncles and that sort of thing scattered through the earth in every regiment under the sun; and very bad soldiers, I don't doubt, always wanting somebody to look after them. I am sure Major O'Shaughnessy was very kind. Won't you sit down?"

"It wasn't to make a brag of his kindness — not a bit of that — though he is a kind man, and a good man, Mr. Ridsdale, though I say it as shouldn't. I have been married to me major these forty years, and if any one knows it, I ought to be the one to know."

"Undoubtedly, Mrs. O'Shaughnessy. I for one am most ready to take the fact on your word."

"And you'd be in the right of it. A man's wife, that's the best judge of his

character. Whatever another may say, she's the one that knows; and if she says too much, one way or the other, sure it's on herself it falls. She has to suffer if he's not as good as she gives him out to be. But maybe you're not interested, Mr. Ridsdale, in an old woman's opinions?"

"I am very much interested, I assure you," said Rollo, always polite. He kept an eye upon Lottie reading her note, but he listened to her friend (if this was her friend) with as much attention, Mrs. O'Shaughnessy always remembered, as if she had been a duchess at the least.

Meanwhile Lottie read the note, which purported to come from Lady Caroline, and which had a wavering C. Huntington at the bottom of the page, which was autograph. The warmth of the appeal however to her dear Miss Despard, to take pity on the dulness of the Deanery and come in "quietly" that evening for a little music, was not in any way Lady Caroline's. She had consented indeed to permit herself to be sung to, on Rollo's strenuous representation of the pleasure it had given her.

"You know, Aunt Caroline, you enjoyed it," he had said; and "Yes, I know I enjoyed it," Lady Caroline, much wavering, had replied. It would not have been creditable not to have enjoyed what was evidently such very good singing; but it was not she who wrote of the dulness of the Deanery nor who used such arguments to induce her dear Miss Despard to come. Lottie's countenance bending over the note glowed with pleasure as Mrs. O'Shaughnessy kept up the conversation. Even with those girls who think they believe that the admiration of men is all they care for, the approbation of a woman above their own rank is always a more touching and more thorough triumph than any admiration of men. And Lottie was not one of those young women; that Lady Caroline should thus take her up, and encourage her, praise her, invite her, went to her very heart. She almost cried over the kind words. She raised her face all softened and glowing with happiness to the anxious messenger who was listening to Mrs. O'Shaughnessy, and as their eyes met a sudden smile of such responsive pleasure and satisfaction came to Rollo's face as translated Lottie back into the very paradise of her dreams.

"I can't say, me dear sir," said Mrs. O'Shaughnessy, "that things are just exactly as we wish here, or as we thought we had a right to look for. The major and me, we've been used to a deal of fine company. Wherever we've gone, was it in Canada, was it the Channel Islands, was it at the depot of the regiment, we've always been called upon by the best. But here, sure the position is anything but what you would wish. We've been here a dozen years, and we don't know a soul. Think of that! Yes, oh yes; some have called out of the town. But that does not count, Mr. Ridsdale, you know, that does not count; and to us in her Majesty's service, that have always been accustomed to the best ——"

"Surely, surely, I quite understand; or rather I don't understand at all, it is nothing less than incredible. Miss Despard," said the ambassador, "I hope you are considering what Lady Caroline says, and will not disappoint our hopes. Last night was a triumph, but this will be enjoyment. You, who must know what talent Miss Despard has — I appeal to you, Mrs. O'Shaughnessy. I am sure from your kind looks that we will have your aid."

"Is it to go and sing for them again, Lottie, me dear? Sure I'd like to see it come to something," said the old lady in an undertone; "but there, there, don't frown at me. Go, me child, go and enjoy yourself. That's just the way, Mr. Ridsdale — excuse me if I speak my mind free — me Lady Caroline and his reverence the dean, when there's something that pleases them in the chevaliers' lodges ——"

"Do I need to write a note?" said Lottie, interrupting hastily to prevent the completion of a speech which seemed to threaten the very foundations of her happiness. "Perhaps it would be more polite to write a note." She looked at him with a little anxiety, for the thought passed through her mind that she had no pretty paper like this, with a pretty monogram and "The Deanery, St. Michael's," printed on its creamy glaze, and even that she did not write a pretty hand that would do her credit; and, going further, that she would not know how to begin, whether she should be familiar, and venture upon saying, "Dear Lady Caroline," which seemed rather presumptuous, calling an old lady by her Christian name, or ——

"I need not trouble you to write. I am sure you mean to say yes, Miss Despard, which is almost more than I dared hope. Yes is all we want, and I shall be so happy to carry it."

"Yes is easy said," said Mrs. O'Shaughnessy; "a great deal easier than no. Oh, me dear, I don't object to your going; not a bit; only I take an interest in ye, and ye must not make yourself too cheap. Know her talent, Mr. Ridsdale? sure I can't say that I do. I know herself, and a better

girl, saving for a bit of temper, don't exist. But a girl is the better of a spark of temper, and that's just what you've got, me dear Lottie. No; I don't know her talent. She has a voice for singing, that I know well; for to hear her and Rowley when she's having her lesson, sure it's enough to give a deaf person the ear-ache. But that's the most that I know."

"Then, Miss Despard," said Rollo, springing to his feet, "if your — friend is in this condition of doubt, it is impossible she can ever have heard you; will you not gratify me and convince her by singing something now? I know it is horrible impertinence on my part, so recent an acquaintance. But — no, Mrs. O'Shaughnessy, you never can have heard her. I have some songs here that I know you would sing to perfection. I deserve to be ordered out of the house for my presumption. I know it; but" — and he clasped his hands and fixed supplicating eyes upon Lottie, who, blushing, trembling, frightened, and happy, did not know how to meet those eyes.

"Sure he'll be down on his knees next," cried Mrs. O'Shaughnessy delighted; "and you wouldn't have the heart to deny the gentleman when he begs so pretty. I'll not say but what I've heard her, and heard her many a time, but maybe the change of the circumstances and the want of Rowley will make a difference. Come, Lottie, me darling, don't wait for pressing, but give us a song, and let us be done with it. If it was a good song you would sing, and not one of those sacred pieces that make me feel myself in the Abbey — where we all are, saving your presence, often enough —— "

"I have a song here that will please you, I know," said Rollo. "We shall have you crying in two minutes. You don't know, my dear Mrs. O'Shaughnessy, what a glorious organ you are talking of."

"Organ! that's the Abbey all over; but, praised be heaven, there's no organ here, only an old cracked piano —— "

"Oh, indeed," cried Lottie, "it is not fit to play on, and I don't think I can sing at sight; and — I know I can't play an accompaniment."

"That shall be my happy office," he said, looking at her with those eyes that dazzled Lottie. They were not dazzling by nature, but he put a great deal of meaning into them, and Lottie, foolish Lottie, innocently deceived, put a great deal more. Her eyes sank beneath this look. She could scarcely keep the tears from coming into them, tears of confused pleasure and wonder and happiness; and she could not refuse him what he asked. He opened the wretched old piano, worn out and jingling, and out of tune as it was. And Mrs. O'Shaughnessy put her knees a little more apart, and threw her bonnet strings over her shoulders, and spread out her warm hands in her lap. There was a little good-humored cynicism in her face. She did not expect to enjoy the singing, but all her faculties were moved by the hint, the scent, of a flirtation, and that she was prepared to enjoy to the full.

From The Westminster Review.

THE TELEPHONE.

Of all modern inventions connected with the transmission of telegraphic signals, the telephone, devised by Mr. Alexander Graham Bell, has excited the most widespread interest and wonder. Wherever Mr. Bell has appeared before the public to give an account of his invention and the researches which have led up to it, crowds have assembled to hear him. Nor is this astonishing; for the telephone professes not only to convey intelligible signals to great distances without the use of a battery, but to transmit in facsimile the tones of the human voice, so that a voice shall be as certainly recognized when heard over a distance of a few hundreds of miles as if its owner were speaking in the room by our side. And the telephone does not fall short of its profession. Scientific men have had their wonder and curiosity aroused even more than the unscientific public, since a scientific man appreciates the enormous difficulties to be overcome before such an instrument can be realized. Had any hardy speculator a few years ago proposed a telephone which should act on the principle, and be constructed in the form, of Mr. Bell's instrument, he would probably have been considered a lunatic. The effects are so marvellous; the exciting causes at first sight so entirely inadequate to produce them. For a telephonic message differs as widely from an ordinary telegraphic message as a highly finished oil painting differs from a page of print. In the one you have only white and black, black symbols on a white ground, the symbols being limited in number, and recurring again and again with mere differences of order. The painting, on the other hand, discloses every variety of color and arrangement. No sharp lines of discontinuity offend the eye; on the contrary, the tints shade off gradually and softly into each other, presenting tone and depth

in endless variety. The page of print is unintelligible without the aid of a key; the painting tells its story plainly enough to any one who has eyes to see.

Let us inquire for a moment what is the nature of the apparatus which we have been using for the last thirty or forty years for the transmission of telegraphic signals. The instruments chiefly employed have been the single-needle telegraph and the Morse instrument. In the former a coil of wire surrounds a magnetized needle, which is suspended in a vertical position. When an electrical current passes through the coil, the needle is deflected, to right or left, according to the direction of the current. The sender by means of a handle can pass either positive or negative currents into the circuit. The right and left deflections of the needle are combined in various ways to form the letters of the alphabet, and the letters form words. Thus at the sending station a message is broken up into little bits, each bit or part of a bit transmitted separately, and the process of building these up again performed at the receiving station. Some of the letters of the alphabet are indicated by a single movement of the needle, that is, by a single current; for others, as many as four are required.

In the Morse instrument only one current is utilized, which may be either positive or negative, and the requisite variety is obtained by allowing the current to pass through the circuit for a longer or shorter interval. The essential part of the instrument consists of an electro-magnet with an iron armature attached to one end of a lever. At the other end of the lever is a pointer or pencil, and a paper ribbon moves at a constant rate in front of the end of the pointer. When the coils of the electro-magnet are traversed by a current, the iron armature is attracted, and the pointer comes in contact with the paper ribbon, on which it makes a mark, long or short, according to the duration of the current. Thus are produced the dots and dashes. These are combined in a similar way to the right and left movements of the needle in the needle instrument. In some of the more refined instruments letters are indicated and even printed directly at the receiving station. This is of course a great simplification; but with such arrangements we cannot have more than this. The page of print represents the limit of what such instruments and methods can do for us. It is true that a skilled operator with the Morse instrument can interpret the signals as they arrive without looking at the marks on the paper, simply by using his ears. Every time the circuit is made or broken a click is heard, and long practice has taught him to rely on the evidence of his ears with as much confidence as one less accustomed to the work would trust his eyes. Nevertheless he hears only a succession of clicks, which must be interpreted before they become intelligible to any one but himself.

In these forms of apparatus, it will be observed, the currents are intermittent; each current, circulating through the coil, is followed by an interval of rest. They begin and end abruptly, and all perform the same kind of work; that is, they deflect a needle, or produce marks on a piece of paper. Telephonic currents, on the other hand, rise and fall, ebb and flow, change in intensity within comparatively wide limits, but preserve their continuity so long as continuous sounds are being uttered in the neighborhood of the telephone. They are called undulatory currents, to distinguish them from the intermittent currents of the ordinary telegraphic apparatus; and their peculiar character is an essential feature of the telephone.

No skill or training is required for the effective use of the telephone. The operator has merely to press the instrument to his ear to hear distinctly every sound transmitted from the distant end. For this, it is true, an effort of attention is required, and some persons use the instrument at the first trial with more success than others. Individuals differ in the facility with which they are able to concentrate their attention on one ear, so as to be practically insensible to what goes on around them. But this habit of attention is readily acquired, and when it is once acquired the telephone may be used by any one who has ears to hear and a tongue to speak. In sending a message, the instrument is held about an inch in front of the mouth, and the sender merely talks into the mouthpiece in his ordinary natural manner. The words are repeated by the instrument at the other end of the circuit with the same pitch, the same cadences, and the same relative loudness. But what strikes one the most is that the *character* of the speaker's voice is faithfully preserved and reproduced. Thus one voice is readily distinguished from another. No peculiarity of inflection is lost. Nor is this result effected over short distances only. No doubt a sentence will be heard with diminishing distinctness as it comes over an increasing distance. In this country experiments

have not yet been made, so far as we know, over very long distances; but Mr. Bell states that he carried on a conversation without any difficulty between Boston and New York, two hundred and fifty-eight miles apart, through an ordinary telegraph wire. A man's breathing was distinctly heard one hundred and forty-nine miles away. At the Newport torpedo station, in Rhode Island, speaking was carried on through a line, including five miles of submerged cable and an equal length of land wire. Resistance coils were added two thousand ohms at a time, until twelve thousand ohms were introduced into the circuit, without interfering with the transmission of speech. The importance of this test will be understood when it is remembered that the resistance of the Atlantic cable is equal to seven thousand ohms only. The experiments at Newport were continued by the addition of a total resistance of thirty thousand ohms, but beyond twelve thousand ohms the sound was found to diminish in intensity. Mr. Bell states that the *maximum* amount of resistance through which the undulating current will pass, and yet retain sufficient force to produce an audible sound at the distant end, has yet to be determined. In the laboratory he has conversed through a resistance of sixty thousand ohms. There is a practical difficulty in transmitting telephonic signals through a telegraph wire running parallel to a number of other wires which are being used for ordinary telegraphic purposes. Induction currents are produced in the telephone wire, which greatly interfere with the distinctness of the sounds. The difficulty is said to be overcome by having an extra return wire, instead of utilizing the earth for a part of the circuit, as is ordinarily done. The two wires are put side by side in close proximity, and the detrimental effect of the inductive currents is thus partially or entirely disposed of. The following extract from a letter which appeared in the *Daily News* a few weeks ago shows that inductive action, when the parallel circuits are not numerous, does not seriously interfere with the transmission of speech:—

The experiments with the telephone were made by me upon the cable lying between Dover and Calais, which is twenty-one and three-quarters miles long. Several gentlemen and ladies were present, and conversed in French and English with a second party in France for upwards of two hours. There was not the slightest failure during the whole time. I was only using one wire. The other three (it is a four-wire cable) were working direct with London and Paris, Calais and Lille. I could distinctly hear the signals by the three wires on the telephone; and at times, when but one of the three wires was working, I could decipher the Morse signals, and read a message that was passing from Glasgow to Paris. Yet when all the three wires were working simultaneously, the telephone sounds were easily and clearly distinguishable above the click of the signals! I happened to know several of the party in France, and was able to recognize their voices. They also recognized mine, and told us immediately a lady spoke that it was a female voice. When making some trials upon a line three-fourths of a mile long, I arranged a musical box (the tones of which are very feeble) under the receiver of an air-pump, the top of the receiver being open. Upon this opening I placed the telephone, and every note came out at the second end so clearly as to enable those who were present to name the tune that was played. Unfortunately we had not the same means in France, but simply held the mouth of the telephone close to the box, and some of the notes were audible, but not so perfect as on the short line. One young lady burst out laughing the moment she placed the instrument to her ear, and exclaimed, "Some one is whistling, 'Tommy make way for your uncle'!" As my correspondent and myself had had a little practice, we were, without the slightest difficulty, able to talk in our usual manner, without any strain upon the voice or any unnatural lengthening of syllables. We were not able to hear breathing, in consequence of the continued pecking caused by induction from other wires.

The construction of the telephone is remarkably simple. It consists of a steel cylindrical magnet, about five inches long and three-eighths of an inch in diameter, encircled at one extremity by a short bobbin of wood or ebonite, on which is wound a quantity of very fine insulated copper wire. The magnet and coil are contained in a wooden cylindrical case. The two ends of the coil are soldered to thicker pieces of copper wire, which traverse the wooden envelope from one end to the other, and terminate in the binding screws at its extremity. Immediately in front of the magnet is a thin circular iron plate, which is kept in its place by being jammed between the main portion of the wooden case, and a wooden cap carrying the mouth or ear trumpet. These two parts are screwed together. The latter is cut away at the centre so as to expose a portion of the iron plate, about half an inch in diameter. In the experiments which Mr. Bell has carried out in order to determine the influence of the various parts of the telephone on the results produced, and their relations to each other when the best effects are obtained, he employed iron plates of various areas and thick-

nesses, from boiler plate three-eighths of an inch in thickness to the thinnest plate procurable. Wonderful to relate, it appears that scarcely any plate is too thin or too thick for the purpose, but the best thickness is that of the ferrotype plate used by photographers. Thin tin-plate also answers very well. The iron plate is cut into the form of a disc, about two inches in diameter, and is placed as near as possible to the extremity of the steel magnet without actually touching it; the effect of this position being that, while the induced magnetism of the plate is considerable, it is susceptible to very rapid changes owing to the freedom with which the plate can vibrate. The dimensions of the various parts of the instrument given above are found to be convenient, but they are by no means essential. Good results have been obtained by means of a magnet only an inch an a half long, and a working instrument need not be too large for the waistcoat pocket. There is no difference between the transmitting and the receiving telephone; each instrument serves both purposes. Nevertheless in order to avoid the inconvenience of shifting the instrument backwards and forwards between the ear and the mouth, it is better to have two on the circuit at each station. The operator then holds one permanently to his ear, while he talks with the other.

It will not be supposed that the idea of this marvellously simple piece of apparatus was evolved ready formed from the inventor's brain; very far otherwise. It is the final outcome of a long series of patient researches carried out by Mr. Bell in the most skilful and philosophical manner, in which one modification suggested another, accessory after accessory was discarded, and finally the instrument was pruned down to its present form and dimensions. Telephones have been long known. A few years ago a simple arrangement whereby articulate sounds could be transmitted over a distance of fifty or sixty yards, or even further, could be bought in the streets for a penny. It consisted of a pair of pill-boxes, the bottoms of which were connected by a piece of string stretched tight, while over the mouth of each was pasted tissue paper. On speaking to one of the pill-boxes the tissue paper and enclosed air were set in vibration. The vibrations so produced were communicated to the thread and transmitted to the distant pill-box, which was held close to the ear, where they affected the air in such a way as to reproduce the original sounds. The simple apparatus was more effective than would be *a priori* imagined. Electric telephones were devised in this country about the same time that the telegraph was introduced, but the best of them differed widely from the modern instrument. They were capable of conveying to a distance sounds of various pitch, so that the succession of notes constituting a melody could be reproduced many miles away, but the special character of the voice by which the melody was originated was entirely lost. Now the great interest which attaches to Mr. Bell's telephone, and the intense wonder and curiosity it has aroused, are due to its power of conveying absolutely unaltered every peculiarity of voice or musical instrument. A violin note reappears as a violin note; it cannot be mistaken for anything else. And in the case of a human voice, it is not less easy to distinguish one speaker from another than it would be if the speakers were in the room close by instead of being miles or even hundreds of miles away. This is the charm of the new telephone; this it is which renders it immeasurably superior to anything of the kind which preceded it.

Mr. Bell's researches in electric telephony began with the artificial production of musical sounds, suggested by the work in which he was then engaged in Boston, viz., teaching the deaf and dumb to speak. Deaf mutes are dumb merely because they are deaf. There is no local defect to prevent utterance, and Mr. Bell has practically demonstrated by two thousand of his own pupils that when the deaf and dumb know how to control the action of their vocal organs, they can articulate with comparative facility. Striving to perfect his system of teaching, it occurred to Mr. Bell that if, instead of presenting to the eye of the deaf mute a system of symbols, he could make visible the vibrations of the air, the apparatus might be used as a means of teaching articulation. In this part of his investigations Mr. Bell derived great assistance from the phonautograph. He succeeded in vibrating by the voice a style of wood, about a foot in length, attached to the membrane of the phonautograph; and with this he obtained enlarged tracings of the vibrations of the air, produced by the vowel sounds, upon a plane surface of smoked glass. Mr. Bell traced a similarity between the manner in which this piece of wood was vibrated by the membrane of the phonautograph and the manner in which the ossiculæ of the human ear were moved by the tympanic membrane. Wishing to construct an apparatus closely resembling the human ear, it was suggested to him by Dr. Clarence

J. Blake, a distinguished aurist of Boston, that the human ear itself would be still better, and a specimen was prepared. Our readers are aware that the tympanic membrane of the ear is connected with the internal ear by a series of little bones called respectively the malleus, the incus, and the stapes, from their peculiar shapes, and that by their means the vibrations of the tympanic membrane are communicated to the internal ear and the auditory nerves. Mr. Bell removed the stapes, and attached to the end of the incus a style of hay about an inch in length. Upon singing into the external artificial ear, the style of hay was thrown into vibration, and tracings were obtained upon a plane surface of smoked glass passed rapidly underneath. The curves so obtained are of great interest, each showing peculiarities of its own dependent upon the vowel sound that is sung. Whilst engaged in these experiments, Mr. Bell's attention was arrested by observing the wonderful disproportion which exists between the size and weight of the membrane — no thicker than tissue paper — and the weight of the bones vibrated by it, and he was led to inquire whether a thicker membrane might not be able to vibrate a piece of iron in front of an electro-magnet. The experiment was at once tried. A piece of steel spring was attached to a stretched membrane of goldbeater'sskin and placed in front of the pole of the magnet. This answered very well, but it was found that the action of the instrument was improved by increasing the area of metal, and thus the membrane was done away with and an iron plate substituted for it. It was important, at the same time, to determine the effect produced by altering the strength of the magnet; that is, of the current which passed round the coils. The battery was gradually reduced from fifty cells to none at all, and still the effects were observed, but in a less marked degree. The action was in this latter case doubtless due to residual magnetism; hence, in the present form of apparatus a permanent magnet is employed. Lastly, the effect of varying the dimensions of the coil was studied, when it was found that the sounds became louder as its length was diminished; a certain length was, however, ultimately reached, beyond which no improvement was effected, and it was found to be only necessary to enclose one end of the magnet in the coil of wire.

Such was the instrument that Mr. Bell sent to the Centennial Exhibition at Philadelphia. The following is the official report of it, signed by Sir William Thomson and others: —

Mr. Alexander Graham Bell exhibits an apparatus by which he has achieved a result of transcendent scientific interest, — a transmission of spoken words by electric currents through a telegraph wire. To obtain this result Mr. Bell perceived that he must produce a variation of strength of current as nearly as may be in exact proportion to the velocity of a particle of air moved by the sound, and he invented a method of doing so, — a piece of iron attached to a membrane, and thus moved to and fro in the neighborhood of an electro-magnet, — which has proved perfectly successful. The battery and wire of this electro-magnet are in circuit with the telegraph wire and the wire of another electro-magnet at the receiving station. This second electro-magnet has a solid bar of iron for core, which is connected at one end by a thick disc of iron to an iron tube surrounding the coil and bar. The free circular end of the tube constitutes one pole of the electro-magnet, and the adjacent free end of the bar core the other. A thin circular iron disc, held pressed against the end of the tube by the electro-magnetic attraction and free to vibrate through a very small space without touching the central pole, constitutes the sounder by which the electric effect is reconverted into sound. With my ear pressed against this disc, I heard it speak distinctly several sentences. . . . I need scarcely say I was astonished and delighted. So were others, including some judges of our group, who witnessed the experiments and verified with their own ears the electric transmission of speech. This, perhaps the greatest marvel hitherto achieved by the electric telegraph, has been obtained by appliances of quite a homespun and rudimentary character. With somewhat more advanced plans and more powerful apparatus, we may confidently expect that Mr. Bell will give us the means of making voice and spoken words audible through the electric wire to an ear hundreds of miles distant.

The present form of instrument, which is now being manufactured in large numbers by the Silvertown Company, does not essentially differ from that reported on so enthusiastically by Sir William Thomson. Only it is more simple in construction and more handy.

Before attempting any explanation of the action of the telephone it may be well to draw the attention of our readers to the special characteristics of the human voice, and to those peculiarities which distinguish one musical note from another. Whatever the differences in question may depend upon, it is certain that they are transmitted and reproduced in the telephone with unerring fidelity, and it is therefore important that we should under-

stand their nature and origin. Take a tuning-fork and set it in vibration by striking or drawing a violoncello bow across its prongs. The fork yields its own proper note, which will be loud or the reverse according as the fork has been struck energetically or lightly. So long as we use one fork only, it is obvious that the only variation which can be produced in the sound is a variation of intensity. If the extent of vibration be small, the resulting sound is feeble; its loudness increases with the excursion of the prongs. What is true of the tuning-fork is true of any other musical instrument, and hence, generally, the loudness of a musical sound depends upon the amplitude of vibration of that which produced it. Now take two similar tuning-forks of different pitch, and suppose that one is exactly an octave above the other. They may be excited in such a way that the notes emitted are of equal loudness, and then the only respect in which they differ from each other is in pitch. The pitch of a fork depends upon its rate of vibration. It is comparatively easy with suitable apparatus to measure the rate of vibration of a tuning-fork, and were we to test the two forks in question, it would be found that that giving the higher note vibrates exactly twice as fast as the other. If the one performs a hundred oscillations in a second, the other, which is an octave above, completes two hundred in the same interval of time. Thus, the pitch of a note yielded by a tuning-fork depends upon its rate of vibration, and on nothing else, and the same is true of a pianoforte wire, the air in an organ pipe, a harmonium reed, etc. We have now accounted for two of the characteristics of a musical note, its loudness and its pitch; but there is a third, equally, if not more, important, and by no means so simple of explanation. We refer to what is usually spoken of in English books on acoustics as the *quality* of the note; the French call it *timbre*, and the Germans *Klangfarbe*. It is that which constitutes the difference between a violin and an organ, or between an organ and a pianoforte, or between two human voices; indeed between any two musical sounds which are of the same pitch and loudness, but are still distinguishable from each other. In order to explain the physical cause of *quality*, we will suppose we have a thin metallic wire about a yard long stretched between two points over a sounding board. When plucked at its centre the wire vibrates as a whole; the two ends are points of rest, and a loop is formed between them. The note emitted by the wire when vibrating in this manner is called its fundamental note. If the wire be damped at the centre, by laying on it with slight pressure the feather of a quill pen, and plucked at a point half way between the centre and one end, both halves will vibrate in the same manner, and independently of each other. That is to say, there will be two equal vibrating segments and a point of rest or node at the centre. But the rapidity of vibration of each segment will be twice as great as that of the wire when vibrating as a whole, and consequently the note emitted will be the octave of the fundamental. When damped at a point one-third of the length from either extremity, and plucked half way between that point and the nearer extremity, the wire will vibrate in three equal divisions, just as it vibrates in two divisions in the previous case. The rate of vibration will be now three times as great as at first, and the note produced will be a twelfth above the fundamental. Similarly, by damping and plucking at suitable points, the wire may be made to vibrate in four parts, five parts, six parts, etc., the rate of vibration increasing to four, five, six, etc., times what it was at first. Let us suppose that when the wire was swinging as a whole and sounding its fundamental note, the number of oscillations performed in a second was one hundred. Then we see that, by taking suitable precautions, the wire can be made to break up into two, three, four, five, six, etc., vibrating segments, the rates of vibration being respectively two hundred, three hundred, four hundred, five hundred, six hundred, etc., and the series of notes emitted being the octave above the fundamental, the fifth above the octave, the double octave, the third and fifth above the double octave, and so on. We now come to an important point, which is this — that, the wire being free, it is practically impossible to strike or pluck it in such a way as to make it vibrate according to one of the above systems *only*. It will vibrate as whole, wherever and however it be struck, but this mode has always associated with it or superposed upon it some of the other modes of vibration to which we have just referred. In other words, the fundamental note is never heard alone, but always in combination with a certain number of its overtones, as they are called. Each form of vibration called into existence sings as it were its own song, without heeding what is being done by its fellows, and the consequence is that the sound which reaches the ears is not simple but highly composite in its character. The word *clang* has been suggested to denote

such a composite sound, the constituent simple sounds, of which it is the aggregate, being called its first, second, third, etc., partial tones. All the possible partial tones are not necessarily present in a clang, nor of those which are present are the intensities all the same. For instance, if the wire be struck at the centre, that point cannot be a node, but must be a point of maximum disturbance; hence all the even partial tones are excluded, and only the odd ones, the first, third, fifth, and so on, are heard.

That characteristic of a musical note or clang which is called its quality, depends upon the number and relative intensities of the partial tones which go to form it. The tone of a tuning-fork is approximately simple; so is that of a stopped wooden organ pipe of large aperture blown by only a slight pressure of wind. Such tones sound sweet and mild, but also tame and spiritless. In the clang of the violin, on the other hand, a large number of partial tones are represented; hence the vivacious and brilliant character of this instrument. The sounds of the human voice are produced by the vibrations of the vocal chords, aided by the resonance of the mouth. The size and shape of the cavity of the mouth may be altered by opening and closing the jaws, and by tightening or loosening the lips. We should expect that these movements would not be without effect on the resonance of the contained air, and such proves on experiment to be the fact. Hence, when the vocal chords have originated a clang containing numerous well-developed partial tones, the mouth-cavity, by successively throwing itself into different postures, can favor by its resonance first one overtone and then another; at one moment *this* group of partial tones, at another *that*. In this manner endless varieties of quality are rendered possible. Any one may prove to himself, by making the experiment, that when singing on a given note he can only change from one vowel sound to another by altering the shape and size of his mouth-cavity.

Having thus briefly indicated the physical causes of the various differences in musical notes, and the production of sounds by the organ of voice, we will devote a few moments to consider how these sounds are propagated through the air and reach the plate of the telephone. When a disturbance is produced at any point in an aerial medium, the particles of which are initially at rest, sonorous undulations spread out from that point in all directions. These undulations are the effect of the rapid vibratory motions of the air particles. The analogy of water waves will help us to understand what is taking place under these circumstances. If a stone be dropped into the still water of a pond, a series of concentric circular waves is produced, each wave consisting of a crest and a hollow. The waves travel onwards and outwards from the centre of disturbance along the surface of the water, while the drops of water which constitute them have an oscillatory motion in a vertical direction. That is to say, following any radial line, the water particles vibrate in a direction at right angles to that in which the wave is propagated. The distance between two successive crests or two successive hollows is called the length of the wave; the amplitude of vibration is the vertical distance through which an individual drop moves. In a similar manner sonorous undulations are propagated through air by the oscillatory motion of the air particles. But there is this important difference between the two cases, that, in the latter, the vibrating particles move in the *same* direction in which the sound is being propagated. Consequently such waves are not distinguished by alternate crests and hollows, but by alternate condensations and rarefactions of the air, the transmission of which constitutes the transmission of sound. The wave-length is the distance between two consecutive condensations or rarefactions. It depends upon the pitch of the transmitted sound, being shorter as the sound is more acute, while the extent of vibration of the air particles increases with the loudness. Such are the peculiarities of the vibratory motion in air corresponding to the pitch and loudness of the transmitted sound. But what is there in the character cf the motion to account for difference in quality? A little consideration will show that there is only one thing left to account for these, and that is the *form* of the vibration. Let us mentally isolate a particle of air, and follow its movements as the sound passes. If the disturbance is a simple one, produced, say, by the vibration of a tuning-fork, the motion of the air particle will be simple also, that is, it will vibrate to and fro like the bob of a pendulum, coming to rest at each end of its excursion, and from these points increasing in velocity until it passes its neutral point. Such, however, is clearly not the only mode of vibration possible. If the disturbance be produced by a clang comprising a number of partial tones of various intensities, all excited simultaneously, it is obvious that the air particle must vibrate in obedience to every one of these. Its motion will be the re-

sultant of all the motions due to the separate partial tones. We may imagine it, starting from its position of rest, to move forward, then stop short, and turn back for an instant, then on again until it reaches the end of its excursion. In returning it may perform the same series of to-and-fro motions in the opposite direction, or it may move in a totally different way. Nevertheless, however complex its motion may be — and, as a rule, it will be exceedingly complex — its periodic character will be maintained. All the tremors and perturbations in one wave-length will recur in all the others.

When sonorous undulations impinge upon the iron plate of the telephone, the latter is set in vibration. Its particles move to and fro in some way or other. The complexity of their motion will depend upon that of the air from which it was derived. But for the sake of simplicity we will assume that the plate has a simple pendulous motion. It will be remembered that the iron plate is placed quite close to, but not quite in contact with, the extremity of the steel magnet. It becomes, therefore, itself a magnet by induction; and, as it vibrates, its magnetic power is constantly changing, being strengthened when it approaches the magnetic core, enfeebled as it recedes. Again, when a magnet moves in the neighborhood of a coil of wire, the ends of which are connected together, an electrical current is developed in the coil, whose strength depends upon the rapidity with which, and the distance through which, the magnet moves. In the telephone then, as the plate moves towards the coil, a current is induced in the latter which traverses the whole length of wire connecting it with the distant instrument; the plate returning, another current with reversed sign follows the first. The intensity of these currents depends, as we have said, on the rapidity with which these movements are effected, but is largely influenced also by the fact that the plate does not retain a constant magnetic strength throughout its excursions. Under the assumption we have made with respect to the simplicity of the plate's motion, it follows that the induced currents, alternately positive and negative, follow each other in a uniform manner, and with a rapidity corresponding to the pitch of the exciting note. These currents pass along the circuit, and circulate round the coil of the distant telephone. There they modify the magnetic relations between the steel magnetic core and the iron plate in such a way that one current — say the positive — attracts the plate, while the other — the negative — repels it. And since the arriving currents follow each other, first positive and then negative, with perfect regularity, the plate will also vibrate in a uniform manner, and will perform the same number of vibrations per second as did the plate of the sending instrument. Hence the sound heard will be an exact copy, except as to loudness, of that produced at the sending station. Having thus followed the sequence of phenomena in this simple case, we are enabled to extend our explanation to the case in which composite sounds of more or less complexity — vowel sounds and speech — are transmitted. We are compelled to admit that every detail in the motion of an air particle, every turn and twist, must be passed on unaltered to the iron membrane, and that every modification of the motion of the membrane must have its counterpart in a modification of the induced currents. These, in their turn, affecting the iron plate of the receiving telephone, it follows that the plates of the two telephones must be vibrating in an absolutely identical manner.

We can thus follow in a general manner the course of the phenomena, and explain how air vibrations are connected with the vibrations of a magnetic plate — how these latter give rise to electrical currents, which, passing over a circuit of hundreds of miles, cause another magnetic plate to vibrate, every tremor in the first being reproduced in facsimile in the second, and thus excite sonorous undulations which pass on to the ear. We can understand all this in a general way, but we are not the less lost in wonder that the sequence of events should be what it is. That a succession of currents could be transmitted along a telegraph wire without the aid of a battery, that, by simply talking to a magnetic membrane in front of a coil of wire, the relations of the magnetic field between the two could be so far modified as to produce in the coil a succession of electrical currents of sufficient power to traverse a long circuit, and to reproduce a series of phenomena identical with those by which the currents were brought into existence, would have been a few years ago pronounced an impossibility. A man would have been derided who proposed an instrument constructed on such principles. Nevertheless, here it is realized in our hands. We can no longer doubt, we can only wonder, and admire the sagacity and patience with which Mr. Bell has worked out his problem to a successful issue.

POETRY.

MISERERE, ... 770
BEFORE THE SNOW, ... 770
"WIE KANNST DU RUHIG SCHLAFEN," 770

PUBLISHED EVERY SATURDAY BY

LITTELL & GAY, BOSTON.

TERMS OF SUBSCRIPTION.

For EIGHT DOLLARS, *remitted directly to the Publishers*, the LIVING AGE will be punctually forwarded for a year, *free of postage*.

An extra copy of THE LIVING AGE is sent gratis to any one getting up a club of Five New Subscribers.

Remittances should be made by bank draft or check, or by post-office money-order, if possible. If neither of these can be procured, the money should be sent in a registered letter. All postmasters are obliged to register letters when requested to do so. Drafts, checks and money-orders should be made payable to the order of LITTELL & GAY.

Single Numbers of THE LIVING AGE, 18 cents.

MISERERE.

AH, well I know 'tis wrong of me, who fain
Would hold my darling from the Lord that gave
Of his great love the boon my heart did crave,
And now would take unto himself again.

Ye do say well — 'tis wrong, I know, I know!
But all the agony of heart, the plann'd
Sweet joys laid waste, ye cannot understand,
Who ne'er gave up what you bid *me* forego.

Oh, do not ask a mother that hath known
The blissful bitter birth of him, if she
Were not more glad he should an angel be,
Than live on but a child to call her own!

No more with those soft locks of golden hair
To dally, and my fondling fingers weave;
No more to hearken every morn and eve
The pretty lisping of his infant prayer!

No more to soothe his little aches and cries,
Watch him at gambol or in rosy rest;
No more to catch him wildly to my breast,
And see all Heaven in his deep blue eyes!

Ah, never, never more to feel the fond
Soft tendril arms around my neck entwine,
And strain him in my own, all mine! all mine!
Fill'd with sweet joy, all other joys beyond.

Ye know not — God forgive me, if I dare
To plead with him! Father, oh, could he be
In Heaven with the angels and with thee,
Liker themselves than now, more pure, more fair?

Take him not from me, lest bereavement's bane
Might slay my soul with cruel, hopeless grief,
And poison of rebellious disbelief,
So I should never see his face again!

For strongest faith is tried by fondest love,
That to its idol clings with heedless hold;
Dumb, blind, and blunted to the manifold
Warnings below, or whispers from above.

Lord, pardon me! That thou shouldst yearn to take
The blessed guerdon back, it is most meet;
Thyself it was who madest him so sweet,
Thou well may'st crave him for the sweetness' sake.

Yea, Lord, thy will be done! Still, if it be
Thine own good pleasure, who didst freely give
What I so grudge to render, let him live,
That I may know thou art not vex'd with me.

Yea, if but for a season. Haply I,
Sore striving, and in very overflow
Of my unbounded gratitude, may grow
Better, O God, and stronger, by-and-by.

Unless — and who may know? save thee, most dread,
Most merciful! for all 'twere only right,
According to our poor weak human sight —
Thou shouldst be pleased to take me in his stead.

Nay, do not heed me, Lord — thy will be done!
Take to thyself, or suffer yet to live;
And — for thou knowest all my heart — forgive
The mother in the love of thy dear Son.

Month.

BEFORE THE SNOW.

AFTER ALBERT GLATIGNY.

WINTER is on us, but not yet the snow;
The hills are etched on the horizon, bare,
The skies are iron grey, a bitter air,
With meagre clouds that shudder as they go;
One yellow leaf the listless wind doth blow
Like some new butterfly, unclassed and rare;
Your footsteps ring in frozen alleys, where
The black trees seem to shiver as you go.

Beyond lie church and steeple, and their old
And rusty vanes that rattle as they veer —
A sharper gust would shock them from their hold.
Yet up that path, in Maytime of the year,
And past that dreary ruined tower we strolled
To pluck wild strawberries with summer cheer!

Macmillan's Magazine. A. LANG.

"WIE KANNST DU RUHIG SCHLAFEN?"

SLEEP, and in peace? How canst thou?
And know I am still alive?
Back comes the old wrath, and straightway
My yoke in sunder I rive.

Dost know the old-world legend,
How once a youth that was dead
At midnight drew his loved one
Down to his churchyard bed?

Oh trust me, thou beauteous wonder,
Of all sweet the sweetest far,
I live, yes, live, and am stronger
Than legions of dead men are!

From The Nineteenth Century.

BENEDICT DE SPINOZA.*

It is now two hundred years since there died, in an obscure lodging at the Hague, Benedict de Spinoza, a philosopher appreciated in his own time only by a very few. His name was indeed widely known, but it was for the most part known only to be execrated. For some time after his death *Spinozist* was current among the theologians of Holland as a term of opprobrium. Spinoza's thought, however, was of that vital kind which sooner or later cannot fail to make for itself a way into its due place. Some three-quarters of a century after his death came the great awakening of letters and philosophy in Germany, and the leaders of that movement, among whom the name of Lessing must be mentioned first, were not slow to perceive Spinoza's importance. Ever since that time his influence has been a widening and increasing one: not that I stop to maintain this in the strictest sense which can be put upon the words, for I do not think a philosopher's influence is properly measured by the number of persons who agree with his doctrines. Philosophical doctrines have been, and will doubtless continue to be, matter of controversy, but it is no matter of controversy that the life of a righteous man who gives up all else that he may seek the truth for its own sake is a sure and priceless possession for all the generations of men who come after him.

Baruch de Spinoza was born at Amsterdam on the 24th of November, 1632. His parents were members of the Portuguese synagogue, a community established towards the end of the sixteenth century by Jewish exiles from Spain and Portugal, who had turned to the United Provinces as a safe asylum. For at this critical time Holland, it should be remembered to her eternal honor, was the most tolerant commonwealth in Europe. Spinoza was brought up in the course of Hebrew learning then usual, and at the age of fifteen was already distinguished for his knowledge of the Talmud. He was also familiar from his youth up, as his writings bear witness, with the masterpieces of the golden age of modern Jewish literature. From the tenth to the twelfth centuries there flourished at the Mohammedan courts of Spain and Africa a series of Arab and Hebrew philosophers who held a position with regard to the societies in which they lived much like that of the Catholic schoolmen afterwards with regard to western Christendom. Like the schoolmen, they set themselves to effect a fusion of the Aristotelian philosophy with the accepted theology of their churches; and the schoolmen were in fact acquainted with their work to a considerable extent, and referred to it quite openly, and in general with respect.*

The Jewish schoolmen, if we may so call them, cannot be said to have founded any distinct philosophical doctrine; in philosophy they were hardly distinguishable, if at all, from their Mohammedan compeers. But they gave a distinct philosophical cast to Jewish theology, and thereby to Jewish education. Two names stand out foremost among them. Ibn-Ezra (1088–1166 A.D.) was a traveller, astronomer, grammarian, and poet, in addition to the learning in theology and philosophy which made his commentaries on the Scriptures classical. But the chief of all is Moses ben Maimon (1135–1205 A.D.) who became known in Europe as Maimonides, the father of modern Jewish theology. He was regarded with such veneration as to be compared to the great Lawgiver himself, so that it passed into a proverb, "From Moses until Moses there arose none like unto Moses." ‡ The Jewish peripatetic school

* In the course of this paper I shall have to refer several times to Dr. A. van der Linde's *Benedictus Spinoza: Bibliografie* (The Hague, 1871), which gives a full account of the literature of the subject.

* The names of Ibn-Roshd (Averroes) and Ibn-Sînâ (Avicenna) were familiar in Europe, and Dante groups them (*Inf.* iv. 143) with the leaders of classical science and philosophy. Ibn-Gebirol (Avicebron), a Jewish member of the school, broke with the Aristotelian tradition to take up Neo-Platonic ideas. His philosophical work was discredited and fell into oblivion among his own people; but it became current in Europe in a Latin form, and was used by Giordano Bruno, through whom it may have thus come round to Spinoza.

† In later times the proverb received an extended application in honor of Moses Mendelssohn, the grandfather of the musician, himself a philosopher and the restorer of Jewish culture in Germany. Maimonides' reputation was not established without conflict. About 1235 his opinions were formally condemned by the synagogue of Montpellier.

was also represented in Provence, where, in the fourteenth century, Levi ben Gerson, the most daring of all the Jewish philosophers, and Moses of Narbonne were its most conspicuous members. This philosophical treatment of theology was on the whole generally accepted, but did not pass without controversy: in particular R. Chasdai Creskas, of Barcelona (flor. 1410 A.D.), whom Spinoza cites by name,* combated the peripatetics with great zeal and ability from an independent point of view. A mind like Spinoza's could not well have found anything more apt to stir it to speculation and inquiry than the works of the men I have named. They handled their subjects with extreme ingenuity, and with a freedom and boldness of thought which were only verbally disguised by a sort of ostentatious reserve. Both Maimonides and Ibn-Ezra delighted to throw out hints of meanings which could not or must not be expressly revealed. Maimonides, in the introduction to his principal work, entreats the reader who may perceive such meanings not to divulge them. Ibn-Ezra says in his commentaries: "Herein is a mystery; and whoso understandeth it, let him hold his peace." † The mysteries were, however, not so carefully concealed but that an open-eyed reader like Spinoza might easily find in them the principles of rational criticism which he afterwards developed in the "*Tractatus Theologico-Politicus*."

At the same time Spinoza was far from neglecting secular learning and even accomplishments. His master in Latin, after he had acquired the rudiments elsewhere, was Francis van den Ende, a physician of Amsterdam who had a high reputation as a teacher, and was also well versed in the natural sciences. It is highly probable that he communicated this part of his knowledge also to Spinoza, who certainly had very sound instruction of that kind at some time; for it is remarkable (as Mr. G. H. Lewes has well pointed out) that Spinoza seldom or never makes mistakes in physics. The references and allusions in Spinoza's writings show that he had a fair knowledge of Latin literature; of Greek he knew something, but not much.* He wrote a Latin which, though not classical, was a very sufficient instrument for his purposes, and which he handled with perfect freedom. He seems to have been also familiar with Italian; and Spanish and Portuguese must have been almost as native to him as Dutch. About this time the philosophy of Descartes was in the first flush of its renown, and, like most new and brilliant things, was vehemently suspected of heresy. Spinoza made himself thoroughly familiar with it, his companions in this study being Henry Oldenburg and Dr. Lewis Meyer, the most constant of his friends in after life. It is at least doubtful, however, whether he was at any time a Cartesian. When he published a short exposition of the system in 1663 (the only work he ever set his name to), it was with an express warning that it did not represent his own opinions. At the same time it is beyond question that Descartes exercised a powerful influence upon the form and direction of Spinoza's speculations. Until of late years his part in this matter has been unduly exalted, and that of the Jewish philosophers underrated, or rather forgotten; but it would be very possible to carry the reaction to excess. In Spinoza's own time it is pretty certain that those who knew him only at second hand looked on him as a sort of erratic Cartesian. We know what Locke thought of the Cartesians as a body, and thus Locke's entire neglect of Spinoza may be explained. Those who followed Locke in England seem to have taken for granted, after his example (though in Berkeley we do find specific references to Spinoza), that Spinoza's philosophy was not worth serious attention.

To these graver studies Spinoza found time to add no small skill in drawing. He filled a book with sketches of distinguished persons of his acquaintance, as we are told by his biographer Colerus,† who had

* "Judæum quendam, Rab Ghasdai vocatum." — Ep. XXIX., *ad fin.*

† Ap. Spinoza, *Tract. Theol. Pol.*, c. 8, § 9. The mystery seems innocent enough to a modern reader.

* He expressly disclaims anything like critical competence in it (*Tract. Theol. Pol.*, cap. 10, *ad fin.*).

† The name is a Latinized form of Köhler. He was the minister of the German Lutheran congregation at the Hague.

the book in his possession. The same writer tells us that Spinoza's master, Van den Ende, had a learned, witty, and accomplished daughter, who took part in teaching his pupils, and Spinoza among them. From a learner, the tale says, he became a lover, but was supplanted by a fellow-pupil named Kerkering, who wooed and won the lady, not unassisted by the material persuasion of a valuable pearl necklace. The story passed current until it was rudely called in question by the facts which Dr. van Vloten discovered and published in 1862. True it is that Van den Ende had a daughter, but she was only eleven years old at the latest time when Spinoza can have been her father's pupil. True it is that she married Theodore Kerkering, but not till several years after, in 1671. He was, like her father, a physician, and earned a considerable scientific reputation by his work in medicine, chemistry, and anatomy. The match appears to have been a very natural and proper one, and the rivalry with Spinoza and the pearl necklace must be dismissed as inventions. It does not necessarily follow, however, that the tale of Spinoza's love for Clara van den Ende is wholly without foundation. Van den Ende probably continued to see something of his former pupil until, to his misfortune, he left Holland; * and we know that Spinoza was from time to time at Amsterdam. Besides this, nothing forbids us to suppose that even from an earlier date there may have sprung up a half romantic, half childish affection between Spinoza and Klaartje. Beatrice was only nine years old, and Dante himself only ten, when the "glorious lady of his soul" first showed herself to his eyes, and the word came to him, "*Ecce deus fortior me, qui veniens dominabitur mihi.*" So that if any one is minded to cling to this one piece of romance in Spinoza's life, I think he may do so by taking the story with some such qualification as here suggested.† I must confess, however, that my own inclination is, on reflection, towards entire unbelief. The story as told by Colerus is not credible, and any credible story we may devise in its stead must be so different from that given by Colerus as to rest in truth on no evidence at all. Besides, the testimony of Colerus is here at its weakest; he does not report this matter, as he does many others, as being within the actual knowledge of himself or his informants, but refers for confirmation to authorities which are all but worthless.*

So much we know of Spinoza for the first twenty-three years of his life. We may well believe that he had not long attained man's estate before the freedom of his thought and discourse, and perhaps also laxity in ceremonial observances, began to excite attention among the elders of his people; but, whatever suspicions may have been conceived, and whatever informal warnings may have been given, no action was taken till 1656. A community which owed its existence to flight from repeated persecutions might be expected by a hasty observer of human nature to practise toleration itself; but experience is far from warranting such an inference. Witness the example of the settlers of New England, whose first use of their freedom from the yoke of episcopacy was to set up a new ecclesiastical tyranny after their own patterns of a kind not less oppressive and infinitely more vexatious. There is too much reason to fear that the Jewish exiles from Spain and

* Van den Ende migrated to France, where he involved himself in a political conspiracy, hoping that it might turn to the profit of his own country, and was hanged at Paris in 1674.

† Most recent writers, including Auerbach, to whom it must have given a pang to cast away the foundation of his charming novel, treat the whole story as a fable. Dr. van Vloten himself (*Benedictus de Spinoza*, 2nd ed., 1871, p. 21), and Dr. H. J. Betz, of the Hague (*Levensschets van Baruch de Spinoza*, 1876), take a line not unlike what I have given in the text. Dr. Rothschild (*Spinoza: zur Rechtfertigung seiner Philosophie u. Zeit*, Leipzig, 1877) boldly maintains Colerus's account as historical, and dismisses the objection as to dates with the remark: "*Es giebt frühreife Naturen.*"

* Kortholt (*De tribus Impostoribus Magnis*, No. 82 in Van der Linde, cf. No. 287), and the article on Spinoza in Bayle's Dictionary. Kortholt's "three impostors" are Hobbes, Lord Herbert of Cherbury, and Spinoza. The book has nothing to do (beyond the studied similarity of title) with the famous, perhaps mythical, *De tribus Impostoribus*, which is a standing riddle of bibliography. Of this, however, a spurious French version circulated in MS. in the eighteenth century, under the name of *L'Esprit*— or, bound up with Lucas's biography, *La Vie et l'Esprit — de M. Benoît de Spinoza*. See Van der Linde, Nos. 99–102.

Portugal had learned some of the evil lessons of the Inquisition.* Apart from this, the synagogue of Amsterdam had good reasons of secular policy for being scrupulous even to excess in its appearance to the outer world. Holland was indeed the land of toleration; but toleration was not such as we are nowadays accustomed to, and at this very time theological controversy ran high. The battle of Remonstrants and Contra-remonstrants was yet fresh in men's minds; and it behoved a society of men foreign in religion, language, and manners, which had been at first received with suspicion, and which existed only on sufferance, to let nothing pass among them which could lay them open to a charge of promoting new heresies or being indifferent to the general interests of religion. Hence we can understand the extreme anxiety to avoid an open schism which marked the first proceedings in Spinoza's case. The elders would have preferred to retain Spinoza in apparent conformity, and offered him as the price of this a pension of one thousand florins. This being declined, it was probably considered that the only safe course remaining, though not a desirable one in itself, was for the congregation to renounce its freethinking member as completely as possible. Meanwhile some obscure fanatic, thinking himself no doubt a messenger of divine justice, outran the zeal of his masters. One evening an unknown assailant set upon Spinoza with a dagger; † but he was on his guard in time, and the blow pierced only his coat, which he kept afterwards as a memorial. This was a sufficient warning that Amsterdam was no safe place for him, and he left the city without waiting for the final decision of the congregation upon the charge of heresy against him. This was given on the 27th of July, 1656, to the following effect: —

The chiefs of the council do you to wit, that having long known the evil opinions and works of Baruch de Espinoza, they have endeavored by divers ways and promises to withdraw him from his evil ways, and they are unable to find a remedy, but on the contrary have had every day more knowledge of the abominable heresies practised and taught by him, and of other enormities ‡ committed by him, and have of this many trustworthy witnesses, who have deposed and borne witness in the presence of the said Espinoza, and by whom he stood convicted; all which having been examined in the presence of the elders, it has been determined with their assent that the said Espinoza should be excommunicated and cut off from the nation of Israel; and now he is hereby excommunicated with the following anathema: —

With the judgment of the angels and of the saints we excommunicate, cut off, curse, and anathematize Baruch de Espinoza, with the consent of the elders and of all this holy congregation, in the presence of the holy books: by the six hundred and thirteen precepts which are written therein, with the anathema wherewith Joshua cursed Jericho, with the curse which Elisha laid upon the children, and with all the curses which are written in the law. Cursed be he by day and cursed be he by night. Cursed be he in sleeping and cursed be he in waking, cursed in going out and cursed in coming in. The Lord shall not pardon him, the wrath and fury of the Lord shall henceforth be kindled against this man, and shall lay upon him all the curses which are written in the book of the law. The Lord shall destroy his name under the sun, and cut him off for his undoing from all the tribes of Israel, with all the curses of the firmament which are written in the book of the law. But ye that cleave unto the Lord your God, live all of you this day.

And we warn you, that none may speak with him by word of mouth nor by writing, nor show any favor to him, nor be under one roof with him, nor come within four cubits of him, nor read any paper composed or written by him.

Thus was Baruch de Spinoza cut off from his own people and from his father's house. Not only was he an outcast from Israel and deprived of all fellowship of his nation and kindred — and the ties of kindred are with his people of exceeding strength and sanctity — but he became as it were a masterless man, a member of no recognized community, having none to stand by him or answer for him. Such a position might well seem a grave one in itself, apart from the shock to his personal feelings.* Altogether the blow must have been such as it is at this time hard for us to understand. Spinoza, however, received the news of the excommunication with per-

* Dr. Grätz (*Gesch. der Juden*, x. 14) says: "They had brought with them from Spain the fatal passion for maintaining the purity of the faith and exterminating heresy. The rabbis of Amsterdam introduced the new practice of sitting in judgment on religious opinions and beliefs, setting themselves up as a kind of Inquisition."

† The exact place and circumstances, which however are not material, are variously related.

‡ "*Ynormes obras que obrava.*" This I had supposed to be a piece of "common form" with no definite meaning; but I learn from a friend possessing special knowledge that it probably refers to distinct breaches of the ceremonial law; some such overt act, beyond mere speculative opinions, being required to justify the excommunication. (Cf. Grätz, *op. cit.*, 172, 175.)

* It is said that the Jewish elders represented to the civil authorities of Amsterdam that Spinoza was a dangerous person, that the Reformed clergy supported their request, and that Spinoza was actually banished from Amsterdam for a time. But Colerus knows nothing of this, nor is it in itself probable.

fect equanimity. "This compels me," he said, "to nothing which I should not otherwise have done." Henceforth he disused his Hebrew name Baruch, and adopted the Latin form Benedict, which has the same meaning, and by which he is generally known. He now had to depend on his own work for a livelihood. It was a rabbinical precept that every one should learn a handicraft; and in compliance with this Spinoza had learned the trade of making lenses for optical instruments, which was no doubt chosen as congenial to his philosophical and scientific studies. He became so skilful in this art that the lenses of his make were much sought after, and some which were left undisposed of at his death fetched a high price. By this means he earned an income sufficient for his limited wants, and also a reputation for a thorough knowledge of optics which appears to have spread more quickly than his fame as a philosopher. In this manner he was brought into correspondence with Huygens and Leibnitz. We find Leibnitz, for instance, writing to him in 1671 to ask his opinion on certain optical questions, and treating him as a person of recognized authority. Leibnitz's behavior to Spinoza some years later can only be called shabby. He professed great interest in Spinoza's philosophy, and endeavored to get a sight of the unpublished MS. of the "Ethics," which Spinoza's prudence did not allow him. On his return from a stay in Paris, Leibnitz visited Spinoza in person. In later years he joined the vulgar cry against him, and borrowed a fundamental idea from his philosophy — which he also marred in the borrowing — without the slightest acknowledgment. The letter now in question begins thus: —

Among your other titles to fame [he says] I understand that you have excellent skill in optics. To you therefore I have chosen to send this attempt of mine for what it may be worth, as on this subject it would be difficult to find a better critic.

The friends who were best acquainted with his work believed that if he had lived longer he would have made some important addition to the science.* As it was, Spinoza's "excellent skill in optics" was only indirectly useful for the advancement of knowledge by affording him the means of cultivating philosophy. On the death of his father, indeed, he became entitled to share with his two sisters an inheritance of some value. The sisters, imagining, as it is conjectured, that the excommunication had deprived him of civil rights, endeavored to exclude him from his share. Spinoza was of opinion, as we know from his writings, that in a country where just laws prevail it is every citizen's duty to resist injustice to himself for the sake of the common weal, lest peradventure evil men find profit in their evil doing. He now acted on this principle, and asserted his rights before the law with success. Having done this, however, he declined to profit by them, and when the division came to be effected he gave up everything to his sisters but one bed, which he kept as a visible symbol of the established justice of his claim.

We know little of Spinoza's movements with certainty till the end of 1660 or beginning of 1661, when we find him at Rhijnsburg, a village near the mouth of the Rhine not far from Leyden. Thence he paid frequent visits to the Hague, where he increased his acquaintance with men of learning and eminence. This society must have had growing attractions for him as time went on, for in 1664 he moved to Voorburg, which is almost a suburb of the Hague, and finally about 1670 to the Hague itself. The greater part of what we know of his doings in after years is derived from the selection of his letters which was made — with a far too sparing hand unfortunately — by the editors of his posthumous works. The series of letters begins in 1661: the most important of Spinoza's correspondents, and also the most interesting to Englishmen, is Henry Oldenburg. Oldenburg spent the best part of his time in this country, where he settled in 1653. He was acquainted with Milton, and was the intimate friend of Robert Boyle; he shared Boyle's scientific tastes, and was the first secretary to the Royal Society (1662), and editor of its "Transactions." His friendship with Spinoza was already of long standing at the time now in question; he had lately visited Spinoza at Rhijnsburg, and the letters are a sort of continuation of the philosophical conversation they had then held. The first of Spinoza's answers to him contains a characteristic point: "It is not my way," he says, "to expose the mistakes of others." A thoroughly constructive habit of mind, an almost insuperable aversion to enter on criticism for criticism's sake, runs through the whole of Spinoza's philosophical work.

* The only scientific work left by him was a small treatise on the rainbow. It was supposed to have been lost, but it was, in fact, published at the Hague in 1687 (Van der Linde, *Bibliografie*, No. 36), and has recently been discovered and republished in Van Vloten's "Supplement."

In 1662 Oldenburg strongly advises Spinoza not to hesitate about publishing some work relating partly to theology, partly to philosophy, which means presumably the "*Tractatus Theologico-Politicus.*"

I would by all means advise you not to begrudge to men of letters the ripe fruits of your ingenuity and learning in philosophy and theology, but let them go forth into the world, notwithstanding any possible grumbling from petty theologians. Your commonwealth is most free [Oldenburg was writing from England]; and therein the philosopher should work most freely. . . . Come then, my friend, cast out all fear of stirring up the feebler folk of our time against you; we have sacrificed enough to their ignorance and trifling scruples; let us spread our sails to the wind of true knowledge, and search out the secrets of nature more thoroughly than has yet been done. In Holland I should think it will be quite safe to print your treatise, and there is no reason to fear its giving the least offence, among men of learning at any rate. If such are your promoters and patrons — and such, I answer for it, you will find — why should you fear the detraction of the ignorant? *

In the following year Oldenburg was again pressing Spinoza to finish and publish a little book on " The Amendment of the Understanding," of which we now have only a fragment, published among the " *Opera Posthuma.*"

Surely, my excellent friend, I believe nothing can be published more pleasant or acceptable to men of true learning and discernment than a treatise such as yours. This is what a man of your wit and genius should regard, more than what pleases theologians, as their manner now is; they care less for truth than for their own advantage.

And he conjures Spinoza by the bond of their friendship, by every duty of increasing and spreading abroad the truth, not to withhold the publication, or, if he indeed has grave reasons for withholding it, at least to write and explain them.† Oldenburg was a sincere friend to Spinoza, and a person worthy of all respect; but one cannot help observing that it is extremely easy for a man to be thus valiant in counsel when he does not risk anything on his own part. When Oldenburg in later years became better acquainted with Spinoza's results, he was himself not a little taken aback. Now, in spite of answers which were not encouraging, Oldenburg returned again and again to the charge; he would never desist till his request was satisfied; meanwhile it would be the greatest possible favor if Spinoza would give him some summary of the contents of the treatise. All this while Spinoza and Boyle were holding a scientific correspondence on chemistry and pneumatics in the form of long messages contained in the letters between Spinoza and Oldenburg, though they seem to have exchanged nothing directly. There is no doubt that Boyle knew a good deal of Spinoza, and took much interest in his work. In 1665 Oldenburg writes: " Mr. Boyle and I often talk of you and of your learning and philosophy." Boyle is also mentioned as joining in Oldenburg's exhortations to Spinoza to persevere in philosophical research. We find allusions in Oldenburg's letters of this time to the miseries of the plague and of the war between England and Holland. A certain book about which Spinoza had asked has not yet reached England " because the plague has almost put an end to all communication, besides which this fearful war brings a very Iliad of mischiefs (*nonnisi malorum Iliada*) in its train, and is like to leave but little civility in the world." He adds that though the meetings of the Royal Society are suspended, Boyle and others go on working in private.

After 1665 there is an unexplained break of ten years in this correspondence, which is but imperfectly supplied by letters between Spinoza and other persons.

The most interesting of Spinoza's other correspondents is Simon de Vries. He was a man younger than Spinoza, his pupil in philosophy, and of much promise. He died in his master's lifetime, having shown his gratitude by material benefactions so far as he was allowed. Once he offered Spinoza a present of two thousand florins; this was declined. He was unmarried, and it was his intention to make a will leaving the bulk of his property to Spinoza. But Spinoza, knowing that Simon de Vries had a brother living, pressed on him the duty of thinking first of his own kindred; so that De Vries finally made the brother his heir, and charged his estate with an annuity of five hundred florins to Spinoza. After his death Spinoza would not entirely accept even this; when the annuity came to be paid in due course, he refused to take more than three hundred florins, which he said was quite enough for him. The letters between Spinoza and his young friend belong to the year 1663, and throw light both on Spinoza's manner of life and on the growth of his philosophical system. They show that the leading definitions and propositions of the

first part of the "Ethics" were already sketched out in MS., and were in the hands of several of Spinoza's friends, who had formed a kind of philosophical club at Amsterdam, and held regular meetings for the study and discussion of the work. De Vries was commissioned, it seems, to write to Spinoza for the explanation of such points as remained obscure to the company. He says in the same letter: —

> At times I complain of my fate in being so far from you. Happy, most happy is the companion who dwells with you under the same roof, and who can at all times, dining, supping, or walking, hold discourse with you of the most excellent matters.*

Spinoza willingly gave the desired explanations, and replied thus to the complaint:

> You need not envy my fellow-lodger. There is no one I like less, or with whom I have been more cautious; so that I must warn you and all our friends not to communicate my doctrines to him till he has come to riper years. He is still too childish and inconstant, and cares more for novelty than truth. Still I hope he will amend these youthful failings some years hence; indeed, so far as I can guess from his disposition, I am pretty sure of it; and so his general character moves me to be friendly with him.†

It is worth observing that these and other letters of the same time, such as the very important one to Dr. Meyer, in which the notions of space, time, and infinity are discussed, show that as early as 1663 Spinoza's philosophy was fully formed as to its main features. This at once fixes the permissible limits of any speculation upon the growth of Spinoza's ideas which may be founded on a comparison of his earlier and later works. For instance, the avoidance of purely metaphysical discussion in the "*Tractatus Theologico-Politicus*," published in 1670, must be set down not to uncertainty or immaturity of thought, but to deliberate reserve dictated by reasons of policy.

At this time (1663) Spinoza published the "Principles of Cartesian Philosophy." It has already been mentioned that in this book he was not speaking for himself, and he attached no value to it (as he informed Oldenburg), save as a means of attracting attention and patronage in certain places (alluding probably to the De Witts), such as might encourage him to publish something more substantial of his own. The book seems to have done its work in assuring the author's reputation. In 1664 we find William van Blyenbergh, a worthy merchant of Dort and a man of good family, introducing himself to Spinoza by letter in these terms: —

> Dear Sir and unknown Friend, — I have already several times carefully read over your treatise lately published with its appendix. It will be more proper for me to speak to others than to yourself of the instruction I found in it and the pleasure I derived from it. This much I cannot forbear saying, that the oftener I go over it with attention, the more I am pleased with it, and I constantly find something which I had not marked before.

He proceeds to ask several metaphysical questions.* Spinoza received his unknown correspondent with a warm welcome.

> Unknown Friend — From your letter I understand your exceeding love of truth, and how that only is the aim of all your desires; and since I direct my mind upon naught else, this constrains me to determine, not only fully to grant your request, which is to answer to the best of my skill the questions which you now send or shall send hereafter, but to perform all else on my part which may avail for our better acquaintance and sincere friendship. For myself, there is among things out of my own control none I prize more than entering into the bond of friendship with men who are sincere lovers of truth. For I believe that nothing in the world, not being under our control, can be so securely taken for the object of our love as men of this temper; since 'tis no more possible to dissolve that love they have for one another (seeing it is founded on the love each of them hath for the knowledge of truth) than not to embrace the truth itself when once perceived.

Blyenbergh sent to this a very long reply, from which Spinoza discovered that their notions of philosophical inquiry did not agree so well as he had supposed. "So that," he says, "I fear we shall get little mutual instruction by our correspondence. For I perceive that no proof, however firm it may be as a proof, may have weight with you unless it agrees with the construction which you or certain other theologians may put upon the Scriptures." For my part, he continues in effect, I confess I find the Scriptures obscure, though I have studied them several years; and on the other hand, when I obtain sufficient proof of anything, I know not how to refuse assent to it. And he goes on to show that Blyenbergh has completely misunderstood his position. This, however, did not put an end to the correspondence,

* Ep. XXVI. a. I use Auerbach's notation for references to the lately discovered letters and parts of letters.

† Ep. XXVII. a. These two letters are for the first time given in full in Van Vloten's "Supplement."

and sundry other letters passed. In one of these Van Blyenbergh throws in by way of postscript the sage question "whether we cannot avoid by the exercise of prudence that which otherwise would happen to us;" to which Spinoza could only say: "As to the question added to the end of your letter, since we might put a hundred like it in an hour and never settle one of them, and you hardly press for an answer yourself, I shall not answer it." Soon after this they met, and had a friendly conversation. Blyenbergh attempted to renew the correspondence, but this time Spinoza distinctly declined it.

We have also letters to various persons, chiefly on scientific topics, which approximately cover the next few years. Mr. Lewes has called attention to the interest shown by Spinoza in an experiment in alchemy to which he was at the time disposed to give credit.* And at the time there was nothing surprising or absurd in this; we have evidence, however, that some years later Spinoza had become more sceptical. For in 1675, when his friend Dr. Schaller had written to him from Paris, describing some similar process, Spinoza replied almost bluntly that he had no mind to repeat the experiment, and felt quite sure that no gold had been produced which was not there before.†

In 1670 was published the "*Tractatus Theologico-Politicus*," of which I give the title from an English translation (London, 1689): —

> A Treatise partly theological and partly political, containing some few discourses to prove that the Liberty of Philosophizing (that is, making use of Natural Reason) may be allowed without any prejudice to Piety, or to the Peace of any Commonwealth; and that the Loss of Public Peace and Religion itself must necessarily follow, when such a Liberty of Reasoning is taken away.

The final thesis of the book is that "In a free commonwealth it should be lawful for every man to think what he will and speak what he thinks." And little more than two centuries ago, in the freest country in Europe, this opinion was put forth without the name of the author, and with the name of an imaginary printer at Hamburg, and had to be gradually led up to by an investigation of the principles of Scriptural interpretation and the true provinces of theology and philosophy. To modern eyes the introduction looks much bolder than the conclusion. I forbear to say more of the contents and character of the work, as Mr. Matthew Arnold has already given an admirable account of it in his essay on "Spinoza and the Bible."

The opposition which Spinoza doubtless expected was not long in showing itself. Early in 1671 Spinoza writes to a friend not named: —

> When Professor N. N.* lately saw me, he told me, among other things, he had heard that my "Theologico-Political Treatise" was translated into Dutch, and that a person whose name he did not know was on the point of printing the translation. I therefore earnestly entreat you to inquire diligently into this matter, and stop the printing if it can be done. This request is not from me alone, but also from many of my friends and acquaintance, who would be sorry to see the book prohibited, as it certainly will be if it appears in Dutch.†

The book was, in fact, formally condemned some time after; it does not appear exactly when, but it must have been before 1673, in which year no less than three editions appeared at Amsterdam with entirely false titles, purporting to be works on medicine or history. It is hardly needful to say that it was also put on the Roman Index, and in that catalogue it may still be seen in a very mixed company.

In the same year a Doctor Lambert van Velthuysen sent to Spinoza through a common friend a long letter, which repeated in violent language all the current topics against the "*Tractatus Theologico-Politicus*," and finally charged the writer with covertly teaching atheism. This fashion of controversy survives to our own day, and has been improved upon. We have invented the term *materialist*, which makes a fine gradation possible. When we want to say in a short and decided form that we disagree with a man's philosophical opinions, we call him a materialist. If we wish to add to this that the disagreement rests on theological grounds also, we call him an atheist.

Spinoza, having a fancy for the exact use of words, did not like these controversial amenities, and replied (though it was unwillingly that he replied at all) more sharply than was usual with him; he obviously thought the criticism almost too perverse to have been made in good faith. But here too we may note his even temper and peaceable disposition. The letter ends thus: —

* Ep. XLV.; Lewes, Hist. Phil., ii. 180 (3rd ed.).
† Ep. LXV. b. (Van Vloten, Supp., p. 318.)

* The name is deliberately suppressed by the editors of the "*Opera Posthuma*."
† Ep. XLVII.

I do not think you will find anything in this which can be considered too harsh in manner towards my critic. But if anything does so appear to you, pray strike it out, or alter it if you think fit. Whoever he may be, I have no wish to exasperate him and make enemies by my work; in fact, since this is a common result of discussions like the present, I could hardly prevail on myself to write this answer; nor should I have prevailed on myself, unless I had promised you.*

Nevertheless, Van Velthuysen and Spinoza were afterwards on friendly terms. One of the latest of Spinoza's letters is addressed to Van Velthuysen, and relates to a project of publishing some notes and explanations to the "*Tractatus Theologico-Politicus*," including, it seems, this very correspondence, or something founded on it. The letter is a model of literary courtesy and good feeling, and as such is worth giving.

I am surprised at our friend Neustadt having told you that I thought of replying to the various writings against my treatise which have been published, and intended to include your MS. in the number. I am sure I never intended to refute any of my opponents, for none of them have seemed to me worth answering. All I remember to have said to Mr. Neustadt is that I purposed to publish some notes explaining the more difficult passages of the treatise, and to add to these your MS. and my answer, if I had your leave for so doing. This I desired him to ask of you, and added that in case you should be unwilling to grant it on the score of certain expressions in the answer being rather severe, you should be at full liberty to strike out or alter them. Meanwhile I have no cause of offence against Mr. N.; but I thought it well to show you the real state of the case, so that, if I cannot obtain your leave, I might at any rate make it clear that I had no intention of publishing your MS. against your will. I believe, indeed, it may be done without any risk to your reputation, if your name is not affixed to it; but I will do nothing unless you grant me leave and license to publish it. But I am free to confess you would do me a far greater favor if you would set down the arguments with which you think you can attack my treatise; and this I most heartily beseech you to do. There is no one whose arguments I should be more glad to consider; for I am aware that your only motive is affection for the truth, and I know the candor of your mind; in the name of which I again entreat you not to decline giving yourself this trouble.

Van Velthuysen afterwards expanded his letter into one of the many answers to Spinoza's treatise that were published in the next few years. In 1674 Spinoza mentions that he had seen an answer to the "*Tractatus Theologico-Politicus*," written by a professor at Utrecht, in a bookseller's window, but on looking into it found it not worth reading, much less answering. "So there I left the book and its author. I smiled inwardly as I considered how the most ignorant of men are everywhere the boldest and the most ready to write books."

In 1672 occurred the one striking incident of Spinoza's life after his excommunication. The public misfortunes of that year, the French invasion of the Netherlands, the outbreak of popular discontent, and the massacre of the brothers De Witt by the infuriated mob of the Hague, belong to general history. Spinoza was a personal friend of John de Witt's, had accepted a small pension from him, and may through his means have taken some part in politics. He was moved by this event, it is said, so much beyond his wont, that he could hardly be restrained from expressing his indignation in public at the risk of his life. Shortly afterwards the Prince of Condé, being then in command of the French army, invited Spinoza to his headquarters at Utrecht. His only motive appears to have been a genuine desire to make the philosopher's acquaintance. The invitation was accepted, and Spinoza betook himself to Utrecht with a safe-conduct. Condé, however, had in the mean time been called away, and Spinoza went home without seeing him, having turned a deaf ear to the suggestion of the French officers who entertained him that he might probably insure a pension from their king if he would dedicate some work to him. On Spinoza's return to the Hague sinister rumors got abroad concerning his journey, and Spinoza's landlord was for a time in fear that the mob would attack and storm the house for the purpose of seizing him as a spy.

Spinoza, however, comforted his host with these words:—

Fear nothing on my account, I can easily justify myself; there are people enough, and of chief men in the country too, who well know the motives of my journey. But, whatever come of it, so soon as the crowd make the least noise at your door, I will go out and make straight for them, though they should serve me as they have done the unhappy De Witts. I am a good republican, and have never had any aim but the honor and welfare of the State.

The danger passed off, but Spinoza's conduct under it is none the less worthy of admiration; and the incident has its

Original from CORNELL UNIVERSITY

value in the light it throws on the general esteem in which he then stood. For the consciousness, not merely of an innocent purpose, but of a character above the possibility of rational suspicion, was necessary to make Spinoza's visit to the French headquarters prudent or justifiable; and the authorities of his own country would assuredly never have consented to it had they not felt absolute confidence that the public good would in no way suffer by it.

In 1673 Spinoza received a courteous letter from Professor Fabritius, of Heidelberg, who was commanded by Charles Lewis, the Elector Palatine, to offer him the chair of philosophy at that university. This letter contained the following sentence: "You will have the largest freedom of speech in philosophy, which the prince is confident you will not misuse to disturb the established religion." It seems by no means unlikely that this condition was inserted merely as a matter of form. The elector probably knew the "*Tractatus Theologico-Politicus;*" and if he seriously meant to impose restrictions, he would have laid down something much more definite. Spinoza, however, answered thus: —

Had it ever been my desire to occupy a chair in any faculty, I could have wished for no other than that which the Most Serene Elector Palatine offers me by your hands: and especially on account of that freedom in philosophy which the prince is pleased to grant, to say nothing of the desire I have long entertained to live under the rule of a prince whose wisdom is the admiration of all men. But since I have never been minded to give public lectures, I cannot persuade myself to accept even this splendid opportunity, though I have given long consideration to it. For I reflect, in the first place, that I must give up philosophical research if I am to find time for teaching a class. I reflect, moreover, that I cannot tell within what bounds I ought to confine that philosophical freedom you mention, in order to escape any charge of attempting to disturb the established religion. Religious dissensions arise not so much from the ardor of men's zeal for religion itself, as from their various dispositions and love of contradiction, which leads them into a habit of decrying and condemning everything, however justly it be said. Of this I have already had experience in my private and solitary life; much more then should I have to fear it after mounting to this honorable condition. You see, therefore, that I am not holding back in the hope of some better post, but for mere love of quietness, which I think I can in some measure secure if I abstain from lecturing in public. Wherefore I heartily beseech you to desire the Most Serene Elector that I may be allowed to consider further of this matter.*

In 1674 Spinoza had an amusing discussion with a person whose name is withheld on the existence of ghosts. In his first answer Spinoza gives an exquisite turn of politeness to his incredulity. He was delighted, he says, to get his friend's letter and have news of him.

Some people might think it a bad omen that ghosts should be the occasion of your writing to me; but I find something much better in it when I consider that not only real things, but even trifles of the imagination, may thus do me good service.

The correspondence continues, on Spinoza's part, in a tone of courteous banter. At last his friend attempts to overpower him with the authority of ancient philosophers. The reply to this last argument has a distinct importance, as showing what were Spinoza's notions about the philosophical systems of Greece.

The authority of Plato, Aristotle, and Socrates has not much weight with me. I should have been surprised, indeed, if you had brought forward Epicurus, Democritus, Lucretius, or any of the supporters of the doctrine of atoms. It is no wonder that those who devised occult qualities, intentional species, substantial forms, and a thousand other fond things, should have imagined ghosts and apparitions, and given ear to old wives to diminish the authority of Democritus, whose fame they so envied that they burnt all his books. If you choose to believe these, how can you deny the miracles of the Virgin and all the saints, recorded by so many renowned philosophers, historians, and theologians, of whom one hundred can be produced for one that has recorded a ghost?†

It is obvious that Spinoza's knowledge of Greek philosophy was slight and at second hand; but it is significant that his sympathy, so far as his knowledge went, was all with Democritus and the atomic school. The sort of metaphysic which in our own time is always clamoring against supposed encroachments by physical science would have found no favor in his eyes.

In 1674 he wrote an important letter explaining the difference between his view and Descartes' on free will.

I call a thing *free* if it exists and acts merely from the necessary laws of its own nature, but *constrained* if it is determined by something else to exist and act in a certain determinate way. Thus God exists necessarily, and yet freely, because he exists by the

necessity of his own nature alone. So God freely understands himself and everything else, because it follows solely from the necessity of his own nature that he must understand everything. You see then that I make freedom consist not in a free decision of the will, but in free necessity. . . .

Imagine, if you can, that a stone, while its motion continues, is conscious, and knows that so far as it can it endeavors to persist in its motion. This stone, since it is conscious only of its own endeavor and deeply interested therein (*minime indifferens*), will believe that it is perfectly free and continues in motion for no other reason than that it so wills. Now such is this freedom of man's will which every one boasts of possessing, and which consists only in this, that men are aware of their own desires and ignorant of the causes by which those desires are determined. So an infant thinks his appetite for milk is free; so a child in anger thinks his will is for revenge, in fear that it is for flight. Again, a drunkard thinks he speaks of his free will things which, when sober, he would fain not have spoken.*

In 1675 the correspondence with Oldenburg is resumed.† By this time the "Ethics" were completely written, and Oldenburg exhorts him to publish the book, though not with such pressing earnestness as he used in former years. He wishes to have some copies sent over to England, and will undertake to dispose of them; yet he wishes their consignment to him not to be talked of. His temper had probably become less valiant since he read the "*Tractatus Theologico-Politicus*."

Spinoza writes, in answer to Oldenburg,‡ that he did go to Amsterdam to see about printing the "Ethics." But the rumor had gone before him that he had in the press an utterly atheistic book; and certain theologians had actually commenced proceedings against him. The Cartesians, who had by this time a respectable reputation to preserve, were only too glad to find a convenient and edifying occasion for disclaiming Spinoza, and joined eagerly in the cry against him. He determined accordingly to put off the publication; and the result was that the "Ethics" did not appear in his lifetime. The work had a certain private circulation, however, among Spinoza's friends. In the same year, 1675, we have a series of letters raising sundry questions on the most abstruse points in the system. The objections here stated are by far the most acute of those which Spinoza had to encounter from his various correspondents, and it gave him no small trouble to answer them. He does not, indeed, give a complete answer, and all but admits that he cannot. The chief part in these letters is now assigned to Ehrenfried Walter von Tschirnhausen, a young German nobleman, who was intimate with both Leibnitz and Spinoza, and afterwards became a member of the French Academy of Sciences, and was distinguished in mathematics and physics, and most chiefly by advances in optics. In the construction of lenses, in particular, he arrived at brilliant results; and one may guess that this special study was the common ground on which his acquaintance with Spinoza was first formed.*

In 1676 Spinoza received an extraordinary letter dated from Florence, and written by one Albert Burgh, identified by Van Vloten's plausible conjecture with the fellow-lodger whose facilities of intercourse with Spinoza Simon de Vries had envied, and of whose temper and capacities Spinoza had expressed the doubtful opinion already quoted. He now informed Spinoza that he had been received into the Church of Rome, and proceeded to denounce with all the zeal of a proselyte the profane philosophy he had abandoned. He tells Spinoza that all his learning is merely chimerical, and laments that he should suffer himself to be so deceived by the devil. He asks, with delightful simplicity: —

How do you know that your philosophy is the best of all that are, or have been, or will be taught in the world? Have you examined all the ancient and modern systems of philosophy which are taught here, in India, and all over the face of the earth? And even if you have, how do you know you have chosen the right one?

Spinoza framed the obvious retort in the easiest and most effective manner by repeating the convert's own words: —

How do you know that your teachers are the best of all those who teach, or have taught,

* Ep. LXII., §§ 2-4. The latest editor of the letters objects to Bruder's division into paragraphs as pedantic: a principle which, if consistently carried out, would make it impossible to give a reference to any passage in most of the classics, to say nothing of the chapters and verses in the Bible.

† Ep. XVII., *et seq.*

‡ Ep. XIX.

* Tschirnhausen has received, I think, hard measure from Van Vloten and others for the unacknowledged use of Spinoza's work in his "*Medicina Mentis*." Not only was it the habit of the time to be careless in this duty, but Tschirnhausen may not unreasonably have been of opinion that his only way to secure a fair hearing for Spinoza's ideas was to conceal their true authorship. It is certain, however, that he gave offence to both Huygens and Leibnitz by appropriating, without acknowledgment, unpublished ideas which they had communicated to him (Van Vloten, *Benedictus de Spinoza*, App. III.).

or will teach other systems of religion? Have you examined all the ancient and modern systems of religion which are taught here, in India, and all over the face of the earth? And even if you have, how do you know you have chosen the right one?

Burgh's letter runs to a great length, and is a curious specimen of unrefined theological amenity. I can give only a condensed extract as a specimen: —

Do not flatter yourself [he cries] with the reflection that the Calvinists, or so-called Reformers, the Lutherans, the Mennonites, the Socinians, etc., cannot refute your doctrine. All those poor creatures, as I have already said, are in as wretched a state as you, and are sitting along with you in the shadow of death.

Worm and ashes and food for worms that you are, how dare you set up for knowing better than all the Church? What foundation have you for this rash, insane, deplorable, accursed arrogance? What business have you to judge of mysteries which Catholics themselves declare to be incomprehensible?

One of his arguments is that it is presumptuous to disbelieve in alchemy and ghosts because Julius Cæsar would probably not have believed a prophecy of gunpowder. Finally, he threatens Spinoza with eternal damnation if he is not convinced. The immortal discourse delivered by Brother Peter in the "Tale of a Tub," which ends with invoking similar consequences on those who offer to believe otherwise, is hardly a caricature of this effusion.

Spinoza's answer,* which I have anticipated in part, was much the sharpest he ever wrote. As far as argument went he had no serious task; the letter contains, however, some striking passages. "As for your argument about the common consent of multitudes, the unbroken succes sion of the Church, etc., that is just the story I know of old from the Pharisees: for they produce their multitudes of witnesses with no less confidence than the adherents of Rome." They are the most ancient, the most persistent, the most obstinate of all the Churches; and if martyrs are evidence, they have more to show than any other. Even in ecclesiastical discipline, he says, Rome is surpassed by the Mohammedans, for they have had no schisms. This seems a rash statement for a writer versed in Jewish philosophy, which abounds in allusions to the different Mohammedan sects. It is, however, true in the sense that there has been in Islam no great visible rupture like the Reformation in Europe.

Of Spinoza's habits in daily life we know just so much as to make us regret that we do not know more. In outward appearance he was unpretending, but not careless. His way of living was exceedingly modest and retired; often he did not leave his room for many days together. He was likewise almost incredibly frugal; his expenses sometimes amounted only to a few pence a day. But it must not be supposed that he shared the opinion of those who profess to despise man and the world. There was nothing ascetic in his frugality, nothing misanthropic in his solitude. He kept down his expenses simply in order to keep them within his means; and his means remained slender because he did not choose to live at other people's charges. He used to say of himself that he was like a snake with its tail in its mouth, just making both ends meet. Doubtless he was indifferent as to money and the world's goods, but with the genuine indifference which is utterly removed from the affected indifference of the cynic. A man to whom he had lent two hundred florins — which must have been a considerable sum in proportion to Spinoza's income — became bankrupt. Spinoza's remark on hearing of it was this: "Then I must lessen my expenses to make up the loss; that is the price I pay for equanimity." In like manner he kept himself retired not because he was unsociable, but because he found retirement necessary for his work. There is ample evidence that he was none of those who hate or disdain the intercourse of mankind. He kept up, as we have seen, an extensive correspondence, of which we must regret that so little has been preserved. He was free and pleasant in familiar conversation with the people of his house. On Sundays he would talk with them of the sermon they had heard, and would praise the sound learning and morality of their worthy Lutheran pastor, a certain Dr. Cordes who was succeeded in his office by Spinoza's biographer Colerus. Thus he won the esteem and affection not only of his philosophic friends, but of the simple folk among whom he lived; and such affection, as M. Renan has well said, is in truth the most precious of all.

Thus he showed in action the ideal of life set forth in those writings which he could not venture to publish in his lifetime, and which were supposed to strike at the foundations of religion and morality. And what is the rule proposed for the guidance

Original from CORNELL UNIVERSITY

of conduct by this man whose opinions have been called abominable, execrable, and atheistic? In one word, it is this: to use the world with cheerfulness and content, not abusing it, and remembering that the good of mankind consists in doing good to one another. Here are some of his precepts: —

Nothing is more useful to man than man; men can desire nothing more exeellent for their welfare than that all should so agree in all things that the minds and bodies of all should make up as it were one mind and one body, and all together strive to maintain their welfare to the best of their power, and all together seek the common good of all. Therefore reasonable men desire no good for themselves which they do not also desire for other men, and so they are righteous, faithful, and honorable.*

Again he says that discontent and melancholy are good for no man: that it is the part of a wise man to use the world and take all reasonable pleasure in it. It is good to refresh oneself not only with moderate food and drink, but with pleasant prospects, music, the theatre, and other things which every man may enjoy without harm to his neighbor.† In the same way, though his own life was most quiet and sedentary, he strongly points out the advantage of being many-sided (as we should now say) in both mind and body, and thereby being apt to receive new impressions and put forth new activities.‡ This is one of the points in which he curiously anticipates modern ideas about development and adaptation to one's environment.

He insists in the strongest terms on the importance of society to man's well-being.

Society is imperfect [he says], but even as it is men get far more good than harm by it. Therefore let satirists laugh at men's affairs as much as they please, let theologians decry them, let misanthropes do their utmost to extol a rude and brutish life; but men will still find that their needs are best satisfied by each other's help, and that the dangers which surround them can be avoided only by joining their strength.§

Again he says: —

He who chooses to avenge wrong by returning hatred for it is assuredly miserable. But if a man strives to cast out hatred by love, he fights his fight in all joy and confidence, being able to withstand many foes as easily as one, and having no need to call on fortune for aid. As for those he conquers, they yield to him joyfully, and that not from failing strength, but because they are made stronger.*

Again: —

The spirit of men is overcome, not by force of arms, but by love and high-mindedness.†

The following maxim contains a lofty refinement of morality, if one may so speak, to which it would be difficult to find a parallel even in Marcus Aurelius: —

If a man wishes to help others by word or deed to the common enjoyment of the highest good, he shall first of all endeavor himself to win their love to him; but not to draw them into admiration of him, that a doctrine may be called after his name, nor in any manner to give cause for offence. Also in common talk he will avoid telling of men's faults, and will speak but sparingly of human weakness. But he will speak largely of man's excellence and power, and the means whereby it may be perfected; so that men may strive to live after the commandment of reason, so far as in them lies, being moved thereto not by fear or disgust, but in pure joyfulness.‡

The mention of M. Aurelius suggests a parallel which I must note in passing, though I have not room to work it out. There is a singular coincidence between the ethical theory of Spinoza and that of the Stoics: I say coincidence, for Spinoza's slender acquaintance with Greek philosophy precludes the supposition of borrowing. The effort or impulse of self-preservation, which in his system is the mainspring of action, is really involved in the Stoic conception of "following nature." He holds that right action for man lies in the preservation — taken in the largest sense — of mankind; not of the individual merely, because, as a matter of fact shown by experience, man is a social animal, and the welfare of the individual can be found only in society. He likewise constantly speaks of a *moral* life as equivalent to a life which is *reasonable* or according to reason. Both these positions are thoroughly Stoic. Nor are these the only resemblances.

Spinoza's health had been failing for some years before his death, and he was attacked by consumption, which possibly was aggravated by his work of glass-polishing. The last illness was short and almost sudden. It came on the 21st of February, 1677. The day was a Sunday, and in the morning Spinoza had been talking to his hosts, Van der Spyck and his wife, as was his custom. His friend and

physician, Lewis Meyer, came from Amsterdam at his request, and was alone with him at the last. When the people of the house came home in the afternoon, they found Spinoza dead.

Some time before this Spinoza had committed to Van der Spyck the trust of sending his unpublished papers to a bookseller at Amsterdam. This was duly fulfilled, and in the course of the same year the philosopher's posthumous works, including the "Ethics," appeared. They were received with even more violent opposition than the "Theologico-Political Treatise," and were forbidden by the States-General of Holland.*

Spinoza's first biographer, Colerus,† whose frank and honest admiration of Spinoza's personal character went along with a no less frank detestation of his philosophy, calls the "*Opera Posthuma*" abominable productions, and states that divers champions were providentially raised up to confute them, who had all the success they could desire. At this day there is probably no man living who has read these refutations, while the fame of Spinoza stands higher than ever.

He was an outcast from the synagogue, a stranger to the Church, a solitary thinker who cast his thought in difficult and startling forms. Notwithstanding all this, men of divers nations and of widely different opinions have joined together to do honor to the memory of Benedict de Spinoza, the philosopher whose genius has made him in some sort the founder of modern speculation, and the man who in modern times has given us the highest example of a true and perfect philosophic life.

It is impossible to attempt in this place any account of Spinoza's philosophy; and I may add that he is eminently one of those writers whose thought cannot be learned at second hand. It may be worth while, however, to give a very brief sketch of the manner in which his influence has risen and spread in modern times.

Spinoza very soon had eccentric followers as well as bitter enemies in his own country;* but in the European world of letters he was entirely misunderstood and neglected for the best part of a century. Leibnitz, the man most capable of doing him justice, preferred to take the opposite course, and he was ill-treated even by the people who might have been expected to take him up if only for the reason that he was hateful to theologians. He fared little better at the hands of Bayle and Voltaire than at the hands of orthodox apologists. To Lessing, the founder in some sort of German literature and criticism, belongs the credit of having seen and announced Spinoza's real worth. In a certain memorable conversation with Jacobi he said, in so many words, "There is no philosophy but the philosophy of Spinoza." This and much more came out after Lessing's death in a long correspondence between Jacobi and Moses Mendelssohn, which finally degenerated into a controversy. After the report of that one conversation, the record of all this is now of little interest; from these, however, and from other letters preserved among Lessing's works, the fact comes out that Lessing thoroughly understood Spinoza, and had grasped the leading points more firmly than many of Spinoza's later critics.

Meanwhile Goethe too had found out Spinoza for himself, and he has recorded how the study of the "Ethics" had a critical effect on the development of his character.† And his statement is fully borne out by the witness of his mature work. Goethe's poems are full of the spirit of Spinoza; not that you can often lay your finger on this or that idea and give a reference to this or that proposition in the "Ethics," but there is a Spinozistic atmosphere about all his deeper thoughts. There is a set of speculative poems, "*Gott und Welt*," which gives the most striking instances; but the same ideas are woven into all parts of Goethe's work, and may be found alike in romance, tragedy, lyrics, and epigrams.

The influence thus started in philosophy and literature spread rapidly. Kant's great work in philosophy was independent of it; but a strong current of Spinozism set in immediately after Kant, and acted powerfully on his successors. Fichte, though his system widely departs from Spinoza's, had obviously mastered his philosophy and felt the intellectual fascina-

* June 20, 1678. The full text of the ordinance is given in Van der Linde's *Bibliografie*, No. 24.

† The Dutch original of his book (No. 88 in *Bibliografie*) is extremely scarce. There is one copy in the Royal Library at the Hague: the only other known one is, according to Dr. van der Linde, at Halle. The French version by which it is commonly known, and which is often taken for the original, is also scarce, but has been several times reprinted. The last reprint is in Dr. Ginsberg's edition of Spinoza's correspondence (Leipzig, 1876).

tion of it; and many of his metaphysical ideas are simply taken from Spinoza. Hegel said, "You are much of a Spinozist or no philosopher at all." In like manner Schelling said that no one could arrive at philosophical truth who had not once at least plunged into the depths of Spinozism. Novalis, Schleiermacher, Heine, and many others have spoken of Spinoza in words of enthusiastic praise. There is in Germany a whole recent literature of exposition and discussion about him, which is fast increasing, and to give an account of which would itself need a monograph.

In France the prevailing tone of philosophy has not been one that accords well with Spinoza; but he has met there with keen and intelligent criticism, which is the next best thing to intelligent admiration; and the beautiful address lately delivered by M. Renan at the Hague (besides the serious attention given to the subject by M. Paul Janet and others) is a sufficient proof that Spinoza has now at least found a response in the highest thought of France.

In England Coleridge, in this as in other things the advanced guard of the peaceful invasion of German culture and philosophy, spread the name of Spinoza, and much of his ideas, among the friends whom he delighted by his conversation. He used to say that the three great works since the introduction of Christianity were Bacon's "*Novum Organum*," Spinoza's "Ethics," and Kant's "*Kritik*." Coleridge's own position as to Spinoza was something like Jacobi's; he admired and honored him without accepting his teaching. It may well be that some part of the nature-worship of Wordsworth's poetry, which has been a most important element in our later English literature, was derived through Coleridge from Spinoza. But we must come down many years later before we find any certain manifestation of this part of Coleridge's influence. Those who have spoken of Spinoza to English readers as he deserves to be spoken of are still among us and working for us. We have Mr. G. H. Lewes's various articles and writings on Spinoza, to which he has given a finished form in his "History of Philosophy." We have Mr. Froude's essay on Spinoza, perhaps the best general account of his doctrine which has been given in our language for those who do not make philosophy their special study. There is Mr. Matthew Arnold's admirable monograph on the "*Tractatus Theologico-Politicus*," whose only fault is that he has not completed it by a companion piece on the "Ethics." There are Mr. Huxley's contributions to pure philosophy, which do not treat of Spinoza directly, but have done much to put Spinoza's fundamental ideas into shapes adapted to the present state of our knowledge. The same may be said of Mr. G. H. Lewes's most recent work in "Problems of Life and Mind." Nor are other signs wanting of an active and increasing interest in Spinoza both at home and abroad.

It has been said of Spinoza by an able and not unfair critic (M. Saisset), that his theory was after all but a system, which has passed away like all other systems, never to come back. It is true that Spinoza did not found a school, and had few or no disciples in the proper sense. It would be difficult to name any one who ever formally accepted his system as a whole. But the worth of a philosopher to the world is measured not by the number of people who accept his system, or by the failure of criticism to detect logical flaws in it, but by the life and strength of the ideas he sets stirring in men's minds. Systems are the perishable body of philosophy, ideas are the living soul. Judged by this test, Spinoza stands on a height of eminence such as very few other thinkers have attained.

F. POLLOCK.

ERICA.*

TRANSLATED FOR THE LIVING AGE FROM THE GERMAN OF

FRAU VON INGERSLEBEN.

XXXI.

(*continued.*)

THE countess paused and turned her marble-like face towards her husband.

"Your word is sufficient," she gasped, "I have your promise to comply with both conditions?"

"My promise to comply with both, Vally!" cried the count bitterly, "but, with this promise, my hatred and contempt for this boundless abuse of your power."

She nodded again, as if in assent, and said gently: "The money shall be ready on Wednesday." Then she turned away, and leaning on her son's arm walked slowly out of the door, while the count

gazed steadily at the floor in gloomy silence. On reaching her room, she threw herself on a sofa, raised both arms toward heaven in passionate agony, and exclaimed amid convulsive sobs,—

"My God, my God, why dost thou try me so terribly! How sweet it would be to pray for the repose of the grave, but I must continue to walk along my dark path, which lies before me so dreary, so bereft of every charm, so full of thorns."

Her voice choked, she covered her eyes with her hands, and gave free course to the tears which perhaps saved her from a convulsion. Ottomar, who stood beside her, threw himself on his knees before his mother, and clasping her in his arms, said in a tone of the warmest affection, —

"My dear, dear mother! Cannot the grateful reverence, the adoring love of your children compensate in some little degree for what you have lost? Cannot the esteem of all who know you partially outweigh words hastily uttered in an outburst of anger?"

The countess threw both arms around her son's neck, and rested her head on his shoulder. "My own Ottomar!" she whispered with the same convulsive sobs; "there is no compensation on earth for me; pray to God that the trial may not be beyond my strength."

The sound of footsteps approaching the door made the countess sit upright, and Ottomar spring to his feet. A servant entered and announced the arrival of Baron von Sonnenstein, who insisted upon being admitted. The young man himself followed close at the footman's heels, and was so greatly agitated that he did not notice the countess's condition, but approached her without the slightest ceremony, and standing before her, said hastily,—

"Madame, I have just come from Bonn, where to my horror I heard of the horrible treachery Ramsdorff has practised towards the count. This is the only term that can be applied to the affair, although the rascal has not been detected, and the news affected me all the more painfully because I am compelled to accuse myself of being the original cause of it. My folly induced me to believe that I could obtain the desire of my heart more speedily by means of his intervention, and he not only took advantage of this delusion to swindle me out of large sums, but also shamefully abused the hospitality offered to him in this house."

The wonderful power of self-control possessed by the countess now showed itself in a way which surprised even her son, as she quietly rose and said to her guest,—

"In what way did you hear of this affair, my dear baron? Is it already town-talk?"

"Oh! God forbid, by no means!" answered the young man in a deeply agitated tone; "Ramsdorff is too cunning for that. But he seems to have been watched by certain parties, and Generode made the discovery and told me himself, after first obtaining a promise that I would not speak of it."

"And why did Count Generode give you this information?" asked the countess, while her eyes rested on her guest with such a penetrating expression, that even the keenest observer would not have suspected, save by the reddened lids, that they had just shed tears of the most bitter agony. "Why did Count Generode tell you about this affair, my dear baron?" she repeated, as the young man made no reply.

"The sum is rather large," he said hesitatingly, "and — and people rarely have so much ready money at their disposal. But a note may easily be made a source of annoyance, because it must be paid at once. I — I happen to have the necessary amount, and hope that —— "

"That we possess sufficient regard for you, to allow you to help us out of this temporary embarrassment;" said the countess, coming to his assistance. "We shall have no hesitation in gratefully accepting your offer, and freely confess that it is very opportune, for we could only have obtained the sum by making heavy sacrifices, and I was already thinking of pawning my jewels, in order to avoid too great a loss from the forced sale of my bonds."

"Merciful Heaven!" cried Baron von Sonnenstein in horror, as he thrust both hands through his hair, "there is really nothing left for me to do except shoot myself, when I think that *I* have brought all this misfortune upon you."

"Nay, my dear baron," said the countess with a pleasant smile, "a *young* man need not reproach himself too bitterly for his lack of knowledge of human nature, when one so many years his senior was deceived by the same person. Do not allow yourself to be so greatly disheartened, but let us all work together to repair the misfortune as speedily as possible. I will instantly make over to you, in return for the sum you are willing to advance, bonds which you may keep until

their value rises so that we can sell them for enough to cover our debt."

"But, madame," replied the young man in a somewhat hurt tone, "I did not expect to arrange the matter in such a business-like way"

"A business matter, even among friends, must always assume a business-like character," replied the countess in her usual cold, quiet tone; "besides, I am not treating you exactly like a merchant, for these bonds may perhaps not be marketable for some time, and yet I offer you no interest."

"That is all that was wanting!" burst forth Sonnenstein, but instantly started at his own words, and was evidently relieved when, at this moment, a servant entered and interrupted the conversation.

"Count Generode!" said the footman; "I beg the countess's pardon," he hastily added, as he noticed his mistress's expression of surprise, "but the gentlemen insist upon coming in to-day."

The new visitor must have been already at the door, for he entered the apartment as soon as it was opened. His dress was not arranged with the studied care it usually displayed when he appeared in the presence of ladies, and especially at Dorneck. It was evidently a fatigue uniform which had seen considerable service, and was, moreover, dusty and disordered by his hasty ride; but the wearer scarcely seemed aware of it, as, like Sonnenstein, he hurriedly approached the countess, saying in a very excited tone,—

"I beg your pardon, Countess Rodenwald, for the unsuitable hour of my visit, but necessity compelled me to come. I hoped to overtake Baron von Sonnenstein and prevent him from perhaps alarming you, but he seems to have hastened his arrival, so you have doubtless already learned that your husband has a note for a considerable sum to pay to that Wehlen-Ramsdorff, although he appears under another name.

"A long time ago, Werner requested me to try to render this man harmless, since, for very evident reasons, the task would be a doubly painful one to Ottomar; and in company with several of my comrades, whom I took into my confidence, I made every possible effort to detect him in cheating at cards, but we could not succeed in doing so, and I feared he had perceived our design and was therefore doubly cautious. Early this morning, I heard from my spies of the count's note, which would soon fall due, and was forced to acknowledge that unless we speedily unmasked the scoundrel, all our efforts would be vain, as he would certainly decamp with his spoils as quickly as possible. I therefore thought myself justified in using somewhat strong measures to attain my object."

The young man paused; and then continued with a faint smile, —

"I must be assured of your pardon, countess, ere I assail your ears with matters which —— "

"Speak," interrupted the countess almost vehemently. "There are circumstances which entirely set aside the ordinary rules of etiquette."

"I gave a dinner at the Star to-day," continued the young man, "where, as usual at a bachelor's entertainment, wine was not spared. The gentlemen became very lively, their gaiety increased to somewhat uproarious mirth, and I really think that some of my accomplices went rather too far."

"That is true enough, heaven knows!" interposed Sonnenstein; "I was really startled when I entered the room, and should have gone out again immediately if I had not felt ashamed to do so before Ramsdorff, who would have called it very narrow-minded."

"It was fortunate that you conquered your sensitiveness, my dear baron," replied Generode, with a somewhat sarcastic curl of the lip; "for without you I should not have attained my object."

"Without me?" asked Sonnenstein in unfeigned astonishment.

"Listen, and you will understand. To be frank, this somewhat boisterous mirth on the part of the gentlemen coincided with my plan. I knew that Wehlen — who is never intoxicated, no matter how much wine he consumes — would instantly take advantage of this opportunity to propose a game, and hoped that the condition of the rest of the party might induce him to be less cautious. Unfortunately, however, I was mistaken in the latter supposition, and it seemed as if, spite of the little farce I performed, he had discovered the only sober spectator, for he occasionally cast searching glances at me. The presence of Baron Sonnenstein — who unexpectedly came in somewhat later — was, to tell the truth, extremely unpleasant, for I feared it would baffle all my plans."

"My presence need not have disturbed you, count," said Sonnenstein, with a good-humored smile; "for Ramsdorff knows that I can scarcely distinguish the ace of hearts from the knave of spades."

"The hours slowly passed away, and I almost despaired of obtaining any success.

At last I happened to think of sending Sonnenstein away, while at the same time I availed myself of his assistance to relieve an embarrassment which was perhaps already making itself felt. I therefore went into an adjoining room to tell him the situation of affairs, and of course instantly found him ready to fulfil my wishes. When he left me to order his carriage, I returned to the card-room, and either by accident, or because I instinctively opened the door noiselessly, my presence was not perceived, as the thick carpet rendered my footsteps inaudible. I involuntarily walked behind Wehlen's chair, and had scarcely taken my position there, when I saw him, with wonderful swiftness, conceal a card in his coat sleeve.

"I was actually stupefied; the lightning-like celerity with which the card had disappeared betrayed long practice, but at the same time made me doubt my own eyes, and I still stood irresolute, without moving, when a second card vanished up the sleeve. I now laid my hand firmly on his arm, and said aloud: "Gentlemen, we will have no farther intercourse with this scoundrel, he cheats!"

All sprang from their seats, Wehlen's eyes pierced me like daggers, and he hastily tried to release his arm from my grasp; but I was prepared for the movement, and held it like an iron vice, so the proofs of his false play could not be removed. A very tumultuous scene ensued; the gentlemen were speedily sobered, and I had considerable difficulty —— But why should I offend your ears with such repulsive things, countess? Enough that they at last yielded to my proposal. Wehlen was forced to acknowledge that he had constantly cheated the count, that he had dishonorably increased the original amount in the note paid for the sums thus due, and lastly that the usurer was his own tool. Landsheim and I accompanied him to his room, and there the note, which he had carefully preserved, was torn to pieces, but unfortunately I could not help promising him the payment of a certain sum to defray the expenses of his departure from this place. We, on our part, not only permitted this immediate departure, but promised not to adopt legal measures against him. This was the sole bait which induced him to yield to my wishes, and I think, countess, you will approve my course."

"Entirely, my dear Generode," said the countess with tears in her eyes. "I thank you most sincerely for your wise and faithful friendship." She held out her hand, over which the young count bowed reverently, and then said, in a very different tone, "This terrible scene must fortunately have transpired in a short time, since you reached Dorneck so soon after Baron von Sonnenstein."

"It *was* very short, countess. I had arranged every detail of my plan beforehand. As I knew that Baron von Sonnestein's coachman, spite of his master's impatience, rarely hurried himself about harnessing his horses, I instantly sprang into the saddle to overtake him and prevent him from being the first to make you aware of the existence of this note, as, to my horror, I afterwards thought might be possible."

"My husband had already informed me of it," said the countess gently, "but now let us see whether the sum you were obliged to promise him may not exceed the amount of ready money at my disposal."

"Unfortunately, it is two thousand thalers," said the young count sadly. "Wehlen obstinately insisted upon having this sum, which he pretended he absolutely required, and preferred to risk a prison, rather than lower his demands. However, he had had all his baggage removed from his villa to Bonn, so he had been preparing for his departure."

"We will gladly pay him the money, and thank God that we have escaped so easily. I hope your friends will say nothing about this matter, and ——"

"They have all promised, I think I can be sure of them in this respect."

"Very well. Fortunately I have the sum at my disposal, and, inhospitable as it sounds, I must beg you to take it to its destination at once, as I shall have no rest until I know this man has really gone."

"And I can do nothing at all?" asked Sonnenstein mournfully, when the countess had left the room.

"You have already played a prominent part in the drama, Sonnenstein," replied Ottomar.

"And what a part!" said Generode, with the same half-sarcastic curl of the lip. "The *rôle* of holy innocence, which, without any knowledge or intention, destroys the most skilful plans of the wicked."

"You seem pleased to be ironical, Count Generode, which I think somewhat unkind at this moment, when I am in a particularly depressed and sorrowful mood."

"Forgive me, Sonnenstein!" said Generode cordially, holding out his hand to the young man, which the latter grasped, and thus peace was concluded.

The countess entered the room, handed the young officer a small package of bank-notes, and took leave of both her guests in a manner very different from her usual calm composure. When once more alone with her son, she said gently,—

"This must have been God's will, Ottomar; if Generode had only attained his object an hour sooner, I should have been spared the bitterest sorrow of my life."

"What will you do now, mamma?" asked Ottomar in the same tone.

The countess smiled sadly. "The gulf which this incident has made cannot be closed by any efforts of mine. And besides, we have gazed too far into the abyss that yearns before us, to be able to walk quietly on its verge again."

"Then you will not release my father from his promise?" asked Ottomar anxiously.

"No, Ottomar," replied the countess firmly. "God will give me strength and courage to pursue my thorny path."

XXXII.

ALTENBORN.

On one of the highest ranges of hills, in a region pleasantly diversified by mountains and valleys, stood Castle Altenborn. The huge edifice, towering high into the air from its rocky foundation, was visible for miles around, and the various styles of architecture represented in the different portions of the building, which by manifold and apparently voluntary combinations formed a perfect and harmonious whole, showed that generations had aided in its erection. The reverent affection of the descendants of a noble family, which spares the creations of its ancestors, makes them accord with the demands of the present, and continues to erect with the same devout reverence for the past, had, in spite of the diversity of architecture, produced a harmonious whole which possessed great charms.

Although at first the eye was somewhat bewildered by the numerous fronts of the various additions to the main building, the numberless balconies supported by pillars, the various towers of all sizes, bow-windows, etc., the spectator's mind soon recognized the harmony that pervaded this apparent confusion, and the seeming conglomeration gradually changed into a beautiful whole.

Centuries had impressed their traces upon these walls, and given them a venerable dignity, which aroused grave thoughts. If yonder towers, with the narrow windows like loopholes, spoke of a time when one man's hand was raised against another, and war was the normal condition of the country, that carved façade with its caryatides, and pillars with richly ornamented capitals, marked the time of the Renaissance, when the strife to produce forms of beauty was so eager, though it afterwards unfortunately degenerated.

The magic of history, appearing in this visible form before the eye, which hovered around the ancient edifice, gave it a charm which secured its precedence over the most beautiful modern castle, for that magic spell no human power can invent; it is the work of the slowly passing centuries, which transfigure ancient buildings as well as former generations, from which no deep mind can escape, and which extorts, even from the practical American, a sigh for the deficiencies of his own country.

An extensive park with ancient trees surrounded the building like a wide, ample cloak. Sloping gradually downward in terrace-like steps, it led to the level ground, and ended in meadows and shrubbery, without any very exact boundary line to define its limits. A smooth carriage-road swept in wide curves to the castle, past numerous artificial lakes and plashing fountains, which showed the visitor that the great abundance of water in the neighborhood produced its unusual fruitfulness.

Even the situation of this park revealed a reverent memory of the past. Before the magnificent façade of the wing which owed its existence to the Renaissance, closely clipped hedges formed regular interlaced lines, and trees cut in fantastic forms stood singly or in groups, while between them, on high pedestals, gleamed somewhat weather-beaten marble statues.

The tastefully arranged beds of flowers — by which the present tries to lure the somewhat too formal garden to its own peculiar domain — were ingeniously and harmoniously placed in various parts of the grounds, and thus aided in forming a whole, whose somewhat stiff exactness, pleasantly relieved by the bright hues of the flowers, produced a most agreeable impression.

The broad terraces in which the grounds were laid out extended around the whole castle for about the same distance, though their style of ornamentation was somewhat different, and luxuriant shrubbery, with the wide-spreading branches of trees left to grow according to nature, soon appeared in the place of those whose forms were regulated by the shears. A winding path on this terrace afforded a view of the whole

landscape, and thus made a most delightful walk. The green waves of the Rhine appeared like a narrow silver ribbon, twining in graceful curves through the meadows. The eye could wander far beyond the range of hills on the opposite shore, and the beautiful landscape lay outspread before the beholder like a chart.

The view from the opposite side of the terrace was closed by the dim blue outlines of distant mountains, and the eyes, satiated with gazing at the beautiful scene, rested upon them with a delightful sense of repose. In the foreground were tolerably rugged rocks, which appeared between the dark foliage of the pines and larches. Foaming waterfalls dashed glittering down to the plain, and were lost in a large lake, in whose centre appeared a wooded island. As if in harmony with these graver surroundings, the visitor here beheld the most ancient portion of the castle. Frowning towers, overgrown with ivy and wild vines, looked down from the rocky height, and walls in which the loopholes made in early times were still visible recalled the dark days when they had been erected for defence and protection.

Nestling at the foot of the hill on which the castle was enthroned, stood the little town belonging to it; the streets lined with small houses, several stories high, covered with grapevines and climbing roses. On an open square in the midst of these houses was the church, embowered in lofty trees, and the parsonage with its large orchard, apparently a very desirable residence.

On a rainy autumn evening, which had closed in unusually early on account of the lowering sky, a travelling carriage rolled through the streets of the little town and entered the avenue leading to the castle. Three ladies were leaning silently and wearily back in the corners, apparently equally anxious to reach the end of their journey. The bright panes of the houses cast fleeting rays of light through the windows of the carriage upon the travellers within, played warmly on the dark, lustrous hair of one, and sent a quick flash into the large brown eyes of the other.

"Thank Heaven, we have reached Altenborn," said an old lady, whom hitherto the light had not reached.

"I'm afraid grandmamma will be anxious about us," replied one of the young girls; "the steamer was certainly very late. Have you been waiting for us long, my dear Fräulein Arensfeld?"

"Oh, I was very glad to do so, countess," replied the old lady kindly. Sidonie slightly raised her eyebrows, as if displeased by the reply, while a faint smile hovered around the other young girl's lips.

"This large, dark building seems to be the church;" the latterly now eagerly exclaimed, leaning close to the pane and trying to pierce the gloom with her keen eyes. "Does the young pastor please the parish?"

"I believe so," replied the old lady; "as the baron allowed them a free choice. He seems rather too young for a pastor, however; he has not the dignity which to me appears inseparable from the office."

"It is a pity that we arrive at night, Erica," said Sidonie; "Altenborn is beautifully situated, and I am always delighted whenever I see it. But you have not uttered a syllable except that one eager question about your admirer. Are you ill, or out of spirits?"

"Neither, Sidonie. I only feel a little embarrassed, because I am going among perfect strangers."

"Why, surely you know Katharina and Elmar, and you will adore my beautiful old grandmamma as soon as you have been with her a single day."

Erica made no reply, so the conversation dropped, and the ladies leaned silently back in their corners as before. The carriage had left the lighted windows behind, and the deepest darkness again surrounded the travellers; only the lamps on each side of the coachman's box cast a faint ray which sometimes illumined a narrow strip of turf, revealed the drooping branches of a tree, or made the jet of a fountain glitter for a moment. Soon, however, the lights of the castle appeared, and at last the carriage, with a noise like thunder, rolled under the lofty portal.

Servants were already standing there and opened the door, while a grey-haired old man in black clothes, with silk stockings and low shoes, bowed respectfully, and welcomed the new-comers in the baroness's name. He then led them up a broad, brilliantly lighted flight of steps, and they entered a large, vaulted anteroom, from which two corridors led in opposite directions.

Sidonie walked rapidly across the anteroom and turned down one of the corridors, while Erica followed with a beating heart, which had gradually grown more and more heavy. She had half expected Elmar to meet them at Coblenz, and now he did not even receive her here, but left this duty to a servant. He was certainly angry with her for coming, and the thought

made her so unhappy that she could scarcely maintain her composure.

"Will the countess go directly to the baroness's room?" asked the old man, who seemed to act as a sort of major-domo.

"Certainly, Hausmann, does she still occupy the same room?"

Hausmann bowed, and immediately threw open a pair of folding doors. The young girls entered a large, lofty room, where a small fire was burning, and which was but dimly lighted by lamps covered with thick shades. Near the chimney-piece, by one of these lamps, sat an old lady, engaged in reading. At the noise made by the opening doors, she raised her eyes, and as soon as she perceived the two young girls, came forward with open arms. Sidonie threw herself into them with a tenderness very unusual to her, and the old lady kissed her affectionately on the lips and forehead.

The next instant she turned to Erica, who was standing a little aside, clasped her also in her arms, and kissed her without the slightest formality. "Thank you, my dear child," she said cordially, "for brightening an old woman's life by your presence. I promised your aunt to watch over you like my own little darling, which, under any circumstances, you will soon become."

Erica stooped and kissed the old lady's hand. The warmth of this reception cheered her, and the deep sadness she had just felt vanished as if by magic.

The baroness now turned to Sidonie again, removed her hat with her own hands, and drew her towards the lamp, gazing with earnest tenderness at the beautiful features, now somewhat flushed by the journey. "What is the matter, Sidonie?" she asked anxiously, "you have grown thin, and look weary and sad. Is this a face for a young lady who bewitches every one, and yet sometimes condescends to brighten an old woman's home with the sunlight of her presence? Don't say a word, Sidonie!" she continued, gently placing her hand on the young girl's lips, as she saw that she was about to make some reply, "it is exactly as I say, my old eyes cannot be deceived. But I assure you that you shall not leave Altenborn until these eyes again sparkle with their former proud light, for my little princess is rather arrogant by nature."

"Now let me look at you too, my little Erica," she continued, turning to the young girl, drawing her also close beside the shaded lamp and gazing earnestly into her face. "I see no sadness here, but on the contrary mirth and a little mischief, though the eyes now look thoughtful and grave. In these features," she added in an undertone, "lies a treasure, of love for those who know how to arouse it, and also firm opposition, nay, unyielding defiance, to all who cannot utter the magic word. I think we shall suit each other, Erica," said the old lady cordially, when she had finished her examination. "I hope we on this side of the house have the divining rod which can disclose the buried riches, and for that wing," she continued with a faint sigh, "this obstinate little head may sometimes prove a blessing."

"Where is Elmar?" asked Sidonie suddenly, and the question crimsoned Erica's cheeks with blushes. She was just wondering whether the old lady's "we" included him also.

"He has been away a long time, and did not know you were coming, or he would probably have hastened his return. I have been secretly rejoicing over the pleasant surprise he would find on reaching home."

"And Katharina?"

"She has gone out to drive. You know, Sidonie, that Katharina is utterly careless of etiquette, otherwise ordinary politeness would probably have required her to be at home to welcome you."

"Oh! she wants to show me that I am not her guest. Well, I am very grateful to her for the opinion, for it is mine too. I intend to devote myself entirely to you, grandmamma."

"Then you will be doing a good work, my little princess, or queen, as Elmar calls you, and to-day I will make tea for my two young ladies with my own hands, that they may feel perfectly at home with me."

"May I not undertake the task, gracious baroness?" asked Erica, approaching the table on which the servant had just placed the tea-service.

"Who is your gracious baroness, Erica?" asked the old lady, with mock sternness. "If you are not yet aware of it, I will tell you that I am grandmamma to the whole family, grandmamma *par excellence*, and if you call me anything else, or do not treat me precisely like a grandmamma, you will expose yourself to the harshest usage. Do you understand me, little malapert?"

"Perfectly my dear, dear grandmamma!" said Erica, pressing her lips to the old lady's hand.

The latter tenderly stroked the young girl's soft brown tresses, and added,

"What beautiful hair this is! Elmar was not so far wrong — but, dear me, I fear I am committing a little indiscretion!" she exclaimed interrupting herself. "When one is nearly eighty years old, one's thoughts are not quite so much under control as they should be."

"And may I make the tea, grandmamma?"

"No, my little Erica, not to-night. To-night I will serve my guests, and let no one but Fräulein Arensfeld help me. Besides, young ladies, you are to have — for I suppose you lost your dinners — a remarkably nice supper. The cook promised me to do his very best. He proposed all sorts of *salmis* and *pâtés*, but I told him to make whips and creams the strong point."

The young girls sat down at the tea-table and allowed the old lady to help them, then drew their chairs close around the fire to talk; and Erica felt as if she were no stranger, but had always been familiar with the household.

How strange on entering the castle had been the thought that she was in Elmar's home, and then — when she could in some degree appreciate its magnificence — that it was so much more grand and beautiful than she had supposed! But the old lady's cordial, affectionate manner had soon crowded all these thoughts into the background, and given her a certain sense of ease and comfort which, in Elmar's presence, she might have lacked.

The supper was really very excellent, as the old lady had promised. The *soufflées à la Vienne* and the *crêmes à la Bacaroise*, which successively appeared, did great honor to their originator, and grandmamma seemed to have correctly understood the tastes of her young guests. But even the boiled partridges and other substantial dishes were eaten with admirable relish by the young girls, whose appetite had been sharpened by the journey. They were again seated around the fire, when Katharina's carriage rolled up to the door.

"Children," said the old lady, when the distant thunder of the wheels became audible in the room, "if you feel no inclination to see *madame la princesse* this evening, I advise you to retire now. Her restlessness has brought her back early, and I know she will rush here as soon as she has laid aside her hat and cloak. I frankly confess that I should not like to end our pleasant evening with the whirlwind Katharina's presence always creates. So good-night, good-night, my dears. May the brightest dreams haunt your sleep!"

XXXIII.

ELMAR.

When Erica went to her window the next morning and saw the broad, beautiful landscape outspread before her, she gave utterance to her surprise and pleasure by loud exclamations of delight. She had been so long deprived of the sight of a wide, open country, that it affected her with a sense of something familiar, different as were these broad plains from those of her home. Soon, however, she perceived that it was only the elevated site of the castle which afforded her such an extensive view of the world at her feet, and that tolerably high chains of hills interrupted the apparently level ground.

Directly before her window the land sloped gently down to the plain, the regular gradation of the terraces was here less perceptible, and the wide, level patches of turf fell gradually down to the valley. The trees and shrubs with which the grass was adorned looked very beautiful in the variegated hues of autumn, while the clumps of flowers in full bloom made one forget the lateness of the season. Some of the trees, which had had plenty of room to grow, had increased to an immense size, and their drooping boughs rested on the turf as if weary, or dipped into the water of one of the little ponds, whose clear surface distinctly reflected all the objects on its banks.

A projecting tower obstructed the view, and Erica therefore boldly entered the tower chamber, unfastened the glass doors opening upon a balcony, and stepped out. Here she perceived the clipped hedges with the statues and prim garden, and saw Tritons spouting jets of water, which fell into a large basin, near which a little boy was standing gazing earnestly in. He had thrown aside his cap, his long, fair hair floated in the autumn breeze, and his little blue velvet skirt was ever and anon dampened by the spray from the Tritons' mouths.

"Carlos!" cried Erica, in a loud, joyous tone, "Carlos, don't you remember me?" But she had not calculated on the distance, the boy still continued to gaze intently into the basin, and, as she now perceived, throw bits of bread into the water. She was obliged to defer meeting the little fellow, but he soon came to pay a morning visit to the baroness. On seeing the young girl, he was at first a little shy and inclined to hide behind his grandmamma's dress; but Erica soon managed to recall herself to his memory, and it was not long before the

old familiar relations were again established between them.

Katharina also at last made her appearance, and evidently endeavored to be amiable and winning. She seemed rather less restless than usual, for she intended in a few days to give a large ball, the preparations for which diverted and occupied her mind. The entertainment — as was a matter of course with a ball given by the Princess Bagadoff — was to be remarkably brilliant, and she had already driven her numerous retinue of servants to the verge of despair by her contradictory orders.

On leaving the room, she wanted to take Erica to her own part of the house at once, but the baroness resolutely vetoed the proposal. "Erica is *my* guest, and must not be carried away from me the first day; I have given up the companionship of my good old Fräulein Arensfeld, and I will not allow myself to be doubly robbed."

"I will gladly return your good old Fräulein Arensfeld, grandmamma," replied Katharina, with her somewhat unmusical laugh, "she is a burden instead of a pleasure."

"You ought to have thought of that before, child, now the matter is settled according to your own wish."

The princess was, for the moment, too much occupied with various matters to attempt any serious opposition, and soon withdrew, as she was obliged to dress early to drive to a dinner-party, to which she had been invited at a castle several miles away.

"I suppose you think me a very heartless old lady, to give up my good Fräulein Arensfeld in this way," said the baroness, when Katharina had left the room. "But we are both too old to find much support in each other, and therefore should soon have parted. The obstinate woman, however, insists upon remaining here until the time arrives when she will be entitled to a pension, though Elmar would of course pay it without this delay. She will then go to a sister who lives in Coblenz, and, in order to give me a little rest from Katharina, offered to spend this time with her."

The old lady then invited the two young girls to take a walk, and the stroll along the winding path on the upper terrace, as well as a longer ramble through the park, was very pleasant and refreshing. The interior of the castle revealed its full magnificence in the broad light of day. The beautiful, spacious staircases and wide corridors, upon which lofty folding doors opened, justly excited Erica's admiration. Altenborn was so different from Dorneck that the two places could not be compared. While magnificence was the predominant feature in the former, the leading thought in the latter was comfort, and while at Altenborn the ante-rooms, corridors, and staircases consumed an immense amount of space, in Dorneck every inch of room was economized and made available. True, at Altenborn, even with a very numerous party of visitors, there would probably be no lack of guest-chambers, but the great size of the building, the numerous staircases, ante-rooms, and passages which connected the various portions, had their objectionable features, which were unknown in the compact mansion at Dorneck.

When they returned to the old lady's room, they found her in her winter garden, as she called a glass-covered balcony filled with flowers, which was built out from one of her rooms. In the autumn and winter the baroness rarely left her own suite of apartments, so this little conservatory was a great source of pleasure to her. It was very charming to sit among the flowers, and the young girls declared it delightful to visit grandmamma, though they remained alone with the old lady nearly every day. But the latter possessed the great art of turning the conversation upon subjects interesting to her guests, and even Sidonie talked far more than was her usual custom. In the evening some book was usually read aloud as they sat by the fire, and they parted with the consciousness of having spent a very pleasant day.

The princess was so much occupied with her ball and the invitations she sent out every day, that she fortunately troubled herself very little about the baroness's guests, and the latter were therefore permitted to lead their pleasant, quiet life a few days undisturbed. The first interruption came from a violent headache, which attacked Sidonie and compelled her to spend the afternoon in bed. The old lady always retired every day to take a little nap, and so Erica remained by the fire, absorbed in her own thoughts.

They must have been neither sad nor gloomy, for she leaned back in one corner of the armchair with her feet propped against the fender, and gave herself up to a very pleasant *dolce far niente*. The book she had intended to read lay untouched upon the little table by her side, and the brown eyes rested dreamily on the leaping flames. By degrees familiar objects seemed to gleam forth amid the forked tongues. The sea, with its danc-

ing waves, sparkled and flashed in the sunlight which blazed hotly on the white sand of the downs, and the pungent odor of the pines floated to her from the forest. There was she herself, with her hat transformed into a flower-basket on her arm, pouring the blossoms over a young man who lay unseen among the heather. She saw the dark eyes rest upon her with the quiet, searching gaze that aroused her anger, and perhaps for that very reason lived so firmly in her memory.

A faint smile played around the lips of the dreaming girl at the thought of this anger, and the recollection of the subsequent timid flight, which was half an advance. Now she sees the dear old house rise from the flames, her invalid mother reclining in her chair, while through the open doors of the veranda the balmy night breeze floats into the room, the breeze that bewitched her on the evening whose adventures would probably exert a lasting influence over her fate. The figure of the robber emerges from the darkness, the flash of his pistol illumines the gloom for a moment, and she firmly grasps the hand of the man she guides steadily and safely through the night.

The noise of the opening door rouses Erica from her reverie. The spell is broken; sea and forest are once more transformed into the dying embers on the hearth, which glow with a dim, red light. She turns her head towards the intruder with a half impatient movement, and instantly starts up with an exclamation of surprise. Elmar is standing on the threshold, looking fixedly at her. He seems almost petrified with surprise, for he remains perfectly motionless a few moments, then hastily approaches her, gazes into her face, and says in a half whisper,—

"I am dreaming, or it is the deceptive light of this hanging lamp. You cannot possibly be Erica."

He seizes her hand as if to convince himself of the reality of the vision before him, and then says in a louder, almost reproachful tone, "So you could not resist Katharina's persuasions?"

The joy which illumined her features has vanished; she feels only too keenly that her presence arouses no pleasure. The expression of his features, now that the first emotion of surprise has passed away, is sad and gloomy, and he slowly lets her hand fall ere any warmer pressure has given a token of welcome. Her eyes fill with tears, but her lips quiver with angry defiance, as she replies,—

"I did not come to the princess, I was sent, against my will, to visit grandmamma."

"You are grandmamma's guest?" asked Elmar with fresh surprise; "and why was this kept a secret from me?"

"Probably because no one thought of you," she replied in her former tone, as she turned away and resumed her seat in the armchair. "I came with Sidonie," she continued, "and my aunt —— "

"Sidonie here too?" interrupted Elmar, as he threw himself down on a little sofa, "I am heartily glad of it, our moods this time will be particularly sympathetic."

Erica cast a side glance at her companion. He had rested his elbow on the arm of the sofa, and was leaning his head wearily on his hand. His eyes were fixed on the fire, as hers had just been, but the leaping flames seemed to conjure up no bright pictures, for the eyes, half concealed under the downcast lids, looked dim and mournful. The angry indignation Erica had felt at his reception began to change into anxiety: what could have happened that he was so altered?

"It must be the decree of destiny that I find you here, Erica," said Elmar after a pause; "I had half resolved never to see you again."

She gazed at him with dilated eyes; this was too much to bear. She rose from her seat, and said in a tremulous voice: "It is not my fault that you find me here against your will, but fortunately I am at liberty to fix the time of my return." She moved, as if to leave the room, but Elmar again caught her hand and thus prevented her departure. Then he drew her back to her former seat, and said in a tone far more like his usual one, —

"The misfortune has happened, little fairy, so we must try to bear it manfully. Besides — I fear my good resolutions would have vanished like chaff before the wind, so it is well to throw the responsibility upon fate."

Erica made no reply; she had completely lost her composure, and was struggling bravely to maintain the mere external appearance of it. Elmar glanced at her face, and bending towards her whispered in a gentle, loving tone, "Don't be angry with me, Erica, you don't know how unhappy I have been the last few days. I believe Heaven has sent you to console me, that your presence may dispel the dark shadows, and my life again become bright and fair."

His words, and still more the tone in which they were spoken, aided her to re-

cover her self-possession more than all her previous efforts, and the brown eyes sparkled with a sudden light, as she answered pouting: "Unfortunately you showed only too plainly that my presence here was a calamity, instead of a consolation. But I have already told you that my return depends entirely on myself, and so ——"

"So you will stay here as long as possible," he replied. "But I hear grandmamma in the next room, let us make our peace quickly, before she comes in."

The young girl did not seem inclined to do so, for she made no reply, but started up and hurried towards the old lady, followed, though more slowly, by Elmar. The baroness seemed overjoyed to see her grandson, kissed him affectionately on the forehead, and then took her usual seat, while Elmar and Erica occupied the sofa.

"Well, Elmar, what do you say to our dear little visitor? Have I pleased you?" asked the old lady, casting a smiling glance at the young man.

"Pleased him, grandmamma?" replied Erica, before he could answer. "Baron von Altenborn reproached me violently for coming, and was still quarrelling about it when you entered."

"That is, grandmamma, the case was exactly reversed, and the young lady was quarrelling with me."

"Indeed?" said the baroness quietly; "I did not know, Erica, that your visit was intended for Elmar, I thought you came to see me."

"Grandmamma!" exclaimed Erica, fixing her startled eyes upon the old lady.

"Yes, or why should you quarrel with each other about it? But he really seems wearied and out of humor, and by no means in the mood to be an agreeable host. So your journey was unsuccessful, Elmar?"

"I am utterly hopeless, grandmamma. I have searched everything myself, bravely bid defiance to the most unspeakable weariness, but without the least result. Eberhard thought, as the document could not be found either here or there, it would probably never be discovered. True, in former times, various portions of the Altenborn estates passed into the hands of other branches of the family, but it is really impossible to believe that such an important document would not be kept here. Yet, for all that, I have searched almost everywhere else."

"Well, don't lose courage, Elmar; perhaps the old paper is still concealed here among the piles of deeds. But we must take our young friend here into our confidence, that she may share our anxieties. The matter in question concerns an old document that entails the estates of Altenborn on the oldest son, and in which — as I know positively, and have often discussed with my son — it is not an essential requirement that the mother should be of equal rank. At that time, to be sure, the founder of the entail probably took this as a matter of course, but the absence of the stipulation gives later descendants, whose views are different, valuable freedom. Elmar's mother was not his father's equal in rank, and this circumstance may be used to his disadvantage if the missing document does not protect him in his right. If nothing more, there might be an annoying lawsuit, which on every account we desire to avoid.

"Katharina, for she is the person in question, would be the next heir, if Elmar were not entitled to the inheritance, and would merely be obliged to add the name of Altenborn to her own. She therefore thinks herself in a certain sense defrauded by Elmar, considers her little boy the true heir of Altenborn, and believes herself very generous in allowing her brother to retain possession of the property so long as the child is his heir. At first she probably did not intend to assert any legal rights, but by degrees the wish has increased to a positive determination, which she is unable to control, and Elmar's marriage would undoubtedly be the signal for her to question his title to the estate."

The fire had burned down somewhat low during the conversation, but notwithstanding this, Erica held in her hand a small screen, to protect her glowing face. The old lady's last words made her heart throb quickly, not with sympathy for the imperilled title to the estate, but a sense of exultant joy. It required no great penetration to enable her to understand what had hitherto been incomprehensible in Elmar's conduct, as well as to explain his reception, and moreover grandmamma's desire to see her and the information she had just given showed a knowledge and at the same time approval of her grandson's choice. The light that had suddenly flashed upon her mind was very bright, and the radiance was so enchanting that she forgot the dark gulf into which she had just been allowed to look.

"You do not answer, Erica," said Elmar, as, without heeding his grandmother's presence, he bent over her. "Are you still angry with me because I did not receive you more warmly?"

Erica seemed to suffer from the heat of the fire, for she held the little screen close before her face as she replied: "I am very much shocked to learn that the princess is capable of treating her own brother in such a way."

"Let us talk no more about the sad affair, that we may not spoil our whole evening," said the old lady. "We will allow Elmar to smoke a cigar before tea to-day, to put him in a good humor, for later in the evening the young gentleman is uncivil enough to look upon the permission as a right."

"Grandmamma, you would light one for me yourself, if I forgot it," said the young man laughing, as he drew out his case to smoke the cigar before tea.

After conversing a long time upon indifferent subjects, Elmar asked: "Where is Sidonie? Has she gone out to drive with Katharina?"

"No, she is ill. I suppose you know Count Meerburg has been living for some time on his estates in this neighborhood."

"I have heard of it, has he been here?"

"Yes, a few days ago; he almost met Sidonie."

"Do you think him very much altered?"

"The Egyptian sun has bronzed his face a little, and the sight of the Pyramids made him somewhat graver, otherwise he seems the same as before."

"Has Katharina seen him?"

"No, he intended to call on her, but she had driven out as usual. Besides, he has accepted the invitation to her ball, and she will permit no visitors to come to this side of the house in order to keep Sidonie's arrival secret. I believe she is specially delighted at the thought of this meeting, because she thinks both parties have a decided aversion to each other."

"Did he confess any dislike to Sidonie to you, grandmamma?"

"What an idea, Elmar! But his conduct certainly shows no great eagerness for the marriage."

"Who likes to have a bride assigned him? But I am curious to see how many balls Katharina will give this winter."

"The entertainment is to be unusually magnificent this time, the rooms in her own wing are not sufficient, and she has ordered all the guest-chambers in the old castle to be prepared. My little Erica, can you turn your pretty brown eyes away from the fire and make tea for us?"

Erica sprang from her seat with a deep blush. The flames had again exerted their magnetic power, only instead of images of the past, their changeful light conjured up visions of a happy future. She had therefore neither attended to the conversation, nor perceived that the servant had set the tea-table. She now hurriedly strove to make amends for her forgetfulness, while the old lady told the footman to move a small marble table before Elmar and set a plate upon it.

"You must know, Erica, that this young gentleman is terribly spoiled by his old grandmother," she said, turning to the young girl, "and we must pass over all his incivilities. So he can take his tea where he is, and moreover we must butter his bread, as he is far too comfortable to undertake any such arduous labor."

"You must know, Erica, that I should make grandmamma thoroughly miserable if I undertook to butter my bread myself."

"Very well, Elmar. Now you want to transform your indolence into an act of self-sacrificing love."

"Unfortunately that will be a useless effort," replied Erica, entering into the jesting tone of the conversation; "the very first time we met I had strong proofs of this love of ease."

"I was lying in the shade asleep, when the thermometer stood at thirty degrees Reaumur; confess, grandmamma, that it would not have been amiss even for a classic Roman."

"I don't know whether a classic Roman would also have reclined on the Sternaus' lawn, or leaned back in a rocking-chair at the little fairy castle."

Elmar hastily started from his recumbent posture. "You amaze me, Erica; you could not have seen me at Herr Sternau's except through the garden fence, or at the little fairy castle except by looking in at the window."

Erica's blush only too distinctly verified Elmar's assertion, and the old lady said laughing, —

"My vanity is very much flattered to know that Elmar is the object of such close attention on the part of the young ladies. Did you look at him through the garden fence, Erica?"

"I see it is dangerous to take grandmamma's part against her grandson," replied the latter, with a very tolerable degree of self-possession, "and shall know how to act in future."

"But now let us think of Elmar's sandwich. What will you have, caviare, roast venison, or broiled salmon?"

"They are all excellent things in their way, and I am not very particular, grandmamma; I should like a little of each."

"We shall have to fill a large plate, Erica. Perhaps you would also like some Westphalian rye bread and Brunswick ginger-bread?"

"Of course, grandmamma."

"And roast chestnuts with new butter?"

"I never refuse chestnuts, grandmamma."

"I see orange marmalade too; will you have some?"

"If there is any toast."

"The toast is here, but I am afraid your marble table will be too small."

"Let us try it, grandmamma," replied Elmar good-naturedly. His melancholy mood seemed to have entirely disappeared, for he evidently felt both cheerful and comfortable. When Erica brought him his teacup and a plate piled with sandwiches, he took her hand and raised it to his lips.

"I have, as you see, adopted the manner of a veritable pacha, Erica, but grandmamma has trained me too well for me to release the hand of such a benevolent fairy without a kiss of gratitude."

Whether grandmamma's training also necessitated so long a detention of the benevolent hand was somewhat doubtful, and Erica at last withdrew it by the exertion of some little strength.

After the tea-equipage was removed, the servant placed a bottle and glass on Elmar's table. Erica, who had already resumed her seat beside him, looked at them with some little surprise.

"It is terrible, Erica, that this evening discloses all my weaknesses," said Elmar, laughing. "I am not satisfied with the tea you present, but drink wine, and moreover fiery red wine, at which you would shudder."

"And light, I see, a second cigar."

"Terrible, but true, Erica."

"My indulgence has made him a very wild fellow," said the old lady, casting a loving glance at her grandson. "Well, I can endure him for the few remaining years of my life, but I sincerely pity his future wife."

It must have been some fortunate instinct, that had just led Erica to take up the fire-screen again; so it was not remarkable that she now held it before her face, as she felt Elmar's glance rest upon her without any apparent cause.

The evening passed away very quickly and pleasantly; they were not compelled to resort to reading, and when the old lady gave the signal to retire, it was discovered that they had talked until a late hour of the night. Notwithstanding this, however, Elmar delayed his departure so long that the baroness was at last obliged to fairly send him away. On bidding them good-night, he showed that he was not only very "wild," but actually heartless, for he declared that he was very glad Sidonie had had the headache to-day. His grandmother pulled his hair a little, by way of punishment, but Erica uttered no reproof, as she cordially sympathized with him.

From The Cornhill Magazine.

A RING OF WORLDS.

THREE hundred years ago, when what was called the Copernican paradox was struggling for existence against the then orthodox Ptolemaic astronomy, the solar system was supposed to consist of eight bodies. The followers of Copernicus believed in a central sun, round which six orbs revolved, while around one of these — our earth — travelled one other orb,— making (with the central sun) eight bodies in all. The followers of the old astronomy, including at that time nine-tenths of the astronomers of repute, believed in a central earth, round which travelled seven planets, the sun and moon being two of these, only distinguished from the rest (as planets) by the comparative simplicity of their movements. During last year the number of bodies forming the solar system, without including comets or meteorites, or the multitudinous satellites which compose the ring of Saturn, has been raised to two hundred — so that for every orb known in the days of Copernicus and his first followers, twenty-five are now recognized by astronomers. Year after year more are becoming known to us. In fact, planets are being discovered so fast, that, after an effort (by dividing the watch upon them among the leading observatories) to keep them well under survey, the task has become regarded as almost hopeless. One or two of the flock are already missing; and it seems not improbable that, before many years have passed, twenty or thirty planets will have to be described as missing, while endless controversies may possibly arise, respecting those newly discovered each year, on the delicate question whether a discovery or a re-discovery has been effected.

It is hardly necessary to say, perhaps, that we refer to that strange ring of small planets which travels between the paths of Mars, the miniature of our earth, and

Jupiter, the giant of the solar system, as far surpassing our earth in size as it is surpassed by the sun. In the wide space between these two planets wander thousands of tiny planets. They form a zone of division not only between Mars and Jupiter, thus unlike each other, but between the family of small planets of which our earth is the principal member, and the family of large planets, — Jupiter, Saturn, Uranus, and Neptune. It is a strange thought that for ages these bodies have been circling round the sun unknown to men, though so near to us, compared with the fixed stars, that from the nearest of these the whole ring, far within which, be it remembered, the earth travels, would appear as the merest point in space. Still stranger is the thought that, among the members of this system or ring of worlds utterly invisible to ordinary eyesight, there must be presented at times, if living creatures are there to see, some of the most remarkable celestial scenery visible from any part of the solar system. For the orbits of these bodies interlace in a strangely complex manner. At times, from one or other of the set, several of the rest must be seen at so short a distance as to appear larger and more conspicuous than Jupiter or Venus appears to ourselves, while occasionally an even nearer approach must be made. In fact, in this part alone, collisions between planets are possible catastrophes; though, fortunately, the motions of these bodies being always in the same direction, they cannot encounter each other full tilt, but can only come into collision by the swifter overtaking the slower. Even of this there is little risk, so small are those planets, and so enormous the ring of space in which they travel.

For many years the idea had been gaining ground that those astronomers who were using their telescopes in the search for small planets, were wasting time which might be better employed. Of what use, many asked, can it be, now that we know these bodies may be counted by thousands, to search night after night for hours on the chance of discovering a few each year? But recently it has been seen that the small planets may give us very useful information. They have in fact already told us how much their giant neighbor Jupiter would weigh if he could be put in a scale against the earth,— or rather (for that was already known) they have shown us that Jupiter had been rightly weighed in another way. And now it seems likely that we shall learn from this despised family the true measure of the sun's distance, and with that the scale of the solar system, the quantity of matter contained by the sun, and many other matters of great importance in astronomy.

As one of the longest known among the minor planets has already given a very fair answer to the questions of astronomers on such points, while two others have recently been put under examination, the occasion seems a suitable one for giving a brief account of this ring of worlds, of the manner of their discovery, and of the ideas which have been suggested as to their origin.

If the solar system could be seen at a single view, its appearance at any moment would give no idea of regularity in its construction. The pictures of the solar system in our books present a certain symmetry even when the paths of the planets are shown with their true eccentricity of position (which is, unfortunately, but seldom done). The symmetry is like that of a leaf or flower, not perfect, not geometrical or rigid, but still it is sufficiently striking. But if from a picture of the orbits, presenting this symmetry of appearance, we prick off the positions of the central sun and of the planets in various parts of their paths around him, we can see no symmetry at all in the resulting set of points. The solar system thus shows how there may be real symmetry of arrangement among bodies apparently scattered without law or order. And it shows us also the part which time plays in educing symmetry from apparent disorder. Conceive a being so constituted that the circuit even of the planet Neptune around the sun, though lasting more than a hundred and sixty of our years, would seem to last but a single instant, so that to his vision the planet would be visible during its entire circuit even as a spark swiftly whirled round appears as a circle of light. To such a being the solar system would present a symmetrical and doubtless a most beautiful appearance. At its centre would be the glowing orb of the sun, round which would appear four rings of light, representing the paths of Mercury, Venus, the earth, and Mars; far outside these again four other rings of light, much brighter and with much wider spaces between them, showing where Jupiter and Saturn, Uranus and Neptune, traverse their wide courses; and between these families would be seen the multitudinous intertwining paths of the small planets, scarce discernible separately, but forming as a whole a faintly luminous ring be-

tween the well-defined sets of bright rings marking the paths of the eight planets. We need not here consider how the beauty of this scene would be enhanced by the rings of light which the moons of the giant plants and of our earth would produce. Let it suffice to note that the symmetry of the solar system, as thus seen, would be altogether marred if the ring of asteroids were removed. It is not given to man, whose span of life is less than half the orbital period of the outermost planet, to witness, scarcely even to conceive rightly, the scene we have described. But the mathematician can perceive what is necessary to its completeness. Accordingly, the astronomer Kepler, enquiring into the harmonies of the solar system, perceived that one note was wanting; or, returning to our ideal description of the system as it would be seen if centuries were fractions only of seconds, he perceived that the absence of a certain feature impaired the symmetry of the picture. He saw that though the distance separating the path of Mars from that of Jupiter is in reality much less than that which separates the path of Jupiter from that of Saturn, the next planet beyond him, yet there is a certain regularity in the progression of the distances which requires that the space between Mars and Jupiter should not be untenanted, as, according to the astronomy of his day, it was supposed to be. In his youth Kepler had noted the want, and had suggested certain fanciful relations which might be fulfilled by a planet occupying the gap. He had written to Galileo on the subject, who had advised him to base his theories on observed facts only. Later, when unwearying researches for nineteen years had revealed to him the laws of the solar system, Kepler suggested, as the relation which connects the distances of the planets, that which is now commonly called Bode's law. It may be thus simply expressed: calling Mercury's distance from the sun 4, the distances of the other planets' orbits from Mercury's orbit are in order as the number 3, 6, 12, and so on, doubling as we proceed. According to this law the distance of Mars from Mercury's orbit should be 12, and the distance of the next planet 24. But there was no known planet at that distance. Jupiter, the planet next beyond Mars, travels at a distance from Mercury's orbit represented on this scale by 48, and Saturn — the most distant known planet — at a distance of 91, the former corresponding exactly, the latter fairly enough, with the law we have indicated. But the planet which, according to the law, should have travelled between Mars and Jupiter at a distance of 24 from Mercury's orbit, or 28 from the sun, either did not exist, or was invisible.

In Kepler's day it was thought by many a sufficient solution of the difficulty to conclude that a planet formerly travelling along this seemingly vacant track had been destroyed on account of the wickedness of its inhabitants. And we are told that there were not wanting preachers who used the destruction of this hypothetical planet as a warning to evil-doers. If they continued in their sins they might not only bring destruction on themselves, but on the world, which might burst, as had that other world, and reduce the sun's family by yet another planet.*

It was not until the discovery of Uranus by Sir W. Herschel in 1781 that the speculations of Kepler attracted scientific attention. Astronomers had seen the three laws of Kepler interpreted physically by Newton, and had come to regard those relations which admitted of no such interpretation as mere coincidences. But when the empirical law of distances, for which, as it appeared, no reason in nature could be assigned, was found to be fulfilled by the new planet, astronomers could not but regard the circumstance as somewhat more than a mere coincidence. It is strange to consider that had Neptune instead of Uranus been discovered by Sir W. Herschel, the very reverse would have been inferred. Mercury's orbit by Bode's law should be 96, but is really 91; that of Saturn's distance from Uranus should be 192, but is really 188, so that Bode's law is satisfactorily fulfilled by Uranus; but Neptune's distance from Mercury's orbit should be 384, and is really but 296, which cannot in any way be reconciled with the law. Supposing Uranus unknown when Neptune was discovered, the distance of Neptune would have seemed too great by 104 for Saturn's next neighbor (being 296 instead of 192), and too little by 88 for Saturn's next neighbor but one, according to Bode's law of distances. Thus astronomers would have inferred that Bode's law was erroneous (as indeed it is), and would

* We do not learn whether the warning was effective or not; but probably the evil-doers were not more troubled by a danger affecting the whole of the human race than by that which had long been described as hanging over themselves in particular. The logical effect of the warning, one would suppose, must have been to encourage that particular form of godliness which is shown by anxiety about the sins of others. For it was clearly very much to the interest of those who did well to see that the evil-doers did not bring about a catastrophe from which good and bad alike could not fail to suffer.

not have thought of looking for a planet between Mars and Jupiter. As, however, by good fortune Uranus was found first, they inferred (mistakenly) that Bode's law represents a real relation existing, no one could say why, among the planetary orbits, and thence concluded (rightly) that the space between Mars and Jupiter is not vacant.

A society was therefore formed — chiefly through the active exertions of De Zach of Gotha — to search for the missing planet. It consisted of twenty-four astronomers, under the presidency of Schroeter. The zodiac, the highway of the planets, was divided into twenty-four zones, one of which was assigned to each member of this Society for the Detection of a Missing World. The twenty-four commenced their labors with great zeal. When we consider that over the region of the heavens which they were to examine at least a hundred planets, well within the range of their telescopes, were travelling, we may fairly wonder that they discovered nothing. Such, however, was the result of their labors. After they had been at work a considerable time, accident revealed to an astronomer outside their society a body which was regarded for a long time as the missing planet.

Professor Piazzi, while observing stars for his catalogue, was led to examine very carefully a part of the constellation Taurus, where Wollaston had marked in a star which Piazzi could not find. On the first day of the present century he observed in this part of the heavens a small star, which he suspected of variability, seeing that it appeared where before no star of equal brightness had been mapped. On January 3 he found that the star had disappeared from that place, but another, much like it, lay at a short distance to the west of the place which it had occupied. The actual distance between the two positions was nearly a third of the moon's apparent diameter. On January 24 (our observer was not too impatient, it will be seen) he transmitted to Oriani and Bode, members of the Missing World Detection Society, an account of the movements of this star, which had travelled towards the west till January 11 or 12, and had then begun to advance. He continued his labors till February 11, when he was seized with serious illness. Unfortunately, his letters to Oriani and Bode did not reach those astronomers until nearly the end of March, by which time the planet (for such it was) had become invisible, owing to the approach of the sun to the part of the heavens along which the planet was travelling.

But the planet was not lost. The sun passed on his way through the region occupied by the planet, and in September that region was again visible at night. In the mean time, the great mathematican Gauss had calculated from Piazzi's observations the real path of the planet. Throughout September, October, November, and December search was made for the missing star. At length, on the last day of the year 1801, De Zach detected the planet, Olbers independently effecting the rediscovery on January 1, 1802. Thus the first night of the present century was distinguished by the discovery of a new planet, and before the first year of the century had passed the planet was fairly secured.

Piazzi, the discoverer of the planet, assigned to it the name of the titular goddess of Sicily, where the discovery was made, — Ceres.

Ceres was found to be travelling in an orbit corresponding in the most satisfactory manner with Bode's law. According to that law the missing planet's distance from the orbit of Mercury should have been twenty-four; calling Mercury's distance from the sun four, the actual distance of Ceres is twenty-three and one-third.

Yet astronomers were not satisfied with the new planet. It travelled at the right mean distance from the sun; but passing over its inferiority to its neighbors, Mars and Jupiter, in size and splendor, it moved in most unplanetary fashion. Instead of travelling nearly in the same plane as the earth, like its neighbors Mars and Jupiter, its path was inclined to that plane in an angle of more than ten degrees, — a thing as yet unheard of among planets. As to its size, Sir W. Herschel, from measurements made with his powerful telescopes, estimated the new planet's diameter at about one hundred and sixty miles, so that, supposing it of the same density as our earth, its mass is less than one hundred and twenty-five thousandth part of hers. Thus it would take more than fifteen hundred and sixty such planets to make a globe as massive as our moon. And even this probably falls far short of the truth. For our earth owes no small part of her density to the compression produced by the attractive energy of her own substance. The moon, which is less compressed, has much smaller density; in fact, little more than half the earth's. Mars, again, being smaller, and having less attractive energy, has less density than the

earth (his density is about seven-tenths of hers).* The tiny Ceres would be very much less compressed, and, if made of the same substances, as we may well believe, would probably have a density less than half the moon's, or not very much exceeding that of water. Thus it would probably take some half million of worlds like Ceres to make such a globe as our earth, while from our moon six thousand such worlds as Ceres might be made. It was natural that astronomers should regard with some suspicion a planet falling so far short of every known planet, and even of a mere moon, in size and mass.

But presently a discovery was made which still more markedly separated Ceres from the rest of the planetary family. Olbers, during his search for Ceres, had had occasion to study very closely the arrangement of the groups of small stars scattered along the track which Ceres might be expected to follow. What reason he had for continuing his examination of these groups after Ceres was found does not appear. Possibly he may have had some hope of what actually occurred. Certain it is that in March 1802, or nearly three months after Ceres had been rediscovered, he was examining a part of the constellation Virgo, close by the spot where he had found Ceres on January 1 in the same year. While thus at work he noticed a small star forming with two others known by him an equilateral triangle. He felt sure this star had not been there three months before, and his first idea was that it was a variable star. At the end of two hours, however, he perceived that it had moved slightly towards the north-west. On the next evening it had moved still farther towards the north-west. It was in fact a planet, and, to the amazement of astronomers, the study of this planet's motion showed that its mean distance from the sun differed very little from that of Ceres. We speak of the amazement of astronomers, because the fact thus discovered was in reality the most surprising of any which had been made known to them since the nature of Saturn's ring was discovered by Huyghens in 1656. We have become so accustomed of late to the discovery of planets travelling along the region of space between the paths of Mars and Jupiter, that we are apt to forget how strange the circumstance must have appeared to astronomers at the beginning of the present century, that the old views respecting the solar system were erroneous, and that in addition to the planets travelling singly around the sun the existence of a ring of planets must be admitted. It is true that the discovery of this second planet (to which the name Pallas was given) did not fully demonstrate this. Still it showed that Ceres was not travelling alone in the region which had so long been supposed untenanted. And as it seemed in some degree to explain the smallness of Ceres, suggesting the idea that possibly the combined mass of bodies travelling in this space might not be greatly inferior to the mass of a primary planet, the notion of a ring of worlds travelling between Mars and Jupiter was presently entertained as according fairly with the facts already discovered.

Olbers himself was fully satisfied that other planets travel in the region between Mars and Jupiter. He was struck by the remarkable features of the orbit of the planet he had discovered. It was inclined more than three times as much as that of Ceres to the plane in which the earth travels, or to that medial plane near which lie the tracks of all the single planets. So greatly is the path of Pallas inclined to this track that even as seen from the sun its range on either side gave to the planetary highway a width of sixty-nine degrees, or nearly four times the width of the zodiac (the conventional highway assigned by the ancients to the planets) as determined by the range of Venus, viewed from the earth, on either side of the medial track. The range of Pallas as seen from the earth is still greater; so great, indeed, that this planet may actually be seen at times among the polar constellations. Moreover the path of Pallas is markedly eccentric, insomuch that her greatest distance from the sun exceeds her least in the proportion of about five to three. Olbers was led by these peculiarities to the belief that Ceres and Pallas are the fragments of a planet which formerly travelled between the paths of Mars and Jupiter, but had been shattered to pieces by a tremendous explosion. If our earth, as she travels along her present path, could by some violent internal action be shattered into fragments, the greater number of these would no longer travel in the plane in which lies the earth's present path. Those which chanced to be driven

* Of course the giant planets Jupiter, Saturn, Uranus, and Neptune seem to present exceptions to the rule we have here indicated. But there can be no doubt that in their case intense heat expands the planets' substance, while in reality we have no means of forming an opinion respecting their real density, since the surfaces we measure are not the real surfaces, but layers of clouds enwrapping these planets, and lying who shall say how far from the solid surface.

outwards in that plane would continue to travel in it, though on a changed path; for their original motion and their imparted motion both lying in that plane, so also of necessity would that motion which would result from the combination of these. But fragments which were driven away at an angle to that plane would no longer travel in it. Hence the great inclination of the path of Ceres and the monstrous inclination of the path of Pallas might be explained by supposing that the former was a fragment which had been driven away at a considerable angle to the ecliptic, while Pallas was a fragment driven away on a path nearly square to that plane.

To show more clearly how Olbers accounted for the peculiar motions of the new planets, suppose our earth to explode on or about March 20, at noon Greenwich time. Then the greater part of South America would be driven forwards; it would therefore travel on a course not far from the original track of the earth, but more quickly; our Indian empire would be driven backwards; and though the advancing motion previously possessed by this part of the earth, in common with the rest, would still carry it forwards, this motion would be greatly reduced. The central parts of Africa and the Atlantic around Ascension Island and St. Helena would be driven sunwards — an impulse which, combined with the previous advancing motion of this region, would cause this part of their new track to cross their former nearly circular track at a sharp angle, passing athwart that track inwards. The part opposite to the last-named — that is, in the middle of the Pacific — would be driven directly from the sun, and this impulse, combined with advance, would cause this part of the new track of the scattered fragments from the Pacific to cross the original track at a sharp angle, passing outwards. All these regions, and all lying on the zone passing through them, would continue to move in or near the former plane of the earth's motion; some more quickly than before, some more slowly, some passing outwards at that portion of their course to return eventually inwards till they came to it again, and some passing inwards for a while, to return, however, after a complete circuit, to the scene of the catastrophe. But England and other European countries would be impelled partly sunwards, partly upwards and northwards, from the plane of their former motion, and would therefore travel on a track largely inclined to their former course; that is, to the earth's present track. The same would happen, so far as upward motion was concerned, to the United States and to all the northern parts of Asia. The fragments from all these regions would thenceforward travel on inclined paths crossing their original track ascendingly at the place where the explosion occurred. On the other hand, Australia and New Zealand, south Africa, and the southern parts of South America, would be driven somewhat downwards or southwards, and the fragments of this zone of the earth would accordingly travel on paths crossing the original track of the earth descendingly at the place of the explosion. The north polar regions, especially the parts north of the American continent, would be driven more directly upwards by the explosion; while the south polar regions, especially the parts south of the Indian Ocean, would be driven as directly downwards: the fragments from these regions then would travel on paths most largely inclined to the original track of the earth.

Regarding the two planets hitherto discovered as fragments of one which had burst, Olbers perceived that there was a certain region of the heavens where he would have a better chance of discovering other fragments than anywhere else. Every fragment after the explosion would have a path passing through the place where the explosion occurred. For the place of explosion, being the spot from which each fragment started, would of necessity be a point along each fragment's future track. The fragments, be it understood, would not return simultaneously to that spot. Those which had been driven forwards (more or less) would have their period of circulation lengthened, those which had been driven backwards would have their period shortened; these last then would return to the scene of the outburst sooner than the former, and in point of fact no two would return simultaneously to that place unless, by some utterly improbable chance, they had been hastened or retarded in exactly the same degree. But all would pass through that spot for many centuries after the terrible catastrophe which had scattered them on their various paths. If the region of the heavens towards which that spot lay could be determined, then, the careful observation of that region probably would soon be rewarded by the discovery of other fragments. Moreover, the region exactly opposite to it would be similarly suitable for the search after these small bodies; for though their paths would not all pass

Original from CORNELL UNIVERSITY

through a *point* exactly opposite the scene of the explosion, these paths would all pass through the prolongation of a line drawn through the sun from that place. This is easily seen. Every planet has its own plane of motion, in which plane the sun necessarily lies; if, then, we know any one point of a planet's path, we know that the line joining the sun and that point lies in the plane of the planet's motion, and if extended beyond the sun must cross the planet's track.

Olbers then set himself the task of carefully observing two parts of the heavens, one being the place where the tracks of Ceres and Pallas approached each other nearest, the other being the place directly opposite to this. One point is to be noticed as essential to Olbers's faith in the success of his method of search. In his day it was generally believed that many centuries had not passed since the planets had been set moving on their respective paths. According to this view the catastrophe by which Ceres and Pallas and the fragments yet to be discovered had been sent on their new courses, could not have occurred so long ago that the paths of the fragments had been materially displaced from their original position. If, on the other hand, millions of years might have elapsed since the catastrophe happened, there would have been little room for hoping that the actual paths of the fragments would have retained any trace of the peculiarity we have described. It was somewhat fortunate for science that Olbers had full faith in the doctrine that the date of the catastrophe could not be more than four or five thousand years before his time, and that therefore he observed the two regions of the heavens indicated by the explosion theory with unwearying assiduity for many months. He also persuaded Harding, of Lilienthal, to pay special attention to these two regions; one near the northern wing of the Virgin, the other in the constellation of the Whale.

At length, on September 4, 1804, the search was rewarded with success; the planet called Juno being discovered by Harding in that part of the Whale which Olbers had indicated. Olbers did not cease from the search, however, but continued it for thirty months after Harding's success, and five years after his own discovery of Pallas. At length on March 28, the fifth anniversary of this discovery, Olbers detected Vesta, the only member of the family of asteroids which has ever (we believe) been seen with the naked eye.

For some reason astronomers seem to have been satisfied with this fourth fragment of Olbers's hypothetical planet. The search was not resumed for twenty-three years. Then Hencke, an amateur astronomer of Driessen, in Germany, commenced a search destined to meet with no success until more than fifteen years had elapsed. We shall return presently to the discovery of the fifth asteroid by Hencke. We must first, however, consider the interesting questions raised by astronomers, after the discovery of Vesta, upon the theory of Olbers that the asteroids are fragments of an exploded planet.

Lagrange, in 1814, examined the theory mathematically, enquiring what degree of explosive force would be necessary to detach a fragment of a planet in such sort that it would not return, but travel thereafter on an orbit of its own around the sun. We have not by us the result of his researches except as they are given in Grant's "Physical Astronomy," as follows: "Applying his results to the earth, Lagrange found that if the velocity exceeded that of a cannon-ball in the proportion of one hundred and twenty-one to one, the fragment would become a comet with a direct motion; but if the velocity rose in the proportion of one hundred and fifty-six to one, the motion of the comet would be retrograde. If the velocity were less than in either of these cases, the fragment would revolve as a planet in an elliptic orbit." This statement is not very satisfactory, because the velocity of a cannon-ball, depending considerably on circumstances, is not a definite unit of measurement. The assertion, too, that the fragment would become a comet is open to exception, and nothing is said about the least velocity necessary to free the expelled body from the earth. Probably the velocity of a cannon-ball was taken by Lagrange at about five hundred yards per second, that being a fair velocity for a sixty-eight pounder at the date of his paper. A velocity, then, exceeding a cannon-ball in the proportion of one hundred and fifty-six to one, would be about forty-four miles a second. Now, for a body expelled from the earth to travel as a retrograde comet, it must be sent backwards with a velocity equal to the earth's in her orbit (about eighteen and one-half miles per second), increased by the proper velocity for a retrograde comet, about twenty-five and one-half miles per second, or forty-four miles per second in all. This agrees, then, with Lagrange's result. But he seems to have been led from the real

Digitized by CORNELL UNIVERSITY Original from CORNELL UNIVERSITY

subject of enquiry to problems which are only matters of curiosity. The fragmentary planets of Olbers's theory move neither as advancing nor as retrograde comets. Leaving, then, Lagrange's paper, as not very much to the point, if rightly represented by Grant, we note simply that the velocity necessary to expel from the earth a fragment of her mass, in such sort that it would not be drawn back, would amount to about seven miles per second, or, say, about twenty-five times the velocity of a cannon-ball.

But again, the expulsion of a fragment, and the explosion of an entire planet, are processes very different in their nature. If a fragment were expelled, the entire mass of the earth would recoil with a motion bearing the same kind of relation to that of the fragment which the recoil of a very heavy cannon bears to the motion of the ball. If a cannon were not heavier than the ball, the cannon would be driven back as rapidly as the ball would be expelled, though frictional resistance would bring it sooner to rest. Again, when a shell at rest bursts, the fragments are driven outwards on all sides, with much smaller velocities than any one of them would have if the entire charge of powder acted upon it, the rest of the shell being in some way restrained from moving. We see, then, that for a planet to explode into fragments which thereafter should be free to travel independently around the sun, the explosive force must enormously exceed what would be necessary in the case of a single fragment expelled as a projectile is expelled from a gun.

When we consider, further, that the frame of the earth is demonstrably not the hollow shell formerly imagined, but even denser at its core than near its surface; that, moreover, it is not formed of rigid materials, but of materials which under the forces to which they are subject are perfectly plastic and ductile, it seems incredible that under any conditions which appear possible our earth could be shattered by an explosion. Professor Newcomb, of Washington, in an able paper on this subject, remarks on this objection that, "since the limits of our knowledge are not necessarily the limits of possibility, the objection is not fatal, and it is difficult to say what weight ought to be attached to it;" and, as many of our readers will remember, Sir W. Thomson, one of the greatest mathematicians living, has not thought the arguments against the possible or probable shattering of a planet sufficiently weighty to prevent the theory from being entertained that one world may be peopled from the seeds of life brought to it by the fragments of another which had exploded. Yet it may fairly be said that if the destructive explosion of a planet is possible it is utterly improbable; and that absolutely nothing is at present known to us which suggests even the bare possibility of such a catastrophe.

Yet the theory that a planet which had been travelling between Mars and Jupiter had burst into fragments had a much more probable appearance in Olbers's time than it has at present; for the four asteroids first discovered travelled on orbits not differing greatly as to their mean distances, which are as the numbers 236 (Vesta), 267 (Juno), 277 (Ceres and Pallas). When asteroids began to be discovered which travelled nearer to the sun than Vesta, and much farther away than Ceres and Pallas, the explosion theory was shown to be improbable. When, further, the actual paths of these multitudinous worlds came to be examined, the theory was found to be utterly untenable. More recently still a circumstance noted by the ingenious American astronomer, Kirkwood, has pointed to another theory as extremely probable.

The history of the successive discovery of the various members of the asteroidal family, though not without interest, would be little suited to these pages. A few details, however, may be mentioned here as illustrating the general character of the search.

We have seen that Hencke engaged in 1830 in the search for a fifth asteroid. On the evening of December 8 he observed a star of the ninth magnitude in the constellation Taurus, in a place where he felt sure, from his recollection of the region, that there had previously been no star of that degree of brightness. He communicated the observation to Encke, of Berlin; and on December 14 they rediscovered it in the place to which by that time it had removed. It was found to be an asteroid travelling at a distance almost midway between that of Vesta and that of Ceres. Hencke requested Encke to name the new planet, and that astronomer selected for it the name of Astræa.

On July 1, Hencke discovered a sixth asteroid which Gauss named at his request, calling it Hebe. In the same year, and only six weeks later, our English astronomer Hind discovered the asteroid Iris; and on October 18 he discovered another, to which Sir J. Herschel, at his request, assigned a name, selecting (somewhat unsuitably, per-

haps, for an October discovery) the name Flora.

Since that date, not a year has passed without the discovery of at least one asteroid, as in 1848, 1849, and 1859. Two were discovered in 1851, 1863, and 1869; three in 1850, 1864, 1865, and 1870; four in 1853, 1855, and 1867; five in 1856, 1860, 1862, and 1871; six in 1854, 1858, 1866, 1873, and 1874; eight in 1852 and 1857; ten in 1861; eleven in 1872; twelve in 1868 and 1876; and seventeen in 1875. During last year six were discovered. The astronomer who has hitherto been most successful in the search for asteroids is Peters, of Clinton, U.S. (Professor Peters is a German by birth, however), with twenty-seven; next Luther, of Bilk, with twenty; and third Watson, of Ann Arbor, Michigan, with twenty. Goldschmidt, a French painter, discovered fourteen; Borelly and our Hind, ten. These six have thus discovered one hundred and one of the one hundred and seventy-five asteroids at present known. After them come De Gasparis and Palisa, with nine each; Pogson, of Madras, with seven; Chacornac and Paul Henry, with six each; Prosper Henry and Tempel, with five, and Perrotin, with four, bringing up the total to one hundred and forty-nine. Of the remaining twenty-three three were discovered by Ferguson; two by Olbers, Hencke, and Tuttle; and Piazzi, Harding, Graham, Marth, Laurent, Searle, Forster d'Arrest, Tietjen, Stéphan, Coggia, Schulhof, Schiaparelli, and Knorre have each discovered one.

Some coincidences which would seem curious, but for the great number of asteroids already known, have naturally occurred during the progress of discovery. Thus the asteroid Irene was discovered by De Gasparis, independently, a few days after Hind had marked it for his own (May 19, 1851). *En revanche*, De Gasparis discovered Psyche on March 19, 1852, while Hind, who had seen the planet on January 18, but had been prevented by bad weather from re-observing it, satisfied himself on March 18 of its planetary character. While Hind was planning a vigorous search after the planet, news reached him that De Gasparis had discovered it. Goldschmidt, on September 19, 1857, discovered two asteroids, which chanced that night to be within a distance from each other equal to about one-third of the apparent diameter of the moon. No other astronomer has ever had the good fortune to capture two of these wandering bodies on the same night and within the same telescopic field of view. But the planet Alexandra was discovered by Goldschmidt, at Paris, on September 10, 1858, and the planet Pandora by Mr. Searle, of Albany, New York, on the same night, only a few hours later. The asteroid Melete, really discovered on September 9, 1857, was not recognized as a new planet till 1858, having been for a long time mistaken for the asteroid Daphne. The latter had been lost since May 1856, and Goldschmidt, its discoverer, was looking for it in September 1857, when he found Melete. When Melete was proved by Schubert's calculations to be a different body, fresh search had to be made for Daphne; but she was not found till August 31, 1862, having been thus lost more than six years.

One feature of M. Goldschmidt's labors in this field of research is worthy of mention. Most of the astronomers who have added to the list of known asteroids were professional observers, employed in well-provided observatories. Goldschmidt was a painter by profession, and the telescopes with which he observed were successively, as he could afford to extend his observational resources, of two inches', two and two-thirds inches', and four inches' aperture only. "None of M. Goldschmidt's telescopes," says Mr. Main, of the Radcliffe Observatory, "were mounted equatorially" (that is, so as to follow any star to which they might be directed by a single motion), "but in the greater number of instances were pointed out of a window which did not command the whole of the sky."

Having now nearly two hundred of these bodies to deal with, we can form a safer opinion, than in Olbers's time, of the theory whether they are fragments of an exploded planet. The answer to this question comes in no doubtful terms. One fact alone suffices to show clearly that they cannot have had a common origin. The least distances of some of the more remote of these bodies from the sun exceed the greatest distances of some of the nearer. Thus Harmonia, at her greatest distance from the sun, is about two hundred and seventeen millions of miles from him, Nemansa two hundred and thirty-one millions, Feronia two hundred and thirty-three millions, and so on; while Cybele, at her nearest, is two hundred and seventy-six millions of miles from the sun, Doris two hundred and sixty-two millions, Hygeia two hundred and fifty-nine millions, and so on. So that Cybele, at her nearest to the sun, is farther from him by nearly eighty million miles than Harmonia at her nearest. The two orbits do not even approach

each other within this distance, enormous though it is, for the place of Cybele's nearest approach is not *nearly* in the same direction from the sun as the place of Harmonia's greatest recession. The two orbits nowhere approach within a distance less than that which separates our earth from the sun. If the two planets were originally parts of a single one, their orbits after the explosion would have intersected. It is utterly impossible that, if this had been so, subsequent perturbations could have separated the paths by so enormous a distance as ninety millions of miles at the place even of nearest approach.

But while the discovery of multitudinous members of this ring of worlds has rendered Olbers's theory of the explosion of a single planet between Mars and Jupiter utterly untenable, it has brought to our knowledge a remarkable relation which points very clearly to the real origin of the ring system of planets.

When as yet only half as many asteroids had been discovered as are now known, Professor Kirkwood, of Bloomington, Indiana, arranging these bodies in the order of their mean distances from the sun, noticed that certain gaps exist, in such sort that no asteroids travel at or nearly at certain mean distances from the sun. And looking more closely into these missing distances, he observed that they correspond to the distance of the giant planet Jupiter in this way, that a planet travelling at any one of these missing distances would have motions synchronizing with those of Jupiter, in the same sense in which the vibrations of one note synchronize with the vibrations of another in harmony with it. For instance, there is a well-marked gap at a distance from the sun exceeding our earth's in the proportion of five to two; now a planet travelling at this distance would make three circuits while Jupiter makes one. There is another gap at a distance somewhat exceeding three and a quarter times the earth's; and a planet at this distance would travel twice round the sun while Jupiter travels once round him. Still more remarkable, because occurring in the very heart of the ring, is the gap corresponding to the distance of a planet which would travel five times round the sun while Jupiter travels twice round him. There are two gaps, also, where a planet would travel seven times round (1) during two circuits, and (2) during three circuits, of Jupiter.

Before enquiring into the meaning of this peculiarity, we note that now, when twice as many asteroids have been discovered, the peculiarity is better marked even than when Kirkwood first noticed it. He was justified in saying, as he did in 1868, that the coincidences are not accidental; for the odds were enormously against the observed arrangement, and its accidental occurrence so unlikely as to be practically impossible. But had the arrangement been accidental with the eighty-seven asteroids known to Kirkwood, it could not but have happened that some of the eighty-nine since discovered would have had mean distances corresponding to those gaps or *lacunæ*. This, however, has not only not happened, but the aggregation of asteroids at distances where Kirkwood had already noticed that they were most numerous, has become still more decided.

We are led back, in our enquiry into the significance of this singular relation, to the time when our solar system was gradually forming from its former nebulous condition. Imagine a ring of nebulous fragments, not as yet gathered into a single mass. The process of aggregation would depend in considerable degree on the disturbances to which the fragments were exposed. If they were all moving in concentric orbits, and were not disturbed at all, there would be no collisions, and they would remain as a ring of fragments. It might seem, then, at a first view, that the zone of asteriods was most favorably placed for aggregation into planet form, being under the special perturbing influence of Jupiter, the mightiest of all the planets. But excessive disturbance would be by no means favorable to the formation of a single planet. The nebulous matter must be churned by perturbations, but it must not be scattered by them; and this is what Jupiter's action on the planetoidal ring has done. Quantity of matter, again, would be a very important point in the process of aggregation. A region crowded with nebulous fragments would soon teem with aggregations, which would before long gather into a few large masses, which in turn would aggregate into one. But in a region where nebulous matter was very sparsely strewn, aggregations would not readily form, however mightily the region might be disturbed. The very activity of the disturbing forces might, in this case, check the process of aggregation. The two bodies which had once come into collision would travel on intersecting orbits, and would therefore before long come into collision, if not perturbed; but if perturbed, their orbits would cease to coalesce; so that the action of a great disturbing planet might prevent a process of

Original from CORNELL UNIVERSITY

aggregation which had already commenced. Nor we know that the quantity of matter in the region where the asteroids travel is less than in any other zone of the solar system. We do not know how many asteroids there are, but we do know how much they all weigh; at least, we know that altogether their weight is not more than a fourth of our earth's, and is probably a great deal less. And the zone over which they range is very much larger than the zone over which our earth may be regarded as bearing sway. Their zone being thus poverty-stricken, and Jupiter's mighty mass in their neighborhood perturbing them too actively to allow of their aggregation, they remain as a ring of fragments.

And now let the signs of Jupiter's influence in this respect be noticed. He would perturb all these fragments pretty equally in a single revolution of his. But those whose periods synchronized with his own would be more seriously perturbed. For the disturbance produced in one set of revolutions which brought any asteroid and Jupiter back to the position they had before those revolutions began, would be renewed in the next similar set, and in the next, and so on, until one of two things happened. Either the asteroid would be thrown entirely out of that periodic motion which had brought it thus under Jupiter's effectively disturbing influence, *or*, being set travelling on a markedly eccentric path, it would be brought into collision with some of the neighboring asteroids, and would cease to have separate existence, or at least move thenceforward on a changed orbit. Thus those asteroids having a period synchronizing with that of Jupiter would be gradually eliminated, and we should find gaps in the ring of worlds precisely where gaps actually exist.

There can be no reasonable doubt that these marked gaps were produced in the manner here described. Their existence can indeed be explained in no other way, and can be so satisfactorily explained in this way that assurance is made doubly sure.

But now consider the significance of this result. Imagine the asteroidal ring as it now exists to be redistributed, the gaps being filled up. The process we have described would immediately come into operation. But many millions of years would be required before it could eliminate even a few among the asteroids having those synchronous periods which expose them to accumulating perturbations. Only one of the two processes above described would really be effective. Mere change of period would be oscillatory. We have an instance of the kind in the motions of Jupiter and Saturn, which very nearly synchronize, Saturn going almost exactly twice round the sun while Jupiter goes five times round. But though for a long period of time accumulating perturbations lengthen Saturn's period (and shorten Jupiter's), after a while the time comes when these changes are reversed; then Saturn's period begins to shorten (and Jupiter's to lengthen). The changes carry these periods on either side of their mean value, just as the swinging of a pendulum carries it on either side of its mean position. So it would be with an asteroid mightily perturbed by Jupiter; its period would oscillate more widely, but still it would oscillate; and during the middle of the oscillation (just as a pendulum at the middle of its swing is in its mean position) the asteroid would have that synchronous period which, as we have seen, none of the asteroids in point of fact possess. We must look, then, to collisions to cause the gaps in the ring of worlds. But how rare must such collisions be among minute bodies like the asteroids, even though they be hundreds of thousands in number, occupying a domain in space so vast as that which belongs to this system! The width of the ring greatly exceeds the earth's distance from the sun, amounting in fact to more than one hundred and twenty millions of miles. Its innermost edge is more than two hundred million of miles from the sun. It is not a flat ring, but shaped like an anchor ring (or a wedding ring), and is as thick as it is wide — insomuch that a cross section of the ring would be a mighty circle, more than one hundred and twenty millions of miles in diameter. Amidst this enormous space a million asteroids, each five hundred miles in diameter (and none of the asteroids are so large, while the number even of those exceeding one hundred miles in diameter scarce amounts to a hundred), would be as widely scattered as a million grains of sand would be in such a space as the interior of St. Peter's, at Rome. Take a cubical block of sandstone, one inch in length, breadth, and thickness, crumble it into finest sand-dust, and imagine this dust scattered in the interior of that great building. How small would be the chance that any two particles from that tiny heap would come into collision during months of their aërial wanderings! Very much smaller would be the risk of a single collision between asteroids during millions of years as they

travel (all the same way round, be it noticed) on their wide orbits, even though their number were a hundredfold greater than it is, and their volumes increased a millionfold.

Either, then, we must imagine innumerable millions of years to have elapsed since the ring of asteroids first existed, and that very gradually the synchronous asteroids have been eliminated by collisions, or else we are forced to the conclusion that the formation of this ring of worlds, or rather this series of rings, belongs to an earlier era of our solar system's history, when the matter from whence the rings were one day to be formed was in the nebulous condition. It appears to us that the latter conclusion is altogether the more probable. We escape none of the difficulties of the problem by adopting the former conclusion, while many other difficulties are introduced. By the latter we simply have the same difficulties to encounter which appertain to all forms of the nebular hypothesis respecting the origin of the solar system. These difficulties are great, because the distance over which we endeavor to look back is great; but they are not insuperable. The positive evidence for the general theory becomes stronger and stronger as astronomical research advances; and the mere circumstance that it is surrounded by difficulties can in no sense lead us to abandon it, although compelling us to admit that as yet we have not thoroughly mastered its details. The asteroids themselves supply an argument in favor of the nebular theory rendering its probability so strong as practically to amount to certainty; for the antecedent probability against the observed uniformity of direction of the one hundred and seventy-five asteroids by chance, or in any conceivable way except as the result of some process of evolution, is equal to that of tossing either "head" or "tail" one hundred and seventy-five times running, or about

23,945,290,000,000,000,000,000,000,000,000,000,000,000,000,000,000,000,000 to 1.

Adopting the nebular theory, we must of course adopt with it the conclusion respecting the origin of the asteroids, to which, as we have seen above, we are led by the examination of the relations presented by this system, — viz., that while still existing as a great ring of nebulous masses, they were to such degree perturbed by Jupiter's mighty attraction upon them, as on the one hand to be prevented from forming into a single planet, and on the other to be sorted out, if one may so speak, into several rings with well-marked gaps between them, these gaps corresponding *exactly* with the distances at which planets would be most effectively disturbed by Jupiter. The close accordance between the results to which we are led by *a posteriori* and *a priori* considerations, affords strong evidence in favor of both lines of reasoning. But it is very noteworthy, also, that when, seeing the probability of the conclusions towards which we have been led, we enquire whether any similar case exists within our solar system, and if so whether the evidence in that case corresponds with that which we have obtained in the case we have been considering, we find the most striking evidence of all. The ring system of Saturn has long been regarded as consisting of multitudes of minute satellites. Thus it resembles the zone of asteroids, only it is relatively much more crowded. Now in the ring system of Saturn there are gaps or relatively vacant divisions separating rings of closely clustering satellites. Distinguished among all these gaps by superior breadth and darkness is the great division separating what were formerly called the two rings from each other. Here, for a breadth of nearly two thousand miles, so few satellites travel that to ordinary observation the great division looks black, though, closely scrutinised, it is found to be simply very dark. Now when we enquire whether satellites moving round this open space would have periods synchronizing with that of the innermost (and therefore most effectively disturbing) of his moons, we discover these remarkable facts, — that a satellite would travel in the very middle of the dark division or open space if its period were one-half that of the innermost of Saturn's moons, and almost on the same track if its period were one-fourth that of the innermost moon but two, while it would be well within the open space, but nearer its inner edge, if its period were one-third that of the innermost moon but one, or one-sixth that of the innermost moon but three. It follows unmistakably from these relations, first noted by Professor Kirkwood, that the great division in Saturn's rings has been swept and garnished by the action of the four innermost of Saturn's moons, but especially by the innermost of all. This fact corresponds so well with the nebular hypothesis, and is so utterly inexplicable on any other, as strongly to corroborate an opinion, expressed by the present writer twelve years ago, that the peculiarities of

the Saturnian ring system would one day be found to afford "a key to the law of development under which the solar system has reached its present development." The same may now confidently be said respecting the ring of worlds travelling between the orbits of Mars and Jupiter. It has already enabled us to weigh the giant Jupiter afresh; it has given excellent measures, and promises to give yet better measures, of the dimensions of the solar system; and we venture to predict that before long this zone of worlds will have placed beyond shadow of doubt or question the general theory of the development of our solar system of which Laplace's nebular hypothesis presents only a few details, or rather suggests only a few possibilities.

From The Nineteenth Century.

HOW THE TURKS RULE ARMENIA.

BY DR. HUMPHRY SANDWITH.
(OF KARS.)

SUPPOSE an English prime minister were to persuade himself and a large section of the public that the security of our dominion in India required the sacrifice, once a year, of twenty innocent natives of both sexes, with every circumstance of cruelty and indignity which could add bitterness to death; and suppose a bill were introduced into Parliament for the purpose of giving practical effect to such conclusion. How many members of Parliament would be found to vote for it? Not one, I believe. The most loyal and submissive of the minister's followers would recoil from participation in the guilt of so great a crime, even though the alternative should be the probable loss of our Indian empire. He would say to himself that the alternative supposed, though possible or even probable, was by no means certain; that the danger was perhaps, after all, not so great as had been supposed, and might perchance be altogether averted by the operation of events as yet unforeseen; but that, in any case, he must decline to have a hand in the commission of a great crime, be the political gain accruing therefrom ever so important.

Now what is the difference, in point of morality, between the policy which I have supposed and that which has found so many advocates in England during the last eighteen months? We have been told on high authority — and the doctrine has been energetically defended in high quarters — that we are bound for the sake of "our own interests" to "uphold" a political system of which we know that one of the inevitable fruits is the periodical torture and slaughter of "ten thousand or twenty thousand" innocent human beings, to say nothing of other evils which are not periodical, but chronic. We are not simply to stand aloof and let matters take their course; we are to "uphold" this periodical sacrifice to the Moloch of "British interests," and must accordingly interfere actively "to prevent changes from occurring" in Turkey which would put an end to the sacrifice, if we think that such changes would be "detrimental to ourselves."* In point of morality there really is no difference at all between upholding a system which now and then massacres twenty thousand persons, and committing the massacre ourselves. Yet so inconsistent is human nature that those who do not scruple to defend the one would shrink in horror from the other. How is this? One cause of the anomaly is probably a defective imagination. We are slow to realize our responsibility for crimes of which the scene is far away, and which are not directly the work of our own hands. Yet if we uphold the system which perpetrates them we are in truth as responsible as if the scene were London, and ours the hands that have been imbrued in innocent blood. Look, for instance, at the arguments in vogue against the annexation of Armenia, wholly or in part, by Russia. Such annexation, we are told, would endanger British interests. But that is a surmise only, and a surmise, moreover, resting on several improbable assumptions. It is an assumption that Russia has any designs on India at all. It is a surmise that Russia is likely to make a railway through the Euphrates valley. It is a surmise that the Porte would always have the will and power to keep open a route to India through the Euphrates valley for the passage of British troops. It is a surmise that Russia would not find her interest in cultivating friendly relations with England, provided England frankly substituted a policy of confidence for a policy of perpetual suspicion and abuse of Russia. And because it is barely possible that one or more of these surmises may come true,

* See Sir Henry Elliot's famous despatch, Blue-Book No. 1, for 1877, p. 197.

just as it is barely possible that Germany is aiming at the annexation of Holland and the invasion of England, we are to oppose — if need be by force of arms — the annexation of any part of Armenia to Russia.

Have those who argue thus made any effort to realize what Turkish rule in Armenia means? Charity forbids me to believe it, for I do not think so ill of them as to suppose that they would deliberately advocate the indefinite perpetuation of wrongs the most intolerable, and cruelties the most revolting, in order to avert some remote and perhaps imaginary danger to British interests. Let me endeavor, then, to give a succinct yet accurate picture of the actual condition of the Christians of Armenia, and then ask the people of England whether they are willing to bear the responsibility of upholding a system which has always produced, and must produce while it lasts, the state of things which I will now proceed to describe. My evidence shall be all official, not that there is any lack of other evidence. I know the country well myself, having spent some considerable time in it rather more than twenty years ago, and paid a visit of some length to it since; but I prefer to give the evidence of her Majesty's consuls, because their natural bias is to palliate rather than exaggerate the misdeeds of the Mussulmans; so that, however black the picture may be, the reader may feel assured that it never goes beyond the facts, but is more likely to fall short of them.

The blue-book that I propose mainly to consider is that marked "Turkey, November 16, 1877." It treats of the state of the Christians in Turkey. The first despatch I call attention to is one from Mr. Consul Zohrab of Erzeroom, a gentleman who has spent the best part of his life in various parts of Turkey, and who speaks the language as a native. Such a man would not be likely to take an exclusively English standard from which to judge her shortcomings. He has also at times proved himself a defender of the Ottoman Empire by his pen. About sixteen years ago he wrote strongly to a leading paper, accusing me of exaggerating the vices of the governing class in a book I had lately brought out entitled "The Hekim Bashy." In December of 1876 he thus wrote from Erzeroom: —

The demands of the government press with crushing weight on all classes. Arrears of taxes (the validity of which no court of justice would admit), current taxes, taxes in advance, aid in money for the war, contributions in kind for the army, means of transport for munitions of war and provisions, are exacted from the Christian and from the Mussulman peasants with pitiless severity, and already thousands of families have been so reduced that they live only by public charity. Unscrupulous employés take advantage of the pressing needs of the government to augment their own exactions, and as there is no possibility of checking such corruption, seeing that the officers who are supposed to watch over and protect the people (!) are the culprits, it is impossible to state what can be done, while Turkish officials have power, to put an end to this systematic spoliation of the people.

In an interview with the pasha he frankly tells him that "the persons the villagers had to dread most were the officials and the lower grades of officers, who are the real oppressors and robbers."

The same gentleman, in a despatch dated December 24, 1876, reports a large fire in the city of Van which occasioned the loss of from eight hundred to one thousand buildings. We all know the rigorous measures taken by civilized people, on the occasion of a fire, against plunderers. In Turkey they know better than this — the government officers share with the plunderers. Mr. Zohrab, writing on this occasion, says: —

The Christians complain bitterly of the conduct of the government officials and soldiers, whom they accuse of having directed their efforts, while the fire lasted, to breaking open, carrying off, and concealing property, instead of endeavoring to arrest the flames.

In another despatch the consul calls on the governor-general to ask what steps he intended to take for the protection of the Christians of Van. His Excellency reads a letter from Nazim Bey, who had just arrived in Van, reporting that the fire was accidental; that the soldiers were not at all implicated; that there had been considerable pillaging, but the greater portion of the stolen property had been recovered; that the Christians had evidently been the most active in pillaging, as the greater part of the lost property was found in their possession; that the fire had destroyed about five hundred shops and stores, about half belonging to the Mussulmans, who were as great sufferers as the Christians.

The consul at once contradicted every detail of the report of Nazim Bey from information "received from disinterested

Original from CORNELL UNIVERSITY

persons who had personally taken evidence, and had visited the scene of the conflagration;" and he remarked: "If Nazim Bey considered the duty laid on him so light that a mere glance was sufficient for him to come to a decision, I feared his reports would be set aside as those of the commissioners sent into Bulgaria by the Porte had been." This plundering by the Turkish officials is no new thing; we read precisely the same reports in the blue-book on the Damascus massacres, during which *officers of the sultan* were seen by Europeans returning from the Christian quarter laden with plunder. Any one knowing the real character of the Turkish officer would not be surprised at anything of the kind. Usually the officer comes from the family of a small shopkeeper, or perhaps oftener he has been a valet or pipe-bearer to some great pasha. He is of a race decidedly lower in *morale* than that of the peasant, is often many months in arrears of pay, and has probably a wife and children dependent on him.

On the 30th of January of this year, the same consul telegraphs to Sir H. Elliot: "Panic in Bitlis district, several murders, many villages devastated, others deserted by inhabitants from dread of Koords, who threaten the town. Inhabitants, Mussulman, Christian, watch armed in their barricaded houses." The state of Bitlis and the neighborhood was simply one of anarchy as described by the consul. The Koords had plundered the villages around; the people had fled into Bitlis, which was in a state of great alarm. On all this being represented to the pasha, he replied that he could spare no troops; "the people of each town must create their own police force." Be it remembered that the Christians are not allowed to bear arms.

On the 14th of March of this year, Mr. Zohrab sent the following telegrams to Mr. Jocelyn at Constantinople: —

> One hundred and seventy-five Redifs, on way to Erzeroom, stopped at Gelintpatch, Kehlabar, and Hosberik, in district of Bunis; have desecrated church, maltreated priest, beat Christians, outraged women — three violated by about sixty men, left dying. Authorities refuse protection. Villages were deserted, Christians fearing massacre having fled. Military authorities here supine. Christians begin to suffer severely — dread opening their shops. Acts of oppression and cruelty occur daily.

The foreign minister assures Mr. Jocelyn that no effort shall be spared to discover and punish the perpetrators with all rigor. The consul follows his telegram by a despatch in which he relates that the village in question was a mixed one. The head of the village was of course a Turk, and he quartered one hundred and twenty-five men on the Christians, and forty-five were taken into Mussulman houses.

> A demand for food was at once made on the Christians, and was complied with. Money was then asked for and given. The troops then got hold of the priest of the village and maltreated him. Afterwards they began abusing and beating all the male Christians they could find, and, entering the women's portion of the houses, commenced outraging the women and violating the girls. Three young women were so brutally treated by about sixty soldiers that they were reported dying when the letters, which I have seen, relating these atrocities, were sent to the authorities here.

The same enormities were committed in the villages of Kielakhboor and Hosberik. These, be it remembered, were not Circassians nor Bashi-Bazooks; they were regular soldiers. The consul complains to the pasha that he should have considered the affair so light as to have sent only a single *binbashi* (major) to investigate it.

The consul makes also a very pertinent remark. He says: —

> The Christians would bear with much hard treatment, under these exceptional circumstances, without complaining, were it not that cruel treatment and oppression originate not with the men, but with the officers. . . . Officers go to shops and take goods at their own prices; the least remonstrance on the part of the owners results in abuse and blows. . . . On the part of the government nothing is done to check these abuses. . . . In the villages officers and soldiers act just as they please, and the accounts of injustice and cruelty daily brought to me are most revolting.

I had intended to confine my quotations to the official blue-books, but a correspondent of the *Times* in Armenia may be mentioned as abundantly confirming all that Mr. Zohrab writes as to the treatment of the Christians in this province. He speaks of large tracts of country where not alone one but every Christian village has been destroyed, and the people either murdered or driven off as refugees. He further states that the Russians, while in their adversary's territory, were careful even not to tread down the corn, and did their utmost to protect all non-combatants. This correspondent was with the Turkish, not the Russian army, and, as he says, had left England with a strong feeling in favor

of the Turks. One significant fact he mentions has not, I fancy, been fully understood by the public. He praises Mouktar Pasha for his determination to put down outrage and robbery, and mentions a case in which a Circassian shot a peasant who remonstrated against his lamb being taken. The Circassian was seized and condemned to death. A number of chiefs interceded for him, but he was hanged; and then about twelve hundred Circassians deserted. The murdered peasant, belonging to a village close to Kars, was evidently a Mussulman. The correspondent in question, Captain Norman, has lately stated in a lecture on the campaign in Armenia that the murdered man was a Mussulman; no such execution would have been possible had he been a Christian.

Further light may be thrown upon the condition of this important Asiatic province by referring to the despatches of Mr. Consul Taylor. It may justly be said that it is not fair to judge of the condition of a country during a state of warfare; so we may inquire how the country was governed before the war, although the mode of carrying on hostilities is surely a valuable test of a nation's civilization. The first despatch of Mr. Consul Taylor is one relating to the condition of the Nestorian Christians of the Tyari Mountains, situated in the Koordish range of heights forming the frontier between Turkey and Persia. These interesting people have been more than once decimated by Koordish or Turkish massacres. In 1875 two of their chiefs came as a deputation to England, and were sent to me to advise them.

They told me they had come to throw themselves at the footstool of the great queen of England to demand her protection against the cruelties of the Turkish officials and the Koords, and they gave me sundry details of outrage and cruelty, which are too common to be repeated; the last that one of them had seen was the yoking of some Christian women to a plough by a Turk. One of these chiefs had a sister who was called Victoria, after the queen of England, as she had been rescued from a Turkish harem, into which she had been introduced on the occasion of the massacre of ten thousand thirty years ago, by the exertions of her Majesty's ambassador, Sir Stratford Canning (now Lord Stratford de Redcliffe). I need scarcely add that these poor mountaineers got nothing substantial for their pilgrimage. The foreign secretary would have nothing to say to them; some religious people took them in hand, and they figured on the platforms of sundry missionary meetings, and that was all. One of them never lived to return to his native mountains. The smoke and fogs of London were too much for him, and he sank and died of phthisis.

The chief aim of Consul Taylor's despatch is to warn our government of Russian intrigues — these intrigues consisting of an address by Mar Shamoon, the Nestorian patriarch, to the grand duke Michael, governor-general of the Caucasus, imploring his protection against the Kurds and Turks. Seeing that a deputation had come to England to ask for protection, I presume the Russian consul also wrote to warn his government against English intrigues. I have no reason to believe that the governor-general of the Caucasus was any more favorable to the address than Lord Derby was to the deputation. Mr. Consul Taylor, however, very forcibly shows the *fons et origo* of these so-called "foreign intrigues." He says: —

I have not thought it necessary to trouble your lordship with a copy of enclosure No. 1 in my despatch to the embassy, as it is simply a long detailed account of the different species of maltreatment and oppression the Koords and Turks have inflicted upon the Nestorians for the last two years. But the substance of that enclosure is that, during that period, they have been plundered of several thousand head of sheep, cattle, and mules; several villages have been entirely pillaged; six of their churches destroyed, eight men barbarously murdered, and no less than ten virgins and married women ravished and forcibly abducted from their homes by the Koords or government police.

These last being the protectors of the Christians!

No punishment has ever attended these acts, the Turkish sub-governors of Inlamerk, Bashkalla, and Guever, where all these atrocities have taken place, paying no attention to the Christian complaints; on the contrary, rather, from their culpable apathy with respect to them, sympathizing with and encouraging the marauders.

Besides the grand duke Michael, our own Consul Taylor was appealed to by the patriarch, and, being a British consul, he was equal to the cruel farce of bidding the lambs to turn to the wolves for redress, according to the well-known custom of the Foreign Office, a custom undeniably correct and judicious *as long as one has to deal with a civilized government.* Mr.

Taylor, in his reply to Mar Shamoon (dated September 5, 1868), says:—

I have now the honor to address you these lines to inform you I shall not be wanting in my endeavors to promote the welfare of your flock as long as its members, by their deportment to the State they are subject to, will enable me conveniently to represent their grievances, when well founded, *to the Erzeroom vali for redress* (!), and suggest means for their proper and permanent relief.

I need not add that no vali, caimakam, mudir, or any such functionary has ever been known to interfere on behalf of Christians; and when these are bidden to look to their own authorities for redress, it is not surprising if such advice appears to them a bitter mockery.

Mr. Consul Taylor gives in a long despatch dated March 19, 1869, a general view of the social and political condition of the consulate for Koordistan. He informs the government that the province of Sileywan, although the richest of the grain-producing districts of Turkey, was suffering from the intolerable measures pursued by the government in the collection of the tithes. Each village was obliged to accept the tithes on grains, fruits, and cotton at a money value based upon winter and spring prices, although the former amounted to 1*l*. 3*s*. 7*d*. a quarter, while the season's wheat barely realized ninety piastres, or 16*s*., for the same measure. He mentions a village which had to borrow thirty thousand piastres at two and one-half per cent. per month to make up the deficiency, the whole of the produce realizing only twenty-two thousand piastres; another, whose produce was seventeen thousand seven hundred piastres, had to pay twenty-four thousand piastres, and while the year of his visit only produced eleven thousand piastres the government claimed twenty thousand. The consul adds these significant words:—

Three years ago, with wheat at two hundred and fifty piastres (2*l*. 5*s*. 5*d*.) per quarter, the whole amount of tithe realized from this district was four lacs (7,000*l*. Turkish). During the same period, however, of the one hundred and six villages then existing, seventy-six only now remain; and in each one of the latter, five or six chifts, or small farms, are entirely deserted.

I am reminded of a circumstance to be found in some consular reports, nearly twenty years old, of the district of Salonica, complaining of the illegal extortions of the government employés. The plaintiffs were directed to furnish a list of these extortions, which soon appeared. The district was then forthwith assessed at that amount, being told, at the same time, that they had proved themselves able to bear it. Under such circumstances large numbers of the fellahs emigrate, and while their lands run out of cultivation, nevertheless their quota of direct taxes is added to the already heavy obligations of those who remain, and thus taxation increases in inverse ratio to population. The measures resorted to by government for collecting arrears are peculiarly Turkish. Consul Taylor reports as follows:—

Moolas, aged men, and council-members were made to transport heavy loads on their backs, in a burning sun, from one place to another, for no other purpose than by such torture to accelerate payment, their steps being unnaturally quickened by frequent blows from the muskets of the brutal soldiery appointed to superintend their unaccustomed labor. Married Christian women, Protestants, were dragged by night, in the absence of their husbands, to the harems and stripped of their gold ornaments; while several of the aged male members of the same creed were so severely injured by the treatment they were subjected to, as to be confined to their beds for months.

A certain Mustafa Pasha was so outrageously tyrannical that the government sent two commissioners to inquire into his deeds, the only result of which was that the pasha was exonerated and his chief accusers thrown into prison for an alleged debt due to government, although the acts of which the pasha was guilty were a subject of public scandal.

The consul gives us much information concerning the Koords. He says:—

The Kochers and Koords are under very imperfect subjection, and it is only by satisfying all demands, however outrageous, that the Christian agriculturists can maintain their position. One unbearable custom, that of *kichlak*, has done more than anything else to contribute to their present paucity and decay. That custom, originating some years ago in the weakness of the government and growing power of the Koords, enabled the latter to exercise the extraordinary right of quartering themselves and flocks during winter in and about the Christian villages, entailing upon the inhabitants large expenses, not only for fodder for their animals, but also food and fuel for themselves during at least four months.

In consequence of this intolerable custom seven hundred and fifty families had emigrated during the last six years to Russia (here is an example of Russian in-

Original from CORNELL UNIVERSITY

trigue), and in the same district the few remaining Christian families have abandoned all culture but that of wheat, as other produce is easier eaten up by Koordish stock. But the consul adds that the slightest complaint to government on the part of the Christians is followed by night attacks or open assaults in the day upon them. During the year preceding this report no less than ten had been killed and forty wounded, in consequence of a complaint to the authorities. In addition to the lawless mob of Koords there exists in these regions a society of holy men, called sheiks, living in the Boolanik district of Moosh. They incessantly preach war against infidels, representing any outrage as lawful or even meritorious. Last autumn (1868) they stormed and plundered

the venerable church and convent, dating from the time of the Illuminator, of Surb Ohann, not ten miles from Moosh itself. In the *mêlée* two of the higher ecclesiastics were severely wounded, all the church plate, ornaments, and embroidered robes carried off; but [hear it, ye antiquarians] the most irreparable loss consisted in the complete destruction of the valuable MS. library by these miscreants. For these and other cases alluded to no redress has been given, no punishment awarded.

The consul adds that "great crimes always unpunished, grievous oppressions unredressed, are perpetrated and merge into what the Koords and Sheiks consider, as warranted by custom, permissible." He tells us, too, that the tithes being sold to the highest bidder, and no one being allowed to cut or gather his crops until assessed, sometimes it is midwinter before they can be gathered. This miserable history is not unrelieved by an occasional grim pleasantry; thus we are informed that a common mode of extorting money is as follows. A Koord extracts one of his own teeth, and then engages purposely in a quarrel with a Christian, during which blows are exchanged. The Koord then complains to his chief, who in every case, unless he is bribed by the Christian, inflicts a fine in money, which varies according to the reputed wealth of the Christian. The *pièce de conviction*, the old tooth, is never impounded, and serves for several other charges, and is sometimes lent to a friend for a similar purpose. The custom is so common as to have originated a proverb: "A Koord carries his teeth in his pocket." In this district the consul informs us that the principal sufferers, "although sedentary agricultural Turks must be included in the category, are the Nestorians, Armenians, and Jews." Within the last two years several have been murdered, others plundered of their property, forced to become Moslems, or emigrate for safety to Persia; while during the same period seven Christian churches have been destroyed, more than thirty human beings killed, virgins and married women abducted, whole villages devastated and plundered, without (in spite of repeated orders from Constantinople) the slightest notice on the part of the vali and subordinate authorities.

The consul describes the present condition of Achlat, a city I once visited many years ago, a city of miserable hovels built upon the splendid ruins of the formerly magnificent Armenian city of Klat. On the occasion of my visit it was but a ruined heap of mounds and hovels, and it has not since improved. Mr. Taylor points out the advantages it presents for commanding the whole district and keeping the Koords in subjection. Of the present state of this once flourishing city the consul says: —

Deserted villages, ruined churches, crumbling mosques, abandoned fields, meet the eye everywhere. The ruthless conduct of these ruffians (Koords), rendered bolder by the feebleness of the executive, has rendered what ought to be a paradise a desert. People who formerly possessed thirty to forty buffaloes, besides sheep and cows, at the same time working ten ploughs, are now begging their bread, and within the last two years the Christian villages, Medzk, Kosthyan, Tapa Vank, Jizroke, Khulleek, Jogkey, and Sivratore, have been utterly abandoned by the Armenians, owing to the depredations of the people mentioned above.

Meantime these Koords pay scarcely anything to government, but receive hard coin for their cattle and sheep from dealers coming to purchase from Egypt and Damascus. Thus they have become extortionate usurers, obtaining three and four per cent. a month, with the additional obligation imposed on the creditor of keeping a cow for the lender during the winter months for every one thousand piastres so lent, or paying one hundred piastres. The consul during his trip arrives at Piran, which, when I visited it in 1849, was comparatively a flourishing community. He had much difficulty in obtaining milk for his tea. The very evening before his visit seven Koords had visited the village, broken into the house of the village priest, beaten him and his son nearly to death,

and carried off the young bride of the latter. She was recovered ten days after, but in a most pitiable state. None of the villagers durst go to the rescue of this poor woman, although her cries resounded through the village. To such a state of abject submission have these people been reduced. For generations past every being amongst them with the slightest courage, self-respect, or nobility of mind has been murdered. Naturally the race has deteriorated, being bred from the most abject of them; and this mean submissiveness has been a reproach against them from many English travellers, and from it the strange argument is deduced that they are best kept under Turkish government.

A large proportion of these Koords are Russian subjects living on the other side of the Russian frontier; and there seems to be no doubt that they fear the Russian government far more than the Turkish, yet on the whole prefer the Christian government, and "are influenced by its intrigues."

The Armenians are everywhere described as industrious and useful citizens. Mr. Taylor, speaking as an official of the Foreign Office, says: —

Everywhere throughout these districts I found the Armenians bitter in their complaints against the Turkish government, at the same time that they were unreserved in their praises of Russia, openly avowing their determination to emigrate. This bias is owing, as already stated, to the constant hostile teaching of their clergy; at the same time ample cause for discontent is afforded by the really wretched system of Turkish provincial administration, the unequal imposition of taxes, scandalous method of levying them and the tithes, persistent denial or miscarriage of justice.

The Christians are betrayed rather than protected by the Christian members of the Mijlis; but as we have been told by other consuls that these are brow-beaten, and obliged to place their signatures to any document that their Moslem masters offer, we can hardly blame them — though it is undeniable that the Turkish system breeds as corrupt a class of Christians as any tyrants could desire for their purposes. Under all these circumstances, it is somewhat amusing to hear the intrigues of Russia and the exhortations of priests spoken of as the cause of the disaffection of the Christians; to use a homely expression, surely this is putting the cart before the horse. The words "loyal" and "dis loyal," too, as applied to these people, are surely as absurd as can be imagined, "because," to quote the words of the consul, a witness of the daily life of these people, "the Christians, in addition to deprivation of property, daily jeopardize their lives, and what is more terrible, the honor of their females, in daily struggle for existence — trials from which the Moslems are exempt." The consul bears witness to Turkish morals in the following words, while speaking of decrease of population: —

Other reasons also, apart from those stated and the detestable vice common to Eastern countries tending to demoralize a people and curtail increase, or rather in favor of decrease, are to be found in the facts that previously no private soldier was allowed to marry, and that in every town and village morals are so depraved that forced abortion and infanticide are daily crimes.

In a further report on the condition of his consulate Mr. Taylor, in a despatch dated July 4, 1871, speaks of a certain holy man of Kurdistan, by name Sheikh Obeyd Ullah, whom the consul irreverently terms "a notorious criminal." He had murdered and plundered amongst the Christian villages in all directions.

Notwithstanding repeated orders of the Porte for this man's trial and punishment, consequent upon the repeated complaints of the Nestorians, the fanatical feelings of the vali prevailing over his sense of justice and true policy induced him to give this criminal, who ought long ago to have been consigned to the bagnio for life, a public entry into the town, escorted by public troops and high functionaries. During his stay here the fanatical party, headed by the vali, treated him more like an inspired being, a man sent from God, than anything else, and on his departure furnished him with such recommendations as induced Aali Pasha, *in the face of his previous orders for Obeyd Ullah's arrest and trial*, to declare his innocence of all the atrocious crimes he or his people, through his instigation and preaching, most undoubtedly committed.

Erzeroom is, as we all know, the capital city of Armenia, and the residence of a British consul. The most industrious and largest portion of the inhabitants are Armenians, who, treated like dogs by their Moslem fellow-citizens, are often accused of being "disloyal." Mr. Consul Taylor gives an example of Moslem fanaticism which is instructive.

A certain Khachatoor Effendi was a

Original from CORNELL UNIVERSITY

wealthy Christian of Erzeroom of great public spirit. He purchased a part of the city that was covered with mean buildings, which he pulled down, and erected in their place two really magnificent spacious khans, rows of elegant shops, and a sumptuous bath. He also entirely repaired and restored a ruined mosque, to the horror of both Christians and Moslems. He also purchased the right to a spring of water; but before the completion of the purchase he was engaged in a lawsuit with the mufti and certain fanatics of Erzeroom, who tried to prevent the purchase on the plea of its being *wugguf*, or mosque property. The wealthy Christian won his cause, as wealthy men invariably do in Turkey. On the very first night of the day on which the water circulated in the new bath the new buildings were discovered to be on fire, and the whole were consumed. This was evidently the work of an incendiary; and the buildings had cost 20,000*l*. During the conflagration not a finger was stirred in any endeavor to extinguish the flames, but several of the Moslems plundered.

Khachatoor Effendi, who was a man of very determined character, sadly but resolutely commenced the work of rebuilding the quarter; and while he was seated in a *café* a Moslem rode up and shot him dead, and not a finger was raised against the assassin. The consul adds: —

All parties seem to agree that the chief promoter of this despicable gang, without whom, indeed, the members would soon be exposed to the punishment they merit, is, unfortunately for the administration of impartial justice in this vilayet, the chief justice or *mufetish-ool-ihkam*, originally a miserable Greek Christian from the islands. This silly renegade openly declares the assassin to have been a Moslem phantom saint in disguise, Khizr Elias, in revenge for the sacrilege done to a mosque by a Christian repairing it, and in like manner, to please the ready dupes around him, he affects incredulity of a witness unless he has certain marks on the palms of his hands, which he regards for that purpose before taking their evidence.

The consul proceeds to say that his influence on the bench or in council is always directed to destroy a Christian's case, however just, if against a Moslem; and in criminal cases against the latter the guilty usually escape. His avarice, however, exceeds even his fanatical partiality, so that a rich Christian has a good chance, when brought before him, of gaining his cause by means of a judicious present.

It would be easy to prove, did space permit, that the European provinces of Turkey are in no better plight than that of Armenia. We have heard much of late, and from none more persistently than from Mr. Consul (now Sir William) Holmes, of Russian and Slav intrigues being the chief cause of trouble in European Turkey. But this apology for Turkish misrule admits of ample refutation out of Consul Holmes's own despatches. In a despatch dated July 3, 1873, he characterizes all the subordinate agents of the government in Bosnia as "venal, ignorant, fanatical, and untruthful."

The same consul, writing to Lord Granville on the 24th of February, 1871, complains that a Greek archimandrite of Mostar, who had been arrested in the previous year, was still in prison, and no decision had been come to concerning him. He adds that after all there is nothing unusual in the case; and the consul, who certainly during the late troubles has shown himself very favorable to the Turks, and has been officially thanked by them in consequence, thus concludes his despatch: —

The unnecessary delay and neglect, to the prejudice often of innocent persons, the open bribery and corruption, the invariable and unjust favor shown to Mussulmans in all cases between Turks and Christians, which distinguish the Turkish administration of what is called "justice" throughout the empire, cannot fail to suggest the question — what would be the lot of foreigners in Turkey were the European powers to give up the Capitulations? I am convinced that their position, in the provinces at all events, would be intolerable, and that they would quit the country to a man, while the outcry and feeling in Europe against Turkey would ultimately cause her ruin. The universal ignorance, corruption, and fanaticism of all classes preclude all hope of an efficient administration of justice for at least another generation.

It certainly does seem strange that a gentleman who could thus describe the administration of a government, of which he is one of the most vehement supporters, should have thought it necessary to seek in the machinations of foreign intrigue the cause of the chronic disaffection which prevails throughout the Christian provinces of the Ottoman Porte. Mr. Consul Holmes does not state the ground of his faintly hinted hope that "at least a generation" would make the slightest change in the state of things which he has painted in such sombre colors. Turkish rule is not a political experiment of so

novel a character that reasoning minds are justified, in the absence of all evidence, in building hopes on its possible amelioration. Turkish rule has a history embracing many ages and countries, and that history tells one invariable uniform tale. The state of things described by Consul Zohrab and others in Armenia, and by Consul Holmes and a legion of unimpeachable witnesses in the European provinces of Turkey, has ever prevailed in every country in which a Mussulman government has wielded independent sway. The student of history, therefore, must reject as idle dreams all hopes and theories which start from the hypothesis that the Turkish government can ever reform itself. The iniquities of its administration are organic. They belong to the essence of Turkish rule, and can only be abolished by the abolition of that rule. For Armenia, for Bulgaria and Bosnia, and the other Christian provinces of Turkey, the only hope is in their emancipation from the foul and cruel yoke of the Turk, for that yoke can never be other than foul and cruel. I have seen its working in times of war and in times of peace. My knowledge of Bulgaria, as of other provinces of Turkey, does not date from yesterday. I have travelled in Bulgaria when Turkey was in the enjoyment of profound peace, and there was no pretension of Russian intrigues, and I know that Consul Holmes's description of Turkish rule in Bosnia would do very well, *mutatis mutandis*, for a description of Turkish rule in Bulgaria. Why should it be thought that Midhat's Constitution gives better hope than the solemn pledge offered to Europe in the more august hatti-houmayoun of the treaty of Paris? Mr. Consul Stuart states that the promises made in that famous international engagement on the part of the Porte "are as dead a letter as if they had never been penned." And he gives forcibly the Moslem argument: —

> God, who gave us these countries, can, if he pleases, enable us to hold them. If we are to lose them, his will be done. But, happen what will, we must follow the commandments of the Prophet. At the same time we must try, as long as we can, to keep up appearances with the Ghiaours, promise anything, and boldly affirm the execution of the promises. Deception is lawful with the Ghiaours.

Mr. Wood, our consul-general at Tunis, puts in a clear form the simple principles of Mohammedan government. He says: —

> It must always be borne in mind that the Koran is at the same time a religious and a political code. All Mussulmans admit it to be so, and it cannot be expected, therefore, that, since their religion is intimately connected with their national policy, they will not make use of the former to carry out the latter. Their policy may be briefly defined, namely, the maintenance of their faith in its purity by exclusiveness and isolation; the emancipation of the countries which have fallen under Christian rule; and the extermination of the infidel nations and races who, by refusing to pay tribute for the redemption of their blood, are pronounced by the Prophet to be in a state of open rebellion against the law, and consequently deserving of death. Enlightened and tolerant Mohammedans will endeavor to palliate these precepts by quotations from the Koran and Hadis; but they are not the less the cherished creed, the conscious belief of upwards of two hundred million Mohammedans.

This is a warning to all Europe. The countries which have fallen under Christian rule, but which were once Moslem, comprise an enormous territory in Asia, the best part of which is now British territory, and flourishing European states, such as Hungary. Supposing for a moment that the dearest wish of the philo-Turks was gratified, that the Ottoman arms were victorious in this war, and that the Russians were driven out of Turkish territory. They flatter themselves doubtless that things would go on precisely as before, *minus* the "intrigues" of Russia. Turkey, the firm ally of England, would preserve the road to India clear by keeping herself weak, anarchical, and ready to be dictated to and to yield to pressure. On the contrary, feeling she had defeated a country which has always seemed to her eyes the most powerful in Europe, Turkey might be pardoned some elation. Would she then continue to submit to the Capitulations, to that international agreement which recognizes the impossibility of Christians being treated with any degree of fairness before the law? In all European countries it is a matter of course that aliens must submit themselves to the laws of the country, so that even an Englishman accused of murder in France would, after due inquiry before a magistrate, be given up to the French authorities, supposing he had crossed the Channel. But in Turkey the subject of any Christian State accused of any offence, even the murder of a Moslem, would at once be delivered up to his own authorities to be dealt with. And why? Because the judges of Turkey from time immemorial have always been recognized as corrupt and fanatical. According to a large party of Englishmen, these

Original from CORNELL UNIVERSITY

judges are good enough for native Christians, but it would be rank cruelty to allow them to judge even the criminal classes of Europe. Under the changed circumstances produced by Turkish victories, the Turks would not for a moment submit to the humiliation of the Capitulations. And what then? Mr. Consul Holmes says that the position of Europeans, a very numerous population, would become intolerable, and that they would quit the country to a man. He is right. There would be an outcry all over Europe; we should as likely as not hear of an English consul being impaled; certainly Englishmen would be rotting in horrible Turkish dungeons all over the country. Would Turkey submit to our holding Aden, a piece of genuine Moslem territory? If she found that fortress too hard a nut to crack, she certainly would no longer allow the Arabs to furnish the garrison with victuals. They have but a few years ago tried to cut off the supplies. Would the Turks patiently allow the Suez Canal to continue to be a high road for infidels through their dominions? If they durst not openly lay hands on it, we may be sure they would block it up *accidentally*, for nothing would be easier.

Our philo-Turks, most of whom are grossly ignorant of the country, seem not to be aware that Turkey is endurable to Europeans only as long as she can be bullied. The ambassadors of the powers are incessantly bringing pressure to bear on the government, which yields only to menaces. This was the secret of the enormous influence of the "great Elchie." He browbeat and bullied the pashas, and played on their fears; he would be about the last man in the world to treat a Turkish minister as a civilized being. All this would be over if Turkey should come out of the war triumphant. Englishmen would find that they had been favored merely because they were supposed to be the enemies of Russia; but after that country had been disposed of Englishmen would be classed with other Ghiaours, but worse, inasmuch as they hold in bondage some millions of true believers. The elation of the Turks would not be the only evil; there would be a general Moslem war-cry all over the world. In the Crimean days we flattered ourselves that we were propitiating our Moslem subjects by fighting for the kaliph. A few months after the termination of the war Moslems were cutting the throats of English women and children. Russia is incessantly accused of "intriguing" in the Christian provinces of Turkey; the charge now would be that Turkey was intriguing amongst the Moslems of India. These would be incessantly reminded that they were under the yoke of the Ghiaour, and they would naturally look to Turkey as their champion. How long under such circumstances could we keep the peace with this Asiatic people, which has been for hundreds of years the unmitigated curse of eastern Europe and western Asia, and has cost us so much blood and treasure?

The tragedy now being acted in European Turkey is such as the world has not witnessed for ages. The Turks have swarmed over the country, ravaging their own territories, and indulging in hideous orgies that none but central Asiatics are capable of. The Bulgarians, when armed by the invaders, have here and there brutally revenged themselves, as might have been expected; but the worst symptom to ourselves is that there exists amongst us a large body of decent Christians who, faintly deploring these deeds as far as they choose to believe them, nevertheless join in the Turkish war-cry and profess to believe Turkish lies, despite the contradictions of our officials on the spot.

Happily, there is now little fear that the arms of Turkey will triumph in the present struggle. Nor is there much doubt that Bulgaria, Bosnia, and Herzegovina, at least, will be delivered from the bondage of Turkish administration. It is in Armenia chiefly that the English admirers of the Turk and his ways will strain every nerve to impose again on the neck of a long-suffering population the galling yoke which the sword of Russia has broken. The writer, however, can hardly persuade himself that the most fanatical among the advocates of Ottoman rule would deliberately commit so great a crime if they knew what they were doing. They really do not know what Turkish rule means for the helpless populations who are subject to its tender mercies. The evidence recorded in the preceding pages — evidence which can hardly be gainsaid — may peradventure open the eyes of those who would commit their country to the hazard of one of the most calamitous and flagitious wars in history.

From The Examiner.

LAY-FIGURES.

THIS is not about the wooden dolls who wear clothes to oblige the artists, and who

accept any sort of attitudes, heroic or vile, pathetic or frivolous, convenient to their delineators, without suffering inconvenience. Those dolls exist for their destiny, and their destiny is their salvation from a worse. But for it they might be fire-wood or kitchen dressers; instead of sitting sacredly on chairs which must not be moved lest they should be ever so little disturbed, they might be chairs themselves, sat upon and knocked over by any mere stout gentleman; they might bear the burden of draperies as towel-horses or clothes-pegs; they might be chipped into matches; they might be trodden on as floors. But, rescued from degradation, rescued from annihilation, they have their calm and honored place; they fulfil their vocation avowedly and without sense of wrong; they are lay-figures and they know it.

The lay-figures who do not know it are the persons in question — the live lay-figures who, not dreaming what is happening to them, sit for their characters to novelists and social caricaturists. They have been seized on in the bosom of their families, in the shelter of their friends' houses, at their clubs, at church, and put to use. Some of them have posed for personages of strange histories, personages fearful and wonderful to them when they come to read of them, never dreaming who has sat for them; some as their mere uneventful selves with just an altered name; some of them for specimens of the latest faults and follies of the age to do duty under a class-labelling in the objurgations of Juvenals by the week.

It is evident that if these live lay-figures never come to know the purposes they have served, and if other people do not come to know it either, if the secret of who was the model remains a fathomless mystery in the artist's breast, they are not the worse for his work upon them. Nobody will feel any uneasiness but the artist, whose conscience, one would think, may get a little pricked if he chance to receive some proof of confidence from the man whose fireside foibles he has copied for his latest villain, or some neighborly charity from the good lady he has, to his thinking, drawn to the life as the vulgar mother. And as, because of the different lights in which other people's characters present themselves to us according to our own position towards them and according to the actual position as regards themselves, and still more because of the difference of perceptions and sympathies which make each man's mental vision in some way differently tinged from every other man's, no two human beings form exactly the same conception of any third human being, it can never be an easy task to produce a likeness of an individual character which shall make itself recognized by everybody without any help from external accessories, and it need never be a difficult task to disguise its identity by such accessories. Some of us could not be easy under any sense whatever of using the intimacies, or even the mere social contacts of life, towards individual portraiture, however disguised; yet this is rather a personal idiosyncracy than the conviction of a carefully reasoning conscience, and there can be no doubt that a skilful employment of one's neighbors as lay-figures is consonant with the strictest honor in every relation of life. In this matter the one certain law of duty, but that law an immutable one, is in plain fact the popular eleventh commandment, *Thou shalt not be found out.* To admit so much is not by one jot or one tittle to palliate the abominable baseness of creeping into confidences for artistic purposes. Still less can it be held to allow the cowardly and easy cleverness of concocting an unmistakable effigy and exhibiting it in a literary pillory against which no protest can be made by or for the original, for to protest is to admit the likeness. Such crimes are heard of and no doubt do happen, though they probably are heard of far oftener than they happen; the common fallacy of the non-writing public that in literature a portrait must necessarily have an original cannot but cause a good many Procrustean fittings of originals to portraits, and the luckless artist who thought he had created may live to learn that he has only caricatured. But however that may be there ought to be, among honest people, no room for discussion whether such crimes, when they do happen, are crimes; nor are they the less so because their results may be amusing, or even edifying, to us as readers, any more than the fraudulent obtaining of a bill of exchange would be less an offence against the law because we ourselves, coming into possession of it as innocent holders, have received good money for it.

The question that does present itself for discussion is whether the conscious use of a lay-figure for a literary portrait is artistically desirable. Should the novelist who wishes to depict some phase of embodied character to the life select a given man of the required character and depict *him* to the life? Or should he, as a means of

Digitized by CORNELL UNIVERSITY Original from CORNELL UNIVERSITY

giving verisimilitude to a more or less invented personage, elaborate the details from some one in actual existence, describing real peculiarities, and perhaps real incidents? The methods, usual enough, sound good on first statement; and they would be good if they were not misleading. The writer believes that, because he has the evidence of actual occurrence in his world of facts for what he has set down as occurring in his world of fiction, he has been true to nature; the reader is conscious, more or less clearly, of the interpolation of one sort of truth to nature into another sort of truth to nature, to the disturbance of both. It is like the crown one sees affixed on the canvas to the painted heads of Madonnas and saints: the beaten gold is real, and the gems are real; without them the face would have been real, and with a higher reality than theirs. The whole picture becomes false by the introduction of the extraneous bit of veritable material. Nor, even, is the actual personage, or the actual saying or doing, interpolated by the writer into his imaginary sequence of causes and effects, however carefully copied, absolutely true in itself apart from its relative truth as a portion in the whole; for these are not themselves except *as* themselves, they need the rest of their facts. Without them they are incomplete; you get a certain full-faced view of them, but the rest of them is not there, and you feel it; just as you miss the rounding sides and back of the crown on the pictures, although perspective would not have allowed of your seeing all round the crown at once if it had been complete.

The fact is, you can learn from each human being a great deal more about human nature than you can learn of his individual nature. Everybody does things which, as coming from him, are quite unaccountable to his most intimate friends — more unaccountable to them the more intimate they are. "I have known So-and-So intimately for years, and he is the very last person I should have expected to do that," — what a familiar phrase it is! The action spoken of may be quite comprehensible, given a certain character and certain circumstance; it may even, if of a meritorious or lofty-souled nature, be what we conceive that we ourselves should do in such a case, but as So-and So's action it is incomprehensible to us. That simply means that, because we are not So-and-So and look on him from the outside, we do not really know his character; he has an identity which we cannot master. Superiority on one side cannot enable us to read him through and through, still less of course can inferiority, and even sympathy will not overcome that inevitable separation of self from self which makes the most closely-knit minds still in so many workings a secret to each other. We may, from what our lives have taught us of many John Smiths, create a John Smith of a probable or at the least possible character, on whom we look from the inside, and make him do according to his character within the facts we assign him in his three-volume career; but we cannot say with certainty of any individual John Smith of our flesh and blood acquaintance what he would be and do in imaginary circumstances. Do what we will the individual John Smith will be incongruous to our theory of him, and when we have got him well copied into our book he will show there as the lay-figure he is.

Supposing that a novelist wants to represent a first-class heroine rejecting a first-class hero for a second-class hero, without any such appearance of idiocy on her part as shall alienate the admiration of the reader. What would be the use of his trying to give her vitality by making her a close study of the real young lady who committed a like error of judgment and refused his real self in favor of his real, and, to his mind, manifestly ineligible rival? He never was able, he never will be able, to comprehend how she arrived at her selection. Consequently if he be never so successful in describing her as he knows her, in transcribing her amiabilities, her caprices, the little traits that reveal disposition, the little special mannerisms that give originality, she will remain incomprehensible to the readers. And in literature the incomprehensible is the unnatural; the personages are allowed no lasting secrets from the reader, their very hearts are laid bare, and what they are must be reason for what they do. If the novelist from what intuition, sympathy, observation, reflection, have taught him of human hearts, generally, and what he has known or has guessed of the feelings and ways, generally, of women of the sort of the heroine he has in view, creates his creature, he will know her too thoroughly to make mistakes about what she would be likely to do in any of her predicaments, and she will even, as he goes on, teach him things he never dreamed of in his first conception of such a nature, and of which all readers will feel, "How true!" and some will say, "What a careful study from the life — evidently a portrait."

There is of course a kind of delineation for which the use of the lay-figure is, artistically speaking, not only unobjectionable but distinctly useful; and that is when the effect aimed at is that of caricature. And by caricature is here meant not merely humoristic exaggeration, but that kind of description which, whether for mirth or for pathos, for blackening or for beautifying, aims at giving vividness by rendering salient points of character, and still more of manner, strongly and persistently conspicuous without much, if any, attempt at general truth to nature. In this sort of work a lay-figure with a peculiarity may be an invaluable model. But it is not a kind of work of which very much is desirable. To do it badly, perhaps even to do it moderately well, is too easy; to do it well is too difficult. Caricature is not, as rash folk suppose, merely a convenient simplifying of art for those who cannot succeed in reproducing the true proportions, but a special sort of art requiring a special gift. It is true, unhappily, that to copy a caricature is immeasurably easier than to copy, let alone to create, an ordinary portrait; and so far the second-hand of caricature is of better result than other imitation: but so far only. For those who have only to read the books, not to write them, the ease with which a vigorous or a deftly touched-in caricature can be imitated into a tedious monstrosity is something other than a gain. However, granted the style, it must be granted that in it the human lay-figure has his use. Must it not, however, also be said that it is just in this manner that he should not be used? To use him you cannot disguise him; on the contrary you must make his peculiarities more evident, you must keep them strong, unmistakable, and you must ignore those large intervals in the lives of the most peculiar of us in which we are not being peculiar. You must, in fact, catch your lay-figure in striking moments so that the likeness shall be unhesitating, and you must not, on pain of losing your points, alter away those features by which recognition of the original is possible. Your fellow-creature's right not to be made a lay-figure under such circumstances is surely as inalienable as his right not to be hanged without trial by judge and jury.

From The Spectator.

THE MOBILITY OF ASIATICS.

THE papers are full of accounts of two great movements among the Mahommedans of eastern Europe,—a flight among those of Roumelia and Bulgaria towards the capital, and an exodus of all classes belonging to all the coast provinces into Asia. The first movement is a most distressing one, — a panic flight of peaceable households, driven from their homes by unreal fears of the Russians, whose interest as well as policy is conciliation, and by real fears of their outraged neighbors, the Bulgarians, of the Turkish irregulars, and of the Circassians, whose criminal violence daunts and exasperates the Turks themselves,—a flight attended by all the horrors which accompany such catastrophes in Asia, but exaggerated by accidental contact with European methods of locomotion. In a normal state of affairs, the terror-stricken crowds would fly slowly, in carts, along many roads, or across the open country, and would of necessity be dispersed, and therefore suffer little from hunger or from overcrowding; but Roumelia has one railway, and as a train moves quicker than a cart, the multitudes precipitate themselves on the stations, throw themselves before the engines till the drivers dare not move, swarm into the carriages till children perish of suffocation, and even sling themselves in crates, like quails or wild ducks, beneath the wheels, without food, or means of momentary escape from imprisonment. The result is as if a herd of buffaloes were stampeding down the Strand, an uncivilized rush being, as it were, compressed, yet not stopped, by contact with a civilized locality, till all circumstances of suffering and horror and violence are concentrated in one spot, to their great increase in reality and their multiplication tenfold in appearance. This flight, of course, will be stopped by peace, or by the restoration of order which follows military occupation, or by a determined effort of the Porte to put the Circassians down; but the second movement, the exodus of Mahommedans out of Europe into Asia, may possibly not end at all, but continue for months or years, until the last Mussulman has shaken off the dust of Europe from his feet.

No idea has a more complete possession of the English mind and no idea has more need of rectification than that of the immobility of the ordinary Asiatic, whether Mussulman or Hindoo. It is supposed that if he is once settled on the land, he becomes so attached to it that nothing will move him from his village, that he will remain ploughing the same fields for age after age, and that nothing but force

will tempt him to quit the one spot that he knows. The immobility of an English villager is said to be activity when compared with the tenacious restfulness of an Asiatic, who remains under all circumstances rooted to the soil, more like a natural feature of it than a human being. This statement is true in the main, but it requires some exceptions which are very seldom made, and which in practice modify the general truth most materially. The Asiatic, west of China, no doubt is attached to his home, knows little if aught beyond it, and is so entirely free from annoyance at the daily monotony of a life confined to one place, that he looks upon such monotony as part of the divine order and as essential to the true enjoyment of existence. He likes to live in one place, to see always the same scenes, to meet always the same people, to perform for years the same daily tasks, to find everything, even moderately unpleasant things, always to-day what they were yesterday and will be to-morrow. He loves monotony — it may be, as many assert, from a peculiarity of the Asiatic temperament inherited through ages, though we find the same love among many of the European nations,— as, for example, the southern French and Bavarians,— and cannot forget that the Aryan came from Bactria, or it may be from the profound conviction which he entertains that the order of things when once settled being divine, the effort to alter is at once impious and futile. There are artisan families in India and, we are told, in Damascus who have worked at the same work day by day for a thousand years; peasant families who have not only tilled the same fields, but have gone into them and left them at the same hour, according to the season, from a period before the birth of Christ. They have no wish for change, no ambition to do better, no inclination to roam, no sense of failure because they are as their forefathers were, and as their sons will be. Such content, content which is consistent with permanent melancholy, and even in occasional instances with deep and persistent sadness, seems incomprehensible to the Englishman, who never witnesses it unless he has already uprooted himself from his own home, and he very readily exaggerates its limits. The Asiatic adheres to his home only when, as the result of his adherence, certain conditions are sure to be fulfilled. He requires a motive for movement other than that hope of enjoyment in change, or that desire of bettering himself, which is the impulse of the Western man, but once disturbed, once presented with a motive for going which is sufficient to his own mind, no man moves so easily. In India, in Persia, in Arabia, in Turkey, pilgrimage is a habit such as it never has been in any European land. The most customary accident — a death in the house, a sickness, a loss of money, an access of spiritual restlessness — is motive sufficient, and in a few days or hours the individual or the family is in motion towards some shrine or some sacred spot hundreds, it may be thousands, of miles away, on a journey which may take months or years, and through lands as unknown to the pilgrims as Egypt is to a Suffolk laborer or Thibet to an Esquimaux. The celebrated pilgrimage to Mecca is but one among hundreds of such pilgrimages, undertaken every day by thousands of Asiatics as readily and as cheerfully as an English migration is undertaken to the next village. Throughout the Asiatic world there are spots toward which, through all ages and from all countries a ceaseless stream of humanity is always slowly flowing, filled up by crowds whose objects and impulses are almost as obscure as their means of subsistence or their chances of a return. Religious anxiety has destroyed content, and the Asiatic moves as readily as the Yankee or the Missourian. Nor is religion the only motive. The Asiatic moves instantly if anything hateful and not visibly of God, like a flood or an earthquake, comes across him, moves out of the way of an army or of an oppressive governor, or of an epidemic, or of famine, or of taxation pressing unbearably, as he thinks, upon his land. All men who have set themselves to organize provinces filled with Asiatics know that there is a turn of the financial screw which will, even in Egypt, empty provinces, entire peoples taking flight to some more favored land. An Englishman, not a century ago, emptied Bundelcund in that way, and the province has never recovered; a stern Persian tax-gatherer often depopulates a district, and an oppressive governor in Turkey sometimes inflicts in one year a blow from which his pashalic does not recover for a century. The people do not perish,— they go away. The attraction to the soil once ended, the Asiatic moves even more easily than the European. He has no feeling about his "country" in the English sense; indeed, in many languages he cannot express the idea. He is not afraid to go far, if he has not to cross the sea, for once uprooted, distance makes

little difference to him. He has no furniture to carry, for, except a carpet and a few brass pans, he uses none. He has no trouble about meals, for he is content with parched grain, which his wife can cook anywhere, or dried dates, or dried flesh, or anything obtainable which will keep. He is, on a march, careless where he sleeps, provided his family are round him — in a stable, under a porch, or in the open air — he never changes his clothes at night, and he is profoundly indifferent to everything that the Western man understands by "comfort." If he has time, he takes his cattle with him, if not, he abandons them or sells them for any sum procurable, turns everything possible into money, and with all his possessions on his back or in a cart marches on, perfectly secure of the favor of God, to the destination which, sometimes from a tradition as old as his own family, he has fixed in his own mind, with a certain stoicism and even nobility of resignation which it is impossible not to admire. If the English had it progress would cease, but so also would discontent. Movements of this kind have repeatedly been reported within the past century in Turkey, in Persia, and even in India, where occasionally a huge wave of population breaks out of or into some misgoverned or well-governed native state. The losses in every such movement are frightful, but the Asiatic is careless of statistics, and thinks of the deaths only as calamitous incidents of the route, no more to be lamented than any others which it may please Providence to send. It is quite possible that an impulse of this kind may strike the European Mussulmans, who as an ascendant caste will sorely chafe under the victory of the Christians, and that within ten years they will all have silently glided away, as they have within the last quarter of a century out of Roumania and Servia. They will fret under the altered social system, they will recall undying traditions of pleasanter lands across the southern straits, where all things are still ordered according to Moslem use and wont, and where there is room for millions; and silently selling their property, they will, with their wives and children, depart for the south, and crossing the Bosphorus or the Dardanelles, settle, each group going deeper and deeper into the interior, in Asia Minor, the wonderfully fertile land, four times as large as England, which the rule of the pashas has emptied of its ancient population. They will not be prosperous there, for their *métier* in life is rule, and not the steady industry through which alone in our day prosperity is attained; but they will be content and tolerably peaceful until the intrusive, restless European, filling up European Turkey, shall decide that the southern Mediterranean also belongs to him, and that the stationary or decaying Moslem must depart thence also. The new settlers will take the unoccupied fields, construct light, unfurnished dwellings, plough, or compel Christians to plough enough acres to maintain them, and live on, unprogressing, sure that this is what God ordained from the beginning, utterly contemptuous of Western restlessness, and leaving the general results of their inaction to fate and the stars. Travellers who see their daily life will like them very much, and travellers who see their spasmodic life — their life when their calm monotony is threatened by men whom they can kill — will consider them brute beasts; and once again the controversy will rise and fall and be fought out, to end, as it always ends, in showing that that which moves will conquer the immobile, and that sand must fly before an advancing breeze. The Moslem, unless we mistake all signs, is uprooting himself, and his tradition as to his home being Asia, will no longer stay in what for him has become the most ungenial quarter of the world.

From Nature.

THE SALARIES OF THE OFFICERS IN THE BRITISH MUSEUM.

THE inadequacy of the salaries of the officers of the British Museum has long been a standing grievance. It is manifestly impossible to give any valid reasons why the literary and scientific men of this great national establishment should not receive emoluments at least equal to those granted in the ordinary branches of the civil service. The obstinacy of the trustees in clinging to obsolete principles of priority, and in endeavoring to keep entirely in their own hands the right of nomination to all the more important posts, has, no doubt, been the main cause why the Treasury have until recently refused to do justice to a most meritorious and ill-treated branch of the public service. From the "Correspondence between the Trustees of the British Museum and the Treasury," which has lately been issued as a Parliamentary paper, we are glad to find that in this instance, as on former

Digitized by CORNELL UNIVERSITY Original from CORNELL UNIVERSITY

occasions, the present ministry has been induced to do justice where their predecessors in office have persistently ignored righteous claims. After a long correspondence, commenced in May, 1876, and extending over some fifteen months, it seems to have been finally settled that the salaries of the keepers of the various departments shall be raised to 750*l.* per annum after five years' service, instead of stopping at 600*l.*, the former limit, and that the salaries of the assistant keepers shall rise to 600*l.* after five years' service, instead of being restricted to 450*l.* as heretofore. The assistants in the various departments will, in future, be divided into two classes, the first, or upper class, with salaries commencing at 250*l.* per annum, and rising by annual increments of 15*l.* to 450*l.*; those of the second, or lower class, commencing at 120*l.*, and rising by increments of 10*l.* to 240*l.* This will create a considerable general improvement in the position of these subordinates, of whom the junior assistants, as they are called, have hitherto commenced at 90*l.*, and the senior assistants have never risen beyond 400*l.* But the trustees have agreed to regard the new second class for the future as an "educational class," from which those persons who show special aptitude for the work of the different departments may be promoted to the first class, whilst those who have no extraordinary abilities must remain content with the maximum salary of the lower class. Another concession that the trustees have been compelled to make in order to obtain the above-mentioned advantages is a reduction in the number of the assistants of the upper class. The Treasury justly point out to the trustees that the scheme of having a first class of assistants double the number of that of the second class, is "inconsistent with all ordinary classification," and that the comparative numbers of the two classes "ought to be exactly reversed." This the trustees have, as it appears, somewhat unwillingly undertaken to effect, by a gradual reduction of the number of first-class assistants as vacancies occur, and by making all future appointments into the second class, except when "an opportunity occurs of securing the services of a person possessing very special qualifications."

A third point which the trustees "are prepared to reconsider" is the number of keeperships, now amounting to thirteen; and in order that the Treasury may have greater control in this matter, they have undertaken not to fill up any keepership which may hereafter become vacant, "without the previous concurrence of the Treasury." A still more important proposal made by the Treasury and "conceded by the trustees," is that the position of keeper should be considered as a "staff appointment, to which no officer within the museum should have any right of succession by seniority." This "concession" will, we trust, do away with the practice of putting round men into square holes, in order to obtain for them an additional salary, which in former years has, we fear, been followed in some instances at the British Museum.

One remaining point, which has much exercised the well-known economy of the secretary of the treasury, we are pleased to see he has been obliged to give up. It was proposed that the keepers who occupy the residences attached to the British Museum ought to give up a certain portion of their salaries in lieu of rent. In reply to this ingenious suggestion, the trustees very justly urge that those keepers who reside on the premises have important duties to perform, in having to take in turn the general charge of the whole museum under the principal librarian, for which the accommodation of a residence is no more than a fair equivalent. This contention was ultimately allowed to prevail; and on the whole, we think, there is every reason to be grateful to the government for the improvements effected by the new scheme in the position of the *employés* at the British Museum. Even in these hard times it cannot be said that a place of 750*l.* per annum with a good residence attached and a pension in future when work is no longer possible, is not such a prospect as may well attract some of the cleverest youths of the period who have a leaning towards literature or science to seek the place of "junior assistant" in the British Museum.

SINCE the article on "Miramar and Maximilian" was in press we are informed that a few weeks since a letter from Madame Bazaine was received by the editor of a French paper, speaking of the article in question as one likely to be widely read by the public, and requesting him to correct the statement that she was in any way related to or connected with General Lopez the betrayer.
